Due to the very low permeabilities of the weathered rock and hard rock at the Quarry Site, the volume and rate of groundwater flow is very low compared to the volume and rate of the flows in the river. For example, the average releases from Friant Dam in August 2025 were 250 cfs (https://www.restoresjr.net/restoration-flows/flow-schedule/), which is near the minimum reported release for January through August 2025. In contrast, the estimated dewatering rate for the Quarry at maximum depth is approximately 165 acre-feet per year, or 0.22 cfs (see Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR). Thus, the Quarry dewatering rate is less than 0.09 percent of the recent base flow rate on the San Joaquin River and less than 0.009 percent of the Stage 1 SJRRP flow scenarios (see Response 6-12). The 165 acre-feet per year estimated dewatering rate is only 0.04 percent of the projected SJRRP annual releases from Friant Dam during average normal year conditions (i.e., release of 400,300 acre-feet per year) and only 0.14 percent of the projected releases under critical dry year low conditions (i.e., release of 116,866 acre-feet per year), as shown in Table 2 of the SJRRP Restoration Flows Guidelines, Version 2.1 (https://www.restoresjr.net/?wpfb_dl=3114). The dewatering volume and flow rate associated with the Quarry dewatering are miniscule compared to the current actual and projected future flows on the San Joaquin River below Friant Dam. Thus, the project would not impact the watershed.

Furthermore, as discussed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR, a detailed Hydraulic Analysis was prepared by Chang Consultants (see Draft EIR Appendix G-1, "Hydraulic Analysis") which evaluated the 100-year flood conditions along the San Joaquin River. As detailed in the analysis, the berm separating the river from the Quarry Site is higher than the 100-year water surface with freeboard and would therefore resist breaching. Further, the Quarry Site is located outside of the San Joaquin River floodway (behind the river bank) and mining activities would not impact the floodplain nor flow velocities. In consideration of commenters' concerns pertaining to severe flooding events and in light of County Policy HS-C.12, Chang Consultants

evaluated the potential for the 200-year flood to enter the Quarry Site and Plant Site. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. A topographic mapping was prepared to display the locations where the berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site. Please see Collective Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site, and see Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10 and Section 4.11, "Land Use."

Comment 465-3

2. Air Quality and Dust Emissions

I have serious concerns about the air quality and exposure to toxic elements from the mining and transportation of materials. We live in an area with serious illnesses from poor air quality and anything that adds to that is a real negative. I hope there is a serious look at the toxins that will be in an area where people are living and recreating, including a very important access road for the large cycling community in the area.

Response 465-3

Please see Collective Response #11 pertaining to community cancer risk. See also Collective Response #9 regarding the project's potential air quality impacts. Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), provides evaluation of potential air quality impacts of the project, including consideration of potential effects associated with fugitive dust and toxic air contaminants and health risk at Impact 4.3-3. The comment does not provide evidence of a deficiency in the Draft EIR.

Comment 465-4

3. Biological Resource Impacts

I am concerned about impacts on sensitive bird habitats…

Response 465-4

Please see Draft EIR Section 4.4, "Biological Resources," for discussion and analysis of the project's impacts to biological resources, including bird habitats and the San Joaquin River. See also Response 65-15 for discussion of the adequacy of the mitigation measures

for the raptors, including Swainson's hawks and bald eagles. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

Comment 465-5

…and on the hopes for getting salmon back on the river. From what I read, hard rock mining can negatively impact salmon and their habitats from release of toxic heavy metals, sediments and acid mine drainage, which can disrupt spawning grounds, reduce water quality and harm fish populations.

Response 465-5

Water Quality impacts are discussed and analyzed in detail in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. No impacts to water quality of the San Joaquin River are expected, and thus is not likely to result in significant impacts to salmon. See Response 65-13 for further discussion of the project's potential impacts to salmon. See also Collective Response #12 for additional discussion of salmon restoration efforts in the San Joaquin River. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10.

Comment 465-6

I understand as well that the mitigation to protect the Swainson's Hawk and the bald eagle are inadequate.

Response 465-6

See Response 65-15 for discussion of the adequacy of the mitigation measures for the raptors, including Swainson's hawks and bald eagles.

Based on existing site conditions, the majority of the project area is characterized by active mining operations, which provide limited foraging opportunities for Swainson's hawks (Draft EIR at page 4.4-49). However, areas adjacent to the mining operations, such as fallow fields and open spaces, may offer potential foraging habitat. The project sites are located within the known nesting range of Swainson's hawk. Project implementation may result in the conversion or loss of marginal foraging habitat; therefore, avoidance, minimization, and Mitigation Measure 4.4-1c would be incorporated as necessary to reduce potential indirect impacts to Swainson's hawk foraging in accordance with CDFW guidance.

Comment 465-7

I don't know whether there are native grinding holes in any of the locations near the mining.

Once things like this are gone, I fear they won't come back.

Response 465-7

Draft EIR Section 4.5, "Cultural Resources," and Draft EIR Section 4.18, "Tribal Cultural Resources," discuss the cultural (prehistoric and historic) setting of the project sites and evaluate potential effects of the project on cultural resources. With regard to the commenter's uncertainty of the presence of "grinding holes," Draft EIR Table 4.5-1, "Cultural Resources Within the Project Sites," (on pages 4.5-19 and 4.5-20) identifies that a palm-sized shallow bowl mortar shaped from a fine-grained granitic stone was identified within the project disturbance area. As discussed in the table, the high degree of disturbance and lack of association with other resources suggest that the artifact was found in a secondary, or possibly tertiary, context, and the evaluation determined that the artifact is not eligible for listing in the California Register of Historical Resources (CRHR). The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 465-8

Lost Lake as I used to know it is not even accessible any more as that part of the park and area are locked to public access. I wonder how it impacts the nature trail from the south end of Lost Lake Park.

Response 465-8

Please see Collective Response #21 pertaining to public access to the San Joaquin River, and please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 465-9

4. Traffic and Noise Concerns

Today as I rode my recumbent trike from home to Millerton Lake, I saw minimum 25 trucks related to mining operations on Friant Road. Sometimes I saw as many as 5 or 6 at the same time, or within minutes of each other. The mine traffic has increased. I understand CEMEX has no plan to pay for road conditions or access or improvements.

Response 465-9

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance. The Draft EIR discusses the proposed increases in traffic with the expansion of proposed project activities and displayed in Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)." Draft EIR Table 4.17-11, "Estimated Annual Average Daily Trip Generation at Plant Site and Quarry Site," indicates Stages 1 and 2 project operations would increase annual daily vehicle trips by 5 to 201 trips per day, which is below the VMT significance threshold. Section 4.17, "Transportation," of the Draft EIR, presents Mitigation Measures 4.17-1a through 4.17-1n to provide equitable share contributions to area roadway widening and signalization improvements required with project approval. For these reasons, the Draft EIR analysis was sufficient in addressing roadway conditions and maintenance.

Comment 465-10

The sand and gravel on the shoulders increases hazards for cyclists.

Response 465-10

Please see Collective Response #30 pertaining to roadway safety and road maintenance. As discussed under Draft EIR Impact 4.17-1, Project Stages 1 and 2 operations and reclamation activities would not conflict with any regional transportation plans, including transit, roadway, bicycle and pedestrian facilities. The project does not propose any changes to the existing roadways or Class I and Class II bicycle lanes located within the project traffic study areas. Draft EIR Impact 4.17-3 assesses the project's contribution to local hazards or incompatible uses on roadways and determined the impact to be less than significant. Further, A Fugitive Dust Control Plan has been developed consistent with Mitigation Measure 4.3-2b, including controls for unpaved roads and stockpiles with chemical dust suppressants and best management practices for cleaning sites and roadways of debris and other aggregate materials. For these reasons, the project's contribution to roadway hazards was found to be less than significant and the Draft EIR analysis was sufficient, and no further response is required.

Comment 465-11

There is already a lot of traffic on Friant and it will only increase with more residential areas nearby. What might have worked 100 years ago doesn't work now and won't work for the next 100 years.

Response 465-11

Please see Collective Response #29 pertaining to project traffic. The Draft EIR discusses the proposed increases in traffic with the expansion of proposed project activities as displayed in Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)." Draft EIR Table 4.17-11, "Estimated Annual Average Daily Trip Generation at Plant Site and Quarry Site," indicate Stages 1 and 2 project operations would increase annual daily vehicle trips below the VMT significance threshold. Draft EIR Mitigation Measures 4.17-1a through 4.17-1n require the Operator to provide equitable share contributions to area roadway widening and signalization improvements required with project approval. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17. For these reasons, the Draft EIR analysis was sufficient in addressing impacts related to project traffic.

Comment 465-12

5. Cumulative Environmental Effects 4.1.1.4

The portion of North Friant Road adjacent to both the Plant and Quarry sites is also a County-designated scenic highway (Fresno County 2024). Specifically, Fresno County has designated Friant Road from the City of Fresno to Lost Lake Road a County designated scenic roadway as it "traverse[s] land with unique or outstanding scenic quality or provide[s] access to regionally significant scenic and recreational areas." How does this additional mining work in this area going forward? Maybe it did 100 years ago but not now.

Response 465-12

The portion of North Friant Road adjacent to the Plant and Quarry sites is a County-designated scenic highway, as noted by the commenter and described on page 4.1-4 of the Draft EIR, where it is identified as traversing areas of scenic quality and providing access to regionally significant scenic and recreational resources. The Draft EIR evaluates the project setting, including the sites' proximity to and visibility from North Friant Road, in its visual resources analysis. Please see Draft EIR Impact 4.1-1 (pages 4.1-51 through 4.1-61) and Impact 4.1-3 (pages 4.1-61 through 4.1-62) for a detailed discussion of visual impacts. As concluded in the Draft EIR, the project would not result in significant impacts to public views from this roadway (Draft EIR page 4.11-35).

Comment 465-13

The Sumner Hill residential development west of the San Joaquin River and within Madera County has views of the Quarry Site. Some large lot residences and private residential communities east of the project sites along North Friant Road and Bluff View Avenue have views of the Plant Site and Quarry Site. Some of these people bought property because they thought the mining was done. What a shock it was to find out the CUP was extended and extended and now this proposal.

Ball Ranch and Ledger Island are, in fact, open and improved. There has been significant improvement to the Ball Ranch area that opened up. Is that mining operation an "attractive nuisance" to young (and maybe old) recreational users in those areas? Are there buffers in place so that safe trails for hiking and biking can continue to be developed as so many of us have dreamed of for decades? The Plant Site and Quarry Site are visible from publicly accessible areas, areas that may become publicly accessible during the lifetime of the proposed project, and from private residential communities surrounding the project sites. The continuation of mining would generate new stockpiles on the Plant Site and Quarry Site; would deepen the mining excavations on both sites to depths of approximately 85 feet bgs at the Plant Site and 600 feet bgs at the Quarry Site; and would add aggregate processing and production facilities to the Quarry Site. Each of these changes has the potential to adversely affect scenic vistas visible from potentially sensitive viewpoints. This includes homes in the area that never anticipated having this "view" from their homes. Some of the homes in this community will be significantly impacted even with mitigation.

CEMEX admits that the 600 foot pit can never be brought back to what it was before the blasting. During Stage 2 operations, the expanded quarry pit would be a clearly visible project feature and the added ready-mix concrete plant and hot mix asphalt plant would also be visible in the ROCKFIELD MODIFICATION PROJECT DRAFT EIR 4.1—Aesthetics and Visual Resources December | 2024 4.1-59 background.

Response 465-13

The Plant and Quarry sites would maintain existing minimum setback distances from the San Joaquin River, North Friant Road, and other property boundaries, as described on pages 2-15 through 2-18 of the Draft EIR. The Draft EIR evaluates the project's visual impacts in detail, including potential effects on scenic vistas and views from surrounding areas. As discussed in Impact 4.1-1, impacts at two locations (Locations #12 and #13)

would be significant and unavoidable. Mitigation Measure 4.1-1, as modified in Chapter 3, "Draft EIR Errata," requires rock staining to reduce visual contrast from the project sites and adjacent viewpoints; however, these impacts would remain significant and unavoidable. The quarry pit would remain visible post-reclamation, although revegetation and reclamation would improve overall visual quality compared to operational conditions.

The Draft EIR also considers potential effects on adjacent parklands and recreational use areas, including views from potential future trail easements along the western boundary of the Quarry Site, which may be developed subject to coordination between the Operator and Fresno County. As discussed in the Draft EIR, such trails would have clear, unobstructed views of portions of Quarry Site operations.

Please see Response 465-12 regarding the Draft EIR's visual impact analysis, Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas, and Collective Response #7 regarding socioeconomic impacts. The commenter does not provide evidence of a deficiency in the Draft EIR; however, the commenter's concerns are noted and will be considered by County decision-makers.

Comment 465-14

The quarry pit would remain clearly visible post-reclamation. The quarry pit's engineered and linear benches would present a significant contrast to existing and Stage 1 conditions resulting in visual quality that is discordant and promotes strong disharmony with the surrounding open space environment. Therefore, this modification represents a significant change compared to existing conditions. The benches are located in hard rock, which is not supportive of the growth of a plant canopy and would therefore not be revegetated under the proposed reclamation plan. The potential future trail easement proposed along the western boundary of the Quarry Site would also be visible but would be similar to the existing access road along that area. As with the other viewpoints assessed, once operations have ceased, the equipment removed, and the Quarry Site is revegetated/reclaimed, the overall visual quality of the reclaimed Quarry Site would slightly improve relative to the operational stages, but the hard rock benches of the quarry pit would remain clearly visible. Mitigation Measure 4.1-1 is proposed to lessen this impact to the greatest extent feasible; however, because the quarry pit would remain visible during Stage 2 operations and post-reclamation (as shown on Figure 4.1-15), the visual impacts at Location #12 are considered significant and unavoidable.

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter going forward.

Response 465-14

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation as relates to the proposed Quarry Site mine pit. The commenter's concerns and requests are noted and will be considered by County decision-makers. The comment does not provide specific recommendations for more analysis, further mitigation, or alternatives not already discussed and evaluated in the Draft EIR, and no further response to these issues is warranted.

Letter #466 March 10, 2025, Michael Chernekoff

Comment 466-1

I am strongly opposed to the cemex rock field expansion project. Its effect on traffic congestion, noise, groundwater quality, and its proximity to rapidly expanding housing will have a negative impact on the existing communities and those to come.

Response 466-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of traffic congestion and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise." The issue of groundwater quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on nearby residences are evaluated primarily in Draft EIR Section 4.1 "Aesthetics and Visual Resources," and Section 4.13. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 466-2

I am strongly opposed to the cemex rock field expansion project. Its effect on traffic congestion, noise, groundwater quality, and its proximity to rapidly expanding housing will have a negative impact on the existing communities and those to come.

Response 466-2

Comment 466-2 appears to be a repeat of Comment 466-1. See Response 466-1.

Letter #467 March 10, 2025, Clayton Dahlen

Comment 467-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 467-1

The commenter's opposition to the project and concerns regarding the Draft EIR are noted and will be considered by County decision-makers.

Comment 467-2

As someone with experience in [Forest Service EIRs, and familiarity with the location], I find that the EIR fails to adequately address the following concerns: Impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, cumulative environmental impacts, or community health concerns.

Response 467-2

The general resource subjects listed in the comment are each addressed in the Draft EIR. The comment does not explain specific concerns or address adequacy of the Draft EIR with regard to these resource topics.

Comment 467-3

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 467-3

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The comment does not provide specific

recommendations for more analysis, further mitigation, or alternatives not already discussed and evaluated in the Draft EIR, and no further response to these issues is warranted.

Letter #468 March 10, 2025, Rose Cordero-Gonzales

Comment 468-1

I appreciate the chance to give feedback on the CEMEX Rockfield Expansion Project's DEIR. I am a resident living about six miles from the site. I'm compelled to speak up—not just for myself but for my neighbors, my community, and the future generations who will inherit this land.

Growing up in this area, I remember visiting the San Joaquin River with my family. It wasn't just a body of water; it was a place where we could breathe deeply, take in the beauty of nature, and find moments of peace. My parents would tell stories about the land, about how it had always provided—clean water, shade from towering trees, and a home for countless animals. It's hard to imagine that same place choked with dust, the sounds of birds drowned out by the roar of trucks. We must protect the environment to prevent this from happening because of industrial growth.

Response 468-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 468-2 through 468-7 below that address specific issues raised in this comment letter.

Comment 468-2

1. **Impacts on the San Joaquin River Watershed**

The beautiful San Joaquin River is one of the last remaining natural spaces in our region. Mining expansion threatens water quality, increases erosion, and upsets the ecological balance. Once the damage is done, it will be almost impossible to reverse.

Response 468-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See also Draft EIR Section 4.1, "Aesthetics and Visual Resources," and Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 468-3

2. **Air Quality and Dust Emissions**

The Fresno area has grown over the past five years, with new homes and families moving in. That means more children playing outside, and more people relying on clean air. But air pollution doesn't just affect statistics on a report—it affects real people. It's the child who develops asthma, the elderly neighbor who struggles to breathe on bad air days, and the parents who worry about the longterm effects on their kids. The Valley already battles some of the worst air quality in the nation. Adding more dust and emissions from this project will only make it worse.

Response 468-3

The project's potential effects on air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Impact 4.3-3 for a discussion of the potential effects of the project's air emissions on public health and Mitigation Measure 4.3-2b regarding the project's Fugitive Dust Control Plan. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3. See also Collective Response #9 regarding the project's potential impact on the existing air quality conditions in the region.

Comment 468-4

3. **Biological Resource Impacts**

The area surrounding the project is home to countless species of wildlife. As Pedro Hernandez, a public lands advocate with Green Latinos, put it: "Most of the environmental projects that are happening that disseminate our natural area happen in Latino communities. So, it's so important to protect one of the few natural areas that we have left." For too long, Latino communities have been disproportionately affected by environmental decisions that prioritize industry over people. Our families deserve to grow up with clean water, fresh air, and green spaces—just like any other community.

Response 468-4

The project's potential effects on wildlife are addressed in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The topic of environmental justice is not required to be evaluated under CEQA; however, the comment is noted for the consideration of the decision-makers.

Comment 468-5

4. **Traffic and Noise Concerns**

Friant Road and other roads near the proposed expansion are already congested, especially with the increase in traffic from the nearby casino. Adding large industrial trucks to the mix will create safety hazards, noise pollution, and wear and tear on roads that aren't designed for heavy transport at this scale. Our community's infrastructure is struggling to keep up with growth, and this project will only add to the problem.

Response 468-5

The issue of traffic congestion is addressed in Draft EIR Section 4.17, "Transportation." See also Draft EIR Chapter 5, "Cumulative Impacts," for a discussion of the project's potential contribution to cumulative transportation impacts. The issue of noise pollution is addressed in Draft EIR Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #30 regarding transportation safety and Collective Response #29 regarding needed roadway improvements and funding for road maintenance.

Comment 468-6

5. **Cumulative Environmental Effects & Long-Term Concerns**

This project is supposed to last for 100 years. But let's be honest—we won't be around to see if anyone fulfills those pledges of environmental restoration. As Sharon Weaver from the San Joaquin River Parkway and Conservation Trust inquired, "If this project goes on for 100 years, not even children or grandchildren are going to see that happen, and what assurance do we have that it will actually happen?" Once this land is gone, it's gone. We can't afford to gamble with our community's future.

Response 468-6

See Collective Response #5 regarding the duration of the proposed use permit. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 468-7

I urge the agency to make CEMEX provide better analysis, stronger safeguards, and safer options. But more importantly, I ask you to listen to the voices of the people who live here. We are not just names on a public comment list. We are the families who breathe this air, drink this water, and walk this land.

Thank you for your time and consideration. I look forward to your response and further discussions on this critical issue.

Response 468-7

See Collective Response #1 regarding the need for additional analysis in the EIR process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. As the commenter does not suggest any specific additional analysis or stronger safeguards that would be required under CEQA, The comment is noted for the consideration of the decision-makers.

Letter #469 March 10, 2025, Phil Daubenspeck

Comment 469-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 469-1

The commenter's concerns regarding the Draft EIR are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see below Responses 469-2 through 469-15 for further discussion of the commenter's specific concerns.

Comment 469-2

This area of the river, just below Millerton Lake, is beautiful and does not need this mine to be expanded. It would negatively impact the traffic in the area as more trucks come onto the road and cause significant damage with each trip. Traffic is already terrible in the areas where these trucks would be entering and departing the highway. Unless hundreds of millions and potentially billions of dollars in upgrades to the traffic infrastructure in that area are done, at the expense of this company that is going to single-handedly ruin our roads based on the numbers shared, this by itself should be enough opposition to deny the permit!

Response 469-2

Please see Collective Response #29 pertaining to project traffic and Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 469-3

While some mining in these areas is to be expected (and has taken place) with the significant amount of gravel created over thousands of years, the need to BLAST this deep into the ground is a shocking request. Shockingly, it is next to a river with many issues already caused by the effects of mining projects over the years.

As someone who frequents the area for its beauty & river access, it would be devastating to see a large operation of this magnitude interrupt what many thousands of locals see as they enter into the area around Millerton. While many houses have been built near this area, they do not have nearly the negative impact a mine like this would create.

Response 469-3

The commenter's concerns regarding project blasting and proximity to the San Joaquin River are noted. The project's potential impact on the San Joaquin River is discussed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Collective Response #27 regarding the project's potential impact on adjacent parklands and recreational use areas. The EIR evaluates potential environmental effects of the project, including proposed blasting, and the comment does not provide evidence of a deficiency in the EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10.

Comment 469-4

In addition, there IS NO NEED for this! We have plenty of gravel as noted in several studies. One such done by the Department of conservation located here:

https://www.conservation.ca.gov/cgs/Documents/Publications/Map-Sheets/MS_052_California_Aggregates_Report_201807.pdf

Response 469-4

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 469-5

In addition, the company cannot be trusted as was mentioned they unsuccessfully tried to gain another permit on the Morrow Mountain proposal. It came out after the county rejected that while they mentioned gravel as the desired extraction, other valuable materials were in fact what they were after. I suspect that the same is true in this instance. They have something and they want to extract it with absolutely zero regard for the surrounding communities. All they want to do is take from our community. It

can no longer be true that we allow these extractions to take place. You must hear the voices of the citizens and stop this!

Response 469-5

The commenter's concerns, opinions, and request to stop the project are noted and will be considered by County decision-makers. Draft EIR Section 2.3, "Project Purpose and Objectives," on pages 2-6 and 2-7 enumerates the objectives of the proposed project. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 469-6

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 469-6

See Response 349-2.

Comment 469-7

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 469-7

See Collective Response #17 regarding bank stability and flooding. See also Response 329-3.

Comment 469-8

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 469-8

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 469-9

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project. Including providing funding for this in perpetuity to ensure this community benefit will last for generations, just as this mine will. It will NEVER go back to the way it is now!
- The DEIR should require CEMEX to fully fund other mitigation projects in the region. Potentially conserving at a 5 to 1 acre or 10 to 1 acre rate to compensate the region for devastating such a prime piece of nature and public lands.

Response 469-9

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River. Regarding the commenter's suggestion for CEMEX to fully fund other mitigation projects, mitigation measures are required only where impacts are determined to be potentially significant. Additional mitigation not related to the potentially significant environmental impacts of the proposed project are outside the scope of the analysis required under CEQA. The commenter's suggestion is noted for the consideration of the decision-makers.

Comment 469-10

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze

these impacts and identify appropriate mitigation measures for the impacts.

Response 469-10

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. See also Collective Response #19 regarding the Draft EIR's information pertaining to surrounding recreational areas.

Comment 469-11

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 469-11

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 469-12

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 469-12

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 469-13

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 469-13

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 469-14

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 469-14

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection. (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional

analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 469-15

Conclusion

Given the significant impacts to the river, wildlife, public safety, air quality, traffic, and the perpetual impacts to the region the County should require additional analysis, MUCH stronger mitigation measures, and GREATER financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

This should be a long process with MUCH outreach to people in the region, especially people in disadvantaged communities and those who are afraid, unaware, or unable to speak up against this environmental atrocity.

Thank you for your time and consideration.

Response 469-15

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the environmental impacts of the proposed project in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #470 March 10, 2025, Clay Davis

Comment 470-1

I am writing to you today in regard to the proposed CEMEX mining pit expansion that is currently seeking entitlement approvals and for which the county is seeking public comments.

I live at 10672 N. Lanes Rd., Fresno, CA on the San Joaquin River, approximately 7 miles downstream of the proposed mining pit. My wife and I have been at this location for 33 years. While our preference is that the County reject their entitlement application, should you decide to approve it, we have a few concerns that I would like to have the county address in their Conditions of Approval (COA's).

Response 470-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 470-2 through 470-7 below that address specific issues raised in this commenter letter.

Comment 470-2

We have 2 wells on our property. Both wells have a fairly high ground water level (20-30 feet) and have historically never varied much over the years we've lived on the river bottom. We've also enjoyed a great water quality in both wells with no issues with contaminants . We suspect that the ground water in our area remains high due to natural ground seepage due to the influence of the river.

My concerns are as follows:

- If the county approves CEMEX's entitlement application, what mitigation measures will the county impose upon CEMEX to ensure the deepening of their mining pit will not adversely impact surrounding domestic water wells?

Response 470-2

See Collective Response #24, which further describes testing, monitoring, and compliance measures that would reduce potential impacts to a less than significant level. See also Response 49-2.

Comment 470-3

- I recommend at a minimum; the following measures be a part of the COA's:

- Require a series of monitoring wells around the pit site
- Require CEMEX to regularly test the wells, both from a water level as well as water quality
- Require the testing be performed by a fully independent third-party testing lab (Krazan, Kleinfelder, etc)
- Require CEMEX to publicly post the results on their website
- Require periodic testing of private domestic wells surrounding the mining pit
- If the ground water drops in the testing wells or the quality is adversely impacted, require CEMEX to immediately cease operations

Response 470-3

See Response 49-3.

Comment 470-4

- Should issues arise with neighboring domestic wells due to CEMEX mining activities, how does the county plan to mitigate those issues in their COA's? Would the only recourse of the impacted property owners be to sue CEMEX? To avoid unreasonable legal costs by owners of impacted wells, I would recommend the following:
    - As part of the COA's, require CEMEX to post a bond to pay for any domestic wells adversely impacted by their activities, including the cost for drilling new wells and/or the installation of water treatment systems to remove any contaminants.

Response 470-4

See Response 49-4.

Comment 470-5

- Friant Rd. is already heavily burdened by heavy gravel trucks and the increased vehicular traffic from new housing developments. This main collector road cannot handle the additional gravel trucks that are projected in the EIR report without additional widening. If the county approves the application, mitigation measures should be required to address traffic impacts.

Response 470-5

Draft EIR Section 4.17, "Transportation," presents a comprehensive analysis of roadway impacts. The Draft EIR discusses the potential increases in traffic with the expansion of proposed project activities as displayed in Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)." Draft EIR Table 4.17-11, "Estimated Annual Average Daily Trip Generation at Plant Site and Quarry Site," indicate Stages 1 and 2 project operations would increase annual daily vehicle trips below the VMT significance threshold. Mitigation Measures 4.17-1a through 4.17-1n would require the Operator to provide equitable share contributions to local roadway widening and signalization improvements, which would reduce potential impacts. Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 470-6

We understand that digging a pit that deep may release natural mineral contaminants, some cancer causing, that could adversely impact water wells.

Response 470-6

The project area is located within the San Joaquin River basin, characterized by alluvial basin fill that overlies older igneous rocks (Draft EIR Section 4.7.1.1, "Geologic Conditions"). More specifically, in the project sites, the surficial geology comprises alluvial sediments, which are derived principally from Sierran granite and granodioritic rocks. These rock types are mapped within the immediate vicinity of the sites and are the primary resource that would be mined and processed to produce aggregate products. Because the alluvial basin fill is compositionally derived principally from these plutonic rocks, the mineralogic assemblage of the underlying crystalline rock and the alluvium is compositionally similar and thus can be expected to exhibit common geochemical characteristics, though minor differences in mineral assemblages may be present in the weathered plutonic bedrock. When these types of plutonic rocks weather and undergo alteration, the resultant mineral assemblage is typically iron-rich and aluminosilicate clays and quartz, which are generally considered to be geochemically stable in subsurface hydrogeologic environments under typical pH and alkalinity levels.

Therefore, the project proposes mining bedrock that is geochemically and mineralogically similar to the alluvial materials presently harvested at the site. Given the mineralogical similarities, the excavation at deeper levels is not expected to expose or

encounter geologic materials that would be geochemically different, and which could, therefore, present a new source of constituents of concern.

For discussion of the project's potential impacts to groundwater quality at the Quarry Site, please see the Draft EIR's discussion of Impact 4.10-6. The proposed project's impacts would be less than significant after the implementation of Mitigation Measure 4.10-1. For discussion of the project's potential impacts to groundwater quality at the Plant Site, see Impact 4.10-5 on page 4.10-95. With the implementation of Mitigation Measures 4.10-5a and 4.10-5b, potential impacts would be reduced to less than significant (see Draft EIR at page 4.10-98). See also Collective Response #24 regarding implementation and funding of the adaptive management program.

Comment 470-7

Based upon CEMEX's history of environmental violations (81 violations since 2000 according to the Fresno Bee), I would encourage you to disapprove their entitlement application.

Response 470-7

See Collective Response #4a regarding the Operator 's regulatory history. The purpose of CEQA is to provide substantial evidence supporting findings of the potential environmental impacts of a project. Consideration of past violations is not germane to the Draft EIR, or the analysis or impact determinations found therein. The Draft EIR provides a detailed evaluation of potential project impacts associated with the required CEQA environmental issues, and proposed the implementation of mitigation measures to reduce potential environmental impacts to less than significant levels, or to the extent feasible. The commenter's opposition is noted for the decision-makers.

Letter #471 March 10, 2025, Bryna De Fede

Comment 471-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I urge careful reconsideration of several critical concerns before moving forward.

Noise Impact from Blasting on Wildlife and Recreation

The transition from standard mining operations to blasting will have profound effects on both wildlife and community recreation. Currently, the sounds of mining are audible from adjacent properties such as Ball Ranch, Sumner Peck Ranch, and Lost Lake,

all of which are open daily for public enjoyment. Introducing blasting will amplify these disturbances, potentially scaring wildlife from their natural habitats and discouraging community use of these valuable public spaces.

- Has a scheduled blasting plan been developed to minimize disruptions? While scheduling may assist community planning, it will not mitigate the displacement of wildlife.

- What could Fresno County require as a mitigation for this issue?

Response 471-1

For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17. Blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and would not result in significant impacts to wildlife. Mitigation Measure 4.10-1 requires implementation of Blasting Protocols, which is also designed to reduce impacts from blasting at the project site. Please see Response 11-27 for further discussion of noise impacts to adjacent properties stated in Comment 471-1.

Comment 471-2

Impacts on the San Joaquin River Watershed

The San Joaquin River is a treasured natural resource with historical, cultural, and ecological significance. Over the years, numerous conservation efforts have sought to protect and preserve it. Allowing a mining company to conduct blasting operations near the river is a direct affront to these efforts.

- The proposed mitigation plans are insufficient compared to other mining companies, who have demonstrated a commitment to site rehabilitation.

    - How will CEMEX ensure meaningful restoration and community benefit post-mining operations - even though restoration will be delayed for 100 years.

- The risks to the river's ecosystem, including pollution, habitat destruction, and long-term degradation, far outweigh any potential economic benefits of the project. The proposed mitigation consists only of monitoring, with no actual action plan in place if the mining wall and the river were to intersect in the future.

- What is the plan if there is major flooding, like the one in 1997?

Response 471-2

The project sites would be reclaimed in accordance with the California Surface Mining and Reclamation Act (SMARA). Reclamation would begin upon the completion of mining at the Plant Site within 30 years. Reclamation would begin upon the completion of mining at the Quarry Site within 100 years. The proposed reclamation plan is provided as Appendix B-1, "Surface Mining and Reclamation Plan," to the Draft EIR. The Draft EIR analyzes the potential impacts of the post-reclamation conditions as compared to the existing conditions at the project sites.

The mitigation measures provided in the Draft EIR require monitoring in certain instances, to ensure that the project is not exceeding certain thresholds of significance. However, no mitigation measure in the Draft EIR consists only of monitoring.

See Draft EIR Impacts 4.10-15, 4.10-16, and 4.10-17 regarding discussion of flood-related impacts at the Plant and Quarry sites. Please also see Collective Response #17 and Response 329-3 for further discussion of major flooding at the project sites.

Comment 471-3

Hazards of a Trail Easements and Parkway Master Plan Compliance

CEMEX's claim of partnership with Parkway-focused organizations is questionable, as there is little to no evidence of their engagement in community discussions. The DEIR states that CEMEX will offer a potential trail easement along the Friant Road frontage and an additional three miles along the river near/on the quarry site.

- This contradicts the Parkway Master Plan, which requires a 300-foot buffer for trails.
    - Why does the proposed plan fail to align with established guidelines?

Response 471-3

See Collective Response #18 regarding the project's consistency with San Joaquin River Parkway Master Plan. The quarry has been in operation since 1924, which predates the 1997 San Joaquin River Parkway Master Plan. Policy LU-C.8 of the Fresno County General Plan requires the County to administer land use regulations in the San Joaquin River Corridor Overlay to preserve and protect identified wildlife corridors along the San Joaquin River (SJR) in consultation with the San Joaquin River Conservancy (SJRC). As

evaluated in the Draft EIR, the proposed project was found to be consistent with all applicable land use regulations. The SJRP Master Plan envisions a multi-use trail planned to extend along the northwest boundary of the Quarry Site and the northwest and southwest boundaries of the Plant Site and notes the actual location of the trail and other Parkway facilities would vary depending on obtaining easements and/or privately owned land. The proposed project operational activity is subject to a 200-foot minimum setback from the SJR to minimize impacts to the river and associated habitat, in compliance with County policies and regulations; the project is not subject to a 300-foot minimum buffer as the commenter suggests. The 300-foot setback required per the SJRP Master Plan would not be feasible given the existing footprint of the Quarry Site. As described in Draft EIR Section 2.5.8, "Trail Easements," the Operator has been in discussions with the SJRC about providing easements on the Plant and Quarry sites (private property) for the future trail system.

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 471-4

- Previous discussions regarding trail easements occurred under past leadership at the San Joaquin River Conservancy.
    - Has CEMEX made any effort to engage with current leadership or update agreements accordingly?

Response 471-4

See Responses 12-26 and 48-16. The Operator has been working with, and will continue to work with, the San Joaquin River Conservancy.

Comment 471-5

- In any case, a trail easement on an active quarry site is incredibly dangerous. An example of good management is the quarry site off of Old Friant Road. That site is NO LONGER ACTIVE and is transitioning to mitigation. The site still can be dangerous so more fencing and security has been added to keep the public safe. That is an example of "if he wanted to he would". CEMEX has not demonstrated the same level of responsibility or sense of community.

Response 471-5

The comment raises concerns regarding potential operational effects of the project on users of nearby parks, trails, and recreational facilities, including potential dangers and

disturbances associated with blasting and other mining activities. These issues are addressed in Collective Response #27.

As discussed therein, the Draft EIR evaluates potential operational effects, including noise, vibration, and safety considerations associated with blasting, at nearby recreational receptors such as the Lost Lake Recreation Area. The analyses conclude that project operations would not result in significant impacts to recreational users.

To the extent the comment references conditions or post-reclamation practices at other mining sites, the Draft EIR evaluates the site-specific conditions and operational characteristics of the proposed project. project activities and site conditions at other locations may differ based on site layout, geology, operational methods, and surrounding land uses, and therefore do not necessarily apply to the proposed project and do not affect the adequacy of the Draft EIR's analysis.

Comment 471-6

- Additionally, Friant Road is known for frequent accidents, making it dangerous for pedestrians and cyclists. The goal should be to create trails that provide safe, off-road alternatives for people rather than forcing them to navigate a hazardous roadway.

  - How does CEMEX plan to address these hazards? The DEIR should include specifics on how and when CEMEX will provide trail easements and contribute to trail construction.

Response 471-6

Please see Collective Response #30 pertaining to roadway safety and road maintenance. Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 471-7

Aesthetic Mitigation

Other mining sites have employed native plantings to reduce visual impact. The DEIR suggests painting exposed rock surfaces, an ineffective and environmentally questionable solution.

- Painting rocks does not constitute mitigation; it is a cosmetic attempt to disguise their reversible and ugly damage that this project will cause.

- CEMEX should consider proven ecological restoration techniques instead and describe them in the DEIR.

Response 471-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 471-8

Biological Resource Mitigation – Burrowing Owl Protection

The mitigation plan for burrowing owls is vague and reactionary. The DEIR states that if an owl is found on-site within 14 days of mining, a plan will be devised in coordination with CDFW. This suggests a lack of proactive conservation planning. There is no reason to allow this destruction of burrowing owl habitats. The project should be rejected outright to protect this species and others.

- What ACTUAL concrete steps will be taken to protect burrowing owls and other wildlife habitats before excavation begins?
- Isn't the purpose of this DEIR to outline mitigation strategies before the project starts, rather than taking a "figure it out later" approach? Fresno County should require appropriate mitigation measures that truly mitigate the environmental impacts of the project.

Response 471-8

While burrow exclusion used to be a standard practice requiring no additional permitting or approvals, since drafting of the original Draft EIR, burrowing owl has become a state candidate species for listing by California. This change in status means that burrowing owls are now given the same protection as a fully listed species by the California Department of Fish and Wildlife (CDFW). Exclusion of burrowing owls from burrows can no longer occur unless an Incidental Take Permit is issued by the CDFW. Considering this status change, Mitigation Measure 4.4-1a is revised in Chapter 3, "Draft EIR Errata," to reflect the species' new status and address the commenters' points.

Comment 471-9

Transportation and Traffic Mitigation

Table 4.17-11 of the DEIR indicates that Stage Two of the project will introduce 266 additional trucks to daily traffic. Friant Road is already a high-risk corridor, with increasing fatalities and congestion.

- I think this document has underestimated the speed of development in North Fresno, traffic and safety concerns will only escalate in the next few years.

    - How will CEMEX address transportation safety and efficiency concerns, in the next 2-3 years?

Response 471-9

Table 7.1, "Pending Projects—Five Year Projections," presented in the Traffic Impact Study included in the Draft EIR as Appendix I, "Transportation," identifies the specific projects that were included in the five-year traffic volumes forecasts to appropriately address the speed of development in North Fresno, Fresno County, and Madera County. The state of the practice to forecast 20-year traffic volumes in Fresno County is to utilize the Fresno County travel model and to consider other pending projects. The Draft EIR further considered the Friant Ranch project. The project would address transportation impacts with the implementation of the mitigation measures identified in the Draft EIR.

Comment 471-10

- The statement, "This impact is considered significant and unavoidable because it is uncertain when the assumed improvements will be constructed," is concerning.

    - This is admitting that CEMEX trucks will have a major impact on traffic but there will only be mitigation on the county's dime?

    - Isn't the purpose of this document to outline how THEY will reduce THEIR negative impact on the community?

Response 471-10

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 471-11

Conclusion

The CEMEX Rockfield Expansion Project is fundamentally flawed and should not proceed under any circumstances. It poses severe risks to wildlife, the San Joaquin River, public recreation, and transportation safety. The mitigation measures proposed are insufficient, and the long-term consequences of this project will be irreversible. I urge decision-makers to reject this project in its entirety. They have been mining for so many years, it's time to move on.

Thank you for your time and consideration. I look forward to your response.

Response 471-11

The Draft EIR sufficiently analyzes the project's potential environmental impacts, including those listed in this comment. The commenter's concerns and opposition to the project are noted and will be considered by County decision-makers.

Letter #472 March 10, 2025, Myrcille DeBenedetto

Comment 472-1

I am writing to you to register my "No" vote on the proposed expansion of CEMEX and their impact on the local environment. The residential areas on and around Friant Road have grown immensely in the past 37 years since I have lived here. The traffic they generate impacts travel on Friant Road,

Response 472-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's contribution to increasing vehicle miles traveled and traffic congestion in the region is discussed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 472-2

but most concerning to me is the hard rock blasting that could impact water quality. Water has always been a concern and any endeavor that would threaten the water supply should be the concern to Fresno County Public Works & Planning Department as well.

Thank you for your time and please vote no on this proposal.

Response 472-2

The issue of water quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impact 4.10-1 beginning on Draft EIR page 4.10-88. Mitigation Measure 4.10-1 requires implementation of Blasting Protocols, as revised in Appendix H-9, "Revised Blasting Protocol," and specify practices to prevent the contamination of groundwater and surface water as a result of blasting. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10 and Appendix H-9. The commenter's opposition to the project is noted for the consideration of the decision-makers.

Letter #473 March 10, 2025, Michelle DeLaBarre

Comment 473-1

After reading the proposed expansion plan I believe the environmental damages to the San Joaquin river will far outweigh any economic gains. There are already approved mines for gravel extraction in our area that will provide construction needs for decades to come. Unfortunately Cemex doesn't seem to have an interest in these other mines so that is driving their expansion request. I see a conflict of interest between campaign contributions to our Board of Supervisors and this expansion request. Please don't approve this expansion. Please stand up for our local river and the health of our county's families.

Response 473-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Letter #474 March 10, 2025, Celeste DeMonte

Comment 474-1

With many of the proposed mitigation measures being inadequate or entirely lacking, there are considerable concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety.

Response 474-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Responses 474-2 through 474-9 below for responses to specific comments.

Comment 474-2

Impacts on Water Quality and the San Joaquin River

The DEIR must identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events, and unequivocally state who it is that will have the responsibility for cleanup and long-term damage if the pit becomes part of the river system. Since 2000, CEMEX has been cited 667 times and fined $52.4 million for environmental, safety, and

employment related offenses. This does not indicate a trustworthy "partnership."

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows without providing clear solutions, and…

Response 474-2

See Response 349-2 regarding the project's impacts on water quality and the San Joaquin River. See Collective Response #17 and Response 329-3 regarding bank stability and flooding. See also Collective Response #4a regarding CEMEX's regulatory history.

Comment 474-3

…the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 474-3

Refer to Collective Response #26, and Response 403-4.

As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the area of the project sites. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 474-4

Impacts on the San Joaquin River Parkway and Recreation

The DEIR uses out of date information when identifying recreational sites proximate to the quarry. The noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Some of the table sources (Table 4.16-1 Recreation Facilities Near the Project Sites) are dated to 2021. Ball Ranch and Ledger Island

were not formally open to the public at that time. These properties are now operated by the San Joaquin River Parkway and Conservation Trust under a contract with the San Joaquin River Conservancy. There is more public use of the sites under current conditions that the project should analyze.

Response 474-4

Please see Collective Response #19 pertaining to public accessibility to parks, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 474-5

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts:

- Scenic Degradation: In an inappropriate deferral of mitigation not allowed under CEQA, the project will harm scenic views with proposed mitigation occurring only after harm has occurred.

Response 474-5

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 474-6

- Air Quality: Unacceptably, the DEIR underestimates the project's air quality impact by comparing emissions to current operations rather than a no-project scenario.

Response 474-6

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 474-7

- Traffic Congestion: While significant traffic impacts are expected, there is no guaranteed funding or timeline for necessary road improvements. The lack of detail on how mitigation takes place is only one example of the inadequacy of the DEIR.

Response 474-7

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 474-8

Threats to Wildlife

Proposed mitigation measures in the DEIR do not comply with existing regulations for the protection of wildlife. Drilling, blasting, and excavation disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Inappropriately, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines.

The biology section of the DEIR does not fulfill the CEQA requirements to fully evaluate and disclose impacts and propose mitigation measures to reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 474-8

The Draft EIR analyzes the project's potential impacts to biological resources in Section 4.4, "Biological Resources." The Draft EIR minimizes and reduces potential impacts to biological resources, in accordance with CEQA standards. Please see Response 58-38 for discussion of Swainson's hawk. See Response 58-37 and 58-40 for discussion of tricolored blackbird. See Responses 58-36, 58-38, 58-40, and 58-50 for discussion of burrowing owl. See Response 58-37 for further discussion of the Western red bat. Please see Response 65-13 and Collective Response #16 for further discussion of the usage of Alaskan Blasting Standards for analyzing potential impacts to fish and salmon. See also Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4.

The biological resources section, as strengthened and amplified in the Final EIR, does not need to be recirculated, as it complies with CEQA requirements.

Comment 474-9

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information needs to be drafted and

recirculated for public review before finalizing the environmental impact report for the project.

Response 474-9

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. Please see responses above regarding specific issues raised in the comment letter. Pursuant to CEQA Guideline Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review but before certification. As discussed in Chapter 3 of this Final EIR, the County has determined that recirculation of the Draft EIR is not required.

Letter #475 March 10, 2025, Judith Dickison

Comment 475-1

I am writing of my concerns about the CEMEX Project, as I am a resident of Woodward Lake since 2001. I am very concerned about the multi-faceted impact on our neighborhood and daily lives that would result from this project. Not only the dust, noise, and increased traffic from trucks that would be needed

Response 475-1

The issues of dust, noise, and potential increase to truck traffic are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13, "Noise," and Section 4.17, "Transportation," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 475-2

(I have personally observed CEMEX trucks run the red light at a high rate of speed at Champlain and Friant; with the numbers of people of all ages crossing the street to go to and from Woodward Park being endangered by these trucks).

Response 475-2

See Collective Response #30 regarding transportation safety.

Comment 475-3

Also, the use of explosives to dig this immense hole would send tremendous amounts of dust into our homes…..And LUNGS.

Response 475-3

The issue of dust is addressed in Draft EIR Section 4.3, a as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Impact 4.3-3, as updated in the Final EIR, for a discussion of the potential effects of project air emissions on public health, as well as Mitigation Measure 4.3-2b regarding the project's Fugitive Dust Control Plan. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3.

Comment 475-4

Why there is a need for a 600 ft gravel pit amidst the rapidly increasing population of the Woodward Park and Friant area is beyond me…. Sounds more like they are mining for gold.

I strongly object to this proposal.

Response 475-4

One of the key objectives of the proposed project is to provide local construction materials for the Fresno region, which would support the infrastructural needs of a growing population (Draft EIR page 6-3). The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #476 March 10, 2025, Allegra Dittmann

Comment 476-1

Hi my name is Allegra Dittmann and I am a high schooler at Clovis North and an environmental advocate.

I've lived in fresno for about 3 years and i moved from LA. i strongly oppose this project with moving forward. Due to Fresnos awful air quality, I get sick on a regular basis already. If this project went forward, so many people including myself would continue to struggle with respiratory issues because of it. I ask, how will you make sure citizens will not be breathing in the Particulate matter that will inevitably come from this project? This project is a step in the wrong direction.

Response 476-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on air quality are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Final EIR Impact 4.3-3 for a discussion of the potential effects of project air emissions on public health. Mitigation Measures 4.3-2a and 4.3-2b would require implementation of steps to reduce pollutant

emissions from off-road diesel equipment and to reduce dust from on-site roads and soil stockpiles. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3.

Comment 476-2

I and many others value the biodiversity of the river and the ecosystem surrounding it: plants, animals, the river itself would all face awful consequences as a result of this project! So many including myself have made large strides in rehabilitating the river habitat, and this would destroy the progress.

Response 476-2

The project's potential effects on plant and animal species are evaluated in Draft EIR Section 4.4, "Biological Resources." The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #12 regarding the project's potential effects on river restoration efforts.

Comment 476-3

Also, the river and quarry site you all have proposed is a valued area of recreation for the citizens of the san joaquin valley that would be affected greatly. I oppose this plan.

Response 476-3

The project's potential impacts on surrounding recreation uses are evaluated in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #477 March 10, 2025, Ryan and Elena Donaghy

Comment 477-1

Thank you for the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Cemex Rockfield Quarry Modification Project (Project). We and several other members of the Donaghy family own residences located immediately south of the property referenced in the DEIR as the "Plant Property."

In the abstract, we do not oppose continued operations on the Plant Property in a manner generally consistent with its existing use.

We are concerned, however, about any effort to expand or intensify operations on the Plant Property.

Response 477-1

The commenter's concern with regard to expansion or intensification of use at the Plant Site portion of the project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted here. Please see Responses 477-2 through 477-7 below for responses to specific issues raised in this comment letter.

Comment 477-2

We did not receive notice of the Project or the DEIR, despite our proximity to the Plant Property. In fact, we did not learn about the Project until reading a February 16, 2025, Op.Ed. piece in the Fresno Bee-well after the January 16, 2025, public information meeting that was conducted solely via the Zoom platform.

Response 477-2

The County distributed a Notice of Preparation for the EIR in June 2020 and distributed a Notice of Availability for the Draft EIR in December 2024. These notices were mailed to owners of property within 1 mile of the project sites. The commenter's address is on the County's distribution lists used for mailing these notices. Additionally, the notices were posted on the CEQAnet online database maintained by the State Clearinghouse. These notices, the Draft EIR and all supporting technical documents and reference documents were made available for public review at the Fresno County Development Services Division located at 2220 Tulare Street, 6th Floor, Fresno, the Woodward Park Regional Library at 944 E Perrin Ave, Fresno, the Fresno County Main Library at 2420 Mariposa Street, Fresno, and on the Fresno County website at: https://www.fresnocountyca.gov/cemex. The County's noticing of the project and availability of the Draft EIR thus complied with CEQA's public noticing requirements.

Comment 477-3

Given that our residences are located a short distance from the Plant Property, it is our hope and expectation that the applicant will communicate with us to discuss the Project and to allay our concerns regarding the Project's impacts on nearby residences. In light of our proximity, we hope to establish a line of communication with the applicant regarding our concerns, and hope to meet with the County and/or the applicant at the applicant's earliest convenience.

We have several questions regarding the Project, as well as some specific comments. However, because we were only recently informed about the Project's existence, please note that we intend to submit additional comments at such time as this matter it presented to the Planning Commission and the Board of Supervisors, to the extent our concerns are not resolved prior to that point.

Response 477-3

The commenter's request for the Operator to engage in discussions is noted, and the comment has been provided to CEMEX representatives for consideration. The commenter's intent to submit additional comments for consideration by County decision-makers is also noted.

The County prepared an Environmental Impact Report (EIR) to evaluate the potential environmental impacts of the proposed project, including those to neighboring properties and residences. The Draft EIR was circulated for a 45-day public review period, with materials made available both online and at Fresno County offices, to provide transparency regarding the proposed project. The County and Operator would continue to communicate with neighboring property owners throughout the life of the project to address potential concerns as they arise.

Comment 477-4

Given the proximity of our homes to the Plant Property, we are concerned about noise and vibration impacts associated with the Project. For example, daytime and evening blasting has the potential to disrupt the enjoyment of the property and endanger structures. The Project Description, however, is ambiguous because there is no indication what level of blasting-if any-will occur on the Plant Property. It is unclear whether this is because (i) there will be no further blasting at the Plant Property, (ii) there will be continued blasting, but at the same level as existing operations, or (iii) there will be additional blasting at the Site. We also attempted to review the thousands of pages of technical appendices to find an answer to this question, but the acoustic/vibration analyses do not clearly disclose whether blasting will occur on the Plant Property. Rather, the vibration analyses only concern the Quarry Property. At a minimum, we would like to better understand the true scope of the Project, which should likewise be reflected in edits to the Project Description. And if there will be no blasting at the Plant Property, this should be confirmed and affirmatively stated in the Project Description.

Response 477-4

Draft EIR Section 2.5.2.1, "Plant Site Mine Plans," describes activities which would occur at the Plant Site during both Phase 1 and 2 operations. In the first full paragraph on Draft EIR Page 2-30, it is noted that "[a]ggregate would be excavated using conventional mining equipment such as front-end loaders, scrapers, graders, excavators/front end loaders, and bulldozers, and then loaded onto haul trucks for transport to the processing plant. Water trucks would be used to minimize dust." Blasting is not proposed at the Plant Site.

Comment 477-5

We are also concerned with the Project's noise impacts. Although the DEIR is thousands of pages long, the document does not answer several important questions regarding the scope of the Project and its potential to create adverse noise impacts. For example, the DEIR states the Project's Stage 1 activities include the development of a "modern asphalt plant" on the plant site to replace the "outdated" asphalt plant that was active until 2009. (See DEIR at 2-3.) It also appears Stage 1 includes an increase in intensity of a crushing plant at the Plant Site to include the "import of concrete debris to recycle into crushed miscellaneous base ... and asphalt debris [into] asphalt product." (DEIR at 2-3.) However, we were unable to locate any information in the Project Description (or the DEIR generally) about the size, estimated throughput, or location of these facilities. To ascertain the noise impacts associated with these facilities, it is important that the DEIR include basic information regarding their scope and scale.

Additionally, Page 36 of Appendix H-1 states there will be no "appreciable change in on-site noise generation" at the Plant Property as a result of the Project. However, as explained above, because it is unclear what specific additional activities will be performed at the Plant Property-including the size, location, or throughput of the new plants-there is no way to confirm or verify how the technical consultant reached this conclusion, nor it is clear what evidence (if any) is being relied upon to support this conclusion. This is of particular concern because the additional operations at the Plant Property will exceed impact thresholds for daytime noise levels for the nearest residential receptors (P-4 and P-5), which are adjacent to our family's properties.

Further, while the technical study refers to several "Noise Mitigation Options" that "could" "be implemented," the technical report does not specifically recommend any of the Noise Mitigation Options. (See generally Appendix H-1, p. 43.) Nor is there any

analysis in the technical report to show the actual reduction any of those noise reduction measures would result in. *(Id.)* The DEIR and the technical report should be modified to actually clarify what mitigation is going to be required, and quantify how those mitigation measures are expected to reduce acoustic impacts to a less than significant level.

For similar reasons, we are concerned about Mitigation Measure 4.13".'-2. This is merely a menu of "one or more" options without (i) analysis of the actual amount of noise reduction, (ii) a firm commitment to any specific mitigation, or (iii) a requirement in terms if ***when*** the mitigation must be implemented. While there appears to be some requirement to monitor noise levels following the implementation of mitigation, Mitigation Measure 4.13-2 appears to allow the Project to exceed the threshold ***indefinitely*** so Long as the applicant is preparing Quarterly Reports: "Quarterly reports of noise monitoring and reduction efforts shall be developed and submitted to the County ***until*** noise monitoring shows that Plant noise levels ***have been reduced to below the applicable thresholds."*** Because the mitigation measure on its face suggests the mitigation may be insufficient to reduce noise levels below the proposed thresholds for a Lengthy period, and in fact contemplates noise Levels will remain above those thresholds for an indefinite period, noise impacts will remain potentially significant notwithstanding the proposed mitigation. Because there is plainly feasible mitigation available, specific mitigation effective to reduce the Project's impacts to a less than significant level should be ***mandated prior to*** Project implementation to ensure the Project's impacts will be less than significant.

Response 477-5

As noted on Page 2-30 of the Draft EIR, "For the Plant Site, the locations of processing and storage areas, including locations of equipment, structures, and facilities would remain the same as under existing conditions." Figure 2-6, "Proposed Plant Site Plan," shows the location of the existing aggregate processing plant and concrete batch plant. Figure 2-7, "Proposed Plant Site Mining Plan," shows the location of the asphalt plant in the northwest portion of the project site. The recycle plant consists of smaller, mobile (portable) crushing/screening equipment that can be relocated onsite as needed to accommodate various production needs. The portable recycling plant is considerably smaller and quieter than the aggregate processing plant.

As noted on page 36 of the project noise study (Draft EIR Appendix H-1, "Environmental Noise and Vibration Assessment"), "No appreciable change in on-site noise generation

will initially occur at the Plant Site. However, as processing operations shift to the Quarry Site the noise generation of the Plant Site would decrease. Within approximately 30 years, all operations at the Plant Site will cease."

Page 41 of the project noise analysis (Draft EIR Appendix H-1) specifically describes the noise generation of the Plant Site at the nearest receptors. That section notes that, to quantify the noise generation of the existing Plant Site operations, reference noise level data was collected at the existing Plant Site in June of 2018 and were utilized.

Because the asphalt and recycle plants were not in operation during that timeframe, noise level data collected for similar equipment operating at the CEMEX Elliot Plant Site in Pleasanton on January 25, 2018, and BAC file data for similar equipment were utilized. Backup warning devices were used on all mobile equipment operating during the reference noise surveys. As a result, noise generated by backup warning devices was included in the reference noise surveys. Draft EIR Table 4.13-16, "Estimated Plant Site Noise Levels (dBA) at Nearest Receptors," indicates that the project standards of significance could be exceeded at two of the 5 nearest existing residences surrounding the Plant Site. Although the identified exceedances were small (2 dB), a potentially significant noise impact was identified, and appropriate noise mitigation measures were recommended (Draft EIR, page 4.13-58). Noise monitoring to confirm the effectiveness of the selected noise control measures in reducing this impact to a level of insignificance is included in Mitigation Measure 4.13-2. Satisfaction with the project standards of significance is not optional, and the required noise monitoring program would ensure the project's noise emissions are satisfactory relative to Fresno County noise standards.

The noise control options provided in Mitigation Measure 4.13-2 have been used extensively at aggregate operations in California and have been proven to be effective. Because aggregate facilities frequently replace older equipment with more modern technology, the noise emissions of greatest concern and which most significantly influence compliance with the applicable noise standards can change over time. Through the requirement that noise monitoring be conducted to ensure compliance with Fresno County noise standards, any equipment found to be responsible for exceedance of the County's noise standards would be treated as appropriate for that type of equipment.

Comment 477-6

The technical study also appears to include some errors that may affect the analysis. Specifically, the discussion of baseline ambient noise at the Plant Property in the technical report references the Quarry Property, including "sensitive receptors to the Quarry Site," with only some discussion therein to the Plant Property. (See Appendix H, p. 24.) It is unclear whether this is

a typographical error, or whether the consultant intended to assess the impact of plant operations on sensitive receptors adjacent to the Quarry Site. Either way, this should be clarified.

Response 477-6

Comment 477-6 is correct in that, on page 24 of the noise study (Draft EIR Appendix H-1), the word "Quarry" was inadvertently inserted where it should have read "Plant". This was a typographical error, and was not intended to imply that impacts of Plant Site operations were assessed at Quarry Site receptors. The typographical error did not affect the calculations of Plant Site noise levels at the nearest sensitive receptors, findings of potentially significant noise impacts, or recommended noise mitigation measures.

Comment 477-7

Finally, the DEIR and its Project Description are unclear on the location of the 12.9-acres owned by CDFW. While Page 2-7 of the DEIR identifies the APNs of the 12.9 acres owned by CDFW, Figure 2-1 (the Plant Site Aerial) is unclear, difficult to read, and the various APNs that may be owned by CDFW are in different locations without clearly delineated boundaries. It is difficult if not impossible to fully comment on the DEIR without being able to understand the full scope of the Project. Understanding the specific location of this portion of the Plant Property is important, especially if those portions of the Plant Property are undeveloped and/or on the periphery of the project area. Indeed, although unclear, some portion of the 43ST appears to be undeveloped land located closest to the residential uses (including our residences) to the south.

Response 477-7

Please see Figure 2-1, "Plant Site Aerial," where the area owned by the CDFW is indicated as the area between the dashed line indicative of the CEMEX property boundary and the solid red line indicative of the existing CUP boundary. Please also see Collective Response #20 pertaining to the relationship between CEMEX-owned properties and properties managed by CDFW as well as the errata pertaining to the typographical error indicating the total area owned by the CDFW is 12.9 acres instead of 11.9 acres.

Letter #478 March 10, 2025, Cherith Drescher Merson

Comment 478-1

Enough is enough. The birds, bees, fish and those of us on two feet and four all enjoy the life brought to us by the San Joaquin River. Few values can justify impairment of that. The devastation caused by the Friant Dam was justified to support agriculture.

The farmlands of California are unique in the world due to their climate. Agriculture is only possible in a narrow range of climate and more broadly limited by geography. Mining is limited narrowly by geography and more broadly by climate.

Response 478-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Response 478-2 for further discussion of specific issues raised in Comment Letter 478.

Comment 478-2

The effects of the extensive mining proposed by the CHEMEX expansion in the can Joaquin Riverbed cannot be justified.

CHEMEX mining can no doubt be done in other areas on the earth less vital to the survival and enjoyment of the life forms nearby.

The proposed activity is too close to both populated areas and wildlife areas. The devastating effects will be felt much too deeply and too wildly to justify imposition. The destruction starts with the extinction of species and moves up to annihilation of the spiritual and aesthetic enjoyment of the place. The operation sould move somewhere else.

Response 478-2

See Draft EIR Section 6.4.2.1, "Alternative Site Locations," for discussion of the Draft EIR's evaluation of reasonable alternative locations for the project. The project's potential impacts to certain fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." Potential effects on traditional spiritual sites and aesthetics are evaluated in Draft EIR Section 4.18, "Tribal Cultural Resources," and Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #479 March 10, 2025, James Driscoll

Comment 479-1

I am resident of Woodward Lake just a couple of miles down from the CEMEX mine, I am extremely opposed to CEMEX expanding its mining operations to include explosive mining. The San Joaquin has experience enough and we have more gravel than we know what to do with. I understand Fresno economy is based on natural resources and farming but this a bridge too far. Oppose to this expansion now!

Response 479-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Letter #480 March 10, 2025, Laura Duncan

Comment 480-1

I am writing about my concerns regarding the planned expansion of the scope of work at the Cemex plants. I am not a scientist nor a geologist. I just have common sense.

Allowing explosives so close to residential areas is unfair to those residents. It is grossly unfair to the natural residents who have called the river home long before the quarry started mining. The noise, dust, and vibrations will certainly have a negative impact. The damage done to the area will be irreparable.

Response 480-1

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," and Section 4.13, "Noise," as updated in the Final EIR. Additionally, the issue of flyrock hazards is addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #9 regarding the project's potential air quality impacts upon the region, including impacts related to blasting. See also Collective Response #13 regarding the project's potential operational effects, including blasting, on wildlife in the habitat surrounding the project sites.

Comment 480-2

There is also the issue of Cemex's long history of violations regarding safety.

Response 480-2

See Collective Response #4a regarding CEMEX's regulatory history.

Comment 480-3

Toxic dust could be thrust into the air, traveling long distances.

Response 480-3

The issue of potential toxic air emissions is addressed in Draft EIR Section 4.3, as updated in the Final EIR. See Impact 4.3-3 regarding the potential effects of the project's air emissions on public health. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section.

Comment 480-4

There is no solid plan in place to secure the walls of the pit.

Response 480-4

The issue of pit wall stability is addressed in Draft EIR Section 4.7, "Geology and Soils." See Impact 4.7-7 beginning on Draft EIR page 4.7-32 for an analysis of the limited potential of slope instability at the Quarry Site. The analysis of slope stability in this section is based on the project's proposed Surface Mining and Reclamation Plan provided as Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," and the Geological and Geotechnical Assessment Report prepared for the Quarry Site and provided as Draft EIR Appendix F-2, "Quarry Site Geotechnical Report." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 480-5

Contamination of the river is also not adequately mitigated.

Response 480-5

The issue of potential surface water quality degradation is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3 beginning on Draft EIR page 4.10-88. Mitigation Measure 4.10-1 requires implementation of Blasting Protocols, as revised in Appendix H-9, "Revised Blasting Protocol," and specify practices to prevent the contamination of groundwater and surface water as a result of blasting. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10.

Comment 480-6

The DEIR does not thoroughly assess the impact of this proposed operation nor provide concrete ways to mitigate the effects, including time frames or funds for mitigation. Overall, it appears to be either a very sloppy report, or altered to meet Cemex's expectations.

Response 480-6

The potential environmental impacts of the proposed project are adequately disclosed and evaluated in the Draft EIR in accordance with the requirements of CEQA. The

mitigation measures presented in the EIR describe the required timing and funding of implementation as appropriate. For instance, Mitigation Measure 4.10-5a describes when groundwater monitoring at the Plant Site would be initiated and its duration, and Mitigation Measure 4.10-5b provides a funding mechanism to ensure continuity of implementation of the monitoring and adaptive management program. The commenter does not specify what impacts have not been thoroughly assessed, nor which impacts are not adequately mitigated. The comment is noted for the consideration of the decision-makers.

Comment 480-7

The river is a natural resource that needs to be protected and cherished. There are plenty of gravel operations that are not endangering an irreplaceable habitat. We do not need the increase in gravel production from this site.

Response 480-7

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Letter #481 March 10, 2025, James Durando (Letter #1)

Comment 481-1

Biological DEIR omission

No invertebrates were noted in the Biological survey of the Plant or Quarry sites in the DEIR. Below find the species of mosquitoes collected at those site by the Consolidated Mosquito Abatement District over the time period of 1/1/2006 to 3/10/25. Attached find supporting evidence.

On and near the Plant site and Quarry site the following Species of mosquitoes have been trapped and identified

Anopheles sp.

Culex sp.

Culiseta sp.

Aedes sp.

These species have been known to transmit the following diseases.

Dog and Cat heartworm

West Nile Virus

St. Louis Encephalitis

Dengue

The above only includes trapping data for mosquitoes. No information was available in the DEIR for any invertebrates terrestrial or aquatic.

Response 481-1

The commenter inaccurately alleges "[n]o information was available in the Draft EIR for any invertebrates terrestrial or aquatic." Invertebrates were included in Table 4.4-1, "Special-Status Wildlife Species," of the Draft EIR for assessment; examples include vernal pool fairy shrimp (*Branchinecta lynchi*), and valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*). The revised Draft EIR also includes additional species of invertebrates for evaluation such as Crotch's bumble bee (*Bombus crotchii*) and midvalley fairy shrimp (*Branchinecta mesovallensis*). No species of mosquito listed by the commenter are designated as Species of Special Concern (SSC), or special-status invertebrates on CDFW's special-status invertebrates list. Therefore, none of the mosquito species noted by the commenter are of conservation status sufficient to include in the Draft EIR.

Regionally occurring species without a specific federal or state listing, or Species of Special Concern designation, were cross-referenced against CDFW's special-status invertebrates list. Species appearing on that list were included in Table 4.4-1, "Special-Status Wildlife Species." Species appearing in the CNDDB (CDFW 2025a) but were not on the special-status invertebrates list (CDFW 2025b) were not included.

Letter #482 March 10, 2025, James Durando (Letter #2)

Comment 482-1

How Do the Cemex Rockfield Friant DEIR and CEQA Compliance Requirements Compare

Introduction: The Cemex Rockfield Friant project, as outlined in the Draft Environmental Impact Report (DEIR), has raised questions regarding its compliance with the California Environmental Quality Act (CEQA). This report analyzes how the project aligns with and fulfills CEQA requirements, identifies areas where the DEIR may fall short, and examines potential social, economic, and environmental impacts.

1. **Alignment with CEQA Requirements:** The DEIR seeks to address various environmental impacts as required by CEQA, including air quality, water resources, biological resources, cultural impacts, and traffic. Several mitigation measures are proposed to lessen negative outcomes, such as restoring habitats, enhancing air quality controls, and road modifications to accommodate increased traffic.

Response 482-1

Please see Draft EIR Section 1.1, "Purpose of and Environmental Impact Report," for an explanation of the purpose of the Draft EIR. The comment does not address the adequacy of the Draft EIR or provide evidence of a deficiency in the Draft EIR and no further response is warranted.

Comment 482-2

2. **Areas Where the DEIR Does Not Meet CEQA Standards:**

- **Vague Mitigation Measures:**

13) **Example:** The DEIR includes mitigation for air quality issues but lacks specificity on implementation timelines, emission reduction targets, or the technology to be employed. For example, the mitigation measure for dust control simply says, "implement best management practices," which is too vague and lacks enforceable action.

Response 482-2

Contrary to the commenter's assertion, Mitigation Measure 4.3-2 on Draft EIR page 4.3-62 describes the project requirement to prepare and obtain San Joaquin Valley Air Pollution Control District (SJVAPCD) approval prior to project implementation. The measure includes three specific requirements (including specific performance standards for off-road engine emissions and for dust suppression efficacy) and may include others as deemed necessary through SJVAPCD review (Draft EIR, page 4.3-62). Contrary to the comment's assertion, the mitigation measure does not state "implement best management practices" nor is the mitigation measure limited to best management practices.

Comment 482-3

14) **Lack of Specificity Regarding Biological Surveys:**

a. The biological surveys conducted were not comprehensive in their assessment of the full range

of species in the area. For example, species that are known to inhabit the region were not adequately surveyed, which raises concerns about the accuracy of the conclusions in the DEIR.

Response 482-3

Several biological studies were conducted on the project sites and peer reviewed by County-retained technical experts to ensure they are adequate to use in the preparation of the project's biological analysis. Please refer to Draft EIR Appendix E-1, "Plant Site Habitat Assessment," and Appendix E-2, "Quarry Site Habitat Assessment," which contain detailed information regarding the surveys conducted for the Draft EIR. See also Response 65-5 and 65-6 for further discussion of the biological field surveys conducted for the project.

Comment 482-4

- **Traffic Impacts:**

15) While the DEIR acknowledges potential traffic issues, it fails to identify exact road modifications and doesn't adequately model future traffic conditions during peak hours. Additionally, the DEIR fails to commit to a timeline for any necessary infrastructure upgrades.

Response 482-4

Please see Collective Response #29 for discussion of the timing of the equitable contributions to roadway improvements. The Draft EIR indicates that the Operator would provide equitable contributions for the following road improvement measures, at intersections specified in Section 4.17, "Transportation," of the Draft EIR: signalization improvements, road widening, and pavement improvements. For further information for the analysis of traffic impacts, please refer to Draft EIR Appendix I-1, "Traffic Impact Study." The Traffic Impact Study analyzes the existing peak-hour trip generation at the Plant and Quarry sites, peak-hour trip generation at the maximum production of 2.0 million tons (MT) per year (Stage 1), and peak-hour trip generation at the maximum production of 3.0 MT per year (Stage 1), and peak-hour trip generation at the maximum production of 3.0 MT per year (Stage 2) (Draft EIR Appendix I-1, pages 9 through 23).

Comment 482-5

3. **Need for the Project:** There is a stated need for aggregate to supply construction materials to the region. However, the DEIR does not provide clear evidence that local demand for aggregate justifies the scale of the project. Data on regional

aggregate shortages or growth projections could strengthen the argument for this project's necessity.

Response 482-5

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 482-6

4. **Employment Impact:** The DEIR mentions that the project will create jobs, but it does not provide a detailed analysis of whether these jobs will be filled locally or whether they will offer sustainable income levels for surrounding communities. The DEIR fails to address long-term job stability or potential for workforce displacement.

Response 482-6

Draft EIR Impact 4.14-1 on page 4.14-4 discusses that approval of the project would result in an estimated 5 additional full-time on-site employees and that the project would not substantially induce population growth. Further, Draft EIR Impact 4.14-1 states that the five new jobs would likely be filled from the existing county workforce. The comment does not provide evidence of any potential that five additional employees associated with the project would contribute to environmental effects required for analysis under CEQA, nor does the comment explain how five additional employees might affect long-term job stability or workforce displacement. Please see Collective Response #7 pertaining to socioeconomic issues.

Comment 482-7

5. **Residents' Concerns:** The DEIR downplays the significance of potential negative out comes for residents in the surrounding areas. In several places, the DEIR dismisses concerns regarding noise, air quality, and visual impacts by stating that they are either temporary or insignificant. Residents are often referred to as "insignificant" in the broader context of regional environmental planning, which is a concerning perspective from a community relations standpoint.

Response 482-7

As an initial matter, there are no instances in the Draft EIR in which residents are either expressly or implicitly referred to as *insignificant*. The Draft EIR evaluates potential noise, air quality, and visual impacts of the project, clearly discussing the project elements associated with impacts and the time period(s) within which impacts would occur. Please also see Collective Response #6 pertaining to operational nuisance. The comment does

not provide any evidence of dismissive or deficient analysis in the Draft EIR and no further response is warranted.

Comment 482-8

6. **Biological Surveys and Their Validity:** Biological surveys were conducted to assess impacts on local fauna and flora. However, the surveys appear to have been conducted with limited scope and did not account for seasonal variations or detailed habitat assessments. For example, certain key migratory species were not surveyed in critical seasonal periods, undermining the validity of the biological findings.

Response 482-8

Please see Responses 65-5 and 65-6 for discussion of the biological field surveys conducted for the project. The 2019 field survey was conducted on April 30, 2019. The 2021 field survey was conducted on June 14, 2021. The April – June time period is when many, if not most, impacted species have the highest likelihood of being present and observable on the project sites. It should be noted that CEQA does not require technical perfection or that all possible surveys be conducted in order to analyze environmental impacts. The surveys conducted, in conjunction with the literature reviews, were sufficient to identify the presence of species on or adjacent to the project sites and possible impacts to such species.

Comment 482-9

7. **Presentation of Data:** The DEIR includes an excess of tables and photos, many of which show pristine landscapes. These images do not represent the ongoing mining and industrial operations that are the subject of the report. The failure to include photos of the current environmental degradation or working project areas creates a skewed representation of the site.

Response 482-9

The comment does not reference any specific tables or photographs in the Draft EIR. Figures 4.1-2 through 4.1-16 include a series of photographs and simulated images. Captions are provided for each photograph in the upper left corner indicating that the photograph is of the "Existing/Baseline View." In some photographs development and existing mine areas are readily visible and in other photographs development and existing mine areas are not visible which is the case when such development or existing mine areas are not within the viewshed of the photograph. Contrary to the comment's assertion, the photographs representing the "existing/baseline view" from each

viewpoint are not skewed and represent the actual view at the time the photographs were taken.

Comment 482-10

8. **Cemex's Environmental Violations:** Cemex's history in California, including the cement issues in Davenport, highlights a lack of timely remediation of environmental violations. The DEIR does not adequately address the corporation's past environmental issues or the steps they've taken to ensure compliance with state and federal regulations.

Response 482-10

Please see Collective Response #4a pertaining to CEMEX regulatory history.

Comment 482-11

9. **Conclusion:** While the Cemex Rockfield Friant DEIR acknowledges various environmental and social impacts, it fails to provide sufficient detail in key areas such as mitigation measures, biological surveys, and traffic impact analysis. The project's need for aggregate is not fully substantiated, and the employment benefits for local communities are not clearly outlined. Additionally, there are concerns over the corporation's past environmental record and the adequacy of the proposed mitigation.

Summary of Report:

The Cemex Rockfield Friant project's DEIR does not fully comply with CEQA requirements. While it addresses some environmental impacts, many mitigation measures are vague, and the DEIR lacks specificity regarding key areas such as biological surveys, traffic impacts, and employment benefits. Residents' concerns are dismissed, and the project's necessity is not sufficiently substantiated. Past environmental violations by Cemex are not adequately considered. Further details and a more transparent approach are needed for full CEQA compliance

Response 482-11

Please see Collective Response #3 pertaining to regional aggregate demand and supply. Appendix E, "Biological Resources," includes biological surveys that were conducted as part of the Draft EIR, and Appendix I, "Transportation," includes traffic impact analyses that were conducted as part of the Draft EIR. See also Responses 482-1 through 482-10 above regarding specific issues raised in the comment letter. Notwithstanding the

commenter's assertions of vague mitigation and lack of specificity in the Draft EIR, the comment does not explain or provide evidence of any specific deficiency in the Draft EIR and no further response is warranted.

Letter #483 March 10, 2025, Terry Easley

Comment 483-1

Kindly stop this project. It will be an eyesore, an environmental disaster, an air quality nightmare for the beleaguered citizens of the central San Joaquin Valley, a further blight on the hardest-working river water in our country, and a repugnant signature Mountain Most of gateway to our High Sierra.

Response 483-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential visual impacts are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." Potential impacts to air quality are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") as updated in the Final EIR. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 483-2

We have been through this battle before when we defeated the dystopian plans of Cemex to blow up the sacred Mountain of the Choinumni Tribe, Jesse Morrow (Wahallich) Mountain for its aggregate, most of which would have be sent to China. We also don't need any more of our nationally treasured farmland to be paved over by unbridled developers.

Whatever meager benefits (few jobs, small revenue for other valley infrastructure projects, etc) would pale in comparison to the destructive consequences of this myopic project.

Please consider these negative repercussions that will undoubtedly impact the quality of life in our region for generations to come.

Response 483-2

The comment does not relate to the adequacy of the Draft EIR. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #484 March 10, 2025, Joan Eaton

Comment 484-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. My family has lived in Fresno for 5 generations, starting in 1874. Each generation has cared deeply for this region and especially for the San Joaquin River, as a treasured natural resource, a recreation opportunity for families, and a source of natural beauty

After reviewing the DEIR, I am deeply concerned about how poorly it recognizes critical dangers to the San Joaquin River and the State owned San Joaquin Conservancy lands that surround the project. More specifically the mitigation proposals inadequately address the negative health effects this project will cause over the next 100 years. My mother was one of the early pediatricians at Valley Children's Hospital and my daughter (her granddaughter and also a pediatrician) have lamented how childhood health has suffered increasingly as environmental factors have deteriorated over the decades. An additional 100 year mining project will exacerbate these poor health factors, for adults as well as children.

The conservation and restoration of the San Joaquin River, its flows, its habitat, and its use by the public have been supported by taxpayers for nearly 40 years. For decades, public use of the land has been exponentially increasing, as the population increased. A project that will greatly impact the River and surrounding land use for the next 100 years must carefully detail the mitigation measures necessary to protect hundreds of thousands of citizens visiting their public lands each year. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 484-1

The commenter's background and concerns are noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. Please see Collective Response #12 pertaining to San Joaquin River restoration efforts. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Responses 484-2 through 484-13 below for responses to specific issues raised in the comment letter.

Comment 484-2

Lack of Mitigation for Rapidly Increasing Public Visitation, Visual, Traffic, and Air Quality Impacts

The DEIR identifies many unavoidable negative impacts, including:

- **Contradictions to Master Plan for the San Joaquin River Parkway:** The DEIR does not address the harm the project will cause to public access to the San Joaquin River. The Master Plan for the San Joaquin River Parkway calls for dramatic increase in the public access points to the River. The DEIR does not address increased public use of areas surrounding the project. Currently, public visitation to State owned Conservancy lands is increasing by the thousands every year. A 100 year project in the middle of one of the State's fastest growing regions needs to consider that visitors to the River Parkway will likely be in excess of 1 million people per year in the near future.

Response 484-2

Please see Collective Response #18 pertaining to the project's consistency with San Joaquin River Parkway Master Plan, and please see Collective Response #21 pertaining to public access to the San Joaquin River.

Comment 484-3

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 484-3

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 484-4

- **Traffic Congestion:** Significant traffic impacts are expected, but there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 484-4

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 484-5

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining? In the region with some of the nation's highest rates of child asthma, it is imperative that CEMEX's current operations be seen as a contributor to current health outcomes. The public has a right to see the project's emissions as compared to a no-project scenario.

Response 484-5

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 484-6

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 484-6

See Response 349-2.

Please see Collective Response #26 regarding the baseline groundwater data used in the Draft EIR analyses.

The water pumped from the excavation area would be primarily pumped to groundwater recharge trenches and ponds along the perimeter of the Quarry Site that faces the San Joaquin River (see Draft EIR at page 4.10-102). The use of recharge trenches would limit the amount of drawdown of the water table to a less than significant level (see Draft EIR at page 4.10-102).

Further, the ponds and water conveyance channels are artificial wetlands constructed and maintained for active surface mining and dewatering of the deeper geologic units and would not affect the water levels in the river. Due to the very low permeabilities of the weathered rock and hard rock at the Quarry Site, the volume and rate of groundwater flow is very low compared to the volume and rate of flows in the river. Implementation of several Draft EIR Mitigation Measures (such as Mitigation Measure 4.10-5a, 4.10-1, and 4.10-10a) would reduce impacts on the quantity of water in the river, and no further analysis is required.

Comment 484-7

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?

- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 484-7

See Collective Response #17. See also Response 329-3.

Comment 484-8

- The San Joaquin River Conservancy has spent millions of dollars fixing breached quarry ponds downstream from the project. More public funds have been spent on the restoration of habitat and water flow by the San Joaquin Salmon Restoration project. The DEIR should identify impacts to these projects.

Response 484-8

Please see Collective Response #12 pertaining to San Joaquin River restoration efforts. See also Response 12-69.

Comment 484-9

- Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 484-9

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods. Refer to Collective Response #26 and Response 484-6.

As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 484-10

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 484-10

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 484-11

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts. If this project is allowed to go forward without adequate mitigation measures, it will cause excelerating deterioratioin of air quality, diminishing recreation opportunities for the region's citizens, and the end result for our region will be an unsightly and dangerous pit.

Response 484-11

Please see Collective Response #19 pertaining to public accessibility to parks, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. Draft EIR Section 4.13, "Noise," provides a comprehensive analysis of potential noise impacts from the proposed project. Figure 4.13-1, "Nearest Sensitive Receptors to Plant Site," provides the locations of the nearest sensitive receptors to the Plant Site. (Draft EIR page 4.13-13.) Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site," provides locations of the nearest sensitive receptors to the Quarry Site. (Draft EIR page 4.13-15.) With implementation of Mitigation Measure 4.13-2, 4.13-3, and 4.10-1, all potential noise and vibration related impacts at the site boundaries and nearby receptors, including receptors adjacent to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, would be reduced to a less than significant level.

The Draft EIR describes numerous mitigation measures which would be required to mitigate the proposed project's potential environmental impacts.

Comment 484-12

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 484-12

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures

are described in detail regarding actions to be taken upon observation of these species for their protection. (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (see Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 484-13

Conclusion

Given the significant impacts to the river, wildlife, public safety, public health, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 484-13

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. Please see Responses 484-1 through 484-12 above regarding specific issues raised in the comment letter. Pursuant to CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review but before certification. As discussed in Chapter 3, "Draft EIR Errata," of this Final EIR, the County has determined that recirculation of the Draft EIR is not required.

Letter #485 March 10, 2025, David Erickson

I am writing to express my opposition to the DEIR submitted for the CEMEX deep pit mining project along the San Joaquin River. As a resident of northeast Fresno, I do not believe the DEIR accurately reflects the impact this project will have on the traffic, pollution and noise in my neighborhood and the surrounding neighborhoods.

Response 485-1

The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise." Potential pollution is a broad topic that is addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") Section 4.8, "Greenhouse Gas Emissions," Section 4.9, "Hazards and Hazardous Materials," Section 4.10, "Hydrology and Water Quality," Section 4.13, and Section 4.20, "Wildfire." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The commenter does not specify which impacts are inaccurately evaluated in the Draft EIR. However, the commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 485-2

I also feel that the negative impact on one of the Central Valley's few (and most important) natural resources will be irreparable, and is unjustified considering the already satisfactory availability of aggregate products needed for the Central Valley for foreseeable future.

Response 485-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 485-3

For the current and future citizens of Fresno County, I strongly believe this DEIR should be rejected.

Response 485-3

The commenter does not specify in this or previous comments how the Draft EIR is inadequate or provide evidence or reasoning to support the assertion that it should not be certified. However, the commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #486 March 10, 2025, Kirsten Field

Comment 486-1

Please let this letter serve as a negative vote for extending/expanding the CEMEX contract for work near the San Joaquin River.

The plan seems: excessive for the industry already in the area; dangerous considering the proximity to town, the river and community wildlife areas; and just downright unpleasant.

Response 486-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Responses 486-2 through 486-4 for further discussion of specific issues addressed in Letter 486.

Comment 486-2

The Draft Environmental Impact Report does not have plans or procedures in place to account for emergency situations due to the inevitable collapse of the mine

Response 486-2

The issues of ground and slope stability are addressed in Draft EIR Section 4.7, "Geology and Soils." Mitigation Measures 4.7-6, 4.7-7a, and 4.7-7b require monitoring of slopes at the Plant Site and Quarry Site, respectively, and implementation of adaptive measures by a qualified geologist, as necessary, to ensure stability of all slopes. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.7. See also Collective Response #17 regarding river bank stability and the limited potential for breach and flooding of the Quarry Site excavation.

Comment 486-3

and the damage to the quality of the water beyond their employees monitoring the situation.

Response 486-3

The issue of water quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Mitigation Measures 4.10-5a and 4.10-10a require implementation of water quality monitoring and adaptive management programs at the Plant Site and Quarry Site, respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. The commenter does not provide evidence or reasoning to support the claim that these water quality monitoring programs would be inadequate.

Comment 486-4

My family and I enjoy recreation in the Millerton area, the San Joaquin River, Lost Lake Park, Ledger Island, Ball Ranch, Tesoro Viejo, Sycamore Island to name a few. Friant Road is a frequent connecting roadway for us. We hope this review process by the county is met with a formal disapproval of the CEMEX proposals.

Please forward this information to the qualified personnel who are responsible for rejecting the proposals regarding the continued and expanded work by the CEMEX company and its mining operations.

Response 486-4

The project's potential impacts to recreational facilities and transportation are addressed in Draft EIR Section 4.16, "Recreation," and Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #19 regarding public accessibility of parks adjacent to the proposed project sites. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #487 March 10, 2025, Carolyn Flores

Comment 487-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project.

As a long time resident of Fresno, who enjoys using the richness of our outdoor spaces we call home. I'm writing to you to express my concern for the ability our children will have to enjoy this natural resource. My children and I often use the trails by the river. My children have participated in River Camp learning more

about this space and how to protect it. This project is in direct opposition to making our waterways accessible to all. How are we to create a thriving Fresno with our outdoor spaces being threatened in this manner? Air-quality, and local water are always on the top of everyone's minds. I want Fresno to be a destination and place to live of choice. That comes with keeping out outdoor spaces free of the harmful effects we know about. We know that blasting into the ground right by the river.

A quote from my 10 year old son, "It would make me really sad to not see animals happy by the river. We need them. Why would people be okay with messing with their home?"

A quote from my 7 year old daughter, "Why would people mess with the San Joaquin River? It makes me mad that the animals would be left without a home that is safe."

These are our future residences. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all. There is no amount of mitigation that would support what they are doing to our natural resources since there are major parts of our community that depend on the river.

Response 487-1

The commenter's background and concerns are noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. Please see Collective Response #12 pertaining to San Joaquin River restoration efforts. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Responses 487-2 through 487-11 below for responses to specific issues raised in the comment letter.

Comment 487-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 487-2

See Response 349-2.

Comment 487-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 487-3

See Collective Response #17 pertaining to bank stability and flooding. See also Response 329-3. As discussed in the Draft EIR, the project sites are located within FEMA Zone A and AE floodplains and regulatory floodways. The project sites are located downstream of Friant Dam, a concrete dam that forms the Millerton Lake reservoir. During unforeseen events, the release of water into the San Joaquin River at rates that could exceed the river channel capacity could be required (Fresno County 2018a). However, the resulting inundation due to the unforeseen events would occur far outside the actual flood hazard zones and thus would not be covered by this impact. In addition, the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir is not required to be addressed under CEQA since the releases are not "reasonably foreseeable." The enlarged mining excavation could help contain and minimize downstream flooding; therefore, potential impacts related to flooding were found to be less than significant.

The Regional Water Quality Control Board is responsible for implementing the Water Quality Control Plan for the Sacramento River Basin and San Joaquin River Basin Plan which regulates and establishes limits for water quality discharged into the SJR below the Friant Dam. In the unlikely and unforeseeable event that the Quarry Site is "captured" by the SJR as the commenter suggests, the Operator would work with several local, state, and potentially federal agencies for any necessary remediation activities.

Comment 487-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 487-4

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods.

Refer to Collective Response #26.

As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the area of the project sites. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 487-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 487-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 487-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze

these impacts and identify appropriate mitigation measures for the impacts.

Response 487-6

Please see Collective Response #19 pertaining to public accessibility to parks, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 487-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts
The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 487-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 487-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 487-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 487-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 487-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 487-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 487-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional

analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 487-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 487-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. Please see Responses 478-1 through 478-10 above regarding specific issues raised in the comment letter. Pursuant to CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review but before certification. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #488 March 10, 2025, Linda Foster

Comment 488-1

Dear Mr. Randall,

I am a 30-year resident of Fresno. For half of those years, I have been involved with the San Joaquin River and how people and wildlife interact with it and around it.

People love The River. They love the open spaces around the river where they can enjoy peace and quiet, relax, and investigate the natural world.

They enjoy watching the birds and other critters that live out there. It is peaceful, quiet, calming, and soothing.

Response 488-1

This is an introductory comment that does not directly address the adequacy of the Draft EIR. See Responses 488-2 and 488-3 for further discussion of specific issues raised in Comment Letter 488.

Comment 488-2

To destroy all that peace and quiet and natural beauty with continuous blasting, dust, dirt, caravans of huge earth movers, huge trucks on Friant Road, again, is a desecration of this special place.

Response 488-2

The project's potential effects on noise and aesthetics are addressed in Draft EIR Section 4.13, "Noise," and Section 4.1, "Aesthetics and Visual Resources." The potential impact on traffic is addressed in Draft EIR Section 4.17, "Transportation." Air quality impacts are discussed in Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

See the description of proposed blasting procedures on page 2-42 of the Draft EIR, which states, "Blasting would occur one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." Furthermore, the project sites have been subject to continuous mining and processing activities for more than 100 years and the proposed project would not extend beyond the operation's existing disturbance areas.

Comment 488-3

The people of Fresno and Clovis and other surrounding areas need, want, and deserve their little slice of nature to be as natural and wild and peaceful as humanly possible.

This blasting of huge, 600 plus feet deep, holes near the San Joaquin River is plain old abusive to the River and to all the birds and critters who live in the area, raise their young there, and depend on it for survival. And abusive to the little kids who love it, and all the big adult people who find peace and comfort in The River and the surrounding countryside.

This is a reckless idea, an insult to all living things that depend on The River and the surrounding area. Whether, for their survival, or for their connection to nature.

Please reconsider this project. It is the absolutely wrong direction to move in for The River and the surrounding area.

Response 488-3

The project's potential impacts to wildlife and the San Joaquin River are evaluated in Draft EIR Section 4.4, "Biological Resources," and Draft EIR Section 4.10 "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #489 March 10, 2025, Laurie Frye

Comment 489-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. 1. Impacts on the San Joaquin River Watershed - this is a local gem that has been under attack for years! Take a look at the river parkway in Sacramento to understand the benefit to a community - economically and environmentally.

Response 489-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 489-2

2. Air Quality and Dust Emission - Fresno is a basin, that already has challenges with pollution, it doesn't need more sources.

Response 489-2

The project's potential effects on air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding the project's potential impact on the existing air quality of the region.

Comment 489-3

3. Biological Resource Impacts - toxins need to be reduced, not increased.

Response 489-3

See Draft EIR Section 4.4, "Biological Resources," for a discussion of the project's potential effects to biological resources. Toxins is a broad topic that is discussed in Draft EIR Section 4.3, "Air Quality" in terms of potential toxic air contaminants, Section 4.9, "Hazards and Hazardous Materials" in terms of potential toxic substances and wastes, and Section 4.10 in terms of potential impacts to surface and ground water quality. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 489-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 489-4

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project.

Letter #490 March 10, 2025, Carlos Garcia

Comment 490-1

Please consider the following comments:

- The 2012 national standard for annual PM2.5 of 12.0 µg/m listed in the DEIR is outdated. The EPA revised the national air quality standards in February 2024 from 12.0 µg/m to 9.0 µg/m. The San Joaquin Valley has been designated as nonattainment for the 2024 PM2.5 standard. The revised PM2.5 standard will be much harder for the San Joaquin Valley to meet, which will further impact the health and quality of life for valley residents. Meeting the new standard requires more stringent emission standards for new or modified sources, especially the proposed CEMEX project due to its proximity to residents. Additionally, the valley is designated as nonattainment for the 1997 PM2.5 standard, nonattainment for the 2006 PM2.5 standard, and nonattainment for the 2012 PM2.5 standard.

Response 490-1

Regarding the significance of impacts presented in Table 4.3-20, "Net Increase in Unmitigated Daily Emissions and Model Screening Level Comparison," there are detailed calculations and analysis providing the substantial evidence to support the determination that after mitigation the impacts are less than significant. The commenter has not provided evidence that the calculations are outdated; additionally, the project and its Draft EIR assessment must comply with current standards. There is no requirement in CEQA guidelines or case law to further mitigate the project impacts which are already shown to be less than significant. As Table 4.3-21 "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates, the project with mitigation measures would result in less PM_{10} and $PM_{2.5}$ than existing baseline conditions. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 490-2

- The criteria air pollutant amounts are summarily listed in table format throughout the document. However, the descriptions and calculations of the individual air emission points could not be found. Without the documentation for

these, one cannot review or comment on the validity of air emissions referenced in the DEIR's tables.

Response 490-2

The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3), including preparation of additional models and a draft Fugitive Dust Control Plan. Moreover, electronic modeling files are available from the County upon request. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 490-3

- The portable plant would process come-back concrete, imported concrete, and imported asphalt debris. What amounts for each, including maximum capacities, are to be processed, and how often would this process take place? Is this process included in VMT? As described in the DEIR, it appears that the portable equipment is part of regular operations and would be a part of their stationary source.

Response 490-3

As stated in the Draft EIR, a portable plant is brought in periodically to recycle come-back concrete (unused concrete in mixer upon return to plant) into crushed miscellaneous base. The amounts of each material is of no consequence because the emissions factors are the same regardless of the material being crushed as demonstrated by the SJVAPCD default factors for this activity (https://www.valleyair.org/media/zafesxpo/recycled-asphalt-and-road-concrete-wc.xls). Production rate of the recycle plant is described in Table 1 of Appendix D-3. Recycled material trips are included in the VMT as shown in tables within Draft EIR Section 4.17, "Transportation." Under the definition of stationary source in the Portable Equipment Registration Program (PERP) regulations (https://ww2.arb.ca.gov/sites/default/files/2020-03/PERP_Reg_12.5.18R.pdf), the portable equipment would be part of the stationary source if the following are true:

(1) are under the same ownership or operation, or which are owned or operated by entities which are under common control;

(2) belong to the same industrial grouping either by virtue of falling within the same two-digit standard industrial classification code or by virtue of being part of a common industrial process, manufacturing process, or connected process involving a common raw material; and

(3) are located on one or more contiguous or adjacent properties. part of a common process.

Conditions 1) and 3) are likely true. If materials being fed to the recycle plant originated from a plant on-site or material produced by the recycle plant is then fed to a plant on-site, the recycle plant would be considered part of the stationary source. In addition, the APCD would consider the plant stationary (though possibly a separate stationary source from the remainder of the site) if it would not meet the definition of portable that is provided below.

> "**Portable**" means designed and capable of being carried or moved from one location to another. Indicia of portability include, but are not limited to, wheels, skids, carrying handles, dolly, trailer, or platform. For the purposes of this regulation, dredge engines on a boat or barge are considered portable. The engine or equipment unit is not portable if any of the following are true:
>
> (1) the engine or equipment unit or its replacement is attached to a foundation, or if not so attached, will reside at the same location for more than 12 consecutive months. The period during which the engine or equipment unit is maintained at a storage facility shall be excluded from the residency time determination. Any engine or equipment unit such as back-up or stand-by engines or equipment units, that replace engine(s) or equipment unit(s) at a location, and is intended to perform the same or similar function as the engine(s) or equipment unit(s) being replaced, will be included in calculating the consecutive time period. In that case, the cumulative time of all engine(s) or equipment unit(s), including the time between the removal of the original engine(s) or equipment unit(s) and installation of the replacement engine(s) or equipment unit(s), will be counted toward the consecutive time period; or
>
> (2) the engine or equipment unit remains or will reside at a location for less than 12 consecutive months if the engine or equipment unit is located at a seasonal source and operates during the full annual operating period of the seasonal source, where a seasonal source is a stationary source that remains in a single location on a permanent basis (at least two years) and that operates at that single location at least three months each year; or

(3) the engine or equipment unit is moved from one location to another in an attempt to circumvent the portable residence time requirements.

It is noteworthy that the definition of "location" used by APCD is different from the definition in PERP regulation which reads, "**Location**" means any single site at a building, structure, facility, or installation. Instead, APCD would define location as the entire facility rather than a single site at the facility. By APCD's interpretation, the portable equipment would require a stationary source permit within 12-months after the equipment is first brought on-site.

Regardless of whether the portable plant would require a stationary source permit, the emissions from the plant and activities related to its operation were appropriately included in the Draft EIR which demonstrates the impact on air quality from the whole of the project would be less than significant.

Comment 490-4

- The general 20% opacity limits in SJVAPCD Regulation VIII are very high. CEMEX needs to commit to limiting opacity/particulate matter to below 5% opacity.

Response 490-4

The SJVAPCD's purpose of Regulation VIII (Fugitive PM_{10} Prohibitions) is to reduce ambient concentrations of fine particulate matter (PM_{10}) by requiring actions to prevent, reduce or mitigate anthropogenic fugitive dust emissions. The commenter states the current limits defined by the SJVAPCD are "very high" and requests a lower limit without providing evidence for the allowable limit being too high. The commenter omits the condition that the 20 percent may only be exceeded up to three minutes in any hour (Draft EIR at page 4.3-26). While 20 percent may seem high, it would occur only infrequently and the remainder of the time opacity would be less and typically around 5 percent, if at all. Moreover, the stationary source equipment would be subject to more stringent opacity standards that would be applied through the stationary source permit conditions that enforce New Source Performance Standard OOO for the aggregates processing equipment which is discussed beginning on Draft EIR Page 4.3-16.

As discussed on page 4.3-27 of the Draft EIR, the project would comply with fugitive dust prohibitions in SJVAPCD Regulation VIII which includes requirements that reduce fugitive dust (particulate matter) from earthmoving activities (Rule 8021), stockpiles (Rule 8031) and open areas (Rule 8051). As provided in the Final EIR, Mitigation Measure 4.3-2b also requires the implementation of a Fugitive Dust Control Plan, subject to the approval of the SJVAPCD prior to project implementation.

Comment 490-5

- All fuel combustion equipment, including diesel use, should be electrified. CEMEX needs to reduce the toxic air emission in any manner. Instead of a VERA agreement, CEMEX should be required to electrify all combustion equipment, including motors, heaters, and vehicles. It may not be cheap to electrify, but neither is our health.

Response 490-5

Where on- or off-road equipment is available and feasible, CEMEX can make use of these new mobile source technologies, including electric vehicles and equipment. Given CARB's mobile source rules in California, project implementation would include use of electric equipment and vehicles as required by state regulation. It is important to note that the mobile source emissions evaluated in the Draft EIR during the initial project year and throughout the project lifetime are less than the baseline year, and therefore less than significant (Draft EIR at Table 4.3-4, "Air Quality Significance Thresholds—Criteria Pollutants").

CEQA Guidelines Section 15126.4 (a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. When potential impacts are reduced to less than significant levels, additional mitigation measures are additionally not required.

Further, electric heavy-duty trucks are in an early development stage and can only operate for about four hours between charges. Given that operations at the Quarry and Plant sites would be active for eight to twelve hours per day, this would lead to a fleet twice the size of the fleet currently anticipated to ensure the fleet is always charged and in operation. This is not reasonable for an operation of this intensity. As electric trucks are limited for a major operation and there is no significant mobile source impact to mitigate, no further action is required. Fresno County will consider these suggestions as part of its deliberations.

Comment 490-6

- Since the valley has failed to meet the 1997, 2006, 2012 and now the 2024 PM2.5 standards, all options to not only curtail, but to reduce the amount of pollution in the valley is paramount for the health of Fresno County residents.

Response 490-6

Tables 4.3-18 and 4.3-19, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), present the proposed project construction and operation emissions compared to significance criteria and $PM_{2.5}$ was below the threshold for both construction and operation criteria pollutant annual emissions. There is no reason to further mitigate the project impacts which are already shown to be less than significant. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," as updated in this Final EIR, demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ emissions than existing baseline conditions. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 490-7

Therefore, I am against the proposed CEMEX Rockfield Expansion Project.

Response 490-7

The commenter's opposition to the project is noted and will be considered by County decision-makers.

Letter #491 March 10, 2025, Victoria Garcia

Comment 491-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Response 491-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Responses 491-2 through 491-5 below for responses to specific issues raised in the comment letter.

Comment 491-2

1. Tribal consultation: I am a member of the Native community, and my ancestors have used the San Joaquin River since time immemorial.

I do not believe that all proper consultation was completed, as the Dumna tribe was never reached out to finalize steps moving forward. Furthermore there are tribes, such as North Fork Rancheria, and Big Sandy Rancheria (Mono) located further up the stream whose cultural items may have traveled through to this site. I believe that these tribes should have the chance to have insight and consultation.

Response 491-2

Draft EIR Impact 4.18-1 on 4.18-8 under the heading "AB 52 Consultation" discusses the County's outreach to Native American tribal representatives in accordance with PRC 21080.3.1. As discussed there, in 2019 after receiving and deeming complete the application for the proposed project, the Fresno County Planning Department notified by letter the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notification of projects, including the Dumna Wo-Wah Tribal Government, Table Mountain Rancheria, and Picayune Rancheria of the Chukchansi Indians. The notification letters were mailed via certified mail on December 9, 2019 (Draft EIR Appendix J, "AB 52 Tribal Notification Letters"). Big Sandy Rancheria of Western Mono Indians is discussed in the Draft EIR at page 4.18-3, but have not requested to be notified for projects within the project area under PRC 21080.3.1. No tribe requested consultation as a result of the tribal notification letters and no responses were received during the project's scoping period. Note that Table Mountain Rancheria representatives subsequently provided comments on the Draft EIR, and those comments and the County's responses are provided at Comment Letters 50 and 52 of Final EIR Chapter 4, "Responses to Comments."

Comment 491-3

2. Environmental impact: Looking through this DEIR I have a lot of questions that simply were not answered. Species outside of the mining site WILL be impacted and should be considered. Especially with this 100 year request- the damage will be irreparable

Response 491-3

Impacts to wildlife adjacent to the project area are sufficiently analyzed under Draft EIR Impact 4.4-2. For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17.

Comment 491-4

3. Expansion size: The size of this site should be reconsidered, as the depth will certainly impact the area around and ultimately

all of Fresno in some way or another. CEMEX does not have a good track record in owning up to the damage they cause.

Response 491-4

Draft EIR Chapter 6, "Alternatives," describes and evaluates several alternatives defined with reduced depths of mining as compared to the proposed project, and the alternatives considered represent a reasonable range of alternatives in accordance with CEQA. The commenter's request for reconsideration of the size of the project is noted. Please see Collective Response #4a pertaining to the Operator 's past regulatory compliance history.

Comment 491-5

Please hear out our communities, and at the very least extend the public comment period so that we may hear back about these concerns. The San Joaquin River is one of our most important waterways here, and without its protection, all life around it is threatened. We have more than enough aggregate, but we do not have more than enough of fresh water and land, and the animals they keep in cycle with our Mother Earth.

Response 491-5

The commenter's concerns and requests are noted and will be considered by County decision-makers. Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input. Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Letter #492 March 10, 2025, Sherri Geer

Comment 492-1

It seems excessive to give a permit to last 100 years to anyone.

Response 492-1

See Collective Response #5 regarding the duration of the proposed use permit.

Comment 492-2

If we base the decision

on our past experience with CEMEX with our plans for the future, it might be wise to deny the permit.

CEMEX has previously violated environmental laws in our state to such an extent that as part of the settlement they were required to sell 400 acres of coastal property to "a non-profit or governmental entity or consortium that commits to hold and manage

the property primarily for conservation purposes, with the only other allowable uses being for low-impact, passive recreation purposes or activities, public access, public education, removal activities, activities to restore native habitat, and activities consistent with existing easements" per the California State Lands Commission Press release August 17, 2017 (City of Marina, CA)

According to the Violation Tracker Global, CEMEX has accrued $36,322,381 in penalties since 2010 in the United States, total number of records involved: 474. (For the period between 2000 and 2010, $16,061,734 in penalties, with 193 records) Seems good reason to deny them this permit.

CEMEX is a member of the Global Cement & Concrete Association, and as such has committed to net zero Carbon emissions by 2050. There is a big "but" though; GCCA has a seven point "roadmap" to carbon neutrality, with one of the points being public policy and its encouraging the use of low carbon products by changes in construction regulations & policies and in government purchases. As CEMEX is a business, their first priority is profit, which would be affected by more restrictive policies & requirements (which their lobbyists can discourage).

Response 492-2

See Collective Response #4a regarding CEMEX's regulatory history. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 492-3

As they are only planning for the next 100 years, they are not looking for sustainability, this is a fixed term and when its over, they only want to return a small portion of the property to its "original" condition, which is not original, but the condition somewhat based on where it is after the first 100 years of mining, and nowhere near the elevation it is now at. (Seriously, mining down 600 feet and then only filling back a fraction of that? How long is the thin wall between their mining area and the river supposed to last? Rivers constantly erode their banks and with climate change, it will be difficult to predict what will happen.)

Response 492-3

The proposed reclamation plan for the project sites, provided as Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," meets the requirements of the Surface Mining and Reclamation Act. See Collective Response #17 regarding riverbank stability and the potential for breach and flooding of the Quarry Site excavation to occur.

Comment 492-4

The people you are negotiating with will not be the people dealing with the property in 100 years; the company has already said they have no money for additional lanes to deal with the increased traffic by their vehicles. Why then would we trust them to have the money to repair any damages to the property? At the very least, they should be required to have funds set aside as the damage is done to ensure that repair can be made when the permit expires, the company pulls out, goes bankrupt, or whatever else happens.

Response 492-4

The comment is inaccurate regarding the funding of proposed roadway improvements described in Draft EIR Section 4.17, "Transportation." See Impact 4.17-1 beginning on Draft EIR page 4.17-27. Mitigation Measures 4.17-1a through 4.17-1g each requires the Operator to pay the project's fair share contribution of the cost of a roadway improvement. These improvements have been determined necessary to address cumulative growth and associated traffic in the area. See also Chapter 3, "Draft EIR Errata." See Collective Response #4b regarding liability and funding of corrective actions needed for unforeseen damages caused by the project.

Comment 492-5

Some damage may not be able to be undone, such as if the wall breaks or there are cracks and the river becomes polluted, animals die &/or become changed genetically.

Response 492-5

See Draft EIR Section 7.3, "Significant Irreversible Environmental Changes that Would Be Caused by the project Should it Be Implemented," for a discussion of the project's potential impacts that could be irreversible. See Collective Response #17 addressing riverbank stability. See Impact 4.4-1 beginning on Draft EIR page 4.4-48 for a discussion of potential direct impacts on certain wildlife species. The commenter does not provide any evidence or reasoning to support the claim that the project could cause genetic changes in animals.

Comment 492-6

The noise due to the blasting may cause some of the neighbors to be mentally & physically stressed and make living there untenable.

Response 492-6

The project's potential noise effects on surrounding sensitive receptors are evaluated in Draft EIR Section 4.13, "Noise." Proposed blasting would not be continuous. See the

description of proposed blasting procedures on page 2-42 of the Draft EIR, which states "[b]lasting would occur one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 492-7

The increased traffic at the intersection of Copper & Friant will be especially dangerous considering a high school is at one corner. Some kids ride their bikes to school; my son was hit leaving City College next to the high school; traffic was a lot more limited then, increased congestion will not make it any safer.

Response 492-7

It is unclear to what location the commenter refers. There are no schools located near the intersection of E. Copper Avenue and N. Friant Road. The issues of traffic congestion and safety are addressed in Draft EIR Section 4.17, "Transportation." Haul trucks and other vehicles associated with the project would continue to be subject to the California Vehicle Code and other local regulations intended to provide an appropriate degree of safety for motorists, bicyclists, and pedestrians. See discussion of Impact 4.17-3 on page 4.17-41 of the Draft EIR addressing potential traffic impacts of the project. See also Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17.

Comment 492-8

CEMEX will still make their money if concrete and associated materials become scarce (supply vs demand); they don't need a 600' deep pit for recycling plants; concrete is being reconfigured and now can contain slag &/or other materials which may actually make it stronger and more environmentally safe. AI is beginning to make changes in how we see and solve our problems. It might be best to kick the can (or the decision on the permit) down the road again. If nothing else, CEMEX needs to provide a realistic amount of responsibility towards their request rather than just lowballing us with denials of money and impact which they know we will reject, implying that they are making concessions when they are not. There is a cost of doing business, but it should be the responsibility of CEMEX, and not fall upon us and our environment.

Response 492-8

In accordance with CEQA, the Draft EIR evaluates the project as proposed by the Operator. The comment describes concrete recycling and is noted for the consideration of the decision-makers.

Letter #493 March 10, 2025, Kimberly Gibson

Comment 493-1

I am writing to express my deep concerns regarding the Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. My connection to the San Joaquin River is both personal and professional. During the summer of 2010, I worked as a naturalist at the San Joaquin River Parkway and Conservation Trust's River Camp at Owl Hollow (about a mile from the site of this proposed Project), where I helped young people develop an appreciation for the river's ecology, biodiversity, and role in sustaining local communities. That experience shaped my path as a scientist, leading me to become a docent at Stanford's Jasper Ridge Biological Reserve and later pursue a PhD in Plant Science at the University of California, Davis. Today, as a researcher at the University of California, Merced, my work focuses on sustainability and economic inclusion. I know from my research and personal experience that the San Joaquin River is one of the Central Valley's most important natural resources, yet this project threatens its air quality, water quality, wildlife, and public access. The DEIR fails to fully account for these risks, and many of its proposed mitigation measures are inadequate or absent.

Response 493-1

The commenter's background and concerns are noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. Please see Collective Response #12 pertaining to San Joaquin River restoration efforts. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Responses 493-2 through 493-14 below for responses to specific issues raised in the comment letter.

Comment 493-2

The San Joaquin River has been the focus of decades of taxpayer-supported restoration efforts. As a result of this investment, public engagement with the river has grown exponentially. This project risks undoing that progress.

Response 493-2

Please see Collective Response #12 for discussion of the San Joaquin River Restoration Program.

Comment 493-3

- The excavation depth and proximity to the river raise serious concerns about groundwater depletion. The DEIR acknowledges potential groundwater depletion and contamination risks but fails to provide a sufficient mitigation plan.

Response 493-3

As discussed in the EMKO Environmental, Inc. report (included as Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR), surface runoff from rainfall and groundwater that accumulates in the excavations would be pumped from the excavation for use in the aggregate plant as wash water and for dust control. At the Quarry Site, water would also be pumped and piped to either the Northeast Pond or to recharge trenches along the west side of the excavation for groundwater recharge. Approximately half of the water from the excavation would recharge the local water-bearing units (Draft EIR page 4.10-107).

At the Plant Site, the use of the recharge trenches would limit the amount of drawdown of the water table in the unconfined alluvial aquifer to a depth of eight feet at a distance of 500 feet from the excavation (KDSA 2021). There are no supply wells within 500 feet of the excavation. As discussed in the Draft EIR, the level of drawdown is not an appreciable portion of the available water column in the existing wells located in surrounding areas, representing no more than five percent of the total available water column in any of the wells. Therefore, the project would not result in a substantial depletion of water supplies with implementation of mitigation measures, such that groundwater use in the basin would be adversely affected.

At the Quarry Site, the use of the recharge trenches would limit the drawdown of the water table in the unconfined alluvial. The recharge operations would result in drawdown levels that would be approximately one-half of those which would occur without any recharge operations (KDSA 2021). The Draft EIR acknowledges reductions in the available groundwater column would occur in the Beck Ranch and Fresno County CSA 44C wells. The estimated decrease in the static water column would range from 30 to 60 feet depending on the recharge operations. If water production volumes from the CSA 44C wells decline to the point where current water demand cannot be met, this would result in a significant impact. Accordingly, Mitigation Measure 4.10-10a is provided as an Adaptive Management Program for Quarry Site Groundwater. As part of the Adaptive Management Program, potential effects on the CSA 44C wells would be assessed through the monitoring of nested wells between the Northeast Pond and the CSA44C wells, and the CSA 44C wells themselves. Mitigation monitoring reports would be submitted to Fresno County annually. If monitoring data indicate groundwater levels

in any of the monitored wells drop such that the available water column decreases by more than 15 percent, corrective measures would be implemented (Draft EIR page 4.10-108). As clarified in Chapter 3, "Draft EIR Errata," Mitigation Measure 4.10-10a has been refined to further specify monitoring, reporting, and adaptive management actions to ensure timely identification and correction of groundwater level changes.

For discussion of the project's potential impacts to groundwater quality at the Quarry Site, please see the Draft EIR's discussion of Impact 4.10-6. The proposed project's impacts would be less than significant after the implementation of Mitigation Measure 4.10-1, as refined in Chapter 3, "Draft EIR Errata." See also Response 65-28 for further discussion of groundwater quality at the Quarry Site. For discussion of the project's potential impacts to groundwater quality at the Plant Site, see Impact 4.10-5 on page 4.10-95. With the implementation of Mitigation Measures 4.10-5a and 4.10-5b, potential impacts would be reduced to less than significant (Draft EIR page 4.10-98).

Comment 493-4

> Additionally, climate change will likely increase flooding events over the lifespan of this project. How have considerations of our changing climate been incorporated into your consideration? Has the County required a hydrological study that evaluates long-term impacts on groundwater and river flow under projected climate change scenarios for the lifetime of the project? What legally binding commitments will CEMEX make to prevent mining-related pollutants from entering the river?

Response 493-4

With regards to the water quality of the San Joaquin River, please see Draft EIR Section 4.10, "Hydrology and Water Quality," for discussion of the proposed project's impacts on hydrologic resources. The Draft EIR concluded that the proposed project would not significantly impact the water quality of the San Joaquin River. The Operator would be required to comply with applicable regulations such as the Stormwater Pollution Prevention Plan (SWPPP) and the Spill Prevention, Control, and Countermeasure (SPCC) plan (Draft EIR page 2-45). See also Draft EIR Impacts 4.10-4, 4.10-5, 4.10-6, 4.10-7, 4.10-8, 4.10-9, 4.10-10, 4.10-11, 4.10-12, and 4.10-13 regarding analysis of the project's potential impacts on groundwater and Mitigation Measures 4.10-1, 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b, for measures required to limit the project's impacts on groundwater.

Additionally, regarding the project's potential impacts on the flow of the San Joaquin River, there is limited hydraulic connectivity between the San Joaquin River and the hard rock underlying the Quarry Site, which limits the potential of the proposed project to

decrease the volumes of water in the San Joaquin River (Draft EIR page 4.10-114). Water levels in the alluvium and the hard rock would be maintained by recharge trenches and the Northeast Pond during mining (Draft EIR page 4.10-114).

Comment 493-5

- Millions of dollars have been spent restoring breached quarry ponds downstream from this project. How will this project ensure it does not create similar long-term damage? How will the county ensure that the cost of future restoration needs falls on the company rather than on taxpayers? What financial assurances or bonds will CEMEX provide to fund restoration in case of environmental damage, similar to the San Joaquin River Conservancy's past restoration efforts?

Response 493-5

Please see Collective Response #4b pertaining to liability. Additionally, note that under the State of California Surface Mining and Reclamation Act (SMARA), surface mine operators are required to maintain financial assurances in an amount sufficient to provide for reclamation of the surface mining operation in accordance with the approved reclamation plan. The amount of the financial assurance must be estimated and updated annually and approved by the SMARA lead agency, in this case, Fresno County.

Comment 493-6

The project site is home to sensitive species, including Swainson's hawk, Tricolored blackbird, and Western red bat, yet the DEIR's biological assessment is inadequate. The proposed mitigation measures are vague and fail to comply with existing regulations for species protection.

Response 493-6

The Draft EIR analyzes the project's potential impacts to biological resources in Section 4.4, "Biological Resources." The Draft EIR minimizes and reduces potential impacts to biological resources, in accordance with CEQA standards. Please see Response 58-38 for discussion of Swainson's hawk. See Response 58-37 and 58-40 for discussion of tricolored blackbird. See Response 58-36, 58-38, 58-40, and 58-50 of discussion of burrowing owl. See Response 58-37 for further discussion of the Western red bat.

Comment 493-7

- Blasting, excavation, and increased noise levels could disrupt wildlife nesting and migration patterns. The DEIR does not adequately assess blasting and excavation impacts on species. Has a comprehensive wildlife impact study been

conducted? Will the County require independent, third-party ecological monitoring throughout the project's lifespan to assess ongoing impacts on wildlife?

Response 493-7

Analysis of impacts to biological resources are located in Section 4.4.4, "Project Impacts and Mitigation Measures," of the Draft EIR. The biological resources analysis is also located in Draft EIR Appendices E-1, "Plant Site Habitat Assessment," and Appendix E-2, "Quarry Site Habitat Assessment." The Draft EIR specifically analyzes blasting impacts on wildlife in Impact 4.4-2 and 4.4-6. Blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and would not result in significant impacts to wildlife. Please see Responses 58-37, 58-38, 58-40, 58-41, and 58-42 for further discussion of blasting impacts upon wildlife. Third-party ecological monitoring would not be necessary to reduce potential impacts to less than significant. CEQA does not require that all possible studies be conducted for the purpose of analyzing environmental impacts (Title 14 CCR Sections 15151, 15204(a)).

Comment 493-8

- The DEIR uses outdated Alaska-based standards to assess fish protection rather than California-specific guidelines. Why hasn't the County required a site-specific assessment for the San Joaquin River's Chinook salmon population?

Response 493-8

Please see Response 65-13 and Collective Response #16 for discussion of the usage of the Alaskan Blasting Standards for analyzing blasting impacts to fish in the San Joaquin River. A site-specific assessment is not necessary to determine the project's potential impacts to salmon in the San Joaquin River, as the Alaskan Blasting Standards provide numeric thresholds for ground vibrations and overpressures.

Comment 493-9

- What legally binding measures will be in place to ensure CEMEX restores the site if operations extend beyond the proposed timeline or the company ceases operations early?

Response 493-9

Surface mining operators are required to submit an annual surface mining report to the Department of Conservation (DOC) and to the County, and the County is required to conduct or cause an inspection of the surface mining operation annually to ensure the surface mining operation is in compliance with the approved conditional use permit, approved mining and reclamation plan, approved financial assurances, and state

regulations pertaining to mining. Please see Response 493-5 regarding liability and financial assurance.

Comment 493-10

As a Fresno-born, life-long Valley resident who has personally suffered from asthma, I am particularly alarmed by the air pollution this project will generate. The Central Valley already suffers from some of the worst air pollution in the country, and the DEIR acknowledges that project emissions may exceed cancer risk thresholds (DEIR pg. 4.3-63) yet dismisses the need to evaluate population-wide cancer burden (DEIR pg. 4.3-64). This is unacceptable.

Response 493-10

The commenter likely references Table 4.3-24, "Unmitigated Project Health Risk Impacts," which identifies the "Unmitigated Project Health Risk Impacts." However, mitigation measures would reduce health impacts to those shown in Table 4.3-25, "Mitigated Project Health Risk Impacts." After mitigation, the cancer risk at the maximum exposed individual sensitive receptor (MEIR) decreases from the Baseline condition (i.e., cancer risk is a negative value demonstrating that the project would be a benefit). Accordingly, other locations would have even less cancer risk, demonstrating an even larger benefit in these other locations. Thus, the cancer burden, a measure summing effects from each census block, would show a benefit. Therefore, cancer burden was not calculated in the Draft EIR. Nevertheless, in response to air comments on the Draft EIR, the technical analysis was reviewed, and the analysis was updated with new information described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The analysis includes cancer burden modeling and demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See Collective Response #11 regarding cancer risks.

Comment 493-11

- The DEIR does not evaluate project emissions against a no-project scenario. Will the County require a reassessment of emissions using baseline air quality conditions rather than current operations?

Response 493-11

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project, and Collective Response #9 regarding the project's impact on existing air quality conditions. CEQA is about the environment and

how it would change with the project. Thus, CEQA defines the existing physical setting as the baseline from which project related impacts occur. The no-project scenario is an alternative to the project and not a baseline against which to evaluate the project effects.

Comment 493-12

- What independent air quality monitoring and enforcement mechanisms will be put in place to protect public health? What legally binding commitments will CEMEX make to ensure air quality impacts do not exceed the expected unacceptably high levels?

Response 493-12

SJVAPCD is the independent agency responsible for air quality monitoring and enforcement to protect public health within the San Joaquin Air Basin. The determination that the project impacts are less than significant is supported by calculations and analysis. As a result, additional mitigation measures are not necessary, given that the impacts have already been reduced to less than significant levels. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently are emitted. The project would implement the required mitigation measures identified in the Draft EIR to further reduce impacts. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment" of the Final EIR), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Collective Response #9 regarding the project's impact on existing air quality conditions.

Comment 493-13

- Given the region's already high asthma rates and respiratory disease rates, what additional mitigation measures will be required to minimize dust and diesel emissions?

Response 493-13

The Health Risk Assessment (HRA) concluded that particulate matter impacts were determined to be less than significant after mitigation. Risk factors used in the HRA, and ambient air quality standards are set at levels that are protective of sensitive populations like those suffering from asthma. Section 3.2.3 in Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment," now updated in the Final EIR as Appendix D-3, discusses the health effects setting and how sensitive populations are

considered in establishing risk factors. Thus, additional measures are unnecessary to protect those individuals about which the commenter is concerned provided that the Draft EIR demonstrates that air quality impacts are less than significant. Draft EIR Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than are currently emitted. The project would also be subject to a Fugitive Dust Control Plan required by SJVAPCD Regulation VIII. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR, as updated in the Final EIR.

Comment 493-14

I urge the County to require additional studies, stronger mitigation measures, and legally enforceable commitments from CEMEX. The public has a right to see a full assessment of the project's long-term impacts before any decision is made.

Response 493-14

The commenter's request for additional analysis and stronger mitigation is noted. The comment does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. Please see Responses 493-1 through 493-13 above for responses to specific issues raised in the comment letter.

Letter #494 March 10, 2025, Gary Gilmore

Comment 494-1

I am writing to express my concerns regarding the Draft Environmental Impact Report (EIR) for the CEMEX Rockfield Quarry Proposed Expansion. As a Fresno County resident for 50 years and a professional with four decades of experience in Engineering and Estimating for PG&E, I have a strong understanding of large-scale infrastructure projects and their potential environmental impacts. I also suffer from asthma, and I am deeply concerned about the air quality implications of this expansion.

Air Quality & Health Concerns

The EIR (Section 4.3, Air Quality) acknowledges that the project will generate particulate emissions, but it does not adequately account for the long-term, cumulative effects on public health. Given that the San Joaquin Valley already experiences some of the

worst air pollution in the country, the lack of a more detailed long-term impact assessment is troubling.

- Cumulative Exposure: The EIR discusses dust control measures, but it does not fully evaluate how the expansion will contribute to worsening regional air quality over time.
- Health Risks: The valley's high asthma rates make it imperative that all new industrial activity be assessed with the strictest air quality standards in mind. The report's reliance on standard mitigation measures does not go far enough in ensuring protection for nearby residents.

Response 494-1

The Draft EIR, as updated by the Final EIR, does adequately account for the long-term, cumulative effects on public health. The commenter is correct in observing that many air pollution problems are cumulative effects of many sources. However, the SJVAPCD significance thresholds used in the Draft EIR take the cumulative nature of air quality problems into account either by adding in background concentrations when comparing concentrations to ambient air quality standards or by being set at the quantity that is cumulatively considerable. The cumulative nature of thresholds used in each air quality impact determined in the Draft EIR, as updated by the Final EIR, is discussed below.

- Impact 4.3-1 describes how the project would be consistent with applicable air quality plans. Addressing cumulative air quality conditions is the primary role of air quality plans. Therefore, consistency with air quality plans is a cumulative analysis.
- Impact 4.3-2 is discussed in Section 7.14 of the Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI) (SJVAPCD, 2015) which describes the thresholds as levels that would "Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant."
- Impact 4.3-3 is discussed in Section 8.5.2 of the GAMAQI which describes how health risk assessment thresholds that were used to evaluate Impact 4.3-3 are meant to exclude background levels from their application. As such, these levels are the amounts that are cumulatively considerable.
- Impact 4.3-4 involves odor. If it would be the case that other odorous sources around the project exist, then cumulative odor may need to be assessed but that is not the circumstance in this case.

The Draft EIR, as updated by this Final EIR, does fully evaluate how the expansion would contribute to regional air quality over time. In fact, the cancer risk analysis shows the long-term health effects from the project are less than significant after mitigation.

The Draft EIR, as updated by this Final EIR, uses the strictest air quality standards and goes beyond standard control measures by offering mitigation measures to the project that reduce impacts to less than significant levels, even for sensitive populations.

Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as updated by the Final EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," of the Final EIR), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 494-2

Water Quality & Proximity to the San Joaquin River

The EIR (Section 4.9, Hydrology and Water Quality) states that the project will not significantly impact water resources, yet it does not fully assess risks related to sediment runoff, groundwater depletion, or potential contamination of the San Joaquin River.

- Runoff & Sediment Transport: While the report notes that erosion control measures will be implemented, it does not thoroughly analyze how increased runoff could affect water quality downstream.

Response 494-2

The Draft EIR analyzes the Project's potential impacts related to erosion or siltation on or off the Site in Impact 4.10-14 on page 4.10-116. As described in the Surface Runoff and Drainage Plan, contained in Appendix G-2, "Surface Runoff and Drainage Plan," of the Draft EIR, stormwater runoff would be contained within each project site by existing berms (Draft EIR page 4.10-116). Furthermore, the proposed project would not alter drainage patterns on either the Plant Site or Quarry Site in a manner that could result in substantial erosion or siltation offsite (Draft EIR page 4.10-116). As such, the proposed project would not impact downstream water quality as a result of erosion.

Regarding the potential for increases in concentration levels for constituents associated with mining and aggregates processing, and specifically blasting agents and petroleum products used in the equipment, the project includes spill prevention, controls and countermeasure plans, as well as best management practices, which when implemented

would eliminate or reduce water quality impacts to levels that would not have any adverse effect to the San Joaquin River or groundwater. Further, the project is designed to be a zero-discharge facility with respect to offsite discharges, and thus would not discharge into the San Joaquin River. Additionally, the proposed project would continue to comply with the State Industrial General Permit which would protect aquatic species and habitats.

Please see Response 65-38 for further discussion of the proposed project's impacts to groundwater levels.

Comment 494-3

- Groundwater Impact: Expanded operations could contribute to long-term declines in the water table, which may have consequences for both agricultural users and natural habitats. A more detailed hydrological study is needed to evaluate these risks.

Response 494-3

Refer to Collective Response #26, and Response 484-6.

Detailed hydrogeological studies are provided in Appendix G-3, "Groundwater Conditions at the Plant Site," Appendix G-4, "Groundwater Conditions at the Quarry Site," and Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR. The geological formations at the Quarry Site do not provide water to agricultural users. As discussed in Collective Response #25, interconnected surface water and groundwater dependent ecosystems are not present in the project vicinity.

The ponds and water conveyance channels are artificial wetlands constructed and maintained for active surface mining and dewatering of the deeper geologic units and would not affect the water levels in the river. Due to the very low permeabilities of the weathered rock and hard rock at the Quarry Site, the volume and rate of groundwater flow is very low compared to the volume and rate of flows in the river. Implementation of several Draft EIR Mitigation Measures (such as Mitigation Measure 4.10-5a, 4.10-1, and 4.10-10a) would reduce impacts on water flow in the river, and no further analysis is required.

Comment 494-4

Wildlife & Habitat Disruption

The EIR (Section 4.4, Biological Resources) focuses primarily on nesting birds but does not sufficiently address potential impacts

on migratory species or broader habitat disruptions caused by dust, noise, and long-term land alteration.

Response 494-4

The Draft EIR analyzes potential impacts to migratory corridors in Impact 4.4-6. Due to the existing conditions at the Plant Site, i.e. the baseline, the project is not expected to result in significant impacts to migratory fish or wildlife species (Draft EIR page 4.4-62). For further discussion of impacts to migratory fish and wildlife species, please refer to Response 65-16. See Response 58-40 for discussion of the project's potential impacts on vegetation and wildlife as a result of from blasting and fugitive dust emissions. See Response 58-42 for discussion of the project's potential noise impacts upon wildlife. See also Collective Response #15 regarding the project's potential impacts to non-nesting birds and birds outside of nesting season.

Comment 494-5

Given these gaps in the environmental review, I strongly urge Fresno County to require a more rigorous and comprehensive EIR before approving this expansion. A more detailed analysis is necessary to fully understand and mitigate the potential long-term impacts on air quality, water resources, and local wildlife.

Response 494-5

Please see Responses 494-1 through 494-4 above for responses to specific issues raised in the comment letter. The commenter's concerns and opinions are noted and will be considered by County decision-makers.

Letter #495 March 10, 2025, Carol Goibur

Comment 495-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all. **To be clear, I am opposed to such a project.**

Response 495-1

The commenter's concerns regarding the Draft EIR and mitigation measures, and the commenter's opposition to the project, are noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation

measures and no further response is warranted here. Please see Responses 495-2 through 495-12 below for responses to specific issues raised in the comment letter.

Comment 495-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 495-2

See Response 349-2.

Comment 495-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 495-3

See Collective Response #17. See also Response 329-3.

Comment 495-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 495-4

Refer to Collective Response #26, and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the area

of the project sites. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 495-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 495-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 495-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 495-6

Please see Collective Response #19 pertaining to public accessibility to parks, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 495-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 495-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 495-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 495-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 495-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 495-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. See also Collective Response #9 regarding the project's impact on existing air quality conditions.

Comment 495-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 495-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 495-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 495-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. Please see Responses 495-1 through 495-10 above regarding specific issues raised in the comment letter. Pursuant to CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review but before certification. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Comment 495-12

P.S. It seems to me that you've not watched Jurassic Park or recall you ancient Greek mythology to see that your are about to release the Kraken. Nothing an no one could stop that monster except one thing: Medusa's head. Have you that? I think not and to seemingly disregard the quality of life for an entire city in favor of one company so it can make billions is not the mark of stellar leadership and stewardship, yet here you are, the county, ill-prepared for the potential catastrophes in the making should you renew Cemex for another hundred years. For all our sakes as well as the flora, fauna, air and river, do not release the Kraken! Your 'electric fences' will not keep the T-Rex contained!!

Response 495-12

See Collective Response #5 regarding the duration of the proposed use permit. This comment does not provide substantial evidence of deficiency in the adequacy of the Draft EIR or mitigation measures, and no further response is warranted.

Letter #496 March 10, 2025, Tracie Goodwin

Comment 496-1

I appreciate the opportunity to submit my comments on the Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, wildlife, local air and water quality, public recreation, and public safety. The DEIR's proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 496-1

The commenter's concerns with the Draft EIR and mitigation measures are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Responses 496-2 through 496-14 below for responses to specific issues raised in the comment letter.

Comment 496-2

There is No Need for Project

Before even addressing the adequacy of the DEIR, the question is what is the need for the project? Fresno and the surrounding areas have plenty of aggregate gravel, sand and crushed stone. It is estimated that the area will require 305 million tons of aggregate for the next 50 years' worth of construction. There are currently 556 million tons of permitted aggregate reserves – nearly double the projected demand.

(https://www.conservation.ca.gov/cgs/Documents/Publications/MapSheets/MS_052_California_Aggregates_Report_201807.pdf.)

There is no compelling evidence of a need to mine aggregate from along the San Joaquin River particularly using much more destructive mining methods than those used since these 1920s. As the Aggregate Sustainability in California Report shows, there is plenty of aggregate available from other sources for many years to come.

There is no explanation why CEMEX needs a 100-year extension to mine aggregate along the San Joaquin River that is not even needed except to make a profit for CEMEX.

Response 496-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 496-3

Impact on Wildlife

The DEIR fails to adequately analyze impacts of blasting on wildlife. The examples in the DEIR of habituation of wildlife to mining operations are for surface mining and not the proposed deep rock mining proposed by CEMEX.

Fresno is part of the Pacific Flyway, a major bird migration route. According to *Birdcast*, 134,400 birds crossed Fresno County on March 9 to March 10, 2025. (https://dashboard.birdcast.info/region/US-CA-019.)

The DEIR does not adequately analyze the impact on birds such as the Tri-colored blackbird, the Swainson's hawk, and the Western Burrowing Owl. It should be noted that the Western Burrowing Owl is currently under consideration to be listed as protected by the California Endangered Species Act with an estimated 1,400 in the Central Valley. (https://www.facebook.com/CaliforniaDFW/posts/the-western-burrowing-owl-athene-cunicularia-hypugaea-a-species-currently-under-/883164983992113/.)

There are also more than four dozen breeding season occurrence records of the Swainson's hawk within two miles of the project (eBird 2025) and numerous potential nesting trees within .5 miles of the project.

The DEIR fails to identify or evaluate the disruptive impacts of drilling, blasting and excavation on the migrating and native birds' habitats, nesting and migration patterns including the Swainson's hawk and California Burrowing Owl. To meet California Department of Fish and Wildlife recommendations for mitigation and protection of the Swainson hawk, protocol surveys would need to be conducted within a .5-mile radius around all project activities. If active nesting is identified within a .5 mile radius, consultation with the CDFW would be required. The DEIR also failed to consider the guidelines regarding the California Burrowing Owl and other bird species the CDFW has published. The proposed mitigation measures fail to comply with existing regulations for wildlife protection.

Response 496-3

The Draft EIR analyzes the project's potential impacts to biological resources in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The Draft EIR minimizes and reduces potential impacts to biological resources, in accordance with CEQA standards. Please see Responses 58-38 and 65-15 for discussion of Swainson's hawk. See Response 58-37 and 58-40 for discussion of tricolored blackbird. See Responses 58-36, 58-38, 58-40, 58-50, 65-6, and 65-10 of discussion of burrowing owl.

For discussion of impacts to migratory fish and wildlife species, please refer to Response 65-16. For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17.

Protocol surveys for special status species do not need to be conducted for the Draft EIR under CEQA (*Save North Petaluma River & Wetlands v. City of Petaluma* (2022) 86 Cal.App.5th 207, 221-226). For further information regarding protocol surveys, see Response 65-5.

Comment 496-4

The DEIR also uses Alaska-based standards to evaluate fish protection rather than California-specific guidelines. The Alaska-based standards are not appropriate for the protection of the spring run Chinook salmon in the San Joaquin River.

Response 496-4

Please see Response 65-13 and Collective Response #16 for discussion of the usage and the sufficiency of the Alaskan Blasting Standards for analyzing blasting impacts to fish in the San Joaquin River.

Comment 496-5

The DEIR failed to follow the industry standard for EIR-level assessments of special-status species, which is a nine-quadrangle search radius. Here, only four quadrangles were searched for the DEIR. Therefore, some special-status species that could occur on or near the project site may not have been considered.

Response 496-5

Please see Response 65-4 for discussion of the scope of the California Natural Diversity Database (CNDDB) search radius. See Chapter 3, "Draft EIR Errata," of this Final EIR for the purpose of amplifying and clarifying information pertaining to baseline conditions of the project's biological resources.

Comment 496-6

The Biology section of the DEIR fails to comply with CEQA requirements to fully identify, disclose and fully evaluate impacts on wildlife, and propose mitigation measures to reduce the impacts.

Response 496-6

The comment provides a general assertion without evidence of a deficiency in the adequacy of the Draft EIR or its mitigation measures. Draft EIR Section 4.4, complies with CEQA requirements, adequately analyzes potential impacts to wildlife, and identifies mitigation measures where necessary to reduce impacts to less than significant levels. Please see Responses 496-3 through 496-5 above pertaining to comments regarding biological resources issues.

Comment 496-7

Impact on Air Quality

The DEIR states that the project's emissions may exceed cancer risk thresholds. It also states that because the mitigation measures would reduce emissions, the DEIR does not evaluate the population-wide cancer. This fails to comply with CEQA, which requires that the analysis be performed before consideration of mitigation measures.

The DEIR also underestimates the project's impact by comparing emissions to current operations rather than under a no-project scenario. This approach fails to analyze and evaluate the full environmental impact of continued mining.

Response 496-7

See Collective Response #11 regarding cancer risks. After mitigation, the cancer risk at the maximum exposed individual sensitive receptor (MEIR) decreases from the Baseline condition (i.e., cancer risk is a negative value demonstrating that the project would be a benefit). Accordingly, other locations would have even less cancer risk, demonstrating an even larger benefit in these other locations. Thus, the cancer burden, a measure summing effects from each census block, would show a benefit. Therefore, cancer burden was not calculated in the Draft EIR. Nevertheless, in response to air comments on the Draft EIR, the technical analysis was reviewed, and the analysis was updated with new information described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The analysis includes cancer burden modeling and demonstrates no new

impacts and no changes to any of the findings in the Draft EIR, as updated by this Final EIR.

CEQA is about the environment and how it would change with the project. Thus, CEQA defines the existing physical setting as the baseline from which project related impacts occur. The no-project scenario is an alternative to the project and not a baseline against which to evaluate the project effects.

Comment 496-8

Impact on Traffic Congestion

The DEIR indicates there will be significant traffic impacts but there is no indication of any guaranteed funding or timeline for the necessary road improvements. With the expected increase in traffic from the project, it is clear there will be a significant increase in road damage, truck debris, and safety hazards. Yet, there is no detail on how mitigation for the expected traffic impacts will occur.

Why is CEMEX not being required to mitigate the traffic congestion on Willow to Friant Road? Particularly, when other large companies have been required to finance mitigation measures. Table Mountain helped finance turning Friant Road into a four-lane highway. At Vulcan's rock quarry at Highway 41 and Road 45, Vulcan was required to make modifications on Road 145 and will be required to help finance the construction of Highway 41 to a four-lane road.

Why is CEMEX, a foreign corporation, being treated differently? CEMEX should contribute its fair share to mitigating the significant traffic impacts its increase in mining operations will cause.

Response 496-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 496-9

Impact on Water Quality & the San Joaquin River

The DEIR acknowledges that mining could reduce river flows, yet fails to provide any clear solutions.

Response 496-9

See Response 349-2.

Comment 496-10

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the DEIR identifies the fact that there is groundwater/surface water interaction at both sites.

Response 496-10

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the area of the project sites. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 496-11

Impact on the San Joaquin Parkway and Recreation

The DEIR uses out of date information when identifying sites in close proximity to the quarry. Some of the table sources go back to 2021. Ball Ranch and Ledger Island were not open to the public at that time. Also, the description of the San Joaquin Fish Hatchery fails to adequately describe the recreational facilities available including FINS and the Parkway Trail from the hatchery to Lost Lake Park.

Response 496-11

Please see Collective Response #19 pertaining to public accessibility to parks.

Comment 496-12

The noise from rock crushing, blasting and drilling will negatively impact visitors to Ball Ranch, Lost Lake Park, Ledger Island and Sumner Peck Ranch but these noise impacts are not evaluated or addressed in the DEIR. The DEIR should fully analyze these impacts and set forth adequate mitigation measures for the impacts.

Response 496-12

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 496-13

The DEIR mentions potential trail easements for public use but it lacks any clear commitment or timeline. The DEIR should identify the time frame and exact location of the trail to be constructed, and make clear that CEMEX would be responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 496-13

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 496-14

Conclusion

Due to the significant impacts to the San Joaquin River, wildlife, public safety, traffic, and air and water quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The County and CEMEX should also explore less harmful alternatives. Public transparency and accountability in the review process is critical to ensure that the long-term health of the San Joaquin River and surrounding communities is protected.

Thank you for your time and consideration of these comments.

Response 496-14

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The comment does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. Please see Responses 496-1 through 496-13 above regarding specific issues raised in the comment letter. Draft EIR Chapter 6, "Alternatives," describes a range of project alternatives and compares the associated potential environmental impacts to those of the proposed project, and the comment does not identify any additional alternatives for consideration.

Letter #497 March 10, 2025, Eva Green

Comment 497-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with

approval. I worry about many of the horrible impacts on the San Joaquin River Watershed.

Response 497-1

The project's potential effects on the San Joaquin River watershed are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 497-2

As well as how it will negatively impact the air quality with all of the exhaust and dust. Endless hours of vehicle emissions from shipping and employees commuting. It will also effect the biological resource that is the San Joaquin River. As stated before there are many traffic and noise concerns with moving of resources and commuting employees making the nearby roads crowded.

Response 497-2

The project's potential effects related to air quality and biological resources are addressed in Draft EIR Section 4.3, "Air Quality" (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.4, "Biological Resources," respectively, as updated by this Final EIR. The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," as updated by this Final EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 497-3

Everything adding up to a large cumulative environmental impact that will negatively impact residents of all of Fresno County.

Response 497-3

The project's potential cumulative effects are described in Draft EIR Chapter 5, "Cumulative Impacts." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter.

Comment 497-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 497-4

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project.

Letter #498 March 10, 2025, Reid Gromis

Comment 498-1

I'm writing to you in regards to the proposed Cemex plan for the large 100 year mining site in Fresno county.

I don't think this is a good idea. I ride my bike with my kids across and along Friant Road often and I believe that an increase in mining activity will dramatically increase the traffic on our route and expand the danger for all pedestrians and cyclists who visit Woodward park. I didn't see any specific mentions of traffic impact on increased pedestrian and cyclists who visit accidents with the expected increase in large vehicle transports.

Response 498-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 498-2

Wouldn't there be a better location for a large scale operation that doesn't impact the best regional park in our county. Maybe west of 99 or along the kings river where much of Fresno county's growth is being forecast. Or even better, an investment to reclaim and recycle materials from long gone projects.

Response 498-2

The Draft EIR provides an extensive discussion of the feasibility of offsite locations as an alternative to the proposed project and the ability of offsite locations to achieve the project objectives. As discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations," on pages 6-5 through 6-7, "[n]o specific location with the attributes necessary to accomplish the project objectives is known in enough detail to be identified as a specific alternative site to feasibly meet the project objective of developing a known high-quality aggregate deposit" and "relocating the proposed operation to another site in the region would introduce new impacts to a site with no previous aggregate mining activity." For these and other reasons detailed in the Draft EIR, an alternative location was properly rejected

from further evaluation. The commenter inquires as to better locations, but the comment does not provide evidence of the availability or feasibility of other potential sites.

Comment 498-3

I also believe the additional traffic and the blast mine itself will contribute to the degraded air quality of Fresno county and hinder the long term health of the most vulnerable residents here for generations to come.

Response 498-3

An Air Quality, Health Risk, and Climate Change Impact Assessment was prepared for the proposed project impacts based on risk factors and air quality standards that account for sensitive populations as discussed in Section 3.2.3 of Draft EIR Appendix D-1, "Air Quality, Health Risk and Climate Change Impact Assessment," as updated by this Final EIR (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). This Assessment concluded that particulate matter impacts were determined to be less than significant after mitigation. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than are currently emitted. The project would also be subject to a Fugitive Dust Control Plan required by SJVAPCD Regulation VIII. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR, as updated by this Final EIR.

As discussed above, the VMT from on-road trucks was used to calculate associated emissions. Regarding the concerns of the possibility of increased transportation on Friant Road resulting in higher levels of diesel particulate exposure, additional modeling was undertaken and shows that the potential increase in trucks on any road would not expose receptors to significant levels of health risk.

Comment 498-4

It seems that there is a plethora of available materials for our community when it comes to building but very little investment in improving the environmental conditions for us to live and breathe.

The owners of the plant won't have to live with these impacts. And the idea of committing to a century of more intense industrial activity in one of the worst air basins in the country is not the right step for future Fresnans.

I have also recently been discovering more and more access points to hike, bike, and explore along the San Joaquin River. After a century of this space being mined, I believe it's time to give it back to the public and nature. The serenity of open green spaces is hard to economically quantify but I know that I need places to go to connect to our planet and myself. My kids loved the peaceful canoe trip down the river without having to put up with the noise pollution of heavy machinery.

I hope that this project is not approved by the county as there are so many negative aspects, both discussed and unforeseen.

Thank you for considering my thoughts on the matter and be well.

Response 498-4

Please see Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. See also Collective Response #21 pertaining to public access to the San Joaquin River, and Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River. The comment does not address the adequacy of the Draft EIR. The commenter's use of areas along the San Joaquin River, interests, and concerns are noted and will be considered by County decision-makers.

Letter #499 March 10, 2025, Amanda Grossman

Comment 499-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion

Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. 1. Impacts on the San Joaquin River Watershed I grew up on the Riverbottom, where my family has lived for generations. The San Joaquin River is more than just a body of water—it is a lifeline for the land, wildlife, and communities that depend on it. This expansion threatens to disrupt the delicate balance of the watershed, leading to increased sedimentation, water contamination, and long-term ecological damage. Our river has already endured enough, and further degradation would be an irreversible loss for future generations, including my children and their children.

Response 499-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See also Draft EIR Section 4.4, "Biological Resources" for discussion of the project's potential direct and indirect effects on certain fish and wildlife species. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The commenter's concern regarding the proposed project is noted for the consideration of the decision-makers.

Comment 499-2

2. Air Quality

and Dust Emissions The dust and pollutants generated by this expansion will have a lasting impact on the health of those who call this area home. My parents still live in the Riverbottom, and I worry about their exposure to airborne particles that can cause respiratory issues and other long-term health complications.

Additionally, the increased industrial activity will contribute to already worsening air quality, affecting not only current residents but also future generations who deserve clean air to breathe.

Response 499-2

The project's potential effects related to air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated by the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding the project's potential impact on existing air quality conditions in the region.

Comment 499-3

3. Biological Resource Impacts The Riverbottom

is home to a diverse range of wildlife, some of which are already struggling to survive due to habitat loss. Further expansion of CEMEX's operations will disrupt these ecosystems, endangering plant and animal species that have thrived in this area for centuries. Once these habitats are destroyed, they cannot be easily restored, leaving a permanent scar on the environment.

Response 499-3

The project's potential impacts to biological resources are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 499-4

4. Traffic and Noise

Concerns The increased truck traffic and industrial noise will not only disrupt the peaceful nature of our community but will also pose safety risks for families who live nearby. Roads that were once quiet and safe will become dangerous due to heavy machinery and increased transportation of materials. This is not the future I want for my children or for any family that calls this place home.

Response 499-4

The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 499-5

5. Cumulative Environmental Effects This project does not exist in isolation. It is part of a larger pattern of environmental degradation that, if left unchecked, will lead to long-term consequences for our community. The cumulative impact of water pollution, air contamination, habitat destruction, and noise pollution will forever alter the landscape of the Riverbottom, stripping it of the natural beauty and resources that have sustained families like mine for generations.

Response 499-5

The project's potential cumulative effects are described in Draft EIR Chapter 5, "Cumulative Impacts." The project's potential visual impacts are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 499-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 499-6

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project.

Letter #500 March 10, 2025, David Grubbs

Comment 500-1

I oppose the extension of the CEMEX aggregate mining permit, and especially the expansion to hard rock mining at the Quarry Site on the San Joaquin River.

Response 500-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted here. Please see responses below to specific comments.

Comment 500-2

First, do we need to mine it at all, especially this way? Studies show we have more than adequate aggregate for at least fifty years.

Response 500-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 500-3

In summary, the San Joaquin River is one of our most valuable assets for improving the quality of life in the region. If mining is to continue, it should be limited to a reasonable time frame and performed using conventional aggregate mining methodology. Ideally locations outside the floodplain should be sought. The same sheet of granite to be blasted into gravel at the CEMEX Quarry Site extends across the valley. Mining land fallowed because of excessive groundwater extraction for example, would have less impact and might help restore the value of land now out of service.

Response 500-3

Please see Collective Response #5 pertaining to the duration of the proposed use permit.

The Draft EIR provides an extensive discussion of the feasibility of offsite locations as an alternative to the proposed project and the ability of offsite locations to achieve the project objectives. As discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations," on pages 6-5 through 6-7, "[n]o specific location with the attributes necessary to accomplish

the project objectives is known in enough detail to be identified as a specific alternative site to feasibly meet the project objective of developing a known high-quality aggregate deposit" and "relocating the proposed operation to another site in the region would introduce new impacts to a site with no previous aggregate mining activity." For these and other reasons detailed in the Draft EIR, an alternative location was properly rejected from further evaluation. Although the comment urges consideration of other locations, the comment does not provide evidence of the availability or feasibility of other potential sites.

Comment 500-4

Below I have addressed several issues that were not addressed or considered adequately, in the DEIR.

1. **The affected population** – The magnitude of many of the impacts of this project are dependent on the population of the area. There are 1,100 homes at Woodward Lakes and many more at Copper River and New Town. Development has accelerated. The 2020 Decennial Census tracts 55.03 and 55.15 boast 8,300 residents in 3,200 households. The construction and expansion of Table Mountain Casino, Millerton New Town and adjacent tracts in the Willow/Shepard gap are now part of the picture.

   The certainty of population growth requires more complete and longer term traffic analysis. The number of people affected by traffic safety and gravel damage to vehicles for example, is destined to rise considerably in the decades that follow. This growth is not accounted for in the DEIR. Growth also assures increasing demand for recreational and open space. And more people impact water quality issues. A hundred year permit is far too long given the paucity of population analysis.

Response 500-4

The state of the practice with respect to traffic analyses is to forecast 20-year traffic volumes in Fresno County. County of Fresno, City of Fresno, and City of Clovis policies require new developments to perform traffic analyses to identify the effect of the new development on intersection and roadway levels of service. As regional growth continues beyond the 20-year horizon, new developments would be required to construct improvements to mitigate their own impacts.

Comment 500-5

2. **Ponds and fluctuating water features.** These invite eutrophication in the warm Central Valley and cyanobacteria blooms and neurotoxins affect wildlife and human health. There is no consideration of this risk in the DEIR. There has been no measurement of, nor plans for monitoring, phosphorus/phosphate, a major trigger for such blooms. The growth and death of these organisms have disastrous impacts on wildlife. Note too that population growth (item 1) exacerbates the risk of these blooms.

Response 500-5

The project does not propose changing the management of the Northeast Pond located at the Quarry Site, and would thus not change the existing water quality of the pond (Draft EIR page 4.20-89). The ponding of water in the quarry pit would also not accumulate concentrations of constituents that would violate water quality standards or otherwise degrade water quality (Draft EIR page 4.10-101).

The Plant Site Pond would be monitored for water quality, as required by Mitigation Measures 4.10-5a and 4.10-5b. Although phosphate is not on the list of parameters to be monitored, the parameters subject to monitoring do include pH, conductivity, temperature, dissolved oxygen, and oxidation-reduction potential. These parameters are general indicators of water quality. If iron/manganese levels are higher than their respective water quality standards for 5 consecutive years, then aeration or mechanical circulation of the water would be required (Draft EIR page 4.10-98). By monitoring the aforementioned parameters, the risk of eutrophic conditions developing at the Plant Site Pond would be minimized.

Comment 500-6

3. **Salmon restoration.** Among the causes of salmon extinction in the San Joaquin river is levee/berm collapse. The river then flows through adjacent ponds. Those river connected ponds are colonized by predators which prey on fry and prevent the recovery of endangered salmon. A 600 foot deep pit two hundred feet from the river edge surely poses this risk. Prevention and restoration if this occurs deserves more assurance than "monitoring" and "advice" from qualified experts.

Response 500-6

Please see Collective Response #17 regarding levee/berm collapse and potential flooding of the project sites. An extreme flooding event is not likely to occur and is speculative,

which does not require further analysis under CEQA. Please see Collective Response #12 for further discussion of the San Joaquin River Restoration Program. The proposed project would not conflict with the goals and ongoing salmon restoration efforts in the San Joaquin River.

Comment 500-7

4. **Riparian ecosystem protection.** Ninety percent of the Quarry Site "has been disturbed by mining operations." Google Earth images reveal "disturbed" to actually be "bare earth."

   After thirty plus years of mining, the only significant native vegetation to survive is the narrow riparian ecosystem. A dozen or so oaks are present and thick riverside vegetation survives. Most all of it is within 200 feet of the river's edge. While this was surveyed to assure there are no "special-status species" of concern, monitoring and protection of the existing riparian habitat should be assured in the permitting process. Dewatering on the site may not be as innocuous as presumed.

   The wildlife evaluation is hard to judge. That the vast majority of animal species expected on a Central California floodplain are not present is no surprise given the decades of industrial disturbance. There was evidence or observations of one hundred and seventy nine vertebrate species in a wildlife survey on similar property downstream. Only thirty or so species were observed or presumed present on the Quarry Site now. Mitigation that would assure species recovery should be required.

Response 500-7

CEQA does not require a project to ensure the continued existence of species within a particular location. Rather, CEQA requires evaluation of whether a project may result in significant impacts upon the environment. Upon the completion of each mining phase, reclamation would occur onsite and would include certain performance standards for ensuring revegetation growth. It should be noted that reclamation activities also do not need to ensure species recovery. The Draft EIR adequately addresses all aspects concerning reclamation and wildlife as raised in the comment under CEQA.

Comment 500-8

5. **Access to navigable waterways.** California does not assure the public's right to cross private property to access navigable waterways. It does however prohibit owners of lands adjacent to navigable waters from interfering with the

public's right to use such waters. The permitting process could protect this right by requiring access, at very least on foot, to the river's edge.

Response 500-8

Please see Collective Response #21 pertaining to public access to the San Joaquin River.

Comment 500-9

6. **Quality of life issues - San Joaquin River Parkway and the Central Valley.**

Fresno, with more than half a million people, ranks year after year as one of the "worst cities" in America for green space, outdoor recreational opportunities and quality of life. Outside.com points out that we "lack green space, have poor access to parks, and made little investment in recreation." We rank fifth from the bottom in America.

The Trust for Public Land notes that only 2% of Fresno is park space and that we have only one playground for every 10,000 people.

The Fresno Bee reported just last month that "Fresno is one of the worst spots for an active lifestyle." Fresno is one of the "least outdoor-friendly cities" according to rv.travel.com.

The San Joaquin River Parkway and Conservation Trust (a nonprofit) and the San Joaquin River Conservancy (a state agency) have, over more than thirty years, brought thousands of acres of the floodplain into public hands, built miles of multipurpose trails, and restored riverside ecosystems. They've provided tours and education programs for years and have recently opened several major SJR Parkway properties to the public. The Parkway, and public transportation to and from it, can address our quality of life issue much better than a 600 foot deep hole owned and operated by a foreign multinational corporation.

The CEMEX site, because of its scope and its location, will have a major impact on the Parkway. The CEMEX Quarry site completely fills the space between Friant Road and the river edge. If it is to be mined at all, provisions should be made to assure public passage through the CEMEX site from Lost Lake and the public facilities at the hatcheries to the Parkway properties downstream.

I have been tolerant, if not outright supportive, of aggregate mining in the San Joaquin river floodplain. After all, California leads the world in the loss of its wetlands. When we dig a hole in

a floodplain, it eventually fills with water and we can get a wetland back.

But not this hole. This 58 story deep pit promises to be an unmitagable [sic] environmental disaster. It does not help that CEMEX has a history of air, water, and labor violations and a reputation for minimal restoration at best. CEMEX was cited and fined in the UK, cited in Victorville, Monterey, and sites in Colorado and Michigan.

It would be wise to require CEMEX to purchase bonds or otherwise provide funds to cover damage to neighbors and to assure their commitment to restore the floodplain property to high standards.

Response 500-9

Please see Collective Response #7 pertaining to socioeconomic issues. Please see Collective Response #12 pertaining to San Joaquin River restoration efforts. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. Please see Collective Response #4a pertaining to CEMEX regulatory history. Please see Collective Response #4b pertaining to liability. The commenter's concerns, opinions, and recommendations are noted and will be considered by County decision-makers. The comment does not provide evidence of a deficiency in the Draft EIR and no further response is warranted here.

Letter #501 March 10, 2025, Alyssa Gurney

Comment 501-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have concerns that I urge you to address prior to moving forward with approval. I am concerned about air quality and dust emissions caused by this project. Air quality in this region continues to be a challenge which prompts many negative health outcomes.

Response 501-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Collective Response #9 for additional discussion pertaining to potential effects on air quality.

Comment 501-2

According to the DEIR:

4.3.4 Project Impacts and Mitigation Measures

"- The DEIR says that project emissions may exceed cancer risk thresholds. DEIR pg. 4.3-63. The DEIR says that because mitigation measures would reduce emissions, the DEIR did not evaluate population-wide cancer burden. DEIR at pg. 4.3-64. CEQA requires that the analysis be performed before taking into account implementation of mitigation measures"

This This is extremely concerning to me that there may be an increase is emissions that may exceed cancer risk thresholds.

Response 501-2

Please see Collective Response #11 pertaining to community cancer risk. Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), provides an evaluation of potential air quality impacts of the project, including consideration of fugitive dust, toxic air contaminants, and health risk at Impact 4.3-3. The impact evaluation quantifies both unmitigated project health risk (Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts") and mitigated project health risk (Draft EIR Table 4.3-25, "Mitigated Project Health Risk Impacts").

As shown in these tables, after mitigation, the cancer risk at the maximally exposed individual sensitive receptor (MEIR) decreases from the baseline condition (i.e., cancer risk is a negative value demonstrating that the project would be a benefit). Accordingly, cancer burden, which represents the cumulative effect across census blocks, would also reflect a net benefit and was therefore not calculated in the Draft EIR.

In response to comments on the Draft EIR, the air quality technical analysis was reviewed and updated to amplify and clarify the information presented, as documented in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3). This updated analysis includes cancer burden modeling and demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Tables 4.3-24 and 4.3-25 as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality." The comment does not provide evidence of a deficiency in the Draft EIR.

Comment 501-3

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in

this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 501-3

The comment does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. Please see above for responses to specific comments. Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input.

Letter #502 March 10, 2025, Sheila Hakimipour

Comment 502-1

I would like to submit my comments to you and Supervisor Bredefeld regarding CEMEX Rockfield Expansion Project DEIR. Below please see my concerns:

1. **Impacts on the San Joaquin River Parkway Access:**

   I have worked as a subconsultant on multiple river access and activation projects for SJR Western Reaches, River West and Circle V projects. Our county is blessed to share a 22 miles border with the San Joaquin River Parkway. With so much potentials, Fresno County residents have very limited access to the River. Further expansion of the CEMEX mining operation will impact the access furthermore.

Response 502-1

Please see Collective Response #21 pertaining to public access to the San Joaquin River.

Comment 502-2

On 4.17 Transportation chapter of the DEIR/San Joaquin River Parkway Master Plan Update, the document says, *"The multi-Use trail would also extends along the northwest boundary of the Plant Site, just outside the site, and extends along the Southwest Boundary of the Plant Site,* ***just inside the site.***" The SJR trail inside a heavy mining site will be extremely unattractive, unsafe, subject to noise and air pollution due to explosives, thus not used by the Fresno County public, compromising access and Parkway vision.

Response 502-2

As shown on Figure 2-7, "Proposed Plant Site Mining Plan," Figure 2-8, "Proposed Quarry Site Mining Plan," Figure 2-9, "Plant Site Final Reclaimed Conditions," and Figure 2-10, "Quarry Site Final Reclaimed Conditions," the proposed trail easement would not travel "inside a heavy mining site," but would be located along the northwest boundary of the Plant Site, outside of active mining areas. The parcel on which the Quarry Site is located abuts the San Joaquin River, and the project includes the dedication of easements within the parcel to Fresno County to allow for future construction of multi-use trail improvements in this vicinity. While portions of the future planned multi-use trail may be located within the broader project site, the trail would be designed with appropriate buffers and measures to minimize potential conflicts with mining operations. The Operator would continue to coordinate with Fresno County as plans for the future multi-use trail are developed.

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River and Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 502-3

> Additionally, the document reference the Fresno County Regional Transportation Plan in multiple places. The county is in the process of updating the RTP, and the new policies are not reflected in the DEIR.
>
> Supervisor Bredefeld, please be a champion for the River and for the public access to River.

Response 502-3

The Draft EIR is revised in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata," to include a description of the ongoing update process for the Fresno County Regional Transportation Plan. However, until an updated plan is adopted, the 2022 Regional Transportation Plan and Sustainable Communities Strategy (RTP/SCS) remains the applicable plan for purposes of the Draft EIR's consistency analysis. The added discussion regarding the RTP update process is provided for informational purposes only.

Comment 502-4

> **2. Impact on Youth Physical and Mental Health:**
>
> I have worked with youth volunteers and Scouts on the river cleanup for four years. I have witnessed firsthand how our

youth enjoy and care for the river and how being outdoor helps them to be off the screen, stay above, bond with each other and bond with nature. I encourage you to set up a town hall meeting with Fresno County youth volunteers who have worked on the river and hear from them what their vision is for their River.

Supervisor Bredefled, please be a champion for our youth and put their health and interest before the big pocket of a multi million dollar non-local (non-US) company.

Response 502-4

The comment does not address the adequacy of the Draft EIR, and no further response is warranted here. The commenter's request will be considered by County decision-makers.

Comment 502-5

3. **Impact on Traffic Safety on Friant and Safe Access to Woodward Park:**

In September 2020, shortly a□er Angel Hernandez was fatally hit by a car at the intersection of Friant and Fort Washington, a group of Audubon Bluff neighbors and Woodward Park users (runners, walkers, etc.) invited you to a walk audit along Audubon and Friant Rd. As you remember, during our walk we tested different crosswalks that lead to Woodward Park on Friant Road. We discussed the traffic safety situation that high volume traffic is causing on Friant Road and its incompatibility with so many pedestrians and bicyclists walking to and from Woodward Park. My Daughter runs with a local high school cross country and track team and she and many high school students who cross Friant to go to the Woodward Park for their practices, are constantly subject to one of worse traffic safety risks in the county using the cross walks on Frint Rd. That day, you promised to help.

Unfortunately, the traffic safety on Friant Rd has gotten worse since then. More fatal accidents like Paul Moore on Friant and Audubon, and Amaya Chenot on Shepard and Friant are proof of that terrible reality. The number of memorials that are erected at every intersection on Friant Road is a testimony to the systematic and chronic traffic safety issues on the roadways near Woodward Park. I speak for many mothers and fathers that must live in fear knowing their sones and daughters are constantly subject

to fatal accidents walking the crosswalks into the park. The CEMEX expansion will increase truck traffic from 250,000 to 400,000 a year and will directly makes Friant Road more dangerous to cross, bike and drive.

Supervisor Bredefled, please be a champion for our young runners and Safe Access to Woodward Park. Please encourage your colleagues on the board to put the health and safety of residents of your district before the wealth of another mega non-local (non-US) company and say NO to CEMEX request to extend the opera□on permit to 100 more years and to a scale so big that it will match the biggest mining operation in California.

Response 502-5

Friant Road, Copper Avenue, and Willow Avenue are identified as truck routes by the City of Fresno. The project would not be responsible for the regional growth that contributed to observed increases in traffic volumes or any potential corresponding systematic and chronic safety issues. The agencies having jurisdiction over intersections with high crash rates may consider alternatives for improving traffic safety. It should be noted that, as traffic volume and congestion increase, the corresponding speed and speed limits on those roadways tends to decrease. The suggestion that an increase in traffic volumes necessarily correlates to an increase in safety issues is not supported by analyses nor substantial evidence.

Letter #503 March 10, 2025, Jeffrey Hallock and Deborah Symes

Comment 503-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed

4.10.1.5 Flood Hazards: The flood hazard analysis is limited to the FEMA 100-year floodway and floodplain and states the "the floodplain does not encroach into the Quarry Site" as shown on Figure 4.10-1. The continued development of the berm between the river channel and the Quarry Site will constrain the river and will create a choke point especially at the north end of the Quarry Site where the easterly bank of the river is more vertical. According to the 100-Year Hydraulic Results found in the Hydraulic

Analysis in Appendix G-1, the flood water surface elevation between Stations 20 and 21averages out to 313.27 feet. Without a constraining bank between Stations 20 and 21on the east side of the river additional water flow will likely push to the east across the north side of the Quarry Site. Further, the Executive Summary includes the following caveat: "The Bureau of Reclamation owns and manages the dam, and, during unforeseen events, may be required to release water into the San Joaquin River at rates that could exceed the river channel capacity (Fresno County 2018a)," a foreseeable hazard not adequately addressed in the DEIR.

Response 503-1

The San Joaquin River 100-year floodplain does not enter the Quarry Site from stations 20 to 21 (Draft EIR Appendix G-1, "Hydraulic Analysis," Appendix A, Figure 2). Friant Dam releases are not controlled by the project.

The Draft EIR is not required to analyze scenarios that are speculative or not reasonably foreseeable (14 CCR Section 15145). As discussed in Draft EIR Impact 4.10-17, sudden releases from Friant Dam are not reasonably foreseeable, and are thus not required to be analyzed under CEQA. Please note that the excerpt from the Executive Summary is consistent with the analysis provided in Draft EIR Impact 4.10-17, as it states the Bureau of Reclamation may require releases of water that exceed the San Joaquin River's channel capacity in the case of an "unforeseen event." The hydraulic analysis incorporated flood flow rates higher than the 1997 flood. The 1997 flood flow rate of 60,300 cfs is lower than the 100-year flow rate of 71,000 cfs studied for the project. The Draft EIR analyzed the proposed project's potential to release pollutants in a flood hazard, tsunami, or seiche zones due to project inundation and concluded that this impact would be less than significant (see Draft EIR discussion of Impact 4.10-17 on page 4.10-118).

Comment 503-2

2. Air Quality and Dust Emissions

The status of the San Joaquin Valley air basin as one of the very worst in the nation is well known, a problem that has created serious health problems for our family and many of our friends. We are not confident that this corporation has the skills or the resources to contain the fine particulates that will inevitably be raised by their proposed uses of the site without excessive water use, the water itself being a scarce and valuable resource.

Response 503-2

The Health Risk Assessment concluded that particulate matter impacts were determined to be less than significant after mitigation. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted, resulting in an overall net benefit to the environment. The project would also be subject to a Fugitive Dust Control Plan required by SJVAPCD Regulation VIII. Further, in response to air quality comments on the Draft EIR, the technical analysis was updated to clarify and amplify the information presented, as described in Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 503-3

4.19.1.10 CSA 44C Wells and Quarry Site Interactions: Impact on water tables for domestic residential wells. The possibility of dropping water tables on the extensive dig is a huge concern for residents.

1. Cemex should install at every residential well a constant water level monitor. This should be monitored monthly by an independent contractor paid for by Cemex.

2. Cemex must provide a bond to protect every residence of this community. If the wells fail or have greatly reduced water production and the homes are no longer realistically habitable, protection for the homeowners must be in place before operations begin. Cemex must be liable and purchase the properties at high market value. There must be a penalty in place to be paid to the resident to cover costs of moving through no fault of their own.

Response 503-3

In addition to the response below, see Collective Response #25. As discussed in the Draft EIR, the use of the recharge trenches would limit the drawdown of the water table in the unconfined alluvial. Additionally, as noted in Response 58-27, recharge trenches and ponds for groundwater recharge have been used for decades at the Quarry Site. The recharge operations would result in drawdown levels that would be approximately one-half of those which would occur without any recharge operations (KDSA 2021). The Draft EIR acknowledges reductions in the available groundwater column would occur in the

Fresno County CSA 44C wells (see Draft EIR page 4.10-107). The estimated decrease in the static water column would range from 30 to 60 feet depending on the recharge operations. If water production volumes from the CSA 44C wells decline to the point where current water demand cannot be met, this would result in a significant impact. Accordingly, Mitigation Measure 4.10-10a is provided as an Adaptive Management Program for Quarry Site Groundwater (Draft EIR, pages 4.10-108 through 4.10-111). As part of the Adaptive Management Program, potential effects on the CSA 44C wells would be assessed through the monitoring of nested wells between the Northeast Pond and the CSA 44C wells, and the CSA 44C wells themselves. Additionally, if access can reasonably be gained to any of the five private wells in Draft EIR Table 4.10-9, "Estimated Drawdown of Groundwater Levels in Wells Near the Quarry Site," located to the west of the Quarry Site from the private owners, then those wells should also become part of the monitoring program as well. Annual mitigation monitoring reports prepared by a Professional Hydrologist/Certified Hydrogeologist would be submitted to Fresno County annually. If monitoring data indicate groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15 percent, a significant impact will have occurred. At that point, corrective measures would be implemented.

Corrective measures include diverting additional water to the recharge trenches and constructing an additional recharge basin on the northeastern side of the Quarry to increase recharge rates (Draft EIR, pages 4.10-108 through 4.10-111). To ensure funding and implementation of the adaptive management program, Mitigation Measure 4.10-10b requires the establishment of an endowment dedicated to the perpetual implementation of the adaptive management program and implementation of corrective actions (Draft EIR, page 4.10-111).

The initial corrective measure would be to divert additional water from the excavation to the Northeast Pond or an additional recharge trench. If upon pumping all available water and the water levels remain 15 percent or more below baseline elevations, mining would not progress to greater depths.

To ensure funding and implementation of the adaptive management program, Mitigation Measure 4.10-10b requires the establishment of an endowment dedicated to the perpetual implementation of the adaptive management program and implementation of corrective actions.

The comment does not provide substantial evidence that the implementation of Mitigation Measures 4.10-10a and 4.10-10b are inadequate to address impacts to the water table caused by the dewatering activities. Additionally, the Operator would not be

responsible for purchasing properties at "high market rate" as the mitigation measures in place reduce any potential impacts to a less than significant level.

Comment 503-4

3. Biological Resource Impacts

4.4.1.4 Wildlife: The DEIR does not adequately analyze potential impacts of blasting on wildlife. The examples of habituation of wildlife to mining operations are for surface mining, not the deep rock mining proposed here.

Response 503-4

Blasting activities would be brief (one to two seconds) and would not significantly impact wildlife (Draft EIR page 4.4-53). Please see Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17 for further discussion of blasting impacts to wildlife.

Comment 503-5

4.4.1.9 Critical Habitat: Mischaracterization of a regulated habitat. The Waste Wash Conveyance Ditch at the Plant Site likely qualifies as a stream, and diverting or obstructing its natural flow, altering its bed, channel, or bank, or depositing any material into this feature would be subject to provisions of California Fish and Game Code Section 1600 et seq.

Response 503-5

See Response 58-33 regarding the waste wash conveyance ditch at the Plant Site. The water conveyance ditch was a man made/created feature in the uplands and is not subject to California Fish & Game Code Section 1600 et seq.

Comment 503-6

4. Traffic and Noise Concerns

The impact of blasting, mining operations, and heavy transportation will inevitably spill over to nearby public parks and recreation areas. This is a cost to the public (and to our own well being) that is not adequately mitigated in the DEIR.

Response 503-6

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 503-7

5. Cumulative Environmental Effects

4.3.4 Project Impacts and Mitigation Measures: The DEIR says that project emissions may exceed cancer risk thresholds (DEIR pg. 4.3-63). The DEIR says that because mitigation measures would reduce emissions, the DEIR did not evaluate population-wide cancer burden (DEIR at pg. 4.3-64). CEQA requires that the analysis be performed before taking into account implementation of mitigation measures.

Response 503-7

Please see Collective Response #11 pertaining to community cancer risk. Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), provides an evaluation of potential air quality impacts of the project, including consideration of fugitive dust, toxic air contaminants, and health risk at Impact 4.3-3. The impact evaluation quantifies both unmitigated project health risk (Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts") and mitigated project health risk (Draft EIR Table 4.3-25, "Mitigated Project Health Risk Impacts").

As shown in these tables, after mitigation, the cancer risk at the maximally exposed individual sensitive receptor (MEIR) decreases from the baseline condition (i.e., cancer risk is a negative value demonstrating that the project would be a benefit). Accordingly, cancer burden, which represents the cumulative effect across census blocks, would also reflect a net benefit and was therefore not calculated in the Draft EIR.

In response to comments on the Draft EIR, the air quality technical analysis was reviewed and updated to clarify the information presented, as described in Appendix D-3, *Revised Air Quality, Health Risk and Climate Change Impact Assessment*. This updated analysis includes cancer burden modeling and demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Tables 4.3-24 and 4.3-25 as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality." The comment does not provide evidence of a deficiency in the Draft EIR.

Comment 503-8

Given these concerns and many other concerns, we urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. We look forward to your response and further discussions on this important matter.

Response 503-8

The commenter's request for additional analysis, enhanced mitigation, and additional alternatives is noted. The comment does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures, and the comment does not recommend specific additional alternatives for consideration. Please see above for responses to specific comments, and please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input.

Letter #504 March 10, 2025, Bryan Harley

Comment 504-1

I am writing to express my strong opposition to the proposed CEMEX Rockfield Expansion Project along the San Joaquin River. This project poses an unacceptable threat to our environment, community health, and the long-term integrity of the San Joaquin River ecosystem.

Research indicates that the Fresno area currently has nearly a 200% surplus of locally sourced gravel—a resource that will comfortably meet regional needs for decades to come. Approving this project, which aims to extract additional material through blasting techniques, is economically unjustifiable and would serve only corporate interests rather than the needs of our community.

Response 504-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding aggregate demand and the need for the proposed project.

Comment 504-2

The proposed blasting and deep-mining operations (extending 600 feet below ground surface) would permanently scar the river bottom, further degrading an already over-extracted and polluted waterway. The San Joaquin River has suffered greatly from decades of mining, with its wetlands, salmon runs, and natural floodplains already in jeopardy. Expanding mining operations at this critical juncture would irreparably harm local ecosystems and disrupt the delicate balance of our natural resources.

Response 504-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to the ecosystems on the project sites and surrounding areas, including potential impacts to wetlands, riparian floodplains, and salmon are evaluated in Draft EIR Section 4.4, "Biological Resources." The Draft EIR concludes that the project's potential impacts to water resources and biological resources would be less than significant with the implementation of mitigation measures. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 504-3

Beyond environmental impacts, the project threatens to dramatically increase truck traffic—potentially adding the equivalent of billions of car trips annually—to our local roads, exacerbating wear on infrastructure and increasing risks to public safety.

Response 504-3

The project's potential impacts related to truck traffic, road maintenance, and transportation safety are evaluated in Draft EIR Section 4.17, "Transportation." The commenter overstates the number of vehicle trips that would be generated by the proposed project. See Draft EIR Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites ," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)," regarding the project's expected annual trip generation at each stage. (Draft EIR pages 4.17-15 through 4.17-18.) See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #29 regarding increased truck trips and road maintenance, and Collective Response #30 regarding transportation safety.

Comment 504-4

The disruption to recreational spaces and the loss of riverfront greenspace will diminish quality of life and limit access to natural areas that many community members depend on for leisure and well-being.

Response 504-4

See Collective Response #27 regarding potential impacts to users of nearby parks and trails from project operations including blasting. The project sites have been previously disturbed by mining projects for at least 30 years, so the project would not result in any

new disturbance to greenspace. Furthermore, the project sites would be reclaimed as mining phases are completed in accordance with the proposed reclamation plan (see Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan"). The project would have no effect on access to existing parks or natural areas. See Collective Response #21 regarding public access to the San Joaquin River.

Comment 504-5

Community stakeholders deserve to be heard, and elected officials and state agencies charged with protecting our natural resources must prioritize public health over corporate profits. The inaction by some agencies and the controversial track record of CEMEX in Fresno County underscore the need for a more cautious and community-centered approach.

For these reasons, I urge the County to reject the proposed expansion of CEMEX's mining operations. Instead, we should focus on sustainable and responsible use of the local gravel surplus while preserving our river's health, securing recreational spaces, and safeguarding the well-being of current and future residents.

Thank you for considering my comments.

Response 504-5

Final EIR Section 2.2, "Public Review Period and Notifications," describes the public and agency review period for the Draft EIR and the opportunities provided for public input. The project has complied with CEQA requirements for public participation. See also Collective Response #4a pertaining to CEMEX regulatory history. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #505 March 10, 2025, John Hayes

Comment 505-1

I am writing to comment on the DIER for the Cemex Rockfield Quarry Project.

This is a project which is not needed for this area.

1. The mining operation as proposed is for hard rock mining which will create a 600 foot hole in the ground not 200 feet from the San Joaquin River and adjacent Conservatory trust area. This hole will be equal in depth to the height of the Statue of liberty with base and torch. Blasting a hole this size in our areas is not acceptable. Further a number of California State and local Plans such as the Surface Mining and Reclamation Act of 1975(SAMRA),

require responsible mineral extraction. Further the Act ensures that adverse environmental impacts from mining are minimized and that mined lands are reclaimed to usable condition. There is no way possible that the proposed operation will ever be reclaimed, 100 years from now. We and the company will all be dead!

Response 505-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The proposed Surface Mining and Reclamation Plan (see Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan") was prepared in compliance with the requirements of Surface Mining and Reclamation Act (SMARA). The project's potential environmental impacts are disclosed throughout the Draft EIR and are minimized and mitigated as necessary. The project sites would be reclaimed concurrently with proposed mining and enforced by Fresno County and the state. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 505-2

2. This company has had over the years and in other states, such as Colorado not been a good corporate partner for the cities/areas it is located in.

Response 505-2

See Collective Response #4a regarding CEMEX's regulatory history.

Comment 505-3

3. The DIER does mitigate the adverse environmental impacts in other areas such as air pollution, noise abatement, road destruction, personal property destruction, river destruction, etc. Mitigation in the report only includes monitoring and not management of the situations.

Response 505-3

See Response 112-11.

Comment 505-4

4. There is no way a company should get a 100year lease in our county/city.

Response 505-4

See Collective Response #5 regarding the duration of the proposed use permit.

Letter #506 March 10, 2025, Jean Hays Gunn

Comment 506-1

The CEMEX Company's application to modify, expand and extend operations of the Rockfield Quarry, occupying two sites on the west side of North Friant Road should NOT be allowed to happen. The company wants to continue this proposed expansion of operations in aggregate mining and processing, which includes rock, sand and gravel. It would be disastrous to people, wildlife, the environment and to the Earth, where we all live. CEMEX wants to extend its operations for another 100 years, as well.

Response 506-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. Please see Collective Response #5 pertaining to the requested use permit duration. The comment does not address the adequacy of the Draft EIR, and no further response is warranted here. See also Response 506-2 through 506-7 below for responses to the commenter's specific concerns.

Comment 506-2

Interestingly enough, Mexico, CEMEX's home country, has banned this kind of excavation. Fresno County can learn from Mexico!

Response 506-2

The comment is not germane to the Draft EIR, or the analysis or impact determinations found therein. This comment does not raise environmental issues, and does not require a response.

Comment 506-3

Among other environmentally-related impacts apparently overlooked are these:

Many drivers along Friant Road have already experienced broken windshields due to gravel escaping from CEMEX truck traffic. With expanded drilling and blasting, that truck traffic would increase.(See DEIR), and so would numbers of broken windshields. Impact on wildlife, including birds, would be huge, to say nothing of the human impact!

Response 506-3

Please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 506-4

There are so many disturbing issues that come to mind while reading the DEIR. I am sure other letters you received will name them, so I will skip those details, while supporting those letters of opposition. Here are some of the things that haunt me because of the serious consequences of approval:

Air Quality: The DEIR says project emissions may exceed cancer risk thresholds and did not evaluate populations-wide cancer burdens. Does ignoring this make it go away?? NO!

Response 506-4

Please see Collective Response #11 pertaining to community cancer risk. Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), provides an evaluation of potential air quality impacts of the project, including consideration of fugitive dust, toxic air contaminants, and health risk at Impact 4.3-3. The impact evaluation quantifies both unmitigated project health risk (Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts") and mitigated project health risk (Draft EIR Table 4.3-25, "Mitigated Project Health Risk Impacts").

The commenter appears to reference Table 4.3-24, which identifies unmitigated project health risk impacts; however, mitigation measures would reduce health risks to those shown in Table 4.3-25. As shown in the mitigated results, the cancer risk at the maximally exposed individual sensitive receptor (MEIR) decreases from the baseline condition (i.e., cancer risk is a negative value demonstrating that the project would be a benefit). Accordingly, cancer burden, which represents the cumulative effect across census blocks, would also reflect a net benefit and was therefore not calculated in the Draft EIR.

In response to comments on the Draft EIR, the air quality technical analysis was reviewed and updated with additional information, as described in Appendix D-3, *Revised Air Quality, Health Risk and Climate Change Impact Assessment*. This updated analysis includes cancer burden modeling and demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Tables 4.3-24 and 4.3-25 as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality." The comment does not provide evidence of a deficiency in the Draft EIR.

Comment 506-5

Impacts from Blasting: CEMEX is now digging gravel. Now they want to blast for gravel! Among the impacts, those to area residents have the potential to be very significantly noisy and could happen once or twice daily. This noise would damage structures and wells and destabilize the San Joaquin River embankment. While this is

addressed in the DEIR, it does not evaluate impacts of blasting to users of the adjacent park (Lost Lake Park), and it barely mentions disturbances to residents of the area!

There is the potential for damage to nearby groundwater wells as well. Keep this in mind as we approach World Water Day on March 22!

The potential for environmental accidents is great with blasting happening at a 600 ft. deep level so close to the San Joaquin River, to say nothing of the giant hole next to the SJ River which would have both aesthetic and environmental impacts on the river and surrounding area. CEMEX has said it would stain the walls of the great pit with earth colors. That doesn't mitigate the potential for a crack in the wall, thus allowing the San Joaquin River to spill into the pit, thus contaminating the river and the surrounding area!

Response 506-5

Comment 506-5 misstates the quantity of blasting, which would occur up to two times per week between the hours of 10 a.m. and 2 p.m., not two times every day (Draft EIR page 4.13-47).

The Draft EIR analyzes the proposed project's impacts upon noise in Section 4.13, "Noise." The noise and vibration impacts related to blasting are analyzed in Impact 4.13-6 on page 4.13-65 of the Draft EIR. With implementation of Mitigation Measure 4.10-1, which would require implementation of the "Blasting Protocols," the potential impacts would be reduced to less than significant (Draft EIR page 4.13-66).

The comment asserts without factual basis that the noise from the proposed project would damage structures, wells, and the San Joaquin River embankment. The proposed project would "[maintain a] vibration residential/commercial structure threshold of 0.75 in/sec PPV" which is substantially lower than the 2.0 in/sec PPV threshold to prevent damage to wells. (Draft EIR page 4.13-65.) As such, measures taken to maintain vibration below the residential/commercial structure threshold would also be protective of any wells associated with the structure. (Draft EIR page 4.13-65.) With regards to the stability of the San Joaquin River embankment, the Draft EIR concludes that implementation of Mitigation Measure 4.10-1 would reduce potential impacts to less than significant. Mitigation Measure 4.7-7 implements other measures to address slope stability. Please see Response 65-37 regarding the structural stability of the quarry pit and the San Joaquin River embankment.

Comment 506-6

More on Noise: Mitigation measures for noise impacts need to be more specifically required in the DEIR rather than a laundry list for the applicant (CEMEX) to choose from.

The DEIR should have analyzed how much noise reduction each would result in and required particular combinations of measures to ensure noise is adequately reduced, especially nighttime noise from the operation.

Response 506-6

See Responses 58C-15, 112-18, and 363-3.

Comment 506-7

I would sincerely hope that, when reviewing this CEMEX proposal, Fresno County would consider the environmental consequences to be the most important criteria for its ruling. The area around the San Joaquin River, especially around the Lost Lake area is a thing of beauty. The San Joaquin River Parkway & Conservation Trust has worked tirelessly to help preserve this beauty. In a time when our Earth environment is in trouble, it is up to US to help preserve and defend it. We live here; our plants and wildlife live here!! To be able to go out to a place nearby to unwind and enjoy the beauty and serenity of the natural environment of which we are a part, is one of the most important aspects of our journey here on Earth.

PLEASE do not allow CEMEX to go on with it's 100-year plan to destroy a part of Mother Earth, and to do so just to make money!! We have more than enough sand and gravel here now to take care of our construction needs!

Response 506-7

The commenter's opposition to the project is noted and will be considered by County decision-makers. Please see Collective Response #12 pertaining to San Joaquin River restoration efforts; and Collective Response #3 pertaining to regional aggregate demand and supply. See also Collective Response #5 pertaining to the duration of the proposed use permit.

Letter #507 March 10, 2025, Frank Helling (Handwritten)

Comment 507-1

My name is Frank Helling, I am a retired teacher and former seasonal ranger, naturalist in King Canyon National Park. I am writing in concern for Cemex Corporation in scene to extend their permit for 100 years to blast a 600 foot hole adjacent to the San Joaquin River. In short this is a bad idea.

Response 507-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 507-2

The impact on the environment, wildlife and nearly residents would be devasting. The project several impact air quality, water quality, fish and wildlife, cultural resources and visual aesthetics.

Response 507-2

The issues of air quality and water quality are addressed in Draft EIR Section 4.3, "Air Quality," and Section 4.10, "Hydrology and Water Quality," respectively. The project's potential impacts on cultural and visual resources are addressed in Draft EIR Section 4.5, "Cultural Resources," and Section 4.1, "Aesthetics and Visual Resources," respectively. The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." Potential effects to nearby residents are discussed throughout the Draft EIR most notably in Section 4.1 and 4.3 (both referenced above), and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here and Appendix D-4, "Revised Section 4.3, Air Quality." The comment is noted for the decision-makers.

Comment 507-3

The California Geological Survey updated in 2018 indicates we already have nearly double the aggregate we need for the next 50 years so supply is not a problem.

Response 507-3

See Collective Response #3 pertaining to aggregate demand and the need for the proposed project.

Comment 507-4

The San Joaquin River Parkway has been working tirelessly to protect what remains of the river's natural beauty. This project would set back their efforts irreparably.

Response 507-4

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #12 regarding the project's potential interaction with the work of the San Joaquin River Restoration Project (SJRRP).

Comment 507-5

Cemex is already encroaching on a wildlife preserve and this would result on even more damage. The river is home to endangered and threatened wildlife such as Swainson hawk, burrowing owl and tri-colored blackbird. Fish and Game has been working to restore chinook salmon to the river. Prior to the constriction of Friant Dam old timers reported that the salmon were so numerous during spawning season you could walk across the river on their backs (and the river was a mile wide.) We are not the only ones who live here. We must share our home with our fellow creatures.

Response 507-5

See Collective Response #20 regarding the suggestion that the existing Rockfield operation encroaches on an ecological preserve. The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4. See Impact 4.4-1 beginning on Draft EIR page 4.4-48 for an evaluation of potential impacts to Swainson's hawk, burrowing owl, and tricolored blackbird among other species. Specifically, Mitigation Measures 4.4-1a and 4.4-1c beginning on Draft EIR page 4.4-50 address mitigating potential impacts to burrowing owls and other nesting bird species (including Swainson's hawk and tri-colored blackbird), respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. See Collective Response #14 for further discussion of impacts to Swainson's hawk and Collective Response #15 for further discussion of impacts to bird species aside from nesting disruptions. See also Collective Response #12 regarding chinook salmon restoration efforts in the region.

Comment 507-6

The Iroquois people speak of a mythical beast called the Windigo which represents greed. No matter how much it gets, it wants more, Cemex is a Windigo.

Their safety and environmental records a abominable. They have been fined more than 43 million dollars for 81 separate environmental violations since the year 2000. What makes us think this will improve.

Cemex is like the guest who doesn't know its time to leave. They say, "Thank you," and make their exit. Cemex its time to go.

Response 507-6

See Collective Response #4a regarding CEMEX's regulatory history. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #508 March 10, 2025, Pedro Hernandez

Comment 508-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. Many of the proposed mitigation measures are simply inadequate and some impacts lack any mitigation at all.

Response 508-1

The commenter's concerns regarding the project are noted and will be considered by County decision-makers. The commenter's concerns regarding project impacts and mitigation measures are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see below for responses to specific comments.

Comment 508-2

Impacts on the San Joaquin River Watershed

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination, The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events. Additionally, the groundwater data used for htDEIA was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since

the document identifies the fact that there is groundwater / surface water interaction at both sites.

Response 508-2

See Response 349-2.

Comment 508-3

Given the length of the permit, the draft environmental impact report should outline steps to ensure that potential risks are mitigated, as well as which parties are responsible should long-term impacts to the San Joaquin River occur. The following are some questions that should be posed and followed through to ensure that solutions for these scenarios are robust:

- What is CEMEX's plan if major foodding, like the 1997 flood, breaches the levee and captures the quarry pit?

- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 508-3

See Collective Response #17 for discussion of potential impacts related to flooding. See also Response 329-3.

Comment 508-4

Impacts on the San Joaquin River Parkway & Recreation

CEMX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments of a timeline:

- The DEIR should identify the timeframe and exact location of the trail to be constructed.

- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway's Master Plan requirement for a 300-foot buffer between mining operations and public access.

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trial is used as a community benefit of the project.

Response 508-4

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 508-5

The DEIR uses outdated information when identifying recreation sites in close proximity to the quarry, including/such as…. Furthermore, this outdated information will result in the noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, as these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 508-5

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 508-6

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- *Scenic Designation:* The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases). This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 508-6

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 508-7

- *Traffic Congestion*: Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 508-7

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 508-8

- *Air Quality*: The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

These impacts will be felt by surrounding communities in terms of the already high levels of asthma and climate impacts such as extreme heat and drought from increased diesel emissions.

Response 508-8

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 508-9

Threats to Wildlife

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts or propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

For example, the DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat that are local to the region and play critical ecological roles. Drilling, blasting, and excavation could disrupt nesting and migration patterns but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations or protections.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River? The DEIR should use state-specific standards to ensure that these fish are protected. CEQA requirements were developed to ensure that impacts to wildlife were properly assessed. The DEIR has failed to adequately capture the biodiversity of the San Joaquin River Basin through inadequate analysis and standard implementation. In order to address these concerns, it is highly recommended that the section go through major revisions and have the public commentary available.

Response 508-9

The Draft EIR analyzes the project's potential impacts to biological resources in Section 4.4, "Biological Resources." The Draft EIR minimizes and reduces potential impacts to biological resources, in accordance with CEQA standards. Please see Response 58-38 and 65-15 for discussion of Swainson's hawk. See Response 58-37 and 58-40 for discussion of tricolored blackbird. See Responses 58-36, 58-38, 58-40, 58-50, 65-6, and 65-10 of discussion of burrowing owl.

For discussion of impacts to migratory fish and wildlife species, please refer to Response 65-16. For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17. For discussion of the usage and sufficiency of the Alaskan Blasting Standards for analyzing impacts to fish in the San Joaquin River, refer to Response 65-13.

Blasting activities would be brief and would not significantly impact wildlife adjacent to the project sites (see Draft EIR page 4.4-53). A typical blasting event would occur for approximately one to two seconds. The project sites are already disturbed by decades of ongoing mining operations.

Comment 508-10

Conclusion

Given the significant impacts on the river, wildlife, public safety, and air quality, the County should require CEMEX to provide additional analysis, stronger mitigation measures, and financial guarantees. This information must be drafted and recirculated for public review before finalizing the environmental impact report. Ensuring public transparency and accountability in this process is crucial to protecting the long-term health of the San Joaquin River watershed and surrounding communities.

Thank you for your time and consideration.

Response 508-10

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. Please see responses above regarding specific issues raised in the comment letter. Pursuant to CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review but before certification. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #509 March 10, 2025, Lenore Hiebert

Comment 509-1

I am writing to lodge a protest against the idea of allowing Cemex to expand or continue their operations at the San Joaquin River.

16) The river is a unique-truly a one-of-a-kind-asset and defining feature of our region. Spending time at Ball Ranch, the Riverview Ranch House, or Sycamore Island is so inspiring. The river is a MAJOR wildlife corridor and all kinds of folks and entire families are out there walking, biking, fishing, bird-watching and more. And there is so much to see! Our first sight on one recent Sunday was a bald eagle soaring by!

17) In addition, we're learning that the more plant life there is in our landscape the more carbon is sequestered in their roots-the bare, dusty, ripped-up, wheel-tracked landscape and truck traffic created by this business isn't doing anything to help our air quality or our warming atmosphere!

18) It is so short-sighted to do ANYTHING to harm the river and the river habitat that is so vital to wildlife survival and human flourishing. We've learned from the past and from such works as Rachel Carson's *Silent Spring* that wildlife health is human health.

Response 509-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." The project's potential effects on the nearby visual and aesthetic setting are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Collective Response #27 pertaining to effects on users of nearby parks and trails from project operations, including blasting. See also Draft EIR Section 4.8, "Greenhouse Gas Emissions," for discussion of climate change and Collective Response #9 regarding worsening existing air quality conditions. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 509-2

19) NIMBY has a bad reputation, but it makes sense that harmful-impact activities like deep pit mining with hard rock blasting shouldn't happen near a popular recreation area and an important wildlife corridor. This should not be done anywhere close to our city at all.

Response 509-2

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #27 pertaining to effects on users of nearby parks and trails from project operations, including blasting. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 509-3

5) And floating the idea of 100-year lease is an extreme move. That is a century! Things can change radically in that amount of time and that makes an agreement like this a very bad move. A huge company can seem like a formidable opponent, but Fresno County's people should have their health and safety put first over this big commercial interest.

Please do all you can to make sure these concerns are clearly reflected in the Draft Environmental Impact Report. Thank you!

Response 509-3

See Collective Response #5 regarding the duration of the proposed use permit.

Letter #510 March 10, 2025, Leslie Hoyt

Comment 510-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. Along with so many other Fresno County residents, I believe the San Joaquin River is a treasure that has been severely abused, neglected, and underutilized partly because of the impact already caused by mining operations. When I visit greenbelts along many other beautiful rivers in our nation, I notice how little we have been able to do in Fresno to make our river the heart of the community. The CEMEX proposal appears to suggest that we will witness further degradation of this valuable resource and its surrounding environment rather than making progress toward developing a ecologically respectful community asset that is available to all

I have reviewed the DEIR and believe that this project threatens the San Joaquin River (a local treasure that mining operations have already impacted in an extremely negative manner), local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 510-1

The commenter's interests in the San Joaquin River and concerns regarding the project are noted and will be considered by County decision-makers. The commenter's concerns regarding project impacts and mitigation measures are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see below for responses to specific comments.

Comment 510-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 510-2

See Response 349-2.

Comment 510-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 510-3

See Collective Response #17. See also Response 329-3.

Comment 510-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 510-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 510-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments, financial or otherwise, or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for funding, constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 510-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 510-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 510-6

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 510-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** Is there any example of rock staining sufficiently mitigating the harm created to the scenic views? The proposal constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 510-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 510-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 510-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 510-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining? Since we know that CEMEX Lyons is the #1 polluter in towns like Boulder County, Colorado, emitting 357,000 tons of CO2 per year, what kind of monitoring will be done to ensure that Fresno County is not similarly impacted?

Response 510-9

Please see Collective Response #10 pertaining to the baseline used to evaluate potential air quality impacts of the project.

The reference to emissions from another CEMEX facility in Colorado does not affect the analysis of the Rockfield Modification Project, which is based on project-specific emissions modeling and evaluated against applicable CEQA significance thresholds and San Joaquin Valley Air Pollution Control District (SJVAPCD) requirements. Operation of the project would remain subject to all applicable SJVAPCD permitting and regulatory requirements. See Draft EIR Section 4.3, "Air Quality," as revised in Appendix D-4, "Revised Section 4.3, Air Quality."

Please also see Collective Response #9 and Response 12-50 and Response 13-16 regarding the updated air quality analysis, implementation of Best Available Control Technology and the Fugitive Dust Control Plan, and applicable SJVAPCD permitting requirements.

Comment 510-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated.

The proposed mitigation measures do not comply with existing regulations for protection and do not supply sufficient information on mitigation measures being proposed to mitigate the effects of blasting activities on migratory birds and species at risk. More information is needed on the overpressure and vibration monitoring program including best management practices being considered to reduce noise and vibration emissions. Standards need to be included in the report that are appropriate to assess fish protection of the species found in this specific river, rather than using standards based on conditions found in Alask.

Response 510-10

The Draft EIR analyzes the project's potential impacts to biological resources in Section 4.4, "Biological Resources." The Draft EIR includes mitigation measures which would minimize and reduce potential impacts to biological resources, in accordance with CEQA standards. Please see Response 58-38 and 65-15 for discussion of Swainson's hawk. See Response 58-37 and 58-40 for discussion of tricolored blackbird. See Responses 58-36, 58-

38, 58-40, 58-50, 65-6, and 65-10 of discussion of burrowing owl. See Response 58-37 for further discussion of the Western red bat.

For discussion of impacts to migratory fish and wildlife species, please refer to Response 65-16. For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17. For discussion of the usage and sufficiency of the Alaskan Blasting Standards for analyzing impacts to fish in the San Joaquin River, refer to Response 65-13.

Blasting activities would be brief and would not significantly impact wildlife adjacent to the project sites (Draft EIR page 4.4-53). A typical blasting event would occur for approximately one to two seconds. The project sites are already disturbed by decades of ongoing mining operations.

Comment 510-11

Conclusion

The impacts of this project on the community, the wildlife, the river, safety and air quality are not sufficiently addressed in this DEIR. Additional and more appropriate analysis should be required, and financial guarantees from CEMEX regarding mitigation measures need to be obtained. rafted and recirculated for public review before the finalizing the environmental impact report for the project. When obtained, this information needs to be readily available for the general public to review.

Response 510-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. Please see responses above regarding specific issues raised in the comment letter. Pursuant to CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review but before certification. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required. Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input.

Letter #511 March 10, 2025, Kay Hutmacher

Comment 511-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several

concerns that I urge you to address prior to moving forward with approval.

The San Joaquin River is an important resource for the residents of Fresno County and for those in counties nearby. The impact of this project has significant repercussions on both the environment of the river and the adjacent areas…

Response 511-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to the ecosystems of the project sites and surrounding areas are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The comment is noted for the consideration of the decision-makers.

Comment 511-2

…and also on the aesthetic and recreational uses of the river corridor. My family is seriously concerned that these impacts will have immediate and long-lasting impacts that will severely compromise our quality of life in the Central Valley.

Response 511-2

The issues of aesthetics and recreational uses of the river corridor are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources," and Section 4.16, "Recreation," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The comment is noted for the consideration of the decision-makers.

Comment 511-3

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Response 511-3

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project. See Chapter 2, "CEQA Public Review Process," of this Final EIR, for a summary of the public outreach and involvement conducted for the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #512 March 10, 2025, Carolyn Johnson

Comment 512-1

Having recently read information and attended a meeting that addressed the expansion project, I am writing to convey my thoughts about the plan. Several of my fellow citizens have done exhaustive research and are much more knowledgeable about the details than I. So, I will record here a simple benefit/risk assessment as this plan relates to those of my Fresno neighbors.

I have lived in the Woodward Lake area for 28 years, am a home owner and retired public servant, having retired from Fresno Unified. I moved here when there was little development save for Woodward Lake.

The river is within walking distance and I frequently use the Eaton bike trail. it is beautiful, especially this time of year. Now, on to the risks/benefits:

Response 512-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 512-2

Air pollution from the blasting and dramatic increase of truck traffic/exhaust fumes

Response 512-2

The issues of air pollution and dust from blasting and increased truck trips are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"),and Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding worsening of existing air quality.

Comment 512-3

Noise pollution from blasting and 16 hours per day of truck traffic

Response 512-3

Noise resulting from blasting and truck traffic are addressed in Draft EIR Section 4.13, "Noise." See Impact 4.13-1 beginning on Draft EIR page 4.13-49 pertaining to traffic noise and Impact 4.13-3 beginning on Draft EIR page 4.13-59 pertaining to operational noise, including blasting, at the Quarry Site. These impacts were determined to be less than

significant with the incorporation of the mitigation measures required in those sections of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13.

Comment 512-4

Water pollution due in part to the close proximity to the river, especially troubling for those home owners who live close and have wells that supply water to their homes

Response 512-4

The issue of water pollution and impacts to domestic wells are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-7 pertaining to surface and groundwater quality and Impacts 4.10-8 through 4.10-11 pertaining to groundwater levels. These impacts were determined to be less than significant with the incorporation of the mitigation measures required in those sections of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10.

Comment 512-5

Light pollution because of the light necessary at the site to operate long hours

Response 512-5

The issue of light pollution is addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Impact 4.1-4 beginning on Draft EIR page 4.1-62 pertaining to new sources of light and glare. This impact was determined to be less than significant. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1.

Comment 512-6

Danger to wildlife from blasting, air and water pollution

Response 512-6

Potential project impacts to wildlife are addressed in Draft EIR Section 4.4, "Biological Resources." The issues of air pollution and dust from blasting are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The project's potential effects on water quality are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 512-7

Decrease in property values of those homes near the site

Response 512-7

See Collective Response #7 pertaining to economic impacts.

Comment 512-8

Increased traffic due to enormous number of trucks

Response 512-8

The issue of increased traffic is addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #29 regarding project truck trips and traffic congestion.

Comment 512-9

BENEFITS TO CITIZENS

More available gravel- NO There is a sufficient supply nearby

More jobs- NO will not be increased opportunity

Response 512-9

See Collective Response #3 regarding aggregate supplies and the need for the proposed project. Economic considerations such as job creation are not CEQA issues and need not be addressed in the EIR. However, the comment is noted for the decision-makers.

Comment 512-10

Aesthetically pleasing, enhances the landscape- no need to answer this one

Response 512-10

The project's potential aesthetic impacts are addressed in Draft EIR Section 4.1. As noted in that section, the project would result in significant and unavoidable impacts to public views at two locations. See Impact 4.1-1 beginning on Draft EIR page 4.1-51 and Impact 4.1-3 beginning on page 4.1-61. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1.

Comment 512-11

In closing, I have a few questions for you

Who does benefit from this expansion, apart from CEMEX?

Would you buy a house in close proximity to the site?

I love my home and have a long history in Fresno, with close personal friendships. I also served hundreds of citizens during my career so I intend to live here. The river and the area are some of the precious few things that there is to enjoy here, however. So now CEMEX and the powers that be in Fresno want to take that away? Can't we do better?

Response 512-11

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #513 March 10, 2025, Pat Johnson (handwritten)

Comment 513-1

My name is Patricia Johnson and I'm 81 years old. During my life I have spent years in Florida where various elements were dug up and sand piled into mountains of sand. I've also lived/spent long periods of time in Georgia, California and most of the South Eastern states, I was able to enjoy some of the areas but also saw and experienced problems in those places which had been torn apart you intend to do to he San Joaquin River.

Response 513-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 513-2

Where mining had lasted for numerous years what had been beautiful landscapes had been turned into bare ground, no tress not bushes. Mining pits were no longer lovely and clear lakes now had dull colored water. Many left it an ugly hole in the ground – no trees, no grass, not anything except a deep ugly hole.

Response 513-2

The comment describes existing conditions at other mining sites. The comment is not relevant to the environmental analysis of the proposed project.

Comment 513-3

The worst problem will be hard rock blasting! In addition to the sound of blasting, it will hardest on residents who have allergies and/or severe respiratory problems. Also, the noise if homes are nearby and are not being taking into consideration and the water quality will be threatened for people and animals and environment!

Response 513-3

The issue of noise from blasting is addressed in Draft EIR Section 4.13, "Noise." See Impact 4.13-3 beginning on Draft EIR page 4.13-59 pertaining to operational noise at the Quarry Site, including blasting. Nearby residences are considered sensitive receptors and are evaluated as such in the EIR. The issue of air quality effects on public health is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The issue of water quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The comment is noted for the consideration of the decision-makers.

Comment 513-4

With these problems causing such an impact on those in the area including employees and others not mentioned, PLEASE think of the people in the nearby property and those where wind will spread dust and other tribulation. Also, think of the nearby property, their exposure plus long lung heath problems and how it will affect their children and coming generations, as well as your workmen and those who will be involved.

Response 513-4

The comment is noted for the decision-makers.

Letter #514 March 10, 2025, Vanessa Jones

Comment 514-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 514-1

The commenter's concerns regarding the project are noted and will be considered by County decision-makers. The commenter's concerns regarding project impacts and mitigation measures are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see below for responses to specific comments.

Comment 514-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 514-2

See Response 349-2.

Comment 514-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 514-3

Refer to Collective Response #17. Under Title 14 CCR Section 15088, responses to comments must address "the major environmental issues" in a Draft EIR. The second bullet point of this comment refers to cleanup if the pit becomes part of the river ecosystem, references a scenario that is outside of the scope of the Draft EIR. Collective Response #17 details how the 100-year flood analysis conducted as part of the Draft EIR shows that the current project design is sufficient to withstand an event such as the 1997 flood.

Comment 514-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document

identifies the fact that there is groundwater/surface water interaction at both sites.

Response 514-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 514-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 514-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 514-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 514-6

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 514-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 514-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 514-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR. The docu [sic]

Response 514-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 514-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 514-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 514-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 514-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR pages 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). In any event, blasting activities would be brief and are not expected to result in sustained or long-term impacts. A typical blasting event would occur for approximately one to two seconds. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore fully and adequately evaluated the impact on each of these species.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 514-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 514-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. Please see responses above regarding specific issues raised in the comment letter. Pursuant to CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public review but before certification. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #515 March 10, 2025, William Koole

Comment 515-1

I am astonished that the Cemex Rockfield Expansion Project is even being considered for approval. The idea that we are committing generations to a 100-year blight of the San Juaquin River is hard to believe.

Response 515-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 515-2

The location of the project is very ill conceived as it sits in the middle of a river corridor that serves as a recreational resource for the citizens of Fresno County and beyond.

Response 515-2

Alternative locations for the proposed project are discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations." The project's potential impacts to recreational facilities are addressed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #27 regarding the project 's operational effects on users of nearby parks and trails.

Comment 515-3

The scope of the project, blasting to a depth of 600 feet to recover gravel would create irreparable harm to the river and surrounding ecosystems.

Response 515-3

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See Draft EIR Section 6.5, "Project Alternatives," for consideration of several alternatives that involved reduced mining depth alternatives to the project. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 515-4

The road that serves the mining area is inadequate to support the additional load and traffic of industrial vehicles. The size and volume of vehicles will create a hazard that jeopardizes the safety of the community.

Response 515-4

The effects of project truck trips on the local road system, including Friant Road, are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #29 regarding traffic congestion and Collective Response #30 regarding road safety.

Comment 515-5

Please reject Cemex Rockfield Expansion Project.

Response 515-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #516 March 10, 2025, Tom Laury

Comment 516-1

Thank you for your consideration of public comments regarding this proposal. I appreciate the opportunity to express my thoughts.

I am very concerned about the proposal for expanding the CEMEX Rockfield Project. This location is entirely inappropriate for expanded mining, and CEMEX is a very dubious partner for Fresno County.

Response 516-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 516-2

Impacts on wildlife:

First and foremost is the impact of noise. Blasting, crushing and screening gravel and rock, operating mining equipment such as loaders and transporters, and accompanying trucks, will all have impacts far beyond the physical boundaries of the mining operation. Birds and mammals, especially, seek protection and refuge from human activity for their daily survival and for nesting and raising their young. Explosions, rock crushing, sand and gravel conveyors, equipment, will all create noise which will drive birds and mammals from the area for miles surrounding the proposed project.

Response 516-2

The project's potential impacts to wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #13 regarding the project's operational effects on wildlife in areas surrounding the project sites. See also Collective Response #15 regarding impacts to bird species.

Comment 516-3

The location of a pit mine in close proximity to the river creates a hazard which can never be mitigated if the river flow is diverted in to the mine through accident, levee failure, or flooding, all of which are nearly inevitable. The entire river bottom area was flooded as recently as 1997. The inclusion of dust, contaminants, and silt with the river itself would be an ecological tragedy, killing and wreaking havoc on fish and amphibians. The only benefit

to placement in this location would be to CEMEX, allowing them to further and maximize income and profits.

Response 516-3

See Collective Response #17 regarding riverbank stability and the potential for breach and flooding.

Comment 516-4

Impacts on the Public and Recreation:

In this modern age of increasing population and dense habitation, which will only increase in the future, people need and seek peace and quiet, a refuge, just as the animals do. We need to reestablish our relationship with Nature from time to time, for our physical, mental, and spiritual health. The Parkway and the Public Lands have been acquired to fill these needs. The noise associated with this proposed use has dramatic impacts far beyond the property lines. The sounds of blasting, machinery, industrial vehicles, will impose and impinge on the needs of the many to benefit the few. Even today, under current use, the peace and quiet which should be experienced canoeing down the river is destroyed by the noise created by CEMEX activities. I don't see these issues addressed anywhere in the EIR.

Response 516-4

See Collective Response #18 regarding the project's consistency with the San Joaquin River Conservation Master Plan. The issue of noise is addressed in Draft EIR Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #27 regarding the project's operational effects, including blasting, on users of nearby parks and trails. The commenter describes existing conditions pertaining to noise, which constitute baseline conditions that are not evaluated in the EIR.

Comment 516-5

Finally, there are so many aspects I would like to consider further, and respond to, but I simply haven't had the time yet to do so. Please consider extending the period for public comment to be submitted. CEMEX has had four years to prepare this, I feel the public is at a considerable disadvantage in this regard.

Response 516-5

See Collective Response #1 regarding extension of the public review period. The comment is noted for the decision-makers.

Letter #517 March 10, 2025, Paul Lerro

Comment 517-1

Since the CEMEX Rockfield Expansion Project (CEMEX Expansion) was acknowledged, I have considered my own and my neighbors' circumstances and Fresno County's future.

Focusing first on Fresno County's future, if the CEMEX Expansion is approved, it will markedly affect the county's long term economic, cultural and societal future. Approval will terminate all but marginal increases in the county's residential and commercial development on the San Joaquin River going northeastward and likely negatively impact existing developments in the surrounding area to the CEMEX Expansion.

To grasp the San Joaquin River's importance in Fresno County's future development, a review of Bexar County TX's experience can provide an historical prospective. After almost forty years of < 2% annual population growth of San Antinio, from the early 1960s to almost 2000, Bexar County focused on planning related to the San Antonio River in the late 1990s and early 2000s. Over the following two decades, 20002-2020, San Antonio's population surged by almost 3%/year (See: (Ref: San Antonio Metro Area Population 1950-2025 | MacroTrends).

Weighing the potential financial gains and costs from the CEMEX Expansion against risks to the existing regional agricultural economy, impacts on future residential/commercial economies, and maintenance of Fresno County's cultural and societal values, County leaders will have the information needed to make sound decisions. Further, identifying existing and future San Joaquin River uses and their inherent risks and likelihood of success, provides additional information to calibrate river-related economic activity.

Although agricultural production/development currently drives Fresno County's economy, future San Joaquin River real estate and commercial development could become a principal regional economic growth factor stimulating area-wide development, especially given the very different real estate valuations in (nearby) major California population centers. Expanded County river use planning (including financial planning) would signal to potential homeowners and investors that growth is a principal County objective. Alternatively, expanding the County's industrial footprint signals a different direction with quantifiable risks to the large agricultural economy.

The San Joaquin River can become an at-risk waterway adjacent to industrial activity or an engine for future county population growth.

Response 517-1

The comment pertains to economic issues that are outside the scope of this EIR. The comment is noted for the decision-makers. See also Collective Response #7 regarding economic impacts.

Comment 517-2

Fresno County's decision to allow a100 year industrial development adjacent to the San Joaquin River or to seek other potential county growth opportunities follows on the facts that the San Joaquin River currently irrigates over a million acres of farmland and helps feed the largest North American estuary.

Response 517-2

The issue of water supply is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 517-3

Regarding the CEMEX Expansion I request that the Fresno County Board of Supervisors seek to limit the potential harm to current area air and water pollution levels, current traffic, and future real estate and commercial development along the San Joaquin River. Additionally,

Response 517-3

The issues of air and water pollution are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality") and Section 4.10, respectively. The issue of traffic is evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. Potential impacts to economic development are outside the scope of this EIR; however, the comment is noted for the decision-makers.

Comment 517-4

Additionally, Fresno County Supervisors should be prepared to develop, negotiate and manage alternatives to the CEMEX Expansion.

Response 517-4

Chapter 6, "Alternatives," of the Draft EIR, provides an evaluation of a reasonable range of alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter. The comment is noted for the decision-makers.

Letter #518 March 10, 2025, Ellen Lipp

Comment 518-1

My husband and I own a home in the Woodward Lake Development, which is very close to Friant Road and not far from Cemex operations. Please seriously consider my concerns about the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. I do not support the proposed Expansion Project at the location near Friant Road.

Response 518-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 518-2

I am particularly concerned about the air quality, dust emissions, and noise due to mining and large trucks driving to and from Cemex. As we all know, the air quality in Fresno County is very poor in the summer months in particular. In recent years, the air has gotten worse year-round partly because of all of the new residents moving into new developments in Madera.

The new residents drive their gas-powered cars and trucks on Friant as they go to and from work and shopping.

Response 518-2

The issue of air quality and dust emissions is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). Noise impacts are addressed in Draft EIR Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #9 regarding the project's potential impacts on existing air quality conditions.

Comment 518-3

When we moved to our current home, I could not hear traffic noise from my home. Now I constantly hear this type of noise; it increases my stress level. We used to live in Clovis. We moved to our current home because the traffic fumes and noise from Willow Ave., which was near our backyard, made our backyard unusable. If

we had stayed, the air pollution over time could have resulted in cardiovascular disease, respiratory disease, cancer, and more. If this Cemex proposal passes, I fear that I will need to move again to save my health.

Response 518-3

The issue of traffic noise is addressed in Draft EIR Section 4.13. See Impact 4.13-1 regarding traffic noise. The public health effects of air emissions are discussed in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #9 regarding the project's potential impacts on existing air quality conditions.

Comment 518-4

I am very disturbed to learn of plans to increase the depth of the mine to 600 feet below the earth's surface. This mining will involve blasting hard rock and then crushing it to make gravel. This type of operation near a city is completely unacceptable. Besides the air pollution and noise, will there be other environmental consequences of blasting hard rock and crushing it? There will be ground vibrations that will affect the quality of life of nearby residents. There may be structural damage. Hence, mining to 600 feet below the surface and blasting hard rock is unacceptable.

Response 518-4

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13. The Draft EIR further evaluates potential impacts related to the use of blasting materials on the Quarry Site in Draft EIR Section 4.9, "Hazards and Hazardous Materials." See also discussion of Impact 4.13-6, which provides that the project would be required to maintain certain "Blasting Significance Thresholds," to ensure that blasting activities would not result in structural damage (Draft EIR pages 4.13-65 through 4.13-67). See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 518-5

I suggest that CEMEX find a location very far from an urban area.

Response 518-5

Draft EIR Chapter 6, "Alternatives," provides an evaluation of a reasonable range of alternatives to the proposed project. The Draft EIR discusses alternative site locations in Section 6.4.2.1, "Alternative Site Locations," on pages 6-5 through 6-7. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter.

Comment 518-6

I am disturbed that the proposed CEMEX Expansion Project extends mining at the site for 100 years. It is unfair to ruin the air and other aspects of the environment for current residents for a few years. Ruining it for 100 years is very poor planning. In 100 years, CEMEX is likely to be in the middle of a busy metropolitan area. It does not belong there.

Please do not support the CEMEX Expansion Project.

Response 518-6

See Collective Response #5 regarding the duration of the proposed use permit. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #519 March 10, 2025, Aaron Lowe

Comment 519-1

I am a longtime resident of Fresno, living in close proximity to Cemex Rockfield's mining operation. Given my deep connection to this community, I am greatly concerned about the potential impacts of their expansion on our neighborhood.

Please find attached a letter detailing my concerns. I urge you to review the points I have outlined and consider the implications this expansion may have on our environment, health, and overall quality of life.

I appreciate your time and attention to this matter and look forward to your response.

In the following letter, I will review some of my main concerns regarding Cemex's proposed expansion of its mining operations near the San Joaquin River, which presents a critical threat to the region's environmental stability, legal integrity, and economic well-being.

Response 519-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 519-2

Given the company's extensive history of regulatory violations, increased extraction activities will only exacerbate the already significant risks posed by industrial mining. The repercussions of this expansion extend well beyond Fresno County, jeopardizing vital surface and groundwater resources, placing additional strain on aging transportation infrastructure, and destabilizing local economies that rely on sustainable land use.

Response 519-2

See Collective Response #4a regarding CEMEX's regulatory history. The Draft EIR analyzes the project's impacts on a local, regional, statewide, or global scale depending on the issue area being discussed. For instance, aesthetic impacts are analyzed locally based on visibility of the sites from surrounding areas; whereas greenhouse gas emissions impacts are analyzed on a global scale. The project's potential impacts related to surface and groundwater are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," while potential impacts to transportation infrastructure are addressed in Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #7 regarding the project's potential economic effects.

Comment 519-3

Moreover, the expansion is not only harmful but also unnecessary. There is already a surplus of gravel available in the region, making this project an unwarranted burden rather than a necessity.

Response 519-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 519-4

Approving Cemex's proposal would represent a short-sighted decision with long-term consequences, saddling communities with environmental degradation and financial liabilities for years to come. This document provides a detailed analysis of the primary risks associated with Cemex's expansion and underscores why

permitting this project would be a costly and irreversible mistake for both the public and the environment.

Response 519-4

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 519-5

Surface Water Contamination

Cemex's industrial activities will inevitably introduce pollutants into the San Joaquin River, a vital natural resource that traverses multiple counties before merging into the Sacramento-San Joaquin Delta and ultimately reaching the San Francisco Bay. Originating in the Sierra Nevada, the river feeds into Millerton Lake before continuing its journey through Fresno, Madera, Merced, Stanislaus, and San Joaquin Counties. As a result, any contamination from Cemex's Fresno County site will not remain confined to the immediate area but will instead be carried downstream, impacting water quality, ecosystems, and public health across a wide geographical region.

The industrial mining operations conducted by Cemex contribute to water pollution through various means. Sediment runoff from excavation and blasting can cloud the water, obstruct sunlight, and disrupt aquatic ecosystems. Heavy metals and chemicals released from industrial machinery pose a risk of seeping into both groundwater and surface water supplies. Additionally, fuel, oil, and other industrial byproducts are prone to entering the river through surface runoff, particularly during storms or in the event of equipment malfunctions.

Given that the San Joaquin River is a crucial water source supporting agriculture, drinking water supplies, and wildlife habitats, the presence of these pollutants poses a significant threat not only to Fresno and Madera Counties but also to every community downstream. Farmers in Merced, Stanislaus, and San Joaquin Counties depend on the river for irrigation, and contamination could lead to crop damage, soil degradation, and financial losses. Moreover, the Sacramento-San Joaquin Delta, which supplies drinking water to millions of Californians, would face direct consequences from upstream pollution, further amplifying the environmental and public health risks associated with Cemex's operations.

Response 519-5

The comment describes numerous potential impacts related to water quality. These impacts are addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," and Section 4.10. See Draft EIR Section 4.10.4, "Project Impacts and Mitigation Measures," Impacts 4.10-1 through 4.10-3 for discussion of the project's potential to degrade surface water quality. See also Draft EIR Section 4.10.1.3, "Surface Water Drainage," for a discussion of Surface Water Drainage and runoff from the project. See also Impact 4.10-14 for discussion of the project's potential to result in erosion and siltation of surface drainages on or offsite. See Draft EIR Section 4.9.4, "Project Impacts and Mitigation Measures," Impacts 4.9-1 through 4.9-3 for discussion of the potential for hazardous substances, such as blasting materials, oils, fuels, lubricants, solvents, and adhesives to be accidentally released to the environment. Each of these impacts was determined to be less than significant with implementation of the mitigation measures required in this EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The comment is noted for the decision-makers.

Comment 519-6

Concerns About Liability for Fresno

Beyond the ethical implications of polluting neighboring counties, Cemex also exposes itself to considerable legal liability. There is well-established legal precedent for intrastate lawsuits concerning water pollution and usage, where counties, municipalities, or state agencies have sued upstream polluters to recover damages.

Several significant cases illustrate this legal risk. In *Missouri v. Illinois* (1906), Missouri sued Illinois over sewage pollution contaminating the Mississippi River, setting an early example of downstream entities taking legal action against polluters. Similarly, in *City of Chicago v. City of Milwaukee* (1972), Chicago brought a lawsuit against Milwaukee for discharging pollutants into Lake Michigan, underscoring the legal consequences of upstream pollution affecting downstream communities. More recently, in *Los Angeles County Flood Control District v.Natural Resources Defense Council* (2013), environmental groups successfully sued L.A. County over stormwater pollution, reinforcing the principle that both local governments and industries bear legal responsibility for water contamination.

Even if such lawsuits do not result in a direct ruling against Cemex, they can drag on for years, accumulating excessive legal costs, attracting regulatory scrutiny, and inflicting lasting

reputational damage. In many cases, companies facing similar litigation opt to settle out of court, often at great expense, paying millions in environmental mitigation measures, cleanup efforts, and penalties.

This legal exposure is entirely avoidable. Cemex's decision to expand mining operations near the San Joaquin River is not merely an environmental concern but a financial and legal risk that extends well beyond Fresno and Madera Counties. By contaminating a critical, shared waterway, the company could become the target of lawsuits from downstream counties, environmental organizations, and even the State of California.

Rather than inviting costly litigation and shifting the burden of industrial pollution onto taxpayers, Cemex should be required to implement rigorous pollution controls, invest in sustainable water management practices, and assume financial responsibility for any potential environmental damage. Failure to take these precautions could result in prolonged legal battles, significant economic losses, and irreversible harm to one of California's most essential waterways.

Response 519-6

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. The project would be required to implement multiple mitigation measures to avoid or minimize potential impacts to water resources. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also Collective Response #4b regarding liability and funding of unforeseeable environmental damage. CEMEX would be responsible for funding certain mitigation measures related to environmental impacts from the project (see e.g., Draft EIR page 4.10-10b).

Comment 519-7

Ground Water and Subduction

If Cemex is permitted to proceed with its expansion plans, the company's increased reliance on groundwater and the resulting strain on local infrastructure have raised serious concerns. Research published in *Stanford Report* by Stanford University highlights that the San Joaquin Valley has been sinking at an average rate of nearly an inch per year from 2006 to 2022. This phenomenon, known as land subsidence, is primarily caused by excessive groundwater extraction, particularly for industrial and agricultural purposes. In light of this, Cemex's proposal to rely more heavily on groundwater instead of surface water from the San

Joaquin River during its expansion presents significant environmental and economic risks.

One of the most alarming aspects of groundwater depletion is that once land subsides due to over-extraction, underground aquifers permanently lose their ability to store water efficiently. Unlike surface water, which can be replenished through seasonal rainfall or managed reservoirs, groundwater recharge is an extremely slow process, often taking decades or even centuries to restore depleted aquifers. When excessive pumping compacts underground structures, the aquifers' capacity to retain water diminishes irreversibly, meaning that even if groundwater extraction were later reduced, the damage would already be done. This leads to long-term water shortages, further straining the region's already fragile water supply.

Additionally, the uneven rate of land subsidence creates differential settlement, where certain areas sink faster than others, placing tremendous stress on infrastructure. Roads, bridges, pipelines, and buildings suffer costly damages as the land beneath them shifts unpredictably. The *Stanford Report* notes that millions of dollars have already been spent repairing infrastructure damaged by subsidence, and continued over-extraction of groundwater will only intensify the problem. Cracked highways, misaligned bridges, and damaged water conveyance systems not only pose safety hazards but also disrupt critical services, affecting both urban and rural communities.

Given these consequences, Cemex's decision to increase its reliance on groundwater is highly problematic. Beyond accelerating subsidence, this approach imposes an additional financial burden on local governments, businesses, and residents who must bear the cost of repairing damaged infrastructure.

Response 519-7

The project's potential impacts to groundwater supplies are evaluated in Draft EIR Section 4.10. See Impact 4.10-10 for discussion of the project's potential effect on groundwater levels resulting from operations at the Quarry Site. Mitigation Measure 4.10-10a requires the Operator to implement an adaptive management program involving continuous monitoring and periodic reporting of groundwater levels and implementation of corrective measures if a significant impact occurs and is attributable to the project. Implementation of this measure and Mitigation Measure 4.10-10b which provides a funding mechanism for the adaptive management program would reduce this impact to a less than significant level. See Chapter 3, "Draft EIR Errata," for proposed

revisions to Draft EIR Section 4.10. See also Collective Response #28 regarding groundwater use and land subsidence.

Comment 519-8

Furthermore, as groundwater reserves become increasingly difficult to access, the cost of water is expected to rise, placing further economic strain on industries and agricultural operations that depend on it.

The depletion of groundwater in Fresno County also has severe implications for local residents who rely on wells for their water supply. As aquifers shrink, water tables drop, forcing homeowners, farmers, and businesses to drill deeper wells to access water. This process is not only expensive but also unsustainable. The cost of drilling a deeper well can range from tens to hundreds of thousands of dollars, an expense that many rural residents, particularly those who depend on private wells, may struggle to afford. Water insecurity and financial hardship will become more widespread as deeper wells become a necessity rather than an option.

Additionally, deeper wells require more powerful pumps to extract water, increasing electricity costs for well owners. The deeper the well, the more energy is needed to lift water to the surface, further burdening households and agricultural operations with rising expenses. Small-scale farmers who depend on groundwater for irrigation will be especially vulnerable, as they must either invest in costly infrastructure upgrades or face reduced crop yields due to water shortages. These financial pressures could ultimately affect local food production and pricing, creating ripple effects throughout the economy. Another risk of deeper groundwater extraction is the potential exposure to lower-quality water. Deeper aquifers often contain higher concentrations of naturally occurring contaminants such as arsenic, nitrates, and heavy metals, which pose significant health risks if not properly treated. Effective water treatment systems to remove these contaminants can be prohibitively expensive, making them inaccessible to many residents. Those who cannot afford such systems may be left with unsafe drinking water, worsening public health concerns in Fresno County.

As groundwater levels continue to decline, well failures will become more common, leaving some residents without immediate access to water. During past droughts, numerous homeowners and farmers in the Central Valley reported dry wells, forcing them to rely on costly emergency water deliveries or relocate to areas

with more stable water supplies. If Cemex and other industries increase their dependence on groundwater, this crisis will only deepen, making it even more difficult for residents to secure affordable and clean water.

Considering these challenges, local and state authorities must take decisive action to regulate groundwater usage more effectively and promote sustainable water management practices. Without intervention, Fresno County will face worsening financial, environmental, and public health crises in the coming years.

Cemex's plan to intensify its groundwater reliance poses a serious threat to both the region's environment and economy. Given the irreversible damage caused by land subsidence and the immense costs associated with groundwater depletion, adopting a more sustainable water management approach is imperative. Instead of accelerating depletion, Cemex should be required to implement robust water conservation strategies, explore alternative sources, and invest in infrastructure that mitigates its impact on subsidence. Failing to do so will only deepen the ongoing crisis, making long-term recovery increasingly challenging and costly.

Response 519-8

The comment describes numerous potential indirect economic effects of increased groundwater usage at the project sites. See Collective Response #7 regarding the project's potential economic effects.

Comment 519-9

Transportation Infrastructure.

Cemex's proposed expansion also places a significant burden on the region's already strained transportation infrastructure. The company has explicitly acknowledged in its Draft Environmental Impact Report (DEIR) that the planned increase in mining activity will lead to a substantial rise in traffic congestion in the vicinity of the quarry. Furthermore, Cemex has conceded that it has no plans to mitigate the effects of its transportation fleet on local roads. This stance is both irresponsible and unacceptable, as it disregards the very real consequences that intensified industrial traffic will have on public infrastructure, road safety, and the surrounding community.

Heavy commercial vehicles, particularly the massive trucks used to transport mined materials, impose a disproportionately high burden on public roadways compared to personal vehicles. These trucks exert immense stress on pavement, causing accelerated wear and

tear, more frequent maintenance requirements, and a drastically reduced lifespan for existing transportation infrastructure. Road surfaces that are not designed to withstand continuous heavy truck traffic deteriorate quickly, leading to potholes, cracks, and structural failures that compromise both safety and drivability. Despite being the primary source of this damage, Cemex has shown no willingness to take financial or logistical responsibility for the inevitable deterioration their fleet will cause. Instead, taxpayers and local government budgets will be left to absorb the costs of road repairs and infrastructure reinforcement, an unfair and avoidable financial burden that should rightfully fall on Cemex.

Response 519-9

The project's potential impacts related to traffic and the region's transportation infrastructure are evaluated in Draft EIR Section 4.17. The comment incorrectly asserts that the Operator would not mitigate the project's transportation-related impacts. Mitigation Measures 4.17-1a through 4.17-1r presented in the Draft EIR each identify needed roadway or intersection improvements to address level of service deficiencies that would occur as a result of cumulative, regional growth. The mitigation measures require the Operator to pay the project's fair share of the overall cost of the improvements. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #29 regarding the project's truck trips and funding of needed improvements as well as ongoing maintenance.

Comment 519-10

Beyond the degradation of infrastructure, Cemex's increased trucking operations introduce considerable safety risks to local communities. The significant rise in truck traffic—especially from heavily loaded semi-trailers—will create hazardous driving conditions on roads already congested with daily commuters, school buses, local business traffic, and pedestrian activity. Large commercial trucks require much longer stopping distances than standard vehicles, making them particularly dangerous in sudden traffic slowdowns, emergency situations, or when navigating intersections where smaller cars and pedestrians may be present. These risks are further amplified by the fact that the proposed expansion is adjacent to Fresno's largest public park, an area frequently visited by families, cyclists, and joggers. Introducing high volumes of heavy gravel-hauling trucks into a corridor where recreational activities take place is not only reckless but poses a direct threat to public safety—one that Cemex has failed to adequately address in its expansion proposal.

Response 519-10

See Collective Response #30 regarding traffic, pedestrian, and bicycle safety.

Comment 519-11

Another critical concern is the potential for increased noise pollution, air pollution, and vibrations caused by the continuous operation of Cemex's trucking fleet. The constant movement of large industrial vehicles will contribute to excessive diesel emissions, worsening air quality in a region that already struggles with pollution-related health issues such as asthma and respiratory conditions. Additionally, the vibrations caused by heavy trucks traveling over local roads may weaken nearby structures, causing property damage over time—yet another cost that Cemex refuses to acknowledge or take responsibility for.

Response 519-11

The issues of traffic noise, vibration, and air emissions are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. See Impact 4.13-1 beginning on page 4.13-49 for discussion of the project's potential to increase noise levels as a result of truck trips traveling to and from the project sites. See Draft EIR page 4.13-64 for discussion of heavy truck off-site vibration. See also Collective Response #9 regarding the project's potential to worsen the region's existing poor air quality.

According to the Caltrans Transportation and Vibration Guidance Manual (April 2020 Update, page 37), human response to continuous vibration from traffic is considered "annoying" when it reaches a peak particle velocity (ppv) of 0.2 inches per second (ips). For roadway vibration to result in the onset of risk of damage to structures, the thresholds are higher. According to Table 18 of the Caltrans Manual, loaded heavy trucks generate vibration levels of approximately 0.076 ips at a distance of 25 feet, which attenuates to approximately 0.035 ips at 50 feet. Because there are no structures located closer than 50 feet from the major haul routes proposed for the project, 0.035 ips represents a conservative estimate of vibration at the nearest structures. This level is well below thresholds for both human annoyance and structural damage; therefore, no vibration impacts are identified for heavy truck traffic on the local roadway network. Moreover, heavy trucks have been utilizing the local roadway network for many years; thus, the project would not introduce a new source of vibration in the area.

See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced above.

Comment 519-12

The failure to mitigate these impacts is not just an oversight but an act of negligence. It would be both irresponsible and unjust for Fresno County to allow this project to proceed without enforcing strict conditions that hold Cemex accountable for its contribution to infrastructure degradation and public safety risks. At a bare minimum, Cemex should be required to contribute to local road maintenance funds, implement traffic management solutions such as designated truck routes and off-peak hauling schedules, and incorporate safety measures to protect pedestrians and commuters from increased accident risks. These requirements are not excessive; they are necessary to ensure that the local community does not suffer from the consequences of a private company's industrial expansion.

Response 519-12

The project's potential impacts related to traffic and the region's transportation infrastructure are evaluated in Draft EIR Section 4.17. See also Mitigation Measures 4.17-1a through 4.17-1r, which require the Operator to provide equitable contributions for various road improvements. See Collective Response #30 regarding traffic, pedestrian, and bicycle safety, and Collective Response #9 regarding the project's potential impact on the region's air quality.

Off-peak hauling schedules would not be feasible because the Operator must service customers based on project-specific demands. Certain construction activities require material delivery during peak hours, and some operations—such as ready-mix concrete plants and on-site portable concrete plants—require a continuous and steady supply of material to function properly.

See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17.

Comment 519-13

Ignoring these impacts in favor of corporate convenience sets a dangerous precedent—one that prioritizes private profit over public well-being. If Cemex is allowed to operate without accountability, it will signal to other industries that they, too, can exploit public infrastructure without consequence. To prevent this, Fresno County must take decisive action to protect its roads, its residents, and its long-term economic stability by requiring Cemex to implement meaningful solutions that mitigate harm to transportation infrastructure, traffic flow, and public safety. Anything less would be an abdication of responsibility, leaving the community to bear the costs of a problem they did not create.

Response 519-13

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 519-14

Fresno Has Enough Gravel

Cemex's request for an extensive new mining expansion along the San Joaquin River is entirely unnecessary, particularly given the overwhelming surplus of gravel already available in Fresno County. While the company argues that additional mining is essential to sustain the region's construction industry, state geological data and independent reports tell a very different story.

According to an article by Gregory Weaver in *Fresnoland*, Fresno County currently possesses nearly 200% more gravel than it needs for the next 50 years. Furthermore, the Kings River alone contains an estimated 2 billion tons of surface gravel—an astonishing volume that could supply regional demand for the next 500 years without requiring any further mining expansions. These figures make one fact undeniably clear: the demand for gravel has already been met many times over. There is no genuine economic or infrastructural necessity for additional gravel extraction along the San Joaquin River.

If local demand is already secured for centuries to come, what then is the true purpose of Cemex's expansion? The answer is simple—profit. Unlike projects that serve a legitimate public need, such as infrastructure development, job creation, or economic stimulus, this expansion offers no tangible benefit to Fresno County's construction industry, housing market, or workforce. Gravel supply is not a limiting factor for development in the region, making Cemex's proposed expansion not only redundant but also entirely self-serving.

Rather than contributing to the public good, Cemex's mining project would only serve to oversaturate the market with unnecessary gravel, prolonging mining operations without any practical justification. If this project moves forward, it will not make construction materials more affordable, nor will it enhance local infrastructure. Instead, it will allow Cemex to strengthen its corporate hold over an already overstocked resource, ensuring that its operations—and its profits—continue at the expense of the community.

If Fresno were experiencing a genuine gravel shortage, this project might at least warrant some debate. However, given the documented surplus, approving this expansion would amount to little more than reckless environmental destruction. Expanding mining operations near Lost Lake Park would permanently scar a delicate and irreplaceable ecosystem, degrading air and water quality while further polluting one of the most environmentally vulnerable rivers in the country.

The San Joaquin River has already suffered decades of environmental degradation from mining, agriculture, and industrial pollution. In a time when conservation efforts should be prioritized, it is both irrational and irresponsible to continue sacrificing the health of this vital waterway for Cemex's corporate gain. With Fresno's construction industry having no urgent need for additional gravel, there is simply no justification for further exploiting this already stressed natural resource. The region should not be forced to bear the environmental costs of an expansion that serves no greater good beyond the financial interests of a multinational corporation.

Response 519-14

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. See also Collective Response #7 regarding evaluation of economic effects under CEQA. The project's potential effects on the water quality and water resources, including the San Joaquin River, are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The comment is noted for the consideration of the decision-makers.

Comment 519-15

Cemex is Untrustworthy

Cemex has an extensive and well-documented history of regulatory violations, demonstrating a persistent pattern of noncompliance that raises serious concerns about the company's ability—or willingness—to adhere to future regulatory agreements. According to data from *Violation Tracker* by Good Jobs First, Cemex has committed 667 violations, resulting in a staggering $52,384,115 in penalties. These infractions span critical areas such as environmental regulations, workplace safety, and employment practices, painting a troubling picture of a corporation that repeatedly disregards legal and ethical standards in favor of its business interests.

A deeper analysis of these violations reveals the extent and severity of Cemex's noncompliance. Environmental violations account for a significant portion of the company's infractions, with 81 recorded offenses totaling $43,564,276 in fines. These violations likely include breaches of air and water quality regulations, failures in hazardous waste management, and other environmentally destructive practices. The sheer magnitude of these penalties suggests that environmental harm is not an occasional oversight but a systemic and recurring consequence of Cemex's operations. Rather than implementing long-term corrective measures, the company appears to accept environmental fines as a cost of doing business.

Equally concerning is Cemex's track record of workplace safety violations. With 577 citations amounting to $6,356,849 in fines, the company has demonstrated a repeated failure to uphold even the most basic safety standards, putting its employees at serious risk. The high frequency of these violations indicates a failure to prioritize worker protection despite multiple penalties. If Cemex consistently neglects employee safety, it is reasonable to question its commitment to upholding environmental regulations or fulfilling mitigation promises associated with its mining expansion.

Beyond safety and environmental infractions, Cemex has also been penalized for employment-related violations, facing nine penalties totaling $2,462,990. These infractions likely involve labor law breaches such as wage theft, discrimination, or failure to comply with fair labor standards. While this category has fewer recorded offenses, it adds another layer to the company's troubling history of noncompliance. The recurrence of legal issues across multiple regulatory domains suggests that Cemex does not merely make occasional mistakes but rather operates within a corporate framework that prioritizes profitability over regulatory adherence.

This history should not be dismissed as a collection of isolated incidents. Instead, it should be understood as part of a broader, systemic issue within Cemex's corporate culture—one in which legal violations and financial penalties are seen as minor obstacles rather than serious obligations requiring corrective action. A company with such an extensive record of noncompliance has demonstrated time and again that it prefers to pay fines rather than invest in meaningful reforms. This raises a crucial question: if Cemex has continuously ignored regulatory requirements despite facing significant financial penalties, what assurance does the

public have that it will behave differently when expanding its Rockfield quarry?

Regulatory agreements are built on the foundation of trust—trust that a company will adhere to mitigation requirements, abide by environmental laws, and operate responsibly. However, Cemex's history suggests that even when faced with consequences, it prioritizes corporate interests over compliance. If the company is granted permission to expand its mining operations, there is little reason to believe it will uphold its environmental obligations or implement the necessary safeguards to prevent harm.

Past behavior is often the best predictor of future actions, and Cemex's track record strongly indicates that it may either fail to follow mitigation requirements or cut corners to maximize profits. The risk of environmental degradation, increased pollution, and safety hazards is simply too great to ignore. Given Cemex's well-documented history of regulatory violations, it is neither reasonable nor responsible to grant the company an expansion without demanding substantial, enforceable commitments to transparency, accountability, and environmental stewardship. Anything less would be a gamble with the well-being of the community, the workforce, and the fragile ecosystem of the San Joaquin River.

Response 519-15

See Collective Response #4b regarding CEMEX's regulatory history. The comment is noted for the consideration of the decision-makers.

Comment 519-16

Conclusion

Cemex's proposed expansion offers no legitimate public benefit, provides no meaningful economic advantage to Fresno's residents, and directly contradicts well-documented geological data that confirms an abundant gravel supply for centuries. The only entity that stands to gain from this project is Cemex itself—at the cost of environmental degradation, infrastructure damage, public health risks, and the financial burden placed on local communities. This expansion is not about meeting a genuine demand for construction materials; it is about maximizing corporate profits while offloading the consequences onto taxpayers, residents, and the environment.

If this project is approved, it will not be because Fresno County lacks gravel or requires new mining operations to sustain its

development. It will be because corporate influence has been allowed to override the public interest, enabling Cemex to exploit the region's resources while shifting the long-term costs onto the community. Furthermore, Cemex's history of noncompliance and regulatory violations should serve as a major red flag. Past behavior is a strong predictor of future actions, and Cemex has shown that it is more inclined to pay fines than implement meaningful reforms. Granting a company with this kind of record expanded mining rights near one of California's most fragile waterways is not just irresponsible—it is a direct invitation for further environmental harm and regulatory neglect.

The environmental consequences of this expansion would be severe and irreversible. Cemex's increased reliance on groundwater would accelerate land subsidence, a problem that has already caused significant infrastructure damage across the San Joaquin Valley. Sinking land not only threatens roads, bridges, and pipelines but also permanently reduces the capacity of underground aquifers, exacerbating long-term water scarcity. At a time when sustainable water management is more critical than ever, allowing an industrial operation to deplete groundwater supplies for an unnecessary mining project is reckless and short-sighted.

Additionally, the expansion would introduce heightened safety risks and financial burdens for the community. These vehicles will place enormous strain on local roads, accelerating deterioration and leading to costly repairs—expenses that Cemex has openly stated it does not intend to mitigate. The presence of more gravel-hauling trucks in an area adjacent to Fresno's largest public park also raises significant public safety concerns, particularly for pedestrians, cyclists, and families who frequent the area.

If Fresno County approves this expansion, it will be setting a dangerous precedent that prioritizes corporate convenience over environmental responsibility, public safety, and long-term economic stability. The decision to allow this project to proceed would signal that industrial polluters can continue to exploit public resources with little regard for the lasting damage they cause. Rather than allowing a multinational corporation to dictate land use policy, local authorities must stand firm in protecting the community's interests, rejecting short-term corporate gains in favor of sustainable environmental stewardship and responsible resource management.

This expansion is unnecessary, destructive, and entirely misaligned with Fresno County's long-term needs. Local decision-makers must reject it outright and instead commit to policies that

prioritize conservation, infrastructure integrity, and public well-being over corporate profit. The San Joaquin River has already suffered decades of environmental abuse—approving another extractive project that will further degrade this critical waterway would be an irreversible mistake. Instead of permitting more industrial destruction, Fresno County should focus on sustainable development strategies that protect natural resources, safeguard public health, and uphold the best interests of future generations.

Response 519-16

This comment is a summary of previous comments. See Response 519-1 through 519-15 above. The comment is noted for the consideration of the decision-makers.

Letter #520 March 10, 2025, Miyoung Lowe

Comment 520-1

Cemex's proposed expansion of its mining operations near the San Joaquin River raises significant concerns about environmental degradation, legal liabilities, and economic burdens on the surrounding communities. As an industrial operation with a well-documented history of regulatory violations, Cemex's intensified mining activities will have far-reaching consequences that extend beyond Fresno County. The expansion poses threats to surface and groundwater resources, transportation infrastructure, and local economies, all while being unnecessary given the existing surplus of gravel in the region. This document examines the key risks associated with Cemex's expansion and why its approval would be a costly mistake for both the environment and the public.

Response 520-1

The commenter's concerns and opinions are noted and will be considered by County decision-makers. Please see Collective Response #4a pertaining to CEMEX regulatory history, and please see Collective Response #3 pertaining to regional aggregate demand and supply. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR and no further response is warranted here. Please see Response 520-2 through 520-10 for further discussion of the commenter's specific concerns.

Comment 520-2

Cemex's operations will inevitably introduce pollutants into the San Joaquin River, a shared natural resource that flows through multiple counties before reaching the Sacramento-San Joaquin Delta and ultimately the San Francisco Bay. Given the river's extensive

reach— beginning in the Sierra Nevada, feeding into Millerton Lake, and then flowing through Fresno, Madera, Merced, Stanislaus, and San Joaquin Counties—any contamination originating from Cemex's site in Fresno County will not remain localized. Instead, pollutants will travel downstream, affecting water quality, ecosystems, and public health across a vast region.

Industrial mining operations like Cemex's generate multiple sources of water pollution, including:

- Sediment runoff from excavation and blasting, which can cloud water, block sunlight, and harm aquatic life.
- Heavy metals and chemicals from industrial machinery, which can seep into groundwater and surface water supplies.
- Fuel, oil, and other industrial byproducts that contaminate the river through surface runoff during storms or equipment failures.

Because the San Joaquin River serves as a critical water source for agriculture, drinking water, and wildlife habitats, these pollutants pose a serious risk not just to Fresno and Madera Counties, but also to every downstream community. Farmers in Merced, Stanislaus, and San Joaquin Counties rely on river water for irrigation, and contamination could lead to crop damage, soil degradation, and financial losses. Additionally, the Sacramento-San Joaquin Delta, which provides drinking water to millions of Californians, would be directly affected by upstream pollution.

Response 520-2

Please see Response 459-2.

Comment 520-3

Beyond the ethical concerns of polluting neighboring counties, Cemex also exposes itself to significant legal liabilities. There is legal precedent for intrastate lawsuits over water pollution and usage, where counties, cities, or state agencies sue upstream polluters for damages. Key cases, such as Missouri v. Illinois (1906) and Los Angeles County Flood Control District v. Natural Resources Defense Council (2013), illustrate the financial and reputational risks Cemex faces should its operations lead to downstream pollution.

Response 520-3

Please see Collective Response #4b pertaining to liability. The comment does not explain how the issues raised relate to the proposed project or Draft EIR.

Comment 520-4

Furthermore, Cemex's expansion plan includes increased reliance on groundwater, exacerbating the already dire issue of land subsidence in the San Joaquin Valley. Studies from Stanford University indicate that the valley has been sinking at nearly an inch per year due to excessive groundwater extraction. Once aquifers lose their capacity to store water efficiently, replenishment becomes nearly impossible, leading to long-term water scarcity and costly infrastructure damage. This not only threatens agricultural sustainability but also burdens local governments with expensive road and bridge repairs due to uneven land sinking.

Response 520-4

See Collective Response #28, Response 65-35 and 459-4. Draft EIR Section 4.7.1.2, "Soils, Geologic, and Seismic Hazards," describes the causes and potential effects of subsidence and concludes that "[b]elow the groundwater level, the subsurface soils at the Plant Site and Quarry Site generally consist of dense to very dense alluvial sands and gravels underlain by sedimentary and/or granitic rock, which have low potential for subsidence" (Draft EIR at page 4.7-11). In addition, Section 3.2.6 of the 2025 Update to the North Kings Groundwater Sustainability Plan states that "the compression of clay as a result of groundwater extraction from confined aquifers is the cause of the vast majority of subsidence documented in the San Joaquin Valley…Most of the permanent subsidence in the San Joaquin Valley has historically been correlated to overdraft in the confined aquifer below the Corcoran Clay."

Dewatering at the Plant Site would be temporary and would occur in an unconfined aquifer zone (Draft EIR at page 4.10-102). Specifically, there are no clay layers that overly the alluvial aggregate deposits to be mined at the Plant Site, such that a confined aquifer is not present within the depths to be dewatered and mined (Draft EIR at pages 4.7-3 to 4.7-4). As noted on page 3-75 of the 2025 Update to the North Kings Groundwater Sustainability Plan, the Corcoran Clay is only present near the western edge of the groundwater subbasin, more than 25 miles from the project area, and there has been only minimal subsidence within the North Kings GSA boundary.

Granitic bedrock formations such as the weathered rock and hard rock at the Quarry Site are not subject to subsidence due to the extraction of groundwater because such

formation do not contain compressible clays and the groundwater occurs within individual fracture zones within the massive rock (Draft EIR at page 4.7-11).

Comment 520-5

Cemex's expansion will also place an immense burden on local transportation infrastructure. In its Draft Environmental Impact Report (DEIR), Cemex acknowledged that the proposed increase in mining operations would significantly heighten traffic congestion in the area. However, the company has made it clear that it does not intend to mitigate the effects of its transportation equipment on local roads.

Response 520-5

Please see Collective Response #29 pertaining to project traffic impacts and mitigation.

Comment 520-6

Heavy commercial vehicles, particularly large trucks used for hauling mined materials, exert extreme stress on roadways, accelerating deterioration and increasing maintenance costs.

Rather than taking financial or logistical responsibility for these damages, Cemex's refusal to contribute to road maintenance shifts the burden onto taxpayers and local governments.

Response 520-6

Please see Collective Response #30 pertaining to roadway safety. See also Collective Response #29 pertaining to project traffic impacts and mitigation.

Comment 520-7

Additionally, the increased truck traffic near Fresno's largest public park introduces heightened safety risks, particularly for pedestrians, cyclists, and families frequenting the area.

Response 520-7

Please see Collective Response #30 pertaining to roadway safety.

Comment 520-8

Cemex's push for a massive new mining expansion along the San Joaquin River is entirely unnecessary given the overwhelming surplus of gravel already available in Fresno County. According to geological surveys, the county has nearly 200% more gravel than it needs for the next 50 years. Additionally, the Kings River alone contains 2 billion tons of surface gravel, a volume sufficient to

meet regional demand for the next 500 years without requiring further mining expansions.

These figures highlight the redundancy of Cemex's proposed expansion. With demand for gravel already secured for centuries, the only entity that stands to benefit from this project is Cemex itself. Unlike projects that fulfill a clear public need—such as infrastructure development or job creation—this expansion serves no meaningful purpose for the community. Instead, it would oversaturate the market with an unnecessary resource while causing permanent environmental damage to an already fragile ecosystem.

Response 520-8

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 520-9

Cemex has a well-documented history of violating regulations, suggesting a persistent pattern of noncompliance. According to data from Violation Tracker, Cemex has committed 667 violations, accumulating over $52 million in penalties. These infractions span multiple areas, including environmental regulations, workplace safety, and employment practices, demonstrating a broad and systemic disregard for legal and ethical standards.

A closer examination of these violations highlights the extent of the issue:

- Environmental Violations: Cemex has been penalized 81 times, paying $43.5 million in fines for environmental infractions, including air and water quality violations.
- Workplace Safety Violations: The company has been cited 577 times, resulting in $6.3 million in fines, indicating a consistent failure to maintain proper workplace conditions.
- Employment-Related Violations: Cemex has faced 9 penalties totaling $2.4 million for labor law infractions such as wage theft and unfair employment practices.

This pattern of repeated violations suggests that Cemex prioritizes business interests over regulatory compliance, often opting to pay fines rather than implementing meaningful reforms. If Cemex is granted permission to expand its Rockfield quarry, there is little reason to believe it will uphold mitigation requirements, given its track record of noncompliance.

Response 520-9

See Collective Response #4a. The purpose of CEQA is to provide substantial evidence supporting findings of the reasonably foreseeable potential environmental impacts of a project. The majority of the comment (i.e., consideration of past violations) is not germane to the Draft EIR, or the analysis or impact determinations found therein. Where **Comment 520-9** does not raise environmental issues, those aspects of the comment does not require a response. (PRC Section 21091(d)(2)(B); Title 14 CCR Sections 15088(c), 15132(d), 15204(a).)

The Draft EIR provides a detailed evaluation of the proposed project's potential environmental impacts, in accordance with CEQA requirements. The decision-makers will consider the commenter's suggestions as part of their deliberations and conditions of approval.

Comment 520-10

Cemex's proposed expansion is fraught with environmental, legal, and economic risks. By intensifying mining operations near the San Joaquin River, the company threatens water quality, accelerates groundwater depletion, burdens local infrastructure, and endangers public safety. Additionally, the expansion is entirely unnecessary given Fresno County's existing surplus of gravel, making the project little more than an exercise in corporate profiteering at the community's expense.

Cemex's extensive history of regulatory violations further calls into question its ability to responsibly manage an expanded mining operation. Given the foreseeable environmental destruction, financial burdens on taxpayers, and legal liabilities, approving this expansion would be an irresponsible decision. Instead, Cemex should be required to implement stringent pollution controls, invest in sustainable water management practices, and take financial responsibility for infrastructure maintenance. Failing to do so will result in long-term damage that far outweighs any potential economic benefits of the project.

Fresno County must prioritize environmental sustainability, public health, and economic fairness over corporate interests. Allowing Cemex's expansion to proceed without accountability would set a dangerous precedent, jeopardizing the future of the region for generations to come.

Response 520-10

The commenter's concerns, opinions, and recommendations are noted and will be considered by County decision-makers. Please see Collective Response #3 pertaining to regional aggregate demand and supply and see Collective Response #4a pertaining to the Applicant's regulatory history. The Draft EIR adequately analyzes the potential environmental impacts of the proposed project, including impacts to surface water and groundwater quality and supply.

Letter #521 March 10, 2025, Kim Lucero

Comment 521-1

As we were driving up to Millerton the other day, we noticed an area along Friant Road and wondered what was going on or what was being built. Was it an extension for Woodward Park or more areas to enjoy nature. We then came across an article regarding the mining, drilling, and blasting along the San Joaquin river. From my understanding the hole is going to be twice as deep as Millerton lake and close proximity to the river bank. This will cause chemical pollution into our environment and water resources, which not only affects our wildlife but our everyday life.

Response 521-1

The proposed project would extend the use permit for the existing Rockfield operation and would not involve development or other disturbances in previously undisturbed areas. The issues of water and soil contamination are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.9, "Hazards and Hazardous Materials," respectively. See also Draft EIR Section 4.4, "Biological Resources," regarding the project's potential impacts on wildlife. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 521-2

I wonder why they want to pursue our San Joaquin river, do we not have enough resource gravel mining available NOW!!!

Response 521-2

See Collective Response #3 regarding aggregate supplies and the need for the proposed project. See also Draft EIR Section 4.10 where the project's potential impacts related to the San Joaquin River are addressed. See also Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 521-3

With the estimated 400K trucks being sent along Friant road annually will further impact our air quality, our current air quality now is one of the worst in California, this will definitely add to it.

Response 521-3

The project's air quality impacts are evaluated in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding the project's potential impact on air quality conditions.

Comment 521-4

We should be adding more biking, hiking, and walking trails for our families to enjoy nature, not a massive hole and pollutants in the air and our water supply. I Live in Clovis and I thought it was "Gateway to the Sierras", not "Gateway to the Polluted Sierras". This project will ruin the environment and our everyday life. I have been working for the Clovis Unified School District for over 15 years and my husband is a retired Fresno Police Officer who served for 25 years, who gave his oath to serve and protect our community and families. Living here for over 30 years and raising a family here, this is just so upsetting that our supervisors are considering this project, There's no need for this project, aren't we here to protect our future for our kids and their kids? Reconsider approving this project!

Response 521-4

See Collective Response #3, regarding aggregate supplies and the need for the proposed project. The comment is noted for the consideration of the decision-makers.

Letter #522 March 10, 2025, Mandy Macias

Comment 522-1

Good afternoon. My comments are of my own opinion and based on what available documentation I could access.

As a member of the greater local tribal community, and specifically an enrolled member of the Dunlap Band of Mono Indians, located in eastern Fresno county, I have concerns for the upcoming renewal. The published documents were too large to access or download for my personal computer. Of what I could review regarding tribal outreach and impacts, it appeared to be lacking. And for an endeavor such as a 100 year extension, I would hope your efforts

were done by someone with expertise of tribal outreach and political experience. While there were public notices I saw no efforts for tribal meetings or forums. With the recognition of tribal sovereignty and knowledge of unique sensitive material, a public forum would not be the anticipated or appropriate venue to discuss tribal concerns. Any data secured prior to 10 years ago is outdated by recent discovery trends, and as constantly evolving governments, the leadership changes with elections and political interests. Your outreach should reflect accurate outreach contacts and should be conducted in good faith, not as an action to be accounted for. I don't recall outreach directly and found out about the proposal through networks.

Response 522-1

The commenter's opinions and recommendations are noted and will be considered by County decision-makers. Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input. Please also note that as advertised in the Notice of Availability for the Draft EIR, the Draft EIR and appendices were made available for viewing in printed hard copy form at the Fresno County Public Works and Planning Department at 2220 Tulare St., Annex Suite B, Fresno, CA 93721.

Draft EIR Impact 4.18-1 on page 4.18-8 under the heading "AB 52 Consultation" discusses the County's outreach to Native American tribal representatives in accordance with PRC 21080.3.1. As discussed there, in 2019 after receiving and deeming complete the application for the proposed project, the Fresno County Planning Department notified by letter the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notification of projects, including the Dumna Wo-Wah Tribal Government, Table Mountain Rancheria, and Picayune Rancheria of the Chukchansi Indians. The notification letters were mailed via certified mail on December 9, 2019 (Draft EIR Appendix J, "AB 52 Tribal Notification Letters"). Dunlap Band of Mono Indians have not requested to be notified for projects within the project area under PRC 21080.3.1. No tribe requested consultation as a result of the tribal notification letters and no responses were received during the project's scoping period. Note that Table Mountain Rancheria representatives subsequently provided comments on the Draft EIR, and those comments and the County's responses are provided at Comment Letters 50 and 52 of Final EIR Chapter 4, "Responses to Comments."

Comment 522-2

An archaeological inventory would not be inclusive of cultural resources such as life way practices, spiritual significances, and genealogical and ancestral knowledge. The San Joaquin River is a

geographical marker, a life sustaining resource, and a place of origin for tribal communities. It is a cultural landscape and habitation place with many tribal resources buried by the ever changing water flow created by the Friant Dam. A pedestrian survey and superficial inventory would not reflect an accurate exam of the landscape.

Response 522-2

See Response 52-2. The County acknowledges the commenter's statements regarding the cultural, spiritual, and historical importance of the project area. These views are noted for consideration by County decision-makers. In addition to the intensive pedestrian surveys conducted on the project sites, a search of the Native American Heritage Commission Sacred Lands File was also conducted to identify sacred sites on the project sites. Furthermore, as described in Response 522-1, the County notified applicable tribes under AB 52 and no response was received. Thus, government-to-government consultation was not initiated, and no Tribal Cultural Resources were identified for purposes of CEQA.

Comment 522-3

If you failed to reach tribal member in your outreach efforts I believe it to be in error. Perhaps your list of contacts is outdated and does not reflect the current administrations, or reflects individuals that are no longer with us. This is a common error and is repeated regularly by agencies and businesses attempting tribal outreach without knowledge of the community. There are several local organizations and agencies with specific expertise that could have assisted, especially since the area of the quarry is along the river, a well known tribal resource, adjacent to recorded resources of local significant, and the trend for tribal interest in quarry projects has been shown to be extensive in the past.

Response 522-3

As described in Response 522-1, the County conducted tribal notification in accordance with PRC Section 21080.3.1 (AB 52). The Dunlap Band of Mono Indians did not request notification for projects within the project area; therefore, a notification was not sent to this Tribe. No requests for formal consultation were received from any notified tribal representatives. The Notice of Preparation (NOP) for the project was also made available to the general public at County offices during the 30-day public scoping period. The commenter does not provide substantial evidence of a deficiency in the County's tribal notification process.

Comment 522-4

Also, to be clear, while the environmental comment period may be coming to a close, the discovery or exposure, as well as consultation with tribes is considered ongoing due to the potential to encounter previously unidentified resources as the project progress. This should be noted in the documents.

Response 522-4

Impact 4.5-2, beginning on Draft EIR page 4.5-30, acknowledges that previously unknown archaeological resources may be present below the surface of the project sites and provides standard discovery mitigation to address this potential (see Mitigation Measure 4.5-2 on Draft EIR page 4.5-31). Mitigation Measure 4.5-2 requires consultation with appropriate Native American representatives in the event that inadvertently discovered cultural resources are prehistoric or Native American in nature.

Comment 522-5

I believe cultural resources or archaeological resources will be encountered and suggested you consider having staff with specific archaeological expertise available to identify such resources from general river rock. I'm also suggesting you consider incorporating local tribal archaeological monitors at the onset of any new excavation.

Response 522-5

The County acknowledges the commenter's concern regarding the potential discovery of cultural or archaeological resources during project implementation. As described in Draft EIR Section 4.5.1, "Environmental Setting," the project sites have been subject to extensive mining and related ground-disturbing activities for more than 100 years and are therefore highly disturbed. As further described in Draft EIR Section 4.5.4, "Project Impacts and Mitigation Measures," the project includes standard inadvertent discovery procedures that require work to cease in the vicinity of any discovered cultural resources and for a qualified archaeologist to evaluate the find and recommend appropriate treatment measures in accordance with CEQA and applicable regulations.

Based on the long history of disturbance at the project sites and the absence of identified eligible resources, the preemptive use of archaeological or tribal monitors is not warranted. The County would ensure that any previously unknown resources encountered during mining or reclamation activities are addressed in accordance with applicable laws and regulations and the mitigation measures provided in the Draft EIR. As discussed in Mitigation Measure 4.5-2 and Response 522-4, prehistoric and historic-era resources encountered during project activities would be evaluated by a qualified

archaeologist, and appropriate Native American consultation would occur where applicable. The commenter's recommendations regarding staff expertise and incorporation of tribal monitors are noted.

Comment 522-6

Regarding the extension of the permit for 100 years, I feel this is too long of a period. This time should be reduced to 25 years at the most.

Response 522-6

Please see Collective Response #5 pertaining to the requested use permit duration. See also Draft EIR Chapter 6, "Alternatives," for description and analysis of a range of alternatives, each of which would have a reduced operational life compared to the proposed project.

Comment 522-7

In summary, your tribal consultation seems lacking, the inventory is not sufficient, the cultural landscape where the project is located is significant, the documents were not accessible, and the permit window is too longs.

Response 522-7

The County acknowledges the commenter's summary of concerns regarding tribal consultation, cultural resource evaluation, document accessibility, and permit duration. As addressed in Response 522-1 through 522-6, the County has complied with applicable CEQA requirements, including tribal notification pursuant to AB 52, evaluation of cultural and archaeological resources, and incorporation of standard inadvertent discovery mitigation measures.

As described in the Draft EIR, the project sites have been extensively disturbed by more than 100 years of mining activity, and no known Tribal Cultural Resources have been identified for purposes of CEQA. The Draft EIR nevertheless provides measures to address the potential discovery of previously unknown resources. The commenter's concerns are noted for consideration by County decision-makers.

Letter #523 March 10, 2025, Florence Maly

Comment 523-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the Cemex Rockfield Expansion Project. I believe there are significant environmental, cultural and community impacts associated with this project. I

urge you to review carefully all impacts and address significant flaws in the DEIR before even considering any approval.

The San Joaquin River is a precious resource that we must honor and revere and begin to correct the damage remaining from past activities, not create more damage and mis-use of this abused river.

Response 523-1

The commenter's concerns are noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR. The project's potential impacts to cultural resources are adequately analyzed in Section 4.5, "Cultural Resources," of the Draft EIR. Please see Response 523-2 through 523-11 below for further discussion of the commenter's specific concerns.

Comment 523-2

Specific concerns I have are as follows:

!. Cumulative Impact Neglect:

The DEIR fails to adequately address the cumulative impacts of the project when combined with other existing and planned projects in the area. While the DEIR should address impacts related to water quality, noise levels, air pollution, and traffic, it does not offer specific data. It should demonstrate specific requirements to avoid or lessen the cumulative problem in relation to air pollution, a cumulative impact by its nature. CEQA Guidelines, Section15130(a) mandates that EIRs discuss cumulative impacts when they are "cumulatively considerable"; failure to adequately assess could be a violation of CEQA.

Response 523-2

Draft EIR Chapter 5, "Cumulative Impacts," provides a comprehensive analysis of the project's incremental effects to be significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects, in accordance with CEQA. The project's cumulative air quality impacts are discussed on pages 5-10 through 5-11 of the Draft EIR. See also Draft EIR discussion of Impact 4.3-2, which concludes that the project's annual emissions would not exceed applicable SJVAPCD significance thresholds, and thus are not cumulatively considerable (Draft EIR page 5-11). The commenter does not explain or provide evidence of any deficiency in the Draft EIR's cumulative impact analysis.

Comment 523-3

2. Impacts on the San Joaquin River Watershed:

Wildlife: the DEIR does not adequately analyze potential impacts of blasting on wildlife. The examples of habituation of wildlife to mining operations are for surface mining, not deep rock proposed here. Furthermore, what impact would there be to aquatic life in the river, especially the Chinook Salmon. The document cites old studies conducted in Alaska that are unlike the San Joaquin River environment.

Response 523-3

For discussion of blasting impacts to wildlife, please refer to Responses 65-8, 65-12, 65-16, and 65-17. For discussion of the usage and sufficiency of the Alaskan Blasting Standards for analyzing impacts to fish in the San Joaquin River, refer to Response 65-13.

Comment 523-4

Critical Habitat: The document has a "Mischaracterization of a regulated habitat. The Waste Wash Conveyance Ditch at the Plant site qualifies as a stream, and diverting or obstructing its natural flow, altering its bed, channel or bank; or depositing any material into this feature would be subject to provisions of California Fish and Wildlife Code Section 1600.

Response 523-4

See Response 58-33 regarding the waste wash conveyance ditch at the Plant Site. The water conveyance ditch was a man made/created feature in the uplands and is not subject to Cal. Fish & Game Code Section 1600 et seq.

Comment 523-5

Surrounding Land Uses: Cemex is currently encroaching on a designated Ecological Reserve, with no apparent measures to halt or mitigate this activity.

Response 523-5

Please see Collective Response #20 pertaining to the relationship between Applicant-owned properties and properties managed by CDFW.

Comment 523-6

Geological Issues: There is limited scope on the stability of the pit wall. The stated mitigation of "monitoring" the wall is completely ridiculous. There are no measures for a Geological

Issues: There is limited scope on the stability of the pit wall. The stated mitigation of "monitoring" the wall is completely ridiculous. There are no measures for a collapse of the wall between the pit and the river, which could have the potential to dump toxic water and even equipment into the river. There is also limited discussion of disturbing the underlying soil/rock stability with blasting; and on the impact of operations on existing groundwater levels and domestic wells.

Response 523-6

Draft EIR Sections 4.7, "Geology and Soils," and 4.10, "Hydrology, Water Quality," and 4.13, "Noise," evaluated the project's potential impacts to water quality, geologic, noise and vibration resources. With the creation of a pit 600 feet below ground surface at the Quarry Site, the potential for slope instability could occur if not developed in accordance with appropriate safety measures. The Geotechnical Memorandum completed a slope stability analysis that determined the potential of the proposed project to result in overall slope instability is low and with Mitigation Measure 4.7-7a, potential risks of slope instability would be reduced to less than significant. Additionally, Mitigation Measures 4.7-7b and 4.7-7c require field observations and surveys mapping kinematic conditions, operational activities, water seepage and groundwater conditions, and failure potential assessments to minimize impacts on slope stability in the project vicinity. In the event any embankment slope failures or pit wall collapses occur, the lead and responsible agencies should be notified and consulted. Adherence to Mitigation Measure 4.10-1 will minimize impacts to less than significant.

Mitigation Measures 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b establish the Plant Site Pond Adaptive Management Program and Quarry Site Groundwater Adaptive Management Program with associated funding mechanisms. These Adaptive Management Programs require continued monitoring, comparison of monitoring results with action levels, and subsequent implementation of mitigation measures if the action levels are exceeded, as discussed in Appendix G-5, "Hydrology and Water Quality Analysis Report," and Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," of the Draft EIR. As stated in the Draft EIR, a "qualified professional shall be responsible for the monitoring and reporting to be conducted" under the Adaptive Management Programs. Monitoring changes, collecting data, and reporting on environmental resources are standard best practices required for projects of this nature and as required by the Lead Agency, Fresno County. Implementation of the adaptive management program will reduce impacts on water quality resources, local domestic wells and the San Joaquin River. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 523-7

3. Tribal Resource and Cultural Resources:

There is a lack of transparency of impacts on Tribal Cultural Resources due to confidentiality concerns.. The DEIR references a Cultural and Paleontology Resource Inventory, but it is not included as an appendix. How do we know that the project has adequately consulted with local tribes and taken appropriate steps to protect culturally significant sites, raising questions of environmental justice and respect for Native Americans, specifically the original inhabitants of the region along the San Joaquin River, the Dumna.

Response 523-7

Draft EIR Impact 4.18-1 on 4.18-8 under the heading "AB 52 Consultation" discusses the County's outreach to Native American tribal representatives in accordance with PRC Section 21080.3.1. As discussed there, in 2019 after receiving and deeming complete the application for the proposed project, the Fresno County Planning Department notified by letter the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notification of projects, including the Dumna Wo-Wah Tribal Government, Table Mountain Rancheria, and Picayune Rancheria of the Chukchansi Indians. The notification letters were mailed via certified mail on December 9, 2019 (Draft EIR Appendix J, "AB 52 Tribal Notification Letters"). No tribe requested consultation as a result of the tribal notification letters and no responses were received during the project's scoping period. However, Table Mountain Rancheria representatives subsequently provided comments on the Draft EIR, and those comments and the County's responses are provided at Comment Letters 50 and 52 of Final EIR Chapter 4, "Responses to Comments."

The Draft EIR properly and clearly explains the results of records searches, physical surveys, and tribal outreach, and uses the information gleaned from these efforts to assess the project's potential to result in adverse effects to cultural resource and tribal cultural resources. Requests for review of confidential documents may be made to the County and the County will determine whether documents will be provided or if redacted versions eliminating confidential information may be produced and made available.

Comment 523-8

4. Cemex Corporation:

Safety record: Their human and environmental safety records are available and they are very poor. There seems to be no Corporate

responsibility for protecting their employees, the environment and their surrounding communities.

Response 523-8

See Collective Response #4a. The purpose of CEQA is to provide substantial evidence supporting findings of the reasonably foreseeable potential environmental impacts of a project. The majority of the comment (i.e., consideration of past violations) is not germane to the Draft EIR, or the analysis or impact determinations found therein. Where the comment does not raise environmental issues, those aspects of the comment do not require a response. (PRC Section 21091(d)(2)(B); Title 14 CCR Sections 15088(c), 15132(d), 15204(a).)

The Draft EIR provides a detailed evaluation of potential project impacts associated with the required CEQA environmental issues, and proposed the implementation of mitigation measures to reduce potential environmental impacts to less than significant levels, or to the extent feasible.

Comment 523-9

Restoration: What assurance do we have that restoration work will ever be done? There is mention that the site will look better at the end of the 100 year project with the planting of some trees. This is ludicrous. Restoration starts before the project starts, and continues throughout the life of a project. Cemex seems to be ignoring this.

Response 523-9

The Draft EIR describes and evaluates the project's requested use permits and reclamation plan as proposed by the Applicant. Reclamation of the project sites in accordance with the approved reclamation plan is required and overseen by Fresno County. Draft EIR Section 4.1, "Aesthetics and Visual Resources," evaluates the proposed project's visual impacts and determines that the project will result in significant and unavoidable visual impacts. Mitigation is provided to reduce the severity of the impact but is not considered sufficient to reduce the visual impact to less than significant at two representative viewpoints within the private community of Sumner Hill. Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation. The comment does not provide evidence of a deficiency in the Draft EIR's evaluation of the visual effects and no further response is warranted.

Comment 523-10

Funds: Cemex states they cannot mitigate many of the traffic and roadway issues because they do not have the funds. This is also

ludicrous. Cemex is a multi-international firm worth billions. Vulcan Materials paid for traffic improvements in Madera County as a condition for their Austin Quarry. Hold Cemex to the same standard.

Response 523-10

Please see Collective Response #29 pertaining to project traffic mitigation.

Comment 523-11

Given these concerns, and many more, I urge the agency to require Cemex to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter. It is time to heal our river.

Response 523-11

The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project, in accordance with CEQA. The comment does not provide evidence of a deficiency in the Draft EIR and the comment does not provide or explain enhanced mitigation measures or less harmful alternatives that should be considered. Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input. The commenter's concerns are noted and will be considered by County decision-makers.

Letter #524 March 10, 2025, Mel Mark

Comment 524-1

I appreciate the opportunity to provide comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant environmental and community impacts associated with this project, I have several concerns that must be addressed before any approval moves forward.

1. **Impacts on the San Joaquin River Watershed**

   The expansion site is located within the San Joaquin River floodplain, a critical water source for the region. Increased mining activities could further degrade water quality by introducing sediment, pollutants, and potential contaminants

into the river system. Additionally, changes in groundwater levels could disrupt the hydrology of the area, affecting both wildlife and agricultural water users downstream. The DEIR must provide a more thorough analysis of these risks and include stronger protections to prevent harm to the watershed.

Response 524-1

Please see Collective Response #23 pertaining to groundwater quality. Please see Collective Response #24 pertaining to groundwater monitoring. Please see Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity. Please see Collective Response #26 pertaining to baseline groundwater data.

Comment 524-2

2. Air Quality and Dust Emissions

The project will generate substantial dust and particulate matter, exacerbating air quality issues in an area that already experiences high levels of pollution. This is particularly concerning for vulnerable populations, including children, the elderly, and those with respiratory conditions. The DEIR should require stricter dust control measures, increased air quality monitoring, and a plan to minimize diesel emissions from equipment and transportation.

Response 524-2

The Draft EIR presents health risk in Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as updated in this Final EIR, at locations where applicable guidance requires the maximum risk level to be reported. Chronic cancer and non-cancer risks are reported at structures where an individual or worker could reasonably spend a year or more. See Collective Response #11 regarding cancer burden. Acute risk is reported at the fence line because there is the possibility of public access at that location for period of one-hour. Results for each receptor including those on the fence line are included in Appendix D-3. The commenter claims that additional mitigation measures are needed, however, the mitigation measures proposed already reduce health risks to less than significant levels as shown in Table 4.3-25, as updated in this Final EIR. Thus, additional mitigation is unwarranted. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," including preparation of a Fugitive Dust Control Plan and additional health risk modeling.

Comment 524-3

3. Biological Resource Impacts

The San Joaquin River Parkway provides critical habitat for a wide range of species, including protected and sensitive wildlife. Expanding mining operations could lead to habitat destruction, displacement of wildlife, and disruptions to ecological connectivity. The DEIR must ensure that habitat restoration and mitigation efforts are sufficient to offset these impacts, with clear commitments to long-term monitoring and preservation of key biological resources.

Response 524-3

The Draft EIR discusses the proposed project's impacts to biological resources in Section 4.4, "Biological Resources." Where applicable, the Draft EIR outlines mitigation measures which would reduce potential impacts to less than significant. As such, potential impacts to biological resources, including potential loss of habitat, displacement of species, and habitat connectivity, are sufficiently analyzed according to CEQA standards.

Comment 524-4

4. Traffic and Noise Concerns

The project is expected to increase heavy truck traffic along local roads, raising concerns about road safety, noise pollution, and wear and tear on infrastructure. Increased traffic will also contribute to greenhouse gas emissions, further impacting air quality. The DEIR should outline more robust traffic management strategies, noise mitigation measures, and alternatives to reduce the project's transportation footprint.

Response 524-4

The Draft EIR provides a comprehensive environmental review of the proposed project. Specifically, the Draft EIR is based on specific details from technical analyses related to the proposed project activities, methods and analysis frameworks approved by the CEQA Lead Agency, to support a legally adequate review of potential impacts to traffic levels, air quality and greenhouse gas emissions, noise, roadway and public safety.

Please see Collective Response #9 for additional discussion pertaining to potential effects on air quality, Collective Response #29 pertaining to project traffic, and Collective Response #30 pertaining to roadway safety.

Draft EIR Section 4.17, "Transportation," presents a comprehensive analysis of traffic and transportation impacts. Mitigation Measures 4.17-1a through 4.17-1r would require the Operator to provide equitable share contributions to area roadway widening and signalization improvements.

Appendices D-4 and D-5 present detailed analysis and substantial evidence that all potential air impacts would be reduced to a less than significant level with mitigation measures, including effects of project-related vehicle operation.

Section 4.13, "Noise," of the Draft EIR provides a comprehensive analysis of potential noise impacts. With implementation of Mitigation Measures 4.13-2, 4.13-3, and 4.10-1, all potential noise impacts at the site boundaries and nearby receptors would be reduced to a less than significant level.

The project's contribution to local hazards on roadways was assessed in Draft EIR Section 4.17, Impact 4.17-3. The project is required to comply with California Department of Transportation regulations as well as comply with local and regional capital programs and regulations. For these reasons the project's contribution to roadway hazards was found to be less than significant.

Public safety was assessed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," with all potential impacts found to be less than significant with mitigation measures following Lead Agency guidance.

The comment does not provide evidence of a deficiency in the Draft EIR, demonstrate the need for more robust management strategies, or identify any specific management strategies for evaluation. Therefore, no further response is warranted.

Comment 524-5

5. Cumulative Environmental Effects

When considered alongside existing and proposed development projects in the area, the CEMEX expansion could contribute to significant cumulative environmental degradation. The DEIR must take a comprehensive approach to evaluating these combined impacts, rather than assessing the project in isolation. This includes examining long-term effects on water resources, biodiversity, air quality, and climate resilience.

Response 524-5

The Draft EIR evaluates the environmental impacts of the proposed project in accordance with CEQA. Furthermore, Draft EIR Chapter 5, "Cumulative Impacts," provides a

comprehensive analysis of the project's incremental effects to be significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects, in accordance with CEQA. The comment does not explain or provide evidence of any deficiency in the Draft EIR's environmental impact analysis.

Comment 524-6

Given these concerns, I urge the agency to require CEMEX to conduct further analysis, strengthen mitigation measures, and fully explore less harmful alternatives. Public transparency and accountability are essential to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is prioritized in this decision-making process.

I'm sure you have received lots of comments with sentiments similar to mine, allow me to add some personal anecdotes: I am a lover of wildlife, especially birds, and frequent Ball Ranch and Lost Lake several times a week. We are blessed here with the location the valley provides below the Sierras. I urge you to go out yourself and enjoy watching these delicate species we are so very lucky to cohabitate with. It is our duty to be good stewards of the land and ensure future enjoyment and prosperity for generations to come.

Thank you for your time and consideration. I look forward to your response and continued discussion on this important issue.

Response 524-6

The commenter's concerns and requests are noted and will be considered by County decision-makers. The Draft EIR evaluates the environmental impacts of the proposed project in accordance with CEQA. Further, the comment does not provide specific recommendations for more analysis, further mitigation, or alternatives not already discussed and evaluated in the Draft EIR.

Letter #525 March 10, 2025, Allison Martinez

Comment 525-1

Thank you for the opportunity to submit my thoughts about the potential CEMEX Rockfield Expansion Project.

Our family has lived in the Fresno area for decades and utilizes the river for exercise and enjoyment. I am grieved our County Supervisors disregard the negative impacts of the current gravel production operation by extending their permit. Additionally, I am seriously concerned about the potential expansion and the effect

it will have on the river itself along with the surrounding area and impact on we homeowners along the Friant Road corridor.

Response 525-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The project's potential impacts to the project area and nearby residents are addressed throughout the Draft EIR. The comment is noted for the consideration of the decision-makers.

Comment 525-2

I urge your agency to require CEMEX to provide additional analyses, enhanced mitigation measures, and less harmful alternatives. The long-term health of the San Joaquin River watershed and surrounding communities' health and enjoyment is a most critical issue which should stand at the forefront of any decision.

Thank you for your time and consideration, I look forward to your response. Sincerely,

Response 525-2

See Collective Response #1 regarding additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. See also Draft EIR Section 4.10 regarding the project's potential impact on the San Joaquin River watershed. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The comment is noted for the decision-makers.

Letter #526 March 10, 2025, Kevin and Crystal Martinez

Comment 526-1

I am writing to communicate my concerns about Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project jeopardizes the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 526-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to

water quality, air quality, recreation, wildlife, and hazards and hazardous materials are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. Please see Response 526-2 through 526-12 below for further discussion of the commenter's specific concerns.

Comment 526-2

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. Our water is vital to life. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

What are DEIR's solutions for protecting water?

The DEIR must identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 526-2

See Response 349-2.

Comment 526-3

What is CEMEX's plan if major flooding occurs?

What is the plan if flooding breaches the levee and captures the quarry pit?

Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 526-3

The Draft EIR explains that there are no signs of significant bank erosion, and during the historic January 1997 flood event of approximately 60,300 cubic feet per second, the easterly bank along the Quarry Site did not experience significant erosion, and the bank has never breached into the Quarry Site (see Draft EIR, page 4.10-7). Regardless, in the event of major flooding or a levee breach, see Response 65-28, which adequately analyzes the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir in an amount that exceeds the River's channel capacity, and concludes that the project sites' enlarged mining excavations would actually help contain and minimize downstream flooding (see Draft EIR, page 4.10-119), and the stormwater would be managed in accordance with all applicable requirements of the NPDES program,

including site-specific SWPPPs prepared in accordance with Industrial General Permit Requirements and updated Waste Discharge Requirements (see Draft EIR, page 4.7-29). Thus, as provided in Appendix G-1, "Hydraulic Analysis," to the Draft EIR, the risk of erosion of the riverbank causing a breach of the easterly bank of the Quarry Site, which could result in fish entrapment due to pit capture, and the risk of the release of pollutants due to project inundation at the Quarry Site or the Plant Site are less than significant (Draft EIR, Appendix G-1, page 7).

Comment 526-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Will DEIR evaluate the groundwater data at different flow rates?

Response 526-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 526-5

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

What is the DEIR's timeframe and exact location of the trail to be constructed? What is the DEIR's plan for proposed trails to meet the San Joaquin River Parkway

Master Plan's requirement for a 300-foot buffer between mining operations and public access?

How will the DEIR hold CEMEX responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project?

Response 526-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 526-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated.

Will the DEIR fully analyze these impacts and identify appropriate mitigation measures for the impacts?

Response 526-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 526-7

The DEIR identifies several unavoidable negative impacts.

The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 526-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 526-8

Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements.

How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards?

Response 526-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety.

Comment 526-9

The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario.

Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 526-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. CEQA is about the environment and how it would change with the project. Thus, CEQA defines the existing physical setting as the baseline from which project related impacts occur. The no-project scenario is an alternative to the project and not a baseline against which to evaluate the project effects. Therefore, CEQA has no requirement to evaluate the no-project scenario.

Comment 526-10

One of my biggest concerns is air quality impacts. Our quality of life will be impacted negatively. The DEIR mentions an increased cancer risk. This is not acceptable.

Response 526-10

Please see Collective Response #11 pertaining to community cancer risk.

Comment 526-11

Another area of concern is the threat to wildlife. The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

How will the DEIR comply with existing regulations for protecting our wildlife?

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines.

Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation

measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 526-11

As described in Draft EIR Section 4.4, "Biological Resources," numerous biological studies were prepared to evaluate the potential for occurrence of special-status species and evaluated the project's potential impacts to those species and their habitats in accordance with CEQA. As detailed, the majority of the project area is characterized by active mining operations, which provide limited foraging opportunities for Swainson's hawks and other nesting bird species. However, areas adjacent to the mining operations, such as fallow fields and open spaces, may offer potential foraging habitat. Therefore, Mitigation Measure 4.4-1C has been incorporated as necessary to reduce potential indirect impacts to nesting birds.

See Response 65-13 for further discussion of the adequacy of the usage of Alaskan blasting standards for analyzing impacts to salmon. Furthermore, a blasting analysis was performed by Vibra-Tech which evaluated the effect of nearby blasting on Salmon populations in the San Joaquin River. This analysis relied on conservative thresholds and site-specific conditions, demonstrating that blasting would not cause significant impacts to CV spring-run Chinook salmon.

Comment 526-12

Will this section be rewritten and recirculated for public comment?

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Response 526-12

The project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. Pursuant to CEQA Guidelines Section 15088.5, a lead agency is required to recirculate an EIR when significant new information is added to the EIR after public notice is given of the availability of the draft EIR for public

review but before certification. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #527 March 10, 2025, Brett Mason

Comment 527-1

I want to register my reservations concerning the approval of a 100-year lease to the CEMEX corporation that will certainly result in the degradation of an already threatened waterway.

Response 527-1

The commenter's reservations concerning the project are noted and will be considered by County decision-makers. As a point of clarification, please note that the Applicant, CEMEX, requests the County's approval of conditional use permits from the County and not a lease from the County. Please see Collective Response #5 pertaining to the requested use permit duration. Please see Response 527-2 through 527-6 below for further discussion of the commenter's specific concerns.

Comment 527-2

Please respond to the following questions:

1. How does the CEMEX corporation intend to confine the waste of their operation and prevent it from contaminating the San Joaquin river?

Response 527-2

See Draft EIR Section 4.19.1.5, "Solid Waste," Draft EIR Chapter 2, "Project Description," under "Utilities and Solid Waste Management," Draft EIR Sections 2.4.4 and 2.5.5 both titled "Supplies and Materials Transport, Use, and Storage," Draft EIR Section 4.10, "Hydrology and Water Quality," as well as the Hydraulic Analysis and Surface Water Runoff and Drainage Plan reports prepared by Chang Consultants and included Draft EIR Appendix G, "Hydrology and Water Quality."

At the Plant Site, domestic sewage will continue to be handled by conventional septic systems and serviced as necessary by commercial septic services. Solid waste, e.g. parts packaging, paper, etc., will continue to be deposited in dumpsters for pickup and disposal by a licensed solid waste disposal company (Draft EIR, page 4.10-86). At the Quarry Site, domestic sewage will be handled by conventional septic systems and serviced as necessary by commercial septic services. Solid waste, e.g. parts packaging, paper, etc., will be deposited in dumpsters for pickup and disposal by a licensed solid waste disposal company (Draft EIR, pages 4.10-87 through 4.10-88).

At the Plant Site, wastes from the facility are and will continue to be stored in designated containers adjacent to the shop in the containment area and/or within the shops are recycled or disposed of in accordance with local, state and federal safety regulations (Draft EIR, pages 2-22 through 2-23). Similarly, at the Quarry Site, wastes from the facility will be stored in designated containers adjacent to the shop in the containment area and/or within the shops and disposed of in accordance with local, state and federal safety regulations (Draft EIR, page 2-44). All materials stored at the project sites are and would continue to be handled in accordance with a Hazardous Materials Business Plan and Spill Prevention Control and Countermeasure Plan.

Further, the project does not propose to discharge stormwater from the Site boundaries (see Draft EIR, Impact 4.10-1, page 4.10-88). With continued compliance of the State Industrial General Permit, should there be a discharge to the San Joaquin River or other surface water bodies, there would be no significant impairment since this permit is based on water quality criteria deemed to be protective to aquatic species and habitats. However, to pre-emptively address a future discharge scenario that could introduce constituents of concern, notably increased levels of iron and manganese that could potentially increase through time as processing of the aggregates occurs, or the introduction of nitrate for example, in the event of residual blasting agents, the project has incorporated an adaptive management strategy to mitigate such impacts to levels that are less than significant (Draft EIR pages 4.10-96 through 4.10-98).

Comment 527-3

2. What measurable standards are put into the lease for prevention of damage to the waterway and what options for redress does the county have if CEMEX does not abide by those standards?

Response 527-3

Please see Draft EIR Chapter 3, "Project Description," for a description of the proposed project and reclamation plan requirements. Please see Draft EIR Section 4.10, for discussion of impacts to water quality and supply, and associated mitigation measures. Where the Draft EIR identifies potentially significant impacts to water quality or supply, mitigation measures are provided to ensure reduction of adverse impacts. See also Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity, and Collective Response #26 pertaining to baseline groundwater data.

Comment 527-4

3. How much tax revenue is expected from the 100-year lease?

4. What campaign contributions has the CEMEX corporation made to supervisors who will be voting on the issue?

Response 527-4

Please see Collective Response #7 pertaining to economic issues. The commenter's questions do not pertain to the adequacy of the Draft EIR, and no further responses is warranted.

Comment 527-5

5. What positive impacts (besides tax revenue) are expected for Fresno county residents?

Response 527-5

One of the main objectives of the proposed project is to continue to provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand for construction materials in the Fresno region (Draft EIR page 6-3). The commenter's question does not pertain to the adequacy of the Draft EIR, and no further response is required.

Comment 527-6

6. What other locations have been studied as alternatives to expanding the current site near Ball Ranch?

Response 527-6

No other locations were evaluated as alternatives due to the lack of feasible alternative locations. See Section 6.4.2.1, "Alternative Site Locations," on page 6-5 of the Draft EIR for further discussion of the lack of feasibility of alternative site locations for the proposed project.

Letter #528 March 10, 2025, Sylvia Mata

Comment 528-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 528-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to water quality are evaluated in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. The project's potential impacts to air quality are evaluated in Section 4.3, "Air Quality," and updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The project's potential impacts to recreation are evaluated in Section 4.16 of the Draft EIR. The project's impacts to wildlife are evaluated in Section 4.4, "Biological Resources," of the Draft EIR. The project's impacts regarding hazards and hazardous materials are evaluated in Section 4.9, "Hazards and Hazardous Materials," of the Draft EIR. Please see Response 528-2 through 528-11 below for further discussion of the commenter's specific concerns.

Comment 528-2

Impacts on Water Quality &[sic] the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 528-2

See Response 349-2.

Comment 528-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 528-3

See Collective Response #17. See also Response 329-3.

Comment 528-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the

groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 528-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 528-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 528-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 528-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 528-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 528-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- Scenic Degradation: The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 528-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 528-8

- Traffic Congestion: Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 528-8

Please see Collective Response #29 pertaining to project traffic impacts and mitigation. Please see Collective Response #30 pertaining to roadway safety.

Comment 528-9

- Air Quality: The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 528-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 528-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 528-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (see Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (see Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). In any event, blasting activities would be brief and are not expected to result in sustained or long-term impacts. A typical blasting event would occur for approximately one to two seconds. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore fully and adequately evaluated the impact on each of these species.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need rewriting or recirculation.

Comment 528-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 528-11

The project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #529 March 10, 2025, Tess McClellan

Comment 529-1

As a Fresno resident, Central Valley Camera Club leader, and conservationist, I urge you to consider alternatives to the proposed CEMEX Rockfield Expansion project.

Response 529-1

See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter. The comment is noted for the decision-makers.

Comment 529-2

The San Joaquin River has suffered greatly already and deserves our protection, especially with ongoing drought and pollution concerns.

Response 529-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 529-3

Our air quality in the valley has also been continually evaluated as extremely harmful, and further mining and development will only increase this harm despite assurances from CEMEX to the contrary.

Response 529-3

The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #9 regarding the project's potential impact on existing air quality conditions.

Comment 529-4

The area around the proposed expansion is important to Fresno's biodiversity and it is already encroaching on the Environmental Reserve.

Response 529-4

The project's potential impacts to biological resources are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #20 regarding the suggestion that the existing Rockfield operation encroaches on an ecological preserve.

Comment 529-5

I am an avid birder and these habitats will face destruction and pollution with far-reaching consequences we cannot yet even fully understand. For example, the Swainson's Hawk breeding grounds within a half mile of the proposed development have not been fully evaluated for threat.

Response 529-5

The project's potential impacts on bird species are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #14 regarding analysis of impacts to Swainson's hawk. See also Collective Response #13 and Collective Response #15 for further discussion of impacts to bird species.

Comment 529-6

Ball Ranch and Lost Lake are two of our county's best places for families to spend time in nature, and the noise, pollution, and increased traffic will have a negative impact on these beautiful parks. These are also some of the only safe, car-free areas where locals can exercise and relax in relative peace and quiet. Mental and physical health of our residents will be impacted.

Response 529-6

The project's potential impacts to recreational facilities are evaluated in Draft EIR Section 4.16, "Recreation." Additionally, the project's effects on traffic are discussed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #27 regarding operational impacts to users of nearby parks and trails. The comment is noted for the decision-makers.

Comment 529-7

Our local camera club, Central Valley Camera Club, has many photographers who also use the beauty of this area for client photoshoots, especially for family portraits. While this may seem trivial to some, it would directly affect the income of local photographers, not to mention their artwork. Ball Ranch is also home to some of the best birding photography Fresno offers. Both Lost Lake and Ball Ranch are wonderful locations for group photo walks and are used frequently by our local Audubon Society as well.

Response 529-7

Project impacts to visual resources are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The project's potential impact on wildlife and birds, specifically, is addressed in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The comment is noted for the consideration of the decision-makers.

Comment 529-8

We do not have many true green spaces left in the county due to non stop housing expansion and development, let alone the traffic deaths wildlife face (especially along Friant road). Increased traffic means increased threat for countless species. Rarely do I see Friant road free of roadkill from the already present traffic. The blasting from the mine may also drive wildlife closer to the housing developments and traffic.

Response 529-8

The project's potential impacts to wildlife are evaluated in Section 4.4. Impact 4.4-1, beginning on Draft EIR page 4.4-48, describes direct impacts to wildlife which would include events such as vehicular strikes. See also Impact 4.4-6, beginning on Draft EIR page 4.4-62, which evaluates potential impacts on wildlife movement and corridors. At the Plant Site, the "continuation of mining and processing activities is not expected to modify or compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor." At the Quarry Site, "the proposed downward direction of mining activities is not expected to compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. See also Collective Response #13 regarding the project's operational impacts, including blasting, on wildlife located in areas adjacent to the project sites. See also Draft EIR Section 4.17, "Transportation," for the project's potential impacts on traffic.

Comment 529-9

Given also the proposed length of the expansion project, it is hard to accurately predict what other harms could be done within *one hundred years.* Our children and grandchildren will suffer with the potential consequences of this expansion.

Response 529-9

See Collective Response #5 regarding the duration of the proposed use permit.

Comment 529-10

Furthermore, the Environmental Impact Report also highlights the relative low economic regional benefit the project would bring to Fresno. It is hard to justify the proposed expansion given all of these concerns and many more. Please consider at the very least an alternative location, or if this project is at all in any Fresno resident's best interest, or just benefits CEMEX's corporate ownership.

Response 529-10

Alternative locations for the proposed project are discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter. The comment is noted for the decision-makers.

Letter #530 March 10, 2025, Donna McCloskey

Comment 530-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 530-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to water quality, air quality, recreation, wildlife, and hazards and hazardous materials are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. Please see Response to 530-2 through 530-11 below for further discussion of the commenter's specific concerns.

Comment 530-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 530-2

See Response 349-2.

Comment 530-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 530-3

See Collective Response #17. See also Response 329-3.

Comment 530-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 530-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 530-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 530-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 530-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 530-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 530-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 530-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 530-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 530-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 530-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 530-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 530-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 530-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (see Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (see Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be

less than significant (see Draft EIR pages 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). In any event, blasting activities would be brief and are not expected to result in sustained or long-term impacts. A typical blasting event would occur for approximately one to two seconds. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore fully and adequately evaluated the impact on each of these species.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need rewriting or recirculation.

Comment 530-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 530-11

The project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #531 March 10, 2025, Gracie McKesson

Comment 531-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed

I believe that all of our water ways and green spaces should be protected from any and all forms of emissions and mining projects.

Response 531-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The comment is noted for the decision-makers.

Comment 531-2

2. Air Quality and Dust Emissions

The Central Valley is already heavily impacted by the bad air quality and pollution that settles in our valley. There is no need to make it worse and increase the numbers of youth asthma but ejecting mining pollution into our air.

Response 531-2

The project's potential impacts on air quality are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Chapter 3 for proposed revisions to this Draft EIR section. See Collective Response #9 regarding the project's potential impacts on existing air quality conditions.

Comment 531-3

3. Biological Resource Impacts

Fresno and the surrounding areas are blessed to be so abundant of biological diversity. It is our duty as patrons of this land to protect our wildlife and our environment.

Response 531-3

The project potential impacts to wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." This section requires multiple mitigation measures intended to avoid and/or minimize potential impacts to fish and wildlife species and their habitats. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

Comment 531-4

4. Traffic and Noise Concerns

High levels of noise and traffic are scientifically proven to be adverse to health. Why negatively affect the quality of life of those living in surrounding areas?

Response 531-4

The issues of noise and traffic are addressed in Draft EIR Section 4.13, "Noise," and Section 4.17, "Transportation," respectively. Public health effects associated with air quality impacts are discussed in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The comment is noted for the consideration of the decision-makers.

Comment 531-5

5. Cumulative Environmental Effects

These green spaces affected by the mining are fundamental to the health and wellness of not only the wildlife but to our human communities. Access to clean and safe natural spaces are vital for positive mental health, family bonding, and community development.

Response 531-5

The proposed project would not interfere with access to existing parks, trails, or other recreational facilities in the project area. See Draft EIR Section 4.16 "Recreation" regarding the project's potential impact on access to existing Neighborhood and Regional parks and other recreational facilities. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #21 pertaining to public access to recreational facilities near the project sites.

Comment 531-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Response 531-6

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter.

Letter #532 March 10, 2025, Gloria Medina-Sancho-

Comment 532-1

I am writing regarding the CEMEX proposal to expand its mining operation on the San Joaquin River.

I am opposed to this project for a number of reasons:

1) CEMEX, a Mexican company, is proposing this type of mining on the San Joaquin because it is illegal in Mexico.

Response 532-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The proposed project would comply with California state law including the California Surface Mining and Reclamation Act (SMARA) and CEQA. Mexico's mining laws are not relevant and have no jurisdiction over the proposed project.

The project is also not proposing to expand its mining operations into the San Joaquin River (SJR). The project would maintain the 200-foot minimum setbacks from the SJR currently required.

Comment 532-2

2) The project will go to a depth of 600 feet, which will destroy that part of the river both for recreation and wildlife habitat.

Response 532-2

The commenter's opinions are noted. Please refer to Draft EIR Section 4.13,"Noise," for further discussion of the project's potential noise impacts. Please refer to Draft EIR Section 4.10, "Hydrology and Water Quality," for further discussion of the project's potential water quality impacts. The commenter does not provide evidence of a deficiency in the Draft EIR and no further response is required.

Comment 532-3

3) The use of blasting for the mining will create intolerable noise for people within miles of the site, frighten pets and wild animals, and ruin the water quality.

Response 532-3

The commenter's opinions are noted. The comment does not provide evidence of a deficiency in the Draft EIR and no further response is warranted.

Comment 532-4

4) The mining will further prevent access to the river by Fresno area residents--there is already very little access to the river. We need more access to the river, not less.

Response 532-4

The commenter's opinions are noted. Please see Collective Response #21 pertaining to public access to the San Joaquin River. The proposed project would not further prevent access to the San Joaquin River (SJR). The parcel for the Quarry Site of the proposed project abuts the SJR, but this parcel is private property, and therefore does not currently allow public access to the SJR. As discussed in the Draft EIR, there may be a future need for the Operator to grant and record easements within the Plant Site and Quarry Site parcels for Fresno County to allow for construction improvements associated with the expansion of the multi-use trail in this vicinity. Although portions of the future planned multi-use trail are proposed to be within the project site, adequate buffers and mitigation to minimize risk should be evaluated and considered, as needed. Fresno County and SJR Conservancy groups would continue to work together to ensure public access to the SJR continues to be provided in accordance with applicable land use plans. Fresno County will consider these suggestions as part of its deliberations and conditions of approval.

Comment 532-5

5) As the mining is proposed to last 100 years, it will inflict its damage for generations to come, which will have no opportunity to protect themselves and their environment from the project.

Response 532-5

Please see Collective Response #5 pertaining to the requested use permit duration. The Draft EIR provides a detailed evaluation of potential project impacts associated with the required CEQA environmental issues, and proposed the implementation of mitigation measures to reduce potential environmental impacts to less than significant levels, or to the extent feasible.

Although the lifespan of the project is 100 years, the Sites would be subject to mitigation while in operation, and reclamation, per the Surface Mining and Reclamation Plan found in Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," when the operational activities have been completed.

Comment 532-6

6) It appears that the current Environment Impact Study has severely underestimated or simply ignored the extreme deleterious effects of this project on Fresno Air Quality.

I am deeply concerned about the extremely serious degradation of our Fresno air quality that this project would cause. The use of explosives to mine rock sends an enormous amount of rock duct into our air, as well as the airborne chemical products of the explosives used. There is no way to mitigate that result, so the blasting must not be allowed to occur.

7) Fresno already has some of the worst air quality in the United States. My neighborhood has families with young children, and it's very well known that poor air quality has negative effects on the brain development of children such that it lowers their IQ's.

Response 532-6

The Draft EIR adequately evaluates potential air quality impacts in Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). As discussed in Section 4.3, most dust generated by construction and mining activities, including blasting, consists of particles larger than 4 microns, which are too large to reach the alveoli of the lungs. The commenter's assertion that impacts cannot be mitigated is not supported. Implementation of mitigation measures, including Mitigation Measures 4.3-2b and 4.10-1, would reduce particulate emissions and associated health risks to less than significant levels, as shown in Draft EIR Table 4.3-25, "Mitigated Project Health Risk Impacts." Since preparation of the Draft EIR, the Operator has prepared a Fugitive Dust Control Plan consistent with Mitigation Measure 4.3-2b.

In addition, the air quality technical analysis was updated to clarify and expand upon the information presented in the Draft EIR, as documented in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3). This updated analysis includes a prepared dust control plan and additional health risk modeling, and demonstrates no new impacts and no changes to the findings of the Draft EIR. See also Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality." See also Collective Response #9 for further discussion of air quality impacts.

Comment 532-7

So I respectfully request that you all in your power to reject any proposal of CEMEX to continue its mining of the San Joaquin River in order to protect the lives of those of us who live in the wide Fresno Area.

Response 532-7

The commenter's opposition to the project and request for denial of the project is noted and will be considered by County decision-makers.

Letter #533 March 10, 2025, Dinora Mendoza

Comment 533-1

I am writing to formally express my opposition to the proposed CEMEX Rockfield Expansion Plan as I have serious concerns regarding its potential negative impacts on the local environment, community, and public health.

First, I would like to highlight the environmental concerns associated with the expansion. The increased extraction of natural resources and the expansion of industrial activities at the Rockfield site could lead to significant ecological damage. The loss of wildlife habitat, the risk of air and water pollution, and the disruption of local ecosystems are all significant issues that need to be carefully considered. I believe the potential environmental consequences far outweigh the benefits that this expansion may bring.

Response 533-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to wildlife habitat and local ecosystems are addressed in Draft EIR Section 4.4, "Biological Resources." The issues or air and water pollution are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality," respectively.

Comment 533-2

In addition to environmental concerns, the expansion could also negatively affect the wellbeing of local residents. The increased traffic, noise, and dust from quarrying operations would significantly disrupt the peace and quality of life for people living nearby. Furthermore, the potential health risks associated

with exposure to airborne particulates and other pollutants are a real concern that must be taken seriously.

Response 533-2

The project's potential effects on traffic and noise are discussed in Draft EIR Section 4.17, "Transportation," and Draft EIR Section 4.13, "Noise," respectively. Public health effects associated with air pollution are discussed in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section, 4.3 Air Quality"). CEQA does not regulate or require evaluation of social or psychological effects, including generalized quality-of-life concerns—unless those effects are directly tied to an adverse physical change in the environment.

Comment 533-3

Finally, I urge you to consider the long-term sustainability of the region. The proposed expansion risks compromising the natural landscape and resources for future generations. While industrial growth is important, it should not come at the expense of preserving the health of the local environment and community.

Response 533-3

Cumulative impacts of the project are evaluated in Draft EIR Chapter 5, "Cumulative Impacts." Additionally, effects on the appearance of the landscape are noted in Draft EIR Section 4.1, "Aesthetics and Visual Resources."

Comment 533-4

I respectfully request that you reconsider moving forward with the Rockfield Expansion Plan and explore alternative solutions that prioritize both economic development and environmental protection. Engaging with the local community and conducting more thorough environmental impact assessments could help to ensure that the needs of both industry and the public are met in a balanced and responsible manner.

Thank you for your attention to this matter. I look forward to your response.

Response 533-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. See Collective Response #1 regarding the provision of additional analysis.

Letter #534 March 3, 2025, Dale Merrill

Comment 534-1

I want to voice my strong opposition to the proposed CEMEX 100 year agreement. I am a frequent hiker and trail rider in the Ball Ranch and Sycamore Island river front and strongly feel that the CEMEX would ruin this wonderful public resource.

Response 534-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #27 regarding operational impacts on users of nearby parks and trails. See also Draft EIR Section 4.16, "Recreation," regarding the project's potential impact on Ball Ranch.

Letter #535 March 10, 2025, Diane Merrill

Comment 535-1

I am a longtime Fresno resident and also a longtime supporter of the San Joaquin River Parkway. My family and I have and enjoyed outdoor recreation along the San Joaquin River for many years.

The San Joaquin River corridor is a valuable, nearby, and accessible outdoor recreation area for Fresno County residents, especially for those in the Fresno/Clovis metropolitan area.

The proposed Cemex Rockfield Expansion Project would be located next to Lost Lake Park, and not far from other recreation areas along the San Joaquin River.

Response 535-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Additionally, the project's potential impact on Lost Lake Park is discussed in Draft EIR Section 4.16, "Recreation." See also Collective Response #27 regarding the project's operational impacts on users of nearby parks and trails.

Comment 535-2

I am very concerned about the negative impact the project would have on air quality in the San Joaquin River area and the people who live, work or enjoy recreation along the San Joaquin River.

Fresno County has a serious air quality problem with particle matter 2.5 pollution. The San Joaquin Valley Air Pollution Control is taking steps to reduce particle matter 2.5 pollution and to

alert residents when pollution levels are high. **CEMEX's proposed project has the potential to significantly increase PM 2.5 pollution in a popular outdoor recreation area near the Fresno/Clovis Metropolitan area.**

The U.S. Environmental Protection Agency has an information piece entitled Particulate Matter (PM) Basics. It states that: "Particulate matter contains microscopic solids or liquid droplets that are so small that they can be inhaled and cause serious health problems. Some

Response 535-2

The issues of particulate matter emissions and associated health effects are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Collective Response #9 regarding the project's potential impact on the region's existing poor air quality.

Letter #536 March 10, 2025, James Minton

Comment 536-1

I am a 40 year resident of Clovis, California and I appreciate the opportunity to submit comments on the Draft Environmental Impact Report for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with this project approval.

1) Impacts on the San Joaquin River Watershed

My residence is reasonably close to the Cemex plant. I have drilled 4 wells on my rural property, chasing an ever declining water table. What will be the impact of continuously pumping water out of a 600' hole near the river? Will all that water pumping further deplete an already impacted water table? An environmental impact statement for CEMEX needs to address impacts to our limited underground water supply.

Response 536-1

The project's potential to impact local groundwater wells and affect nearby domestic wells is evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-8 through 4.10-13 beginning on Draft EIR page 4.10-102. The comment is noted for the consideration of the decision-makers.

Comment 536-2

2) Air quality and dust emissions

Working as an Allergist in this highly polluted air basin, I have seen first hand the impacts of air pollution. One in 4 children in our county have asthma and numerous studies link proximity to busy streets and freeways with asthma severity. The emissions of diesel trucks and dust contribute enormously to the disease burden of our children. The Cemex plant is a major contributor of these emissions.

Response 536-2

The project's potential operational air quality impacts are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 regarding the project's potential impact on the region's existing poor air quality.

Comment 536-3

3) Biological Resource impacts

Clear cold water is essential to fish habitat, including restoring Salmon to the San Joaquin River. Loss of the fishery impacts the entire riparian ecosystem, including the birds and even river otters that rely on fish. I kayak the San Joaquin river almost weekly and see these beautiful birds including Bald Eagles, Swainson's hawks and Osprey on a regular basis. What a tragedy it would be for these birds to disappear from our area due to noise pollution and water quality degradation.

Response 536-3

The project's potential impacts to biological resources are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-1 beginning on Draft EIR page 4.4-48 for discussion of potential impacts to fish and wildlife species on the project sites and Impact 4.4-2 beginning on page 4.4-52 for discussion of potential impacts to species in riparian areas surrounding the project sites. See Collective Response #12 regarding salmon restoration efforts in the San Joaquin River. See also Collective Response #14 regarding Swainson's hawk and Collective Response #15 regarding potential impacts to birds aside from nesting disturbances. Finally, see Collective Response #16 pertaining to vibration and water quality impacts to salmon spawning. The comment is noted for the consideration of the decision-makers.

Comment 536-4

4) Traffic and noise concerns

I live on Behymer Ave which is a busy and narrow 2 lane road. As Clovis subdivisions are rapidly approaching Behymer, this congestion will increase markedly. I already see numerous CEMEX trucks traveling this road, adding to the noise and congestion. The limited infrastructure in this area does not support expansion of the CEMEX plant.

Response 536-4

The issues of traffic congestion and traffic noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," respectively. See Collective Response #29 regarding project truck trips, traffic congestion, and needed roadway improvements.

Comment 536-5

5) Cumulative Environmental Effects

In addition to air and noise pollution and impacts to local traffic, there is an even more important reason to not grant CEMEX a 100 year lease extension. This has to do with the limited opportunity for outdoor recreation in Fresno. The San Joaquin River is the only natural green space for our City. Having lived in areas such as Boulder, Colorado with extensive open spaces around the city, I have seen how access to natural areas impacts quality of life as well as improves property values. The Parkway trust should be allowed to expand the only natural area adjacent to our city for all to enjoy. Hearing the blasts and machinery noise from an expanded CEMEX plant is not compatible with creating a natural area space for all of our area residents to enjoy!

Response 536-5

See Collective Response #18 regarding the project's consistency with the Parkway Master Plan and Collective Response #21 regarding public access to recreational uses in the project area. The project's noise effects are addressed in Draft EIR Section 4.13. See also Collective Response #27 regarding the project's operational effects on users of nearby parks and trails. The comment is noted for the consideration of the decision-makers.

Comment 536-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long term

health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 536-6

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. See Final EIR Chapter 2, "CEQA Public Review Process," for a summary of the public outreach and involvement conducted for the proposed project

Letter #537 March 10, 2025, Samai Munoz

Comment 537-1

Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. 1. Impacts on the San Joaquin River WatershedThere are many different ways throughout the entirety of the project that creates a negative impact on the watershed, river, and water in the area. Some are labeled as LTS or PS but in context of our type of environment, no impact feels less than significant to me. Nor do I think it would be of very little significance to the people who enjoy recreation and nature in the area. And much much less do the animals that reside within the area that depend on the water. Even minor impacts can create ripple effects that magnify as they continue to impact places, people, and species.

Response 537-1

See Response 363-1.

Comment 537-2

2. Air Quality and Dust Emissions The air quality impact 4.3-2 is categorized as significant requiring a mitigation measure. The mitigation measure requires the use of water. But water impacts also require mitigation measures. There are layers of natural resources being negatively impacted and their solution is to use natural resources. For the amount of money being extracted out of these projects, very little has been invested in better measures to counteract the possible damage being done and it is apparent.

Response 537-2

The commenter's concern regarding the use of water for dust control and the potential for related resource impacts is acknowledged. As described in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Impact 4.3-2 identifies potentially significant fugitive dust emissions, and Mitigation Measure 4.3-2b, the Fugitive Dust Control Plan, requires implementation of standard dust control measures to control dust emissions on unpaved roads and stockpiles, including the application of water, covering, and/or the application of chemical dust suppressants, to reduce impacts to less than significant levels.

Water use associated with dust control is accounted for in the project's overall water demand and is evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." As discussed therein, the project's water use, including water used for dust suppression, would not result in a significant impact on water supply or water quality with implementation of applicable mitigation measures. The commenter does not provide substantial evidence demonstrating that the mitigation measures identified in the Draft EIR would be infeasible or ineffective.

In response to comments on the Draft EIR, a Fugitive Dust Control Plan was prepared, which would be submitted to the Air District prior to project implementation. See Final EIR, Appendix K of Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment." See also Collective Response #9 regarding the project's air quality impacts and associated mitigation measures, including the Fugitive Dust Control Plan.

Comment 537-3

3. Cumulative Environmental Effects I find this report illuminating on the efforts to reduce impact to our natural environment, our region, and to our people and animals. It is appalling that from these reports there must be alternatives to the project including less years and less time on the site but yet the request is 100 years. The amount of time needs to be reduced significantly. It should also be re-evaluated often. The impact from this project if permitted, of 10 years could be in a magnitude that would ripple through generations. Please reconsider this project.

Response 537-3

See Response 363-3. See also Collective Response #5 regarding the duration of the proposed use permit.

Comment 537-4

I ask the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 537-4

See Response 363-1 through 537-3 and relevant collective responses.

Letter #538 March 10, 2025, Leticia Murrietta

Comment 538-1

This will serve to express my opposition to the proposed expansion of CEMEX. It is my understanding that if the proposal is approved, CMEX is allowed an additional 100 years of mining and the creation of a 600 foot deep mining pit caused by hard rock blasting. This activity poses a threat to our water quality and impacts fish and wildlife according to experts.

Please do not approve the proposal.

Response 538-1

The commenter's opposition to the proposed project is noted for County decision-makers. See Collective Response #5 regarding the duration of the proposed use permit. The project's potential impacts to water quality and fish and wildlife species are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Letter #539 March 10, 2025, Jorge Negrete

Comment 539-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 539-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to water quality, air quality, recreation, wildlife, hand hazards and hazardous materials are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials. Please see Response 539-2 through 5.9-11 below for further discussion of the commenter's specific concerns.

Comment 539-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 539-2

See Response 349-2.

Comment 539-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 539-3

See Collective Response #17. See also Response 329-3.

Comment 539-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 539-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 539-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 539-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 539-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 539-6

Please see Collective Response #19 pertaining to public accessibility to parks. See also Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 539-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 539-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 539-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 539-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety.

Comment 539-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 539-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 539-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 539-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR pages 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). In any event, blasting activities would be brief and are not expected to result in sustained or long-term impacts. A typical blasting event would occur for approximately one to two seconds. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore fully and adequately evaluated the impact on each of these species.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need rewriting or recirculation.

Comment 539-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 539-11

With implementation of the mitigation measures provided in this EIR, the project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #540 March 10, 2025, Katharine Nelson

Comment 540-1

Thank you for allowing residents the opportunity to have input regarding the proposed expansion of the CMEX company mining expansion proposal in our beloved San Joaquin River valley.

Response 540-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 540-2

I have lived in the nearby Woodward Lake neighborhood since moving to Fresno in 2016. We chose to live in this area of town specifically for the access to the beautiful river valley, which I continue to frequent almost every day. I know many people choose to live near there for the same reason. The whole Copper River

area has grown so much just since I've been here. The weekends are packed with fellow-outdoor lovers along the river valley walkways. I know the river valley contributes to our property values.

Response 540-2

The project's potential effect on the appearance of the area is discussed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See also Collective Response #7 regarding evaluation of the project's potential economic effects in the Draft EIR. The comment is noted for the consideration of the decision-makers.

Comment 540-3

I am concerned of the environmental impacts that the new mining type and the depth of the pit will have to the area-both aesthetically and practically. I hope that the potential environmental impacts will be thoroughly investigated in terms of possible problems with water/ air quality and the negative impact on the wildlife (fish, birds and mammals that live in the area). And what will it look like?? I remember visiting Butte, MT and seeing the blight of the Berkeley Pit. It went from providing economic prosperity to a toxic lake that cannot support life.

Response 540-3

The project's potential effect on the appearance of the area and the potential effect on wildlife are discussed in Draft EIR Section 4.1 and Draft EIR Section 4.4, "Biological Resources," respectively. Additionally, the project's potential impact on air quality is discussed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. In addition, see Draft EIR Section 2.5.7, "Reclamation," for the planned reclamation of the mine after production ceases including allowing the Quarry Site excavation to fill with groundwater and rainfall creating a 108-acre, 100-foot-deep lake.

Comment 540-4

We have so little official "green space" in the Fresno area. I hope that all efforts have been made to investigate the potential harm to our beautiful gem of a river valley. Thank you for your thorough consideration.

Response 540-4

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project.

Letter #541 March 10, 2025, Kathie Nesbitt

Comment 541-1

I am writing regarding the CEMEX proposal to expand its mining operation on the San Joaquin River.

I am opposed to this project for a number of reasons:

(1) CEMEX, a Mexican company, is proposing this type of mining on the San Joaquin because it is illegal in Mexico.

Response 541-1

See Collective Response #4c regarding the proposed mining methods. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 541-2

(2) The project will go to a depth of 600 feet, which will destroy that part of the river both for recreation and wildlife habitat.

Response 541-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on recreation and wildlife habitat are evaluated in Draft EIR Section 4.16, "Recreation," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced here.

Comment 541-3

(3) The use of blasting for the mining will create intolerable noise for people within miles of the site, frighten pets and wild animals, and ruin the water quality.

Response 541-3

The effects of proposed blasting are evaluated in Draft EIR Section 4.13, "Noise," Section 4.4, "Biological Resources," Section 4.9, "Hazards and Hazardous Materials, and Section 4.10, "Hydrology and Water Quality." See also Collective Response #13 regarding the project's operational impacts, including blasting, on wildlife located in areas adjacent to

the project sites. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced here.

Comment 541-4

(**4)** The mining will further prevent access to the river by Fresno area residents--there is already very little access to the river. We need more access to the river, not less.

Response 541-4

See Collective Response #21 regarding public access to the San Joaquin Rover.

Comment 541-5

(**5)** As the mining is proposed to last 100 years, it will inflict its damage for generations to come, which will have no opportunity to protect themselves and their environment from the project.

Response 541-5

The Draft EIR evaluates the effects of the proposed project throughout all operational phases and during and post reclamation. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 541-6

(**6)** It appears that the current Environmental Impact Study has severely underestimated or simply ignored the extreme deleterious effects of this project on Fresno Air Quality. I am deeply concerned about the extremely serious degradation of our Fresno air quality that this project would cause. There is no way to mitigate the effects of the enormous amounts of rock dust that would be sent into our air by blasting.

(7) Fresno already has some of the worst air quality in the United States. This Cemex proposal would make it significantly worse.

So I respectfully request that you do all in your power to reject any proposal of CEMEX to continue its mining of the San Joaquin River in order to protect the lives of those of us who live in the wide Fresno Area.

Response 541-6

The project's potential impacts on air quality are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air

Quality"). See also Collective Response #9 regarding the project's potential impact on the region's existing poor air quality conditions.

Letter #542 March 10, 2025, Peter Newell

Comment 542-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed

Response 542-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 542-2

2. Air Quality and Dust Emissions

Response 542-2

The project's potential effects on air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 542-3

3. Biological Resource Impacts

Response 542-3

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 542-4

4. Traffic and Noise Concerns

Response 542-4

The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," respectively. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 542-5

5. Cumulative Environmental Effects

Response 542-5

The project's potential cumulative effects are evaluated in Draft EIR Chapter 5, "Cumulative Impacts." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 542-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 542-6

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project.

Letter #543 March 10, 2025, Christina Olague

Comment 543-1

My name is Christina Olague and I'm a concerned Fresno County resident. I was made aware that CEMEX is proposing a massive impact on our one and only San Joaquin River, which has already been called The Most Endangered River in America, according to American Rivers and Scientific American (source:https://www.scientificamerican.com/article/americas-most-endangered-river-san-joaquin-in-california/).

Response 543-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 543-2

I've also been made aware of the fact that Fresno has a massive gravel surplus, which is predicted to provide enough local gravel for Fresno's construction needs over the next 500 years, according to the California Geological Survey (source:https://fresnoland.org/2025/03/06/cemex-blast-mine/?utm_campaign=linkinbio&utm_medium=referral&utm_source=later-linkinbio).

Response 543-2

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 543-3

The impacts of this proposed projects do not offer any benefits to our local community and in fact impose great harm and duress to our one last and only local waterway. Why would any resident of our beautiful Fresno want to see natural waterways degraded any further? Why would anyone want to blast a crater, nearly twice as deep as Millerton lake, off the shores of our one and only endangered San Joaquin River, when there is absolutely no need for gravel?

As a voter, I firmly believe the CEMEX Company's profits and campaign donations should not have the glaring level of targeted sway over local city officials decision-making to this degree.

In summation, I absolutely oppose this proposed project and it's environmental impacts on our natural waterways.

Thank you for your time.

Response 543-3

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See also Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #544 March 10, 2025, Suzanne Olguin

Comment 544-1

I would like to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. This project will likely have substantially negative impacts on the surrounding environment/ecosystem. Aside from the actual damage to the land and waterways, the increased pollution, both air and noise, will be detrimental to the people that use the area and the animals that live there.

If this project is to move forward, it should be with all of those aspects fully considered and supported above all. We can't continue to put profits ahead of lives. Thank you for your time and consideration of these comments.

Response 544-1

The potential issues listed in the comment area evaluated in Draft EIR Section 4.4, "Biological Resources," Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #545 March 10, 2025, Patricia Oren

Comment 545-1

I am writing to formally express my opposition to the proposed 100-Year Permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report prepared for this project. The report, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 545-1

See Draft EIR Chapter 5, "Cumulative Impacts," for a discussion of the potential cumulative effect of the proposed project on the San Joaquin River and surrounding area. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 545-2

The impact on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, cumulative environmental impacts, community health, all major concerns.

Response 545-2

The project's potential effects on wildlife habitat, water quality, and air pollution are addressed in Draft EIR Section 4.4, "Biological Resources," Section 4.10, "Hydrology and Water Quality," and Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The issues of noise pollution and groundwater depletion are evaluated in Draft EIR Section 4.13, "Noise," and Section 4.10. The project's potential cumulative effects are discussed in Draft EIR Chapter 5, "Cumulative Impacts." Community health is addressed in relation to air pollution in Section 4.3 and in relation to exposure to hazardous substances in Section 4.9, "Hazards and Hazardous Materials."

Comment 545-3

I request that the Planning Department reconsider this permit in light of the inadequacies of the Environmental Impact Report and demand a more thorough environmental review before any decisions are made.

Response 545-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #1 regarding providing additional analysis of the project.

Letter #546 March 10, 2025, Eli Ortiz

Comment 546-1

Do not approve the mining expanding project. You're ruining the chance of future generations to enjoy our natural resources.

Response 546-1

No specific comments related to the adequacy of the Draft EIR were made. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #547 March 10, 2025, Hailey Owji

Comment 547-1

As a North Fresno resident ,living close to Proposed Cemex project area, We are against expansion of this project to lost lake. Some of major concerns are noise pollution ,water/river pollution ,air pollution , plus additional traffic on Friant , Copper and Willow Street. These are residential areas and Public safety will be jeopardized. We will appreciate ur attention to this matter.

Response 547-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of noise pollution and water pollution are addressed in Draft EIR Section 4.13, "Noise," and Section 4.10, "Hydrology and Water Quality." The issues of air pollution and traffic are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.17, "Transportation." Public safety is addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced here. See also Collective Response #30 regarding traffic safety.

Letter #548 March 10, 2025, Sarah Parkes

Comment 548-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. The San Joaquin River Parkway has been an important and meaningful piece of my professional and personal life over the last 18 years, and I am committed to its continued preservation and to expanding opportunities for people in the San Joaquin Valley to experience its wonder and resources as I've been privileged to. I am deeply concerned about the proposed Cemex Rockfield Expansion Project's adverse and, in many cases, unreparable impacts on the San Joaquin River, the San Joaquin River Parkway, regional air and water quality, recreational opportunities, public safety, and wildlife. Additionally, I find many of the proposed mitigation measures inadequate and some impacts entirely lacking mitigation.

Response 548-1

The commenter's background and concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. Please see Response 548-2 through 548-18 below for further discussion of the commenter's specific concerns.

Comment 548-2

Impacts on the San Joaquin River Watershed and Water Quality

The proposed project involves mining operations adjacent to the San Joaquin River, including blasting and drilling a 600-foot deep pit. The DEIR acknowledges that the project will reduce river flows and recognizes the connection between groundwater and river water,

raising concerns about river water potentially flowing into the mining pit or reclamation pond (Appendix G-3).

- The DEIR fails to demonstrate how the project will comply with the Sustainable Groundwater Management Act (SGMA), particularly its requirement to prevent significant and unreasonable depletions of interconnected surface waters.

- It appears that the DEIR inadequately assesses how groundwater pumping and excavation will impact surface water flows and the river's beneficial uses. Additional study is necessary to fully understand how downstream water users and ecosystems will be impacted.

- What specific mitigation measures will be required of CEMEX to prevent reductions in river flows and ensure compliance with SGMA regulations, and how will they be monitored?

Response 548-2

The project's potential effects related to groundwater and surface water were evaluated within Draft EIR Section 4.10, "Hydrology and Water Quality," as well as within Appendix G-5, "Hydrology and Water Quality Analysis Report," and Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," prepared by EMKO Environmental, Inc.

The potential for the proposed project to impede sustainable management of the groundwater basin is addressed in the Draft EIR in Impacts 4.10-9, 4.10-11, and 4.10-13. The Quarry Site and Plant Site would:

(a) Not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project would impede sustainable groundwater management of the basin, and
(b) Not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management (see Draft EIR, Appendix G-5, Section 2.2.1, pages 10 through 12 and Section 5.0, pages 55 through 57).

Further, Impact 4.10-11 determined that the project would not substantially decrease groundwater supplies during mining operations and after completion of reclamation at the Quarry Site, and thus the project would not impede sustainable groundwater management of the Basin (Draft EIR at pages 4.10-112 through 4.10-113). In addition, Impact 4.10-13 analyzed and determined that the Plant Site and Quarry Site would not impede sustainable groundwater management of the Basin, nor substantially interfere with groundwater recharge (Draft EIR at pages 4.10-114 through 4.10-115).

Please see Response 65-38 for further discussion of the project's consistency with the North Kings Groundwater Sustainability Plan. Please see Collective Response #24 for further discussion of groundwater monitoring and mitigation measures. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 548-3

Given that climate change is increasing the frequency and severity of extreme weather events, a significant concern is how CEMEX will prepare for and respond to major flooding events, such as the flood of 1997. If a flood causes the San Joaquin River to breach the levee and capture the quarry pit, it could permanently alter the river's hydrology, making future reclamation efforts nearly impossible.

- The DEIR must fully analyze the long-term consequences for water quality, habitat integrity, and downstream flood risks if the river captures the Quarry pit, providing detailed modeling and mitigation measures for this scenario. A comprehensive assessment should be conducted to evaluate these risks under various climate change scenarios.

- In the event of river capture, who will bear the responsibility for mitigation and restoration? What legally binding financial and logistical commitments has CEMEX made to ensure that taxpayers and local agencies are not left to cover the costs of remediation and flood control?

Response 548-3

See Response 6-116, which provides mitigation measures related to the slope stability of both project sites and the embankment of the Quarry Site. Additionally, as explained in Response 65-20 and Response 65-22, potentially significant effects or indirect physical changes, for example, related to extreme flooding, are not required to be analyzed or mitigated if those effects would be speculative. (CEQA Guidelines Section 15064(d)(3).) Finally, see Response 6-99, which explains that this unforeseeable event would result in an impact of the environment or other infrastructure (e.g., dam failure) on the project, not an impact of the project on the environment. See also Collective Response #17 for further discussion of flooding and river capture.

Comment 548-4

The geologic survey (Appendix F-1) indicates that the deepest groundwater level found was at 34 feet. Per the report, it appears that Tetra Tech conducted the study in August of 2021. During that month, Friant Dam releases averaged 260-280 cubic feet per second

per the USGS water monitoring tool. The DEIR should evaluate the groundwater data at different flow rates since the document admits the interconnectedness of ground and surface water at both the Plant and Quarry sites.

Response 548-4

In addition to the response below, see Collective Response #26, which provides for the groundwater data at different flow rates and see Collective Response #25, which provides analyses related to the interconnectedness of the San Joaquin River and groundwater.

The Stability Assessment of Perimeter Mining Slopes report prepared by Tetra Tech (2021b; see Draft EIR Appendix F-1) acknowledges that groundwater levels at the project sites are expected to be affected by the water levels in the San Joaquin River. Therefore, recent stream gauge reports from two San Joaquin River gauging stations located within the vicinity of the project were reviewed. Based on the reported river water levels, an interpolated river water surface elevation located 0.5 mile west of the project sites is approximately 280 feet. The elevation appears to correlate with the groundwater levels encountered in the Tetra Tech borings.

The intent of Tetra Tech's analysis was to determine if groundwater levels would have an impact on the temporary mining perimeter slopes. The project is designed to dewater to achieve a dry excavation. As such, groundwater would have no impact on the temporary mining perimeter slopes, and additional analysis of groundwater data under various flow rates is not warranted.

Comment 548-5

Section 4.4.9 of the Surface Mining and Reclamation Plan (Appendix B-1) provides a brief description of how explosives will be received, the equipment used, and the removal of unused explosives. This section states that dynamite will not be used but doesn't provide any information about the nature or type of explosives that will be used during blasting.

Response 548-5

The blasting agents that would be used are described in the Revised Hydrology and Water Quality Analysis Report, attached as Appendix G-5 to the Draft EIR, page 54. As described there, blasting agents typically used for hard rock mining include both an oxidizer and an accelerant. Oxidizers are generally nitrate-based compounds, such as ammonium nitrate. Accelerants are generally flammable liquids such as fuel oil or mineral oils. One of the most common blasting agents is ammonium nitrate/fuel oil, known as ANFO.

Comment 548-6

Further, the Vibra-Tech Blasting Protocols report (beginning on page 1245 of Appendix 2 PDF) summarizes blasting protocols and provides "best practices" for flyrock control and mitigating groundwater and surface water contamination. The report states that there should be an inventory of the types of explosive materials on site. Additionally, the report states that interaction between muck piles and storm water will be managed, but not how.

20) The DEIR inadequately analyzes the impacts of blasting as it does not specify the nature of the explosives that will be used. Fresno County should require CEMEX to complete a more thorough analysis of the impacts of blasting on water quality that includes detailed information on the types of explosives expected to be incorporated into the blasting plan.

21) The DEIR should also be more specific in HOW the interaction between storm water and blasted rock muck piles will be managed. How will the interaction between stormwater and blasted rock muck piles be managed to prevent contamination, erosion, and downstream impacts? What specific measures will be implemented to ensure compliance with water quality regulations?

Response 548-6

The blasting agents typically used for mining include both an oxidizer and an accelerant, generally in the form of nitrate-based compounds and flammable liquids. The Blasting Protocols required by Mitigation Measure 4.10-1 would ensure that blasting activities at the Quarry Site do not create a significant impact to the environment or nearby residences. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR section referenced here.

Comment 548-7

Impacts on the San Joaquin River Parkway

Table 4.16-1 includes out-of-date and incorrect information regarding recreation facilities near the project sites. In November 2024, the San Joaquin River Parkway and Conservation Trust opened Ball Ranch and Ledger Island under contract with the San Joaquin River Conservancy for public access 7 days per week. The current operating conditions are much more robust than described based on information dated to 2021. Additionally, both Sumner Peck

Ranch and the Coke Hallowell Center for River Studies are open daily for free public recreation access. The DEIR does not adequately analyze the impacts of the project based on current existing conditions of recreational facilities.

Response 548-7

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 548-8

The DEIR Project Objectives section (ES-3) includes a goal to "provide potential Parkway trail easements." The Surface Mining Reclamation Plan (Appendix B-1) references past discussions between CEMEX and the San Joaquin River Conservancy but lacks clarity on commitments and timelines.

The DEIR must provide greater clarity regarding the proposed trail development associated with the project. Specifically:

22) The timeframe and exact location of the trail must be clearly identified.

23) The San Joaquin River Parkway Master Plan (Buffer.3 policy) requires a 300-foot buffer between trails and active mining sites, separated by physical barriers. The DEIR must demonstrate how the proposed trails comply with this requirement.

24) Since the trail is being presented as a community benefit of the project, the DEIR must explicitly state that CEMEX is responsible for its construction and long-term maintenance. This aligns with the County's General Plan Policy TR-A1.15—"the County shall seek funding for construction and maintenance of bicycle facilities and trails."

Additionally, the DEIR should disclose:

25) What actions CEMEX is currently taking in collaboration with the San Joaquin River Conservancy to develop plans for trail easements.

26) The anticipated timeline for securing easements, finalizing designs, and initiating the construction of the trails described in the DEIR.

Response 548-8

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 548-9

I also have concerns about the noise impacts that will result from processing aggregate materials as well as blasting and drilling. The Plant Site and Quarry Site are in close proximity to public and private lands, providing recreational opportunities along the San Joaquin River. Today, a walk through Ball Ranch would expose you to the stark visual and aesthetic impacts of the processing equipment and the disruptive noise of rock crushing, negatively impacting the physical and mental health benefits of spending time in open spaces. When the processing equipment is moved to the quarry site, coupled with the noise from blasting and drilling, visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch will experience significant impacts from the project. Clearly, the project will negatively impact recreational amenities in proximity to the project. Additional analysis is needed to mitigate these impacts fully.

Response 548-9

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 548-10

Inadequacy of Proposed Mitigation Measures for Significant Unavoidable Impacts

The DEIR documents three significant and unavoidable impacts:

1. 4.1-1 and 4.1-2: Substantial effects on a scenic vista and visual character.

2. 4.17-1: Conflicts with transportation plans.

Impacts 4.1-1 and 4.1-2: The project will substantially affect a scenic vista and degrade the existing visual character or quality of public views. The proposed mitigation measure—staining exposed rock only after each phase is completed—is entirely inadequate, as it does nothing to minimize the visual degradation during the project's active lifespan. This represents an improper delay in

implementing required mitigation measures, which is not permitted under CEQA.

- Project neighbors, Parkway users, and the broader community should not be subjected to these significant impacts for the next 100 years; mitigation measures must be implemented proactively as impacts occur rather than deferred indefinitely.

Response 548-10

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation. Please see Collective Response #29 and Collective Response #30 pertaining to transportation impacts and mitigation and road safety.

Comment 548-11

Additionally, the DEIR states that significant and unavoidable impacts at two intersections cannot be fully mitigated due to uncertain funding and timelines for necessary improvements.

- The County must not approve a project with known, significant, and unavoidable traffic impacts without a clear timeline and guaranteed funding for necessary roadway improvements. The DEIR must clearly document financial assurances and timelines for road improvements required to mitigate the projects transporation [sic] impacts.

- Comprehensive contingency plans must be established to address increased congestion, and safety concerns for local residents, Parkway users, cyclists, and commuters.

- The DEIR should outline the specific measures that CEMEX will be required to implement to address roadway impacts, including damage to vehicles from falling rocks, broken windshields, and debris accumulation in bike lanes.

- There must be enforceable requirements for truck covering, roadway cleaning, and financial responsibility for road maintenance and repairs to ensure public safety and infrastructure protection.

Response 548-11

Please see Collective Response #29 pertaining to project traffic impacts and mitigation. See also Collective Response #30 pertaining to roadway safety.

Comment 548-12

Impacts on Air Quality

The DEIR's air quality analysis compares emissions from the proposed expansion to existing mining operations rather than a no-project scenario (4.3.3.3). I believe this analysis methodology minimizes the project's actual impact, especially since neither the Plant Site nor Quarry Site operations have previously undergone the CEQA process.

27) Fresno County should require further air quality analysis to establish a baseline that assumes no project rather than comparing emissions from the proposed expansion to existing conditions. It is appropriate to evaluate the project's full impact against a scenario where mining ceases to assess the project's true impact on air quality.

Response 548-12

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 548-13

Table 4.3-24 shows that the proposed project may exceed cancer risk thresholds, a potentially significant impact. The DEIR states that mitigation measure 4.3-2 will reduce this impact to a less-than-significant level.

28) The DEIR must state who will be responsible for monitoring CEMEX to ensure that mitigation measure 4.3-2 requirements are correctly implemented and what enforcement mechanisms will be put into place to ensure compliance, including what consequences CEMEX will face if it fails to meet these requirements.

Response 548-13

Please see Collective Response #11 pertaining to community cancer risk.

Comment 548-14

Impacts on Wildlife

The DEIR must be revised to fully assess the project's potential impacts on wildlife, including threatened and sensitive species, and to ensure compliance with state and federal protections.

29) The current analysis (Table 4.4-1) is too limited and may have overlooked species that could be significantly affected by the project. To capture all relevant occurrences of special-status species, Fresno County should require additional analysis, expanding the special-status search radius to the industry standard nine-quadrangle.

Response 548-14

Please see Response 65-4 and Final EIR Appendix E-6, "WRA Supplemental Biological Resources Evaluation Memorandum," for discussion of the scope of the California Natural Diversity Database (CNDDB) search radius. See also Chapter 3, "Draft EIR Errata," Section 3.2.5.4, "Errata to Draft EIR Section 4.4, Biological Resources," for revisions to the Draft EIR for the purpose of amplifying and clarifying information pertaining to baseline conditions of the project's biological resources.

Comment 548-15

- The mitigation measure for nesting birds 4.4-1c appears inadequate per the CA Department of Fish and Wildlife policies for protecting nesting birds. Several key concerns should be addressed:

  - There is a lack of clear, enforceable monitoring duration. The measure states that the biologist "may decide whether ongoing nest monitoring is warranted," which creates uncertainty and leaves too much discretion without a defined standard. The mitigation should specify the required monitoring frequency and duration if an active nest is found. Ongoing monitoring should be required.

  - The buffer zones mentioned in the DEIR are not adequate for certain sensitive species (Swainson's hawk and Bald eagle), particularly raptors or other large birds, which require larger species-specific buffers.

  - The DEIR must demonstrate compliance with applicable laws, including the California Endangered Species Act, the federal Endangered Species Act, and CDFW guidelines for species protection.

Response 548-15

As revised in Chapter 3, "Draft EIR Errata," Mitigation Measure 4.4-1c provides the following:

> If an active avian nest is discovered during the pre-construction clearance survey, mining and/or reclamation activities shall stay outside of a buffer recommended by the qualified biologist. Buffers may be as small as 100 feet around the active nest of non-status passerine species. For listed and raptor species, this buffer shall be expanded to 500 feet (minimum for raptors) and 0.25 mile for bald eagle or listed species such as Swainson's hawk. A qualified biologist shall be present to delineate the boundaries of the buffer area and monitor the active nest as detailed below to ensure that nesting behavior is not adversely affected by mining and/or reclamation activities. Once the young have fledged and left the nest, or the nest otherwise becomes inactive under natural conditions, mining and/or reclamation activities within the buffer area can occur.

As revised in Chapter 3, "Draft EIR Errata," Mitigation Measure 4.4-1c provides the following criteria that define the amount and duration of nest monitoring that would be required if an active avian nest is located during a preconstruction clearance survey:

30) If an active nest is found and construction will need to occur within the recommended buffer the qualified biologist shall watch the nest for at least 1 hour prior to initiating mining and/or reclamation activities and continuing for at least 1 hour following the start of mining and/or reclamation activities to determine if the nesting birds are disturbed by construction activities. If the birds appear distressed or behave aggressively toward the construction, work will not occur within the buffer, and a greater avoidance buffer shall be implemented and observations by the biologist will continue. Once a suitable buffer has been determined to be effective, the biologist may decide whether ongoing nest monitoring is warranted.
31) If an active nest is found and construction will occur within the specified buffer for the active nest for multiple weeks, the nest shall be checked on the first day as described above, while establishing a suitable buffer. Subsequently the nest shall be checked at least twice per week to determine if its status has changed. The biologist shall then recheck the nest a week after mining and/or reclamation activities have ceased in the focal area to note the status, e.g., if the nest remains active.

32) If the nest of a listed or fully protected species is found within the survey buffer, and work will need to occur within that buffer, CDFW will be notified for coordination of any additional monitoring recommendations.

The biologist would be required to observe and monitor an active avian nest (if located) for a minimum of 15 minutes during construction activities. If the birds appear distressed, the Biologist would establish a greater avoidance buffer zone between the nest and the construction activities. The biologist would have the discretion to determine whether future monitoring is necessary based upon the behavior of the nesting birds. (Draft EIR 4.4-51 through 4.4-52.) Mitigation Measure 4.4-1c would require at a minimum that the biologist check on an active nest on a weekly basis in the scenario where construction would occur within 300/500-ft of the nest for multiple weeks. See Response 65-15 for a discussion of the sufficiency of the buffer zones for nesting birds and raptors.

The proposed project would continue to comply with all applicable state and federal laws associated with species protection. The CDFW guidelines for species protection are not mandated by CEQA.

Comment 548-16

The analysis of the impacts on fish is based on Alaska Department of Fish and Game standards for the Proper Protection of Fish, resulting in a finding that the impacts will be less than significant, with no mitigation required. Additionally, the DEIR lacks analysis of how deeper mining could impact river flows and, consequently, spring-run Chinook salmon.

33) The County must not rely on Alaska standards to assess impacts on California rivers unless it can be demonstrated that the site conditions under which those standards were developed are directly comparable to the existing conditions of the San Joaquin River.

34) CEMEX should be required to conduct a more thorough analysis of how deeper mining could affect river flows and the potential consequences for spring-run Chinook salmon, ensuring that the evaluation is based on site-specific data and California-relevant standards.

Response 548-16

Please see Response 65-13 for discussion of the adequacy of the Alaskan Blasting Standards for evaluating potential impacts to fish in the San Joaquin River.

The Draft EIR analyzes the project's potential impacts to San Joaquin River flows through the alluvium and weathered rock, and concludes that this impact would be less than significant (see discussion of Impact 4.10-12 on Draft EIR pages 4.10-113 through 4.10-114). The proposed project would not significantly impact spring-run Chinook salmon (Draft EIR page 4.4-63).

Comment 548-17

Delayed Mitigation Measures and Production Threshold Concerns

The DEIR fails to ensure that the critical mitigation measures will be implemented in a timely manner, as some are only triggered when CEMEX reaches the 3.0 million tons (MT) production threshold. This raises serious concerns:

- There is no guarantee that CEMEX will ever reach the 3.0 MT threshold, meaning these mitigation measures could be indefinitely delayed or never implemented at all.
- Mitigation must be tied to actual environmental impacts rather than production levels. The County must require that these measures be implemented based on cumulative impacts over time, not conditional production milestones.
- A clear enforcement mechanism must be established to ensure that all necessary mitigation measures are carried out, regardless of whether CEMEX reaches the specified production levels.

Response 548-17

The comment incorrectly asserts that Draft EIR mitigation measures are triggered by a 3.0 million tons (MT) per year threshold. It is unclear which specific mitigation measure the commenter is referring to; however, to the extent the comment pertains to Mitigation Measures 4.17-1h, 4.17-1i, 4.17-1o, and 4.17-1p, these measures relate to traffic signal warrant analyses and potential signal installation based on those analyses. As described in the Draft EIR, the evaluation of these measures interpolates between analysis scenarios at 2.0 MT per year and 3.0 MT per year of production, with the trigger for conducting traffic signal warrant analyses occurring at approximately 2.65 MT per year based on that interpolation. These mitigation measures, as revised in Chapter 3, "Draft EIR Errata," would be incorporated into the Mitigation Monitoring and Reporting Program (MMRP) and overseen and enforced by the County.

To the extent the commenter is instead referring to reclamation activities, these are not mitigation measures triggered by a production threshold but are part of the project's

phased operations. Reclamation at the Quarry Site would occur upon completion of Phase 2 mining, and reclamation at the Plant Site would occur at the end of Phase 2, anticipated within approximately 30 years. The Draft EIR adequately addresses reclamation activities in compliance with CEQA.

Comment 548-18

Given the significant environmental, public safety, and community concerns outlined, the DEIR fails to assess the project's long-term consequences adequately. The San Joaquin River, its fragile ecosystems, and the residents and visitors who depend on it for clean air and water deserve a far more rigorous evaluation. Fresno County must require additional analysis, enforce stronger mitigation measures, and secure binding financial commitments from CEMEX before considering project approval. However, the best course of action is to reject this project outright—preventing irreversible damage to the San Joaquin River and the Parkway and avoiding the creation of a 600-foot-deep scar that will outlast generations. The County has a choice: allow this project to permanently alter the landscape or take action now to ensure these lands are restored for future generations. Reclaiming these lands today would leave a far better legacy than a deep, abandoned pit.

Thank you for your time and consideration of these comments, questions, and requests.

Response 548-18

The commenter's concerns and requests for additional analysis or for denial of the project are noted and will be considered by County decision-makers. Please see responses above regarding specific issues raised in the comment letter.

Letter #549 March 10, 2025, Pearson Family

Comment 549-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 549-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the

adequacy of the Draft EIR or mitigation measures. Please see Response 549-2 through 549-11 below for further discussion of the commenter's specific concerns.

Comment 549-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 549-2

See Response 349-2.

Comment 549-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 549-3

See Collective Response #17 related to bank stability and flooding.

Comment 549-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 549-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that

Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 549-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 549-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 549-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 549-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 549-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 549-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 549-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 549-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety.

Comment 549-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 549-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 549-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 549-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (see Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section

4.4, "Biological Resources," does not need to be rewritten or recirculated. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 549-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 549-11

The project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #550 March 10, 2025, Steven Pearson

Comment 550-1

Good day Mr Randall. We have not been prone to add our thoughts on local events, but with this project we see nothing but red flags.

We have lived in the Millerton area for almost 12 years now, and pass this location several times a week.

There is already an endless convoy of trucks on Friant Rd adding to traffic. The size and weight of these vehicles breaks down the road surface much faster than regular vehicle traffic. They play havoc on our cars, especially windshields, which we have had to replace on multiple times due to rock damage from these trucks.

Response 550-1

The issue of truck traffic is addressed in Draft EIR Section 4.17, "Transportation." See Collective Response #29 regarding the project's truck trips, traffic congestion, and road

maintenance. See also Collective Response #30 regarding vehicle damage from haul truck rock debris.

Comment 550-2

The size of the project is also concerning. A 600' deep pit? Really? And will they fill this pit back in when they're complete? And what with constant expansion of the city, and home building, this location will not be considered a remote location for much longer. It certainly appears that this will be within an area of city influence area soon.

Response 550-2

As described in Draft EIR Section 2.5.7.2, "Quarry Site Reclamation Plans," the Quarry Site excavation would be allowed to fill with groundwater and rainfall creating a 108-acre, 100-foot-deep lake. The issues of land use compatibility and consistency with applicable land use plans are discussed in Draft EIR Section 4.11, "Land Use and Planning." The comment is noted for the decision-makers.

Comment 550-3

The final thing that bothers us is the time frame that will be allowed for the expansion to operate. ONE HUNDRED YEARS is a ridiculous number. Do you really think that there will not be changes in even the next 5 or 10 years that should require a re-look or reassessment of the operation of this project?

We hope those involved with this decision will choose to act responsibly.

Response 550-3

See Collective Response #5 regarding the duration of the proposed use permit. The comment is noted for the consideration of the decision-makers.

Letter #551 March 10, 2025, Corona, Celeste Perez

Comment 551-1

As a frequent volunteer along the river, I write this letter to urge you to address the air quality, noise pollution, water pollution, and wildlife protection issues that the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project fails to consider effectively.

Response 551-1

The Draft EIR addresses the topics of air quality, noise pollution, and water pollution in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13 "Noise," and Section 4.10, "Hydrology and Water Quality," respectively. Additionally, it addresses wildlife in Draft EIR Section 4.4 "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. The comment is noted for the decision-makers.

Comment 551-2

Regarding the air quality, what measures will Cemex take to ensure the air pollution they will be causing is minimized, and how can we hold them accountable as well as how can they hold themselves accountable?

Response 551-2

The issue of air pollution is addressed in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). Mitigation Measure 4.3-2b would require the Operator to prepare and implement a Fugitive Dust Control Plan including the use of water and chemical suppressants to prevent dust on roads and disturbed surfaces as well as Mitigation Measure 4.3-4, as updated in the Final EIR, requiring incorporation of design features to the proposed asphalt plant to control emissions. These measures would be enforced through annual reporting and County inspections.

Comment 551-3

Regarding noise pollution, Cemex already ruins the current natural space around them with their production noises. How can we hold them accountable to the noises they will be making during the process of the pit? Have they

Response 551-3

The issue of noise pollution is addressed in Draft EIR Section 4.13, "Noise." The comment describes existing conditions which are not required by CEQA to be evaluated in the Draft EIR. Draft EIR Section 4.13 provides Mitigation Measures 4.13-2 and 4.13-3 to reduce noise levels at the Plant Site and the Quarry Site, respectively. Mitigation Measure 4.10-1 is further provided to address anticipated groundborne vibrations resulting from proposed blasting. These measures would be enforced through monitoring as specified in the measures and through annual County inspections and noise complaints.

Comment 551-4

Have they considered how that will affect the wildlife? If so, how will they ensure the wildlife remains in the area?

Lastly, have they spoken to local ranchers and talked to them about the effects this will have on their cattle and other livestock? How will Cemex ensure the wildlife such as the fish, deer, birds, and critters aren't harmed? How will they hold themselves accountable, and how can we hold them accountable?

Response 551-4

The project's potential effects on fish and wildlife species are evaluated in Draft EIR Section 4.4. See Impact 4.4-1 beginning on Draft EIR page 4.4-48 for discussion of the project's effects on wildlife on the project sites and Impact 4.4-2 beginning on page 4.4-52 for discussion of effects on wildlife located in riparian areas surrounding the project sites. Multiple mitigation measures are provided to avoid or minimize impacts to sensitive wildlife species and include requirements for pre-construction surveys and avoidance measures monitored by a qualified biologist.

Comment 551-5

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 551-5

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. The comment is noted for the decision-makers.

Letter #552 March 10, 2025, Alan Pinkerton

Comment 552-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. As a frequent user of the San Joaquin River

corridor between Friant and Sycamore Island, I have several concerns that I urge you to address prior to moving forward with approval.

The DEIR says that project emissions may exceed cancer risk thresholds. DEIR pg. 4.3-63. The DEIR says that because mitigation measures would reduce emissions, the DEIR did not evaluate population-wide cancer burden. DEIR at pg. 4.3-64. CEQA requires that the analysis be performed before taking into account implementation of mitigation measures.

Response 552-1

After mitigation, the cancer risk at the maximum exposed individual sensitive receptor (MEIR) decreases from the Baseline condition (i.e., cancer risk is a negative value demonstrating that the project would be a benefit). Accordingly, other locations would have even less cancer risk, demonstrating an even larger benefit in these other locations. Thus, the cancer burden, a measure summing effects from each census block, would show a benefit. Therefore, cancer burden was not calculated in the Draft EIR. Nevertheless, in response to air comments on the Draft EIR, the technical analysis was reviewed, and the analysis was updated to clarify and amplify the information described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3, Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The analysis includes cancer burden modeling for the project and after mitigation. It demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 552-2

Inadequate analysis of the potential effects of the project on the state listed as threatened Swainson's hawk. With more than four dozen breeding season occurrence records of this species within 2 miles of the project site (eBird 2025) and numerous potential nest trees within 0.5 mile, the project could impact Swainson's hawk. Construction activities such as blasting, excavating, trenching, or using other heavy equipment that disturbs or harms a Swainson's hawk or substantially modifies its habitat could constitute a significant impact. To meet California Department of Fish and Wildlife (CDFW) recommendations for mitigation and protection of this species, protocol surveys would need to be conducted within a 0.5-mile radius around all project activities. If active nesting is identified within the 0.5-mile radius, consultation with that agency would be required.

Response 552-2

Based on the existing site conditions, the majority of the project area has been disturbed by decades of continuous mining operations, which therefore limit foraging opportunities for Swainson's hawks within the project boundaries. However, areas adjacent to the mining operations, such as fallow fields and open spaces, may offer potential foraging habitat. The project sites are located within the known nesting range of Swainson's hawk. Project implementation may result in the conversion or loss of marginal foraging habitat; therefore, Mitigation Measure 4.4-1c requires pre-construction clearance surveys for active avian nests which would reduce potential indirect impacts to the Swainson's hawk to less than significant. Please see response 58-36 and 58-38 for further discussion of the project's potential impacts to Swainson's hawk.

Comment 552-3

Mischaracterization of a regulated habitat. The Waste Wash Conveyance Ditch at the Plant Site likely qualifies as a stream, and diverting or obstructing its natural flow; altering its bed, channel, or bank; or depositing any material into this feature would be subject to provisions of California Fish and Game Code

Section 1600 et seq.

Response 552-3

The wastewater conveyance ditch is a pre-existing feature at the Plant Site and constitutes the CEQA Baseline (Draft EIR, page 4.4-4). This feature is a temporary feature that is part of the existing site design. Its purpose is to convey water from aggregate washing operations to the silt ponds, where the silts and fines are settled out. The wastewater conveyance ditch would be removed with mining. This feature does not meet the criteria for "waters of the state" and is not subject to Fish & Game Code Section 1600 et. seq.

Comment 552-4

Public Safety especially as it relates to the Quarry Site is a concern for the future once the site is abandoned. This could be analyzed under the Hazard category as the Fresno County General Plan Implementation Program HS-E.B includes a statement that "The County shall, as part of the development review process, ensure that new development does not create manmade safety hazards.

The public safety hazard that the quarry will represent after the project is complete 100 years or so from now (and maybe before) is a significant concern that needs further analysis and mitigation measures. With the stepped but vertical walls and a surface water elevation more than 400 feet below the trail elevation, the open

quarry will not be suitable for fishing, swimming, boating, kayaking, canoeing, floating or anything else. But it will be ATTRACTIVE, especially to preteens and teenagers. Rest assured fences that will keep people out. What will happen when one or more of the public falls into the pit or worse yet drowns in the pit after the site is abandoned? I question if the County Search and Rescue is trained and equipped to deal with body recovery in 400 feet of water.

Response 552-4

See Response 358-5 regarding public safety at the quarry pit. The project would comply with SMARA and Fresno County requirements pertaining to pit safety. CEQA focuses on a project's environmental impacts. The potential risk of trespassing does not involve any physical environmental impacts and thus would be outside the scope of the analysis required under CEQA.

Comment 552-5

The flood hazard analysis is limited to the FEMA 100-year floodway and floodplain and states the "the floodplain does not encroach into the Quarry Site" as shown on Figure 4.10-1.

The continued development of the berm between the river channel and the Quarry Site will constrain the river and will create a choke point especially at the north end of the Quarry Site where the easterly bank of the river is more vertical. According to the 100-Year Hydraulic Results found in the Hydraulic Analysis in Appendix G-1, the flood water surface elevation between Stations 20 and 21averages out to 313.27 feet. Without a constraining bank between Stations 20 and 21 on the east side of the river additional water flow will likely push to the east across the north side of the Quarry Site. The Executive Summary includes the following caveat: The Bureau of Reclamation owns and manages the dam, and, during unforeseen events, may be required to release water into the San Joaquin River at rates that could exceed the river channel capacity (Fresno County 2018a). This sounds like a highly likely "train wreck" to me.

Response 552-5

The 100-year floodplain does not enter the Quarry Site from stations 20 to 21. As discussed in Impact 4.10-17, the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir is not required to be addressed under CEQA because such releases are not reasonably foreseeable. In consideration of commenters' concerns pertaining to severe flooding events and in light of County Policy HS-C.12, Chang

Consultants evaluated the potential for the 200-year flood to enter the Quarry Site and Plant Site (see Appendix G-7, "200-year Flood Hazard Analysis – Quarry Site" and Appendix G-8, "200-year Flood Hazard Analysis – Plant Site"). Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. A topographic map was prepared to display the locations where the berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site. Please see Collective Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site, and see Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.11, "Land Use."

Comment 552-6

The threshold of significance used is inappropriate at this site. Noise along area roadways used by truck traffic already exceeds the General Plan normally acceptable standard of 60 dBA in residential areas. The threshold used doesn't make sense in an area where residents are already exposed to high levels of noise. Any increase of noise should be considered significant. See DEIR Table 4.13-6 at pg. 4.13-28 and Table 4.13-13 at [sic] starting at pg. 4.13-49.

Response 552-6

The rationale for the selection of thresholds used to assess the significance of increases in traffic noise exposure due to the project is provided on Draft EIR Page 4.13-32. These thresholds, which are based on Federal research into assessing project related noise level increases, have been used extensively in multiple EIRs prepared by the noise study authors, and, to the authors knowledge, have never resulted in an EIR failing to be certified as adequate. CEQA requires that a project-related increase in noise be substantial for a finding of potentially significant noise impact, not simply audible. As such, audibility is not a test of significance under CEQA.

Additionally, see Response 291-5, which addresses project-traffic noise impacts, including increases in ambient noise levels resulting from project heavy truck traffic.

Comment 552-7

Table 4.16-1 Recreation Facilities Near the Project Sites – Some of the table sources are dated to 2021. Several properties listed (namely Ball Ranch and Ledger Island) were not formally open to

the public then. These properties are now operated by the San Joaquin River Parkway and Conservation Trust under a contract with the San Joaquin River Conservancy. There is more public use of the sites under current conditions that the project should analyze.

The description of the San Joaquin Fish Hatchery does not fully encompass the recreational facilities available, including FINS and the Parkway Trail from the hatchery to Lost Lake Park. It is more than "limited public access" today.

The descriptions of Ball Ranch and Ledger Island do not encompass the current operational status of public access availability 7 days a week.

The descriptions of the River Center and Peck Ranch state public access by permission, which is not entirely accurate. The properties have regular operating hours and is open to the public daily.

As you can tell from my response I am concerned and adamantly opposed to extending any expanded and future use of the CEMEX Rockfield site on the San Joaquin River. Please add me to any future correspondence concerning the future of this proposal.

Response 552-7

Please see Collective Response #19 pertaining to public accessibility to parks, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

The commenter's concerns and opposition to the project are noted and will be considered by County decision-makers.

Letter #553 March 7, 2025, Chrisopher Pluhar

Comment 553-1

This letter constitutes public commentary of a local citizen on the subject draft EIR. I recognize that the Fresno area requires a local aggregate supply in order to maintain a local healthy economy and minimize the climate impacts of shipping large quantities of heavy low- value material large distances. However, the proposed project and its alternatives suffer from some important shortcomings. A useful comparison operation is Vulcan Materials' Austin Quarry, which does/will do much the same type of operation, but significantly: 1) Austin Quarry is not directly adjacent to one of California's largest rivers, 2) Austin Quarry is much further from significant population than the proposed activity.

Response 553-1

The commenter's input is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR. Please see Response 553-2 through 553-9 below for further discussion of the commenter's specific concerns.

Comment 553-2

Concerns:

Impact 4.10-1, 4.10-2, 4.10-3

Flood.

1) It is well known that 100-year-flood levels can change due to urbanization of a watershed https://www.sciencedirect.com/science/arJcle/pii/S002216941 8308242, other floodplain modifications https://onlinelibrary.wiley.com/doi/abs/10.1002/hyp.8261, and climate change https://nhess.copernicus.org/arJcles/17/2199/2017/. Our region is specifically predicted to experience increased flood extremes, e.g., https://onlinelibrary.wiley.com/doi/abs/10.1111/j.1752-1688.2011.00546.x. The proposed project uses FEMA flood projections from 27 years ago and adjusts for local topographic change. These 27 years included all ten of the ten hottest years on record (https://journals.ametsoc.org/view/journals/bams/101/5/bams-d-19-0215.1.xml). Winter storms are expected to deliver increased proportions of rain compared to snow, meaning that past snowpack storage will be decreased and winter runoff increased. These well-known trends towards increased future flood hazard are not addressed by the EIR, though they are "reasonably foreseeable [sic]". A flood overtopping or eroding and breaching the buffer zone between the proposed quarry pit and the San Joaquin River would deliver sediment, equipment, and potentially hazardous materials directly to the river. This would not be an acceptable outcome.

Response 553-2

The San Joaquin River watershed tributary to the site is primarily rural and natural, so the hydrology is essentially the same as determined by the FEMA study. Under CEQA case law, CEQA generally requires analysis of a project's impacts on the environment, rather than the effects of the environment (including future climate change) on a project. See *California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62

Cal.4th 369, 392-397. Accordingly, the Draft EIR is not required to evaluate the potential effects of future climate change on the proposed project. The buffer zone berm is higher than the 100-year water surface elevations, which would prevent overtopping breaching (see Draft EIR Appendix G-1, "Hydraulic Analysis"). The hydraulic analysis incorporated flood flow rates higher than the 1997 flood. The 1997 flood flow rate of 60,300 cfs is lower than the 100-year flow rate of 71,000 cfs studied for the project (Draft EIR Appendix G-1).

Comment 553-3

2) The draft EIR contains the following, completely-unsupported claim "*During historic flow events, including the January 1997 flood event of approximately 60,300 cfs, the existing easterly channel bank along the Quarry Site did not experience significant erosion and the bank has never breached into the Quarry Site.*" *The draft EIR apparently does not demonstrate that no erosion took place, and therefore any conclusions upon which this is based are speculative, such as the assertion that significant bank erosion will not occur during the project period of 100 years. An attempt should be made to measure historic channel erosion, which could be done with historical airphoto records.*

Response 553-3

As a part of geotechnical design studies for the proposed project, available historical aerial photographs dating back to 1957 were in fact reviewed by the geotechnical consultants as a part of the 2019 geotechnical investigation. (Draft EIR Appendix F-2, "Quarry Site Geotechnical Report," page 20.) While water levels within the channel were noted to vary, no significant changes to the eastern bank of the San Joaquin River adjacent to the project were interpreted from the reviewed photographs. The proposed project would include a horizontal buffer zone of 200 feet which would extend from the top of the existing river channel to the top of the planned mining slope easterly of the river side. The planned mining slopes within the soil cover would be excavated at a maximum gradient of 2(H):1(V). This gradient within the soil cover would provide an additional lateral buffer from the river channel to the anticipated groundwater surface.

The Flood Insurance Rate Maps No. 060044 and 065029 (Panel 1030 of 3525), prepared by the Federal Emergency Management Agency (FEMA, 2009, 2017), indicate that the westerly portion of the site adjacent to the San Joaquin River is located within Zone AE, i.e., determined base flood elevations from south to north along the western property limits of 307 feet to 311 feet. Analysis by Chang Consultants (2019) utilized more recent site topography from November 2018 and concluded that the November 2018 site grades

and planned quarry expansion comply with local, state, and federal floodway and floodplain regulations, with no significant flood risk for the project.

Comment 553-4

Impact 4.7-3, 4.7-4, & 4.7-07

Soil slope stability

Upon dewatering the site, hydraulic head between the San Joaquin River and the quarry will substantially increase, causing the flow of water through the buffer to increase, potentially triggering sapping/piping of higher-permeability soil zones and triggering slope degradation by that mechanism. This will be exacerbated by proposed installation of water recharge trenches along the buffer between the river and the quarry. Piping/sapping problems are well-known to trigger river levee failures by washouts as well as slope failure. The geophysical seismic logs span only a tiny fraction of the perimeter of the quarry site and could easily miss some variations in the depth of soil-bedrock interface that may be significant in this regard. In addition, the lateral variation in alluvial soils means that it could be easy to miss zones of preferential groundwater/soil piping/sapping problems. Additional geophysical surveying along the entire perimeter between the river and quarry site, including groundwater-sensitive techniques such as resistivity, would be important to identify problem areas. Groundwater cutoff walls should be considered to mitigate the potential sapping/piping problem as well as groundwater infiltration to the quarry site.

Response 553-4

Groundwater modeling for purposes of slope stability analysis and as a means of controlling seepage related conditions during mining were based on the well data available at the time of the investigation in 2018-2019 (see Draft EIR Appendix G-4, "Groundwater Conditions at the Quarry Site"). A program of groundwater monitoring for purposes of verifying conditions during the planned mining was provided to CEMEX in 2021 (Tetra Tech 2021b). Consideration for piezometer installation and aquifer testing was made and included within the investigation report. While the subsurface geologic data and the groundwater data at the time of the investigation did not cover all areas of the project, the distribution of data, particularly along the western edge of the site adjacent to the San Joaquin River, is considered adequate to meet the intent of the geotechnical design and the standard of care for similar projects. The additional groundwater data to be obtained during the planned mining would be used as a basis for updating the site geologic and hydrologic model and for analyses supporting future

mining. These data, and the results of the analyses, would be provided to the Operator for their use in mining planning as well as the need for modifications to the groundwater monitoring system.

The comment suggests groundwater cutoff walls to mitigate potential sapping/piping; however, this is not necessary because sapping/piping is not possible in granitic bedrock due to its massive, intact, competent nature. The overlying weathered bedrock and alluvium are not within the zone of the groundwater flow (Ken D. Schmidt and Associates 2021); therefore, groundwater flow-induced mechanisms (i.e., sapping/piping) are not applicable.

Comment 553-5

Impact 4.7-3 & 4.7-07

Rock slope stability

Kinematic analysis can reveal slope instability that occurs from rock discontinues, such as fractures, foliation, and/or faults. Elements in the draft EIR:

- "*The geological data obtained from ROC-1 through ROC-7 could not be utilized for kinematic analyses due to the absence of the dip directional information. The geological data obtained from MW-5D through MW-7D also could not be utilized for kinematic analyses due to the absence of both the dip angle and dip directional information. Only geological information obtained from the 4 geophysically logged borings MW-1D through 4D are available for kinematic analyses. Although helpful, this information is not considered sufficient to support developing meaningful or reliable kinematic models for stability evaluation of the planned mining slopes for the mining area extending over 280 acres*".

- "*It is our opinion that groundwater monitoring data reported on December 14, 2018 are based on open standpipe data and therefore do not provide information about the continuity of the groundwater flow, distribution of aquifers and aquitards, and consequently they do not provide the key information for the pore pressure distribution within the slope stability model. Therefore, the pore pressure distribution for the slope stability model was "backcalculated" as to provide an acceptable Factor of Safety for the proposed slopes.*

  This "backcalculated" groundwater regime/pore pressure distribution will need to be verified either by focused field

investigation consisting of installation of piezometers and permeability packer tests prior to the commencement of the mining operations, or by development of a mitigation plan combined with implementation of a monitoring program during mining." In other words, critical elements of the slope stability, pore water pressures, are not known, but values were inserted into the calculations to give acceptable answers. Elevated pore water pressure is typically the proximal cause in slope failures.

- Abundant rock fractures occur within the granitic bedrock at a wide range of orientations:
    - ROC-1 89 fractures in a 253 P deep borehole, averaging 1 fracture per 2.8 P
    - ROC-2 42 fractures in a 228 P deep borehole, averaging 1 fracture per 5.4 P
    - ROC-3 30 fractures in a 208 P deep borehole, averaging 1 fracture per 6.9P
    - ROC-4 56 fractures in a 203 P deep borehole, averaging 1 fracture per 3.6 P
    - ROC-5 34 fractures in a 217 P deep borehole, averaging 1 fracture per 6.4P
    - ROC-6 152 fractures in a 260 P deep borehole, averaging 1 fracture per 1.7 P
    - ROC-7 38 fractures in a 208 P deep borehole, averaging 1 fracture per 5.5 P

  MW boreholes also contain significant fractures. This highlights the possibility of wedge failure at a much wider variety of orientations than those analyzed, as show in the "MW" borehole kinematic analyses – every intersecting arc is a potential wedge failure. The boreholes sample only a vertical section with no lateral extent, while the project excavation will have a very long lateral extent, exposing any and all fractures that are not parallel to the rock slope.

Other facts

- Unloading a rock mass by excavation by the proposed large amount is known to trigger fracturing in bedrock as the stress state of the material is substantially altered. This would

enhance the number, length, aperture, interconnection, and groundwater conductivity of the fracture network, all of which would reduce slope stability.

- Significant DEIR space is devoted to the strength of the granitic rock mass. This is only important for "rock bridges" in between the rock fractures. To first order, the rock mass is held in place by friction on the rock fractures and the strength of the rock bridges.

As such, the proposed slope stability design is largely speculative. Given the large potential negative impact of a slope instability compromising the buffer between the San Joaquin River and the quarry, this seems unacceptable. "groundwater regime/pore pressure distribution" should be measured in order to adequately address slope stability concerns. The kinematic analyses should also include the spatial variation of factors of safety in the modeled slopes.

Response 553-5

Slope stability was evaluated along four sections considered representative of geologic conditions for the planned perimeter mining slopes at the completion of mining. The slope stability analyses initially utilized strengths associated with fractures and foliations of the involved earth materials based on published relationships and engineering judgment and groundwater conditions associated with anticipated partly saturated slopes. Following the peer review, the analyses were updated with rigorously determined shear strengths for the intact granite based on Hoek et al. 2002 and assuming an extremely conservative, fully saturated slope groundwater condition. This range of assumptions in the slope stability analyses reliably covers the anticipated slope conditions. Results of the slope stability analyses using both methods indicated factors of safety meeting the project criteria and standard of care.

Although no kinematic analyses were performed due to the absence of necessary data, this aspect was well recognized and discussed in the design documents contained in Draft EIR Appendix F-3 (Tetra Tech 2021a, page 8) and a procedure for addressing the kinematic stability was included. The procedure would include mapping and assessing of the actual mining slopes during the early stages of the mining, with field surveys occurring every six months initially. Because mining would commence within the central portion of the Quarry Site, the kinematic model would be available long before the mining expands to the mining slope limits, which would provide sufficient time for updating and revising the geologic model and associated slope stability analyses and applying them to the final perimeter mining slopes and allowing slope configuration

changes, if necessary. Although unlikely given the massive nature of the granite bedrock, if kinematic instability is present, it would manifest during the early stages of mining and would be addressed by simply modifying the final benching and slope configuration.

Comment 553-6

Impact 4.7-11

Paleontology

The draft EIR states "*No known fossil localities in the project area from the Natural History Museum of LA County vertebrate collections (McLeod 2017, 2019, cited in Appendix F-2). The closest Natural History Museum of LA County locality on record (LACM 7254) occurs in older Quaternary deposits 30 miles northwest of the project area and immediately northeast of Chowchilla.*" *In fact, a bison fossil was found along the San Joaquin River floodplain margin a few miles downstream from the project site (Dundas, Robert G., Yesenia Ibarra, Frederika J. M. Harmsen and Peter K. Van de Water (2009) Bison cf. B. latifrons from the Late Pleistocene Broach Locality, Fresno, California. Current Research in the Pleistocene, v.26, pp.149-151), highlighting the need for the paleontological mitigation, and suggesting that a more-thorough literature review may be needed.*

Response 553-6

Draft EIR Section 4.7.1.3, "Paleontological Resources," on pages 4.7-12 through 4.7-14 provides a comprehensive discussion of paleontological resources occurrence and potential for presence within the project sites. Draft Impact 4.7-11 on pages 4.7-39 through 4.7-41 provides a detailed discussion of potential project impacts to paleontological resources identifying the potential for mining operations and reclamation activities to destroy paleontological resources within the remaining alluvial aggregate at the Quarry Site, similar to the Plant Site, and requires the implementation of Mitigation Measure 4.7-11 at both the Plant Site and Quarry Site. Mitigation Measures 4.7-11, on Draft EIR pages 4.41 through 4.7-43 provides detailed requirements for a paleontological resource impact mitigation program and determined to be sufficient to reduce potential impacts to less than significant. Notwithstanding potential occurrences of fossils outside of the project area that may have been or may in the future be discovered and documented, the Draft EIR sufficiently identifies the potential for paleontological resources encounter and provides effective mitigation to ensure significant impacts would be avoided. The comment does not provide evidence of a deficiency in Mitigation Measure 4.7-11 and no additional literature review of modifications to the measure are needed to ensure the measure's effectiveness.

Comment 553-7

Impact 4.10-10, 4.10-12

Groundwater Impacts

Recharge ditches are proposed to return dewatering water to the subsurface along the west side of the quarry site, adjacent to the San Joaquin River. Thus, some would flow through the subsurface into the river, and some would move back into the quarry. This activity would artificially raise the water table in this area, exacerbating the possibility of slope instability and piping/sapping erosion described above.

Response 553-7

Paleontological resources are considered to be older than recorded human history and/or older than the middle Holocene period (older than 5,000 years). As acknowledged in the Draft EIR and as the commenter suggests, hundreds of fossil plant and vertebrate localities have been reported throughout the San Joaquin Valley. Draft EIR Appendix F-2, "Quarry Site Geotechnical Report," provides a Paleontological Memorandum which assessed the paleontological sensitivity of geologic units exposed at the ground surface and potentially in the project vicinity and the record searches can be found in detail within Appendix F-1, "Plant Site Geotechnical Report." As discussed in Impact 4.7-11, and since no known fossil localities were found in the project area, mining operations, excavation, and ground disturbing reclamation activities have the potential to destroy paleontological resources and therefore, could cause potentially significant impacts. With project implementation of Mitigation Measure 4.7-11 Paleontological Resources, the Operator would develop and implement a Paleontological Resource Impact Mitigation Program (PRIMP) to reduce impacts. The PRIMP requires that all mining operations be halted if a paleontological resource is encountered during earthmoving activities and notify Fresno County. With the implementation of Mitigation Measure 4.7-11 impacts would be less than significant.

Comment 553-7 does not provide substantial evidence the Mitigation Measure 4.7-11 would mitigate potential impacts to paleontological resources to a less than significant level.

Comment 553-8

Other

Public Safety and Wildlife

Quarry walls are proposed to be benched with 50-foot-high highwalls to a depth of 600 P below grade. If the mine site fills with water to the claimed level following operations, this would leave a public safety hazard in perpetuity as well as a trap for non-avian animals.

Response 553-8

See Response 358-5 regarding public safety at the quarry pit. With regards to potential impacts to wildlife after the completion of mining and reclamation, please refer to Impact 4.4-3 beginning on page 4.4-53 of the Draft EIR. The Quarry Site would have fencing around the perimeter of the property, which would reduce potential impacts to non-avian animals (see Draft EIR, Appendix B-1, "Surface Mining and Reclamation Plan," page 59).

Comment 553-9

The forgoing reasons, among others no doubt expressed by the public, indicates that additional planning and justification is needed for the proposed work or its alternatives. If the goal is to mine hard rock for aggregate, it may be done anywhere within a huge swath of the Fresno/Clovis/Madera area with much less impact. The proposed activity and alternative displays too many negative impacts or potential impacts.

Response 553-9

The commenter's concerns and suggestion that additional planning and justification is needed are noted. The Draft EIR provides an extensive discussion of the feasibility of offsite locations as an alternative to the proposed project and the ability of offsite locations to achieve the project objectives. As discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations," on pages 6-5 through 6-7, "[n]o specific location with the attributes necessary to accomplish the project objectives is known in enough detail to be identified as a specific alternative site to feasibly meet the project objective of developing a known high-quality aggregate deposit" and "relocating the proposed operation to another site in the region would introduce new impacts to a site with no previous aggregate mining activity." For these and other reasons detailed in the Draft EIR, an alternative location was properly rejected from further evaluation.

Letter #554 March 10, 2025, Pamela Pokrovsky

Comment 554-1

I have lived in Fresno my entire life. I would like to voice my concerns regarding the Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project.

This project poses multiple threats to the quality of life in the Fresno/Madera area.

Any projected benefits of this project are far outweighed by the harm and detrimental impact it will cause.

Response 554-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter. However, the comment is noted for the consideration of the decision-makers.

Comment 554-2

It threatens the San Joaquin River, local water quality, air quality, public safety, wildlife, and public recreation.

Many of the proposed mitigation measures are not adequate. There even are some impacts that don't have any mitigation planned.

Response 554-2

The project's potential impacts to the San Joaquin River and water quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." The issues of air quality, wildlife, and public recreation are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.4, "Biological Resources," and Section 4.16, "Recreation." The issue of public safety is addressed in multiple sections across the Draft EIR including Section 4.7, "Geology and Soils" (seismic shaking and landslide), Section 4.9, "Hazards and Hazardous Materials" (hazardous substances and emergency access), Section 4.10, "Hydrology and Water Quality" (flooding), and Section 4.15, "Public Services." Mitigation measures are required only where impacts are determined to be potentially significant. The commenter does not specify which mitigation measures are inadequate or missing and no further response can be provided. The comment is noted for the decision-makers.

Comment 554-3

Deep mining will have a great impact on water quality and the San Joaquin River.

Mining next to our precious resource of our San Joaquin River is putting the profits of one company against the health and safety of residents (both human and animal). It raises serious concerns about water loss and contamination. The Draft Environmental Impact Report (DEIR) recognizes that mining could reduce river flows, however it does not any straightforward solution.

The DEIR should identify the impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 554-3

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Collective Response #25 regarding the potential for seepage from the river to reduce surface flows.

Comment 554-4

There has already been a president where flood waters breached the levee and the quarry pit. Where is CEMEX's plan of precaution?

What will happen if the pit becomes a part of the river system? Who will be responsible for cleaning it up or for the long-term damage it would cause?

Response 554-4

See Collective Response #17 regarding riverbank stability and the potential for breach and flooding of the excavation. See also Collective Response #4b regarding liability and funding of unforeseeable environmental damage.

Comment 554-5

In addition, the DEIR utilized data for groundwater that was obtained during a period of low river flow. The DEIR should reevaluate the groundwater data, using data. There is groundwater/surface water interaction at both sites as indicated by the DEIR.

Response 554-5

See Collective Response #26 regarding the baseline groundwater data used in the Draft EIR analyses.

Comment 554-6

There is a lack of mitigation for the impact on air quality, traffic, and appearance.

Response 554-6

The issues of air quality, traffic, and site appearance are addressed in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.17, "Transportation," and Section 4.1, "Aesthetics and Visual Resources." All feasible mitigation measures are required in each of these sections where impacts are determined to be potentially significant. Impacts 4.1-1 and 4.1-3, regarding visual project impact ratings, would remain significant and unavoidable at Locations #12 and #13 despite application of all feasible mitigation measures.

Comment 554-7

The quality of our air will be negatively impacted by the CEMEX project. The DEIR acknowledges that there will be a negative impact on air quantity but does not fully appreciate the severity of he impact. Rather than comparing emissions to current operations, the DEIR should make comparisons to what it is like without such a project. The underestimates impact of the project's impact by not taking this into account the full environmental impact of additional mining.

Response 554-7

The Draft EIR properly compares the proposed project's estimated air emissions with the baseline conditions which include current operations at the project sites. See Collective Response #10 regarding the use of alternative baseline for the air quality analysis. See also Collective Response #9 regarding the project's potential effect on the existing air quality.

Comment 554-8

Congested traffic and road damage are expected outcomes of this project. The project will have a significant impact on traffic. However where is the guaranteed funding and plan for road improvements? How will the County keep CEMEX accountable for debris, damage to the road, and other safety hazards?

Response 554-8

The issues of traffic congestion and road damage are evaluated in Draft EIR Section 4.17. See Collective Response #29 regarding traffic congestion and funding of necessary improvements. See also Collective Response #30 regarding traffic safety, road debris, and vehicle damage.

Comment 554-9

The project will be a blight to our scenic views. With any proposed mitigation occurring only after the harm takes place, for example,

rock staining after mining phases. This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA

Response 554-9

The mitigation proposed in this project is proper under CEQA. A deferral of mitigation measures is inappropriate under CEQA when the measures are not planned until after the project approval, and the approving agency has not 1) committed itself to the mitigation, 2) adopted specific performance standards the mitigation would achieve, and 3) identified the type of potential action(s) that can feasibly achieve that performance standard and that would be considered, analyzed, and potentially incorporated in the mitigation measure. See CEQA Guidelines Section 15126.4(a)(1)(B). This is not the type of deferral that is inappropriate under CEQA. See Collective Response #8 regarding proposed visual mitigation.

Comment 554-10

The CEMEX project creates threats to Wildlife.

Years ago we had a thriving salmon population and wetlands. We have lost 95% of it due to previous poorly made decisions that did not protect the river. The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns. Why have those impacts not identified or evaluated? The proposed mitigation measures do not comply with existing regulations for protection.

Response 554-10

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4. See Collective Response #14 regarding analysis of Swainson's hawk impacts and Collective Response #15 for further evaluation of potential impacts to bird species. In response to comments received on this issue, the Draft EIR was revised to expand discussion of bat species and to strengthen multiple mitigation measures. See Chapter 3, "Draft EIR Errata," for these proposed changes. Potential impacts to nesting birds are evaluated under Impact 4.4-1 beginning on Draft EIR page 4.4-48 while impacts to migration patterns are discussed under Impact 4.4-6 beginning on page 4.4-62. The comment is noted for the consideration of the decision-makers.

Comment 554-11

In addition, it is not appropriate for the DEIR to use Alaska-based standards to assess fish protection instead of California-

specific guidelines. How can these be standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

Response 554-11

See Collective Response #16 regarding use of an Alaska Department of Fish & Game standard in analyses of salmon impacts.

Comment 554-12

The biology section of the DEIR does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce impacts. It creates more questions than it answers. It should be fully reevaluated, rewritten, and recirculated for public comment.

Response 554-12

The comment does not provide any reasoning or substantial evidence to support the claim that Draft EIR Section 4.4 fails to meet CEQA requirements or that the Draft EIR should be recirculated. The comment is noted for the consideration of the decision-makers.

Comment 554-13

Deep mining will have a negative impact on the San Joaquin River Parkway & Recreation CEMEX has referenced "potential" trail easements for public use, yet the DEIR does not garner any actual commitments for this, nor a timeline.

The timeline for construction and exact locations of any trails to be constructed should be identified and committed by the DEIR prior to any implementation of the CEMEX project.

The DEIR should describe how the proposed trailsmeet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access.

The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 554-13

See Collective Response #18 regarding the project's consistency with the Parkway Master Plan. See also Collective Response #22 regarding the proposed trail easements and future construction of trails near the project sites.

Comment 554-14

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. Blasting, rock crushing, and drilling crest will create noise that will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts have not been evaluated. The first priority should be wellbeing of the community, rather than the financial benefit of CEMEX.

The DEIR should fully analyze these impacts and identify appropriate mitigation measures for all impacts.

Response 554-14

See Collective Response #19 regarding public access at nearby parks. The project's potential noise impacts are evaluated in Draft EIR Section 4.13. As shown on Draft EIR Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site," the Lost Lake Recreation Area and Sumner Peck Ranch were identified as sensitive receptor Q-5 and Q-15 respectively. Draft EIR Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site," on Draft EIR page 4.13-22 presents existing ambient noise levels at sensitive receptors while Draft EIR Table 4.13-17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," on Draft EIR page 4.13-60 presents the estimated noise levels from proposed Quarry Site operations at sensitive receptors. As shown, neither existing ambient nor predicted noise levels at receptor Q-5 nor Q-15 exceed the County's significance thresholds. In other words, a significant noise impact would not occur at the Lost Lake Recreation Area nor Sumner Peck Ranch due to project operations. See also Collective Response #27 regarding the project's potential effects to users of nearby parks and trails. The comment is noted for the consideration of the decision-makers.

Comment 554-15

In conclusion, the severe impact by the proposed CEMEX projecton the river, wildlife, air quality and public safety, should be enough for the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. This additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project

Response 554-15

Based on comments received on the Draft EIR, additional analysis and revised and new mitigation measures are provided in this Final EIR. See Collective Response #1 regarding the provision of additional analysis. See also Collective Response #4b regarding liability and funding to respond to unforeseen damages. None of the proposed revisions to the

Draft EIR text warrant recirculation of the EIR for further public review. The comment is noted for the consideration of the decision-makers.

Letter #555 March 10, 2025, Joan Poss

Comment 555-1

You have the opportunity to stand up to and halt the degradation of the beloved San Joaquin River by Cemex which wants to drill a 600 foot deep pit very close to the river. This means blasting which will not only impede the salmon which have been neglected for years but also the fish being raised at the fish hatchery.

Response 555-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to fish species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Collective Response #16 regarding the project's potential to effect salmon spawning due to vibrations from blasting and Collective Response #12 regarding the project's effects on salmon restoration efforts in the San Joaquin River.

Comment 555-2

The blasting will impact those who canoe the river, walk, hike and bicycle in this natural setting.

Response 555-2

See Collective Response #27 regarding the project's operational effects on users of nearby parks and trails.

Comment 555-3

This pit will be three times larger than the highest building in down town Fresno. The multitude of trucks on the roads near the river will cause hazards to motorists as well as bicycle riders and walkers and nearby residents.

Response 555-3

The issues of traffic congestion and safety are addressed in Draft EIR Section 4.17, "Transportation." See also Collective Response #30 regarding potential traffic safety concerns.

Comment 555-4

There is an easy solution. There are many other sand and gravel resources. It's time for Cemex which has invaded the river for

over 100 years to give up blasting and drilling in the backyard of our beloved resource.Ra [sic]

Mr. Randall, I hope you will go for a walk, canoe, hike or whatever is your pleasure near or at the river.

Response 555-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #556 March 10, 2025, William Priddy and Jessica

Comment 556-1

I am submitting our opinion on the CEMEX request. We are senior citizens and feel the impact of this request would be detrimental to our beautiful San Joaquin River. To request 100 more years of mining is ridiculous. I hope Fresno Development will deny this request.

Response 556-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See also Collective Response #5 regarding the duration of the proposed use permit.

Letter #557 March 10, 2025, Asdruval Ramirez

Comment 557-1

I have a few comments regarding the proposed Cemex Rockfield Expansion Project:

- **Economic and Environmental Justification:** There is considerable doubt regarding the necessity of this project. Data indicates that our region already possesses a substantial surplus of aggregate resources, which calls into question the economic justification for extending mining operations for an additional 100 years. The projected job benefits seem minimal when weighed against the potential long-term environmental degradation and community disruption.

Response 557-1

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. Economic considerations are not evaluated under CEQA. However, the comment is noted for the decision-makers.

Comment 557-2

- **Project Impacts:** The plan poses significant risks to our community and environment. The projected deep blasting and drilling could result in excessive noise, dust, vibration, and water quality issues, particularly affecting the San Joaquin River and nearby residential areas.

Response 557-2

The issues of noise/vibration and dust are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The issues of water quality and effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality."

Comment 557-3

The expected increase in truck traffic also raises concerns about road damage and public safety.

Response 557-3

The issue of truck traffic is addressed in Draft EIR Section 4.17, "Transportation." See Collective Response #29 regarding the project's truck trips and road maintenance. See also Collective Response #30 regarding traffic safety.

Comment 557-4

- **Project Documentation Inadequacies:** Upon review, the technical appendices and project description appear to underestimate the long-term environmental and community impacts. In particular, the analysis does not fully address potential adverse effects on the local ecosystem or adequately outline the risks associated with a 600-foot deep pit and sustained high-volume truck traffic.

Response 557-4

The cumulative effects of the project are noted in Draft EIR Chapter 5, "Cumulative Impacts," including a discussion of truck traffic in Draft EIR Section 5.3.17, "Transportation." The comment does not state how the Draft EIR fails to fully address potential effects related to ecosystems and truck traffic. The comment is noted for the decision-makers.

Comment 557-5

Safeguard and Mitigation Measures: I recommend that the County require additional and more robust mitigation measures. These should include:

Stricter controls on blasting operations and continuous monitoring of environmental impacts.

A comprehensive traffic management plan to address the increased truck movements.

Clear, enforceable commitments to restore and protect the impacted areas, including enhanced reclamation efforts beyond the current proposals.

In light of these concerns, I urge the Board to re-examine the need for this project and to insist on more rigorous safeguards before any further approvals are considered.

Thank you for your attention to these issues.

Response 557-5

See Collective Response #1 regarding additional analysis and enhanced mitigation measures. See also Collective Response #29 regarding project truck trips, traffic congestion, and needed roadway improvements. The commenter does not provide any reasoning or evidence for the need to revise the proposed blasting plan, require a traffic management plan, or enhance the proposed reclamation plan. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Letter #558 March 10, 2025, Jillian Ramirez

Comment 558-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 558-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the

adequacy of the Draft EIR or mitigation measures. Please see below for responses to specific comments.

Comment 558-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 558-2

See Response 349-2.

Comment 558-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 558-3

See Collective Response #17. See also Response 329-3.

Comment 558-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 558-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that

Department of Water Resources criteria for interconnected surface water are not met at the project sites.

Comment 558-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 558-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 558-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 558-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 558-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 558-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 558-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 558-8

Please see Collective Response #29 pertaining to project traffic impacts. Please see Collective Response #30 pertaining to roadway safety.

Comment 558-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 558-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 558-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western

red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 558-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and

would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4, "Biological Resources," does not need to be rewritten or recirculated.

Comment 558-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 558-11

The project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #559 March 10, 2025, Radley Reep

Comment 559-1

These comments on the CEMEX Rockfield Quarry Project Draft Environmental Impact Report (EIR) address hydrological conditions adjacent to and directly north of the Quarry Site.

Having read the Draft EIR for the CEMEX mining project as well as County documents related to the proposed Friant Ranch housing project northeast of the Quarry Site and the Lost Lake Park Master Plan, I've come to the conclusion that the Draft EIR fails to include all significant information about groundwater and surface water flows north of the project site.

The purpose of this comment letter is to present that information, to ask for additional review and to propose a new adverse impact and environmental mitigation measure.

Response 559-1

The comment is introductory. Please see Response 559-2 through 559-10 below for further discussion of the commenter's concerns pertaining to the Draft EIR's analysis of the project's impacts to surface water and groundwater quality and supply.

Comment 559-2

The map are [sic] the right shows **[A graphic was included as part of Comment 559-2 that is not reproduced here. To view this graphic please see Letter 559 in Appendix M, "Draft EIR Comment Letters"]** the project Quarry Site (blue striping), the proposed Friant Ranch housing development project (yellow boundary line) and the proposed expansion of the Friant Community Plan (pink boundary line).

Groundwater in the vicinity of the Quarry Site generally flows from north to south, which means that ground water underlying Lost Lake Park will be captured in the future quarry pit. According to an analysis by EMKO Environmental, Inc., at present and under normal conditions, the inflow of groundwater into the quarry pit is approximately 95 acre-feet per year.[1] (*Footnote 1: "Based on the aquifer properties from the aquifer pumping tests, KDSA (2021) estimates that the groundwater flow under the Quarry Site in the alluvium and weathered rock is approximately 95 acre-feet per year, or about 60 gpm. In the hard rock, the estimated groundwater flow under the site within the depth interval to be mined is estimated at 80 acre-feet per year, or about 50 gpm. Thus, the total groundwater flow under the site totals about 175 acre-feet per year, or 110 gpm. As noted by KDSA (2021), discharge of treated wastewater from the Friant Ranch development project to the Beck Ranch property, once that development project is completed, would increase the amount of recharge and groundwater flow to the north of the Quarry Site. [DEIR Appendix G-4 (Revised Hydrology and Water Quality Analysis Report, Rockfield Modification Project, Fresno County, California, page 19)*)

But there are several conditions under which groundwater flow into the quarry pit could be much higher. The sources of water are these (1) rainfall on hills one to two miles northeast of the Quarry Site, (2) treated effluent from the wastewater treatment plant for the Friant Ranch housing project, (3) flood waters from the San

Joaquin River and (4) water diverted from the outlet of the fish hatchery to ponds within the park.

Response 559-2

Comment noted. The enumerated items in the second paragraph of this comment are addressed in Responses 559-3, 559-4, 559-5, and 559-6, respectively.

Comment 559-3

Rainfall

Below are two illustrations **[A graphic was included as part of Comment 559-3 that is not reproduced here. To view this graphic please see Letter 559 in Appendix M, "Draft EIR Comment Letters"].** The illustration at the left is from a portion of a FEMA flood insurance map[2] (*Footnote 2: FEMA Flood Insurance Map Panel 1030 of 3525, revised February 18, 2009*) showing a water course flowing east to west that drains an area east of Friant Road into Lost Lake Park. The illustration at the right is from the 2011 Lost Lake Park Master Plan.[3] (*Footnote 3: Figure 3-4 (Potential Waters of the United States) from the April 18, 2011 Lost Lake Park Master Plan, page 29. The Lost Lake Master Plan is found on the County of Fresno website using this path: Home / Departments / Public Works and Planning / Divisions of Public Works and Planning / Resources and Parks Division / Parks / Lost Lake Recreational Area.*) It shows the boundaries of the seasonal wetlands fed by that water source. These wetlands lie just north of the park entrance road (Lost Lake Road). The red diamond pinpoints the same location on both maps.

Response 559-3

The FEMA FIRM delineates the San Joaquin River 100-year floodplain.

Comment 559-4

Treated Effluent

In February 2023, the County of Fresno circulated a revised Draft EIR for the "Friant Ranch Project," which encompasses both a revision of the Friant Community Plan and the proposal for a new Friant Ranch Specific Plan — a 2,270-unit, age-restricted (55+) residential development.

The project's wastewater facility would be situated on the west side of Friant Road just south of the park entrance. Serving Friant Ranch and other users in the Friant area, the wastewater facility would store tertiary-treated effluent in an existing 25-acre borrow pit commonly known as the "Beck pond."

[A graphic was included as part of Comment 559-4 that is not reproduced here. To view this graphic please see Letter 559 in Appendix M, "Draft EIR Comment Letters"]

Several studies over the years have yielded mixed findings as to whether treated effluent from that storage basin would seep into groundwater.

For example, in 2009, Provost & Pritchard Consulting Group concluded that there would be little if any flow to groundwater.[4] (*Footnote 4:* March 18, 2009 memorandum from Provost & Pritchard Consulting Group titled "*Friant Ranch ADEIR Evaluation of the Beck Property for Effluent Storage & Reclamation*," page 2.) The conclusion was based on observations of a similarly-configured pond located at the northeast corner the Quarry Site, which was reported to lose water only through evapotranspiration.

Two years later at a February 1, 2011 Fresno County Board of Supervisors hearing to approve the Friant Ranch Project, a consultant representing CH2M Hill (a company that had designed, constructed and operated wastewater treatment plants in California since 1946), testified[5] (*Footnote 5: Testimony of Joe Glicker, CH2M Hill, before the Fresno County Board of Supervisors for the approval of the Friant Community Plan Update and Friant Ranch Specific Plan as reported on pages 008847 and 008848 in the administrative record for Fresno County Superior Court Case No. 11CECG00726 (Sierra Club, Revive the San Joaquin and League of Women Voters of Fresno vs. County of Fresno)*) that leakage from the Beck pond would likely be between 9 and 12 acre-feet per year (3 to 4 million gallons. The consultant said,

> "*Now there has been an estimate of how much of the water could potentially leak through the bottom of the [Beck] pond into the groundwater system and that's shown here as about 3 to 4 million gallons [per year]. It's the potential leakage out of the pond into the groundwater system….*"

The estimated seepage from the Beck effluent storage pond rose considerably with an October 2012 report by Kenneth D. Schmidt & Associates titled *Groundwater Conditions at and in the Vicinity of the Beck Ranch.*[6] *(Footnote 6: The Schmidt report is attached as Exhibit C to a May 14, 2014 letter from Dennis Bacopulos, Operating Manager of Friant Ranch LP, to the Fresno County Board of Supervisors for a May 20, 2024 Board hearing to approve the wastewater treatment plant designed to serve Friant Ranch.*) *On pages 34 and 35 of that report are calculations supporting a*

conclusion that seepage from the storage pond will actually approximate 69-acre feet per year.

That same report also concluded that seepage would not reach the river, that it would percolate a short distance west and south to neighboring San Joaquin River Conservancy ponds where it would evaporate. As illustrated at the right **[A graphic was included as part of Comment 559-3 that is not reproduced here. To view this graphic please see Letter 559 in Appendix M, "Draft EIR Comment Letters"]**, *the report also concluded that due to a subterranean low point between the ponding basin and river, should effluent migrate farther westward, it would mix with groundwater and travel south toward the Quarry Site.*

Response 559-4

As noted in this comment, the wastewater would be tertiary-treated effluent. Tertiary-treated effluent generally meets water quality standards for discharge to the environment, including groundwater recharge for subsequent potable use (see California State Water Resources Control Board Recycled Water Policy webpage at https://www.waterboards.ca.gov/water_issues/programs/recycled_water/). Therefore, any percolation of tertiary-treated effluent from the ponds would not degrade groundwater quality. Based on the information provided in this comment, the actual magnitude of potential percolation to groundwater is uncertain and therefore speculative at this time. Note that information from the 2012 Beck Ranch report by Kenneth D. Schmidt and Associates is included in Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR.

Comment 559-5

Flood Waters

On occasion, the San Joaquin River floods. Two notable floods during the last century occurred in December 1937 with a peak flow of 77,200 cfs (cubic feet per second) and in January 1997 with a peak flow of 60,300 cfs. The 1937 flood occurred before Friant Dam was built.

River flooding can flood Lost Lake Park. The aerial photo at the right shows flooding in Lost Lake Park during the 1997 flood.

In 1997, flood waters entered the park north of Lost Lake all along the park's one-mile interface with the river. Floodwater completely filled the normally mostly-dry 38-acre lake. My personal observation was that the lake was inches from overtopping its most southern edge (area shown by the red circle). The force

of the water was such that a concrete public restroom situated at the north end of Lost Lake disappeared without a trace.

During 1997 and 1998, lake water returned to its prior level, the water either evapotranspiring or traveling south as groundwater to the Quarry Site.

Response 559-5

The December 1937 flood is not relevant to current conditions because it occurred prior to the construction of Friant Dam. The hydraulic analysis incorporated flood flow rates higher than the 1997 flood. The 1997 flood flow rate of 60,300 cfs is lower than the 100-year flow rate of 71,000 cfs studied for the project. (Draft EIR Appendix G-1, "Hydraulic Analysis.") It is unclear why the comment references Lost Lake Park. However, high ground exists between Lost Lake Park and the Quarry Site.

Comment 559-6

Water Diversion

To improve habitat in Lost Lake Park generally, to prevent young salmon from being entrapped in ponds isolated from the river (the result of flooding) and to improve park safety for the visiting public, the July 18, 2021 Lost Lake Master Plan called for recontouring the entire park,[7] (*Footnote 7: The cumulative total of all earth moving activities is projected to be between 1.5 million and 1.9 million cubic yards of material. The existing 20-foot high piles overburden from prior mining activity within the park would be used to partially fill existing ponds and create gentler terrain throughout the park.*) as illustrated in the conceptual drawing at the right. **A graphic was included as part of Comment 559-6 that is not reproduced here. To view this graphic please see Letter 559 in Appendix M, "Draft EIR Comment Letters"]**

Important to this discussion, the Lost Lake Master Plan also contains a proposal to divert water to recontoured ponds year-round by diverting water from the fish hatchery outlet at the north end of the park to enable water to flow southward through the center of the park.[8] (Footnote 8: April 18, 2011 Lost Lake Park Master Plan, page 68.) The recontouring would re-establish secondary channel connectivity to the river at the southern end of park. Directing river water to the center of the park could greatly increase the amount of groundwater making its way to the Quarry Site.

Should the bulleted factors below occur simultaneously during an extremely wet year, groundwater flows into the quarry pit could

substantially increase in a relatively short period of time.[9] *(Footnote 9: Elevated rainfall in 2023 "resulted in…a rapid increase in groundwater levels across the entire [Quarry Site]…."[Draft EIR Appendix G-6 (Revised Hydrology and Water Quality Analysis Report), April 4, 2024, page 3])*

35) Low temperatures and high humidity, decreasing evapotranspiration north of the quarry pit

36) Treated effluent at capacity in the wastewater storage basin (maximum hydrostatic pressure)

37) Water entering the park from the fish hatchery

38) Heavy rain, with rainwater traveling to Lost Lake Park from the hills east of Friant Road

39) Floodwater flowing through the center of the park filling ponds to capacity

40) High river flow west of the quarry pit with increased infiltration of water into alluvial soils

If water were to accumulate at the Quarry Site faster than it could be removed through the use of recharge trenches, then excavation and/or washing of aggregate at the Quarry Site might need to pause. Should that occur, there may be an interest on the part of mine operators to move water from the Quarry Site to the San Joaquin River.

Response 559-6

While the simultaneous occurrence of the six conditions identified in this comment is speculative, any discharge of water from the Quarry Site to the San Joaquin River would require a National Pollutant Discharge Elimination System (NPDES) permit from the California Regional Water Quality Control Board, Central Valley Region. Discharge of water from the mine excavation to the river is not a part of the project and, therefore, would not be allowed.

Comment 559-7

There being no analysis that I can find in the Draft EIR regarding this matter, I see the need to identify a new potential adverse impact along with a mitigation measure to reduce the impact to a level of insignificance.

Adverse Impact: Violate surface water quality standards or otherwise substantially degrade the water quality of the San Joaquin River due to water on mined lands entering the San Joaquin River.

Mitigation Measure: The mine operator shall ensure that water does not move from any "mined lands," as defined in Section 272910 of the Surface Mining and Reclamation Act, to the San Joaquin River.

Response 559-7

The project is designed as a zero-discharge facility with respect to offsite discharges, so by nature, it does not propose to discharge water to the San Joaquin River, and all water is to be retained onsite. As such, no adverse impact on the San Joaquin is to occur; therefore, no potentially significant impact and no mitigation measure is necessary. Please see discussion of Impact 4.10-1, which addresses the project's potential impacts to surface water quality on page 4.10-88 of the Draft EIR.

Comment 559-8

In addition to recommending the adverse impact and mitigation measure written above, I also have a request and a question:

Request: I ask that the Final EIR include an analysis of the combined impact of the environmental conditions described above where rainfall, high river flows and water flowing into Lost Lake Park from flooding, the wastewater treatment facility and the fish hatchery combine to increase water flowing into the quarry pit. Given these conditions, what is the maximum rate at which the quarry pit could fill with water? And given these same conditions, what is the maximum rate at which the recharge trenches could move water out and away from the quarry pit? The analysis should take into consideration the information presented in the March 18, 2009 memorandum from Provost & Pritchard, namely, that the pond at the northeast end of the quarry pit does not offer recharge potential. The analysis should also take into consideration that under these same conditions the recharge trenches on the north side of the quarry pit (adjacent to Lost Lake Park) and the recharge trenches on the west side of the quarry pit (adjacent to the river) are unlikely to move water away from the quarry pit as ground water below those trenches would be moving southward and eastward, respectively, toward the pit.

Response 559-8

See Collective Response #24 related to groundwater monitoring program changes and funding.

Comment 559-9

Question: For me, the Draft EIR does not describe well the hydrological connection between the river the Quarry Site. Page 4.10.113 reads as follows:

> "*The base flows within the San Joaquin River are typically at or below the elevation of the base of the alluvium on the Quarry Site. Thus, flows from the San Joaquin River toward the Quarry Site within the alluvium can only occur during the infrequent and relatively short-term high flow periods. Due to the recharge trenches along the west side of the Quarry Site, groundwater levels in the alluvium and the weathered rock would be maintained consistent with existing conditions. As a result, there would be no significant change in the volume of potential inflow from the river into the quarry during high flow events through the alluvium and weathered rock as a result of the project.*"

What are the actual elevation differences between the surface of the river at high and low flows compared to the elevations of weathered rock and hard rock at the western edge of the Quarry Site?

Response 559-9

The relationship between river stage elevations and the elevation of the top of the weathered rock along the western edge of the Quarry Site is described in more detail in Section 2.2.3 of Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR. Collective Response #25 also provides additional discussion of the hydrological connection between the river and groundwater at the Quarry Site.

The stage of the river surface from January 2014 to February 2023 was a median of 3.0 feet, with the elevation of bottom between 291 to 286.5 feet above msl (upstream and downstream on the San Joaquin River in the vicinity of the project sites). Thus, the elevation of the river surface is typically between 294 to 289.5 feet above msl. (Appendix G-5 at page 20.) The elevation of the top of the weathered seen in MW-1 (northwest of the Quarry Site) is 290 feet above msl. The elevation of the top of the weathered rock at MW-2 (near the San Joaquin River in the meander area toward the central/southern end of the Quarry Site) is 289 feet above msl.

Comment 559-10

Please find attached the following documents:

41) FEMA Flood Insurance Map Panel 1030 of 3525, revised February 18, 2009

42) March 18, 2009 memorandum from Provost & Pritchard Consulting Group titled "*Friant Ranch ADEIR Evaluation of the Beck Property for Effluent Storage & Reclamation*

43) Partial testimony of Joe Clicker before the Fresno County Board of Supervisors on February 1, 2011

44) *Groundwater Conditions At and In the Vicinity of the Beck Ranch*, Kenneth D. Schmidt Associates, October 2012 (attached as Exhibit C to a May 14, 2014 letter from Dennis Bacopulos, Operating Manager of Friant Ranch LP, to the Fresno County Board of Supervisors for a May 20, 2024 Board hearing to approve the wastewater treatment plant designed to serve Friant Ranch).

Response 559-10

The referenced attachments are noted, were reviewed in consideration of the responses above, and are included with the original comment letter in Final EIR Appendix M, "Draft EIR Comment Letters."

Letter #560 March 10, 2025, Richard Rollin

Comment 560-1

Dear David, I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. 4.19 1.10 CSA 44C Wells and Quarry Site Interactions

"Impact on water tables for domestic residential wells. The possibility of dropping water tables on the extensive dig is a huge concern for residents. 1) Cemex should install at every residential well a constant water level monitor. This should be monitored monthly by an independent contractor paid for by Cemex. 2) Cemex must provide a bond to protect every residence of this community. If the wells fail or have greatly reduced water production and the homes are no longer realistically habitable,

protection for the homeowners must be in place before operations begin. Cemex must be liable and purchase the properties at high market value. There must be a penalty in place to be paid to the resident to cover costs of moving through no fault of their own."

Response 560-1

See Response 503-3.

Comment 560-2

2. 4.13.1.4. Quarry Site Ambient Noise Environment

"-The threshold of significance used is inappropriate at this site. Noise along area roadways used by truck traffic already exceeds the General Plan normally acceptable standard of 60 dBA in residential areas. -The threshold used doesn't make sense in an area where residents are already exposed to high levels of noise. Any increase of noise should be considered significant. See DEIR Table 4.13-6 at pg. 4.13-28 and Table 4.13-13 at starting at pg. 4.13-49."

Response 560-2

See Responses 291-5 and 552-6.

Comment 560-3

3. 4.16.1 Environmental Setting

"Table 4.16-1 Recreation Facilities Near the Project Sites – Some of the table sources are dated to 2021. Several properties listed (namely Ball Ranch and Ledger Island) were not formally open to the public then. These properties are now operated by the San Joaquin River Parkway and Conservation Trust under a contract with the San Joaquin River Conservancy. There is more public use of the sites under current conditions that the project should analyze. o The description of the San Joaquin Fish Hatchery does not fully encompass the recreational facilities available, including FINS and the Parkway Trail from the hatchery to Lost Lake Park. It is more than "limited public access" today. o The descriptions of Ball Ranch and Ledger Island do not encompass the current operational status of public access availability 7 days a week. o The descriptions of the River Center and Peck Ranch state public access by permission, which is not entirely accurate. The properties have regular operating hours and is open to the public daily."

Response 560-3

Please see Collective Response #19 pertaining to public accessibility to parks, including Ball Ranch and Ledger Island. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 560-4

My primary concern is this: the DEIR , as you can conclude from the comments above, is wholly inadequate to the proposed expansion of activity. The DEIR fails in most instances to set out any sufficient regimen of monitoring or mitigation. The DEIR should, at the very least, be re-submitted for public comment. The 45 day comment period was not long enough to address all the inadequacies in the document. if additional comment time is not allowed, then the DEIR should be rejected by the Board of Supervisors as not adequately addressing all aspects of the proposal. Cemex should take the time and expense to do it over and get it right. And finally, the whole project needs to be rejected as it is not needed to serve the economic needs of the area, and it is an environmental and aesthetic disaster.

Response 560-4

The commenter's concerns and requests are noted and will be considered by County decision-makers. The commenter does not provide evidence of a deficiency in the Draft EIR or its mitigation measures. Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input. Please also see Collective Response #3 pertaining to regional aggregate demand and supply. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #561 March 10, 2025, Laura Rosenberger Haider

Comment 561-1

Road oil was proposed for dust suppression. A material safety data sheet by Ergon, Inc. reveals that road oil may cause flash fires. Also, it states, "Breathing of high vapor concentrations may cause dizziness, lightheadedness, headache, nausea, and loss of coordination". (https://msds.ergon.com>files>2017_11_29-sds) Probably road oil would be used when Fresno's water is used up, but instead, they should be required to import water by railroad or electric tanker truck.

Response 561-1

The comment describes potential safety concerns related to the use of chemical dust suppressants. As described in Mitigation Measure 4.3-2b, a combination of water, covering, and use of chemical dust suppressants would be used to control dust at the project sites in order to mitigate the risk of net increase of any criteria pollutant for which the project region is non-attainment under applicable ambient air quality standards. The Fugitive Dust Control Plan, including the type of dust suppressant to be used, would be subject to the approval of the San Joaquin Valley Air Pollution Control District (SJVAPCD). The risk of harm after implementation of this mitigation measure was determined to be less than significant. Further, the project would comply with applicable worker safety regulations, as dictated by the Occupational Safety and Health Administration (OSHA). Such pertinent OSHA regulations are described in Draft EIR Section 4.9.2.1,"Federl," beginning on page 4.9-6. Finally, the project's potential impacts associated with wildfire risk are addressed in Draft EIR Section 4.20, "Wildfire."

Letter #562 March 10, 2025, Kristen Roznovsky

Comment 562-1

I am writing in opposition to the proposed 600' deep hole. The disruption it will cause to our precious river bottom is not worth it. The parkway trust has put so much effort into making these beautiful walk trails.

My family has owned property on the river bottom for 60+ years & would be saddened if this project is allowed to happen. Why does it have to be at the area we worked so hard to preserve? Please re-consider & not do this project. We have land to preserve & to protect.

Response 562-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Impacts to visual resources are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Collective Response #18 regarding the project's consistency with the Parkway Master Plan. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #563 March 10, 2025, Stephanie Ruiz

Comment 563-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental

and community impacts associated with this project, I have concerns that I urge you to address before moving forward with approval.

The proximity of the CEMEX quarry and plant sites to the San Joaquin River raises concerns about potential contamination. Although these sites are not directly beside the river, contamination can spread through various pathways. One such pathway includes groundwater leaching, in which contaminants can seep into the groundwater and flow toward the river. To assess this risk, it is crucial to analyze groundwater flow direction to identify potential contaminant pathways that could lead to the river or other bodies of water utilized by the public. Surface runoff is another major factor, as rain can wash contaminated soil, waste, or chemicals into the San Joaquin River. Implementing hydrological models to predict the movement of surface runoff can help assess this risk. Additionally, airborne pollutants from mining activities may settle into the river over time, leading to contamination. There must be a good understanding of how these pollutants will disperse based on wind speed, topography, and weather conditions. Assessing the long-term impact on the San Joaquin River over the next 100 years is crucial to identify the most effective mitigation strategies. Effective measures could include dust suppression techniques, baseline and ongoing water quality monitoring, and so forth. Furthermore, it is important to establish financial accountability for remediation efforts in case of severe contamination.

Response 563-1

In addition to the response below, see Response 6-75.

The baseline surface water and groundwater quality conditions are presented in Section 4.10.1.6, "Surface Water Quality," and Section 4.10.1.9, "Groundwater-Surface Water Interaction at the Quarry Site," of the Draft EIR. At the Plant Site, the existing silt pond was sampled and analyzed for various constituents. The only constituents above a water quality standard were conductivity, which was above the basin plan limit and does not apply in this case since there is no discharge to the San Joaquin River, and total concentrations of arsenic, iron, lead, and manganese. Of note here, the dissolved concentrations of these constituents tested below the applicable water quality standards. As stated in the Draft EIR, the total metals concentrations are due to the presence of suspended silts and sediment within the silt pond. Since elevated metals concentrations were not present in the filtered sample, which represents the dissolved concentrations within the water, the detected metals levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the aggregate being processed at the Plant Site. The lack of elevated metals in the filtered

samples demonstrates that the metals are not leaching from the silt into the natural soils beneath the silt pond and to groundwater.

At the Quarry Site, the surface water samples collected show that with the exception of conductivity and pH, the water quality meets the applicable water quality standards.

The groundwater quality data were within compliance of groundwater standards with the exception of manganese, iron, nitrate, conductivity, and gross alpha activity. These elevated constituents already existing at the project sites are representative of baseline conditions that do not indicate past or future effects from the proposed project. However, as discussed in the Draft EIR, the elevated nitrates are a regional issue that is being addressed by the Regional Water Quality Control Board. The gross alpha activity concentrations found at well MW-2M appear to be an outlier as it differs significantly from the other samples collected at the Quarry site and may not be representative of the site conditions. With respect to iron and manganese, Mitigation Measure 4.10-5a is included as an adaptive management strategy to assess whether the project would cause a violation of water quality standards for iron and manganese in the reclaimed Plant Site pond and to identify actions that would be taken if an impact is verified. The monitoring would begin once mining is completed and water starts filling the excavation, with measurements taken every six months. If iron or manganese levels exceed regulatory limits during two consecutive monitoring periods, further lab testing and seasonal assessment would follow. Persistent exceedances would trigger mitigation measures, such as aeration, vegetation control, or other methods to reduce iron and manganese concentrations. Monitoring would continue until five years pass without exceedances, at which point it may end. Annual reports would be submitted to the County, detailing monitoring results and any corrective actions taken.

Based on the groundwater contour maps presented by KDSA (Figures 5 through 8 in KDSA, 2021), groundwater flow in the alluvium and weathered rock is toward the south or southeast. Groundwater flow in the hard rock is generally south-southwest, but shows a depression in the center of the Quarry Site, possibly due to ongoing dewatering of the pit (see Figure 9 in KDSA, 2021).

Both the Quarry Site and Plant Site do not presently discharge and would not discharge groundwater or surface water offsite. The project is designed to manage all surface water runoff onsite, and therefore this water would not enter the San Joaquin River.

With regards to air quality, Sespe Consulting modeled the air emissions that would result from the project, and compared the modeled emissions to the San Joaquin Valley Air Pollution Control District (SJVAPCD) screening levels. The analysis found that the

emissions increases associated with the project may exceed the screening levels for CO, PM_{10}, and $PM_{2.5}$. Therefore, three mitigation measures are included as follows:

- **AQ-1:** Off-road engines shall be retrofitted or upgraded in order to meet the Tier 4i Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower-hour.
- **AQ-2:** Unpaved roads shall be controlled at a level of 90 percent by application of chemical dust suppressants or other equivalent methods.
- **AQ-3:** Stockpiles shall be controlled at a level of 85 percent by application water or other equivalent methods.

Dust control presently occurs and would continue to occur at both the Plant and Quarry sites.

Otherwise, Comment 563-1 does not provide evidence or argument that the Draft EIR's evaluation of these potential impacts are inadequate.

Comment 563-2

Another concern I wish to express is the potential for this project's emissions to exceed cancer risk thresholds. Since the CEMEX quarry and plant sites are surrounded by publicly accessible areas like Ball Ranch, Sumner Peck Ranch, and Lost Park, a population-wide cancer burden assessment should be conducted to evaluate potential health impacts. It is deeply concerning and confusing that a thorough health impact assessment would not be a priority, especially considering the site's proximity to areas where people regularly visit for recreational

purposes. Failing to account for these risks demonstrates a lack of responsibility in addressing potential long-term health consequences for visitors and nearby communities. Public health should be taken seriously, and comprehensive studies must be conducted to ensure that residents and visitors are not unknowingly exposed to harmful pollutants. The absence of such an evaluation raises critical questions about oversight and accountability, emphasizing the urgent need for transparency and proactive risk mitigation.

Response 563-2

A comprehensive Health Risk Assessment was conducted to assess the potential project impacts on sensitive receptors. All air modeling included estimating impacts at the fence line of the proposed project facilities; the modeled emissions (including criteria air pollutants, and health risks) at the fence line receptors represent the worst-case air impacts from the proposed project. Any potential impacts on the surrounding areas of

Ball Ranch, Summer Peck Ranch, and Lost Park would be less than those potential air impacts reported in the Draft EIR for the fence line receptors. Because the proposed project air impacts were all below all significance thresholds for the fence line receptors, the potential impacts at locations which are further from the proposed project's modeled fence line receptors, would be less than significant. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including preparation of a dust control plan and additional health risk modeling. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 563-3

The San Joaquin River serves as a vital source of water, supports diverse ecosystems, and provides recreational and economic benefits to the region. I urge that rigorous environmental assessment and precautionary steps be taken to prevent irreversible damage. Recovery is often difficult and costly, so it is important to ensure that the San Joaquin River is able to be enjoyed for generations to come. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 563-3

The commenter's observations regarding the San Joaquin River are noted and will be considered by County decision-makers. The Draft EIR sufficiently analyzes the project's potential impacts to surface water quality, including the San Joaquin River, in Section 4.10, "Hydrology and Water Quality." The commenter does not identify a deficiency in the Draft EIR.

Letter #564 March 10, 2025, Monica Ruiz-Cangco

Comment 564-1

I am writing to provide my public comments regarding the proposed Cemex Rockfield Expansion Project. I have serious concerns about several aspects of the proposal:

- **Questioning the Need:** There is considerable doubt regarding the necessity of this project. Data indicates that our region already possesses a substantial surplus of aggregate resources, which calls into question the economic

justification for extending mining operations for an additional 100 years. The projected job benefits seem minimal when weighed against the potential long-term environmental degradation and community disruption.

Response 564-1

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 564-2

- **Project Impacts:** The plan poses significant risks to our community and environment. The projected deep blasting and drilling could result in excessive noise, dust, vibration, and water quality issues, particularly affecting the San Joaquin River and nearby residential areas.

Response 564-2

The Draft EIR includes evaluation of project impacts associated with noise (see Draft EIR Section 4.13, "Noise") dust (see Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), vibration (see Draft EIR Section 4.13), and water quality (see Draft EIR Section 4.10, "Hydrology and Water Quality"). The comment does not identify a deficiency in the Draft EIR analyses of these topics. Please also see Collective Response #6 pertaining to operational nuisance.

Comment 564-3

The expected increase in truck traffic also raises concerns about road damage and public safety.

Response 564-3

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety.

Comment 564-4

- **Flaws in Project Documentation:** Upon review, the technical appendices and project description appear to underestimate the long-term environmental and community impacts. In particular, the analysis does not fully address potential adverse effects on the local ecosystem or adequately outline the risks associated with a 600-foot deep pit and sustained high-volume truck traffic.

Response 564-4

The comment does not provide evidence of any deficiencies in either the Draft EIR project description, the Draft EIR analysis, or the Draft EIR technical appendices. The evaluations address the proposed project, including the proposed quarry dimensions and project-related vehicle trips.

Comment 564-5

- **Mitigation Measures: I recommend that the County require** additional and more robust mitigation measures. These should include:
    - Stricter controls on blasting operations and continuous monitoring of environmental impacts.
    - A comprehensive traffic management plan to address the increased truck movements.
    - Clear, enforceable commitments to restore and protect the impacted areas, including enhanced reclamation efforts beyond the current proposals.

Response 564-5

The commenter's request for additional and more robust mitigation is noted; however, the comment does not provide evidence of any deficiency in Draft EIR mitigation measures.

Comment 564-6

In light of these concerns, I urge the Board to re-examine the need for this project and to insist on more rigorous safeguards before any further approvals are considered.

Thank you for your attention to these critical issues.

Response 564-6

The commenter's input is noted and will be considered by County decision-makers.

Letter #565 March 10, 2025, Kyan Salehi

Comment 565-1

As a resident and property owner of Bluff Avenue, I am completely opposed to CEMEX's mine proposal along the San Joaquin river based on the following:

CEMEX's argument that if the project isn't approved, the Fresno region will lose the economic and environmental benefits of locally sourced materials is completely meritless.

Per Fresnoland investigation, based on thousands of pages of technical documents, environmental reports, and state geological records, CEMEX'S mine proposal is a needless assault on the San Joaquin River to extract materials. State records reveal that the Fresno area already has a staggering surplus of locally sourced gravel which is one of the largest in the state. According to the California Geological Survey, the Fresno metro area currently has nearly 200% more gravel than is needed for the next 50 years coming from local mines. The Kings River has roughly 2 billion tons of easily available surface gravel (enough for 500 years at Fresno's current 4 million-ton annual rate). As such, CEMEX's proposal to blast a new massive crater is completely unnecessary and is purely based on corporate greed. If the Board of Supervisors approve the mine, the asset value claimed by the company would skyrocket. At current gravel prices ($10-$50 per ton), the total gravel forecasted by CEMEX to come from the site could be valued at $2 billion to $10 billion.

Response 565-1

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 565-2

CEMEX'S mine proposal will have a devastating impact on the San Joaquin River.

CEMEX's plan targets a 300-acre stretch of the San Joaquin River which is already ranked among America's most polluted waterways. Decades of extraction have left virtually no surface gravel intact, according to reporting by The Fresno Bee. The significant additional extraction by the CEMEX's mine proposal would have a massive negative impact on the river's flow, salmon runs and wetlands.

Response 565-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See also Collective Response #25 regarding the potential for seepage into the excavation to effect surface water flows. The project's potential impacts to salmon and wetlands are evaluated in Draft EIR Section 4.4, "Biological Resources." See also Collective Response #16 for further discussion of

potential impacts to salmon populations. See Impact 4.4-5, which determined that any potential adverse effect on protected wetlands or waters of the state would be less than significant.

Comment 565-3

CEMEX'S mine proposal will have a significant negative impact on the traffic on Friant Road.

If approved, CEMEX's project would double its gravel output, sending an estimated 400,000 trucks down Friant Road annually (up from 100,000 in the 1980s and 250,000 in 2023). Each truck causes wear equivalent to 5,000 cars, meaning the project would add the impact of 2 billion car trips to north Fresno's streets every year in a region already deadlocked over how to pay for its existing road quality crisis.

The road and traffic conditions on Friant Road are already dreadful. There have been many fatalities at every intersection of Friant. Woodward park attracts significant pedestrians and bicyclists. CEMEX's mine proposal and the significant additional traffic it brings would make Friant Road substantially more unsafe.

Wherefore, I request that CEMEX's mine proposal be denied.

Response 565-3

Traffic impacts are evaluated in Draft EIR Section 4.17, "Transportation." The commenter overstates the number of vehicle trips that would be generated by the proposed project. See Draft EIR Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites ," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)," regarding the project's expected annual trip generation at each stage (Draft EIR page 4.17-15 through 4.17-18). See also Collective Response #29 regarding the project's contribution to traffic conditions and funding of road maintenance as well as Collective Response #30 regarding traffic, cyclist, and pedestrian safety.

Letter #566 March 10, 2025, Shirinnaz (Shauna) Salehi

Comment 566-1

As a resident and property owner of Bluff Avenue, I am completely opposed to CEMEX's mine proposal along the San Joaquin river based on the following:

Response 566-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. Please see Response 566-2 through 566-5 for further discussion of the commenter's specific concerns.

Comment 566-2

CEMEX's argument that if the project isn't approved, the Fresno region will lose the economic and environmental benefits of locally sourced materials is completely meritless.

Per Fresnoland investigation, based on thousands of pages of technical documents, environmental reports, and state geological records, CEMEX'S mine proposal is a needless assault on the San Joaquin River to extract materials. State records reveal that the Fresno area already has a staggering surplus of locally sourced gravel which is one of the largest in the state. According to the California Geological Survey, the Fresno metro area currently has nearly 200% more gravel than is needed for the next 50 years coming from local mines. The Kings River has roughly 2 billion tons of easily available surface gravel (enough for 500 years at Fresno's current 4 million-ton annual rate). As such, CEMEX's proposal to blast a new massive crater is completely unnecessary and is purely based on corporate greed. If the Board of Supervisors approve the mine, the asset value claimed by the company would skyrocket. At current gravel prices ($10-$50 per ton), the total gravel forecasted by CEMEX to come from the site could be valued at $2 billion to $10 billion.

Response 566-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 566-3

CEMEX'S mine proposal will have a devastating impact on the San Joaquin River.

CEMEX's plan targets a 300-acre stretch of the San Joaquin River which is already ranked among America's most polluted waterways. Decades of extraction have left virtually no surface gravel intact, according to reporting by The Fresno Bee. The significant additional extraction by the CEMEX's mine proposal would have a massive negative impact on the river's flow, salmon runs and wetlands.

Response 566-3

This comment is noted. See Collective Responses #12, #16, and #25.

Comment 566-4

CEMEX'S mine proposal will have a significant negative impact on the traffic on Friant Road.

If approved, CEMEX's project would double its gravel output, sending an estimated 400,000 trucks down Friant Road annually (up from 100,000 in the 1980s and 250,000 in 2023). Each truck causes wear equivalent to 5,000 cars, meaning the project would add the impact of 2 billion car trips to north Fresno's streets every year in a region already deadlocked over how to pay for its existing road quality crisis.

The road and traffic conditions on Friant Road are already dreadful. There have been many fatalities at every intersection of Friant. Woodward park attracts significant pedestrians and bicyclists. CEMEX's mine proposal and the significant additional traffic it brings would make Friant Road substantially more unsafe.

Response 566-4

Traffic impacts are adequately analyzed in Draft EIR Section 4.17, "Transportation." Please see Collective Response #29 pertaining to project traffic impacts. Please see Collective Response #30 pertaining to roadway safety, including bicyclist and pedestrian safety.

Comment 566-5

Wherefore, I request that CEMEX's mine proposal be denied.

Response 566-5

The commenter's request for denial of the project is noted and will be considered by County decision-makers.

Letter #567 March 10, 2025, Kristen Samaniego

Comment 567-1

My name is Kristen Samaniego. I am a Fresno native, currently living with my family in the outskirts of Fresno County. The San Joaquin River is a landmark for our county as well as one of our largest natural resources. I have deep concerns over the future of our beloved landmark. Cemex's proposed plans to take dynamite to our river will not only put the river itself into danger but

countless residents and animals as well. Aside from being a natural resource for plants, animals and humans, it is also a place that many people use for recreational purposes.

Response 567-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise." The project's potential effects on recreational facilities in the project area are evaluated in Draft EIR Section 4.16, "Recreation." The potential impact to plant life, animals, and habitat in the surrounding project area is evaluated in Draft EIR Section 4.4, "Biological Resources."

Comment 567-2

This frivolous project could have a damning effect on our Central Valley for years to come as countless toxins and pollutants will be pumped into our water and air. It seems as though the belief is that "if we just do this 3 miles out of town, it won't matter" that is just not true at all. The area itself is currently occupied by many residents and animals, whose daily lives would be gravely affected by the extra traffic and noise and additional pollution the project would bring.

Response 567-2

The issues of water quality and air quality are addressed in Draft EIR Section 4.10, and Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). Hazardous substances are discussed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13. The project's potential impacts to wildlife species are evaluated in Draft EIR Section 4.4.

Comment 567-3

The river itself could give way creating mass destruction even loss of life and for what?

Response 567-3

See Collective Response #17 regarding riverbank stability and the potential for breach and flooding of the Quarry Site excavation.

Comment 567-4

Rock that we already have in excess. Cemex must be stopped. Please hear the cries of Central Valley residents everywhere and protect our beloved San Joaquin River.

Response 567-4

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #568 March 10, 2025, Isabel Santos-Gonzales

Comment 568-1

I am writing to express serious concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety.

Given CEMEX's history of pursuing destructive, controversial projects in Fresno County and its ultimate goal of lining its own pockets with profits, the proposed mitigations are clearly inadequate. One can hardly believe with confidence that they will actually stick to any meaningful mitigations in the first place.

Response 568-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted here. Please see Response 568-2 through 568-6 for further discussion of the commenter's specific concerns.

The Draft EIR provides a comprehensive environmental review of the CEMEX Rockfield Modification Project. Specifically, the Draft EIR is based on detailed technical analysis related to the proposed project activities, using methods and analysis frameworks approved by the CEQA Lead Agency (Fresno County), to support a legally adequate review of potential project impacts to the environment, including impacts on the San Joaquin River, local water quality, air quality, public recreational facilities, wildlife, and public safety. The mitigation measures listed in the Draft EIR would be incorporated into the approved project after certification of the Final EIR, as required by Fresno County.

The San Joaquin River and overall water quality was assessed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Potential water quality impacts to the San Joaquin

River and surface and groundwater quality would be reduced to a less than significant level with implementation of Mitigation Measures 4.10-1, 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b.

Section 4.3, "Air Quality," and Section 4.8, "Greenhouse Gas Emissions," present detailed analysis and substantial evidence that potential air quality impacts would be reduced to a less than significant level after mitigation. Implementation of Mitigation Measures 4.3-2b and 4.3-4 would further reduce potential for adverse air quality impacts from the proposed project operations and reclamation.

Public recreation was assessed in Draft EIR Section 4.16, "Recreation," with all potential impacts on existing or expanded recreational facilities found to be less than significant. Wildlife impacts were assessed in Draft EIR Section 4.4, "Biological Resources," with all potential impacts found to be less than significant after mitigation. With implementation of Mitigation Measures 4.4-1a, 4.4-1b, 4.4-1c, 4.10-1, 4.3-2a, 4.3-2b, and 4.13-6, the project related impacts on biological resources would be less than significant. Public safety concerns were evaluated throughout the Draft EIR and Section 4.9, "Hazards and Hazardous Materials," determined the project impacts related to exposing people or structures to a significant risk of loss involving wildland fires or interfering with an emergency response plan were less than significant. With implementation of Mitigation Measures 4.9-1 and 4.10-1 Flyrock Mitigation Plan established by the Blasting Protocols, impacts created by a significant hazard to the public through release or hazardous materials or flyrock generated using blasting agents at the Quarry Site would be reduced to less than significant.

See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

For these reasons, the Draft EIR's analysis of environmental impacts is sufficient pursuant to CEQA. Fresno County will consider these comments as part of its deliberations. All substantive comments are considered prior to certification of the Final EIR and any project approval.

Comment 568-2

I am particularly concerned about threats to wildlife and the impact on our city's already horrific air quality.

Response 568-2

The commenter's concerns are noted and will be considered by County decision-makers. Please see Section 4.4 of the Draft EIR for more information pertaining to the project's

potential impacts to biological resources, including wildlife. Please see Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), of the Draft EIR for more information pertaining to the project's potential impacts to air quality.

Comment 568-3

On wildlife threats:

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

Response 568-3

The Draft EIR analyzes the project's potential impacts to biological resources in Section 4.4. The Draft EIR includes mitigation measures which would minimize and reduce potential impacts to biological resources, in accordance with CEQA standards. Please see Response 58-38 and Response 65-15 for discussion of Swainson's hawk. See responses 58-37 and 58-40 for discussion of tricolored blackbird. See Responses 58-36, 58-38, 58-40, 58-50, 65-6, and 65-10 of discussion of burrowing owl. See Response 58-37 for further discussion of the Western red bat.

For discussion of impacts to migratory fish and wildlife species, please refer to Response 65-16. For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17. For discussion of the usage and sufficiency of the Alaskan Blasting Standards for analyzing impacts to fish in the San Joaquin River, refer to Response 65-13.

Comment 568-4

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 568-4

Draft EIR Section 4.4 sufficiently analyzes the project's potential impacts to biological resources. Potential impacts are disclosed, evaluated, and mitigation measures would be required where applicable to reduce certain impacts to less than significant. As such, the biological resources section does not need to be rewritten or recirculated.

Comment 568-5

On air quality:

The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining? Additionally, according to a Fresnoland investigation, this project would send an estimated 400,00 trucks down Friant Road annually. This project would add the impact of 2 billion car trips to north Fresno's streets, which will not only worsen road quality but also add emissions that our region does not need.

Response 568-5

CEQA is about the environment and how it would change with the project. Thus, CEQA defines the existing physical setting as the baseline from which project related impacts occur. The no-project scenario is an alternative to the project and not a baseline against which to evaluate the project effects. Therefore, CEQA has no requirement to evaluate the no-project scenario and the Draft EIR is sufficient without further changes. Further, Mitigation Measures 4.17-1a through 4.17-1r describe how CEMEX would pay their Equitable Share Contributions to road upgrades and maintenance.

Comment 568-6

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should explore all possible alternatives to this project. At the very least, it must require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX.

Response 568-6

With implementation of the mitigation measures required in the EIR, the project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns are noted and will be considered by County decision-makers. The comment does not provide evidence of a deficiency in the Draft EIR or the need for additional analysis or stronger mitigation measures. With regard to alternatives,

the comment does not address the adequacy of the Draft EIR's alternatives evaluation or suggest additional feasible alternatives for further consideration. With regard to financial guarantees, note that under the State of California Surface Mining and Reclamation Act (SMARA), surface mine Operators are required to maintain financial assurances in an amount sufficient to provide for reclamation of the surface mining operation in accordance with the approved reclamation plan. The amount of the financial assurance must be estimated and updated annually and approved by the SMARA lead agency, in this case, Fresno County.

Letter #569 March 10, 2025, Joan Schoettler (Letter #1)

Comment 569-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

4. Traffic and Noise Concerns

1) Potential blasting vibration damage 2) Human perception of vibration and overpressure 3) Building damage (Refer to the noise level at the San Francisco Airport and how decades later they needed to replace all the windows and door for noise control. This may be a factor now and in years to come) 4) Blasting. This is not something we want in our community. It is enough that we have jets blasting over our city disrupting teaching in classrooms, causing people at outdoor events to stop conversations, and making Fresno a much less desirable place to live. 5) Use of noise at Woodward Park, the San Joaquin Parkway, and neighborhood. 6) Noise will affect wildlife.

Response 569-1

The issues of noise and vibration are evaluated in Draft EIR Section 4.13, "Noise." See Impact 4.13-5 for discussion of vibration impacts from mining activities and Impact 4.13-6 for discussion of vibration impacts from blasting. Mitigation Measure 4.10-1 requires the Operator to implement the best practice blasting protocols, which includes monitoring of vibration levels and implementing an adaptive management plan to ensure that vibration levels do not exceed allowable levels and that impacts to nearby structures and residents are minimized.

See Collective Response #27 regarding the project's potential operational impacts, including blasting, to users of nearby parks and trails.

The project's operational impacts on wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-1 beginning on Draft EIR page 4.4-48 for discussion of the project's potential effects on wildlife species within the project sites and Impact 4.4-2 beginning on Draft EIR page 4.4-52 for discussion of the project's operational effects on wildlife species within riparian areas surrounding the project sites. Multiple mitigation measures are provided in Section 4.4 to avoid or minimize disturbances to fish and wildlife species primarily through the conduct of preconstruction surveys and implementation of avoidance measures consistent with applicable resource agency guidance. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4.

Comment 569-2

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 569-2

See Collective Response #1 regarding additional analysis and transparency in the planning process. Mitigation measures to reduce any potential substantial impacts of the project are discussed throughout the Draft EIR. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project.

Letter #570 March 10, 2025, Joan Schoettler (Letter #2)

Comment 570-1

Please for your family, your friends, your community, and the greater community of Fresno, Fresno County, and the San Joaquin Valley, make use this expansion does not take place.

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding

communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter. Sincerely,

Response 570-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #1 regarding additional analysis and transparency in the planning process. Mitigation measures to reduce any potential substantial impacts of the project are discussed throughout the Draft EIR. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project.

Letter #571 March 10, 2025, Joan Schoettler (Letter #3)

Comment 571-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

3. Biological Resource Impacts

These are the concerns I have regarding the biological resource impacts: 1) DEIR does not adequately analyze potential impact of blasting on wildlife. 2)Impact on the fish and wildlife in and close to the river 3) Threat to the Swainson's hawk

Response 571-1

The project's potential impacts to fish and wildlife species and associated habitats are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-1 for an evaluation of the project's operational effects on fish and wildlife species, including blasting. See Collective Response #16 for further discussion of potential impacts to salmon populations. See also Collective Response #14 for discussion of potential impacts to Swainson's hawk.

Comment 571-2

4) Obstructing the natural flow, altering the river bed channel or bank 5) Protecting the provisions of the California Fish and Game Code Section 1600 et seq.

Response 571-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." As discussed in Section 4.4.1.7, "Wetlands and Waters of the State," of Section 4.4, the various ponds, ditches, and other water features present on the project sites do not meet the criteria for "waters of the state" and are not subject to Fish & Game Code Section 1600 et. seq.

Comment 571-3

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 571-3

See Collective Response #1 regarding additional analysis and transparency in the planning process. Mitigation measures to reduce any potential substantial impacts of the project are discussed throughout the Draft EIR. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project.

Letter #572 March 10, 2025, Joan Schoettler (Letter #4)

Comment 572-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

2. Air Quality and Dust Emissions

My concern is for the air quality for the next 100 years. With the increased number of trucks, dust from the drilling, and increase of air particles in a part of California that already has poor air quality should be enough to decide that this CEMEX project does not work in the benefit of Fresno County and the San Joaquin Valley in general.

Response 572-1

The project's potential air quality impacts are evaluated in Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 regarding the project's potential to worsen the region's existing poor air quality. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 572-2

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 572-2

See Collective Response #1 regarding additional analysis and transparency in the planning process. Mitigation measures to reduce any potential substantial impacts of the project are discussed throughout the Draft EIR. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project.

Letter #573 March 10, 2025, Daniel Schwartz

Comment 573-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

First, allow me to tell you a bit about myself and my experiences with the San Joaquin River in and around this particular site. I moved to Fresno in 1990 from the very crowded and developed megalopolis of Los Angeles. I have been an avid outdoor enthusiast since my early teen years, and I find the Fresno region is not far from multiple areas of natural beauty and great nature experiences without the overwhelming presence of humans with their noise, traffic, pollution, development, and other telltale signs that detract greatly from connecting with nature. I am not just a member but an event organizer in a large community of hikers that plans regular outings all over Central California, but not limited to

just that either. It is known as the Central Valley Hiking Group with over 2,000 members. Over the years, I have personally led several groups on various hikes along the river parkway at River West (both Fresno and Madera sides, Ball Ranch, Sumner Peck Ranch, Ledger Island, Sycamore Island, Lost Lake, and at the broken bridge in Friant. When it's not too hot, I enjoy taking my dogs down to the river in these areas regularly too, at least 1-2 times a month. Plus, I've introduced these areas to friends and visitors outside my hiking club. In my opinion, all of these places I mentioned offer some of the best natural riparian woodlands experiences and so close to our city for people of any age with the possibility to observe all kinds of interesting wildlife and plants. I've seen young bobcats, foxes, beavers, several deer in herds or alone, coyotes fairly close by, bald eagles, osprey, Swainson's hawks, Coopers hawks, red-tail and red-shoulder hawks, owls with a nest of owlets, all types of herons and egrets, large flocks of majestic white pelicans and other waterfowl and avian species, plus countless other smaller animals (in fact, there is a huge rookery of egrets in the trees right along the river with multiple large nests in plain view across from the Willow Unit Ecological Reserve not too far from the Cemex plant site). One time, I even had a herd of deer cross the river from the Madera side to the Fresno side very near to me when I was at the Native American mortar station site at Ledger Island. They were actually going towards Cemex's quarry site.

Response 573-1

The commenter's concerns, background, and experiences within the San Joaquin River corridor are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. Please see Response 573-2 through 573-12 for further discussion of the commenter's specific concerns.

Comment 573-2

I will use the template letter provided by the conservation trust to address the specific reasons why I believe this project DEIR is inadequate and that in reality, there should not be any changes to the current methods being used to extract gravel from these sites. Also, 100 years is simply too long a period of time to renew this mining operation. 20-30 years at a time seems more reasonable.

Response 573-2

The commenter's concerns are noted. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 573-3

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 573-3

See Response 349-2.

Comment 573-4

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 573-4

See Collective Response #17. See also Response 329-3.

Comment 573-5

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 573-5

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project sites.

Comment 573-6

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 573-6

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 573-7

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 573-7

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 573-8

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an

inappropriate deferral of mitigation which is not allowed under CEQA.

Response 573-8

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 573-9

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 573-9

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety.

Comment 573-10

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 573-10

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. CEQA is about the environment and how it would change with the project. Thus, CEQA defines the existing physical setting as the baseline from which project related impacts occur. The no-project scenario is an alternative to the project and not a baseline against which to evaluate the project effects. Therefore, CEQA has no requirement to evaluate the no-project scenario and the Draft EIR is sufficient without further changes.

Comment 573-11

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or

evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 573-11

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4, "Biological Resources," does not need to be rewritten or recirculated.

Comment 573-12

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 573-12

The Draft EIR provides a comprehensive environmental review of the Rockfield Quarry Modification project based on detailed technical analyses and methodologies approved by the CEQA lead agency, Fresno County. The Draft EIR evaluates potential impacts to the San Joaquin River, air quality, biological resources, and public safety, and identifies mitigation measures where necessary to reduce impacts to less than significant levels.

Potential impacts to the San Joaquin River and water quality are addressed in Section 4.10, "Hydrology and Water Quality." With implementation of Mitigation Measures 4.10-1, 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b, impacts to surface water and groundwater quality would be reduced to less than significant levels. Air quality and greenhouse gas emissions are evaluated in Section 4.3 and 4.8, "Greenhouse Gas Emissions," respectively, which demonstrate that impacts would be reduced to less than significant levels with implementation of Mitigation Measures 4.3-2b and 4.3-4.

Impacts to biological resources are analyzed in Section 4.4 and would be reduced to less than significant levels with implementation of Mitigation Measures 4.4-1a through 4.4-1c, 4.10-1, 4.3-2a, and 4.13-6. Public safety impacts are addressed in Section 4.9, "Hazards and Hazardous Materials," and would be reduced to less than significant levels with implementation of Mitigation Measures 4.9-1 and 4.10-1 (Blasting Protocols), including measures addressing flyrock. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections.

The Draft EIR sufficiently analyzes the project's potential environmental impacts and includes mitigation measures where required in accordance with CEQA. The commenter's concerns and request for additional analysis, mitigation, and recirculation

are noted; however, as discussed in Chapter 3, "Draft EIR Errata," recirculation is not required. Fresno County will consider all substantive comments prior to certification of the Final EIR and any project approval.

Letter #574 March 10, 2025, Kulraj Sidhu

Comment 574-1

Do not approve the mining expanding project. You're ruining the chance of future generations to enjoy our natural resources.

Response 574-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #575 March 10, 2025, Joleen Siebert

Comment 575-1

It is time to protect the San Joaquin River and its parkway by stopping its destruction by CEMEX. All current information says that Fresno County has plenty of aggregate to meet its construction needs. Further, CEMEX is planning to dig a hole in the riverbed hundreds of feet deep, effectively destroying the San Joaquin River, which is a treasure for the residents of this area. Finally STOP CEMEX and its destruction of our environment.

Response 575-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality."

Letter #576 March 10, 2025, Jeff Single

Comment 576-1

I have been a Fresno resident for 40 years, living near the intersection of Friant Road and Copper Avenue for the past 20 years. Much of my professional work, and personal recreation during that time has been in the vicinity of the proposed project and surrounding areas, and I have a good knowledge of the region. I also have experience in evaluating impacts and proposing mitigation for mining, oil and gas activities, urban development, and transportation projects.

I respectfully submit these comments and observations on the Rockfield Quarry DEIR.

There are many issues with the Project and DEIR. These warrant not only at least recirculation of a revised DEIR, but very reasonably support denial of the Application.

Response 576-1

The commenter's background, knowledge of the region, and requests are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR. Please see Response 576-2 through 576-25 below for further discussion of the commenter's specific concerns.

Comment 576-2

In general, issues with the Project include:

- The Project does not meet an identified need, as already permitted aggregate resources are almost double the 50-year forecast demand. Permits for future projects can be considered to meet currently unknown future needs.

Response 576-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 576-3

- The Project would cause highly significant alteration of the landscape and negative impacts to both existing and future known beneficial uses [It's a 400 or 600 foot deep pit adjacent to a busy regional park (Lost Lake Park), in the San Joaquin River bottom, across the river from one of the best areas along the San Joaquin (Ledger Island), adjacent to public use areas and in a viewshed. A 600 foot deep hard rock mine is well beyond reasonable use for the area.]

Response 576-3

Draft EIR Section 4.1, "Aesthetics and Visual Impacts," provides a detailed analysis of the project's visual impacts. Please also see Collective Response #8 pertaining to the visual resource impact analysis and mitigation. With regard to public use areas, please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. The commenter's concerns are noted and will be considered by County decision-makers. The comment does not provide evidence of a deficiency in the Draft EIR.

Comment 576-4

- It creates the potential for low frequency-high risk catastrophic events such as river channel impacts during extreme floods and loss of human life from accidents and trespass incidents; these risks persist well beyond the 100-year active Project lifetime. Such events also create operational and financial liabilities for the County and other public agencies at they respond to these events. The DEIR does not propose any special authorities nor funding to facilitate the County actions nor offset County expenses.

Response 576-4

With regard to liability, please also see Collective Response #4b pertaining to liability. As discussed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR, the project has been designed to withstand the 100-year flood event based on detailed hydraulic modeling of the San Joaquin River, consistent with CEQA requirements. The onsite berms separating the river from the Quarry Site are higher than the 100-year water surface with freeboard and would therefore resist breaching and the berms located on the northern portion of the Plant Site prevent the Little Dry Creek floodplain from breaching the site (Draft EIR at page 4.10-67). Catastrophic events exceeding the 100-year design storm, such as dam failure, are considered highly speculative and not reasonably foreseeable under CEQA (Title 14 CCR Section 15145). Therefore, such events are not required to be analyzed under CEQA. Concerns regarding Fresno County liability or costs associated with emergency response are fiscal and administrative in nature and do not constitute an environmental impact under CEQA.

Comment 576-5

- The Project's greatest and potentially most catastrophic impacts continue forever, beyond the 100 years of operation, due to presence of a 300-600 foot deep pit. The ongoing impacts from this presence, including risks to public safety and possible costs to the County, need to be evaluated and considered as part of the County's decision.

Response 576-5

See Response 358-5 and Response 553-8 regarding public safety at the quarry pit. The commenter's concerns pertaining to the depth of the pit are noted. The Draft EIR fully evaluates the potential impacts of the proposed project, including the total proposed mining depth, in accordance with CEQA. The project would comply with applicable State and local regulations pertaining to mining safety.

The reclamation plan, included as Appendix B-1, "Surface Mining and Reclamation Plan," to the Draft EIR, addresses the protection of public health and safety upon completion of mining (Draft EIR Appendix B-1, page 59). The Plant Site and Quarry Site would be fenced in accordance with the provisions of the reclamation plan to exclude potential trespassers.

Comment 576-6

- The Project will affect property values of nearby existing and potential private properties, and adversely affect Fresno's reputation and ensuing ability to attract beneficial business and development.

Response 576-6

Please see Collective Response #7 pertaining to economic issues, including property values.

Comment 576-7

- Permitted aggregate mining has left the San Joaquin River corridor in poor condition in many areas but has been generally shallow enough that the sites can be reclaimed to offer some potential beneficial uses for recreation, views, and wildlife habitat, and not pose high risks from extreme flows. The proposed 400-600 ft deep pit cannot be restored and used in such a fashion. It would permanently remove that area from public uses and benefits, with no offsetting mitigation.

Response 576-7

There is no SMARA requirement that the reclaimed land serves a recreational purpose. Upon final reclamation, the Plant and Quarry sites would both be converted to open space for riparian and open water habitat. At the Plant Site, there would be a pond, and at the Quarry Site, there would be a lake formed, to be used as open water habitat (Draft EIR at pages 2-45 through 2-49). All required and reasonable measures would be taken to ensure that the reclaimed sites would not endanger public health or safety, and the sites would be fenced to prevent trespassing (Draft EIR at page 4.11-22). Thus, the EIR and reclamation are consistent with the Fresno County General Plan.

Comment 576-8

- The Project proponent, CEMEX, is a foreign corporation with an established reputation of noncompliance with regulations, and intractability in working with local governments – this creates a substantial financial liability for the County, as

well as uncertainty that mitigation measures will be executed, and uncertainty about the long term robustness of mitigation, restoration and post operation conditions. This is a glaring weakness that can and should be corrected.

Response 576-8

Please see Collective Response #4a pertaining to the Operator's regulatory history. Please see Collective Response #4b pertaining to liability.

Comment 576-9

Specific Issues and Comments

Existing conditions/environmental baseline

The DEIR uses existing conditions as the baseline for evaluating project impacts. However, the project sites are currently largely disturbed with active mining operations, and are destined for recovery and restoration. In the absence of the proposed Project, the sites would be restored to semi-natural habitat and be generally amenable to positive viewing and public recreation, as well as have habitat value and ecosystem services. This is the future "no Project" condition, to which Project impacts should be compared. By comparing Project impacts to the active mines at the project site, the DEIR impact analyses do not reflect the sites' conditions in the absence of the proposed Project. The analyses are inherently biased to show less significant impacts due to the proposed Project.

Response 576-9

CEQA requires analysis of potential environmental impacts compared to existing conditions (i.e. the CEQA baseline) at the time of the Notice of Preparation. Thus, the Draft EIR correctly analyzes the potential environmental impacts as compared to the existing conditions, which include the mining operations on the project site.

Comment 576-10

The proposed Project would delay restoration and mitigation at the plant site by perhaps 70 years; the absence of the benefits this mitigation would provide is an impact that has not been disclosed nor analyzed in the DEIR. Additionally, the proposed project would eliminate the current mitigation and restoration outcomes at the Quarry site, causing impacts to habitat values, views, recreation and other beneficial uses different than those disclosed and analyzed in the DEIR.

Response 576-10

See Response 576-9 above. Under CEQA, the project's impacts must be analyzed as compared to conditions existing at the time of the Notice of Preparation. A comparison of the projected environmental impacts associated with the existing reclamation plan and potential environmental impacts associated with the proposed reclamation activities for the project is not required because the Baseline does not include future conditions (i.e. those associated with future reclamation), but rather the existing physical environment (CEQA Guidelines Section 15125(a)).

Comment 576-11

Impact Analysis

Temporal scope

The project lifetime is 100 years. But, impacts of the presence of the proposed pit will continue well past the Project's operational life. This extremely long period of active impacts should be analyzed and disclosed. Impact analyses should encompass the 100-year active life, plus forecast past that to the conditions that will persist after project closure.

Response 576-11

Draft EIR Chapter 2, "Project Description," clearly describes the proposed duration of operations at both the Plant Site and the Quarry Site and describes reclaimed conditions at both site. Draft EIR Chapter 4, "Environmental Analysis," evaluates the environmental effects of the project consistent with the project description. The comment does not provide evidence of a deficiency in the Draft EIR's evaluation of operations or reclaimed conditions. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 576-12

The proposed project eliminates mitigation for an existing approved project.

The restoration plan for the existing permitted Rockfield quarry includes a design adaptable to public use, in a shorter time frame (approximately 30 years), and without the extreme attractive nuisance of a larger deeper pit. Presumably this restoration was considered in the balance as part of the mitigation for the existing permitted project. The proposed Rockfield Quarry Project would eliminate this restoration and mitigation. This is an added impact that does not appear to have been addressed in the DEIR and should be.

Response 576-12

See Response 576-10 above. The project proposes to extend the life of the existing operations at both the Plant and Quarry Site, and introduce blasting at the Quarry Site for the purpose of extracting hard rock. Therefore, prior Reclamation Plans are subject to change. See Draft EIR Appendix B-1, which includes the Reclamation Plan for the proposed project.

Comment 576-13

The flood analyses used a 100-year event standard.

A more conservative 250-year standard should be used, because extreme events are becoming more common, and reservoir management is not guaranteed to be consistent over time. Extreme events and rare but catastrophic consequences should be evaluated, and 100yr climate forecast scenarios should be employed for better context.

The very deep pit left after mining will be only 200 feet from the San JoaquinRiver. Flood analyses only looked at 100yr flood events. What prevents erosion and maintains long-term stability of the bank and floodplain in the 200 feet between the river and the pit? What happens if the river breaches the pit wall? Who pays for damages? Who modifies the site to ensure stability if river conditions change over or after 100 years? Local and state taxpayers should not have to foot the bill for these kinds of impacts.

Response 576-13

The mine has been operating since 1913 and has not been inundated, including during the 1997 flood. The proposed project includes multiple mitigation measures under the Blasting Protocols to ensure that the blasting design does not damage the structural integrity of the San Joaquin River bank. This includes ground vibration measurements, air overpressure measurements, and visual inspection of the San Joaquin River riverbank (Draft EIR page 4.4-57). The Operator is responsible for the funding mechanism of corrective actions, if necessary, over the life time of the proposed project. For further discussion of the proposed project's potential impacts on the stability of the San Joaquin River bank and associated mitigation measures, see discussion of Impact 4.4-4. For more information regarding the Blasting Protocols, refer to Appendix H-9, "Revised Blasting Protocols," of the Final EIR.

Comment 576-14

Flooding and Geohydraulogy

The DEIR uses the 100 year events to analyze flood and river-related impacts. However, California is experiencing increased volatility in precipitation and flooding, so that the use of 100 year events is not the best predictor of risks. A 250 year event standard should be used for these analyses. This more conservative approach should be used also because the Project's situation along the San Joaquin River creates a potential for a rare event to have catastrophic consequences, such a channel alteration, dangerous changes in river flows, water pollution/water quality impacts, and unpredicted flooding.

Response 576-14

See Response 576-13.

Comment 576-15

Recreation:

There is little to no quantification of recreation use in the area surrounding the Project over the 100-year Project lifetime, nor afterwards. Project impacts on usage numbers, patterns, impacts of shifting recreation use away from the Project area to other areas and their concomitant impacts were not analyzed in detail. Nor were there any analyses of economic impacts on Fresno and Madera Counties resulting from changes in recreation caused by the project. Such analyses are possible and should be conducted; they should cover the Project's 100 years of operational life, as well as account for the continued impacts of the pit past that lifespan.

Response 576-15

Please see Collective Response #7 pertaining to economic issues.

Comment 576-16

Housing

Projects like the Rockfield Quarry are known to reduce property values.

This affects current homeowners, other property owners, and investors and developers. These impacts should be analyzed for the active life of the project and beyond.

Response 576-16

Please see Collective Response #7 pertaining to economic issues, including property values.

Comment 576-17

Public Safety

The quarry will be an eternal attractive hazard. It is reasonable to expect juvenile (and adult) thrill seekers to access the site. Criminals seeking to dispose of industrial waste, stolen cars, or bodies are also possible trespassers. Deaths and injuries and other problems will occur despite security measures. What mitigation is proposed for public safety after closure? What funding mechanisms are in place to assure maintenance of site security after operations cease?

In addition to avoidable public suffering, the County and other government entities will be burdened with the cost of responding to rare but tragic events. The project should provide financial assurances to the County to address these potentially huge impacts to County finances.

Response 576-17

See Response 358-5 regarding public safety at the quarry pit.

All required and reasonable measures would be taken to ensure that the reclaimed sites would not endanger public health or safety, and the sites would be fenced to prevent trespassing (Draft EIR at page 4.11-22). Trespassing is a social issue rather than a physical environmental impact, and thus outside the scope of the analysis required under CEQA.

Comment 576-18

Mitigation

The mitigation measures listed in the DEIR generally require only monitoring and reporting, with few review criteria, and vague outcomes (generally the preparation of plans without specific actions.) They do not establish the authority of the County to unilaterally require action in response to mitigation monitoring results, changed site conditions, or noncompliance. There is little to no funding established to ensure mitigation and compliance. Nor is there any fund established for potential damages resulting from the project during operation or after closure (when the pit remains). All these deficiencies should be addressed. Proposed mitigation measures should be rigorous and enforceable;

there should be a substantial fund established to ensure compliance with mitigation measures, and fund legal and on-the-ground actions to remedy any faults or violations. A third-party mitigation overseer, separately funded by the project in the form of secure endowments or other robust and durable ways, should be required for the life of the project and for 25 or more years after.

Response 576-18

The comment's assertions regarding the adequacy of mitigation measures is not supported by evidence nor does the comment reference any specific mitigation measure(s) or deficiency of any mitigation measure. Mitigation measures adopted for the project would be incorporated into a mitigation monitoring and reporting program (MMRP) that would provide for County oversight to ensure implementation of adopted mitigation measures. Additionally, the Operator is responsible for reclamation of the project sites in accordance with the approved reclamation plan. Both Fresno County and the California Surface Mining and Reclamation Act (SMARA) require that surface mining Operators maintain a financial assurance mechanism payable to the SMARA lead agency (here, Fresno County) and to the State of California sufficient to accomplish reclamation as prescribed by the surface mining operation's approved reclamation plan, including conditions of approval and mitigation measures associated with reclamation. The Operator is required to annually prepare and submit for County review and approval a financial assurance cost estimate and evidence of a financial assurance mechanism in an amount at least equal to the cost estimate to ensure reclamation in accordance with the approved reclamation plan would be available in the event of the Operator's failure to reclaim the site in accordance with the approved reclamation plan.

Comment 576-19

Because of the significant ongoing public interest in the Project, and its continuing impacts upon the public even after closure, the County should establish a process for publication and public review and comment on all mitigation reports and proposed actions. A citizens' advisory panel or similar group should be established by the County to assist in overseeing compliance and mitigation; this should be funded by CEMEX.

Response 576-19

Please see Response 576-18 regarding mitigation measures, the Mitigation Monitoring and Reporting Program (MMRP), and oversight. Under CEQA, the lead agency—in this case, the County of Fresno—is responsible for ensuring implementation of adopted mitigation measures through the MMRP following certification of the Environmental Impact Report (EIR). The MMRP identifies each mitigation measure and specifies the

responsible party, timing, and procedures for monitoring compliance. As a condition of project approval, the Operator would be required to implement all mitigation measures adopted as part of the certified Final EIR.

The commenter's recommendation for a citizen's advisory panel or similar oversight group is noted and will be considered by County decision-makers; however, CEQA does not require the formation of such a group, and the comment does not provide evidence that additional oversight beyond the MMRP is necessary to ensure implementation of mitigation measures.

Comment 576-20

Significant but Unmitigable Impacts

The DEIR lists two Significant but Unmitigable Impacts. One is the visual impact, which is deemed not mitigable – but, staining the pit walls some appropriate color is offered as a partial mitigation measure. This is ridiculous on the face of it. How was this determined to be reasonable mitigation? What color will be chosen and why, and by whom? How is funding provided for ongoing in perpetuity maintenance?

Response 576-20

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 576-21

The other unmitigable impact is traffic delays at Willow and Friant. Partial mitigation for traffic impacts is offered as paying "equitable share" costs for improvements in a few traffic signals, road widening and road surface maintenance. As written, the Mitigation Measure does not specify a number of critical requirements, such as timing of payments, funding source, maintenance of improvements after the operational life of the Project, or remedies for default. It seems that substantially better mitigation could be provided.

Response 576-21

The County cannot legally require the project to fully fund the necessary road improvements and instead must limit the imposition of mitigation requirements to those that are roughly proportional to the project's impacts (Title 14 CCR Section 15126.4(a)(4); *Dolan v. City of Tigard*, 512 U.S. 374 (1994)). Therefore, the appropriate mitigation requirement for project impacts associated with traffic operations is for the Operator to

contribute its proportional share of funding toward the improvements, which is required here. See Draft EIR Mitigation Measures 4.17-1a through 4.17-1r. As discussed in the Draft EIR (see Draft EIR pages 4.17-29 and 4.17-30), even with the Operator's contribution of the project's proportional share of funding for these improvements, the improvements necessary to achieve acceptable LOS and pavement conditions at these intersections may not occur before the project's introduction of additional vehicle trips because of, for example, a lack of funding for the other proportional shares beyond the control of the Operator. Therefore, the project's impact at 5 intersections (identified on Draft EIR page 5-28 and 5-29) under the following conditions is considered significant and unavoidable:

- Existing-Plus-Project Conditions (Stage 1—3.0 MT per year);
- Five-Year Cumulative Conditions with Project (Stage 1—2.0 MT per year);
- 15-Year Cumulative Conditions with Project (Stage 1—3.0 MT per year);
- Cumulative (Year 2040) No-Project Conditions; and
- Cumulative (Year 2040) Conditions with Project (Stage 1—3.0 MT per year).

See Draft EIR Section 4.17, "Transportation," for a detailed discussion of the Traffic Index analysis and the LOS and Queuing analysis. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR section referenced here.

Comment 576-22

Duration of mitigation

The Project causes impacts that persist after its 100 year active life. Costs of ongoing mitigation measures, (such as monitoring, site security, emergency response, and response to catastrophic events such as flooding) should be analyzed, and secured funding provided.

Response 576-22

Please see Response 576-18 regarding mitigation measures, the MMRP, and oversight. Please also see Collective Response #4b pertaining to liability.

Comment 576-23

Security and durability of mitigation funding.

CEMEX has a poor history of compliance with environmental regulations, having been fined over 41 million dollars for 81 violations, according to one 2000 report. Especially relevant to Fresno County's situation, Cemex had a sand mining operation in the city of Marina, along Monterey Bay. In March 2016 the

California Coastal Commission issued a cease and desist order asking for administration civil penalties, stating that the operation is narrowing beaches and impacting environmentally sensitive habitat. Cemex denied the allegations and continued to operate. A settlement was reached in 2017 and CEMEX ended mining in December 2020.

Response 576-23

Please see Collective Response #4a pertaining to the Operator's regulatory history. The purpose of CEQA is to provide substantial evidence supporting findings of the reasonably foreseeable potential environmental impacts of a project. The majority of the comment (i.e., consideration of past violations at an unrelated site) is not germane to the Draft EIR, or the analysis or impact determinations found therein. The Draft EIR provides a detailed evaluation of potential project impacts associated with the required CEQA environmental issues, and proposed the implementation of mitigation measures to reduce potential environmental impacts to less than significant levels, or to the extent feasible. The County and the Operator are committed to ensuring full compliance with the law and environmental review process.

Comment 576-24

Environmentally Superior Alternative

The No Project Alternative was identified clearly as the Environmentally Superior Alternative. Pursuant to CEQA requirements, another Environmentally Superior Alternative was selected from those provided in the DEIR. Alternative 5, reduced mining depth (400ft) and reduced annual sales (2.5 MTY) is identified as the environmentally superior alternative pursuant to CEQA.

However, it appears that Alternative 4, reduced mining depth (300 ft) with additional setbacks, would accomplish much of what Alternative 5 does, with the added advantages of providing additional buffers for impacts to recreation, aesthetics, and possible catastrophic events involving the San Joaquin River. The choice of "next best" Environmentally Superior Alternative should be reevaluated. A more expansive and scalable set of Alternatives should be provided to allow a less constrained choice of "next best" alternative.

Response 576-24

Draft EIR Chapter 6, "Alternatives," provides a detailed evaluation assessing impacts of the alternatives as compared to the proposed project. With Chapter 6, Section 6.6,

"Comparison of Alternatives," then provides a comparative assessment of the various alternatives against each other, presenting the assessment in summary form in Table 6-2, "Alternatives Impact Comparison Summary," on Draft EIR pages 6-60 through 6-76. Table 6-2 identifies certain impacts for which Alternative 4 would have reduced severity as compared to the proposed project and Alternative 5. However, Table 6-2 also identifies several impacts for which Alternative 5 would have reduced severity as compared to the proposed project and Alternative 4. As discussed in the Draft EIR, Alternative 5 is determined to be the environmentally superior alternative due to reduced impacts to air quality, biology, energy, groundwater quality, groundwater supplies, mineral resources, noise and transportation. The commenter's observation regarding certain comparative merits of Alternative 4 is noted; however, the County's identification of Alternative 5 as the Environmentally Superior Alternative is based on substantial evidence and analysis in the Draft EIR and in compliance with CEQA.

Comment 576-25

Conclusion

The proposed Project is inconsistent with existing and planned uses of the San Joaquin River corridor. The Project far exceeds historic and current aggregate extraction operations in the San Joaquin River corridor, and their impacts. It would create an enduring scar with ongoing impacts the DEIR does not adequately disclose or analyze; the mitigation measures proposed are inadequately defined; Project compliance is not assured; mitigation funding is not secured; and the County is left with additional unmitigated impacts in terms of potentially massive financial liabilities for more than 100 years. Deficiencies in the DEIR necessitate at least reanalysis and recirculation, but it is in the best interest of the public for the Commission to deny the Application.

Response 576-25

The commenter's concerns regarding the project and Draft EIR are noted and will be considered by County decision-makers. The comment does not provide evidence of a deficiency in the Draft EIR or mitigation measures identified in the Draft EIR. Please see Collective Response #18 pertaining to the project's consistency with San Joaquin River Parkway Master Plan. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #577 March 10, 2025, Stephanie Smallie

Comment 577-1

I've grown up on our San Joaquin River for over 50 years. I've had the privilege of living at the Spano Ranch for 25 years. I've spent almost every Saturday in my childhood roaming around the river bottom with my grandfather, Oscar Spano. I grew a deep appreciation for our river. It's a beautiful natural resource with so much vegetation, open land not to mention all of the wild life. There is a peace it brings my soul.

Response 577-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 577-2

The blasting will change everything that is peaceful and serene.

Response 577-2

The project's proposed blasting operations are described in the Draft EIR under Section 2.5.2.2, "Quarry Site Mine Plans," on page 2-42. Blasting would be limited to one to two blasts per week on weekdays between the hours of 10 a.m. and 2 p.m. The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections.

Comment 577-3

I strongly oppose this project. The amount of disturbance to our river is unimaginable. No matter how good an EIR "plan" is, there is no way that it couldn't not negatively affect our river and all that it encompasses.

Response 577-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality."

Letter #578 March 10, 2025, Peter Smith (handwritten)

Comment 578-1

I write to you as a concerned citizen of the County. I have deep concerns about the proposed CEMEX Quarry Modification ER and how it will impact the environmental we all share.

Response 578-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 578-2

While I recognize legitimate needs for production and material demands in the County, the well-being of County communities is paramount. The San Joaquin River is a vital public resource that is integral to human, animal, and environmental health. A massive pit mine in this location will compromise hiking, rafting, biking, wildlife habitats, quite and water resources. Ramping up mining at CEMEX Rockfield Quarry will increase truck and heaving machinery traffic which will severely impact air quality in the Valley/County. I don't need to remind you that air quality is already one of the biggest problems in our County. Rockfield Quarry expansion would only make it worse.

Response 578-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Impacts to recreation are addressed in Draft EIR Section 4.16, "Recreation." See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. Potential impacts to wildlife habitats, quiet, and water resources are evaluated in Draft EIR Section 4.4, "Biological Resources," Section 4.13, "Noise," and Section 4.10, "Hydrology and Water Quality," respectively. The issues of truck traffic and air pollution are evaluated in Draft EIR Section 4.17, "Transportation," and Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. See also Collective Response #9 regarding the project's potential to effect the region's existing air quality conditions.

Comment 578-3

My understanding is that there is sufficient rock aggregate material available in the region already so this project is both unnecessary and degrading to the River environment.

Response 578-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 578-4

The proposed mitigation efforts outlined in the DEIR are flimsy and insufficient to address harms.

[sic; the first part of the sentence did not copy well and therefore was not legible when drafting this response to comments. See Appendix M, "Draft EIR Comment Letters," for a copy of Letter 578 as it was received] community members when considering projects like CEMEX Rockfield Quarry Modification because of the major impacts on humans and all who share space in this watershed.

Response 578-4

The comment does not provide any reasoning or evidence to support the assertion that the mitigation measures required in the Draft EIR are insufficient. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #579 March 10, 2025, Brian Snyder

Comment 579-1

I appreciate the opportunity to provide comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts of this project, I have several concerns that I urge you to address before moving forward with approval.

Traffic, Noise, and Cumulative Environmental Effects

As our city and county continue to grow, a deeper excavation site will leave a lasting mark on the landscape. Future generations will question the wisdom of approving such a significant expansion—one that risks becoming a permanent scar in the heart of their community. When the original site was approved, it was in a remote area, surrounded only by the San Joaquin River and farmland.

Today, that is no longer the case.

If approval is inevitable, I strongly urge you to require CEMEX to establish a substantial, independently managed bond—funded entirely by the company, not taxpayers—to ensure full environmental restoration and remediation long after we are gone.

Response 579-1

Land use compatibility and consistency with local land use plans are discussed in Draft EIR Section 4.11, "Land Use and Planning." See Collective Response #4b regarding liability and funding for remediation of environmental damage.

Comment 579-2

Transparency and accountability in this review process are essential to protecting the long-term health of the San Joaquin River watershed and surrounding communities. I appreciate your careful consideration of these concerns.

Response 579-2

See Collective Response #1 regarding transparency in the County planning process.

Letter #580 March 10, 2025, Clare Statham

Comment 580-1

I am writing to ask that Fresno County say no to CEMEX's request for a 100-year sand and gravel permit.

1. PERMIT LENGTH: By any measure, a permit for 100 years is unreasonable and irresponsible. We and our children will be long gone before the project is completed and the required mitigations are in place. In approving such a long-term permit, the county would give up its leverage with the company. Say NO TO A 100 YEAR PERMIT.

Response 580-1

The commenter's request for denial of the project and concern with regard to the duration of the project are noted and will be considered by County decision-makers. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 580-2

2. TRUCK TRAFFIC AND PLANT OPERATION HOURS: Look carefully at the DEIR Tables 2-5 and 2-6. Within 10 years this project will be generating 1,076 trips per day. As the tiny 2-6 Table Notes say, this number is for **ONE WAY TRIPS**. But logic tells us that trucks cannot be going only one way. So how many round trips? Over 2,100 trips a day? Table 2-5 states that the plant will be running six days a week, from 4:00 AM to 9:00 PM (with reduced hours on Saturdays starting at 6:00 AM.) But the small print Table Notes say something quite different: "Continuous 24 hours per day operation may be required." So the neighborhoods to the south of

Friant Road and the houses in the river bottom will be subjected to the noise, and the larger region to the air pollution generated by somewhere between 80 and 160 trucks per hour anywhere from 4:00 AM to 9PM or 24 hour a day. We don't know. The DEIR allows the company to operate whenever in wants.

Response 580-2

Draft EIR Table 2-6, "Existing and Proposed Daily Truck Trip Generation," presents vehicle trips in terms of one-way trips. A roundtrip consists of two one-way trips (inbound and outbound); therefore, converting one-way trips to roundtrips would reduce the reported values by half, not double them as suggested by the commenter. The commenter's assertion of approximately 2,100 trips reflects a misunderstanding of how trips are reported in the Draft EIR.

As described in the Draft EIR Traffic Impact Study (TIS), trip generation estimates are based on typical peak-hour conditions at maximum production under existing conditions and permits. Table 4.1 of the TIS identifies an existing average of approximately 684 daily roundtrip truck trips and 278,126 annual roundtrip trips for all vehicle types, while Tables 4.2 through 4.4 estimate trip generation under the proposed expansion.

The commenter also appears to misinterpret Draft EIR Table 2-5, "Proposed Typical Hours and Days of Operation," Note 2, which states that continuous 24-hour operations may be required for certain public roadway projects under limited circumstances (e.g., nighttime or emergency work), and clarifies that this does not apply to blasting or recycling operations. Accordingly, the Draft EIR does not propose continuous 24-hour operations for the Plant Site, asphalt plant, or ready-mix concrete plant.

Potential noise impacts associated with project-related traffic and operations are addressed in Draft EIR Section 4.13, "Noise." The analysis concludes that noise levels would be below applicable thresholds, and implementation of Mitigation Measures 4.13-3 and 4.10-1, along with conditions of approval, would further reduce potential impacts to less than significant levels. The project is also consistent with applicable goals and policies of the Fresno County General Plan (see Draft EIR Table 4.11-1, "Project Consistency with Local Planning Documents"). Therefore, no additional mitigation measures are required.

Comment 580-3

I have studied the tables on noise and cannot understand how a 100% increase in truck trips in the next 10 years does not lead to a substantial increase in noise. I think the logic is this: if an air national guard airplane flies over my house there is a loud

noise. If another one flies over two minutes later there is another loud noise, but it is not louder than the first noise. So one can say that there is no increase in decibel level. But increasing the time one listens to the noise amounts to an increased impact even if the decibel level does not change. That logic is the only way I can account for both the tremendous increase in truck traffic proposed and the supposed minimal change in noise noted in the DEIR.

Response 580-3

In addition to the response below, see Response 291-5 and Response 552-6.

In response to the commenter's statement regarding the effects of increased traffic on perceived noise levels, the following explanation is offered. Because the decibel scale is exponential, a doubling of sound energy equates to a 3 decibel increase in noise level (10*log102=3 dB). For similar noise sources, a 3 dBA increase is considered the threshold of perception that an increase has occurred, and a 10 dBA increase is required before a traffic noise level increase is subjectively perceived as being twice as loud. As such, a large change in traffic volume is required before a clearly noticeable change in traffic noise level is perceived. The Draft EIR analysis clearly indicates that traffic noise levels would increase along roadways utilized by project traffic, and does not state that the decibel level would not change as a result of the project as asserted by the commenter.

Comment 580-4

3. IMPACT ON ROADS: As stewards of the county's transportation infrastructure, you can image what this volume of heavy weight traffic will do to Friant Road. The proposed mitigation is "Equitable Share Contribution." Equitable share is not defined, and the DEIR does not estimate what percentage of wear CEMEX trucks would cause. I foresee when the time comes to determine how an Equitable Share translates into actual dollars, CEMEX will argue for far less road damage than it is causing and the county taxpayers will be left footing most of the bill for the damage caused by hundreds of thousands of truck trips each year. How the enormous increase in traffic will affect the safety of other drivers is also not adequately addressed.

Table 2-5
Proposed Typical Hours and Days of Operation

Activity	Typical Hours and Days[1,2]
Excavation, Aggregate, and Recycle Processing	6 a.m. - 7 p.m., Monday through Friday
Loading, Unloading, and Aggregate Trucking[3]	4 a.m. - 9 p.m., Monday through Friday
Asphalt and Ready-Mixed Concrete Plants[4]	4 a.m.-6 p.m., Monday through Friday, May - October 5:30 a.m.-6 p.m., Monday through Friday, November - April 6 a.m.-2 p.m., Saturdays
Blasting	10 a.m. – 2 p.m., Monday through Friday 1 to 2 times per week

Table Source: CEMEX 2021.
Table Notes:
1. Maintenance of mobile and plant equipment extend beyond these hours.
2. Continuous 24 hours per day operation may be required for major public road projects that are required to be completed during night hours or on weekends to avoid traffic conflicts or during periods of public emergency affecting the health and safety of the community. This is not applicable to blasting operations and recycle processing.
3. Major public road projects may be required to be completed during night hours or on weekends to avoid traffic conflicts. Such projects may require loading operations beyond the hours and days of operation shown.
4. Asphaltic oil, cement, propane, and other supplies may be delivered during nighttime hours.

Table 2-6
Existing and Proposed Daily Truck Trip Generation

Description	Employees	Interplant Truck Haul	All Other Trucks	Total Annual Average Daily Truck Trips
Existing	110	450	240	690
Project Stage 1 at 2.0 MTY (5 years)	114	134	560	694
Project Stage 1 at 3.0 MTY (10-30 years)	120	216	860	1,076
Project Stage 2 - 3.0 MTY (30-100 years)	120	0	944	944

Table Source: CEMEX 2021.
Table Notes: Estimated trips are one-way trips.

Response 580-4

Please see Collective Response #29 pertaining to project-related transportation impacts and mitigation, Collective Response #30 pertaining to roadway safety, and Section 3.2.5.17, "Errata to Draft EIR Section 4.17, "Transportation," with revisions to the Draft EIR Transportation section that clarify and amplify information, analysis, and mitigation measures related to transportation.

Regarding the commenter's assertion that equitable share is not defined, please see Draft EIR page 4.17-26 which provides the equation and definitions used by Fresno County to determine a project's equitable share of the cost of improvements. In summary, the project's equitable share is equal to the number of project trips generated during the peak hour of the adjacent facility divided by the forecasted future with-project traffic volume

on the impacted facility. The project's equitable share proportions were calculated in the November 15, 2029, "Traffic Impact Study, Proposed CEMEX Rockfield Modification Project" included as Appendix I-1, "Traffic Impact Study," of the Draft EIR. As presented there in Table 12.2, the equitable share responsibility calculations based on the A.M. peak hour are as follows:

Location	Equitable Share
SR 41 / Road 145	1.55%
Road 206 / Road 145	2.99%
Friant / North Fork Road	2.20%
Friant / Quarry Site	100%
Friant / Plant Site	100%
Friant / Willow	6.44%
Willow / Copper	0.97%

Comment 580-5

3. AIR QUALITY IMPACTS AND LACK OF MITIGATION: The DEIR's air quality information is especially evasive in dealing with the impacts of the CEMEX proposal. Page after page is devoted to identifying agencies that deal with air quality, where their jurisdictions are, what the San Joaquin Air Pollution Control District does, which regulations it adopted in which years. It identifies the harms of diesel emissions and other noxious compounds. In these 33 pages the DEIR identifies the factors that make the San Joaquin Valley's air exceptionally dirty and acknowledges that our air is not meeting federally mandating clean air standards. What the DEIR does not do is evaluate in a substantive way the pollution this project will create.

The information relevant to CEMEX boils down to just one two-sentence paragraph at the end of 4.3-33. This paragraph states that CEMEX will emit the pollution ("actual emissions") and "the applicant can pay its fair share" into some other offset program rather than deal with "potential emissions" i.e., the emissions you prevent from becoming emissions. The DEIR notes that "many years in the future" new and by implication more stringent "diesel engine requirements [will be] fully implemented." Translation: CEMEX's operation will have significant impact on air quality, the company will pay a mitigation fee that is unlikely to improve our local air, and eventually stricter regulations enforced by someone else will make the company clean things up, so let's deal with this air quality business later. In the meantime we can breathe even dirtier air. I have copied the relevant paragraph below.

Page 4.3-33: The proposed project is well suited for offsetting actual emissions rather than potential emissions because the applicant can pay its fair share to mitigate the cumulative effects of ozone (VOC, NOx) and PM10 by complying with the existing in-use on- and off-road diesel engine regulations. In addition, it is likely that the maximum production amounts analyzed for the proposed would first occur many years in the future after the diesel engine requirements are fully implemented, thus potentially reducing emissions relative to the estimated emissions presented in the Air Quality Assessment and associated Addendum of the proposed project, because the emissions estimates in these studies follow conservative methodologies to ensure they represent the maximum reasonably foreseeable future condition with the project.

Response 580-5

The commenter is referencing a section in the Draft EIR that discusses the option of the project entering a VERA with the SJVAPCD. As discussed in the Draft EIR, applicants that enter a VERA may pay up-front for potential excess emissions predicted for the entire project. The project is well suited for offsetting actual emissions through this program payment to mitigate cumulative effects of ozone and PM_{10} by complying with existing diesel regulations. The SJVAPCD uses all of the off-site mitigation fees from the VERAs to fund emission reduction projects through its Incentives Programs to achieve emission reductions on behalf of the projects. Further, the paragraphs that the commenter references are based on more detailed reports contained in Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment," and Appendix D-2, "Addendum No. 2 to the Air Quality, Health Risk, and Climate Change Impact Assessment."

The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan and additional health risk modeling. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 580-6

4. EXISTING AGGREGATE PERMITS AND THE ISSUE OF JOBS: Finally, there is the issue of jobs dependent upon aggregate mining and supply. CEMEX has stated that the project will add only five new jobs at the work sites. They state 37 other jobs will be created but do not say these jobs will be in Fresno County. If they were local

jobs, I think CEMEX would have shared that fact. Perhaps those 37 jobs will be created at company headquarters in San Pedro, Mexico. What about jobs in the building industry that use the sand and gravel? We have enough local production of these materials to keep these industries supplied for decades. I include here the Fresno section of a table from the California Geological Survey's most recent report on aggregate mining and a link to the complete report. If you read the introduction to this report you will see that it was written by someone who understands the importance of aggregate mining for the building industries and for California's micro-economies. It is not a report hostile to mining and construction, so its conclusions should carry weight with those of you who support our local housing and construction industries.

AGGREGATE SUSTAINABILITY IN CALIFORNIA

https://www.conservation.ca.gov/cgs/Documents/Publications/Map-Sheets/MS_052_California_Aggregates_Report_201807.pdf

AGGREGATE STUDY AREA[1]	50-Year Demand (million tons)	Permitted Aggregate Reserves (million tons)	Permitted Aggregate Reserves Compared to 50-Year Demand (percent)	Projected Years Remaining
Bakersfield P-C Region	338	1,708	505	More than 50
Barstow-Victorville P-C Region	163	117	72	31 to 40
Claremont-Upland P-C Region	202	90	45	21 to 30
El Dorado County	82	15	18	11 to 20
Fresno P-C Region	305	556	182	More than 50
Glenn County	41	22	54	21 to 30

Response 580-6

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 580-7

Many other problems exist with this proposal: the impact on the San Joaquin River, the recreational areas near the CEMEX operation, and the aesthetic impact. I have restricted my comments to the topics on which I am most versed and could read the DEIR with the greatest understanding.

The people of Fresno and Madera counties do not need this project to have a healthy local building industry. The CEMEX project would have serious adverse effects on air, traffic, and quality of life, particularly noise pollution from excessive traffic. One hundred years is too long a time to approve the very best of projects.

Unfortunately, CEMEX is a company with a problematic record in a number of areas. Please, do not approve the CEMEX permit.

Response 580-7

The commenter's concerns and opposition to the project are noted and will be considered by County decision-makers. The Draft EIR discusses impacts to water resources, recreation, aesthetics and visual resources, air quality, and traffic in Section 4.10, "Hydrology and Water Quality," Section 4.16, "Recreation," Section 4.1, "Aesthetics and Visual Resources," Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.17, "Transportation." Please see Collective Response #5 pertaining to the requested use permit duration. Please see Collective Response #4a pertaining to CEMEX regulatory history.

Letter #581 March 10, 2025, Miranda Stelfox

Comment 581-1

As a resident of Friant, I am writing to express my profound concern regarding the escalating negative impacts of increased truck traffic and related issues, particularly the destruction of our unique natural environment. This area, rare within the Fresno region, is experiencing significant degradation due to the increased industrial activity. I have personally observed and experienced the following, addressing the key concerns as outlined in the example:

Response 581-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR. Please see Response 581-2 through 581-6 below for further discussion of the commenter's specific concerns. See also Draft EIR Section 4.17, "Transportation," for discussion of the project's potential traffic-related impacts.

Comment 581-2

Traffic Congestion and Safety:

The increased volume of large trucks has created significant traffic congestion, particularly during peak hours. This poses a serious safety hazard for residents, cyclists, and other motorists. The narrow roads in Friant are ill-equipped to handle the current level of truck traffic, leading to dangerous situations and near-misses. The combination of large trucks, cyclists, and regular car traffic creates unsafe conditions, deterring residents

and visitors from enjoying the natural beauty of the area. This diminishes the recreational value of our unique ecosystem.

Response 581-2

Please see Collective Response #29 pertaining to project traffic impacts. Please see Collective Response #30 pertaining to roadway safety.

Comment 581-3

Road Damage and Maintenance:

The heavy truck traffic is causing severe damage to our roads, resulting in cracks, potholes, and overall deterioration. The current road conditions are unacceptable and pose a risk to vehicle safety. The roads are not designed for this heavy traffic. The resulting erosion from the damaged roads is impacting the San Joaquin river watershed. The dust and debris generated are impacting native flora and fauna.

Response 581-3

Please see Collective Response #29 pertaining to project traffic impacts. Please see Collective Response #30 pertaining to roadway safety and road maintenance. With regard to effects of runoff, dust, and debris from existing roads and vehicle operation, the commenter does not provide evidence that such existing conditions cause or contribute to a project effect not already evaluated in the Draft EIR.

Comment 581-4

Dust and Air Quality:

The constant movement of large trucks and earth generates excessive dust, which negatively impacts air quality and poses health risks to residents. This dust also settles on vegetation, harming native plant life. The dust and debris are impacting the air quality, harming both human and ecological health.

Response 581-4

The project would be subject to mitigation measures which reduce the construction and operation emissions throughout the life of the project. Additionally, the project would be subject to a Fugitive Dust Control Plan required by SJVAPCD Regulation VIII. This Dust Control Plan would also benefit plant life.

All air modeling included estimating impacts at the fence line of the proposed project facilities; the modeled emissions (including criteria air pollutants, and health risks) at the

fence line receptors represent the worst-case air impacts from the proposed project. Any potential impacts on the adjacent Conservancy owned properties (and even further as the commenter suggests Friant, Fresno and Madera) would be less than those potential air impacts reported in the Draft EIR for the fence line receptors. Because the proposed project air impacts were all below all significance thresholds for the fence line receptors, the potential impacts at the surrounding communities of Friant, Fresno and Madera, which are all further from the proposed project's modeled fence line receptors, would be less than significant. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan and additional health risk modeling. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 581-5

Noise Pollution:

The increased truck traffic has significantly increased noise pollution in our community, disrupting the peace and tranquility of our rural environment. This noise disturbance disrupts wildlife patterns and diminishes the quality of life for residents. The noise, dust, and physical disturbance are disrupting wildlife patterns and degrading the overall health of the environment.

Response 581-5

The Draft EIR analyzes potential noise impacts in Section 4.13, "Noise." Existing traffic noise is part of the environmental baseline, and CEQA does not require analysis of the effects of existing environmental conditions. The Draft EIR was prepared to analyze the potential environmental impacts of the proposed project and to identify appropriate mitigation measures for impacts determined to be potentially significant. See Responses 60-13, 363-1, and 448-28 for discussion of the project's potential noise impacts. See Response 58-42 for discussion of the project's potential noise impacts. See Response 58-40 for discussion of the project's potential impacts on vegetation and wildlife as a result of blasting and fugitive dust emissions.

Comment 581-6

Environmental Impact:

The increased truck traffic and associated road damage are directly contributing to the destruction of the fragile ecosystem that makes Friant so special. The rock and debris deposited by trucks are contaminating our natural areas. The increased debris is also polluting the San Joaquin river watershed. This area is a gem in the Fresno area, and the damage is devastating. The heavy truck traffic is causing severe damage to our roads, fragmenting natural habitats and increasing erosion that pollutes nearby waterways.

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected

I urge you to take immediate and decisive action to mitigate these serious environmental and safety impacts. The unique natural beauty of Friant is being compromised, and we must act now to protect it for future generations. I am available to discuss these concerns further and provide additional details about my observations.

Response 581-6

Transportation impacts are analyzed in Draft EIR Section 4.17 and potential effects related to roadway use, including runoff, dust, and debris from vehicle operations, are addressed in the context of project traffic and roadway conditions. The commenter does not provide evidence that existing roadway conditions would result in impacts beyond those already evaluated in the Draft EIR. Please see Collective Response #29 regarding project traffic and Collective Response #30 regarding roadway safety and road maintenance.

Potential impacts to the San Joaquin River and water quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." With implementation of Mitigation Measures 4.10-1, 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b, as revised and strengthened in Chapter 3, "Draft EIR Errata," impacts to surface water and groundwater quality would be reduced to less than significant levels.

The Draft EIR discloses the environmental impacts of the project and includes mitigation measures where necessary to reduce potentially significant impacts in accordance with

CEQA. The commenter's concerns and request for additional analysis, enhanced mitigation, and less harmful alternatives are noted; however, the comment does not provide evidence of a deficiency in the Draft EIR. Please also see Collective Response #1 regarding the CEQA review process and opportunities for public input.

Letter #582 March 10, 2025, Wendell Stephenson

Comment 582-1

I'm a 76-year-old Fresno native who scarcely gave a thought about the San Joaquin River running to the north of Fresno during my formative years in the 1950's and 60s. It was only after I returned to Fresno in 1999 to teach Philosophy at Fresno City College that I had any thought about the river. And then I had lots of thoughts about it.

I won't tell you about those thoughts now, for this letter is mainly in regard to the EIR submitted by CEMEX to expand its mining operations along the San Joaquin River for the next 100 years.

Response 582-1

The commenter's background is noted. Please see below for responses to specific comments.

Comment 582-2

Questions that occurred to me as I read through parts of the EIR.

1. What is an "unclassified conditional use permit"?

Response 582-2

An unclassified conditional use permit is a permit that allows for specific uses not allowed as a matter of right within a zoning district.

Comment 582-3

2. Has the California Department of Fish and Wildlife commented on this plan? The proposal impinges on its land and concerns, so I think it must comment.

Response 582-3

The California Department of Fish and Wildlife (CDFW) reviewed and provided comments on the Draft EIR. CDFW comments and the County's responses are included in the Final EIR at comment letter #15.

Comment 582-4

3. Here is the 6th stated project objective: "6. Continue to provide an environmentally sound project that would balance the recovery of the aggregate resource with the protection of other resources including wildlife habitat, groundwater, surface water, and air quality;" CEMEX is implying here that its current project along the river is "environmentally sound"? How so? More importantly, how would its proposed expansion result in an "environmentally sound" project? No "balance" is needed if the "recovery of the aggregate resource" is not necessary. That it is not necessary is something I adumbrate below. Before doing that, I'd like to know, assuming the project is necessary, how CEMEX's proposal constitutes the "right balance".

Response 582-4

The Draft EIR demonstrates an extensive consideration and analysis of the potential environmental impacts of the proposed project. The potentially significant impacts of the project would be mitigated to the extent feasible, in accordance with CEQA. Therefore, the project as proposed is environmentally sound. As discussed in Draft EIR Section 4.10, "Hydrology and Water Quality," the project would not result in significant impacts to the San Joaquin River. Please refer to Collective Response #3 regarding aggregate supply and demand in the Fresno region.

Comment 582-5

4. Cemex says it is proposing to mine and blast down to a depth of 600 feet below the surface. Apart from creating a gigantic hole, what all would this entail? It seems to me that the EIR is very weak on what this actually would entail.

Response 582-5

Draft EIR Chapter 2, "Project Description," provides a detailed description of the project sufficient for informing the Draft EIR's environmental evaluations. See specifically Draft EIR Section 2.5.2.2, "Quarry Site Mine Plans" and Figure 2-8, "Proposed Quarry Site Mining Plan," on pages 2-36 through 2-37. Additional information about the proposed project is available in Draft EIR Appendix B, "Application Materials," including the proposed "Surface Mining and Reclamation Plan, CEMEX Rockfield Modification Project" (Draft EIR Appendix B-1) and the "Project Description/Operational Statement, CEMEX Rockfield Modification Project" (Draft EIR Appendix B-2). Blasting impacts are discussed throughout the Draft EIR. See also Draft EIR Appendix H-3, "Blast Impact Analysis," Appendix H-4, "Blasting Effects on San Joaquin River Embankments," and

Final EIR Appendix H-9, "Revised Blasting Protocols," for further discussion of the proposed blasting. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 582-6

5. "The following impacts were found to be significant and unavoidable, as feasible mitigation is either unavailable or would not effectively reduce the severity of the impact to less than significant:

- Impact 4.1-1: Have a substantial adverse effect on a scenic vista.
- Impact 4.1- 3: In non urbanized areas, substantially degrade the existing visual character or quality of public views (i.e., views experienced from publicly accessible vantage point(s) of the project sites and their surroundings.
- Impact 4.17-1: Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. "

Why is there no feasible mitigation?

Why allow a project that conflicts "with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities"? Tell me how that makes sense.

Response 582-6

The Draft EIR discusses each significant and unavoidable impact and applies mitigation measures to reduce the severity of each to the extent feasible. The Draft EIR concludes that Impact 4.1-1 is significant and unavoidable because the quarry pit's engineered and linear benches would remain visible from two identified viewpoints (private residences). Mitigation Measure 4.1-1, the quarry pit staining measure, would reduce impacts to the greatest extent feasible. The Draft EIR draws the same conclusion for Impact 4.1-3 for the same reasons as Impact 4.1-1 (i.e. the visual quality from two identified viewpoints would decrease relative to existing conditions, even with mitigation).

Regarding Impact 4.17-1, the Draft EIR concludes that the project would increase the traffic index and levels of service at specified intersections relative to existing conditions, thus resulting in significant impacts. To reduce impacts at the specified intersections, the Draft EIR provides Mitigation Measures 4.17-1a through 4.17-1r which require the

Operator to contribute equitable share contributions for future signalization and pavement improvements to Fresno County. The impacts to traffic indices and levels of service are significant and unavoidable because it is uncertain when the traffic improvements would be constructed.

With regard to each of the significant and unavoidable impacts identified in the Draft EIR, including Impact 4.17-1, County decision-makers will consider information in the EIR and other factors in deciding whether to approve or deny the project. Decision-maker "findings" pertaining to a project approval decision will be documented separately from the EIR and will be deliberated as part of the project decision-making process.

Comment 582-7

7. CEMEX says that the negative impact of increased truck traffic and traffic congestion that would be caused by its work cannot be mitigated. Its reason? There are no funds. My question: why cannot the company be required to stump up any required funds to fully mitigate such traffic and congestion? In general, why can't the company be required to make any and all necessary mitigations as a necessary condition of approval?

Response 582-7

The County's imposition of mitigation requirements for the project must have a nexus to the project impact and must be roughly proportional to the impact. Therefore, mitigation measures included for traffic-related impacts of the project specify an equitable share funding contribution toward improvements (e.g., signal installation). Where improvements are not solely required as a result of the project, the County may not impose the full cost of improvements. Additionally, there may be other factors that delay or preclude the installation of certain improvements. For these reasons, the Draft EIR properly concludes that impacts related to traffic are considered significant and unavoidable. See also Collective Response #29 regarding the Draft EIR's traffic impact analysis and mitigation.

Comment 582-8

I said in 3 above that I don't think the proposed project is necessary. As Marek Warszawski writes in his Fresno Bee editorial of 16 Feb 2025: "there isn't a compelling reason to mine aggregate from along the San Joaquin River utilizing more destructive methods than those previously employed since the 1920s.

Other local sources will provide more than we need, as the California Geological Survey report shows". (The California Geological Survey report is cited in his editorial.)

If CEMEX disagrees with this conclusion, what are its reasons? What are the good reasons, good enough to continue degrading one of CA's great rivers for the next 100 years, that justify this proposal?

Response 582-8

Please see Collective Response #3 pertaining to regional aggregate demand and supply. Please see Collective Response #5 pertaining to the requested use permit duration.

Letter #583 March 10, 2025, Kathy Suda

Comment 583-1

My name is Kathie Suda, and I am a concerned citizen who deeply cares about the wildlife and natural environment surrounding the San Joaquin River. I am writing to express my concerns regarding the proposed expansion of the CEMEX-Commerce Group's mining operations near this precious area.

As you know, the San Joaquin River is home to diverse ecosystems and provides vital re-sources for both wildlife and human communities alike. The health and sustainability of this river system are critical not only for the flora and fauna that depend on it but also for the long-term well-being of our environment.

Response 583-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to fish and wildlife species and associated habitats are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections.

Comment 583-2

I respectfully request that CEMEX be required to conduct and submit a thorough Environmental Impact Report that specifically addresses the potential harm their proposed expansion might have on the San Joaquin River. This report should carefully evaluate, at a minimum, the following aspects:

Response 583-2

The Draft EIR for the proposed project was completed and released for public review and comment on January 2, 2025. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10.

Comment 583-3

1. Air Quality: How will the expansion of the mining operations affect the air quality in and around the San Joaquin River area? Willi dust and emissions from machinery and transportation increase, potentially harming both human heallth and local wildlife?

Response 583-3

The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The impacts identified in this section were determined to be less than significant with the incorporation of Mitigation Measure 4.3-2b and Mitigation Measure 4.3-4. See Chapter 3, "Draft EIR Errata," and Appendix D-4, "Revised Section 4.3, Air Quality," for revisions to Draft EIR Section 4.3 and Mitigation Measure 4.3-4. Since publication of the Draft EIR, the Operator has prepared a Fugitive Dust Control Plan for the project (see Appendix K of Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). Implementation of this dust plan would minimize the project's dust emissions benefiting air quality for both humans and wildlife.

Comment 583-4

2. Water Quality: The mining project should be evaluated for its potential impact on the water quality of the San Joaquin River. Will the expansion contribute to runoff or contaminants that could harm the river's delicate ecosystem and the species that depend on it?

Response 583-4

The issue of water quality is addressed in Draft EIR Section 4.10. See Impacts 4.10-1 through 4.10-3 for discussion of surface water quality.

Comment 583-5

3. Wildlife: Finally, I urge you to ensure that the report includes an analysis of the impact on local wildlife. This includes both the direct harm that might come from habitat destruction and the indirect consequences of air and water pollution on the health of animals that inhabit the area, including the Swainson's Hawk.

Given the rich biodiversity that relies on the San Joaquin River, it is critical that any development near it be held to the highest environmental standards to ensure that wildlife and the river's ecological balance are not compromised.

I trust that, as stewards of our city's natural resources, the City of Fresno will prioritize the protection of our environment and ensure that CEMEX provides the necessary data to demonstrate that their operations will not harm the San Joaquin River area that I love.

Response 583-5

The project's potential impacts to wildlife species are evaluated in Draft EIR Section 4.4. See also Collective Response #14 regarding the analysis of impacts to Swainson's hawk presented in the Draft EIR.

Letter #584 March 10, 2025, Judith Swick

Comment 584-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 584-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter does not provide any reasoning or evidence to support the assertion that the Draft EIR is insufficient or inaccurate.

Comment 584-2

As Volunteer Coordinator for the Clark Bonsai Museum I am concerned with the amount of traffic that would be added to the already busy Friant Road. At the Clark Bonsai Museum we welcome visitors from all around the world, the United States, California, throughout the Central Valley and especially Fresno and Clovis. I believe that the EIR fails to adequately address the following concerns:

Response 584-2

The issue of traffic is addressed in Draft EIR Section 4.17, "Transportation." See also Collective Response #29 regarding the project's truck trips and traffic congestion.

Comment 584-3

1. The impact of air pollution and NOISE pollution on the many visitors to Woodward Park and gardens within the park, e.g. Clark Bonsai Museum and Shinzen Gardens.**[Insert Specific Concern—e.g.,

Impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater impacts, or community health concerns]**

Response 584-3

The issues of air quality and noise associated with the project are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," respectively. See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Comment 584-4

2. The impact of public safety on an already very busy Friant Road.

Response 584-4

See Collective Response #30 regarding traffic and pedestrian safety.

Comment 584-5

3. The potential damage to the San Joaquin River, wildlife habitat, and certainly water quality, which leads to community health concerns.

Response 584-5

The project's potential effects on the San Joaquin River, including water quality degradation, are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources."

Comment 584-6

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 584-6

The Draft EIR provides a comprehensive evaluation of the proposed project's potential environmental effects and meets the standards of CEQA. Draft EIR Chapter 5, "Cumulative Impacts," focuses specifically on potential cumulative impacts of the project. The commenter does not provide any reasoning or evidence to support the assertion that the Draft EIR is inadequate and in need of revision.

Letter #585 March 10, 2025, Deborah Symes

Comment 585-1

CEMEX's proposed blasting deep pit mine ignores or fails to adequately address crucial adverse impacts on the San Joaquin River and existing parks and residential areas Fresno and its fast-expanding suburbs to the north suffer from very limited access to nearby natural areas for recreation: hiking, fishing, horseback riding, photography, painting, birdwatching, and enjoying nature.

Recently, Ball Ranch park just to the north of the proposed 600-foot deep blasted pit mine -- a 358 acre park -- opened to the public. It is a great addition to the parklands available to the growing urban area and would be directly and detrimentally affected by the proposed CEMEX project. My husband and I have enjoyed several lovely hikes with sightings of birds, animals and wildflowers. Blasting and hard rock mining operations will create environmental impacts that cannot be mitigated to avoid adverse effects on the park experience.

Please consider the need of Fresno area families and especially children for unpolluted parks within reach of town to discover and enjoy nature.

Response 585-1

The project's potential impacts to recreational facilities in the project area are discussed in Draft EIR Section 4.16, "Recreation." See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise." The project's potential effects on the San Joaquin River and potential impacts to wildlife species are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively.

Letter #586 March 10, 2025, Carly Tex

Comment 586-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 586-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Response 586-2 through 586-5 below for further discussion of the commenter's concerns.

Comment 586-2

As a member of the North Fork Rancheria of Mono Indians, and a resident of Fresno, I have a concern about the mitigation of impacts on cultural resources both physical, and spiritual.

Mitigation for cultural resources

I noticed in the description in Section 4.18 that North Fork Mono Tribe was mentioned in the list of current tribes, but not North Fork Mono Rancheria, which is a different Tribe whose lands are near the head of the San Joaquin River. The references used in this section may be outdated if it does not even include them and begs the question of whether research was thorough.

Response 586-2

Draft EIR Impact 4.18-1 on page 4.18-8 under the heading "AB 52 Consultation" discusses the County's outreach to Native American tribal representatives in accordance with PRC Section 21080.3.1. Pursuant to PRC Section 21080.3.1, the County is required to provide formal notification under AB 52 only to California Native American tribes that have submitted a written request to the County to receive such notice. Neither the North Fork Mono Tribe nor the North Fork Rancheria of Mono Indians have requested to be notified by Fresno County for projects within the project area under PRC Section 21080.3.1.

After receiving and deeming complete the application for the proposed project in 2019, the Fresno County Planning Department notified by certified letter the designated contact of, or a tribal representative of, traditionally and culturally affiliated California

Native American tribes that had requested notification of projects, including the Dumna Wo-Wah Tribal Government, Table Mountain Rancheria, and Picayune Rancheria of the Chukchansi Indians. The notification letters were mailed via certified mail on December 9, 2019 (Draft EIR Appendix J, "Transportation"). North Fork Mono Tribe is discussed in the Draft EIR at page 4.18-3 in relation to the ethnography of the project area, and the discussion there is not intended as a listing of all contemporary Native American groups. No tribes requested consultation as a result of the tribal notification letters and no responses were received during the project's scoping period. Note that Table Mountain Rancheria representatives subsequently provided comments on the Draft EIR, and those comments and the County's responses are provided at Comment Letters 50 and 52 of Final EIR Chapter 4, "Responses to Comments."

Comment 586-3

In Appendix J, it notes, *"No other cultural resources were identified as a result of the pedestrian survey. However, a search of the NAHC Sacred Lands File identified one or more sacred sites in the Project area. The NAHC recommended contacting the Dumna Wo-Wah Tribal Government and provided a list of other individuals and tribes to contact for more information."* What is the list of "other individuals and tribes to contact for more information," and were they contacted with adequate time to request a formal consultation or were they left out?

Response 586-3

The list referred to in the referenced excerpt from the Draft EIR is a list of tribes and individuals maintained by the Native American Heritage Commission (NAHC) who have requested, in writing, to receive notification of projects within the geographic area with which they are traditionally and culturally affiliated, pursuant to PRC Section 21080.3.1(b)(1). This list is provided by the NAHC to assist lead agencies in identifying potentially affiliated tribes based on the project location, consistent with PRC Section 21080.3.1(c).

In accordance with AB 52, formal tribal consultation obligations apply only to those California Native American tribes that have submitted a written request to the lead agency to receive notice of projects in the applicable geographic area (PRC Section 21080.3.1(b)). Tribes or individuals included on the NAHC list, but who have not submitted such a written request are not entitled to AB 52 consultation notice requirements.

All tribes that had submitted a written request for notification for the project area were provided timely notice of the project and an opportunity to request consultation consistent with AB 52. No tribes entitled to AB 52 consultation were omitted.

Comment 586-4

Also, how is it determined that the sacred sites are alright to develop upon? What is the plan if later archaeological discoveries are found and will you have members of local Tribes to aid in identification, mitigation, and management of artifacts? On the subject of mitigation, it would be good to have training of project staff for cultural awareness and the ability for tribes to review the permit periodically as well as be made aware of ongoing discoveries over the course of this 100-year project. Also, what if any compensation can tribes expect for the exchange of desecration and exposure of those sacred sites? This is a multi-generational project and tribal leadership is bound to change over the course of the project, being open to continued tribal consultation beyond the draft EIR public comment period is urged.

Response 586-4

Mining operations have been ongoing for decades at both the Plant and Quarry sites. The majority of each site is disturbed by the previous mining operations. Please refer to Draft EIR Section 4.5, "Cultural Resources," Impact 4.5-2 regarding the project's potential to result in a substantial adverse change in the significance of an archaeological resource pursuant to CCR Section 15064.5. Mitigation Measure 4.5-2, addressing inadvertent discovery of archaeological resources, specifies that "Fresno County shall consult with appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature" providing for input from local Native American tribes for appropriate treatment of any such material.

Comment 586-5

In closing, I hope the public's comments will be considered, additional information drafted and recirculated for public review before the finalizing of the environmental impact report for the project.

Response 586-5

The commenter's requests for additional information and recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in

Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #587 March 10, 2025, Guinevere J. Thelin and Kirk Brown

Comment 587-1

We are writing to express our concerns over the current proposed Cemex modification project which threatens the San Joaquin river. The ecosystem of these areas are incredibly fragile and the damage done will have untoward consequences for generations to come. These resources are precious and to destroy them in the thirst for profit is short sighted and only benefits a few at the expense of so much more.

Please do not allow it to progress.

Response 587-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #588 March 10, 2025, Robb Tibstra

Comment 588-1

I am writing to submit my formal public comment regarding EIR 7763 for the proposed CEMEX Rockfield Quarry Expansion. As an ecologist by training with a background in aquatic ecology, environmental planning, sensitive species, and field biology, I am deeply concerned by the insufficient analysis presented in this Environmental Impact Report (EIR) and its potential long-term consequences for our community and natural resources.

The proposal to create a 600-foot deep pit so close to the San Joaquin River (SJR) is alarming. The project's environmental costs appear to greatly outweigh any perceived benefit to our community. The region already has ample permitted aggregate reserves that can meet future demand without the need to impact such a sensitive and crucial ecosystem. There is no compelling reason to extract aggregate from an area connected to one of the most endangered rivers in the country when other sources are available and already permitted for extraction.

Response 588-1

The commenter's background and concerns are noted and will be considered by County decision-makers. Please see Collective Response #3 pertaining to regional aggregate demand and supply. The commenter does not provide evidence of a deficiency in the adequacy of the Draft EIR. Please see Response 588-2 through 588-7 below for discussion of the commenter's specific concerns.

Comment 588-2

Particularly concerning is the lack of consideration for native aquatic species in the SJR ecosystem. There is little mention of Chinook salmon, and no mention of other native fish species such as threespine stickleback, hardhead, Sacramento perch, Tule perch, riffle or prickly sculpin, for example. A major, multi-agency and multiple stakeholder effort to restore native Chinook salmon populations to the SJR in the immediate vicinity has been ongoing for decades. The only mention of salmon in the EIR appears to be in relation to direct impacts from blasting at the Quarry site, which it states are less than significant and assumes salmon will not occur in the project area. There appears to be zero consideration of long-term impacts to salmon or other aquatic species--impacts which include increased habitat for non-native, predatory aquatic or otherwise competitive species, such as largemouth bass, bluegill, green sunfish, spotted bass, American bullfrog, and pond (red-eared) sliders. Juvenile salmon are known to utilize temporarily flooded portions of rivers as rearing habitat, and non-native, warm water fishes are known to prey on smaller fish. Any habitat changes that increase numbers of these non-native species while decreasing natural floodplain habitat present potential significant impacts to native salmon populations, particularly if there are ever surface water connections between the river and the altered, open-water habitats.

Response 588-2

The Draft EIR is required to analyze impacts to state and federally listed species, which may or may not coincide with native species (i.e. CEQA does not require a specific analysis of impacts to native species.) Chinook salmon and Central Valley Spring Run are both state and federally listed as threatened. As such, the Draft EIR includes an analysis of potential impacts to Chinook salmon related to blasting and discusses this in conjunction with the ongoing San Joaquin River Restoration Program (SJRRP). For additional discussion of the SJRRP, please refer to Collective Response #12.

The proposed project would not impact the water quality of the San Joaquin River, and would not significantly impact San Joaquin River flows, and as such, would not impact fish species in the river, including each of those named in the comment.

The commenter alludes to a scenario which the Plant Site and Quarry Site ponds, which contain certain predatory species, are directly connected to the San Joaquin River. This scenario is speculative in nature and is not required to be analyzed in the Draft EIR. For additional information pertaining to flooding and the floodplain analysis, please refer to Collective Response #17.

Comment 588-3

The EIR indicates that recent mapping has been used to redraw maps to exclude the Plant and Quarry sites from the FEMA 100-year floodplain. However, it also indicates that "berms" constructed in the last 20 years have altered the topography to account for these changes in floodplain mapping. It has no detailed analysis of the berms and their susceptibility to erosion from the SJR, other than to state that they haven't eroded yet. The EIR should describe the condition, dimensions, and composition of the berms, any associated riparian vegetation, and an analysis of various flow conditions to determine the likelihood of erosion and the potential for subsequent surface water connections between the SJR and the "open water" habitats created by mining operations. Similarly, there is little detail regarding the river water ditch at the Plant site that provides water for mining operations. In the absence of such detail, it is assumed that the ditch is unscreened and has potential to provide a corridor for fish and aquatic species to access open-water ponds into which it terminates. Given the proximity of the project site to the SJR, it is likely that surface water connections will be established at some point during the project's lifetime, resulting in connections of fish populations between the two habitats. Salmon populations are already impacted by past mining operations within the SJR floodplain which have converted suitable floodplain rearing habitat for juvenile salmon to enormous instream "lakes" that contain an abundance of non-native and predatory fish species. Once these lakes are established, it is virtually impossible to manage them for anything other than the non-native fish species that occur there. The habitat conversion effectively removes that portion of the landscape from ever having the potential to be managed for native aquatic species, as well as greatly increasing the negative effects to native species from non-native fish populations. The SJR historically did not contain instream lakes that greatly alter natural flow regimes and fish species composition.

Response 588-3

The hydraulic analysis, located in Appendix G-1, "Hydraulic Analysis," of the Draft EIR, provides a detailed analysis of the 100-year water surface elevations and flow velocities along the San Joaquin River. The "berms" are reflected in the topographic mapping used for the analysis. (See Appendix G-1 of the Draft EIR.) Vegetation is incorporated in the hydraulic analysis and is reflected in the roughness coefficients. The berm is higher than the 100-year water surface elevations, which would prevent breaching. (Draft EIR Appendix G-1.)

Please refer to Responses 65-19, 65-21, and 67-17 regarding the river water delivery ditch.

Comment 588-4

The reclamation of the project sites is also very concerning. The EIR states that the final slopes of the banks will be seeded with native grasses and forbs and planted with native plants, but offers little detail concerning goals for the habitat. It states that because it will be seeded during the rainy season, there will be no need for supplemental irrigation. In addition, the performance criteria for revegation includes 75% cover, but indicates that any vegetation (non native or native) will suffice. It also states a goal for "native trees or shrubs" to be established at a density of 2 plants per 150 feet of bank. In my experience, these goals would be wholly unacceptable for any revegetation or restoration plan that aims to restore natural habitats. Any plan should include an analysis of native riparian habitats nearby to provide a template for the goals of the project. At a minimum, the species types (annuals, perennials, etc.), size, and density, etc. should be clearly delineated with the goal of emulating a healthy, native riparian habitat. This would also require a detailed monitoring plan that utilizes supplementary irrigation to establish native perennial species such as riparian trees.

Response 588-4

The Draft EIR provides a revegetation plan at the Plant and Quarry sites. For further discussion of the revegetation plan, please refer to Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," Section 5.1.7, "Revegetation" on pages 60 through 61. As discussed there, the existing habitat in the adjacent natural areas has been used as reference areas to determine the appropriate native species to be planted at the Plant Site. Additionally, the existing habitat in the adjacent San Joaquin River corridor has been used as a reference to determine the appropriate native species to be planted at the Quarry Site. Draft EIR Table 2-7, "Summary of Vegetation Performance Criteria," provides that vegetation includes both introduced and volunteer species, native and non-native

naturalized to the region. Table 2-7 in the Draft EIR and Table 12 in Draft EIR Appendix B-1, indicates a performance standard for species richness, providing for 6 native species per 25 sq. ft. area.

At the Plant Site, trees and shrubs planted around the Plant Site pond would be irrigated until the plants can survive without irrigation (Draft EIR, Appendix B-1 page 61). The revegetation seed mix that would be introduced at the project sites would be introduced during the rainy season, thus negating the need for irrigation. A noxious weed management program would be implemented. The performance criteria provided in Draft EIR Table 2-7 would be used to determine revegetation success five years after revegetation and at least two years without human intervention, such as irrigation (Draft EIR, Appendix B-1 page 61). The revegetation plan is sufficient under SMARA and Fresno County requirements.

Comment 588-5

The EIR also fails to consider the significant cumulative effects relating to the conversion of floodplain habitat to open-water, lake-type habitats, which results in impacts to sensitive species such as salmon. There is no mention of other gravel mining operations in the SJR that have resulted in several instream lakes that are populated with non-native fish, pond sliders, American bullfrogs, and invasive plants such as false bamboo (*Arundo donax*) and red sesbania (*Sesbania punicea*). This project will not only add to these already-significant effects, but will remove any potential for floodplain restoration for native species. The areas closer to Friant dam, especially upstream of Highway 41, offer the most potential for salmon restoration and enhancement due to temperature regimes and substrate characteristics and thus should be evaluated with this in mind.

Response 588-5

The commenter describes the project sites as a "floodplain habitat," which fails to account for the fact that the majority of the project sites are disturbed by decades of ongoing mining operations. As it currently exists, both the Plant and Quarry sites provide minimal habitat for any species. Implementation of the project would not impede future floodplain restoration projects.

Please see Collective Response #12 for further discussion of the San Joaquin River Restoration Program.

Comment 588-6

The proposed mitigation measures for sensitive species such as the spadefoot toad and western pond turtle also raise significant concerns. The EIR indicates that there is not suitable habitat for western pond turtles, yet presents surveys that detected pond (red-eared) sliders in the project site. Given that sliders routinely bask at sites with pond turtles, and that pond turtles occur in the SJR, it should be assumed that pond turtles exist in the project area. Extensive research has demonstrated that western pond turtles and their nests are highly cryptic and difficult to detect. The EIR's approach of conducting surveys before construction and relocating any turtles found (mitigation measure 4.4-1b) is insufficient. To effectively protect this species, surveys should be conducted well in advance of construction, and transmitters should be placed on turtles to track their movements and habitat use around the quarry. Without these more robust monitoring techniques, the EIR fails to demonstrate how it will avoid significant impacts to this protected species.

Response 588-6

The biologists properly concluded that the likelihood of western pond turtles to occur on the project sites is low given the lack of suitable habitat on the Plant and Quarry sites, the lack of recently recorded CNDDB observations, and because they were not observed during the habitat assessments conducted in 2019 or 2021. For further discussion of the Draft EIR's analysis of impacts to western pond turtle, please see Response 58-50 and Response 65-11. CEQA does not require the biologists to speculate on the presence of pond turtles at the site solely based on the presence of another species, where the habitat assessments indicate low habitat suitability on the sites due to lack of movement opportunities. (Draft EIR page 4.4-35.) See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR section referenced here.

Mitigation Measure 4.4-1b is sufficient to reduce potential impacts to western pond turtles by requiring a qualified biologist to conduct pre-construction clearance surveys for western pond turtle within suitable habitat areas. If individuals are observed, they would be relocated by a qualified biologist with CDFW approval to suitable nearby habitat outside the disturbance area. These measures are sufficient to avoid and minimize potential impacts, and no additional revisions to the Draft EIR are required.

Comment 588-7

I hope the public's input is not dismissed with inadequate responses. The people of Fresno deserve a transparent process and a real commitment from county officials to safeguard our

environment and human health. There has been significant investment by the public in the restoration of the SJR, including Chinook salmon runs and native riparian plant communities. A project of this magnitude has the potential to significantly alter these efforts, and the County has the ability to guide the restoration further by its actions relating to this project.

Thank you for your attention to these critical issues. I look forward to seeing how the County addresses these concerns in the final response.

Response 588-7

Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input. Please see Collective Response #12 pertaining to San Joaquin River restoration efforts. The commenter's requests and input are noted and will be considered by County decision-makers.

Letter #589 March 10, 2025, Rachael Torres

Comment 589-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project.

As a Fresno resident who has been visiting various points along the San Joaquin River over the past several years, I believe the negative impacts of this plan are too high to approve.

I have enjoyed the river for it's peaceful atmosphere and have appreciated over the years the successful efforts of the San Joaquin River Parkway and Conservation Trust to preserve and restore the natural ecosystem. Walking the trails around the river is a breath of fresh air that everybody should have the right to. The actions proposed by CEMEX will cause unnecessary disruption and destruction to our river system.

Response 589-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Collective Response #18 regarding the project's consistency with the Parkway Master Plan. See also Collective Response #21 regarding public access to the San Joaquin River.

Comment 589-2

We should do our best to preserve these dwindling resources, especially in these times. I have great concerns about inevitable water contamination, wildlife disruption, and air pollution.

Response 589-2

The issues of water contamination, wildlife disruption, and air pollution are addressed in Draft EIR Section 4.10, Section 4.4, "Biological Resources," and Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively.

Comment 589-3

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX.

Response 589-3

The project's potential impact on the San Joaquin River, wildlife, and air pollution are addressed in Draft EIR Section 4.10, Section 4.4, and Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. Mitigation Measure 4.10-1 requires implementation of the Blasting Protocols (see Final EIR Appendix H-9, "Revised Blasting Protocols"), which contain a range of safety measures related to structural protection, river embankment protection, human safety, flyrock prevention and monitoring, and administrative oversight including annual reporting requirements. See Collective Response #1 regarding the need for additional analysis and Collective Response #4b regarding financial guarantees from the Operator.

Letter #590 March 10, 2025, Aracely Trejo Mendoza

Comment 590-1

Dear David, I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

The DEIR does not adequately analyze potential impacts of blasting on wildlife. The examples of habituation of wildlife to mining operations are for surface mining, not the deep rock mining proposed here.

Response 590-1

Blasting activities would be brief (lasting one to two seconds) and would not result in significant impacts to wildlife (Draft EIR page 4.4-53). For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17.

Comment 590-2

I would like to raise an issue that affects Public Safety especially as it relates to the Quarry Site. This could be analyzed under the Hazard category as the Fresno County General Plan Implementation Program HS-E.B includes a statement that "The County shall, as part of the development review process, ensure that new development . . . does not create manmade safety hazards . . .". The issue pertains to the public safety hazard that the quarry will represent after the project is complete 100 years or so from now (and maybe before). With the stepped but vertical walls and a surface water elevation more than 400 below the trail elevation, the open quarry will not be suitable for fishing, swimming, boating, kayaking, canoeing, floating or anything else. But it will be ATTRACTIVE, especially to preteens and teenagers. There is not a fence that will keep them out. What will happen if one or more of the public falls into the pit? They won't fall all the way down - just 50 feet. That is a sure death."

Response 590-2

See Response 358-5 regarding public safety at the quarry pit. There is no SMARA requirement that the reclaimed sites serve a recreational purpose. Upon final reclamation, the Plant and Quarry sites would both be converted to open space for riparian and open water habitat. At the Plant Site, there would be a pond. At the Quarry Site, there would be a lake formed, which would be used as open water habitat (Draft EIR at pages 2-45 through 2-49). All required and reasonable measures would be taken to ensure that the reclaimed sites would not endanger public health or safety, and the sites would be fenced in to prevent trespassing (Draft EIR at page 4.11-22). It should be noted that the potential risk of trespassing does not involve any physical environmental impacts; and thus, would be outside the scope of the analysis required under CEQA. Thus, the EIR and reclamation plan are consistent with the Fresno County General Plan.

Comment 590-3

"Table 4.16-1 Recreation Facilities Near the Project Sites – Some of the table sources are dated to 2021. Several properties listed (namely Ball Ranch and Ledger Island) were not formally open to the public then. These properties are now operated by the San

Joaquin River Parkway and Conservation Trust under a contract with the San Joaquin River Conservancy. There is more public use of the sites under current conditions that the project should analyze.

Response 590-3

Please see Collective Response #19 pertaining to public accessibility to parks, including Ball Ranch and Ledger Island. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 590-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 590-4

The commenter's requests and opinions are noted and will be considered by County decision-makers. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input. The commenter does not address the adequacy of the Draft EIR or provide specific recommendations for enhanced mitigation or less harmful alternatives.

Letter #591 March 10, 2025, Bert Tribbey

Comment 591-1

Thank you for the opportunity to review the CEMEX DEIR referenced above, and to submit comments. I now have a much more complete understanding of the magnitude of the CEMEX proposal and its presumed impacts. My understanding was greatly aided by the numerous review comments posted by the San Joaquin River Parkway Conservation Trust (Parkway Trust) on their website, which I assume they will be submitting to you, and which I will not be repeating here. Instead, I will try to limit this letter to my personal concerns about the project, and how adequately the DEIR addresses those concerns.

During my 41 year career (1965-2006) as a professor of biology at CSU-Fresno (specialization, general and freshwater ecology), I led

dozens of field trips to the San Joaquin River (SJR), primarily at Lost Lake Park. Following retirement, I helped my wife with a few dozen more docent-led SJR educational trips for the Parkway Trust. Those experiences convinced me that the SJR and its associated riparian corridor are a natural treasure to the region, woefully underutilized primarily due to lack of access, with great recreational, aesthetic, and educational potential for all people to enjoy. Recently it has been gratifying to see welcome changes in access, primarily led by the Parkway Trust. And there is hope that these changes can continue to grow into the future so that this section of the SJR can achieve its potential.

Response 591-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter. See also Letter #58 and Letter #68 submitted by the San Joaquin River Parkway & Conservation Trust, Inc.

Comment 591-2

So, my first concern is that any future sand and gravel mining does not impede the progress this area is achieving in reaching that potential. What I am looking for in the DEIR is a realistic idea of the impacts this project will have on people who come to the river largely to escape the sights and sounds of activities like gravel extraction. Stated another way: How much of the project will visitors hear and see at various recreational locations surrounding the project area? Will they be able to hear the sound of earth-moving equipment, or blasting? If so, how often? Continuous or not? Let us know how much of a nuisance this project will be, both visually and auditorily, when people are visiting the park for educational or recreational reasons. And how these impacts might be mitigated? Granted, this is not easily done, but it would make a welcome and necessary addition to the sections on Recreation (4.16) or Cumulative Impacts (5-3).

Response 591-2

See Collective Response #21 regarding public access to the San Joaquin River.

The project's potential noise impacts are evaluated in Draft EIR Section 4.13, "Noise." As shown on Draft EIR Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site," the Lost Lake Recreation Area was identified as sensitive receptor Q-5. Draft EIR Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site," on Draft EIR page 4.13-22 presents existing ambient noise levels at sensitive receptors while Table 4.13-

17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," on Draft EIR page 4.13-60 presents the estimated noise levels from proposed Quarry Site operations at sensitive receptors. As shown, neither existing ambient nor predicted noise levels at receptor Q-5 exceed the County's significance thresholds. In other words, a significant noise impact would not occur at the Lost Lake Recreation Area due to project operations. Blasting would occur up to twice a week between 10:00 a.m. and 2:00 p.m. on weekdays, as discussed in Response 591-3 below. A typical blasting event lasts approximately one to two seconds. See also Collective Response #27 regarding the project's potential effects to users of nearby parks and trails.

The project's potential visual impacts are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." As shown on Draft EIR Figure 4.1-1, "Potentially Sensitive Viewpoint Locations," and summarized in Table 4.1-2, "Summary of Potentially Sensitive Viewpoint Locations," beginning on page 4.1-15, numerous sensitive viewpoint locations were identified in recreational areas surrounding the project sites. The San Joaquin River is identified as Sensitive Viewpoint Location #1 and Lost Lake Recreation Area is identified as Sensitive Viewpoint Location #2. The anticipated change in visual quality at each sensitive viewpoint location is shown in Table 4.1-3, "U.S. Bureau of Land Management Visual Project Impact Ratings at Nearby Viewpoints," beginning on Draft EIR page 4.1-53. As shown, the expected visual change at the San Joaquin River and Lost Lake Recreation Area would be less than significant.

Comment 591-3

My other major concern is the empathy I feel for those people who own property in the area that will be impacted by the project. Let's face it: Proposing to blast, scrape, and mine a 600 ft hole in the neighborhood for the next 100 years is a truly lousy thing to do to anyone. At the very least, if this project were to be approved, those unlucky people deserve the full range of mitigations to minimize their harm. Three that come to mind immediately are: 1) Blasting, which should be done only upon mutually acceptable rules; 2) Guaranteed protections to homeowners if the project causes any structural damages to property, or to the production of water wells; and

Response 591-3

The project's proposed blasting operations are described in the Draft EIR under Section 2.5.2.2, "Quarry Site Mine Plans," on page 2-42. Blasting would be limited to one to two blasts per week on weekdays between the hours of 10 a.m. and 2 p.m. The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3,

Air Quality"), and Section 4.13, as updated by this Final EIR. Mitigation measures are provided in those sections to reduce potential impacts to less than significant levels. These include Mitigation Measure 4.10-1 which requires implementation of the Blasting Protocols, as updated April 29, 2026, and provided as Appendix H-9, which include monitoring of vibration levels and adaptive management of the blasting plan to ensure that impacts to surrounding receptors are minimized.

Comment 591-4

3) Highway improvements paid by CEMEX to offset the increased traffic burden created by the project.

Response 591-4

See Collective Response #29 regarding funding of the roadway and intersection improvements identified in Mitigation Measures 4.17-1a through 4.17-1r.

Comment 591-5

In my comments, I have not dealt with details because I am aware you will get loads of them from people more qualified than I am, and I do not want to be redundant. Mine are offered only because I feel so strongly that the final EIR must adequately protect 1) the living things that depend upon the SJR corridor for survival; 2) the rights of the people to enjoy and benefit from the river without the disruption that would be caused by unmitigated heavy mining; and 3) the residents of the area potentially affected by the proposed project. I am sure that you and your staff share those views, so I wish you success in ensuring that CEMEX fully addresses each of those issues in its final EIR. I will look forward to hearing more as the process moves forward.

Response 591-5

The comment is a summary of the points raised in the letter. The comment is noted for the decision-makers.

Letter #592 March 10, 2025, Ignacio Valdez

Comment 592-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 592-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to water quality, air quality, recreation, wildlife, and hazards and hazardous materials are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. Please see Response 592-2 through 592-11 for further discussion of the commenter's specific concerns.

Comment 592-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 592-2

See Response 329-2.

Comment 592-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 592-3

See Response 329-3. See Collective Response #17 which further addresses flood concerns.

Comment 592-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document

identifies the fact that there is groundwater/surface water interaction at both sites.

Response 592-4

See Response 329-4. See Collective Response #25 regarding groundwater/surface water interaction, and Collective Response #26 regarding the baseline conditions for analyzing the project's potential groundwater impacts.

Comment 592-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 592-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 592-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 592-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 592-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 592-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 592-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 592-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety.

Comment 592-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 592-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. See also Collective Response #9 regarding the project's impact on existing air quality conditions, and see Response 528-9.

Comment 592-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 592-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4 does not need to be rewritten or recirculated.

Comment 592-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 592-11

With the implementation of mitigation measures, the project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #593 March 10, 2025, Jesse Verduzco

Comment 593-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. In todays world it feels to us citizens that those in power continue to prioritize wealth over health. At a national level, this is reflected in the practices of the current administration which aims to eliminate our social, economic, and political systems which make our country great. The defunding of the Environmental Protection Agency (EPA) and removing protections

for our nation's most sacred lands is the first step at dismantling the concept of public land in the service of a greedy corporate America. Now at a local level these stains in the fabric of our republic bleed into weave of our blanket, our home Fresno. This project will endanger our community in multiple ways, and not only now but for many years to come if the proposed 100 year DEIR were to be approved. The San Joaquin River, our water quality, air quality, public recreation spaces, wildlife, and public safety are all to risk due to the wishes of an international corporation who's practices are banned in their own country of Mexico but allowed in our backyard. Many of the proposed mitigation measures are inadequate and many impacts lack any mitigation at all. As a local born and raised here in our home of Fresno, California allow me to elaborate on the issues present in the draft report which raise alarm.

Response 593-1

See Response 554-2. This is an introductory comment that does not specifically address the adequacy of the Draft EIR. See responses below that address specific issues raised in this comment letter.

Comment 593-2

Impacts on Water Quality and the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 593-2

The project's potential impacts to the San Joaquin River are primarily evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." Each of the impacts identified in this section were determined to be less than significant with implementation of the associated mitigation measure(s). See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR Section 4.10. See Collective Response #25 regarding the potential for the project to reduce river flows; Collective Response #17 regarding riverbank stability and the potential for breach and flooding of the Quarry Site excavation; and Collective Response #26 regarding the baseline groundwater data used in the Draft EIR and groundwater/surface water interaction at the project sites.

Comment 593-3

There are also multiple inadequacies in the DEIR in terms of how much water will actually be used during operation of the mine. Multiple figures are present in the document which claim to be the max amount of water that is used during the ice of the mine so which figure is it? We would like to know exactly how much of our water will be diverted to be used in this project not only during the blasting phase of the project but also in the production of cement.

Response 593-3

The project's estimated water demands are presented in Draft EIR Table 4.19-1, "Existing and Proposed Water Use Summary (Acre-Feet per Year)," on page 4.19-9. The table provides the total annual water demand for the project during each project stage. The actual duration of each operational stage of the project is not known, and so water demands for the life of the project are not provided in the Draft EIR. Further, water supply and demand are typically analyzed on an annual basis, as available supplies are measured by the water year and naturally fluctuate with precipitation levels.

Under existing conditions, the operation uses 770 acre-feet per year. During project stage 1, the operation would use 650 acre-feet each year, a decrease of 120 acre-feet compared to existing conditions. Stage 1 is estimated to be up to 30 years and would have a total water demand of up to 19,500-acre feet during that period. During project stage 2, the operation would use 990 acre-feet each year, an increase of 220 acre-feet compared to existing conditions. Stage 2 is estimated to be up to 70 years and would have a total water demand of up to 69,300 acre-feet during that period. Therefore, project stages 1 and 2 would have a total water demand of up to 88,800 acre-feet over the 100-year operational life of the project.

Comment 593-4

There are no concerns shared in the DEIR report for the chemicals that will be surfaced when using the technique of blast mining. In the past mines of this nature when at a depth of 260 feet release a particle 16 times smaller than the width of a hair, Hexavalent Chromium. This forever chemical is known to enter the body and through breathing and cause many adverse health effects such as emphysema, asthma, and lung cancer. What are the plans to mitigate the release of this toxin onto our air and water?

Response 593-4

As discussed in Draft EIR Section 4.10.1.8, "Groundwater Quality," hexavalent chromium is identified as a water quality concern in some areas of the North Kings groundwater basin but not within the vicinity of the project sites.

Hexavalent chromium is also identified in the Draft EIR as a hazardous air pollutant (HAP) and was included in the analysis of soil samples taken from the project sites as described in Table 17 and Appendix C of the *Air Quality, Health Risk, and Climate Change Impact Assessment* prepared for the project (see Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment," which is updated in the Final EIR at Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The health effects of hexavalent chromium emissions were assessed using current methodologies and, when combined with the health effects of other toxic air contaminants, are determined in the Draft EIR, as updated in the Final EIR, to result in health risk levels that are less than significant. As such, hexavalent chromium is not a HAP of concern associated with project operations.

Comment 593-5

Geology and Impacts on Soil

The proposed 200 ft wall that will separate the San Joaquin River and the mine is highly inadequate in both its scope on the impact to the San Joaquin, and integrity for which CEMEX claims the wall to hold. The DEIR says the the official mitigation of the wall collapsing in a mine using explosives is to keep an eye on the wall and monitor it… this is highly inadequate and ridiculous to propose. The wall will eventually erode and leak into the quarry causing a spillage that will impact the health of the river and the health of the workers who aim to extract rejoices from the earth. This 600 foot deep pool will also have a large impact on water flow further down the river possibly impacting farmers and ranchers in our valley. What are the measures to secure water rights for our citizens and those who need it for agriculture?

Response 593-5

See Collective Response #17 regarding riverbank stability and the potential for breach and flooding as well as Collective Response #25 regarding seepage and effects to river flows.

Comment 593-6

Impacts on the San Joaquin River Parkway and Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 593-6

See Collective Response #18 regarding the project's consistency with the Parkway Master Plan. See Collective Response #22 regarding the proposed trail easements and future construction of trails near the project sites.

Comment 593-7

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry.

Response 593-7

See Collective Response #19 regarding public access at nearby parks.

Comment 593-8

The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, Ball Ranch, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 593-8

The project's potential noise impacts are evaluated in Draft EIR Section 4.13, "Noise." As shown on Draft EIR Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site ," the Lost Lake Recreation Area was identified as sensitive receptor Q-5. Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site," on Draft EIR page 4.13-22 presents existing ambient noise levels at sensitive receptors while Table 4.13-17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," on Draft EIR page 4.13-60 presents the estimated noise levels from proposed Quarry Site operations at sensitive receptors. As shown, neither existing ambient nor predicted noise levels at receptor Q-5 exceed the County's significance thresholds. In other words, a significant noise impact would not occur at the Lost Lake Recreation Area due to project operations. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13. See also Collective Response #27 regarding the project's potential effects to users of nearby parks and trails.

Comment 593-9

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 593-9

See Collective Response #8 regarding proposed visual mitigation.

Comment 593-10

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 593-10

The issues of traffic congestion and road damage are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See Collective Response #29 regarding traffic congestion and funding of

necessary improvements. See also Collective Response #30 regarding traffic safety, road debris, and vehicle damage.

Comment 593-11

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 593-11

The Draft EIR properly compares the proposed project's estimated air emissions with the baseline conditions which include current operations at the project sites. See Collective Response #10 regarding the use of alternative baseline for the air quality analysis. See also Collective Response #9 regarding the project's impact on existing air quality conditions, and see Response 528-9.

Comment 593-12

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The propose mitigation measures do not comply with existing regulations for protection.

Response 593-12

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Collective Response #14 regarding analysis of Swainson's hawk impacts and Collective Response #15 for further evaluation of potential impacts to bird species. In response to comments received on this issue, the Draft EIR was revised to expand discussion of bat species and to strengthen multiple mitigation measures. See Chapter 3, "Draft EIR Errata," for these proposed changes. Potential impacts to nesting birds are evaluated under Impact 4.4-1 beginning on Draft EIR page 4.4-48 while impacts to migration patterns are discussed under Impact 4.4-6 beginning on page 4.4-62. The commenter does not specify which mitigation measures do not comply with existing regulations, nor does the commenter provide any support for this claim.

Comment 593-13

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

Response 593-13

See Collective Response #16 regarding the use of an Alaska Department of Fish & Game standard in analyses of salmon impacts.

Comment 593-14

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 593-14

The comment does not provide any reasoning or evidence to support the claim that Draft EIR Section 4.4, "Biological Resources," fails to meet CEQA requirements or that the Draft EIR should be recirculated. See Response 593-12 and Response 593-13 above.

Comment 593-15

Impacts to Local Residents

I live in the Tower District and due to an increase in farm land and urban development encroaching on the wilderness surrounding our city, wildlife like red foxes have been appearing more frequently in people's backyards. Now extrapolate that sort of behavior of animal flight to the surrounding citizens which reside near the CEMEX plant. Mountain lions, bobcats, coyotes and foxes are sure to appear in peoples backyards if explosions were to go off and scare these animals away.

Response 593-15

The project sites have been subject to active mining and processing operations for over 100 years including the use of heavy equipment and haul trucks. As described in Draft EIR Section 4.4, under Impact 4.4-2, beginning on page 4.4-52, the Plant Site and Quarry Site habitat assessments indicate that wildlife is often observed to habituate well to daily recurring activities and noise associated with the operations including haul trucks, excavators, scrapers, front-loaders, dozers, rock being loaded on trucks, rock crushing, night lighting, etc. The continuation of mining activities on the project sites, with the

existing disturbance footprints, would not be expected to significantly affect wildlife occupancy in the area. Potential impacts to wildlife movement and migration are further evaluated in Impact 4.4-6 beginning on Draft EIR page 4.4-62. See also Collective Response #13 regarding the project's operational effects on wildlife in areas surrounding the project sites and revisions to the Draft EIR to make associated mitigation measures more rigorous.

Comment 593-16

Property values are also shown to drop up to 30% when in half a mile of a blast mine and up to 14% in homes even 3 miles away from the project. Are there any concerns for the hard working citizens that will lose 30% of their life savings put into their property?

Response 593-16

See Collective Response #7 regarding the project's potential economic effects.

Comment 593-17

Wildfire Concerns

With an increase of wildfires and a decrease in trust in insurance companies, the concern for an errant spark causing a fire on the river is very present on the mind. No where in the DEIR report is there any fire mitigation and assurance of proper equipment maintenance. Are there any plans by the city to handle an enormous fire on the San Joaquin River? This must be included in the official EIR.

Response 593-17

The issue of wildland fire is addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," and Section 4.20, "Wildfire." See Impact 4.9-6 beginning on Draft EIR page 4.9-23. See also Impact 4.20-2, beginning on page 4.20-12, discussing the project's potential to exacerbate wildfire risks. As discussed in the Draft EIR, fire risk within the project sites is considered low as the sites contain generally denuded ground with no vegetation to serve as fuel and are located outside the Very High Fire Hazard Severity Zone. Furthermore, onsite equipment would be subject to California Air Resources Board and EPA regulations that require engines to be properly maintained for emissions compliance. These requirements would also reduce the risk of mechanical failure, which is one of the primary causes of equipment-related wildland fire ignitions. Further, Mitigation Measure 4.10-1 (see Final EIR Appendix H-9, "Revised Blasting Protocols"), would further mitigate any potential to exacerbate fire risk to a less than significant level.

See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 593-18

Economic and Urban Development

One major objection to the cessation of the CEMEX plant will be its contribution to urban development in the form of cement production as well as the amount of jobs crated by the project. I do empathize with the working class for which I am a part of when it comes to financial struggle but these issues should not be used to push through inadequate resource and land management policies in our local government.

After a quick research one can find that we have approximately 180% of the amount of aggregate that we need to grow here in Fresno for the next 50 years. The argument of scarcity should not be used in this case for we have an abundant supply. One can even argue that mining more aggregate would create even more waste than capital in the form of storage and recycling material which is not used and then re-ground to make new cement product.

Response 593-18

See Collective Response #7 regarding the project's potential economic effects. See also Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 593-19

CEMEX's Environmental Compliance

In 2020 CEMEX was kicked out of Monterey, California for violations at their sand mine site. Also compared to other aggregate companies in the Fresno area like Vulcan, CEMEX has 5x more violations. Since 2000, CEMEX has been cited 667 times and fined $52.4 million for environmental, safety & employment related offenses. Is a company that has a record of violating the law worthy of receiving a 100 year contract to exploit the San Joaquin River? The idea that that any privatized mitigation program could sufficiently monitor and manage a project with as large of an impact as this one for that long is preposterous. Neither you or I or even our grandchildren will not be able to keep this international corporate entity in check and they will eventually out live us if we let them.

Response 593-19

See Collective Response #4a regarding CEMEX's regulatory history. As discussed in Draft EIR Section 2.6, "Discretionary Action," and Section 3.3, "Mitigation Measures," as well as throughout the Draft EIR, compliance with the mitigation measures presented in the EIR is ensured through a mitigation monitoring and reporting program (MMRP) adopted by the County at the time of project approval, in accordance with PRC Section 21081.6(a). Additionally, implementation of all mitigation measures identified in the EIR would be required as conditions of approval of the project.

Comment 593-20

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

I implore you and others in city management to consider rejecting the project outright in order to preserve the health of our city. Combat of ruthless company practices will be rewarded and praised in our community through respect and loyalty in upcoming elections.

Thank you for your time and consideration.

Response 593-20

The comment summarizes the previous comments provided in the letter. See Response 593-1 through 593-19. The commenter has not provided any evidence to support the assertion that the Draft EIR should be modified or recirculated. No new or more severe environmental impacts were identified, and no new mitigation measures were determined to be necessary. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #594 March 10, 2025, Evelyn Vieira

Comment 594-1

I strongly object to the Cemex Mining Plans to extend their operations and pursue Blast mining as opposed to the previous Mechanical Boring Mining which is less Dangerous to the Fresno-Madera already poor air quality, water resources, traffic congestion, noise pollution.

Response 594-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of air quality and water resources are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality," as updated in the Final EIR, respectively. The issues of traffic congestion and noise pollutions are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 594-2

Please don't allow our vital air to become even more harmed, we are #4 worst Air Quality in the USA! We must learn from past mistakes and do better for ourselves and future generations! Cemex Mining isn't our only Mining Resource locally or in California, why jeopardize everyone's health for their greed?

Response 594-2

See also Collective Response #9 regarding the project's impact on existing air quality conditions.

Comment 594-3

According to JOUAV.com March 27, 2024 over the length of a mining project the budget info. from the quicker Blasting vs. Tunnel boring machine is not that much savings compared Environmental impact, health, and safety issues.

Response 594-3

In accordance with CEQA, the Draft EIR evaluates the project as proposed by the Operator. The comment describes an alternative mining method and is noted for the consideration of the decision-makers.

Comment 594-4

Does our Police and Fire departments have all the resources on duty and available to Cemex in case of Blast Mining Emergencies? Cemex is no longer in a remote area, It is not far from schools, homes, eldercare facilities, PG&E plants, and Valley Children's Hospital.

Response 594-4

The project's potential effects on public services such as law enforcement and fire protection are evaluated in Draft EIR Section 4.15, "Public Services." Both the Notice of Preparation and the Draft EIR were circulated for review by public agencies including public service providers. See Comment Letter 1 submitted by the Fresno County Fire Protection District and related responses.

As described in Draft EIR Chapter 2, "Project Description," all blasting would be performed by a California licensed blasting contractor (see page 2-42), and no explosives would be stored on either project site (see page 2-44). Mitigation Measure 4.10-1 requires implementation of the Blasting Protocols (see Final EIR Appendix H-9, "Revised Blasting Protocols"), which contain a range of safety measures related to structural protection, river embankment protection, human safety, flyrock prevention and monitoring, and administrative oversight including annual reporting requirements. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Letter #595 March 10, 2025, Leni Villagomez Reeves

Comment 595-1

I oppose the proposed 100-year permit for the CEMEX mining operation. The e Draft Environmental Impact Report (EIR) prepared for this project is inadequate The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 595-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter does not provide any reasoning or evidence to support the assertion that the Draft EIR is inadequate or inaccurate. See responses below that address specific issues raised in this comment letter.

Comment 595-2

As someone who has lived in this area for over 45 years, and who has worked as an ER physician at Valley Childrens Hospital for over 20 of those years, I find that the EIR fails to adequately address the following concerns:

1. Impact on the health of the community, especially our children.

Response 595-2

The commenter does not specify what community health impacts should be further evaluated in the EIR. The issue of air pollution and public health is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). Impact 4.3-3 evaluates the effects of the project's air emissions on sensitive receptors. With implementation of a dust control plan as required by Mitigation Measure 4.3-2, this impact would be less than significant. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.3. See also Collective Response #11 regarding the analysis of population-wide cancer burden.

Comment 595-3

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 595-3

The commenter does not provide any reasoning or evidence to support the assertion that the Draft EIR fails to meet the standards required by CEQA. The commenter's opposition to the proposed project is noted for the decision-makers.

Letter #596 March 10, 2025, James Von Tersh

Comment 596-1

I was born and raised in Fresno. I grew up spending my summers at the San Joaquin River and enjoy it still. But accessing the river has always been a challenge, and those areas that are accessible have been severely degraded by gravel pit mining. Improved river access and restoration would not only help create a more vibrant and attractive community, but would bring more awareness to the treasure that the San Joaquin River is, and help foster a closer sense of place and uniqueness for local residents. To say this is lacking in Fresno is an incredible understatement.

Response 596-1

The project would have no effect on public access to the San Joaquin River (SJR). See Collective Response #21 regarding public access to the SJR and the suggestion that the project sites should be public parks providing new access points to the river.

Comment 596-2

People want to see and visit A RIVER. Not a series of mine pits that scar the landscape. We can do better.

A healthy and publicly accessible San Joaquin River would benefit millions of Fresno County and San Joaquin Valley residents. Those that are around today and generations of those to come. The expansion of the CEMEX Rockfield mine will create a blight on the river that will negatively impact those same people while benefiting a small handful of individuals in the short term. The decision on this mine expansion should be clear. Do you support the needs of millions of present and future Fresno residents or the desires of a few who wish to further damage a public resource for their benefit?

The CEMEX Rockfield mine on the San Joaquin River should be decommissioned as planned, not extended for another 100 years, or allowed to blast a 600-foot deep pit. The area should be restored and eventually made accessible to the public, something that is not likely to happen if this expansion is approved. **I am urging the Fresno County Planning Commission to reject CEMEX's proposed Rockfield mine expansion.**

Response 596-2

The project's potential impacts to the visual landscape are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1. See Collective Response #21 regarding public access to the SJR and the suggestion that the project sites should be public parks providing new access points to the river. The comment is noted for the consideration of the decision-makers.

Letter #597 March 10, 2025, Evonne Waldo

Comment 597-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological,

and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 597-1

The commenter does not provide any reasoning or evidence to support the assertion that the Draft EIR is insufficient or inaccurate. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 597-2

As someone concerned about the welfare of my grandchildren and their children, I find that the EIR fails to adequately address the following concerns:

1. cumulative environmental impacts,

Response 597-2

The project's potential cumulative effects are discussed in Draft EIR Chapter 5, "Cumulative Impacts." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 5.

Comment 597-3

2. community health concerns]**

Response 597-3

The commenter does not specify what community health concerns require further evaluation in the EIR. The issue of air quality and associated health concerns are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Impact 4.3-3, as updated in the Final EIR, concluding that the project's potential health risk impacts on sensitive receptors would be less than significant. Further, in response to air comments on the Draft EIR, the technical analysis was updated to clarify and amplify the information presented, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3). The 2026 Air Report included an updated health risk assessment, which further confirmed that the project would not result in significant health risk impacts. See Chapter 3, "Draft EIR Errata," and Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3. See also Collective Response #9 for further discussion of the project's health risk impacts.

Comment 597-4

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Response 597-4

The commenter does not provide any reasoning or evidence to support the assertion that the Draft EIR fails to meet the standards required by CEQA. The commenter's opposition to the proposed project is noted for consideration of the decision-makers.

Letter #598 March 10, 2025, Lisa Walzem

Comment 598-1

I wanted to briefly voice my strong concerns against allowing CEMEX to expand their operations along our San Joaquin River. This river has struggled for decades to overcome the lack of water to its clogged up flow to the point that we no longer have salmon spawning here.

Response 598-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See Collective Response #12 regarding the project's effects on salmon restoration efforts in the San Joaquin River and Collective Response #25 regarding the potential for seepage into the excavations to impact river flows.

Comment 598-2

Along with the water flow problems, the increase in traffic and resulting air pollution is not worth the environmental cost to not only the river but the surrounding embankments, neighborhoods and general area in Fresno.

Response 598-2

The issues of traffic and air pollution are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 598-3

We have enough sources for aggregate and cement without this expansion so please, please don't let this be approved.

Response 598-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Letter #599 March 10, 2025, Gary and Venus Warner

Comment 599-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Quarry Modification Project. My wife and I reside in the community directly across from the quarry site, and given our proximity to the proposed mining operations, we would bear the most significant negative impacts. Accordingly, I urge you to address several serious concerns before moving forward with any potential approval.

Response 599-1

The commenter's proximity to the project and concerns are noted and will be considered by County decision-makers. Please see Response 599-2 through 599-11 below for further discussion of the commenter's specific concerns.

Comment 599-2

At the outset, I would like to highlight the inherent imbalance in this process. CEMEX has unlimited time, significant financial resources, access to technical experts, and the ability to make considerable political donations to influence key decision-makers. In contrast, the public is given only 45 days to respond to a thousand-page technical document without similar economic capacity or expertise. As such, we rely on public officials like yourself to ensure that the interests of the community are protected against projects such as this one by fully addressing the following issues.

Response 599-2

Please see Collective Response #1 pertaining to the CEQA review process and opportunities for public input.

Comment 599-3

1. Environmental Concerns

The proposed expansion presents substantial environmental risks. The deeper extraction of materials poses a serious threat to local ecosystems. The DEIR acknowledges potential adverse effects on air quality, water resources, and wildlife habitats. Increased emissions of particulate matter and greenhouse gases contribute to environmental degradation and public health risks. Additionally, the impact on the San Joaquin River and surrounding water tables raises concerns regarding long-term water availability and quality. The risk of water contamination is particularly troubling given the proximity of the quarry to critical groundwater resources that local residents depend on.

Response 599-3

Project impacts associated with the issues and concerns identified in the comment are evaluated and presented in the Draft EIR. The project's potential impacts to water quality and supply are evaluated in Section 4.10, "Hydrology and Water Quality." The project's potential impacts to air quality are evaluated in Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The project's impacts to wildlife are evaluated in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The commenter's concerns are noted. The comment does not provide evidence of a deficiency in the Draft EIR's evaluation of these issues.

Comment 599-4

2. Adverse Effects on Public Health and Quality of Life

The expansion would exacerbate air pollution, increasing respiratory issues among residents. Dust, fine particulate matter, and potential toxic emissions from mining operations have been linked to asthma, bronchitis, and other lung diseases. Noise pollution from blasting, heavy machinery, and increased truck traffic will further degrade the quality of life for nearby communities, reducing property values and making residential areas less desirable.

Response 599-4

Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), presents evaluation of potential air quality impacts of the project, including potential health effects associated with fugitive dust and toxic air contaminants. Please see Collective Response #9 for additional discussion pertaining to potential effects on existing air quality. The issues of traffic and noise pollution are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," respectively. The comment does not provide evidence of a deficiency in the Draft EIR's air quality or noise evaluation. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #7 regarding the evaluation of economic impacts under CEQA.

Comment 599-5

3. Negative Impact on Local Infrastructure and Traffic

The project would significantly increase truck traffic, overburdening North Friant Road and other local roadways. The increased wear and tear will necessitate costly taxpayer-funded repairs. Traffic congestion and safety hazards, particularly for cyclists and pedestrians, will escalate. Additionally, the increased presence of heavy trucks raises serious public safety concerns, with residents already reporting dangerous conditions due to industrial traffic. In addition to current traffic issues, the increase in future traffic needs to also be considered given the new communities that are emerging in the area.

Response 599-5

Draft EIR Section 4.17 presents evaluation of potential impacts of the project associated with project vehicle trips. Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance. The commenter's concerns are noted. The comment does not provide evidence of a deficiency in the Draft EIR's transportation evaluation.

Comment 599-6

4. Inconsistency with Regional Planning and Conservation Efforts

The San Joaquin River Parkway Master Plan emphasizes conservation and recreational land use. Expanding mining operations in this area directly contradicts these regional objectives. The project threatens protected riparian habitats and undermines Fresno County's broader land-use planning goals. Conservation groups have

warned that increased excavation will disrupt local wildlife populations, including endangered species.

Response 599-6

Please see Collective Response #12 pertaining to San Joaquin River restoration efforts, and see Collective Response #18 pertaining to the project's consistency with the San Joaquin River Parkway Master Plan. See also Draft EIR Section 4.4 for further discussion of potential impacts to wildlife and special status species. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

Comment 599-7

5. Economic and Social Disruptions

Studies show that properties near active mining operations suffer devaluation due to noise, dust, and industrialization. Home values in similar communities have dropped by as much as 20-30%. Homeowners may also struggle to secure or maintain insurance due to the risks associated with mining activities, including blasting damage and groundwater contamination.

While CEMEX claims the project will generate jobs, the short-term economic benefits do not outweigh the long-term environmental and social costs. Increased pollution could deter tourism and recreational activities that contribute significantly to the local economy.

The negative economic impact on the nearby community needs to be considered, and efforts to mitigate such impact need to be addressed.

Response 599-7

Please see Collective Response #7 pertaining to the evaluation of economic issues under CEQA. The commenter's concerns are noted and will be considered by County decision-makers.

Comment 599-8

6. Lack of Necessity for Additional Mining Resources

A Fresnoland investigation found that Fresno County already possesses a 200% surplus of gravel resources, one of the highest in California. This surplus is projected to meet regional demand for decades. Approving this project would result in unnecessary environmental degradation without economic justification. More sustainable resource management alternatives should be considered.

Response 599-8

Please see Collective Response #3 pertaining to regional aggregate demand and supply. Draft EIR Chapter 6, "Alternatives," describes a reasonable range of project alternatives and compares the associated potential environmental impacts to those of the proposed project. The comment does not address the adequacy of the Draft EIR or explain additional feasible alternatives for further consideration.

Comment 599-9

7. Insufficient Mitigation Measures

The DEIR acknowledges significant environmental impacts, yet the proposed mitigation measures are inadequate. The long-term consequences of deeper mining operations remain uncertain, and irreversible damage to land and water resources is a major concern. Groundwater depletion and contamination pose particularly serious risks to nearby communities that rely on these water sources.

Response 599-9

Draft EIR Section 4.10 presents evaluation of potential surface and groundwater impacts of the project and provides mitigation for identified significant impacts reducing each to levels of less than significant. The project's potential impacts to groundwater supply are analyzed in Draft EIR Impacts 4.10-8, 4.10-9, 4.10-10, and 4.10-11. The Draft EIR concludes that the project's impacts to groundwater supply would be less than significant, with the implementation of Mitigation Measure 4.10-10b, the "Quarry Site Groundwater Adaptive Management Program." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. The comment does not provide evidence of a deficiency in the mitigation or otherwise identify additional feasible mitigation measures for consideration. For additional discussion of water resources, please see Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, and Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity.

Comment 599-10

Conclusion

Given the overwhelming environmental, public health, and infrastructure concerns, the CEMEX Rockfield Quarry Modification Project should not be approved in its current form. A more sustainable approach to resource extraction must be considered,

prioritizing environmental preservation, community well-being, and responsible land use.

Response 599-10

The commenter's concerns and request that the project not be approved in its current form are noted and will be considered by County decision-makers.

Comment 599-11

Furthermore, given Fresno County's substantial surplus of gravel, this project is unnecessary and would result in excessive environmental destruction for minimal economic gain. We urge decision-makers to reject this proposal and seek alternative solutions that align with Fresno County's environmental and social priorities.

Response 599-11

Please see Collective Response #3 pertaining to regional aggregate demand and supply. The commenter's request to reject the project and consider alternatives is noted and will be considered by County decision-makers.

Letter #600 March 10, 2025, Laura Watkins

Comment 600-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 600-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to water quality are evaluated in Section 4.10, "Hydrology and Water Quality." The project's potential impacts to air quality are evaluated in Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The project's potential impacts to recreation are evaluated in Section 4.16 "Recreation." The project's impacts to wildlife are evaluated in Section 4.4, "Biological Resources." The project's impacts regarding hazards and hazardous materials are evaluated in Section 4.9, "Hazards and Hazardous Materials." See Chapter 3, "Draft EIR Errata," for proposed

revisions to the Draft EIR sections referenced here. Please see Response 600-2 through 600-11 below for further discussion of the commenter's specific concerns.

Comment 600-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 600-2

See Response 329-2.

Comment 600-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 600-3

See also Response 329-3, which fully addresses this comment. See also Collective Response #17 related to flooding and pit capture.

Comment 600-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 600-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water

to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 600-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 600-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 600-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 600-6

Please see Collective Response #19 pertaining to public accessibility to parks, including Lost Lake Park, Ledge Island, and Peck Ranch. Please see Collective Response #27 pertaining to the project's potential effects on adjacent parklands and recreational use areas.

Comment 600-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 600-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 600-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 600-8

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety.

Comment 600-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 600-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. See also Collective Response #9 regarding the project's impact on existing air quality conditions and Response 528-9.

Comment 600-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 600-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered. (Draft EIR, page 4.4-51.) With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4 does not need to be rewritten or recirculated.

Comment 600-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Response 600-11

The project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #601 March 10, 2025, Elizabeth Weeks

Comment 601-1

My name is Elizabeth Weeks, and my family and I live at 15226 Bluff View Ave in Friant, directly across the street from the Cemex Quarry. As someone who enjoys the beauty of the river, and a local resident, I have so many concerns. Thank you in advance for taking the time to read through my entire e-mail.

After trying to read through this very large document and seeing all that can go wrong, I think the only option is the 'No Project' option. I truly feel that this project will do irreparable harm to the river, wildlife, humans, land, air, water, and everything else.

Response 601-1

The commenter's location, interest in the San Joaquin River, and preference for denial of the project are noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR. The project's potential impacts to water quality, including the San Joaquin River, are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's impacts to wildlife and air quality are evaluated in Draft EIR Section 4.4, "Biological Resources," and Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. Please see Response 601-2 through 601-24 below for further discussion of the commenter's specific concerns.

Comment 601-2

We are not a town in need of more quarries. We are a town that's in need of more open spaces and outdoor activities to enjoy with our families. As builders stack one home on top of another and make the backyards so tiny that they're unusable, this river and area is more needed than ever before. We currently have many mines in the surrounding area that are either operational or permitted and can operate at any time. Fresno County has 200% surplus of what we need for the next 50 years, so this project seems unnecessary.

Response 601-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply. The commenter's interest in open space and outdoor activity enjoyment areas is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR.

Comment 601-3

As someone who lives across the street from Cemex, I'm a bit flustered at all of the mitigation promises as I'm wondering why they're not doing them now. Having experienced the frustrations of having Cemex do whatever they want, and nobody to help us, this DEIR has caused a ridiculous amount of anxiety as I feel that the promised mitigation practices are nothing more than words on paper. In addition, people in this community were told that Cemex would cease operations and leave years ago, and now they want us to trust more promises for another hundred years. Once given the green light, they will continue to practice as they have been. Considering all of the horrific things that can go wrong, even if they miraculously followed the mitigation practices to their full

extent, they admit that accidents may happen and therefore that would endanger the lives of so many people and the destruction of the San Joaquin River. If they are allowed to proceed, any issues that come up or accidents that happen will have been foreseeable especially when residents and reporters are sounding the alarm at their constant violations. So I ask myself why if Fresno has 200% gravel surplus for the next 50 years, and Cemex has a proven track record of violating rules and paying out and moving on as if nothing happened, why is Fresno County even considering this project? The best predictor of future behavior is past behavior. And I believe that they have already shown us who they are.

Response 601-3

Mitigation measures adopted for the project would be incorporated into a mitigation monitoring and reporting program (MMRP) that would provide for County oversight to ensure implementation of adopted mitigation measures. Additionally, the Operator is responsible for reclamation of the project sites in accordance with the approved reclamation plan. Both Fresno County and the state Surface Mining and Reclamation Act (SMARA) require that surface mining Operators maintain a financial assurance mechanism payable to the SMARA lead agency (here, Fresno County) and to the State of California sufficient to accomplish reclamation as prescribed by the surface mining operation's approved reclamation plan, including conditions of approval and mitigation measures associated with reclamation. Please see Collective Response #4a pertaining to CEMEX regulatory history, and please see Collective Response #4b pertaining to liability. The comment does not address the adequacy of the Draft EIR. The commenter's concerns are noted and will be considered by County decision-makers.

Comment 601-4

We want something different. I moved from Los Angeles to Fresno because of the lack of traffic and the wide open spaces. Contractors have removed our farmlands one after another and put in homes that are the minimum distance away from each other leaving no backyard space for children or families to spend time outdoors. The stacking of homes right on top of each other is more of a reason to deny this project as the residents in this town deserve much better than a company that threatens to damage the San Joaquin River and take away the few outdoor pleasures we now have in this town. When talking to physician groups, they will all say that recruiting to this town is extremely hard. It's not a lack of housing as Cemex and the contractors would have you believe, it's the lack of anything fun to do in this town. So as we keep giving companies like Cemex permission to do their worst to our air, water, roads, river, and homes, we're also preventing other

professionals from coming into this town. It's a very serious issue as we draw more residents here with track homes, but will lack the staffing of professionals to care for them. That's a crisis waiting to happen.

Response 601-4

The commenter's opinions are noted and will be considered by County decision-makers. Please see Collective Response #7 pertaining to the evaluation of economic issues under CEQA.

Comment 601-5

Here are some of my biggest concerns:

Blasting and digging:

-The proposed mine is 200 feet away from the river. What happens if this gets breached/damaged from the blasting and digging? This is dangerously close. Who pays for the repair? And could it even be repaired?

Response 601-5

Please see Collective Response #17 pertaining to the banks stability of the San Joaquin River and inundation of the quarry pit. Please see Collective Response #4b pertaining to liability.

Comment 601-6

-The DEIR hugely lacks information about the explosives being used and therefore their conclusion that they will have the same results as the study from 1980 doesn't hold water. In reading a much more recent article from 2023 from the NIH, it explains that the gases released are based on explosive composition, explosive reaction degree, rock mass medium, working environment, etc. In addition to CO, NH3, NO, NO2, and other toxic gases, H2S and SO2 will also be generated if sulfur or sulfides are present in the explosives or the rocks. We don't know what will be produced from these blasts as we do not have all of the information required, and therefore, we don't know what they're putting into the groundwater, river, or air.

Response 601-6

Blasting emissions were quantified using two emissions factor sources from San Diego APCD as presented in the 2019 (versus 1980) Air Quality, Health Risk, and Climate Change Impact Assessment. Dust emissions were calculated using the San Diego APCD

quarrying drill-and-shoot emissions factor while explosives detonation emissions were calculated using factors from San Diego APCD Drilling-Blasting Ammonium Nitrate and Fuel Oil procedure. The San Diego APCD thresholds protect public health and are beneficial to the natural environmental including groundwater, water quality and hydrology. Emissions were accounted for and do not result in any new potentially significant impacts as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment") including preparation of a Fugitive Dust Control Plan and additional health risk modeling. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR, as updated in this Final EIR. See also Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 601-7

-Since there are no federal or state mining regulations that specifically address potential blast-induced impacts at surface mines such as this, who will be regulating this? What rules will the County make sure they abide by to keep us safe?

Response 601-7

Blasting is to be performed by a state of California-licensed blasting contractor meeting specific qualifications established under the State of California Department of Industrial Relations. Project blasting protocols are presented in Final EIR Appendix H-9, "Revised Blasting Protocols," in a blasting protocol document that summarizes the monitoring, control and reporting requirements for ground vibrations and air overpressures emitted from blasting at the project sites. In addition, the blasting protocol document provides "Best Practices" for the control and mitigation of flyrock from rock blasting. The Blasting Protocols are referenced and summarized in the Draft EIR (e.g., see Impact 4.9-4 on pages 4.9-19 through 4.9-21; see Impact 4.10-1 on pages 4.10-88 through 4.10-92) and Draft EIR Mitigation Measure 4.10-1 requires that the blasting protocols be implemented and that the protocols be appended to the Mitigation Monitoring and Reporting Program (MMRP) and conditions of project approval.

Comment 601-8

-The DEIR doesn't do a good job discussing the effects of digging or blasting on surrounding land or river bottom.

Response 601-8

The commenter's opinion is noted. Blasting associated with the project would occur at the Quarry Site and would maintain a minimum setback distance of 200 feet from the San Joaquin River; no blasting would occur within the river channel.

The potential environmental effects of blasting are analyzed throughout the Draft EIR based on substantial evidence. Draft EIR Section 4.4 (Impact 4.4-4, pages 4.4-55 through 4.4-58) evaluates potential effects on adjacent riparian habitat and sensitive communities. Section 4.9, "Hazards and Hazardous Materials," (Impacts 4.9-2 and 4.9-4, pages 4.9-17 through 4.9-21) addresses potential hazards associated with blasting, including chemical and mineralogical changes to groundwater and risks related to flyrock. Section 4.10 (Impact 4.10-1, pages 4.10-88 through 4.10-92) evaluates potential water quality effects, and Section 4.13, "Noise," (Impact 4.13-6, pages 4.13-65 through 4.13-67) addresses groundborne and air vibration impacts. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections.

As discussed in Response 601-1, implementation of Mitigation Measure 4.10-1 and other applicable measures would reduce all identified blasting-related impacts to a less-than-significant level. Accordingly, the Draft EIR provides a comprehensive and adequate analysis of blasting impacts under CEQA. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Please also see Collective Response #27 regarding potential effects on adjacent parklands and recreational use areas.

Comment 601-9

Water levels:

-The DEIR claims they will monitor local wells every 6 hours, compile it into a report in 6 months, and submit that to the county in a year. By the time this process has been completed, wells could technically be completely dried out. If levels drop more than 15%, then they will investigate the cause. If they can rule out all other possible causes, of which they list many, then they may begrudgingly take responsibility. Their solution will be to try to fill up the well, to the minimum of 14.9% depletion (it states from 0 to 15% so it could be 14.9%). At best, they say they will try to fill it up to 85% of what we originally had. If unable to repair it, they will stop mining and update the reclamation with the total depth mined. That's it. There's no recourse to the homeowners who have lost their homes. Residents need to have immediate access to reports (weekly) and have the ability to force

the mining company to stop mining immediately until these wells have been fixed. Cemex doesn't get to decide if they want to take responsibility. If this gets approved, a bond would need to be set up to buy out all local homeowners at fair market value plus a reasonable increase in price had Cemex not been there and we were able to continue to live here for another 20-30 years, plus an additional amount due to forcing relocation.

Response 601-9

See Response 503-3.

Comment 601-10

Aesthetics:

-Looking at the pictures of what the views look like now and what they will look like, I found all of the pictures to look oddly identical, as if nothing were occurring for the next 100 years. In reading the report, we know that in addition to the pit, there will be hundreds more trucks, customer cars, oil drums, blasting equipment, billows of dirt, and so many other things. The visual will not improve for anyone. In the report, it states that my community will have a better view in 100 years because of some trees and a gate. If Cemex wanted to be good neighbors, they could've put up trees and a gate some time in the past 100 years. That's not much to ask. Why didn't they do it already? The promises that are being made for 100 years from now, they are aware that nobody can hold them accountable for in 100 years. And that's assuming that in 100 years, they don't ask for another 100 year extension to do much worse.

Response 601-10

Draft EIR Section 4.1, "Aesthetics and Visual Resources," assesses the projects visual impact in consideration of the anticipated change to the existing visual character that would result from project implementation. The commenter's concerns about existing conditions and methods of potential improvement to existing conditions do not pertain to the adequacy of the Draft EIR. Photographic simulations are used in the Draft EIR to provide representative views to aid in the impact analysis, but are not intended to represent all possible views and all possible visual activities over the lift of the operation. The Draft EIR clearly explains the types of activities and changes in visual character anticipated by the project and is sufficient for compliance with CEQA. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1. Additionally, please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 601-11

Lighting:

-One of the reasons many chose to move out to this area was because of the lack of light pollution. The DEIR states that there will be no impact because the lights will be taken down in a few decades. Once again, the time in between has been ignored. There needs to be a real study done on the effects of light pollution to this area, when many chose to move out here to enjoy such things as star gazing.

Response 601-11

Draft EIR Section 4.1 at Impact 4.1-4 on pages 4.1-62 through 4.1-64 describes and evaluates existing lighting and proposed lighting at the Plant Site and Quarry Site. As discussed there, the analysis concludes that due to the use of high-pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association-approved fixtures), County Zoning Ordinance 834.4.220.I.22 which requires night lighting to be arranged and controlled so as not to illuminate public rights of way or adjacent properties, location of facilities below grade and screening, the project's lighting would not result in significant lighting impacts. Although the Draft EIR also discusses the timeframe for reclamation and removal of lighting, the analysis and conclusions of the severity of the impacts of project lighting is not dependent upon the future removal of project lights. The comment does not provide evidence of a deficiency in the Draft EIR light impacts evaluation and no changes to the Draft EIR are warranted.

Comment 601-12

Air Quality:

-The DEIR lists information from one station that's 9 miles away, and only measures distances up to 2.5 miles and the report is from 8 years ago. The air quality is significantly different here than in the middle of the City of Clovis or Fresno, and different than it was back in 2017. There are so many days that the diesel fume and dust from across the street are so bad, that we have to stay inside until dissipated. It takes Air Pollution control hours to arrive, and by that time the dust has settled. A proper mitigation would be to install a monitoring device and live camera feed directly to Air Pollution Control so that they are able to see for themselves. And in addition, there would need to be a hefty fine associated with every single day that they are in violation and put into a bond that will cover healthcare costs of local residents who suffer due to their negligence. In addition, residents need to be made aware of the days they were in violation

and have their CUP cancelled if they violate more than a certain amount of days. The DEIR claims that all of these toxins can be mitigated to be under the allowable amount, but who is monitoring that? Stating there's new equipment that's safer isn't mitigation. It also states that the cancer risk is significantly high for residents close by, but with mitigation, that won't be the cause. Who's monitoring to make sure this cancer risk is truly mitigated?

-The DEIR states that this project could increase the levels of CO, PM2.5 and PM10 to exceed the safe limits. With mitigation, they state that the levels will decrease. However, the mitigation is to buy newer trucks and tamp down the dirt with water. Considering how dangerous and life-threatening all of those are, those mitigation measures don't seem sufficient. If Cemex is aware of these protocols, why aren't they doing them now?

Response 601-12

The Draft EIR, as updated in the Final EIR, presents health risk in Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," at locations where applicable guidance requires the maximum risk level to be reported. Chronic cancer and non-cancer risks are reported at structures where an individual or worker could reasonably spend a year or more. See Collective Response #11 for analysis of the cancer burden. Acute risk is reported at the fence line because there is the possibility of public access at that location for period of one-hour. Results for each receptor including those on the fence line are included in Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment," and Appendix D-2, "Addendum No. 2 to the Air Quality, Health Risk, and Climate Change Impact Assessment," which have been updated and replaced in their entirety by Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment." The mitigation measures proposed reduce health risks to less than significant levels as shown in Table 4.3-25. Thus, additional mitigation is unwarranted. Further, the technical analysis for air quality impacts was updated to include preparation of a Fugitive Dust Control Plan and additional health risk modeling, as documented in Appendix D-3. The updated analysis identified no new impacts and did not change any of the conclusions of the Draft EIR. The resulting revisions to Tables 4.3-24 and 4.3-25 are provided in Final EIR Appendix D-4, "Revised Section 4.3, Air Quality."

CEQA Guidelines Section 15126.4 (a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. When potential impacts are reduced to less than significant levels, additional mitigation

measures are not required. While mitigation measures are not required for less than significant impacts, Fresno County will consider these suggestions as part of its deliberations.

Comment 601-13

Diesel fumes:

The DEIR states that 70% of cancer risk is from diesel fumes. Therefore, they've set up rules to mitigate which requires idling to be limited to 5 minutes. However, there are a slew of reasons they can violate that rule. So the 5 minute rule is put into place because of the dangers, but those dangers take a back seat to every possible reason they could have to idle. As someone who can see the trucks across the road, those trucks are idling first thing in the morning for approximately an hour. So does the 5 minute rule not apply to them now? I would think it's just as unsafe to idle more than 5 minutes now than it would be if the project gets approved. This is yet another reason why allowing Cemex to monitor themselves and tell us that nothing bad will happen as they have rules to follow means nothing more than words on paper. We are currently being exposed, and nobody is doing anything about it.

Response 601-13

In 2005, the California Air Resources Board (CARB) adopted an Airborne Toxic Control Measure (ATCM) to control emissions from idling trucks and prohibits idling for more than 5 minutes for all diesel-fueled commercial motor vehicles with gross vehicular weight ratings over 10,000 pounds that must be licensed for operation on highways. Per the CARB, the goal of this measure is to reduce public health impacts from diesel emissions and energy savings in reduced fuel consumption from unnecessary idling. As discussed in the Draft EIR, as updated by the Final EIR, project design features have been incorporated with the general assumption that the excavation and associated equipment would operate in compliance with applicable air quality regulations, including diesel engines compliance with applicable state regulations establishing an idling policy and limiting idle time to less than five minutes (13 CCR Section 2449). Fugitive dust emissions would be controlled through implementation of controls and compliance measures within SJVAPCD Rules 8011, 8021, 8031, 8041, 8051, 8061, and 8071. See also Collective Response #9 regarding the project's impact on existing air quality conditions.

Comment 601-14

Odor:

The DEIR acknowledges that odor is a significant impact if it is confirmed more than once a year for 3 years, or average of 3 unconfirmed complaints in that same time. So the odor would have to be tolerated for at least 3 years before anything could be done. Their solution is to try to use asphaltic cements with lower VOC/SVOC, to the extent feasible. So if it's not 'feasible' according to them, they could forego this mitigation. So for at least 3 years, residents may have been subjected to extremely dangerous and life-threatening toxins in the air. In addition, since SVOC doesn't have an odor, we wouldn't know it's in the air. The DEIR acknowledges cancer risk is high for local residents, but will do their best to mitigate. That's not very reassuring.

Response 601-14

Draft EIR Impact 4.3-4, as included in the Final EIR, presents the assessment of potential odor impacts of the project including odors associated with asphaltic cement production. The Draft EIR concludes that it is not anticipated that the operation of the asphalt plant on the Quarry Site could generate odors that would adversely affect a substantial number of people but conservatively concludes that the impact is potentially significant based solely on the San Joaquin Valley Air Pollution Control District's (2015) *Guidance for Assessing and Mitigating Air Quality Impacts'* presumption that significant odor impacts could occur at sensitive receptors within one mile of such plants. The Draft EIR then recommends Mitigation Measure 4.3-4, as updated in the Final EIR (see Draft EIR page 4.3-69 and 4.3-70 and Appendix D-4, "Revised Section 4.3, Air Quality") to further reduce any potential for odor impacts from the proposed operation of the asphalt plant to less than significant.

The commenter likely references Table 4.3-24, "Unmitigated Project Health Risk Impacts," which identifies the "Unmitigated Project Health Risk Impacts" in their comment that "cancer risk is high for local residents." However, mitigation measures would reduce health impacts to those seen in Table 4.3-25, "Mitigated Project Health Risk Impacts." The Draft EIR, as updated by the Final EIR, presents health risk in Tables 4.3-24 and 4.3-25 at locations where applicable guidance requires the maximum risk level to be reported. Chronic cancer and non-cancer risks are reported at structures where an individual or worker could reasonably spend a year or more. Acute risk is reported at the fence line because there is the possibility of public access at that location for a period of one-hour. Results for each receptor including those on the fence line are included in Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment,"

and Appendix D-2, "Addendum No. 2 to the Air Quality, Health Risk, and Climate Change Impact Assessment," which have been updated and are provided in Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment." The mitigation measures proposed reduce health risks to less than significant levels as shown in Table 4.3-25. Thus, additional mitigation is unwarranted. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including preparation of a dust control plan and additional health risk modeling. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR, as updated in this Final EIR. See also Tables 4.3-24 and 4.3-25 as they have been updated in the Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

CEQA Guidelines Section 15126.4 (a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. When potential impacts are reduced to less than significant levels, additional mitigation measures are not required. For these reasons, the Draft EIR analysis was sufficient, and no further response is required. While mitigation measures are not required for less than significant impacts, Fresno County will consider these suggestions as part of its deliberations.

Comment 601-15

Road hazards:

-The DEIR missed a very important section about rocks/debris flying out of Cemex trucks. In the past year, I have had 3 cracked windshields. I try to avoid driving anywhere close to a Cemex truck now. If I'm able, I will pull over to give myself some distance. California code states that trucks should be covered to prevent items from flying out. I understand there are some exceptions to the rule for aggregate material, but in considering all of them, it seems that they are still in violation. Their own DEIR states that they need to cover their hauls. The fact that I have had 3 incidences in 1 year is proof that they're in violation. It is extremely jarring to have something hit your windshield so hard that it breaks. In addition, we have many bike riders that may be hit in the face while riding. This is extremely dangerous. In talking to residents all around town, I've heard many stories of the same thing happening to them. This is an extremely dangerous road hazard that needs to be addressed immediately. In addition,

as they leave the stations, they track so much dirt and gravel onto Friant Road. You can see the plume of dirt as they exit. So any car driving through that could kick up rocks on to other cars or bike riders. What is their mitigation to ensure this will not happen moving forward?

Response 601-15

Please see Collective Response #30 pertaining to roadway safety for motorists and bicyclists.

Comment 601-16

Emergency Services:

-The DEIR states that since no road closures are required and Friant Road is a 4 lane road, that their trucks would not interfere with emergency services. However, that fails to mention Cemex trucks are routinely seen on Willow cut-through to Copper Ave, Copper Ave east of Willow, and Minnewawa Ave, each having only 1 lane each way. Will Cemex vehicles be restricted from traveling on these roads? What if the emergency vehicle or a resident is in a rush to get to a hospital and wanting to go speed limit vs 15 miles an hour following behind Cemex trucks? Cemex trucks consistently cause traffic and delays and it will get worse with the addition of more vehicles. The DEIR states no mitigation is required, however I think that mitigation should either require Cemex trucks to stay off these roads indefinitely or expand them to be 4 lanes like Friant.

Response 601-16

The project would not alter existing roads or contribute to haul truck use on roads that are not or would not be used for aggregate hauling with or without the project. As discussed in the Draft EIR, the proposed project would not require the closure or partial closure of any public roads and therefore would not inhibit access by emergency vehicles or interfere with an evacuation plan. Additionally, as discussed in the Draft EIR, automobiles and trucks associated with the proposed project would be required to obey all traffic safety laws, including Section 21806(a) of the California Vehicle Code, which requires vehicles to yield the right-of-way and drive to the right side of the roadway and stop until emergency vehicles have passed. The roads referenced in the comment are routinely used for transport of construction aggregates as well as other construction materials by CEMEX and all other local and regional aggregate and construction material transporters. It is overly speculative to attribute some future potential interference with emergency response vehicles due to project trips on public roads as implicating a project

impact on emergency services and emergency response. As such, the Draft EIR's analysis of potential project effects associated with emergency services and emergency response is sufficient.

Comment 601-17

Noise:

-The current noise level is much higher than the DEIR states and common sense says it will get much worse. The berms do nothing to protect the sound traveling up and into our community. We can hear the trucks entering and leaving the quarry, so it would be highly impossible that that sound would not get worse. There is not much in the way of mitigation. And if there were, why aren't they doing it now?

Response 601-17

In addition to the response below, see Response 11-27 and Response 58-65.

The baseline noise environment described in the Draft EIR was based on extensive monitoring of ambient conditions in the immediate vicinity of both the Quarry and Plant sites (see Draft EIR, pages 4.13-40 and 4.13-43 through 4.13-44). It is recognized that some residences in the vicinity of the Quarry Site are elevated and, as a result, would not benefit from perimeter berms equally to existing residences that are essentially at the same elevation as the Plant and Quarry sites. As excavation equipment progresses deeper into the mining pit, the degree of shielding provided by perimeter topography would increase.

Mitigation Measure 4.13-3 specifically pertains to noise generated at the Quarry Site, which mitigation includes various options for industrial noise control that have been proven effective at aggregate facilities throughout the State of California, but Mitigation Measure 4.13-3 does not include the construction of earthen berms as a noise mitigation option for this site.

Comment 601-18

-Blasting 10a-2pm weekdays will make my home feel like I'm living in a war zone. They don't have any real information on explosives used or how they would mitigate the sound, the vibrations, or the damage done to the surrounding properties' home structures or windows. In addition, the vibrations even if not felt by humans will definitely be felt by wildlife animals and our pets. As most pet owners are aware, 4th of July is a very scary time for their pets. This project will condemn us to that type of disturbance on

a daily basis for the rest or our time here. We will be forced to sell and move out as that type of noise is extremely unhealthy for pets and humans with medical conditions. In addition, expanding the work hours to outside normal business hours means we won't get a break at all. The new hours state that they can work weekends, nights, around the clock. This gives them carte blanche permission to do whatever they want, whenever they want. I do not believe there is any mitigation for blasting. This should absolutely not be allowed to happen. If this gets approved, a bond would need to be set up to buy out all homeowners who feel the effect of the blasting (not for Cemex to judge but for homeowners) at fair market value plus a reasonable increase in price had Cemex not been there and we were able to continue to live here for another 20-30 years, plus an additional amount due to forcing relocation.

Response 601-18

According to the project description (Draft EIR page 2-43), blasting would occur 1-2 times per week between the hours of 10 am and 2 pm. The duration of aggregate blasts is typically approximately 2 seconds or less. As a result, the blasting would occur for a total duration of approximately 2-4 seconds per week. Mitigations Measures 4.10-1 and 4.13-6 specifically requires the Operator to implement an extensive blasting protocol, which includes predictions, monitoring, and reporting for blasting events occurring at the Quarry Site.

The Blasting Protocol details requirements for the implementation of a blast monitoring program that includes ground vibration measurements and air overpressure measurements. Should significance thresholds be exceeded, the County must be notified within 48 hours, and a corrective action plan must be developed that identifies changes to the blasting program to prevent future exceedances. The Blasting Protocols also detail the requirements for complaint response procedures; record-keeping; and annual reporting of monitoring, complaints investigations, and corrective actions. Lastly, the Blasting Protocols would require the Operator of the Rockfield Quarry to develop an annual Blasting Plan that includes the proposed blasting designs for areas proposed for blasting each year. The blasting design must be supported by calculations that maintain blast-induced vibrations below the significance thresholds. The plan must be submitted to the County each year for review. Following implementation of this protocol, the Draft EIR determined that blasting noise and vibration would be less than significant at nearby sensitive land uses, and no additional mitigation beyond that included in the "blasting protocol" would be warranted.

The comment does not provide evidence or argument that the implementation of Mitigation Measures 4.10-1 and 4.13-6 are inadequate to address impacts caused by blasting activities.

The proposed hours of operation at both the Plant and Quarry sites are provided in Table 2-5, "Proposed Typical Hours and Days of Operation," on page 2-43 of the Draft EIR. Continuous 24-hour per day operation may be required for major public road projects that are required to be completed during night hours or on weekends to avoid traffic conflicts or during periods of public emergency affecting the health and safety of the community. This would not apply to blasting operations and recycle processing.

Additionally, CEMEX would not be responsible for purchasing properties, as the mitigation measures in place reduce any potential impacts to a less than significant level. For further discussion of economic impacts, including impacts to property values, please see Collective Response #7.

Comment 601-19

Traffic:

-Table 4.17-1 states that there are currently an average of 342 trucks entering and 342 trucks exiting for a total of 684 per day. However, this wrongly assumes they are working 365 days. Cemex currently works 5 days a week and closes for holidays. If we give them the benefit of 260 working days, the actual number is 480 entering and 480 exiting for a current daily total of 960. I think this is a huge difference when talking about how many trucks are out on any given day. Similarly, table 4.17-3 states that for stage 1 there will be a total of 1,074 daily truck trips. Since they don't work 365 days, the more accurate number would be 1,510 truck trips (assuming 260 days). That's a huge daily increase in traffic, and would cause irreparable harm to our roads and to all of the residents trying to get to/from work and school every day.

Response 601-19

The Annual Average Daily Truck Trips presented in Draft EIR Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites ," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)," as revised in this Final EIR, are the appropriate variables for calculation of the traffic index for pavement impacts, which are based on the actual number of truck trips over the course of one year. Those Annual Average Daily Truck Trip values are not utilized in the peak-hour operational analyses and are not intended

to represent the number of trucks that would occur at the project during a single work day. The peak-hour trips presented in Tables 4.5 through 4.12 of the TIS (see Draft EIR Appendix I-1) were utilized in the operational analyses. As such, the analyses presented in the Draft EIR are applicable and did not understate the project trips. See Final EIR Chapter 3, "Draft EIR Errata."

Comment 601-20

-When contractors build a community of homes, they're typically required to do many things such as adding lanes to roads, building schools, etc. Other than paying a small share of adding some lights here and there (the offer to expand Willow at Copper is moot since that was already done by a builder), they haven't been asked to pay for any of the inconvenience and damage. Considering their trucks will be equivalent to 2 billion passenger vehicles on the road annually, they need to pay a huge share of repairing our roads and expanding roads that will be backed up because of their operation.

Response 601-20

See Response 12-69. The project would be required to mitigate its equitable share of the impacts and would contribute funds for transportation improvements. See discussion of Impact 4.17-1 on pages 4.17-27 through 4.17-40 of the Draft EIR.

Comment 601-21

EFFECT ON LOCAL HOMEOWNERS:

-Homeowner's Insurance: I have spoken to insurance agents and was told that an insurance company would have the right to cancel policies if they found that a company was blasting across the street. They can't be sure that the blasting will not affect the structure of the home. The DEIR makes it seem like there will be tiny blasts going off and that they last for short periods of time, however, the underground vibration could affect the structure of our entire community. What will Cemex do to protect the homeowners when our policies get cancelled? If this gets approved and we lose our homeowners policies or our policies exclude certain provisions due to the mine across the street, then Cemex should have buy out homeowners at fair market value plus a reasonable increase in price had Cemex not been there and we were able to continue to live here for another 20-30 years, plus an additional amount due to forcing relocation.

-Decrease in property value: All of the above environmental concerns will also be a huge concern for any potential buyer of

homes anywhere close to this mine, and will significantly reduce the value. In speaking to realtors and asking how this would affect my sales price, I was told that it would be significant and the buyer would have to get a 'great deal' to put up with all of the nuisance of the mine and want to take the other risks that come with being this close to a blasting mine. In doing online research, it seems that homes that are within 1/4 mile saw their property values decrease approximately 30-40%. If this project gets approved, then each homeowner that's affected should be given the option of staying in their home and having Cemex pay them the loss in home value based off of fair market value in addition to loss of future gains. Since appraisers use homes with a given vicinity to value homes, that means all homes within miles will see their property values decrease. As homeowners lose value in their homes, the County and even city of Fresno and city of Clovis will also lose due to decrease in property taxes based on new lowered values.

Response 601-21

Please see Collective Response #7 pertaining to the evaluation of economic issues, including property values, under CEQA.

Comment 601-22

FUTURE DEVELOPMENT:

-The DEIR states that this will not interfere with any future projects, however, one could easily say that it absolutely will. There are land lots available on Friant Road for people to purchase and build their dream home. How many do you think will want to build right next to this mine? We have the opportunity to attract buyers who want to build their dream homes across from a beautiful river that will bring in a lot of property taxes to the County. They will not pay to build across from Cemex.

Response 601-22

The commenter's assertion that "the Draft EIR states that this will not interfere with any future projects" is unclear and no reference to any section or page of the Draft EIR is provided by the commenter. The purpose of the EIR is to evaluate and disclose environmental effects of the proposed project. The comment does not explain and provides no evidence of a project interference with future projects or an environmental effect associated with such interference.

Comment 601-23

POLICIES AND GOALS:

In reading through this document, I found many policies and goals from the agencies and feel that everything in this DEIR goes against them. I have listed some of the most important ones I feel would be violated if this project were to be approved and support my opinion of the 'No Project' option:

Policy H-G.5 states that the County shall manage development of land within and adjacent to existing neighborhoods to avoid adverse impacts on living environment.

Policy OS-G.11 states the County shall continue, through its land use planning processes, to avoid inappropriate location of residential uses and sensitive receptors in relation to uses that include, but are not limited to, industrial and manufacturing uses and any other uses which have the potential for creating a hazardous or nuisance effect.

Goal OS-G: To improve air quality and minimize the adverse effects of air pollution in Fresno County.

Policy LU-A.3.c: The operational or physical characteristics of the use shall not have a detrimental impact on water resources or the use or management of surrounding properties within at least one-quarter (1/4) mile radius.

Policy OS-C.4: The County shall impose conditions as necessary to minimize or eliminate the potential adverse impact of mining operations on surrounding properties.

Goal LU-C: To preserve and enhance the value of the river environment as a multiple use, open space resource; maintain the environmental and aesthetic qualities of the area; protect the quality and quantity of the surface and groundwater resources; provide for long term preservation of productive agricultural land; conserve and enhance natural wildlife habitat; and maintain the flood-carrying capacity of the channel at a level equal to the one (1) percent flood event (100-year flood).

Goal OS-C: To conserve areas identified as containing significant mineral deposits and oil and gas resources for potential future use, while promoting the reasonable, safe and orderly operation of mining and extraction activities within areas designated for such use, where environmental, aesthetic, and adjacent land use compatibility impacts can be adequately mitigated.

Response 601-23

The commenter's opposition to the proposed project and opinion regarding the project's conflict with certain goals and policies are noted. Draft EIR Section 4.11, "Land Use and Planning," Table 4.11-1, "Project Consistent with Local Planning Documents," on pages 4.1-10 through 4.11-47 includes an assessment of the project's consistency with Fresno County General Plan goals and policies deemed applicable to the proposed project. As discussed in Draft EIR Impact 4.11-2 on page 4.11-49, the analysis concludes that the proposed project would be consistent with each of the applicable Fresno County General Plan goals and policies.

Comment 601-24

As someone who hopes to stay in this town for years to come, I truly hope we can take our river back and keep it safe for future generations to enjoy.

Mr. Randall, thank you again for taking the time to read my very lengthy letter.

Response 601-24

The commenter's interests and input are noted and will be considered by County decision-makers.

Letter #602 March 10, 2025, Patricia Wells

Comment 602-1

I have written a letter regarding the CEMEX project, attached to this email. May the future generations have the treasures that nature has provided for us.

Please take into consideration the many many species that will be impacted by this project, a project that could easily be moved to the area where you are already extracting materials.

Response 602-1

The project's potential impacts on fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." Note that the project sites are currently operated as an aggregate mine as described in Draft EIR Section 2.4, "Existing Conditions." Alternative locations for the proposed project were rejected from further consideration as discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

Comment 602-2

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 602-2

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter does not provide any reasoning or evidence to support the assertion that the Draft EIR is insufficient or inaccurate. The comment is noted for the decision-makers.

Comment 602-3

As someone who loves the region, I find that the EIR fails to adequately address the following concerns:

The impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, cumulative environmental impacts, or community health concerns will devastate the environment and render the area to be an undesirable place to visit, my greatest concern is how the future will unfold.

Response 602-3

The project's potential impacts on wildlife habitat and air pollution are addressed in Draft EIR Section 4.4 and Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), as updated in the Final EIR, respectively. The issues of water quality and groundwater depletion are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Noise pollution is evaluated in Draft EIR Section 4.13, "Noise," while the project's cumulative effects are discussed in Draft EIR Chapter 5, "Cumulative Impacts." The issue of community health is addressed in relation to air pollution in Section 4.3, as updated by this Final EIR (see Appendix D-4), and in relation to exposure to hazardous substances in Section 4.9, "Hazards and Hazardous Materials." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 602-4

For example, you sir, do you have children, grandchildren, or simply have friends with children. How will you explain why you chose to destroy this area given the availability of a region where you are already extracting material? Do the future generations

matter to you, sir? In this age of lies and deception, does it not matter that most of Fresno does not know of these plans? And finally, do the opinions of Fresno residents matter to you?

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Response 602-4

The public was properly notified of the project and the Draft EIR as described in Final EIR Section 2.2, "Public Review Period and Notifications." Public comments and opinions on the project were accepted by the County during the review period and are responded to herein. The commenter does not provide reasoning or evidence to support the assertion that the Draft EIR does not meet the stated standards. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #603 March 10, 2025, Tom and Anna Wielicki

Comment 603-1

I have been a resident of Fresno Bluffs for the last 30 years and had numerous close calls while driving on Friant Road due to the heavy truck traffic generated by the CEMEX company in the middle of residential area.

Response 603-1

The issues of traffic congestion and safety are evaluated in Draft EIR Section 4.17, "Transportation." See also Collective Response #29 regarding the project's truck trips and traffic congestion and Collective Response #30 regarding traffic safety.

Comment 603-2

Vast majority of Fernans believe that a city at our location needs to pivot from polluting heavy industry to a service economy. Why don't you guys?

I can tell you that extension of operating permits for CEMEX will make many of my neighbors in the Bluffs REALLY angry and we will not hesitate to show it.

Please, make a smart decision that is aligned with the will and interest of your constituency and stop CEMEX from operating in our neighborhood.

Response 603-2

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment, and the commenter's opposition to the proposed project, are noted for the consideration of the decision-makers.

Letter #604 March 10, 2025, Christine Williams

Comment 604-1

I want to voice my opposition to the proposed CEMEX Expansion.

I have been a resident of Woodward Lake since 1988. I have always enjoyed the peace and quiet and the beauties of nature which this area provides. At first, we had no noise pollution except an occasional noisy truck on Friant Road. Eventually, we started being buzzed several times a day by an unwelcome helicopter (Cty or Highway Patrol?). This noise pollution is unsettling and interferes with the peaceful life that I value very much.

NOW, we are in danger of far more noise pollution from unexpected blasting sounds and an increase in truck traffic on Friant Road! Birds and other wildlife could diminish in numbers because they, like us, do not thrive when they are frequently bombarded by unexpected loud sounds.

When the birds and wildlife diminish or disappear altogether, the ecosystem of the San Joaquin River will be negatively affected,

Response 604-1

The comment describes existing noise conditions which are not required to be evaluated in the Draft EIR. The project's potential noise impacts are evaluated in Draft EIR Section 4.13, "Noise." See Impact 4.13-1 for discussion of traffic-related noise effects and Impact 4.13-6 for discussion of groundborne vibration effects of the proposed blasting. See Collective Response #13 regarding the project's operational effects on wildlife in areas surrounding the project sites.

Comment 604-2

Adding to the degradation of the River ecosystem will be more dust in the air and water, further eroding the health of the fish and wildlife in the area. This is an unsustainable situation which will only worsen over time. Possibly there will be additional mining chemicals released into the water and air that could prove to be deadly or affect the health of humans and wildlife alike.

Please do not approve the CEMEX Expansion!

Response 604-2

The issue of dust is addressed as an air emission in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and in terms of erosion and sedimentation in Section 4.10, "Hydrology and Water Quality." The issue of hazardous materials contamination is addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The impacts identified in these sections were each determined to be less than significant with incorporation of the mitigation measures presented in this EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #605 March 10, 2025, Darlene Young (handwritten)

Comment 605-1

I am writing to express my concerns to the proposed 100 yr. permit for the CEMEX mining operation.

For the last 34 yrs, I have resided near Friant Rd. and depend on its access for daily use. Granting the permit to CEMEX as proposed will significantly impact traffic, air quality from equipment exhaust and increase health risks.

Response 605-1

The project's potential impacts related to traffic congestion are addressed in Draft EIR Section 4.17, "Transportation." See also Collective Response #29 regarding the project's truck trips and traffic congestion. The issue of air quality and associated health risks is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 605-2

The vibration and dust created by drilling near recreational areas will impact the wildlife habitat and those of us who use the trails near by.

I respectfully request your consideration to these concerns.

Response 605-2

The issues of vibration and dust are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. The issue of disturbance to wildlife is addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #27 regarding the project's operational effects on users of nearby parks and trails. This impact is noted for the consideration of the decision-makers.

Letter #606 March 10, 2025, Sean Zweifler

Comment 606-1

Dear Mr. Randall, thank you for taking my comments on the draft EIR for the CEMEX expansion project. I have numerous concerns about the environmental impacts that this draft EIR does not adequately address.

Response 606-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Response 606-2 through 606-11 below for further discussion of the commenter's specific concerns.

Comment 606-2

1. Tricolor blackbirds have been recorded throughout this region, more study is needed to see how land use changes and blasting noises will affect these critically imperilled [sic] birds. The EIR completely dismiss the possibility of them utilizing the sites which seems unlikely.

2. Yellow warblers are not even mentioned, despite being a special status species that occurs along the San Joaquin River.

Response 606-2

The Draft EIR discusses tricolored blackbird in Section 4.4, "Biological Resources," including Table 4.4-1, "Special-Status Wildlife Species," which identifies a low potential for occurrence on the project sites. As reflected in Table 4.4-1, the California Natural Diversity Database (CNDDB) search—expanded to include the surrounding 9-quadrangle area—did not identify any known occurrences of tricolored blackbird in the vicinity of the project sites. In addition, the disturbed nature of the Plant Site and Quarry Site does not provide suitable habitat for the species. Therefore, the project would not result in a significant impact to tricolored blackbird.

Mitigation Measure 4.4-1c requires pre-construction clearance surveys for nesting birds, including tricolored blackbird, and would further ensure that any potential impacts to nesting birds are reduced to less than significant. Please also see Response 58-37 and Collective Response #15 for additional discussion of potential impacts to bird species.

The yellow warbler is a California Species of Special Concern but is not state or federally listed as threatened or endangered. The species was not identified in the CNDDB records for the project area (including the expanded 9-quadrangle search) and was not observed during habitat assessments. In addition, the disturbed conditions at the project sites limit the suitability of habitat for this species. In any event, implementation of Mitigation Measure 4.4-1c would reduce any potential impacts to nesting birds, including yellow warbler, to less than significant.

Comment 606-3

3. *Sagittaria sanfordii* is documented throughout the Fresno region, including a number of manmade habitats such as irrigation canals. To treat this plant as presumed absent is inappropriate. It is quite likely this species occurs in ponds, ditches or other water features throughout the two sites. A focused survey should have been done.

4. *Delphinium hansenii* **ssp.** *ewanianum* is documented in valley grassland throughout the Fresno region. To treat this plant as presumed absent is inappropriate. A more focused survey for this plant should have been conducted.

5. *Cryptantha hooverii* this plant has been documented on the Madera side of the river in valley grassland. To treat this plant as presumed absent is inappropriate and a more focused survey should have been conducted.

Response 606-3

The Draft EIR presumed the Sanford's arrowhead (S*agittaria sanfordii*) to be absent because it was not found on the plant site and only grows in swamp or marsh conditions which are not found on the project sites (see Appendix E-1, "Plant Site habitat assessment"). This comment does not provide evidence to show that the project sites would support Sanford's arrowhead. A plant species' potential presence in the area must be considered in the baseline only if it could occur in the project area, which is not the case here (see *Nassiri v. City of Lafayette* (2024) 103 Cal.App.5th 910, 931 citing Guidelines Section 15332(c)). If the site has no value as a habitat for a listed species, then analysis of impacts to those species do not need to be made (*Id.* at 926). For further discussion of Sanford's arrowhead, please refer to Response 58B-9.

Ewan's larkspur (*Delphinium hansenii ssp. ewanianum*) was presumed absent due to lack of suitable habitat within the project site and was also not observed on site (see Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," and Appendix C, "Visual Impact Analysis"). Hoover's cryptantha (*Cryptantha hooveri*) was presumed absent because the project sites are out of the elevation range of this species and was also not observed on site (see Draft EIR Appendix B-1 and Appendix C). As such, the Draft EIR did not need to analyze impacts to these species.

Comment 606-4

6. In general the reports from consultants that inform this dEIR are riddled with errors. Plant names are misspelled, non native plants are listed as native, habitat descriptions are incorrect. For example **"The area between the river banks and the project site, support upland vegetation, primarily extensive non-native grasses (*Stippa* spp.) and scattered valley oaks woodlands."** Stippa is not a plant, Stipa is, but it's a native bunchgrass. Likely meant Bromus.

Response 606-4

Please see discussion of Quarry Site Vegetation on page 4.4-7 of the Draft EIR, which details the plant community located in, and along, the eastern boundary of the Quarry Site abutting North Friant Road. See also the Draft EIR's discussion of riparian habitat and upland vegetation adjacent to the Plant and Quarry sites on page 4.4-8. Some Stipa species are native to California, but some Stipa species are not native. The commenter does not specify how the habitat descriptions provided in the Draft EIR are incorrect.

Comment 606-5

7. The dEIR makes no mention of Kern brook lamprey ***Lampetra hubbsi,*** a species known to occur in the adjacent stretch of the San Joaquin River and the Friant-Kern canal. It is quite likely to occur in the delivery ditch at the plant site as well.

Response 606-5

The comment asserts that the Kern brook lamprey (*Lampetra hubbsi*) may occur in the San Joaquin River, the Friant-Kern Canal, and potentially within the existing river water delivery ditch at the Plant Site. The potential presence of this species in these waterways is an existing condition, and the proposed project would not modify the existing ditch, alter its operation or use, or increase water demand or water conveyance between the San Joaquin River and the Plant Site. Accordingly, the project would not create or increase the potential for Kern brook lamprey to use the ditch or otherwise affect the species through changes to the existing water delivery system. Therefore, the project would not result in a significant impact to Kern brook lamprey or other fish species. Furthermore, the Kern brook lamprey is not a state or federally listed threatened or endangered species, but is a California Species of Special Concern. See Draft EIR Section 4.10, "Hydrology and Water Quality," regarding the project's potential impacts to hydrologic resources.

Comment 606-6

8. This project conflicts with the San Joaquin River Parkway master plan in a way that would likely make it unfessible [sic] to ever complete the parkway and multi-use path. While the EIR makes vague statements about easement availability, in the absence of any clear plan or commitment to mitigate these impacts this is highly unlikely to occur. In addition this project, even with easements for a trail, would severely detract from the beauty and enjoyment of this trail.

Response 606-6

Please see Collective Response #18 pertaining to the project's consistency with San Joaquin River Parkway Master Plan, and please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 606-7

9. The EIR makes no mention of impact to bicycle traffic along Friant and Willow roads. These are heavily trafficked by bicycle riders, and increased truck traffic as well as increased gravel spillage on the roads would contribute to

making these stretches significantly more dangerous for cyclists.

Response 606-7

Please see Collective Response #30 pertaining to roadway safety.

Comment 606-8

10. The draft EIR fails to address how increased aggregate availability would impact development patterns in the region and lead to increases in traffic, decreases in air quality, loss of habitat, and other negative effects in our region.

Response 606-8

As discussed in the Draft EIR, the demand for aggregate for construction projects within the region would exist with or without the project (Draft EIR, page 4.17-24). As explained in the Department of Conservation California Geological Survey's (CGS) "Map Sheet 52 (Updated 2018) Aggregate Sustainability in California" (CGS 2018) when there is more demand in a region than can be met by local production, the demand is typically met by importing construction aggregate from neighboring aggregate producing regions (CGS 2018, page 18). Thus, a shortage of local aggregate availability does not implicate slowed or restricted development and, instead, implicates longer haul distances, increased costs, and increased environmental effects associated with aggregate transport from more distant locations (e.g., air pollutant and greenhouse gas emissions) and an adequate local supply of aggregates can serve to avoid or minimize transport of aggregate from more distant locations.

Draft EIR Section 7.4, "Growth Inducing Analysis Overview," provides evaluation of potential growth inducing effects of the proposed project and concludes the proposed project is not considered growth inducing and would therefore not result in potential environmental effects associated with induced growth. The comment does not provide evidence of a deficiency in the Draft EIR's evaluation of potential growth inducement, and the comment does not provide evidence that the project's supply of aggregate would impact development patterns in a manner that would cause adverse environmental effects.

Comment 606-9

11. The draft EIR fails to take into account white root sedge *Carex barbarea* beds as a cultural resource. This is a really important material for basketry and is known to occur in culturally significant sized patches near the project site and should be taken into account.

Response 606-9

The comment does not provide evidence of occurrence of white root sedge within the project sites or evidence that the project would have any effect on white root sedge or access to white root sedge. *Carex barbarae* (also known as Valley Sedge or Santa Barbara Sedge) was not observed at the Plant or Quarry sites (see Draft EIR Appendix E-1, "Plant Site Habitat Assessment," and Appendix E-2, "Quarry Site Habitat Assessment").

Comment 606-10

12. The draft EIR fails to take into account expanded minings [sic] impacts on recreation on the river, such as fishing and floating down the river.

Response 606-10

The comment does not provide evidence that the project would have an environmental effect associated with San Joaquin River surface water recreational uses. The proposed project would not significantly impact the San Joaquin River or associated recreational uses of the San Joaquin River. See discussion of Impact 4.10-1 and Impact 4.10-12 beginning on page 4.10-88 of the Draft EIR.

Comment 606-11

13. The draft EIR completely fails to take into account the impact of the noise of blasting on birds breeding off of the project site.

Response 606-11

Blasting activities would be brief (lasting one to two seconds) and would not significantly impact wildlife (Draft EIR page 4.4-53). Response 58-42 addresses the project's potential noise impacts upon wildlife, including birds. Please also see Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17 for further discussion of blasting impacts to wildlife.

Letter #607 March 10, 2025, Jericho Guansing

Comment 607-1

Hello, I am Jericho Guansing. I have lived in the Central Valley for my whole life and I am an advocate for preserving the health of not only the environment of the valley, but the people living in it. The San Joaquin Valley has many elderly people and young children living in it. The drilling by CEMEX is something I oppose as it threatens the health of the people living in the valley. Firstly, the drilling will cause slopes and the ground to become unstable. This instability of the ground will inevitably cause

particulate matter like dirt to pollute and spread through the air. The valley's air quality is already terrible as is and places like Bakersfield and Fresno are constantly dealing with high levels of tropospheric ozone and particulate pollution. The two sites that CEMEX is planning will create a large amount of air pollution. This air pollution, on top of the already existing pollution, will create conditions unsuitable for the health of the citizens living here as it will worsen health conditions like asthma and even cause health conditions. I would like to speak about a personal experience with growing up with asthma. My sister and I both personally had terrible asthma and it was only worsened with the air quality. If we were to grow up with the worsened air pollution from CEMEX, who knows how our health would be now? I am fortunate enough that my asthma doesn't impair my health now, but what about the other children who are just like me? Their health will be significantly impacted by the CEMEX drilling. This project will span over 100 years and the effects will be devastating for the younger generation. A whole generation of kids from the central valley will be facing major health problems like asthma, bronchitis, and other respiratory issues. I would also like to speak about the elderly population. My grandma was recently diagnosed with cancer and is currently being treated for it. Many other elderly people are facing the same diagnosis as my grandmother. Many are also facing other health conditions besides cancer. It is key to preserve the health and allow the elderly to live the rest of their lives out of harm. CEMEX threatens this as the air pollution will also negatively affect the elderly generation. I am personally concerned for the recovery and health of my grandma that could potentially be harmed by the drilling. I want this project to be reconsidered and thoroughly evaluated as the health impacts will be devastating for the people who call the Central Valley home.

Response 607-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issue of dust and associated health risks is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 regarding the project's potential to worsen the region's existing air quality conditions and Collective Response #11 regarding the analysis of population-wide cancer burden in the Draft EIR, and as updated by this Final EIR. Note that the project sites are currently operated for mining extraction, and no new areas of disturbance are proposed. The commenter's personal experiences and concerns regarding public health are noted for the consideration of the

decision-makers. However, no specific comments related to the adequacy of the Draft EIR were made, and no further response can be provided.

Letter #608 March 11, 2026, Marie Motta

Comment 608-1

I am writing to express my concerns regarding the Draft EIR No 7763 on the CEMEX Project. This projects threatens the San Joaquin River, local water quality, air quality, wild life, public safety, and local recreation.

Response 608-1

The project's potential impacts to the San Joaquin River and local water quality are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential impacts related to air quality, wildlife, and local recreation are addressed in Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.4, "Biological Resources," and Section 4.16, "Recreation," as updated by this Final EIR, respectively. The issue of public safety is addressed in multiple sections across the Draft EIR including Section 4.7, "Geology and Soils" (seismic shaking and landslide), Section 4.9, "Hazards and Hazardous Materials" (hazardous substances and emergency access), Section 4.10 (flooding), and Section 4.15, "Public Services." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections.

Comment 608-2

1. Building a 6-story hole next to a river that can flood which can cause water loss and contamination raises serious concerns.

Response 608-2

See Draft EIR Section 4.10 for discussion of the project's hydrology-related impacts. See also Collective Response #17 regarding riverbank stability and the potential for breach and flooding and Collective Response #25 regarding seepage from the San Joaquin River resulting in reduction of river flow.

Comment 608-3

2. Building a 6-story hole next to where the San Joaquin River Parkway is to be built raises serious concerns. How will the 300-foot buffer be met?

Response 608-3

See Collective Response #18 regarding the project's consistency with the Parkway Master Plan and Collective Response #22 regarding proposed trail easements.

Comment 608-4

3. Also of concern is blasting, drilling, and crushing hard rock so close to the river, the Parkway, and the road to Millerton Lake. How will these be able to be used during these activities?

Response 608-4

The potential effects of project operations are evaluated throughout the Draft EIR. See Section 4.10, Section 4.13, "Noise," and Section 4.17, "Transportation," for related analyses. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. See also Collective Response #27 regarding the project's operational effects on users of nearby parks and trails. No specific comments related to the adequacy of the Draft EIR were made, and no further response can be provided.

Comment 608-5

The above stated activities have impacts on birds, fish, and other wild life that have not been adequately analyzed.

Response 608-5

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4. See also Collective Response #13 regarding the project's operational effects on wildlife in areas surrounding the project sites. The commenter does not provide reasoning or evidence to support the assertion that the Draft EIR fails to adequately analyze impacts to fish and wildlife species. The comment is noted for the decision-makers.

Comment 608-6

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional, stronger mitigation measures, and financial guarantees from CEMEX.

Response 608-6

As determined necessary in this Final EIR, additional mitigation measures have been added to address project impacts. See Chapter 3, "Draft EIR Errata," for the proposed changes to the Draft EIR. See also Collective Response #4b regarding liability and funding

for the remediation of environmental damage caused by the project. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #609 March 11, 2025, Shirinnaz (Shauna) and Kyan Salehi

Comment 609-1

As residents and property owners on Bluff Avenue, we are writing to you to express that we are entirely opposed to CEMEX'S mine proposal along the San Joaquin River based on the following:

Response 609-1

The commenters' opposition to the project is noted and will be considered by County decision-makers.

Comment 609-2

CEMEX's argument that if the project isn't approved, the Fresno region will lose the economic and environmental benefits of locally sourced materials is completely meritless.

Per Fresnoland investigation, based on thousands of pages of technical documents, environmental reports, and state geological records, CEMEX'S mine proposal is a needless assault on the San Joaquin River to extract materials. State records reveal that the Fresno area already has a staggering surplus of locally sourced gravel which is one of the largest in the state. According to the California Geological Survey, the Fresno metro area currently has nearly 200% more gravel than is needed for the next SO years coming from local mines. The Kings River has roughly 2 billion tons of easily available surface gravel (enough for 500 years at Fresno's current 4 million-ton annual rate). As such, CEMEX's proposal to blast a new massive crater is completely unnecessary and is purely based on corporate greed. If the Board of Supervisors approve the mine, the asset value claimed by the company would skyrocket. At current gravel prices ($10-$50 per ton), the total gravel forecasted by CEMEX to come from the site could be valued at $2 billion to $10 billion.

Response 609-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 609-3

CEMEX'S mine proposal will have a devastating impact on the San Joaquin River.

CEMEX's plan targets a 300-acre stretch of the San Joaquin River which is already ranked among America's most polluted waterways. Decades of extraction have left virtually no surface gravel intact, according to reporting by The Fresno Bee. The significant additional extraction by the CEMEX's mine proposal would have a massive negative impact on the river's flow, salmon runs and wetlands.

Response 609-3

The Draft EIR analyzes impacts to hydrologic resources in Section 4.10, "Hydrology and Water Quality," and impacts to biological resources, including salmon, in Section 4.4, "Biological Resources." As per these sections of the Draft EIR, the proposed project would not significantly impact the San Joaquin River flow and would not significantly impact salmon. Furthermore, the project would not significantly impact adjacent riparian habitats as operations would stay within the existing footprint. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. See also Collective Response #25, regarding the potential for the project to reduce river flows, and Collective Response #16, regarding potential impacts to salmon populations.

Comment 609-4

CEMEX'S mine proposal will have a significant negative impact on the traffic on Friant Road.

If approved, CEMEX's project would double its gravel output, sending an estimated 400,000 trucks down Friant Road annually (up from 100,000 in the 1980s and 250,000 in 2023). Each truck causes wear equivalent to 5,000 cars, meaning the project would add the impact of 2 billion car trips to north Fresno's streets every year in a region already deadlocked over how to pay for its existing road quality crisis.

The road and traffic conditions on Friant Road are already dreadful. There have been many fatalities at every intersection of Friant. Woodward Park attracts significant number of pedestrians and bicyclists. CEMEX's mine proposal and the significant additional traffic it brings would make Friant Road substantially more unsafe.

Wherefore, we request that CEMEX's mine proposal be denied.

Thank you for your attention.

Response 609-4

Please see Collective Response #29 pertaining to project traffic. Please see Collective Response #30 pertaining to roadway safety, including bicyclist and pedestrian safety.

The commenters' request for denial of the project is noted and will be considered by County decision-makers.

Letter #610 March 12, 2025, Bryan Hamer

Comment 610-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 610-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to water quality, air quality, recreation, wildlife, and hazards and hazardous materials are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," Respectively. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. Please see Response 610-2 through 610-11 for further discussion of the commenter's specific concerns.

Comment 610-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 610-2

See Response 329-2.

Comment 610-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 610-3

See Collective Response #17 related to bank stability and flooding.

Comment 610-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 610-4

Refer to Collective Response #26 and Response 484-6. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 610-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.

- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 610-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 610-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 610-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 610-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 610-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 610-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 610-8

Please see Collective Response #29 pertaining to project traffic impacts and road maintenance. Please see Collective Response #30 pertaining to roadway safety.

Comment 610-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 610-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. See also Collective Response #9 regarding the project's impact on existing air quality conditions and Response 528-9.

Comment 610-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 610-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, as revised in Chapter 3, "Draft EIR Errata," the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4 need not be rewritten or recirculated.

Comment 610-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and

recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 610-11

The project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #611 March 12, 2026, William Podolsky

Comment 611-1

I would like to urge you and Fresno county to reject the CEMEX Rockfield Expansion and its DEIR. My concerns are many, including my belief that the DEIR does not adequately evaluate the damage to our community, including the city of Fresno, adjacent county areas, the San Joaquin Parkway, and the river. Damage will occur due to heavy traffic, noise, air pollution, and probable water pollution of the river and aquifers. There is no need for such a radical and long-term manipulation of the ground and river near large populations.

Response 611-1

The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," The issues of air pollution as well as surface water and groundwater pollution are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality," respectively. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. The commenter does not provide any reasoning or evidence to support the claim that the Draft EIR provides inadequate analysis of these issues. The comment is noted for the decision-makers.

Letter #612 March 12, 2025, Nathan Schramm

Comment 612-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River,

local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 612-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The project's potential impacts to water quality, air quality, recreation, wildlife, and hazards and hazardous materials are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. Please also see Response 612-2 through 612-11 below for further discussion of the commenter's specific concerns.

Comment 612-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 612-2

See Response 329-2.

Comment 612-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 612-3

See Collective Response #17. As discussed in Draft EIR Section 4.10, the project includes a detailed Hydrologic Analysis prepared by Chang Consultants which evaluated flood conditions along the San Joaquin River. Modeling results demonstrate that the onsite

berm elevations are higher than the 100-year flood water surface elevations, which would prevent overtopping or breaching during extreme flood events. The 1997 flood, which reached a flow rate of 60,300 cfs, was less severe than the 100-year flow rate of 71,000 cfs used in the project's flood analysis. As such, the analysis and information documented within the Draft EIR provide a conservative flood model and the potential for breaching of the pit is not reasonably foreseeable.

Under Title 14 CCR Section 15088, responses to comments must address "the major environmental issues" in a Draft EIR. The second bullet point of this comment refers to cleanup if the pit becomes part of the river ecosystem, references a scenario that is outside of the scope of the Draft EIR. Collective Response #17 details how the 100-year flood analysis conducted as part of the Draft EIR shows that the current project design is sufficient to withstand an event such as the 1997 flood.

Comment 612-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 612-4

Refer to Collective Response #26 and Response 329-4. As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 612-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.

- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 612-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 612-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 612-6

Please see Collective Response #19 pertaining to public accessibility to parks. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 612-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 612-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 612-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 612-8

Please see Collective Response #29 pertaining to project traffic impacts and road maintenance. Please see Collective Response #30 pertaining to roadway safety.

Comment 612-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 612-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. See also Collective Response #9 regarding the project's impact on existing air quality conditions and Response 528-9.

Comment 612-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 612-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, as amplified in Chapter 3, "Draft EIR Errata," the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4, "Biological Resources," does not need to be rewritten or recirculated.

Comment 612-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and

recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 612-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #613 March 10, 2025, Elsa Mejia, City of Madera District 5 Councilmember

Comment letter originally missorted as an Agency comment letter and moved to Letter 613 from Letter 14.

Comment 613-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 613-1

The commenter's opposition to the project and concerns regarding the Draft EIR are noted and will be considered by County decision-makers. The comment does not provide substantial evidence of a deficiency in the Draft EIR, and no further response is warranted here. Please see below for responses to specific issues.

Comment 613-2

As someone with lifelong familiarity with the location, I find that the EIR fails to adequately address the following concerns:

1. Impacts on wildlife habitat

Response 613-2

Draft EIR Section 4.4, "Biological Resources," presents evaluation of potential biological resources impacts of the proposed project. Please also see Collective Response #12 pertaining to San Joaquin River restoration efforts, Collective Response #13 pertaining to

impacts to offsite wildlife, Collective Response #14 pertaining to Swainson's hawk, Collective Response #15 pertaining to non-nesting birds, and Collective Response #16 pertaining to Salmon. The comment does not provide evidence of a deficiency of the Draft EIR's analysis of biological resources, including impacts on wildlife habitat.

Comment 613-3

2. Water quality

Response 613-3

Draft EIR Section 4.10, "Hydrology and Water Quality," presents evaluation of potential surface and groundwater impacts of the project including those associated with the San Joaquin River. Please also see Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, and Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity. The commenter does not provide substantial evidence of a deficiency in the EIR's analyses of hydrology and water quality.

Comment 613-4

3. Air Pollution

Response 613-4

Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), presents evaluation of potential air quality impacts of the proposed project including those associated with air pollutant emissions from onsite mining activities and offsite aggregate transport. The comment does not provide evidence of a deficiency in the Draft EIR air quality evaluation. Please see Collective Response #9 pertaining to air quality for additional discussion.

Comment 613-5

4. Noise pollution

Response 613-5

Draft EIR Section 4.13, "Noise," presents evaluation of potential noise impacts associated with the project. Impacts 4.13-1 through 4.13-4 on Draft EIR pages 4.13-49 through 4.13-69 assess potential noise impacts associated with onsite activities and offsite project-related vehicle trips in consideration of surrounding communities including consideration of 5 representative sensitive receptor locations in association with the Plant Site (see Draft EIR Figure 4.13-1, "Nearest Sensitive Receptors to Plant Site") and 15 representative sensitive receptor locations in association with the Quarry Site (see Draft

EIR Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site"). The Draft EIR identifies that potentially significant noise impacts associated with operations at the Plant Site would be reduced to less than significant with implementation of Mitigation Measure 4.13-2 presented on Draft EIR page 4.13-58 and 4.13-59 and the Draft EIR identifies that potentially significant noise impacts associated with operations at the Quarry Site would be reduced to less than significant with implementation of Mitigation Measure 4.13-3 presented on Draft EIR page 4.13-61 and 4.13-62. The comment does not provide evidence of a deficiency in the Draft EIR noise analysis.

Comment 613-6

5. Groundwater depletion

Response 613-6

Draft EIR Section 4.10, "Hydrology and Water Quality," provides detailed analyses of potential groundwater effects of the proposed project. The analyses are based on the Hydrology and Water Quality Analysis Report (Draft EIR Appendix G-5, "Hydrology and Water Quality Analysis Report") which utilizes information from groundwater conditions reports included as Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR and groundwater and surface water monitoring and sampling data collected for the project sites to draw conclusions on the existing groundwater hydrology conditions on the project sites and to evaluate the potential impacts to groundwater hydrology under the proposed project. Detailed methodology and findings are provided in Appendix G-5. As discussed, and presented in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10 and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111). The comment does not provide evidence of a deficiency in the Draft EIR analysis of groundwater impacts or the efficacy of mitigation measures.

Comment 613-7

6. Cumulative environmental impacts, and

Response 613-7

Draft EIR Chapter 5, "Cumulative Impacts," provides a comprehensive analysis of the project's incremental effects to be significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future

projects, in accordance with CEQA. The comment does not explain or provide evidence of any deficiency in the Draft EIR's cumulative impact analysis.

Comment 613-8

7. Community health concerns

Response 613-8

Draft EIR Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), provides evaluation of potential air quality impacts of the project, including consideration of potential effects associated with fugitive dust and toxic air contaminants and health risk at Impact 4.3-3 (see Appendix D-4). The impact evaluation quantifies estimated unmitigated project health risk impacts (see Appendix D-4, Table 4.3-24, "Unmitigated Project Health Risk Impacts") and mitigated project health risk impacts (see Appendix D-4, Table 4.3-25, "Mitigated Project Health Risk Impacts"). Please also see Collective Response #9 for additional discussion pertaining to potential effects on air quality and Collective Response #11 pertaining to community cancer risk. The comment does not provide evidence of a deficiency in the Draft EIR nor does the comment provide evidence of any community health issues associated with the project that require evaluation in the EIR.

Comment 613-9

8. Cultural Resources

Response 613-9

Draft EIR Section 4.5, "Cultural Resources," describes cultural resources associated with the project setting, presents the regulatory framework within which cultural resources are evaluated, and analyzes the potential impacts to cultural resources from the mining, processing, production, and reclamation activities of the proposed project. Mitigation Measures 4.5-2 and 4.5-3 are provided to protect cultural resources and human remains, respectively, in the event of inadvertent discovery. The comment does not explain or provide evidence of any deficiency in the Draft EIR's cultural resources impact analysis or mitigation measures.

Comment 613-10

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions

that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Response 613-10

The commenter's concerns and request for additional analysis and mitigation are noted. Draft EIR Chapter 3, "Project Description," provides a detailed description of the project including the scale and duration, and the Draft EIR environmental impact analyses properly evaluate the project as proposed. For additional discussion regarding the project duration, please see Collective Response #5. The comment does not provide evidence of a deficiency in the Draft EIR project description, analyses, mitigation measures, or alternatives evaluations. The commenter's concerns and requests are noted and will be considered by County decision-makers.

CHRIS	California Historical Resources Information System
ClWMB	California Integrated Waste Management Board
CMB	crushed miscellaneous base
CMP	Congestion Management Program
CNDDB	California Natural Diversity Database
CNEL	community noise exposure level
CNPS	California Native Plant Society
CNRA	California Natural Resources Agency
CO	carbon monoxide
CO_2	carbon dioxide
CO_2E	carbon dioxide equivalent
COG	council of governments
County	Fresno County
CPF	cancer potency factor
CPUC	California Public Utilities Commission
CRHR	California Register of Historical Resources
CSA	community service area
CUP	conditional use permit
CUPA	Certified Unified Program Agency
CV-SALTS	Central Valley Salinity Alternatives for Long-Term Sustainability

CWA	Clean Water Act
dB	decibels
dBA	A-weighted decibels
DBH	trunk diameter at breast height
DBCP	dibromochloropropane
DDT	Dichlorodiphenyltrichloroethane
DO	dissolved oxygen
DOC	California Department of Conservation
DOE	U.S. Department of Energy
DOT	U.S. Department of Transportation
DSoD	California Department of Water Resources Division of Dam Safety
DWR	California Department of Water Resources
EIA	United States Energy Information Administration
EIR	environmental impact report
EISA	Energy Independence and Security Act of 2007
EPA	U.S. Environmental Protection Agency
°F	Fahrenheit
FAM	financial assurance mechanism
FEMA	Federal Emergency Management Agency
FESA	Federal Endangered Species Act
FESOP	Federally Enforceable State Operating Permit
FHA	Federal Highway Administration
FICON	Federal Interagency Commission on Noise
FIFRA	Federal Insecticide, Fungicide, and Rodenticide Act
FIRM	flood insurance rate map

FMMP	Farmland Mapping and Monitoring Program
FPA	Forest Practice Act
fps	feet per second
FTA	Federal Transit Administration
GHG	greenhouse gases
GIS	geographic information system
gpd/ft	gallons per day per foot
gpd/ft^2	gallons per day per square foot
gpm	gallons per minute
GPS	Global Positioning System
gr/dscf	grains per dry standard cubic foot of gas
GSA	groundwater sustainability agency
GVWR	Gross Vehicle Weight Rating
GWP	global warming potential
H_2O	water vapor
HCD	California Department of Housing and Community Development
HCP	Habitat Conservation Plan
HDPE	High-density polyethylene
HFCs	Hydrofluorocarbons
HI	hazard index
HMA	hot mix asphalt
HMBP	hazardous materials business plan
hp	horsepower
HRA	health risk assessment
HSWA	Hazardous and Solid Waste Amendments

HUD	United States Department of Housing and Urban Development
HWCL	Hazardous Waste Control Law
Hz	hertz
IAQ	Indoor Air Quality
IDA	International Dark-Sky Association
IEPR	Integrated Energy Policy Report
in/sec	inches per second
IPCC	Intergovernmental Panel on Climate Change
KOP	key observation point
kWh	kilowatt hours
lbs	pounds
LAMP	local area management plan
LCFS	Low Carbon Fuel Standard
LDAMDV	light duty auto – medium duty vehicle
Ldn	day-night average noise level
Leq	equivalent noise level
LOS	level of service
LUP	land use permit
LUST	leaking underground storage tank
MBTA	Migratory Bird Treaty Act
MCL	Maximum Contaminant Levels
MEIR	maximum exposed individual sensitive receptor
MEIW	maximum exposed individual off-site worker
mg/L	milligrams per liter
mg/m^3	milligrams per cubic meter

MLD	Most Likely Descendent
MMBtu/hr	million British thermal units per hour
MMRP	mitigation monitoring and reporting program
MMT	million metric tons
$MMTCO_2E$	million metric tons of CO2E
mph	miles per hour
MPO	Metropolitan Planning Organizations
MRP	monitoring and reporting program
MRZs	Mineral Resource Zones
msl	above mean sea level
MT	million tons
Mt.	Mount
MTBE	methyl tertiary butylether
MTY	million tons per year
MW	megawatt
MW	monitoring well
Mw	moment magnitude
N_2O	nitrous oxide
NAAQS	national ambient air quality standards
NAHC	Native American Heritage Commission
NAS	National Academy of Sciences
NCAR	National Center for Atmospheric Research
NCCP	Natural Community Conservation Plan
NEHRP	National Earthquake Hazards Reduction Program
NEPA	National Environmental Policy Act

NF_3	nitrogen trifluoride
NHTSA	National Highway Traffic Safety Administration
NO	nitric oxide
NO_2	nitrogen dioxide
NO_x	oxides of nitrogen
NOA	notice of availability
NOAA	National Oceanic and Atmospheric Administration
NOC	notice of completion
NOP	notice of preparation
NPDES	National Pollutant Discharge Elimination System
NPS	National Park Service
NRCS	Natural Resources Conservation Service
NRHP	National Register of Historic Places
NSPS	National Society of Professional Surveyors
NWPR	Navigable Waters Protection Rule
O_3	ozone
OEHHA	Office of Environmental Health Hazard Assessment
OPR	Governor's Office of Planning and Research
ORP	oxidation-reduction potential
OSHA	Occupational Health and Safety Act
OSMRE	Office of Surface Mining Reclamation and Enforcement
OWTS	Onsite Wastewater Treatment Systems
P&O	prioritization and optimization
PCB	polychlorinated biphenyl
PCC	Portland Cement Concrete

PCE	Primary Constituent Elements
pCi/L	picoCuries per liter
PDA	Priority Development Areas
PFCs	perfluorocarbons
PG&E	Pacific Gas and Electric Company
pH	potential of hydrogen
PM_{10}	respirable particulate matter
$PM_{2.5}$	particulate matter
PMI	point of maximum impact
pou	publicly owned utilities
ppm	parts per million
ppmv	parts per million volume
PPV	peak particle velocity
PRC	Public Resources Code
PSD	prevention of significant deterioration
R	Range
RACT	Reasonably Available Control Technology
RAP	recycled asphalt product
RCIS	Regional Conservation Investment Strategy
RCNM	Roadway Construction Noise Model
RCRA	Resource Recovery and Conservation Act
REL	reference exposure level
RFS	Renewable Fuel Standard
RHNA	Regional Housing Needs Assessment
RMS	root mean square

ROAR	Responsible Official Affirmation of Reporting
ROG	reactive organic gases
RPS	Renewables Portfolio Standard
RTAC	Regional Targets Advisory Committee
RTP	Regional Transit Plan
RWQCB	Regional Water Quality Control Board
SAFE	Safer Affordable Fuel-Efficient
SARA	Superfund Amendments and Reauthorize Act
SB	Senate Bill
SCS	sustainable communities strategy
SF_6	hexafluoride
SGMA	Sustainable Groundwater Management Act
SIC	Standard Industrial Classification
SIP	State Implementation Plan
SJVAPCD	San Joaquin Valley Air Pollution Control District
SJRC	San Joaquin River Conservancy
SMARA	Surface Mining and Reclamation Act
SMRP	Surface Mining and Reclamation Plan
SNMP	Salt and Nitrate Management Plan
SOx	oxides of sulfur
SOI	sphere of influence
SO_2	sulfur dioxide
SPCC	Spill Prevention Control and Countermeasure
SR	state route
SRRE	source reduction and recycling element

SSJVIC	Southern San Joaquin Valley Information Center
SVP	Society of Vertebrate Paleontologists
SWPPP	Stormwater Pollution Prevention Plan
SWRCB	State Water Resources Control Board
T	township
TACs	toxic air contaminants
TCP	trichloropropane
TIZ	traffic impact zone
TDS	total dissolved solids
TMDL	Total maximum Daily Load
TPF	tree protection fencing
tpy	tons per year
TSCA	Toxic Substances Control Act
UCMP	UC Berkeley Museum of Paleontology
USDA	United States Department of Agriculture
USACOE	United States Army Corps of Engineers
USFWS	United States Fish and Wildlife Service
USGS	United States Geological Survey
UST	underground storage tank
VdB	vibration decibels
VDE	visible dust emissions
VDECS	Verified Diesel Emission Control Strategies
VERA	Voluntary Emission Reduction Agreement
VOCs	Volatile Organic Compounds
VMT	vehicle-miles traveled

WCI	Western Regional Climate Action Initiative
WDR	waste discharge requirement
WRCC	Western Regional Climate Center
yr	year
ZEV	zero emission vehicle
