Impacts 4.13-2 and 4.13-3 assess increases in ambient noise levels from Plant Site and Quarry Site operations that could exceed local standards. The analysis indicates that operational noise at night is projected to exceed the thresholds of significance and the impacts without mitigation would be potentially significant (see Tables 4.13-16 and 4.13-17, DEIR pages 4.13-57 through 4.13-60). To address these potential impacts, the related mitigation measures (4.13-2 and 4-13.3) take the approach of requiring the operator to "implement one or more of the" measures listed to reduce noise from site operations. The mitigation measure does not identify which of these optional measures is actually required or appropriate. One of those measures is noise monitoring after operations have already commenced. Therefore, only after impacts occur, complaints are received, and excessive noise levels are found through review of monitoring data would additional noise reduction measures be identified and implemented. And that process of justifying, coordinating, and implementing the additional mitigation measures could take significant time and efforts.

The "wait and see" approach taken by this mitigation measure is insufficient to fulfill the mandate of identifying significant impacts and implementing effective mitigation measures to reduce noise BEFORE the community is exposed to excessive noise. Only AFTER the Project operation is confirmed to generate excessive noise will noise reduction measures be implemented. Meanwhile, the

operation continues to expose people to excessive noise during the potentially lengthy process developing further mitigation measures, conducting pricing and feasibility studies, and submitting the measures through an approval process. This noise mitigation approach is inadequate. Instead, the operational noise impact analysis must identify the specific sources or activities that are expected to generate significant construction noise and then develop specific, effective, and feasible noise reduction measures that would reduce noise to a less than significant level.

In summary, the proposed mitigation measures are inadequate as they fail to protect the community from excessive noise BEFORE it occurs. The mitigation fails to include specific measures that would be needed to reduce all potentially significant impacts.

Response 58C-13

The comment is correct that Draft EIR Impacts 4.13-2 and 4.13-3 assess increases in ambient noise levels from Plant Site and Quarry Site operations that could exceed local standards, including nighttime operations. However, the first paragraph on page 4.13-58 of the Draft EIR states the following:

> Because the identified exceedance of the significance criteria would be relatively small in magnitude (2 dB), it is anticipated that, with the implementation of one or more of the noise reduction measures, it would be feasible to reduce operational noise from the Plant Site to below the significance thresholds.

A 2 decibel increase in noise levels is commonly considered to be barely perceptible, so the magnitude of Impact 4.13-2 is overstated in the comment. Mitigation Measure 4.13-2 specifically requires the Operator to "implement one or more of the following measures to reduce noise from Plant Site operations:

1) Line aggregate hopper drop-points with heavy urethane sheets.
2) Ensure that all processing area conveyors are properly lubricated at all times.
3) Equip all mobile plant area equipment with acoustic growler-type backup warning systems, rather than conventional beepers.
4) Suspend acoustic curtains around the aggregate processing plant crushers and screen decks (i.e. the loudest components of the processing plant).
5) Install acoustic silencers on the asphalt plant bag house exhaust fan.
6) Suspend acoustic curtains around the asphalt plant burner."

These noise control measures have been effectively implemented at multiple aggregate facilities throughout California. Each of the noise control measures cited in this mitigation measure, on its own, would provide a noise level attenuation of at least 5 dBA for the specific equipment or operation it is applied to. Sound engineering practice is to apply the type of noise control device required to mitigate the specific noise source in question. Because there are a wide variety of noise sources associated with aggregate excavation and processing facilities, a wide range of noise control options is required to specifically target noise sources that may be contributing to an exceedance of the noise level performance standards.

Furthermore, the commenter's assertion that, "the proposed mitigation measures are inadequate as they fail to protect the community from excessive noise before it occurs", is incorrect. Mitigation Measure 4.13-2(7) specifically states that noise monitoring is required following implementation of the appropriate noise control measures," not before.

Rather than deferring mitigation, as stated in the comment, the Draft EIR mitigation measures are tied to performance standards that would ensure that appropriate noise mitigation measures are implemented for the project to reduce the project sites' noise levels to a less than significant impact.

Comment 58C-14

#2.B DEIR Does Not Demonstrate Efficacy of Operational Noise Mitigation

As mentioned in Comment #2A above, Mitigation Measures 4.13-2 and 4-13.3 take the approach of requiring the operator to "implement one or more of" a variety of measures to reduce noise from site operation. However, the DEIR provides no supporting information to demonstrate how one or more of the listed measures will actually reduce noise to a less-than-significant level. Without such effort to define the efficacy of the operational noise mitigation measures, the DEIR cannot conclude that noise would be reduced to a less-than-significant level.

Response 58C-14

The mitigation measures are commonly implemented to reduce mining and industrial noise. The extensive analysis of project noise generation concluded that project-generated noise levels may exceed the applicable standards of significance by 2 dB for Draft EIR Impact 4.13-16 and by 2-5 dBA for Draft EIR impact 4.13-17, which, as noted in the Draft EIR, are relatively small levels of exceedances. As noted in the Response 58C-13, each of the industrial noise control measures would be expected to provide a source-

specific noise level attenuation of at least 5 dBA. However, it is important to note that implementation of asphalt plant duct silencers would have no effect on noise generated by aggregate crushers. For this reason, and due to the variability of types of equipment and processes involved in aggregate extraction and processing operations, it is important that the mitigation be targeted to the specific source. Compliance with the Fresno County noise standards is not optional, and the mitigation measure requiring testing of sound levels after implementation of appropriate noise control measures is specifically included to ensure that the selected noise control measures have effectively reduced project noise generation to a less than significant noise level.

Comment 58C-15

#2.C Impact of Nighttime Noise is Compounded by Extended Operational Hours

The above comments related to nighttime noise impact findings and mitigation are compounded by the fact that the Project includes extending the hours of processing operations during nighttime hours. DEIR pages 4.1-62 and 4.1-63 note that hours of operation would be revised as follows:

"Specifically, excavation as well as aggregate processing and recycling operations would be expanded from 6 p.m. to 7 p.m., and loading/unloading and aggregate trucking could occur between the hours of 4 a.m. and 9 p.m. under the proposed project, whereas under existing conditions the earliest operations begin between 4 a.m. and 6 a.m., depending on the time of year, and end at 6:00 p.m. year-round."

Extended operations before 6 a.m. and after 7 p.m. come with increased risk and potential for sleep and speech disturbance for the nearby sensitive receivers. This further emphasizes the need to provide adequate and specific noise reduction measures in Mitigation Measures 4.13-2 and 4-13.3.

Response 58C-15

The comment is correct in asserting that nighttime hours are more noise-sensitive than daytime hours. For this reason, the noise analysis prepared for the project specifically evaluated both overall noise levels and increases in ambient noise levels resulting from the project during the more sensitive nighttime hours when project operations could be occurring. As noted in both Table 4.13-16, "Estimated Plant Site Noise Levels (dBA) at Nearest Receptors," and Table 4.13-17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," of the Draft EIR, estimated noise exposure resulting from the project is provided for daytime (7 am – 10 pm), and nighttime (10 pm – 7 am) periods. Impacts

were separately evaluated for both time periods and noise mitigation measures were required for impacts occurring during any time of the day when the project standards of significance were identified as potentially being exceeded. As noted in Draft EIR Impact 4.13-3, the project is not predicted to exceed the standards of significance at the Plant Site during daytime hours, but potential exceedance of those standards during nighttime operations was identified. As a result, noise Mitigation Measure 4.13-3 was specifically developed to reduce noise during the more sensitive nighttime hours when project operations may occur. As a result, the commenter's assertion that the Draft EIR failed to include an analysis of potential noise impacts during the more sensitive nighttime periods is contrary to the extensive information pertaining to nighttime noise impacts in the Draft EIR. The County's independent noise consultant (Saxelby Acoustics) conducted an extensive peer review of the Draft EIR noise analyses and concluded that the Draft EIR adequately evaluated project noise impacts and implemented adequate mitigation measures, including for impacts during nighttime hours (Draft EIR, page 4.13-2).

Comment 58C-16

#2.D – Nighttime Noise Impact and Sleep Disturbance is Not Adequately Addressed

The conditions of this project and the community warrant an analysis of nighttime noise and the potential for sleep disturbance since operations will occur at nighttime hours (4 a.m. to 7 a.m.). The sleep disturbance study should evaluate both average and single-event maximum noise (i.e., Leq/L50 and Lmax noise levels) from processing, truck loading, and truck pass-by noise. The nighttime industrial activities could annoy residents and cause sleep disturbance. A revised EIR should identify appropriate mitigation, including specific limitations on nighttime noise and activities.

Response 58C-16

The comment asserts that nighttime noise impacts are not adequately addressed in the Draft EIR. See Responses 58-C-13 and 58C-15 for information pertaining to the evaluation of potential noise impacts during nighttime operations. Otherwise, the comment does not provide any evidence that the Draft EIR's evaluation of potential noise impacts during nighttime operations is inadequate.

Comment 58C-17

#3 NOISE AND VIBRATION IMPACT TO WILDLIFE IS NOT SUFFICIENTLY EVALUATED

We also reviewed the comments on noise impact on wildlife in the DEIR Chapter 4.4 Biological Resources. The DEIR indicates that:

- "Ground disturbance and noise impacts from mining could disturb nesting birds located on or near the project sites." (DEIR page 4.4-49) --- and ---

- "Mining activities on the Plant Site and Quarry Site could result in potential adverse impacts to special-status species in the riparian habitat surrounding the project sites if light, noise and vibration, and the operation of heavy equipment during mining activities result in substantial disturbance." (DEIR page 4.4-52)

However, the DEIR provides very little substantive analysis regarding noise in neighboring wildlife areas that will be subject to noise from the project operations. It appears that:

1. Existing ambient noise levels were not measured or evaluated in the neighboring wildlife areas. And based on the ambient noise data presented in Chapter 4.13, we expect that such areas, that are located away from current sources of noise (e.g., roadways), would have rather low noise levels.

2. Project operational noise levels were not predicted at neighboring wildlife areas. Without such analysis, the potential noise increase has not been evaluated adequately.

3. Impact 4.4-6 discusses impact of blasting activities on fish in the San Joaquin River. A vibration limit of 2.0-inch/second is presented as a threshold of significance, and the related mitigation of limiting blasting vibration at the river to 0.5 inch/second is incorporated into the mitigation measure. However, the evaluation of blasting ground-borne vibration and "airblast" pressure goes no further. There is no analysis of blasting impact on other wildlife and riparian habitat in the nearby areas.

Response 58C-17

The impacts of the mining operations upon wildlife onsite and offsite, including blasting, are analyzed in Impact 4.4-2 starting on page 4.4-52 of the Draft EIR. The impacts of the project upon riparian habitats and sensitive natural communities are analyzed in Impact

4.4-4 of the Draft EIR. The duration of a blast is one second. As such, a blasting event is not anticipated to be disruptive for wildlife. The commenter provides no evidence or substantive support that the proposed blasting would cause significant adverse impacts to wildlife. Implementation of Mitigation Measures 4.10-1, 4.3-2a, and 4.3-2b would reduce impacts to adjacent riparian areas and/or sensitive natural communities to less than significant. See Response 58-42 for discussion of the noise measurements in neighboring wildlife areas.

See also responses to comments to Letter #58B for further discussion of the project's potential impacts on wildlife.

Comment 58C-18

The DEIR fails to fully analyze the noise and vibration impact of the Project on wildlife. There are no noise or vibration thresholds of significance presented for wildlife (beyond fish in the San Joaquin River). Thus, the impact to wildlife is still unknown. Furthermore, there are no noise and vibration mitigation measures that control operational noise or blasting vibration, in particular, such as halting blasting during times when birds are nesting within in the nearby area where noise, vibration, and airblast could disrupt the animals.

Response 58C-18

The impacts of the mining operations upon wildlife onsite and offsite, including blasting, are analyzed in Impact 4.4-2 starting on page 4.4-52 of the Draft EIR. The duration of a blast is one second. As such, a blasting event is not anticipated to be disruptive for wildlife. The commenter provides no evidence or substantive support that the proposed blasting would cause significant adverse impacts to wildlife. See also responses to comments to Letter #58B for further discussion of the project's potential impacts on wildlife.

Letter #59 March 10, 2025, Cala Carter, CCIS Bonding & Insurance Services

Comment 59-1

Dear Mr. Randall,

Myself and my husband strongly oppose the CEMEX proposed plan for changing the Quarry site from a mechanical (digging) of sand and gravel, to (blasting & manufacturing) blasting hard rock and crushing it into gravel.

The idea of blasting explosions going off so close to residential areas & public roadways is a safety hazard, not to mention creating

a 600 ft below ground surface right next to the San Joaquin River, and not far from our River Parkway conservation area which is a museum devoted to teaching future generations the history of the San Joaquin River, and how our generation is protecting and preserving these wetlands for the future of our land's natural resources, is unacceptable!

CEMEX needs to find a different area to propose such a project. Attached is our response letter to the CMEX proposal.

Response 59-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Please see below for responses to the comment letter.

Comment 59-2

Dear Mr. Randall,

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 59-2

The commenter's concern with regard to the Draft EIR is noted. Please see below for responses to specific issues raised in the comment letter.

Comment 59-3

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 59-3

Draft EIR Section 4.10, "Hydrology and Water Quality," provides detailed analyses of potential groundwater and water quality effects of the proposed project. The analyses are based on the *Revised Hydrology and Water Quality Analysis Report* (Draft EIR Appendix G-

5), which utilizes information from groundwater conditions reports included as Appendices G-3 and G-4 of the Draft EIR and groundwater and surface water monitoring and sampling data collected for the project sites to draw conclusions on the existing groundwater hydrology conditions on the project sites and to evaluate the potential impacts to groundwater hydrology under the proposed project. Detailed methodology and findings are provided in Appendix G-5.

Additionally, please see Collective Response #25 for discussion pertaining to surface and groundwater analyses. As further explained in Collective Response #25, the Draft EIR and its appendices contain substantial evidence, in the form of graphical comparisons, tabular data, and narrative analysis demonstrating among other things that surface water in the San Joaquin River and the groundwater at the project sites are not interconnected and that future mining and dewatering at both the Quarry Site and Plant Site would not significantly alter the amount of water moving from the San Joaquin River into the groundwater.

As discussed and presented in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management. See Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10 and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111.

The comment does not address the adequacy of the Draft EIR hydrology analyses or the efficacy of these mitigation measures, and no further response is warranted.

Comment 59-4

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 59-4

The berm is higher than the 100-year water surface elevations, which would prevent breaching (see Draft EIR Appendix G-1). The 1997 flood flow rate of 60,300 cfs is lower than the 100-year flow rate of 71,000 cfs studied for the project. The Draft EIR analyzes the potential for the proposed project to release pollutants in flood hazard, tsunami, or seiche zones due to project inundation in Impact 4.10-17. Given that the 100-year floodplain does not encroach onto the Quarry Site, the Draft EIR concludes the following:

> "…, the resulting inundation due to the unforeseen events would occur far outside the actual flood hazard zones, and thus would not be covered by this impact. In addition, the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir is not required to be addressed under CEQA since the releases are not "reasonably foreseeable." (Draft EIR p. 4.10-119.)

The Draft EIR concludes that the potential releases of pollutants due to the inundation of the project sites due to a rapid release of water from Friant Dam would be less than significant due to the enlarged excavation pit's ability to capture water and reduce downstream flooding. Further, the project is required to adhere to the requirements of the SPCC Plan and Industrial General Permit SWPP (see Draft EIR p. 4.10-119).

See also Collective Response #17 and Response 329-3.

Comment 59-5

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 59-5

As identified in Appendix G-6 of the Draft EIR, groundwater level data have been collected continually since 2017 at the Plant Site and since 2018 at the Quarry Site (except for Well MW-7D, where monitoring began in 2020, immediately after that well was installed). As shown on Figure 5 of Appendix G-6, this period covers both wet and dry years. Figure 4.10-10, "Comparison of San Joaquin River Stage and Daily Rainfall," of the Draft EIR demonstrates that groundwater level monitoring has occurred during periods of both low flow (referred to as base flow) and periods of elevated river releases, with flows at times exceeding planned restoration flows to occur as part of the San Joaquin River Restoration project. See also Responses 6-12 and 6-14. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10, and the supporting technical appendices.

Collective Response #25 addresses the potential for interconnected surface water and demonstrates that Department of Water Resources criteria for interconnected surface water do not exist at the project site.

Comment 59-6

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 59-6

The commenter's suggestions for San Joaquin River Parkway trail construction and maintenance are noted and will be considered by County decision-makers. Please see Collective Response #22 for additional discussion of trail funding and easements. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 59-7

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 59-7

See Collective Response #27 pertaining to the effects of project operations, including blasting, on users of nearby parks and trails.

Comment 59-8

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 59-8

Please see Collective Response #8 pertaining to visual impacts and mitigation.

Comment 59-9

- **Traffic Congestion: Significant traffic impacts are expected, yet** there is no guaranteed funding or timeline for necessary road improvements.

Response 59-9

Please see Collective Response #29 pertaining to traffic-related impacts and mitigation.

Comment 59-10

How will the County ensure that CEMEX is held accountable for road damage,…

Response 59-10

Please see Collective Response #30 pertaining to road maintenance and mitigation.

Comment 59-11

…including truck debris and safety hazards?

Response 59-11

Please see Collective Response #30 pertaining to road safety.

Comment 59-12

The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR. The docu [sic]

Response 59-12

Please see responses above and the referenced Collective Responses #29 and #30 regarding traffic and transportation impacts and mitigation measures. Note also that, as discussed in Draft EIR Section 3.3 on page 3-4, in accordance with PRC Section 21081.6(a) the County would adopt an MMRP at the time it certifies the EIR. The purpose of the MMRP is to ensure that the Operator complies with the adopted mitigation measures. The MMRP would identify each of the mitigation measures and describe the party responsible for monitoring, the time frame for implementation, and the program for monitoring compliance.

Comment 59-13

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 59-13

Please see Collective Response #10 pertaining to the environmental baseline used for the air quality analysis.

Comment 59-14

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Response 59-14

Please see Collective Response #13 pertaining to project effects on wildlife nesting and migration patterns. See also Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4, and the mitigation measures referenced in this response.

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on the Plant Site Mining Plan (see Figure 2-7, "Proposed Plant Site Mining Plan") and Quarry Site Mining Plan (Figure 2-8, "Proposed Quarry Site Mining Plan"). Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (see Draft EIR pages 4.4-

50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (see Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR, page 4.4-49-4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). In any event, blasting activities would be brief and are not expected to result in sustained or long-term impacts. A typical blasting event would occur for approximately one to two seconds. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore adequately evaluated the project's potential impacts on each of these species.

Comment 59-15

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

Response 59-15

Please see Collective Response #16 pertaining to evaluation of potential impacts on salmon spawning and analysis methods.

Comment 59-16

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 59-16

Please see responses above and the referenced collective responses with regard to specific comments. The comment does not provide evidence or demonstrate a need for rewriting and recirculating Draft EIR Section 4.4.

Comment 59-17

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional

analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Response 59-17

The proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. Please see responses above and the referenced collective responses with regard to specific comments. Please also see Collective Response #4b pertaining to liability and financial obligations. The comment does not provide evidence or demonstrate a need for recirculation of information prior to preparation of the Final EIR.

Letter #60 March 10, 2025, Andrew Escamilla, California Environmental Voters Education Fund

Comment 60-1

Greetings,

On behalf of the listed organizations, I am writing to provide our comments and feedback on the CEMEX Rockfield Modification Project. We appreciate the Board for releasing a Draft Environmental Impact Report for public views and the opportunity to comment on the CEMEX Rockfield Modification Project to ensure transparency, public participation, and compliance with existing policies such as the California Environmental Quality Act (CEQA).

We acknowledge the County's dedication to a comprehensive review process. The undersigned organizations respectfully submit this letter to enhance our community's well-being and ensure that critical environmental and public health standards are upheld. For your consideration, please find our comments below.

Response 60-1

This is an introductory comment that does not address the adequacy of the Draft EIR. No further response is warranted. See responses below that address specific issues raised in this comment letter.

Comment 60-2

Section 4.1 Aesthetics and Visual Resources

The DEIR acknowledges that the CEMEX Rockfield Modification Project will have significant and unavoidable visual impact even with mitigation measures. This draft EIR fails to analyze the

equity implications of these impacts. Communities that already experience poor air quality, excessive heat, and lack of green space should not have to further endure the degradation of their visual and environmental surroundings. The San Joaquin River is a vital environmental and cultural asset that will face significant degradation if this project moves forward. This river serves as one of the few remaining natural refuges in the region, providing recreational, mental, and physical health benefits to local residents.

Response 60-2

Please see Collective Response #8 pertaining to visual impacts and mitigation.

Comment 60-3

Under Table ES-1 Mitigation Measure 4.1-1, the proposed mitigation measures, such as rock staining to reduce visual contrast, are insufficient and temporary solutions that fail to restore the ecological integrity of the affected land. Rock stain is a short-term aesthetic fix, it does not provide a real solution and does not address the lasting environmental impact caused by this project. Over time, weather conditions will diminish any aesthetic improvements, making this measure ineffective. The stain is not guaranteed to restore the ecological integrity of the land, and over a period of time, weather conditions may impact in making disturbed areas visible again. In the long term, this is a "green washing" mitigation measure that does not address the land degradation and fails to reduce environmental impacts.

Response 60-3

Please see Collective Response #8 pertaining to visual impacts and mitigation.

Comment 60-4

To effectively mitigate the impact of the area's aesthetics and visual resources, Fresno County must conduct a more comprehensive environmental review that thoroughly examines the project's disproportionate effects on impacted communities. The county should require that CEMEX engage in mandatory and enforceable land restoration efforts, that includes large scale tree planting, native vegetation restoration, and long-term air quality monitoring. Impacted residents must be engaged and considered a part of the direct decision making in the project proposal to ensure that our community needs and concerns align with restoration efforts.

Furthermore, the county must impose a legal binding requirement on CEMEX to fund sustainable improvements to public parks, trails and tree cover in impacted areas, ensuring that communities' access to natural spaces is not just another place for corporate gains.

Response 60-4

Draft EIR Section 4.1, "Aesthetics and Visual Resources," includes a detailed Visual Impact Analysis (VIA) evaluating the project's potential effects on scenic vistas and visual quality. The analysis is supported by photographs of existing conditions, photographic simulations, and descriptions of site conditions from thirteen representative viewpoints, and was prepared using the BLM Visual Resource Management System. The analysis concludes that visual changes would be less than significant from certain viewpoints, but that visibility of the quarry pit from some locations would be significant (see Impacts 4.1-1 and 4.1-3; see also Collective Response #8 and Responses 60-2 and 60-3).

The project includes a Reclamation Plan (Appendix B-1) requiring revegetation with native species and restoration of disturbed areas consistent with SMARA and Fresno County requirements. The comment does not provide evidence that additional measures such as large-scale tree planting or native vegetation restoration beyond those already required would reduce identified visual impacts.

Air quality impacts are addressed in Appendix D-4, "Revised Section 4.3, Air Quality," and mitigation measures are identified where necessary. Improvements to community parks, trails, or other off-site amenities, as well as delegation of decision-making authority to affected communities, are outside the scope of CEQA. The CEQA process provides for public review and comment, and all substantive comments are considered prior to certification of the Final EIR and any project approval (see also Collective Response #4b regarding Operator funding and financial obligations).

Comment 60-5

Section 4.3 Air Quality

Fresno County is already suffering from some of the worst air pollution in the nation, disproportionately harming low-income, immigrant, and BIPOC communities. The San Joaquin Valley consistently exceeds the state and federal air quality standards for PM2.5 (9.0 µg/m^3 annually, or 35 µg/m^{31} (Footnote 1: https://ww2.arb.ca.gov/our-work/programs/state-and-federal-area-designations/federal-area-designations/pm2-5) and ozone (8 hour standard of 0.070 ppm). CARB's recent workshop proposing updates to the PM 2.5 standard identified the San Joaquin Valley as the state's worst region in exceeding the 9.0 µg/m^3 annual standard,

at 16.2 µg/m^3 according to recent data^2 (*Footnote 2: 1https://ww2.arb.ca.gov/sites/default/files/2024-12/9ugm3_Annual_PM2.5_Workshop_Recommendations_and_Inventory_Updates_ADA.pdf*). Additionally, the San Joaquin Valley Air Pollution Control District recognizes the air basin as being in non attainment with both of these pollutants^3 (*Footnote 3: https://ww2.valleyair.org/air-quality-information/ambient-air-quality-standards-valley-attainmnet-status/*). As such, the proposed CEMEX expansion will further deteriorate the already overburdened air quality, compounding existing environmental injustices.

Response 60-5

Appendix D-4, "Revised Section 4.3, Air Quality," presents a detailed emissions analysis using project-specific data. The project would be required to comply with SJVAPCD's air quality standards. All potential impacts on air quality would be less than significant with the implementation of Mitigation Measures 4.3-2a, 4.3-2b and 4.3-4. See also Collective Response #9 pertaining to the project's potential effect on the region's existing air quality conditions.

Comment 60-6

The threshold values in the DEIR fail to account for cumulative pollution exposure, which is a critical oversight. This is a major problem because communities, especially those already burdened by pollution, do not just experience from a single pollutant but from the accumulation of pollution from various types of pollutants. Nearby communities from this project site are already enduring severe health crises, including high rates of asthma, respiratory diseases, and other pollution-related illnesses.

Response 60-6

The threshold values are used as intended to protect human health and the environment. The commenter is correct in observing that many air pollution problems are cumulative effects of many sources. However, the SJVAPCD significance thresholds that are used in the Draft EIR, as updated by this Final EIR, take the cumulative nature of air quality problems into account either by adding in background concentrations when comparing concentrations to ambient air quality standards or by being set at the quantity that is cumulatively considerable. The cumulative nature of thresholds used in each air quality impact determined in the Draft EIR and Final EIR is discussed below.

- Impact 4.3-1 describes how the project would be consistent with applicable air quality plans. Addressing cumulative air quality conditions is the primary role of

air quality plans. Therefore, consistency with air quality plans is a cumulative analysis.

- Impact 4.3-2 is discussed in Section 7.14 of the GAMAQI (SJVAPCD, 2015) which describes the thresholds as levels that would "Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant."
- Impact 4.3-3 is discussed in Section 8.5.2 of the GAMAQI which describes how health risk assessment thresholds that were used to evaluate Impact 4.3-3 are meant to exclude background levels from their application. As such, these levels are the amounts that are cumulatively considerable.
- Impact 4.3-4 involves odor. If it would be the case that other odorous sources around the project exist, then cumulative odor may need to be assessed but that is not the circumstance in this case.

(See Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4.)

Comment 60-7

While the DEIR acknowledges potential health risks, it underestimates the severity of these health risks and fails to propose meaningful or enforceable mitigation measures. There is no clear outline strategy of how pollutants will be monitored or transparency for impacted residents.

To ensure our communities health as a priority, we demand that Fresno County take immediate and binding actions to safeguard our communities that are directly impacted by environmental harm such as air pollution. We suggest that the county enforce a comprehensive, real-time community air monitoring program with public access to ensure health protection and also hold CEMEX accountable if their pollution level exceeds safe limits.

Response 60-7

The Draft EIR determined the severity of health risks using the methods approved by SJVAPCD, OEHHA and CARB. Mitigation Measures 4.3-2a, 4.3-2b, and 4.3-4 are meaningful because their implementation would reduce emissions. As described by SSP 1610 (SJVAPCD, 2012) which is used by District staff to permit mining facilities. Fugitive dust would be monitored by visual opacity observation as required by SJVAPCD rules like Rule 4101 that are described in Section 4.3.2.3, "Local" (see Appendix D-4, "Revised Section 4.3, Air Quality"). Residents would know when excursions from conditions described in the Draft EIR as updated in the Final EIR occur because they would see dust exceeding 20 percent opacity for more than three minutes in any hour. One way to record a possible event would be by video tape of the source causing the emissions. Further, in

response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Final EIR Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 60-8

In addition, we suggest the county require CEMEX to transition to zero emission emissions equipment to reduce and eliminate particulate pollution.

Response 60-8

No such trucks or equipment currently exist and the project's potential impacts on air quality and GHG would be less than significant. Therefore, such a requirement would be unwarranted as a mitigation measure and impossible to comply with at this time.

Comment 60-9

Section 4.11 Land Use and Planning

Upon review under Section 4.11 Land Use and Planning of the DEIR, we've identified several concerns regarding the project's consistency with Fresno County's General Plan goals and policies. As labeled in Goal LU-A, which aims to promote long-term conservation, potentially productive agricultural lands, and accommodate agricultural-support services and related activities that support the sustainable agriculture to further the County's economic development goals, the DEIR provides no specific plan to stay consistent.

Response 60-9

Draft EIR Section 4.11, "Land Use and Planning," assesses the project consistency with the Fresno County General Plan, including General Plan Goal LU-A and relevant policies of Goal LU-A. As discussed in Draft EIR Table 4.11-1, "Project Consistency with Local Planning Documents," on pages 4.11-10 through 4.11-12, the assessment concludes that the project would be consistent with Goal LU-A and relevant policies. As discussed there, mineral extraction is an allowed use in areas designated Agriculture per Fresno County General Plan Table LU-1. Also as discussed in Draft EIR Table 4.11-1 at Policy LU-A.3 on Draft EIR pages 4.11-10 and 4.11-11, the project would meet the criteria for non-agricultural uses listed in General Plan Table LU-1 and Table 4.11-1 provides an assessment of the project against each of the criterion. The comment does not address the

adequacy of the Draft EIR land use plan consistency analysis, and no further response is warranted.

Comment 60-10

In addition, the DEIR stated that the proposed project provides a needed service to the surrounding area by producing cement products for construction projects. As stated by Marek Warszawski, in CEMEX's own document, Fresno County utilizes only 28% of their production. There are multiple sites where the county uses such as Vulcan Sanger Site, Academy Quarry, Fresno River Rock, AI's Concrete, Bass Avenue Materials, Carmelita Mine, Coalinga Pit #1, Coalinga Pit #2, Gale Sands, Kings River Sand and Gravel, River Rock Site, Riverbend Sand and Gravel, Sante Fe Aggregate, Sierra Pacific Materials, and Tivy Valley Granite.

Response 60-10

Please see Collective Response #3 pertaining to regional aggregate demand and need for the project.

Comment 60-11

Following Goal LU-C, focusing on ensuring long term preservation of productive agricultural land, conserving natural wildlife habitats, and maintaining flood-carrying capacities, the project was identified as consistent. However, there was no further explanation regarding CEMEX's effort to measure how the project will be implemented to achieve this goal. The DEIR asserts that the proposed project is consistent with applicable Fresno County General Plan goals and policies, as demonstrated in Table 4.11-1. Nevertheless, the DEIR does not provide sufficient evidence or detailed analysis to support this assertion.

The DEIR lacks detailed plans and commitments necessary to demonstrate how the project will effectively contribute and be consistent with current policies and zoning regulations.

Response 60-11

Contrary to the comment's assertion, the Draft EIR provides analysis and substantial evidence in Section 4.11, evaluating the project consistency with the Fresno County General Plan. Draft EIR Table 4.11-1 identifies and lists applicable policies of the Fresno County General Plan and provides an evaluation of the project's consistency with each on Draft EIR pages 4.11-10 through 4.11-41. Additionally, Table 4.11-1 and its analysis includes discussion of and reference to mitigation measures identified elsewhere in the Draft EIR that would serve to reduce project environmental impacts and ensure project

consistency with General Plan goals and policies. The County disagrees with the comment's assertion that the Draft EIR does not provide sufficient evidence or analysis to support the conclusion that the project would be consistent with the Fresno County General Plan.

Comment 60-12

More specifically, it fails to provide concrete measures or strategies that will be implemented to ensure the conservation of agricultural lands and support for agricultural activities. Best practices for agricultural sustainability, such as land conservation, habitat preservation, and mitigation of land degradation must be integrated into the project's plan to prevent long-term impact. We strongly demand a detailed plan is provided with coherent and actionable steps to demonstrate CEMEX project alignment with each policy goal. We also ask that CEMEX do a thorough examination of each relevant goal and policy, specifying clear steps to reach agricultural sustainability. This is essential to validate its claim to be consistent with local priorities.

Response 60-12

Please see Responses 60-9 through 60-11 above. Mineral extraction is an allowed use in areas designated Agriculture per Fresno County General Plan Table LU-1, and the project is not required to ensure conservation of agricultural lands.

Comment 60-13

Section 4.13 Noise

Noise pollution is a serious yet often overlooked public health issue. Chronic exposure to excessive noise is linked to increased stress, sleep disturbances, cardiovascular disease, and cognitive impairments, particularly among vulnerable groups such as children and the elderly. The DEIR fails to assess noise pollution's cumulative impacts alongside other environmental stressors. Instead, it dismisses noise impact of nearby communities and labels it as a "less than significant" issue without proposing adequate mitigation under noise per **Figure 4.17-1.** Just because noise levels at currently identified intersections 2, 3, 14, and 15 exceed 60 decibels (dBA LdnI) within 100 ft from the road does not mean added noise will not impact communities. Dismissing the need to take further action on how this project noise impact is unacceptable. Even small noise increases can have a negative impact on residents especially combined with other pollution sources.

The DEIR clearly fails to acknowledge the project's noise impact level on residents and is dismissive of the cumulative harm to impacted communities. We demand that Fresno County impose stringent noise mitigation measures to be implemented, including stricter operational limits, noise barriers, and increased monitoring.

Response 60-13

Draft EIR page 4.13-6 discusses public health issues associated with excessive noise under the heading "Negative Effects of Noise on Humans," identifying effects related to noise such as hypertension, sleep disturbance, interference with activities, etc. The development of the standards of significance utilized to evaluate noise impacts within the Draft EIR carefully considered both the Fresno County noise standards and thresholds for evaluating effects related to noise level increases (Draft EIR, pages 4.13-27 through 4.13-30). Both sets of thresholds were developed with the objective of protecting people from the harmful effects of noise. Because a person's reaction to noise is highly subjective, quantifiable numeric thresholds are used to evaluate potential noise impacts in EIR's prepared throughout the State of California. CEQA requires that a noise level increase be substantial, rather than simply audible (see Appendix G of the CEQA Guidelines). Noise thresholds considered in the analysis of potential noise impacts are presented on Draft EIR Pages 4.13-25 through 4.13-39. While the Draft EIR recognizes that the project would add traffic to the local roadway network, thereby increasing the current traffic noise environment at sensitive receptors located in the vicinity of project truck routes, the magnitude of the increase was determined to be below thresholds required for a finding of significant noise impact (see Draft EIR Impact 4.13-1). In cases where potentially significant noise impacts were identified, such as locations near the Quarry Site, appropriate noise mitigation measures were developed (see Draft EIR Mitigation Measure 4.13-3). Following an extensive, quantitative, analysis of off-site traffic noise impacts (see Impact 4.13-1), the analysis concluded that the thresholds required for a finding of a potentially significant noise impact were not exceeded. Otherwise, the comment provides no substantial evidence that the project would exceed noise levels and does not address these mitigation measures or analyze why they are deficient.

Comment 60-14

Additionally, the County must ensure full community participation in decision-making. We demand extended public comment periods, mandatory public hearings in impacted neighborhoods, and transparency in enforcement actions.

Response 60-14

Please see Collective Response #1 pertaining to public review and input opportunities.

Comment 60-15

The County must require that CEMEX establish sound barriers, limit operational hours, and conduct long-term noise monitoring to minimize harm to nearby residents.

Response 60-15

Mitigation Measure 4.13-2 (Draft EIR page 4.13-58) specifically includes noise barriers in the form of suspended acoustic curtains, and noise monitoring to ensure that the mitigation measures adequately reduce the identified potentially significant noise impact to a level of less than significant. The noise analysis determined that additional restrictions on hours of operation were warranted, and those recommendations were included in the mitigation measure. Finally, Mitigation Measure 4.13-3 requires monitoring to occur. Since the Draft EIR already includes the mitigation measures recommended in the comment, adoption of additional noise mitigation measures is unnecessary (see *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 880).

Comment 60-16

Section 4.17 Transportation

The increase in truck traffic resulting from the CEMEX expansion will not only contribute to higher emissions but also increase safety risks for pedestrians and cyclists.

Fresno County already suffers from severe air pollution, and adding more truck traffic will significantly worsen our air quality, particularly for those living near major roadways.

Response 60-16

Please see Collective Response #9 pertaining to the project's potential effect on the region's existing air quality and please see Collective Response #30 pertaining to roadway safety.

Comment 60-17

Additionally, while there are existing bike lanes along impacted intersections, pedestrian infrastructure is severely lacking. An increase in truck traffic will make conditions even more dangerous for cyclists and pedestrians, especially with limited lighting, inadequate signage, and unprotected bike lanes. The risk of road hazards, such as falling aggregates from these trucks, further endangers residents.

Response 60-17

Please see Collective Response #30 pertaining to roadway safety.

Comment 60-18

Although we appreciate CEMEX initiatives to reach a net-zero CO2 by creating a zero emission fleet and switching to having zero-emission electric ready mix trucks, the DEIR of the Rockfield Expansion Project does not detail how these sustainability goals will be integrated into the local project. The oversight of potential hazards that will impact our communities is a high concern.

Also, in light of CNRA's California's Advanced Clean Car II Rule to reach zero-emission vehicles by 2035, we advise that the DEIR address how the Rockfield Expansion Project plans to incorporate zero-emission vehicle into its operation to ensure compliance with state priorities and contribute to our regional air quality improvements. We strongly urge a Specific, Measurable, Achievable, Realistic, Time bound, Inclusive, and Equitable (SMARTIE) plan on how they will transition to zero-emission transport vehicles and fund community air quality monitoring programs.

Response 60-18

The Operator has and would continue to comply with all applicable emissions regulations, including the use of zero-emissions vehicles if/when the technology becomes viable, and the applicable regulatory agencies such as the California Air Resources Control Board (ARB) require that mine operators turn over their existing fleets. California's Advanced Clear Car II rule does not apply to heavy duty aggregate mining trucks. See Response 12-44 regarding usage of zero-emissions vehicles for the project.

Comment 60-19

Additionally, the County should also establish buffer zones between truck routes and residential areas to protect our public health.

Response 60-19

Please see Collective Response #9 pertaining to the project's potential impact on the region's existing air quality. The comment does not provide evidence or otherwise explain that buffer zones between truck routes and residential areas are feasible or necessary to address air quality impacts of the proposed project.

Comment 60-20

Improvements to pedestrian and cyclist safety should include enhanced protected pedestrian lanes, improved and clear signage, and improved traffic management and safety measures to prevent accidents and fatalities.

Response 60-20

Please see Collective Response #30 pertaining to roadway safety.

Comment 60-21

Again, we thank you for the opportunity to comment on this period of the process. The undersigned are gravely concerned about the length of the time the Fresno County has allowed ongoing and unmitigated environmental issues, despite full understanding of its impact on our communities health, air quality, water quality, and infrastructure damage.

Response 60-21

The commenter's concerns about environmental issues associated with community health, air quality, water quality, and infrastructure are noted. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 60-22

Fresno County has an opportunity to demonstrate environmental leadership by upholding strong policies that protect both the environment and the well-being of its residents. I urge the county to reconsider this project proposal mitigation measures and instead adopt a community-centered approach to preserving the priorities of its community needs and health.

Thank you for your time and consideration. I look forward to your response.

Response 60-22

The opinion and recommendations requested in the comment are noted and will be considered by County decision-makers.

Letter #61 March 10, 2025, Gohar Hakimipour, Clovis North River Alive Club

Comment 61-1

I hope this letter finds you well. My name is Gohar Hakimipour, and I am the president and founder of the Clovis North River Alive Club. For the past four years, River Alive has spent over 1,500

hours completing service work by the San Joaquin River. Our goal from the start was to preserve the natural beauty of the river by picking up trash and restoring abandoned spots by the river to their former beauty. So, when our club heard of the plans for the CEMEX expansion, we knew it was our right to have a say. River Alive is one of the many stewarts of the river. The CEMEX expansion will hurt the river and its habitat that River Alive has worked so hard to protect. It will jeopardize the peaceful and enjoyable access to the river, but it will also risk the safety of the animals that reside near the river.

Response 61-1

As an initial matter, please note that although the comment letter (email) was addressed to Supervisor Bredefeld, the responses here have been prepared by County staff and do not represent a response to the commenter from Supervisor Bredefeld. The commenter's concerns are noted and will be considered by County decision-makers.

Draft EIR Section 4.4, "Biological Resources," discusses potential biological resources impacts of the project, and the comment does not address the adequacy of the Draft EIR's biological resources evaluation.

Please see Collective Response #21 pertaining to public access to the San Joaquin River.

The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 61-2

I am also part of the Clovis North cross country team. As for being a part of a huge running community that extends beyond the boundaries of my school, running across Friant to Woodward Park is stressful with the amount of anxious car traffic going on. A person has died at every intersection on Friant in the past seven years. Those lives were taken because of reckless driving due to traffic. The Cemex expansion will significantly impact the traffic on Friant, adding thousands more heavy truck traffic annually to the current heavy traffic on the Friant Road. Additional traffic as the result of Cemex expansion will compromise traffic safety on Friant and other streets in the area and will put running teams' health and wellness in danger.

Response 61-2

Please see Collective Response #29 pertaining to traffic, and please see Collective Response #30 pertaining to roadway safety.

Comment 61-3

Not to mention, Cemex expansion will also significantly impact air quality and consequently it impacts the health of the runners and pedestrians who use Woodward Park everyday.

Response 61-3

The Draft EIR and Final EIR determined that the project would have less than significant effects on air quality. See Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4 "Project Impacts and Mitigation Measures."

Comment 61-4

From as long as I could remember, the San Joaquin River has been a safe haven for me. As a child, I made a lot of memories by the San Joaquin with my family—especially my mom. We used to canoe and swim in the river on weekends. These excursions, although tiresome, allowed me to connect to nature and connect with my mom. The CEMEX expansion will negatively impact this experience for another little girl and her mother. Therefore, I plead with you— protect the San Joaquin River. Ensure the people of Fresno can continue enjoying our beautiful river, and that we don't exacerbate the air quality problems in our city. I hope this moves you in favor of the community of Fresno. Thank you.

Response 61-4

The comment does not address the adequacy of the Draft EIR. The commenter's interest in the San Joaquin River and concerns regarding the proposed project are noted and will be considered by County decision-makers.

Letter #62 March 10, 2025, Thomas R. Johnson, San Joaquin River Restoration Program

Comment 62-1

Background

The San Joaquin River Restoration Program (SJRRP) is the direct result of the San Joaquin River Restoration Settlement (Settlement) reached in September 2006 by the U.S. Departments of the Interior and Commerce, the Natural Resources Defense Council (NRDC), and the Friant Water Users Authority (FWUA). The Settlement, which followed an 18-year lawsuit, received Federal court approval in October 2006. The Settlement acknowledges two goals: to restore and maintain fish populations in "good condition" in the main stem of the San Joaquin River below Friant Dam to the confluence of the Merced River, (the "Restoration Goal") and to reduce or avoid adverse water supply impacts to all of the Friant

Division long- term contractors that may result from the Restoration Flows provided for in the Settlement (the "Water Management Goal").

A key portion of the Settlement in support of the Restoration Goal is the release of a portion of the unimpaired runoff into Millerton Lake down the San Joaquin River to support fisheries. The Settlement also includes the role of a Restoration Administrator (RA), who is selected by the non-Federal Settling Parties (NRDC and FWUA) and appointed by the Court. The RA, in association with an assigned Technical Advisory Committee (TAC) also specified by the Settlement, is tasked with recommending how Restoration Flows will be released to meet the Restoration Goal of the Settlement and with providing input and recommendations for the implementation of various channel improvement measures to be implemented as a part of the Settlement.

Response 62-1

The comment's overview of the San Joaquin River Restoration Settlement, its restoration goals, and administration is noted. Please see responses below regarding specific issues raised in the comment letter.

Comment 62-2

For the purposes of reviewing and commenting on the CEMEX Rockfield Modification Project (Project), the focus and interest of the RA will be the potential for any impact to hydrology or water quantity that may result from implementation of the Project.

The CEMEX Rockfield Modification Project (Project) may affect hydrology, river flow and losses along the San Joaquin River beyond what was assumed in the Settlement. Paragraph 13(f) of the Settlement[1] (*Footnote 1: NRDC, et al., v. Kirk Rodgers, et al., 381 F.Supp.2d 1212 (2005, E.D.Cal.), https://www.restoresjr.net/?wpfb_dl=9*) states:

> *The Parties agree to work together in identifying any increased downstream surface or underground diversions and the causes of any seepage losses above those assumed in Exhibit B and in identifying steps that may be taken to prevent or redress such increased downstream surface or underground diversions or seepage losses.*

As a representative of the Court tasked to consult on the implementation of the Settlement, the RA supported by the TAC has participated in the review of the Draft EIR for the Project.

Response 62-2

See Collective Response #25, which concludes that trends in groundwater levels and river stage show that conditions indicative of interconnected surface water are not present at the Quarry and Plant sites. Furthermore, as provided in Draft EIR Impact 4.10-12, "[s]ince the hard rock is not in direct contact with the channel or bed of the San Joaquin River, the only way that the lower groundwater levels in the hard rock could draw water from the river is if that water percolated downward through the alluvium and/or weathered rock, … [which] the hydraulic conditions are such that there would be no significant change in the volume of water flowing from the river through the alluvium and weathered rock as a result of the project" (see Draft EIR, Impact 4.10-12, page 4.10-114). Additionally, implementation of Mitigation Measure 4.10-10a would address potential impacts to flows in the San Joaquin River after mining is completed and pumping to the recharge trenches ceases (see Draft EIR, page 4.10-114). The comment provides no evidence or support that the project may affect hydrology, river flow, and losses along the San Joaquin River beyond what is assumed in the September 2006 San Joaquin River Restoration Settlement.

Comment 62-3

Key Concerns Regarding the Project

The San Joaquin River downstream of Friant Dam to the Merced Confluence is the Restoration area, where the goal of returning riparian vegetation and anadromous fish species is being implemented. This approximately 153-mile series of reaches also experiences substantial losses of river flows – depending on year type, 30% to 85% of the water released to the river at Friant Dam does not reach the Merced confluence. The cause of the losses includes natural seepage and authorized diversions but also include unauthorized diversions and induced seepage from interconnected surface and ground water. These losses have significantly increased in the river reach between Friant Dam and Gravelly Ford, in some years more than 35% greater than what was assumed in the Settlement and the 2002 San Joaquin River Background Report.

Response 62-3

Comment acknowledged. See Collective Response #25, addressing the potential for interconnected surface water at the project sites, based on California Department of Water Resources criteria. Also see Responses 6-12 and 6-14 regarding the magnitude of groundwater inflow compared to base flows and SJRRP restoration flows.

Comment 62-4

As further background, it should be noted that in all but the wettest years, the full flow of the San Joaquin River downstream of Friant Dam is fully subscribed – various users hold existing water rights, and flows are utilized for consumptive or environmental purposes. Water rights holders and contractors along the river are engaged in working together, and with various Groundwater Sustainability Agencies (GSA's) to monitor flows, uses and losses in the river, and to identify and limit any unauthorized or illicit losses.

Restoration Flows released pursuant to the Settlement are released from water stored by the Bureau of Reclamation (Reclamation) pursuant to Reclamation's water rights. Restoration Flows released by Reclamation are protected by Section 1707 of the California Water Code, and Restoration Flows are not "abandoned water" available for other uses. But for the Restoration Flow releases, the full volume of Reclamation's stored water would be available for water supply to various Reclamation contractors. All flows stored and released by Reclamation have substantial monetary value to Reclamation or it's contractors.

As RA for the SJRRP, my focus in reviewing the Draft EIR for the Project is the potential for diversion or loss of in-river flows due to implementation of the Project, and as a result of that implementation any negative impacts for the Settlement or Restoration Program. Simply stated, no additional unauthorized diversions, or uncontrolled seepage or losses from river flows that are not fully mitigated, can be allowed because of Project Implementation.

Response 62-4

Thank you for your statement. There is no comment on the analysis of the EIR. For those reasons, no further response is required.

Comment 62-5

Comments

I have coordinated with Reclamation during the review of the Draft EIR and concur and support all of Reclamation's comments on the Project as described and explained in Reclamation's comment letter of March 7, 2025.

Response 62-5

The commenter's coordination with the U.S. Bureau of Reclamation (USBR) and support of USBR's March 7, 2025, comments is noted. Please see Responses to Comment Letter #6 in this Final EIR for the County's responses to comments in USBR's March 7, 2025, letter.

Comment 62-6

In addition to Reclamation's comments, I have several comments on the analysis of groundwater and Groundwater-Surface Water Interaction at the Quarry Site.

There are a number of generalizations used in the hydraulic analysis of the Quarry site. The analysis uses a small number of test wells (three) along the 7,000 + foot border between the Quarry Site and the San Joaquin River, as well as a limited data set of testing, to characterize all manner of conditions groundwater and hydrologic conditions and potential impacts.

The following statement appears on pg. 4.10-113 of the Draft EIR:

> *The base flows within the San Joaquin River are typically at or below the elevation of the base of the alluvium on the Quarry Site. Thus, flows from the San Joaquin River toward the Quarry Site within the alluvium can only occur during the infrequent and relatively short-term high flow periods. Due to the recharge trenches along the west side of the Quarry Site, groundwater levels in the alluvium and the weathered rock would be maintained consistent with existing conditions. As a result, there would be no significant change in the volume of potential inflow from the river into the quarry during high flow events through the alluvium and weathered rock as a result of the project.*

Data and information elsewhere in the Draft EIR contradicts the statement that base flows are typically at or below the elevation of the base of the alluvium. For example, the HEC-RAS model results in Appendix G-1, Hydraulic Analysis, show a riverbed elevation of 286.77 at the downstream end of the Quarry Site, and 291.01 at the upstream end of the Quarry Site. Figure 3 & 4, Appendix G-4, Groundwater Conditions at the Quarry Site, shows substantially different thicknesses of alluvium and weathered rock across the site, generally much lower in elevation than the lowest point of the river. Pg 12 of Appendix G-5, states:

> *"Where present, the alluvium is up to 60 feet thick. Beneath the alluvium, the weathered rock ranges in thickness from 20 feet to 60 feet."*

Contrary to the statement above from the DEIR, it is indeed quite possible that there would be a significant change in the volume of inflow from the river, particularly when additional mining activity further lowers the hydraulic grade line across the site.

On pg. 81 of Appendix G-4, Groundwater Conditions at the Quarry Site, it is noted that "for the hardrock, the best values for transmissivity are from the pump tests on MW-1D and 2D. These values were 320 gpd per foot and 960 gpd per foot, respectively, or an average of 640 gpd per foot." These wells are closest to the river of all the monitoring wells, and thus likely represent the best available estimate of current seepage from the river. However, these estimates were averaged with transmissivity values from wells across the site, yielding a much lower estimate of overall transmissivity (350 gpd per foot) and therefore a much lower estimate of groundwater inflow to be addressed in future operation or mitigation [sic]

Response 62-6

Mining of the alluvial material at the Quarry Site has been occurring for decades, such that all of the alluvium has been removed from western part of the Quarry Site, nearest the river. Future mining as part of the project would occur only within the deeper weathered rock and hard rock, which are bedrock geological units. Thus, seepage from the river into the Quarry excavation is part of the existing baseline for the CEQA analysis. Future operations would not change any conditions related to the alluvium and potential groundwater inflow through that geologic unit.

The maximum grade line slope extends from the elevation of the river on the west side to the base of the alluvium on the east side of the berm separating the existing Quarry excavation from the river. Therefore, mining deeper into the bedrock units would not change the grade line for flow through the alluvium. Furthermore, the primary porosity and overall permeability of the alluvium is substantially greater than the fracture porosity and permeability of the underlying weathered rock and hard rock such that dewatering of the deeper bedrock units would have little or no effect on the water levels within the alluvium.

Comment 62-7

On Pg 4.10-56 of the DEIR, identifies the Friant-Kern Canal as "may be the predominant source of recharge" for the Quarry Site during some times of year. Setting aside the facts that the concrete-lined Friant-Kern Canal is more than a mile from the edge of the Quarry Site boundary at its nearest proximity whereas the river is only 200 feet distant, there is analysis, well data, or

other evidence to corroborate this assumption. Further, Appendix N of Appendix G-4 concludes in part:

> *"Stable isotope data demonstrate that all surface water and groundwater present at the site originated at the same elevation in the Sierra Nevada mountains and is present at the site due to percolation from the San Joaquin River."*

The assumption that some portion of groundwater flow into the Quarry Site originates from the Friant- Kern Canal is not supported and represents another opportunity to substantially underestimate the amount of water moving from the river into the Quarry Site.

Response 62-7

See Responses 6-12, 6-14, 6-56, and 9-9.

The groundwater studies provided in Appendices G-4 and G-5 of the Draft EIR show that the groundwater flow direction within the deeper bedrock units is predominantly from the northeast to the southwest, in other words, toward the San Joaquin River, not away from it. The substantial evidence provided in the Draft EIR and its appendices indicates that much of the groundwater within the deeper bedrock units is potentially sourced along the Friant Kern Canal. Regardless, the volume of groundwater that flows under the site, and the volume that would be pumped from the Quarry during dewatering, are miniscule fractions of the total flow within both the canal and the river. Even if the inflow to the Quarry were to increase by an order of magnitude (i.e., 10-fold), it would have an unmeasurable effect on SJRRP restoration flows. Please see Response 6-14 for further discussion of the factors which support the conclusion that most of the groundwater flow in the underlying hard rock may come from leakage from the Friant Kern Canal.

Comment 62-8

It seems entirely possible that various favorable assumptions may have resulted in the underestimation of the volume of inflow from the river to the Quarry Site, particularly as mining progresses and lowers the hydraulic grade line for the site. If true, the losses to the river could be substantial. Even under the favorable assumptions in the DEIR, there is no end of losses from the river nor the need for continuous mitigation in the form of future pumping. From the DEIR, pg. 4.10-88:

> *Upon completion of mining at the Quarry Site at the end of Phase 2… The consumption of groundwater at the Quarry Site would be 145 acre-feet more per year than under existing conditions (i.e., 270 acre-feet after reclamation minus 125 acre-feet existing). An approximately 108-acre, 100- foot-*

deep lake would be formed from groundwater and rainfall in the excavation bottom. Water would continue to be pumped from the quarry pit into the Northeast Pond and groundwater recharge trenches. Therefore, equipment related to water management, such as pumps, piping, monitoring wells, and related electrical infrastructure, would remain.

Under more conservative estimates of inflows from the river, it is possible that losses from the river and the extent of permanent mitigation may be far greater.

Response 62-8

As noted in the Responses 6-12, 6-14, and 6-56, the volume of groundwater inflow into the Quarry is very small compared to the volume of flows in the San Joaquin River. As noted in the Response 6-56, the magnitude of the difference between the water budget at the Quarry Site and the flows in the San Joaquin River demonstrate that there would be no measurable depletion of the flows in the river, even if groundwater and surface water were interconnected. For example, the average releases from Friant Dam in August 2025 were 250 cfs (https://www.restoresjr.net/restoration-flows/flow-schedule/), which is near the minimum reported release for January through August 2025. In contrast, the estimated dewatering rate for the Quarry at maximum depth is approximately 165 acre-feet per year, or 0.22 cfs (see Appendix G-4 of the Draft EIR). Thus, the Quarry dewatering rate is less than 0.09 percent of the recent base flow rate on the San Joaquin River and less than 0.009 percent of the Stage 1 SJRRP flow scenarios (see Response 6-12). The 165 acre-feet per year estimated dewatering rate is only 0.04 percent of the projected SJRRP annual releases from Friant Dam during average normal year conditions (i.e., release of 400,300 acre-feet per year) and only 0.14 percent of the projected releases under critical dry year low conditions (i.e., release of 116,866 acre-feet per year), as shown in Table 2 of the SJRRP Restoration Flows Guidelines, Version 2.1 (https://www.restoresjr.net/?wpfb_dl=3114). Even if different assumptions resulted in increases in the estimated dewatering volumes for the Quarry, those volumes would still be a very small percentage of the volume of the releases from Friant Dam. Such volumes would be at least one to two orders of magnitude less than the losses of 35 percent to 85 percent of the Friant Dam releases described in Comment 62-3.

Comment 62-9

It is recommended that a site-specific groundwater model be developed and run for analyzing inflows from the river and the extent of pumping required to address those inflows. In particular, different scenarios for subsurface conditions, transmissivity and future river stage can be modeled to provide a full understanding of the range of possible impacts on river flows.

Response 62-9

As described in the Responses 6-12, 6-14, 6-56, and 62-8, the groundwater inflows into the Quarry are very small fractions of the flows within and dam releases to the San Joaquin River. A site-specific groundwater flow model would not improve on the accuracy of the groundwater inflow estimates, because the model would be based on the same data (i.e., groundwater elevations, permeabilities, river stage) as the analysis in the Draft EIR. CEQA does not require such additional testing and level of detail under these circumstances (CEQA Guidelines Section 15204(a)).

Comment 62-10

The disposal of excess water from the Quarry Site is via a seepage trench located along the river. This appears to be sufficient for current activities, although there are several questions and issues with this system:

- The seepage trench is located between river and excavation area. Per the DEIR appendices (Pg 77 – 79, Appendix G-4), "it is assumed that half of the groundwater ditch recharge would flow to the San Joaquin River… the remainder would enter the excavation". If only half of the flow is returned to the river, this is a permanent impact to river flows.

- The current array of wells on the site is not reliably able to estimate inflows from the river, nor effectively measure how much water is returned to the river.

- Appropriate annual filings of water use with the State Water Resources Control Board for any water withdrawn from the San Joaquin River, and volumes of groundwater pumped and transported to the appropriate GSA, should be required.

Response 62-10

This comment is related to a baseline operating condition for the existing Quarry, and does not relate to any potential impacts from the project beyond the existing baseline. The first two bullets regarding the seepage trench and the current wells on the site do not dispute the current physical conditions at the Quarry Site or Plant Site. Under CEQA, the lead agency need only consider impacts based on the baseline physical environmental conditions at the time of publication of the notice of preparation (CEQA Guidelines, Section 15125(a); *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 322). See also Response 112-10, which provides information about well-monitoring data collection and groundwater depth levels.

Regarding the third bullet, the Draft EIR confirms that the project would comply with all federal, state, and local requirements, including all appropriate reporting requirements with the State Water Resources Control Board, GSAs, and other applicable government agencies (see, e.g., Draft EIR, pages 4.10-71 through 4.10-72; pages 4.10-1 through 4.10-2). See also Collective Response #25, which discusses potential impacts on flows in the San Joaquin River.

Comment 62-11

It is recommended that an alternative mitigation system for excess groundwater inflows, inflows from the river, or accumulated mining pit water be identified and included in any final permitting for the Project. The mitigation system must be able to adaptively and permanently manage the entirety of flows to the site, including rainfall, flood flows, and increased inflows to the site due to increased river stage. The mitigation system should be able to a) accurately assess the inflows from the river, b) return 100% of inflows from the river to the river, with no impact on water quality, and c) can accurately measure the returns to the river.

I appreciate the considerable effort that the applicant and the County have taken to compile the information in the DEIR and appreciate the opportunity to comment on this Project.

Response 62-11

Under CEQA, mitigation is only required for potentially significant impacts caused by the project. CEMEX has pre-existing water rights to use river water for industrial purposes. Under existing conditions (refer to Section 2.4, "Existing Conditions," of the Draft EIR which details how inflows are managed), this water is used at the Plant Site to wash aggregate, and is then sent to the silt ponds where silts and fines settle out (Draft EIR page 2-21). Water from the silt ponds is recycled back to the plant as process water. The silt ponds also serve as a source of recharge to groundwater. At the Quarry Site, groundwater and surface water runoff from rainfall accumulates in ponded pits and is pumped out to accommodate mining operations. The water is used by water trucks for dust control and is pumped to the existing groundwater recharge trenches. The management of water onsite described above would continue as part of the project. CEMEX is not required to return 100 percent of water diverted from the river as it has pre-existing water rights. No offsite discharge of any water onsite is proposed as part of the project, and therefore, no additional mitigations are warranted.

Letter #63 March 10, 2025, Anthony Molina, Safe Access to Woodward Park Coalition

Comment 63-1

On behalf of the Safe Access to Woodward Park coalition, we would like to share a letter we are submitting to Supervisor Bredefeld, who represents the area around Woodward Park, regarding our strong opposition to the Cemex Project.

Response 63-1

As an initial matter, please note that although the comment letter (email) was addressed to Supervisor Bredefeld, the responses here have been prepared by County staff and do not represent a response to the comment from Supervisor Bredefeld. The commenter's opposition to the proposed project is noted and will be considered by County decision-makers.

Comment 63-2

Dear Supervisor Bredefeld,

In September 2020, shortly after Angel Hernandez was fatally hit by a car at the intersection of Friant and Fort Washington when you were the City of Fresno District 6 Councilmember, we invited you to a walk audit along Audubon and Friant Rd with Councilmember Karbassi. As you remember, during our walk we tested different crosswalks that lead to Woodward Park on Friant Road. We discussed the traffic safety situation that high volume traffic is causing on Friant Road and its incompatibility with so many pedestrians and bicyclists walking to and from Woodward Park. Unfortunately, the traffic safety on Friant Rd has gotten worse since then. More fatal accidents like Paul Moore on Friant and Audubon, and Amaya Chenot on Shepard and Friant are proof of that terrible reality. The number of memorials that are erected at every intersection on Friant Road is a testimony to the systematic and chronic traffic safety issues on the roadways near Woodward Park.

Response 63-2

The commenter's concerns are noted. Please see Collective Response #30 pertaining to traffic safety.

Comment 63-3

The CEMEX expansion will increase truck traffic from 250,000 to 400,000 a year. We desperately encourage you to put the health and safety of residents of your district before the wealth of another mega non-local (non-US) company and say NO to CEMEX request to

extend the operation permit to 100 more years and to a scale so big that it will match the biggest mining operation in California.

Response 63-3

The commenter's concern with regard to increased truck trips associated with the proposed project are noted. Draft EIR Section 4.17, "Transportation and Traffic," provides a detailed discussion of anticipated project trip generation in Draft EIR Section 4.17.3.2, "Local," and tabulates existing and projected annual trips volumes associated with the project (see Draft EIR Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)"). Please see Collective Response #30 pertaining to traffic safety.

The commenter's concerns and request for denial of the project are noted and will be considered by County decision-makers.

Letter #64 March 10, 2025, Jason Palmer, Fresno Fly Fishers for Conservation

Comment 64-1

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years.

Response 64-1

See Response 20-1.

Comment 64-2

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource.

Response 64-2

See Response 20-2.

Comment 64-3

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations.

Response 64-3

See Response 20-3.

Comment 64-4

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts.

Response 64-4

See Response 20-4.

Comment 64-5

The increased truck traffic, potential river pollution, and habitat destruction would be devastating for local wildlife.

Response 64-5

See Response 20-5.

Comment 64-6

Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells.

Response 64-6

See Response 20-6.

Comment 64-7

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability.

Response 64-7

See Response 20-7.

Comment 64-8

Moreover, the current agreement lacks measurable performance oversight, and

Response 64-8

See Response 20-8.

Comment 64-9

reports indicate repeated violations of work schedules and environmental standards.

Response 64-9

See Response 20-9.

Comment 64-10

The increased truck traffic alone-up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences.

Response 64-10

See Response 20-10.

Comment 64-11

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs.

Response 64-11

See Response 20-11.

Comment 64-12

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the

public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century.

Thank you for your time and consideration. I look forward to your response on this critical issue.

Response 64-12

See Response 20-12.

Letter #65 March 10, 2025, Sofia Prado-Irwin, Center for Biological Diversity

Comment 65-1

These comments are submitted on behalf of the Center for Biological Diversity (the "Center") regarding the Draft Environmental Impact Report ("DEIR") for the proposed Rockfield Quarry Modification Project ("Project"). The Center has reviewed the DEIR closely and has found that the DEIR's analyses and mitigation for the Project's impacts to biological resources, greenhouse gas emissions, surface and groundwater quality and availability, and its analysis of project alternatives are inadequate. The Center urges the County, at a minimum, to correct the deficiencies identified below and recirculate a revised DEIR to ensure adequate and informed public review of the Project.

Response 65-1

The comment is introductory and does not raise specific environmental issues. Detailed responses addressing the issues referenced in the comment letter are provided in Responses 65-3 through 65-17 (biological resources), Responses 65-20 through 65-38 (surface and groundwater availability and quality), Responses 65-39 through 65-42 (greenhouse gas emissions), and Responses 65-43 through 65-46 (project alternatives).

Please also see Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR. As discussed therein, the revisions included in the Final EIR clarify and amplify the analysis presented in the Draft EIR but do not constitute significant new information. The Final EIR does not identify any new significant impacts or a substantial increase in the severity of previously identified impacts, nor does it identify new or substantially different mitigation measures or alternatives that would clearly lessen significant environmental effects.

Accordingly, the information added to the Final EIR does not deprive the public of a meaningful opportunity to comment on a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect. Therefore, recirculation of the Draft EIR is not required pursuant to CEQA Guidelines Section 15088.5.

Comment 65-2

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Fresno County.

Response 65-2

The comment provides background regarding the commenter's organization and interests but does not raise issues related to the adequacy of the Draft EIR or any environmental impact. Therefore, no further response is required (PRC, Section 21091(d)(2)(B); Title 14 CCR Section 15088(c)).

Comment 65-3

I. The DEIR Fails to Provide an Accurate Baseline Regarding the to Biological Resources

Under CEQA, an environmental review document must evaluate the potential environmental impacts of the project as compared to the existing environmental conditions (the "baseline"), so that the Project's impacts can be meaningfully analyzed and compared to alternatives. (CEQA Guidelines § 15125(a); see County of Amador v. El Dorado County Water Agency (1999) 76 Cal.App.4th 931, 952; Neighbors for Smart Rail v. LA County Metropolitan Transit Authority (2013) 57 Cal.4th 310, 315.) The evidence provided in the DEIR's analysis of impacts to biological resources does not meet this standard.

Response 65-3

The comment is not specific and conclusory in nature. The Draft EIR's baseline consists of existing environmental conditions at the time of the Notice of Preparation (NOP) (Title 14 CCR Section 15125). Here, biologists established baseline conditions of the biological resources of the project sites by conducting searches of the California Natural Diversity Database (CNDDB), conducting multiple field surveys between 2017 and 2021, and by analyzing the sufficiency of the project sites and adjacent properties to provide suitable habitat for any special-status species, in accordance with CEQA standards (Title 14 CCR Section 15125). The commenter refers to *Neighbors for Smart Rail v. LA County Metropolitan Transit Authority* (2013) 57 Cal.4th 310, 315, which primarily discusses use of future conditions as a baseline for analysis of project impacts, which was not the case for the

baseline for biological resources used in the Draft EIR. The baseline described in the Draft EIR fully complies with CEQA requirements.

Mitigation measures are included where necessary, providing sufficient information for meaningful assessment and comparison of alternatives, consistent with CEQA Guidelines Section 15125(a). See Responses 65-4, 65-5, 65-6, 65-7, 65-8, 65-9, 65-10, 65-11 for further discussion regarding the sufficiency of the Draft EIR's baseline for analyzing impacts to biological resources.

Comment 65-4

a. The DEIR Improperly Limits the Scope of Analysis for Special-Status Species

To determine which special-status species have the potential to occur on the Project sites, the DEIR includes a literature review and search of existing databases, including a query of the CNDDB ("California Natural Diversity Database") database. However, the DEIR limits its analysis of special-status species to only four USGS 7.5-minute quadrangles (Friant, Lanes Bridge, Little Table Mountain, and Millerton Lake West) but provides no justification for this limited scope (4.4-20). Many special-status species travel long distances or disperse and migrate according to seasonal and climatic patterns. Species that experience metapopulation dynamics exhibit patchy presence and absence across a landscape but depend on suitable unoccupied habitat for long-term population stability. As such, not all species that may be impacted by the Project will be captured focusing on the four quadrangles centered on the Project site. To thoroughly analyze the potential impacts of the proposed Project, the Applicant should expand the CNDDB search to include all nine quads surrounding the Project site. The CNDDB has even created a tool to do so: the QuickView tool "Species in 9 Quads" query.[1] (*Footnote 1: CNDDB QuickView.* https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data#43018410-cnddb-quickview-tool*)*

Response 65-4

The comment is noted. While often performed, a nine-quadrangle California Natural Diversity Database (CNDDB) search is not specifically required for CEQA review. The Draft EIR relied on a query of the four relevant U.S. Geological Survey quadrangles, which captured all recorded occurrences of special-status species within a 5-mile radius of the project sites. This search area was determined to be appropriate given the nature of the proposed project, which involves the continuation and modification of existing mining operations within previously disturbed and actively managed sites.

The CNDDB query was used to identify special-status species with potential to occur in the vicinity of the project sites and was supplemented by additional database queries, literature review, and field surveys conducted in 2019 and 2021. These surveys did not identify the presence of certain species discussed in the comment, and available records indicate that the nearest documented occurrences are located at distances ranging from approximately 1 to 3 miles from the project sites. A follow-up CNDDB search conducted in 2024 did not identify any new occurrences that would alter the conclusions of the analysis.

However, in response to this and similar comments, a nine-quadrangle CNDDB search was conducted. The results of this expanded search are consistent with the findings of the original analysis and do not identify any new occurrences within the project sites or in close proximity that would change the impact conclusions. The results of the nine-quadrangle search have been incorporated into the Final EIR through errata presented in Chapter 3, "Draft EIR Errata."

Accordingly, the Draft EIR, as clarified and supplemented in the Final EIR, provides an adequate and complete assessment of special-status species in accordance with CEQA.

Comment 65-5

b. The DEIR Improperly Withholds Data and Fails to Provide Adequate Information on Biological Surveys

The DEIR fails to perform more than cursory analysis of presence or absence of sensitive species in and around the Project area. The DEIR conducted a literature review and search of existing databases, but only performed limited surveys. While the literature sources of information used for the DEIR's analyses are extremely valuable and necessary, they are not sufficient to determine the biological resources present in the Project area, and the minimal survey for wildlife is far from adequate to detect special-status species. At each Project site, general surveys were conducted on a single day, April 30, 2019 (App E-1, p.6; App E-2, p.6). The only surveys that targeted any special status species were three surveys conducted over three days in 2017, which exclusively targeted special-status plant species within the Project boundaries (App E-3, p.1). The only surveys that assessed the habitats around the Project site, which include the San Joaquin River and Little Dry Creek among other habitats, were generalized wildlife surveys conducted on a single day, June 14, 2021 (4.4-3). This survey only extended to habitats between the two Project sites, between the Plant site and Little Dry Creek, and within 0.5 miles of the Project site along the San Joaquin River.

Notably, the information provided in the DEIR regarding the 0.5 mile surveys is inconsistent and insufficient to determine how the surveys were actually conducted, and therefore insufficient to determine whether the surveys were adequate. For example, the Plant Site Habitat Assessment (App E-1) states that this 0.5 mile buffer included in the survey only "extends from the project site to the edge of the riparian zone associated with the San Joaquin River" (App E-1, ES-1). Presumably, this is because the River lies 0.6 miles west of the project site (App E-1, ES-3), however this is not stated outright. However, later in this same appendix (App E-1 Section 4.2.6, Riparian Habitat and Upland Vegetation, p.13), the DEIR lists several plant species that were "found" in the survey. Was the riparian area included in this survey or not? The Quarry Site Habitat Assessment (App E-2) also references the additional 0.5 mile buffer survey conducted in 2021. In both assessments, the exact same language is used: "A subsequent biological inventory was conducted on June 14, 2021, by Thomas J. McGill and Jacob Davies." However, neither assessment provides detailed information on how that subsequent survey was conducted; a description of methodology is only provided for the April 30, 2019 surveys. It is therefore unclear whether the subsequent 2021 surveys a) included riparian habitat and b) were field surveys or were based on aerial imagery or existing databases. This lack of detail obfuscates the DEIR and makes it impossible to assess the survey efforts.

On-the-ground surveys are particularly important to determine the wildlife that surround the Project sties. The riparian zone along the San Joaquin River should receive particular attention and survey effort, as it provides suitable habitat for numerous special-status species. The DEIR itself states that "Riparian habitats found along the San Joaquin River… provide nesting habitat for raptor species" (App E1, p.15) and "The San Joaquin River corridor is considered a significant wildlife movement corridor that provides natural areas for wildlife to move through the region in search of food, shelter, or nesting habitat." (App E1, p.16).

Alarmingly, the survey information is even further deficient—the DEIR does not actually provide the data from the survey efforts at all, except in the form of maps of vegetation/habitat types. Both the Quarry and the Plant site assessments reference an Appendix B, the Observed Flora and Fauna Compendium: "Common plant species observed during the habitat assessment were identified by visual characteristics and morphology in the field and recorded in a field notebook (See Appendix B)" (App E-1, and E-2 p.7); "Wildlife species detected during the habitat assessment by sight, calls, tracks, scat, or other sign were recorded during surveys in a field

notebook (See Appendix B)." (App E-1 and E-2, p.8). For both assessments, Appendix C, Potentially Occurring Special-Status Biological Resources, referenced in E-1 p.17 and E-2 p.20 is also missing. Astoundingly, this data appears to have been removed from the DEIR "for brevity" (App E-1, PDF page 61, App E-2, PDF page 125). Instead, a link is provided to the County's Project website,[2] but the website does not provide this information either. This is an egregious oversight that amounts to a clear withholding of important from the public.

For the public to properly assess the biological resources analysis and mitigation, the DEIR must provide detailed information on what areas were actually surveyed, how all surveys were performed, and what species (plants and animals) were observed. The DEIR fails to do this, instead withholding data, in clear violation of CEQA

Response 65-5

The comment is noted. The analysis and conclusions in the EIR assume a context of mining and associated activities at both project sites that have been ongoing and habitual for years. The EIR considers the proposed continuation of these activities with some temporal and on-site changes. Section 4.4 of the Draft EIR and its supporting studies (Appendix E-1 and E-2) do provide an overview of habitat both within and adjacent to the Plant and Quarry sites and applicable habitat assessments. The literature and database review, and habitat assessment and surveys performed are adequate for the purposes of this EIR. As warranted, mitigation measures have been developed in cases where the analysis indicated that potentially significant impacts to biological resources may result due to the proposed project.

Protocol surveys for special status species do not need to be conducted for the Draft EIR under CEQA (*Save North Petaluma River & Wetlands v. City of Petaluma* (2022) 86 Cal.App.5th 207, 221-226). The reconnaissance field surveys conducted for the project are sufficient under CEQA. Targeted surveys are not required where there is sufficient evidence indicating the probable absence of a certain species. The County is not required to undertake a protocol-level survey when assessing whether a project will affect endangered, rare, or threatened species. Here, reconnaissance-level surveys are sufficient for the purposes of assessing impacts to special status species, especially given the prolonged history of impacts from mining operations (see *Save North Petaluma River & Wetlands v. City of Petaluma* (2022) 86 Cal.App.5th 207, 221-226). ELMT Consulting conducted a CNDDB query to first identify possible sensitive species which may be present at the project sites and followed up with field surveys in 2017, 2019, and 2021. Please see Response 65-4 regarding the literature review conducted for the project. See

also Chapter 3, "Draft EIR Errata" for further discussion of the updated CNDDB 9-quadrangle search and revisions to Table 4.4-1, ""Special Status Wildlife Species."

The 2021 surveys included the riparian area adjacent to the San Joaquin River and included field surveys of the areas surrounding the project sites. Furthermore, the methodology followed in the 2019 field surveys remained consistent in the 2021 field surveys.

The riparian areas next to the San Joaquin River were surveyed for up to distances of 0.5 mile away from the project sites. The 0.5-mile radius is sufficient to determine the species adjacent to the project site. The comment is incorrect; all species observed in the field surveys are reflected in the Draft EIR Appendix B, "Observed Flora and Fauna Compendium," of Draft EIR Appendix E-1 and Appendix E-2. The comment does not accurately describe Appendix C of the Draft EIR's Appendices E-1 and E-2. Appendix C is included in both Draft EIR Appendices E-1 and E-2—the information contained in Appendix C is also presented in Table 4.4-1 in the Draft EIR on page 4.4-25.

The literature and database review, and habitat assessment and surveys performed are adequate for the purposes of this EIR. As warranted, mitigation measures have been developed in cases where the analysis indicated that potentially significant impacts to biological resources may result due to the proposed project.

Comment 65-6

c. The DEIR Fails to Provide Adequate Baseline Information on Numerous Special-Status Species

As noted above, the DEIR relies on existing databases, aerial imagery, and only brief general biological surveys time to determine whether special-status species are present in and around the Project area. The surveys included walking transects and recording plants and animals that were observed, including animal sign like scat (App E-1 p.7, E-2 p.8). However, general biological surveys often do not detect cryptic, fossorial, migratory, aestivating, or nocturnal wildlife species. Such species with suitable habitat in and around the Project area could be permanently or periodically present, even if not observed during a general biological survey. Targeted surveys are necessary to assess the presence of these species.

However, targeted surveys were not performed for *any* species, either within or around the two Project sites. Instead, the DEIR relies on historical data and claims that because quarry operations have been ongoing for decades, numerous species either do not occur

or are unlikely to occur in and around the Project site (4.4-23). However, numerous special-status species have been observed in very close proximity to the Project area, and have the potential to be impacted by the proposed Project. Species-specific survey data is therefore particularly important for these species, which include California tiger salamander, burrowing owl, western pond turtle, and western spadefoot, all of which can be difficult to detect without targeted surveys. For example, western spadefoot and California tiger salamander spend the majority of the year underground, and would not be detected by a one-day survey based on daytime visual observations along a transect, which is all that the DEIR includes. The DEIR therefore does not provide sufficient evidence that these species are either absent or unlikely to occur, thereby failing to provide an accurate baseline.

The DEIR claims that California tiger salamander and burrowing owl are both absent from the Project sites and that western pond turtle and western spadefoot have a low potential to occur. These claims are based on CNDDB data and a 2019 habitat assessment. However, California tiger salamanders have been observed within 1 mile and 0.5 miles of the of the Plant site and Quarry sites, respectively (4.4-29, 30), burrowing owls have been observed just over 2 miles away from each Project site (4.4-32), western pond turtles have been observed within 2.75 and 3.25 miles of the Plant and Quarry sites respectively (4.4-35), and western spadefoots have been observed within 1.8 and 1.2 miles of the Plant and Quarry sites respectively (4.4-36). All of these are small distances well within the possible movement range of these species. For example, California tiger salamanders regularly move over 600m, and sometimes up to 2.2 km, away from their breeding ponds (Orloff, 2011; Searcy et al., 2013). Burrowing owls forage over 2-3km from their nests, and young owls disperse up to 50+ km. Additionally, many burrowing owl populations are migratory, moving across very large distances (Miller, 2024). Western pond turtle nests have been found up to 1,919 feet from aquatic habitats and individuals have been documented to move regularly between aquatic habitats with long-distance movements of up to 2,018 feet (Sloan, 2012). Western spadefoots have been observe to disperse up to 600 m from breeding pools, and are likely able to disperse even further (Halstead et al., 2021; Laabs et al., 2001).

Response 65-6

CNDDB observations and onsite suitability analysis were sufficient to rule out the need for focused surveys. The analysis presented in Draft EIR Section 4.4 demonstrates that blasting and mining activities are not expected to result in significant impacts to these species.

The reconnaissance field surveys conducted for the project were sufficient under CEQA. Targeted surveys are not required where there is sufficient evidence indicating the probable absence of a certain species. The County is not required to undertake a protocol-level survey when assessing whether a project would affect endangered, rare, or threatened species. Reconnaissance-level surveys are sufficient for the purposes of assessing impacts to special status species, especially given the prolonged history of impacts from decades of mining operations. (See *Save North Petaluma River & Wetlands v. City of Petaluma* (2022) 86 Cal.App.5th 207, 221-226.) ELMT Consulting conducted a CNDDB query to first identify possible sensitive species that may be present at the project Sites and followed up with site visits in 2017, 2019, and 2021. See Response 65-4 and Chapter 3, "Draft EIR Errata," regarding the updated 9-quadrangle CNDDB review. Neither western spadefoot nor western pond turtle were observed during the 2019 or 2021 field surveys.

The western pond turtle has not been observed near the site for over 20 years. The nearest recorded occurrence of western pond turtles was 2.75 miles away from the Plant Site in 2004 and 3.25 miles away from the Quarry Site in 2004 (Draft EIR 4.4-35). The nearest recorded occurrence of western spadefoot was 17 years ago, with the nearest recorded observance located 1.80 miles northwest of the Plant Site in 2008 and 1.20 miles northwest of the Quarry Site in 2008 (Draft EIR 4.4-36). An additional field survey was conducted in 2021 to survey areas adjacent to the project sites; no western spadefoot or western pond turtle were observed during this survey (Draft EIR 4.4-22). Notably, ELMT Consulting conducted another CNDDB search in 2024 which revealed no changes in the identification of possible species present at the project sites and no further appearances of the western pond turtle and western spadefoot.

The Draft EIR includes a discussion of the likelihood of California Tiger Salamanders (CTS) to be present at the Quarry and Plant sites on page 4.4-23 and 4.4-29 through 4.4-31. The nearest recorded observation of CTS was 0.5 mile northeast of the Quarry Site in 2008, which is 17 years ago. The nearest recorded observation of CTS near the Plant Site was 23 years ago, recorded 1.0 mile east of the Plant Site in 2002. The Draft EIR explains that the perennial nature of the ponds at both the Plant and Quarry sites has resulted in the presence of bullfrogs in all ponds, which would readily prey upon CTS (Draft EIR page 4.4-29). CTS habitat exists from Millerton Lake to the north of the Plant Site and south towards Highway 41. However, within this stretch, there are no vernal complexes and no recorded occurrence of CTS. The Draft EIR concludes that the barriers created by the San Joaquin River and by Friant Road has disrupted CTS migration, preventing them from habituating in these areas surrounding the Plant and Quarry Site.

Burrowing owls were not observed during the habitat assessments and there were no visible signs of burrowing owls on either the Plant Site or Quarry Site. As mentioned by Comment 65-11, Mitigation Measure 4.4-1a requires implementation of pre-construction surveys prior to disturbance of grasslands that are established on the Quarry Site. (Draft EIR page 4.4-50.) Any burrowing owls found would be relocated in accordance with a relocation plan approved by the CDFW (Draft EIR page 4.4-50).

The Draft EIR properly analyzed the presence of western pond turtles, western spadefoot, burrowing owls, and CTS. Thus, the conclusion that western pond turtles, western spadefoot, burrowing owls, and California Tiger Salamanders are not likely to occur at the project sites is sufficiently substantiated by the CNDDB search, the habitat surveys, and by the lack of suitable habitat availability. The absence of western pond turtles, western spadefoot, and burrowing owls would be further substantiated once the pre-construction clearance surveys are conducted (see *Save Round Valley All. v. County. of Inyo* (2007) 157 Cal.App.4th 1437 providing that CEQA requires that studies are sufficiently credible to be considered as part of the total evidence that supports the agency's decision).

The comment cites to some examples of western spadefoot, western pond turtle, the burrowing owl, and CTS, having wide-ranging movement/dispersal across their habitats. These studies are not necessarily applicable to this project site's conditions, which has been undergoing continuous mining operations for 100 years and is a severely disturbed area, thus limiting migration opportunities for the species discussed in the comment. For example, the Orloff, 2011 study was only based off one singular location; and the location selected had eight known CTS breeding ponds. In contrast, there are no known vernal pool complexes near the project sites and no recently recorded observations of CTS. A disagreement among experts does not render an EIR inadequate. (See *Chico Advocates for a Responsible Economy v. City of Chico* (2019) 40 Cal.App.5th 839, 252 Cal.Rptr.3d 859).

The project is designed to avoid direct impacts to sensitive habitats along the SJR and adjacent non-native grasslands where these species may forage. Mining and processing activities would continue to be confined to previously disturbed areas at the Quarry and Plant sites, which do not support high-quality riparian, wetland, or riverine habitats. Habitat impacts would be limited to existing project areas. The project sites are already disturbed by ongoing mining activities, and would not have a significant increase in activity.

Comment 65-7

The DEIR claims that because the Project area has already been significantly disturbed and numerous movement barriers surround the Project sites, it is unlikely that any of these species will

occur in the Project area. However, disturbance does not preclude the presence of these species. For example, California tiger salamanders can be found in agricultural channels and stock ponds (Alvarez et al., 2021; Wilcox et al., 2015), and numerous burrowing owl colonies exist at airports (Miller, 2024). Additionally, movement barriers around the Project area are not complete—wildlife movement across roads for example does occur, even though it may be infrequent—and individuals have the potential to enter the Project site from surrounding areas.

Response 65-7

The comment is noted. While wildlife may utilize disturbed areas in some instances, the evaluation of a species' potential to occur on a site requires consideration of the full environmental context, including the degree and duration of disturbance, ongoing operational activity, presence or absence of key habitat features, natural and manmade barriers, and the known distribution of the species.

The project sites have been subject to continuous mining and associated disturbance for decades, which substantially limits the availability of suitable habitat for many special-status species. In particular, CTS is not expected to occur at the project sites. CTS has not been documented on the same side of the San Joaquin River as the project sites in this area, indicating that the river, in combination with Friant Road and other development, serves as a barrier to movement. In addition, CTS depends on upland refugia such as burrows created by fossorial mammals; the ongoing ground disturbance associated with long-term mining activities substantially limits the availability and persistence of such habitat features. The absence of vernal pool complexes further reduces habitat suitability. Consistent with this, no recent CNDDB records of CTS occur in the immediate vicinity (Draft EIR, page 4.4-25). Accordingly, the Draft EIR reasonably concludes that CTS is unlikely to occur and is presumed absent from the project sites.

Similarly, burrowing owls were not observed during habitat surveys conducted for the project, and the disturbed nature of the Plant Site and Quarry Site does not provide suitable habitat conditions to support this species. Observations of special-status species in other disturbed environments do not, by themselves, indicate that suitable habitat exists at the project sites.

The Draft EIR's analysis of special-status species, including CTS, burrowing owl, and other species, is provided in Section 4.4, including Impact 4.4-1 (beginning on page 4.4-48). This analysis evaluates species-specific habitat requirements, site conditions, and available occurrence data to determine the potential for species to occur, consistent with

CEQA requirements. The conclusions are further supported by database queries and field surveys conducted for the project.

The comment does not provide substantial evidence demonstrating that the Draft EIR's analysis is inadequate or that the project would result in a substantial adverse effect on special-status species (PRC Sections 21068, 21100(d)). Therefore, the Draft EIR's analysis is adequate, and no further revision is required.

Comment 65-8

Additionally the DEIR fails to consider importance of adequate baseline data near the Project site but outside of the Project's footprint, as the potential impacts from the proposed quarry—including both ongoing operations and the newly proposed blasting—may impact surrounding areas. As noted above, the DEIR references surveys of a 0.5 mile buffer around the survey area, but it these surveys also did not target any specific species – in fact, it is unclear if they included any field data at all.

As detailed below, the rock blasting which would occur as part of the proposed Project operations has not been conducted previously, and is likely to have new detrimental impacts to wildlife outside of the Project footprint. These impacts, which include but are not limited to noise, vibrations, flyrock, dust, and geological stability, would extend beyond the Project footprint into the surrounding areas, which include the San Joaquin River and the Ball Ranch Nature Preserve, both of which support rich biodiversity and special-status species. Any special-status species that may be present in these areas, as well as on the Project sites, could be impacted by the proposed Project. Surveys and analyses must therefore include both the Project sites and the surrounding area. The DEIR entirely fails to accomplish either of these requirements.

Response 65-8

The Draft EIR provides sufficient information regarding the baseline of the surrounding areas, which is supported by literature searches and field surveys (Title 14 CCR Section 15125). In June 2021, the County-retained biological consultants surveyed the area between the Plant Site and the San Joaquin River to document the baseline conditions of the surrounding areas. The County-retained biologists also reviewed the habitat within a 0.5-mile buffer of the Plant Site and Quarry Site by way of aerial images. The biologists then conducted field surveys documenting conditions and recording any species observed. All methods of collecting data were consistent from 2019 and 2021 field surveys.

Baseline information is provided in multiple sections of the Draft EIR, including Section 4.4. The supporting studies for this section are provided as Draft EIR Appendix E-1 and E-2. These sections evaluate habitat suitability for special status species with potential to occur on the site and, where needed, propose mitigation measures to reduce potential impacts to these species to a less than significant level. Focused species surveys were not needed because proposed mitigation would reduce potential impacts to specific species, if present, to a less than significant level.

Blasting activities would be brief, lasting approximately one to two seconds in duration, and occurring two times per week, and are not expected to result in sustained or long-term impacts. The Draft EIR concludes that blasting-generated dust would be temporary and minimized through enforceable measures in the Fugitive Dust Control Plan, including dust suppressants and stockpile management. These standard measures are effective at reducing impacts to less-than-significant levels, and no additional mitigation or analysis is required.

Comment 65-9

d. The DEIR Improperly Excludes Numerous Water Features from Analysis of Baseline Conditions

The DEIR's analysis of impacts to biological resources excludes at least two water features from analysis, the river water delivery ditch at the Quarry site and the waste wash conveyance ditch at the Plant site (4.4-7). The river delivery ditch connects the quarry to the San Joaquin River, which hosts many special-status species that may also use the ditch as habitat and may therefore be impacted by the Project. The waste wash ditch conveys water from the aggregate processing plant to the onsite silt ponds. The DEIR presumably justifies exclusion of the ditches because they are not technically defined as a water of the US, a water of the state, or a lake or streambed under state and federal laws (4.4-19), although an explicit justification is not provided.

Regardless of legal definition, the ditches may serve as habitat for special-status species. The river supply ditch in particular connects a natural river that supports high biodiversity to the Project Site, and it is entirely possible that special-status species including but not limited to western pond turtle may use the ditch as habitat. For example, western pond turtles use a wide variety of aquatic and terrestrial habitats, including perennial and ephemeral waters, as well as standing water and streams (Bondi, 2009; Holland, 1994; M. R. Jennings & Hayes, 1994), and could use either of the two ditches as habitat. The DEIR also provides no detail on whether the river supply ditch is accessible by fish

from the San Joaquin River, which could include Chinook salmon. If the ditch is accessible by salmon, then it is entirely possible that individuals could become trapped in the ditch or the quarry, leading to injury or mortality. In such a case, the impacts to this sensitive species could be significant. Additionally, the Project proponent would be obliged to obtain take authorization to operate the Project including the river supply ditch, which the DEIR fails to account for. By failing to assess the existing conditions in the ditches, and failing to consider special-status species that may occur in the ditches, the DEIR fails to establish an accurate baseline and potentially excludes important impacts to special-status species, in violation of CEQA.

Response 65-9

Both the wash water conveyance ditch and the river water supply delivery ditch are discussed with regards to the environmental setting and baseline discussion of biological resources on the project sites (Draft EIR at page 4.4-7). Section 4.4.1.3, "Vegetation," of the Draft EIR describes the vegetation occurring on the Plant and Quarry sites. The Draft EIR discusses the vegetation associated with the river supply ditch and the conveyance ditch for wash water at the Plant Site. As discussed on page 4.4-7, the wash water conveyance ditch was excavated in upland habitat within previously mined areas. The conveyance ditch, which is part of an ongoing industrial facility, is routinely dredged to keep the ditch clear so it may function as part of the mining and processing of aggregate. Dredging results in periodic removal of vegetation that colonizes the banks of the conveyance ditch.

The analysis of the existing setting and potential impacts was made without regard to whether the water conveyance systems are considered "jurisdictional" under state or federal law.

The river water delivery ditch is open water and generally unvegetated on the Plant Site (Draft EIR page 4.4-7). The Draft EIR only discusses the river water delivery ditch and the wash water conveyance ditch within the boundaries of the project sites. The river supply ditch is connected to the San Joaquin River (SJR) as the SJR is where the supply ditch gets its water from. Water from the SJR flows from the main river via the river supply ditch to the Plant Site where the water collects in a ponded area before entering the Plant Site. The water from the ponded area is then pumped into the Plant Site for use. There is a barrier between the Plant Site and the river supply ditch and ponded area.

Habitat is generally defined as the place or environment where a species lives and grows. Habitat must contain all of the constituent elements to support successful growth and reproduction of a species. Water can flow from the SJR into the wastewater ditch and down to the onsite pond by gravity flow only, as there is no pump in the SJR, and this is

the only way the SJR would be connected to the site. Without a natural connection to the SJR there is no source population or access for native fish to move into and out of the site volitionally. Any ditches and ponds are also regularly maintained for mining, features such as spawning gravels and vegetative cover, rearing cover or other specific features required for reproduction and growth by most special-status fish are entirely absent. Therefore, the features interior of the levees are not considered habitat because a species could not grow, survive, and reproduce. Some species of non-native fish such as centrarchids (i.e., bass) may be able to use ponds as habitat despite their regularly maintained state. However special-status species which require migratory corridors, spawning gravels, riffles to supply invertebrate prey and vegetative cover would not be able to survive. Therefore, the ponds, and ditches are not "habitat" for special-status species.

To be affected by water draws from the ditch, fish would have to migrate approximately 0.9 miles up the supply ditch then be entrained by the pump and pulled into the site. The absence of any queue such as a freshwater source adding cool water to the SJR makes it unlikely that salmon would stray so far up a channel. The shallow nature of the channel is also likely to warn the water, creating a natural deterrent for fish, limiting the chance of fish moving up the channel. Therefore, the commenter offers no information about why the river water delivery ditch would be considered habitat, and no case is made that additional take coverage would be required.

Comment 65-10

e. The Proposed Mitigation for Numerous Special-Status Species is Insufficient and Improperly Deferred

The deficiencies in the baseline analyses noted above contribute to a lack of sufficient mitigation for impacts to special-status species. Because the DEIR inappropriately concludes that California tiger salamander is absent from the Project site, the DEIR fails to provide any mitigation measures for potential impacts to this species at all. Given the lack of adequate surveys described above, this failure to mitigate for the potential impacts to California tiger salamander is completely unjustified, and must be remedied.

The DEIR does provide mitigation measures for impacts to burrowing owl, western spadefoot and western pond turtle within the Project sites (MM 4.4-1a,b), but these mitigation measures include only pre-construction surveys and development of relocation plans (4.4-50). In the case of the burrowing owl, relocation should not be considered an appropriate mitigation measure except as a last resort. As noted by the California Department of Fish and

Wildlife's ("CDFW") Staff Report, all possible avoidance and minimization measures should be considered before temporary or permanent exclusion and closure of burrows to avoid "take," and habitat compensation must be provided for any evicted owl (State of California Department of Fish and Game, 2012). The DEIR fails to consider any mitigation except relocation, in violation of these standards.

Response 65-10

The Draft EIR confirms that California tiger salamanders were unlikely to be present at the project sites (Draft EIR at pages 4.4-23 and 4.4-29). For further discussion of the adequacy of analysis regarding the CTS presence on the project sites, please see Response 65-6.

CEQA only requires mitigation measures where the Draft EIR concludes that an environmental impact may be significant. Because the Draft EIR concludes that impacts to CTS will be less than significant, no additional mitigation measures are required (see PRC Section 21002.1(a), 21061, 21100(b)(3)). For further discussion regarding impacts to California tiger salamanders, see pages 4.4-22 through 4.4-31 of the Draft EIR.

If burrowing owls are present during the pre-construction clearance surveys, an Incidental Take Permit would be obtained from California Department of Fish and Wildlife (CDFW), and relocation is a potential mitigation measure that would be negotiated with CDFW. The revised burrowing owl measure (Mitigation Measure 4.4-1a) is provided with such detail. See Final EIR Chapter 3, "Draft EIR Errata," for these revisions.

Comment 65-11

Additionally, for all three of these species, the proposed mitigation is improperly deferred, offering only vague plans to relocate any individuals encountered. The burrowing owl mitigation (MM 4.4-1) states that if burrowing owls are found, "a relocation plan shall be developed, approved by CDFW, and implemented prior to development of any Quarry Site grasslands. The western pond turtle and western spadefoot mitigation (4.4-2) states that these species would be relocated "to a nearby, suitable habitat near the Quarry Site." However, no specific relocation sites are identified for any of the three species. Relocation plans should be developed and completed for the DEIR so that the public and decision makers can judge whether such measures would adequately mitigate the Project's impacts. The DEIR therefore provides insufficient detail for the public and decision makers to ascertain whether such

measures would adequately mitigate the Project's impacts to these sensitive species.

This improperly deferred mitigation violates CEQA. (see *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 670 [EIR inadequate where the success or failure of mitigation efforts "may largely depend upon management plans that have not yet been formulated, and have not been subject to analysis and review within the EIR"]). In the limited circumstances in which deferred mitigation is appropriate, the agency must meet all of the following elements: (1) practical considerations prevented the formulation of mitigation measures during the planning process; (2) the agency committed itself to developing mitigation measures in the future; (3) the agency adopted specific performance criteria prior to project approval; and (4) the DEIR lists the mitigation measures to be considered, analyzed, and possibly incorporated into the mitigation plan. (See *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 736-37 [review denied].) The DEIR fails to meet these criteria.

Additionally, as noted elsewhere in this letter, impacts from the Project are likely to extend beyond the Project's footprint, so relocating individuals to areas close to the Project may not prevent significant impacts. In fact, the proposed mitigation for burrowing owl, western pond turtle, and western spadefoot entirely fails to consider impacts outside of the boundaries of the Project sites at all, despite the fact that impacts from the proposed Project's new operations (including blasting) are likely to extend well beyond the existing Project footprint. These mitigation measures are therefore insufficient.

Response 65-11

As mentioned by the comment, Mitigation Measure 4.4-1a requires implementation of pre-construction surveys prior to disturbance of grasslands that are established on the Quarry Site (see Draft EIR at page 4.4-50). The preconstruction clearance survey for burrowing owls would be conducted in accordance with the CDFW Staff Report on Burrowing Owl Mitigation (dated March 7, 2012) (see Draft EIR page 4.4-50). Mitigation Measure 4.4-1a also provides that "the first survey shall be conducted at least 14 days prior to the initiation of construction of the aggregate plant and/or of each mining phase and the second survey shall be conducted within 24 hours of the start of construction of the aggregate plant and/or of each mining phase to ensure burrowing owl remain absent from the Quarry Site." Any burrowing owls found would be relocated in accordance with a relocation plan approved by the CDFW (see Draft EIR at page 4.4-50). This mitigation measure is in accordance with CEQA standards, because identification of suitable

habitats may permissibly be completed at a later time (see *Ocean St. Extension Neighborhood Ass'n v. City of Santa Cruz* (2021) 73 Cal.App.5th 985, 1010; see also *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260).

For burrowing owl, if exclusion or relocation is required, it is standard practice for a relocation plan to be developed and implemented following review and approval by the CDFW. As described in the Draft EIR, the CDFW Staff Report on Burrowing Owl Mitigation (2012) provides the appropriate regulatory framework and guidance for this process. The commenter does not provide substantial evidence demonstrating that CDFW oversight would be inadequate or that the Staff Report's recommended measures would fail to reduce potential impacts to burrowing owl to a less-than-significant level.

In addition, as described in Chapter 3, "Draft EIR Errata," Mitigation Measure 4.4-1a (burrowing owl) has been revised to strengthen avoidance and minimization measures. These revisions include additional pre-construction survey requirements, expanded buffer and monitoring provisions, and procedures for consultation with CDFW, including development and implementation of a relocation plan and, if necessary, compliance with applicable permitting requirements. These revisions further ensure that potential impacts to burrowing owl would be reduced to a less-than-significant level.

Similarly, the western spadefoot and western pond turtle were neither observed in the 2019 nor 2021 habitat assessments, and the most recent nearest recorded observations of these species occurred over 10 years ago. Mitigation Measure 4.4-1b requires that pre-construction clearance surveys be conducted no more than 14 days prior to removal of a temporary pond at the Quarry Site. The clearance survey would involve a combination of visual and trapping surveys by a CDFW qualified biologist. If determined to be present, a qualified biologist may capture the western spadefoot and western pond turtles prior to construction activities and relocate them to nearby, suitable habitat. Additionally, exclusion fencing would be installed, if feasible, to prevent the turtles and spadefoot from reentering the work area. The biologist would conduct weekly follow-up visits to monitor the effectiveness and take appropriate action if the measures are not adequate. Mitigation Measure 4.4-1b was revised in the Final EIR Chapter 3, "Draft EIR Errata," to clarify that a qualified biologist would be present during pond removal activities.

Relocation of amphibians and reptiles out of work areas by a qualified biologist is a standard measure for reducing potential impacts to these species to a less than significant level under CEQA. If such species are listed under the federal or state Endangered Species Act, additional permits or approvals may be required; however, this is not the case for the species with potential to occur at the project sites. As such, implementation of

standard avoidance and relocation measures by a qualified biologist is sufficient to reduce impacts to less than significant.

Comment 65-12

II. The DEIR Fails to Adequately Analyze or Mitigate the Project's Blasting Impacts to Special-Status Species

The DEIR fails to provide an adequate analysis of significant impacts from the proposed Project, particularly (but not limited to) impacts from the proposed blasting. The proposed Project would include blasting up to 600 ft deep into hard rock below the alluvium in the Quarry Site, which would lead to numerous potential new impacts, including flyrock, dust, pollutants, noise, and ground vibrations. The DEIR fails to analyze any of these impacts on the wildlife that may be present in and around the Project site, including sensitive species that reside in and around the San Joaquin River (with the exception of a brief but flawed consideration of Chinook salmon), which lies a mere 200 feet from the edge of the quarry.

In place of an actual analysis of potential impacts, the DEIR provides only generalized anecdotal examples of wildlife habituating to ongoing quarry operations in the past (4.4-53, 54). Anecdotal evidence is far from sufficient to determine impacts and their significance. Not only does such evidence suffer from detection bias (i.e., only those individual animals that are able to acclimate will be observed, and those that are unable to acclimate will be unjustly ignored), but it also fails to consider the best available science on blasting. Additionally, these anecdotal examples describe habituation of wildlife to the ongoing quarry operations, which consist only of surface mining, and do not include blasting. The DEIR provides no actual study of how blasting will change the impacts of the Project and how wildlife might be affected. The so-called evidence provided in the DEIR is therefore not an appropriate to determine potential impacts of the proposed Project, particularly expansion of quarry operations through blasting.

The San Joaquin River is a precious biodiversity resource, home to numerous special-status species, including Chinook salmon, raptors, riparian birds, western pond turtle and many others. All potential impacts to the San Joaquin River and its species must be thoroughly analyzed and mitigated. The DEIR fails to accomplish this.

Response 65-12

A typical blasting event would last approximately one to two seconds and are not expected to result in sustained or long-term impacts. The Draft EIR concludes that blasting-generated dust would be temporary and minimized through enforceable measures in the Fugitive Dust Control Plan, including dust suppressants and stockpile management. See also Responses 6-17 and 65-13 regarding blasting impacts to salmon. These standard measures are effective at reducing impacts to less than significant levels, and no additional mitigation or analysis is required.

The comment asserts that Draft EIR's analysis of blasting impacts to special-status species is inadequate because it is based, in part, upon anecdotal evidence. The comment implies but does not point to any specific alternative method of analyzing blasting impacts to species, probably due to the lack of conclusive literature available on the subject. Under CEQA, the County is not required to conduct all possible tests or exhaust all research methodologies in evaluating impacts (see *Save N. Petaluma River & Wetlands v. City of Petaluma* (2022) 86 Cal.App.5th 207, 224; *Save Panoche Valley v. San Benito County* (2013) 217 Cal.App.4th 503, 524). An assessment of environmental impacts need not be exhaustive and need not include all information that is available on an issue (see *Association of Irritated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1397; *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26).

The Draft EIR analyzed the impact to terrestrial species in off-site riparian areas and the potential impacts of blasting vibration on fish in the San Joaquin River (see Draft EIR Impact 4.4-2 on page 4.4-52). Given the extensive history of mining operations and disturbances at both the Plant and Quarry sites, and given the fact that the operations would not expand the perimeter of disturbed areas, the project is not likely to result in significant adverse impacts to species. Furthermore, the mining operation has neighbored the ecological reserves for several years, during which time the species have habituated to the ongoing mining operations (see Draft EIR Impact 4.4-2 on page 4.4-52).

See the discussion of Draft EIR Impact 4.13-6 regarding the project's generation of groundborne vibration as a result of blasting (Draft EIR at page 4.13-65). Mitigation Measure 4.10-1 "would require implementation of the Blasting Protocols (Appendix H-6) which specify that blasting must begin at the center of the Quarry Site so that monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibrations measurements and allow for adjustments in blasting design to occur based on the monitoring results." Please note that the Blasting Protocols were updated to include additional blasting thresholds and are provided in Appendix H-9 of the Final EIR.

See also Collective Response #13 for further discussion and clarification of blasting impacts on wildlife.

Comment 65-13

a. Central Valley Spring- and Fall-run Chinook Salmon

The DEIR's analysis and mitigation for impacts to Chinook salmon is insufficient. Chinook salmon have been extremely economically and culturally important for thousands of years, and remain so today. Extensive water diversions, dams, and other modifications along the San Joaquin River have rendered much of their historical habitat inaccessible, and the species has suffered great declines. The Central Valley spring-run Chinook salmon is currently listed as threatened under the state and federal Endangered Species Acts, and fall-run Chinook salmon are a species of concern. The San Joaquin River Restoration Program, a multi-agency effort to restore fish populations in the River, is currently conducting a reintroduction effort to bolster this sensitive species in the San Joaquin River. It is therefore of paramount importance that any impacts to salmon, particularly (but not limited to) those from blasting, be thoroughly analyzed and fully mitigated.

The DEIR fails to accomplish this. The DEIR provides an analysis of impacts to Chinook salmon, but the analysis is insufficient, and it minimizes the risks to this highly sensitive species. The DEIR claims that the impacts to salmon will be less than significant (4.4-63), with insufficient evidence to support this claim. The DEIR's analysis is based on a comparison of blast modeling results to the State of Alaska Department of Fish and Game blasting standards (Kolden & Aimone-Martin, 2013; "Alaska standards"). These standards are themselves based on March 10, 2025 Page 8

a summary analysis of numerous empirical studies, which investigated different species using different methods, some of which were lab-based and some of which were field-based, but none of which were standardized. In fact, only one study cited in the Alaska standards included Chinook salmon, and the study focused solely on impacts to juvenile fish, not eggs or adults. Such data are no doubt important to our understanding of blasting impacts on salmonids, but do not necessarily provide a standard that can be applied to all salmonid species in all localities. The DEIR fails to address this, providing no evidence showing that the results from the Alaska standards are applicable to the species and conditions present in the San Joaquin River. In fact, the Alaska standards themselves show that different species of fish have

different sensitivity thresholds to vibrational impacts. Further, the ecology and biology of California are extremely different from many of the localities studied in the references cited in the Alaska standards, which primarily focused on Alaska and Canada. It is not safe to assume that standards developed for Alaskan biological communities and Alaskan river conditions are relevant to those in the San Joaquin River.

Critically, the proposed Project provides no avenues for monitoring or adjustment in the case that the noise or vibrational impacts are greater than predicted by the modeling. Given the weaknesses in the analysis outlined above, it is entirely possible that the blasting would result in greater noise and vibrations reaching the river than expected, but without any kind of monitoring in place, we would never know such impacts were occurring. The DEIR is therefore entirely inadequate to detect, let alone mitigate, impacts to Chinook salmon in the San Joaquin River. To even approach adequacy, the Blasting Protocols (4.4-57) must include monitoring of the actual sound and vibrational impacts to the riverbed, and provide a contingency plan in the case that data detected in the San Joaquin River exceeds those thresholds. The County must not put the fate of this iconic socially and economically important species on limited data without proper checks in place.

Given the sensitivity of the Chinook salmon population in the San Joaquin River and the significant resources and effort that are currently being applied to support this species, relying on untested modeling, unproven assumptions and limited data to determine whether fish will be harmed is not acceptable.

Response 65-13

An evaluation of the proposed blasting against the ADF&G's "Blasting Standard for the Proper Protection of Fish," was prepared by Vibra-Tech Engineers in 2021 and is presented as Appendix E-4, "Effects of Blasting on Fish," to the Draft EIR. This study concluded that ground vibrations from the project's proposed blasting limits and as described in the Blasting Protocols (Draft EIR Appendix H-9) would be below the limit for the protection of embryos in spawning gravels and the level of overpressure would be significantly below the limit established for the safety of salmon when fish are present. Furthermore, Mitigation Measure 4.10-1, requires the monitoring of ground vibration and air overpressure thresholds at three points along the San Joaquin River to ensure that blasting does not exceed the specified thresholds. Exceedances of any specified blasting thresholds would result in the implementation of corrective actions, further outlined in

the Blasting Protocols, which are updated in Final EIR Appendix H-9. These checks and adaptive management approaches adequately address the concerns of the commenter.

The comment does not propose an alternative method of analyzing the impacts that blasting would have upon Chinook Salmon. The commenter criticizes the Draft EIR's usage of ADF&G Standards without providing an alternative superior approach, likely because such an approach would not exist due to the lack of information available on the subject. Although not an industry standard, ADF&G's Blasting Standards are more prescriptive because they provide concrete numeric thresholds (psi and in/s) and monitoring/permit expectations. As such, the usage of the ADF&G Blasting Standards to analyze blasting impacts upon special status species is supported by substantial evidence.

The commenter seemingly criticizes usage of empirical studies rather than standardized blasting standards for a particular species of fish; however, the commenter does not point to the existence of such studies. Empirical studies are valuable because they synthesize research based on direct observation, experimentation, and measurable data rather than theory or speculation alone. As such, reliance upon the ADF&G Blasting Standards is sufficiently credible to support the conclusions drawn in the EIR. The ADF&G Blasting Studies reported upon studies conducted on both embryos and fish. Based on the studies available, the lowest measured Peak Particle Velocity (PPV) that caused mortality in Chinook Salmon was 5.8 in/s. The ADF&G standard for PPVs in salmon spawning gravels is limited to no more than 2.0 in/sec, which is a conservative measurement in light of the studies' conclusions. In comparison, the projected ground vibrations at the crest of the embankment, which is close to the river's edge, are limited to 0.5 in/sec (Draft EIR Appendix E-4 on page 2). The ground vibrations from the proposed project's blasting limits would be only 25 percent of the threshold limit for the protection of embryos in spawning gravels and the level of overpressure would be significantly below the limit established for the safety of salmon (Draft EIR Appendix E-4).

The comment suggests implementation of monitoring for the sound and vibrational impacts to the riverbed. The Draft EIR already discusses implementation of a blast monitoring plan as a component of Mitigation Measure 4.10-1 (see Draft EIR page 4.4-57). As discussed in the Draft EIR, "the *Blasting Protocols* detail requirements for the implementation of a blast monitoring program that includes ground vibration measurements, air overpressure measurements, visual inspection of the San Joaquin River embankment whenever blasting occurs within 1,000 feet of the embankment and depths less than 100 feet within the hard rock portion of the quarry pit." The Draft EIR also includes a contingency plan should significance thresholds be exceeded or if signs of slope instability are present. This involves stopping blasting activities, notification of the

County within 48 hours, and development of a corrective action plan (Draft EIR page 4.4-58).

Comment 65-14

b. Western Spadefoot and Western Pond Turtle

The DEIR also provides limited mitigation for western spadefoot, which only addresses impacts to individuals present on the Project site. Potential impacts of the expanded quarry operations including blasting were not addressed at all. Mining for gravel and clay has destroyed and degraded vernal pool habitat in many areas, disrupting soil formations, hydrology, and seed banks and introducing harmful invasive species (U.S. Fish and Wildlife Service, 2005). In the case of the proposed Project, such impacts would have occurred long in the past, if at all. However, if western spadefoot are still present in and around the Project site (which is impossible to determine with certainty given the lack of surveys described above), they are likely to be negatively impacted by the proposed Project. In addition to directly killing individuals and destroying spadefoot habitat when present, activities that disturb the soil and produce low frequency noise and vibration, such as mining, grading for development, and seismic exploration for natural gas may negatively impact western spadefoots (U.S. Fish and Wildlife Service, 2005). Dimmitt & Ruibal, (1980) found that western spadefoots were extremely sensitive to these types of stimuli and would emerge early from their burrows in response to these ground-moving activities, disrupting their natural dormancy patterns. Such emergence at inappropriate times could lead to non-lethal detrimental effects that may result in reduced fitness or mortality (U.S. Fish and Wildlife Service, 2005).

Western pond turtles are also likely to be impacted by the Project's operations if they occur in or around the Project site. While only limited data exists on the impacts of noise and vibrations on turtles, studies show that turtles can detect a range of sounds, with sea turtles likely avoiding anthropogenic noises, and noise can affect nesting in at least one sea turtle species (Maeda et al., 2024; Simmons & Narins, 2018). As discussed above, western pond turtles may occur in and around the Project site, nest in upland habitats near bodies of water, numerous of which are present in and around the Project site. Any western pond turtles near the Project sites could be harmed by the Project's blasting and operations, even outside of the project footprint.

The only mitigation provided for these two species (western spadefoot and western pond turtle) is Mitigation Measure 4.4-1b, which would require pre-construction surveys and clearance of any ponds on the two sites that are scheduled for removal. The impacts to these species from ongoing operations as well as new operations, including blasting, are not analyzed or mitigated at all. In addition to the failure to conduct adequate surveys, the DEIR provides insufficient analysis or mitigation for potential impacts to western spadefoot or western pond turtle from the proposed Project's operations.

Response 65-14

The Draft EIR analyzed the project sites' suitability to provide habitat for the western spade foot and western pond turtle, researched their last recorded occurrences near the project sites, and biological consultants conducted reconnaissance field surveys in 2019 and 2021 where these species were not observed. Due to the lack of suitable habitat caused by extensive mining operations (which is a part of the long-existing baseline conditions) as noted in the comment, the lack of recently recorded observations of either species, and because neither species was observed during either habitat survey conducted in 2019 and 2021, the Draft EIR properly concludes that the spadefoot and pond turtle are not likely to occur on the project sites. The cited sea turtle study is not relevant to a different species that does not live in the sea.

Given the fact that western spadefoot and western pond turtle are not likely to occur on the project site, it is not likely that they would be disturbed by continued mining operations. However, because the project sites provide some potentially suitable habitat for western spadefoot and western pond turtle, the Draft EIR conservatively proposes Mitigation Measures 4.4-1b which involve preconstruction clearance surveys, subject to approval by CDFW. Mitigation Measure 4.4-1b has been revised, as reflected in the Final EIR. With the implementation of revised Mitigation Measure 4.4-1b, impacts to western spadefoot and western pond turtle would be less than significant (see Draft EIR page 4.4-49). These measures are sufficient to avoid and minimize potential impacts, and no additional revisions to the Draft EIR are required.

Comment 65-15

c. Nesting Raptors

The DEIR does acknowledge potential impacts to nesting raptors, including Swainson's hawk and bald eagle. The DEIR notes that "abundant nesting habitat for raptor species can be found offsite along the San Joaquin River… and in the area along Little Dry Creek" and that "Ground disturbance and noise impacts from mining

could disturb nesting birds located on or near the project sites" (4.4-49). However, the proposed mitigation for these impacts is insufficient to address these acknowledged potential impacts. MM 4.4-1c requires pre-construction surveys for nesting birds, including raptors. However, the mitigation requires only a 500' buffer zone around the disturbance area for these surveys, which is well below the standard mitigation outlined by CDFW. The CDFW guidelines for Swainson's hawk nesting surveys stipulate a 0.5 mile survey radius, significantly larger than that which is required in the DEIR (Swainson's Hawk Technical Advisory Committee, 2000). The National Bald Eagle Management Guidelines specify that new activity should not occur within 660 feet of a nest (US Fish and Wildlife Service, 2007); again, greater than the search radius described in the DEIR's mitigation. The DEIR therefore ignores guidelines based on the best available science, rendering its mitigation for impacts to Swainson's hawk and bald eagle insufficient.

Response 65-15

The comment is noted. See Response 15-13 regarding the sufficiency of Mitigation Measure 4.4-1c, as updated in the Final EIR, for nesting birds, including raptors.

The CDFW survey guidelines for Swainson's hawks are recommendations, and are not legally required under CEQA. As such, Mitigation Measure 4.4-1c, as revised in the Final EIR, sufficiently reduces potential impacts to Swainson's hawks and other raptors (including bald eagles) with the implementation of preconstruction clearance surveys which require a survey within the immediate area where construction will be initiated as well as within a minimum 500-foot buffer. This survey area is sufficient given the extensive history of mining operations.

The majority of the project area is characterized by active mining operations, which provide limited foraging opportunities for Swainson's hawks. However, areas adjacent to the mining operations, such as fallow fields and open spaces, may offer potential foraging habitat. The site is located within the known nesting range for Swainson's hawk. Existing Mitigation Measure 4.4-1c is revised in this Final EIR to increase the survey and buffer distance for Swainson's hawk and bald eagle through errata presented in Chapter 3, "Draft EIR Errata," to further strengthen protections to the focal species.

Comment 65-16

d. Other Resident and Migratory Birds

Resident and migratory birds are similarly overlooked. The DEIR notes that habitats within and around the Project sites "provide

suitable habitat for a variety of year-round and seasonal avian residents, as well as migrating songbirds that occur in the area." (4.4-18). Even with minimal wildlife surveys, numerous bird species were detected in the two Project sites, including red-winged blackbird, gadwall, red- tailed hawk, killdeer, American coot, common yellowthroat, pied-billed grebe, northern rough-winged swallow, tree swallow, and western kingbird (4.4-12,17). Additional nesting and resting habitat for both resident and migratory birds lies in around the Project sites, including the San Joaquin River and the Ball Ranch Nature Preserve. As noted in the DEIR, "Nesting habitat occurs west of the project sites in riparian and oak woodland habitats associated with the San Joaquin River as well as north of the Plant Site associated with Little Dry Creek." (4.4-22). Any additional disturbance or alteration of natural habitat through the Project's proposed operations will have significant impact on the many bird species that use the habitats around the Project sites area, including not only nesting birds but migratory birds as well. The Project's impacts to migratory birds must therefore be analyzed, disclosed, and mitigated.

The DEIR asserts that pre-construction nesting surveys for nesting birds, and buffers around any existing nests, will reduce impacts to less than significant (4.4-50-52). However, this analysis ignores the impacts of edge effects from Project operations on nesting birds, and fails to analyze impacts to birds that are not nesting, which includes birds that may use the Project and surrounding areas as a migratory stopover point or birds that forage in and around the Project sites. As described above, the proposed Project blasting operations will introduce new edge effects, including noise, which may impact resident and migratory birds within and around the Project areas. For example, field observations and controlled laboratory experiments have shown that traffic noise can significantly degrade habitat value for migrating songbirds (Ware et al., 2015). Subjects exposed to 55 and 61 dBA (simulated traffic noise) exhibited decreased feeding behavior and duration, as well as increased vigilance behavior (Ware et al., 2015). Another study found a 28% decrease in bird abundance in areas when traffic noise was present compared to when there was no traffic noise (McClure et al., 2013). And these impacts do not always improve over time: researchers have postulated that some species in areas with chronic noise pollution may become *more* sensitive to noise stressors instead of becoming habituated or less sensitive to them (Goudie & Jones, 2004). Therefore, birds (and other native wildlife) in and around the project site could be significantly adversely affected by ongoing noise from the proposed Project operations, including blasting.

Nesting and foraging would both be impacted. Birds that would otherwise nest near the project site may be unable to do so, and birds that forage in and around the Project may not be able to access previously available foraging areas. However, the DEIR fails to consider these impacts, and provides no analyses or mitigation to address them, in violation of CEQA.

Response 65-16

The comment is noted. The analysis and conclusions in the Draft EIR assume a context of mining and associated activities at both project sites that have been ongoing for decades. The proposed mining and processing activities would continue to be confined to previously disturbed areas at the two project sites, which themselves do not support high-quality avian habitats. The proposed project activities would avoid direct impacts to more sensitive habitats along the San Joaquin River and Ball Ranch Nature Preserve. The Draft EIR analysis assumes that a variety of bird species may be present adjacent to and within the project sites, including use of these areas during migration. However, given existing conditions and the history of mining, processing, and associated activities within these areas, the comment does not provide substantial evidence that the proposed project activities would result in significant impacts to biological resources. To the contrary, there is substantial evidence in the record that impacts to biological resources have be reduced to less than significant levels.

Comment 65-17

III. The DEIR Fails to Adequately Analyze or Mitigate the Project's Impacts to Wildlife Connectivity

Habitat connectivity is vital for wildlife movement and biodiversity conservation. Limiting movement and dispersal with barriers (e.g., development, roads, or fenced-off croplands) can affect animals' behavior, movement patterns, reproductive success, and physiological state, which can lead to significant impacts on individual wildlife, populations, communities, and landscapes (Ceia-Hasse et al., 2018; Cushman, 2006; Haddad et al., 2015; Trombulak & Frissell, 2000; Van Der Ree et al., 2011). Individuals can die off, populations can become isolated, sensitive species can become locally extinct, and important ecological processes like plant pollination and nutrient cycling can be lost. In addition, connectivity between high quality habitat areas in heterogeneous landscapes is important to allow for range shifts and species migrations as climate changes (Cushman et al., 2013; Heller & Zavaleta, 2009). Lack of wildlife connectivity results in decreased biodiversity and degraded ecosystems.

Connectivity among and between natural waterways and upland habitat is essential for native species as well. The shade and erosion control from riparian vegetation provide cool and clear streams that are ideal for spawning and rearing (Lohse et al., 2008; Moyle et al., 2011). Encroachment and over-aggressive removal and degradation of riparian areas have been identified as major drivers of declines in California's freshwater and anadromous fish (Grantham et al., 2012; Lohse et al., 2008; Moyle et al., 2011; Opperman et al., 2005; Pess et al., 2002). Many other species, including mountain lions and bobcats, often use riparian areas and natural ridgelines as migration corridors or foraging habitat (Dickson et al., 2005; Hilty & Merenlender, 2004; M. Jennings & Lewison, 2013).

In addition to providing habitat connectivity, buffer zones around the County's aquatic habitats are essential to protect the County's high diversity of plants, fish, aquatic invertebrates, birds, amphibians, and reptiles. The streams (perennial and intermittent), wetlands (including vernal pools), and reservoirs throughout the County support numerous special-status flora and fauna, including steelhead trout, western pond turtles, and California red-legged frogs. Species that rely on these aquatic habitats also rely on the adjacent upland habitats (*e.g.*, riparian areas along streams, grassland habitat adjacent to wetlands). In fact, 60% of amphibian species, 16% of reptiles, 34% of birds and 12% of mammals in the Pacific Coast ecoregion (which includes Napa County) depend on riparian-stream systems for survival (Kelsey & West, 1998). Additionally, fish rely on healthy upland areas to influence suitable spawning habitat (Lohse et al., 2008), and agricultural encroachment on these habitats has been identified as a major driver of declines in freshwater and anadromous fish (Lohse et al., 2008; Moyle et al., 2011).

The DEIR fails to adequately analyze or mitigate impacts to wildlife connectivity from the proposed Project. The DEIR downplays the importance of the Project area to connectivity, failing to mention the area has been identified as CDFW as a "Conservation and Planning Linkage"3 and failing to admit that the Project may impact the San Joaquin River. Instead, the DEIR erroneously claims that the "downward direction of mining activities is not expected to compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor" (4.4-62) and that impacts to wildlife movement or corridors would therefore be less than significant (4.4-63).

This conclusion ignores the fact that the quarry is already likely disrupting connectivity, particularly along the San Joaquin River, and the proposed Project's extension of quarry and plant operations would continue to disrupt connectivity along the river for another hundred years. Even if the proposed Project did not include new hard rock mining, a continuation of the status quo alluvial mining operations that have been occurring for decades would itself have a significant impact on wildlife connectivity. If instead the operations were to be discontinued, connectivity would likely be greatly enhanced along the San Joaquin River and its riparian corridor. Further, the new proposed blasting operations and the additional mining operations that go with them will likely have additional, novel impacts to connectivity that must also be fully analyzed. The DEIR fails to do either of these necessary analyses.

The Quarry Site is already extremely close to the San Joaquin River—within 200 feet. This distance is significantly smaller than the buffers around aquatic resources that are supported by the best available science. Even buffer zones of 400 feet along streams and wetlands are often insufficient for wildlife protection (Fischer & Lindenmayer, 2000; Kilgo et al., 1998; Semlitsch & Bodie, 2003). A literature review found that recommended buffers for wildlife often far exceeded 325 feet, well beyond the largest buffers implemented in practice, and far beyond the distance between the San Joaquin River and the Quarry Site (Fischer & Lindenmayer, 2000; Robins, 2002). For example, Kilgo et al. (1998) recommend more than 1,600 feet of riparian buffer to sustain bird diversity. In addition, amphibians have been found to migrate over 1,000 feet between aquatic and terrestrial habitats through multiple life stages (Cushman, 2006; Fellers & Kleeman, 2007; Semlitsch & Bodie, 2003; Trenham & Shaffer, 2005), and western pond turtles have been found to migrate over 1,300 feet and 10,000 feet respectively from breeding ponds and streams (Semlitsch & Bodie, 2003; Trenham, 1998). Little Dry Creek, which lies 500 feet north of the Plant Site (2-23), is also within these science-based buffer zones, and its function as a potential riparian wildlife connectivity corridor would also likely be compromised by both ongoing and expanded operations.

As described above, edge effects from the Project include but are not limited to noise, vibrations, flyrock, dust, and geological stability, all of which can impact the quality of the San Joaquin River riparian corridor and the ability of animals to move around the Project site. The proposed Project will continue the status quo of disruptive quarry operations near an essential riparian corridor and will introduce additional potential impacts from increased operations and new blasting activity that will further

degrade a critical connectivity area. The DEIR fails to adequately disclose, assess, and mitigate the Project's impacts to wildlife connectivity and therefore fails to comply with CEQA.

Response 65-17

The Draft EIR does not need to analyze impacts assuming that the mining operations are not present. Here, the extensive history of decades of mining is included in the baseline conditions of the biological resources at the project sites (Title 14 CCR Section 15125; as noted repeatedly in the comment, e.g. "The Proposed Project will continue the status quo of disruptive quarry operations…" and "the quarry is already likely disrupting connectivity…"). Thus, the continuation and expansion of mining at the Quarry Site, (which involves an increase in depth rather than increase in area of the mining pit), would not be a substantial deviation from baseline conditions for purposes of wildlife connectivity.

The buffer zones suggested in the comment are not feasible given the location of the long-existing Quarry Site and the location of the granite deposit which would be mined. Additionally, the Quarry Site's currently permitted buffer zone of 200-ft from the San Joaquin River is a part of the CEQA baseline. While the depth of the pit would be increased, the perimeter of the disturbed areas would not increase. As such, no significant impacts to wildlife connectivity are expected from the continuation of Quarry operations, even with the introduction of blasting (see discussion of Draft EIR Impact 4.4-6 regarding the project's impacts on wildlife movement, corridors, or nursery sites).

See Response 65-8 regarding the project's impacts to species resulting from mining operations, including, flyrock, dust, geological stability, noise, dust, and vibrations

Comment 65-18

IV. The DEIR Vastly Understates the Risk of Blasting Impacts on the SanJoaquin River Ecosystem, and Improperly Defers Mitigation

The San Joaquin River is vitally important not only to California's water supply but to the many species and ecosystems that rely on its function and flows. The River has suffered over the past decades and centuries from over-exploitation, and the remaining perennial stretches with healthy riparian habitats are more important to preserve than ever.

The DEIR notes that "without appropriate vibration and airblast reduction measures, blast-induced groundborne vibration could exceed bank stability threshold" (4.4-57) and claims that the Blast Protocols would prevent significant impacts to the San Joaquin River (4.4-58). The Blasting Protocols include guidelines to

monitor the impacts of blasting on the River, including vibration measurements, overpressure measurements, and visual inspection of the embankment. However, the Blast Protocols state that these visual inspections will only occur until blasts reach a depth of 100 feet (App H-6, p.5), without explaining this decision or providing any justification for cessation of riverbank monitoring. The DEIR appears to assume that blasting below 100 feet would not introduce additional risks of riverbank destabilization, but without providing a scientific explanation as to why this would be the case, it is impossible to determine whether this proposed mitigation will be sufficient to mitigate blasting impacts.

Response 65-18

An evaluation of the proposed blasting against the ADF&G's "Blasting Standard for the Proper Protection of Fish," was prepared by Vibra-Tech Engineers in 2021 and is presented as Draft EIR Appendix E-4. This study concluded that ground vibrations from the project's proposed blasting limits and as described in the blasting plan (Final EIR Appendix H-9) would be below the limit for the protection of embryos in spawning gravels and the level of overpressure would be below the limit established for the safety of salmon when fish are present. These checks and adaptive management approaches adequately address the concerns of the commenter.

Regarding the blast visual inspections of the portions of the San Joaquin River embankments that are located within 1,000 feet of each blast and depths less than 100 feet within the hard rock portion of the quarry pit, the Draft EIR provides that "[g]iven that the distance between the blast and the river embankment generally increases as the pit depth increases, the visual inspections are not required for blasts conducted at depths greater than 100 feet within the hard rock portion of the quarry (measured at the contact between the alluvium and rock)" (see Draft EIR, Appendix H-7, Section 3.3.4, page 7). Furthermore, in analyzing the blasting effects on the San Joaquin River embankments the Draft EIR provides that the hard granite is considered rigid element and the thickness of the hard rock material "has no effect on the natural frequencies and mode shape of the river embankment" (see Draft EIR, Appendix H-4, page 12; Impact 4.4-4 pages 4.4-57 through 4.4-58; Draft EIR, Section 4.13.3.2, "Significance Thresholds," page 4.13-39; Impact 4.13-6, pages 4.13-65 through 4.13-67; and Figure 4.13-6, "San Joaquin River Embankment Vibration Threshold Curve," page 4.13-41). Finally, the Draft EIR utilized conservative values in analyzing the stability of the San Joaquin River embankment, which was determined to "provide additional safety for the river embankment due to blast induced ground vibration" (see Draft EIR, Appendix H-4, page 19). Thus, the Draft EIR provides an adequate analysis as to why visual inspections are not required for blasts conducted at depths greater than 100 feet (e.g., within the hard rock).

Comment 65-19

Furthermore, the DEIR provides absolutely no contingency plan for a situation in which the river embankment becomes damaged or the quarry experiences pit failure. Instead, the DEIR states "Should significance thresholds be exceeded or signs of instability of the embankment (such as clumping or cracking) be noted, the County must be notified within 48 hours. If it is determined that the instability is the direct result of blasting, and not due to natural water erosion, with or without flooding, then a corrective plan must be developed that identifies changes to the blasting program to prevent future exceedances" (4.4-58). Even the Blasting Protocols themselves state: "If the blast monitoring indicates that ground vibration or air overpressure exceed the criteria recommended… or if flyrock exceeds the limits of the defined blast clearance zone, the operator will provide notification to Fresno County within 48 hours and identify changes to the blasting program that will be implemented to prevent future exceedances" (App H-6, p.6). This mitigation provided in the form of the Blasting Protocols (MM4.10-1) is improperly deferred. Any corrective plan or contingency plan must be fully developed before any blasting would occur, and must include an evidenced-based strategy that would be quickly implemented to prevent collapse of the riverbank and avoid potential catastrophe outlined below.The DEIR must include sufficient information about mitigation that the public and decisionmakers can determine whether such measures would adequately mitigate the Project's blasting impacts to the San Joaquin River. The DEIR entirely fails to accomplish this. As explained above, such improperly deferred mitigation violates CEQA.

Further, this approach of deferring contingency plans until bank stability problems arise vastly minimizes the potential disastrous impacts of a pit failure. If the banks of the San Joaquin River were to become unstable, whether directly due to blasting operations or due to natural processes, and the river channel was to be altered such that flow was diverted into the quarry, even temporarily, the local and downstream impacts could be catastrophic. Such an event could wash out riparian habitat, harm and kill aquatic and riparian wildlife that get diverted into the pit, and introduce sediment and pollutants from the pit into the river, impacting wildlife and water quality for miles downstream.

Blasting of any kind is likely to increase this risk, even with the monitoring requirements outlined in the DEIR. One small mistake or miscalculation could lead to wide-reaching disaster from which the San Joaquin River might never fully recover. The County should

not put the health of an entire river ecosystem at risk by allowing blasting so close to the San Joaquin River.

The potential for pit failure is particularly concerning given the potential for natural flooding as well. As described below in this letter (Section V-c), the DEIR's analysis conveniently finds that the San Joaquin River's 100-year floodplain no longer overlaps with the Quarry site, which FEMA's floodplain designation does (App G-1, App. A, Fig. 2). However, research indicates that flooding in California will become more extreme with climate change, not less, indicating that the 100-year floodplain may need to be updated to include the Quarry site. If blasting weakens the river embankment at all, even if those impacts are below the DEIR's established thresholds of significance, this weakening may compound with natural flooding and erosion processes to further stress the riverbanks and potentially increase the risk of pit failure, along with other synergistic flood impacts.

Even without a pit failure, deepening of the quarry is likely to have long-term impacts on the river. As stated by Norman et al. (1998), "In the long term, stream capture by gravel pits is a near certainty. Because the gravel pits have a lower base elevation, there is risk of rapid channel change into the pits during high flows, a process termed avulsion. The flooded pits "capture" the stream." If the Quarry is deepened by 600 feet as the Project proposes, any flooding in the near- or long-term could result in capture of a huge amount of streamflow. The impacts of such avulsion include river bed erosion, channel incision, bank erosion and collapse, changing aquatic habitat, increase in sediment, and damage to fish spawning habitat, among others (Norman et al., 1998).

The DEIR fails to consider the impacts of avulsion at all and fails to provide adequate analysis or mitigation for the impacts to the San Joaquin River embankment from blasting or ongoing operations. Instead, the DEIR improperly minimizes the potential impacts of the project to this sensitive ecosystem and defers important mitigation contingency planning. The DEIR's failure to adequate analyze or mitigate impacts that could have severe consequences not only for the local area but also for the entire San Joaquin River system is an egregious oversight and a clear violation of CEQA.

Response 65-19

See Responses 12-75, 58-64, and 58-65 which adequately address the comment's incorrect allegation that Mitigation Measure 4.10-1's Corrective Action Plan constitutes deferred mitigation. Notably, the comment fails to acknowledge that pursuant to Mitigation Measure 4.10-1, upon a determination of instability all blasting must immediately cease until the Corrective Action is approved by the County (see Final EIR, Appendix H-9, at page 6; see also Draft EIR, pages 4.4-57 through 4.4-58).

See also Response 65-37, which adequately addresses the comment's incorrect allegation that the Draft EIR fails to adequately analyze or mitigate impacts to the San Joaquin River embankment from blasting or ongoing operations.

Finally, see Response 58-25, which adequately addresses the comment's incorrect allegation that the Draft EIR must analyze climate change's impact to the 100-year floodplain.

Regarding the commenter's assertions regarding pit capture, aka avulsion, the cited article has little, if any, relevance to the project site. (See Norman, D. K., C. J. Cederholm and W. S. Lingley (1998) Flood Plains, Salmon Habitat, and Sand and Gravel Mining. Washington Geology 26(2/3): 3-28.) (the "Norman Article.") The Norman Article limits its evaluation only to aggregate mines along specific rivers in Washington state, hundreds of miles from the San Joaquin River and in an entirely different biological and topographic environment and climate, with no consideration of the San Joaquin River ecosystem or its geology. Further, the Norman Article confirms that avulsion typically occurs during floods (Norman Article, page 9). The Washington rivers and floodplains examined in the Norman Article are in a much rainier and flood-prone climate than the San Joaquin Valley. This is confirmed by the Chang Consultants' analysis of the project sites, which identified no significant flood risks based on November 2018 topography of the sites (see Draft EIR, Appendix F-1, Stability Assessment, page 13). The comment thus can only speculate, without support, as to any potential impacts of avulsion occasioned by deepening the quarry pit by 600 feet.

The Draft EIR nonetheless considers each of the effects of blasting impacts at the project sites listed in the comment, including any such potential riverbed erosion, channel incision, and bank erosion and collapse stemming from the project, whether due to avulsion or otherwise (see Appendix G-1, "Hydraulic Analysis," pages 5-7 and Appendix A, Figures). The Draft EIR specifically considers aquatic habitat at Impact 4.4-6, which states that any effect at all to native or migratory species or fish riparian habitat, whether in the San Joaquin River or Little Dry Creek, is less than significant without any

mitigation measures (see Draft EIR pages 4.4-62 through 4.4-63; see also Appendix E-4, "Effects of Blasting on Fish").

Comment 65-20

V. The DEIR Does Not Adequately Disclose, Analyze, or Mitigate Impacts to Surface Water Quality

The San Joaquin River is the second largest river in California (Laćan & Resh, 2016). It comes from headwaters in the central Sierra Nevada, including in Yosemite and Kings Canyon National Parks, and the Ansel Adams Wilderness. Snowmelt flows through the upper reaches of the River into Millerton Lake, a lake created by the Friant Dam that supplies irrigation water to the Central Valley. Past the dam, the River flows north of Fresno and then joins the Sacramento River and numerous tributaries to form the Sacramento- San Joaquin Delta (the "Delta.") The Delta is the hub of the California water system and the most valuable estuary and wetland ecosystem on the west coast.

The San Joaquin River has earned the title "hardest working river in California" by irrigating thousands of acres of cropland, providing drinking water for millions of people, and supporting fisheries and vast wetlands.

a. The DEIR Does Not Establish by Substantial Evidence that The Project Will Not Degrade Surface Water Quality.

The Plant Site and the Quarry Site are directly adjacent to the San Joaquin River. Dry Creek passes 475 feet to the north of the Plant Site on its way to the River. (DEIR at 4.10-15.) A river water delivery ditch directly connects the Plant Site to the River. (DEIR at 4.4-7.) Both the Plant Site and the Quarry Site have standing ponds of polluted industrial wastewater under current operating conditions. (DEIR at 4.10-8.) The surface water storage on the site will expand as a result of the proposed Project. At the Quarry Site, the amount of water that must be pumped out of the excavation site and stored on site will increase as the mining depth increases. (DEIR at 4.10-8.) At both the Plant Site and the Quarry Site, new ponds "may" be formed as mining progresses. The project will add groundwater recharge trenches at the boundaries of the Plant Site. All this water will be moved and stored on a site that is adjacent to the River and connected to it via surface water, but the DEIR dismisses without evidence the idea that this could lead to any surface water contamination.

The DEIR offers no estimate of the quality of the retained industrial wastewater created by the Project that will become surface water on-site. It merely reports on the current surface water quality, without considering how the intensified mining operations proposed by the Project might affect that water quality. The Project will increase the intensity of existing operations and the magnitude of blasting, and add entirely new pollutants like asphaltic oil. (DEIR at 2-44.) By completely neglecting to analyze or disclose this impact, the EIR fails to provide information regarding the project's significant environmental impacts that is sufficient to allow decision-makers and the public to understand the environmental consequences of the project, in violation of CEQA. (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 520; *Laurel Heights Improvement Ass'n v Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 404; See CEQA Guidelines §15151.)

And even under current conditions, the on-site surface water is toxic. The current surface water has a conductivity level roughly ten times higher than the San Joaquin River. This conductivity level violates the drinking water standard in the basin plan. Conductivity is a general gauge of overall water quality. A higher level commonly indicates a discharge of some pollutant and a resulting harm to the overall health of the water body and the associated ecosystem (EPA, 2025). Surface water at the plant site also has significant arsenic, lead, and iron—none of which are present in significant levels in the San Joaquin River. The arsenic level at the Plant Site is 20 times the drinking water limit. The lead level is 30 times the limit. The iron level is a staggering 1,590 times above the limit. (DEIR at 4.10-24.) The DEIR claims that this toxic water—which will only get more toxic with intensified mining—will not have any impacts because the Project does not "propose" to discharge the water into the San Joaquin River. But a CEQA review is not limited to what the Project proposes; it extends to the Project's reasonably foreseeable impact. Commingling between the dirty surface water on site and the San Joaquin River is in fact reasonably foreseeable through flooding and through the confluence of the river supply channel and Little Dry Creek.

Response 65-20

The project's potential effects related to surface water quality were evaluated within Draft EIR Section 4.10, "Hydrology and Water Quality," as well as within the *Revised Hydrology and Water Quality Analysis Report* and the *Addendum to: Revised Hydrology and Water Quality Analysis Report* prepared by EMKO Environmental, Inc., and included as Draft EIR Appendix G-5 and G-6, respectively (see also Draft EIR, pages 4.10-24 through 4.10-25;

Responses 6-52, 6-71, 6-72, and 65-27, which adequately analyze water quality impacts associated with the Plant Site's silt pond water percolating into the groundwater aquifer).

The water quality data presented in the Draft EIR represents pre-existing baseline conditions and therefore does not represent conditions that must be addressed as part of this project. Rather, the environmental review must evaluate whether the project as designed would result in impacts to the existing water quality conditions at levels deemed to be significant.

The project surface water conditions and project impacts are discussed extensively in the Draft EIR at Impact 4.10-1 and the Draft EIR at Appendix G-5, Section 2.1 at page 7 and Section 5 at pages 52-57. As noted at Impact 4.10-1 at page 4.10-88, the limits in the Basin Plan are intended to regulate discharges to the San Joaquin River, and the project does not propose to discharge to the San Joaquin River. Commingling of the surface water on the site with the San Joaquin River through flooding is not a reasonably foreseeable impact. The risk of flooding is addressed at Impact 4.10-17, and the comment does not address the conclusions of Impact 4.10-17, which was that there is a less than significant impact related to the potential release of pollutants in flood hazard zones due to project inundation (see Draft EIR, pages 4.10-118 through 4.10-119). As also noted in the Draft EIR, water is conveyed to the Plant Site via an existing river conveyance system (see Draft EIR, Impact 4.10-4, pages 4.10-93 through 4.10-94).

The project does not propose to discharge groundwater or surface water to offsite surface water features. The water stored in the onsite ponds and recharge trenches will not leave the facility boundaries. As such, no contamination to surface waters is expected to occur due to the project's design. As previously mentioned, the baseline water quality of the surface water within the Plant Site silt pond and the Quarry Site ponds was evaluated in the EMKO Environmental, Inc. report (included in Draft EIR Appendix G).

The conductivity of the Plant Site silt pond surface water exceeded the Basin Plan water quality standard; however, the Basin Plan standard only applies in the case of a discharge to the San Joaquin River, which is not part of the project's design. The arsenic, iron, lead, and manganese concentrations above a water quality standard represent total concentrations. Of note here, the dissolved concentrations of these constituents tested below the applicable water quality standards. As stated in the Draft EIR, the total metals concentrations are due to the presence of suspended silts and sediment within the silt pond. Since elevated metals concentrations were not present in the filtered sample, which represents the dissolved concentrations within the water, the detected metals levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the aggregate being processed at the Plant Site. The lack of

elevated metals in the filtered samples demonstrates that the metals are not leaching from the silt into the natural soils beneath the silt pond and to groundwater.

With respect to the Quarry Site's surface water quality, apart from exceeding the Basin Plan standard for conductivity, which does not apply as the project does not propose to discharge to the San Joaquin River, and two pH measurements likely due to uptake of carbon dioxide and release of oxygen by aquatic plant growth in the pond, the surface water quality of the Quarry Site ponds meets the applicable water quality standards. Again, the water quality data presented in the Draft EIR represents existing baseline conditions and therefore do not represent conditions that must be addressed as part of this project. Rather, the environmental review must evaluate whether the project, as designed, would result in impacts to the existing water quality.

The project proposes to modify mining to include the hard rock (granite) beneath the alluvial deposit currently being mined. The bedrock is mineralogically similar to the alluvial materials presently harvested at the site, and thus excavation at deeper levels is not expected to expose or encounter geologic materials that would be different geochemically and present a new source of constituents of concern. Therefore, the water quality is not expected to change from the existing baseline.

Worth noting, for the Plant Site Mitigation Measures 4.10-5a and 4.10-5b require implementation as of an adaptive management strategy to assess whether the project could cause a water quality impairment, specifically for iron and manganese in the reclaimed Plant Site pond within the former mining excavation, and actions to be undertaken in the event of a verified impact. The monitoring would begin once mining is completed and water starts filling the excavation, since there would be no appreciable water-rock interaction under pumping conditions. With this mitigation implemented, water quality would be monitored via direct measurement every six months. If iron or manganese levels exceed regulatory limits during two consecutive monitoring periods, further lab testing and seasonal assessment would follow. Persistent exceedances would trigger mitigation measures, such as aeration, vegetation control, or other methods to reduce iron and manganese concentrations. Monitoring would continue until five years pass without exceedances, at which point it may end. Annual reports would be submitted to the County, detailing monitoring results and any corrective actions taken.

The comment further inaccurately states that the Draft EIR fails to analyze the potential intensification of the existing operations and the additions of asphaltic oils. However, these are discussed extensively in the Draft EIR at Impact 4.10-1 (see Draft EIR, pages 4.10-88 through 4.10-92). Section 4.10.2.2, "State," of the Draft EIR describes the regulatory requirements that the mine is already subject to, such as the site's current

waste discharge requirements No. 90-083 (WDR), its Industrial stormwater pollution prevention plan (SWPPP), its hazardous materials business plan (HMBP) and its spill prevention and countermeasure plan (SPCC), among others (see Draft EIR, pages 4.10-66 through 4.10-74; see also Draft EIR Impact 4.10-1, pages 4.10-88 through 4.10-92). Impact 4.10-1 further discusses these in the context of the proposed project. For example, the Draft EIR at page 4.10-89 notes that the SWPPP and WDR would need to be updated to reflect the proposed project, while the Draft EIR at page 4.10-90 notes that the HMBP and SPCC would need to be updated. The Draft EIR at 4.10-90 also notes that the Blasting Protocols (see Appendix H-9 of the Final EIR) "specify practices to prevent the contamination of groundwater and surface water as a result of blasting." The comment fails to acknowledge these requirements or analyze why they are deficient.

Comment 65-21

b. The DEIR Does Not Properly Disclose Current Surface Water Quality Conditions.

The DEIR omits water quality testing necessary to understand baseline conditions and to predict likely environmental impacts. First, the surface water at the Quarry Site was not tested for lead or arsenic. (DEIR at 4.10-26.) Those two toxic metals were present in the surface water at the Plant Site at very high levels. (DEIR at 4.10-24.) Because the Project is documented to release these metals into surface water, it is inexcusable not to test for them at the Quarry Site. The County must conduct this testing.

Second, the DEIR does not test—indeed, does not analyze at all—water quality in the river supply channel. This waterway directly connects the San Joaquin River to the Plant Site, and so understanding its water quality is critical to understanding how the Project might affect water quality in the River. The DEIR asserts that water flows through the channel from the River to the Plant Site and assumes that the channel cannot introduce contamination into the River. However, without evidence, it is impossible to know if contaminates from the site are present in the channel, and, if so, if they make it to the River. The channel is an acknowledged interaction site between River water and site surface water. The failure to disclose adequate, up-to-date information about the current level of contamination means that the EIR does not establish environmental baseline, invalidating its analysis. (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 320 [holding that use of the proper baseline is critical to a meaningful assessment of a project's environmental impacts], *Save Our*

Peninsula Comm. v Monterey County Bd. of Supervisors (2001) 87 Cal.App.4th 99, 119.)

Response 65-21

As provided in Responses 6-78, 48-4, and 65-27, the water quality at the Quarry Site was tested. Specifically, Responses 6-78, 48-4, and 65-27, provide that Table 4.10-6, "Quarry Site Groundwater Quality Data," of the Draft EIR presents groundwater quality data from the Quarry Site wells, which includes the same parameters analyzed at the Plant Site. Thus, the potential presence of arsenic, lead, and other parameters in the groundwater pumped to the ponded water features would be indicated in the groundwater quality in Table 4.10-6. Table 4.10-6 (Draft EIR, page 4.10-45 to 4.10-47) provides the groundwater quality sampling data. 12 wells across the quarry were sampled and testing included arsenic. Arsenic was not detected in 4 of the 12 samples and in the other 8, the maximum concentration was 4.8 micrograms per liter (ug/L). The water quality standard for arsenic is 10 ug/L. Thus, it is reasonable and appropriate to conclude that the three ponded water features identified in Table 4.10-4, "Quarry Site Surface Water Quality Data," which contain groundwater, do not have elevated arsenic.

The project's potential effects related to surface water quality were evaluated within Draft EIR Section 4.10, "Hydrology and Water Quality," as well as within the *Revised Hydrology and Water Quality Analysis Report* and the *Addendum to: Revised Hydrology and Water Quality Analysis Report* prepared by EMKO Environmental, Inc., and included within Draft EIR Appendices G-5 and G-6, respectively.

The water quality data presented in the Draft EIR represent pre-existing baseline conditions, and therefore does not represent conditions that must be addressed as part of this project. Rather, the environmental review must evaluate whether the project as designed would result in impacts to the existing water quality conditions at levels deemed to be significant.

Table 4.10-4 in the Draft EIR presents data from several ponded water features at the Quarry Site. Only Ponded Water Feature 3, the Northeast Pond, is still present at the site and is the only ponded water feature that would remain as part of the expansion project. The water within the ponded water features at the time of sampling consisted primarily of groundwater seepage prior to dewatering of those areas for subsequent mining (Ponded Water Features 1 and 2 on Figure 4.10-4, "Quarry Site Surface Water Features and Wells," of the Draft EIR) or groundwater that was pumped to the Northeast Pond during dewatering of other areas of the Quarry Site. Table 4.10-6 of the Draft EIR presents groundwater quality data from the Quarry Site wells, which includes the same parameters analyzed at the Plant Site. Thus, the potential presence of arsenic, lead, and

other parameters in the groundwater pumped to the ponded water features would be indicated in the groundwater quality in Table 4.10-6. Thus, consistent, or congruent, information is available for both the Plant Site and the Quarry Site.

The project does not propose to discharge groundwater or surface water to offsite surface water features. The water stored in the onsite ponds and recharge trenches would not leave the facility boundaries. As such, no contamination to surface waters is expected to occur due to the project's design.

The river supply channel (RSC), as referred to by this commenter, is called the river water delivery ditch in the Draft EIR (see Section 2.4.2.1, "Plant Site Existing Conditions," first paragraph and under the heading "Water Usage"). The RSC is an existing component of the Plant Site operations, and no changes are proposed as part of the project except that water use from the river, through the ditch would decrease once the aggregate processing plant at the Quarry Site begins operation (see Draft EIR Section 2.5.2.1, "Plant Site Mine Plans," under subheading "Water Usage"). Therefore, since the proposed conditions with respect to the RSC are identical to the existing baseline conditions for the RSC, there are no potential impacts to the environment related to the RSC, in accordance with CEQA, and no testing of the water in the RSC is warranted.

Further, the Draft EIR does analyze the water quality in the river supply channel. Specifically, because the proposed conditions with respect to the RSC are identical to the existing baseline conditions for the RSC, there are no potential impacts to the environment related to the RSC, in accordance with CEQA. Furthermore, the water from the San Joaquin River flows by gravity through the RSC from the San Joaquin River to the Plant Site. There is currently no discharge of water from the Plant Site operations to the RSC and there is no proposed future discharge to the RSC as part of the project. The Draft EIR appropriately explains existing physical conditions at the project sites relating to water quality. See information most relevant to the comment and the baseline at pages 4.10-23 through 4.10-49 of the Draft EIR.

Comment 65-22

c. The DEIR Dismisses the Threat of Surface Water Quality Impacts from Flooding Without Evidence.

Climate change is increasing the risk of extreme precipitation events and resulting floods in California. In particular, anthropogenic warming increases Sierra snowmelt significantly—likely by 200 to 400% during storms (Swain et al., 2018). Scientists estimate that this phenomenon may have already contributed to the failure of the Oroville Dam in 2017 when historical warming increased runoff in the Feather River Watershed

by over a third. (Huang et al., 2018; Huang & Swain, 2022). Hydrological modelling done by UCLA and the National Center for Atmospheric Research projects that the runoff-based flood risk has already doubled from historical averages and will increase further with every degree of warming. The increased flooding risk from both runoff and from sea level rise means that the amount of land in California considered to be at risk from a flood has already doubled relative to FEMA official 100-year flood projections (The Precipitation Problem: 8th Annual Risk Assessment, 2023).

The DEIR acknowledges that the FEMA floodplain delineation based on studies from 1981 and 1998 is out of date, as it certainly is. (DEIR at 4.10-16; Figure 4.10-1.) But instead of updating the delineation with current information about the increased frequency and magnitude of flooding in California under climate change, the DEIR purports to update it based only on changed site topography. (DEIR at 4.10-16.) This results in a current site floodplain that is smaller than what FEMA delineated in 2009—a scientific implausibility that the DEIR supports with no evidence. Based on this supposed floodplain, the DEIR concludes that the San Joaquin River floodplain does not enter the Plant Site or the Quarry Site and therefore that there is no significant risk from flooding. (DEIR at 4.10-118-19.) This is contrary to the evidence and is not supported by adequate analysis. Because floodplains are expanding, not contracting, under climate change, the Project site likely is at risk of inundation from flooding in the watershed. In the event that a flood that reaches the Project site, the toxic industrial runoff stored as surface water would enter the San Joaquin River, and cause health and environmental damage everywhere the floodwaters reach.

The DEIR admits that excessive water released rapidly from the Friant Dam could result in flooding of the Quarry Site or Plant Site. However, it says that it is not necessary to consider this risk because it is "unforeseen." The DEIR does not cite any evidence to support the contention that rapid releases from the dam cannot be foreseen. In fact, the only citation in the paragraph is to the Fresno County Multi-Jurisdictional Hazard Mitigation Plan which actually estimates a "high" vulnerability to dam failure and flood in Fresno County. (The vulnerability ranking reflects the potential impact and the likelihood of future occurrences.) Just two years ago, heavy rains created record-breaking spillovers at the Friant Dam (Kassandra Gutierrez, 2023). Moreover, dam failures are increasing across the US and in California due to aging infrastructure and intensifying precipitation (Hwang & Lall, 2024; Mallakpour et al., 2019). By dismissing this threat without evidence, the DEIR violates CEQA.

Response 65-22

As provided in Response 58-25, Climate Change's impacts to the floodplain are not required to be analyzed in an EIR. Specifically, the California Supreme Court held that the purpose of an EIR is "to analyze the 'environmental effects' of a project … not … the environment's effects on a project" (*California Building Industry Assn. v. Bay Area Air Quality Management Dist.* (2015) 62 Cal.4th 369, 392; Citing Cal. PRC Sections 21002 and 21002.1(c)). Other than incorrectly alleging that the Draft EIR must analyze the floodplain impacts caused by climate change, the comment fails to provide any legal support that CEQA requires such an analysis.

As stated in the comment, Figure 4.10-1, "Current and Regulatory Floodways and Floodplains," depicts the current and regulatory floodways and floodplains for the project sites. As explained in the Draft EIR since the FEMA studies on which the Flood Maps were based were from 1981 to 1998, an updated hydraulic analysis was completed (see Appendix G-1) to determine floodplain changes, which also utilized the 2009 FEMA Flood Insurance Rate Maps that delineated the areas of known special flood hazards and associated applicable risks to the community near the project sites (Draft EIR pages 4.10-15 and 4.10-16; see also Draft EIR, Appendix G-1, page 2). An updated hydraulic analysis (in Appendix G-1) was completed to estimate floodplain changes that have occurred as a result of physical changes within and surrounding the project sites, "particularly changes that occurred as a result of the development of berms along the project site's boundaries" (Draft EIR page 4.10-16). In other words, the FEMA studies had to be updated to reflect the development of berms and other features. The analysis methodology summarized in the Draft EIR at Section 4.10.3.2, "Analysis Methodology," and is set out in detail in Appendix G-1. The comment does not cite to or provide any analysis as to why Draft EIR Appendix G-1 and the summary contained in the Draft EIR at Section 4.10.3.2 are inaccurate. The comment does not address this factual information.

A discussion as to Friant Dam is included in Draft EIR Section 4.10.1.5, "Flood Hazards," including a discussion of controlled releases from the Dam. Friant Dam is owned and operated by the Federal Bureau of Reclamation, making dam failure an unlikely event as its design and operation are subject to extensive federal regulations and requirements. CEQA does not require speculation nor analysis of unlikely events (Title 14 CCR Section 15145).

Further, the 2024 Fresno County Hazard Mitigation Plan provides that "it should be noted that there have not been any failures of major dams in the County. Uncontrolled or controlled release flooding below dams due to excessive rain or runoff are more likely to occur than failures" (May 2024 Fresno County Hazard Mitigation Plan, page 44; see also

April 2018 Fresno County Multi-Hazard Mitigation Plan, page 4.23). Additionally, the 2024 Fresno County Hazard Mitigation Plan provides that:

> The potential for climate change to affect the likelihood of dam failure is not fully understood at this point in time. With a potential for more extreme precipitation events as a result of climate change, this could result in large inflows to reservoirs. However, this could be offset by generally lower reservoir levels if storage water resources become more limited or stretched in the future due to climate change, drought and/or population growth (*Ibid*.)

Accordingly, the Draft EIR is supported by substantial evidence that the project environmental impacts to surface water quality would be less than significant with the included mitigation measures (Draft EIR, Section 4.10). In addition, a "[d]isagreement among experts does not make an EIR inadequate" (Title 14 CCR Section 15151).

In consideration of commenters' concerns pertaining to severe flooding events and in light of County Policy HS-C.12, Chang Consultants evaluated the potential for the 200-year flood to enter the Quarry Site and Plant Site (Chang 2026a & 2026b, Appendices G-7 and G-8). Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. A topographic mapping was prepared to display the locations where the berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site. Please see Collective Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site.

The 2026 Hydraulic Analysis also demonstrated that the existing berms and topography of the Plant Site would prevent both the San Joaquin 200-year flood and the Little Dry Creek 200-year flood from entering the Plant Site (Chang 2026b, Appendix G-8). As such, the project sites are sufficiently protected from flood risks, including from the 200-year flood.

Comment 65-23

d. The DEIR Relies on Improperly Deferred Mitigation for Surface Water Quality Impacts.

The DEIR repeatedly insists that stormwater runoff from the Project will be contained within the Project sites, citing no evidence besides the Surface Runoff and Drainage Plan. However, the Surface

Water and Drainage Plan—meant to present "the overall conceptual approach for managing storm drainage"—is nothing more than an aspirational plan to make a plan at a later date. The Plan consists of statements like, "off-site runoff will not commingle with active project area runoff" and "stormwater runoff will be captured by the open water ponds." (DEIR at 4.10-84-85.) This is not a management plan and does not approach an effective mitigation strategy. The DEIR says that best management practices for stormwater treatment, erosion protection and stormwater monitoring will be provided in the Stormwater Pollution Prevention Plan that will be developed and implemented later, out of public view. (DEIR at 4.10-84.)

The County may not defer mitigation to a later date unless the EIR provides specific reasons why a mitigation plan cannot be developed now and provides specific performance measures to evaluate its success. (14 Cal. Code Regs. §15126.4(a)(1)(B); *San Joaquin Raptor Rescue Ctr. v County of Merced* (2007) 149 CA4th 645, 670; *Cleveland Nat'l Forest Found. v San Diego Ass'n of Gov'ts* (2017) 17 CA5th 413, 442.) An EIR is inadequate if "[t]he success or failure of mitigation efforts may largely depend upon management plans that have not yet been formulated, and have not been subject to analysis and review within the EIR." (*San Joaquin Raptor, supra*, 149 Cal.App.4th at p. 670.) As courts have pointed out "[f]undamentally, the development of mitigation measures, as envisioned by CEQA, is not meant to be a bilateral negotiation between a project proponent and the lead agency after project approval, but rather, an open process that also involves other interested agencies and the public." (*Communities for a Better Environment v. City of Richmond*, 184 Cal. App. 4th 70, 93.)

Here, the County proposes exactly that—a stormwater mitigation plan that will be developed after Project approval, with no guarantee of success, for no clear reason. In the meantime, the DEIR asserts without evidence that stormwater will be entirely contained on the site, making the DEIR inadequate. The EIR has not established that this vague, undefined plan will effectively reduce the impact of this Project o surface water to less than significant. (*Banning Ranch Conservancy v. City of Newport (2012) 211 Cal.App.4th 1209, 1232-34*.)

Response 65-23

The comment states that there is no SWPPP for the site, but the sites are both existing and SWPPPs already exist for both sites. The SWPPP for each site would be amended if the project is approved.

See Response 459-2, which explains that the project is designed to be a zero-discharge facility with respect to stormwater. Under CEQA case law, engineering level detail is not required in an EIR (see *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 36).

The Surface Runoff and Drainage Plan, which is included in Draft EIR Appendix G-2, is supported by substantial evidence, and the effectiveness of that plan is also analyzed under Impacts 4.10-1 and 4.10-14 through 4.10-15 of the Draft EIR (PRC Section 21080(e)(1); see also CEQA Guidelines Section 15384 (b)). The Surface Runoff and Drainage Plan and the associated sections of the Draft EIR describes the regulatory requirements applicable to the project sites, engineering components of the plan, and includes things like discussions of the calculations used to estimate runoff volume from the design storm event, and the stormwater routing approach among other details. The comment ignores the fact that these are existing facilities currently subject to regulatory permits and that the Draft EIR Impact 4.10-1 as well as Draft EIR Appendix G includes further details as to what permits would need to be amended.

Impact 4.10-1 describes the regulatory requirements that the mine is already subject to, such as the site's current existing waste discharge requirements No. 90-083 (WDR), its Industrial stormwater pollution prevention plan (SWPPP), its hazardous materials business plan (HMBP) and its spill prevention and countermeasure plan (SPCC), among others. Impact 4.10-1 further discusses these in the context of the proposed project. For example, Draft EIR page 4.10-89 notes that the SWPPP and WDR would need to be updated to reflect the proposed project, while the Draft EIR on page 4.10-90 notes that the HMBP and SPCC would need to be updated. The Draft EIR on page 4.10-90 also notes that the Blasting Protocols (see Appendix H-9 of the Final EIR) "specify practices to prevent the contamination of groundwater and surface water as a result of blasting." The comment does not address these requirements or analyze why they are deficient. Accordingly, the mitigation measures are not unlawfully deferred.

Comment 65-24

e. The DEIR Ignores Possible Impacts from the River Supply Channel without Disclosure or Analysis.

Given that the river supply channel is an acknowledged direct connection between surface water on site and the San Joaquin River, the DEIR must be revised to include a full analysis not just of its water quality, but of its slope, flow characteristics, path to the River, and interactions with Dry Creek. Under Project conditions, the amount of water drawn from the River through the channel will decrease from 295 acre-feet per year to 125 acre feet

per year. (DEIR at 4.19-9.) The DEIR offers no way to understand the effect of that change, or if a lower water level in the channel might allow water to move from the Project site to the River.

A "conclusory discussion" of a significant environmental impact makes an EIR "inadequate as an informational document" as a matter of law. (*Sierra Club*, *supra*, 6 Cal.5th at p.514.) An EIR must provide information regarding the project's significant environmental impacts that is sufficient to allow decision-makers and the public to understand the environmental consequences of the project. (*Id.* at p. 520; *Laurel Heights Improvement Ass'n vRegents of Univ. of Cal.* (1988) 47 Cal.3d 376, 404; See CEQA Guidelines § 15151.) The document must include enough detail to enable the public "to understand and to consider meaningfully the issues raised by the proposed project." (*Id.* at 516 (citation omitted).) By omitting discussion of the river supply ditch almost entirely, the DEIR is inadequate.

Response 65-24

The river supply channel (RSC), as referred to by the commenter, is also called the river water delivery ditch in the Draft EIR (see Section 2.4.2.1, first paragraph and under the heading "Water Usage"). The RSC is an existing component of the Plant Site operations, and no changes are proposed as part of the project except that water use from the river, through the ditch would decrease once the aggregate processing plant at the Quarry Site begins operation (see Draft EIR Section 2.5.2.1, under the heading "Water Usage"). The decrease in use would simply mean less water is diverted to the RSC. Since the proposed conditions with respect to the RSC are identical to the existing, baseline, conditions for the RSC, there are no potential impacts to the environment related to the RSC, in accordance with CEQA. As such, testing the water in the RSC is not required.

Comment 65-25

IV. The DEIR Fails to Adequately Assess and Mitigate Impacts to Ground water Quality and Groundwater Flow.

The DEIR's inadequate analysis of the Project's impacts on groundwater quality, groundwater flow, and groundwater supply lacks substantial evidence and overlooks several reasonably foreseeable impacts. CEQA requires adequate assessment of impacts associated with acquiring and providing water to a Project. (See *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova (2007) 40 Cal.4th 412, 434 [hereinafter "Vineyard Area Citizens"].) This assessment must include both direct and indirect environmental impacts resulting from the permanent allocation of water to a proposed project. (Vineyard Area Citizens,*

supra, 40 Cal.4th at 434.) Here, the DEIR overlooks not only groundwater supply, but groundwater contamination and impacts to groundwater flow from the Project's substantial groundwater pumping and blasting. It further fails to support all mitigation measures with substantial evidence and fails to assess consistency with the North Kings Groundwater Sustainability Plan.

a. The DEIR Fails to Adequately Assess Impacts on Groundwater Quality.

The DEIR fails to adequately assess impacts on groundwater quality and support its conclusions of "less than significant impacts" for several reasons. First, the DEIR fails to mention, let alone adequately discuss, potential cross-contamination between aquifers due to the 600-foot depth of the Quarry site. The 2025 North Kings GSP provides that it is possible for the Project to tap into a separate aquifer at 600 feet below ground surface, which is the maximum depth of this project (North Kings Groundwater Sustainability Agency, 2025). This lower aquifer could have several different contaminants, or the same as those identified, at higher concentrations, impacting both surface water quality and groundwater quality as the Project pumps this water into ponds and trenches.

Response 65-25

See Responses 6-79, 50-5, 65-26, and 506-5, which adequately address the comment's incorrect allegation that the Draft EIR fails to analyze impacts on groundwater quality, which includes groundwater quality down to 600 feet below ground surface. In addition, as provided in Response 410-6, the groundwater contours, isotope data, aquifer pumping test measurements, and water quality data provided in the groundwater conditions report for the project demonstrate that the San Joaquin River is not in direct hydraulic communication with the weathered rock and hard rock; thus, the potential for cross contamination to occur is less than significant. Furthermore, cross contamination between aquifers would not occur with implementation of Mitigation Measure 4.10-1, which is designed to eliminate or reduce water quality impacts to levels that would not have any adverse effect on the San Joaquin River or groundwater.

In the case cited in the comment, *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007), the Court reasoned that, "[t]he ultimate question under CEQA, moreover, is not whether an EIR establishes a likely source of water, but whether it adequately addresses the reasonably foreseeable *impacts* [sic] of supplying water to the project" (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 434).

Groundwater flow and consumption are discussed and analyzed in Section 4.10.3.2 of the Draft EIR (Draft EIR, Section 4.10.3.2, pages 4.10-85 through 4.10-88) and Impacts 4.10-5, 4.10-7, 4.10-8, 4.10-9, 4.10-11, 4.10-12, and 4.10-13 (Draft EIR, pages 4.10-95 through 4.10-98, 4.10-101, 4.10-102, pages 4.10-104 through 4.10-105, 4.10-112 through 4.10-113, 4.10-113 through 4.10-114, and 4.10-114 through 4.10-115, respectively). The Draft EIR adequately addresses the reasonably foreseeable impacts of supplying water to the project, including mitigation measures to ensure less than significant environmental impacts.

The Draft EIR also assesses and determines consistency with the North Kings GSA in Section 4.10, and Chapter 5, "Cumulative Impacts" (Draft EIR pages 5-22 through 5-23, 4.10-56, 4.10-71 through 4.10-72, 4.10-104, 4.10-112 through 4.10-113, and 4.10-115).

Comment 65-26

Relatedly, the DEIR fails to support its contention that "[b]ecause there would be no change in the management of the Northeast Pond, no change in the existing water quality in the Northeast Pond is anticipated." (DEIR at 4.10-89.) Considering the massive increase in pumping at the Quarry site, and thus (1) the increase in groundwater that will end up in the pond, and (2) the water potentially originating from a different aquifer with different contaminants in different concentrations, the EIR must provide more than simply an assumption that the water quality at the Northeast Pond will remain unchanged.

Response 65-26

The project's potential effects related to groundwater and surface water quality were evaluated within Draft EIR Section 4.10, as well as within the *Revised Hydrology and Water Quality Analysis Report* and the *Addendum to: Revised Hydrology and Water Quality Analysis Report* prepared by EMKO Environmental, Inc. (Appendices G-5 and G-6) and included within Draft EIR Appendix G.

Excavations proposed at the Quarry Site would extend to 600 feet below the ground surface, which is contained within the hard rock unit (Draft EIR, Appendix G-5, Section 1.0, pages 2 and 3). Groundwater samples were collected that are representative of the water found in the deeper hard rock unit, so potential groundwater constituents that could be introduced as a result of the proposed project have already been analyzed (Draft EIR, page 4.10-43).

Of the samples collected for the Quarry Site, water quality standards for groundwater were also in compliance, with the exception of the following:

- Nitrate in MW-2M, MW-2D, and MW-6D;
- Manganese in MW-1D, MW-3S, and MW-4D; and
- Gross alpha activity in MW-2M (Draft EIR, p. 4.10-43).

As mentioned in Impact 4.10-6, the elevated nitrates are a regional issue that is being addressed by the RWQCB through the Salt and Nitrate Management Plan (SNMP) (Draft EIR, Impact 4.10-6, pages 4.10-98 through 4.10-99). The exceedances of manganese in some wells only exceed the Basin Plan standards, which do not apply here because the Basin Plan limit for manganese would only apply to groundwater pumped from the Quarry Site if the water was to be discharged directly to the San Joaquin River, and secondary MCL standards, which are in place to avoid undesirable tastes, odors, staining, or scaling but do not pose a threat to human health (*Id.* at page 4.10-99). It is also of note that manganese is a naturally occurring mineral component within the geologic materials at the Quarry Site (*Ibid*.) Finally, the gross alpha activity concentrations found at well MW-2M appear to be an outlier as it differs significantly from the other samples collected at the Quarry Site and may not be representative of the site conditions (*Id.* at page 4.10-99). The concentrations of nitrate, manganese, and gross alpha activity are unassociated with the mining operations (Draft EIR page 6-16), as the samples collected and tested for the purposes of this Draft EIR represent baseline conditions and are not indicative of potential project effects or past practices (Draft EIR page 4.10-85).

Accordingly, the Draft EIR addresses the issues raised by the comment, and the comment does not provide any evidence that these conclusions are inaccurate.

Comment 65-27

Second, the DEIR fails to support the assumption that leaving contaminated water in ponds throughout the Project site will not significantly impact groundwater quality. The DEIR identifies several groundwater quality concerns, including arsenic, nitrate, iron, manganese, and hexavalent chromium (DEIR at 4.10-42) and admits that iron, manganese, and conductivity already exceed their maximum contaminant levels in the Plant Site silt pond and three Quarry Site ponds. (DEIR at 4.10-42, 88.) It further admits that an iron and manganese rich pond that will form at the Plant Site following Phase I could impact groundwater quality. (DEIR at 4.10-95.)

However, the DEIR simply assumes the ponds will not impact groundwater quality. Appendix G provides the only explanation for

this assumption: "Concentrations of total iron, total manganese, and total arsenic exceeded the respective MCLs, indicative of metals in the sediment part of the water samples. These higher concentrations aren't indicated to pose a threat to groundwater quality, because of filtration as some of the silt pond water percolates to groundwater." (Appendix G-3 at 26) Contrary to CEQA's requirement to support such contentions with "substantial evidence," nowhere does the DEIR support this conclusory statement that percolation will essentially eliminate all groundwater quality concerns. (See *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027.)

Relatedly, the DEIR further concludes, without explanation, that leaching from the Plant Site pond into groundwater will essentially stop after operations conclude, despite the Plant Site reclaimed pond remaining full of contaminated water. The DEIR states that any leaching from the Plant site reclaimed pond will "likely" not occur. (DEIR at 4.10-95.) However, nowhere does the DEIR provide an explanation for this assumption.

Response 65-27

The comment incorrectly states that the water in the ponds, and specifically in this case the Plant Site silt ponds, is contaminated. The silt ponds contain naturally occurring mineral, or soil, fines (i.e., silts and clays) that have been washed from the mined aggregate material using water that has either been diverted from the San Joaquin River or prior wash water that has been recycled through the silt ponds (Draft EIR, page 4.10-86). No chemicals or other additives are used as part of the aggregate washing process and thus, no contaminants are discharged to the silt ponds.

As noted in the Response 6-52, Table 4.10-3, "Plant Site Surface Water Quality Data," of the Draft EIR presents data related to existing baseline conditions at the Plant Site silt pond, and as explained in Impact 4.10-1, the limits established by Table 4.10-3 are intended to regulate water quality standards, in the event that there was ever water that discharges to the San Joaquin River, which the silt pond and project do not and would not discharge to the river (Draft EIR, Impact 4.10-1, page 4.10-88). As stated on page 4.10-25 of the Draft EIR:

> The water in the silt pond is typically turbid and contains a high level of suspended solids due to the aggregate washing process. The suspended solids are clays that consist of natural earth materials and minerals. For these constituents, both unfiltered and filtered samples (shown as "total" and "dissolved," respectively in Table 4.10-3) were analyzed. The unfiltered samples contain the suspended mineral solids and represent the total

> concentration of the metals in the water and the suspended solids. The filtered samples contain only metals dissolved in the water. The total concentrations of arsenic, iron, lead, and manganese from the unfiltered samples exceed their respective water quality standards, but the dissolved concentrations from the filtered samples do not.

As the Draft EIR provides, the elevated metals concentrations are due to the presence of suspended silts and sediment within the silt pond (*Id*. at page 4.10-25). Since elevated metals concentrations were not present in the filtered sample, which represents the dissolved concentrations within the water, the detected metals levels in the unfiltered sample are simply a reflection of the naturally occurring metals in the natural soils and earth materials in the fines from the aggregate being processed at the Plant Site (*Id*. at page 4.10-25). The lack of elevated metals in the filtered samples demonstrates that the metals are not leaching from the silt into the natural soils beneath the silt pond and to groundwater.

Comment 65-28

Third, the DEIR fails to provide any support for its contention that the groundwater pumped into ponds and trenches, and later reclaimed ponds, will not impact water quality in the San Joaquin River. For example, the DEIR explains that conductivity levels for four Plant Site wells exceeded the conductivity limit for the San Joaquin River below Friant Dam; however, it dismissed this impact because the Project will not discharge groundwater *directly* to the San Joaquin River. (DEIR at 4.10-43.) This, too, requires further assessment, as Appendix G states that "It is assumed that *half of the groundwater ditch recharge would flow to the San Joaquin River* or local groundwater beyond the project site," (Appendix G-3 at 35 [emphasis added]) and estimates that 145 acre feet per year will go from the trenches to the San Joaquin River or alluvium (over 47 million gallons). (Appendix G-4 at 86.) This is unsurprising, considering "[t]he recharge ditches would be located so as to have a maximum effect in two areas: 1) *near the river*, and 2) near a concentration of offsite wells to the southeast." (Appendix G-3 at 42.) Despite this assumption, nowhere does the DEIR assess impacts of high conductivity levels on groundwater and surface water, nor impacts of other contaminants on water quality in the San Joaquin River and local aquifers.

Furthermore, it remains reasonably foreseeable that flooding in the groundwater trenches and Project Site could contaminate the San Joaquin River. As described above, the DEIR admits that releases from the Friant Dam "could result in flooding of the Quarry site and/or plant site." (DEIR at 4.10 at 119.) The recharge

trenches are just feet from the San Joaquin River (DEIR at 2-19), and again, Appendix G admits that "*half of the groundwater ditch recharge would flow to the San Joaquin River* or local groundwater beyond the project site." (Appendix G-3 at 35[emphasis added].) This is a critical oversight and must be fully assessed.

Response 65-28

The Draft EIR provides adequate analyses and support for its contention that the groundwater pumped into ponds and trenches, and later reclaimed ponds, would not impact water quality in the San Joaquin River, which is addressed in Impacts 4.10-1 and 4.10-4 through 4.10-6 regarding both surface water and groundwater conductivity levels/impacts and Mitigation Measure 4.10-5a (Draft EIR pages 4.10-88, 4.10-93 through 4.10-100).

As provided in Impact 4.10-6, "[t]he project proposes to use and discharge groundwater to the … recharge trenches within the Quarry Site" which groundwater "is generally within established water quality standards, … [and] there are no known sources of potentially hazardous materials contamination of the groundwater at the Quarry Site or its vicinity; therefore, pumping of dewatered groundwater to the … into proposed groundwater recharge trenches along the western boundary of the [Quarry] [S]ite would not have the potential to substantially degrade groundwater quality relative to existing conditions" (Draft EIR, Impact 4.10-6, page 4.10-99).

As explained at pages 4.10-42 through 4.10-43 of the Draft EIR, the Basin Plan conductivity limit is for discharge to the San Joaquin River. Pages 4.10-42 through 4.10-43 of the Draft EIR explain that conductivity levels for Plant Site wells MW-1, MW-2, MW-3, and MW-4 exceeded the Basin Plan conductivity limit for the San Joaquin River below Friant Dam if water from the wells would be discharged to the San Joaquin River, but this is not a proposed part of the project. Plant Site wells MW-1, MW-2, MW-3, and MW-4 are for monitoring purposes only. While the Basin Plan limits for conductivity, iron, and manganese were exceeded, the Basin Plan limits would only apply to groundwater pumped from the Plant Site if the water was to be discharged directly to the San Joaquin River, which is not proposed under this project (Draft EIR, Impact 4.10-4, page 4.10-94).

Similarly, the water pumped to the recharge trenches would come from the groundwater at the Quarry Site (Draft EIR, page 4.10-99) for which the water quality is generally within established water quality standards, and would not be discharged into the San Joaquin River (Draft EIR, page 4.10-99). Therefore, the Basin Plan conductivity limit would not apply.

As explained in Responses 65-20 and 65-22, potentially significant effects or indirect physical changes, for example, related to extreme flooding, are not required to be analyzed or mitigated if those effects would be speculative (CEQA Guidelines Section15064(d)(3)). Furthermore, extreme releases of water from the Friant Dam is not required to be addressed under CEQA since the releases are not reasonably foreseeable (see Draft EIR, Impact 4.10-17, pages 4.10-118 through 4.10-119; see also CEQA Guidelines Section 15064(d)(3)). Regardless, in the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir in an amount that exceeds the river's channel capacity, the Draft EIR provides that the project sites' enlarged mining excavations could help contain and minimize downstream flooding (Draft EIR, page 4.10-119), that the on-site storm runoff, wash water, and sediment would be retained within the project sites' pits and ponds (which would include the recharge trenches), and that the stormwater would be managed in accordance with all applicable requirements of the NPDES program, including site-specific SWPPPs prepared in accordance with Industrial General Permit Requirements and updated Waste Discharge Requirements (Draft EIR, page 4.7-29). In addition, the SWPPP provides that both the Plant and Quarry sites are surrounded by berms/levees that separate onsite drainage from offsite drainage (Draft EIR, page 4.10-68). Finally, the recharge trenches would be at least 200 feet from the San Joaquin River (see Draft EIR, page 4.11-30), not "just feet from the San Joaquin River" as the comment misrepresents.

Comment 65-29

Finally, despite these groundwater quality concerns, the DEIR relies on two unsupported mitigation measures to render these impacts less than significant. For the Plant Site pond specifically, the DEIR includes Mitigation Measure 4.10-5a. However, this mitigation measure requires only monitoring and only suggests a single mitigation strategy for just manganese and iron: "aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond" if iron and manganese levels persist for five years above their water quality standards (DEIR at 4.10-97-98.) Not only does this mitigation measure overlook other contaminants that could exceed standards in the pond, but it provides no support for the efficacy of aeration. This is impermissible, as substantial evidence in the record must support mitigation measures' effectiveness. (*Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027.)

Response 65-29

See Responses 12-76, 12-97, and 12-100, which provide the requirements of Mitigation Measure 4.10-5a that are supported by substantial evidence that Mitigation Measure 4.10-5a would be effective and commits to a detailed plan for monitoring groundwater quality by sampling every six months until manganese levels have fallen to within the water quality parameters for a five-year period, and commits the Operator to complying with regulations relating to groundwater quality thresholds which may change (Draft EIR pages 4.10-95 through 4.10-96; see also CEQA Guidelines Section 15384(b)). Additionally, as provided in Response 12-100, Mitigation Measure 4.10-5a has been revised through errata presented in Final EIR Chapter 3, "Draft EIR Errata," to more clearly describe timing and oversight of measure implementation.

Comment 65-30

And for groundwater quality at the Quarry Site, the DEIR provides "Blasting Protocols" to prevent groundwater contamination from explosives. However, not only does this ignore other potential sources of contamination (e.g. cross contamination between aquifers), but the DEIR fails to explain how the list of Best Management Practices in Appendix H-6 will prevent groundwater contamination from explosives, as CEQA requires. (DEIR at 4.10-99-100.)

Response 65-30

See Responses 12-75 and 58-46, which adequate address the Blasting Protocols and Mitigation measure 4.10-1.

As part of the project design, the use of blasting agents would involve standard industry best practices, that when implemented are proven to mitigate potential impacts to groundwater and surface water (see Draft EIR, Impact 4.10-1, page 4.10-90). Recognizing these potential effects, the Draft EIR includes Mitigation Measure 4.10-1, which requires compliance with Blasting Protocols, which are designed to eliminate or reduce water quality impacts to levels that would not have any adverse effect on the San Joaquin River or groundwater (Draft EIR, Impact 4.10-1, Mitigation Measure 4.10-1, pages 4.10-88 through 4.10-92; see also Draft EIR, Appendix G-5, Section 6, pages 57 through 61).

The Blasting Protocols work to prevent groundwater contamination by prohibiting the storage of explosives on site, requiring blasting designs and loading controls to be prepared by qualified blasting contractors to ensure complete detonation, specifying loading practices such as cleaning loading equipment in areas where wastewater can be properly contained, requiring explosives to be selected that have appropriate water resistance for the site conditions present, and requiring the implementation of practices

for the management of muck piles (the fragmented pieces of rock left after the blast) to prevent interaction with stormwater (see Draft EIR, Impact 4.10-1, page 4.10-90).

Comment 65-31

b. The DEIR Fails to Adequately Support Its Conclusions Regarding Impacts to Groundwater Flow.

First, the DEIR fails to support its estimate regarding how much groundwater will be diverted from its natural flow pattern and end up in the Project site excavations. The DEIR admits that "[s]everal communities and individual residences in the foothills and Sierra Nevada rely exclusively on groundwater from bedrock wells for their supply." (Appendix G-5 at 12.) And it explains that groundwater infiltration into the bedrock does occur and is dependent on the degree and nature of fracturing of the weathered rock and hard rock. (DEIR at 4.10-48.)

However, despite impacts on groundwater in this bedrock and communities that rely on it, the DEIR failed to provide sufficient information on impacts of that groundwater ending up in the Project excavations. While Appendix G estimates average hydraulic conductivity through hard rock as 1.4 gallons per day per foot (Appendix G-4 at 90), and estimates that 195 acre feet will end up in the Quarry Site annually, Appendix G acknowledges that "the thickness of the water producing fractures [in the bedrock] is unknown." (Appendix G-4 at 90.) This is critical information missing from the groundwater flow analysis. The Project could capture far more groundwater, diverted from its natural flow path, than the DEIR acknowledges.

Response 65-31

The impacts to groundwater supplies during mining operations and after reclamation are adequately analyzed in Impacts 4.10-10, 4.10-11, 4.10-12, and 4.10-13 (see Draft EIR, pages 4.10-105 through 4.10-115). Impact 4.10-10 determined that there would be a potentially significant impact. Specifically, if "[w]ater production volumes from the CSA 44C wells decline to the point where current water demand cannot be met, then this would result in a significant impact to available groundwater supply," and that "[s]imilar effects could occur in the other water supply wells near the Quarry Site" (Draft EIR, Impact 4.10-10, page 4.10-107). To reduce such potential impacts to a less than significant level, the project must implement Mitigation Measure 4.10-10a, which monitors groundwater levels within the alluvium, weathered rock, and hard rock, and which requires that if at any point the mining operation causes groundwater levels to decrease by more than 15 percent from the existing CEQA baseline, all dewatering operations must

cease. Mitigation Measure 4.10-10b requires an Adaptive Management Program Funding Mechanism to ensure mitigation measures continue after mining ceases.

The comment mischaracterizes Draft EIR Appendix G-4, page 90. While acknowledging that the thickness of the water producing fractures is unknown, Draft EIR Appendix G-4 on page 90 goes on to describe how hydraulic connectivity was calculated by the hydrology expert. The comment does not describe how this methodology is inadequate.

The discussion on page 90 of Appendix G-4 of the Draft EIR is referring to the thickness of the hard rock zone that is fractured and contains groundwater. The subsequent discussion in the paragraph on page 90 of Appendix G-4 to which this comment refers addresses the assumptions that were used, based on site-specific hydrogeological data and observations, to estimate the thickness of the groundwater-bearing fractured interval in the hard rock. The thickness identified in Appendix G-4 is the minimum potential value. However, it is important to note that the referenced discussion in Appendix G-4 is describing the calculations used to estimate the hydraulic conductivity (K) value, which relates to groundwater flow rate, using the transmissivity (T) values, which relates to aquifer yield, that were measured at the Quarry Site during the aquifer pumping tests. The relationship between the hydraulic conductivity and the transmissivity is defined by the following equation:

$$T = K \times b$$

where b is the saturated thickness of the aquifer zone. Thus, as described on page 90 of Appendix G-4, the hydraulic conductivity value is calculated by dividing the transmissivity by the saturated aquifer thickness. Thus, if the saturated aquifer thickness were greater than that estimated in Appendix G-4, the hydraulic conductivity value would be lower than the 1.4 gallons per day per square foot value identified on page 90 and the resulting rate of groundwater movement would be less.

By using the measured transmissivity value for the hard rock, based on the pumping test results, and the minimum potential saturated aquifer thickness, based on the field observations during drilling, the resulting hydraulic conductivity of the hard rock identified in Appendix G-4 provides a high estimate of the potential rate of groundwater flow under the Quarry Site. Using a higher value for the fracture zone thickness would result in hydraulic conductivity values that would suggest that less groundwater would be captured by the project.

In any case, groundwater pumped from the Quarry would be recharged back to the aquifer through perimeter trenches and the Northeast Pond, and Mitigation Measure

4.10-10a provides for on-going monitoring and actions to ensure that groundwater levels do not fall below prescribed levels in onsite monitoring wells and adjacent supply wells.

Moreover, "[w]hile a lead agency must use its 'best efforts' to evaluate environmental effects, including the use of reasonable forecasting, 'foreseeing the unforeseeable' is not required, nor is predicting the unpredictable or quantifying the unquantifiable." (*Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1060–1061; citing Guidelines, Section 15064, subd. (d)(3).) Here, the County uses its best efforts in the Draft EIR to evaluate the impacts to groundwater flow utilizing hydrologic experts with doctoral degrees and years of experience in their fields. Further, as discussed in Response 12-77, to ensure that there is a less than significant impact, Mitigation Measures 4.10-10a and 4.10-10b could be implemented, which would mitigate any groundwater depletion caused by the mine greater than 15 percent as compared to the CEQA baseline.

Comment 65-32

Second, DEIR fails to take into account the potential for blasting and drilling to impact the thickness of the fractures in the hard rock. Thicker and more numerous fractures in the hard rock from blasting would result in more groundwater reaching the Project site after passing through the alluvium, drawing down aquifers potentially far beyond the Project site. Despite this potential, the EIR concludes that there will be "no significant change in the volume flowing through alluvium and weathered rock" than before the quarry deepens. (DEIR at 4.10-114.) The EIR needs to assess this impact and assess the potential for more groundwater to flow into the Project site as a result of thicker fractures after blasting.

Response 65-32

The comment asserts that the Draft EIR fails to analyze blasting and drilling impacts to the thickness of the fractures in the hard rock. Impact 4.10-11 addresses this and provides that:

> As the mining excavation extends to greater depths in the hard rock, the amount of dewatering necessary would increase. However, the increase in dewatering would not be directly proportional to the increase in depth of the quarry pit. This is because the extent of fracturing within hard rock geologic units tends to be greater at shallow depths and decreases with depth due to the pressure of the overlying rock, which tends to push any

> fractures closed (Draft EIR, page 4.10-112; see also Draft EIR Appendix G-5, Section 3.2.1, pages 45 through 46).

The comment does not address the determination and analysis contained within Draft EIR Impact 4.10-11, nor describe why the statement noted above is incorrect. Regardless, impacts to the groundwater would be adequately mitigated by Mitigation Measure 4.10-10a, which requires that dewatering operations cease (i.e., no more blasting could occur) if groundwater levels decrease 15 percent below the CEQA baseline.

The effects of blasting on the rock are described in Appendix H-3 and summarized on page 4.13-8 of the Draft EIR. As stated in the Draft EIR, the volume of rock that is fractured during blasting is a downward pointing cone, with its apex at the bottom of the boreholes in which the blasting agents were placed, and its base at the surface of the ground where the boreholes were drilled. The radius of the base is equal to the depth of the borehole. Beyond this cone-shaped volume, no permanent deformation, or fracturing, of the rock occurs. As noted in Section 2.5.2.2 of the Draft EIR, the Quarry Site would be mined with approximately 50-foot-high benches. Thus, blasting would only result in additional fracturing to a distance of 50 feet away from each blast hole. As a result, there would be no enhancement of the fractures outside of the Quarry Site and no potential for increased groundwater flow into the Quarry due to blasting.

Furthermore, Mitigation Measure 4.10-1 would require implementation of the Blasting Protocols (Appendix H-9), which specify that blasting must begin at the center of the Quarry Site so that monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibrations measurements and allow for adjustments in blasting design to occur based on the monitoring results, which would prevent additional fracturing of the hard rock outside of the Quarry Site.

Comment 65-33

Third, the DEIR fails to explain the flow patterns of groundwater within the bedrock. Rather, Appendix F-2 explains that "the 7 groundwater monitoring wells installed within the bedrock that have been recently installed do not provide information about the continuity of the groundwater flow … [or] distribution of aquifers and aquitards." (Appendix F-2 at 9.) In other words, the DEIR lacks critical information about flow that should affect the monitoring well placement 600 feet below ground in the bedrock. The EIR requires this critical information, as clustered monitoring wells should monitor groundwater both upstream and downstream with screening intervals at different depths to capture representative samples of contaminants. As a result, the final EIR must contain

a full study modeling groundwater flow in the bedrock and place monitoring wells accordingly.

Response 65-33

The Draft EIR adequately analyzes the flow patterns of groundwater within the hard rock (see Draft EIR, page 4.10-85; see also Draft EIR Appendix G-3, "Groundwater Conditions at the Plant Site," and Draft EIR Appendix G-4, "Groundwater Conditions at the Quarry Site"). The Draft EIR analyzes the existing groundwater hydrology conditions on the project sites and evaluates the potential impacts to groundwater hydrology under the proposed project (see Draft EIR, page 4.10-85 through 4.10-86). Further, Mitigation Measure 4.10-1 requires the implementation of the Blasting Protocols, which "specify practices to prevent the contamination of groundwater … as a result of blasting" (see Draft EIR, page 4.10-90; see Impact 4.10-1; see also Appendix H-9 of the Final EIR).

Further, Draft EIR Appendix F-2, which is referenced in the comment, is the Quarry Site Geotechnical Report, and the quoted statement is made within the context of determining the "pore pressure distribution within the slope stability model," not to provide data as to groundwater conditions at the Plant Site and Quarry Site. The discussion on page 9 of Appendix F-2 of the Draft EIR that is cited in this comment is referring to the sufficiency of information for the sole purpose of assessing pore pressure distribution within the geotechnical slope stability model.

Appendix G-4 of the Draft EIR contains a detailed evaluation of groundwater conditions, includes groundwater contour maps, boring logs, and aquifer pumping test observations and results that address the continuity of flow, along with the distribution of different groundwater zones, or aquifers.

It is important to note that Appendix F-2 was completed in April 2019, while Appendix G-4 was completed in May 2021. Therefore, the statement from Appendix F-2 cited in this comment predates the detailed groundwater evaluation of the Quarry Site and is, therefore, no longer relevant beyond the description of the methods used in 2019 to estimate pore pressure distribution.

Comment 65-34

c. The DEIR Fails to Adequately Assess the Project's Impacts on Groundwater Supply.

The Project will require significant dewatering, first during excavation, then continuously as groundwater flows into the excavation pits. The DEIR estimates that half of the groundwater pumped out of the excavations will go to recharge trenches along

the perimeter of the project site to "minimize drawdown" near a number of offsite wells and may also be used for dust control and wash water. (DEIR at 4.10-86, 87.) The rate of dewatering at the Plant Site will reach 1,610 acre feet per year (DEIR at 4.10-86) and at the Quarry Site 320 acre-feet per year under current conditions, 375 acre-feet per year after 30 years of mining, and 405 acre-feet per year at the end of mining. (Appendix G-5 at 45.) The projected drawdown would be approximately 90 feet at the edge of the quarry pit, 45 feet 2,000 feet from the pit, and 15 feet at 4,000 feet away. (DEIR at 4.10-107.) Dewatering will result in impacts to groundwater hydrology, altered flow regimes, and reduced groundwater levels.

Despite these critical impacts, the DEIR relies solely on recharge trenches to prevent aquifer depletion from additional acres of impervious surfaces at the Quarry Site, groundwater pumping, and the cone of depression. (DEIR at 5-23-24.) The DEIR explains "it is *most likely* that the recharge operations would be conducted throughout the mining and active dewatering period as the primary means to manage the water pumped from excavation." (DEIR at 4.10-107 [emphasis added].) In other words, the DEIR concludes that because some water pumped from the excavation area would end up in recharge trenches and ponds, "there [will] not be a substantial reduction in local groundwater volumes during mining." (DEIR at 4.10-102.)

Nowhere does the DEIR provide evidence supporting this conclusion. Instead, Appendix G estimates that there will be about 195 acre feet of outflow from the recharge ditches annually (compared to the maximum dewatering from the Plant Site of 1,610 acre feet per year and 405 acre feet from the Quarry Site per year.) (Appendix G-4 at 86.) Furthermore, the DEIR admits that only about half of the water taken from the excavation during dewatering will go to the recharge trenches (DEIR at 4.10-87), only half of which will flow to the San Joaquin River *or* local aquifers. (Appendix G-3 at 35.) Thus the DEIR's reliance on recharge trenches is not supported by substantial evidence.

Response 65-34

See Response 58-27, which adequately addresses this comment's allegation that the Draft EIR's reliance on recharge trenches is not supported by substantial evidence. As noted in Response 58-27, recharge trenches and ponds for groundwater recharge have been used for decades at the Quarry Site, and at numerous other aggregate mining sites in the San Joaquin Valley. Those sites have been reviewed and are within the personal knowledge of two of the hydrology experts who worked on the Draft EIR hydrology reports.

Furthermore, Draft EIR Appendix G-6 (the *Addendum to: Revised Hydrology and Water Quality Analysis Report*) provides a quantitative assessment of the efficacy of the use of recharge trenches to mitigate effects on groundwater levels (see Draft EIR, Appendix G-6, page 3). In addition, as noted in Response 12-77, Mitigation Measure 4.10-10a requires mining operations to cease if groundwater recharge cannot be maintained within 85 percent of the CEQA Baseline groundwater levels.

Recharge of groundwater using perimeter trenches and the Northeast Pond have been occurring at the Quarry Site for decades and are part of the existing baseline conditions. Furthermore, Appendix G-6 provides a comparison of rainfall with groundwater elevation data at both the Plant Site and the Quarry Site. Based on the data from 2017 to 2023, Appendix G-6 reaches the conclusion that:

> "The rapid response to elevated rainfall, especially in the weathered rock and hard rock, demonstrates the viability and anticipated efficacy of recharge trenches to mitigate any potential decline in groundwater levels in nearby wells due to dewatering of the quarry. More specifically, since dispersed rainfall resulted in such a rapid increase in groundwater levels across the entire site, recharge trenches focused on areas where effects on groundwater levels in nearby wells may potentially occur due to dewatering would have the same localized effects in areas where mitigation may be called for in accordance with the adaptive management plans presented in the June 2023 Revised Hydrology and Water Quality Analysis Report prepared by EMKO Environmental, Inc."

The referenced adaptive management plans are described in Appendix G-5 of the Draft EIR and are incorporated into Mitigation Measure 4.10-10a. Therefore, the analysis in the Draft EIR related to recharge is based on substantial evidence presented in Appendices G-5 and G-6.

Comment 65-35

Additionally, nowhere does the DEIR discuss the possibility of subsidence as a result of the massive pumping the Project will require. Instead, it dismisses this impact with one sentence, explaining that because the project will drill into hard rock there will be no subsidence. (Appendix F-1 at 14, F-2 at 8.) However, the Project Description provides that "remaining alluvial deposits on approximately 117.6 acres of the 138.5-acre Plant Site would be mined to a depth of approximately 85 feet below ground surface." (DEIR at 2-3, 2-29.) This will require substantial dewatering at the Plant site, which could result in subsidence. Subsidence, if it were to occur, could also have additional impacts, including a

potential increase in flood risk. The EIR must provide more than one sentence to support its conclusion that subsidence will not be a significant impact.

Response 65-35

The Draft EIR found that "[n]o significant ground subsidence from mining operations is anticipated" at the Plant Site since "[b]elow the groundwater level, the subsurface soils generally consist of dense to very dense alluvial sands and gravels underlain by sedimentary and/or granitic rock…" (see Draft EIR, Section 4.7.1.2, "Regulatory Setting," page 4.7-11; and Appendix F-1, Section 7.8, page 14). In addition, Section 3.2.6 of the 2025 Update to the North Kings Groundwater Sustainability Plan states that "the compression of clay as a result of result of groundwater extraction from confined aquifers is the cause of the vast majority of subsidence documented in the San Joaquin Valley…Most of the permanent subsidence if the San Joaquin Valley has historically been correlated to overdraft in the confined aquifer below the Corcoran Clay."

Dewatering at the Plant Site would be temporary and would occur in an unconfined aquifer zone. Specifically, there are no clay layers that overly the alluvial aggregate deposits to be mined at the Plant Site, such that a confined aquifer is not present within the depths to be dewatered and mined. As noted on page 3-75 of the 2025 Update to the North Kings Groundwater Sustainability Plan, the Corcoran Clay is only present near the western edge of the groundwater subbasin, more than 25 miles from the project area, and there has been only minimal subsidence within the North Kings GSA boundary.

As to the Quarry Site, the Draft EIR found that since "the site is underlain by in-place granitic rock, no significant ground subsidence from mining operations is anticipated" (see Draft EIR, Appendix F-2, Section 4.8, page 8). The granitic rock zones have effectively no primary porosity and very limited secondary fracture porosity (see Draft EIR, Impact 4.10-11, page 4.10-112). Thus, dewatering of the deeper bedrock zones would have little or no effect on water levels in the overlying alluvium (Draft EIR, at pages 4.10-112 through 4.10-113).

In addition, the citation to the Draft EIR on pages 2-3 and 2-29 have no relevance to the analysis of subsidence, as they do not describe the conditions underlying the Plant Site.

Comment 65-36

The only mitigation measures provided for the reasonably foreseeable drawdown of water around the Project site are Mitigation Measure 4.10-10a, "Quarry Site Groundwater Adaptive Management Program" and Mitigation Measure 4.10-10b, "Quarry Site Groundwater Adaptive Management Program Funding Mechanism."

However, neither provide mitigation measures beyond the recharge trenches. Rather, they require only monitoring and vague "corrective measures" if drawdown goes beyond 15% of the baseline. (DEIR at 4.10-109.) The only specifics they provide is additional water diverted to recharge trenches, which is already part of the Project and the sole strategy identified in the DEIR for mitigating drawdown. (Id.) This is insufficient under CEQA, which requires that a lead agency adopt concrete, specific, and enforceable actions to mitigate significant impacts. (California Clean Energy Committee v. City of Woodland (2014) 225 Cal.App.4th 173); (See also Federation of Hillside & Canyon Ass'ns v. City of Los Angeles (2000) 83 Cal.App.4th 1252, 1261 [mitigation measures must be "fully enforceable through permit conditions, agreements, or other measures" so "that feasible mitigation measures will actually be implemented as a condition of development."].)

Response 65-36

The comment asserts that Mitigation Measure 4.10-10a fails to provide concrete, specific, and enforceable actions to mitigate drawdown around the Quarry Site. Specifically, all dewatering activities would cease if the groundwater level drops due to the mine activities by more than 15 percent of the CEQA baseline groundwater level (see Draft EIR, Mitigation Measure 4.10-10a, page 4.10-109). This measure constitutes a concrete, specific, and enforceable action to mitigate the impact (i.e., ceasing dewatering if the groundwater level goes below 85 percent of the CEQA baseline). Other than to criticize the use of recharge trenches, which is addressed in the Response 58-27, the comment does not address the effectiveness of Mitigation Measures 4.10-10a and 4.10-10b, which measures encompass four pages in the Draft EIR (Draft EIR pages 4.10-108 through 4.10-111), and contain extensive requirements such as continuous groundwater level monitoring during the life of the mining operation, continuous use of recharge trenches and the Northeast Pond, ceasing all dewatering mining operations if groundwater levels in the monitoring wells drop below 85 percent of the CEQA baseline due to mine activities, providing post-mining monitoring of the groundwater levels and funding in the case of indefinite utilization of the recharge trenches and Northeast Pond post-reclamation. Specifically, if the water column decreases by more than 15 percent due to factors not caused by the mine, such as drought, future developments in the area that rely on groundwater, or a reduction in regional groundwater recharge (for example, by changes in operating practices on the San Joaquin River or Friant Kern Canal), then the mine would not be the cause to any significant impact on the available groundwater supply (Draft EIR, Mitigation Measure 4.10-10a, page 4.10-110).

Comment 65-37

d. The DEIR Fails to Acknowledge the Potential of Pit Failure and Its Impacts on Groundwater Quality and Flow.

Nowhere does the DEIR even mention, let alone meaningfully discuss, impacts to groundwater quality and flow from potential pit failure. Instead, the DEIR asserts that mitigation through monitoring will reduce the impact of pit failure at both sites to less than significant, despite the Quarry Site's location just 200 feet from the San Joaquin River. (DEIR at 4.7-30-37, 2-17.) However, in reaching this conclusion, the DEIR admits that it lacks critical information to support its slope stability conclusions: (1) it lacks boring data to develop reliable kinematic models; and (2) it lacks information about local groundwater conditions that could affect kinematic stability of portions of mining slopes, including artesian conditions, preferential seepage paths, and piping conditions. (DEIR at 4.7-34.) Specifically, Appendix F-2 explains that "the 7 groundwater monitoring wells installed within the bedrock that have been recently installed do not provide information about the continuity of the groundwater flow … [or]distribution of aquifers and aquitards, and consequently they do not provide sufficient information key to assessing pore pressure distribution within the slope stability model."(Appendix F-2 at 9.) Without this critical information, the DEIR fails to support its conclusions regarding slope stability with substantial evidence and overlooks grave potential impacts to groundwater quality and flow.

The DEIR promises to mitigate the impacts of slope instability at the Quarry Site with a Quarry Site kinematic analysis and another study on groundwater conditions with the potential to impact stability. (DEIR at 4.7-36-37.) But this is insufficient under CEQA, which requires binding, enforceable mitigation *before* Project approval. (Guidelines § 15126.4, subd. (a)(2)). "[A]n agency goes too far when it simply requires a project applicant to obtain a [] report and then comply with any recommendations that may be made in the report." (*Ctr. for Biological Diversity v. Dep't of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 240); (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 793.) These reports regarding potential slope instability cannot be deferred until a later stage; they must be completed before Project approval.

Response 65-37

The adaptive approaches in Mitigation Measures 4.7-6, 4.7-7a, and 4.10-1, adequately address the potential of pit failure and its impacts on groundwater quality and flow, and thus do not constitute deferred mitigation.

Impact 4.7-7 addresses slope instability at the Quarry Site (Draft EIR, pages 4.7-32 through 4.7-37). Impact 4.7-7 determined that "the development of the quarry pit with the proposed slopes would achieve the required factors-of-safety for slope stability under both static and seismic loading" (Draft EIR, page 4.7-33). In addition, to be conservative, the Draft EIR requires the implementation of Mitigation Measures 4.7-7a, 4.7-7b, and 4.7-7c, which would require continued monitoring of the quarry pit slope stability as mining progresses and pit areas are exposed, which are currently underground, and which include the following:

- Mitigation Measure 4.7-7a, "Quarry Site Slope Stability Monitoring" (Draft EIR pages 4.7-35 through 4.7-36):
  - Retention of a County-approved qualified engineering geologist or geotechnical engineer experienced in evaluating the stability of slopes in both hard rock and alluvial materials;
  - Develop an inspection and reporting program, which inspections will be semi-annual until a comprehensive and reliable geologic and groundwater model of the site is developed;
  - Inspect the interim mining slopes as well as perimeter slopes;
  - Based on inspection results, recommend any necessary reconfiguration of mining slope gradients, dewatering measures, and localized stabilization;
  - Conduct the survey and monitoring program, which includes the following:
    - Groundwater regime characterization, including effects of dewatering on the aquifers and slope stability;
    - Rock mass discontinuities and structure characterization; and
    - Slope stability evaluation, including kinematic failure analyses;
  - Submit inspection reports within 30 days after every inspection; and
  - If mining operations have an adverse impact on slope stability or groundwater, the engineering geologist or geotechnical engineer would provide feasible recommendations to mitigate the slope stability concerns to achieve a minimum static factor of safety of 1.5 and a pseudo-static (seismic) factor of safety greater than 1.1, which must be implemented within six months.

- Mitigation Measure 4.7-7b, "Quarry Site Kinematic Analyses" (Draft EIR, page 4.7-36):
  - Conduct periodic field surveys of structural geologic data and apply this information to kinematic analyses of the quarry pit;
  - During the first year of mining, conduct field surveys every six months;
  - After that, during the Phase 1 mining, carry out mapping every time the excavation exposes an area of approximately 50 vertical feet and 1,000 horizontal feet of previously unmapped slope;
  - As the mapping proceeds, identify structural domains (i.e., portions of the rock mass with similar patterns of rock mass discontinuities) and conduct appropriate kinematic analyses of various failure modes;
  - Submit inspection reports within 30 days after every inspection, which reports include recommendations to prevent kinematic-type failure; and
  - Implement recommendations within 6 months, if feasible, otherwise no later than one year from the publishing of the recommendations.
- Mitigation Measure 4.7-7c, "Quarry Site Groundwater Conditions" (Draft EIR, page 4.7-36 through 4.7-37):
  - Conduct observations of groundwater conditions relevant to slope stability, which observations must focus on the potential presence of:
    - Artesian conditions;
    - Preferential seepage paths; and
    - Piping conditions.
  - To assist with these observations, install at least four piezometers (wells) within six months of project commencement and within the hard to very hard intact granitic rock, which wells would also cover the full interval to be mined, and nested to establish at least 3 monitoring intervals within the intact bedrock:
    - Two locations spaced equally between MW-1 and MW-2 along the westerly perimeter of the quarry pit along the San Joaquin River;
    - One location at the eastern boundary near the entry point from Friant Road; and
    - One location at the southwest limit of the project area between MW-2 and MW-7.
  - Evaluate seepage conditions that may indicate local or more extensive rock slope instability due to local water pressure conditions.
  - Document groundwater observations and submit to the County as required under Mitigation Measure 4.7-7b.

- The comment's deferred mitigation comment is also adequately addressed by Response 58-46, which discussed Mitigation Measure 4.10-1's Blasting Protocols.

Further, Impact 4.7-6 adequately addresses the Plant Site's slope stability, and requires implementation of Mitigation Measure 4.7-6, which is similar to Mitigation Measure 4.7-7a discussed above (Draft EIR, pages 4.7-30 through 4.7-32).

In addition, Mitigation Measures 4.7-6, 4.7-7a, 4.7-7b, 4.7-7c, and 4.10-1 constitute appropriate studies under CEQA because "there is a definite commitment both to produce the study and to take such mitigation measures as are recommended by it" (*Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 366).

Finally, Mitigation Measure 4.7-7a on Draft EIR page 4.7-35 and Mitigation Measure 4.7-7c on Draft EIR page 4.7-37 are revised in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata," specifying the timing of the prescribed inspections and monitoring activities.

Comment 65-38

e. The DEIR Fails to Adequately Assess Consistency with the North Kings Groundwater Sustainability Plan.

Finally, Appendix G of CEQA provides that a project has significant impacts if it conflicts with or obstructs a sustainable groundwater management plan. (DEIR at 4.10-83.) However, the DEIR incorrectly claims that it need not assess consistency with the North Kings Groundwater Sustainability Plan (GSP) (or any other GSP) because it is not part of the North Kings GSA area. (DEIR at 4.10-112-13.) Specifically, it claims that the top of the hard rock unit at the Quarry site is the top of the plutonic bedrock: a depth at which the North Kings GSA does not address. (DEIR at 4.10-112.) However, the boundary modification request to Department of Water Resources (DWR) that *may* draw this boundary has not yet been approved. (North Kings 2025 GSP at 3-33.) Thus, at this time the DEIR must assess consistency with the GSP, as it is admittedly "located within the jurisdiction of the North Kings GSA," in a critically over-drafted subbasin. (DEIR at 5-23.)

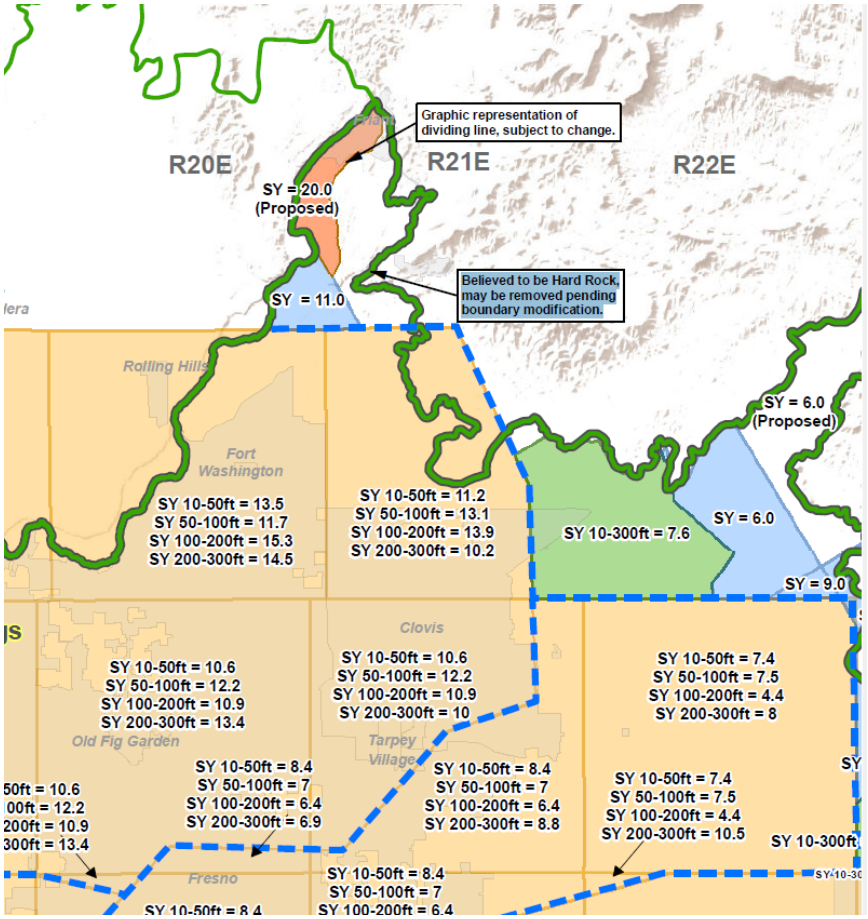
As a result of this incorrect assumption, the DEIR's assessment of consistency with the GSP is inadequate. The DEIR even admits elsewhere that "[t]the use of groundwater by the proposed project and cumulative projects in a critically over-drafted groundwater basin could also lead to conflict or obstruction of the North Kings GSA Groundwater Sustainability Plan, which is a potentially

significant cumulative impact." (DEIR at 5-23.) However, the DEIR assures that Impact 4.10-18 fully assessed this conflict: an impact that does not exist in the DEIR. (DEIR at 5-23, 4.10-119 [impact 4.10-17 is the final in the section].) The EIR must include this assessment and support any consistency findings with substantial evidence.

Response 65-38

The Draft EIR provides that the North Kings Groundwater Sustainability Agency's groundwater management area is not experiencing critical overdraft conditions and that the Quarry Site and Plant Site would:

(a) Not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project would impede sustainable groundwater management of the basin, and
(b) Not conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management



(see Draft EIR, Appendix G-5, Section 2.2.1, pages 10 through 12 and Section 5.0, pages 55 through 57).

Further, Impact 4.10-11 determined that the project would not substantially decrease groundwater supplies during mining operations and after completion of reclamation at the Quarry Site, and thus the project would not impede sustainable groundwater management of the Basin (Draft EIR, pages 4.10-112 through 4.10-113). In addition, Impact 4.10-13 analyzed and determined that the Plant Site and Quarry Site would not impede sustainable groundwater management of the Basin, nor substantially interfere with groundwater recharge (Draft EIR, pages 4.10-114 through 4.10-115).

In citing Draft EIR pages 4.10-112 through 4.10-113, the comment asserts that the Draft EIR does not assess consistency with the North Kings Groundwater Sustainability Plan (GSP) because the Quarry Site is not part of the North Kings GSA area. As provided in Impact 4.10-11, the North Kings GSP includes the alluvial within the aquifer system, but does not include the hard rock, and since the Quarry Site no longer has the alluvial (due to existing mining operations), the remaining "hard rock unit and groundwater within it are not part of the North Kings GSA area groundwater basin and are not addressed by the" GSP (Draft EIR, Impact 4.10-11, pages 4.10-112 through 4.10-113). This is further supported by the North Kings GSA GSP: "Wells drilled into hard rock are not eligible for mitigation, since they would be located outside of a DWR-designated alluvial groundwater basin, and therefore not subject to SGMA" (2025 North Kings GSA GSP, Appendix 6-B, Domestic Well Mitigation Program Rules & Regulations, Section 3.2, page

5). The EIR has much more detailed site specific information on the hard rock issue as compared to the GSP, which GSP was required to cover a much larger geographic area (which larger area is illustrated on page 33 of the North Kings GSA GSP, the page referenced in the comment). Furthermore, the Draft EIR correctly states that "[t]he project sites are located within the jurisdiction of the North Kings GSA, which experiences a positive water balance during normal and wet year conditions" (see Draft EIR, page 5-23; see also North Kings GSA GSP, Table 3-10, page 3-111). In turn, the Draft EIR determined that "the project's contribution to the significant cumulative impacts related to the depletion of groundwater and conflict/obstruction with the North Kings GSA GSP would be less than cumulatively considerable" because "the estimated increase in groundwater consumption at the Plant and Quarry sites are several orders of magnitude smaller than the fluctuations in the water balance of the North Kings GSA area" (*Ibid*.).

Finally, revisions are made to Draft EIR pages 5-22 through 5-24 in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata," to correct typographical errors that twice cited incorrect impact numbers.

This image is from page 33 of the North Kings GSA GSP 2025.

Comment 65-39

VII. The DEIR's GHG Analysis Is Inadequate and Misleading.

The Project will emit significant GHG emissions, which the DEIR obscures with an outdated baseline and an incorrect threshold of significance that ignores feasible mitigation and misrepresents the state's climate plans. The Project proposes to lock in intensive mining on the site for one hundred years, long past the time when California needs to achieve net zero emissions. Approving a Project of this scale without adequate consideration of GHG impacts is irresponsible and a violation of CEQA.

a. The Climate Crisis Is a Catastrophic and Urgent Threat to California.

A strong, international scientific consensus has established that human-caused climate change is causing widespread harms to human society and natural systems, and that climate change threats are becoming increasingly dangerous. The Intergovernmental Panel on Climate Change (IPCC), the leading international scientific body for the assessment of climate change, concluded in its 2023 Sixth Assessment Report that: "[u]nsustainable and unequal energy and land use as well as more than a century of burning fossil fuels have unequivocally caused global warming, with global surface temperature reaching 1.1°C above 1850-1900 in 2011-2020." (IPCC, 2023). The increase in global surface temperature has resulted in sea level rise, increased frequency of extreme weather events, and has resulted in "irreversible losses" at the species and ecosystem levels. (IPCC, 2023). These findings were echoed in the United States' own 2023 Fifth National Climate Assessment, prepared by scientific experts and reviewed by the National Academy of Sciences and multiple federal agencies. The 2023 Assessment concluded that "[t]he global warming observed over the industrial era is unequivocally caused by greenhouse gas emissions from human activities–primarily burning fossil fuels" and long-term responses include "sea level rise, ice sheet losses, and associated disruptions to human health, social systems, and ecosystems." (US Global Change Research Program, 2023).

In its 2020 update, the National Academy of Sciences and the Royal Society concluded that climate change is largely a result of human activity, as "natural causes alone are inadequate to explain the recent observed changes in climate." (National Academy of Sciences & Royal Society, 2020). The additional carbon input from human activities has significantly disturbed the natural carbon cycle, resulting in an imbalance in the system that fosters global climate stability. (National Academy of Sciences & Royal Society, 2020).

Based on observed and expected harms from climate change, in 2009 the U.S. Environmental Protection Agency found that greenhouse gas pollution endangers the health and welfare of current and future generations. (74 Fed. Reg. 66496 (Dec. 15, 2009) [U.S. EPA, Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act; Final Rule].) In 2021, EPA again recognized the critical nature of the climate crisis, stating that: "[t]he changing climate is affecting people's health and livelihoods and damaging infrastructure, ecosystems, and social systems in communities in every region of the nation." (US Environmental Protection Agency, 2021)

These authoritative climate assessments decisively recognize the dominant role of greenhouse gases in driving climate change. In its 2023 Assessment Report, IPCC stated that "the extent to which current and future generations will experience a hotter and different world depends on choices now and in the near term." (IPCC, 2023). In order to prevent global warming from reaching an irreversible point, policies must be implemented to reach net zero CO2 emissions and achieve significant reductions in other greenhouse gases. (IPCC, 2023).

The impacts of climate change will be felt by humans and wildlife. Climate change is increasing stress on species and ecosystems—causing species-level changes in morphology, behavior, phenology, and geographic range shifts, and ecosystem-level changes such as the increasing frequency of extreme weather events, widespread changes in productivity, species interactions, and vulnerability to biological invasions (Weiskopf et al., 2020). Climate-change-related local extinctions are already widespread and have occurred in hundreds of species. (Wiens, 2016). Catastrophic levels of species extinctions are projected during this century if climate change continues unabated (Maclean & Wilson, 2011; Thomas et al., 2004; Urban, 2015). Conservation actions aimed at protecting biodiversity can slow the progression of climate change–the ecosystem services provided by biodiverse ecosystems are an integral part in the balanced functioning of our climate system (Shin et al., 2022).

Therefore, immediate and aggressive greenhouse gas emissions reductions are necessary to keep warming well below 2°C above pre-industrial levels. The IPCC Sixth Assessment Report and other expert assessments have established global carbon budgets, or the total amount of carbon that can be burned while maintaining some probability of staying below a given temperature target. According to the IPCC, "[t]he best estimates of the remaining carbon budgets from the beginning of 2020 are 500 GtCO2 for a 50% likelihood of

limiting global warming to 1.5°C and 1150 GtCO2 for a 67% likelihood of limiting warming to 2°C." (IPCC, 2023). Additionally, "[i]f the annual CO2 emissions between 2020-2030 stayed, on average, at the same level as 2019, the resulting cumulative emissions would almost exhaust the remaining carbon budget for 1.5°C (50%), and deplete more than a third of the remaining carbon budget for 2°C (67%)." (IPCC, 2023). As of 2023, climate policies by the world's countries would lead to an estimated 2.7°C of warming, and possibly up to 3.4°C of warming, well above the level needed to avoid the worst dangers of climate change (Climate Action Tracker, 2023).

The United States has contributed more to climate change than any other country. The U.S. is the world's biggest cumulative emitter of greenhouse gas pollution, responsible for 24 percent of cumulative global CO2 emissions from 1850 to 2022, and the U.S. is currently the world's second highest emitter on an annual and per capita basis (Friedlingstein et al., 2023; Friedrich et al., 2023). U.S. climate policy is wholly inadequate to meet the international climate target to hold global average temperature rise to well below 2°C above pre-industrial levels to avoid the worst dangers of climate change. Current U.S. climate policy has been ranked as "insufficient" by an international team of climate policy experts and climate scientists which concluded: "[w]ithout additional, drastic emission reductions measures, the US will still be far from meeting its domestic climate target, let alone get its emissions onto a 1.5°C trajectory." (Climate Action Tracker, 2023). In its 2018 Special Report on Global Warming of 1.5°C, the IPCC—the leading international scientific body for the assessment of climate change—described the devastating harms that would occur at 2°C warming. The report highlights the necessity of limiting warming to 1.5°C to avoid catastrophic impacts to people and life on Earth (IPCC, 2018). The report also provides overwhelming evidence that climate hazards are more urgent and more severe than previously thought, and that aggressive reductions in emissions within the next decade are essential to avoid the most devastating climate change harms.

In California, climate change will transform our climate, resulting in such impacts as increased temperatures and wildfires, and a reduction in snowpack and precipitation levels and water availability (Turco et al., 2023). In response to inadequate action on the national level, California has taken steps through legislation and regulation to fight climate change and reduce statewide GHG emissions. Enforcement and compliance with these steps are essential to help stabilize the climate and avoid catastrophic impacts to our environment. California has a mandate

under AB 1279, the California Climate Crisis Act, to achieve net zero GHG emissions by no later than 2045, and achieve and maintain net negative GHG emissions thereafter, and to ensure that by 2045, statewide GHG emissions are reduced to 85% the level in 1990. (AB 1279 2022.) In 2019, Governor Newsom issued an executive order to leverage state investments to further California's climate goals (Executive Order N-19-19 (2019).) Newsom has continued to issue climate-related executive orders, such as a 2020 order requiring that, by 2035, all passenger vehicles will be zero-emission, in addition to other motor vehicle emission goals. (Executive Order N-79-20 (2020).) Through these bills and orders, California has laid a path that may allow the state to achieve tangible climate solutions, but there is still work to be done.

Although some sources of GHG emissions may seem insignificant, climate change is a problem with cumulative impacts and effects. (*Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*, (9th Cir. 2008) 538 F.3d 1172, 1217 ("the impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis" that agencies must conduct).) One source or one small project may not appear to have a significant effect on climate change, but the combined impacts of many sources can drastically damage California's climate as a whole. Therefore, project-specific GHG emission disclosure, analysis and mitigation is vital to California meeting its climate goals and maintaining our climate.

b. The GHG Analysis Is Invalidated by the Use of an Unsupported Baseline.

Information provided in the EIR is inadequate to establish a reliable baseline of existing GHG emissions at the Project site. Under CEQA, an environmental review document must evaluate the potential environmental impacts of the project as compared to the existing environmental conditions (the "baseline"), so that the Project's impacts can be meaningfully analyzed and compared to alternatives. (CEQA Guidelines § 15125(a); see *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 952; *Neighbors for Smart Rail v. LA County Metropolitan Transit Authority* (2013) 57 Cal.4th 310, 315.)

The DEIR uses production records from the year 1998 as a baseline for this Project. (DEIR at 4.8-30.) It makes no attempt to explain why records from twenty-six years ago are an accurate report of current environmental conditions. Especially given that the last twenty-six years have seen tremendous progress on emissions reductions technologies and climate regulation, it is very likely

that emissions from 1998 drastically overstate emissions from the facility today. By comparing the Project's projected emissions against an inflated baseline, the increase in emissions over baseline conditions caused by the Project will be incorrectly understated. (*Communities for a Better Env't v South Coast Air Quality Mgmt. Dist.* (2010) 48 C4th 310, 315.) The DEIR must be revised to compare the Project's GHG emissions against an accurate baseline and recirculated.

Response 65-39

The Draft EIR describes climate change policies and measures, including at the state level (Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," Table 4.8-4, "California Climate Change Executive Orders," and Table 4.8-5, "Applicability of Scoping Plan Climate Change Policies and Measures").

As noted in the errata to the Final EIR, the baseline year is 2005, not 1998. Further these quantities were analyzed using EMFAC2025 Fresno County fleet average emission factors for on-road engines for a baseline year of 2018, while off-road engines were modeled using Year 2012 emission factors. In other words, the baseline emissions used in the GHG analysis are lower than the emissions that would have actually occurred in 2005 in that the model used assumes cleaner engine technology.

See Collective Response #10 regarding use of historical production for the baseline under CEQA, which comment also provides further substantial evidence in support of using production from 2005, which year predated the Great Recession. See also Appendix D-3. The Final EIR explains the analysis methodology for GHG emissions in Appendix D-5, Section 4.8.3.3, "Analysis Methodology."

As analyzed in revised Section 4.8," Greenhouse Gas Emissions," of the Final EIR (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emission"), appropriate thresholds of significance were determined by the lead agency (CEQA Guidelines Section 15064.4(b)).

Though the comment states that the project proposes to mine for 100 years, it would be infeasible and unreasonable for California to stop mining for construction materials when also in the midst of a housing shortage, and mines may be permitted elsewhere, even with California's goal to achieve net zero emissions in the future. Appendix D-5, provide adequate consideration of potential GHG impacts and complies with CEQA Guidelines Section 15064.4(b).

Comment 65-40

c. The EIR's Threshold of Significance Forecloses Consideration of Foreseeable GHG Impacts and Is Not Supported by Substantial Evidence.

A lead agency's selection of a threshold of significance must be supported with substantial evidence. Moreover, a determination that an environmental impact complies with a particular threshold of significance does not relieve a lead agency of its obligation to consider evidence that indicates the impact may be significant despite compliance with the threshold. (CEQA Guidelines § 15064(b)(2).) If evidence shows that an environmental impact might be significant despite the significance standard used in the EIR, the agency must address that evidence. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1111.)

Response 65-40

The referenced Section 15064(b)(2) actually refers to "substantial" evidence, not just evidence. For GHG emissions, the Draft EIR and Final EIR uses both of the significance criteria provided in Appendix G of the CEQA Guidelines (see Appendix D-5, Section 4.8.4, "Project Imants and Mitigation Measures") SCAQMD methodology was used to evaluate whether the project would generate GHG emissions that may have a significant impact on the environment because San Joaquin Air District's methodology (2009) is out-of-date. Moreover, as noted in the errata, the SCAQMD threshold was applied in a conservative manner and the calculations included emissions from sources subject to the Cap-and-Trade program.

Comment 65-41

i. The DEIR Rejects Air District Guidance Without Evidence.

The San Joaquin Valley Air Pollution Control District ("SJVAPCD"), which has jurisdiction over the Project, provides guidance on evaluating GHG emissions under CEQA which the DEIR opts to ignore. (DEIR at 4.8-27.) It is not necessarily clear at this stage that the SJVAQMD threshold would adequately capture the significant impacts of the Project. A recirculated DEIR would have to provide substantial evidence to establish that the SJVAPCD threshold, or any threshold it opted to use, is sufficient. But dismissing a threshold that the local air district recommends, that does include performance standards directly relevant to this type of Project, with conclusory statements and no evidence falls short of the level of disclosure required under CEQA. disclose the analytic route the . . . agency traveled from evidence to action and is thus not

sufficient to allow informed decision making." (*Vineyard Area Citizens for Responsible Growth*, 40 Cal.4th at p. 445 [A DEIR must "disclose the analytic route the . . . agency traveled from evidence to action."].)

The threshold recommended by SJVAPCD is that Projects must either implement Best Performance Standards or achieve a 29% reduction in emissions compared to business as usual. The DEIR claims that this policy adopted by the local air district, "does not apply to the proposed project for a number of reasons." But those reasons are unsupported by substantial evidence or reasoning. First, the DEIR notes that Fresno County is the lead agency for the Project. However, Fresno County can still use a threshold adopted by the local air district--in fact, this is exactly how it often works. (See *Center for Biological Diversity v Department of Fish & Wildlife* (2015) 62 C4th 204, 230 [suggesting air district numerical thresholds as one possible approach].) Second, the DEIR claims that the passage of cap-and-trade in 2010 somehow makes the Air District threshold adopted in 2009 irrelevant. This is a misunderstanding of CEQA and cap-and-trade, as discussed further below. The passage of cap-and-trade did not displace local authority to regulate land use projects, and it certainly did not supersede CEQA analysis for projects that *are not subject* to cap-and-trade. The DEIR thus ignores an applicable threshold without evidence.

The DEIR likewise rejects the best performance standard required by the SJVAQMD threshold, with inadequate explanation. (DEIR at 4.8-34.) The air district published performance standards for Continuous Mix Asphalt Plant Dryers in 2010 that would reduce their GHG emissions by 13.1% to 17.2%. The DEIR says that "certain features" of the standard are "not feasible." The only elaboration here is the claim that requiring the facility to use warm mix asphalt is not feasible because the mix design is not always under the control of the operator. This assertion stops far short of substantial evidence. It does not explain why mix design would not be controlled by the operator or who would control it. Nor does it address why other aspects of the best performance standard could not be adopted.

Instead, the DEIR rejects SJVAQMD guidance entirely in favor of a threshold adopted by the South Coast Air Quality Management District, but its application of that threshold is invalidated by the same misunderstanding of cap-and-trade that led it to incorrectly reject the SJVAQMD threshold.

Response 65-41

The lead agency has the discretion to select the methodology most appropriate to allow decision-makers to intelligently take into account the project's GHG emissions (CEQA Guidelines Section 15064.4(c)). That is what occurred here. Although we recognize the commenter disagrees with how Fresno County exercised the County's discretion, that does not make the County's decision non-compliant with CEQA. The County does not have to support its decision to not use the SJVAPCD standards by "substantial evidence" as stated by the commenter.

As explained in the Draft EIR on pages 4.8-26 through 4.8-27, because Fresno County is the lead agency for the project and because the SJVAPCD Best Performance Standards (BPS) are not required by CEQA, it is sufficient to note the relevant standard and explain why it was not applied in this case. Therefore, the SJVACPCD standard has not been "ignored," rather it was discussed in the Draft EIR and Final EIR (see Appendix D-5, Section 4.8.2.3, "Local"). The SJVAPCD GHG approach is an approach that Fresno County could have utilized, but Fresno County decided not to do so for the reasons explained in the Final EIR.

The comment restates substance from the Draft EIR, including that an optional threshold recommended by the SJVAPCD is that projects should implement BPS or achieve a 29 percent reduction in emissions compared to Business-as-Usual. This comment removes context from the SJVAPCD guidance, including that "[p]rojects not implementing BPS would require quantification of project specific GHG emissions" and "quantification of GHG emissions would be expected for all projects for which the lead agency has determined that an Environmental Impact Report is required, regardless of whether the project incorporates Best Performance Standards" (see pages 5 through 6). Notably, the Draft EIR and Final EIR do include and analyze quantification of GHG emissions expected for the project (see Appendix D-5, Section 4.8.3.3). The comment interprets the Draft EIR as stating that the 2009 SJVAPCD GHG standard is irrelevant. The Draft EIR instead describes that standard as outdated.

The Draft EIR does not state that Cap-and-Trade "displace[s] local authority to regulate land use projects…[nor] supersede CEQA analysis for projects that *are not subject* to [C]ap-and-[T]rade." The Draft EIR is consistent with the comment on this point. Fresno County has local control and that is precisely why the County has the right to select the GHG guidance of SCAQMD.

It is not the responsibility of Fresno County, the lead agency here, to explain why the SJVAPCD has not adopted its draft asphalt plant BPS.

The comment suggests that SCAQMD thresholds and methodology would be less stringent than the Air District's, but SCAQMD is known nationally for having some of the most stringent air quality requirements in the U.S. 77 Fed. Reg. 12,674; 12,686 col. 3 (Mar. 1, 2012) (The Environmental Protection Agency acknowledging the SCAQMD measures "generally represent the most stringent air pollution control requirements for stationary, area, and mobile sources nationwide"). Regarding GHG analysis, the SCAQMD establishes a significance threshold of 10,000 metric tons per year from stationary combustion sources. In contrast, the EIR conservatively evaluates the project's impacts against the 10,000 metric tons per year threshold including both stationary and mobile sources of emissions. Additionally, under CEQA, Fresno County, as the lead agency, is permitted to use the 10,000 metric ton threshold choice. *See Cuyama Valley v. County of Santa Barbara* 213 Cal. App 4th 1059 (2013). Therefore, the use of this 10,000 metric ton value is an appropriate choice for this project.

Comment 65-42

ii. The Cap-and-Trade Program Does Not Alter CEQA or Relieve Lead Agencies of their CEQA Responsibilities.

The DEIR relies on cap-and-trade compliance to minimize the significance of the Project's emissions. It does this without answering the most fundamental question—whether the Project is in fact subject to cap-and-trade. Petroleum refineries, which includes facilities that produce asphalt,4 are included if they produce over 25,000 MT CO2e per year. (CARB, 2012). The only information the DEIR provides on current GHG emissions at the facility is the "baseline" figure from 1998. As discussed above, this is inadequate information and the DEIR must provide an actual baseline of current conditions or explain why the 1998 data is a reasonable approximation.

However, if that baseline does reflect current conditions, then the facility as currently operating is not subject to cap-and-trade. But the DEIR goes on to estimate the proposed Project's estimated emissions at 31,812 MT CO2e, so, presumably, the facility would be subject to cap-and-trade after expansion. (DEIR at 4.8-32.) That would mean that the Project would be given an allowance that permitted a certain amount of total GHG emissions. If the Project's total emissions were less than that, it could trade the excess to other covered entities or bank them for later. If it wanted to emit more than the allowed amount, it would have to purchase credits to allow that.

But none of this is what the DEIR says. Instead, it says that *other* entities—namely, electricity and transportation fuel suppliers—

are covered by cap-and-trade. (DEIR at 4.8-32.) Therefore, the DEIR ignores all the GHGs emitted by the Project's use of electricity and transportation fuel on the theory that cap-and-trade makes those emissions invisible to CEQA. These ignored emissions total 9,356 MT CO2e, almost a third of the Project's total emissions. (DEIR at 4.8-33.) The remaining emissions, from the asphalt dryer and asphalt oil heater, the DEIR says are not covered by cap-and-trade. Because the asphalt dryer and oil heater will emit 8,508 MT CO2e and that number is below the SCAQMD's significance threshold, the DEIR concludes the Project will not have significant GHG impacts. (DEIR at 4.8-34.

This analysis is riddled with errors and inconsistencies. As an initial matter, the DEIR must explain why the Project—a petroleum refinery that will emit over 25,000 MT CO2e —is not itself a covered entity. Splitting the Project's emissions between some that are covered by cap-and-trade at some point upstream and others that are not covered does not make sense for a Project that should be complying with cap-and-trade in its own right, for its own total emissions.

If the Project is indeed not subject to cap-and-trade, then the cap-and-trade regulation does not cover any of its emissions, or excuse any of them from being considered under CEQA. For one thing, it is not true that all electricity and transportation fuel suppliers are necessarily covered; most types of suppliers are only covered if they emit more than 25,000 MTs CO2e. The DEIR's claim that all electricity and transportation fuel used by the Project will come from a covered entity is not supported by evidence.

Further, even electricity or fuel supplied by a covered entity is not somehow immune from consideration under CEQA at the point of use. The DEIR misunderstands the function and purpose of the cap-and-trade regulation. The cap-and-trade regulation does not eliminate or mitigate emissions and it is far from the be-all-end-all of the State's plan to achieve climate goals. The DEIR claims that the lead agency has no responsibility to address emissions from combustion of transportation fuels and electricity that *this Project* will cause; it can merely point to marginal reductions that California will achieve on a statewide level through cap-and-trade. But the cap-and-trade program is just one of many complementary programs that require different actors to work in different ways to reduce emissions. Covered facilities must participate in cap-and-trade, and local governments must mitigate impacts of their land use decisions through CEQA. One responsibility does not discharge the other.

Under CEQA, a lead agency must consider the whole of the action and the entire underlying activity being approved, including parts of the project might be regulated by another entity. (14 Cal Code Regs §15378(a), (c)–(d); *Orinda Ass'n v Board of Supervisors* (1986) 182 CA3d 1145, 1171.) This approach is necessary to prevent piecemealing, a strategy where environmental considerations are concealed through a focus on individual parts that overlooks the whole. (*Bozung v LAFCO* (1975) 13 C3d 263, 283.) Here, the DEIR considers a Project that will emit 17,864 MT CO2e over baseline and simply subtracts 9,356 MT CO2e of those emissions in order to fall under the 10,000 MT significance threshold. All 17,864 MT CO2e of these emissions are part of the same Project and must be considered together. To do otherwise is a violation of CEQA.

And the SCAQMD does not bless this approach in its significance threshold either, contrary to the DEIR's assertion. The threshold asks whether the project is consistent with a qualifying local GHG reduction plan that itself has been analyzed under CEQA. If it is, then the emissions are not significant. Cap-and-trade is a statewide plan, not local, and it was never analyzed under CEQA. Moreover, the DEIR claims *it does not apply to the Project*. The SCAQMD threshold says that emissions are insignificant if the project as a whole complies with a local climate plan like a CAP; it does not contemplate separating emissions into categories based on other entities' compliance with state law and ignoring some of them. The Project cannot have it both ways: at times rely on the cap and trade program for its emissions and in other instances ignore cap and trade program.

Furthermore, in its 2022 Scoping Plan, CARB explicitly rejects exactly the approach the DEIR uses: (Scoping plan at 20-21.)

> While CARB has developed programs such as the… the Cap-and-Trade program to reduce sector-wide GHG emissions, these programs were not designed to directly mitigate individual land use development project emissions from a CEQA perspective. Therefore, claimed consistency with these programs should not be used to conclude that motor vehicle emissions from a land use development project are fully mitigated or that such projects are definitively consistent with the Scoping Plan—particularly where the project at issue is not itself directly regulated by these programs.

The DEIR bases its GHG analysis on a threshold of significance that ignores half of the Project's emissions based on a misunderstanding of cap-and-trade that has been plainly rejected by CARB. This is an inadequate threshold of significance that

invalidates the DEIR. The DEIR must be revised to accurately consider the significance of the GHG impacts and recirculated so the public and decision makers receive correct, legally adequate information.

Response 65-42

The comment contains numerous statements requiring clarification regarding project GHG emissions, the Cap-and-Trade Program, and CEQA's treatment of GHG emissions.

First, the commenter suggests that the project is a petroleum refinery under the Cap-and-Trade Program. The proposed asphalt plant would not meet the regulatory definition of a petroleum refinery. Petroleum Refinery" or "Refinery" means any facility engaged in producing various fuels, which are specifically defined in the regulations along with "asphalt (bitumen) through distillation of petroleum. . . " (Title 17 CCR Section 95802). The asphalt batch plant does not produce asphalt (bitumen) through distillation of petroleum. Rather it uses asphalt (bitumen) as an additive to other materials, such as aggregate, to produce a product used in paving that contains asphalt. The asphalt batch plant does not distill petroleum to produce bitumen. Rather, that product is obtained for use at the batch plant.

As also explained above Collective Response #10, the baseline was determined based on historical production records for the year 2005 in the County's sound discretion based on prior maximum production (see also Final EIR, Appendix D-3).

The comment also states that "presumably, the facility would be subject to cap-and-trade program after expansion." It is unclear why the commenter presumes this. The Cap-and-Trade Program only covers certain entities that emit more than the 25,000 MT CO_2e per year threshold, of which the project sites is not one of the covered entities. These entities are set out in Title 17 CCR Section 95911. For each covered entity, the specific types of emissions required to be reported are set out in the regulations (see, e.g., Title 17 CCR Section 95852).

Moreover, the Cap-and-Trade regulations also provide specific inclusion thresholds (amounts of emissions) for covered entities to be included in the Cap-and-Trade Program. The comment erroneously mixes different aspects of the Cap-and-Trade Program to somehow suggest that the project would be provided free GHG allowances that it can sell to other entities. This is incorrect.

Moreover, the Draft EIR did not exclude the GHG emissions associated with electricity and fuel use. The GHG emissions related to transportation fuel and electricity are described in Appendix D-5, in Section 4.8.3, "Significance Thresholds and Analysis

Methodology," Section 4.8.4, "Project Impacts and Mitigation Measures," and summarized in Table 4.8-8, "Maximum Annual Operation Phase GHG Emissions." As noted in the Draft EIR, electricity production and transportation fuels production are explicitly included within the Cap-and-Trade Program through such covered entities as petroleum refineries and electricity generation facilities (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions").

However, as noted in the errata for the Final EIR, emissions from sources subject to the Cap-and-Trade program were included in calculating whether total emissions exceeded the 10,000 MTs CO_2e threshold.

The commenter also suggests that the transportation fuel suppliers and electricity generators may not be a covered entity under Cap-and-Trade if they don't meet the emissions thresholds of 25,000 MTs CO_2e. PG&E is the electricity supplier to the project. PG&E is a covered entity. Transportation fuels used at the site are provided by commonly recognized fuel suppliers that may vary over time, but which are covered entities. Refining of transportation fuels in the State of California occurs at scales that would far exceed the emissions thresholds noted in the comment (Draft EIR pages 5-17 and 5-18).

The Draft EIR recognizes that the Cap-and-Trade Program does not eliminate all emissions at the project site. Rather, the Cap-and-Trade Program mitigates GHG emissions by reducing them over time as part of a State-wide program. Moreover, the requirement to purchase allowances encourages covered facilities to invest in technology and equipment that would reduce the overall output of greenhouse gases on a statewide level. Finally, the State uses funds used for the purchase of Cap-and-Trade allowances to implement programs and strategies to further reduce GHG emissions across the State. However, as noted above, emissions from sources subject to the Cap-and-Trade Program are included in the updated Final EIR calculations.

The Draft EIR and Final EIR also account for other programs implemented to address GHG emissions. These are described in detail in the Draft EIR. Federal programs are described in Appendix D-5, Section 4.8.2.1, "Federal," while State legislation, regulations and executive orders are described in detail in Appendix D-5, Section 4.8.2.2. For example, and bearing directly on GHG reductions related to transportation fuels, is the Low Carbon Fuel Standard, indicated in the Draft EIR and Final EIR at Table 4.8-3, "California Climate Change Regulations." This is also extensively discussed in the Final EIR and in Appendix D-3. Appendix D-5, Section 4.8.3 also discusses the CEQA regulations applicable to GHG emissions and discusses the methodology for the threshold of significance for GHG emissions selected by the County.

Contrary to the suggestions in the comment, the Draft EIR and Final EIR describe the entirety of the projected emissions related to the project, including the baseline and the incremental GHG emissions, and provides information breaking out emissions from the asphalt plant, which baseline emissions are zero, along with emissions from transportation fuels and electrical production. These emissions are considered together, and in the Final EIR are included in determining whether the SCAQMD threshold was exceeded (see Appendix D-5, Table 4.8-8).

The comment also states that the SCAQMD guidance on analyzing the impacts of greenhouse gas emissions only contemplates "whether the project is consistent with a qualifying local GHG reduction plan." The SCAQMD guidelines "consist of determining whether or not the project is consistent with a GHG reduction plan *that may be part* of a local general plan, *for example*" (Emphasis added). Thus, the SCAQMD guidelines use compliance with a local plan as one pathway to reach a less than significant determination, not as the only pathway.

Further, the comment states that the Cap-and-Trade program "was never analyzed under CEQA." This is not correct. In 2008, CARB released the Climate Change Scoping Plan pursuant to AB 32, which included a California Environmental Quality Act Functional Equivalent Document. Thus, the Cap-and-Trade program was subject to review under CEQA.

CEQA Guidelines at Section 15064.4(c) makes it clear that a lead agency has discretion to select a methodology or model it considers appropriate to intelligently take into account a project's contribution to climate change. It is unclear why the commenter suggests that the County is prohibited from discussing the Cap-and-Trade Program regulations in relation to the project emissions or why use of the SCAQMD threshold is prohibited, particularly as these emissions are included in determining the SCAQMD threshold in the Final EIR.

Finally, the comment misstates a quote from the 2022 CARB Scoping Plan. First, the cited text is not from pages 20 and 21 of the Scoping Plan. It is from Appendix D of the Scoping Plan. Appendix D of the Scoping Plan at page 1 states specifically why the cited text is not applicable. In particular, page 1 states that: "[t]his appendix is not regulatory . . . [and] focuses primarily on . . . local authority over new residential development. <u>It does not address other land use types</u>."

Comment 65-43

VIII. The DEIR's Alternatives Assessment Is Inadequate.

The purpose of an EIR's discussion of alternatives is to identify ways to substantially reduce or avoid significant environmental impacts. (Laurel Heights Improvement Association v. Regents of Univ. of Cal. (1988) 47 C3d 376, 403.) Therefore, an EIR must focus on alternatives that avoid or substantially lessen the Project's significant environmental impacts. (Pub. Res. §21002; 14 Cal Code Regs §15126.6(a)-(b).) The EIR should analyze alternatives that offer substantial environmental advantages over the proposed project. (Citizens of Goleta Valley v. Board of Supervisors (1990) 52 C3d 553, 566); (see e.g. Cleveland Nat'l Forest Found. v. San Diego Ass'n of Gov'ts (2017) 17 CA5th 413, 436 [an EIR that did not consider alternatives that would reduce vehicle miles travelled was inadequate].)

CEQA requires the County to prepare an EIR that meaningfully considers the suggested alternatives in detail. (Friends of the Eel River, 108 Cal.App.4th at p. 873 [holding that because the discussion of alternatives omitted relevant, crucial information, it subverted the purposes of CEQA and was legally inadequate].) A proper alternatives discussion of alternatives should provide sufficient "information to the public to enable it to under, evaluate, and respond" to the agency's conclusion. Stated differently, the discussion should "contain facts and analysis, not just the agency's bare conclusions or opinions," and should include "meaningful detail." (Id. at 404-406.) As explained in Citizens of Goleta Valley v. Board of Supervisors (1988) 197Cal.App.3d 1167, 1180-83, assertions that a particular alternative is economically infeasible simply because it would be more expensive or less profitable to the private applicant are not adequate. "In the absence of comparative data and analysis, no meaningful conclusions regarding the feasibility of the alternative could have been reached." (Id. at 1180-81.) The Court of Appeals added that:

The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

(*Ibid.*) Because the DEIR fails to provide substantial evidence supporting a finding of infeasibility for any suggested alternatives, additional analysis is required before the County may approve the project. (Pub. Res. Code § 21002.)

Response 65-43

The comment is noted. Draft EIR Chapter 6, "Alternatives," describes a range of project alternatives and compares the associated potential environmental impacts to those of the proposed project. The chapter includes a discussion of CEQA requirements for an alternatives analysis and the methodology used to identify potentially feasible alternatives that would avoid or substantially lessen the significant impacts of the proposed project while still meeting most of the basic project objectives. Based on this process, the Draft EIR identifies and evaluates a reasonable range of alternatives consistent with CEQA Guidelines Section 15126.6.

Each alternative is evaluated for its comparative merits with respect to reducing environmental impacts relative to baseline conditions and the proposed project. The chapter also identifies alternative concepts that were considered but eliminated from detailed consideration, along with the reasons for their elimination. Accordingly, the Draft EIR provides a sufficient evaluation of a reasonable range of alternatives in compliance with CEQA.

This response is introductory in nature. Please see Responses 65-44, 65-45, and 65-46 for further discussion of the project alternatives and specific issues raised by the commenter.

To the extent the comment raises economic considerations, such issues are outside the scope of CEQA unless they are related to physical environmental effects (Title 14 CCR, Sections 15064, subd. (e), 15131, subd. (a)). Economic considerations may be relevant to the County's findings and, if applicable, a Statement of Overriding Considerations (*Id.*, Sections 15091, 15093).

Comment 65-44

a. The General Plan or Zoning Codes Do Not Require this Proposed Project.

The DEIR refused to consider the Reduced Operational Life Alternative and an alternative 200 feet below ground surface because it claims mining aggregate for a shorter duration would conflict with the existing state MRZ-2 classification and the Fresno County General Plan and zoning designations for the project sites, which identify the project sites as having aggregate deposits of regional and local significance (Fresno County, 2024). Specifically, it states: "[T]he County eliminated the Reduced Operational Life Alternative from further consideration as an alternative in this EIR as it would reduce utilization of a known MRZ-2 resource in conflict with Fresno County's General Plan and does not fully meet some of the project objectives." (DEIR at 6-

8.) However, nowhere does the General Plan state that MRZ-2 resources must be mined for a certain duration or at a certain depth: The General Plan states only that "[t]he County shall not permit land uses incompatible with mineral resource recovery within areas designated as Mineral Resource Zone 2 (MRZ-2)." (DEIR at 6-8.) This means the County could not, for example, permit an office building on an area with MRZ-2 resources.

The DEIR also claims drilling to any shallower depth would clash with Goal OS-C of the Fresno County General Plan Mineral Resources Section of the Open Space and Conservation Element to conserve areas identified as containing significant mineral deposits for potential future use. (DEIR at 6-39.) However, this goal specifically seeks to conserve MRZ-2 resources while also "promoting the reasonable, safe, and orderly operation of mining and extraction activities within areas designated for such use, where environmental, aesthetic, and adjacent land use compatibility impacts can be adequately mitigated." (Fresno General Plan at 2-120-21.) This goal hardly requires 100 years of mining at 600 feet bgs when environmentally superior alternatives exist.

The DEIR's other excuses for refusing a shorter-duration Project similarly lack support. For example, the DEIR claims that "interim loss of this aggregate resource could cause future shortages of construction and aggregate material in the Fresno region," and "[b]ased on this analysis, the County eliminated the Reduced Operational Life Alternative from further consideration as an alternative." (DEIR at 6-8.) Nowhere does the DEIR support this contention regarding shortages, as CEQA requires.

Response 65-44

The comment focuses on the Draft EIR's conclusion regarding the Reduced Operational Life Alternative but does not address the other considerations such as traffic, air emissions, noise, and visual impacts (Draft EIR, page 6-9). The Reduced Operational Life Alternative would restrict the full mineral development of the project sites. This would conflict with the existing state MRZ-2 classification and the Fresno County General Plan (Draft EIR page 6-8). The Reduced Mining Depth (300 Feet) with Additional Setbacks Alternative would also be inconsistent with Goal OS-C of the Fresno County General Plan Mineral Resources Section of the Open Space and Conservation Element to conserve areas identified as containing significant mineral deposits for potential future use, because it would not promote operation of mining and extraction activities within areas designated for such use (Draft EIR page 6-39). While Goal OS-C does not require 100 years of mining at 600 feet bgs, the proposed project would produce more material while

still limiting significant environmental impacts. In addition, the comment does not address whether, if the already disturbed project sites are not mined to a deeper depth, a replacement mine with separate environmental impacts would eventually need to be developed.

An EIR is only required to provide a reasonable range of alternatives which meet most of the project's objectives (Title 14 CCR Section 15126.6). An EIR need not consider every conceivable alternative to a project (Title 14 CCR Section 15126.6 (a)). CEQA does not mandate perfection, nor does it require an analysis to be exhaustive (Title 14 CCR Section 15151; See also *Chaparral Greens v. City of Chula Vista* (1996) 50 Cal.App.4th at 1145). The County is entitled to deference to reject the 200-foot mining depth alternative from further consideration because the EIR demonstrates that such an alternative would hinder one of the main goals set for the project which is to ensure a long-term supply of aggregate for the region (Draft EIR page 2-6; *Los Angeles Conservancy v. City of West Hollywood* (2017) 18 Cal.App.5th 1031, 1041, citing *California Native Plant Society, supra,* 177 Cal.App.4th at 997, 999).

The analysis of project alternatives provided in Chapter 6 of the Draft EIR is meaningful and contains analysis sufficient to allow informed decision-making (*Friends of the Eel River v. Sonoma County Water Agency* (2003) 108 Cal.App.4th 859, 873).

See also Collective Response #3 regarding aggregate supply and demand in the Fresno Production-Consumption Region.

Comment 65-45

b. The DEIR Fails to Support Its Conclusions Regarding Other Alternatives with Substantial Evidence.

Beyond its flawed reasoning regarding the General Plan, the DEIR bases its GHG emissions assessment of all shallower alternatives (Alternatives 2-5) on unsupported assumptions. It claims that shallower mining would have the same or worse GHG emissions because "[t]he development of new or expansion of existing quarries or the reopening of Rockfield Quarry would result in even greater GHG emissions as aggregate is hauled into Fresno County from further distances, as compared to continuing the operation of the Rockfield Quarry as planned under the proposed project." (e.g. DEIR at 6-34.) In other words, not drilling to the depth of 600 feet "would require the Applicant, or other aggregate suppliers, to search for another aggregate source to supply the County's regional needs. As a result, another mine could be developed elsewhere in the County with similar or additional significant environmental impacts and

increasing the overall footprint of aggregate mines in the County." (e.g. DEIR at 6-39.)

Nowhere does it support this contention, as CEQA requires. To the contrary, the Aggregate Sustainability in California report, last updated by the California Geological Survey in 2018, provides that the Fresno region will need an estimated 305 million tons of aggregate for the next 50 years' worth of construction, while it already has 556 million tons of permitted aggregate reserves, nearly double the projected demand. (Clinkenbeard & Gius, 2018; p.5) As a result, it is fairly possible that aggregate demand will go down, rather than stay the same.

Response 65-45

The comment is noted. Please see Collective Response #3 pertaining to regional aggregate demand and supply in the Fresno Production-Consumption Region.

The Draft EIR properly concludes that greenhouse gas (GHG) emissions may be greater under the No Project Alternative or reduced production alternatives because other suppliers would be required to meet regional aggregate demand, potentially resulting in increased transportation distances and associated emissions (see *Save Our Residential Environment v. City of West Hollywood* (1992) 9 Cal.App.4th 1745, 1754).

The commenter asserts that it is "fairly possible" that aggregate demand would decrease; however, no substantial evidence is provided to support this claim. Even if aggregate demand were lower than projected, demand for aggregate in the Fresno region would not cease, and aggregate production and transportation would still be required. A reduction in overall demand could result in lower total GHG emissions compared to projections in the Draft EIR; however, it would not change the relative benefit of maintaining a local aggregate supply, which reduces haul distances and associated emissions.

Additionally, the referenced 2018 Map Sheet 52 is outdated and does not accurately reflect current conditions regarding aggregate supply and demand in the region. As discussed in Collective Response #3, the Draft EIR relies on more recent and relevant data in evaluating regional supply conditions.

Accordingly, the Draft EIR's analysis of GHG emissions and regional aggregate supply and demand is adequate, and no further revision is required.

Comment 65-46

c. The DEIR Fails to Support Its Conclusions Regarding Alternative 5 as the Environmentally Superior Alternative.

CEQA requires that before approving a project with significant environmental impacts, the agency must make findings identifying the specific considerations that make the environmentally superior alternative infeasible. (Pub. Res. Code § 21081; Preservation Action Council v. City of San Jose (2006) 141 Cal.App.4th 1336, 1351-52.)

The County rejected Alternative 5 (400 feet bgs, with reduced annual sales), despite this alternative (and all other shallower, shorter duration alternatives) meeting at least partially all the project objectives because it determined that Alternative 5 is not "economically feasible" without any further explanation. But under CEQA, determining that an alternative "may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible." (Preservation Action Council, 141 Cal.App.4th at 1352.) Instead, the agency must present "evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the [alternative]." (Id.) This evidence may include, for example: total estimated costs, total projected income, total expenses, and the change in the per unit cost of a project that results from a project alternative or mitigation measure. (See Citizens of Goleta Valley v. Board of Supervisors (1988) 197 Cal.App.3d 1167, 1180.).) The findings of infeasibility must be supported by substantial evidence. (Id. at 1176-77.)

The DEIR contained no substantial analysis as to Alternative 5's economic feasibility. Nor did it even explain why it chose Alternative 5 as the "environmentally superior alternative. The DEIR states only that Alternative 5 would reduce impacts on air quality, biological resources, energy, groundwater quality and supply, mineral resources, noise, and transportation. However, this requires further support, especially considering there are no differences in the conclusions regarding those very impacts for alternative 3 (300 feet bgs.) And the only difference between Alternative 5 and Alternative 4 (300 feet bgs with additional setbacks) is that Alternative 5 would have reduced energy impacts, whereas the DEIR asserts, without any support, that energy demands under alternative 4 would remain the same because of its unsupported assertion that "demand for aggregate resources would remain." (DEIR at 6-44.)

In sum, the DEIR failed to provide any support for Alternative 5 as the environmentally superior alternative and for why Alternative 5 is economically infeasible. Both deficiencies must be address before the Project can be approved. (CEQA Guidelines, § 15091, subd. (a)(3) ["No public agency shall approve or carry out a project for which an EIR has been certified... [unless environmentally superior] project alternatives identified in the final EIR" are infeasible].) The EIR must support its conclusions regarding alternatives with substantial evidence and provide additional information for the public to comment on.

Response 65-46

The comment misconstrues the Draft EIR's statement regarding the economic feasibility of Alternative 5, "Reduced Mining Depth (400 feet) with Reduced Annual Sales (2.5 MTY)." The Draft EIR states that "[t]he alternatives analysis and conclusions reached regarding the environmentally superior alternative do not determine the ability of Alternative 5 to be an economically feasible option for the Applicant" (Draft EIR, page 6-59). A plain reading of this statement indicates that the Draft EIR does not analyze the economic feasibility of the alternative. Rather, the Draft EIR focuses on evaluating the environmental impacts of the proposed project and alternatives, consistent with CEQA. This does not mean that the Draft EIR has determined Alternative 5 to be economically infeasible.

The Draft EIR identifies Alternative 5 as the environmentally superior alternative due to reduced impacts to air quality, biological resources, energy, groundwater quality, groundwater supplies, mineral resources, noise, and transportation compared to the proposed project. The alternatives analysis provides sufficient information regarding the relative merits of the project and alternatives; the analysis need not be exhaustive (*Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 547; *Del Mar Terrace Conservancy, Inc. v. City Council* (1992) 10 Cal.App.4th 712; see also *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 404–405).

In addition, the commenter's assertion that the Draft EIR was required to support a finding of economic infeasibility for Alternative 5 is misplaced. CEQA Guidelines Section 15091 pertains to findings made by the lead agency prior to project approval, after certification of the EIR, and does not define the required contents of a Draft EIR. The County will consider the information contained in the EIR, along with other information in the administrative record, when making the findings required for project approval, including any findings regarding alternatives and, if applicable, a statement of overriding considerations (PRC, Sections 21002.1, subd. (b), 21081; Guidelines, Sections 15091, 15092).

Accordingly, the Draft EIR's analysis of Alternative 5 is adequate, and no revision is required.

Comment 65-47

I. Conclusion

Thank you for the opportunity to submit comments on the DEIR for the CEMEX Rockfield Quarry Modification Project. The DEIR fails to adequately analyze or mitigate the proposed Project's impacts to biological resources, greenhouse gas emissions, surface and groundwater quality and availability, and project alternatives.

Given the possibility that the Center will be required to pursue legal remedies in order to ensure that the County complies with its legal obligations including those arising under CEQA, we would like to remind the County of its statutory duty to maintain and preserve all documents and communications that may constitute part of the "administrative record" of this proceeding. (§21167.6(e); *Golden Door Properties, LLC v. Superior Court* (July 30, 2020, Nos. D076605,D076924, D076993) ___Cal.App.5th___ [2020 Cal. App. LEXIS 710.) The administrative record encompasses any and all documents and communications that relate to any and all actions taken by the County with respect to the Project, and includes "pretty much everything that ever came near a proposed [project] or [] the agency's compliance with CEQA . . . ." (*County of Orange v. Superior Court* (2003) 113 Cal.App.4th 1, 8.) The administrative record further includes all correspondence, emails, and text messages sent to or received by the County's representatives or employees, that relate to the Project, including any correspondence, emails, and text messages sent between the County's representatives or employees and the Applicant's representatives or employees. Maintenance and preservation of the administrative record requires that, *inter alia*, the County (1) suspend all data destruction policies; and (2) preserve all relevant hardware unless an exact replica of each file is made.

Please add the Center to your notice list for all future updates to the Project using the email addresses below and do not hesitate to contact the Center with any questions.

Response 65-47

Thank you for participating in the public comment review process. To the extent that the comments raise environmental issues, these have been addressed in the prior responses.

The Draft EIR adequately analyzes the project's environmental impacts in accordance with CEQA. Please see Responses 65-3 through 65-17 regarding analysis and mitigation for biological resources; Responses 65-20 through 65-38 regarding surface water and groundwater availability and quality; Responses 65-39 through 65-42 regarding greenhouse gas emissions; and Responses 65-43 through 65-46 regarding project alternatives. Revisions to the Draft EIR are identified in the responses, where applicable.

The County and the Operator are committed to ensuring full compliance with applicable laws and the environmental review process. The County also complies with all applicable document retention requirements.

The commenter's representatives have been added to the County's notification distribution list for future updates related to the project.

Letter #66 March 10, 2025, Scott Roycroft, Earth Funeral Services

Comment 66-1

Dear Fresno Planning Department,

As a partnering business and donor to the San Joaquin River Parkway, I take significant interest in the conservation and protection of this section of the San Joaquin River. This section of river provides countless ecosystem services and critical habitat for special species.

Fresno County has a duty to protect these critical resources which are threatened by the rockfield expansion project. Please consider the adverse impacts of this project on the river.

Thank you for your time and consideration.

Response 66-1

The proposed project's potential impacts to the ecosystems and wildlife habitats of the project area are addressed in Section 4.4, "Biological Resources." See Impact 4.4-1 beginning on Draft EIR page 4.4-48 and Impact 4.4-2 beginning on Draft EIR page 4.4-52 for discussion of potential impacts to special status species through onsite habitat modification and potential impacts to species within the riparian habitat near the Quarry Site, respectively. See Final EIR Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. No specific comments related to the adequacy of the Draft EIR were made, and no further response could be provided. The comment is noted for the consideration of the decision-makers.

Letter #67 March 10, 2025, John Shelton, Friends of the River

Comment 67-1

Friends of the River (FOR) is submitting this comment letter regarding the County of Fresno's Draft Environmental Impact Report (DEIR) 7763 for the CEMEX Rockfield Quarry: Rockfield Modification Project (proposed project).

FOR's mission is to protect and restore California rivers by influencing public policy and inspiring citizen action. In addition, FOR is one of the Settling Parties of the the San Joaquin River Restoration Program (SJRRP) which is currently being implemented in accordance with the San Joaquin River Restoration Settlement and the San Joaquin River Restoration Settlement Act (Act), included in Public Law 111-11. The proposed project is located within the SJRRP Restoration Area and has the potential to impact Reclamation's successful implementation of the SJRRP.

FOR appreciates the County of Fresno's efforts on the proposed project and consideration of our comments. General comments and specific comments are provided in the attached "Comments on the Draft Environmental Impact Report: CEMEX Rockfield Quarry: Rockfield Modification Project (EIR 7763) and Unclassified Conditional Use Permit Applications No.s 3666 and 3667."

Response 67-1

The commenter's organizational mission and relationships are noted. Please see responses below to individual issues raised by the commenter.

Comment 67-2

FOR does not believe there are enough overriding conditions that could be used to justify the extension of the Conditional Use Permits and that the County of Fresno should deny the application. If the County does make finding of overriding concerns for those impacts not fully mitigated, CEMEX should be required to implement more comprehensive mitigation for wildlife, recreation, visual, and traffic impacts.

Response 67-2

The commenter's position regarding the project justification and general recommendations for more comprehensive mitigation are noted. Please see responses below to individual issues raised by the commenter.

Comment 67-3

For several CEQA required areas of disclosure, Fresno County decision makers, FOR, and the public does not have enough information to adequately analyze the impacts of the proposed project on the resources for which we advocate. Also as an active party to the SJRRP settlement, we do not believe that the analysis is adequate to inform us in providing direction to the agencies implementing the SJRRP. We request additional information be provided in the DEIR regarding baseline conditions, impact analyses, and mitigation measures, as described in the attached document.

FOR appreciates the opportunity to comment on this proposed project and the County's consideration of our comments. Please contact John Shelton at jshelton@friendsoftheriver.org with any questions or if there is a need for discussion of these comments in more detail.

Response 67-3

The commenter's position regarding the adequacy of information in the Draft EIR are noted. Please note that certain clarifications and amplification of information in the Draft EIR are provided through errata in Chapter 3, "Draft EIR Errata," and in certain responses to comments on the Draft EIR. Please see responses below to individual issues raised by the commenter.

Comment 67-4

Background

Staff from Friends of the River have reviewed the documents that Fresno County has made available on their website (https://www.fresnocountyca.gov/Departments/Public-Works-and-Planning/divisions-of-public-works-and-planning/development-services-division/planning-and-land-use/environmental-impact-reports/cemex-rockfield-expansion). With the amount of information available, and the limited time for review, staff focused on issues that are important for our organization such as fisheries and wildlife, public health, and outdoor recreation. In accomplishing our review, we also discussed the project with other organizations and community members, press coverage, and social media discussions. We used these communications to note issues that should also be brought to the attention of those making the decision to move forward with this project. It is possible that some issues were covered adequately in the appendices to the Draft Environmental Impact (DEIR) or other documentation, but were not summarized adequately in the main DEIR.

Response 67-4

The comment and focus of the commenter's staff in providing comments is noted. The County's decision-making process will consider all of the information in the Draft EIR, including the appendices to the Draft EIR.

Comment 67-5

General Comments

Our organization, along with other environmental organizations and community members, does not believe that a gravel quarry and gravel processing plant is an appropriate land use for the San Joaquin River corridor currently or into the future. Historically, as the area developed and gravel mining operations were sited, the gravel and sand resources of the San Joaquin River and its immediate corridor were a fast and easy source. We understand that society's values change, and believe strongly that those values now reflect a desire to let the San Joaquin River and its associated floodplains and connected upland, recover from decades of sand and gravel extraction. In the last few decades, the State (Pappas & LiveScience 2014)

Response 67-5

The opinions and preferences regarding the San Joaquin River expressed in the comment are noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 67-6

Overriding Considerations and Need for Gravel Operations in the River Corridor

Statements within the DEIR and supporting documents are misleading to imply that the Plant and Quarry are needed for gravel supply for the NE Fresno and North Clovis areas. As reported in Fresno and by Gregory Weaver (Weaver 2025) and documented by The California Geological Survey (Clinkenbeard & Gius 2018), this region is better than adequately resourced with developed supplies for next 50 years. Although some benefits can accrue to specific segments of the County's economy, the analysis of whether those benefits are greater than the benefits of a completed San Joaquin River Parkway, that may be precluded for the next 100 years is not undertaken. In addition, the significant impacts to Visual Resources and Traffic, by themselves could show that the overall economic impact to this region is likely to be negative.

The San Joaquin River has been noted in the past as California's most endangered river (Pappas & LiveScience 2014). Since 2014, the San Joaquin River Restoration Program, the San Joaquin River Conservancy, both the Counties of Madera and Fresno, and the City of Fresno, have been intent of making the river more ecologically resilient by investing in properties for recreation, passing land use designations for the San Joaquin Parkway, and approving projects.

For these reasons, any finding of Overriding Considerations that are related to the economy, including employment, cannot be supported without much more analysis and information disclosure.

Response 67-6

Please see Collective Response #3 pertaining to regional aggregate demand and supply and please see Collective Response #18 pertaining to the San Joaquin River Parkway Master Plan. The Draft EIR evaluates potential environmental impacts of the proposes project on San Joaquin River resources that may be affected by the project. Overriding considerations will be considered by County decision-makers in consideration of information in the Final EIR as well as other relevant information. The analysis in the Draft EIR, as amplified and clarified by information in the Final EIR, provides sufficient disclosure regarding potential environmental impacts of the project for compliance with CEQA and consideration by decision-makers.

Comment 67-7

Project Analysis Should Be Based on Both Existing and Future Impacts, Including the Length of Time Those Impacts are Occurring

- Analysis of ecological, recreational, and other impacts should be based both on existing conditions and length of impacts.

Response 67-7

Draft EIR Chapter 2, "Project Description," provides a detailed description of the proposed project, including the duration of the requested use permit extensions. The environmental impact analyses in Draft EIR Chapter 4, "Environmental Analysis," provides detailed evaluations of potential environmental effects of the proposed project, including consideration of the project duration and duration of impacts consistent with the duration of the requested use permit extensions. The comment does not provide evidence that the Draft EIR is deficient in either its description of the project or the evaluation of impacts and no further response is warranted.

Comment 67-8

- Hydrology and wildlife (fisheries especially) should be analyzed for planned restoration from SJRRP, SJRC, Active Transportation, and other Future Land use projects

Response 67-8

The Draft EIR assessed the compatibility of the proposed project with applicable local, regional, and state land use plans and policies in Section 4.11, "Land Use and Planning." The Draft EIR concluded that the proposed project would be consistent with the County's Goal OS-E to "help protect, restore, and enhance habitats in Fresno County that support fish and wildlife species so that populations are maintained at viable levels" (Draft EIR page 4.11-28). For further discussion of the SJRRP, please see Collective Response #12. The proposed project would not conflict with the goals of the SJRRP because it would not significantly impact the San Joaquin River flows, fish passages or migratory corridors, or surface water quality of the San Joaquin River.

Comment 67-9

- Future impacts to water supply should quantify, based on future planned/predicted river hydrology from open water (transpiration) surfaces.

Response 67-9

The comment is noted. Draft EIR Impact 4.10-9 (pages 4.10-104 through 4.10-105) evaluates the project's potential to decrease groundwater supplies during mining operations and following reclamation of the Plant Site. The analysis considers and quantifies relevant factors, including evaporation and evapotranspiration.

In addition, as discussed under Draft EIR Impact 4.10-12, the analysis evaluates the interaction between the San Joaquin River and groundwater conditions at the Quarry Site. Base flows in the San Joaquin River are typically at or below the elevation of the base of alluvium at the Quarry Site; therefore, flow from the river toward the alluvium would occur only during infrequent and relatively short-duration high flow events. With implementation of recharge trenches, groundwater levels in the alluvium and weathered rock would be maintained consistent with existing conditions during mining operations, and no substantial change in the volume of potential inflow from the river into the quarry would occur.

The Draft EIR further acknowledges that following completion of mining, if pumping to the recharge trenches ceases, additional flow from the river into the quarry pit could occur under certain conditions if drawdown increases. To address this potential

condition, Mitigation Measures 4.10-10a and 4.10-10b are included as adaptive management strategies. These measures require monitoring of groundwater conditions, comparison of monitoring results to established action levels, and implementation of corrective measures if those action levels are exceeded.

Accordingly, the Draft EIR adequately evaluates potential groundwater supply impacts and includes appropriate mitigation to ensure impacts are reduced to a less-than-significant level.

Comment 67-10

The DEIR does not adequately compare the Proposed Project to the No Project Alternative. While we agree with the assessment that the No Project Alternative is the best environmental option, the analysis and discussion should include more information on reasonably foreseeable projects and future conditions. For example, the analysis regarding transportation impacts does not fully discuss the intention of both the City and County of Fresno, and the City of Clovis, to implement numerous plans and policies that encourage Active Transportation. The impact of this project on the ability for these jurisdictions to encourage biking and walking within the affected area of this project is not analysis nor discussed other than with current conditions. The impacts of blasting, gravel truck traffic, and spread of rocks and gravel from transporting materials on Friant Avenue is likely to disrupt the implementation of Active Transportation elements significantly over time.

Response 67-10

Draft EIR Section 6.5.2, "Alternative 1: No Project," provides a detailed description of the No Project Alternative as compared to the proposed project (see "Description" subsection on Draft EIR pages 6-12 and 6-13) and provides a detailed analysis of impacts of the No Project Alternative as compared to the proposed project (see "Impact Analysis" subsection on Draft EIR pages 6-13 through 6-20). The comment's contentions that the Draft EIR does not adequately compare the proposed project to the No Project Alternative and that more information on reasonably foreseeable projects is not sufficiently explained nor supported by evidence in the comment, and no further response to these contentions is warranted.

Draft EIR Section 4.17, "Transportation," describes relevant aspects of the Fresno County Regional Active Transportation Program (see subsection "Fresno County Regional Transportation Plan" on Draft EIR pages 4.17-10 through 4.17-11) and evaluates the proposed project's potential to conflict with the Fresno County Regional Active

Transportation Plan (see Draft EIR Impact 4.17-1 on Draft EIR pages 4.17-27 through 4.17-29). The Fresno County Regional Active Transportation Plan is the applicable active transportation plan of the jurisdiction within which the project is located and the project's consistency with this plan is appropriately and sufficiently addressed in the Draft EIR. The comment's contention that the Draft EIR transportation analysis does not fully discuss the City and County of Fresno and City of Clovis plans and policies pertaining to active transportation does not provide substantial evidence of a deficiency in the Draft EIR. The comment does not provide evidence that the project would be inconsistent with or otherwise conflict with any policies of either the City of Fresno Active Transportation Plan or City of Clovis Active Transportation Plan. Additionally, the comment does not provide any evidence for the assertion that project activities such as blasting, or haul truck operations would disrupt implementation of active transportation elements.

Comment 67-11

The hydrologic and wildlife impacts, similar to Transportation and recreation, should consider and analyze future hydrologic conditions that are being implemented by water agencies. The San Joquin River Restoration Program has well publicized intents to implement full restoration flows on the San Joaquin River. This program, that has invested $100's millions in the San Joaquin River, is based on a legally binding settlement and Federal Government law (https://www.restoresjr.net/). Analysis within the DEIR should consider the higher levels of flows within the river that is mandated by the program, the higher levels of fisheries resources that are being pursued, and other related information that is available.

Given the long timeframe of the extension of the CUPs, the DEIR should also acknowledge the US Fish and Wildlife Service's, National Marine Fisheries Service's, Department of Fish and Wildlife's, and the San Joaquin River Conservancy's plans for restoration of fish and wildlife resources. This project area is an important component of future habitat for several listed and candidate species, and species of special concern that, and programs for recovery well documented. These efforts should be reasonably foreseeable to increase the number and types of fisheries and wildlife over the 100 years of the length of this CEQA project.

Response 67-11

The project is analyzed with respect to biological resources in Draft EIR Section 4.4 and the supporting materials referenced therein. Hydrology is analyzed in Draft EIR Section 4.10. Of particular relevance to this comment, the Draft EIR determined that the most important factor determining the flow regime of the San Joaquin River is release of water

from the Millerton Reservoir. It did not find that the project would have a significant impact on flows in the river and as such, no significant impacts to off-site fisheries were identified. Please see Collective Response #12 for further discussion of the San Joaquin River Restoration Program (SJRRP). To ensure the proposed Surface Mining and Reclamation Plan (SMRP) does not adversely affect the SJRRP, project activities would be coordinated with the U.S. Bureau of Reclamation and other responsible agencies to complement, rather than conflict with, the goals of the SJRRP by avoiding changes to river flows, fish passage, or water quality.

Comment 67-12

Relative to hydrologic analysis and water supply, the DEIR should also find that reclaiming both the plant site and the quarry area will increase evaporation of water that is directly linked to groundwater flow or would intercept water from Little Dry Creek that would ultimately impact the River's flow. Although reclamation to other than open water habitat would likely be cost prohibitive for the Company that ultimately is the owner when reclamation is implemented, this impact needs to be stated as a unmitigated significant impact.

Response 67-12

Draft EIR Impact 4.10-9 on pages 4.10-104 through 4.10-105 evaluates the project's potential to decrease groundwater supplies during mining operations and after the completion of reclamation of the Plant Site. The analysis considers and quantifies potential impacts in consideration of factors including evaporation (see Draft EIR page 4.10-104). Additionally, Draft EIR Impacts 4.10-13, 4.10-14, 4.10-15, 4.10-16, and 4.10-17 (see Draft EIR pages 4.10-114 through 4.10-119) discuss potential effects associated with Little Dry Creek and conclude based on supporting technical studies that the proposed project mining operations and reclamation activities would not alter the course of either the San Joaquin River or Little Dry Creek (e.g., see Draft EIR Impact 4.10-15 on page 4.10-117), and would not impede or redirect Little Dry Creek flood flows (e.g., see Draft EIR Impact 4.10-16 on page 4.10-118). Although the comment asserts that reclamation to open water habitat "needs to be stated as a unmitigated impact," the comment does not provide evidence pertaining to the adequacy of the Draft EIR analysis and conclusions that the project would have a less than significant impact associated with evaporation.

Comment 67-13

Future Conditions Should be Analyzed with Climate Change Considerations

- Future conditions should be analyzed with climate change considerations
    - Hydrology – flood potential with climate modeling
    - Water Quality (algae blooms in open water pits)

Related to the above discussion of reasonably foreseeable future conditions, most of the analysis on the future conditions does not incorporate well documented future impacts due to climate change. Analysis regarding hydrological conditions for the San Joaquin River and Little Dry Creek do not include like conditions that will exist both by 2050 and 2100. As is well documented with climate models, including downscaled modeling and analysis for this region, the climate in this region will have both hotter conditions and more flashy climatological events (for examples, see Moser & Ekstrom 2010, Zhang et al. 2024, and Liu et al. 2021). The analysis of the integrity of the quarry site from inundation, including through higher levels of groundwater flow from increased height of the river, and power of the river, should be better analyzed. An especially important, mitigation that would prevent the failure of the walls of the quarry should be very robust. The analysis of the quarry site from inundation from extreme flows of Little Dry Creek is especially superficial. (see below for related issues).

Climate Change projections are nearly unanimous in the prediction of hotter summers for this region. Reclaiming the plant and quarry sites to open water habitat does not consider what the future conditions will mean for water temperatures and the likelihood of outbreaks of Microcystis, a potentially dangerous micro algae (Power et al. 2024). With the potential for Microcystis outbreaks, the DIER should consider the potential future implications to fishers, wildlife and humans.

Response 67-13

The Draft EIR properly analyzed the impacts of the proposed project by analyzing the difference the proposed project would make as compared to existing baseline conditions at the time of the Notice of Preparation. The future impacts of climate change would not impact the proposed project.

The Draft EIR analyzed the project's potential effects regarding flood potential for the 100-year floodplain and concluded that the San Joaquin River floodplain does not enter into the Quarry Site nor the Plant Site. See Draft EIR Section 4.10, as revised in this Final EIR. In consideration of commenters' concerns pertaining to severe flooding events and in light of County Policy HS-C.12, Chang Consultants evaluated the potential for the 200-year flood to enter the Quarry Site and Plant Site. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. A topographic mapping was prepared to display the locations where the berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site. Please see Collective Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site.

The 2026 Hydraulic Analysis also demonstrated that the existing berms and topography of the Plant Site would prevent both the San Joaquin 200-year flood and the Little Dry Creek 200-year flood from entering the Plant Site (Chang 2026b, Appendix G-8). As such, the project sites are sufficiently protected from flood risks, including from the 200-year flood.

The commenter is referred to Section 4.10.1.6, "Surface Water Quality," of the Draft EIR, *Surface Water Quality,* which provides baseline water quality data on the ponds and recharge basins at the Plant and Quarry sites. The water within the onsite ponds and recharge basins would continue to be handled as presently managed. Presently, at the Plant Site water diverted from the San Joaquin River (under existing water rights) that is used to wash aggregate is sent to the silt ponds, where silts and fines settle out. The water from the silt ponds is then recycled back to the plant as process water. The silt pond also serves as a source of recharge to groundwater. At the Quarry Site, groundwater and surface water runoff from rainfall accumulates in ponded pits from historic and current mining, and is pumped out to accommodate mining operations. The water is used by water trucks for dust control, and is pumped to the existing groundwater recharge pond or existing recharge trenches. Please refer to Section 4.10 of the Draft EIR, which provides baseline water quality data of the water stored in these pre-existing features. The continuous flow of water through the ponds and basins at the Plant and Quarry sites presently minimizes and would continue to minimize stagnation, and by association microcystic and other bacterial growth.

Comment 67-14

Better, more Comprehensive Mitigation Should be Implemented, Especially for Significant Impacts that Cannot be Fully Mitigated to Less Than Significant Impacts

An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures (§15093 of the State CEQA Guidelines). This project is one which takes a valuable resource of the County and State, and allows for the commercialization of that resource. The likelihood of a lucrative return to the local economy is documented within the DEIR. From this perspective, it is likely that CEMEX will significantly benefit from this project. For this reason, feasible mitigation measures need to be considered that in other instances could be deemed too expensive.

For Transportation impacts, especially for those that involve the safety of pedestrians and bicyclists, there are several mitigation measures that could reduce the over impacts of this proposed projects. The City and County of Fresno have identified multiple intersections along Friant Avenue within the likely travel routes for the gravel trucks. The County should consider the installation of pedestrian and bike bridges at the intersections of Fresno, Audubon, Shepard, Fort Washington, Champlain, Copper, and Willow. Potentially these overcrossings can be completed over time, with those nearest Woodward Park being the highest priority. Related to this is the impacts to the San Joaquin River Parkway multiuse trail. Although CEMEX states in their supporting documents that they could work with the San Joaquin River Conservancy to build this between the plant and Friant road, and along their quarry pit, both of these alignments will still have safety concerns with the increased truck traffic. The County should require that CEMEX build a the multiuse train and underpass at the entrance to their plant, in addition to constructing the multiuse trail on Ball Ranch, connecting by a bridge across the river to Ledger Island, and then reconnecting to the Fresno side of the river upstream of the quarry site and connecting it to Lost Lake Park. These additions would keep pedestrians and bicyclists away from the quarry and allow for safe travel by the plant site. In addition, this should also take more bicycle traffic off of Friant Road and avoid safety considerations of increased traffic.

[A graphic was included as part of Comment 67-14 that is not reproduced here. To view this graphic please see Letter 67 in Appendix M, "Draft EIR Comment Letters"]

Figure 1. From the San Joaquin River Parkway Master Plan. Siting of existing and proposed multiuse trails with two crossing of the San Joaquin River.

Response 67-14

The comment is noted. CEQA Guidelines Section 15126.4(a)(1) requires an EIR to identify feasible mitigation measures that would avoid or substantially lessen significant environmental impacts; it does not require an EIR to include every conceivable mitigation measure or evaluate infeasible or unsupported measures.

The Draft EIR includes a detailed transportation analysis (see Appendix I-1) that evaluates potential impacts related to traffic operations, congestion, and vehicle, pedestrian, and bicycle safety along affected roadways and intersections. Based on this analysis, Mitigation Measures 4.17-1a through 4.17-1r require the Operator to pay its fair share toward the cost of roadway and intersection improvements needed to address project-related traffic and cumulative growth in the region. These improvements include, as appropriate, signalization, roadway widening, paving, and other operational enhancements. The specific design and implementation of such improvements are subject to County discretion and future engineering.

The comment suggests additional measures, such as pedestrian and bicycle overpasses at multiple intersection and an underpass at the Quarry Site entrance; however, the commenter does not provide substantial evidence demonstrating that such measures are necessary to address identified impacts or that they are feasible. As described in the Draft EIR (see Impact 4.17-1, beginning on page 4.17-27), the project would not impede or interfere with existing or planned transit, bicycle, or pedestrian facilities with implementation of the identified mitigation measures. In addition, the project area is rural in character and does not include existing pedestrian sidewalk or bicycle lane networks along North Friant Road connecting to established communities.

Accordingly, the Draft EIR identifies and incorporates feasible mitigation measures sufficient to reduce transportation impacts, and no additional mitigation, such as pedestrian or bicycle overpasses or underpasses, is warranted. Please also see Collective Response #30 regarding pedestrian and cyclist safety.

Comment 67-15

Specific Comments

Silty discharge from Plant site ponds to Little Dry Creek active floodplain The proposed project at the plant site (Figure 2) does not discuss past levee breakage and loss of water from the silt

pond. Although the proposed project describes some protection from discharges of the silt pond, there is not much information on any increase in design characteristics to the levee than can justify more confidence that further discharges will not happen. As seen in Figures 3-7, the silt pond is located next to the active flood plain of Little Dry Creek and has likely discharged silt and silty water into that flood plain. With the existing water quality constituents of the silt pond as reported in DEIR, the proposed project should provide strong mitiation measures to assure that the levee separating the silt pond from Little Dry Creek is much stronger, better monitored, and include a spill cleanup and abatement plan.

Response 67-15

The proposed project's berms would prevent levee breakage and separate the Plant Site from Little Dry Creek. A hydraulic analysis of the Plant Site was conducted in 2020 (see Draft EIR Appendix G-1) and indicated that the Little Dry Creek 100-year floodplain does not encroach onto the Plant Site boundaries due to the existence of the berms along the northern boundary of the Plant Site. The 2026 Hydraulic Analysis also demonstrated that the existing berms and topography of the Plant Site would prevent both the San Joaquin River 200-year flood and the Little Dry Creek 200-year flood from entering the Plant Site (Chang 2026b, Appendix G-8).

The proposed project would be required to comply with the SWPPP, which would specify best management practices (BMPs) including: inspection of areas where soil erosion occurs on the outer perimeter of berms and levees to ensure it does not affect the site's perimeter stormwater containment; and maintenance and repair of equipment and operational systems to uncover conditions such as cracks or slow leaks that could cause breakdowns or failures that result in stormwater pollution (Draft EIR page 4.10-69).

See also Impact 4.10-1 beginning on Draft EIR page 4.10-88 for discussion of the proposed project's impacts upon surface water quality standards and waste discharge requirements at the Plant Site during mining and reclamation.

Comment 67-16

Little Dry Creek supplies the Main Pond on Ball Ranch, that is used by the public for fishing, swimming and boating recreational activities. With the potential for future discharges of the silt pond, analysis should be done for the Main Pond on wildlife and fisheries species (see Figure 8), water quality issues, and impacts to hydrology from the proposed extension of the plant site CUP.

Figure 8: Sacramento Pikeminnow at the entrance of the Ball Ranch Main Pond. Photo taken April 12, 2029.

Response 67-16

The project's potential effects related to surface water quality and hydrology were evaluated within Draft EIR Section 4.10, as well as within the *Revised Hydrology and Water Quality Analysis Report* (Appendix G-5) and the *Addendum to: Revised Hydrology and Water Quality Ana*lysis *Report* (Appendix G-6), prepared by EMKO Environmental, Inc., and the *Hydraulic Analysis* (Appendix G-1) and *Surface Water Runoff and Drainage Plan* (Appendix G-2), prepared by Chang Consultants.

As discussed in the Draft EIR, the project as designed would not alter the course of Little Dry Creek, nor does the project propose to discharge surface water or groundwater to Little Dry Creek. Since there would be no discharges from the Quarry or Plant sites, there would be no potential for impacts to the water quality of Little Dry Creek. Therefore, no impacts to Little Dry Creek are anticipated as a result of project implementation. See discussion of Draft EIR Impact 4.10-14 beginning on page 4.10-116.

Comment 67-17

Lack of any analysis of the Inlet Ditch that is connected to the San Joaquin River and Little Dry Creek

- Silt issues
- Crossing of Little dry Creek
- Low water crossing of Little Dry Creek
- Invasive species issues in Ditch
- Lack of Fish Screen
- Lack of Water Quality Analsis

Figure 2 also shows the CUP boundary, which is also described as the Project Area for the plant site. A very important area that is not included, but should be, is the inlet ditch that supplies water to the plant. Figure 3 also shows, approximately, the location of the inlet ditch as in connects to the plant site on its western boundary, travels west before turning north and connecting to the

San Joaquin River. A very important note is that the ditch crosses Little Dry Creek at grade, causing the waters to commingle (Figure 9). The ditch supplies project related water supplies, and has required maintenance in the past, which is likely to continued being required for flow. For this reason, it should be included in the project area and its continued operations and maintenance described and mitigation for continued negative impacts covered.

[A graphic was included as part of Comment 67-17 that is not reproduced here. To view this graphic please see Letter 67 in Appendix M]

Figure 9: Rockfield water supply ditch with a focus on the crossing of Little Dry Creek from Google Earth, access in March 2025 and using the time series tool to show October 2023. Note the water within Little Dry Creek downstream of the inlet ditch crossing.

For example, Figure 10 shows how close land disturbance is to the inlet ditch pond at the plant site. This proximity of disturbance can allow silt and other contaminants to enter the water in the inlet ditch. With flows of Little Dry Creek, the likelihood of flow going back towards the River is likely. As with the water quality of the silt pond, water quality of the inlet ditch needs to be described.

Mitigation and monitoring requirements need to be put into place to avoid, if possible, on going and future negative impacts. Siltation of fine sediments is especially problematic for the fisheries of the San Joaquin River and is identified as potential issues in the continue efforts as reestablishing a run of Chinook salmon.

An important mitigation measure to avoid some of the most important negative impacts from continued operations at the plant site is to separate the ditch water from Little Dry Creek. A siphon or some other such infrastructure should be required.

Response 67-17

The "inlet ditch" as referred to by the commenter is referred to as the river water delivery ditch in the Draft EIR. The river water delivery ditch is part of the existing operations at the Plant Site, and presently delivers water from the river to the Plant (under CEMEX's water rights). There are no changes proposed as part of the project to the use of the river water delivery ditch, and therefore additional analysis is not required as part of CEQA.

The project is designed as a zero-discharge facility with respect to offsite discharges, so by nature, it does not propose to discharge water to any offsite surface waters, and all

water is to be retained onsite. Per the hydraulic analysis, the proposed project is designed to direct stormwater and groundwater to onsite basins and ponds. Therefore, the project would not impact the water quality of offsite surface water features.

The baseline groundwater levels at the project sites and within the region are described in Section 4.10.1.7, "Local Geologic and Groundwater Conditions," of the Draft EIR.

At the Plant Site, groundwater occurs within three geologic units: alluvium, weathered rock, and hard rock. Mining at the Plant Site is only proposed to occur in the alluvium. The groundwater conditions at the Plant Site were investigated by the installation of four alluvial monitoring wells and review of existing data from other onsite and adjacent wells. The depth to groundwater based on this analysis varies from 10 to 40 below ground surface, with seasonal fluctuations in water levels of up to 18 feet. The Plant Site groundwater data covers the years 2018 through 2023 (refer to Appendix B in the EMKO Environmental report).

At the Quary Site, groundwater also occurs within the alluvium, weathered rock, and hard rock. The groundwater conditions at the Quarry Site were investigated by the installation of four alluvial monitoring wells, four weathered rock monitoring wells, and seven hard rock monitoring wells. Pressure transducers with dataloggers were installed in these wells to monitor fluctuations in groundwater levels. The depth to groundwater across the Quarry Site varies from 10 to 45 feet below ground surface, with seasonal fluctuations up to 6 feet. The Quarry Site groundwater data covers the years 2017 through 2023 (refer to Appendix A in the EMKO Environmental report).

The potential project effects on wells surrounding the Plant and Quarry sites were evaluated in the Draft EIR.

At the Quarry Site, the use of the recharge trenches would limit the drawdown of the water table in the unconfined alluvial. The recharge operations would result in drawdown levels that would be approximately one-half of those which would occur without any recharge operations (KDSA 2021). The Draft EIR acknowledges reductions in the available groundwater column would occur in the Beck Ranch and Fresno County CSA 44C wells. The estimated decrease in the static water column would range from 30 to 60 feet depending on the recharge operations. If water production volumes from the CSA 44C wells decline to the point where current water demand cannot be met, this would result in a significant impact. Accordingly, Mitigation Measure 4.10-10a is provided as an Adaptive Management Program for Quarry Site Groundwater. As part of the Adaptive Management Program, potential effects on the CSA 44C wells would be assessed through the monitoring of nested wells between the Northeast Pond and the

CSA44C wells, and the CSA 44C wells themselves. Annual mitigation monitoring reports would be submitted to Fresno County annually. If monitoring data indicate groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15 percent, a significant impact would have occurred. At that point, corrective measures would be implemented.

At the Plant Site, per the Draft EIR, the use of recharge trenches would limit the drawdown of the water table in the unconfined alluvial aquifer from dewatering to six to eight feet at a distance of 500 feet from the excavation. There are no supply wells within 500 feet. At a distance of 500 to 1,000 feet, where there are three wells, the drawdown would be approximately three to five feet (KDSA 2021). The level of drawdown would continue to decrease past this distance. Within one-half mile of the perimeter of the Plant Site, there are five wells; the level of drawdown is not an appreciable portion of the available water column of the existing wells in surrounding areas, representing no more than five percent of the total available water column. Therefore, the project would not result in a substantial depletion of water supplies that could impede the use of groundwater in the basin.

Comment 67-18

In addition, none of the background information describes a right to use water from Little Dry Creek, and with the water comingled, CEMEX is taken water from a water body without any clam of rights for that.

Response 67-18

The comment raises an issue on water rights, not on environmental impacts. Water rights are not a proper subject of a CEQA analysis. The comment inaccurately states that the Operator is taking water from Little Dry Creek without the requisite water rights. Little Dry Creek is a tributary of the San Joaquin River (Draft EIR page 2-23). The Operator has water rights to use water from the San Joaquin River for industrial purposes in connection with processing rock, sand, and gravel (see Draft EIR page 4.10-8). As also noted in the Draft EIR, water is conveyed to the Plant Site via an existing river conveyance system (Draft EIR, Impact 4.10-4, pages 4.10-93 through 4.10-94). Furthermore, the project does not propose expansions or alterations in the existing water rights (i.e., there are no changes in the baseline conditions surrounding surface water usage) (see information most relevant to the baseline at pages 4.10-23 through 4.10-49 of the Draft EIR). The comment does not provide any substantial evidence that the river conveyance ditch is utilizing water from a water body without any claim of water rights.

Comment 67-19

[A graphic was included as part of Comment 67-16 that is not reproduced here. To view this graphic please see Letter 67 in Appendix M]

Figure 10: Rockfield water supply ditch with a focus on the crossing of Little Dry Creek and the inlet pond from Google Earth, access in March 2025 and using the time series tool to show May 2023. Note that Little Dry is flowing and that the surface disturbance at the plant site goes up to the inlet pond, allowing siltation and contaminants to enter the inlet ditch waters that are connected to Little Dry Creek.

Response 67-19

Regarding the comment's Figure 10 and observations in the caption, please see Response 67-18, above.

Comment 67-20

Impacts to Fisheries and Wildlife Need a More Comprehensive Analysis and a Mitigation and Monitoring Plan that Adequately Prevents Impacts

Although the supporting documentation for the DEIR discusses modeling that purports to show that the likelihood of impacts from blasting to fisheries, including Spring run Chinook salmon, are not expected, the monitoring, with mitigation measures if monitoring shows impacts taking place, is not sufficient to protect this very important resource. The 2013 State of Alaska Department of Fish and Game Blasting Standard (Alaska Blasting Standard) cited by the applicant identifies mitigation monitoring (hydrophones) that should be conducted in conjunction with blasting. The following is a recommended mitigation approach:

- Year 1 of blasting: Monitor blasting impacts at the river adjacent to the Quarry Site. Depending on monitoring results, implement the following actions:

1. Below 0.6 pounds per square inch and 0.5 inches per second: no action.

2. Between 0.6 pounds per square inch-6 pounds per square inch or 0.6 inches per second-2.0 inches per second: implement avoidance and minimization measures outlined in the Alaska Blasting Standard and continue monitoring.

3. Above 7.3 pounds per square inch or 2.0 inches per second: implement avoidance, minimization, and mitigation measures outlined in the Alaska Blasting Standard and continue monitoring.

At the end of one year of monitoring, re-evaluate the need for monitoring using the following parameters:

- If after 1 year, river impacts stay below 0.6 pounds per square inch and 0.5 inches per second, no additional monitoring is needed so long as future blasting techniques don't create additional pressure or other river impacts.

- If after 1 year, river impacts have been between 0.6 pounds per square inch-6 pounds per square inch or 0.5 inches per second-2.0 inches per second, continue monitoring and implementing avoidance and minimization measures until 1 year of 0.6 pounds per square inch and 0.5 inches per second measurements.

- If after 1 year, river impacts exceeded above 7.3 pounds per square inch or 2.0 inches per second, continue to implement monitoring and avoidance, minimization, and mitigation measures until 1 year of lesser pounds per square inch measurements are experienced, at which point follow guidance for the range of pounds per square inch and inches per second measurements experienced.

- If at any point blasting technique changes so that blasts have the potential to be more impactful to the surrounding land than they were during a 1-year monitoring period where blasts registered below 0.6 pounds per square inch and 0.5 inches per second at the river, river monitoring should take place for the period of higher impact blasting to verify that the new blasting technique does not create additional impacts to the river. So long as impacts of the new blasting technique remain below 0.6 pounds per square inch and 0.5 inches per second at the river, no additional monitoring is necessary for that blasting technique. If the blasting technique creates impacts, either cease the technique or re-enter monitoring, avoidance, minimization, and mitigation measures described above.

Response 67-20

The Draft EIR includes multiple mitigation measures governing blasting activities, including the Blasting Protocols (Mitigation Measure 4.10-1; see Draft EIR page 4.10-92), which are designed to avoid and minimize potential impacts.

An evaluation of the proposed blasting relative to the Alaska Department of Fish and Game (ADF&G) Blasting Standard for the Proper Protection of Fish was prepared by Vibra-Tech Engineers in 2021 (see Draft EIR Appendix E-4). This analysis concluded that ground vibrations associated with the proposed blasting would be well below the threshold for protection of fish embryos in spawning gravels, and that hydroacoustic overpressure levels would be substantially below levels associated with potential impacts to fish.

Specifically, the analysis determined that ground vibrations at the crest of the embankment—closer to blasting activities than the river's edge—would not exceed 0.5 inches per second, which is consistent with the ADF&G criterion for protection of embryos in spawning gravels. In addition, overpressure levels in the San Joaquin River resulting from adjacent blasting would be less than 1 pound per square inch (psi), which is well below the 2.7 psi threshold established in the ADF&G standard for the protection of fish, including salmon.

See also Response 65-13 for further discussion of the applicability of the ADF&G blasting standards and Collective Response #16 regarding potential impacts to salmon. Revisions to the Draft EIR are described in Chapter 3, "Draft EIR Errata."

Accordingly, the Draft EIR's analysis and mitigation measures related to blasting impacts are adequate, and no further revision is required.

Comment 67-21

The analysis of impacted wildlife species from operations, including blasting at the quarry site, does not adequately discuss probable species of wildlife expected in the area. The main example of this is any analysis of bat species. The North American Bat Monitoring Program has established monitoring sites very close to both the plant site and to the quarry site (NA Bat Monitoring Program 2023). This program has identified numerous species of bats adjacent to the project sites. In addition, Pallid Bats, recently listed as California's official state bat, have been identified in a night roosting site within 10 miles of the plant site (Figure 11). The DEIR should analyze the potential for blasting impacts of roosting of bat species, document their areas

of concern, and potentially impacts for impaired water bodies such as the silt ponds on their diet.

[A graphic was included as part of Comment 67-21 that is not reproduced here. To view this graphic please see Letter 67 in Appendix M]

Figure 11: Pallad bats at the Lanes Road house of the San Joaquin River Conservancy. Photo taken by J. Shelton November 2022

Response 67-21

The comment is noted. Section 4.4 of the Draft EIR, "Biological Resources," evaluates the project's potential to affect biological resources, including special-status wildlife species. Table 4.4-1, "Special-Status Wildlife Species," includes an analysis of the potential for individual species to occur on the project sites, including bat species.

The pallid bat is designated as a species of special concern by the California Department of Fish and Wildlife and is not listed under the federal or California Endangered Species Acts. The Draft EIR indicates that no pallid bats were observed on the project sites during biological surveys. In response to comments received, a nine-quadrangle California Natural Diversity Database (CNDDB) search was conducted, and additional discussion of pallid bat has been incorporated into the EIR through errata presented in Final EIR Chapter 3, "Draft EIR Errata." The results of the expanded records search are consistent with the conclusions of the Draft EIR and do not indicate the presence of pallid bat on the project sites or in close proximity that would alter the impact analysis.

Blasting activities would be brief and intermittent and are not expected to result in sustained or long-term impacts to wildlife species, including bats. In addition, blasting would occur during daytime hours when bat species are not active. Accordingly, the Draft EIR concludes that potential impacts to bats, including pallid bat, would be less than significant and do not require species-specific mitigation. To address potential impacts to bats, the Final EIR incorporates Mitigation Measure 4.4-1d, which requires a bat roost pre-construction clearance survey 30 days prior to surface disturbing activities. Please see Chapter 3, "Draft EIR Errata" for the full list of measures provided to reduce potential impacts to bats.

Therefore, the Draft EIR's analysis of impacts to pallid bat is adequate, and no further revision is required.

Letter #68 March 10, 2025, Sharon Weaver, San Joaquin River Parkway & Conservation Trust, Inc.

Comment 68-1

As I continue to review the DEIR I just came across the following paragraph in the 4.11 table regarding land use consistency with local planning documents:

See Section 4.10, "Hydrology and Water Quality."

With implementation of mitigation measures, the project would have less-than-significant impacts on water quality, groundwater supplies and recharge, and drainage patterns. However, as it cannot be said with certainty at this time that access would be granted to County and private residential supply wells to allow for the full implementation of Mitigation Measure 4.10-11a, the County has determined that the proposed project's potential impact on groundwater supply wells surrounding the Quarry Site would be significant and unavoidable.

If the County of Fresno has determined Groundwater impacts to be significant and unavoidable according to this statement, why weren't those impacts highlighted in the Notice of Availability?

Response 68-1

The comment identifies an error in Draft EIR Section 4.11, "Land Use and Planning," within Table 4.11-1, "Project Consistency with Local Planning Documents," on page 4.11-10 in the consistency analysis of Policy LU-A.3. Mitigation Measure 4.10-10a is incorrectly referred to as Mitigation Measure 4.10-11a and the level of significance of the associated impact is incorrectly identified as significant and unavoidable. As shown on Draft EIR page 4.10-111, Impact 4.10-10 was determined to be less than significant with implementation of Mitigation Measures 4.10-10a and 4.10-10b. The Notice of Availability published for the Draft EIR correctly identifies the project's significant and unavoidable impacts related to aesthetics and transportation (Impacts 4.1-1, 4.1-3, and 4.17.1).

Draft EIR Table 4.11-1 on page 4.11-10 is revised in this Final EIR through errata to correct the identified error. See Chapter 3, "Draft EIR Errata," to view this proposed revision to the Draft EIR.

4.4 INDIVIDUAL RESIDENTS' COMMENTS AND RESPONSES

Letter #69 January 22, 2025, James Durando

Comment 69-1

Good morning Mr. Randall, The Cemex is weighing heavy on my mind. I know you are only in charge of EIR. I need your advise [sic] and direction of who to contact for the loss of property value. I do not know the county mechanism and I am hoping you can direct me or find out who I contact. This is a very important consideration that needs to be addressed. The value in our home is what we have to care for us in our elder years a 37% loss would be devastating.

I would like the email for Mr Mtunga. The email I had to add us to the Cemex notification list returned to me.

Thank you for your consideration on our behalf.

Response 69-1

See Collective Response #7 regarding potential effects on property values. County staff responded to the commenter via e-mail providing the requested information. The comment is noted for the consideration of the decision-makers.

Letter #70 January 23, 2025, Evany Zirul

Comment 70-1

This letter is in protest to the approval of the Cemex USA proposition by the Fresno County to extend it's [sic] contract permit and property access for another 100 years. The damage to the (our)environment will be incalculable.

Response 70-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 70-2

Located adjacent to the river, the project has unknown damage to the water and river. In this increasingly arid environment, the xxx to the river could be significant.

Response 70-2

The project's potential impacts to water resources and the San Joaquin River are identified and addressed in Draft EIR Section 4.7, "Geology and Soils," Section 4.10, "Hydrology

and Water Quality," and Section 4.19, "Utilities and Services Systems," as well as Chapter 5, "Cumulative Impacts." Impacts that were determined to be potentially significant were found to be reduced to less than significant levels with implementation of the mitigation measures provided in the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made, and no further response could be provided. The comment is noted for the consideration of the decision-makers.

Comment 70-3

Also, the continued and increased traffic of oversize vehicles is and will be a source of damage to our roads and air quality.

Response 70-3

The project's potential effects on air quality and traffic are addressed in Draft EIR Section 4.17, "Transportation," and Appendix D-4, "Revised Section 4.3, Air Quality," as updated in this Final EIR. See Collective Response #9 regarding the project's potential to impact the region's existing air quality and Collective Response #29 regarding potential damage to roads. See also Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 70-4

Why would a foreign company have such influence on our governors?

Response 70-4

The Operator has been subject to the same administrative process for requesting a use permit extension as all other applicants per the County Municipal Code requirements. The County Board of Supervisors will decide on the proposed action based on the whole of the record before them. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #71 January 24, 2025, Bob Papazian

Comment 71-1

I'm a 4th generation Fresnan. I just received the mailer today from the County of Fresno regarding the proposed CEMEX extension/modification of their existing agreement for mining rock, sand, & gravel adjacent to the San Joaquin River near north Fresno.

I am AGAINST any extensions or modifications to the existing agreement with CEMEX. I would like to see them cleanup, restore,

& vacate that sight as spelled out in the current agreement. This property is sorely needed for the public, as Fresno continues to grow. It's been gratifying to finally see some public space (Ball & Sumner Peck ranches) set aside for public use near the San Joaquin River. The CEMEX operation has served its purpose. It's time to say "no" to any mining request extensions in that area, especially so near the river. I personally would like to see that property managed by the San Joaquin River Parkway & Trust & opened to the public, just like the former Ball Ranch & Sumner Peck properties.

Response 71-1

The commenter's opposition to the proposed project is noted for the decision-makers. See Collective Response #21 regarding use of the project sites as parkland with public access to the San Joaquin River.

Letter #72 January 25, 2025, Agellon Family

Comment 72-1

County Planners, please do not allow Cemex to extend their contract and mining in this area. We currently live in Tuscan Bluffs off Friant Road and strongly oppose the Cemex project extension and plans for a 600 foot pit. Particularly concerning is that CEMEX is a multinational company headquartered in Mexico, where they do not even allow the type of blasting/drilling CEMEX wants to do in Fresno.

Response 72-1

The commenter's opposition to the proposed project is noted for the decision-makers.

Comment 72-2

Please do not allow air, noise, and water pollution to affect our community.

Response 72-2

The issue of air pollution is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality." See also Chapter 3, "Draft EIR Errata." The issue of noise pollution is addressed in Draft EIR Section 4.13, "Noise." The issue of water pollution is addressed in both Section 4.7, "Geology and Soils," and Section 4.10, "Hydrology and Water Quality." Each of the impacts identified in these sections of the Draft EIR were determined to be less than significant with implementation of the mitigation measures provided. The comment is noted for the consideration of the decision-makers.

Comment 72-3

The San Joaquin River Parkway should be restored.

Response 72-3

See Collective Response #12 regarding river restoration efforts in the project area. The comment is noted for the decision-makers.

Comment 72-4

Further, Friant Road is already very dangerous and we can't imagine what adding more truck traffic to it would cause.

Response 72-4

See Collective Response #30 regarding traffic safety. The comment is noted for the decision-makers.

Letter #73 January 25, 2025, Corrie Lucchesi

Comment 73-1

I vehemently oppose the Cemex Rockfield Expansion which includes the blasting of a 600 foot pit.

(https://www.fresnocountyca.gov/files/sharedassets/county/v/1/vision-files/files/46439-eir-7763-informational-slideshow.pdf)
There are many things not to like about this expansion, but the simplest reason is the continued damage to the environment. What has already been done is bad enough, but to allow it to continue and on a heightened level is outrageous. Not only would this continue to damage the ecosystem, but it poses more danger for Fresno's citizens as air quality worsens and elevated noise pollution commences. In addition, Fresno is already among the top 10 most polluted cities in the US as was reported in The Fresno Bee on 4/27/24, and adding to this atrocity is an affront to humanity.(https://www.fresnobee.com/news/local/article288061190.html)

In conclusion, there are many homes in the vicinity of Cemex and its homeowners would be unduly and adversely affected by this expansion. I am one of those homeowners and I forcefully oppose this expansion taking place.

Response 73-1

The commenter's opposition to the project is noted for the decision-makers. The issue of impacts to ecosystems is addressed in Draft EIR Section 4.4, "Biological Resources." The

issue of increased noise is addressed in Draft EIR Section 4.13, "Noise." The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality." Each of the project impacts identified in these sections was determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata." See also Collective Response #9 regarding the project's potential impact on the region's existing air quality. The comment is noted for the consideration of the decision-makers.

Letter #74 January 28, 2025, Susan McAndrew

Comment 74-1

I just received a letter informing me about the proposed modification of the CEMEX expansion plans.

I am very opposed to this expansion. I have lived nearby for the last 35 years. We have already endured enough dust, traffic, speeding and pollution from this operation. I realize there is great pressure to provide building materials for area growth but they are basically trying to do that in the middle of a suburban area and a nature preserve.

Response 74-1

The commenter's opposition to the proposed project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted. Please see responses below to specific issues raised in the comment letter.

Comment 74-2

The traffic on Friant Rd has increased tremendously over the past decade. Having the large cement trucks and other construction vehicles try to share the road with all the new traffic is quite dangerous. Those trucks don't like to stop and I see them run redlights very frequently. They also speed along the highway. The proposed change would afford even more traffic between the two plants as well as inbound customers to the concrete plant and hot-mix plant.

Those drivers are on a timeline everyday. They have to check in at arrival and departure. Every part of their day is tightly measured. They are under orders to get the job done. Quickly.

Friant road has some of the highest accident rates in the city. Many of them are fatal.

The city of Fresno has tried to mitigate the number of accidents. They lowered the speed limits. They limited right turns at red lights, highlighted signal lights and traffic signs, repainted lane lines and accommodated bicycle lanes near Woodward Park. That's another thing- the route of access for all this truck traffic goes right next to a large regional park that has very heavy usage. A lot of the parking is on the South side of the road so there are groups of people crossing at all times. I see the disappointed looks on the faces of these big-truck drivers early in the morning when I change the light at Rice Road so I can cross to the Eaton trail.

So, are we going to unleash all this increased CEMEX traffic right into the middle of this suburban, recreation area?

Response 74-2

A decision of whether to approve the proposed project will be made by County decision-makers. The commenter's concern with regard to increased truck trips associated with the proposed project are noted. Draft EIR Section 4.17, "Transportation," provides a detailed discussion of anticipated project trip generation in Draft EIR Section 4.7.3.2, "Analysis Methodology," and tabulates existing and projected annual trips volumes associated with the project (see Draft EIR Table 4.17-1, "Existing Annual Trip Generation at Plant and Quarry Sites," Table 4.17-2, "Project Annual Trip Generation—Stage 1 (2.0 MT Per Year)," Table 4.17-3, "Project Annual Trip Generation—Stage 1 (3.0 MT Per Year)," and Table 4.17-4, "Project Annual Trip Generation—Stage 2 (3.0 MT Per Year)"). Please see Collective Response #29 pertaining to project traffic and Collective Response #30 pertaining to traffic safety and road maintenance. See also Chapter 3, "Draft EIR Errata," to view revisions to Draft EIR Section 4.17.

Comment 74-3

Additionally, I see large holes in the pavement from the weight of the trucks. There would be two or three or four times more of them under this new plan.

So who is going to pay to refurbish the road? Has that aspect been considered?

Response 74-3

Please see Collective Response #29 pertaining to project traffic and Collective Response #30 pertaining to traffic safety and road maintenance.

Comment 74-4

Then there are plenty of environmental concerns. Dust, debris falling off trucks, noise. All of this is a disturbance to the natural environment. Isn't that what the park was created for? The area is home to eagles, hawks, owls, coyotes, rabbits, finches, foxes etc. All of the commotion of CEMEX doesn't support that natural environment in the least.

Response 74-4

Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR, provides an evaluation of the proposed project's potential air quality impacts (see Appendix D-4, "Revised Section 4.3, Air Quality"), including fugitive dust emissions, Draft EIR Section 4.4, "Biological Resources," provides a discussion of potential biological resources impacts of the proposed project, Draft EIR Section 4.11, "Land Use and Planning," discusses and assess the project's potential to conflict with land uses and land use plans, and Draft EIR Section 4.13, "Noise," provides evaluation of potential noise impacts of the proposed project including noise generated from onsite project activities and offsite haul trucks. See Chapter 3, "Draft EIR Errata," to view revisions to the Draft EIR sections referenced in this response. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 74-5

When I moved here , it was my understanding that CEMEX was supposed to be phased out.

I don't even want to think about a 600 ft deep hole in the ground near Lost Lake Park!

I respectfully request that these concerns be taken into consideration and be given the most weight possible when the county makes decisions on this property.

Response 74-5

Draft EIR Chapter 2, "Project Description," describes the existing operations existing use permits and durations and provides a detailed description of the requested use permit extensions and modifications of the proposed project. For additional discussion, please see Collective Response #3 pertaining to previous use permit extensions and Collective Response #5 pertaining to the requested use permit duration. The commenter's concerns are noted and will be considered by County decision-makers.

Letter #75 February 3, 2025, Nyein Win

Comment 75-1

I would like to voice my objection to expanding the mining operations of Cemex. Traffic in that area is dangerous and congested enough without additional mining operations going on there.

Response 75-1

The commenter's opposition to the project is noted for the decision-makers. See Collective Responses #29 and #30 regarding the issues of traffic congestion and traffic safety, respectively.

Comment 75-2

The hours of operation for this project start far too early given their proximity to residential areas

Response 75-2

The project's proposed hours of operations are summarized in Table 2-5 on Draft EIR page 2-43. The primary impact to residential uses related to nighttime and early morning operations is noise. The project's potential noise impacts are addressed in Draft EIR Section 4.13, "Noise." Mitigation Measure 4.13-3 on Draft EIR page 4.13-61 restricts the project's hours of operations to reduce operational noise levels at the Quarry Site. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13. The comment is noted for the consideration of the decision-makers.

Comment 75-3

and has a significant impact on air quality which is something we already struggle with in our Valley.

Response 75-3

The project's potential effect on air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality." See also Chapter 3, "Draft EIR Errata." See also, Collective Response #9 regarding the project's potential impacts to the region's existing air quality conditions. The comment is noted for the consideration of the decision-makers.

Comment 75-4

How much tax revenue will they be contributing to mitigate the effects of the air pollution, noise pollution, and traffic congestion on those of the community who will have to bear the brunt of it?

Response 75-4

The project's projected tax revenue is an economic impact outside of the scope of the EIR. Under CEQA statute, guidelines, and case law, economic impacts are not cognizable CEQA issues. See Collective Response #7, regarding economic effects. The project's potential impacts related to air pollution, noise pollution, and traffic congestion are evaluated in Draft EIR Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13 and Section 4.17, "Transportation," as they are updated in the Final EIR, respectively. See Chapter 3, "Draft EIR Errata." The funding and responsibility for implementation for each mitigation measure presented in these sections are specified in the text of the individual measure and summarized in the Mitigation Monitoring and Reporting Program (MMRP), which will be considered for adoption in conjunction with project approval. See also Collective Response #4b regarding liability for unforeseen damages caused by the proposed project.

Comment 75-5

Blasting 600 feet underground so close to recreation areas and residential areas could also have unforeseen impacts on ground stability.

Response 75-5

Issues related to ground and slope stability are addressed in Draft EIR Section 4.7, "Geology and Soils," and Section 4.13. See Impact 4.13-6, beginning on Draft EIR page 4.13-65, for evaluation of the potential for blasting within the Quarry Site to result in the instability of the San Joaquin River embankment. Impact 4.13-6 and all other impacts identified in these sections were determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #17 regarding riverbank stability and Collective Response #27 regarding potential effects of blasting on users of adjacent recreation areas. The comment is noted for the consideration of the decision-makers.

Comment 75-6

There are no guarantees that this company will pay for any damages blasting mining will have on the surrounding areas and it could

have a large impact on public funds as liability gets hashed out in the courts.

Response 75-6

See Collective Response #4a regarding CEMEX's regulatory compliance and Collective Response #4b regarding liability for unforeseen damages caused by the proposed project.

Comment 75-7

Additionally, I have serious concerns about the impact this project will have on the river and the surrounding areas such as Woodward Park and Lost Lake park. I understand reclamation is a part of their plans but that will be 70 years in the future. My children are alive now. They're the ones who will have to live through these disruptions in their environment with very little benefit to them. Just an eyesore, air pollution, noise pollution, more traffic and who knows what else.

Response 75-7

The project's potential impacts to the San Joaquin River are addressed primarily in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR Section 4.10. See also Collective Response #25 regarding project effects on river flows.

See Collective Response #27 regarding operational impacts on adjacent public parks.

As described in Draft EIR Section 2.5.7, "Reclamation," beginning on page 2-45, both the Plant Site and the Quarry Site would be mined in phases. Reclamation of each phase would occur once operations have completed within a phase. Reclamation of the Plant Site would begin at the end of Stage 1 within 30 years. Reclamation of the Quarry Site would begin at the end of Stage 2 within 100 years under the proposed project.

The comment is noted for the consideration of the decision-makers.

Comment 75-8

I oppose the extension of this project. It is too close to recreation areas and residential areas. Any financial gains to our community would not outweigh the negative impacts.

Response 75-8

The commenter's opposition to the project is noted for the decision-makers.

Letter #76 February 5, 2025, Diane Durando (Letter #1)

Comment 76-1

Mr Randall, The term monitor for the barrier between the dig and the San Joaquin River is inadequate. Monitor means nothing without parameters and in-depth studies of the safety of the barrier. I saw no report from independent geologist as to the safety and stability of the barrier. If this fails it could have catastrophic down river and in flooding and contamination from the blast site. We must have evaluation by an independent fine geologist study this concern.

Response 76-1

Each of the technical studies prepared for the proposed project by the Operator or its consultants, including the Quarry Site Geotechnical Report presented as Draft EIR Appendix F-2, "Quarry Site Geotechnical Report," were independently peer-reviewed by County-retained experts in an appropriate field. Appendix F-3, "Quarry Site Geotechnical Memorandum," presents a response to this peer review including how the Quarry Site Geotechnical Report was revised to address comments that were made. See Collective Response #17 regarding bank stability and the potential for breach at the Quarry Site. The comment is noted for the consideration of the decision-makers.

Letter #77 February 5, 2025, Diane Durando (Letter #2)

Comment 77-1

I see no report from our local native American community in the EIR as to the effect of this blast /dig may have on their river sites that have many traditional grinding holes. Has the local Table Mountain Rancheria been consulted? Have they had time to evaluate possible destruction of these Native American sites?

Response 77-1

Potential impacts to tribal sites and cultural resources are addressed in both Draft EIR Section 4.5, "Cultural Resources," and Section 4.18, "Tribal Cultural Resources." Section 4.18.1.2, "Known Tribal Cultural Resources Within the Project Sites," of the Draft EIR at page 4.18-4 describes the known cultural and historic resources within the project sites. The County's notification and consultation process with local tribes for the project is described on Draft EIR page 4.18-8. The Table Mountain Rancheria and other applicable local tribes were notified of the proposed project via certified mail on December 9, 2019. See Draft EIR Appendix J, "AB 52 Tribal Notification Letters," for the notification letters. No tribes responded or requested consultation within the 30-day statutory limit for consultation requests under AB 52.

On January 9, 2025, the Table Mountain Rancheria submitted a letter to Fresno County in response to the Notice of Availability of the Draft EIR requesting consultation with the County pursuant to AB 52. Although the request was submitted after the statutory AB 52 consultation request period had closed, the County nevertheless provided a site visit and project documentation to the Tribe in February 2025 to facilitate review of potential cultural and tribal cultural resources.

See Comment Letter #19 submitted by the Santa Rosa Rancheria Tachi-Yokut Tribe and Comment Letters #50 and #52 both submitted by the Table Mountain Rancheria.

Letter #78 February 5, 2025, Diane Durando, (Letter #3)

Comment 78-1

I am very concerned about the term Monitor in the report. To monitor with no established preexisting levels means nothing. Water levels do vary during the year. There are no current studies presented that have completed a year of establishing the current water levels at each of the 5 domestic wells within 1/2 mile of the project. Every well must be checked as they may be in different depth levels. One of the wells serves 11 homes. Water levels do vary during the year this is why a complete evaluation of each well is mandatory to protect peoples [sic] water.

Response 78-1

The Plant Site Groundwater Conditions report is presented in Draft EIR Appendix G-3, "Groundwater Conditions at the Plant Site," which provides further information about the sampling program implemented to establish groundwater quality at the Plant Site. The Quarry Site Groundwater Conditions Report is located in Draft EIR Appendix G-4, "Groundwater Conditions at the Quarry Site," which also provides information regarding sampling methodology and findings. A hydrologist established the existing baseline conditions of wells near the Plant and Quarry sites. The commenter requests that all wells be included in the analysis; however, this is not necessary to establish the baseline conditions of groundwater adjacent to the project sites. Please see Table 4.10-8 on page 4.10-103 of the Draft EIR for more information pertaining to well samples near the Plant Site and the existing water column. See also Table 4.10-9 regarding the wells sampled near the Quarry Site (Draft EIR 4.10-106). The studies and well-sampling conducted are sufficient for the purposes of establishing the existing depth of the sampled water columns and for CEQA review.

Please note that CEQA does not require technical perfection and does not require all studies to be conducted to evaluate environmental impacts (Title 14 CCR Section 15204). See Response 78-2 regarding monitoring wells adjacent to the Quarry Site.

Comment 78-2

The wells levels must be protected by 24/7 evaluation by a public agency to protect the domestic wells.

Then there must be parameters to this monitoring. At what percent of water level loss is there a complete halt of the proposed blast & dig? Cemex could choose to monitor us to no water. There must be exact legal language protections in place to protect domestic wells.

I know the man on the zoom meant well when he said monitor like it was the best protection, but I do not believe he really thought through his statement.

Response 78-2

As detailed in the Draft EIR, at the Quarry Site, the use of the recharge trenches would limit the drawdown of the water table in the unconfined alluvial (Draft EIR page 4.10-102). The recharge operations would result in drawdown levels that would be approximately one-half of those which would occur without any recharge operations (KDSA 2021). The Draft EIR acknowledges reductions in the available groundwater column would occur in the Beck Ranch and Fresno County CSA 44C wells (see Draft EIR discussion of Impact 4.10-10). The estimated decrease in the static water column would range from 30 to 60 feet depending on the recharge operations. If water production volumes from the CSA 44C wells decline to the point where current water demand cannot be met, this would result in a significant impact. Accordingly, Mitigation Measure 4.10-10a is provided as an Adaptive Management Program for Quarry Site Groundwater. As part of the Adaptive Management Program, potential effects on the CSA 44C wells would be assessed through the monitoring of nested wells between the Northeast Pond and the CSA 44C wells, and the CSA 44C wells themselves. Annual mitigation monitoring reports prepared by a Professional Geologist/Certified Hydrogeologist would be submitted to Fresno County. If monitoring data indicate groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15 percent, a significant impact would have occurred. At that point, corrective measures outlined in Mitigation Measure 4.10-10a would be implemented (Draft EIR page 4.10-108 to 4.10-111). Mitigation Measure 4.10-10a provides the following: "If, during mining, all available water from dewatering is being pumped to the Northeast Pond or recharge trench and the water level in the MW-3 well cluster remains 15 percent or more below the baseline elevations, then mining could not progress to greater depths in the quarry" (Draft EIR page 4.10-109).

Letter #79 February 5, 2025, Neil Thompson

Comment 79-1

I would like to raise an issue that affects Public Safety especially as it relates to the Quarry Site. This could be analyzed under the Hazard category as the Fresno County General Plan Implementation Program HS-E.B includes a statement that "The County shall, as part of the development review process, ensure that new development . . . does not create manmade safety hazards . . .".

The issue pertains to the public safety hazard that the quarry will represent after the project is complete 100 years or so from now (and maybe before). The public would expect that the site would be fenced for security purposes during the operational years. However, after the operations have ceased and the Applicant or their successors have vacated the property the quarry will remain as an attractive nuisance forever and beyond. By that time the metropolitan population will be several times larger than it is now and the river parkway will be utilized far beyond what we can now envision. Recreational travel up and down the river will lead everyone past the open quarry whether the trail is on the east or west side of the quarry.

With the stepped but vertical walls and a surface water elevation more than 400 below the trail elevation, the open quarry will not be suitable for fishing, swimming, boating, kayaking, canoeing, floating or anything else. But it will be ATTRACTIVE, especially to preteens and teenagers. There is not a fence that will keep them out.

What will happen if one or more of the public falls into the pit? They won't fall all the way down - just 50 feet. That is a sure death. And if they do fall into the water, how will they get out? With vertical walls all around, they may have to swim more than one half mile to find the sloped haul road at one point. How many people have drowned at Lost Lake because they can't swim? This might be a great EMS training center.

Who is going to maintain the fence FOREVER? The definition of an old mining feature is "abandoned mine." That is a liability that the County will own FOREVER.

Response 79-1

Proposed fencing is described on Draft EIR page 2-35 and in Section 5.1.5 of the proposed Surface Mining and Reclamation Plan presented as Appendix B-1, "Surface Mining and

Reclamation Plan," to the Draft EIR. As described, the entire perimeter of each project site would be fenced in accordance with Section 834.4.220, subsection I.4 of the Fresno County Zoning Ordinance. Secured gates wide enough to allow for emergency access, would be maintained at site entrances.

Letter #80 February 6, 2025, Ken and Betty Cornelisen

Comment 80-1

As residents of Fresno County, we want to strongly object to the Cemex proposal to dig a 600-foot hole in the San Joaquin Riverbed for mining purposes. This will further destroy the river and the natural habitat for birds, wildlife, and plant species. Please do not allow Cemex to continue with this project.

The negative effects of allowing this corporation to continue is overwhelming. Traffic, air quality and the destruction of our precious remaining environment is reason enough to refuse Cements efforts to go any further.

For the benefit of our valley and all who live here please deny their request.

Response 80-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Potential impacts to the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water." Potential impacts to plant and wildlife species and associated habitats are addressed in Draft EIR Section 4.4, "Biological Resources." See also Collective Responses #12 through #16 related to biological resources. Potential impacts related to traffic are addressed in Draft EIR Section 4.17, "Transportation." See also Collective Responses #29 and #30 related to traffic congestion, roadway improvements, and traffic safety. Potential impacts to air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata." See also Collective Response #9 regarding the project's potential impact on the region's existing air quality.

Letter #81 February 6, 2025, Eve Hudson

Comment 81-1

The 600-foot-deep pit mine proposed for the San Joaquin River near Friant creates many problems to our air quality, water quality and the environment in general.

Response 81-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Potential impacts to air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata." See also Collective Response #9 regarding the project's potential impact on the region's existing air quality.

Potential impacts to water quality are addressed in Draft EIR Section 4.10, "Hydrology and Water." See also Collective Response #23 regarding groundwater quality. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 81-2

Cemex, as you know, is a multinational corporation based in Mexico. Last fall, the lower house of Mexico's congress passed a bill banning the same kind of mining that Cemex proposes to do in our country, on our own San Joaquin River. Why, if Cemex's proposal is not good enough for Mexico would we allow it here in our own country?

Response 81-2

No specific comments related to the adequacy of the Draft EIR were made and no further response is warranted. However, the comment is noted for the consideration of the decision-makers.

Comment 81-3

My family and I have spent many happy hours recreating and enjoying the San Joaquin River in that area. We need all the park space that we have and more. Please do not destroy our natural environment and the open spaces that we enjoy.

I am asking you to vote no on Cemex's proposal to further mine the San Joaquin River.

Response 81-3

See Collective Response #27 regarding potential noise impacts to users of adjacent parks and trails. See also Collective Response #21 regarding the assertion that the project sites should become public parks. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #82 February 6, 2025, Ken Hudson

Comment 82-1

Do NOT approve Cemex's application to extend their open pit mining operation. As a life-long resident of Fresno County, I have always enjoyed the San Joaquin River near Friant for canoeing, fishing, swimming, hiking, wildlife-viewing, and field trips for my elementary students. Some of my fondest memories are seeing deer, egrets, beavers, and lately, even eagles.

Response 82-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 82-2

Allowing this multinational company, based outside the United States, to disturb the riparian environment and muddy the water with a 600-foot mining pit for a hundred years is unconscionable. As local columnist, Marek Warszawski, points out, "last fall the lower house of [Mexico's] Congress passed a bill banning the same type of open pit mining the company wants to do in Fresno County. If blasting and drilling a 600-foot deep pit next to a major river isn't kosher in Mexico, it should be equally beyond the pale for the San Joaquin Valley." (The Fresno Bee, Jan 14, 2025)

Response 82-2

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 82-3

Fifteen years ago my family and I joined others in successfully calling for the planning commission and BOS to oppose Cemex's application to mine Jesse Morrow Mountain. Let's see Fresno County do the right thing again. Vote NO on the Cemex application.

Response 82-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #83 February 6, 2025, Brenda Markham, (Letter #1)

Comment 83-1

To whom it may concern:

With regard to DEIR Another major impact that CEMEX would have on the environment is noise. According to section 4.13-6 ,the negative effects of noise on humans can result in auditory and non auditory effects. These effects could lead to temporary or permanent hearing loss -not to mention behavioral and physiological effects. Truck pass-by noise standard is 80 (dBA) [See page 770-771;4.13-25&26]. This level far exceeds the General Plan acceptable limits of 60 (dBA). see table 4.13-6.

This impact alone is detrimental to the health and well being of the surrounding communities. How do you plan to compensate for people with medical complications caused by high levels of noise?

Response 83-1

In addition to the response below, see Response 60-13, which addresses the commenter's concern regarding public health issues associated with excessive noise.

Comment 83-1's assertion that the 80 dBA standard identified in Title 40 CFR Section 205.52 exceeds the Fresno County General Plan 60 dBA standard applicable to residential uses is incorrect. The CFR standard is a maximum noise standard applicable to a single truck, meaning that no single heavy truck pass-by shall exceed a maximum noise level of 80 dBA L_{max} measured at a reference distance of 15 meters. By contrast, the Fresno County 60 dBA standard is a weighted 24-hour average noise level standard (Ldn), meaning that the weighted 24-hour average of all vehicles on a public roadway shall not exceed 60 dBA Ldn at noise-sensitive outdoor areas of residential uses. The differences between a single-event maximum (L_{max}) noise level and a 24-hour average (Ldn) noise level are vast and the two descriptors are not interchangeable.

Finally, the extensive noise analysis prepared for this project carefully evaluated both absolute noise levels as well as the increases in noise levels which would result from the project. (See Draft EIR Appendix H-1, "Environmental Noise and Vibration Assessment") In both cases the analysis concluded that the project would not exceed the local, state, and federal noise standards designed to protect people from the harmful effects of excessive noise.

Letter #84 February 6, 2025, Brenda Markham (Letter #2)

Comment 84-1

Regarding the DEIR-

There are several environmental impacts listed, but one of my main concerns is Air Quality. I see on item 4.3-10 that "long term exposure to diesel exhaust particles poses the highest cancer risk of any toxic contaminant evaluated by OEHHA. The ARB has estimated that about 70% of the cancer risk that the average Californian faces from breathing toxic air contaminants stems from diesel exhaust particles".

This alone is detrimental to communities in the surrounding area. How do you intend to mitigate this?

Thank [sic] you for your attention to this matter

Response 84-1

Please see Collective Response #11 pertaining to community cancer risk. Draft EIR Impact 4.3-3, as updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality," evaluates the potential exposure of sensitive receptors to substantial pollutant concentrations, including diesel particulate matter. The impact discussion quantifies estimated unmitigated health risk impacts (Appendix D-4 Table 4.3-24) and mitigated health risk impacts (Appendix D-4 Table 4.3-25). As shown in Tables 4.3-24 and 4.3-25, the project's potential to expose sensitive receptors to substantial pollutant concentrations is less than significant before or after mitigation.

This impact discussion is based on the Health Risk Assessment (HRA) prepared for the project and included as part of Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment," as updated and provided as Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment." As determined in Impact 4.3-3 on Appendix D-4, Section 4.3.4, "Project Impacts and Mitigation Measures," with or without implementation of Mitigation Measures 4.3-2a and 4.3-2b, the proposed project would not result in cancer, chronic, or acute health risks to residents or workers above the respective significance thresholds.

Furthermore, in response to comments received, an updated HRA and a Fugitive Dust Control Plan was prepared in the Air Quality, Health Risk, and Climate Change Technical Report (Appendix D-3). This updated analysis included cancer burden modeling and demonstrated no new impacts and no changes to the findings in the Draft EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata."

Letter #85 February 6, 2025, Brenda Markham (Letter #3)

Comment 85-1

Regarding the DEIR:

A concern I have is the environmental impact on wildlife. I don't see any mention of how wildlife is affected while there's blasting going on. This would be different from the surface mining that's been going on.

Response 85-1

Potential impacts to wildlife species from proposed project operations, including blasting, are addressed in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-1 beginning on Draft EIR pages 4.4-48. See also Collective Response #13 regarding operational impacts to wildlife on adjacent properties and Collective Response #16 regarding the project's potential impacts on salmon from groundborne vibration and sedimentation. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

Letter #86 February 7, 2025, Cheyenne Jenvey

Comment 86-1

Do you care about the impact this will have on our city, our water, our river, our park our habitat and our peace of mind? Nope because all you care about is $$$$ signs!

We & I who are natives to Fresno VOTE NO on this plan & project!

The San Joaquin River is important and precious and needs to be LEFT ALONE!

Response 86-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #87 February 7, 2025, Neil Thompson

Comment 87-1

Flood hazards are discussed in Section 4.10.1.5 starting on Page 4.10-15 of the Executive Summary and further described in an analysis found in Appendix G-1.

The flood hazard analysis is limited to the FEMA 100-year floodway and floodplain and states the "the floodplain does not encroach into the Quarry Site" as shown on Figure 4.10-1.

The continued development of the berm between the river channel and the Quarry Site will constrain the river and will create a choke point especially at the north end of the Quarry Site where the easterly bank of the river is more vertical. According to the 100- Year Hydraulic Results found in the Hydraulic Analysis in Appendix G-1, the flood water surface elevation between Stations 20 and 21averages out to 313.27 feet. Without a constraining bank between Stations 20 and 21on the east side of the river additional water flow will likely push to the east across the north side of the Quarry Site.

Response 87-1

The Quarry Site does not encroach into the 100-year floodplain of the San Joaquin River, and would thus not create a choke point. See Appendix G-1, "Hydraulic Analysis," of the Draft EIR for further discussion of the hydraulic analysis. The floodplain does not enter the Quarry Site from stations 20 to 21 (see Draft EIR Appendix G-1, Appendix A, Figure 2).

Comment 87-2

The Executive Summary includes the following caveat: *The Bureau of Reclamation owns and manages the dam, and, during unforeseen events, may be required to release water into the San Joaquin River at rates that could exceed the river channel capacity (Fresno County 2018a).*

The establishment of an earthen berm around the Quarry Site that is higher (approximately 30 feet) than any land between the natural banks of the historic San Joaquin River will be an obstruction to unforeseen water flows in the historic channel. In fact, the creation of the Quarry Site berms will effectively obstruct about 70 percent of the historic channel width at the north end of the Quarry. This could have a devastating upstream impact as floodwaters are impeded by the Quarry Site berm.

[A graphic was included as part of Comment 87-2 that is not reproduced here. To view this graphic please see Letter 87 Appendix M, "Draft EIR Comment Letters"]

Response 87-2

The Quarry Site berm described in this comment already exists at the Quarry Site and is part of the baseline conditions for the CEQA analysis presented in the Draft EIR (Draft EIR at page 2-8).

Comment 87-3

The Fresno County General Plan HS-C.4 states: *The County shall require . . . developments within areas subject to 110- and 200-year frequency flood are designed and constructed in a manner that will not cause floodwaters to be diverted onto adjacent property or increase flood hazards to property located elsewhere."*

The Fresno County General Plan HS-C.12 states in part: *The County shall encourage the performance of appropriate investigations to determine the 200-year water surface elevations for the San Joaquin River . . . "*

Because the construction of the Quarry Site berm is intended to and will be required to remain FOREVER, it is unreasonable to assume that the analysis can be limited to the 100-year horizon. It should be a FOREVER horizon as the berm will have to withstand all conceivable and inconceivable events that it will face FOREVER.

More analysis is required to determine future impacts to this site and surrounding impacted areas due to flood hazards.

Thank you for your consideration.

Response 87-3

Although the Quarry and Plant sites are located near the San Joaquin River, the river's 100-year floodplain does not extend into the Quarry Site (Draft EIR page 4.10-16). Similarly, the San Joaquin River 100-year floodplain does not encroach onto the Plant Site, as demonstrated in the 2020 Hydraulic Analysis provided in Appendix G-1 and clarified in Final EIR Chapter 3, "Draft EIR Errata." The existing topography and berms along the north edge of the Plant Site prevent the Little Dry Creek 100-year floodplain from entering the Plant Site. Note that all proposed project improvements would be located outside of the floodplain, and no flood control measures are required. Stormwater runoff would continue to be directed to existing onsite ponds, canals, and trenches as necessary.

In consideration of commenters' concerns pertaining to severe flooding events and in light of County Policy HS-C.12, Chang Consultants evaluated the potential for the 200-year flood to enter the Quarry Site and Plant Site. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. Topographic mapping was prepared to display the locations where the berms were raised and is included in the 200-year hydraulic analysis for the Quarry Site. Please see Collective

Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site, and see Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.11, "Land Use."

The 2026 Hydraulic Analysis also demonstrated that the existing berms and topography of the Plant Site would prevent both the San Joaquin 200-year flood and the Little Dry Creek 200-year flood from entering the Plant Site (Chang 2026b, Appendix G-8, "200-year Flood Hazard Analysis—Plant Site"). As such, the project sites are sufficiently protected from flood risks, including from the 200-year flood.

It should be noted that the Draft EIR Hydraulic Analysis' use of the FEMA 100-year floodplain to analyze the project's flood hazards is sufficient for the purposes of analyzing potential flooding impacts under CEQA.

Letter #88 February 7, 2025, Laurie Tidyman-Jones

Comment 88-1

Hello, I'm a resident of the City of Fresno, Fresno County and live near Woodward Park. I have lived in Fresno for over 50 years. I am writing to register my opposition to the continued dredging of the San Joaquin River and the proposal to blast the river basin.

Response 88-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 88-2

The river bottom, air, water, and noise pollution is unacceptable, as well is the destruction of one of Fresno's greatest assets for beauty and wildlife, the San Joaquin river area.

Response 88-2

The issue of air pollution is addressed in Draft EIR Section 4.3, "Air Quality," while the issue of water pollution is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," as these sections are updated in this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata." The project's potential noise impacts are addressed in Section 4.13, "Noise."

Potential impacts to the San Joaquin River are addressed primarily in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential impacts to the aesthetics of the project area are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See also Collective Response #25 regarding the project's potential impacts to river flows and

effects to downstream users and Collective Response #12 regarding potential impacts to recent restoration projects along the San Joaquin River.

Comment 88-3

The continuance of CEMEX without an EIR since 2014 has seriously compromised the river basin and its aesthetic.

Response 88-3

The commenter's statement that CEMEX has operated "without an EIR since 2014" is incorrect. Existing Rockfield Quarry operations have not been conducted without environmental review. As discussed in Collective Response #2, the County previously completed CEQA review for the existing operations, and the County has approved extensions of the existing conditional use permits to allow continued operation while the County processes the proposed entitlement application and this EIR. The proposed project and its potential impacts, including impacts related to aesthetics, are evaluated in the EIR. Existing conditions at the project sites reflect the environmental baseline for purposes of this EIR analysis. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 88-4

We can't just be about making money we need a vision and a plan for a Fresno to be proud of, not embarrassed by. When Mr. Bredefeld (now County Supervisor representing me) his website bragged about Woodward Park and the beauty thereof. I am assuming he wants that to continue? It will be interesting to see.

Please stop this acceleration and reconsider the continued presence of CEMEX in the river bottom.

Response 88-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #89 February 8, 2025, Patrick Cassen

Comment 89-1

I write in opposition to expansion of the CEMEX Rockfield Project.

Response 89-1

The commenter's opposition to the proposed project is noted and will be considered by County decision-makers.

Comment 89-2

The Central Valley, with its chronic air pollution problems, is not the appropriate place for a major blasting operation. Pollution exposure associated with particulate dust is a well documented health issue; it causes respiratory inflammation and degraded lung function, which aggravate respiratory diseases such as asthma. The CEMEX operation cannot avoid the production of unsafe quantities of dust.

The EIR notes (4.3 60) that "…the proposed project could potentially generate emissions that exceed the annual PM10, and the daily screening level for CO, PM10, and PM2.5. Therefore the proposed project could potentially result in a cumulatively considerable net increase of these criteria pollutants."

Response 89-2

The project's potential impact on air quality, including potential release of criteria pollutants, is discussed in Draft EIR, Section 4.3, "Air Quality," as updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality." In response to comments received, the *Revised Air Quality, Health Risk, and Climate Change Technical Report* (see Appendix D-3), was prepared. This updated analysis resulted in the project exceeding the daily emission screening criteria for CO and NO_x and not the annual screening criteria for PM_{10}, or the daily screening criteria for PM_{10} and $PM_{2.5}$. See Tables 24 and 25 of Appendix D-3. Table 28 of Appendix D-3, "Mitigated Criteria Pollutant Concentrations and AAQS Comparison," demonstrates that when mitigated the proposed project would not exceed the ambient air quality standards significance threshold for any criteria pollutant, including PM_{10} and $PM_{2.5}$. Please see Collective Response #9 pertaining to the project's potential impact on regional air quality, and please see the following responses to specific comments from Letter 89. See also Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata."

Comment 89-3

This conclusion requires mitigation measures, so a 'Fugitive Dust Control Plan' is projected to render the pollutant levels "less than significant".

Three points regarding this mitigation plan should be noted:

1. The mitigation plan is projected to reduce daily emissions of PM2.5 a mere 1.5% (.015) below threshold, and similarly marginal amounts for other pollutants. This is reminiscent of CEMEX's mitigation projections for the rejected Jesse Morrow

proposal, for which mitigations were calculated to nudge the pollutants to barely below threshold for significance.

Response 89-3

The project Operator has prepared a Fugitive Dust Control Plan which will be submitted for the approval of the SJVAPCD prior to project implementation per the requirements of Mitigation Measure 4.3-2b. See Appendix K of Appendix D-3, "Fugitive Dust Control Plan."

Draft EIR Section 4.3, has been updated with the changes proposed in Final EIR, Chapter 3, "Draft EIR Errata," and Appendix D-4, "Revised Section 4.3 Air Quality." Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions, and Table 4.3-22, "Mitigated Net Change in Daily Emissions," demonstrate that the project would have a less than significant impact in regard to Criteria Air Pollutant emissions including $PM_{2.5}$. Neither table shows the $PM_{2.5}$ emissions to be within 1.5 percent of the threshold as the commenter claims. Appendix D-4 Table 4.3-22 shows PM_{10} emissions to decrease 437.5 pounds per day and $PM_{2.5}$ emissions to decrease 97.8 pounds per day compared to baseline conditions, which is below the significance threshold. Therefore, further mitigation would be unnecessary.

Comment 89-4

2. Dust mitigation essentially requires the application of copious amounts of water. It is up to the County to monitor the effectiveness of the plan. The record shows that CEMEX cannot be relied upon to faithfully employ the mitigation plan. CEMEX has been cited for multiple air pollution violations (e.g., in Victorville, CA, Fairborn, OH and, more recently, Boulder, CO.) Although each violation required CEMEX to pay a few millions of dollars in fines, such penalties are apparently readily accommodated by this multi-billion dollar corporation.

Response 89-4

Please see Collective Response #4a pertaining to the Operator's regulatory compliance history. Draft EIR Section 4.19, "Utilities and Service Systems," discusses the proposed project's water demand and supply sources. Table 4.19-1, "Existing and Proposed Water Use Summary," provides a summary of current and proposed water use at the project sites. Water used for dust suppression at the Plant Site would be recycled water from the silt ponds and is not considered a new water demand. Water used for dust suppression at the Quarry Site would be obtained from ponded pits and is accounted for in the "Water Use from Ponded Pits" source category in Table 4.19-1.

Comment 89-5

3. Blasting produces a major fraction of particulate pollution (presumably included in the projections for Aggregate Plant in Tables 4.3 15-17). But standard containment procedures for fugitive dust from roads and machinery operation are not effective for blast produced dust, so it is not obvious what measures are envisioned for this aspect of mitigation. As far as we can tell, the EIR does not address this factor.

Response 89-5

The impact of blasting on air quality is discussed in Draft EIR Section 4.3, as updated by the Final EIR in Appendix D-4, "Revised Section 4.3, Air Quality." This impact is quantified as a permit-exempt emission source as indicated in Tables 4.3-15 through 4.3-17. In addition, an updated Air Quality, Health Risk, and Climate Change Impact Assessment (see Appendix D-3) was prepared in response to comments received. In this report, blasting emissions were calculated using the San Diego Air Pollution Control District (SDAPCD) standard emissions factors. See Section 3.4.2 of Final EIR Appendix D-3. See also Chapter 3, "Draft EIR Errata," and Appendix D-4. Additionally, see also Collective Response #9, regarding the project's potential impacts to air quality and emissions from blasting.

Comment 89-6

I urge the County to reject the application for the expansion of the CEMEX Rockfield Project.

Response 89-6

The commenter's request for denial of the proposed project is noted and will be considered by County decision-makers.

Letter #90 February 10, 2025, Bonnie Douglas

Comment 90-1

The San Joaquin River is a treasured resource. The CEMEX Rockfield expansion will change that. It will extend the contract to 100 years, and blast a 600 foot deep pit so they can continue mining. The area is popular for recreation, such as hiking, biking, fishing, and swimming. The city of Fresno does not have enough parks, so many people use this river area to recreate.

Response 90-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The effects of the proposed project are evaluated throughout the Draft

EIR. Potential impacts to recreation in the project area are addressed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for revisions to this section of the Draft EIR. See also Collective Responses #19, #21, and #27 regarding the publicly accessible parks adjacent to the project sites and potential operational impacts on park users.

Comment 90-2

Air pollution from rock dust and vehicles, water and aquifer pollution from blasting, sound from blasting, and road damage from trucks will all contribute, making this an undesirable project.

Response 90-2

The issue of air pollution is addressed in Draft EIR Section 4.3, "Air Quality," As updated in this Final EIR in Appendix D-4, "Revised Section 4.3, Air Quality." See also Collective Response #9 regarding the project's potential impacts to air quality and emissions from blasting. The issue of surface and ground water pollution is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The issue of operational noise is addressed in Section 4.13, "Noise." The issue of road damage and maintenance is addressed in Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. See also Collective Response #29 regarding funding of road maintenance.

Comment 90-3

Will the pit be filled in? Some say, "No one now alive will be here to see it".

Response 90-3

As described in Draft EIR Section 2.5.7.1, "Plant Site Reclamation Plans," beginning on page 2-45, at the Plant Site overburden and fines recovered from proposed aggregate processing would be used as fill to reclaim the bottom 20 feet of the quarry pit. The pit would then be allowed to fill with groundwater and rainfall to form an approximately 100.5-acre, 20-foot-deep pond. As described in Draft EIR Section 2.5.7.2, "Quarry Site Reclamation Plans," beginning on page 2-46, at the Quarry Site the quarry pit would not be filled with material and would instead be allowed to fill with groundwater and rainfall to form an approximately 108-acre, 100-foot-deep lake. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 2, "Project Description." The comment is noted for the consideration of the decision-makers.

Comment 90-4

The Dragonfly Golf Course, Copper River Country Club and San Joaquin River Conservancy and Trust are all close by and offer recreational activities.

Response 90-4

Existing parks and recreational uses surrounding each project site are described in Draft EIR Section 2.4.5, "Surrounding Land Uses." See Chapter 3, "Draft EIR Errata," for revisions to this section of the Draft EIR. See also Collective Response #19 regarding parks adjacent to the project sites.

Comment 90-5

We must stop this greedy international company with a poor environmental and labor reputation from continuing to pollute our county.

Response 90-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #91 February 10, 2025, Marianna Kast

Comment 91-1

I am concerned with several aspects of this project. Primarily however, it seems that since 90% or more of both the quarry and plant sites are environmentally disturbed due to longtime mining operations, the County of Fresno, by issuing this DEIR, is declaring the sites unworthy of reclamation for the next 100 years.

Response 91-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 91-2

The sites are eyesores on the San Joaquin River in Fresno county, where over the past 40 years, citizens, governmental agencies, and elected officials have worked tirelessly to restore and protect this natural resource. According to the San Joaquin River Conservancy Act (1992):

"…the San Joaquin River, its broad corridors, and its prominent bluffs constitute a unique and important environmental, cultural, scientific, agricultural, educational, recreational, scenic, flood water conveyance, and wildlife resource that should be preserved for the enjoyment of, and appreciation by, present and future generations."

Response 91-2

The commenter references the existing or baseline visual conditions of the project sites. The comment does not address the adequacy of the Draft EIR, and no further response is warranted. See also Collective Response #12 regarding the project's potential impacts on recent restoration projects along the San Joaquin River.

Comment 91-3

Now, visitors have finally gained more and easier access to the river (Ball Ranch, Sumner Peck, River Center), yet this proposal condemns the river to 100 more years of unsightly destruction.

Response 91-3

See Collective Response #8 regarding the project's visual impacts and proposed visual mitigation measures. See also Collective Response #21 regarding public access to the San Joaquin River and adjacent recreational sites. Potential impacts to visual resources are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The commenter's opinion regarding the proposed project's visual effects is noted and will be considered by the decision-makers.

Letter #92 February 10, 2025, Bayard and June Taylor

Comment 92-1

We are *deeply concerned* about CEMEX's application for a permit to expand operations at the Rockfield Quarry and extend their permit for those operations for 100 years.

Response 92-1

The commenter's concern regarding the proposed project is noted for the consideration of the decision-makers. Please see Collective Response #5 regarding the duration of the proposed use permit. See also Responses 92-2 through 92-9 below, which address the commenter's specific concerns.

Comment 92-2

The timeframe

100 years is a long, long time. It's four or five generations. It's far longer than most people live.

Response 92-2

The commenter's opinion regarding the proposed project timeframe is noted. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 92-3

It would be short-sighted and foolhardy to approve a project of this magnitude without full transparency and thorough review.

Lack of transparency

Our objection is not just the length of time this EIR proposes. We are also *deeply concerned* with the manner in which this project is being proposed. It feels like a back-door, smoke-filled room, sweetheart deal that will enrich a very few and damage the many.

Response 92-3

The commenter's objection and concern regarding the project process are noted. Please see Collective Response #1 pertaining to the environmental review process for the proposed project. The Draft EIR provides a detailed and thorough review of the proposed project's potential environmental impacts and details mitigation measures where necessary to minimize potentially significant impacts. As such, the Draft EIR fulfills the CEQA requirements to serve as an informational document.

Comment 92-4

Typical mining practices

The consistent pattern of mining companies is to *privatize profits* and to *socialize risks.* In other words, they

- plan on lack of transparency by railroading at high speed the decision-making process -- consisting of [1] thousands of pages of highly technical words and of [2] very tight deadlines to blunt potential questions, comments and opposition from the public.
- obtain excessively long permits for operations which are not in the best interest of the surrounding community.

- extract as much wealth as possible from the site while at the same time degrading and despoiling the natural landscape where the mining operations occur.

- funnel the exorbitant profits to their own corporate owners and executives, leaving little or no benefit to the community from which they are extracting wealth.

- delay or refuse to restore and reclaim the land that has been degraded and despoiled by their operations.

- declare bankruptcy so they don't have to pay for cleaning up and restoring the mining site, burdening the local taxpayers and the state with the clean-up costs to restore the land (restoration which almost never happens).

Response 92-4

The commenter's objection and concerns are noted. Please see Collective Response #1 pertaining to the project environmental review process. The Draft EIR provides a detailed and thorough review of the proposed project's potential environmental impacts and details mitigation measures where necessary to minimize potentially significant impacts. As such, the Draft EIR fulfills the CEQA requirements to serve as an informational document.

Comment 92-5

Our demands

Specific to *this* CEMEX project, we are demanding that you and the Fresno County Supervisors:

- REFUSE to grant a 100-year permit to the expansion and extension of the CEMEX Rockfield Aggregate mining site. A 100-year permit is patently absurd. That's saddling four to five future generations with a huge problem caused by greedy corporations, short-sighted planners, and/or politicians who are foolish or in the pocket of the mining companies. A ten-or-twenty year permit, with requirements for extending another ten years at a time, would be more reasonable.

Response 92-5

The comment's request for denial of the proposed project's requested use permit duration and opinion that a 10- or 20-year permit would be more reasonable are noted and will be considered by County decision-makers. The commenter's opinion regarding the

proposed project timeframe is noted. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 92-6

- Before even considering approval of the permit, REQUIRE the mining company (CEMEX) to commit a large deposit of money to a clean-up fund before the project starts. Also, you need to REQUIRE the mining company (CEMEX) to commit to contributing money on a monthly or quarterly basis to provide for clean-up of its own mess or to cover for lawsuits against the company for harms or violations of the law. To wait until all the environmental and health damages have already happened is patently absurd. CEMEX needs to build up a clean- up "superfund" account, managed by fiduciary professionals (an account which is impervious to being raided by politicians) if they want to do business in Fresno County.

Response 92-6

Please see Collective Response #4b pertaining to liability and funding for potential damages.

Comment 92-7

- Before the project is even provisionally considered, INSIST that the project NOT ruin or drain our already-depleted groundwater aquifers. "Water is life," as the Indigenous People say. We are totally dependent on water for living and for the main business of the Central Valley -- farming. But California's Central Valley aquifers are extremely stressed and are extremely vulnerable given climate change/global warming. Furthermore, our Central Valley aquifers are extremely shallow (in some cases only about 100 feet deep) -- and CEMEX is proposing an open-pit mine 600 feet deep, the "height" of a 43 story building! That's 500 feet deeper than the aquifers here! A 600-foot open pit mine has the potential to drain all the groundwater in the vicinity.

Response 92-7

The commenter's objections are noted and will be considered by the County decision-makers. Please see Collective Response #17 pertaining to bank stability of the San Joaquin River, and Collective Response #25 pertaining to surface and groundwater connection, and Collective Response #23 pertaining to groundwater quality. The Draft EIR provides an analysis of potential impacts to groundwater resources, and concluded this impact would be less than significant. See discussion of Draft EIR Impacts 4.10-7, 4.10-8, 4.10-9,

4.10-10, 4.10-11, 4.10-12, and 4.10-13, which address the project's potential impacts to groundwater supply at the Plant and Quarry sites. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 92-8

To give a foreign company a 100-year permit to foul or drain our groundwater supplies is folly of the first order.

Response 92-8

Please see Collective Response #25 pertaining to surface and groundwater connection and please see Collective Response #5 pertaining to the requested use permit duration.

Comment 92-9

Other extremely important factors not mentioned in this short letter must be considered. CEMEX should not be allowed to ram through the project approval process without adequate public transparency. We cannot allow them to destroy forever our groundwater supply, the San Joaquin watershed, and the natural beauty of this place.

Response 92-9

Please see Collective Response #1 pertaining to the environmental review process and public input opportunities. The commenter's concerns are noted and will be considered by County decision-makers.

Letter #93 February 10, 2025, Dorothy Woolum

Comment 93-1

I am writing to you to oppose the expansion and extension of the CEMEX Rockfield Project as it is specified in the published EIR.

The production of unsafe levels of dust is unavoidable with such a project and even the EIR's meager mitigation efforts involve huge amounts of our area's precious water resources. This project threatens the respiratory health our residents, who already suffer from our poor air quality. It threatens our access to adequate potable water and chemically-acceptable crop-irrigating water supplies in an area extending out an reputed "breadbasket".

Response 93-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Dust generation is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR as Appendix D-4, "Revised Section 4.3 Air Quality." See Impact

4.3-2 and Mitigation Measures 4.3-2a and 4.3-2b in Section 4.3.4 of Appendix D-4. Implementation of these measures was determined to reduce Impact 4.3-2 to a less than significant level. See Collective Response #9 regarding the project's potential impacts on the existing air quality conditions in the region. See also Collective Response #11 regarding analysis of the project's population-wide cancer burden. The project's potential impacts on potable water supplies are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.19, "Utilities and Service Systems." Impact 4.19-2 evaluates the availability of sufficient water supplies to serve the proposed project. This impact was determined to be less than significant. See also Impacts 4.10-8 through 4.10-13 regarding potential impacts to groundwater supplies. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 93-2

Further, the above does not even consider CEMEX's poor record in making good on promised mitigation efforts in the first place (e.g. Boulder, Colorado's "fugitive" dust storms: https://coloradosun.com/2024/10/22/cemex-lyons-boulder-county-permit-revocation/).

CEMEX also has a poor record in making good on reclamation promises, right here in California (e.g., the un-reclaimed Davenport plant on the coast) and world-wide.

Response 93-2

See Collective Response #4a regarding CEMEX's regulatory compliance history.

Comment 93-3

And who of us will even be around at the 100 year(!) end of the Friant operation to hold them accountable? If approved the timeframe of the project should be drastically cut to the order of 10 , not 100, years and should provide some means to guarantee that there will be sufficient CEMEX funds for reclamation.

Response 93-3

See Collective Response #5 regarding the duration of the proposed use permit.

Comment 93-4

I am also concerned about the significant costs of the project to our tax payers. For examples:

** road repairs and new traffic controlling infrastructure will be necessary, and it does not appear that CEMEX will deal with these costs.

**monitoring the air and water quality will surely involve significant financial costs and hassles! (necessary increased staff, possible need for new monitoring sites , litigations, etc)

Response 93-4

The project's potential transportation-related impacts are addressed in Draft EIR Section 4.17, "Traffic and Transportation." See Collective Response #29 regarding funding for road maintenance. See Impact 4.17-1, beginning on page 4.17-27, regarding funding for roadway and intersection improvements. Mitigation Measures 4.17a through 4.17r describe various intersection improvements that were determined necessary to address cumulative traffic increases in the project area, including the proposed project's truck trips. These measures require CEMEX to pay a fair share contribution of the cost to construct these improvements. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See Collective Response #29 also related to truck traffic increases anticipated under the proposed project and required roadway improvements. See also Collective Response #24 regarding the proposed groundwater monitoring program.

Comment 93-5

Finally, there should be serious consideration of the project's threat to the well-being of local wildlife and the peace and beauty of the region that lies at the heart of entries to 3 National Parks, a National Monument and the magnificent wilderness areas in the adjacent Sierras. These are invaluable assets that should not be lost, degraded or diminished!

Response 93-5

The project's potential impacts to wildlife in the project area are evaluated in Draft EIR Section 4.4, "Biological Resources." The project's potential impacts to scenic vistas in the region are addressed in Section 4.1, "Aesthetics and Visual Resources." See Impact 4.1-1 beginning on page 4.1-51. Each of the impacts identified in these sections was determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The comment is noted for the decision-makers.

Letter #94 February 12, 2025, Naomi Quintana

Comment 94-1

To whom it may concern, My name is Naomi Quintana, and I writing this comment as a concerned community member and environmental advocate to strongly oppose the CEMEX Rockfield Expansion along the San Joaquin River. This project poses serious and irreversible harm to our local environment, wildlife, and public resources. The San Joaquin River is home to a fragile riparian ecosystem that supports a wide variety of wildlife. The proposed expansion threatens several special-status species, including the burrowing owl, western pond turtle, western spadefoot toad, and numerous nesting birds. Habitat destruction from blasting and excavation will disrupt these species, some of which are already facing population decline. This expansion would further fragment an already vulnerable ecosystem, reducing biodiversity and weakening the resilience of our natural environment.

Response 94-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to biological resources are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-2, beginning on page 4.4-52, regarding potential impacts to special-status wildlife species in riparian habitat and Impact 4.4-4, beginning on page 4.4-55 regarding potential impacts to riparian habitat and other sensitive natural communities. The project's potential impacts to protected wildlife species including burrowing owl, western pond turtle, western spadefoot toad, and nesting birds are addressed in Impact 4.4-1, beginning on page 4.4-48, through Impact 4.4-3, beginning on page 4.4-53. Mitigation Measure 4.4-1a (page 4.4-50) reduces potential impacts to burrowing owl. Mitigation Measure 4.4-1b reduces potential impacts to western pond turtle and western spadefoot toad. Mitigation Measure 4.4-1c reduces potential impacts to nesting birds. As clarified and refined in the Final EIR, including revisions to Mitigation Measures 4.4-1a, 4.4-1b, and 4.4-1c, impacts to these resources would be reduced to a less than significant level. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 94-2

Additionally, the project's excavation plans would create unstable slopes, increasing the risk of erosion and landslides. The long-term environmental consequences of soil destabilization cannot be ignored, especially in an area where the integrity of our land is

crucial for both ecological and human health. Disturbing the geological structure of this region could lead to unforeseen hazards that we, as a community, will ultimately bear the burden of this change.

Response 94-2

The issues of slope stability, erosion, and landslides are addressed in Draft EIR Section 4.7, "Geology and Soils." See Impacts 4.7-6 and 4.7-7 regarding slope stability. See Impacts 4.7-4 and 4.7-5 regarding soil erosion and the topsoil loss, respectively. See Impact 4.7-3 regarding landslide. Each of the impacts identified in these sections were determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 94-3

Beyond the environmental consequences, this project would have lasting negative effects on the local landscape, traffic, and public infrastructure. The excavation would degrade the scenic vista of the San Joaquin River, a cherished natural landmark.

Response 94-3

The project's potential impacts to scenic vistas are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources," under Impact 4.1-1 beginning on page 4.1-51. Implementation of Mitigation Measure 4.1-1 would address this impact by reducing the contrast in color of the exposed rock of the Quarry Site pit wall. However, there are no feasible mitigation measures available to fully reduce the impact and it was determined to be significant and unavoidable. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1. The comment is noted for the decision-makers.

Comment 94-4

It would also cause traffic congestion at key intersections, with no clear funding plan to mitigate these delays.

Response 94-4

See Collective Response #29 regarding traffic congestion and funding and implementation of needed intersection improvements (see Mitigation Measures 4.17-1a through 4.17-1r beginning on Draft EIR page 4.17-29).

Comment 94-5

These impacts diminish the quality of life for residents and visitors alike, with no guaranteed solutions to address them. This project is not a necessity, it is an irreversible gamble with our environment and community resources. I urge decision-makers to prioritize the long-term health of our region over short-term industrial gains.

Please reject the CEMEX Rockfield Expansion and protect the San Joaquin River for future generations.

Response 94-5

See Collective Response #3 regarding the need for the proposed project. The commenter's opposition to the proposed project is noted for the decision-makers.

Letter #95 February 13, 2025, Sally Negin

Comment 95-1

Thank you for allowing me to comment on the proposal for the CEMEX Rockfield Quarry Modification Project.

After reading the latest proposal, I have questions about the need to modify the current allowance and the need to extend it so far into the future.

As I'm sure you are aware, CEMEX is a multinational building materials company held in Mexico. It holds it's [sic] business in 50 counties. It was ranked in 2020 as the 5th largest cement company in the world.

That being said, it has options. It has other holdings in the US which produces 30% of its total operations.

As my father was involved in the concrete business, I am aware of the need for these products. I am also aware the need may increase as we work to decrease the use of wood products due to the climate changes especially in California. But that does not mean that we should anticipate the future. Are we trading the impact on wood products for the impact on the local waterways?

Response 95-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 95-2

Why is there a need to dig dipper at the current location with the increased risk to the environment as well as the neighbors - both human and animals? This is so close to a protected area that nothing justifies to the need to extend the current timeline for 70 years!

Response 95-2

The Draft EIR evaluates the project as proposed in the project application submitted to the County (see Draft EIR Appendix B, "Application Materials"). Alternative locations for the proposed project were evaluated and rejected from further consideration as discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations," beginning on page 6-5. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision- makers.

Comment 95-3

What is the need to expand the current agreement at this time? We can do it as we come to the end of the current agreement. What is the need for a 70 year extension?

Response 95-3

See Collective Response #5 regarding the duration of the proposed use permit. The comment is noted for the decision-makers.

Comment 95-4

I encourage you to allow them to continue their current project without any extension. Allow the current changes in the environment and the current political changes happening now to stabilize before stepping forward. Once an agreement is accepted, it is difficult to walk back. Do not put yourself into a contract that does NOT need to be made. Granted, it is doubtful that many of us will be alive in 70 years, but this would be something that future generations will have to deal with. Isn't that justification enough to not approve this proposal?

Response 95-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #96 February 13, 2025, Unnamed Resident

Comment 96-1

I am a concerned citizen of the Fresno County who has recently discovered that CEMEX plans on creating a whole about two football feilds [sic] deep in the San Joaquin River. This concerns me as the blast will disturb local wild life, such as cranes, field mice, and fish, in their natural habitat. I recently

Response 96-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts on wildlife and associated habitat are addressed in Draft EIR Section 4.4, "Biological Resources." See also Collective Response #27 regarding operational impacts on wildlife located on properties adjacent to the project sites. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

Comment 96-2

I recently volunteered with River Park Way Trust (@riverparkwaytrust on IG) to plant native trees and shrubbery along the San Joaquin River and would hate to see our good intentions be blasted away by CEMEX.

Response 96-2

See Collective Response #12 regarding the project's potential effects on recent restoration projects along the San Joaquin River. The comment is noted for the decision-makers.

Comment 96-3

Please consider the wildlife, the nature, and the people before you continue with something like this. I ask that you do more environmental research, as well as more public votes and hearings before the plan takes place.

Response 96-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #1 regarding the County's processing of the proposed project.

Letter #97 February 14, 2025, Brenda Markham

Comment 97-1

To whom it may concern With regard to aesthetic impact as a result of blasting and deep mining I see that section 4.2.4 identifies the Plant site and Quarry site as "Vacant or Disturbed Land" and as such would not have any impact and no mitigation required.

How can this be? Destruction of further mining will only destroy the land; especially by blasting a 600' pit by the San Joaquin River. I think this is a poor excuse to avoid making any kind of statement saying that there's nothing to address with regard to aesthetics!

The same reasoning goes with 4.2.3- just because there's no conflict with zoning for forest land, timberland, or timberland production doesn't mean there's not going to be destruction to the surrounding area. Of course there's going to be visual impairment of the land!!

Explain how you are going to mitigate the destruction you will generate over the next 100 years.

Response 97-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Draft EIR Figure 4.2-1, "Plant Site FMMP Designations," and Figure 4.2-2, "Quarry Site FMMP Designations," display the Farmland Mapping and Monitoring Program (FMMP) designations for the Plant Site and Quarry Site, respectively (Draft EIR pages 4.2-2 through 4.2-5). The majority of the Plant Site has been disturbed by decades of mining operations, and as such is mapped as "Vacant or Disturbed Land" pursuant to the FMMP. The commenter conflates the proposed project's impacts upon agricultural and forestry resources with the impacts upon aesthetics and visual resources. The Draft EIR properly concludes that the project would not result in significant impacts to prime farmland, unique farmland, or farmland of statewide importance because the Department of Conservation has not classified the Quarry Site or Plant Site as containing any of these farmland designations (see Impact 4.2-1 on page 4.2-15 of the Draft EIR). For further information regarding the proposed project's impacts to aesthetics and visual resources, see Draft EIR Section 4.1, "Aesthetics and Visual Resources," and Collective Response #8.

Letter #98 February 14, 2025, Linda and George Sward

Comment 98-1

I am writing to express serious concerns about the impact of the proposed CEMEX quarry expansion. I urge your office to recommend not approving the project due to the significant impacts noted in your letter and others in the draft EIR [of >1000 pages!].

As a long time resident of Fresno County I have already seen the impacts of urban sprawl into eastern Fresno County. As a hiker and birder I see the effects on the river of the current operations [noise, altered habitats, heavy traffic and damages to Friant Rd]. My husband, George Sward, regularly kayaks on the SJ River and sees more directly the impacts of past and current gravel mining on the river. The impacts of a 100 year project that digs down potentially 600 ft into the riverbed are mind boggling! The planned "mitigations" for such a lengthy project cast reasonable doubt on how well and whether they will actually take place! And in the meantime, people, other animals and the physical environment are impacted for many, many decades!

I am not an engineer nor do I have the expertise to analyze such a lengthy report. But I can see what has already taken place and what continues to take place. The proposed project is too big, too damaging and too lengthy to assure true mitigation and accountability. I urge your office to state this in your report.

Response 98-1

Each mitigation measure presented in the Draft EIR and listed in the MMRP, which will be considered for adoption in conjunction with project approval, provide implementation and enforcement responsibilities and timing. The operation would continue to be inspected annually by the County to ensure compliance with all requirements, including the mitigation measures presented in the Draft EIR. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #99 February 15, 2025, Chris Howes

Comment 99-1

As a concerned citizen and resident of this area I must protest the expansion of the Cemex Rockfield quarry. Converting this facility to and explosive methodology will do far more harm to the people, landscape and environment that adding 55 jobs will bring benefit.

Response 99-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 99-2

My entire career was spent leading clim operations for State Farm Insurance all over the United States and, in my professional opinion, the increased risk of blasting in the area may not be tolerated by many homeowners' carriers. Yes, of course I read the mitigation plan on the DEIR but that only addresses explosions/pyrotechnics on their site. Granted, at first blush 350 acres of rock does not seem to be much of a wildfire risk, but when someone ignites an illegal bottle rocket it's usually not the igniter's house that burns; it's someone adjacent to their property! We also need to consider the explosive vendor will be transporting their hazardous materials through Fresno County, all the way increasing the risk of an accident and subsequent wildfire.

With the Pallisades Fire fresh in everyone's memory this is not the time (and probably never will be) to add to the public danger in the highly sensitive geographical area..

Response 99-2

The issue of wildfire risk is addressed in Draft EIR Section 4.20, "Wildfire." No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 99-3

One las thing to consider; having lived all over the country Fresno does not exactly have a stellar image, but it's improving. Do we really want to be known for the second deepest rock mine in California?

Response 99-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #100 February 16, 2025, Matthew Ethen

Comment 100-1

Since moving to Fresno in 1989 from water-feature abundant Minnesota, I have been dismayed by the neglect of the San Joaquin River. I am a River Parkway member and hope that the Friant to 99 uninterrupted ribbon can...someday...become a reality.

Expanding the Cemex operation would disastrously limit this possibility and become another example of "Why can't Fresno have nice things?" Playing devil's advocate for the project, can we identify how many "additional jobs" and/or net positive economic impact we could expect? The potential for the San Joaquin River to become an attraction and "something nice...." for Fresno area citizens and visitors seems – as ever -- untapped.

Please forward this to our Fresno County Supervisors.

Response 100-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #101 February 16, 2025, Lee Liddle

Comment 101-1

I strongly oppose any and all proposals to blast and excavate on or near the San Joaquin River. This land has been abused long enough. Cemex should pay all costs to restore and improve the property they have damaged.

Response 101-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The existing operation is subject to an approved reclamation plan that requires CEMEX to complete reclamation of the project sites to an end use of open space, including lakes and natural grazing lands. The operation's current, approved reclamation is available for review on the County's website at the following location: https://www.fresnocountyca.gov/eir7763.

Letter #102 February 16, 2025, Brian Paulsen

Comment 102-1

I want to voice my opposition to Cemex plans to expand by blasiing . The operation is already an eyesore and an obstacle to the San Joaquin River Parkway completion. The river is one of the remaining

scenic and recreational sites left in Fresno County. I don't want it further abused.

Response 102-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #103 February 16, 2025, Cathleen Perez

Comment 103-1

I am a resident of Fresno and would like to share my thoughts on the CEMEX blast mine proposal that will be voted on soon.

I am absolutely against this proposal for the following reasons:

1. The health of the San Joaquin River is at stake - the environmental impact will be devastating to humans, wildlife, and nature - Why is this company allowed to encroach on a wildlife preserve?

Response 103-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #20 regarding the assertion that the project encroaches on an ecological preserve.

Comment 103-2

2. CEMEX states there is nothing they can do about the increased traffic impact in the intersections of Friant/Willow and Willow/Copper. These areas have a very large amount of traffic incidents currently and will just increase safety issues if CEMEX is allowed to begin their blast mine proposal.

I urge you to NOT allow this proposal to move forward.

Response 103-2

See Collective Response #30 regarding traffic and pedestrian safety.

Letter #104 February 16, 2025, Stephanie Salazar

Comment 104-1

I'm sure if this message will reach you in regards the public comments against the Cemex Rockfield Expansion proposal. But I just heard of this project this morning.

As a former Fresno County Employee, and current Madera County Resident who lives within a 5 mile radius of this mining operation, I am strongly opposed to the expansion project and the method of rock quarrying.

My husband and I hike and ride our bikes to the San Joaquin River from the Tesoro Viejo community regularly. From the hills that overlook the River, you can see, hear, and smell the quarry…at its current state of operations.

Response 104-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter describes baseline environmental conditions in the project area. The Draft EIR evaluates the project's potential visual, noise, and odor impacts in Section 4.1, "Aesthetics and Visual Resources," Section 4.13, "Noise," and Section 4.3, "Air Quality" (as updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. See Chapter 3, "Draft EIR Errata," regarding proposed changes to the Draft EIR.

Comment 104-2

With their proposed changes, I fear that the operations would have a significant negative effect on the noise pollution experienced by humans and wildlife in the area.

Response 104-2

The project's potential noise impacts on humans are addressed in Draft EIR Section 4.13. All impacts identified in this section were determined to be less than significant with incorporation of the mitigation measures provided. Noise impacts on wildlife are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," to view revisions to these Draft EIR sections. See also Collective Response #13 regarding the effects of blasting and other operations on wildlife on adjacent properties.

Comment 104-3

This location is one of the closest places that one can visit for peace and serenity that doesn't require a major trip out of town.

Needless to mention the destruction of the beautiful natural habitats that surround the river and the plant would have other negative effects. I would highly suspect, that if this quarry were a completely new plant, and not a 100 year old grandfathered operation, that the issue for permit would be denied.

Please take my concern to heart. I do not want this expansion project in my backyard. It's not good for the inhabitants in the area who live and breathe here.

Response 104-3

The project's potential effects to the natural habitats on and surrounding the project sites are addressed in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4. See also Collective Response #13 regarding the effects of blasting and other operations on wildlife on adjacent properties. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #105 February 17, 2025, Zach Baroni

Comment 105-1

I am providing a public comment regarding EIR 7763. I would like to express my opposition to the proposed Rockfield Quarry modification project.

Response 105-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 105-2

This project will degrade the environment and the water quality for me, a resident who lives near the proposed project and uses water that flows near the site for drinking. The San Joaquin River is a natural resource that I use for recreation and for water access, since my drinking water comes from wells filled by the San Joaquin. The proposal of a 600-foot deep pit near the San Joaquin threatens environmental damage and degradation of water quality. The CEMEX, the industrial company, has been cited numerous times for environmental infractions, and I cannot trust that they will not continue to break environmental law and threaten the safety of my drinking water.

Response 105-2

The proposed project's potential effects to groundwater quality and groundwater levels at nearby domestic wells are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Impacts 4.10-1 through 4.10-7 comprehensively address potential water quality impacts both during mining operations and during reclamation at both sites. Mitigation Measures 4.10-1, 4.10-5a, and 5.10-5b reduce the project's potential water quality impacts by requiring implementation of the "Blasting Protocols" developed for the project (see

Final EIR Appendix H-9, "Blasting Protocols") and requiring implementation of an adaptive management program at the Plant Site to monitor and adapt project operations to ensure compliance with water quality standards. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and Appendix H, "Noise Assessment." See also Collective Response #4a regarding CEMEX's regulatory compliance.

Comment 105-3

Furthermore, this project threatens the environment for several animal species, including the Western pond turtle and burrowing owl, both vulnerable species whose native environment will be disrupted.

Response 105-3

The project's potential impacts to wildlife species, including the western pond turtle and burrowing owl, are addressed in Draft EIR Section 4.4, "Biological Resources." See Impacts 4.4-1 through 4.4-3. Mitigation Measure 4.4-1b is provided on Draft EIR page 4.4-50 to avoid and minimize potential impacts to western pond turtle by requiring pre-construction surveys and exclusionary measures to protect individual turtles throughout construction activities. After careful review of comments received on the Draft EIR, Mitigation Measure 4.4-1b is revised in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata," to require biological monitoring during pond draining and removal to further clarify implementation requirements, thereby strengthening protections for western pond turtle.

Mitigation Measure 4.4-1a is provided on Draft EIR page 4.4-50 to avoid and minimize potential impacts to burrowing owl by requiring pre-construction surveys and implementation of a relocation plan for any identified individuals. As described in Chapter 3, "Draft EIR Errata," Mitigation Measure 4.4-1a has been revised to clarify and strengthen the survey, avoidance, and relocation requirements for burrowing owl, consistent with the most recent CDFW guidance for burrowing owl, further ensuring that potential impacts are avoided or minimized. The Draft EIR, as revised in this Final EIR, adequately evaluates potential impacts to these species and provides effective measures to mitigate to a less than significant level.

Comment 105-4

Considering that the aggregate reserves we have are more than sufficient, it seems that this mining project does not have a legitimate purpose. We have enough aggregate reserves; there is no reason to threaten the water and the environment near the San Joaquin river, particularly to a company that repeatedly breaks

environmental regulations, and uses its massive profit margin to merely pay fines rather than ceasing from breaking law.

Response 105-4

See Collective Response #3 regarding available aggregate reserves in the region and the need for the proposed project. See also Collective Response #4a regarding CEMEX's regulatory compliance history.

Comment 105-5

Therefore, I reiterate my demand that this project be rejected outright. I'm sorry that people spent so much time and money studying a project which obviously should never have been considered, but that's not my fault. Protect citizens and protect the environment we depend on, especially for our water.

Response 105-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #106 February 17, 2025, Johnathan Benson

Comment 106-1

My name is Johnathan Benson, I am a science teacher and nature enthusiast in this community. I am deeply concerned about many of the impacts that this proposed mining expansion would have on our local communities, both human and ecological. Below, I have outlined some of my concerns and questions about this proposed expansion that I would like to see addressed.

1. Does this open-pit mine have to be built in this, notably sensitive, location? Is there a particular reason that the underlying bedrock is different from that from other areas more far-removed from the river? Is the water from the river essential for the operation of the aggregate processing? My question is essentially, does this have to happen here? Or could it happen in a drier place less prone to the myriad problems (stream dewatering, groundwater contamination, noise pollution effects on riparian life, etc.) that are specific to this location? If it is a question of marginally increased cost, then I oppose it, but if there is some reason it has to be in this location then I would be less concerned. I have not seen a thorough rationale for why this mine has to exist here, other than the fact that it already does.

Response 106-1

The Draft EIR focuses on evaluation of the project as proposed by the Operator. However, as required by CEQA, the Draft EIR also provides an evaluation of a range of feasible alternatives to the proposed project. Draft EIR Section 6.4.2.1, "Alternative Site Locations," beginning on page 6-5, describes why an alternative location for the proposed project was rejected from further consideration.

Comment 106-2

2. I enjoy swimming and paddling on the San Joaquin River, I enjoy biking alongside the San Joaquin River, and I enjoy the natural beauty of the areas surrounding the San Joaquin River. All of these benefits, available to the community at large, would be reduced by the expansion of this mining operation. A big part of the natural beauty for me is the biodiversity present in the area. I am certain that I will see less wildlife in the area as it is disturbed significantly by more intensive mining. Rather than recharacterizing the often blighted San Joaquin River into a cultural attraction, this project would further diminish the ecological diversity of this area for a century to come. I understand that there are mitigation strategies in place for the protection of particular species, but how can you account for the opportunity cost of decreased future value of a cultural attraction. Fresno is undoubtedly growing, and will continue to do so. Has the loss of tourism potential due to impacts to the scenic vista been included in the cost benefit analysis for this project? I would like to see thorough estimation of the social and economic benefits of re-wilding the impacted areas of the riparian zone as compared to the benefits provided by the mine expansion.

Response 106-2

The project's potential impacts to visual resources are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources," while impacts to wildlife and biodiversity are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. The comment is noted for the consideration of the decision-makers.

Comment 106-3

3. The consistent noise of bedrock blasting would be detrimental to my enjoyment of recreational activities near the river, particularly in the, recently reopened, Ball Ranch area. I have seen many other individuals and families

enjoying a day of quiet recreation near the river, this would be negatively impacted by the constant noise of mining, processing, and additional truck traffic. Is there a set of numbers provided that would give the volume (in decibels) of allowed noise at different locations from the mining operation?

Response 106-3

The project's potential noise impacts are evaluated in Section 4.13, "Noise." Each of the impacts identified in this section were determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.13. See also Collective Response #27 regarding potential effects of blasting on users of adjacent parks and trails.

Comment 106-4

4. One of the major drivers of health issues in the Central Valley is poor air quality. This would be worsened by the expansion of mining operations in this area. The release of silicate dust is a guarantee while blasting granite and that dust would add to the already large volume of dust in the air from agricultural activities in the area. This is especially concerning with several schools within a few miles of the site. Additionally, suburban expansion continues to encroach in this area which will mean even greater human exposure as this mine operates for the next 100 years. I would like to see estimates of the added human health risk of dust exposure from mining operations over the next century, especially as connected to projected developments in the area.

Response 106-4

The project's potential impacts to air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR in Appendix D-4, "Revised Section 4.3, Air Quality." See also Chapter 3, "Draft EIR Errata." Each of the impacts identified in this section were determined to be less than significant with implementation of the mitigation measures provided.

Nevertheless, in response to comments received, an updated Health Risk Assessment was prepared in the Air Quality, Health Risk, and Climate Change Technical Report (Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). This updated analysis included cancer burden modeling and demonstrated no new impacts and no changes to the findings in the Draft EIR. See also

Collective Response #9 regarding the project's potential effect on the region's existing air quality conditions.

Regarding possible suburban expansion towards the project sites; the project sites are located in Exclusive Agricultural (AE) zone districts with approved industrial uses. The vision, goals, and policies of the Fresno County General Plan do not contemplate the construction of new housing developments in the agricultural zones surrounding the project sites. Further, the project sites are located outside the Spheres of Influence of both Fresno and Clovis for the provision of municipal services to residential land uses.

Comment 106-5

Thank you for your time and consideration. I hope that you will be organizing additional public comment opportunities, especially in-person, so that county leadership can see how seriously their constituents take this issue.

Response 106-5

The County will hold a public hearing for the proposed project prior to deciding on the application and further public comment will be received at that time. The date, time, and location of the hearing will be publicly noticed, and notice of the hearing will be provided to neighboring property owners, individuals and organizations that have requested notice, commenters on the Draft EIR, and other persons entitled to notice pursuant to applicable law.

Letter #107 February 17, 2025, Francesca Cannizzo

Comment 107-1

I am providing a public commenting regarding EIR 7763. I am an ecologist and previously an environmental planner. I am in shock that county officials would claim this EIR is sufficient for publishing. How could the people involved with writing this EIR claim they have any concept of impacts 100 years out? To adequately evaluate impacts on environmental resources for 100 years that would take much more extensive research than proposed in this EIR. Environmental modeling is a standard that could be used to determine impacts to air quality, biological resources, and hydrology. Those models should be employed prior to the quarry inflicting damage that cannot be reversed, not punt this effort down the road when it's too late. Also, the models should be conducted using standards agreed upon by the scientific community, not governed by the company that benefits from the results being in their favor.

Response 107-1

The comment asserts deficiencies in the Draft EIR pertaining to evaluation of impacts for the 100-year duration of the proposed project; however, the comment does not provide evidence that the Draft EIR is deficient in its analysis and modeling of impacts. Although the comment asserts that environmental models should be employed, but the comment does not refer to any specific models that the commenter asserts should have been employed for the Draft EIR.

Comment 107-2

As a citizen of Fresno, I have concerns of why one of the areas with the worst air quality in the county is supporting projects to further degrade our air quality.

Response 107-2

The commenter's concerns regarding air quality are noted and will be considered by County decision-makers. Please see Collective Response #9 pertaining to the project's potential impact to the region's existing air quality.

Comment 107-3

Additionally, the burrowing owl has been listed as a candidate species under the California Endangered Species Act and that is not reflected in this EIR.

Response 107-3

Table 4.4-1, "Special-Status Wildlife Species," on page 4.4-25 of the Draft EIR has been updated to reflect that the burrowing owl is a candidate species under the California Endangered Species Act (CESA). The Draft EIR's description of the burrowing owl has also been updated to reflect the burrowing owl's status as a candidate species under CESA. See Chapter 3, "Draft EIR Errata," of this Final EIR to view these revisions to the Draft EIR.

Consistent with this updated status, if burrowing owls are found onsite during pre-construction surveys, CDFW would be consulted regarding any required Incidental Take Permit and related measures.

Please note that this designation, which changed in October 2024, does not change the Draft EIR's impact analysis of burrowing owls.

Comment 107-4

The mitigation measures listed for spadefoot toad and western pond turtle I believe are not adequate to make the impact less than significant. There is EXTENSIVE research showing that pond turtles and their nests are extremely hard to detect. To actually protect the turtles, surveys should be done months in advance to place transmitters on turtles to see where they are operating around the quarry. How can this EIR claim they are not having an impact when they are not taking the necessary steps to detect such a cryptic species. And then continue to see if they come back to the work site. The way the mitigation measure (4.4-1b) is written it leaves open ended on how to prevent relocated animals from reentering the work area. As someone who has personally relocated many animals, and from learning about people doing this work such as efforts in Yosemite National Park to relocated turtles, they will come back to where they were captured.

Response 107-4

See Draft EIR Section 4.4,"Biological Resources," provides an analysis of the potential impacts to biological resources, including wildlife. The Draft EIR (see Impact 4.4-1 beginning on page 4.4-48) determined that spadefoot toad and western pond turtle would not be significantly impacted because these species are not expected to be on the site. However, Mitigation Measure 4.4-1b would minimize impacts to these species in the event that they are detected during project implementation. As revised in the Final EIR, Mitigation Measure 4.4-1b has been clarified to include biological monitoring during pond draining and removal activities further ensuring that individuals are protected if present. CEQA does not require that EIRs perform all studies that could be conducted to inform the determination of significance; rather it requires that studies be sufficient to evaluate potential impacts and mitigate these potential impacts to the extent feasible. In the case of spadefoot toad and pond turtle at this site, the level of analysis performed, especially with the mitigation proposed, is adequate to conclude that the project would have a less than significant impact on these species under the criteria established by CEQA. No further analysis or mitigation is required.

Contrary to the commenter's assertion, Mitigation Measure 4.4-1b does include a screening measure which would help to prevent a western spadefoot toad or western pond turtle from reentering the work area (Draft EIR page 4.4-50). More specifically, exclusion fencing would be installed to prevent turtles and spadefoot toads from reentering the work area, in the scenario that these species are located during the pre-construction clearance surveys (Draft EIR page 4.4-50).

See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4. For discussion of the mitigation measures proposed for the western spadefoot toad and western pond turtle, please refer to Responses 58-50 and 65-11.

Comment 107-5

I plan to attend any future meetings regarding this EIR to help make sure county officials don't brush off these comments by writing a few sentences saying "we disagree". The public expects to see how the county is actually addressing our concerns.

Response 107-5

The commenter's intent to attend future meetings is noted. Please see Collective Response #1 pertaining to the public review process.

Letter #108 February 17, 2025, Sophia Froelich

Comment 108-1

I am a resident of Fresno County and am deeply concerned about the proposed blast mine near the San Joaquin River. This is an incredibly important landmark and ecological site.

Response 108-1

The comment is noted.

Comment 108-2

There is already more than enough aggregate to be obtained through permitted sites to meet Fresno's (and Madera's) expected needs for the next 50 years. I cannot understand why CEMEX, a company with a spotty history and more than 3 environmental violations per year for the last 20 years to the tune of $43 million in fines, should be allowed anywhere near a river as important to our city. It is neither needed nor wanted.

Response 108-2

See Collective Response #3 regarding available aggregate reserves in the region and the need for the proposed project. See also Collective Response #4a regarding CEMEX's regulatory compliance history.

Comment 108-3

I have seen the damage done by mining companies firsthand from my time growing up in Alaska. Fresno is already affected by urban sprawl and a lack of green spaces. It does not need a giant open

pit near one of our most important land marks and important waterways. Please do everything in your power to prevent this plan from happening.

Response 108-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #109 February 17, 2025, Unnamed Resident

Comment 109-1

Good morning: I don't believe the idea of allowing an enormous pit next to the San Joaquin river is in the best interest of our community. The San Joaquin river is an unbelievably resource that, so far, has not been fully taken advantage of. The long term efforts to build improved public access to this resource are indeed VERY slow but happening nonetheless.

Response 109-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #21 regarding the request that the project sites should be transitioned to publicly accessible parks.

Comment 109-2

The excavation of a huge pit next to the river would not only be a tremendous eyesore but a serious potential hazard as well.

Response 109-2

The project's potential impacts related to aesthetics and visual resources are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." Potential hazards related to project implementation are discussed in Section 4.9, "Hazards and Hazardous Materials." These issues include hazardous materials use and transport (Impacts 4.9-1 through 4.9-3), generation of flyrock (Impact 4.9-4), interference with emergency response (Impact 4.9-5), and wildfire (Impact 4.9-6). See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 109-3

The potential for communication between the river and a rock pit is a real threat.

Response 109-3

The issue of groundwater interaction with surface water flows in the San Joaquin River is discussed in Impact 4.10-12 beginning on Draft EIR page 4.10-113. Implementation of Mitigation Measures 4.10-10a and 4.10-10b (shown on Draft EIR page 4.10-108) reduces this impact to a less than significant level by requiring implementation of an adaptive management plan that would include continuous monitoring of groundwater levels and corrective measures if a significant impact to available groundwater supply occurs as a result of project operations.

Comment 109-4

The banks of rocks pits are notorious for cave-ins!

Response 109-4

The issue of slope stability is addressed in Draft EIR Section 4.7, "Geology and Soils." See Impact 4.7-6, beginning on page 4.7-30, for discussion of slope stability at the Plant Site and Impact 4.7-7, beginning on page 4.7-32, for discussion of slope stability at the Quarry site. With implementation of Mitigation Measures 4.7-6 and 4.7-7a through -7c, these impacts were determined to be less than significant. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 109-5

The river is a rare and unbelievable opportunity for public use that could last for generations to come. It would be VERY poor planning to place our river at risk for something that, is not only unnecessary, but a bad environmental idea to begin with. Please don't allow this proposal to continue.

Response 109-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See also Collective Response #3 regarding available aggregate reserves in the region and the need for the proposed project.

Letter #110 February 18, 2025, Donna Duckworth

Comment 110-1

I can't imagine a County or City accepting a proposal as stated.

With water, air quality and environmental concerns the project would create. We have enough air pollution and river problem's without adding an addition burden to the City/ County.

Please do not allow the project.

Response 110-1

Issues related to water are addressed in Draft EIR Sections 4.4, "Biological Resources," 4.7, "Geology and Soils," 4.10, "Hydrology and Water Quality," and 4.19, "Utilities and Service Systems." The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. See also Collective Response #9 regarding the project's potential impact on the region's existing air quality.

Letter #111 February 18, 2025, Diane and Jim Durando (Letter #1)

Comment 111-1

1) Cemex states that they will not mitigate the traffic congestion

That is ludicrous, This very wealthy company needs to mitigate the traffic congestion on Willow to Friant Road.

There is precedent in this county for this requirement. Table Mountain helped finance turning Friant Road into a four lane highway. Vulcan at the Austin quarry on road 145 and 41 has been required to make modifications on Road 145. They are required to finance Highway 41 to a four lane road when the county is ready to begin construction.

Response 111-1

Draft EIR Section 4.17, "Transportation," presents the evaluation of potential transportation impacts of the project and identifies mitigation that would require the proposed project to fund equitable share contributions for certain roadway improvements. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17. The comment does not address the adequacy of the Draft EIR. Please see below for additional responses.

Comment 111-2

1) At the Friant Willow junction there should be two left lanes made for turning onto Willow from Friant. The trucks should only be allowed to use one lane.

2) A requirement that the entire Willow Road between Friant and Copper be expanded to 4 lanes.

3) A requirement that the north direction on Willow be expanded to two lanes from International to Copper.

Response 111-2

As indicated by the analyses presented in the Draft EIR, the need for intersection widening improvements is not warranted as a mitigation measure for the project alone. The Draft EIR transportation analysis (see Section 4.17) identifies the project's contribution to cumulative impacts and requires payment of the project's fair share toward future improvements. Specifically, the project would contribute its equitable share of the cost of cumulative mitigation pursuant to Mitigation Measures 4.17-1a and 4.17-1d.

The commenter's recommended road improvements are noted; however, the comment does not provide substantial evidence demonstrating a need for additional or different improvements beyond those identified in the Draft EIR. As discussed in the Draft EIR and Response 12-69, the need for roadway widening is anticipated to occur in the future as a result of regional growth, including large-scale development projects such as Friant Ranch, Millerton New Town, and the Rio Mesa area in Madera County, rather than the project alone.

Accordingly, the Draft EIR's transportation analysis and mitigation measures, as revised in this Final EIR, appropriately address the project's impacts.

Comment 111-3

4) There is a concern with increased heavy truck traffic effecting the traffic safety near the schools on International and Willow.

Response 111-3

Please see Collective Response #30 pertaining to traffic safety. The volume of truck traffic near the intersection of Willow and International Avenues is not expected to exceed historic volumes, as the aggregate mine was in operation before the schools were constructed (Table 4.17-11 of the Draft EIR). The volume of aggregate truck traffic in the future would likely be the same with or without the project, as demand for aggregate in the area would not change (Draft EIR at page 6-15). In the absence of the project, trucks hauling aggregate near the intersection of Willow and International Avenues would likely originate at other aggregate mines in the region, such as those approved in eastern Madera County, but the demand for aggregate would not be reduced (Draft EIR at page 6-25).

Comment 111-4

If Cemex cannot afford this they have no business mining on the river. What happens if there is a catastrophe at the mining site? Will they say we don't have money to repair?

Response 111-4

Please see Collective Response #4b pertaining to liability and funding for potential damage associated with the project.

Comment 111-5

2) Impact on water tables for domestic residential wells.

The possibility of dropping water tables on the extensive dig is a huge concern for residents.

1) Cemex should install at every residential well a constant water level monitor. This should be monitored monthly by an independent contractor paid for by Cemex.

2) Cemex must provide a bond to protect every residence of this community. If the wells fail or have greatly reduced water production and the homes are no longer realistically habitable, protection for the homeowners must be in place before operations begin. Cemex must be liable and purchase the properties at high market value. There must be a penalty in place to be paid to the resident to cover costs of moving through no fault of their own.

Response 111-5

Please see Collective Response #24 pertaining to groundwater monitoring, Collective Response #25 pertaining to groundwater and surface water impact evaluations, and Collective Response #4b pertaining to liability and funding. See also, Response 503-3.

Letter #112 February 18, 2025, James Durando (Letter #2)

Comment 112-1

1-The Friant and Willow and Willow and Copper intersections are referenced as sections of road that will be used by the trucks in the project. These intersections will not effectively handle the traffic loads that the Cemex project will create. Modifications should be made to create safe intersections and road improvements as needed before the project can start.

Response 112-1

The intersections were studied in the Draft EIR and in the Traffic Impact Studies (Draft EIR Appendix I-1, "Traffic Impact Study," Appendix I-2, "Estimates of Vehicle Miles Travelled," Appendix I-3, "Response to Comments on Traffic Impact Study," through Appendix I-4, "Additional Responses to Comments on Traffic Impact Study"); the appropriate intersection control and lane configurations with the project were identified in the analyses. Although the project would not immediately contribute to the need to upgrade road facilities, Mitigation Measures 4.17-1a through 4.17-1r provides that the Operator would contribute their equitable share of the cost of future road facility improvements. See Response 12-69. See also Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17, "Transportation."

Comment 112-2

2-Why is Willow south of Copper not included in the study area intersections while the Friant Road study area intersections go to the south of Teague. Willow south of Copper is a busy road with a high school, middle school, elementary school and junior college along that stretch of road. Trucks from Cemex use that road currently and increased traffic will lead to more wear and tear on that road surface, increases air quality degradation and a more crowded road. It seems like including those intersections along Willow to Teague would have been an option.

Response 112-2

Locations along Willow Avenue south of Copper Avenue were not analyzed because less than 15 percent of the project trips are expected to regularly travel on Willow Avenue (Section 4.17 of the Draft EIR). A majority of project trips are expected to travel on Friant Road south of Teague Avenue, which is the reason that more intersections along Friant Road were studied (Section 4.17 of the Draft EIR and Chapter 3 of the Final EIR for revisions to Draft EIR Section 4.17).

The City of Fresno General Plan designates Willow Avenue as a super arterial, and the City has identified Willow Avenue as a truck route. The City of Clovis General Plan designates Willow Avenue as an arterial. Although the City of Clovis does not have a truck route plan, City of Clovis Policy 6.1 states: "Truck routes. Plan and designate truck routes that minimize truck traffic through or near residential areas." The intent of such a policy is to require a majority of trucks to travel on major streets, such as Willow Avenue. Both cities allow limited access to Willow Avenue and have planned an ultimate width of six lanes along a majority of the section south of Copper Avenue. Willow Avenue, as

planned by both cities, is intended to accommodate greater traffic volumes and to accommodate trucks.

Additionally, the Draft EIR analyzes the project's air quality impacts in Section 4.3, "Air Quality," as updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 112-3

3-Mitigation for Traffic signals at Friant and willow needs to be completed before the traffic increases.

Response 112-3

As identified in the Draft EIR and supporting Traffic Impact Studies (Appendices I-1 through I-4), the study intersections were evaluated and appropriate intersection control and lane configurations with the project were identified. The analyses conclude that the project would not cause signal warrants to be satisfied and would not independently require upgrades to roadway facilities.

As development progresses in the region, the County of Fresno and the City of Fresno will continue to require traffic studies to determine if and when signalization or other improvements are warranted, and will require such improvements in accordance with their adopted policies. Although the project would not immediately trigger the need for these improvements, it would contribute its equitable share of the cost of future intersection and roadway improvements pursuant to Mitigation Measures 4.17-1a through 4.17-1r. See Response 12-69. See also Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17.

Comment 112-4

4-Pavement modifications between North Fork Road at Friant Road and Copper River Drive needs to be completed due to the increased wear that the project truck traffic will generate.

Response 112-4

The Operator would contribute an equitable share of the cost of the pavement improvements (see Mitigation Measures 4.17-1a through 4.17-1r). The agencies having jurisdiction over those sections or roadway would determine the timing of road maintenance and improvements. See Response 12-69. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17.

Comment 112-5

5-Willow avenue north of Copper has only one northbound lane with a tall cement curb. With no shoulder any stopped vehicle will block that road. There is no shoulder to move onto.

Response 112-5

Wide dirt shoulders exist along a majority of Willow Avenue north of Copper Avenue.

Comment 112-6

6-With the lack of adequate road surface, controlled intersections, and lane widening as needed the area leading to and away from both the plant and quarry seem inadequate to provide the safety and reduced greenhouse gas emissions that should be part of this project. Saying that it will be "fixed" when financially possible is not a solution. Saying that the impact is unavoidable is not the answer. Eliminate the impact first.

Response 112-6

Please see Collective Response #29 pertaining to traffic impacts and road improvement requirements.

Comment 112-7

7-prehistoric bowl mortar (P-10-007115) Where is the prehistoric bowl and mortar (P-10-007115) that was found in the quarry site? Was it returned to a local tribe? Have any tribal archeologists been notified of that find?

Response 112-7

The bowl mortar (P-10-007115) was identified within the quarry area and, during the pedestrian survey, was moved to an undisclosed location within the project but outside the proposed area of impact. The item was not collected. The mortar bowl was determined as not eligible for the California Register of Historic Resources (Draft EIR page 4.5-20). The California Public Records Act exempts disclosure of confidential Native American and archaeological resource information so the exact location cannot be provided. However, the Native American tribes participating in Assembly Bill 52 consultation with the County were provided a copy of Applied EarthWorks' 2020 inventory report.

Comment 112-8

8-As required by the current CUPs, there are appropriate traffic warning signs at access roads for both the Plant Site and Quarry

Site. Existing company identification signs are located at the entrance roads to both the Plant Site and the Quarry Site in accordance with county signage regulations. There are no signs present at the quarry site at all. Who monitors/enforces the conditions of the CUPs?

Response 112-8

The commenter's observations regarding signage are noted. The permittee is responsible for compliance with conditions of approval; conditions compliance monitoring and enforcement is performed by the County or a County-retained third party.

Comment 112-9

9-Perceptible levels of ground vibration and air overpressure at some locations close to the quarry will be present. Is there a map showing where this impact will occur? I would like some specifics as to amount or vibration and how much air overpressure. Have actual tests for these explosions been done in situ? Are these computer models that they are basing this on?

Response 112-9

Figure A-1 in the Blast Impact Analysis Report by Vibra-Tech shows the location of the six closest structures that are immediately adjacent to the site. Also shown on this figure is the final limit of excavation. No test blasts have been done in-situ at the site. The threshold of significance is set at 0.6 in/sec for ground vibration and 0.1 psi for air overpressure. Blasts must be designed to be below these levels at all locations. Since the blast would be designed to be below these levels at the closest receptor, receptors at greater distances would experience much lower levels of ground vibration and air overpressure. Analysis regarding blasting impacts is discussed in Impact 4.13-6, at Draft EIR pages 4.13-65 to 4.13-67. Further, Mitigation Measure 4.10-1, shall be implemented at all times. This mitigation measure would reduce the effects of ground or airborne vibration as a result of blasting to a less than significant level. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.13, "Noise," and supporting technical appendices (see Draft EIR Appendix H, "Noise Assessment").

Comment 112-10

10-Their mitigation states that structures and wells will be monitored. That is very vague. What will they be monitoring? How will they monitor the structures and wells? What type of equipment will be used to do the monitoring? There needs to be specific guidelines as to what will be looked at and how changes will be addressed. It should be a non-cemex entity doing this independent work.

Response 112-10

Please see Collective Response #24 pertaining to groundwater monitoring. To clarify what would be monitored, Mitigation Measure 4.10-10a provides that, groundwater would be monitored in the existing MW-3 well cluster at the Quarry Site (individual wells completed in alluvium, weathered rock, and hard rock), as well as water level data from the CSA 44C wells that would be provided by Fresno County (Draft EIR, pages 4.10-108 through 4.10-111). The MW-3 cluster wells consist of dataloggers, which are programmed to record water levels at least once every six hours. The data shall be downloaded every 6 months for review and inclusion in annual mitigation monitoring reports prepared by a Professional Geologist/Certified Hydrogeologist and submitted to Fresno County annually.

If the monitoring data indicate that groundwater levels drop such that the available water column decreases by more than 15 percent, a potential impact would have occurred. If the data and assessment confirms that a decrease in water levels greater than 15 percent is exclusively attributable to mine dewatering, then CEMEX would implement corrective measures (Draft EIR, pages 4.10-108 through 4.10-111). See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10, "Hydrology and Water Quality."

The initial corrective measure would be to divert additional water from the excavation into the Northeast Pond or to a recharge trench to enhance groundwater recharge. If all available water is being pumped to the Northeast Pond or recharge trench, and the water level remains 15 percent or more below baseline levels, then mining would not progress to greater depths at the quarry.

For wells completed west of the Quarry Site, and for the San Joaquin River, the existing MW-1 monitoring well cluster would be monitored. These wells are also equipped with dataloggers that record groundwater level every 6 hours. If access to any of the five private wells located west of the Quarry Site can be obtained from the private owners, then those wells would become part of the monitoring program. Again, if the available water column decreases by more than 15 percent, a potential impact would have occurred, and the corrective measures would be implemented. Here, the initial corrective measure would be to divert additional water from the excavation to the recharge trench on the west side of the Quarry Site. The rate of pumping into the recharge trench would be increased until the water column in the MW-1 and private wells recovers to within 85 percent or more of baseline levels. If this standard is not met, then mining would not progress to deeper depths.

Following completion of mining to the full approved depth, if no potentially significant impact to nearby wells or flows in the San Joaquin River has occurred, then groundwater monitoring at the MW-1 and MW-3 wells would continue for at least 3 years.

Comment 112-10 does not provide any substantial evidence that Mitigation Measure 4.10-10a is inadequate to monitor groundwater levels.

Comment 112-11

11-Anywhere in the DEIR that it says that monitoring will be the mitigation needs to be reevaluated and done with specificity. Monitoring is too vague a term and means nothing. A monitoring plan with guidelines, methods, procedures, equipment and actions based on the data is needed. Just using the term monitoring as a type of mitigation is lazy and inadequate.

Response 112-11

Although several mitigation measures in the Draft EIR include monitoring as a specific element of mitigation, none of the mitigation measures in the Draft EIR are solely limited to monitoring. For instance, as discussed and presented in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10 and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111, each of which include monitoring and adaptive management in response to conditions observed through monitoring). See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10. The comment does not identify any specific mitigation measures in the Draft EIR for which monitoring is a sole component, nor does it specify a particular mitigation measures that is insufficient.

Comment 112-12

12-Has a blasting quarry operating on a mined-out gravel pit like this been done in California? It seems like a similar quarry would have many answers to the questions arising?

Response 112-12

In accordance with CEQA Guidelines Sections 15126.2(a) and 15125, the EIR focuses on the significant environmental effects of the proposed project and describes the conditions on the project sites. The Draft EIR's analysis of potential environmental effects associated with the project, including blasting and excavation, is based on site-specific conditions and technical studies prepared for this project.

Mining involving blasting at hard rock quarries is commonplace throughout California and is frequently preceded by excavation of overlying alluvial materials. While similar operations exist, the evaluation of other quarries is not required under CEQA, as environmental impacts must be assessed based on the specific characteristics of the project sites and surrounding environment.

Accordingly, the Draft EIR provides an adequate, site-specific analysis of the proposed project's potential impacts.

Comment 112-13

13-In the ground water and surface contamination from blasting there are a few major components missing that need to be considered. What are the explosives that are being used? What are the sizes of the various charges they are using? What are the chemical components that the blasting produces? What are the chemical compounds that will contaminate the surface and ground water? None of this is mentioned in the report. Has any blasting been done on the quarry site to determine ground vibration levels and the distance they are travelling from the point of ignition?

Response 112-13

The Blast Impact Analysis prepared by Vibra-Tech Engineers (see Draft EIR, Appendix H-3, "Blast Impact Analysis") provides information on the characteristics of blasting. Based on Vibra-Tech's analysis prepared for the proposed project it was determined that appropriate vibration and airblast control measures should be implemented when conducting onsite blasting to ensure blast-induced groundborne vibration would not exceed bank stability thresholds. Specifically, Mitigation Measure 4.10-1 would require development and implementation of Blasting Protocols that specify that blasting must begin at the center of the Quarry Site so that monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibration measurements and allow for adjustments to occur based upon the monitoring results. Additionally, charge weight per hole would be adjusted depending on the distance the blast is occurring form the nearby San Joaquin River embankment. If significance thresholds are exceeded or signs of instability of the embankment occur, Fresno County must be notified within 48 hours. Multiple studies have been completed about the effects of blasting on groundwater that all concluded that there would be no potentially significant long-term chemical or mineralogical changes observed in groundwater that could be attributed to blasting. Therefore, and with implementation of Mitigation Measure 4.10-1, it is unlikely that blasting would result in the release of hazardous materials to the environment.

Additionally, the permanent storage of explosives on-site would be prohibited, and the explosives would be delivered to the site once or twice per week by a licensed or qualified blasting contractor to ensure complete detonation and the management of the remaining fragments after the blast to prevent interaction with stormwater and compliance with all relevant regulations, including the California Fire Code, Cal/OSHA Mine Safety Orders, and applicable CUPA programs related to hazardous materials storage and handling. Unused explosives and detonators would be returned to the blasting contractor's secure off-site magazines. As discussed in the Draft EIR, blasting agents typically used for mining include both an oxidizer and an accelerant, generally in the form of nitrate-based compounds and flammable liquids. The Blasting Protocols would minimize the risk of substantial groundwater water quality degradation by expanding blasting activities on the Quarry Site. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 112-14

14-Who will monitor the ground water and surface water contamination? How will domestic wells and other ground water resources in the area be protected?

Response 112-14

Draft EIR Section 4.10, "Hydrology and Water Quality," provides detailed analyses of potential groundwater and water quality effects of the proposed project. The analyses are based on the Hydrology and Water Quality Analysis Report (Draft EIR Appendix G-5, "Hydrology and Water Quality Analysis Report") which utilizes information from groundwater conditions reports included as Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR and groundwater and surface water monitoring and sampling data collected for the project sites to draw conclusions on the existing groundwater hydrology conditions on the project sites and to evaluate the potential impacts to groundwater hydrology under the proposed project. Detailed methodology and findings are provided in Appendix G-5. Additionally, please see Collective Response #25 for discussion pertaining to surface and groundwater analyses.

As discussed, and presented in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10 and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111). See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and supporting technical appendices.

The comment does not address the adequacy of the Draft EIR hydrology analyses or the efficacy of these mitigation measures, and no further response is warranted.

Comment 112-15

15-The impact blasting will have on salmonids is mentioned in regards to the reintroduced salmon in the San Joaquin River. Why is an old Alaska Department of Fish and Game study used? The substrate at the study site cannot be like what is at the quarry site. The river in Alaska is most like not that similar to the San Joaquin River in substrate, volume and flow. Has any actual testing with blasting been done for this DEIR in this area on the river?

Response 112-15

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. No site-specific blasting studies have been conducted for the San Joaquin River. CEQA does not require that all possible studies be conducted for the purpose of analyzing environmental impacts, but rather that the analysis be based on substantial evidence and accepted methodologies. (Title 14 CCR Section 15151.)

As described in the Draft EIR, the evaluation of potential blasting impacts to salmonids is based on established and widely accepted thresholds for fish protection, and is supported by project-specific modeling of ground vibration and overpressure. In addition, Mitigation Measure 4.10-1 requires implementation of Blasting Protocols (provided in Draft EIR Appendix H-6, "Blasting Protocols" and updated in Appendix H-9, "Revised Blasting Protocols"), which establish limits on charge weights, timing, and other blasting parameters to ensure that vibration and overpressure levels remain below specified thresholds for the river embankment and pit slope that would be protective of aquatic species in the river.

The Blasting Protocols also require monitoring to verify that blasting remains within modeled and allowable limits. Please refer to Final EIR Appendix H-9 to view the updated Blasting Protocols.

Accordingly, the Draft EIR relies on accepted scientific standards, project-specific analysis, and enforceable mitigation measures with monitoring to ensure that impacts to salmonids would be less than significant.

Comment 112-16

16-Signage at the entrance of the quarry is nonexistent currently. There are no signs indicating an entrance to the quarry site from

north or south. No signs showing trucks entering the road or quarry. The current CUP is not enforced.

Response 112-16

See Response 112-8. The commenter's observations regarding signage are noted. The permittee is responsible for compliance with conditions of approval and would fully comply with all such conditions, including any or all conditions concerning signage. Conditions compliance monitoring and enforcement is performed by the County or a County-retained third party.

Comment 112-17

17-All domestic wells in the area should be tested to provide a baseline for water quality and well production. Testing should be done quarterly during the life of the mining operation to monitor the impact on water quality and production.

Response 112-17

As discussed in Section 4.10, of the Draft EIR, Mitigation Measure 4.10-10a (Quarry Site Groundwater Adaptive Management Program) provides for monitoring of the MW-3 well cluster to assess groundwater level conditions that might affect wells to the east and northeast of the Quarry Site, and of the MW-1 well cluster to assess groundwater level conditions that might affect the San Joaquin River and wells to the west of the Quarry Site. Each well cluster includes a separate well within the alluvium, the weathered rock, and the hard rock. Electronic dataloggers have been present in these wells since August 2017 (except for MW-3S, which was installed in 2018, with datalogger recording beginning in September 2018) (see Draft EIR at page 4.10-108). Therefore, a five- to six-year baseline of groundwater elevation data already exists in each of these well clusters, as provided in Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," of the Draft EIR. These wells would continue to be monitored throughout the project duration and after reclamation.

Mitigation Measure 4.10-10a describes the data analysis to be conducted and the changes in groundwater levels that would require further assessment. If the groundwater changes are confirmed, then specific mitigation actions would be required, including increasing the amount of water provided for groundwater recharge, either at the Northeast Pond or at the western recharge trenches, as appropriate (Draft EIR at page 4.10-109). The mitigation measure goes so far as to require mining to cease if groundwater levels cannot be maintained above defined thresholds (Draft EIR at page 4.10-109). The cessation of mining would also result in the halting of dewatering, which would then allow groundwater levels to recover, if they had dropped below the target criteria.

Mitigation Measure 4,10-10a includes the possibility of monitoring groundwater levels in offsite private wells. However, neither CEMEX nor Fresno County can require private well owners to allow monitoring at their individual residential wells (Draft EIR at page 4.10-110). Similar programs have been implemented at other aggregate mining quarries throughout California, the nearest being at the Vulcan Austin Quarry in Madera County, approximately 5 miles northwest of the Quarry Site. For such a program to be implemented, the well owners would be provided the opportunity to participate and enter into an access agreement to have the water levels in their wells monitored. For owners that elect not to participate, data would not be available to assess any effects on the groundwater levels in their wells. That is the prerogative of each well owner and the choice that any well owner can make.

The monitoring and reporting work to be performed under Mitigation Measure 4.10-10a would be conducted by a California-licensed Professional Geologist or Certified Hydrogeologist and must be reviewed and approved by Fresno County (Draft EIR at page 4.10-108). The program would be funded by CEMEX as described in Mitigation Measure 4.10-10b.

Mitigation Measure 4.10-10a specifies that monitoring is to continue for at least 3 years after mining reaches the full approved mining depth and no nearby wells have been significantly affected. In other words, monitoring would occur for at least 3 years after dewatering of the quarry stops (see Draft EIR at page 4.10-111). Thus, during this 3-year period, the water level within the Quarry, and in the surrounding hard rock aquifer, would be recovering, or increasing, since dewatering would no longer be occurring. Thus, there is no practical potential that dewatering of the quarry pit would have any additional or future effects on nearby groundwater levels once the 3-year period begins since dewatering would have ceased. As an additional protective requirement, the 3-year period must include at least two below-normal rainfall years or one critically dry year, as defined by the California Department of Water Resources (DWR) (Draft EIR at page 4.10-111). Thus, if mining reaches the full permitted depth during a period of wet years, the monitoring period and funding mechanism must remain in place for more than 3 years.

Mitigation Measure 4.10-10a also states that if the water level in any of the monitored wells has decreased by more than the defined criterion of 15 percent at the time mining reaches the full permitted depth, pumping to the Northeast Pond and/or recharge trenches must continue indefinitely until the 15 percent criterion is met in all wells (Draft EIR at page 4.10-111). To verify that the 15 percent criterion is met, the monitoring program would have to continue until all wells meet that standard. Thus, the funding mechanism would also remain in place until each of these requirements are met.

With the inclusion of Mitigation Measure 4.10-10a project impacts were determined to be less than significant and no additional mitigation measures are necessary.

Comment 112-18

18-Ambient noise should not increase. Increased truck noise, explosions and eventually plant operations will all increase noise in the area. Operating hours are not reasonable in an area surrounded by existing homes that have been present for over 40 years. Operating 16 hours a day in a suburban residential area should not be allowed.

Response 112-18

Virtually every physical process generates noise that contributes to the local ambient noise environment. Whether it be a tractor operating in an agricultural field, a distant aircraft overflight, a power boat on a lake or river, or a garbage truck in a residential neighborhood, to name a few. As noted in the Response 60-13, CEQA requires that a noise level increase be substantial to result in a finding of a significant noise impact, rather than just audible.

The proposed hours of operation are identified in Table 2-5, "Proposed Typical Hours and Days of Operation," of the Draft EIR (see Draft EIR, page 2-43). The proposed typical hours of operation avoid the most noise-sensitive periods of 9 p.m. to 4 a.m., but recognize that early morning truck loadout, ready mix and asphalt production may be required, as well as extended hours of operation such as cases where night paving projects require the delivery of materials outside normal operating hours. This is particularly necessary for temperature-sensitive Portland cement concrete and hot-mix asphalt during the hotter period of May through October. The proposed hours of operation were carefully considered in the noise analysis prepared for the project Draft EIR, and potentially significant noise impacts specific to pre-7am operations were identified at some residential receptors (see Impact 4.13-3). Appropriate noise mitigation measures, including follow-up noise testing to ensure the mitigation measures are adequate, were developed in response to impacts identified during nighttime hours (see Mitigation Measures 4.13-2 and 4.13-3).

The comment fails to provide any evidence justifying decreased hours of operation, and fails to acknowledge these mitigation measures or analyze why they are deficient.

Comment 112-19

19-Air quality will be impacted by:

Increased truck/tractor activity/dust PM10 PM2.5

Blasting PM10 PM2.5

Batch plant PM 2.5

Rock crushing /Dust PM 10 PM 2.5

Air quality will suffer with increase mining activity and trucking and equipment use in the quarry producing more greenhouse gas emissions.

Diesel exhaust is a major source of PM 2.5 a known health hazzard [sic]

Response 112-19

It is true that air quality would be impacted by some of the sources listed by Comment 112-19. However, as shown in Draft EIR Tables 4.3-20, 4.3-21, 4.3-22, 4.3-23, 4.3-24, and 4.3-25, as updated in Appendix D-4, "Revised Section 4.3, Air Quality," certain features of the project and the mitigation measures proposed would reduce emissions and associated health risks with increased production to less than significant levels (Appendix D-4, Section 4.3.4, "Project Impacts and Mitigation Measures"). The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), including preparation of a Fugitive Dust Control Plan and inclusion of additional information regarding the project's air quality impacts associated with blasting. See Collective Response #9 for further discussion of the project's potential air quality impacts. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis, as amplified by the Final EIR, is sufficient, and no further response is required.

Comment 112-20

20-Ambient Air Quality is monitored by the Air District. The closest station with data being used to monitor pollutants is the project site, Clovis-Villa station (Air Quality Station ID 06-019-5001. This station is located approximately 9 miles south of the project sites and measures a variety of air quality parameters. Looking at the PM 10 and PM 2.5 components the data in Table 4.3-2 Ambient Air Quality in the Project Area shows that the PM 10

values exceed state standards in the years 2013-2017. The PM 2.5 values exceed federal standards for the same years 2013-2017. There are two weaknesses to this information. The Clovis-Villa station is designed to monitor at a neighborhood scale covering an area of 0.5km to 4.0 km the station is about 9 miles away. It is confusing to have two different measuring systems used in an explanation so to convert to US standard measure for length the area covered by the monitoring station would be about 500 yards to 2.4 miles from the station. How does this measure anything from the Plant or Quarry site that is about 9 miles away? Why wasn't the air monitored at the sites of the projects. Some of the data was collected more than 10 years ago. There must be more recent data available. This information does not seem to provide an accurate value for PM10 or PM2.5 for the sites.

Response 112-20

The air quality impact analysis follows the SJVAPCD Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI) (SJVAPCD, 2015) which requires a summary of "ambient air quality, including data for at least the last three years from the air quality monitoring station(s) closest to the project site" (GAMAQI, page 55). The Clovis Station is the closest one to the project. The Draft EIR contains the most recent years available when the Air Quality and Climate Change Impact Assessment was prepared (Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment"). The technical analysis for air quality impacts was updated to include the ambient air quality data from the Clovis station for the years 2020 through 2024, as described in Section 3.2.2 of the *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3). Further data for the Clovis Station is provided below.

The SJVAPCD follows EPA requirements and guidelines when deciding where air monitoring stations are located. An annual Air Monitoring Network Plan and a 5-year Air Monitoring Network Assessment are each prepared for EPA review. The network plans and EPA guidance are described on the District website (https://www.valleyair.org/air-quality-information/air-monitoring/).

The 2025 Air Monitoring Network Assessment (SJVAPCD, 2025) describes the following objectives and goals:

- Objectives:
  - Ensure compliance with the NAAQS,
  - Track long term air quality trends and control strategy effectiveness, Provide data for photochemical modeling and emissions inventory development,
  - Support daily air quality forecasting, and

  - Communicate current conditions to the public and inform of actions to reduce health-risks during air pollution episodes.
- Goals:
  - Determine the highest criteria pollutant concentrations expected to occur in the area covered by the network,
  - Measure typical concentrations in areas of high population density,
  - Determine the impact of significant sources or source categories on air quality,
  - Determine general background concentration levels, and
  - Determine the extent of regional pollutant transport among populated areas.

A network assessment must consider whether project sites support air quality characterization for areas with relatively high populations of susceptible individuals (*e.g.,* children with asthma) and other at-risk populations. Office of Environmental Health Hazard Assessment ranks communities in the top quartile of susceptibility. SJVAPCD reports that a majority of the air monitoring sites are within the specific areas or are within 4 km.

Scales of spatial representativeness are described in terms of physical dimensions of the air parcel or zone where air quality is expected to be reasonably consistent around the monitor. The monitor thus represents that area, not just the location of the monitor. The following **spatial scales** are identified in 40 CFR Part 58, Appendix D:

- **Microscale**: An area ranging from several meters up to about 100 meters.
- **Middle scale**: An area up to several city blocks in sized ranging between about 100 meters to 0.5 kilometers.
- **Neighborhood scale**: An extended area of the city that has relatively uniform land use with dimensions ranging 0.5 to 4.0 kilometers.
- **Urban scale**: An area of city-like dimensions, from about 4 to 50 kilometers.
- **Regional scale**: Covering a rural area of reasonably homogeneous geography without large sources, extending from tens to hundreds of kilometers.

According to Table 3-1 in the 2025 network assessment report, the Clovis-Villa location is an urban center and the purpose of measurements there would be to measure maximum ozone precursor concentrations. The commenter is correct that the concentrations in the urban area are different from those near the project which is in a rural area and far from most of the air pollution sources. However, criteria pollutant exceedances are episodic because they are brought on by unfavorable weather conditions and when episodes occur, they occur throughout the region. The Madera Pump Yard Station may experience

concentrations of pollutants (particularly ozone precursors and $PM_{2.5}$) more like the conditions at the project sites because it is also rural and measurements are taken there to represent background concentrations.

Air pollutants were not measured at the project sites because it is not customary to do so, particularly for a common, well understood source type like a rock quarry in a rural setting. The cost of collecting monitoring data for multiple pollutants over multiple years for a project like this, which is located in an area of relatively average to better-than-average air quality, as compared to the top quartile in the region, is unnecessary. See also Appendix D-4, "Revised Section 4.3, Air Quality," regarding updated emissions data for criteria pollutants including PM_{10} and $PM_{2.5}$.

Comment 112-21

21-How can the Air Quality Control District monitor the sites for this DEIR without any monitoring equipment on the sites? There is no mention of monitoring or any data from monitoring other than the Clovis-Villa station and the Fresno Garland site.

Response 112-21

As discussed in Response 112-20, the purpose and objectives of air monitoring networks go beyond a single site and focus more broadly on where population is most exposed (urban areas), to understand background and transport of pollutants from one area (urban) to another.

Comment 112-22

22-4.3 Air Quality

Goal OS-G To improve air quality and minimize the adverse effects of air pollution in Fresno County.

Policy OS-G.11 The County shall continue, through its land use planning processes, to avoid inappropriate location of residential uses and sensitive receptors in relation to uses that include, but are not limited to, industrial and manufacturing uses and any other uses which have the potential for creating a hazardous or nuisance effect.

In this case the county has allowed residential development by the quarry site. The CUPs for the site expired and now the county wants to create an industrial site in the midst of a suburban residential area. This is in opposition to the Goal OS-G for Air Quality.

Response 112-22

The policy referenced in the comment is actually Policy OS-G.12 (Fresno County 2024), not Policy OS-G.11. As stated in the Air Quality section of the Open Space and Conservation Element of the Fresno County General Plan, the linkages between land use patterns, transportation systems, and air quality are the primary means for local governments to address air quality issues. The policies and implementation programs addressing air quality are directly related to land use and transportation. The project is requesting to expand an existing use and extend the life of its operations. The County is not creating a new "industrial site in the midst of a suburban residential area" because 1) it is not a new site and 2) it is not located in an urbanized area. In fact, the majority of the surrounding adjacent properties to the project sites are zoned Exclusive Agricultural with 20-acre minimum parcel size (AE20). There are two existing, vacant planning areas near the project sites zoned for residential, but they both include conditional neighborhood beautification standards. While there are scattered single family residences resulting from urban sprawl within a mile radius of the project, the residences are located within agriculturally classified zones which were intended for agricultural uses. Thus, allowing the continued operation in the existing sites would create fewer impacts than moving the operations to disturb a new site or multiple sites elsewhere.

Comment 112-23

23-4.4 Biological Resources

Fish-Only Gambusia and Micropterus were observed during habitat assessment. Why didn't they seine the pond to survey what is in the water? The assessment done was a visual observation of the surface of the pond.

Response 112-23

Mosquitofish (*Gambusia affinis*), and largemouth bass (*Micropterus salmoides*) are not listed as endangered or threatened under the California Endangered Species Act or the federal Endangered Species Act. (Title 14 CCR Section 670.5; 50 C.F.R. Section 17.11). Neither the Mosquitofish nor the largemouth bass were observed during the habitat assessment of the project sites in any event. (See, Draft EIR, page 4.4-17). All measures taken are sufficient to avoid and minimize potential impacts, and no additional revisions to the Draft EIR are required.

Comment 112-24

Amphibians-western toad and spadefoot toads exist on the adjacent properties to the north and south. Without a thorough survey they would not be found.

Response 112-24

Please see Response 65-6 regarding the sufficiency of the habitat surveys conducted for this Draft EIR. Please note that bullfrogs are present in the ponds located on the project sites which are invasive and predatory of western spadefoot, thus lessening the likelihood of their presence on the project sites.

To ensure the protection of the western spadefoot, the Operator would conduct pre-construction clearance surveys by a qualified biologist for Western Spadefoot within suitable habitat areas, as required by Mitigation Measure 4.4-1b (Draft EIR, page 4.4-50). As described in Chapter 3, "Draft EIR Errata," Mitigation Measure 4.4-1b has been revised to clarify and strengthen survey and implementation requirements, further ensuring protection of special-status amphibians, including western spadefoot. If individuals are observed, they would be relocated by a qualified biologist to suitable nearby habitat outside the disturbance area. These measures are sufficient to avoid and minimize potential impacts, and no additional revisions to the Draft EIR are required.

Comment 112-25

Reptiles-pond turtles are in the ponds on adjacent properties and travel great distances overland. They should be present in the quarry site ponds. Western fence lizards are very abundant in the area and would be found in the quarry site as well [sic]

Response 112-25

Please see Response 65-6 for further discussion of the sufficiency of the habitat surveys conducted for this Draft EIR. The Draft EIR concluded that the Western pond turtles are not likely to be present on the Quarry Site or Plant Site due to lack of suitable habitat; however, because there is marginal habitat associated with the San Joaquin River and to further ensure protection of the pond turtle, pre-construction clearance surveys would be conducted by a qualified biologist for Western Pond Turtles within suitable habitat areas as required by Mitigation Measure 4.4-1b (Draft EIR, page 4.4-50) and, as clarified in the Final EIR, implementation of Mitigation Measure 4.4-1b includes biological monitoring during pond draining and removal activities. If individuals are observed, they would be relocated by a qualified biologist to suitable nearby habitat outside the disturbance area.

Western Fence Lizards are not listed as endangered or threatened under the California Endangered Species Act or the federal Endangered Species Act. (Title 14 CCR Section 670.5; 50 C.F.R. Section 17.11). No Western Fence Lizards were observed during the habitat assessment of the project sites. (See, Draft EIR, page 4.4-17). These measures, as refined in this Final EIR, are sufficient to avoid and minimize potential impacts.

Comment 112-26

Avian-Tricolored black birds nested in the ponds by the thousands until a few years ago when the tules disappeared. Bald and Golden

eagles do still use the area but are seasonal. Observing them would involve looking at the right time of the year. Ospreys are using the pond to forage all year long. White Pelicans are visitors to the quarry ponds throughout the year as well. The survey ignores more than 5 species of ducks that use the pond as well as no mention of Canada geese.

Response 112-26

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including raptors, prior to the initiation of a mining phase as shown on the Plant Site Mining Plan (see Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," of Chapter 2, "Project Description") and Quarry Site Mining Plan (see Draft EIR Figure 2-8, "Proposed Quarry Site Mining Plan"). As revised in the Final EIR, pre-construction surveys would be conducted by a qualified biologist within 500 feet of the limits of disturbance and would include multiple survey visits, as appropriate. If an active nest of a subject nesting bird species is observed during the survey, appropriate avoidance buffers would be established based on species-specific requirements, including up to 500 feet or greater for listed and raptor species, and construction activities would be modified, delayed, or avoided within the buffer in coordination with California Department of Fish and Wildlife (CDFW), as appropriate, until a time when the birds have left the nest, or the nest becomes inactive under natural conditions. With implementation of Mitigation Measure 4.4-1c, as revised in this Final EIR, the potential for the proposed project to result in adverse impacts to nesting birds at or near the project sites would be less than significant. See Chapter 3, "Draft EIR Errata." Canada geese are mentioned in the Draft EIR as well as numerous waterfowl species; any impacts at the site on these species are less than significant, requiring no mitigation (Draft EIR, page 4.4-52 through 4.4-53). The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. For blasting activities occurring during the nesting season, additional pre-blasting surveys would be conducted within a 0.25-mile radius of blasting locations to address species with greater sensitivity to disturbance, such as Swainson's hawk and bald eagle.

Comment 112-27

Mammals-Mountain Lions have been in the area for years. They use the area of the quarry, the riparian habitat along the river corridor and all of the habitats in the area. They were not sighted in the habitat assessment as it was performed. Trail cameras which

are easily available and inexpensive would have been a good tool for the assessment to have incorporated instead of "observed" or not.

Response 112-27

No mountain lions were observed during the habitat assessment. In any event, blasting activities would be brief, with each blast lasting approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity as affecting this species.

Letter #113 February 18, 2025, George Hewett

Comment 113-1

Tuesday morning greetings, with a quick message to say I'm greatly concerned about any project that utilizes explosives/blasting methods, especially underground and especially in close proximity to a damsite. I'm no geological engineer, if such is the correct term, but just the same I have to wonder if there isn't a potentially "safer," for lack of a better term, method if such a project really needs to be completed at all. Sounds "suspiciously" as though it's yet another case of big business coming in and creating a big disruption of the "ecology," again, for lack of a better term, with the thoughts of big profits being the driving force.

Response 113-1

The proposed blasting operations are described in Draft EIR Section 2.5.2.2, "Quarry Site Mine Plans," beginning on page 2-42 As stated on Draft EIR page 2-44, "[e]xplosives used in blasting would not be stored on-site but would be brought to the site by a California licensed blasting contractor." Transport of explosive materials would occur in compliance with existing regulations that require licensing and the use of identified travel routes (see Draft EIR page 4.9-10). The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #114 February 18, 2025, Debi Schmidt

Comment 114-1

We live not too far from the Cemex blast proposal area. We are AGAINST it. Especially since it's not a necessary item that needs to be "mined" at this time, there is no shortage or huge demand that is not being satisfied.

Response 114-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding available aggregate reserves in the region and the need for the proposed project.

Comment 114-2

We do not want the noise or the disruption to the environment, plants, animals, people etc.

Response 114-2

The project's potential noise impacts are addressed in Draft EIR Section 4.13, "Noise," while potential impacts to plants and animals are addressed in Section 4.4, "Biological Resources." Each of the impacts identified in these sections was determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Letter #115 February 19, 2025, Kathryn Elliott

Comment 115-1

I think this proposal is a terrible idea. Heavy loads of mined rock on Friant Road will tear the road up and we taxpayers will be asked to pay for its repair.

Response 115-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #29 regarding funding for road maintenance.

Comment 115-2

New housing in the area will suffer air polluted with rock dust

Response 115-2

The project's potential air quality impacts are addressed in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for revisions to Draft EIR Section 4.3. See also Collective Response #9 regarding the project's potential impact on the region's existing air quality.

Comment 115-3

and the road is already burdened with with too much traffic. I hope you will see that CEMEX's plan is turned down.

Response 115-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #29 regarding truck traffic increases anticipated under the proposed project.

Letter #116 February 19,2025, Ann Heiniger

Comment 116-1

I am writing to object to CEMEXs blast mine proposal. The current permit should not be extended or modified for the following reasons:

Fresno / Madera counties do not need the aggregate. Our regional demand of 305 million tons for the next 50 years will be met by the 556 million tons of reserves already permitted at on the Kings River and at Austin Quarry.

Response 116-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding available aggregate reserves in the region and the need for the proposed project.

Comment 116-2

CEMEX has been fined more than $43 million for 81 environmental violation since 2000. The draft EIR does not require them to have a reserve to pay for future damage, such as a breach between the mine and the river. No amount of money could compensate for the potential environmental damage!

Response 116-2

See Collective Response #4a regarding CEMEX's regulatory compliance history and Collective Response #4b regarding liability for unforeseen damages caused by the proposed project. See also Collective Response #17 regarding riverbank stability and the potential for breach at the Quarry Site.

Comment 116-3

CEMEX has no plans to rectify the unavoidable impact to traffic on Friant.

Response 116-3

Comment 116-3 refers to Impact 4.17-1 (see Draft EIR page 4.17-27) which was determined to be significant and unavoidable. The Draft EIR presents a series of

mitigation measures to address the impacted intersections identified in the Traffic Impact Study (see Draft EIR Appendix I-1, "Traffic Impact Study"). Each measure requires CEMEX to contribute an equitable share of the cost to construct the improvements needed to address cumulative traffic increases at the identified intersections. However, as discussed in greater detail in Draft EIR Section 5.3.17, "Transportation," beginning on page 5-28, the timing of construction of these improvements is not certain and may occur after project implementation. Therefore, the impact was determined to be significant and unavoidable. Regardless, with implementation of Mitigation Measures 4.17-1a through 4.17-1r, CEMEX would pay the project's equitable share of the cost to construct the identified improvements. See also Collective Response #29 regarding the assertion that CEMEX should fully fund and construct the necessary roadway improvements prior to project implementation.

Comment 116-4

The visual blight on the landscape has encroached on an adjacent state ecological preserve.

Response 116-4

The project's potential impacts to aesthetics and visual resources are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for revisions to this section of the Draft EIR. See also Collective Response #20 regarding the assertion that the project encroaches on an ecological preserve.

Comment 116-5

The constant dynamiting is not compatible with fish and wildlife or humans living near the site!

Response 116-5

The potential effects of proposed blasting on fish, wildlife, and humans are evaluated throughout the Draft EIR. See Draft EIR Section 4.4, "Biological Resources," Section 4.9, "Hazards and Hazardous Materials," and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. The comment is noted for the consideration of the decision-makers.

Comment 116-6

Please do not extend the current permit and reject the proposal to modify it!

Response 116-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #117 February 19, 2025, Multiple Signers

Comment 117-1

Absolutely no on CEMEX!

Response 117-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #118 February 20, 2025, Jenine Cortopassi

Comment 118-1

I, along with many neighbors living at Copper River Ranch, are quite concerned about the possible Cemex Rockfield expansion.

Between traffic congestion along Friant Road, safety concerns, noise pollution, extreme wear on the roadway AND environmental concerns I am writing to have you consider alternate plans for Cemex.

PLEASE, PLEASE, PLEASE take this request seriously!!!

Response 118-1

The issue of traffic congestion along Friant Road is addressed in Draft EIR Section 4.17, "Transportation." See Collective Response #29 related to project truck traffic and funding for road maintenance. See also Collective Response #30 related to traffic and pedestrian safety. The issue of noise pollution is addressed in Draft EIR Section 4.13, "Noise." See Collective Response #27 regarding noise impacts on users of adjacent parks and trails. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Letter #119 February 20, 2025, George Folsom

Comment 119-1

I am writing to express my strong opposition to the proposed modification of the existing CEMEX Rockfield Quarry, including Environmental Impact Report (EIR) No. 7763 and Conditional Use Permit (CUP) Application Nos. 3666 and 3667.

First and foremost, the expansion would exacerbate air quality issues, particularly dust and particulate matter, which pose serious respiratory risks to nearby residents. Increased mining operations will generate higher levels of fine dust particles, which have been linked to asthma, lung disease, and other health problems, especially for vulnerable populations such as children and the elderly.

Response 119-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Health effects related to air pollution are discussed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3 Air Quality"). Specifically, air pollutants and associated health effects are described in Section 4.3.1.2, "Pollutants and Health Effects," while toxic air contaminants are described in Section 4.3.1.3, "Toxic Air Contaminants." Potential health effects resulting from project emissions are evaluated under Impact 4.3-3 in Section 4.3.4," Project Impacts and Mitigation Measures," of Appendix D-4. In response to comments received an updated Health Risk Assessment was prepared in the *Air Quality, Health Risk, and Climate Change Technical Report* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment") of this Final EIR. This updated analysis included cancer burden modeling and demonstrated no new impacts and no changes to the findings in the Draft EIR. See Collective Response #9 regarding the proposed project's potential effects on the region's existing air quality conditions.

Comment 119-2

Additionally, the modification poses a substantial threat to local water resources. The expansion could lead to groundwater depletion, contamination from mining runoff, and long-term effects on nearby ecosystems. Given the ongoing concerns about water scarcity and conservation efforts in our region, approving this modification would be irresponsible and harmful to the local environment.

Response 119-2

The project's potential impacts to water resources are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Collective Responses #24, #25, and #26 regarding groundwater level monitoring and potential effects on groundwater levels. The issue of groundwater depletion is addressed in Impacts 4.10-8 through 4.10-12 and were determined to be less than significant with implementation of Mitigation Measures 4.10-10a and 4.10-10b. The issue of groundwater quality is addressed in Impacts 4.10-1 through 4.10-7 and were determined to be less than significant with implementation of

Mitigation Measures 4.10-1, 4.10-5a, and 4.10-5b. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10. See also Collective Response #23 regarding water quality in onsite ponds.

Comment 119-3

Traffic and noise pollution are also critical concerns. Increased quarry activity will result in more heavy truck traffic, further straining local infrastructure, increasing wear and tear on roads, and elevating the risk of accidents.

Response 119-3

The issue of traffic is addressed in Draft EIR Section 4.17, "Transportation." The issue of noise pollution is addressed in Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. See Collective Response #29 regarding truck traffic increases anticipated under the proposed project, required improvements, and road maintenance. See also Collective Response #30 regarding traffic and cyclist/pedestrian safety.

Comment 119-4

Furthermore, prolonged exposure to blasting and excavation noise will significantly diminish the quality of life for residents in surrounding areas.

Response 119-4

The project's potential noise impacts are evaluated in Draft EIR Section 4.13. Each of the impacts identified in this section was determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.13. See also Collective Response #27 regarding the effects of proposed blasting on users of adjacent parks and trails. The comment is noted for the consideration of the decision-makers.

Comment 119-5

Beyond these immediate impacts, approving this modification sets a dangerous precedent for future industrial expansion at the expense of our environment and community. We must prioritize sustainable development that aligns with long-term public health and ecological conservation goals rather than allowing corporations to expand operations without fully addressing these adverse impacts.

For these reasons, I urge the Planning Commission to reject the proposed modification of the CEMEX Rockfield Quarry and uphold the best interests of the community and environment. Thank you for your time and consideration.

Response 119-5

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #120 February, 20, 2025, Debra Keldrauk

Comment 120-1

It has come to my attention that CMEX has applied for a permit to convert to a blast mine. This is such a terrible idea for the Fresno/Friant area. With homeowners insurance in California already at a super premium and many consumers in CA being denied, this would only add to the problem. CEMEX is already a problem working as a mechanized mine, in my opinion.

Response 120-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 120-2

I know countless citizens who have had rocks pop up on that road between Fresno and Friant, cracking windshields and creating yet another insurance issue: the high cost of auto insurance.

Response 120-2

See Collective Response #30 regarding vehicle damage.

Comment 120-3

Face it: everything in California is horribly expensive. We need a break. If CEMEX wants to blast they need to find another site in another city, they have been here since the 1920's I say enough already. Please do not consider approving this new permit to blast.

Response 120-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #121 February 20, 2025, Brenda Markham (Letter #1)

Comment 121-1

With regards to the potential impact of water quality (section 2.5.6).

If the wall of earth separating the river and the open pit collapses, the impact of the water quality would be devastating. CEMEX claims they would "monitor" this; there has been no money set aside to mitigate this).

This is totally unacceptable.

Response 121-1

See Collective Response #17 regarding river bank stability and the potential for breaching at the Quarry Site.

Letter #122 February 20, 2025, Brenda Markham (Letter #2)

Comment 122-1

According to CEMEX, There are two unavoidable impacts:

1) The pit itself (which in and of itself is destructive and not aesthetic at all!)

Response 122-1

The comment references Impacts 4.1-1 (see Draft EIR page 4.1-15) and 4.1-3 (see Draft EIR page 4.1-61). Mitigation Measure 4.1-1 (see Draft EIR page 4.1-61) is provided to reduce these impacts and represents the only feasible mitigation measure available to address the visual impact of the exposed quarry pit walls by reducing color contrast. This measure would be funded and implemented by CEMEX following completion of active mining in each phase. Although all available, feasible mitigation measures would be implemented, the impact remains significant and unavoidable because a significant change in the visual character of the Quarry Site from two viewpoints would remain. The comment is noted for the decision-makers. See also Collective Response #8 for further discussion of Mitigation Measure 4.1-1.

Comment 122-2

2) Traffic delays (due to increase in truck trips) both at Friant and Willow and Willow and Copper.

CEMEX apparently is not rectifying these impacts, namely because they don't have the funds! Again, totally unacceptable

Response 122-2

The comment references Impact 4.17-1 (see Draft EIR page 4.17-27). See Collective Response #29 regarding truck traffic increases anticipated under the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #123 February 20, 2025, Unnamed Resident

Comment 123-1

I would like to bring my concerns to the County of Fresno regarding the CEMEX Rockfield Quarry project. My concerns center around the following analyses:

1) Hydrology and Water Quality

2) Biological Resources

3) Land Use and Planning

Hydrology and Water Quality

The Draft EIR did not adequately analyze the Project's impact to the beneficial uses and water quality of the San Joaquin River. Specifically, I am concerned that the River Supply Channel's impact was not analyzed in this draft EIR. Excluding an analysis of River Supply Channel makes the draft EIR inadequate. I request that the Lead Agency conduct further analysis.

The River Supply Channel connects the Plant Site to the San Joaquin River (SJR) in two ways. According to the draft EIR, this Plant Site receives water from the San Joaquin River via a supply channel (see DEIR, Section 4.10.1.4 Current Operational Water Uses and Supplies - Plant Site Water Use and Supplies). However, this direct connection does not flow *from* the Plant Site, but rather *towards* the Plant Site. It can be presumed that the channel is sloped towards the Plant Site, though this is not explicitly stated. The second connection is the confluence/intersection of the supply channel and Little Dry Creek (about 0.3 miles west of the Plant site), where flows in Little Dry Creek (LDC) may transport water from the river supply channel to the SJR. The fact that Little Dry Creek intersects with the Supply Channel is not mentioned in the draft EIR at all. This confluence/intersection may not be a concern if the water quality of the River Supply Channel (RSC) is within acceptable levels, and if the Plant Site's discharges to the RSCl meet the requirements of the Industrial General Permit and any requirements from the California Department of Fish and Wildlife.

Unfortunately, the Draft EIR and its appendices do not discuss the water quality of the River Supply Channel.

The River Supply Channel may be a pollutant source that regularly contributes to the degradation of the San Joaquin River regardless of season, but the draft EIR does not discuss this or analyze this potential impact. Taking a look at available aerial imagery shows that the RSC's pond is often discolored (see Exhibit 1). According to these aerials, the discoloration extends 0.20 miles upstream, where the confluence of LDC and the RSC is located. Both images in Exhibit 1 show the discolored water commingling with LDC flows, and the image taken on June 23, 2023 shows LDC flowing through a discolored section, over a weir, and out towards the SJR. It could be argued that the weir prevents overflows for a certain rain event or flow rate, or that Best Management Practices are in place to prevent contaminants from entering the supply channel. However, the EIR does not even mention the potential for commingling at this location– let alone the impacts this commingling may have on the San Joaquin River.

There are multiple sources of flows in Little Dry Creek that may cause an overtop of the weir near the Plant Site. These sources include: (a) flows from Big Dry Creek Reservoir, (b) flows from the Clovis Recycled Water Plant, (c) potential flows from Millerton New Town, and (d) rain events (see Exhibit 2). This list may not include all sources, but this list does show that flows may occur in all seasons and are not storm dependent. For example, flows from the Clovis Recycled Water Plant may occur throughout the year, and flows from the Big Dry Creek Reservoir may occur whenever the Fresno Metropolitan Flood Control District must dewater the reservoir. The exhibit I have included shows flows occurring during the Winter *and* during the Summer, where the Summer flows are visibly overtopping the weir. Furthermore, it is likely that storm-related flows overtop the weir regularly, but aerials can't capture those events because of cloud cover during storm events. However, the Lead Agency may inspect the weir during storm events to confirm how frequent overtopping happens.

This may be a pre-existing issue as the Site's Industrial Stormwater Pollution Prevention Plan (SWPPP) does not include this commingling point as part of its Project Area. I don't know the reasoning behind not including this in the Plant Site's SWPPP. If there was no risk for contaminated flows to the SJR, then I would agree that it wouldn't be necessary to include the confluence of LDC and the RSC. But, I have explained possible sources and shown photo evidence of commingling of discolored water with Little Dry Creek's flows where the commingled flows enter the San Joaquin

River. It is a safe presumption that discoloration may indicate contamination/pollution. The SJR is unambiguously a Waters of the U.S., and the home of state and federally protected species.

I recommend that impacts 4.10-1 and 4.10-17 should be re-analyzed taking the River Supply Channel into consideration. Impact 4.10-1 analyzes whether the Project would violate surface water quality standards or Waste Discharge Requirements or otherwise substantially degrade surface water quality at the Plant Site or Quarry Site during Mining and Reclamation. My discussion shows that this impact was not adequately analyzed because the draft EIR excluded mention or discussion of the River Supply Channel's potential impact on the surface water quality of the San Joaquin River; which aerial photography shows there is a risk of this occurring [sic]. Impact 4.10-17 analyzes whether the Project would result in a release of pollutants in Flood Hazard, Tsunami, or Seiche. As mentioned previously, Little Dry Creek commingles with the supply channel and may regularly overtop its weir and carry any contaminants to the San Joaquin River. It can be presumed that a flood event would scale up this commingling, and the draft EIR inadequately discusses the risk of floods in regards to these commingling events.

An analysis of the supply channel's water quality and of the frequency of commingling events is necessary because this information is unknown. I am basing my critique of this project's EIR based on aerials showing discolored water in the supply channel. Aside from this discoloration, I personally do not have knowledge of the channel's water quality. However, I request that the applicant or Responsible Agency re-analyze the aforementioned impacts considering the information provided.

Response 123-1

The river supply channel (RSC), as referred to by this commenter, is called the river water delivery ditch in the Draft EIR (see Section 2.4.2.1, "Plant Site Existing Conditions," first paragraph and under the heading "Water Usage"). The RSC is an existing component of the Plant Site operations, and no changes are proposed as part of the project except that water use from the river through the ditch would decrease once the aggregate processing plant at the Quarry Site begins operation (see Draft EIR Section 2.5.2.1, "Plant Site Mine Plans," under the heading "Water Usage"). Therefore, since the proposed conditions with respect to the RSC are identical to the existing, baseline, conditions for the RSC, there are no potential impacts to the environment related to the RSC, in accordance with CEQA.

Furthermore, the water from the San Joaquin River flows by gravity through the RSC from the river to the Plant Site. There is currently no discharge of water from the Plant Site operations to the RSC and there is no proposed future discharge to the RSC as part of the project. Thus, the water quality within the RSC is essentially equivalent to the water quality within the river, which is reported in Table 4.10-3, "Plant Site Surface Water Quality Data," of the Draft EIR.

The aerial images provided as exhibits with this comment document existing conditions on lands that are not a part of the Plant Site. There would be no changes to the RSC as part of the proposed project. Therefore, as noted above, the project would not result in any changes to conditions along the RSC such that conditions under the project would be the same as existing, or baseline, conditions for the purposes of the CEQA analysis. As a result, no further analysis is warranted under CEQA.

Comment 123-2

Biological Resources

I will quickly mention that any potential water quality impacts may affect biological resources near the Project. I recommend that the following impacts are re-analyzed considering the newly identified confluence between the RSC and LDC:

a. Impact 4.4-2 - Adverse effect, directly or indirectly, on special status species in riparian habitat surrounding the plant Site during mining operations
   i. The Project may affect special status species in SJR by affecting Little Dry Creek's water quality. Little Dry Creek is an immediate tributary to the San Joaquin River, and the potential pollutant source, the Plant Site, is less than a mile from the San Joaquin River.
b. Impact 4.4-4 - Substantial adverse effect on any riparian habitat or other sensitive natural community
   i. See reasoning for Impact 4.4-2
c. Impact 4.4-5 - Impact on protected wetlands or water of the state.
   i. See reasoning for Impact 4.4-2
d. Impact 4.4-6 - Interfere with migratory fish
   i. See reasoning for Impact 4.4.-2. The following migratory species may be affected:
      1. Chinook Salmon
      2. Steelhead
      3. Pacific Lamprey

Response 123-2

It is assumed that by "RSC" the commenter refers to the "River Supply Ditch," the name given in the Draft EIR to the channel that supplies the Plant Site with water from the San Joaquin River, and by "LDC" the commenter refers to "Little Dry Creek." It is unclear which "newly identified confluence" between the River Supply Ditch and Little Dry Creek this comment refers to.

The project sites is already disturbed by ongoing mining activities and would not result in a significant increase in activity. The proposed project would not involve any new alterations to the River Supply Ditch. The River Supply Ditch has been routinely dredged to remove built up silts and to allow the ongoing functioning of the ditch (Draft EIR, page 4.4-7). Furthermore, all construction activities associated with the Plant Site would be separated from Little Dry Creek by more than 500 feet (Draft EIR, page 4.11-28). Potential for indirect impacts to Little Dry Creek due to dust and noise/vibration are addressed through Mitigation Measures 4.3-2 and 4.10-1, respectively (Draft EIR, page 4.11-30).

The Draft EIR (see Section 4.10, "Hydrology and Water Quality," and supporting technical appendices) provides a detailed analysis of hydrology and water quality at the project sites, including groundwater–surface water interactions (Section 4.10.1.9). While Little Dry Creek is a tributary to the San Joaquin River, the analysis concludes that the project would not result in significant off-site water quality impacts. Little Dry Creek does not support special-status fish species with respect to maintaining key aspects of their life histories. The analysis concludes that such impacts would not occur with implementation of the project.

In addition, flows in the San Joaquin River in the vicinity of the project are primarily regulated by releases from Millerton Reservoir, rather than local groundwater or precipitation, and aquatic habitat conditions are therefore largely influenced by regional water management factors.

Accordingly, the Draft EIR, as revised in this Final EIR, provides adequate analysis to determine that the project would not result in substantial impacts to the biological resources identified by the commenter. The commenter does not provide substantial evidence demonstrating that a significant adverse impact to these resources would occur.

Comment 123-3

Land Use and Planning

Finally, I'd like to raise my concern that the draft EIR did not explicitly determine the Project's impact on the San Joaquin River Parkway Master Plan. This issue may be an oversight as the Parkway

Master Plan was discussed in Section 4.11 - Land Use and Planning (see Page 4.11-44 regarding SJR Parkway Master Plan Goal, and see Page 4.11-47 regarding the SJR Parkway Policy). However, during the analysis of Impact 4.11-2, the SJR Parkway Master Plan was left out. As in, the draft EIR stated that the Project would have a less than significant impact on the Fresno County General Plan, the Madera County General Plan, the Fresno County Zoning Ordinance, and the Fresno County Surface Mining and Reclamation Ordinance. The draft EIR did not state what impact the Project would have on the San Joaquin River Parkway Master Plan. This concern could be easily addressed by having a discussion of the impacts to the SJRP Master Plan in the Final EIR.

My recommendation is that the Final EIR should explicitly determine the Project's impact on the San Joaquin River Parkway Master Plan, where the applicant and the Responsible Agency should discuss this issue with the San Joaquin River Conservancy and the San Joaquin River Parkway and Conservation Trust.

Response 123-3

Please see Collective Response #18 pertaining to the San Joaquin River Parkway Master Plan. The commenter's recommendations for Operator and agency coordination are noted.

Comment 123-4

Additionally, as a local resident, I encourage the Lead Agency to mediate a deal where the SJR Conservancy may provide public access along the San Joaquin River adjacent to the Plant Site and the Quarry Site in the near future (<5 years). A river-long trail could be world-class, and a valuable resource to Central Valley residents. It seems that it could be possible to connect the Pacific Crest Trail to the City of Fresno via a SJR-long trail.

Response 123-4

The commenter's recommendations and observations regarding public access to the San Joaquin River are noted. Please see Collective Response #22 pertaining to trail access and easement.

Comment 123-5

Listed Questions and/or Recommended Further Analysis and Discussion:

This section clearly lists the questions I would like answered, and the recommendations I made in my comment letter.

1. Recommendation: Clarify whether the River Supply Channel flows towards the Plant Site or towards the San Joaquin River?
2. Recommendation: Mention that Little Dry Creek intersects with the River Supply Channel.
3. Recommendation: Analyze the following:
   a. The flow rate/rain event in LDC's watershed required to overtop the aforementioned weir.
   b. An analysis of sources of flows within Little Dry Creek.
   c. Water quality analysis of Little Dry Creek upstream and downstream of the confluence point.
   d. Water quality analysis of the River Supply Channel.
4. Recommendation: Re-analyze the following impacts:
   a. Impact 4.10-1: Violate Surface Water Quality Standards or Waste Discharge…
      i. May potentially impact beneficial uses: SPWN, COLD, MIGR
   b. Impact 4.10-17: Release of Pollutants in Flood Hazard, Tsunami, or Seiche
      i. Pollutants may be carried to the San Joaquin River.
5. Recommendation: Require that the Site's Industrial SWPPP is updated to include this commingling point and to include sampling at this location. Additionally, BMPs should be implemented at this location. The RWQCB may have additional requirements.
6. Recommendation: Consult with the following agencies regarding potential contamination from the river supply channel:
   a. California Department of Fish and Wildlife (copied)
   b. Central Valley Regional Water Quality Control Board (Fresno office, copied)

Response 123-5

The River Supply Channel and Little Dry Creek have been present for many decades and are, therefore, part of the existing baseline conditions for the project. No changes are proposed with respect to the use or operation of the River Supply Channel or Little Dry Creek. Therefore, the project would not result in any potentially significant impacts related to the River Supply Channel or Little Dry Creek. Also see Response 6-35.

Comment 123-6

7. Re-analyze the following impacts:
   a. Impact 4.4-2
   b. Impact 4.4-4
   c. Impact 4.4-5
   d. Impact 4.4-6

Response 123-6

See Response 123-2 describing the Draft EIR analysis. The Draft EIR adequately analyzes the referenced impacts, and the commenter does not provide substantial evidence either of an analytical deficiency on any of the referenced impacts or that the conclusions in the Draft EIR are incorrect.

Comment 123-7

8. Recommendation: Explicitly state the Project's impact to the San Joaquin River Parkway Master Plan while analyzing Impact 4.11-2.

Thank you for your time and for accepting my comments to improve this Project's EIR.

[A graphic was included as part of Comment 123-7 that is not reproduced here. To view this graphic please see Letter 123 in Appendix M, "Draft EIR Comment Letters"]

Response 123-7

Please see Collective Response #18 and Response 11-16 regarding the project's consistency with the San Joaquin River Parkway Master Plan. The Draft EIR provides a consistency analysis with the San Joaquin River Parkway Master Plan on pages 4.11-44 through 4.11-47. See Chapter 3, "Draft EIR Errata," for revisions to this consistency analysis. As determined in the Draft EIR, and amplified by this Final EIR, the proposed project would be consistent with the applicable San Joaquin River Parkway Master Plan goals and policies.

Letter #124 February 21, 2025,Tom Bozzo

Comment 124-1

I have been a resident of Fresno since 1985, and live near Woodward Park. I am retired and walk along the San Joaquin River bluff and trails almost daily.

As an outdoor enthusiast, River access and restoration have been issues that I am sincerely interested in.

As such, I have completed a partial review of the Benchmark DEIR conducted relative to the CEMEX request to extend their CUP and dramatically alter the size and scale of their operations. I am deeply concerned that the scope of their request will have irreparable impacts on the well-being of the residents and wildlife in the region.

While the content of the Benchmark document may check the boxes required under CEQA, in my opinion there are numerous shortcomings in their review, and many liberties taken in their assumptions as to what impacts might be significant, and whether they might be mitigated.

With such a massive document, and short timeline for public review and comment, I've noted some concerns in several key areas, with questions below. They are not listed in any order of concern or importance. And there are other substantial issues that should be of concern, such as water, air quality, traffic, noise and more.

Response 124-1

The commenter's concerns and observations are noted for the record. The comment does not provide evidence of any deficiencies in the Draft EIR. Please see Collective Response #1 pertaining to public review and input opportunities. Please see below for responses to specific comments.

Comment 124-2

I've also done some comparisons with the existing Vulcan operations, as I'm certain that much of the general public is unaware of how the river bottom mining operations are being conducted. It would be unfortunate to have someone dismiss the importance of the CEMEX decision by simply thinking that Vulcan is already operating under similar constraints with their CUP.

Response 124-2

The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 124-3

CEMEX DEIR Review

Project need

- Recites need for 6 MT of aggregate for future growth.
- What is the regional supply of aggregate materials?
- Who can meet the area demand with available resources?
- What other sites in the area might be able to supply future demand?
- What percentage of local supply is provided by CEMEX?
- Does CEMEX export local materials out of the area?
- Are the employees at CEMEX able to continue at other locations? Other employers?
- Would the CEMEX plant expansion have an adverse effect on other local companies?

Response 124-3

Please see Collective Response #3 pertaining to regional aggregate availability and demand. The commenter's questions regarding alternative employment opportunities and effects on other local companies does not pertain to and/or do not provide explanation of the relevance to the adequacy of the Draft EIR, and no further response is warranted.

Please see Collective Response #3 regarding aggregate supply and demand in the Fresno region.

Comment 124-4

Community / Corporate cooperation

- CEMEX is currently encroaching on an existing Environmental Reserve, outside of their permit.

Response 124-4

Please see Collective Response #20 pertaining to the relationship between the project sites and the Willow Unit Ecological Reserve.

Comment 124-5

- Since 2000, CEMEX has been cited 667 times and fined $52.4 million for Environmental, safety & employment related offenses.
- Compared to Vulcan, cited 148 times and fined $4.8 million in the same categories listed above.
- CEMEX quarry site is 3 miles north of the San Joaquin River and the City of Fresno. But less than that if a direct line is extended to the north Fresno communities of Copper River.
- Vulcan Austin quarry site is 10 miles from the River and City of Fresno, and further than that to Madera.
- Vulcan mining operations at the Friant site have terminated and restoration is underway.
- What assurance do we have that CEMEX, a foreign corporation will have the resources and commitment to meet proposed restoration efforts at the end of the project?

Response 124-5

Please see Collective Response #4a pertaining to regulatory compliance history.

Comment 124-6

Geology / Hydrology / Biology

- Limited scope on the stability of the mining wall.
- Limited discussion on the potential issues of disturbing the underlying soil / rock stability with blasting and digging.

Response 124-6

Draft EIR Section 4.7, "Geology and Soils," discusses geological conditions and slope stability analyses performed for the proposed project (see Draft EIR Impacts 4.7-6 and 4.7-7 pertaining to slope stability and Mitigation Measures 4.7-6 and 4.7-7). See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.7. The comment does not address the adequacy of the slope stability analysis, and no further response is warranted.

Comment 124-7

- Limited discussion on the impact of operations on existing groundwater levels and domestic wells.

Response 124-7

Draft EIR Section 4.10, "Hydrology and Water Quality," provides detailed analyses of potential groundwater and water quality effects of the proposed project. The analyses are based on the Hydrology and Water Quality Analysis Report (Draft EIR Appendix G-5, "Hydrology and Water Quality Analysis Report") which utilizes information from groundwater conditions reports included as Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR and groundwater and surface water monitoring and sampling data collected for the project sites to draw conclusions on the existing groundwater hydrology conditions on the project sites and to evaluate the potential impacts to groundwater hydrology under the proposed project. Detailed methodology and findings are provided in Appendix G-5. As discussed, and presented in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10 and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111). These sections fully comply with CEQA and address with sufficient detail all concerns presented for the County decision-makers. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 124-8

- Restoration of the Chinook Salmon on the SJR. Would blasting and/or mining have any adverse effect on aquatic life? Anyone who has been around a fish aquarium knows what happens when you tap on the glass. I can't imagine how fish in the river would react to blasting sound and vibration.

Response 124-8

Please see the Draft EIR's discussion of blasting impacts to wildlife in Impact 4.4-6 on page 4.4-62. Blasting activities would be brief, with each blast lasting approximately one to two seconds, and would not result in significant impacts to wildlife (Draft EIR at page 4.4-53). The groundborne vibrations that would be generated by the project are not likely to result in adverse impacts to Chinook salmon. Please see Response 65-13 for further discussion of blasting impacts to Chinook salmon (Draft EIR page 4.4-63).

Comment 124-9

- Index recites old studies completed in Alaska that are unlike the River. What impact would blast pressure and vibration waves have at this specific site?

Response 124-9

See Responses 124-8 and 65-13, and Collective Response #16 regarding the usage and efficacy of Alaskan Blasting Standards for analyzing impacts to fish in the San Joaquin River. See Draft EIR Impact 4.4-4 for further discussion of potential blasting impacts upon riparian habitat and 4.4-6 for discussion of potential blasting impacts upon migratory fish or wildlife species movement.

The report referenced in this comment is applicable to the project sites. The Alaska report focused on damage thresholds to various types of fish as a result of blasting, and methods to prevent damage to fish as a result of blasting. The effect of blasting that is contemplated in the Alaska report is largely similar to that in the proposed project – that blasting creates a large amount of pressure at a localized area and that pressure radiates out through different mediums and the effects are felt at varying levels depending on the distance from the blast and the medium the vibrations travel through. Further, blasting activities would be brief, each lasting one to two seconds in duration, and are not expected to result in sustained or long-term impacts.

Comment 124-10

- Has CDFW and the USFW reviewed the proposal and shared their concerns?

Response 124-10

A list of state and federal agencies which provided comments on the Draft EIR is provided in Section 4.2, "Public Agencies Comments and Responses," Table 4-1, "Comment Letters," in Chapter 4, "Response to Comments," of this Final EIR. As listed there, the California Department of Fish and Wildlife (CDFW) submitted comments on the Draft EIR. The Draft EIR was provided to the U.S. Fish and Wildlife Service (USFWS), but no comments on the Draft EIR were submitted from USFWS. Federal agencies that commented on the Draft EIR include the United States Bureau of Reclamation (USBR) and National Marine Fisheries Service (NMFS), as listed in Table 4-1. All comment letters are provided in the EIR in their original form in Appendix M, "Draft EIR Comment Letters," where the comment letters are numbered in the upper right corner of the first page to correspond to the numbering used in Chapter 4.

Comment 124-11

The size and scale of the DEIR is daunting, to say the least. And the issues required to be addressed under CEQA are well outside the areas of expertise of the general public. I'm hopeful that the Planning Department and Board of Supervisors will be able to cast

serious doubt on whether this project is in the best interests of the local community.

Thanks for your time and consideration.

Response 124-11

See Collective Response #1 pertaining to review and input opportunities. The commenter's observations regarding the Draft EIR and the project are noted for consideration by County decision-makers.

Letter #125 February 21, 2025, Ronald Martin, Ph.D.

Comment 125-1

The EIR that the CEMEC Corporation submitted in pursuit of a permit for a century of gravel mining a few feet from from the San Joaquin River shows that their plan is a threat to our planet as it is asking for permitting for use of fossil-fueled trucks.

Response 125-1

The Quarry Site is 200 feet away from the San Joaquin River. The Draft EIR was prepared by an independent consultant on behalf of and under contract with Fresno County with input from CEMEX regarding operational details and studies provided by CEMEX. The technical studies submitted by CEMEX to support the Draft EIR were peer reviewed by various independent consultants also on behalf of and under contract with Fresno County.

Comment 125-2

Table 4.8-5 of the EIR, Applicability of Scoping Plan Climate Change Policies and Measures, refers to an executive order concerning heavy-duty trucks requiring that such trucks meet the Mobile Source Strategy for Cleaner Technology and Fuels. There are detailed requirements and timelines for classes of vehicles.

The CEMEX EIR simply states that none of this applies to them since their trucks are not heavy-duty trucks but heavy-heavy duty trucks.

A continuing CEMEX gravel operation would continue to be a cause of the release of green-house gasses that are warming our planet. And we don't want that.

We should plan for more responsible industry, without exceptions, for the sake of earth's habitability for grandchildren.

Response 125-2

The issue of climate change and greenhouse gas emissions is addressed in Draft EIR Section 4.8, "Greenhouse Gas Emissions," as updated in this Final EIR (see Appendix D-5, "Revisions to Section 4.8, Greenhouse Gas Emission,"), Table 4.8-5, "Applicability of Scoping Plan Climate Change Policies and Measures," provides an analysis of the applicability of climate change policies and measures under the state's cap and trade program to the proposed project. While these policies and measures were determined not to apply to the proposed project, other state and local climate change regulations do apply to the project as described throughout Draft EIR Section 4.8.2, "Regulatory Setting."

Comment 125-3

Rather, as CEMEX's permit to mine gravel runs out, let them wind down their San Joaquin River operation, move elsewhere if they choose, and free the mining area to become part of the River Parkway and Conservation Trust.

Response 125-3

See Collective Response #21 regarding the assertion that the project sites should be transitioned to publicly accessible parks.

Letter #126 February 21, 2025, Julie Olsen

Comment 126-1

I am a resident near clovis North and would be impacted by the proposed Cemex Rockfield Expansion. I am against this expansion due to increased noise, pollution and traffic congestion. What can I do to show my opposition?

Response 126-1

The issue of noise is addressed in Draft Section 4.13, "Noise." Pollution is a broad topic that is evaluated throughout the Draft EIR including in Section 4.3, "Air Quality" (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality," as updated in this Final EIR. The issue of traffic congestion is addressed in Draft EIR 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. The commenter's opposition is noted for the consideration of the decision-makers.

Letter #127 February 21, 2025, Gerald Vinnard

Comment 127-1

I write to submit comments on the Environmental Impact Report ("EIR:) for the Cemex proposal to mine gravel to a depth of 600

feet in the area between Friant Road and the San Joaquin River, and southeast of Lost Lake Park.

For many years, residents of our community have looked forward to the development of a recreational trail running continuously from the town of Friant along the San Joaquin River to Highway 99. Any such trail running south from Lost Lake Park would have to be located between the proposed quarry site and the San Joaquin River.

The EIR states that the mining activities will include blasting within the site at any time from 6:00 am to 7:00 pm. Anyone using a recreational trail adjacent to the quarry site will be exposed to these very loud, startling, unpleasant and unpredictable noises. This could be particularly problematic for anyone riding horses on a nearby trail, as the sudden noise could cause a horse to become uncontrollable and possibly "throw" a rider. Noises such as this are unacceptable in a recreational area. Mitigation of this problem could include limitations on the times blasting is permitted.

Response 127-1

Please see Collective Response #22 pertaining to dedication of trail easements along the San Joaquin River corridor at both the Plant Site and Quarry Site.

Comment 127-2

As the EIR acknowledges, corridors for the movement of wildlife are important. The banks of the San Joaquin River provide one such corridor. As relevant, that "corridor" includes the area downstream from Lost Lake Park between the proposed quarry site and the River. The EIR specifies a 200 foot wide setback between the proposed quarry site and the River, which would be the only possible location for the extension of a wildlife corridor south from Lost Lake Park. This is also the only feasible location for the extension of the contemplated recreational trail.

Response 127-2

The commenter refers to a condition of approval imposed on the Quarry Site by Conditional Use Permit No. 367 which states:

4. All extraction operations, including stockpiling, shall be set back a minimum of 200 feet from the existing San Joaquin River Channel. Riparian vegetation within 200 feet of said Channel shall not be disturbed.

The CUP does not more clearly define the limits of the river channel as it applies to this required setback. This condition applies specifically to extraction operations and stockpiling of mined materials and does not prohibit other uses within the 200-foot setback area, such as construction of a recreational trail, subject to applicable permits and approvals.

Comment 127-3

The EIR is vague as to exactly where the western edge of this 200 foot buffer will be located. Is the distance to be measured from the low or the high water shore of the River, of perhaps from an historic high water shore? If the low water shore is used, the trail could be flooded during periods of high water, rendering it unusable for either a wildlife corridor or a trail.

Response 127-3

The western perimeter of the Quarry Site is located 200 feet from the San Joaquin River (SJR). Per Fresno County General Plan Policy OS-E.14, the County requires a 200-foot-wide minimum wildlife corridor along particular stretches of the San Joaquin River (SJR). As noted in the General Plan, the exact locations for the corridors should be determined based on the results of biological evaluations of the SJR.

There is an existing minimum 200-foot buffer established at the Quarry Site (see Figure 2-8, "Proposed Quarry Site Mining Plan," within the Draft EIR), and this would not change and be maintained throughout the life of the project.

Comment 127-4

The EIR states that after mining activities cease, the quarry area will be left with a 100 foot deep pond having a surface 500 feet below the surrounding area. The water in the pond will be stagnant, with no inflow or outflow. This presents a number of problems, some of which are as follows:

- The pit will be an eyesore for users of the nearby recreational trail.
- The pit will be a safety hazard for wildlife and trail users.
- The pit will breed mosquitoes.
- The pit will produce unpleasant odors.
- Over time, trash and debris will accumulate in the pit, and will need to be removed.

Response 127-4

As described in the Quarry Site Groundwater Conditions Report, provided as Draft EIR Appendix G-4, "Groundwater Conditions at the Quarry Site," post reclamation, groundwater would flow through the reclaimed lake from the northeast to the southwest. In addition, the lake water would experience seasonal vertical movement or overturning (mixing of the water column) due to temperature stratification. This lateral groundwater movement and vertical movement of surface water would preclude stagnation in the reclaimed lake.

The potential effects of the project on the visual landscape of the project area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." Viewpoint location 1 provides a representational view from the river corridor just west of the Quarry Site. As shown on Draft EIR Figure 4.1-2, "Quarry Site Public Viewpoint—Location #1," the Quarry Site excavation would not be visible from this location and, as described in Draft EIR Table 4.1-3, "U.S. Bureau of Land Management Visual Project Impact Ratings at Nearby Viewpoints," the project is expected to have a beneficial impact to views at this location.

With regard to safety hazards associated with the Quarry Site excavation, the project would comply with SMARA and Fresno County requirements pertaining to pit safety and reclamation of the sites. CEQA focuses on a project's environmental impacts. Any risk of trespassing and related concerns unrelated to environmental impacts is outside the scope of the analysis required under CEQA. With regards to potential impacts to wildlife after the completion of mining and reclamation, please refer to Impact 4.4-3 beginning on page 4.4-53 of the Draft EIR. The Quarry Site would have fencing around the perimeter of the property, which would reduce potential impacts to non-avian animals (see Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," page 59).

Mosquito breeding habitat typically includes shallow pools of stagnant water with emergent vegetation in warm months. Following reclamation, the Quarry Site excavation would gradually fill to become a large, deep open-water lake (approximately 108 acres and up to 100 feet deep) with continual and seasonal water circulation. These conditions would not provide habitat favorable to mosquito breeding and an increase in mosquito populations would not be expected to occur as a result of the project.

With regard to potential production of unpleasant odors in the Quarry Site excavation, Draft EIR Impact 4.3-4 on pages 4.3-65 through 4.3-69 presents the assessment of potential odor impacts of the project including potential stagnation and odors under reclamation conditions. The evaluation based on substantial evidence discussed in the Draft EIR concludes that it is not anticipated that due to groundwater flow through the reclaimed

pond on the Plant Site the potential for odors due to stagnation would be minimized. As also discussed, the Quarry Site Groundwater Conditions Report (Draft EIR Appendix G-4, "Groundwater Conditions at the Quarry Site") indicates that groundwater would flow through the reclaimed lake from the northeast to the southwest and seasonal vertical movement of water due to temperature differences would preclude stagnation and, therefore, odors due to stagnation would not occur. The comment does not address the adequacy of these Draft EIR impact evaluations, and no further response is warranted.

The potential for trash or debris to accumulate in the Quarry Site excavation is not an environmental impact evaluated under CEQA. Post reclamation, the Quarry Site would be closed to the public and its perimeter fenced minimizing the potential for trash or debris to enter onto the site or into the excavation.

See Collective Response #27 regarding the project's potential operational effects on users of the nearby parks and trails. See also Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 127-5

Cemex should be required to dedicate an easement or grant for a trail on the proposed setback. Cemex should also be required to plant appropriate vegetation along the eastern side of the setback to screen trail users' views of the quarry.

Response 127-5

Please see Collective Response #22 pertaining to trail easement dedication. There are vegetated topsoil stockpiles along the western perimeter of the Quarry Site that would provide visual screening from the location of the proposed trail easement.

Comment 127-6

Other possible mitigation measures for these problems could include a cement lining and pump-driven circulation system for the water in the pond, a chain link fence surrounding the pond, and mosquito fish.

Response 127-6

As described in Response 127-4, post-reclamation, water in the reclaimed lake at the Quarry Site would not be stagnant. The commenter fails to provide sufficient evidence or reasoning that a significant impact related to stagnant water in the reclaimed lake would occur or that the proposed mitigation measures are warranted. The comment is noted for the consideration of County decision-makers.

Comment 127-7

permitted, Cemex should be required to provide appropriate financial assurances, such as a bond, for any mitigation measures that are required.

Thank you for considering these comments.

Response 127-7

Mitigation measures adopted for the project would be presented in a mitigation monitoring and reporting program (MMRP) that would provide for County oversight to ensure implementation of adopted mitigation measures. Additionally, the Operator is responsible for reclamation of the project sites in accordance with the approved Reclamation Plan. Both Fresno County and the state Surface Mining and Reclamation Act (SMARA) require that surface mining operators maintain a financial assurance mechanism payable to the SMARA lead agency (here, Fresno County) and to the State of California sufficient to accomplish reclamation as prescribed by the surface mining operation's approved reclamation plan, including conditions of approval and mitigation measures associated with reclamation. The Operator is required to annually prepare and submit for County review and approval a financial assurance cost estimate and evidence of a financial assurance mechanism in an amount at least equal to the cost estimate to ensure reclamation in accordance with the approved reclamation plan would be available in the event of the Operator's failure to reclaim the site in accordance with the approved reclamation plan.

Letter #128 February 22, 2025, Beth Arrindell

Comment 128-1

I am writing to formally submit my comments regarding the Draft Environmental Impact Report (EIR) for the proposed CEMEX Rockfield Quarry Modification Project. My children have participated in the San Joaquin River Parkway and Conservation Trust's River Camp programs, as campers and counselors. I am deeply concerned about the potential environmental and public health impacts this project may have on the **2500 children** who participate in the camp programs along the San Joaquin River each summer. The camp locations along the river are one to five miles from the planned CEMEX plant and quarry sites.

The Draft EIR acknowledges significant environmental impacts; however, I believe the proposed **mitigation measures are insufficient to protect the children, staff and volunteers in the River Camp programs.** Below, I outline key areas of concern and

offer recommendations for stronger, more effective mitigation strategies.

Response 128-1

The commenter's concerns regarding potential effects associated with camp programs along the San Joaquin River are noted. Please see below for responses to specific issues raised in the comment letter.

Comment 128-2

1. Water Quality and Safety Risks

The potential contamination of the San Joaquin River from mining operations poses a direct risk to children and adults who swim, canoe, and engage in other water-based activities. The Draft EIR states that blasting and excavation could introduce contaminants such as nitrates, heavy metals, and sediment into groundwater and surface water sources.

Recommended Mitigation Measures:

- Implement **independent, third-party water quality monitoring** with real-time data transparency, focusing on **nitrates, heavy metals, turbidity, and bacterial contaminants.**
- Require **double-lined retention ponds** with **leak detection systems** to prevent groundwater contamination.
- Mandate **advanced filtration systems** (e.g., activated carbon and biofiltration) to treat runoff before it reaches the San Joaquin River.
- Increase the **minimum buffer zone from 200 feet to at least 500 feet** to better prevent contamination risks to the river.
- Establish an **emergency response plan** for immediate action in the event of contamination.

Response 128-2

As discussed in the Draft EIR, the project is designed as a zero-discharge facility with respect to offsite discharges, and, therefore, the project does not discharge to the San Joaquin River; and there would be no impacts to surface water quality offsite (see Responses 6-15, 6-51, 6-55, 65-23 and 459-2.)

The Draft EIR did identify the potential for blasting to potentially affect groundwater quality during mining, and that potential impact is addressed in Mitigation Measure 4.10-1.

To provide additional detail, Mitigation Measure 4.10-1 is in place to provide measures to minimize the potential water quality impacts associated with blasting. In order to reduce the risk of release to groundwater and surface water, the practices and procedures would be implemented for all blasting associated with the project (see Final EIR Appendix H-9, "Blasting Protocols").

The Operator would continue to comply with local, state, and federal regulations regarding the protection of surface water and groundwater at the Plant Site and the Quarry Site. Pollution control programs include Storm Water Pollution Prevention Plan (SWPPP); Hazardous Materials Business Plan (HMBP); a Spill Prevention Control and Countermeasure Plan (SPCC); Employee Training; Record Keeping; Preventative Maintenance; and Best Management Practices as required by existing permits for the sites.

The comment's recommended additions to the groundwater water quality and safety risks are noted. In addition to the above, see Responses 6-75 and 493-3 (for the Quarry Site) and 6-72 (for the Plant Site), which provide for project sites groundwater well sampling protocols and measures. The Draft EIR analyses are adequate on groundwater quality, thus, adoption of the comment's recommended additions to the groundwater well sampling program is unnecessary (see *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 880).

Comment 128-3

2. Noise and Vibration from Blasting

Blasting operations could create loud noises and vibrations that may disturb campers, many of whom are young children. The Draft EIR does not provide strong enough measures to minimize this impact.

Recommended Mitigation Measures:

- Prohibit blasting during **peak camp hours (8:00 AM – 4:00 PM)** to avoid disturbing activities.
- Require the use of **blast mats** to absorb shockwaves and reduce noise levels.

- Install **real-time vibration monitoring** along the riverbank to assess the impact of seismic activity on nearby camp facilities.

- Establish a **notification system** so that River Camp staff receive advance warning before any blasting occurs.

Response 128-3

Draft EIR Impact 4.13-6 analyzes noise and vibration levels generated by blasting. This impact was identified as being potentially significant and Mitigation Measure 4.10-1, was developed to implement strict protocols for blasting at the site, including blast monitoring. As explained in Response 65-37, Mitigation Measures 4.7-6, 4.7-7a, and 4.10-1 adequately address the potential of pit failure and provides for ongoing slope stability analyses. Additionally, Mitigation Measure 4.10-1, which addresses potential impacts to the San Joaquin River embankment, requires continuous pre-blast and post-blast visual inspections of the portions of the San Joaquin River embankment that are located within 1,000 feet of each blast and depths less than 100 feet within the hard rock portion of the quarry pit. In the case of a potential effect, all blasting must cease until the County approves a Corrective Action Plan (see Draft EIR, pages 4.4-57 through 4.4-58; Mitigation Measure 4.10-1; and Appendix H-9, Section E, page 5). The Blasting Protocols also detail the requirements for complaint response procedures; record-keeping; and annual reporting of monitoring, complaints investigations, and corrective actions. Lastly, the Blasting Protocols would require the Operator of the Rockfield Quarry to develop an annual Blasting Plan that includes the proposed blasting designs for areas proposed for blasting each year. The blasting design must be supported by calculations that maintain blast-induced vibrations below the significance thresholds. The plan must be submitted to the County each year for review. Following implementation of the Blasting Protocol, the Draft EIR determined that blasting noise and vibration would be less than significant at nearby sensitive land uses, and no additional mitigation beyond that included in the "blasting protocol" would be warranted. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Since the Draft EIR already has Comment 60-15's recommended mitigation measures, the adoption of the commenter's recommended noise mitigation measures are unnecessary (see King & Gardiner Farms, LLC v. County of Kern (2020) 45 Cal.App.5th 814, 880).

Comment 128-4

3. Air Quality and Health Risks from Dust and Emissions

Mining activities will generate significant amounts of particulate matter (PM10, PM2.5) and diesel exhaust emissions, which could

negatively impact children's respiratory health. The EIR's mitigation measures do not go far enough to ensure safe air quality.

Recommended Mitigation Measures:

- Require **continuous air quality monitoring** at River Camp locations with **publicly available real-time data.**
- Implement **enhanced dust suppression** techniques, including water misting and chemical stabilizers.
- Mandate the use of **low-emission or electric-powered vehicles and equipment** to reduce diesel exhaust exposure.
- Create **vegetative buffer zones** using trees and shrubs to filter air pollutants.

Response 128-4

The comment is inaccurate. The Draft EIR shows that after mitigation, the project would generate particulate matter (PM_{10}, $PM_{2.5}$) and diesel exhaust emissions in amounts that are less than significant and would expose the public, including children and sensitive individuals, to amounts that produce no observable adverse health effects.

What constitutes an adverse health effect from air pollution is described by the American Thoracic Society in a white paper cited by the Office of Health Hazard Assessment (OEHHA) as the standard by which health risk assessment is performed in California. The white paper appears at Appendix D of the Air Quality and Climate Change Impact Assessment in Draft EIR Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment," as updated in the Final EIR as Appendix D-3.

Mitigation Measures 4.3-2a, 4.3-2b, and 4.3-4 are sufficient to reduce the potentially significant emissions to less than significant emissions that would have no observable adverse effect on the public. The measures comply with CEQA, which requires that significant impacts be mitigated to less than significant levels or the maximum amount feasible. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Technical Report* (Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Appendix D-4, "Revised Section 4.3, Air Quality," regarding revisions to the Draft EIR Section in accordance with the updated analysis.

CEQA Guidelines Section 15126.4(a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. When potential impacts are reduced to less than significant levels, additional mitigation measures are not required. Because the impacts to air quality mentioned above would be reduced to less than significant levels with the project's proposed mitigation measures, the additional mitigation measures requested in this comment would not be required.

Comment 128-5

4. Ecological Damage to River Habitat and Wildlife

The San Joaquin River is a critical habitat for many species, and degradation due to mining could disrupt biodiversity, impacting the hands-on environmental education provided by River Camp.

Recommended Mitigation Measures:

- Require a **comprehensive habitat restoration plan** that prioritizes native species and long-term ecological recovery.
- Expand **riparian habitat conservation areas** beyond the proposed buffer zones.
- Conduct **independent biological assessments** before and during mining operations to assess impacts on local wildlife populations.

Response 128-5

The Draft EIR discusses impacts to biological resources in Section 4.4, "Biological Resources," and provides a detailed analysis of the project's potential to affect biological resources using methodologies consistent with CEQA. The analysis did not determine that the project would result in significant impacts to biological resources.

The project sites are already disturbed by ongoing mining activities and would remain within existing boundaries. As such, impacts to riparian habitat adjacent to the San Joaquin River would be less than significant with implementation of Mitigation Measures 4.10-1, and 4.3-2b. For further discussion of potential impacts to adjacent habitats, please see Draft EIR Impact 4.4-4. See also Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections.

Regarding the proposed mitigation measures, each is addressed in turn. The commenter suggests implementation of a comprehensive habitat restoration plan; however, at the

completion of each mining phase, reclamation would occur at the Plant and Quarry sites in accordance with Fresno County and SMARA requirements. It is unclear what riparian habitat conservation areas the commenter is referring to. The Quarry Site would be required to maintain a 200-foot setback from the San Joaquin River in accordance with Fresno County policies, and due to the location of the existing quarry pit, it would not be feasible to increase this setback distance.

The proposed measure to conduct independent biological assessments before and during mining operations is not necessary, as it would not improve the analysis of impacts to wildlife currently provided in the Draft EIR, which already includes pre-construction surveys and mitigation measures for potentially affected species. CEQA does not require that all possible studies be conducted for the purpose of analyzing environmental impacts (Title 14 CCR Sections 15151, 15204(a)).

The commenter does not provide substantial evidence that the analysis is deficient or that impacts from the project, with mitigation, would be significant.

Comment 128-6

5. Increased Truck Traffic and Safety Risks

The projected increase in heavy truck traffic poses safety risks for families traveling to and from River Camp. The Draft EIR does not adequately address traffic mitigation near recreational areas.

Recommended Mitigation Measures:

- Implement **strict truck routing plans** that avoid high-use recreational areas during peak summer months.
- Require **additional pedestrian crossings and signage** near camp entrance points.
- Install **sound barriers along major truck routes** to minimize noise pollution affecting campers.

Response 128-6

The Draft EIR analyzes the project's potential traffic impacts in accordance with CEQA requirements. Draft EIR Figure 4.17-1, "Traffic Study Intersections and Project Trip Distribution Percentages," displays the project site's location in proximity to the selected intersections of the traffic impact analysis. The River Camp is located south of the Plant Site. The River Camp's entrance points are located between Traffic Study intersection 6 (Willow Ave. and Friant Road) and 7 (Copper Ave. and Friant Road) on Figure 4.17-1. According to Draft EIR Figure 4.17-1, 55 percent of the project's trip distribution would

occur between intersections 6 and 7. The commenter suggests implementation of truck routing plans to avoid recreational areas during summer months. The project would comply with the County's policies and regulations pertaining to truck routes and these policies allow truck traffic adjacent to recreational areas. Moreover, there is no indication of how signage and pedestrian crossings placed near camp entrances would mitigate potential traffic impacts along Friant Road.

The project's traffic noise impacts are discussed in Section 4.13, "Noise," of the Draft EIR. Please refer to Impact 4.13-1 for further discussion of the traffic noise analysis and study intersections. The Draft EIR concluded that the project's potential to generate substantial temporary or permanent increases in ambient noise due to project-generated traffic would be less than significant. Thus, the installation of sound barriers along truck routes would not be necessary here. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. Please see Collective Response #29 for further discussion of the traffic impacts analysis and traffic mitigation measures. See also Collective Response #30 for further discussion of road safety.

Comment 128-7

Conclusion

While the proposed mitigation measures in the Draft EIR acknowledge potential environmental impacts, they do not go far enough to **protect the health, safety, and experience of children at River Camp.** Without **stronger protections,** this project could significantly harm the San Joaquin River ecosystem and the quality of outdoor educational opportunities available to future generations. **Fresno County must require CEMEX to 1.) adopt more robust mitigation strategies, and 2.) describe how they (CEMEX) will fund them before approving any mining expansion near this sensitive area.**

I appreciate your consideration of these comments and respectfully request that they be addressed in the Final Environmental Impact Report.

Response 128-7

Please see responses above pertaining to the concerns and mitigation recommendations provided by the commenter. The commenter's concerns are noted and will be considered by County decision-makers.

Letter #129 February 22, 2025, Deanna Bailey

Comment 129-1

I am writing to object to the CEMEX blast mine proposal.

The current permit should not be extended or modified for the following reasons:

- Fresno and Madera counties do not need the aggregate. Our regional demand of 305 million tons for the next 50 years will be met by the 556 million tons of reserves already permitted at the Kings River and at Austin Quarry.

Response 129-1

See Collective Response #3 regarding available aggregate reserves in the region and the need for the proposed project.

Comment 129-2

- CEMEX has been fined more than $43 million for 81 environmental violations since 2000.

Response 129-2

See Collective Response #4a regarding CEMEX's regulatory compliance history.

Comment 129-3

- The draft EIR does not require CEMEX to have a reserve to pay for future damage, such as a breach between the mine and the river.

- No amount of money could compensate for the potential environmental damage.

Response 129-3

See Collective Response #4b regarding liability for unforeseen damages caused by the proposed project.

Comment 129-4

- CEMEX has no plans to rectify the unavoidable impact to traffic on Friant Road.

Response 129-4

The comment refers to Impact 4.17-1 (see Draft EIR page 4.17-27) which was determined to be significant and unavoidable. The Draft EIR presents a series of mitigation measures

to address the impacted intersections identified in the Traffic Impact Study (see Draft EIR Appendix I-1, "Traffic Impact Study"). Each measure requires CEMEX to contribute an equitable share of the cost to construct the improvement(s) needed to address cumulative traffic increases at the identified intersections. However, as discussed in greater detail in Draft EIR Section 5.3.17, "Transportation," beginning on page 5-28, the timing of construction of these improvements is not certain and may occur after project implementation. Therefore, the impact was determined to be significant and unavoidable. Regardless, with implementation of Mitigation Measures 4.17-1a through 4.17-1r, CEMEX would pay the project's equitable share of the cost to construct the identified improvements. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 129-5

- The visual blight on the landscape has encroached on an adjacent state ecological preserve.

Response 129-5

See Collective Response #20 regarding the assertion that the project encroaches on an ecological preserve.

Comment 129-6

- The constant dynamiting is not compatible with fish and wildlife or humans living near the site!

Response 129-6

The project's potential noise and vibration effects on humans are discussed in Draft EIR Section 4.13, "Noise," while potential noise and vibration effects on fish and wildlife are discussed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response. See also Collective Response #13 regarding potential effects on wildlife located on properties surrounding the project sites and Collective Response #16 regarding vibration effects on salmon.

Comment 129-7

Please do not extend the current permit and reject the proposal to modify the permit!

Response 129-7

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #130 February 22, 2025, Unnamed Resident (Local Water Keeper)

Comment 130-1

I'd like to add the included exhibit as part of my original comment. My concerns with the project's water quality impacts still stand. Specifically, that the draft EIR did not address the comingling of the River Supply Channel and Little Dry Creek. This was not discussed at all. The draft EIR is inadequate because it does not analyze the impact of the river supply channel to Little Dry Creek, a tributary to the San Joaquin River. Specifically, the Plant Site's supply pond appears discolored in multiple aerials, and full of sediment in the most recent aerial (see attached image). **The public cannot get a full picture of the CEMEX project's impacts to the environment without this analysis/discussion.** See my original letter for recommendations to improve the EIR's analysis.

Response 130-1

The commenter's request to include the additionally provided exhibit(s) is noted and the exhibits are included with the commenter's submittal in their original form as Letter #130 in Appendix M, "Draft EIR Comment Letters." Please see Responses to Comment Letter 123 (the commenter's February 20, 2025, comment letter) which have been prepared in consideration of the additional exhibit and comments in the commenter's February 22, 2025, comment letter.

Comment 130-2

Included is an aerial taken on February 9, 2025 showing the Plant Site, the River Supply Channel, and the San Joaquin River. This aerial matches the aerials included in my original comment letter (which will be included with this smaller letter). Note the heavy brown discoloration of the River Supply Channel (RSC) as it crosses Little Dry Creek (LDC). From what I gather from the EIR, the RSC flows towards the Plant Site, not towards the San Joaquin River (SJR). However, my original comment letter shows that the RSC's discoloration usually extends upstream, over LDC. The discoloration may not reach the SJR, but LDC may have flows that commingle with the RSC's discolored water, consequently allowing a mixture of RSC and LDC water to flow to the SJR, less than a mile away. The attached aerial shows brown discolored water suggesting heavy sedimentation in the water. The aerial was taken 3-4 days before a large storm that produced over an 1.0" of rain at the Fresno Airport rain gauge (see attached). It is safe to presume that the rain storm produced enough flows in LDC to carry polluted water from the RSC over the nearby weir to the SJR.

Response 130-2

See Responses 6-35 and 123-5. The river supply channel has been present for many decades and is, therefore, part of the existing baseline conditions for the project. No changes are proposed with respect to the use or operation of the river supply channel. Therefore, the project would not result in any potentially significant impacts related to the river supply channel.

Comment 130-3

The EIR leaves questions unanswered (un-mentioned, to be frank) regarding the impact of this comingling to the SJR:

- What's the water quality of the RSC usually?
- What is the water quality of the RSC when it is discolored as shown in the aerials?
- How often does LDC commingle with RSC water?
- How often does LDC + RSC commingle water flow over the nearby weir (aerials show overflows during the summer)?
- What is the water quality impact to the SJR during the weir overflow?
- Why isn't the supply pond and channel included in the Project boundary in the EIR, or the Plant Site's SWPPP?
- Why doesn't CEMEX regularly sample the water quality in the River Supply Channel as part of their SWPPP requirements?
- What is the impact of this comingling to biological resources in the SJR?

Response 130-3

The river supply channel (RSC), as referred to by this commenter, is called the river water delivery ditch in the Draft EIR (see Section 2.4.2.1, "Plant Site Existing Conditions," first paragraph and under the heading "Water Usage"). The RSC is an existing component of the Plant Site operations, and no changes are proposed as part of the project except that water use from the river through the ditch would decrease once the aggregate processing plant at the Quarry Site begins operation (see Draft EIR Section 2.5.2.1, "Plant Site Mine Plans," under the heading "Water Usage"). Therefore, since the proposed conditions with respect to the RSC are identical to the existing baseline conditions for the RSC, there are no potential impacts to the environment related to the RSC, in accordance with CEQA.

The nature of an almost 80-year-old Holding Contract and the status of water rights are not environmental impacts that are addressed under CEQA.

Furthermore, the water from the San Joaquin River flows by gravity through the RSC from the river to the Plant Site. There is currently no discharge of water from the Plant Site operations to the RSC and there is no proposed future discharge to the RSC as part of the project. Thus, the water quality within the RSC is essentially equivalent to the water quality within the river, which is reported in Table 4.10-3, "Plant Site Surface Water Quality Data," of the Draft EIR.

The aerial images provided as exhibits with this comment document existing conditions on lands that are not a part of the Plant Site. There would be no changes to the RSC as part of the proposed project. Therefore, as noted above, the project would not result in any changes to conditions along the RSC such that conditions under the project would be the same as existing, or baseline, conditions for the purposes of the CEQA analysis. As a result, no further analysis is warranted under CEQA.

Comment 130-4

Please see my original comment letter for recommendations to improve the EIR's analyses and to provide the public with a full picture of the project's environmental impacts.

Response 130-4

Please see Responses to Letter 123 for responses to the commenter's *original* (February 20, 2025) comment letter.

Letter #131 February 23, 2025, T Cassidy

Comment 131-1

The EIR that the CEMEC Corporation submitted in pursuit of a permit for a century of gravel mining a few feet from from the San Joaquin River shows that their plan is a threat to our planet as it is asking for permitting for use of fossil-fueled trucks.

Table 4.8-5 of the EIR, Applicability of Scoping Plan Climate Change Policies and Measures, refers to an executive order concerning heavy-duty trucks requiring that such trucks meet the Mobile Source Strategy for Cleaner Technology and Fuels. There are detailed requirements and timelines for classes of vehicles. The CEMEX EIR simply states that none of this applies to them since their trucks are not heavy-duty trucks but heavy-heavy duty trucks. Continuing the CEMEX gravel operation would be a long-term source of release of green-house gasses that are warming our planet.

Response 131-1

Draft EIR Table 4.8-5, "Applicability of Scoping Plan Climate Change Policies and Measures," provides a summary of the climate change programs, policies and measures discussed in the California Air Resource Board's (CARB's) Scoping Plan, as required by Assembly Bill 32. As presented in Table 4.8-5, the Scoping Plan's recommended action of implementing Mobile Source Strategy (Cleaner Technology and Fuels) Phase 1 regulations are not applicable to heavy-heavy duty vehicles.

Additionally, see Response 12-40, which describes how the GHG technical analysis was reviewed and the analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The new analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions."

The maximum annual increase in emissions relative to baseline conditions were estimated for the proposed project and can be found in Appendix D-5, Table 4.8-9, "Proposed Project GHG Emissions Including Cap-and-Trade Program Sources," which shows the proposed project does not exceed the 10,000 MT CO_2e significance threshold for GHG emissions. Therefore, impacts related to generating GHG emissions would be less than significant and no additional analysis is required.

Comment 131-2

Additionally

4.3.1.2 Pollutants and Health Effects

4.3.1.3 Toxic Air Contaminants

Toxic air contaminants can cause long-term health effects such as cancer, birth defects, neurological damage, asthma, bronchitis or genetic damage; or short- term acute effects, such as eye watering, respiratory irritation (a cough), running nose, throat pain, and headaches. For evaluation purposes, toxic air contaminants are separated into carcinogens and non-carcinogens based on the nature of the physiological effects associated with exposure to the pollutant.

Carcinogens are assumed to have no safe threshold below which health impacts would not occur, and cancer risk is expressed as excess cancer cases per one million exposed individuals, typically over a lifetime of exposure. Non- carcinogenic substances differ

in they are generally assumed to feature a safe level of exposure below which no negative health impact is believed to occur.

These levels are determined on a pollutant-by-pollutant basis. Acute and chronic exposure to non-carcinogens is expressed as a Hazard Index, which is the ratio of expected exposure levels to an acceptable reference exposure levels.

Response 131-2

In response to air comments on the Draft EIR, the HRA was updated in the A*ir Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3). This updated analysis includes cancer burden modeling and confirms that there are no new impacts and no changes to the conclusions presented in the Draft EIR.

Additionally, Draft EIR Section 4.3, "Air Quality," has been updated in the Final EIR as Appendix D-4, "Revised Section 4.3, Air Quality." The updated HRA quantified the effects of toxic air contaminants on sensitive receptors, which were determined to be less than significant before and after mitigation. See Impact 4.3-3 in Section 4.3.4, "Project Impacts and Mitigation Measures," of Appendix D-4. Additionally, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," of Appendix D-4, demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted. For these reasons, the Draft EIR analysis of PM_{10} and $PM_{2.5}$ impacts was sufficient and supports the finding of less than significant health impacts. See Chapter 3, "Draft EIR Errata." See also Collective Response #11 regarding the analysis of the population-wide cancer burden for the project.

Comment 131-3

We should plan for more responsible industry, for the sake of earth's habitability for future generations, without exceptions. Rather, as CEMEX's permit to mine gravel runs out, let them wind down their San Joaquin River operation, move elsewhere if they choose, and free the mining area to become part of the River Parkway and Conservation Trust.

Response 131-3

The commenter's preferences and requests are noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Letter #132 February 23, 2025, Ron Cortopassi

Comment 132-1

I live at Copper River Ranch and am concerned about the extension and expansion of the Cemex operation along the San Joaquin River.

My concerns are as follows:

a. The environmental impact on the ecosystem and biodiversity of the river bottom. I have had firsthand experience of surface mining and drilling in Rangley, Colorado. Its effects on deer migrations and diminished wildlife populations was significant. With the continued development of open space it is more important than ever that we preserve those ecosystems that provide habitat for wildlife and also recreational space for citizens to enjoy. The San Joaquin River is a precious resource that is unique and valuable. We have already managed to destroy the river's natural migrations of salmon and steel head, let us not further damage this precious place.

Response 132-1

The project's potential impacts to biological resources are addressed in Draft EIR Section 4.4, "Biological Resources." Each of the impacts identified in Section 4.4 were determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4. See Collective Response #12 regarding river and salmon restoration projects in the region.

Comment 132-2

b. Other than to advance the business and profit incentives of rock removal from this area, there is no lack of available rock for construction and other commercial ventures. Therefore, I can see no justification for continuing to damage and desecrate this unique ecological place.

Response 132-2

See Collective Response #3 regarding available aggregate reserves in the region and the need for the proposed project.

Comment 132-3

c. The Central San Joaquin Valley already has some of the worst air quality in the United States. The incident of asthma, COPD and other respiratory disease plages our city and county. How can we continue to justify rock removal and the generation of air particulates when this is purely a business venture with no need for additional product (gravel, rock, etc).

Response 132-3

The project's potential impact on air quality is discussed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," and Appendix D-4, "Revised Section 4.3, Air Quality," for a health risk assessment of the project. See also Collective Response #9 regarding the project's potential impact to the region's existing air quality.

Comment 132-4

d. Noise pollution, traffic congestion and danger to cyclist who use Friant, Copper and Willow for recreation and/or travel to and from school or work.

Response 132-4

The issue of noise pollution is addressed in Draft EIR Section 4.13, "Noise." The issues of traffic congestion and cyclist/pedestrian safety are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. See also Collective Response #29 regarding the truck traffic increases anticipated under the proposed project and Collective Response #30 regarding cyclist and pedestrian safety. The comment is noted for the consideration of the decision-makers.

Comment 132-5

e. The impact of explosives being used at the excavation site and its close proximity to homes.

Response 132-5

The potential effects of the proposed blasting operations are evaluated throughout the Draft EIR. See Section 4.9, "Hazards and Hazardous Materials," and Section 4.13, "Noise." See also Draft EIR pages 2-42 and 2-43 for a summary of the proposed blasting operations. Blasting would be performed by a California licensed blasting contractor. The blast design would change based on the distance between the planned blasting location and the nearest sensitive receptors. Modifications could include reducing the amount of explosives used or changing the diameter of the bole holes. Sensitive receptors identified near the project sites are described in Draft EIR Section 4.13.1.2, "Sensitive Receptors in the Project Vicinity," and shown in Figure 4.13-1, "Nearest Sensitive Receptors to Plant Site," and Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site." See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 132-6

f. The effects on our home values and quality of life with the environmental impact of this project (noise pollution, traffic congestion, dangers of rocks harming cars and people, and air pollution secondary to excavation and truck emissions.

Response 132-6

See Collective Response #7 regarding evaluation of the project's economic effects and Collective Response #6 regarding operational nuisances frequently attributed to mining operations. The comment is noted for the consideration of the decision-makers.

Comment 132-7

g. How can anyone forsee the environmental consequences of granting Cemex a 100 year extension on their operations. Especially with a project that does not serve the population at large.

Response 132-7

See Collective Response #5 regarding the proposed duration of the use permit.

Comment 132-8

I hope you will give serious consideration to these issues those expressed by others and reject Cemex's proposal.

Response 132-8

The comment is noted for the consideration of the decision-makers.

Letter #133 February 23, 2025, Amanda Joy

Comment 133-1

NO THANK YOU! Explosive mining near town, near waterways, near a dam, with our hot, dry summer heat and already high fire risk???!!! Are you kidding me?! Is our city's safety for sale? Please put people over profit.

Response 133-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Hazards associated with the use of explosives on the project sites are evaluated primarily in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The issue of wildfire is also discussed in Draft EIR Section 4.20, "Wildfire." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. The comment is noted for the consideration of the decision-makers.

Letter #134 February, 23, 2025, Georgia Murach

Comment 134-1

I'm trying very hard to control my anger with the Board of Supervisors for even allowing this project to go forward!

What price can there be on our neglected San Joaquin River? This river should be a crowning jewel for a park system itself, instead it faces a 600 foot deep mining pit!

Rockfield Quarry Modification, AKA Cemex, is the culprit.

Response 134-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #21 regarding the request that the project sites should be transitioned to publicly accessible parks.

Comment 134-2

For my part, I would like to know if the Cemex's 2024 EIR correlates the increases in ozone and fine particulates that impact human health. We often seem to have the worst air quality in the nation and this is a serious concern for me.

Response 134-2

The project's potential air quality impacts are addressed in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR. See Impact 4.3-2 for a discussion of the project's estimated emissions of ozone precursors and fine particulate matter ($PM_{2.5}$). See Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," and Appendix D-4, "Revised Section 4.3, Air Quality," regarding the project's potential impacts on ozone and fine particulate emissions. See also Collective Response #9 regarding the project's potential effects on the region's existing air quality. The comment is noted for the consideration of the decision-makers.

Letter #135 February 23, 2025, Louise Richardson

Comment 135-1

Please deny CEMEX'S application to modify an existing use permit that allows hard-rock mining within the boundaries of the San Joaquin River Parkway.

Heavy trucking of megatons of aggregate will further ruin Friant Road and add countless traffic jams at the Friant Road and Audubon Drive intersection and at the Friant Road and Champlain intersection.

Please deny this application, also known as the Rockfield Quarry Modification Project.

Thank you for your time and consideration.

Response 135-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #29 regarding the truck traffic increases anticipated under the proposed project, required roadway improvements, and funding for roadway maintenance.

Letter #136 February 23, 2025, Cheryl and Ralph Waterhouse

Comment 136-1

NO on the proposal to modify Cemex Permit

Please vote NO on this proposal to expand the Cemex operation. This corporation is located too close to a large populated area and would destroy important habitat.

Response 136-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4.

Letter #137 February 24, 2025, Suzanne Abrams

Comment 137-1

Please use your decision-making power to STOP CEMEX's proposed blasting and drilling of a 600-foot-deep pit near the San Joaquin River to supply aggregate for future area construction.

Please take note that:

- The pit would, be a huge eyesore on this currently beautiful landscape.

Response 137-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential aesthetic impacts are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." Mitigation Measure 4.1-1 is provided to reduce the project's visual effects; however, both Impact 4.1-1 and 4.1-3 were determined

to be significant and unavoidable. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.1 and Mitigation Measure 4.1-1.

Comment 137-2

- Trucks connected with the project would cause ongoing traffic delays at two nearby intersections.

Response 137-2

See Collective Response #29 regarding truck traffic increases anticipated under the proposed project.

Comment 137-3

- Statistics noted in The Fresno Bee on Feb. 16, 2025 indicate that the need for this project is in serious question. CA state geologists have reported that other sources already can supply nearly double the area's projected demand for aggregate over the next 50 years. (See "Aggregate Sustainability in California," updated in 2018 by the California Geological Survey.) What's the reasoning here?

Response 137-3

See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Comment 137-4

- CEMEX has 81 separate environmental violations since 2000, according to the same issue of *The Fresno Bee.* With their record, is there reason to trust that CEMEX would observe environmental rules?

Response 137-4

See Collective Response #4a regarding CEMEX's regulatory compliance history.

Comment 137-5

Please note that the draft agreement doesn't require that CEMEX put money aside to pay for potential environmental damage by this project.

Response 137-5

See Collective Response #4b regarding liability for unforeseen damages caused by the proposed project.

Comment 137-6

In my view, all of this adds up to the need to STOP CEMEX. We do not need this project.

Please do not allow CEMEX to impose its negative effects on our community!

Response 137-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #138 February 24, 2025, Catherine Farinelli

Comment 138-1

I am a resident of the Woodward Lake community.

I am opposed to the Cemex open pit mine expansion project.

We need to preserve the environment especially in these delicate times.

Not only would it harmful to the environment but would also cause unnecessary hardship to the surrounding communities which have expanded immensely in the last 2 decades.

I feel they should stop or take their business elsewhere. Thank you

Response 138-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The potential environmental effects of the proposed project are evaluated throughout the Draft EIR. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Letter #139 February 25, 2025, Nancy Gilmore

Comment 139-1

I am submitting comments on the Draft Environmental Impact Report (EIR) for the CEMEX Rockfield Quarry Proposed Expansion. As a Fresno County resident for over 40 years, a Board Member of the Fresno Audubon Society, and someone with academic and professional expertise in Biology and Engineering holding a B.S. in Mechanical Engineering and undergraduate studies in Biology from Cal Poly, San Luis Obispo, I have serious concerns regarding the report's treatment of air quality and impacts on migratory and special-

status birds. Additionally, as someone who suffers from asthma, I am particularly concerned about how this project will exacerbate air quality issues in an already compromised region.

Response 139-1

The commenter's background and concerns are noted and will be considered by County decision-makers. The project's impacts on air quality are addressed in Section 4.3.4, "Project Impacts and Mitigation Measures," of Draft EIR Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality," for revisions to Draft EIR Section 4.3 and supporting appendices. Please see Responses 139-2 through 139-6 for further discussion of the commenter's specific concerns.

Comment 139-2

Air Quality Impacts

While the EIR proposes mitigation measures such as a Fugitive Dust Control Plan (Mitigation Measure 4.3-2), **it does not sufficiently evaluate the long-term cumulative effects of continuous quarry operations.**

Health Risks: The San Joaquin Valley has high asthma rates, and fine particulate pollution worsens respiratory conditions. The EIR does not provide a clear plan for monitoring long-term air quality impacts.

Cumulative Emissions: The report does not adequately consider the combined effect of quarry emissions alongside other industrial and agricultural pollutants in the region.

Ongoing Operations: While construction-related emissions are discussed, the impact of continuous dust and emissions over a 100-year period remains largely unaddressed.

Response 139-2

Contrary to the assertion in the comment, the Draft EIR evaluates long-term cumulative effects including health risks associated with ongoing operations by including a human health risk assessment (HRA) consistent with the state guidelines (OEHHA 2015). The cumulative nature of thresholds used in each air quality impact determined in the Draft EIR is discussed below.

- Impact 4.3-1 describes how the project would be consistent with applicable air quality plans. Addressing cumulative air quality conditions is the primary role of

air quality plans and thus consistency with air quality plans is a cumulative analysis.

- Impact 4.3-2 is discussed in Section 7.14 of the GAMAQI (SJVAPCD, 2015) which describes the thresholds as levels that would "Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant."
- Impact 4.3-3 is discussed in Section 8.5.2 of the GAMAQI, which describes how health risk assessment thresholds that were used to evaluate Impact 4.3-3 are meant to exclude background levels from their application. As such, these levels are the amounts that are cumulatively considerable.
- Impact 4.3-4 involves odor. If it would be the case that other odorous sources around the project exist, then cumulative odor may need to be assessed but that is not the circumstance in this case.

CEQA requires cumulative analysis where emissions from other past, present, and foreseeable future projects (and locations) are added to, or in this case, subtracted from, the project impact. However, as demonstrated above, the thresholds of significance used in the Draft EIR account for cumulative effects. The HRA determined that the impacts associated with long-term health risks would be less than significant after mitigation. Therefore, no change to the HRA is warranted to account for cumulative or operation related emissions previously addressed.

Nevertheless, in response to air comments on the Draft EIR, the HRA was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Technical Report*, (Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment") including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Appendix D-4, "Revised Section 4.3, Air Quality,"

Comment 139-3

Impacts on Birds & Migration

The EIR focuses on nesting birds but **fails to account for migratory species and special-status birds, particularly the Tricolored Blackbird (Agelaius tricolor).**

Tricolored Blackbird Concerns: This species, listed as threatened under the California Endangered Species Act since 2019, has been well documented in Fresno County. Given its colonial nesting habits in agricultural and disturbed landscapes, the expansion could disrupt critical habitat.

Response 139-3

The Draft EIR discusses the tricolored blackbird on page 4.4-36. There are no known occurrences of tricolored blackbird within the immediate vicinity of the project sites according to the California Natural Diversity Database (CNDDB). Both the Quarry and Plant Sites are already disturbed by decades of ongoing mining activities and do not provide suitable habitat for the tricolored blackbird. As such, the project would not significantly impact the tricolored blackbird. Please also see Response 58-37 for further discussion of potential impacts to the tricolored blackbird.

Neither the Plant Site nor the Quarry Site is located within federally designated Critical Habitat (Draft EIR, page 4.4-37).

Noise, dust, and similar mining-related disturbances have existed for decades at the project sites due to ongoing mining operations. Because the existing mine has operated in this location for many decades, natural nesting or foraging substrates are largely absent within the project area, and the area is unlikely to support nesting or non-nesting use by birds.

For further discussion of the project's potential impacts to migratory fish or wildlife species movement, corridors, or nursery sites, please refer to Impact 4.4-6 of the Draft EIR. See also Collective Response #15 regarding potential impacts to birds aside from those associated with nesting.

Comment 139-4

Dust & Noise Impact: Airborne dust settling on foraging areas and increased noise from operations may affect feeding and breeding success.

Response 139-4

Please see Responses 58-38, 58-40, and 58-41 regarding potential effects of fugitive dust emissions on plants and wildlife. Mitigation Measures 4.3-2a and 4.3-2b would require the implementation of the Fugitive Dust Control Plan, which would help reduce the potential impacts raised in the comment. CEQA does not require that all possible studies be conducted for the purpose of analyzing environmental impacts. (Title 14 CCR Sections 15151, 15204(a).)

Comment 139-5

Lack of Seasonal Study: The EIR does not sufficiently analyze how quarry activities could disrupt non-nesting birds during migration or other non-nesting periods.

Response 139-5

The proposed project would not significantly impact wildlife, including non-nesting and migratory birds, during mining operations at the Quarry Site (Draft EIR Impact 4.4-2). See Response 58-48 for further discussion of Draft EIR Impact 4.4-2.

For further discussion of the project's potential impacts to migratory fish or wildlife species movement, corridors, or nursery sites, please refer to Impact 4.4-6 of the Draft EIR. Please also refer to the Draft EIR's discussion of Impact 4.4-4, which concludes that the project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community with the implementation of Mitigation Measures 4.10-1, 4.3-2a, -2b, and -2c (Draft EIR page 4.4-55 through 4.4-58).

Comment 139-6

This project has the potential for significant environmental and public health consequences. A much more thorough review is necessary to ensure that these impacts are fully understood and effectively mitigated.

Thank you for your time and consideration.

Response 139-6

The commenter's concerns are noted and will be considered by County decision-makers. The Draft EIR provided a sufficiently detailed analysis of potential environmental impacts, in accordance with CEQA.

Letter #140 February 24, 2025, Lynn Gorman

Comment 140-1

Re: the CEMEX Rockfield Quarry Modification Project DEIR, I would like to convey my opposition to the project, as the location is wrong for a hard rock project. The San Joaquin River corridor below Friant Dam was designated as a Mineral Resource Zone because of its' alluvial aggregate, not hard rock, resources. Those aggregates are near exhaustion, as has been recognized and planned for decades. The Counties of Fresno and Madera, the City of Fresno, the State, and the community at large have all recognized this, and planning and community expectations have shifted from resource extraction to residential development and open space uses.

Response 140-1

Mineral Resource Zone designations are based on the likelihood for significant mineral deposits to occur in an area and are intended to broadly support county land use planning. However, the actual presence and significance of mineral deposits must be determined through site-specific investigations. Therefore, the particular MRZ designation for an individual site, or the absence of these designations in an area, does not preclude the use of a site for mineral resource extraction. As discussed at the bottom of Draft EIR page 4.7-16, the majority of the Plant Site is designated by the state as MRZ-1 (areas where adequate information indicates no significant mineral resources are present). However, Operator borings of the Plant Site indicate that, although much of the site has been mined and backfilled to depths of between 5 and 32 feet bgs, there are recoverable sand and gravel resources to a depth of about 85 feet bgs. Furthermore, the proposed use is permitted by the current general plan land use designation and zoning classification for the project sites. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 140-2

The San Joaquin River Parkway and Conservation Trust, a local organization with widespread support, is an outgrowth of this long-anticipated phasing out of sand and gravel extraction on the San Joaquin River and the urgent need for local parks. This local commitment was recognized and supported by the State when it formed the San Joaquin River Conservancy to insure acquisition of these lands for ultimate public access and open space use. The Central San Joaquin Valley has the distinction of having fewer State parks than any other region, and Fresno, the 5th largest city in the State, has some of the lowest amount of open space per capita. The San Joaquin River represents a unique opportunity to correct this deficiency with a continuous and uninterrupted Parkway, a goal that many, including myself, have been working toward for decades. This project is entirely inconsistent with that goal.

Response 140-2

See Collective Response #21 regarding the assertion that the project sites should be transitioned to publicly accessible parks. The comment is noted for the consideration of the decision-makers.

Comment 140-3

Naturally-occuring aggregates are limited to current and historic river channels, which is the only reason why the MRZ designation was made on the San Joaquin River, but the hard rock of the Sierra makes up virtually the entire eastern County and underlies much of

the Valley. Countless other local locations could be considered with far fewer environmental risks and impacts. Given the amount of mining already authorized within the local production-consumption region, there is no real need for this expansion, but even if there were a shortage of locally-produced sand, gravel, and other rock materials, there is no reason for a hard rock project such as this to be located directly on the San Joaquin River, with its' unique environment, and within the footprint of the long-anticipated Parkway.

This is the wrong location and should not be approved.

Response 140-3

See Response 140-1. See also Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Letter #141 February 24, 2025, Ellen and Lynn Hemink

Comment 141-1

I am writing to express my extreme disagreement with the proposed modification to the existing CEMEX Rockfield Quarry (EIR N0.7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

One of the greatest attributes to balanced, healthy life in Fresno and surrounding areas is the access to nature and natural environments. Access to and protection of the San Joaquin River and the nature corridor along its banks is of primary importance.

Response 141-1

The commenter opposes the proposed project. See Collective Response #21 regarding public access to the San Joaquin River. See also Collective Response #12 regarding the project's potential effects on ongoing river restoration projects in the area. However, the comment is noted for the consideration of the decision-makers.

Comment 141-2

Blasting for deep pit mining of aggregate material will be detrimental to the birds and other wildlife to say nothing of people living in the area. Excessive noise pollution is a known health risk.

Response 141-2

The project's potential noise and vibration impacts on humans are addressed in Draft EIR Section 4.13, "Noise," while such impacts on fish and wildlife are addressed in Section

4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. See Collective Response #16 regarding vibration impacts on salmon. See also Collective Response #27 regarding operational impacts on users of adjacent parks and trails.

Comment 141-3

The addition of heavy truck traffic hauling aggregate will add to the air pollution and be a continual traffic hazard to an already dangerous stretch of highway.

Response 141-3

The project's potential traffic impacts are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for revisions to this Draft EIR section. The project's potential air quality impacts are addressed in Section 4.3, "Air Quality," as updated in this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for revisions to this section. See also Collective Response #9 regarding the project's potential impact on the region's air quality, Collective Response #29 regarding truck traffic increases anticipated under the proposed project, and Collective Response #30 regarding traffic and pedestrian safety.

Comment 141-4

In addition there is no documented need for the increased aggregate to be blasted from the proposed 600 foot deep pit. According to the Aggregate Sustainability in California report, the Fresno region already has 556 million tons of permitted aggregate reserves more than enough to meet future needs.

Response 141-4

See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Comment 141-5

Unfortunately, according to Good Jobs First, a Washington, DC based non-profit that tracks corporate and governmental accountability in economic development, CEMEX's record for environmental violations is of huge concern. The proposed project for deep pit mining is ripe with the possibility of environmental damage. How can Fresno disregard its people, its natural environment, its wildlife to a project run by a corporation with so little concern for its negative impact particularly when the product in question is not needed for future use?

PLEASE do not allow the proposed modification to the existing CEMEX Rockfield Quarry.

Response 141-5

See Collective Responses #4a and 4b regarding CEMEX's regulatory compliance history and liability for damages that may occur as a result of the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #142 February 24, 2025, Barry Kriebel

Comment 142-1

I am making these comments in opposition to the Cemex application. I am a long term member of the Fresno Community and an original homeowner at Woodward Lake since 1987, a long time supporter of the San Joaquin Parkway, and supporter of the agricultural and recreational uses of the San Joaquin River.

It is very common for companies to remove valuable resources from our lands without creating adequate financial resources to remedy their path of destruction. Unless Cemex voluntarily establishes a fully funded safe and secure escrow which can be used by the County to restore the land and its environmental effects, their application should be denied.

Response 142-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #4b regarding liability for unforeseen damages caused by the proposed project.

Letter #143 February 24, 2025, Leo Labbe

Comment 143-1

This memorandum documents additional concerns that I have regarding the CEMEX Rockfield EIR7763. For reference, my initial concerns were sent to you on February 2, 2025 via EMAIL.

After I submitted my initial comments stating my strong objection to this EIR, I kept on learning more while discussing this EIR with other concerned citizens and reading the 3000 plus page EIR document, reviewing its impact on the environment, the community for several generations the more I become adamant against the approval of this project.

Do we need more Aggregate?

In discussions I was recently advised that the existing mines in our area can produce 180% of the needed aggregate! So I ask, why do we need more capacity for what we have an ample supply?

Response 143-1

See Letter #16 for responses to the commenter's referenced February 2, 2025, comment letter. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Comment 143-2

Nobody wants WANT!

I've shared my concerns with many other perplexed Fresno County Citizens and concluded that the EIR contains no metrics for ongoing monitoring of environmental issues and overall performance of CEMEX. In fact the Fresno County monitors daily Air quality and often bands home fireplace uses on bad Air quality days! Yet they might approve a foreign LLC to further degrade the Air quality.

Response 143-2

The operation would continue to be inspected annually by County staff or a County-retained consultant to determine compliance with applicable regulations, permit conditions, and conditions of approval in accordance with the County's Surface Mining Ordinance (Section 834.4.220 of the Fresno County Zoning Ordinance). The Draft EIR would place additional use permit conditions on the operation to avoid or minimize identified impacts. Mitigation Measures 4.7-7a through 4.7-7c require regular monitoring of slopes by a qualified geologist to ensure stability. Mitigation Measures 4.10-5a and 4.10-5b require ongoing groundwater level monitoring while Mitigation Measures 4.10-10a and 4.10-10b require ongoing water quality monitoring and implementation of an adaptive management plan.

The project's potential air quality impacts are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The Rockfield operation would also be subject to routine inspection by air district staff to ensure compliance with air district permit conditions. For example, Mitigation Measure 4.3-2b requires the preparation of a Fugitive Dust Control Plan that would be submitted to and reviewed by the SJVAPCD. See Appendix D-4, Section 4.3.4, "Project Impacts and Mitigation Measures." See also Collective Response #9 regarding

the project's potential effects on the region's existing air quality conditions. The comment is noted for the decision-makers.

Comment 143-3

Most citizens are already concerned about Water, Air, Noise and Traffic levels (WANT) and are adamant that we don't WANT any more contaminants added to our already fragile environment!

Response 143-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Refer to Draft EIR Section 4.10, "Hydrology and Water Quality," for discussion of impacts to hydrology, Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), for discussion of impacts to air quality, Section 4.13, "Noise," for discussion of impacts to noise, and Section 4.17, "Transportation," for discussion of impacts to traffic, respectively. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 143-4

In addition, the blasting will not only add unwanted noise, but it will cause vibrations that are not defined and their repeated occurrence would cause many unknown effects on humans, waterfowl, other native animal species, the fish population and specifically the reintroduction of the Salmon population in the San Joaquin River.

Response 143-4

The project's proposed blasting operations are described in the Draft EIR under Section 2.5.2.2, "Quarry Site Mine Plans," on page 2-42. Blasting would be limited to one to two blasts per week on weekdays between the hours of 10 a.m. and 2 p.m. The effects of noise and vibration from these blasting events are evaluated in Draft EIR Section 4.13, "Noise," and Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections referenced in this response. See Collective Response #13 regarding effects of blasting on wildlife and Collective Response #16 regarding effects of vibration on salmon.

Comment 143-5

The potential for Water and Air pollution will be compounded by the blasting with the possibility of disturbing heavy metals and other contaminants and releasing them to the Air and Water which could contaminate the nearby San Joaquin River or the water table that neighbors depend upon for their well Water!

Response 143-5

Potential water quality impacts associated with blasting are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," under Impact 4.10-1 on page 4.10-90, second paragraph. Implementation of the blasting protocols (Mitigation Measure 4.10-1) would reduce potential water quality impacts by prohibiting the storage of explosives on the site, requiring blasting to be performed by a qualified contractor, and specifying best practices for handling and disposing of blasting materials. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response. See also Collective Response #9 regarding potential air emissions from blasting events. The comment is noted for the decision-makers.

Comment 143-6

Monitoring WANT

The EIR should list the current levels of each contaminate, as well as, the maximum acceptable level of the WANT issues.

I would suggest that a licensed Independent Environmental Firm provide the basic levels for a normal safe community and the threshold that would have a negative impact on all forms of health and life in the area.

These potential contamination parameters would require constant checking and appropriate actions if exceeded. CEMEX would be responsible for monitoring the levels with periodic reporting to the County on the exact levels and trends. The County would be allowed to verify readings with unannounced audit visits. All equipment used would be required to have routine validation and calibrations completed by an authorized firm. Additionally, sensors for Air and Noise pollution would sound alarms when exceeded and send an immediate alert to the Fresno County officials for appropriate action.

Response 143-6

Each section of Draft EIR Chapter 4, "Environmental Analysis," provides a description of the existing conditions on the project sites, specific thresholds of significance, and mitigation as necessary to reduce identified impacts. Where appropriate, these measures may include implementation of monitoring programs and adaptive management plans.

For water resources, see Draft EIR Section 4.10 for a description of the existing water quality conditions on the project sites as well as existing groundwater levels in the project area. See Section 4.10.1.6, "Surface Water Quality," for existing surface water quality

conditions (Tables 4.10-3 and 4.10-4), Section 4.10.1.7, "Local Geologic and Groundwater Conditions," for existing local groundwater supply conditions, and Section 4.10.1.8, "Groundwater Quality," for existing groundwater quality conditions (Tables 4.10-5 and 4.10-6). See also Draft EIR Appendix G, "Hydrology and Water Quality," for more detailed data related to these topics. Mitigation Measures 4.10-5a and 4.10-5b would require an adaptive management program for the Plant Site ponds which would include monitoring and, if necessary, mitigation measures to address exceedances of applicable water quality standards. See also Collective Responses #23 and #26 regarding surface water quality and groundwater level monitoring, respectively.

For air quality, Draft EIR Section 4.3.1.4, "Regional Air Quality and Attainment Status," as updated in this Final EIR provided in Appendix D-4, "Revised Section 4.3, Air Quality," describes the existing ambient air quality in the project area and applicable standards. See Table 4.3-2, "Ambient Air Quality in the Project Area," for monitoring data from five previous years and see Table 4.3-1, "Ambient Air Quality Standards," for the corresponding federal and state ambient air quality standards obtained from CARB. See also Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," for analysis of the ambient air quality years 2020 through 2024 and an updated analysis of the project's potential impact on air quality. This updated analysis demonstrates no new impacts and no changes to the findings in the Draft EIR. The technical report presented in this appendix was independently peer reviewed by a County-retained consultant prior to being incorporated into the Draft EIR.

For noise, see Draft EIR Section 4.13.1.3, "Plant Site Ambient Noise Environment," beginning on page 4.13-12 and Section 4.13.1.4, "Quarry Site Ambient Noise Environment," beginning on page 4.13-21, which describe the existing ambient noise environment surrounding the project sites (see Table 4.13-3, "Existing Ambient Noise Environment at Nearest Receptors to Plant Site," and Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site," on page 4.13-22). See also Draft EIR Appendix H, "Noise Assessment," for more detailed information related to noise. The technical reports presented in this appendix were independently peer reviewed by a County-retained consultant prior to being incorporated into the Draft EIR.

Existing traffic volumes and intersection operations are detailed in Section 5.0 of Draft EIR Appendix I-1, "Traffic Impact Study." Impact significance criteria are also provided in Appendix I-1 at Section 2.0. Draft EIR Section 4.17, "Transportation," provides an evaluation of the project's impacts to the local transportation system and provides mitigation measures requiring funding of various roadway and intersection improvements to address these impacts. The Traffic Impact Study was prepared by an

Operator-retained consultant and was independently peer reviewed by a County-retained consultant prior to being incorporated into the Draft EIR.

See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections and appendices referenced in this response.

Comment 143-7

Any breach of water from the San Joaquin River would require immediate stoppage in mining activity with a repair plan requiring approval of Fresno County Offices and execution of the plan at the sole expense by CEMEX until the damage is completely mitigated.

Response 143-7

The operation would continue to be inspected annually by County staff or consultant to determine compliance with applicable regulations, permits, and conditions of approval in accordance with the County's Surface Mining Ordinance (Section 834.4.220 of the Fresno County Zoning Ordinance). See also Collective Response #17 regarding riverbank stability and the potential for breach to occur at the Quarry Site.

Comment 143-8

Cost for highway upgrades

The increase in Traffic activity in the nearby area is already a major concern with broken windshields and loose aggregate falling from CEMEX trucks. The speed limit in that area is 65MPH which is the expected highway speed and the CEMEX truck require a long distance to safely merge in or exit with Traffic especially when commuter Traffic is at peak.

Response 143-8

See Collective Response #30 regarding traffic safety and damage to vehicles.

Comment 143-9

In addition, the fully loaded trucks are difficult to stop; they are hard on the highways due to their excessive weight when loaded with product.

Response 143-9

See Collective Response #29 regarding road maintenance.

Comment 143-10

It is strongly recommended that CEMEX finances entrance and exit lanes to their sites to safely allow their trucks to enter and exit. I would also recommend that a study be performed at the intersection of Willow and Friant Road. This is where southbound Traffic turns left onto Willow at high speeds against Traffic moving at 60MPH. A traffic light may be required and if so the cost should also be borne by CEMEX.

Response 143-10

The Draft EIR evaluates the project's potential impacts to the Plant Site and Quarry Site entrances along Friant Road. See page 4.17-33 and Mitigation Measure 4.17-1h which requires CEMEX to pay an equitable share contribution of the cost to signalize the intersection in the future to address cumulative increases in traffic volumes. See also page 4.17-34 and Mitigation Measure 4.17-1i which similarly requires CEMEX to conduct a traffic signal warrant analysis and pay an equitable share contribution of the cost of future signalization.

The Draft EIR also analyzed the project's potential impacts to the intersection of Friant Road and Willow Avenue (see Draft EIR page 4.17-29). The Draft EIR determined that with project traffic the level of service standard would be exceeded at this intersection. Mitigation Measures 4.17-1a, 4.17-1c, and 4.17-1j are provided requiring CEMEX to pay an equitable share contribution of the total cost to signalize the intersection.

Comment 143-11

Termination

I suggest that the EIR contains a section for "Termination For Cause" if CEMEX ever exceeds the levels established by the Independent Environmental Firm for WANT issues or other performance failures that the county not only has the right, but the obligation to terminate the site activity!

In addition to the WANT metrics there should be other measures that are part of maintaining acceptable limits on any project of this magnitude. They should include others such as:

Not adhering to the agreed work schedule Exceeding the number of daily truck loads

Blasting during silent periods And many, many more…….

Having an agreement for 100 years with no performance clauses is totally absurd.

Response 143-11

Violations at the proposed project and other mining operations in Fresno County are regulated under applicable provisions of the Fresno County Ordinance Code and the Surface Mining and Reclamation Act (SMARA). If an operation is not in compliance with County approvals, including the applicable use permit or reclamation plan, the County would follow the procedures set forth in SMARA (PRC Section 2774.1 and Section 2774.2) concerning violations and penalties, as well as applicable County enforcement provisions, including those related to revocation of a CUP. Should the County fail to comply with the provisions of SMARA, the State Mining and Geology Board (SMGB) may take action to assure compliance through administration of SMARA.

Comment 143-12

I would ask that Fresno County issue a statement of compliance with the current agreement that exits with CEMEX LLC. Comments have been made by many that they continually violate standards and they keep on mining.

If there are no standards and metrics then there is no obligation to perform!

I look forward to your response and I urge the Fresno County Supervisors to ***decline this CEMEX 100 YEAR*** request to blast and mine 600 FEET within 200 FEET of the San Joaquin River. That is just insane!

Response 143-12

See Collective Response #4a regarding CEMEX's regulatory compliance history. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #144 February 24, 2025, Bill Schmidt

Comment 144-1

I am writing to express my opposition to the proposed CEMEX expansion of their facility off Friant Road.

I am a resident of Fresno County and live very close to the CEMEX facility. From our home, about 1.5 miles away, we can hear the loud plant operations at all hours.

Response 144-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The comment refers to existing noise conditions that are not the result

of the proposed project and are not evaluated in the Draft EIR. The project's potential noise impacts and feasible mitigation measures are provided in Draft EIR Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.13.

Comment 144-2

Further, the traffic on Friant due to the trucks transporting materials causes traffic delays. More importantly is the damage the heavy trucks cause to the roads.

Response 144-2

See Collective Response #29 regarding truck traffic increases anticipated under the proposed project, required intersection improvements, and funding for roadway maintenance.

Comment 144-3

CEMEX stating, they will not or cannot support road improvements for the expansion is disingenuous.

Response 144-3

The comment refers to Impact 4.17-1 (see Draft EIR page 4.17-27) which was determined to be significant and unavoidable. The Draft EIR presents a series of mitigation measures to address the impacted intersections identified in the Traffic Impact Study (see Draft EIR Appendix I-1, "Traffic Impact Study"). Each measure requires CEMEX to contribute an equitable share of the cost to construct the improvement(s) needed to address cumulative traffic increases at the identified intersections. However, as discussed in greater detail in Draft EIR Section 5.3.17, "Transportation," beginning on page 5-28, the timing of construction of these improvements is not certain and may occur after project implementation. Therefore, the impact was determined to be significant and unavoidable. Regardless, with implementation of Mitigation Measures 4.17-1a through 4.17-1r, CEMEX would pay the project's equitable share of the cost to construct the identified improvements.

Comment 144-4

I understand that the materials taken from the plant are necessary for construction, however I believe the area has 180% of the needed material for decades to come that is financially feasible to mine.

Please record my opposition to the expansion and add my email to any list of citizens who are kept updated on the proposal.

Response 144-4

See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #145 February 24, 2025, Sue Vaughn

Comment 145-1

I am writing to protest the expansion of mines to include blasting and a continuation of the business for 100 years as it was original supposed to terminate its operations since 2008. I live at Woodward Lake and enjoy our outdoor activities in the area. The increased pollution will be detrimental to our environment including damage to our river water ecosystem.

Thank you for considering the long range effects of this important decision to the inhabitants of all the residents located near the blast areas.

Response 145-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issue of water pollution and impacts to the San Joaquin River are addressed primarily in Section 4.9, "Hazards and Hazardous Materials," and Section 4.10, "Hydrology and Water Quality." Potential impacts to water ecosystems are addressed in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Letter #146 February 24, 2025, Kaili Zink-Hernandez and Family

Comment 146-1

I am a lifelong resident of Fresno, and my family and I are frequent visitors to the San Joaquin River Parkway trails. Our young daughters adore their trips to the River House and Sumner Peck Ranch, so we are now greatly concerned with the proposed CEMEX Rockfield expansion.

Adding a 600 foot deep pit is something that should not just be approved overnight; further studies, particularly in regards to the environmental impact, need to occur.

Response 146-1

The Notice of Preparation of the Draft EIR was released for public review and comment on June 5, 2020. The Draft EIR provides a comprehensive evaluation of the project's potential environmental effects and meets the requirements of CEQA and the CEQA Guidelines. However, the comment is noted for the consideration of the decision-makers.

Comment 146-2

Our 4 year old loves trying to find animal tracks as we hike along the nearby trails - animals that may be chased out of their natural habitat with this project.

Response 146-2

The project's potential effects on wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." Each of the impacts identified in this section were determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. See also Collective Response #13 regarding potential impacts of blasting on wildlife located on surrounding properties.

Comment 146-3

Then, of course, there would be added particulates to the air, adding to our already heavily impacted poor air quality. Again, this is in an area where so many Central Valley residents seek to enjoy the outdoors - we run and bike through Woodward Park and its extended trails, pick blueberries and citrus at Sumner Peck Ranch, to name a few. We should be able to enjoy what precious levels of fresh air that we can - again, what would be the projected environmental impact here in this regard?

Response 146-3

The project's potential impacts to air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding the project's potential impact on the region's existing air quality conditions.

Comment 146-4

We would also be interested to see the impact that the CEMEX plant in general has on the nearby water supply/water table, something that heavily dissuaded us from looking at an otherwise delightful piece of property along Old Friant Road, and something that

continues to dissuade us from ever refilling our water bottles while we're down at the River House.

Response 146-4

The project's potential impacts to groundwater quality and supplies are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impact 4.10-1 through 4.10-7 for discussion of the project's impacts to water quality. See Impacts 4.10-8 through 4.10-12 for discussion of the project's impacts to groundwater supply. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #23, #24, #25, and #26 related to water resources. However, the comment is noted for the consideration of the decision-makers.

Comment 146-5

Lastly, I'm sure others will raise concerns over the traffic impact along Friant Road as well, an already heavily traveled thoroughfare. The large trucks leaving CEMEX and headed for the 41 onramps have affected many a work-time commute. Yet, I feel this is just a small concern in comparison to the long-term ramifications and environmental impact that this rockfield expansion could cause. As our daughter said, "Please protect our beautiful river."

Response 146-5

See Collective Response #29 regarding truck traffic increases anticipated under the proposed project and required roadway improvements. The comment is noted for the decision-makers.

Letter #147 February 25, 2025, Carole Bryson

Comment 147-1

I'm sending this email to let you know I am opposed to the Rockfield Quarry Modification Project. From what I've read about it, it benefits Cemex company, but there is no benefit at all to the residents of Fresno County.

We are in need of parks, playgrounds, and other quiet green spaces where we can relax and enjoy nature, wildlife, and just being out of doors. This project threatens that.

Response 147-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #21 regarding the request that the project sites should be transitioned to publicly accessible parks.

Comment 147-2

We (and the whole valley) need clean water. Water is precious here, and this project, so close to the river, would endanger our supply.

Response 147-2

The project's potential impacts on water supplies are addressed in both Section 4.10, "Hydrology and Water Quality," and Section 4.19, "Utilities and Service Systems." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Responses #23, #24, #25, and #26 related to groundwater and surface water quality and supplies. This comment is noted for the decision-makers.

Comment 147-3

There will be traffic delays at the affected intersections, with no plans to remedy the delays. How does that make things better for taxpayers?

Response 147-3

The project's potential traffic related impacts are addressed in Draft EIR Section 4.17, "Transportation." See Impact 4.17-1 beginning on page 4.17-27. Mitigation Measures 4.17a through 4.17r describe various intersection improvements that were determined necessary to address cumulative traffic increases in the project area, including the proposed project's truck trips. These measures require CEMEX to pay a fair share contribution of the cost to construct these improvements. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #29 related to truck traffic increases anticipated under the proposed project and required roadway improvements.

Comment 147-4

All of this, just to benefit Cemex. Fresno County doesn't even need the aggregate that will be mined; the County has enough aggregate for the next 50 years.

Response 147-4

See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Comment 147-5

I've lived in this area for a long time, and so often I have seen taxpayers get stuck with paying for infrastructure, cleanup, etc. while developers and big companies profit from their projects.

Please don't allow this unnecessary and potentially harmful project to go forward.

Response 147-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #148 February 25, 2025, Mitchell Hall

Comment 148-1

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years.

Response 148-1

See Response 20-1.

Comment 148-2

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource.

Response 148-2

See Response 20-2.

Comment 148-3

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations.

Response 148-3

See Response 20-3.

Comment 148-4

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts.

Response 148-4

See Response 20-4.

Comment 148-5

The increased truck traffic, potential river pollution and habitat destruction would be devastating for local wildlife.

Response 148-5

See Response 20-5.

Comment 148-6

Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells.

Response 148-6

See Response 20-6.

Comment 148-7

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability.

Response 148-7

See Response 20-7.

Comment 148-8

Moreover, the current agreement lacks measurable performance oversight, and

Response 148-8

See Response 20-8.

Comment 148-9

reports indicate repeated violations of work schedules and environmental standards.

Response 148-9

See Response 20-9.

Comment 148-10

The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences.

Response 148-10

See Response 20-10.

Comment 148-11

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs.

Response 148-11

See Response 20-11.

Comment 148-12

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century.

Response 148-12

See Response 20-12.

Letter #149 February 25, 2025, Linda Odell

Comment 149-1

As a concerned senior citizen who has witnessed the effects of exploitation of the earth's resources or monetary profit – I urge you to use wisdom and conscience to oppose the upcoming proposal that would allow the CEMEX corporation to further mine the banks of the San Joaquin River.

We must start reversing the damage that we have been inflicting – our future generations will be the ones paying for our greed [sic].

God has given us all we need in remarkable ecosystem that is designed to sustain us all - if we would start protecting the environment as wise stewards.

Please do the right thing – for the sake of, and responsibility to the future habitants of our land.

Response 149-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #150 February 25, 2025, Jackie Taggart

Comment 150-1

As a resident of Fresno City, I wish to express my opposition and concern regarding the extension of the CEMEX Quarry along the San Joaquin River. I feel this is so very wrong on many levels. This would be a huge threat to our natural resource of the San Joaquin River.

Response 150-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 150-2

My main reasons for opposing this project are the environmental impact on the ecosystem and biodiversity of the area,

Response 150-2

The project's potential impacts to ecosystems and biodiversity in the project area are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses

#12, #13, #14, #15, and #16 related to various biological resource issues. However, the comment is noted for the consideration of the decision-makers.

Comment 150-3

increased air pollution,

Response 150-3

The issue of air pollution is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section.

Comment 150-4

increased water usage,

Response 150-4

See Impact 4.19-2 beginning on Draft EIR page 4.19-8. The project's water demands are disclosed in Table 4.19-1, "Existing and Proposed Water Use Summary (Acre-Feet per Year)," on page 4.19-9 and are compared to available water supplies in Table 4.19-2, "Availability of Water vs Project Use (Acre-Feet Per Year)," on page 4.19-10. It was determined that for all project stages water availability would be in excess of the proposed water use and the impact would therefore be less than significant.

Comment 150-5

increased heavy truck usage of Friant Road,

Response 150-5

The issue of traffic is addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response. See also Collective Response #29 regarding truck traffic increases anticipated under the proposed project.

Comment 150-6

and the impact of explosives in a sensitive area.

Response 150-6

Hazards associated with the proposed use of explosives on the Quarry Site are evaluated in Draft EIR Section 4.9, "Hazards and Hazardous Materials." Noise and vibration impacts are evaluated in Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 150-7

Please do not let this company have the permits it seeks.

Response 150-7

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #151 February 25, 2025, Julie Taylor

Comment 151-1

I am writing to express my deep concern over the proposal CEMEX is making. This will affect so much in that area.

I'm sure you are aware that state geologists have written that 305 million tons of aggregate will be needed for the next 50 years worth of construction. We currently have 556 million tons of permitted aggregate reserves. Since these reserves mostly come from Minkler and Austin quarries, the only reason CEMEX wants this project on the San Joaquin river is to increase their profits. I imagine they will sell everything from the proposed plant to other locales.

Response 151-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Comment 151-2

Why does Fresno need this imposition of the increased noise (from blasting) and traffic,

Response 151-2

The issue of noise is addressed in Draft EIR Section 4.13, "Noise," while the issue of traffic is addressed in Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #29 regarding truck traffic increases anticipated under the proposed project.

Comment 151-3

Plus, the possibility of shaft collapse (that BTW doesn't require CEMEX to put money in reserve to pay for potential damage)?

Response 151-3

The issue of slope stability is addressed in Draft EIR Section 4.7, "Geology and Soils." Impact 4.7-6 evaluates slope stability at the Plant Site and was determined to be less than significant. Impact 4.7-7 evaluates slope stability at the Quarry Site and, with implementation of Mitigation Measures 4.7-7a through 4.7-7c, was also determined to be less than significant. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #17 regarding riverbank stability. See also Collective Response #4b regarding funding for unforeseen damages caused by the proposed project.

Comment 151-4

It's possible that much lower on your list of things to consider are the potential effects on the environment- water quality,

Response 151-4

The issue of water quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 151-5

encroachment on a state ecological preserve,

Response 151-5

See Collective Response #20 regarding the assertion that the project encroaches on an ecological preserve.

Comment 151-6

as well as on residents in surrounding communities. However, these ecological effects are often disregarded by those who only look at profit.

I am asking you to seriously consider not just profit but all the side effects that a project such as this will have on this community.

My vote is NO.

Response 151-6

Where appropriate, the Draft EIR evaluates potential impacts on nearby communities. Section 4.1, "Aesthetics and Visual Resources," evaluates potential impacts to views from nearby residents in Madera County (see Impact 4.1-1 and Figure 4.1-1, "Potentially Sensitive Viewpoint Locations"). Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), evaluates potential impacts to regional air quality including multiple surrounding communities. Section 4.17, "Transportation," evaluates potential cumulative impacts to operation of the regional road network based on foreseeable development in Fresno and Madera counties. Chapter 5, "Cumulative Impacts," further evaluates the project's contribution to cumulative impacts which, depending on the cumulative setting identified for the issue area, may consider effects on nearby communities in addition to the project area. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Letter #152 February 25, 2025, Neil Thompson (Letter #1)

Comment 152-1

As specified in Section 2.5.4 of the Executive Summary, the current count of 55 employees at the Plant Site process (and deliver as Ready-Mix drivers) the 1.4 MT annual production as allowed by the current CUPs.

This equates to 25,455 tons per employee on an annual basis. According to Table Note b. of Table 4.17-1, the interplant haul is accomplished by six private party truckers who arrive and leave the site with their own trucks and are, therefore, not employees.

In Table 2-6 the employee count for Stage 1 (5 years) increases to 57 employees who will process (and deliver) 2.0 MTY, or 35,088 tons per employee annually. This amounts to a 38% increase in the production rate with two additional employees. What accounts for the significant production increase? Or will the employee count increase?

In Table 2-6 the employee count for Stage 1 (10-30 years) and Stage 2 (30-100 years) increases to 60 employees who will process (and deliver)

3.0 MTY, or 50,000 tons per employee annually. This amounts to a 42 % increase in the production rate with three additional employees. What accounts for the significant increase? At 50,000 tons per employee this is a 96% increase over the existing production rate. Will they really be able to double their

efficiency? What happens if they do not significantly increase their efficiency? A ready-mix truck will only hold 9.5 cubic yards. The efficiency of those drivers can increase only if they drive substantially faster or drive a substantially shorter distance.

Table 4.17-1 Existing Annual Trip Generation at Plant and Quarry Sites provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-1 shows annual Trips for employees at the Quarry Site (entering and exiting totaling 500 annual trips) and at the Plant Site (entering and exiting totaling 26,926 annual trips) for a total employee trip count of 27,426 annual trips. Dividing by 365 days per year results in an employee count of 75.14. This is significantly more than the 55 employees that are claimed in Table 2-6. Why is there a difference?

Likewise, in Table 4.17-2 Project Annual Trip Generation – Stage 1 (2.0 MT Per Year) provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-2 shows annual Trips for employees at the Quarry

Site (entering and exiting totaling 6,000 annual trips) and at the Plant Site (entering and exiting totaling 22,602 annual trips) for a total employee trip count of 28,602 annual trips. Dividing by 365 days per year results in an employee count of 78.36. This is significantly more than the 57 employees that are claimed in Table 2-6. Why is there a difference?

Further, in Table 4.17-3 Project Annual Trip Generation – Stage 1 (3.0 MT Per Year) provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-3 shows annual Trips for employees at the Quarry Site (entering and exiting totaling 6,000 annual trips) and at the Plant Site (entering and exiting totaling 24,252 annual trips) for a total employee trip count of 28,602 annual trips. Dividing by 365 days per year results in an employee count of 82.88. This is significantly more than the 60 employees that are claimed in Table 2-6. Why is there a difference?

Finally, in Table 4.17-4 Project Annual Trip Generation – Stage 2 (3.0 MT Per Year) provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-4 shows annual Trips for employees at the Quarry Site (entering and exiting totaling 30,252 annual trips) for a total employee trip count of 28,602 annual trips. Dividing by 365 days per year results in an employee count of 82.88. This is significantly more than the 60 employees that are claimed in Table 2-6. Why is there a difference?

Table 4.17-1 Existing Annual Trip Generation at Plant and Quarry Sites shows 39,906 total annual trips for Ready-Mix concrete sales whereas Table 4.17-3 Project Annual Trip Generation – Stage 1 (3.0 MT Per Year) shows 63,158 total annual trips for Ready-Mix concrete sales – a 58% increase. However, the increase in total aggregate production from 1.4 MTY to 3.0 MTY is a 114% increase. Why is the increase in Ready-Mix production substantially less (50%) than the total aggregate production increase.

Substantial review and reconciliation of the actual and projected employee counts is warranted.

Thank you for your consideration.

Response 152-1

Increases in aggregate extraction and associated production rates do not require a similar increase in onsite employees in a linear fashion as the commenter suggests. As shown in Table 2-5, "Proposed Typical Hours and Days of Operation," within the Draft EIR, the operational hours would be slightly expanded, therefore existing employees would have the ability to conduct mining/processing operations for longer periods in a given day, thereby increasing production without increasing staff. Similarly, equipment improvements over time would also allow for the same or fewer employees to extract and produce more material per year.

Additionally, the employee trip numbers utilized within the Traffic Impact Study (see Draft EIR Appendix I-1, "Traffic Impact Study") were calculated using a different methodology to intentionally overestimate the trip data to make the analysis more conservative. Using higher estimated traffic numbers ensured that potential Level of Service (LOS) impacts to affected roadways would be overestimated, and therefore conservative when compared to the actual employee automobile trip numbers associated with the project. The lower employee numbers and associated trip data presented in Table 2-6, "Existing and Proposed Truck Trip Generation," represent the actual estimated employee numbers developed by the Operator based on the design and capacity of the proposed project.

Letter #153 February 25, 2025, Ada Allaire

Comment 153-1

I strongly oppose allowing CEMEX to continue its mining operation close to the San Joaquin River. Please don't allow the drilling and blasting of a 600-foot deep pit so close to the river.

Response 153-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #154 February 26, 2025, Neil Thompson (Letter #2)

Comment 154-1

Dear Mr. Randall,

According to Section 2.2.2 of the Executive Summary: "*Upon approval of the project, the combined annual sales of aggregate from both sites are estimated to increase from the 1.4 MT/year allowed under the current permits to 2.0 MT/year within approximately five years of project approval and up to 3.0 MT/year within approximately 10 years of project approval.*"

According to this statement, impacts to Pavement Conditions would not be triggered until the project attained the 3.0 MT per year threshold, currently estimated to be 10 years after project approval.

- The 3.0 MT per year threshold is more than twice the current 1.4 MT permitted production rate.
- What happens if the project never produces 3.0 MT/year?
- What if the production rate is held slightly less than 3.0 MT/year but more than twice the current 1.4 MT/year allowable to avoid triggering the Pavement Condition Mitigation 4.17-1b?
- What recourse does the County have to obtain compensation for the deteriorating pavement conditions caused by significant overloading?

Response 154-1

See Response 12-69. The project would contribute an equitable share of the cost of the pavement improvements even when actual annual production is less than 3.0 MT per year (see Mitigation Measures 4.17-1a through 4.17-1r). This would function to compensate the County for increased wear on the pavement as a result of the project. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17, "Transportation."

Comment 154-2

Table 4.17-10 indicates the Existing Traffic Index to be 9.5.

What Traffic Index was utilized for the current pavement section design and existing construction? Was it less than the current traffic flow TI of 9.5?

Response 154-2

CEQA requires that an EIR analyze the impacts of the project compared to the existing conditions. The existing traffic index for segments of Friant Road and Willow Avenue is presented in Table 4.17-10, "Traffic Index Summary—Existing and Existing Plus Project," on page 4.17-27 of the Draft EIR and was based on field calculations included in the Traffic Impact Study, included as Appendix I-1, "Traffic Impact Study," of the Draft EIR. The Traffic Index utilized for the current pavement section design and existing construction is not pertinent to the evaluation of the project's impacts to the existing traffic index.

Comment 154-3

Mitigation Measure 4.17-1b should be revised to include: The County should start collecting 1/20th of the project's share during the first year of the project and continue collecting every year for one hundred years. The equitable fair share contribution shall be recalculated every 20 years.

Because the design life of pavement is typically 20 years, the project should contribute its fair share over each of the five 20-year periods over the lifetime of the project.

Response 154-3

See Response 12-69. The County may consider a per-load fee to accomplish the equitable share contribution for the entire life of the project, and may consider an annual adjustment for inflation. Mitigation Measures 4.17-1a through 4.17-1r provides that the Operator would contribute their equitable share of the cost of future road facility improvements. See Final EIR Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17.

Letter #155 February 27, 2025, Vickie Klassen

Comment 155-1

I'd like to voice my opposition to the permit for CEMEX to expand their operations. This would be a great dis-service to out environment and our community!

Please do NOT allow this to pass.

Response 155-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #156 February 27, 2025, Cheryl Milnac

Comment 156-1

CEMEX, a multinational mining company wants to dynamite a 600 foot deep pit too close to the San Joaquin River. County planners spent 5 years preparing a 3,767 page draft EIR for the so-called **"Rockfield Quarry Modification Project".**

For the Fresno area, the ***Aggregate Sustainability in California*** report (last updated by the **California Geological Survey** in 2018) states that 305 million tons of aggregate will be needed for the next 50 years. We already have **556** million tons of permitted aggregate reserves.

Response 156-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Comment 156-2

If the wall of earth separating the river and the open mine gave way, a **disaster** would result.

Response 156-2

See Collective Response #17 regarding river bank stability and the potential for breaching at the Quarry Site. See also Collective Response #4b regarding liability for unforeseen damage caused by the proposed project.

Comment 156-3

For these and many other reasons please oppose the development of the **Rockfield Quarry Modification Project.**

Response 156-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #157 February 27, 2025, Multiple Signers

This comment letter is a duplicate of other comment letters received (#156, #160, #225, and #226). See responses to Comment Letter #156 for details.

Letter #158 February 27, 2025, Laura Rosenburger Haider

Comment 158-1

Section 4.10-43 -Hydrology shows that in one well, gross alpha radiation activity was over the water quality standard. The NRC stated that no level of radiation exposure is safe. A USGS study by Dr. Peter McMahon (around 2019) led him to claim that manganese pulls radium out of sediment. Table 4.10-6 shows that at the Rockfield Quarry site, manganese was not within water quality standards in 3 wells.

Response 158-1

The water quality data presented in the Draft EIR represents existing baseline conditions and therefore does not represent conditions that must be addressed as part of this project. Rather, the environmental review must evaluate whether the proposed project would result in impacts to the existing water quality conditions at levels deemed to be significant. Accordingly, the EMKO hydrogeologic study contained in Draft EIR Appendix G-1 includes a water quality analysis, the pertinent portions of which are discussed below in relation to the comment.

In the sample from MW-2M, the gross alpha activity is appreciably greater than the sum of the activity reported for the common alpha particle emitters uranium, radium 226, and radium 228. For all other samples, the sum of the alpha activity reported for the common alpha particle emitters ranges from at least 50 percent to over 90 percent of the gross alpha activity, whereas for MW-2M the sum of the alpha activity from the common emitters is about 30 percent of the gross alpha activity. Thus, the gross alpha result for MW-2M may not be representative of site conditions.

Letter #159 February 27, 2025, Julia Smith

Comment 159-1

As a long time resident in Fresno, I am asking you to oppose the Rockfield Quarry Modification Project. My concerns are long range considerations, something that must be considered when making decisions that impact the entire San Joaquin Valley.

Environmentally, the project will increase an already serious air quality problem in the San Joaquin Valley.

Response 159-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Issues regarding air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 regarding the project's potential impact to the existing air quality of the region.

Comment 159-2

CEMEX had already agreed to wind down their activity. State geologists have stated there is no need for more aggregate as the reserve supply is greater than the need for the next fifty years.

Response 159-2

See Collective Response #3 regarding the available aggregate reserves in the region and the need for the proposed project.

Comment 159-3

The rapidly growing metropolitan area around Fresno is growing so fast that traffic congestion is now a problem without having to also deal with trucks hauling rock.

Response 159-3

See Collective Response #29 regarding truck traffic increases anticipated under the proposed project.

Comment 159-4

It will also endanger one of the best treasures in the valley, what is left of the San Joaquin River. Currently, water quality is good and recreational use becoming one of the best hidden adventures in Fresno!

Response 159-4

The issue of water quality and impacts to the San Joaquin River are addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," and Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 159-5

The dust and possible breaching of overflow from the excavation would cause permanent harm to not only the river but also the ribbon of trees and wild life along the river.

Response 159-5

See Collective Response #17 regarding river bank stability and the potential for breaching at the Quarry Site.

Letter #160 February 27, 2025, Jeri Stubblefield

This comment letter is a duplicate of other comment letters received (#156, #160, #225, and #226). See responses to Comment Letter #156 for details.

Letter #161 February 27, 2025, Cindy Volpa

Comment 161-1

I just became aware of the proposal being submitted to the County by the Cemex corporation. I live in close proximity to the quarries and also spend a great deal of time enjoying the river nearby. I am so distressed by the proposal and can't believe it's even being considered.

I'm aware that Cemex has had to submit an environmental impact report. The results should speak to the issues of proximity to the San Joaquin River,

Response 161-1

The issue of water quality and impacts to the San Joaquin River are addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," and Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 161-2

the depletion of ground water,

Response 161-2

The issue of groundwater depletion is addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #24, #25, and #26 related to groundwater monitoring and potential impacts to groundwater levels from seepage into the quarry pit.

Comment 161-3

and of course the threats to the nearby wildlife. I'm planning to attend the meeting on February 28th.

Please pass my letter along to the committee considering this horrifying proposal.

Response 161-3

The project's potential impacts to wildlife are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #162 February 27, 2025, Joe Volpa

This comment letter is a duplicate of Letter #161. See Response Letter #161 for details.

Letter #163 February 28, 2025, Sarah Allison

Comment 163-1

I am writing to formally express my strong opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas. This 100-year permit is a threat to the beauty of Fresno County.

As someone who has worked in an industrial setting for over 18 years, I appreciate clean air, open spaces, and pristine pockets of green space and wildlife in and around the San Joaquin River. Many people do! It is a respite from the hustle and bustle of the cities and towns in Fresno County.

Response 163-1

The comment and the commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 163-2

I find that the EIR fails to adequately address the following concerns:

1. Impacts on wildlife habitat

Response 163-2

The project's potential impacts to wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #12, #13, #14, #15, and #16 related to biological resources.

Comment 163-3

2. Water quality

Response 163-3

The project's potential impacts to water quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #23 related to water quality.

Comment 163-4

3. Air pollution-from the production facility and from trucks going in and out.

Response 163-4

The project's potential impacts to air quality are evaluated in Draft EIR Section 4.3, "Air Quality," As updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 related to the project's impact on the region's existing air quality conditions.

Comment 163-5

4. Noise pollution

Response 163-5

The project's potential impacts related to noise are evaluated in Draft EIR Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 163-6

5. Groundwater depletion---the citizens and farmers of Fresno County cannot spare one drop of fresh water for a project like this.

Response 163-6

The project's potential impacts to groundwater supplies are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #23, #24, #25, and #26 related to groundwater levels and monitoring.

Comment 163-7

6. Industrial blight. ---don't ruin the beauty of the San Joaquin River with something like this.

Response 163-7

The project's potential impacts to aesthetics are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #8 regarding the proposed mitigation for the project's visual impacts (Mitigation Measure 4.1-4 on Draft EIR 4.1-61).

Comment 163-8

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit considering the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 163-8

The Draft EIR provides an adequate analysis of potential environmental impacts and provides mitigation measures to reduce impacts to less than significant, where applicable. The long-term, cumulative effects of the proposed project are described in Draft EIR Chapter 5, "Cumulative Impacts."

Letter #164 February 28, 2025, Stephanie Castillo

Comment 164-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not

sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 164-1

The Draft EIR provides an adequate analysis of potential environmental impacts and provides mitigation measures to reduce impacts to less than significant, where applicable.

Comment 164-2

As someone with experience in outdoor recreation, I find that the EIR fails to adequately address the following concerns:

1. Impacts on wildlife habitat and water quality

Response 164-2

The project's potential impacts to wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See also Collective Responses #12, #13, #14, #15, and #16 related to biological resources. The project's potential impacts to water quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See also Collective Response #23 related to water quality. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 164-3

2. Air pollution and noise pollution

Response 164-3

The project's potential impacts to air quality are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 related to the project's impact on the region's existing air quality conditions. The project's potential impacts related to noise are evaluated in Draft EIR Section 4.13, "Noise."

Comment 164-4

3. Groundwater depletion and

Response 164-4

The project's potential impacts to groundwater supplies are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See also Collective Responses #23, #24, #25,

and #26 related to groundwater levels and monitoring. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 164-5

cumulative environmental impacts

Response 164-5

The long-term, cumulative effects of the proposed project are described in Draft EIR Chapter 5, "Cumulative Impacts."

Comment 164-6

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Response 164-6

The Draft EIR provides a comprehensive evaluation of the project's potential environmental effects and meets the requirements of CEQA.

Letter #165 February 28, 2025, Diana Durham

Comment 165-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 165-1

The Draft EIR provides a comprehensive evaluation of the project's potential environmental effects and meets the requirements of CEQA.

Comment 165-2

As someone with familiarity with the location I find that the EIR fails to adequately address the following concerns:

1. Impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, cumulative environmental impacts, and community health.

Response 165-2

The environmental issues listed are evaluated throughout the Draft EIR. See Section 4.4, "Biological Resources," Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13, "Noise," and Chapter 5, "Cumulative Impacts." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 165-3

2. Safety concerns for recreational cyclists on Friant Road.

Response 165-3

See Collective Response #30 regarding traffic and cyclist/pedestrian safety.

Comment 165-4

3. Beauty of the San Joaquin River.

Response 165-4

The project's potential impacts to the aesthetics and visual resources of the project area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 165-5

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Response 165-5

The Draft EIR provides a comprehensive evaluation of the project's potential environmental effects and meets the requirements of CEQA.

Letter #166 February 28, 2025, Chris Hamilton (Letter #1)

Comment 166-1

Hi David!

I've been reading the EIR for the Cemex Rockfield Expansion. It is clearly written and very helpful in understanding the effects of the project might have.

I have some questions I was hoping your staff can answer.

1. I have heard that there have been tainted wells of nearby landowners as a result of the current operations. If so, what was done by Cemex and the county to remedy the problem.

Response 166-1

A review of County records indicates that there have been no violations at the current Rockfield operation that resulted in, or had the potential to result in significant effects to groundwater quality. The comment is noted for the consideration of the decision-makers.

Comment 166-2

2. There appears to be a risk, of an excavation pit wall which borders the river, of potentially collapsing. The report states that the company will monitor regularly to prevent. Is there a required scheduled for that monitoring? If there is a collapse and any toxic waste is washed into the river... who pays for the clean up?

Response 166-2

See Collective Response #17 regarding riverbank stability and the potential for breach.

Comment 166-3

3. A 600 foot deep mining operation that lasts 100 years is a project that is so vast in scope and repercussions that it is difficult to truly monitor and hold people accountable.

Response 166-3

See Collective Response #5 regarding the duration of the proposed use permit.

Comment 166-4

What prevents an international business, like CEMEX, from walking away from a toxic, deep pit and leaving the locals to pay for the clean up. The proposed bond is unlikely to be large enough to cover any major damage.

4. If Mexico doesn't allow this type of mining, why are we approving it?

Response 166-4

See Collective Response #4b regarding liability for unforeseen damages caused by the proposed project as well as the legality of the proposed mining methods.

Comment 166-5

Thank you for your hard work. Government employees are so under threat and under appreciated these days. I just want you to know I am thankful for people like you who are helping to create beautiful communities for all the citizenry.

Response 166-5

The comment is noted.

Letter #167 February 28, 2028, Chris Hamilton (Letter #2)

Comment 167-1

I have some additional concerns regarding this project that I don't see covered by the DEIR. I'm looking forward to hearing your findings.

1. **Increased particulate matter from diesel trucks resulting in increase health risks not addressed.**

   The projected average number of daily truck trips for this project is between 650 to over 900 daily truck trips based on the charts in the study. The particulate emissions from the diesel trucks is much higher and more toxic than auto emissions especially with more EV and hybrid vehicles on the road . Higher particulate matter results in greater risks of developing cancer and asthma. There has to be an increase in health risks, such as cancer and asthma, for people along the

trucks' routes but the DEIR doesn't address that. Proximity makes a difference.

Response 167-1

The VMT from on-road trucks was used to calculate associated emissions. Regarding the possibility of heavier traffic on Friant Road resulting in higher levels of diesel particulate exposure, additional modeling was undertaken and shows that the potential increase in trucks on *any* road, and specifically Friant Road, would expose receptors to health risks at levels that are less than significant. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment") including preparation of the aforementioned haul route models. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 167-2

2. Incorrect baseline for statistics

In the study, Cemex has a baseline for air pollution and wear and tear on the roadways that is calculated incorrectly. It calculates effects based on what CEMEX operations are already creating rather than starting at zero which would reflect if the business was not operating so no damage was done to the air or the roadways. If the company completed mining the surface level deposits as first approved, they would have completed it within the 100 year time frame. Then, the baselines would reflect "no damage"- "0" to use as the basis for the deciding whether to allow expansion and blasting.

Response 167-2

The Draft EIR properly evaluates the proposed project in consideration of the existing site conditions and ongoing activities which the County determined represents the appropriate environmental baseline for the purpose of environmental review of the proposed project.

Comment 167-3

3. Incorrect calcuations [sic] of Cemex operation damage to roadway and mitigations insufficient

According to government statistics, large semi trucks create 15 times the wear and tear on a roadway compared to a passenger vehicle. In the DEIR, Cemex calculates their share of the responsibility by number of vehicles in each category

(auto vs Cemex trucks) during the day not by proportional damage. It also states that there are no funds to mitigate needed roadway improvements. Wouldn't that be another reason to not have this project. If a multibillion dollar company, doesn't value its impact on the surrounding community enough to prevent decline of safety and quality of life for residents of Fresno County, then their requests should be denied.

Response 167-3

Please see Collective Response #29 pertaining to traffic impacts and mitigation requirements.

Comment 167-4

4. Safety- No stats re: damage to people and vehicles due to truck spills

I drive my car and ride my bicycle with friends on Friant road several days a week. There is no question that having trucks filled with rock and gravel pose a danger to both car and bike traffic. There is always gravel in the bike lane and often 6 inch boulders that have been dropped off passing trucks. A nearby resident was driving his car and hit a 6" boulder with their car and sustained considerable damage. The community is trying to promote bicycling for health and recreation but it doesn't take much in the roadway to have a life changing accident. Fresno has experienced tremendous growth in the last 100 years when a simple conditional use permit was given. The huge developments that are being built have changed the use of Friant Road from a rural 2 lane road to a 4 lane residential commute route. The benefits of expanding the project do not compensate for the negative impacts it causes.

Response 167-4

Please see Collective Response #30 pertaining to traffic safety.

Comment 167-5

5. Fresno Already Has Sufficient Sand & Gravel Resources – Additional Mining Not Needed

The DEIR does not acknowledge that the California State Department of Mines and Geology has found that Fresno has 180% of the sand and gravel it needs for the next 30 years. Why create a 400-600 foot deep crater in the earth that

threatens the health of the San Joaquin river and its wildlife if we don't even know what our needs will be 30 years from now.

Response 167-5

Please see Collective Response #3 pertaining to regional aggregate supply and demand.

Comment 167-6

6. **How many loads (% of business) are delivered outside the Fresno Area**

   Fresno has 180% of the supplies it needs for the next 30 years. The DEIR does not provide information regarding how many loads and percentage of their business is trucked out of Fresno County. Longer deliveries create greater air pollution for the valley. If the supplies aren't needed locally and are being shipped to other places, the people of Fresno are bearing the environment burden for international corporate profits. The expansion should thus be denied.

   Thank you for all your hard work. I appreciate your dedication to create a healthy, happy and successful community through wise planning and development.

Response 167-6

Please refer to Collective Response #3 for discussion of aggregate supply and demand in the Fresno region.

While vehicle miles traveled (VMT) were quantified for haul trucks traveling to and from the project site, the following relevant assumptions are summarized in the Traffic Impact Study (TIS) and related supplemental documentation (see Appendix I-1, "Traffic Impact Study" of the Draft EIR):

1. The number of sources available in a region is not expected to affect the demand for the material and the more sources that are available the shorter the average length per trip is expected to be.
2. The project truck trips estimated in the TIS would redistribute to other sources; and the assumption was made that no additional employees or automobile trips would be required at the other sources.
3. The VMT analysis indicates that, although the project appears to generate a high number of VMT, the actual effect of the project on a regional basis is to reduce VMT as compared to the condition in which the project does not exist. See Table

4.17-8, "No-Project Annual VMT Estimates—All Regional Aggregate Sources Operating," and Table 4.17-9, "No-Project Annual VMT Estimates—Only Currently-Active Regional Aggregate Sources Operating," on page 4.17-23 of the Draft EIR.

4. With no project, and the same demand for aggregate, aggregate users within the region served by the project would need to travel farther (i.e., more VMT) on average to obtain aggregate.

The project would implement Mitigation Measures 4.3-2 and 4.3-4 for further emission reductions, including off-road engine upgrades to meet Tier 4 Final Particulate Emissions standards. A key objective of the proposed project is to help serve the local construction industry by continuing to provide a local source of aggregate materials in lieu of more environmentally impactful and more distant sources.

Letter #168 February 28, 2025, Judith Looby

Comment 168-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 168-1

The Draft EIR provides a comprehensive evaluation of the project's potential environmental effects and meets the requirements of CEQA.

Comment 168-2

As someone with experience in outdoor recreation and knowledge of this area, I find that the EIR fails to adequately address the following concerns:

1. Impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, cumulative environmental impacts, or community health.

Response 168-2

The environmental issues listed are evaluated throughout the Draft EIR as updated by the Final EIR. See Section 4.4, "Biological Resources," Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4,

"Revised Section 4.3, Air Quality"), Section 4.13, "Noise," and Chapter 5, "Cumulative Impacts." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 168-3

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this .permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 168-3

The Draft EIR provides a comprehensive evaluation of the project's potential environmental effects and meets the requirements of CEQA.

Letter #169 February 28, 2025, Ron Martin

Comment 169-1

There is a problem with the DEIR for the CEMEX rockfield expansion permit. Section Impact 4.3-4, Asphalt Plant Emission Controls, is identified as a Possibly Significant problem. The mitigation measure proposed is to heat largely the types of asphaltic concrete that release the least noxious organic compounds. Also when more volatile organic (VOCs) are heated, the VOCs are to be piped back to the burner in the plant, and before the plant is operational, Imperial County building inspectors would be brought in to verify the piping.

Why would inspectors be brought from four hundred miles away to inspect a plant in Fresno County? Are Imperial County Inspectors inspectors more competent for some reason than our Fresno County inspectors? This is not explained. Transporting and housing these distant inspectors, from Imperial County, will incur extra travel and lodging expenses, which should be borne by CEMEX.

Another possibility is that this DEIR is not designed for the San Joaquin River, but is a recycled report for a project near the Mexican border. Perhaps this report is not fully an examination of Fresno County's northern border's environment.

Response 169-1

The comment identifies an errant reference in Mitigation Measure 4.3-4 which incorrectly references verification by "Imperial County Building Inspectors" where the reference should be to "Fresno County Building Inspectors." The text of Draft EIR Mitigation Measure 4.3-4 is revised in this Final EIR through errata presented in Chapter 3, "Draft EIR Errata." The correction does not affect the efficacy of the mitigation measure.

Comment 169-2

Seeking to usually make lower-VOC asphaltic concrete is only a partial mitigation. Piping of noxious gasses cannot be expected to seal perfectly. If we consider the nearby housing developments, with more to be built in the future, the gasses will degrade more health of Fresno County residents than ever.

Response 169-2

The project sites are located in Exclusive Agricultural (AE) zone districts with approved industrial uses. The vision, goals, and policies of the Fresno County General Plan do not contemplate the construction of new housing developments in the agricultural zones surrounding the project sites. Further, the project sites are located outside the Spheres of Influence of both Fresno and Clovis for the provision of municipal services to residential land uses.

The Draft EIR assesses impacts from the proposed asphalt plant based on standard mix design and asphalt cement materials. Mitigation Measure 4.3-4, as updated in the Final EIR, (Asphalt Plant Emissions Controls) does not rely on substitution of lower-emitting asphalt cement materials, but instead requires implementation of measures to control emissions, including the use of blue smoke control equipment, which would reduce emissions of criteria air pollutants and odors. Implementation of Mitigation Measure 4.3-4 would reduce impacts to less than significant without quantifying potential asphalt cement substitutes. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata."

A hot-mix asphalt plant previously operated at the Plant Site until 2009, and according to San Joaquin Valley Air Pollution Control District (SJVAPCD) records, no complaints regarding odors or emissions were received. The Draft EIR also determined that potential health risks for nearby receptors, including VOC emissions associated with asphalt production, would be less than significant after mitigation (Appendix D-4, Section 4.3.4, "Project Impacts and Mitigation Measures").

Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), including an analysis of the project's potential to release odorous emissions. See Appendix D-3, Section 3.5.4. This analysis revealed that the project would have a less than significant impact concerning odorous emissions with implementation of the proposed mitigation measures. See also Appendix D-4, Section 4.3.4, "Project Impacts and Mitigation Measures."

Accordingly, additional mitigation or quantification of lower-emitting asphalt cement materials is not required.

Comment 169-3

Even if this DEIR is applied to our county, with its weak mitigation measures, it is best that this river gravel and asphalt operation be wound down now. If the corporation chooses, it would be best to set up their operations far from the river.

Response 169-3

Please see Response 169-2 pertaining to the sufficiency of Mitigation Measure 4.3-4. The commenter's preferences regarding existing and future operations are noted and will be considered by County decision-makers.

Letter #170 February 28, 2025, Neil Thompson (Letter #1)

Comment 170-1

The traffic Mitigation Measures that pertain to signalization and/or intersection improvements are very broad and lack specificity as to who, what, when and how the implementation of the Mitigation Measure will be monitored. This information is important because many of these mitigating improvements may not be triggered until sometime in the distant future well after the current cast of characters have moved on.

Response 170-1

County of Fresno, City of Fresno, and City of Clovis policies require new developments to perform traffic analyses to identify the effect of the new development on intersection and roadway levels of service. As regional growth continues, new developments will be required to construct improvements to mitigate the impacts. Mitigation Measures 4.17-1a through 4.17-1r provides that the Operator would contribute their equitable share of the cost of future road facility improvements.

Comment 170-2

Some of the questions that need to be addressed are:

Mitigation measure 4.17-1a: Equitable Share Contribution – Friant Road and Willow Avenue Traffic Signal.

This Mitigation is not expected to be warranted until the project is producing 3.0 MT/year – projected to be 10 years from approval or possibly far beyond.

The project should contribute its fair share over the 10 years preceding the signalization.

- What is the calculation?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the signalization is complete?

Response 170-2

The mitigation measure requiring contribution of an equitable share is applicable at the initiation of the project and is not deferred to the future based on actual production. The calculations of the equitable share percentages are presented in the Traffic Impact Study included in the Draft EIR (Appendix I-1, "Traffic Impact Study," of the Draft EIR). The calculation of the equitable share amount in terms of dollars and its collection is managed by the lead agency, the County of Fresno. In the case of the project, the equitable share amount may be collected in advance, or an agreement may be made to make regular payments, potentially in terms of a per-load fee. Transparency is ensured by the Freedom

of Information Act and the California Public Records Act, which allows private parties to request records held by public agencies.

Comment 170-3

Mitigation Measure 4.17-1c Friant Road and Willow Avenue signalization

- The project should contribute its fair share over the 5 years preceding the signal installation.
- What is the calculation formula to establish required contributions?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the signalization is complete?

Response 170-3

See Response 170-2.

Comment 170-4

Mitigation Measure 4.17-1d Copper Avenue and Willow Avenue signalization

- The signal has been installed and is operational.
- Will this project be required to reimburse other developments for its equitable share of the signalization?

Response 170-4

Mitigation Measure 4.17-1d requires the project to pay an equitable share of the cost of future widening and signalization of the Copper and Willow Avenue intersection. (Draft EIR 4.17-31.) The equitable share of the cost would be collected and managed by the County. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 170-5

Mitigation Measure 4.17-1e Widening of SR 41 and Road 145 Intersection.

The project should contribute its fair share over the 15 years preceding the road widening.

- What is the calculation formula to establish required contributions?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection widening is complete?

Response 170-5

See Response 170-2.

Comment 170-6

Mitigation Measure 4.17-1f Road 206 and Road 145 Intersection Improvements

The project should contribute its fair share over the 15 years preceding the intersection improvements.

- What is the calculation formula to establish required contributions?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-6

See Response 170-2.

Comment 170-7

Mitigation Measure 4.17-1g Friant Road and North Fork Road Intersection Improvements

The project should contribute its fair share over the 15 years preceding the intersection improvements.

What is the calculation formula to establish required contributions?

- Who runs the calculation?
- When is the calculation run?

- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made?
- When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-7

See Response 170-2.

Comment 170-8

Mitigation Measure 4.17-1h Friant Road and Quarry Site Access Intersection Improvements

The project should contribute its 100% share over the 15 years preceding the intersection improvements.

- Why is this an Equitable Share Improvement? Without the Quarry operation there would not be a requirement for intersection improvements. The project should pay 100% of the required improvement and signalization costs.
- Who will perform the annual traffic warrant analyses? Who will review and verify the results of the analyses?
- Who will monitor the County Annual Mine Inspections for annual production?
- When is the contribution to be made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these warrant calculations are run?

- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-8

The Traffic Impact Study included in the Draft EIR indicates that the equitable share percentage at the site access driveways is 100 percent (Appendix I-1 of the Draft EIR). The County would require that the project retain a licensed traffic engineer or civil engineer with experience in traffic engineering to perform warrant studies at regular intervals. County staff would be responsible for reviewing the analyses and confirming the results. The County may require the project to construct the traffic signals when warranted.

See also the Response 170-2.

Comment 170-9

Mitigation Measure 4.17-1i Friant Road and Plant Site Access Intersection Improvements

The project should contribute its 100% share over the 15 years preceding the intersection improvements.

- Why is this an Equitable Share Improvement? Without the Plant Site operation there would not be a requirement for intersection improvements. The project should pay for 100% of the required improvements and signalization.
- Who will perform the annual traffic warrant analyses? Who will review and verify the results of the analyses? Who will monitor the County Annual Mine Inspections for annual production?
- When is the contribution to be made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these warrant calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-9

See Responses 170-2 and 170-8.

Comment 170-10

Mitigation Measure 4.17-1j Friant Road and Willow Avenue Intersection Improvements

The project should contribute its fair share over the 15 years preceding the signal installation.

- What is the calculation formula to establish required contributions?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the signalization is complete?

Response 170-10

See Response 170-2.

Comment 170-11

Mitigation Measure 4.17-1k Copper Avenue and Willow Avenue signalization

- The signal and road widening has been installed and is operational. Will this project be required to reimburse other developments for its equitable share of the signalization?

Response 170-11

See Responses 170-4 and 12-69.

Mitigation Measures 4.17-1a through 4.17-1r provides that the project Operator would contribute their equitable share of the cost of future road facility improvements.

Comment 170-12

Mitigation Measure 4.17-1l Widening of SR 41 and Road 145 Intersection.

(This mitigation measure is essentially identical to MM 4.17-1e, as the year 2040 may occur before 15 years have passed since project approval.)

- The project should contribute its fair share over the 15 years preceding the road widening.
- What is the calculation formula to establish required contributions?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection widening is complete?

Response 170-12

See Response 170-2.

Comment 170-13

Mitigation Measure 4.17-1m Road 206 and Road 145 Intersection Improvements

(This mitigation measure is essentially identical to MM 4.17-1f, as the year 2040 may occur before 15 years have passed since project approval.)

- The project should contribute its fair share over the 15 years preceding the intersection improvements.
- What is the calculation formula to establish required contributions?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-13

See Response 170-2.

Comment 170-14

Mitigation Measure 4.17-1n Friant Road and North Fork Road Intersection Improvements

(This mitigation measure is essentially identical to MM 4.17-1g, as the year 2040 may occur before 15 years have passed since project approval.)

- The project should contribute its fair share over the 15 years preceding the intersection improvements.
- What is the calculation formula to establish required contributions?
- Who runs the calculation?
- When is the calculation run?
- What percentage share does the project carry?
- Who determines what is an equitable share. How is it spread?
- When are the contributions made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-14

See Response 170-2.

Comment 170-15

Mitigation Measure 4.17-1o Friant Road and Quarry Site Access Intersection Improvements

(This mitigation measure is essentially identical to MM 4.17-1h, as the year 2040 may occur before 15 years have passed since project approval.)

- The project should contribute its 100% share over the 15 years preceding the intersection improvements.
- Why is this an Equitable Share Improvement? Without the Quarry operation there would not be a requirement for intersection improvements. The project should pay for 100% of the required improvement and signalization.

- Who will perform the annual traffic warrant analyses? Who will review and verify the results of the analyses? Who will monitor the County Annual Mine Inspections for annual production?
- When is the contribution to be made? When do they start?
- Are the contributions in advance? In arrears?
- Are they made annually? Monthly?
- Who monitors when each of these warrant calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-15

See Responses 170-2 and 170-8.

Comment 170-16

Mitigation Measure 4.17-1p Friant Road and Plant Site Access Intersection Improvements

(This mitigation measure is essentially identical to MM 4.17-1i, as the year 2040 may occur before 15 years have passed since project approval.)

- The project should contribute its 100% share over the 15 years preceding the intersection improvements.
- Why is this an Equitable Share Improvement? Without the Plant Site operation there would not be a requirement for intersection improvements. The project should pay for 100% of the required improvements and signalization.
- Who will perform the annual traffic warrant analyses? Who will review and verify the results of the analyses? Who will monitor the County Annual Mine Inspections for annual production?
    - When is the contribution to be made? When do they start?
    - Are the contributions in advance? In arrears?
    - Are they made annually? Monthly?

- Who monitors when each of these warrant calculations are run?
- Who monitors when each of these contributions are made?
- What transparency is there on this process until the intersection improvements are complete?

Response 170-16

See Responses 170-2 and 170-8.

Comment 170-17

Mitigation Measure 4.17-1q Friant Road and Willow Avenue Intersection Improvements

(This mitigation measure is essentially identical to MM 4.17-1j, as the year 2040 may occur before 15 years have passed since project approval.)

- The project should contribute its 100% share over the 15 years preceding the intersection improvements.
- The project should contribute its fair share over the 15 years preceding the signal installation.
  - What is the calculation formula to establish required contributions?
  - Who runs the calculation?
  - When is the calculation run?
  - What percentage share does the project carry?
  - Who determines what is an equitable share. How is it spread?
  - When are the contributions made? When do they start?
  - Are the contributions in advance? In arrears?
  - Are they made annually? Monthly?
  - Who monitors when each of these calculations are run?
  - Who monitors when each of these contributions are made?

- What transparency is there on this process until the signalization is complete?

Response 170-17

See Response 170-2.

Comment 170-18

Mitigation Measure 4.17-1r Copper Avenue and Willow Avenue signalization (This mitigation measure is essentially identical to MM 4.17-1k, as the year 2040 may occur before 15 years have passed since project approval.)

- The signal and intersection widening has been installed and is operational. Will this project be required to reimburse other developments for its equitable share of the signalization?

Response 170-18

Mitigation Measure 4.17-1r requires the project to pay an equitable share of the cost of future widening and signalization of the Copper Avenue and Willow Avenue intersection (Draft EIR 4.17-31). The equitable share of the cost would be collected and managed by the County. See Responses 170-2, 170-4, and 170-11.

Comment 170-19

Please rewrite these Mitigation Measures with sufficient detail such that each of the parties (Applicant, County, Public, etc.) will know who is responsible for what at least 15 or more years from Approval.

Response 170-19

The commenter requests that Mitigation Measures 4.17-1a through 4.17-1r be rewritten to provide additional implementation detail regarding responsibility, timing, calculation, monitoring, and transparency. The County acknowledges the commenter's concern regarding long-term administration of transportation mitigation measures; however, the County does not agree that the mitigation measures are inadequate or require comprehensive revision. As discussed in Responses 170-1 through 170-18, the Draft EIR identifies the responsible party for implementation of the mitigation measures, establishes that the Operator would contribute its equitable share, or where applicable 100 percent, of identified roadway and intersection improvements, and explains that equitable share percentages are based on the Traffic Impact Study included as Draft EIR Appendix I-1.

As explained in Responses 170-2 and 170-8, the County, as lead agency, would be responsible for administration of the mitigation program, including calculation and collection of required contributions, review of warrant analyses where applicable, and confirmation of the timing of required improvements. For intersections where annual warrant analyses are required, the County would require the project to retain a qualified traffic engineer to prepare the analyses, subject to County review. For the project's access intersections, the Traffic Impact Study identifies the project's share as 100 percent. For other facilities, the project's equitable share is identified in the Traffic Impact Study and would be administered by the County consistent with applicable policies and permitting requirements.

The Draft EIR is required to identify feasible mitigation measures to reduce significant impacts; it is not required to describe every future administrative step or to prescribe all details of long-term funding collection procedures within the text of the EIR itself. The mitigation measures, together with the Traffic Impact Study and the County's project approval and monitoring processes, provide sufficient performance standards and implementation direction to ensure enforceability. To the extent the comment reiterates concerns regarding timing of payments, calculation of equitable share, responsibility for warrant analyses, reimbursement for already constructed improvements, or monitoring and transparency, those issues are addressed in Responses 170-1 through 170-18. Accordingly, no further revision to the Draft EIR is required in response to this comment. The reader is referred to Chapter 3, "Draft EIR Errata," to view other proposed revisions to Draft EIR Section 4.17, "Transportation." For additional discussion of traffic impacts and mitigation, please see Collective Response #29.

Letter #171 February 28, 2025, Neil Thompson (Letter #2)

Comment 171-1

Mitigation Measure 4.7-6 Regarding Plant Site Slope monitoring includes at least two open ended questions:

- The measure calls for a periodic inspection to be performed. The inspection and reporting program to be established by a County approved engineering geologist or geotechnical engineer should specify a maximum period of time between inspections.

Response 171-1

Mitigation Measure 4.7-6 requires that the Operator of the Quarry "shall retain a County-approved qualified engineering geologist or geotechnical engineer experienced in evaluating the stability of slopes in alluvial materials." The engineering geologist or

geotechnical engineer shall develop an inspection and reporting program for the Plant Site slopes, with the interim mining slopes and perimeter slopes periodically inspected as dictated by the exposed conditions. This Mitigation Measure intentionally allows the qualified professional to determine the appropriate inspection frequency based on site-specific conditions, slope gradients and stability, and groundwater observations. This flexibility ensures that the program can adapt to changing conditions and maintain slope stability consistent with the safety factors, as detailed in Mitigation Measure 4.7-6 and the Plant Site geotechnical evaluation completed for the revised reclamation plan by Tetra Tech in 2021. The County would review the inspection and reporting program to confirm that the proposed inspection intervals are adequate to protect public safety, comply with the intent and purpose of the mitigation measure, and implement any feasible recommendations to mitigate slope stability concerns as necessary to ensure that impacts are reduced to a less than significant level.

Comment 171-2

- It should be clear that the Operator shall pay for all inspections including County review costs.

Response 171-2

Mitigation Measure 4.7-6 clearly details that the Operator of the Rockfield Quarry is responsible for retaining the County-approved qualified engineering geologist or geotechnical engineer to develop and implement the inspection monitoring and reporting program. Consistent with standard practice, the Operator would be responsible for all costs associated with implementing the mitigation measure, including the preparation of inspection reports and necessary slope stability recommendations. The Operator would also be responsible for compensating the County for their review and inspection costs in accordance with the County's adopted permit and fee system in place.

Comment 171-3

- The "if feasible " caveat regarding recommended implementations should be defined. Who will determine if it is feasible? The Operator? The Engineer? The County? Can safety be disregarded?

Response 171-3

The "if feasible" language included in Mitigation Measure 4.7-6 refers to the practical implementation of slope stability recommendations, considering site conditions, engineering constraints, and regulatory requirements. Feasibility would be determined by the County-approved qualified engineering geologist or geotechnical engineer in consultation with the Operator and subject to County review and approval. As defined

by the CEQA Guidelines Section 15364, "feasible" means capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors. Safety shall not be disregarded; the mitigation measure requires that slope stability be maintained to achieve the minimum static and pseudo-static factors of safety, as explicitly stated in the mitigation measure. If a recommended action cannot be implemented, the engineer must identify alternative measures that achieve equivalent safety performance, and these alternatives would be reviewed and approved by the County.

Letter #172 February 28, 2025, Neil Thompson (Letter #3)

Comment 172-1

Mitigation Measure 4.7-7a Regarding Quarry Site Slope monitoring includes at least two open ended questions:

- The measure calls for a periodic inspection to be performed. The inspection and reporting program to be established by a County- approved engineering geologist or geotechnical engineer should specify a maximum period of time between inspections.

Response 172-1

Section 4.7, "Geology and Soils," of the Draft EIR, evaluated the potential soil stability at the project sites and offered mitigation measures, including Mitigation Measures 4.7-6, 4.7-7a, 4.7-7b, and 4.7-7c, "Quarry Site Groundwater Conditions." With implementation of these mitigation measures, these potential soils and geological impacts would be reduced to a less than significant level. The periodic inspections would occur between 6 and 12 months after site operations start. The inspections required by Mitigation Measure 4.7-7a would occur at least once a year. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.7 and supporting appendices.

As discussed in Response 65-37, the adaptive approaches in Mitigation Measure 4.7-7a, as revised in this Final EIR, adequately address the potential of pit failure and its impacts on groundwater quality and flow, and are thus sufficient under CEQA.

Comment 172-2

- It should be clear that the Operator shall pay for all inspections including County review costs.

Response 172-2

Mitigation Measures 4.7-6 and 4.7-7a require the Operator to retain a qualified geologist or geotechnical engineer to develop an inspection and reporting program for slope

stability monitoring at both the Plant and Quarry sites. Accordingly, the Operator would pay the costs associated with slope stability monitoring at the project sites. Fresno County would require the project to implement a Mitigation Monitoring and Reporting Program (MMRP) to submit all of the inspection reports and data during ongoing project operations. Determination of fees and costs associated with review of the MMRP would be at the sole discretion of Fresno County.

Comment 172-3

The "if feasible " caveat regarding recommended implementations should be defined. Who will determine if it is feasible? The Operator? The Engineer? The County? Can safety be disregarded?

Response 172-3

Section 15364 of the CEQA Guidelines defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal social, and technological factors." Consideration of safety would be encapsulated by these factors. The lead agency shall use this definition to make the determination for feasibility of implementing a measure. Mitigation Measure 4.7-6, which is sufficient to address any concerns, provides the following:

"Recommendations shall be implemented within 6 months by the Operator, if feasible, otherwise no later than one year from the publishing of the recommendations."

Comment 172-4

Mitigation Measure 4.7-7b Regarding Quarry Site Kinematic Analyses has at least one open ended questions

- The "if feasible" caveat regarding recommended implementations should be defined. Who will determine if it is feasible? The Operator? The Engineer? The County? Can safety be disregarded?

Response 172-4

Section 15364 of the CEQA Guidelines defines feasible as "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal social, and technological factors." Consideration of safety would be encapsulated by these factors. Mitigation Measure 4.7-7b requires a County-approved qualified engineering geologist or geotechnical engineer to provide feasible recommendations, if necessary, to mitigate kinematic-type failures. The engineer would determine the feasibility of any recommendations and would determine the feasibility of implementing such recommendations within 6 months or within a year.

Comment 172-5

It should be clear that the Operator shall pay for all inspections including County review costs.

Response 172-5

The Operator would pay for the costs associated with retaining a qualified geologist or geotechnical engineer, required by Mitigation Measures 4.7-6 and 4.7-7a, to carry out periodic field surveys of structural geologic data and shall apply that information to kinematic analyses of the quarry pit. Fresno County would require the project to implement a Mitigation Monitoring and Reporting Program (MMRP) to submit all of the inspection reports and data during ongoing project operations. Determination of fees and costs associated with review of the MMRP would be at the discretion of Fresno County.

Letter #173 February 28, 2025, Neil Thompson (Letter #4)

Comment 173-1

Mitigation Measure 4.10-5a Plant Site Pond Adaptive Management Program anticipates that, at the completion of the mining and reclamation work, testing will be required for at least 5 years and that remediation work may be required to obtain required water quality standards.

Mitigation Measure 4.10-5b requires that a funding mechanism be established to provide funds to pay for the work required in MM 4.10-5a although no specifics are given regarding this mechanism.

Response 173-1

The comment is noted. Mitigation Measure 4.10-5b requires the Operator to establish a funding mechanism for the Plant Site Pond Adaptive Management Program prior to the completion of mining at the Plant Site. The commenter does not specify any proposed changes to Mitigation Measure 4.10-5b.

Comment 173-2

- What would happen if the Operator ceased operations prior to the allowed limits of excavation?

Response 173-2

The Operator must comply with SMARA and the Fresno County Surface Mining Ordinance. If the Operator ceased operations prior to the allowed limits of excavation, the project sites would be required to be reclaimed in accordance with the approved reclamation plan.

Comment 173-3

- What would happen if reclamation work was not complete?

Response 173-3

If the Operator does not reclaim the project sites, the County or its contractor would utilize the financial assurances required by SMARA to reclaim the site according to the approved reclamation plan. See Section 834.4.220, subsection K of Fresno County's Surface Mining Ordinance.

Comment 173-4

- Who would be responsible to satisfy the water quality standards?

Response 173-4

The Draft EIR discusses water quality in Section 4.10, "Hydrology and Water Quality." See the Draft EIR's discussion of Impact 4.10-1 regarding the project's potential impacts on surface water quality standards during mining and reclamation. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 173-5

The Funding Mechanism should be established prior to the Approval of the Project and contributions to the fund should start and continue with each truckload of aggregate that is removed from the Plant Site.

Response 173-5

Fresno County's Surface Mining Ordinance requires the approval of a CUP, Mining and Reclamation Plan, and Financial Assurances for all surface mining operations in the County and outlines the submission requirements and processing procedures for each. (Draft EIR page 4.11-49.) The lead agency, the County, would require the Operator to establish the financial assurance cost estimate and the financial assurance mechanism as a condition of approval of the project, in accordance with the County's Surface Mining Ordinance, Section 834.4.220. The financial assurances are required to remain in effect for the duration of the surface mining operation and any additional period until reclamation is completed.

Letter #174 February 28, 2025, Neil Thompson (Letter #5)

Comment 174-1

Mitigation Measure 4.10-10a Quarry Site Groundwater Adaptive Management Program anticipates that, at the completion of the

mining, testing will be required for at least 5 years and that remediation work may be required to obtain required water quality standards.

Mitigation Measure 4.10-10b requires that a funding mechanism be established to provide funds to pay for the work required in MM 4.10-10a although no specifics are given regarding this mechanism.

- What would happen if the Operator ceased operations prior to the allowed limits of excavation?
- What would happen if remediation work was not complete?
- Who would be responsible to satisfy the water quality standards?

The Funding Mechanism should be established prior to the Approval of the Project and contributions to the fund should start and continue with each truckload of aggregate that is removed from the Quarry Site.

Response 174-1

See responses to Comment Letter #173. See also Collective Response #4b regarding liability for unforeseen damages caused by the proposed project.

Letter #175 February 28, 2025, Neil Thompson (Letter #6)

Comment 175-1

I am confused by Impacts 4.10-11 and 4.11-12 regarding the impacts to existing groundwater elevations and supplies at the Quarry Site. Both Impacts are listed as Less than Significant although MM 4.11-12 is LTS with implementation of MM 10.10- 5a and 10.10-5b.

How can that be if the residual water elevation in the Quarry at completion is at -190' BSL as shown on Figure 2-10. That 190' plus 330' equals 520' below the nominal Quarry Site elevation of 330' ASL. Either the Impacts as specified are incorrect or the residual water elevation on Figure 2-10 will ultimately be much higher.

Response 175-1

There is no Impact 4.11-12 in the Draft EIR. Based on the context of the comment, the comment apparently intended to refer to Impact 4.10-12.

Impact 4.10-11 is related to whether the project may impede sustainable management of the groundwater basin. As discussed in the Response 65-38, the alluvial sediments at the

project sites that are part of the groundwater basin have already been mined from the site. The underlying bedrock zones (i.e., the weathered rock and the hard rock units) are not within the groundwater basin. Thus, groundwater conditions within those bedrock units would not have any potentially significant impacts on sustainable management of the groundwater basin, as concluded in Impact 4.10-11.

Impact 4.10-12 addresses whether decreases in groundwater levels would result in substantial volumes of water flowing from the San Joaquin River to the Quarry Site. As discussed in Collective Response #25 and the Responses 6-12 and 6-14, the volume of water that would flow into the Quarry is a very small fraction of the flows within the San Joaquin River due to the very low permeability of the weathered rock and hard rock. Therefore, despite the anticipated reclaimed water level elevation in the Quarry of 190 ft below sea level, no significant additional inflow of water from the river into the Quarry would occur through the weathered rock and hard rock due to the very low permeabilities. Impact 4.10-12 does find that additional flow could occur through the alluvium if pumping to the recharge trenches were to cease. This potential impact is addressed through Mitigation Measures 4.10-10a and 4.10-10b.

Regarding the final elevation of the water in the quarry Pit after reclamation, an average of 285 acre-feet of groundwater and 315 acre-feet of rainfall would enter the quarry Pit per year (Draft EIR at page 4.10-112). Of this, 15 acre-feet would flow out of the quarry pit as groundwater and 585 acre-feet would evaporate each year (Draft EIR at page 4.10-112). This would result in no anticipated net inflow or outflow to the reclaimed quarry pit.

Letter #176 March 1, 2025, Brian Agbayani

Comment 176-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have a particular concern since I live in the Tesoro Viejo community just a few miles from the Cemex plant, literally on the other side of the hill. Though we are not residents of Fresno County, many of the residents in Tesoro Viejo work and shop in nearby Fresno. The residents in the Tesoro Viejo community area would almost certainly be detrimentally affected by the proposed mining activities, including the proposed daily blasting, as well as all of the other environmental impacts that have been identified with this project. The DEIR barely mentions any potential impact on area residents, even though our community is literally around the corner.

Response 176-1

The Tesoro Viejo community, and other residential communities in the project area, were evaluated as sensitive receptors as appropriate throughout the Draft EIR. As discussed in Draft EIR Section 4.1, "Aesthetics and Visual Resources," the Sumner Hill residential development within Madera County was considered in the aesthetic evaluation represented by viewpoints #12 and #13.

As shown on Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site," on page 4.13-15, four sensitive receptors (Q1 through Q4) within Madera County were selected for inclusion in the noise analysis. These receptors represent residences within the Tesoro Viejo community. As shown in Table 4.13-17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," on page 4.13-60, noise levels at each of these receptors would increase but not in excess of the applicable impact thresholds.

Furthermore, the Tesoro Viejo community is included in the evaluation of the project's cumulative impacts. See Draft EIR Chapter 5, "Cumulative Impacts," Table 5-1, "List of Nearby Projects," beginning on page 5-4. As shown in this table and on Figure 5-1, "Cumulative Projects," residential communities in the project area including those in Fresno County and the cities of Fresno and Clovis were considered in the cumulative analysis for the project, as appropriate.

See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 176-2

Given the potential impacts on the residents near the Cemex mine, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Response 176-2

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #177 March 1, 2025, Michelle Harris

Comment 177-1

I am writing to express my concern that the EIR for the 100-year permit for the CEMEX mining operation, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

I'm a staff wildlife biologist with Colibri Ecological Consulting and involved in tricolored blackbird monitoring in the Central Valley, and I find that the EIR fails to adequately address the following concerns:

Response 177-1

The comment's assertions that the Draft EIR does not sufficiently or accurately assess impacts are noted; however, the comment does not provide evidence or describe deficiencies of the Draft EIR. Please see responses to specific comments below.

Comment 177-2

1. Potential habitat destruction for endangered tricolored blackbirds and other wetland species.

Response 177-2

Noise, dust, and similar mining-related disturbances have existed for decades at the project sites due to ongoing mining operations, and the proposed excavation areas would stay within the boundaries of the currently existing project sites. In addition, because the existing mine has operated in this location for many decades, natural nesting or foraging substrates are largely absent within the project area. The project areas thus are unlikely to support nesting, or non-nesting use by birds. The proposed project affect the habitat for tricolored blackbird or other wetland species. Please refer to the Draft EIR's discussion of Impact 4.4-4, which concludes that the project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community with the implementation of Mitigation Measures 4.10-1, 4.3-2a, and 4.3-2b (Draft EIR page 4.4-55 through 4.4-58).

Comment 177-3

2. Impacts to the San Joaquin River, including water quality and groundwater depletion.

Response 177-3

The Draft EIR provides extensive discussion and analysis of resources associated with the San Joaquin River. Additionally, please see Collective Response #12 pertaining to San Joaquin River restoration efforts, Collective Response #13 pertaining to potential effects on offsite wildlife, Collective Response #14 pertaining to Swainson's hawk, Collective Response #15 pertaining to non-nesting birds, Collective Response #16 pertaining to salmon and San Joaquin River habitat, Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, and Collective Response #25 pertaining to surface and groundwater connectivity. The

comment does not address the adequacy of the Draft EIR evaluation of impacts to the San Joaquin River water quality or groundwater depletion, and no further response is warranted.

Comment 177-4

3. Whether expansion is necessary or if we as a society can learn to consume and build less.

Response 177-4

Please see Collective Response #3 pertaining to regional aggregate demand and supply. The comment does not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 177-5

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit and demand a more thorough environmental review before any decisions are made.

Response 177-5

The commenter's concerns and request are noted. The comment does not provide evidence or explain deficiencies in the Draft EIR analysis, cumulative impacts evaluation, or mitigation measures.

Letter #178 March 3, 2025, Alice and Robert Knapp

Comment 178-1

Dear Mr. Randall.

My husband and I have been members of the San Joaquin River Parkway for many years and have enjoyed wonderful experiences along the San Joaquin River and the adjoining parkway. We live in the area and have a personal interest in maintaining the integrity of the Parkway. The SJRP is committed to "PRESERVING & RESTORING San Joaquin River lands of ecological, scenic or historic significance, to EDUCATE the public on the need for STEWARDSHIP, to RESEARCH issues affecting the river, and to promote educational,

recreational and agricultural uses of the river bottom consistent with the PROTECTION OF THE RIVER'S RESOURCES."

It has come to our attention that Cemex Construction Materials is proposing an expansion of its operations near the San Joaquin River. They are requesting an extension of mining for 100 years, changing the technique from mechanical digging of sand and gravel to blasting hard rock and crushing it into gravel, and increasing the depth of the mine to 600 feet below ground surface. These requests are obviously extreme and without evidence of the effect that will manifest in the 100-year future.

Response 178-1

The commenter's opposition to the proposed project is noted for the decision-makers. See Collective Response #5 regarding the proposed duration of the use permit. The long-term effects of the proposed project are evaluated throughout the Draft EIR. See Draft EIR Chapter 5, "Cumulative Impacts."

Comment 178-2

Recently we were introduced to the CEMEX Rockfield Draft EIR (Environmental Impact Report). According to professional analysis, this report falls way short of being accurate. The consideration of wildlife, pit depth and its geologic ramifications, noise, traffic, pollution, cultural historic context, and safety issues are not addressed adequately, to mention a few. This report needs careful consideration with all parties well informed so that the best decisions are made.

Response 178-2

The project's potential impacts to wildlife are evaluated in Draft Section 4.4., "Biological Resources," while impacts related to the proposed pit depth and geology are evaluated in Draft Section 4.7, "Geology and Soils." The project potential impacts related to noise and traffic and evaluated in Draft EIR Section 4.13, "Noise,' and Section 4.17, "Transportation," respectively. Potential impacts to cultural and historic resources are evaluated in Draft EIR Section 4.5, "Cultural Resources," and Section 4.18, "Tribal Cultural Resources." Finally, the project's potential impacts related to public safety are addressed primarily in Draft EIR Section 4.9, "Hazards and Hazardous Materials." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response. See also Collective Response #30 regarding traffic and pedestrian safety.

Comment 178-3

The idea that you would grant 100 years of mining to this business is unconscionable. A decision affecting generations to come when no one knows what this kind of mining will do to the environment! Please explain why 100 years is even being considered.

Response 178-3

See Collective Response #5 regarding the proposed duration of the use permit. The effects of the proposed mining operations are disclosed in the Draft EIR and its technical appendices. The comment is noted for the decision-makers.

Comment 178-4

The surrounding area around CEMEX is land devoted to stewardship and recreation. The CEMEX proposal is the exact opposite.

Response 178-4

See Collective Response #27 regarding potential operational impacts on users of the parks and trails adjacent to the project sites. See also Collective Response #21 regarding the assertion that the project sites should be publicly accessible parkland.

Comment 178-5

None of us are opposed to sand and gravel operations if they are situated in the right location. I cannot imagine a more wrong location for an operation of this nature that reflects so negatively on the San Joaquin River and the surrounding area, if approved.

Thank you for the opportunity to comment and we trust that this ill-founded proposal will be denied.

Response 178-5

The comment is noted for the decision-makers.

Letter #179 March 1, 2025, Carol Labbe

Comment 179-1

The more that I review the EIR the more frustrated that I become that this type of project would even be considered in our backyard!

CEMEX has already destroyed the wonderful landscape from Friant Road and minimized access to the San Joaquin River for the citizens of Fresno County. Now they want to start blasting and drilling to

ungodly depths of 600 feet right near the river for the next 100 years!

Response 179-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The comment references the existing baseline conditions in the project area which are not evaluated in the Draft EIR.

Comment 179-2

What could possibly go wrong? We are already cursed with air and water pollution and now they want to increase noise, dust, shock and vibration that will make us feel as though we are in a combat area. We will add to the pollution of water, air

Response 179-2

The baseline conditions in the project area related to air quality and water quality as well as the project's potential impacts on these resources are described in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality," as they are updated in this Final EIR. See also Collective Response #9 regarding the project's potential effects on the region's existing air quality.

The project's proposed blasting operations are described in the Draft EIR under Section 2.5.2.2, "Quarry Site Mine Plans," on page 2-42. Blasting would be limited to one to two blasts per week on weekdays between the hours of 10 a.m. and 2 p.m. The effects of noise and vibration from these blasting events are evaluated in Draft EIR Section 4.13, "Noise," and also Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response. See also Collective Response #27 regarding the project's potential operational impacts on adjacent parks and trails.

Comment 179-3

and increased traffic which will cause more chaos, as these huge trucks enter and exit Friant Road!

Response 179-3

The issues of traffic congestion and safety are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #30 regarding traffic safety.

Comment 179-4

All of this increased pollution will have a tremendous impact on all forms of life.

A relevant anecdote; a few days ago a neighbor cut down a tree that was leaning on a fence. We noticed that the squirrels and birds were going crazy dashing around looking for their home and the next day they were gone. Some like CEMEX might call this progress! We call it destruction!

Response 179-4

The comment is noted.

Comment 179-5

Cemex has the audacity to use terms like:

LTS = Less than Significant; PS = Potentially Significant; S = Significant; SU = Significant and Unavoidable Oh and they use the initials NI which is not defined but I can only assume to mean No Impact or Not Important.

I have to ask who made them so authoritarian!

Response 179-5

The Draft EIR was prepared by a County-retained consultant and all Operator-prepared technical studies supporting the Draft EIR were peer reviewed by County-retained experts to confirm their methods and conclusions. The entire Draft EIR, including the technical appendices, represent the independent judgement of the County as the CEQA lead agency.

The level of significance terms referenced in this comment are standard terms established in CEQA and the CEQA Guidelines and routinely used in environmental impact reports. To confirm, the abbreviation "NI" does stand for "No Impact." The No Impact determination is reserved for issues where the analysis indicates that the project would have no potential to effect the resource being evaluated. For instance, a project would have no potential to affect coastal resources if the site is located inland, away from the coastal zone.

Comment 179-6

First of all, the area would not be so unpleasant if they were never here. This probably would be a community park giving access

to the public to enjoy the great outdoors. Something we are lacking in our county!

Or maybe remained as farmland where the owner lived in harmony with nature.

Response 179-6

The comment describes existing baseline conditions which are not evaluated in the Draft EIR. See Collective Response #21 regarding the assertion that the project sites should be publicly accessible parkland.

Comment 179-7

Who set the standard for LTS? There is no measurement that defines the level of significance and the threshold for the issue to become significant! My favorite is SU which equals "Significant and Unavoidable". I would argue that it is totally avoidable if they were to leave the area and return it to its natural state.

Oh but they can't as they have already stripped the land barren removing all of the topsoil and leaving us with a dust factory!

Response 179-7

The Draft EIR provides clear thresholds of significance for each resource area within the respective sections of Chapter 4, "Environmental Analysis." For example, the applicable thresholds of significance for air quality are presented in Section 4.3.3, "Significance Thresholds and Analysis Methodology, " (see Appendix D-4, "Revised Section 4.3, Air Quality").

The significant and unavoidable finding indicates that an impact cannot be fully mitigated and would be significant and unavoidable if the project is approved and implemented. The effects of the "No Project" alternative, which assumes that the project is not approved or implemented, are disclosed in Draft EIR Chapter 6, "Alternatives." Upon completion of mining operations, whether the project is approved or denied, the project sites would be reclaimed to an end use of open space and freshwater habitat per the project's Surface Mining and Reclamation Plan (see Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan").

Regarding dust produced during the operation of the project, the technical analysis was updated with new information, as described in the revised *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), including the preparation of a Fugitive Dust Control Plan.

Comment 179-8

Many of the impact statements are listed as Potentially Significant with mitigation occurring during the implementation phase, so our great-grandchildren may see the results in 100 years! What a travesty!

Response 179-8

The timing of each mitigation measure presented in the Draft EIR is provided in the text of the individual measure and are also detailed in the project's Mitigation Monitoring and Reporting Program (MMRP), which will be considered for adoption in conjunction with project approval. The comment is noted for the decision-makers. Comment 179-9

The word blasting appears 317 times in the EIR Summary. The following is an excerpt from the EIR

"However, the proposed project would introduce blasting to the Quarry Site. Blasting generates groundborne noise and vibration that could impact fish in the San Joaquin River."

Response 179-9

See Collective Response #16 regarding the effects of blast-induced ground vibration and the Alaska-based study that is referenced in the Draft EIR.

Comment 179-10

They go on to refer to an Alaska Department of Fish and Game comment that showed no impact to the Salmon in that study. Yet they provide no details on the conditions and use of the explosives. Were they blasting 200 feet from the river to depths of 600 feet? I would suggest that Fresno County and California Fish and Game provide their own study.

Response 179-10

See Collective Response #13 regarding blasting noise effects on wildlife on surrounding properties and Collective Response #27 regarding blasting noise effects on users of adjacent parks and trails.

Comment 179-11

The EIR does state that the noise level would exceed the limit of 85 dB with lasting level of 140 dB which is the threshold for pain! I'm sure that they will protect their workers, but what will that do to all of the wildlife in the area and the surrounding neighborhoods who are trying to enjoy a peaceful afternoon outside.

Will it cause damage to nearby homes, or maybe weaken the nearby Millerton Dam.

Response 179-11

The issue of noise is addressed in Draft EIR Section 4.13, "Noise." The comment seems to refer to Draft EIR page 4.13-26, second paragraph, which describes the regulations of the Occupational Health and Safety Administration (OSHA) related to worker exposure to excessive noise levels. This discussion of existing regulations does not describe the project's anticipated operational noise levels. As discussed in Impacts 4.13-1 through 4.13-4 beginning on Draft EIR page 49, with mitigation, the project's anticipated operational noise levels would be below applicable County noise standards at the nearest sensitive receptors. Impact 4.13-6, beginning on Draft EIR page 4.13-65, specifically addresses potential impacts resulting from groundborne or airborne vibrations from blasting events and would be less than significant with implementation of Mitigation Measure 4.10-1. This measure requires implementation of the proposed Blasting Protocols (provided as Draft EIR Appendix H-6, "Blasting Protocols" and updated in Appendix H-9, "Revised Blasting Protocols") that provide a range of measures intended, in part, to minimize offsite noise and vibration impacts. These measures include implementation of a blast monitoring program that would adjust the blasting design based on monitoring data thus ensuring vibration levels do not exceed thresholds or otherwise have the potential to cause damage to surrounding structures. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13 and supporting appendices.

See Collective Response #27 regarding potential effects of blasting on users of nearby parks and trails. See also Collective Response #13 regarding potential effects of operational noise on wildlife in the surrounding area.

Comment 179-12

We moved to Fresno 28 years ago because it was a great place to live; it offered great scenery, access to the mountains in a pleasant surroundings. Please don't let a Foreign LLC like CEMEX spoil it for profit!

The community needs support from our County officials.

Response 179-12

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #180 March 2, 2025, William A. and Deborah Dotson

Comment 180-1

Hello - as long time residents of Fresno (26 years in this location) - specifically near the intersection of Friant and Fort Washington, we are vehemently opposed to any further activity by CEMEX.

Between the noise, the dust, the traffic, and disturbances caused by the large trucks rumbling up and down Friant, we can't believe that our Fresno legislators would even consider any request from CEMEX to blast a giant hole in their location beyond what they have now and increase their activity. We should be considering closing them down, not providing them a reason to stay and grow.

Please vote NO to stop this travesty.

Response 180-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The comment references various existing conditions in the project area including noise, dust, and traffic attributed to the existing operations and truck trips. Existing and proposed traffic conditions are described in Draft EIR Section 4.17, "Transportation." See Table 4.17-11, "Estimated Annual Average Daily Trip Generation at Plant Site and Quarry Site," on page 4.17-28. However, existing traffic conditions are part of the baseline conditions in the project area and are not evaluated in the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #6 regarding common operational nuisance complaints such as noise, dust, and traffic congestion.

Letter #181 March 2, 2025, James Durando

Comment 181-1

The DEIR says that "Best Practices" for the control and mitigation of fly rock from rock blasting and the mitigation of groundwater and surface water contamination from the use of explosive products are in place. What are these best practices that are mentioned? There is no explanation of the methods or manners of these "best practices".

Response 181-1

Blasting protocols are presented in Appendix H-9, "Revised Blasting Protocols," in a blasting protocol document that summarizes the monitoring, control and reporting requirements for ground vibrations and air overpressures emitted from blasting at the

project sites. In addition, the blasting protocol document provides "Best Practices" for the control and mitigation of flyrock from rock blasting and the mitigation of groundwater and surface water contamination from the use of explosive products. The Blasting Protocols are referenced and summarized in the Draft EIR (e.g., see Impact 4.9-4 on pages 4.9-19 through 4.9-21; see Impact 4.10-1 on pages 4.10-88 through 4.10-92).

Comment 181-2

What are the specific blasting protocols that will be used to prevent the contamination of groundwater and surface water because of blasting? It mentions explosive products but not what they are. Each type of explosive product will produce its own type of contaminants for ground and surface water. What are the actual explosive products that will be used? What are the byproducts of the explosion that will contaminate the ground water and surface water?

How will the contaminant levels be monitored and by whom? What is the plan to mitigate the contamination of the water table and surface waters? What health concerns can be caused by the contaminants left if the water?

Blasting agents need to be identified in this DEIR. "The use of blasting agents has the potential to contaminate groundwater with nitrates and other chemicals, such as petroleum hydrocarbons, if not managed properly." This is a nonresponse as to what the blasting agents will be. The DEIR states that dynamite will not be used. What will be used to do the blasting? Virtually any blasting agent will produce nitrates and other chemicals. Nitrate and nitrite water contamination are major health issues with drinking water. How will this be minimized or avoided completely? The mention of soil type for the effects of the blasting agents will be hard rock granite. Are there any datasets of tests with this DEIR for that type of rock which is found in the quarry site.

Response 181-2

The proposed blasting protocols are described in detail throughout the body of the Draft EIR, and within the Blasting Protocols report included in Appendix H-6 of the Draft EIR. See Chapter 3, "Draft EIR Errata," and Appendix H-9, "Revised Blasting Protocols," for revisions to the Blasting Protocols. In accordance with Mitigation Measure 4.10-1, the Operator shall at all times implement the requirements of the "Blasting Protocols", which strictly dictates the size, location and design of onsite blasting, as well as the best management practices (BMPs) and monitoring requirements to be implemented during blasting. The Blasting Protocols also dictates specific BMPs to be implemented to ensure

onsite blasting would contaminate groundwater or surface water. See also Responses 12-75, 58-46, and 65-30 which adequately address the Blasting Protocols and Mitigation Measure 4.10-1.

Multiple studies have been completed about the effects of blasting on groundwater, which all concluded that there are no significant long-term chemical or mineralogical changes observed in groundwater that could be attributed to blasting (see discussion of Impact 4.9-2 in the Draft EIR). With the implementation of Mitigation Measure 4.10-1 (which also requires implementation of Blasting Protocols), the potential for release of hazardous materials due to blasting would be less than significant (Draft EIR page 4.9-17). The Blasting Protocols would also prohibit the storage of explosives on-site, and the explosives would be delivered to the site once or twice per week by a licensed or qualified blasting contractor to ensure complete detonation and the management of the remaining fragments after the blast to prevent interaction with stormwater and compliance with all relevant regulations, including the California Fire Code, Cal/OSHA Mine Safety Orders, and applicable CUPA programs related to hazardous materials storage and handling. Unused explosives and detonators would be returned to the blasting contractor's secure off-site magazines. As discussed in the Draft EIR, blasting agents typically used for mining include both an oxidizer and an accelerant, generally in the form of nitrate-based compounds and flammable liquids. Implementation of Blasting Protocols would minimize the risk of substantial groundwater water quality degradation by expanding blasting activities on the Quarry Site. See Response 6-15 regarding groundwater quality at the project sites.

Comment 181-3

According to the DEIR "Studies have concluded that there are no significant long-term chemical or mineralogical changes observed in groundwater that could be attributed to blasting." Where are the results of those studies? Is this data described in one of the many tables included in the DEIR. "In one study, water samples were taken in the same hole that explosives were detonated in, and no change in water quality due to the decomposition products of the explosives could be discerned from the analysis." Not possible for the water to be unchanged. Is there evidence of the water samples before and after the detonation? Statements need to be supported by data. Were there other impacts on the water quality due to products other than "decomposition products"? This statement in the DEIR may not be completely accurate or transparent.

Response 181-3

The quoted statements from the Draft EIR provided in this comment, which appear on both page 4.9-18 and page 4.10-100 of the Draft EIR, also include citations for three specific studies upon which the discussion and analysis is based (these being Bond (1975), Berger (1980), and Beaver (1984). Despite the conclusion that it is unlikely that blasting would result in impacts to groundwater quality, the Draft EIR includes Mitigation Measure 4.10-1 which requires implementation of the Blasting Protocols presented in Appendix H-6 and updated in Appendix H-9, "Revised Blasting Protocols." Those Blasting Protocols include a Groundwater and Surface Water Contamination Mitigation Plan.

Comment 181-4

This DEIR indicated that "Ground vibration at the closest residential/commercial structures, the closest wells, and at several locations along the crest of the East side of San Joaquin River embankment is (are) monitored with digital seismographs."

What were the results for the East side of the San Joaquin River embankment? Where is the data for ground vibration and an explanation of those results? This is a critical area of concern in this DEIR for the quarry site. A breech in the embankment or subsurface flow between the San Joaquin River and the quarry pit would be catastrophic. Where are the results of this monitoring? Where were the seismographs situated? When was this done? Which residential/commercial structures were monitored? Is there a map with these locations marked. Are the results of the monitoring for each site available and explained? There should be data from their study that can be shared with the public. Over what period were these tests run? There is no mention of what type of vibration was being measured. How was the vibration generated? Was it ground vibration from blasting, using similar charges that would be detonated in the quarry? Was it monitoring ground vibration from natural ground movement? This is not clearly stated what was being measured and how it was being measured with the seismographs. This nonspecific description leaves many questions unanswered.

The DEIR states "The data is closely analyzed and logged into a spreadsheet program to track the readings and to build a dataset that can be used to further track the frequency of the vibration time histories, predict the vibration levels, and make adjustments to the blast plan as blasting progresses." That is a horribly long run on sentence! There are no mentions of how any of the data will be utilized. How will it be analyzed? How will tracking the "readings frequencies of vibration" be used to predict vibration

levels and allow for the blast plan to be adjusted? What criteria from the vibration data would be used to adjust the blasting plan? Logging data with no explanation of how it will be analyzed and used does not explain the purpose of this vibration monitoring.

Response 181-4

There is currently no blasting at the project sites, therefore there is currently no monitoring or collection of vibration data. A report entitled, *Blast Impact Analysis CEMEX – Rockfield Quarry, Fresno, California dated September 9, 2019*, by Vibra-Tech details the ground vibration criteria for the protection of the river embankment, wells and structures (Appendix H-3, "Blast Impact Analysis," of the Draft EIR). The report gives maximum allowable scaled distances for each receptor location to meet the criteria limits. These allowable scaled distances were determined based on standard attenuation equations shown in equations 1 and 2 of the report (Draft EIR at pages 4.13-47 and 4.13-48).

The ground vibration criteria for nearby structures and the ground vibration criteria for the embankment are variable particle velocity vs. frequency criteria. As blasting gets closer to a particular off-site receptor such as a structure, well, or the river embankment, it would be important to understand the ground vibration amplitude vs. distance relationship along with the corresponding frequency. By collecting peak particle velocity and scaled distance data, it is possible to use least squares regression analysis to predict and control future vibration levels. The mitigation or control comes by changing the charge weight (adjustments to the blast plan) the for a given distance to maintain ground vibrations below the criteria. Blast timing analysis can also be undertaken to control ground vibration frequency.

Further, Mitigation Measure 4.10-1, shall be implemented at all times. To ensure that actual ground vibrations match the projected vibrations, the Mitigation Measure 4.10-1 requires that blasting begins at the center of the Quarry Site so that monitoring of groundborne vibration can occur and confirm that predicted maximum ground vibrations are consistent with actual ground vibration measurements (Draft EIR at page 4.13-66). This mitigation measure would reduce the effects of ground or airborne vibration as a result of blasting to a less than significant level.

Comment 181-5

Air Pollution is a concern in the San Joaquin Valley and even more so in the area around the Plant site and Quarry site. The geography of this localized area in a trough with elevated hills on both sides that produce an elongated bowl. Fog settles in this area in the winter and dust and other particulate accumulate there as well. Potential emissions for the project include ROG, NOx, CO, SOx,

PM10, and PM2.5. Individually or in combination these can create long-term health effects. It seems that monitoring of these emissions has not been done directly on either site. The data that has been shared in the DEIR may not be accurate. Are there tests that have been performed on the sites that shows these specific emissions and their levels in situ? Were tests run at various times of the year under varying conditions?

Response 181-5

The air quality and health risk models incorporate five years of hourly meteorological data and terrain elevation data that are representative of the conditions in the area. Emissions of particulates were speciated into toxic components and assessed in the health risk assessment. After mitigation, health risks from the project are less than significant. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment") including additional dispersion modeling. This updated model showed that after mitigation, the project would have a less than significant impact in regard to criteria pollutant emissions. See Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4, "Project Impacts and Mitigation Measures." See also Collective Response #11 regarding analysis of the population-wide cancer burden of the project. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 181-6

The effects of the emissions and PM10 and PM2.5 for various sources can have dramatic health on people. The DEIR lists how pollutants can affect health but neglects to indicate what levels of the contaminants will cause adverse effects. Their operations will have a negative impact on the health of the people of Fresno county. The mitigation of PM2.5 does not seem to be adequate and many of the vehicles and the operations of the quarry and plant sites will generate PM2.5. PM2.5 exposure is very dangerous with many negative outcomes. How

does the mitigation plan for PM2.5 reduce the risk to people in the area?

Response 181-6

Contrary to the assertion in the comment, the Draft EIR indicates what levels of the contaminants would cause adverse effects beginning with Table 4.3-1, "Ambient Air Quality Standards," which contains the ambient air quality standards including

standards for PM_{10} and $PM_{2.5}$. The Draft EIR goes further to speciate the toxic components in PM_{10} and $PM_{2.5}$ and performs health risk assessment to evaluate the acute and chronic non-cancer risks and cancer risk associated with the particulates generated by the project. Although the commenter incorrectly claims the "operations will have a negative impact on the health of the people," as shown in Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently emitted. The claim that $PM_{2.5}$ mitigations "do not seem to be adequate" lacks a basis or even suggestion of mitigations that may be needed. The health risk assessment provides those answers. Appendix D-4, "Revised Section 4.3, Air Quality," Table 4.3-25, "Mitigated Project Health Risk Impacts," shows that with implementation of the project's mitigation measures the health risk levels would be less than significant.

Additionally, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Technical Report* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan and additional modeling. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Letter #182 March 2, 2025, Danielle Grassi

Comment 182-1

I am writing to express my concern about the Rockfield Expansion Project. Particularly the idea of blasting the hard rock and increasing the depth of the mine. The San Joaquin River is one of the few nice areas of wildlife we have to enjoy in Fresno. Mining operations will impact wildlife, air quality, and cause irreversible damage to the watershed. I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Response 182-1

Potential impacts to wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." Potential impacts to air quality are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). Potential impacts to the watershed that encompasses the proposed project are evaluated in Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 182-2

Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 182-2

See Collective Response #1 regarding transparency and the County's processing of the proposed project.

Letter #183 March 2, 2025, Robert Hills (Letter #1)

Comment 183-1

I do not see in the eir [sic]who will be responsible financially for the increased accidents on Friant road. Will Cemex take responsibility, or will the county be responsible. If the traffic on Friant cannot be mitigated because of lack of funds to correct, why would the project be allowed to move forward until the funds are available. The EIR should not be allowed to skirt this issue, nor should the county in good faith condone this issue.

Response 183-1

See Collective Response #29 regarding the project's potential traffic impacts and associated mitigation measures regarding road improvements. See Collective Response #30 regarding traffic safety.

Letter #184 March 2, 2025, Robert Hills (Letter #2)

Comment 184-1

In the EIR they allude to the fact that they are already tearing up the environment, so it somehow justifies continuing to do so. How does this pass the smell test. How can Cemex justify this. They should be made to go back and justify these areas in a direct fashion, or admit that they cannot be mitigated [sic].

Response 184-1

In accordance with CEQA, the Draft EIR describes the existing conditions of the project sites at the time the Notice of Preparation (NOP) is released for public comment and evaluates the project's effects on those existing conditions.

Letter #185 March 2, 2025, Robert Hills (Letter #3)

Comment 185-1

I am concerned that Cemex is using the bait and switch approach. Attempting to get something outlandish passed (100 years and 600 ft.) and then accepting something less to appear as accepting a compromise. This is not acceptable and should be dismissed for what it is. The integrity of the San Joaquin river is to precious to gamble with its future [sic].

Response 185-1

See Collective Response #5 regarding the duration of the proposed use permit. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #186 March 2, 2025, Robert Hills (Letter #4)

Comment 186-1

If and when wells run dry in the area, who will be responsible to purchase the properties at fair value sinse their properties will become worthless. Will the county for approving a shady project or will cemex do the right thing.

Response 186-1

See Collective Response #4b regarding liability for unforeseen damages caused by the proposed project. See also Collective Responses #24 through #26 for further discussion of the project's potential impacts to groundwater levels.

Letter #187 March 2, 2025, Robert Hills (Letter #5)

Comment 187-1

Since this project should have been shut down many times, I do not beleive the job issue should be a consideration. The workers on the site have known for many years that their jobs should be coming to an end. I am sure Cemex will have a nice severence package for the workers. How many years do their jobs have to be guaranteed? They have already been extended many times. This issue should not

overshadow the protection of the San Joaqin river, the tranquility of the area and the greater good for the population of Fresno. I do have empathy for the loss of jobs.

Response 187-1

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers. See Collective Response #12 regarding the project's potential effects on river restoration projects in the region.

Letter #188 March 2, 2025, Robert Hills (Letter #6)

Comment 188-1

Cemex needs to hire an indepent engineering firm to be on site whenever their is activity at the mine.

Response 188-1

Mitigation Measures 4.7-6 and 4.7-7a, presented on Draft EIR page 4.7-32 and page 4.7-35, respectively, would require the Operator to retain a County-approved qualified engineering geologist or geotechnical engineer experienced in evaluating the stability of slopes in alluvial materials to develop and implement an inspection and reporting program on both project sites. Mitigation Measure 4.7-7b further requires the retained geologist or engineer to carry out periodic field surveys of structural geologic data at the Quarry Site during mining excavations and complete kinematic analyses until it can be assured that the geologic conditions on the site are consistent.

Comment 188-2

Cemex has been fined for all kinds of violations at many sites. Both ommision and commission [sic].

Response 188-2

See Collective Response #4a regarding CEMEX's regulatory compliance history.

Comment 188-3

When there is a infraction, the mine needs to be shut down until the issue is remidied and whatever fines necessary are paid. If there is not a remedy, then the project needs to be shut down, and the land be brought back to its natural state. This has been the plans for many years.

Response 188-3

Violations at the proposed project and other mining operations in Fresno County are regulated under applicable provisions of the Fresno County Ordinance Code and the Surface Mining and Reclamation Act (SMARA), which states that if an operation is not in compliance with County requirements or the applicable use permit or reclamation plan,

the County would follow the procedures set forth in SMARA (PRC Section 2774.1 and Section 2774.2) concerning violations and penalties, as well as applicable County enforcement provisions, including those related to revocation of a conditional use permit. Should the County fail to comply with the provisions of SMARA, the State Mining and Geology Board (SMGB) may take action to assure compliance through administration of SMARA.

Letter #189 March 2, 2025, Robert Hills (Letter #7)

Comment 189-1

The proposal for the extended land use and the time duration of the project is not realistic.

Response 189-1

See Collective Response #5 regarding the duration of the proposed use permit.

Comment 189-2

How does cemx propose to protect Lost lake. How does it propose to protect it from noise, air pollution [sic], and the protection of the wildlife. Wildlife does not respond well to noise, as well as humans.

Response 189-2

The proposed project's potential noise impacts on surrounding uses are evaluated in Draft EIR Section 4.13, "Noise." See Collective Response #27 regarding the project's potential operational effects on users of adjacent parks and trails, such as the Lost Lake area.

The proposed project's potential air quality impacts are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Chapter 3, "Draft EIR Errata." All project air quality impacts were determined to be less than significant with implementation of the provided mitigation measures.

The proposed project's potential effects on wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." See also Collective Response #13 regarding the project's potential effects on wildlife located on adjacent properties, such as the Lost Lake area.

See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 189-3

Cemex proposal to allow a trail to go through their property is not only ludirous but also dangerous.

Response 189-3

The issue of hazards to humans from the proposed project is addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." See Impact 4.9-4 on page 4.9-19 regarding hazards associated with flyrock from blasting events. Implementation of the Flyrock Mitigation Plan established by the Blasting Protocols for the project (see Mitigation Measures 4.10-1) would reduce this impact to a less than significant level. See also Collective Response #27 regarding the potential effects of project operations on the users of adjacent parks and trails.

See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.9. See also Response 58C-3 for further discussion of the blasting protocols required by Mitigation Measure 4.10-1.

Comment 189-4

Many other areas have enhanced their proximity to a river for the enjoyment of their citizens. Why would Fresno not want to embrace the river, instead of abusing it.

Response 189-4

See Collective Response #21 regarding the assertion that the project sites should be publicly accessible parks.

Letter #190 March 2, 2025, Robert Hills (Letter #8)

Comment 190-1

I am not aware if the IRA considered anything with the tribal community. I am aware that the tribal community at Table Mountain are trying to get access to the sight. At this time I am told Cemex is not coorperating. If a company cannot be transparent, they can not be trusted. How does Cemex plan to address the issue?

Response 190-1

The County has and will continue to coordinate with Table Mountain Rancheria as required pursuant to CEQA and for a respectful government-to-government relations. See responses to Comment Letters #50 and #52, each submitted by representatives of the Table Mountain Rancheria. The comment does not address the adequacy of the Draft EIR,

nor does the comment provide evidence of issues associated with tribal coordination involving the County.

Letter #191 March 2, 2025, Robert Hills (Letter #9)

Comment 191-1

If this project does go through, since Cemex is a LLC, they should have to put up a huge bond. What amount do they propose to put up so the county tax payables are not stuck paying for their folly. It also needs to be tied to inflation, as time passes it will be worthless. It should be reviewed and accessed on a yearly basis. Has Cemex addressed these issues and has it agreed to an realistic bond tied to inflation.

Response 191-1

See Collective Response #4b regarding liability for unforeseen damages caused by the proposed project.

Comment 191-2

Please remember Cemex has had compliance issues in other locations. Actually, their past record alone should negate the county from even considering any agreement, particularly for a 100 years.

Response 191-2

See Collective Response #4a regarding CEMEX's regulatory compliance history.

Comment 191-3

Do laws in Mexico prohibit this type of mining?

Response 191-3

See Collective Response #4b regarding the legality of the proposed mining methods.

Letter #192 March 2, 2025, Robert Hills (Letter #10)

Comment 192-1

I did not see anything to address the large numbers of bike riders on Friant road.

Response 192-1

Please see Collective Response #30 pertaining to roadway safety, including discussion of bicyclists' use of Friant Road.

Comment 192-2

I am somewhat disappointed in the vagueness of the EIR considering all the extentsions [sic] that they have had. They need to study the consequenses [sic] of air quality, noise and safetjy [sic] of the bike riders.

Response 192-2

Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), evaluates potential air quality impacts of the proposed project and Draft EIR Section 4.13, "Noise" presents evaluation of potential noise impacts of the project, including noise impacts associated with predicted project-related traffic noise levels. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. The comment does not provide evidence that the Draft EIR analysis of these topics is deficient. Please also see Collective Response #30 pertaining to roadway safety, including discussion of bicyclists' use of Friant Road.

Comment 192-3

Will the Cemex trucks just bully themselves into the 2nd lane to avoid the riders who often ride double file. The law says traffic has to stay 4 feet away from the riders. They do not make any exceptions when the bikers are riding double file on the line. This also makes it dangerous for the traffic in the passing lane when the trucks pull over into their lanes. I see it often.

Response 192-3

Please see Collective Response #30 pertaining to roadway safety, including discussion of bicyclists' use of Friant Road.

Letter #193 March 2, 2025, Robert Hills (Letter #11)

Comment 193-1

I do not see any remedy for the folks that have their windshieds broken by the gravel left on the road and coming off the trucks. This has been a historical issue with Cemex. With all the cameras and so forth, windshields are $500.00 a pop. Maybe the cars effected could enter Cemex's property and someone cut them a check for $500.00 to remedy the problem Cemex has caused them. Also it is dangerous for bike riders.

Response 193-1

See Collective Response #30 regarding vehicle damage from CEMEX trucks.

Letter #194 March 2, 2025, Krystle Hollingsworth

Comment 194-1

As a Fresno resident I am concerned about the effect this blast will have on our environment as well as the wildlife in the area. Please STOP the proposed Lost Lake blast.

Response 194-1

The project's potential impacts to wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." Each of the impacts identified in this section were determined to be less than significant with implementation of the mitigation measures provided. See Chapter 3, "Draft EIR Errata," for revisions to this Draft EIR section. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #195 March 2, 2025, Ariana Murillo

Comment 195-1

I hope this finds you well. I am reach outing to you as a concerned citizen and a Native American woman. It has come to my knowledge about the CEMEX expansion that will put in danger wildlife, the river and the surrounding lands. As you may know Fresno County is Yokut land, and the Native American community has always been protectors of this land since for thousands of years the Native population have survived off the land. This land has beautiful history tied to it and therefore I do not want this expansion to happen knowing the dangers it will cost to the wildlife, the land, to the Native American Community, and the Fresno County public.

Response 195-1

See Draft EIR 4.18, "Tribal Cultural Resources," for an evaluation of the project's potential effects on sites and objects with cultural value to local tribes. Potential impacts to wildlife are addressed in Draft EIR Section 4.4, "Biological Resources," while potential impacts to the San Joaquin River are primarily addressed in Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections.

Letter #196 March2, 2025, Leigh-Ann Olsen

Comment 196-1

Thank you for taking comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. As an environmental science teacher in Fresno County and avid user of

the San Joaquin River for birding and student opportunities, I wanted to share my concerns about

the expansion of the CEMEX mining operation.

The river provides several ecosystem services such as aesthetics, habitat for several species, clean water, temperature regulation, stabilization of soil, and a place for people to experience natural spaces close to where they live. Most of our valley is industrialized or agriculturalized. It's hard to find unadulterated natural spaces close by.

I have seen numerous bird species that utilize the river along with river otters, muskrats, several fish species, and many more! These species are so amazing to witness and would be impacted by your proposal.

Mining operations are important for economical reasons and I understand that, however they should be done responsibly so as not to impact those who depend on the ecosystem services provided by this important river.

Response 196-1

The commenter's concerns regarding the proposed project are noted for the consideration of the decision-makers. The project's potential effects on wildlife are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to this Draft EIR section.

Comment 196-2

On top of our water resources, air quality can be heavily impacted by the dust and particulates as a result of increased mining. Our air quality has historically been one of the worst but it IS improving! Why should we go backwards? We have high rates of asthma and will still be suffering from the impact of wildfires in California. Do we really want to add to that issue?

Response 196-2

Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), evaluates potential air quality impacts of the proposed project. See Chapter 3, "Draft EIR Errata." See also Collective Response #9 regarding the project's potential effects on the region's existing air quality. The comment is noted for the consideration of the decision-makers.

Comment 196-3

My students will be doing water quality studies along the river this year and over the next few years. I was hoping to use the San Joaquin as an example of a cleaner river than our closer Kings River so we could compare the two. If this proposal goes through I would hate to have to explain to future students why they may see declining results.

Response 196-3

The project's potential effects on surface water quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for revisions to this Draft EIR section. The comment is noted for the consideration of the decision-makers.

Comment 196-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Response 196-4

A range of feasible alternatives to the proposed project are evaluated in Draft EIR Chapter 6, "Alternatives." No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 196-5

Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 196-5

See Collective Response #1 regarding transparency in the County's processing of the proposed project application.

Letter #197 March 2, 2025, Denise Taylor

Comment 197-1

I am writing to express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the Draft

Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas. As someone familiar with the location, I find that the EIR fails to adequately address the following concerns:

1. The Swanson's hawk has a right to not only exist, but to flourish. With this project the hawk's very existence will be in peril. Its habitat and ability to breed will be significantly impacted by the project's blasting, excavating, and trenching as well as by the use of heavy construction equipment.

Response 197-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #14 regarding the project's potential effects on Swainson's hawk.

Comment 197-2

2. The serious harm to the Chinook Salmon because of blasting.

Response 197-2

The project's potential effects on salmon resulting from blasting are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-1 beginning on Draft EIR page 4.4-48. See Chapter 3, "Draft EIR Errata," for revisions to this Draft EIR section. See also Collective Response #16 regarding the effect of blasting-induced vibration on salmon.

Comment 197-3

3. Blasting and digging could destabilize the underlying soil and rock layer.

Response 197-3

The project's potential effects related to slope and ground stability are evaluated in Draft EIR Section 4.7, "Geology and Soils." See Impact 4.7-3 beginning on Draft EIR page 4.7-28. See also Chapter 3, "Draft EIR Errata," for revisions to this Draft EIR section.

Comment 197-4

4. Very little is known of the synergy of living ecological systems. Wildlife and the microbial organisms that support them are at risk of irreparable harm if a 600-foot deep pit is blasted or dug.

Response 197-4

The project's potential impacts to wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." No species of microorganisms are currently protected under existing federal or state regulations and were not evaluated in the Draft EIR. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4. The comment is noted for the decision-makers.

Comment 197-5

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations. I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Response 197-5

The Draft EIR provides a comprehensive evaluation of the project's potential environmental effects and meets the requirements of CEQA.

Letter #198 March 2, 2025, Alexis Torres

Comment 198-1

Fresno has been one of the best places I've ever been to in the US. The land scapping, green trees, and surrounding mountains is what makes Fresno a beautiful place to live in. I've always appreciated how the community's in Fresno love our few and only locations of nature. I asked you to press cancel on this project so we can continue to appreciate the amazing city of Fresno and we can push the agenda of a cleaner city even more now than ever.

Response 198-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #199 March 3, 2025, Kerry Allred

Comment 199-1

I am writing to express my opposition to the proposal on the expansion of the Cemex open mining on the San Joaquin River. To allow hard rock blasting, or a 600 foot deep pit, or blasting for the next 100 years is absolutely destructive to the environment and will have repercussions far beyond our life term. I strongly urge a NO stance.

Response 199-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #200 March 3, 2025, Beth Arrindell

Comment 200-1

I am writing to express my deep concerns and strong objection to the findings in the aesthetics section of the Draft Environmental Impact Report (EIR) for the CEMEX Rockfield Modification Project. As a long-time resident of Fresno, I frequently visit Lost Lake Park, and hike in areas surrounding the planned Quarry Site. This project, as currently proposed, will cause irreparable harm to the scenic vistas and visual character of the surrounding area.

Response 200-1

The commenter's concerns and objection to the Draft EIR aesthetics section are noted. Please see below for responses to specific comments and issues raised in the comment letter.

Comment 200-2

The Draft EIR states that:

- The project will result in a substantial adverse effect on a scenic vista (Impact 4.1-1).
- The project will cause a substantial degradation of the existing visual character or quality of public views in nonurbanized areas (Impact 4.1-3).
- The proposed mitigation, including rock staining, will not eliminate the discordant and disharmonious visual contrast caused by the engineered quarry benches.

It is unacceptable that the only proposed solution for mitigating these impacts is to apply a superficial stain to the exposed rock faces. This approach does not meaningfully address the permanent alteration of the landscape and fails to provide an effective or lasting solution to the substantial visual degradation caused by the project.

Response 200-2

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation. The commenter does not provide any additional or alternative visual mitigation recommendations for consideration by the County.

Comment 200-3

Furthermore, the proposed trail easement along the San Joaquin River at the Quarry Site raises serious public safety concerns. The Draft EIR does not adequately address the risks posed by the planned trail's proximity to the quarry excavation. The following questions need to be answered before the project can proceed:

Safety and Risk Mitigation

1. Will a protective fence or barrier between the trail and the quarry be installed after the quarry is reclaimed? If not, why not?

2. What measures will be taken to prevent trail users from accidentally accessing hazardous areas?

3. Will the trail have warning signs, lighting, or emergency access points to ensure user safety?

4. How will liability be handled if an accident occurs near the quarry?

Trail Design and User Experience

6. Will the trail have any buffer zones, landscaping, or natural barriers to visually separate it from the quarry? If there are buffer zones, how wide will they be?

7. How will noise and dust from ongoing quarry operations affect trail users? What mitigation measures planned?

Response 200-3

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River. Please see Collective Response #27 pertaining to potential effects on adjacent parklands.

Comment 200-4

Environmental Considerations

10. Will trail construction impact local wildlife, and if so, what mitigation measures will be in place?
11. How will stormwater runoff from the trail be managed to prevent erosion near the quarry?
12. Will trail lighting (if any) be designed to minimize disruption to nocturnal wildlife?

Long-Term Maintenance and Responsibility

13. Who will be responsible for maintaining the trail and ensuring it remains safe over time?
14. If the quarry site changes in the future (e.g., deeper excavation, flooding), how will thataffect the trail's viability?
15. What plans are in place for the trail's upkeep after the quarry is fully reclaimed?
16. Will CEMEX commit to paying for the above safety and mitigation measures, (#1 – 15above)? If not, why not?

Response 200-4

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 200-5

I also have serious concerns about the environmental impact of the proposed rock staining process. The Draft EIR lacks details about the risks of staining materials to soil and water quality. The following questions need to be addressed:

Composition and Environmental Safety of the Stain

17. What specific materials and chemicals are used in the rock staining process?

18. Are the staining chemicals non-toxic, biodegradable, and environmentally approved? What studies, regulatory approvals, or impact assessments confirm their safety?

19. Has the stain been tested for leaching in wet conditions? If so, what specific studies demonstrate the extent of leaching?

20. Does the stain contain heavy metals, volatile organic compounds, or harmful substances? If so, what material safety data sheets, chemical analysis reports, or regulatory reviews confirm the safety of the stain?

21. What published evidence or peer-reviewed research supports the use of rock stains planned for this project?

Soil Testing and Monitoring

22. Will soil samples be tested before and after staining to detect contamination? If so, what testing methodology and standards will be used?

23. At what distances from the staining area will soil samples be collected, and what scientific basis supports this sampling range?

24. What testing parameters will be used (e.g., pH, metal content, chemical residues), and which regulatory or industry standards will guide these tests?

25. How frequently will soil testing occur, both initially and as part of ongoing monitoring? What are the regulatory requirements or precedent studies upon which this testing frequency is based?

Water Quality Protection

26. Will groundwater wells and surface water sources be tested for staining-related contaminants? If so, what sampling methodology, frequency, and testing parameters will be used, and which environmental standards will be followed?

27. What scientific or engineering measures will be implemented to prevent stain runoff into water sources during rain

events? What hydrological studies or best management practices justify these measures?

28. Will a sediment and erosion control plan be implemented? If so, what specific techniques and regulatory guidelines will govern its design and enforcement?

29. What is the response plan if contaminants, including those from staining, are detected in water sources? What enforcement mechanisms ensure compliance and remediation?

Regulatory Compliance and Best Practices

30. What federal, state or local regulations govern the use of rock stains in mining operations? Provide references to specific statutes, environmental codes or agency guidelines apply.

31. Will the project follow best management practices for applying stains in an environmentally responsible manner? What industry standards, case studies or agency-approved guidelines support CEMEX's planned use of rock stains?

Long-Term Environmental Monitoring and Accountability

32. Will there be long-term monitoring of soil and water quality after the staining process is completed? If so, what monitoring duration, testing parameters and regulatory oversight will be in place?

33. Who will be responsible for ongoing monitoring and reporting results? Will independent third-party verification be required? If not, why not?

Response 200-5

The proposed rock staining process is a standard practice employed by quarries around the country and in California. The products that may be used for staining the quarry pit walls would be well established within the commercial and industrial industry. Any products used onsite would have undergone environmental testing and would be free of volatile organic compounds (VOCs) that could be volatilized into the environment.

The staining product would only be applied to the "visible pit walls" and would not be applied to soils, vegetation, or any other areas not disturbed/exposed by mining. As such, staining application would generally be limited to the higher portions of the pit walls, as the lower portions would generally not be visible from surrounding viewpoints. This

would further lessen the potential for staining products to potentially encounter native soil or water contained within the excavation pits. There are no known areas of soil or groundwater contamination or recorded hazardous materials released within or near the Plant and Quarry sites, and the Operator would continue to properly manage and store onsite materials (including any rock staining products) in accordance with existing BMPs, and spill prevention plans. Lastly, as the CEQA lead agency, the County would have oversight over the implementation of rock staining, as well as all other mitigation measures, through implementation of the Mitigation Monitoring and Report Program (MMRP).

The project would comply with County and SMARA requirements governing erosion control (Draft EIR page 4.7-19). Draft EIR Impact 4.7-4 analyzes the project's potential to result in substantial soil erosion and concluded that this impact would be less than significant.

Comment 200-6

Finally, Fresno County must require stronger mitigation measures, require additional studies, and insist on meaningful solutions rather than superficial fixes. Approving the project as it stands would set a dangerous precedent for handling significant environmental impacts. Given the project's proximity to parks, residential areas, and the San Joaquin River, I strongly encourage the County to reconsider the project's location. At the very least, the proposal should be rejected unless these concerns are fully addressed.

Response 200-6

The commenter's concerns and requests are noted and will be considered by County decision-makers. The Draft EIR discusses the evaluation of alternative project locations at Section 6.4.2.1, "Alternative Site Locations."

Letter #201 March 3, 2025, Adham Barghi

Comment 201-1

I live next door to Woodward park. I am voicing my comment and saying NO to the Cemex Expansion.

Response 201-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #202 March 3, 2025, Kathleen Belden

Comment 202-1

With all due respect, I urge you to do all you can to prevent the CEMEX expansion from moving forward. The San Joaquin River is home to so many species that are essential to the health of the local ecosystem, and destroying their habitat will have effects for generations to come.

Response 202-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Wildlife species and associated habitats located within the project sites and surrounding area are described in Draft EIR Section 4.4, "Biological Resources." The project's potential impacts on wildlife species are evaluated under Impact 4.4-1 beginning on Draft EIR page 4.4-48. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Comment 202-2

My family and I visit the river area regularly, which is where I teach my children how to respect and care for their environment in a tangible way. When I am teaching my 5 year old son about the local bird populations, I am instilling in him a love and respect for the natural world that then affects how he (and we) consume and care for the resources around us. When I am explaining to my daughter the interactions between the different animals in the food web in our local ecological community, I am teaching her to treat other living creatures with kindness.

Please don't allow the mining project to be approved. We need these protected wild places more than we know.

Response 202-2

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #203 March 3, 2025, Brendan Bergh

Comment 203-1

My wife and I received the mailer concerning the potential CEMEX expansion that would impact the San Joaquin River. We are homeowners and We are throughly opposed to any expansion. This is one of the only remaining open spaces in the area and we love the area.

Response 203-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 203-2

We are also worried about any potential harm to the local fish and wildlife and our water quality. Fresno water is already suspect enough.

Response 203-2

Potential impacts to fish and wildlife species are addressed in Section 4.4, "Biological Resources," of the Draft EIR. Potential impacts to water quality are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #204 March 3, 2025, Rebekah Bergh

Comment 204-1

I oppose the expansion and am a resident of Fresno county who enjoys outdoor spaces. Fresno has little to do for fun, so please don't take this space away.

Response 204-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #205 March 3, 2025, William Bopp

Comment 205-1

Dear Mr. Randall:

I am writing to you regarding the Draft Environmental Impact Report for the expansion project.

I am a born and raised, Fresno boy, 67 years old, who likes to jog/run down by the San Joaquin River. It is a jewel. It's only going to get better with time.

I see that your title says Senior Planner. I assume you are good at your job. Like you, I've spent some time reading the pros and cons to this project.

I seem to come back to this one sentence: "They want to dynamite hundreds of feet below ground in close proximity to one of the country's most endangered rivers."

As you know, things happen. Mistakes are made.

I'd like my grandkids to enjoy this river that we have in Fresno. I'm sure you feel the same for your grandkids.

Do the right thing. Do NOT approve this project. It's the right thing to do.

Response 205-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #206 March 3, 2025, Melinda Brewer

Comment 206-1

After reviewing the PowerPoint information online, and although I am pro-industry advancement, I believe it is too much of a risk to move forward with this project. We cannot afford damaging the river and wildlife surrounding it.

Response 206-1

The project's potential impacts to the San Joaquin River are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Potential impacts to wildlife are addressed in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #207 March 3, 2025, Kelli Dudley

Comment 207-1

I urge you to think critically of the environmental impacts of such an expansion. Currently, we need to consider the lasting impacts of expansions like these. As climate continues to change at the hands of corporations, we the people need to protect our lands. Our environmental future rests in the hands of people like you, and we need you to think of everyone and every living thing impacted by this, not merely financial gain. Please do your part for the people of Fresno, please reconsider this expansion and the harmful effects it will have on our beautiful lands in Fresno. I urge you to lead with your heart and have compassion and empathy for all beings whose safety rest in your hands.

Response 207-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #208 March 3, 2025, Sharon Edwards

Comment 208-1

I am writing to vehemently oppose the proposed CEMEX expansion. If approved, it will cause irreparable damage to the San Joaquin River and the fish and wildlife that depend on it.

Response 208-1

The project's potential impacts to the San Joaquin River are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Potential impacts to fish and wildlife species are addressed in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #209 March 3, 2025, Preston Ernest

Comment 209-1

I am writing to voice my opposition to the proposed 100-year permit for the CEMEX mining operation and to formally challenge the adequacy of the Draft Environmental Impact Report (EIR). In my professional experience working with our region's unique ecosystems and native plant communities, I have witnessed firsthand how sensitive habitats can be disrupted by long-term industrial activities. Despite the significance of this project's potential impact on the San Joaquin River and surrounding areas, the EIR as drafted appears insufficient in scope and depth.

Response 209-1

The commenter's opposition to the proposed project and challenge to the adequacy of the Draft EIR are noted. Please see below for responses to specific issues raised in the comment letter.

Comment 209-2

Several key issues demand stronger analysis:

1. **Potential Degradation of Local Habitats**

   The EIR does not convincingly detail how continuous mining will affect flora and fauna that rely on existing

ecosystems. Even slight encroachments can lead to cumulative habitat loss, yet the report provides limited evidence of a robust plan to preserve biodiversity over a century-long timeline.

Response 209-2

Draft EIR Section 4.4, "Biological Resources," provides a detailed evaluation supported by substantial evidence of the project's potential to effect biological resources both within the project sites and adjacent areas. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The comment does not address the adequacy of the Draft EIR's evaluation of biological resources impacts, and no further response is warranted.

Comment 209-3

2. Threats to Water Resources

Extended mining activities have the potential to alter groundwater tables and water quality—factors crucial to both native species and the broader community. The EIR offers minimal detail on how these resources will be monitored or protected over the long term.

Response 209-3

Please see Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, and Collective Response #25 pertaining to surface water and groundwater interconnectivity. The comment does not provide evidence of a deficiency in the Draft EIR analyses of these topics.

Comment 209-4

3. Insufficient Cumulative Impact Assessment

Given that this permit spans 100 years, a comprehensive forward-looking evaluation is critical. The document needs to address how ongoing mining intersects with other regional pressures, including land-use changes, climate variability, and population growth.

Response 209-4

Draft EIR Chapter 5, "Cumulative Impacts," provides a detailed evaluation of cumulative impacts of the proposed project that explains the methodology including methods for assessing future cumulative conditions as influenced by specifically identified past, present, and reasonably foreseeable future projects as well as regional growth projections

(see "Analysis Method" at Draft EIR pages 5-2 and 5-3, and see Table 5-1, "List of Nearby Projects," on Draft EIR pages 5-4 and 5-5). Draft EIR Chapter 5 then provides a detailed evaluation assessing how each of the project impacts identified in Draft EIR Chapter 4, "Environmental Analysis," would have the potential to result in cumulative impacts in consideration of other specific projects and regional growth. The comment does not explain or provide evidence of a deficiency in the Draft EIR cumulative impact evaluation.

Comment 209-5

A project of this magnitude demands thorough scientific scrutiny, transparent mitigation strategies, and a clear plan for oversight to safeguard our local environment. Without a more rigorous assessment, it is premature to move forward with such a far-reaching permit.

Thank you for considering my perspective. I respectfully request that the Planning Department reconsider this permit until the shortcomings in the EIR are adequately addressed.

Response 209-5

The comment does not explain or provide evidence of a deficiency in the Draft EIR. The commenter's perspective and request is noted and will be considered by County decision-makers.

Letter #210 March 3, 2025, Amy Gallagher

Comment 210-1

Hi, I am a Fresno County resident and wanted to submit comments on the DEIR for the CEMEX Rockfield Expansion Project.

A healthy, thriving river will be so much better economically for the region than any mine. I was at the Louis S. Eaton Trail today that runs north of Woodward Park along Friant and even though it was a cold, breezy morning, there were so many people out enjoying nature. I hiked Ball Ranch farther north last week and we saw so many dog walkers, families, and birders out enjoying the area. We need to do everything we can to protect the few green spaces we have.

Response 210-1

See Collective Response #7 regarding economic effects of the project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 210-2

Why would we allow a company to ruin our river? We have one river; we don't get a do-over.

Response 210-2

Potential effects to the San Joaquin River are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #17 and #25.

Comment 210-3

Also, a hundred years? A hundred-year contract is so long it almost boggles the mind. My elementary-aged children would have to live with the noise pollution, the air pollution, and the lack of river access for their *entire* lives. We should not move forward with a project that will negatively affect generations of Fresno county residents.

We need the river - whole and healthy - more than we need a mine.

Response 210-3

See Collective Response #5.

Comment 210-4

A few questions that need to be answered:

1. I need to know that the river will not be affected at all. My children go to River Camp just south of the proposed area and they deserve a childhood full of nature, and a chance to enjoy the river.

Response 210-4

Potential effects to the San Joaquin River are addressed in Section 4.10 of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #17 and #25.

Comment 210-5

2. Birds! We have so many birds along the river, I need to know that their habitat and food will be safe and that the mining will not affect them.

Response 210-5

Potential impacts to birds and other wildlife species are addressed in Section 4.4, "Biological Resources," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Impact 4.4-1 beginning on Draft EIR page 4.4-48. See also Collective Responses #13 through #15.

Comment 210-6

3. Fresno already has some of the worst air pollution in the country. I need to know that there will be NO additional air pollution.

Response 210-6

Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR, evaluates potential air quality impacts of the proposed project. See Chapter 3, "Draft EIR Errata," and Appendix D-4, "Revised Section 4.3, Air Quality." See also Collective Responses #9 regarding the project's potential effects on the region's existing air quality.

Comment 210-7

4. No one is going to want to hike or camp at Lost Lake for the hundred years they're mining next door. Lost Lake is one of the few county parks that we can camp at, and to lose that would be terrible. I need to know that the mining won't affect the enjoyment of being at Lost Lake.

Response 210-7

See Collective Response #27 regarding operational effects on users of nearby parks and trails.

Comment 210-8

5. And blast mining that close to a Friant Dam, less than three miles apart? That feels like a disaster waiting to happen. Have *independent* dam engineers agreed that explosions that close to a dam are ok?

Response 210-8

See Responses 300-4 and 448-34.

Comment 210-9

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in

this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments.

I look forward to your response and further discussions on this important matter.

Response 210-9

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project.

Letter #211 March 3, 2025, Thomas Grogan

Comment 211-1

Dear Sir, my wife and I live very close to Cmex and abhor the idea that the business is expanding. There are already too many large trucks traveling up and down Friant Avenue.

Response 211-1

The issue of truck traffic on Friant Road is addressed in Section 4.17, "Transportation," of the Draft EIR. See Impact 4.17-1 beginning on Draft EIR page 4.17-27. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #29.

Comment 211-2

Also, the damage to the river and the surrounding environments can't be mitigated once done.

Response 211-2

Potential effects to the San Joaquin River are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #17 and #25.

Comment 211-3

Hard rock blasting is noise and dust pollution as well as threatening to our water to say nothing about impacting fish and wildlife.

Response 211-3

The issues of noise and dust are addressed in Section 4.13, "Noise," and Section 4.3, "Air Quality," of the Draft EIR, respectively. The project's potential impacts to water and fish and wildlife species are addressed in Section 4.10 and Section 4.4, "Biological Resources," of the Draft EIR, respectively. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including the impact of the project's proposed blasting on air quality. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections and supporting appendix referenced in this response.

Comment 211-4

There must be a better quarry location than next to a projected 5,000 homes! We are opposed to the project.

Response 211-4

See Draft EIR Section 6.4.2.1, "Alternative Site Locations," for a discussion of alternative locations for the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #212 March 3, 2025, Karen Hammer

Comment 212-1

I am a resident of Fresno County and I am writing to express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR does not sufficiently or accurately assess the environmental, ecological, and community impacts this long-term operation will have on the San Joaquin River and surrounding areas.

Response 212-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See the following more detailed Responses 212-2 through 212-6 to the commenter's individual comments describing inadequacies in the Draft EIR.

Comment 212-2

As someone who frequently travels on roads through the area impacted by this project, and with experience in conservation and outdoor recreation, I find that the EIR fails to adequately address the following concerns:

1. The DEIR states that project emissions may exceed cancer risk thresholds. Has an analysis been done of the population-wide cancer burden? CEQA requires an analysis be done before taking into account possible mitigation measures. Fresno already has some of the worst air quality in the state!

Response 212-2

See Collective Response #11 regarding analysis of the project's population wide cancer burden. See also Collective Response #9 regarding the project's potential effects on the region's existing air quality.

Comment 212-3

2. What about the noise from blasting and its effects not only on residents in the area, but on people walking in the adjacent park lands? What mitigation measures are there for noise reduction at night as well as in the daytime?

Response 212-3

The issue of noise is addressed in Section 4.13, "Noise," of the Draft EIR. See Impact 4.13-3 regarding operational noise at the Quarry Site (where blasting would occur) (see Draft EIR page 4.13-59) and Impact 4.13-6 regarding groundborne vibration resulting from blasting (see Draft EIR page 4.13-65). Mitigation Measure 4.13-3 requires the operator to select and implement noise reduction measures from a range of measures as appropriate depending on the location and conditions of the active mining area. Additional noise monitoring would then be conducted to ensure noise levels meet County standards or additional measures would be implemented until standards are met. Mitigation Measure 4.10-1 would require a similar adaptive monitoring program to ensure that sufficient noise control measures are implemented to reduce blasting-related noise to below applicable standards. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13. See also Collective Response #27 regarding effects of blasting on users of nearby parks and trails.

Comment 212-4

3. I am very concerned about traffic congestion and the heavy trucks that will be using the Friant/Willow corridor. I am concerned about my safety and the safety of student drivers from the Willow/International education complexes. What will CEMEX do to mitigate the traffic impacts?

Response 212-4

The issues of traffic congestion and roadway safety are addressed in Section 4.17, of the Draft EIR. See Collective Response #29 regarding increased truck traffic and Collective Response #30 regarding traffic safety. Mitigation Measures 4.17-1a through 4.17-1r require the Operator to pay the project's fair share of the cost of a range of road and intersection improvements in the project area to address identified service deficiencies and improve traffic safety. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17.

Comment 212-5

4. Some areas of local and regular recreation for residents of Fresno County include Ball Ranch, Ledger Island, Sumner Peck, and the River Center. Has the EIR analyzed the impact this project would have on the ability of county residents to recreate in these areas taking into account the noise pollution, traffic congestion and hazards, and air quality/

Response 212-5

The Draft EIR addresses the topics of noise pollution and traffic congestion in Section 4.13 and Section 4.17, respectively. The topics of hazards and air quality are addressed in Section 4.9, "Hazards," and Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), as they are updated in this Final EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #27 pertaining to the project's potential operational effects on users of nearby parks and trails.

Comment 212-6

A project of this scale and duration - 100 years??!! - requires a far more comprehensive environmental review with thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. This DEIR does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 212-6

See Collective Response #5 regarding the duration of the proposed use permit. Chapter 5, "Cumulative Impacts," of the Draft EIR presents the cumulative impact analysis for the

proposed project. The Draft EIR sufficiently analyzes potential environmental impacts of the proposed project. The comment is noted for the consideration of the decision-makers.

Letter #213 March 3, 2025, Carla Hawks

Comment 213-1

Do not allow Cemex to make another gravel pit on what's left of our river.

What does an international corporation like Cemex care about our quality of our environment? They do not care.

I am extremely opposed to another gravel pit. I worked at PW&P for John Thompson and I know how much the Parkway means to our community.

Do what's right for Fresno County and the San Joaquin River.

Response 213-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #214 March 3, 2025, Robert Hills (Letter #1)

Comment 214-1

I did not see in the ERI any mention of the recreational needs of people of color and the less fortunate. Not everyone has a cabin in Shaver, a boat or even the means to hop up to Shaver to recreate by the water. Lost lake has been an outlet for swimming, fishing and picknicking for many years. We walk there once a week for the peace and tranquility of the area. Cemex needs to address this issue.

Response 214-1

See Collective Response #21 regarding public access to the river. The project's impacts to recreational resources are analyzed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #215 March 3, 2025, Robert Hills (Letter #2)

Comment 215-1

I think the ERI is a little wishy washy when it comes to the reaction of fish if this project is giving the go ahead. I am a fly fisherman. Every fly fisherman in the world knows that fish

react in a fraction of a second to shockwaves, noise and shadows. If they don't, they won't catch any fish. This area will become a dead zone if it is foolishly given the go ahead.

Response 215-1

See Collective Response #27 regarding effects of blasting on users of nearby parks and trails. See also Collective Response #16 regarding the effects of vibrations on salmon spawning. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #216 March 3, 2025, Jonathan Howerton

Comment 216-1

The purpose of this email is to voice my objections to the proposed CEMEX expansion. I am a resident in the Woodward Lake community and feel that this expansion would negatively affect my quality of life as well as the quality of life for the entire geographic area.

My biggest concerns include noise, traffic, environmental damage to the land, environmental damage to the river and waterways, and damage to wildlife habitats. Please include these concerns in the decision making process.

Response 216-1

The issues of noise and traffic are addressed in Section 4.13, "Noise," and Section 4.17, "Transportation," of the Draft EIR, respectively. Potential impacts to water resources and wildlife habitat are addressed in Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #217 March 3, 2025, Steven Hromada, PhD.

Comment 217-1

I have reviewed the Draft EIR for the CEMEX project, and I see a few glaring issues, especially with respect to the Biological Resources:

The project claims that Western Pond Turtle is unlikely to occur on the project site as "the level of disturbance" prohibits movement of the species without a citation. This federal candidate species is known to occur at the Fresno Water Treatment plant (and others in CA, Germano 2010), so this claim that it is unlikely to occur due to disturbance seems optimistic. They noted that red-

eared slider turtles were found, suggesting that suitable aquatic turtle habitat is present yet they could not detect pond turtles during their brief assessments. Red- eared sliders can exclude pond turtles from basking sites, making detection of pond turtles more difficult (Lambert et al., 2019). A real survey and plan to exclude turtles from the project site is needed, as there could be risks (vehicle collisions) associated with turtles using the site even if habitat is not disturbed.

Response 217-1

The Draft EIR does state that the potential for western pond turtle to occur at the project sites is low due to the disturbance surrounding the silt ponds that would inhibit movement of Western Pond Turtles into the project site (Draft EIR at page 4.4-35). However, the Draft EIR does plan for the possibility of western pond turtles occurring at the project sites. Mitigation Measure 4.4-1b would require pre-construction clearance surveys of the ponds on the Plant and Quarry sites no more than 14 days prior to the removal of a pond (Draft EIR at page 4.4-49). As clarified in Chapter 3, "Draft EIR Errata," Mitigation Measure 4.4-1b also requires biological monitoring during pond draining and removal activities to ensure protection of western pond turtle. If any western pond turtles are discovered within the project sites as part of this pre-construction clearance, a qualified biologist with approval from the CDFW would relocate the individual to similar habitat near the project sites (Draft EIR at page 4.4-49). These measures are sufficient to avoid and minimize potential impacts, and no additional revisions to the Draft EIR are required.

Comment 217-2

There is no mention of surveys for the Northern legless lizard (Anniella pulchra). Although not known from this area, the species of special concern was recently discovered in the dry riverbed of the Fresno river in Madera (Hansen and Shedd 2025). This suggests that the species potentially occurs in eastern Fresno county, though no formal surveys have been performed. The species can persist in annual grassland habitats and surveys should be performed to confirm absence.

Response 217-2

Please see Response 65-6 regarding the sufficiency of the field surveys conducted for the Draft EIR. CEQA does not require that protocol level surveys be conducted for the purposes of establishing the likelihood of a species' presence on or adjacent to the project site. Species of Special Concern receive consideration by CDFW and local lead agencies during the CEQA process (Draft EIR at page 4.4-39). In light of this, the CDFW *recommends* consideration of these species during project impact analyses (Draft EIR at

page 4.4-39). The Northern legless lizard is not federally or State listed as threatened or endangered, and was not observed in the habitat surveys conducted for the Draft EIR.

Comment 217-3

Better surveys for presence of western spadefoot is also needed, as they may occupy the annual grassland on the site and use other bodies of water for reproduction. There are historic occurrences along the San Joaquin River.

Response 217-3

See Response 65-6 regarding the sufficiency of the field surveys conducted for the Draft EIR. The analysis demonstrates that blasting and mining activities are not expected to result in significant impacts to these species (Draft EIR at page 4.4-48). However, to further ensure protection, Mitigation Measure 4.4-1b requires the Operator to conduct pre-construction clearance surveys of the ponds on the Plant and Quarry sites no more than 14 days prior to the removal of a pond (Draft EIR at page 4.4-49). If any Western spadefoot toads are discovered within the project sites as part of this pre-construction clearance, a qualified biologist with approval from the CDFW would relocate the individual to similar habitat near the project site (Draft EIR at page 4.4-49). These measures, as revised and strengthened in Chapter 3, "Draft EIR Errata," to include additional biological monitoring and implementation requirements during pond removal, are sufficient to avoid and minimize potential impacts, and no additional revisions to the Draft EIR are required.

Comment 217-4

Suitable habitat also likely exists for other amphibian (e.g. *Batrachoseps gregarius*) and reptile species (e.g. *Thamnophis sirtalis*, *Sceloporus occidentalis*) that were absent from the report suggesting that the study was not thorough in accounting for potential impacts.

Response 217-4

See Response 65-6 for discussion of the field surveys conducted for the Draft EIR. The species identified in the comment were not identified during the habitat assessment conducted at the project site, nor were they identified as having the potential to occur within the boundaries of the survey area. Further, none of the species identified in Comment 217-4 are identified as endangered and the habitat onsite was not determined to be suitable for these species.

Comment 217-5

Further, although breeding birds may not be present directly on the site, the changes in practices and increased traffic may cause nests to fail in the surrounding area. Nesting birds in the area should be better documented and potential impacts of blasting on nearby nests should be considered.

Response 217-5

The impacts from construction and mining, including blasting, on nesting and migration patterns are adequately analyzed in the Draft EIR. See Response 65-12 for further discussion of the project's potential impacts on wildlife related to blasting and continued mining operations. With implementation of Mitigation Measure 4.4-1c, as revised through errata in Final EIR Chapter 3, "Draft EIR Errata," a qualified biologist would conduct pre-construction surveys for nesting birds on the project sites or within 500 feet of planned disturbance before initiation of each mining phase. Potential impacts to nesting birds would therefore be less than significant (Draft EIR at page 4.4-49).

Wildlife in the surrounding area of the project sites has habituated well to the recurring noise of the project site. Osprey have successfully nested annually on power poles immediately adjacent to rock plants and along truck haul routes; bald eagles have nested above and next to heavily trafficked access roads and next to crushing operations and forage within the mining operation; great horned owls roost and nest annually on rock plants; raptors successfully nest and forage within the mining operations; and resident and migratory birds have been observed to nest adjacent to active mining operations (Draft EIR at page 4.4-52). As such, no significant impacts to nesting birds are anticipated.

Letter #218 March 3, 2025, Barbara Hueyn

Comment 218-1

I am totally against approving the CEMEX Expansion. It will:

1. Irreparably harm the river.

Response 218-1

The project's potential impacts to the San Joaquin River are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 218-2

2. Limit land use needs in the future 100 years. Land has already been dedicated to provide natural outdoor experiences for the citizens.

Response 218-2

See Collective Response #18 regarding the project's consistency with regional recreational planning efforts in the area. See also Collective Response #21 regarding public access to the San Joaquin River.

Comment 218-3

3. Add to the congestion on the roads in close proximity to Woodward and the Parkway, residences, and commercial establishments.

Response 218-3

See Collective Response #29 regarding traffic congestion and increased truck trips.

Comment 218-4

4. Limit Senior citizens the pleasure open spaces available, since they are unable to travel farther.

Response 218-4

See Collective Response #21 regarding public access to the San Joaquin River and Collective Response #27 regarding the project's operational effects on users of nearby parks and trails.

Comment 218-5

5. Increase disturbing wildlife.

Response 218-5

Project impacts on wildlife are addressed in Section 4.4, "Biological Resources," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Responses #12 through #16 regarding the project's potential impacts upon fish and wildlife species.

Comment 218-6

The company has outlived using the land for their own use. The city has grown around them. Their existence unfortunately no longer fits into the scheme of our city.

Response 218-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #219 March 3, 2025, John and Norma Kirby

Comment 219-1

In considering approval of the Cemex expansion plans, we note all the areas listed below that benefit Cemex.

We note nothing in this rather long list that explains the benefits to the residents of Fresno County. *We therefore stand in opposition to the approval of this expansion plan.*

Cemex's expansion plan primarily benefits from increased market reach, particularly in the US, allowing them to capture a larger share of the construction materials market, leading to potential for **higher revenue**, **improved profitability**, **and stronger market position** ; additionally, their focus on sustainable practices and "Urbanization Solutions" could attract environmentally conscious customers and tap into growing urban development needs, while also potentially enhancing brand reputation and opening new growth avenues.

Key benefits of Cemex's expansion plan:

Market Penetration:

By expanding their presence in the US, especially in the aggregates market, Cemex can tap into a large and growing construction sector, potentially increasing sales and market share significantly.

Profitability Boost:

Accessing a larger market with higher demand could lead to increased revenue and profitability, allowing for re investment in further growth initiatives.

Diversification:

Focusing on the "Urbanization Solutions" business can provide a new revenue stream beyond traditional cement products, aligning with growing urban development needs.

Sustainability Advantage:

By prioritizing lower-carbon and circular practices, Cemex can appeal to environmentally conscious customers and potentially gain a competitive edge.

Operational Efficiency:

Investment in technology and digital platforms like "Cemex Go" can optimize operations, improve customer service, and reduce costs.

Brand Reputation:

A focus on sustainability initiatives can enhance CemeX's brand image and attract a broader customer base.

Response 219-1

See Draft EIR Section 6.3.1, "Project Objectives," which discusses the objectives of the project. See also Chapter 3, "Draft EIR Errata," for proposed revisions to the project objectives as presented in the Draft EIR Executive Summary, Chapter 2, "Project Description," and Chapter 6, "Alternatives." One of the main objectives is to continue supplying aggregate and construction materials in the Fresno region. The comment, and the commenter's opposition to the proposed project, are noted for the consideration of the decision-makers.

Letter #220 March 3, 2025, Russell and Rebecca Lindquist

Comment 220-1

This email is to share our concerns about the Cemex expansion and the type of mining they will be conducting.

We are longtime Fresno County residents who value efforts to support a beautiful river as a resource for residents and wildlife in our area.

We need natural beauty close to population, not a few hours drive away. Many cities place high value on their waterways and natural habitats because they understand the importance of these resources for human respite and wildlife refuge, not to mention property values.

We have enjoyed time spent along the river and bird walks along its shores. However, we remember well the unsightly mining that used to permeate the San Joaquin River! We appreciate leaders who turned it into something better and more useful so it can contribute to quality of life for our Valley.

The Cemex expansion threatens this valuable resource to Fresno County. Let's not go backwards.

Response 220-1

The issue of visual resources is addressed in Section 4.1, "Aesthetics and Visual Resources," of the Draft EIR. Potential impacts to wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #27 regarding the project's operational effects on users of nearby parks and trails and Collective Response #7 regarding economic effects of the project. The comment and the commenter's opposition to the project are noted for the consideration of the decision-makers.

Letter #221 March 3, 2025, Steven Matthews

Comment 221-1

I am writing to let you know I oppose the CEMEX expansion project. I feel it is detrimental to the residents of Fresno County.

It will increase traffic, add wear and tear to the roads, impact recreational areas nearby, impact fish and wildlife, add pollution, while adding no benefit to the tax paying residents of Fresno County.

Please take my opinion into consideration.

Response 221-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of traffic congestion and road maintenance are addressed in Draft EIR Section 4.17, "Transportation." See also Collective Response #29 regarding project truck traffic and funding for road maintenance. See Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Project impacts on fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." The issues of air and water pollution are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality," as they are updated in the Final EIR, respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections and supporting appendices referenced in this response. See also Collective Response #7 regarding economic effects of the project.

Letter #222 March 3, 2025, Gerard Medeiros

Comment 222-1

I am writing to express my strong opposition to the proposed expansion of the CEMEX Rockfield Quarry, as detailed in the Draft Environmental Impact Report (DEIR). This project poses significant threats to the San Joaquin River ecosystem, public safety, and local infrastructure.

Environmental Concerns:

- Depth of Excavation: The plan to excavate up to 600 feet below ground surface raises concerns about potential impacts on groundwater levels and the overall health of the river ecosystem.

Response 222-1

The project's potential impacts to groundwater levels and to the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The comment is noted for the consideration of the decision-makers.

Comment 222-2

- Blasting Operations: Transitioning from mechanical digging to blasting hard rock introduces risks of habitat disruption, noise pollution, and potential harm to aquatic and terrestrial wildlife.

Response 222-2

The effects of blasting and other operational activities are evaluated throughout the Draft EIR. See Draft EIR Section 4.4, "Biological Resources," for an evaluation of effects on wildlife habitat and aquatic and terrestrial wildlife. See also Draft EIR Section 4.13, "Noise," for an evaluation of noise pollution. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 222-3

Public Safety and Infrastructure:

- Increased Traffic: The project is expected to increase heavy truck traffic on local roads, leading to accelerated wear and tear, elevated maintenance costs, and heightened risks of accidents.

Response 222-3

See Collective Response #29 regarding increased traffic and road maintenance costs. See also Collective Response #30 regarding traffic safety.

Comment 222-4

- Air Quality: Blasting and increased vehicular emissions could degrade air quality, adversely affecting public health, especially for vulnerable populations.

Response 222-4

The issues of air pollution and public health are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." Additionally, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including the impact of the project's proposed blasting on air quality and an updated HRA. This updated analysis demonstrates no new impacts and no changes to the findings in the Draft EIR. See also Chapter 3, "Draft EIR Errata."

Comment 222-5

Economic Considerations:

- Tourism and Recreation: The San Joaquin River is a vital recreational asset. The proposed expansion could deter tourism, impacting local businesses and diminishing residents' quality of life.

Response 222-5

See Collective Response #7 regarding the project's potential economic effects.

Comment 222-6

Recommendations:

1. Comprehensive Environmental Review: Conduct a thorough and updated environmental impact assessment to address the potential consequences of deeper excavation and blasting.

2. Public Consultation: Engage with local communities, environmental organizations, and other stakeholders to gather input and address concerns transparently.

3. Alternative Solutions: Explore less invasive methods or alternative sites that would minimize environmental and community impacts.

In conclusion, the potential risks associated with the CEMEX Rockfield Quarry expansion outweigh the anticipated benefits. I urge the Fresno County Public Works & Planning Department to reconsider the approval of this project to safeguard our community and natural resources.

Response 222-6

The comment describes the environmental review process under CEQA which has been completed for the proposed project and presented in the Draft EIR. Analysis of the project's potential impacts is presented in Draft EIR Chapter 4, "Environmental Analysis." Draft EIR Chapter 6, "Alternatives," presents an evaluation of a range of alternatives to the proposed project. Section 2.2, "Public Review Period and Notifications," of this Final EIR summarizes the public participation process for the project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #223 March 3, 2025, Carol Ann Meme

Comment 223-1

I am writing regarding my **OPPOSITION** to the CEMEX expansion project that is being considered for approval by the County Board of Supervisors.

There are several areas of concern that I have.

1. The DEIR states that the project could have emissions that may exceed cancer risk thresholds. There is no evaluation of the population-wide cancer burden. We already have an increased risk of cancer due to environmental issues (air pollution, poor water quality, etc) here in the Central Valley and this will only add to that burden.

Response 223-1

After mitigation, the cancer risk at the maximum exposed individual sensitive receptor (MEIR) decreases from the baseline condition (i.e., cancer risk is a negative value demonstrating that the project would be a benefit) (see Draft EIR, Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts"). Accordingly, other locations would have even less cancer risk, demonstrating an even larger benefit in these other locations. Thus, the cancer burden, a

measure summing effects from each census block, would show a benefit. Therefore, cancer burden was not required to be calculated in the Draft EIR. Nevertheless, in response to air comments on the Draft EIR, the technical analysis was reviewed and updated with new information described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Tables 4.3-24 and 4.3-25, as updated in this Final EIR at Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 223-2

2. The DEIR does not adequately analyze potential impacts of blasting on wildlife in this area. The examples given only related to surface mining and not the deep pit mining that is being proposed. Our wildlife in this area are already burdened by excessive heat, drought, loss of habitat and lack of clean water. This will only make conditions worse for our already threatened wildlife.

Response 223-2

See select collective responses addressing the potential impacts of blasting, specifically Collective Response #12 (river and salmon restoration), Collective Response #13 (nesting birds and other wildlife), Collective Response #15 (non-nesting birds and birds outside of nesting season), and Collective Response #16 (salmon spawning). The project sites are already disturbed by decades of ongoing mining operations, and the proposed excavation areas would stay within the boundaries of the currently existing project sites. As such, the proposed project would not result in the loss of habitat for tricolored blackbird or other wetland species. Please refer to the Draft EIR's discussion of Impact 4.4-4, which concludes that the project would not have a substantial adverse effect on any riparian habitat or other sensitive natural community with the implementation of Mitigation Measures 4.10-1, 4.3-2a, and 4.3-2b (Draft EIR page 4.4-55 through 4.4-58).

Comment 223-3

3. Impacts from blasting on local residents are not adequately addressed in the DEIR. Besides the noise, there are the impacts it can have on structures, wells, destabilization of the San Joaquin River embankment. The DEIR also did not analyze the impact that blasting may have on those who use Woodward Park.

Response 223-3

Please see Collective Response #17 pertaining to blasting impacts upon bank stability and risk. Please see Collective Response #27 pertaining to potential effects on adjacent parks.

Comment 223-4

4. There is also concern that this additional mining is not even really needed. I read an article in the Fresno Bee by Marik Warszawski stating that there are more than adequate reserves of the materials that this mining is going to produce. So why would we risk all these potential negative impacts when we have plenty of the product already at hand and provided by a different vendor?

Response 223-4

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 223-5

Please let the county know that this is a very bad idea from many standpoints. Let's protect our air quality, our wildlife and the residents who live in this area from more destruction for no purpose.

Thank you for taking the time to read my comments.

Response 223-5

The comment does not address the adequacy of the Draft EIR. The commenter's opinions regarding the project and interest in protection of air quality, wildlife, and residents are noted and will be considered by County decision-makers.

Letter #224 March 3, 2025, Rene Mertens

Comment 224-1

Please do not allow 100 more years of mining by CEMEX near the SJ River. The environmental impact to wildlife and the river would be a disaster. The noise and scale of blasting would impact neighborhoods in surrounding areas and the health of those communities.

This is an existential threat to the SJ River and all those who enjoy its beauty and would also threaten water quality.

Response 224-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit. Potential impacts to wildlife and the San Joaquin River are addressed in Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality," respectively. The issue of noise is addressed in Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective

Response #27 regarding the effects of proposed blasting on users of surrounding parks and trails.

Letter #225 March 3, 2025, Cheryl Milnac

Comment 225-1

CEMEX, a multinational mining company wants to dynamite a 600 foot deep pit too close to the San Joaquin River. County planners spent 5 years preparing a 3,767 page draft EIR for the so-called **"Rockfield Quarry Modification Project".**

For the Fresno area, the ***Aggregate Sustainability in California*** report (last updated by the **California Geological Survey** in 2018) states that 305 million tons of aggregate will be needed for the next 50 years. We already have **556** million tons of permitted aggregate reserves.

Response 225-1

See Collective Response #3 regarding aggregate demand and the need for the proposed project.

Comment 225-2

If the wall of earth separating the river and the open mine gave way, a **disaster** would result.

For these and many other reasons please oppose the development of the **Rockfield Quarry Modification Project**

Response 225-2

See Collective Response #17 regarding river bank stability and the potential for breach and flooding of the quarry pit. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #226 March 3, 2025, Multiple Signers

This letter is a duplicate of Letter #225.

Letter #227 March 3, 2025, Marcella L Osterhaus

Comment 227-1

The proposed expansion of CEMEX operations along the San Joaquin River is detrimental to the environment.. It negatively impacts the surrounding habitat and possibly impacts the San Joaquin River itself. CEMEX has been in that location and has a permit for 100 years but at this point allowing it to expand by digging a 600

foot hole so close to the river, so near a growing area is harmful to the community.

Response 227-1

The project's potential impacts to the San Joaquin River are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Potential impacts to wildlife are addressed in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #17 regarding river bank stability and the potential for breach to occur. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 227-2

Recreational areas like ball ranch, and the open area of Sumner-Peck affords people to go out and enjoy the river so allowing Cemex to dig a 600 foot hole in that area is not good.

Response 227-2

See Collective Response #21 regarding public access to the San Joaquin River and Collective Response #27 regarding the effects of blasting and other project activities on users of nearby parks and trails.

Comment 227-3

Friant Road has a lot of traffic already and it continues to have more and more traffic as homes are being built north and east of it. Allowing many heavy gravel trucks to use it daily makes the situation worse.

Response 227-3

The issue of traffic congestion is addressed in Section 4.17, "Transportation," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #29 regarding project truck traffic.

Comment 227-4

Many families enjoy going to the San Joaquin River and allowing Cemex to dig there harms air quality. The environmental impact report was done when? Has there been a recent EIR done? In this area we have very few places to take families to the San Joaquin River and this is one of them and it's important to keep it to enjoy now and years to come.

Response 227-4

The issue of air quality is addressed in Section 4.3, "Air Quality," of the Draft EIR. The Draft EIR for the proposed project was completed in December 2024 and released for public review between December 21, 2024, and March 10, 2025. See Chapter 3, "Draft EIR Errata," and Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3 and supporting technical appendices. See Collective Response #9 regarding the project's potential impact on the region's existing air quality conditions. See also Collective Response #21 regarding public access to the San Joaquin River.

Letter #228 March 3, 2025, John Peckham

Comment 228-1

I oppose the expansion. My main fear is for the San Joaquin river. Many millions of dollars have and will be spent to try and introduce Chinook Salmon back to the river. Blasting and possible contamination by silt and other runoff could severely damage fish and other wildlife. I and some of my Kokanee Power friends have volunteered at the Friant fish hatchery. We know how delicate the salmon fry are. They need clean water.

Response 228-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Potential impacts to fish species and the San Joaquin River are addressed in Draft EIR Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #12 regarding project effects on salmon restoration efforts and Collective Response #16 regarding effects of blasting on salmon spawning.

Comment 228-2

It seems that there are two other locations for the aggregate that is needed. Kings River and 145 and 41 area. Thanks for listening. Please register my NO vote.

Response 228-2

See Collective Response #3 regarding aggregate demand and the need for the proposed project. The commenter's opposition is noted for the decision-makers.

Letter #229 March 3, 2025, Karl Quinn

Comment 229-1

I am writing to ask you NOT to approve the the proposed CEMEX expansion.

I am a hiker and photographer and would like to preserve the San Joaquin River and surrounding area. After many years of hard work, the river is doing much better. Let us preserve that progress for everyone to enjoy.

Response 229-1

Potential impacts to the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #18 regarding the project's consistency with the Parkway Master Plan and Collective Response #12 regarding the project's potential effects on recent river restoration efforts.

Comment 229-2

The proposed expansion with one hundred years of continued mining is a very long time! A many hundred foot deep pit mine will have drastic and deleterious effects on the surrounding wild area. Please do not approve this proposal.

Response 229-2

See Collective Response #5 regarding the duration of the proposed use permit. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #230 March 3, 2025, Nanette Stockle

Comment 230-1

Please disapprove Cemex expansion. I would not approve threating water quality and impacting fish and wildlife. Please say NO to Cemex expansion!!

Response 230-1

The issue of water quality is addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Potential impacts to fish and wildlife species are evaluated in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #231 March 3, 2025, Jack Tacchino

Comment 231-1

Like so many of my friends and neighbors, I am deeply opposed to allowing the expansion of CEMEX. Allowing the creation of a 600-foot-deep mining pit in this residential and environmental area would be greatly damaging in many ways. Mining rights for 100 years in this area would also be irresponsible. Please reject the CEMEX project.

Response 231-1

See Collective Response #5 regarding the duration of the proposed use permit. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #232 March 3, 2025, Neil Thompson (Letter #1)

Comment 232-1

Dear Mr. Randall.

Figure 2-8 Quarry Site Proposed Mining Plan indicates a potential route for a Parkway Trail along the western side of the Quarry Site.

Figure 2-8 also includes notes that seem to indicate that there was, is and will be a 200' setback from the edge of the river channel and any earth stockpiling or excavation. Please note that the 200' setback is from the edge of the river (presumably at normal water release levels from Millerton Lake) to the top edge of the open pit mine where the 2:1 slope drops into the pit. The setback is not from CEMEX's property line! There are several locations near the westerly bend in the river where the setback will be less that 100 feet from the edge of the pit. This means that the "berm" that will separate the river from the pit will be far less wide than anticipated. And there is no indication that the "berm" will have any height to it nor that it will be higher than the edge of the pit.

Response 232-1

To clarify, Figure 2-8, "Proposed Quarry Site Mining Plan," shows a potential parkway trail easement along the eastern bank of the San Joaquin River, just west of the Quarry Site. The commenter is correct in assessing that the minimum 200-foot setback is from the river's edge and not the parcel boundary, which is adjacent to the riverbank in many locations. The Operator has adhered and would continue to adhere to the existing

setbacks summarized in Section 2.4.2.2, "Quarry Site Existing Conditions," within the Draft EIR (see page 2-18). The Operator is also engaged in discussions with the San Joaquin River Conservancy to provide easements for future development of connected trails along the river from the Plant and Quarry sites and is consistent. Such an easement would be consistent with the San Joaquin River Parkway Master Plan Update EIR. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 2.4.2.2. See also Collective Response #17, which describes that CEMEX raised the berm separating the Quarry Site from the San Joaquin River to conservatively address potential flooding impacts.

As discussed in the Draft EIR, vegetated topsoil stockpiles are located along the western perimeter of the project sites to provide additional screening for visual relief. Specifically, as described in Section 2.4.2.2, there is an existing, minimum five-foot high screening berm along the North Friant Road frontage and an existing minimum fifteen-foot-high screening berm along the south property line, extending from the southwest corner of the site to approximately 475 feet from the North Friant Road right-of-way.

Comment 232-2

A close examination of the topographic survey found in Appendix G-1, Appendix 1, Figure 2 shows the extent of the stockpiling and excavations that have been performed in the past. It is obvious that significant earthwork would be required to construct the "berm" to separate the river from the pit mine. It is unclear when the berm would be constructed. Without the berm there would not be any chance of constructing a Parkway Trail along the approximately 1.5 miles of river frontage.

Response 232-2

Please see Collective Response #17, which describes that CEMEX raised the berm separating the Quarry Site from the San Joaquin River to conservatively address potential flooding impacts. Various perimeter berms and stockpiles exists throughout both project sites and provide additional screening from the river channel. Berms may also be created in the future onsite as needed/feasible. However, any future berms would be installed no closer than 25 feet to any property boundary except for those berms meant to shield offsite areas from noise or visibility (these would primarily be maintained along the project site's eastern boundary along North Friant Road, and not along the western boundary adjacent to the river). Specifically, there is an existing 5-foot screening berm along the frontage of North Friant Road and a 15-foot screening berm along the southern property boundary of the Quarry Site that would remain in place.

Comment 232-3

It is also evident that a serious flood risk exists along this stretch of the river as the westerly bank is much higher than the Quarry side is. This flooding risk would increase the likelihood that the Trail would be severely damaged or rendered unusable for long periods of time and at great cost of reconstruction.

Response 232-3

See Responses 12-26 and 58-25. See also Collective Responses #17, pertaining to flooding, riverbank stability, and potential for breach to occur, and Collective Response #22, pertaining to dedication of trail easements adjacent to the project sites. Additionally, the Draft EIR included detailed hydrology analyses (see the technical studies in Appendix G, "Hydrology and Water Quality") that looked at potential flooding conditions/flow rates within the adjacent San Joaquin River. Specifically, a 100-year HEC-RAS analysis was prepared along the Quarry Site. This study reach covers the majority of the Quarry Site and was used to define the current floodplain and identify potential impacts related to hydrologic and water quality conditions as a result of the proposed project. Detailed methodology is provided in Appendix G-1, "Hydraulic Analysis," of the Draft EIR. Based on these analyses, the Draft EIR found that the proposed project mining operations and reclamation activities would not alter the course of either the San Joaquin River or Little Dry Creek.

The Quarry Site is located adjacent to and contains portions of the FEMA 100-Year Zone AE Floodplain that encompasses the San Joaquin River (SJR). As discussed in the Draft EIR, the easterly bank of the SJR does not show signs of significant bank erosion and the bank has never breached into the Quarry Site, based upon 100-year flow velocity and floodway characteristic data. The Applicant has also discussed providing an easement to the County for purposes of future pedestrian trail improvements, and potential flood risks would be assessed and addressed while planning and designing the future trail improvements if that proposal moves forward. See Chapter 3, "Draft EIR Errata," for revisions to Section 4.10, "Hydrology and Water Quality," of the Draft EIR.

For these reasons, the project is not expected to generate additional flood risks within the adjacent San Joaquin River, nor would it create additional risks to the existing or planned future trails. CEMEX would continue to implement existing BMPs to ensure water and erosion are properly controlled.

Comment 232-4

The construction of a Parkway Trail would probably require at least a 20-25' easement for the trail itself plus additional slope easements to accommodate changing terrain contours. The visual

quality of the trail immediately next to the pit is less than appropriate. About as exciting as walking down the Los Angeles River.

Response 232-4

Please see Collective Response #22 pertaining to dedication of trail easements along the San Joaquin River corridor at the project sites.

Comment 232-5

Did I mention the safety risk of someone, or many, falling down the 2:1 slope into the pit? No fence can keep preteens, teenagers and other curious humans from exploring dangerous conditions. Who will install the fence? Who will maintain the fence FOREVER? The significant liability for the County will never cease.

Response 232-5

As discussed in the Draft EIR on pages 2-35 and 2-41, the project sites would be fenced to ensure site security and public safety. The majority of the project sites would be fenced in accordance with Mine Safety and Health Administration (MSHA) regulations, including but not limited to four-foot-high barbed wire ranch fencing and six-foot-high chain-link fencing. Additionally, upon project approval, fencing meeting applicable Fresno County standards, including those set forth in the Fresno County Zoning Code, Section 834.4.220, "Material Extraction Sites," would be erected along boundaries of each project site, including areas adjacent to public rights-of-way. The fencing would be erected by the operator and maintained both during onsite operations and post-reclamation, as needed, to prevent trespassing and prohibit unauthorized access to the site.

Comment 232-6

The offer of the Parkway easement is given as an inducement for the County's approval of the Application, yet it is not listed as a required Mitigation Measure.

Response 232-6

Please see Collective Response #22 pertaining to dedication of trail easements along the San Joaquin River corridor at the project sites. The dedication of trail easements is a component of the proposed project and not a mitigation measure, therefore, it is not identified as a mitigation measure in the Draft EIR.

Comment 232-7

Without a Parkway trail along the westerly (or easterly) boundary of the Quarry Site, the Quarry Site will physically divide an established community, the San Joaquin River Parkway with the San Joaquin Conservancy as Lead Agency, which is a CEQA Impact 4.11-1. Without the trail the Quarry will physically block all pedestrian traffic from moving up and down the river corridor. It will also substantially block westerly bicycle traffic as the use of Friant Road for west bound bicyclists has been known to be a dangerous section with significant aggregate on the bike path and stones being thrown from the aggregate trucks.

Response 232-7

Access along the San Joaquin River does not represent a connection between established communities and neither restriction of access nor establishment of new access would inhibit or promote connection between established communities. Please see Collective Response #30 pertaining to traffic safety, including that associated with bicycle use along Friant Road.

Comment 232-8

The lack of a trail also falls under CEQA Impact 4.11.2 as the Quarry Site "*conflict(s) with land use policies, plans and regulations*".

OS-A.15 **San Joaquin River Protection.** *The County shall support policies of the San Joaquin River Parkway Master Plan to protect the San Joaquin River as an aquatic habitat, recreational amenity, aesthetic resource, and water source. (See Policy OS-H.11*)

OS-C.8 **Aggregate Mine Buffers** *The County shall, where feasible along the San Joaquin River, site recreational trails, bikeways, and other recreation areas at least three hundred (300) feet from the edge of active aggregate mining operations and separate them by physical barriers. Recreational trail/bikeway crossings of active haul routes should be avoided whenever possible; if crossing of haul routes are necessary, separate where feasible.*

OS-H.10 restates **OS-A.15** noted above.

OS-I.3 Trail/Bikeway Right-of-Way *The County shall require that adequate rights- of-way or easements are provided for designated trails or bikeways as a condition of land development approvals.*

HS-C.4 Floodwater Diversion *The county shall require new flood control projects or developments within areas subject to 100- and*

200- year frequency floods are designed and constructed in a manner that will not cause floodwaters to be diverted onto adjacent property or increase flood hazards to property located elsewhere.

HS-C.12 200- Year Water Surface Elevation Investigations *The County shall encourage the performance of appropriate investigations to determine the 200-year water surface elevations for the San Joaquin River, taking into account recent storm events and existing channel conditions, to identify the potential extent and risk of flooding. New development, including public infrastructure projects, shall not be allowed along the river until the risk of flooding at the site has been determined and appropriate flood risk reduction measures identified.*

Therefore, the EIR should be revised to include a required Mitigation Measure for a future Parkway Trail easement at the Quarry Site.

Response 232-8

Please see Collective Response #22 pertaining to dedication of trail easements along the San Joaquin River corridor at the project sites. As discussed above, the dedication of trail easements is a component of the proposed project and not a mitigation measure, therefore, it is not required or appropriate to be identified as a mitigation measure in the Draft EIR. Please see Collective Response #17 for discussion of the 200-year flood analysis conducted for the Quarry Site.

Comment 232-9

The Mitigation Measure should address, at a minimum, the following issues

- The easement shall be on the westerly side of the Quarry, adjacent to the river.
- The easement shall not be within 300 feet from the breakover point into the mine that has a slope the is steeper than 4:1 (horizontal to vertical).
- The layout of the easement shall be solely on the lands of CEMEX
- The easement shall provide such width as necessary for a Multi-Use Trail with Shoulder for Equestrian Use as shown on Figure 7-2 of the Joaquin River Parkway Master Plan plus such additional width for slope easement as necessary.

- The surface elevation of the land within the easement shall be not lower than one foot above the established flood water surface elevation for a 200-year flood event.

- The surface elevation of the land within the easement shall be completed within 5 years after the approval of the Application such that the Parkway Trail can be constructed at that time if the Conservancy so desires.

- The easement shall not require the construction of bridges within the lands of CEMEX.

Response 232-9

Please see Collective Response #22 pertaining to dedication of trail easements along the San Joaquin River corridor at the project sites. As discussed above, the dedication of trail easements is a component of the proposed project and not a mitigation measure; therefore, it is not required or appropriate to be identified as a mitigation measure in the Draft EIR. The commenter's recommendations for requirements associated with trail easement dedications are noted and will be considered by County decision-makers; however, the recommendations are not required to mitigate a significant environmental effect and need not be incorporated to the project's easements dedication component.

Letter #233 March 3, 2025, Neil Thompson (Letter #2)

Comment 233-1

Section 6 of the DEIR discusses the various Alternatives that have been proposed in addition to the Alternative 1: No Project.

With the exception of Alternative 4: Reduced Mining Depth (300 feet) with Additional Setbacks, none of the revised project alternatives (Alternates 2, 3 & 5) provide any reduction in the impacts to the environment other than reducing the duration of the impact from a very long term to only a long term - maybe only impacting two or three generations as opposed to impacting four generations of a typical family. And the physical impacts to the river, wildlife, birds and surrounding land would never benefit from the reduction in time of disruption from 100-years to 63-years.

These are hollow Alternatives. They provide no basis for acceptance as they only impact the Applicant by reducing the Operational Life or extraction volume.

Response 233-1

Draft EIR Chapter 6, "Alternatives," describes a range of project alternatives and compares the associated potential environmental impacts to those of the proposed project. The chapter includes a discussion of the CEQA requirements for an alternatives analysis and the methodology used for the selection of alternatives, with the intent of developing potentially feasible alternatives that avoid or substantially lessen the significant impacts identified for the proposed project while still meeting most of the basic project objectives. The chapter identifies a reasonable range of alternatives that meet these criteria. Each of the alternatives is evaluated for its comparative merits with respect to minimizing adverse environmental effects compared to existing environmental conditions (referred to as the baseline conditions) and compared to the impacts of the proposed project. The Draft EIR evaluation of alternatives provides a detailed and sufficient evaluation of a reasonable range of alternatives to the proposed project in compliance with CEQA. The comment does not address the adequacy of the Draft EIR or suggest additional feasible alternatives for further consideration. Please see responses below to specific issues raised by the commenter regarding alternatives.

Comment 233-2

Section 6.4.2.1 provides excuses for not considering alternative sites. The Applicant avoids acknowledging that they have previously investigated another site (Jesse Morrow) at great length. It stands to reason that the Rockfield site(s) was not their first selection but a fallback position when the Jesse Morrow site became unavailable. If there are two potential sites (Rockfield and Jesse Morrow) in Fresno County, there must be other potential sites.

Response 233-2

Please see Response 233-1 pertaining to alternatives. The Applicant's previously proposed Jesse Morrow Mountain quarry site is located near Minkler over 30 miles southeast of the proposed project and the application for that surface mine permit was rejected by Fresno County in 2012. The Draft EIR provides an extensive discussion of the feasibility of offsite locations as an alternative to the proposed project and the ability of offsite locations to achieve the project objectives. As discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations," on pages 6-5 through 6-7, "[n]o specific location with the attributes necessary to accomplish the project objectives is known in enough detail to be identified as a specific alternative site to feasibly meet the project objective of developing a known high-quality aggregate deposit" and "relocating the proposed operation to another site in the region would introduce new impacts to a site with no previous aggregate mining activity." For these and other reasons detailed in the Draft EIR, an

alternative location was properly rejected from further evaluation. Although the comment suggests that there must be other potential sites, the comment does not provide evidence of any other potential sites.

Comment 233-3

- The Alternative Analysis should be rewritten to provide significant alternatives that might at least include:
  - no hard rock mining at the Rockfield site(s)
  - expanded setbacks along the river and Friant Road
  - reclamation plans that do not have hard rock facings
  - potential alternative sites

Thank you for your consideration.

Response 233-3

Draft EIR Chapter 6 evaluates project alternatives, including a "No Project Alternative" that would involve ongoing mining activities and processing operations at the existing Plant and Quarry sites through 2026, as allowed under existing permits. Under the No Project Alternative, the existing mining operations would cease when the existing permits expire in 2026, and the Quarry and Plant sites would be reclaimed as open space uses including lakes and grazing land. The evaluation for the No Project Alternative determined a reduced impact on aesthetic and visual resources compared to the proposed project. Four reduced mining-depth alternatives are also considered in the Draft EIR.

Project Alternative 4 evaluates the project with a reduced mining depth of 300 feet and additional setbacks. This alternative would reduce the total mining depth from the proposed 600 feet to 300 feet below ground surface and would impose an additional 100-foot setback from the San Joaquin River, totaling 300 feet, and a 100-foot setback from Friant Road (Draft EIR page 6-39). Under this alternative, the total areas of disturbance would be reduced by approximately 30 acres and shorten the lifespan of the project operations by 37 years. The analysis of each project alternative considers whether the alternative would reduce impacts as compared to the project as proposed.

In summary, the alternatives analysis in the Draft EIR demonstrates that a reasonable range of alternatives were thoroughly considered. These alternatives ensure that decision-makers and the public have a comprehensive understanding of the potential benefits and trade-offs associated with each option.

Letter #234 March 3, 2025, Linda Tibonie

Comment 234-1

It is very hard not to be emotional at the mere thought of this happening along the beloved San Joaquin River. It"s bad enough that Cemex was allowed to operate where it currently is instead of being turned over to the Parkway Trust.

Response 234-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #235 March 3, 2025, Claudia Tischler

Comment 235-1

I am writing to oppose the Cemex expansion for 100 years on the river.

Response 235-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit.

Letter #236 March 3, 2025, Doris Van

Comment 236-1

I live in North east Fresno and frequently go to Woodward Park. I am against the proposal to allow 100 more years of mining and to create a 600 ft pit. The impact to residents of Fresno and Madera will be huge - air quality will be worse, traffic and noise will be unacceptable to those who live nearby or use the parks or river.

Response 236-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of air quality and traffic congestion are addressed in Section 4.3, "Air Quality," and Section 4.17, "Transportation," of the Draft EIR, as they are updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #9 regarding the project's potential impact on the region's existing air quality and Collective Response #29 regarding project truck traffic. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 236-2

This location is too close to those who live nearby or travel on the road that already is impacted by traffic. The San Joaquin river is used by the community and they project will be an eyesore. This will increase traffic and pollution on the nearby roads and community.

Please do not approve this project as it will affect our children and grandchildren.

Response 236-2

The project's potential visual impacts are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." As described under Impact 4.1-1 beginning on Draft EIR page 4.1-51, the project would result in significant and unavoidable visual impacts at two locations even with implementation of Mitigation Measure 4.1-1. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1 and Mitigation Measure 4.1-1. See also Collective Response #8 regarding the proposed visual mitigation. See Response 236-1 above regarding air quality and traffic. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #237 March 4, 2025, Karla Baker

Comment 237-1

I do not want 100 more years of mining our river. Please stop the mining of our beautiful river and do not contribute to the further expansion of this horrible eyesore. Also I'm very troubled by all the river rock people are using on mediums and in their landscaping. Its no different from asphalt, concrete, in that it further reduces the humidity in the air and increases the temperature of our city. Please stop this polluting project.

Karla Baker retired LCSW and mental health provider and someone who wants to protect our beautiful river for our children.

Response 237-1

The project's potential visual impacts are addressed in Section 4.1, "Aesthetics and Visual Resources," of the Draft EIR. See also Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment, and the commenter's opposition to the proposed project, are noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit

Letter #238 March 4, 2025, Gerald and Charleen Bier

Comment 238-1

We are extremely opposed to the application of Cemex for a 600-foot mining pit along the San Joaquin River.

We hope the county staff will vigorously recommend against this application.

Response 238-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #239 March 4, 2025, Dalessi M

Comment 239-1

As a citizen of the San Joaquin Valley, I strongly oppose and urge you to move to end the expansion of CEMEX. This project will impact San Joaquin River and is extremely harmful to our environment, putting fish and wildlife in the area at risk and threatening our water quality. We, the people of San Joaquin Valley, do not want this for our environment and will hold local leadership accountable for the generational impacts and damage on our valley's endangered habitats and resources.

Response 239-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Potential effects to the San Joaquin River and water quality are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR. Potential effects to fish and wildlife species and their habitats are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #240 March 4, 2025, Ron Darnell

Comment 240-1

I am very familiar with blasting in open pit mines in the coal mines in New Mexico, Arizona, Utah, and Colorado. I was in a service truck for Cummins Rocky Mountain and served the oil fields in the San Jaun Basin and multiple open pit coal mines in 4 states around the 4 Corners area.

It required radio silence for 15 min the whole mine property before a blast. These mines were very remote. I would have concerns of radio frequency causing detonation near a population like ours

along with issues to the city water wells on the north side of town.

Response 240-1

Mining the hard rock requires drilling and blasting that would occur approximately 600 feet below ground surface level. Methods of blasting and the impacts from blasting are described in detail within Draft EIR Chapter 2, "Project Description," and the Blasting Protocols (see Appendix H-9, "Revised Blasting Protocols"). Additionally, a certified or qualified blasting contractor would be required to deliver the explosives in Department of Transportation certified commercial trucks to the Quarry Site for each blast event, one to two days per week. Any unused explosives would be removed after blasting is complete and prohibited from being stored on-site. Dynamite would not be used for any blasting activities.

Certain types of blasting equipment require a period of "radio silence" prior to detonation due to use of radio signals with the electric charges for the blasting material, but this is not required for every type of blasting event. Pursuant to the Mine Safety and Health Administration (MSHA) and Draft EIR Blasting Protocols, the certified or qualified handler of the blasting equipment would implement best practices to minimize risk and mitigate impacts from the blasting activities. The Blast Impact Analysis and Blasting Protocols can be found in Appendix H-3, "Blast Impact Analysis," and H-9, "Revised Blasting Protocols," respectively. Multiple studies have been completed about the effects of blasting on groundwater, which all concluded that there are no significant long-term chemical or mineralogical changes observed in groundwater that could be attributed to blasting. As discussed in the Draft EIR, blasting agents typically used for mining include both an oxidizer and an accelerant, generally in the form of nitrate-based compounds and flammable liquids. Adherence to the Blasting Protocols, regulations, and Mitigation Measure 4.10-1 would sufficiently reduce the potential risk of substantial groundwater quality degradation due to onsite blasting activities to less than significant levels. See Appendix H-9, "Revised Blasting Protocols," for revisions to the Blasting Protocols.

Comment 240-2

Water seepage from the San Joaquin River is another concern.

Response 240-2

Please see Collective Response #25 pertaining to surface and groundwater interconnection.

Comment 240-3

Now the biggest concern is semi truck traffic.

Vulcan in Sanger sends out up to 1600 trucks daily from a smaller mine. Friant Rd cannot handle that kind of traffic, esp. During rush hour traffic when truck traffic would be the heaviest.

How many trucks would they be able to load daily?

Response 240-3

Please see Collective Response #29 pertaining to project-related traffic impacts and road improvements.

Comment 240-4

Who will maintain Friant Road?

Response 240-4

Please see Collective Response #29 pertaining to project-related traffic impacts and road improvements.

Comment 240-5

With blasting, is there possibly of fracturing the hardpan all the homes in N. Fresno are built on?

Response 240-5

Mitigation Measure 4.10-1 requires the project to implement Blasting Protocols (found in Appendix H-9, "Revised Blasting Protocols"), which include groundborne vibration and air overpressure measurements, monitoring and reporting. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.13, "Noise." See also Response 58C-3 and Appendix H-8, "Blasting and Human Response Technical Memorandum," for further discussion and analysis of the Blasting Protocols. The potential for the project to generate substantial groundborne vibration to destabilize the riverbank at the Quarry Site was less than significant. Therefore, blasting impacts potentially fracturing the hardpan of homes in northern Fresno further from the project sites, would be less than significant after mitigation.

Comment 240-6

Why do they need to mine that big of a hole that close to town? When Vulcan ran out of materials they relocated to where the hard rock is very shallow at Hwys 41/145. They are not near any homes or in a fragile river system.

Cemex needs to do the same as Vulcan.

Hwy 41 is much better prepared to handle the heavy truck traffic and we can avoid future water well issues if Cemex is not next to town.

Response 240-6

Under CEQA, the environmental review process evaluates the proposed project against its stated objectives and considers feasible alternatives, as detailed in the Draft EIR. The proposed location meets key objectives, including proximity to existing and ongoing CEMEX operations, efficient use of existing infrastructure, and continued supply of aggregate to regional markets. Mining and processing operations have occurred at the Plant and Quarry sites for over a century, and the environmental baseline reflects this long-standing land use. Relocating operations to another site would require new infrastructure development and could introduce new impacts to other sensitive resources.

The Draft EIR provides an extensive discussion of the feasibility of offsite locations as an alternative to the proposed project and the ability of such locations to achieve project objectives. As discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations," on pages 6-5 through 6-7, no specific alternative location with the attributes necessary to accomplish the project objectives is known in sufficient detail to be identified as a feasible alternative site, and relocating operations would introduce new impacts to areas with no previous aggregate mining activity. For these and other reasons detailed in the Draft EIR, an alternative location was properly rejected from further evaluation. The comment does not provide evidence of the availability or feasibility of other potential sites or suggest additional feasible alternatives for further consideration.

Draft EIR Chapter 6, "Alternatives," provides a detailed evaluation of a reasonable range of alternatives consistent with CEQA requirements, including consideration of alternatives that would reduce impacts while meeting most project objectives.

In addition, mitigation measures addressing potential impacts to surrounding domestic water wells include Mitigation Measures 4.10-1 4.10-5a and 4.10-5b, and 4.10-10a and 4.10-10b. Implementation of these measures requires groundwater monitoring, including collection of water level data at regular intervals, periodic data review, and preparation of annual reports by a Professional Geologist/Certified Hydrogeologist submitted to Fresno County (see also Draft EIR Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report"). If monitoring indicates groundwater levels fall below established thresholds attributable to project activities, corrective actions would be implemented in accordance with the adaptive management programs.

Letter #241 March 4, 2025, Ed Dostal

Comment 241-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed. This will have a devastating effect on our precious river resource.

Response 241-1

Potential effects on the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. No specific comments related to the adequacy of the Draft EIR were made. However, the comment is noted for the consideration of the decision-makers.

Comment 241-2

2. Air Quality and Dust Emissions. Air quality in the Central Valley is a vicious problem that will be exacerbated by this project.

Response 241-2

Air quality and dust emissions are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Draft EIR Appendix D-4, "Revised Section 4.3, Air Quality." See also Collective Response #9 regarding the project's potential impact on the existing air quality conditions of the region.

Comment 241-3

3. Biological Resource Impacts. Our fisheries can not withstand the impact of this project.

Response 241-3

Potential project impacts to fisheries are addressed in Section 4.4, "Biological Resources," of the Draft EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. No specific comments related to the adequacy of the Draft EIR were made. The comment is noted for the consideration of the decision-makers.

Comment 241-4

4. Traffic and Noise Concerns. There is already too much congestion in the area. We don't need to make it worse.

Response 241-4

See Collective Response #29 regarding project truck trips and traffic congestion.

Comment 241-5

5. Cumulative Environmental Effects. CEMEX is a Mexican company. Send them back to Mexico to destroy the environment there. We don't want it here in California.

Response 241-5

Draft EIR Chapter 5, "Cumulative Impacts," provides an evaluation of the project's cumulative effects. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 241-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 241-6

The proposed project's potential impact on the health of the San Joaquin River is addressed in Draft EIR Section 4.10. See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections and supporting appendices referenced in this response.

Letter #242 March 4, 2025, John Edwards

Comment 242-1

I can't believe that this expansion is being considered.

Deep pit mining and hard rock blasting.

Terrible for the San Joaquin river.

Please don't approve.

Response 242-1

See Collective Response #17 pertaining to river bank stability and the potential for breach and flooding. See also, Draft EIR Section 4.10, "Hydrology and Water Quality," in regard to the proposed project's potential effect on the San Joaquin River. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #243 March 4, 2025, Don R. Falkenberg

Comment 243-1

I am writing to voice my opposition of the above subject project.

The draft EIR does not adequately address the impact of this project because it is impossible for any planner or forecaster to project over that extraordinary long period of time. 100 years! That, in itself, should disqualify any consideration of this proposal.

Response 243-1

See Collective Response #5 regarding the duration of the proposed use permit. Draft EIR Chapter 5, "Cumulative Effects," presents an analysis of the project's potential cumulative effects. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 243-2

Furthermore, blasting a 600 foot deep mining pit within a relatively few feet of the San Joaquin River, where the State of California has created the San Joaquin River Conservancy, is inconsistent with the mission of the Conservancy. The impact of mining vs. blasting is not adequately addressed in the EIR.

Thank you for consideration of my comments, inasmuch as I am concerned about the negative impact of this expansion project, as a resident of the City of Fresno and Fresno County.

Response 243-2

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment, and the commenter's opposition to the proposed project, are noted for the consideration of the decision-makers.

Letter #244 March 4, 2025, Janice Ferrell

Comment 244-1

I Am Fresno County Resident, And Read Your Postcard, And Read This Fresno residents must rally against CEMEX blast mining plan | Fresno Bee

Regarding The Mining Extension, Proposed For The San Joaquin River. I Strongly Disagree With Any Mining, Or Digging There, Due To

Fact That Will Weaken, And Make The Ground Unstable, And Because There Is An Earthquake Fault Near There, That Produces 6.3 To 6.7 Magnitude Earthquakes.

Please Reject This Proposed Project, Right Away!!!

Response 244-1

See Collective Response #17 regarding river bank stability. The issue of seismic activity is addressed in Draft EIR Section 4.7, "Geology and Soils." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #245 March 4, 2025, Alberta Ferrer

Comment 245-1

Please do NOT allow hard rock blasting and a crater of 600 feet deep mining pit. Too much noise, dust and destruction of our our San Joaquin river bed. Please DO NOT harm our environment any more than has already been allowed.

Please say NO to this expansion.

Response 245-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of noise and dust are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," as they are updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). Potential impacts to the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #246 March 4, 2025, Laurell Huber

Comment 246-1

I believe the proposed mining project along the San Joaquin River should definitely not be pursued.

A concerned senior citizen and life-long Fresno resident,

Response 246-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #247 March 4, 2025, Brad and Kristi Hushaw

Comment 247-1

As lifetime Fresno County residents, we were are totally AGAINST the proposed expansion of the CEMEX project currently before the county administration. The expansion flies in the face of Fresno city and county residents' ongoing work to complete the San Joaquin River Parkway,

Response 247-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 247-2

not to mention its effect on water, fish, wild life, roads, and residents living near the business.

Response 247-2

The comment describes a range of potential environmental effects of the project. These issues are addressed primarily in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.4, "Biological Resources," and Section 4.17, "Transportation." Potential effects on residents are discussed throughout the EIR including Draft EIR Section 4.13, "Noise," and Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 247-3

The only way to mitigate the effects of blasting near the San Joaquin River would have been to NOT approve it in the first place. Who in Fresno County will hold CEMEX's feet to the fire when the environmental plan is not adhered to and necessary mitigation not followed? The many identified potential issues and problems necessitating mitigation in the plan are so numerous to be almost laughable if violations weren't so potentially disastrous. Is this draft tough enough ??

Response 247-3

The existing approved use permit does not permit blasting. The proposed project, which does propose blasting, has not yet been approved or denied. The proposed project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. Additionally, the cumulative effects of the project are discussed in Draft EIR Chapter 5, "Cumulative Impacts." The operation is currently, and would continue to be, inspected annually by County staff or consultants to determine compliance with applicable regulations, permits, and conditions of approval (including mitigation measures) in accordance with the County's Surface Mining Ordinance as codified in the Fresno County Zoning Ordinance. Violations are managed in accordance with the requirements of this section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #248 March 4, 2025, Sue Karibian

Comment 248-1

Please save the San Joaquin River from Cemex. Please!!!!!

Response 248-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #249 March 4, 2025, Marianna Kast

Comment 249-1

I am writing to oppose the CEMEX Rockfield Modification Project (EIR 7763), and Conditional Use Permit Application 3666 and 3667.

The California Geological Survey Map Sheet 52 provides information about the availability of and future demand for California's already permitted aggregate reserves. The 2018 update, the most recent available, indicates that the Fresno Production-Consumption Area has already permitted far more aggregate reserves for mining than this area's projected need. Here's the CGS Map Sheet 52 projection for the Fresno area:

CALIFORNIA GEOLOGICAL SURVEY MS 52

Table 1. Comparison of 50-Year Demand to Permitted Aggregate Reserves for Aggregate Study Areas as of January 1, 2017.

AGGREGATE STUDY AREA[1]	50-Year Demand (million tons)	Permitted Aggregate Reserves (million tons)	Permitted Aggregate Reserves Compared to 50-Year Demand (percent)	Projected Years Remaining
Bakersfield P-C Region	338	1,708	505	More than 50
Barstow-Victorville P-C Region	163	117	72	31 to 40
Claremont-Upland P-C Region	202	90	45	21 to 30
El Dorado County	82	15	18	11 to 20
Fresno P-C Region	305	556	182	More than 50
Glenn County	41	22	54	21 to 30
Merced County	154	61	40	21 to 30

Since our area has already permitted aggregate reserves equal to 182% of projected needs through 2066, there is no justification for the continued destruction of the Fresno side of the San Joaquin River from aggregate mining. This mining operation should be be halted immediately, and prohibited from continuing and expanding in the future.

Response 249-1

See Collective Response #3 regarding aggregate demand and the need for the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #250 March 4, 2025, Kathryn Kelly

Comment 250-1

Please do not cause new harm to the San Joaquin River with the CEMEX expansion. By rejecting this project, we can keep our wildlife and fish safe by protecting our water quality for generations to come.

Response 250-1

Potential project effects on fish and wildlife species and water quality are addressed in Draft EIR Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment, and the commenter's opposition to the proposed project, are noted for the consideration of the decision-makers.

Letter #251 March 4, 2025, June Kezerian

Comment 251-1

Per CEMEX expansion: I am against this expansion as it is a detriment to the surrounding environment

Response 251-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #252 March 4, 2025, Emily Kuizenga

Comment 252-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed I am very concerned about the idea of blasting rock from the delicate San Joaquin River bottom. This is an incredibly crucial part of our valley's eco-system and introducing heavy machinery and blasting away rock will ruin habitat for native animals, create sound pollution, and interfere with the aesthetics of the area.

Response 252-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Specifically, Draft EIR Section 4.10.1.5, "Erosion and Sedimentation," regarding concerns about erosion of the banks of the San Joaquin River. The issues of sound pollution and aesthetics are addressed in Draft EIR Section 4.13, "Noise," and Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 252-2

2. Air Quality and Dust Emissions The amount of dust that will be created from blasting rock can not be helpful for our community. We have enough difficulties maintaining air quality as it is in the Central Valley and should avoid any additional emissions that can be controlled.

Response 252-2

The issues of air pollution and dust are addressed in Draft EIR Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. Additionally, see Collective Response #9 regarding the project's potential impact on the existing air quality conditions in the region.

Comment 252-3

3. Cumulative Environmental Effects The delicate habitats of owls, native birds, and turtles will be disturbed as will the overall stability of the earth near the site. The impacts of such a major disturbance to the landscape can not be fully known and I am very concerned about the potential for ecological destruction in such a sensitive area.

Response 252-3

The project's potential cumulative impacts related to biological resources are addressed in Draft EIR Section 5.3, "Cumulative Impacts Evaluation," beginning on page 5-11. The issue of ground stability is addressed in Draft EIR Section 4.7, "Geology and Soils." See Impact 4.7-3 regarding potential for landslides and Impacts 4.7-6 and 4.7-7 regarding slope instability. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also, Collective Response #13, regarding the proposed project's operational effects on offsite wildlife.

Comment 252-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 252-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #1 regarding transparency in the County's processing of the project and the need for additional analysis and enhanced mitigation. Additionally, a reasonable range of alternatives for the proposed project are discussed in Draft EIR Chapter 6, "Alternatives."

Letter #253 March 4, 2025, Kathryn Lemon

Comment 253-1

I am writing to voice my opposition to allowing Cemex to continue mining . The San Joaquin River has become a jewel for the valley. Families from across the valley enjoy the river. Please don't destroy what has taken decades to rebuild.

Response 253-1

See Collective Response #21 regarding public access to the San Joaquin River. See also Collective Response #12 regarding project effects on recent river and salmon restoration efforts. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #254 March 4, 2025, Mary Ann Martinez

Comment 254-1

This is to let you know that I am OPPOSED to the CEMEX expansion. It will allow 100 more years of mining, create a 600 foot deep mining pit which would greatly damage Millerton Lake area, and change the mining type to hard rock blasting.

Please refuse approval of this expansion. It would be an environmental disaster in my opinion.

Response 254-1

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment, and the commenter's opposition to the proposed project, are noted for the consideration of the decision-makers.

Letter #255 March 4, 2025, Rebecca Mendoza

Comment 255-1

I received a notice that mentioned a project for CEMEX expansion. I am concerned about the impact on the San Joaquin River and the environment as a whole. Can you address the impact hard rock blasting would have on wildlife?

Response 255-1

The project's potential effects on the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." Project effects on wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #256 March 4, 2025, Lynn Quinn

Comment 256-1

I am writing to ask you NOT to approve the proposed CEMEX expansion!

I live near by and I am a hiker who utilizes the area near the Cemex Plant. I would like to preserve the San Joaquin River and the surrounding area. After many years of hard work, the river is doing much better. Let us preserve that progress for everyone to enjoy.

Response 256-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #12 regarding the project's potential effects on recent river and salmon restoration projects. See also, Collective Response #21 regarding public access to the San Joaquin River.

Comment 256-2

The proposed expansion with one hundred years of continued mining is a very long time! A deep pit mine utilizing hard rock blasting will have drastic and deleterious effects on the surrounding wild area. Please do not approve this proposal!

Response 256-2

See Collective Response #5 regarding the duration of the proposed use permit. See Collective Response #13 pertaining to the project's operational effects on wildlife surrounding the project sites. Project effects on the areas surrounding the project sites are evaluated throughout the Draft EIR. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #257 March 4, 2025, Molly Schnur-Salimbene

Comment 257-1

Dear David,

The expansion of and changes to mining "along" the San Joaquin River will have devastating results for the river, riparian areas, effects on the groundwater table, and set the precedent for the continued exploitation of Fresno's first and best resource-the river.

There are many times when I find myself speaking with people who don't realize there IS a river here, running through and creating the border between Fresno and Madera. Many people don't realize that without that river, neither city would be here. It is only because of it that the community itself exists.

Response 257-1

Potential effects to the San Joaquin River and groundwater resources are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential effects to riparian areas are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-4 beginning on Draft EIR page 4.4-55. See also Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 257-2

The proposed extension/deepening to the existing mining site off of Friant Road will disturb the water table and natural connectivity to the river,

Response 257-2

Potential effects on the hydrologic conditions of the project area are evaluated in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft

EIR section. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 257-3

create further obstacles to the public in accessing the river,

Response 257-3

See Collective Response #21 regarding public access to the San Joaquin River.

Comment 257-4

and continue to be a nuisance to those who regularly use Friant Rd (show me a person who uses that stretch of road who HASN'T had a windshield nick or crack from gravel flying off a truck- I've had 3).

Response 257-4

See Collective Response #30 regarding vehicle damage from aggregate haul trucks.

Comment 257-5

More importantly, it is the ultimate act of giving priority to money over the general benefits to the community. It's a case where "who knows?, it could be fine," feels like the first line response from the people who are supposed to be acting on our behalves .

Believe in this instead: this river gave use to the land, created our cities, and has allowed us to stay. Let's repay the respect.

Response 257-5

The cumulative effects of the project are discussed in Draft EIR Chapter 5, "Cumulative Impacts." The potential impact of the proposed project on the San Joaquin River is discussed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #258 March 4, 2025, Amanda Schoelen

Comment 258-1

Dear Mr. Randall,

I am writing to express and record my opposition to the proposed 100-year permit for the CEMEX mining operation and challenge the adequacy of the Draft EIR prepared and submitted for this

particular project. As currently drafted, the EIR does not assess the environmental, ecological, and community impacts that this 100-year timeline will have on the San Joaquin River and surrounding areas deeply enough.

As an amateur naturalist, outdoor recreation enthusiast and avid birder, I find that the EIR fails to adequately address my concerns:

- safeguarding our biological resources here in Fresno County. The search area is not adequate to identify species of special status, likely mischaracterizes a habitat that would be subject to the CA Fish and Game Code, and does not have adequate analysis of the potential effect on threatened Swainson's hawk

Response 258-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to biological resources are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4. See also Collective Response #14 regarding the project's potential effects on Swainson's hawk.

Regarding the search area used for the special status species records search and associated analyses. The search records and the search radius provide sufficient information about potential special status species located in the project sites, in accordance with CEQA standards. The mining site is located within a narrow band or corridor of mostly disturbed habitat bordered by the San Joaquin River on its western boundary and North Friant Road on its eastern boundary, effectively isolating this area of previously disturbed habitat from the surrounding areas of open native habitats. (See Section 2.4.2, "Project Sites Land Uses," of the Draft EIR.) In this instance, a 4-quadrangle search is sufficient to provide a comprehensive list of sensitive species in the project area for project analysis. The project sites have been severely impacted by mining operations and agricultural activities and is a biologically isolated area with prior significant loss of native habitats due to mining and agricultural activities. An EIR need not include all information available on a subject. (*Assn. of Irritated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383.) It should be noted that the biological consultants working on the EIR reviewed the CNDDB in 2024 and this did not change the list of potentially occurring plant and wildlife sensitive species expected to occur as those listed in the 2019 when consultant initially queried the CNDDB.

Despite this, as part of preparing the Final EIR, the biological consultants conducted a 9-quadrangle CNDDB search over the following quadrants: Little Table Mtn., Millerton Lake West, Millerton Lake East, Lanes Bridge, Friant, Academy, Fresno North, Clovis, and Round Mountain for the purpose of amplifying and clarifying information pertaining to baseline conditions of the project's biological resources. This additional search changed none of the biological impact conclusions in the Draft EIR.

Comment 258-2

- Air Quality and environmental effects on health of human residents and recreationists. Project emissions may exceed acceptable cancer risk thresholds.

Response 258-2

The issue of air quality and related health effects is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also, Collective Response #9 regarding the project's potential impact on preexisting air quality conditions, Collective Response #11 regarding the potential population-wide cancer risk of the project, and Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Comment 258-3

- 100 years is much too long a period to adequately assess future risks in our rapidly changing culture, political system and climate.

Response 258-3

See Collective Response #5 regarding the duration of the proposed use permit. See also, Draft EIR Chapter 5, "Cumulative Effects," regarding the potential cumulative effects of the project over the period of the use permit.

Comment 258-4

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

Our responsibility to our community requires us to consider extractive projects with the high potential for harm carefully and

with an eye on all the factors at play, not just the growth of industry.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made. I believe that we can do better.

Response 258-4

See Collective Response #1 regarding additional analysis and enhanced mitigation measures. See also Draft EIR Chapter 5, regarding the potential cumulative effects of the proposed project. Comment 258-4 is noted for the consideration of the decision-makers.

Letter #259 March 4, 2025, Judy Simon

Comment 259-1

CEMEX should NOT be allowed to create new harm by mining in in county!

Response 259-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #260 March 4, 2025, Kelty Spencer

Comment 260-1

I am emailing to strongly oppose the CEMEX expansion. Fresno has so little green space as it is I cannot believe this expansion would be pushed through. 100 more years of mining would impact generations of Fresno's citizens,

Response 260-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 260-2

and due to the change in mining type it threatens water quality and impacts fish and wildlife. Fresno, and the surrounding communities, do not want this.

Response 260-2

Potential effects on water quality and fish and wildlife species are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #13 regarding the project's potential operational effect on wildlife. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #261 March 4, 2025, Roger Stewart

Comment 261-1

I oppose the proposed expansion because (a) the support for a current and future need for the gravel is weak; (b) there is adequate current supply, and almost limitless untapped supply, in several local counties; (c) the San Joaquin River is a unique feature of this part of California and would be irreparably damaged if the Cemex expansion is allowed to proceed.

Response 261-1

See Collective Response #3 regarding aggregate demand and the need for the proposed Project. Potential effects of the project on the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #262 March 4, 2025, Unnamed Residents

Comment 262-1

I live at Woodward Lakes, and I am against the following CEMEX is proposing:

- 100 more years of mining
- Creating a 600-foot-deep mining pit
- Changing the mining type to hard rock blasting. This will threaten the water quality and impact the fish and wildlife of the San Joaquin River and the surrounding areas of the river bottom.

This is NOT acceptable for our quality of life but also it will impact and harm the San Joaquin River.

There is NO need for CEMEX to expand/change their current operation. I believe they make more than enough profits for their current operation, but as a company they want more profit. This is greed. DO NOT APPROVE!

Response 262-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit. Project effects on water quality and the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." Project effects on fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #263 March 4, 2025, John Zweifler

Comment 263-1

I am writing to express my strong opposition to the proposed creation of a 600 foot mine in the San Joaquin River bottom with excavation rights for the next 100 years! I have two major objections. My first objection is that the proposed site sits next to and separates some of the nicest parkland in Fresno County. There is Woodward Park on one side, and Lost Lake and Millerton Lake on the other, not to mention Ball Ranch. Fresno has precious little natural habitat of any kind, let along natural habitat that is publicly accessible- we should do everything we can to optimize what we have, such as constructing walking and bicycle pathways and trails along this section of the San Joaquin River similar to what has been done in other communities such as Sacramento. This would greatly improve the ambience of Fresno and make it a much more attractive destination for visitors and for those considering relocation, as well as preserve the unique and very limited habitat along this beautiful river. The dollar value and the positive impact on the mental and physical health of our community of creating a vibrant pathway along the San Joaquin River would far outweigh the incremental savings that might be achieved with this mine. Instead of becoming a magnet for visitors and residents, the proposed 600 foot mine would be a construction zone eyesore, reinforcing negative stereotypes regarding short-sighted planning, deference to developers, and lack of consideration for quality of life.

Response 263-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #21 regarding public accessibility of the San Joaquin River. The project proposes dedicating easements for the future construction of trail segments adjacent to the project sites. See Collective Response #22 regarding the proposed easement dedications. The issue of visual impacts is addressed in Draft EIR 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #7 regarding the project's economic effects. Additionally, see Collective Response #27 regarding the project's potential operational effects on park users. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 263-2

My other concern is regarding the long-term consequences of blasting a 600 foot mine by a river. You could argue that water is the most valuable resource we have- or dont have. What would it take to mitigate the damage done by blowing up land 600 feet down- the potential to disrupt water tables, contribute to ground water pollution, and other consequences we can only imagine? What would the cost be to return the earth to its natural state before it was ripped apart by this proposed mine? Can we even calculate what that cost would be?

Lets recognize the value we have right here in Fresno and preserve and honor the San Joaquin River by turning it into a parkway, not a parking lot.

Response 263-2

Draft EIR Section 4.10, "Hydrology and Water," requires implementation of multiple mitigation measures to reduce the project's potential impacts on water resources. See Impacts 4.10-8 through 4.10-11 and 4.10-13 regarding potential impacts to groundwater levels and supplies. See Impacts 4.10-4 through 4.10-7 regarding potential impacts to groundwater quality. Each measure provides details as appropriate on funding and which entity is responsible for implementation. For instance, Mitigation Measures 4.10-5b and 4.10-10b each describe the funding mechanism required to implement related Mitigation Measures 4.10-5a and 4.10-10a. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section and associated mitigation measures. Funding and implementation details will be summarized in the Mitigation Monitoring and Reporting Program (MMRP) that will be prepared for the project, if it is approved. See Collective Response #21 regarding public access to the San Joaquin River.

Letter #264 March 5, 2025, Loren Alving

Comment 264-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, **I have several concerns that I urge you to address** prior to moving forward with approval.

3) Impacts on the San Joaquin River Watershed: It goes without saying that the quality of the SJ River Watershed will be further degraded with this expansion of mining. This watershed is crucial to the health of the local environment and important to the wellbeing of its citizens. One example: Lowering of the water table and the impact on residential owners in the vicinity has not been addressed. These owners should be monetarily shielded from the effects of this project before the project begins.

Response 264-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Impacts 4.10-1 through 4.10-3 for discussion of potential surface water quality impacts. See Collective Response #23 regarding water quality impacts from project discharges. See also Collective Responses #24 and #25 regarding potential impacts to groundwater levels and nearby wells and proposed monitoring. Additionally, see Collective Response #4b regarding liability and funding to respond to unforeseen damages.

Comment 264-2

4) Air Quality and Dust Emissions: Dust and emissions are already a problem and will be getting worse. Currently, Fresno air quality is the worst or close to the worst in the nation and small particulate matter is extremely hazardous to human health; blasting will contribute significantly to that.

Response 264-2

The issues of air quality and dust emissions are addressed in Draft EIR Section 4.3., "Air Quality," as updated in this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also Collective Response #9 pertaining to the project's potential impact on existing air quality conditions and the evaluation of air emissions from blasting events.

Comment 264-3

5) Biological Resource Impacts: The SJ River Watershed is home to many different species of animals and plants. These communities will undergo huge disruption and suffer severe consequences. The switch to hard rock blasting will threaten water quality and have severe consequences on fish and wildlife.

Response 264-3

The issue of water quality is addressed in Draft EIR Section 4.10. The project's potential impacts on fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #13 pertaining to the project's operational effects on wildlife surrounding the project sites. See also, Collective Response #16 regarding the project's potential operational effects on salmon spawning.

Comment 264-4

6) Traffic and Noise Concerns: There are already too many mining trucks on the road ways, increasing traffic (moving very slowly on the on ramps to the freeway and causing backup and near accidents daily especially when they are allowed to enter 41 during rush hours with meters on the ramps). This will only increase them.

Response 264-4

The issues of traffic congestion and road improvements are addressed in Draft EIR Section 4.17, "Transportation." The issue of Noise is addressed in Draft EIR Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #29 regarding traffic congestion and project truck trips. See also Collective Response #30 regarding traffic safety.

Comment 264-5

Additionally, it does not appear that in their analysis they have evaluated the impacts of blasting to users of the nearby park or the disturbance to nearby residents. Blasting will have major impacts on quality of life for nearby residents and their analysis barely addressed this.

Response 264-5

The project's potential noise and groundborne vibration impacts on nearby residents and other sensitive receptors are addressed in Draft EIR Section 4.13. See Chapter 3, "Draft

EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #27 pertaining to the project's operational effects on users of nearby parks and trails. Quality of life is not an environmental issue and is not required to be addressed under CEQA.

Comment 264-6

> 7) Cumulative Environmental Effects: this new mining operation will create a massive pit in the SJV River, 600 ft deep and the size of a 43 story skyscraper. And, the most worrisome aspect of all: this project will allow 100 more years of mining. There is no reason to tie our community and our natural environment up for 100 years…

Response 264-6

Draft EIR Chapter 6, "Alternatives," evaluates a reasonable range of mining depths. Alternatives 2 and 5 describe a mining depth of 400 feet while Alternatives 3 and 4 describe a mining depth of 300 feet. Draft EIR Section 6.4.2.3, "Reduced Mining Depth (200 Feet)," discusses why a mining depth of 200 feet was rejected from consideration in the alternatives analysis. See Collective Response #5 regarding the duration of the proposed use permit. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 264-7

> Given these concerns, **I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.** Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.
>
> I would ask you to not approve this project on the basis of its environmental impact and to make sure that all the environmental concerns are addressed in any updated proposal.
>
> Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 264-7

This comment is a summary of previous comments. See Responses 264-1 through 264-6 for further discussion of specific concerns. See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range

of alternatives to the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #265 March 5, 2025, Penelope Critchlow

Comment 265-1

CEMEX's proposal is an atrocity against Fresno's greatest natural resource, already scarred by a century of gravel mining the company previously agreed to wind down, and should have been rejected point blank. Undeterred, county planners and hired guns spent five years working to sidestep urgent issues and fool the public, urging modifications to the proposal put forward by CEMEX, a wealthy international corporation.

Modification? They want to dynamite hundreds of feet below ground in close proximity to one of the country's most endangered rivers.

Do not allow this unnecessary project to go forward.

Response 265-1

Potential impacts to the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #1 regarding the County's planning process, Collective Response #3 regarding the need for the project, and Collective Response #17 regarding river bank stability and potential for breach and flooding. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 265-2

Some of the negative effects of this expansion are: further endangering the Salmon that bravely endure historical injury to the river. Impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, and cumulative environmental impacts,

Response 265-2

The project's potential impacts to salmon and wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See also Collective Response #12 regarding the project's potential effects on recent salmon restoration efforts and Collective Response #16 regarding the potential effects of project vibrations on salmon spawning. The issues of water quality and groundwater supplies, air pollution, and noise are addressed in Draft EIR Section 4.10, Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as they are updated in the Final EIR. Draft

EIR Chapter 5, "Cumulative Impacts," provides an evaluation of the project's cumulative environmental effects. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 265-3

Fresno County has enough aggregate resources available without letting CEMEX have its way in our precious valley.

Response 265-3

See Collective Response #3 regarding the duration of the proposed use permit.

Letter #266 March 5, 2025, Robert Crooks

Comment 266-1

I object to the proposed Cemex expansion. The River is an unbelievable natural resource that should not be impinged upon any more than it already has. Right now you can kayak or canoe from Friant to Fresno without becoming aware that you are in a near urban corridor. There is no traffic noise and little sign of human development along the way EXCEPT passing the Cemex plant. In that area there is a constant rumbling of industrial activity.

Response 266-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. This comment describes existing conditions along the San Joaquin that are not evaluated as part of the proposed project. Instead, they form the environmental setting or baseline condition of the project sites. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 266-2

I fear that if the expansion is approved and blasting is used to mine the rock there will be even more noise and probable disturbance of wildlife. In particular there are two large heron rookeries, at least one bald eagle nest and a large population of ducks and geese along this stretch or river.

Response 266-2

The issue of noise is addressed in Draft EIR Section 4.13, "Noise." The project's potential to disturb wildlife species is evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See

Collective Response #13 regarding the effects of blasting on wildlife located outside of the project sites. See also Collective Response #15 regarding impacts to non-nesting birds.

Comment 266-3

I don't know about the salmon restoration project but the impact on this multi-million dollar project should be considered as well.

Response 266-3

See Collective Response #12 regarding the project's potential effects on recent salmon restoration projects in the area.

Comment 266-4

Cemex should find somewhere else to establish a mine. Please do not approve this project.

Response 266-4

Draft EIR Section 6.4.2.1, "Alternative Site Locations," discusses potential alternative locations for the proposed project and why an alternative location was not evaluated as a project alternative. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #267 March 5, 2025, Ron Darnell

Comment 267-1

Cemex has deep pockets and MANY rather questionable environmental, MSHA, & OSHA violations, totalling over $53 million in the last 25 years.

Response 267-1

See Collective Response #4a regarding CEMEX's regulatory history.

Comment 267-2

Is the City of Fresno in agreement or denial of a permit?

What organizations are against it?

Response 267-2

The City of Fresno submitted two comment letters on the Draft EIR. See Letter #3 and #12. Comment letters received from organizations are presented as Letters #16 through #68. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 267-3

It's time they let the riverbottom heal from 100 yrs of abuse.

Response 267-3

The comment provides general information regarding existing environmental conditions in the project area. Existing environmental conditions are not evaluated as part of the proposed project. Instead, they form the environmental setting or baseline condition of the project sites. No specific question or issue related to the adequacy of the Draft EIR or the analysis of environmental impacts has been raised. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 267-4

How many acres would a 600' deep pit need?

How would a 600' pic reclamation?

What are their plans to get rid of all water they have to pump from the hole?

There are a lot more questions than answers.

Response 267-4

The commenter asks several questions regarding the proposed project design, plan of operations, and reclamation plan. See Draft EIR Figure 2-8, "Proposed Quarry Site Mining Plan." As shown on this figure, mining would occur over most of the Quarry Site in five phases totaling 281.9 acres. As described on Draft EIR page 4.7-29, post-reclamation "…approximately 108 acres of the 352.4-acre Quarry Site would contain a lake (shown on Figure 2-10, "Quarry Site Final Reclaimed Conditions"), with the hard rock of the quarry slopes above the lake covering an additional approximately 174 acres of the site."

The proposed reclamation plan is provided as Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," and is summarized in Draft EIR Section 2.5.7.2, "Quarry Site Reclamation Plans."

As described on Draft EIR page 2-30, "When groundwater is reached, dewatering would be implemented. Water pumped from pit areas would be pumped into groundwater recharge trenches that would be developed along the west and south sides of the Plant Site (see Figure 2-7)."

Comment 267-5

Has there been an environmental impact survey done?

If so, by what company?

Response 267-5

The Draft EIR for the proposed project was completed in December 2024 and released for public review between December 21, 2024, and March 10, 2025. See Draft EIR Chapter 8, "List of Preparers," for a list of parties involved in the preparation of the Draft EIR.

Letter #268 March 5, 2025, David DeFrank

Comment 268-1

I live in Friant and take my dog on walks at Lost Lake park multiple times per week. We love the beauty and wildlife present there. Changing the mining type at the CEMEX site to hard rock blasting threatens impacts to fish and wildlife in the area. It's not worth it.

Response 268-1

The project's potential impacts to fish and wildlife species are evaluated in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #16 regarding effects of blasting on salmon spawning and Collective Response #27 regarding the project's potential operational effects on park users. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 268-2

I am also concerned about the project's effects on the water table and water quality. I have a residential well very close to the site. It provides drinking water for my family, including young children. If this project is approved, CEMEX should be required to undertake substantial mitigation measures to ensure there are zero impacts to the water table, water quality or water quantity.

Response 268-2

The project's potential impacts on groundwater levels, supplies, and quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Mitigation Measure 4.10-5a. This measure requires the Operator to implement an adaptive management program at the Plant Site to ensure water released to recharge ponds for groundwater recharge meets applicable water quality standards. See also Mitigation

Measure 4.10-10a. This measure requires the project to implement an adaptive management program at the Quarry Site to ensure project operations do not significantly reduce groundwater levels at nearby wells. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #269 March 5, 2025, Debra Dooley

Comment 269-1

I am deeply concerned about the proposed CEMEX Rockfield Expansion project. I would appreciate your consideration of the following negative impacts this project would have on our environment and community.

1. The proposed 600 ft hole will create an unacceptable scar to the San Joaquin River bottom, and possibly damage the river itself. This is a risk that cannot be justified.

Response 269-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to the aesthetics of the project sites are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The project's potential impacts to the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 269-2

2. CEMEX proposes to change from the digging of sand and gravel to blasting hard rock and crushing it into gravel. This change will cause noise pollution and dust emissions. All nearby life (people and animals) will be negatively affected. Would you want to live near all of this noise and dust? I certainly would not.

Response 269-2

The issues of noise pollution and dust emissions are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," as they are updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. As determined in these sections, the project would not result in any significant noise or dust impacts that cannot be mitigated

to a less than significant level. See also Collective Response #9 regarding the evaluation of air emissions from blasting events.

Comment 269-3

3. Granting a 100 year extension is, in my opinion, irresponsible and ill advised.

Thank you for your consideration of my concerns in this matter.

Response 269-3

See Collective Response #5 regarding the duration of the proposed use permit.

Letter #270 March 5, 2025, Magda Gilewicz

Comment 270-1

I'm writing to strongly oppose the extension for another 100 years of Cemex's rights to mine along the San Joaquin River.

With the City of Fresno expanding further north and east swallowing more and more open, green spaces, the presence of the enormous mining pit in one of very few undeveloped areas along the river is very undesirable.

The whole area occupied by Cemex should be available for use by the half million population of the city, not for monetary exploitation by a multinational company.

A hundred years ago that spot was miles away from the city; now we have a huge industrial hole that will be even larger, if allowed, right where thousands of Fresnans could go for recreation. Instead, if the lease is extended, we will suffer from more air and noise pollution, face the danger of having our river contaminated and deal with the huge industrial blight where we could all have access to recreational land.

Allowing another 100-year lease will impact several future generations and deprive us all of access to undeveloped areas along the river. There's no room for that kind of industrial operation in the city any longer. Don't extend the lease!

Response 270-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #21 regarding public access to the river and the suggestion that the project sites be converted to public parkland. See also Collective Response #27 regarding the effects of blasting and other project operations on the users

of nearby parks and trails. The issues of air pollution, noise pollution, and aesthetics are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13, "Noise," and Section 4.1, "Aesthetics and Visual Resources," as they are updated in this Final EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Letter #271 March 5, 2025, Flannery Good

Comment 271-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. 1. Impacts on the San Joaquin River Watershed 2. Air Quality and Dust Emissions 3. Biological Resource Impacts 4. Traffic and Noise Concerns 5. Cumulative Environmental Effects

Response 271-1

The comment describes a range of potential environmental effects of the proposed project. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to air quality and biological resources are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") and Section 4.4, "Biological Resources," as they are updated in this Final EIR. The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise." Draft EIR Chapter 5, "Cumulative Impacts," presents an evaluation of the project potential cumulative impacts. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections and supporting appendices referenced in this response.

Comment 271-2

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 271-2

See Collective Response #1 regarding transparency in the County's processing of the proposed project and the need for additional analysis and enhanced mitigation measures. Draft EIR Chapter 6, "Alternatives," presents an evaluation of a range of reasonable alternatives to the proposed project.

Letter #272 March 5, 2025, Robert Greteman

Comment 272-1

I am very much opposed to CEMEX expansion. The San Joaquin riverbed and surrounding area should be protected from the pollution, noise and damage to the environment.

Response 272-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of water pollution and noise are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 272-2

I am also very tired of the endless trucks barreling down Friant Road constantly.

Response 272-2

This comment describes existing conditions along Friant Road that are not evaluated as part of the proposed project. Instead, they form the environmental setting or baseline condition of the project sites. The issue of traffic is addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #29 regarding traffic congestion.

Letter #273 March 5, 2025, Robert Heisdorf

Comment 273-1

I am writing to object to any planning for expansion by CEMEX in & around the San Joaquin River.

I object for a number of reasons to any expansion by CEMEX to harm our river further.

Please do not approve, or allow this project to go forward any further.

Response 273-1

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment, and the commenter's opposition to the proposed project, are noted for the consideration of the decision-makers.

Letter #274 March 5, 2025, David Horwitz

Comment 274-1

I am writing as a resident of Fresno, about the Cemex expansion to mine the San Joaquin River for 100 years, going 600 feet deep. This would not be without consequences for the entire region, not to mention the state's riparian corridors enabling the water the river supplies to recharge the local aquifers. While the San Joaquin River doesn't contribute directly to the Fresno Aquifer, indirectly, it acts as a riparian woodland cloud seeder, as the trees release water transpiring from their stomata, conglomerated with beneficial to plant fungal spores, dust, and pollutants, that act as cloud seeders, nucleating water molecules to form together and create rainfall downwind, which since the Sierras are right next to us, also rebuttals that rainfall onto farmers, gardeners, and recharge basins for the aquifers here around Fresno on the Valley floor. Blast mining 600 feet deep, or the equivalent of two football fields, will destroy the groundwater supply for the native riparian woodland trees that indirectly supply our region with water, including our endemic Valley Oaks, which are losing habitat at alarming rates.

Response 274-1

The commenter's opposition is noted for the decision-makers.

Please see Draft EIR Section 4.10, "Hydrology and Water Quality," for discussion of the project's potential impacts to hydrologic resources and groundwater supply. With regards to the project's potential impacts to groundwater dependent vegetation, including valley oaks, please refer to Draft EIR Impact 4.4-4, which concludes that "the potential for project dewatering and reclaimed groundwater elevations at the Plant Site to result in an adverse effect to groundwater dependent ecosystems and river flow dependent ecosystems would be less than significant (see Draft EIR page 4.4-56). The potential for project dewatering at the Quarry Site and the resulting impact upon river flow dependent ecosystems would also be less than significant (see Draft EIR page 4.4-

57). See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced in this response.

Comment 274-2

Add to this the simile for mining building materials, fracking, and earthquakes are not an impossibility, especially given California already has multiple fault zones. All we need is deep perturbations in a sensitive area, and Fresno County could become another earthquake hotspot.

Response 274-2

The geotechnical consultant's 2019 (July 2025) review of California State Oil and Gas data indicates no oil or gas wells in the vicinity of the project sites; therefore, fracking does not need to be analyzed or considered a factor to the proposed project. For reference, the closest fault deemed active per the State of California is the Great Valley fault (Segments 13), approximately 54 miles southwest of the project sites. Earthquakes originating on this fault are not considered of engineering significance to the project.

Comment 274-3

Then, there is agriculture. East side farmers along the San Joaquin River, and more western SJR farmers as well, rely on clean irrigation water, directly pumped from the river by riparian rights, or indirectly from adjacent groundwater, for their crops. This project would be an existential death trap for these farmers, polluting their water supply and decimating their irrigation baseline for their incomes.

Response 274-3

Please see Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity. Please see Collective Response #24 pertaining to groundwater monitoring. Please see Collective Response #23 pertaining to groundwater quality. The comment does not provide evidence that the project would adversely affect water rights, the quality of irrigation water, or access to irrigation water.

Comment 274-4

The stated reason for this mining is the region's growth occurring will need infrastructure material for building. Yet Vulcan Mining, a competitor of Cemex, already has provisioned this region with enough mining materials for the next century. Also, Cemex's previous mining on the river has only added to that. More is not even a necessity to begin with.

Response 274-4

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 274-5

Also, the San Joaquin River is a water supply for human needs like clean water, fishing, and mental uplift from natural ecosystems, termed biophilia in psychology, literally, "love of life". Truly, those of us who love life, all life, both human and non-human, love the San Joaquin River.

Response 274-5

Draft EIR Section 4.10 presents evaluation of potential surface and groundwater impacts of the project including those associated with the San Joaquin River. Draft EIR Section 4.4, "Biological Resources," presents evaluation of potential biological resources impacts of the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The comment does not address the adequacy of the Draft EIR or provide evidence of a potentially significant impact not addressed in the Draft EIR. The commenter's opinions regarding the San Joaquin River are noted and will be considered by County decision-makers.

Comment 274-6

While not a certainty, sinkholes have been known to arise in coal and gold mining operations of much less depth of extraction, so they might also arise here. It is known when mining hundreds of feet deep in area, especially watery areas, that sometimes, due to extreme subsidence, sink holes can emerge, and sometimes not even on the site of mining, but in subterranean cavities beneath adjacent urban areas that connect to riparian areas. This would spell disaster for many north Fresno residents should it commence, which 100 years and 600 feet deep; that ensures it is a possibility

Response 274-6

Earth materials within the project area, to the depth of the planned Quarry Site excavation, consist of a relatively shallow cover of gravel-rich alluvial soils over granitic bedrock. Sinkholes form within carbonate rock (e.g., limestone) when acidic groundwater conditions are present. Granitic bedrock is not subject to the formation of sinkholes. Therefore, bedrock sinkholes are not considered a hazard for the proposed project and the surrounding areas. The Draft EIR does not need to analyze impacts which are speculative or unlikely to occur. See Title 14 CCR Section 15064(d)(3) (indirect impacts that are speculative or unlikely to occur are not reasonably foreseeable and need not be considered under CEQA).

Comment 274-7

Lastly, air pollution from the many diesel trucks and machinery handling drilled materials and doing the drilling, day in and day out for 100 years, is going to total the health of the region's residents. We already have some of the worst air pollution in the San Joaquin Valley. This would intensify and enhance that by multitudes. Too many residents suffer from severe air pollution industrial chemical allergies from automobile exhaust, not to mention some chemicals in farms and lawns and homes and gardens.

This would forever damage the quality of life for the region, given the sheer volume of diesel fueled truck traffic transporting materials, and the mining offputs themselves.

Response 274-7

Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR, presents an evaluation of the potential air quality impacts of the proposed project including those associated with air pollutant emissions from onsite mining activities and offsite aggregate transport. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. Please see Collective Response #9 pertaining to the proposed project's potential impact on the region's existing air quality. No specific comments related to the adequacy of the Draft EIR were made, and no further response can be provided. However, the comment is noted for the consideration of the County decision-makers.

Comment 274-8

Simply put, I know this project must be terminated if the Central Valley is to survive economically and environmentally. Agriculture is a huge portion of the economy, and losing ecosystem services like available clean water, and pest predators from riparian native species, would be a loss for the regional farming community.

Environmentally, the very citizens of Fresno County are endangered by the destruction that will ensue. This project must be stopped. The costs, both financial and existential, ultimately will outweigh any short-term benefits Cemex promised.

Response 274-8

The comment does not discuss the adequacy of the Draft EIR or provide evidence of environmental effects. Please see Responses 274-1 through 274-7 above to specific issues raised in the comment letter. The commenter's concerns and opposition to the project are noted and will be considered by County decision-makers.

Letter #275 March 4, 2025, Elaine Johnson

Comment 275-1

It has come to my attention that CEMAX has plans to expand their work in our San Joaquin River bottom.

How in the world can we even think of allowing this dis-spoilage of our precious river practically in the city of Fresno.

Our way of life will not allow this blasting, this ruin right in the back yard of our city. We should be planning of the beautification of our river, not this.

100 years out? No! For money? No!

This is the river for all of us and we should not be selling our beautiful landscape and the peace that comes with it for any amount of money.

Response 275-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on the visual landscape are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See also Collective Response #5 regarding the duration of the proposed use permit.

Letter #276 March 5, 2025, Patty Kanemoto

Comment 276-1

I am concerned about the expansion of CEMEX operations as proposed. I reviewed the EIR and ultimately, I am left with a lot of concern in the areas of slope stability, air pollution, blasting, water quality and groundwater supply.

Response 276-1

The issues of slope stability and air pollution are addressed in Section 4.7, "Geology and Soils," and Section 4.3, "Air Quality," of the Draft EIR, as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The potential effects of blasting are addressed in both Draft EIR Section 4.9, "Hazards and Hazardous Materials," and Section 4.13, "Noise." The issues of water quality and groundwater supply are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 276-2

While there are mitigations stated, there is always the risk of an "accident" or it could be that we find a breach a little too late for the damage that might have already occurred . The consequences of material flowing down the river are too great and the consequences to the environment would be too grave.

Response 276-2

See Collective Response #17 regarding the potential for breach of the quarry pit wall and flooding. The comment is noted for the consideration of the decision-makers.

Comment 276-3

Also of great concern, is the depth of mining at 600 feet.

Response 276-3

Draft EIR Chapter 6, "Alternatives," evaluates a reasonable range of mining depths. Alternatives 2 and 5 describe a mining depth of 400 feet while Alternatives 3 and 4 describe a mining depth of 300 feet. Draft EIR Section 6.4.2.3, "Reduced Mining Depth (200 Feet)," discusses why a mining depth of 200 feet was rejected from consideration in the alternatives analysis. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 276-4

We already live in an area with poor air quality. It is time to put the brakes on adding more air pollution in future years.

Response 276-4

See Collective Response #9 regarding the proposed project's potential impact on the existing air quality conditions of the region.

Comment 276-5

To commit to this endeavor for another 100 years is unimaginable. I am opposed to this expansion in totality.

Response 276-5

See Collective Response #5 regarding the duration of the proposed use permit. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #277 March 5, 2025, Marjorie Keir

Comment 277-1

I am writing to you as a concerned citizen, mother, and grandmother. I am asking you not to allow the expansion of CEMEX. We have very few natural waterways in our county. In addition to contributing to poor air quality by dust created

Response 277-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for revisions to this Draft EIR sections. The issue of dust and air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding the project's potential impact on the region's existing air quality. See also Mitigation Measure 4.3-2b, as revised in Section 4.3.4, "Project Impacts and Mitigation Measures," of Appendix D-4, which addresses mitigating air pollution associated with dust creation from the project to a less than significant impact.

Comment 277-2

and increased traffic along the Friant roadway, this expansion would threaten water quality and impact fish and wildlife.

Response 277-2

See Collective Response #29 regarding traffic congestion and the project's increased truck trips. The issue of water quality is addressed in Draft EIR Section 4.10. The project's potential impacts to fish and wildlife species are addressed in Draft EIR Section 4.4, "Biological Resources."

Comment 277-3

Our San Joaquin River is a wonderful resource that we must protect for future generations. School children from around the county are able to explore nature that they rarely experience. Please do not allow this expansion that would only contribute to the detriment of our environment that many are trying so hard to preserve.

Response 277-3

See Collective Response #21 regarding public access to the San Joaquin River. See also Collective Response #18 regarding the Project's consistency with the San Joaquin River

Parkway Master Plan. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #278 March 5, 2025, Ann Lewis

Comment 278-1

The San Joaquin River is such an overlooked natural resource for the county, city and state!

Please, do not allow this permit to proceed.

Future generations will thank you as they enjoy and celebrate the fauna and flora which will thrive there. The undisturbed, continuous river will attract visitors and new residents and businesses. The town of Friant will also prosper.

Response 278-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #279 March 5, 2025, Dylan Lewis

Comment 279-1

I am writing to express my strong opposition to the CEMEX Rockfield Expansion Project. This area, once home to Native American communities, is a natural gem that should be preserved for public use—not subjected to another century of industrial exploitation.

Response 279-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 279-2

For over 100 years, this land has been used for concrete production, and now CEMEX wants to extend its operations for another century, further degrading the San Joaquin River and surrounding environment. The project's own environmental report acknowledges serious risks, including potential cancer-causing emissions, threats to wildlife, and dangers to water resources. Meanwhile, the public is expected to wait 100 more years before reclaiming any of this land—why should we accept that?

Response 279-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for suggested revisions to this Draft EIR section. The issue of cancer-causing emissions is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also, Impact 4.3-3 and Table 4.3-25, "Mitigated Project Health Risk Impacts," of Appendix D-4, where the project's potential impact regarding increased cancer risk to sensitive receptors was determined to be less than significant with or without the implementation of Mitigation Measure 4.3-2b.

Additionally, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including an updated HRA and a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also Collective Response #11 regarding analysis of population-wide cancer burden. The project's potential impacts on wildlife and water resources are addressed in Draft EIR Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality," respectively. See Chapter 3, "Draft EIR Errata." See also Collective Response #5 regarding the duration of the proposed use permit.

Comment 279-3

Fresno would benefit far more from accessible riverfront development. Imagine a vibrant riverwalk, similar to those in major cities, with restaurants, shops, and recreation areas—a space for families, businesses, and tourism. Instead, this plan offers us a hazardous mining pit.

Response 279-3

Hazards associated with the proposed quarry pits are addressed in Draft EIR Section 4.7, "Geology and Soils," (slope stability), Section 4.9, "Hazards and Hazardous Materials," (blasting), and Section 4.10, "Hydrology and Water Quality," (water quality). See Collective Response #21 regarding public access to the San Joaquin River and future uses of the existing project sites.

Comment 279-4

I urge you to reject this expansion and prioritize a future that benefits the people of Fresno, not just a concrete company's profits. Let's invest in a vision that enhances our city, not poisons it.

Response 279-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #280 March 5, 2025, H Lopez

Comment 280-1

I disapprove of CEMEX expansion and hope you can find a less destructive way to achieve your goals.

Response 280-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #281 March 5, 2025, Douglas Marsh

Comment 281-1

I am gravely concerned of the adverse impact the CEMEX project will have on the San Joaquin River and the surrounding environment. Please don't allow this project to advance.

Response 281-1

The project's potential effects on the San Joaquin River and the environment adjacent to project sites are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #282 March 5, 2025, Madison Nield

Comment 282-1

I'm writing today to lodge my protest against the expansion of Cemex mining operations. The proposed activities will negatively impact generations. Our children's ability to enjoy the beautiful nature of what remains of the San Joaquin River area will be destroyed. Trading profit for the destruction of our environment is not a fair trade for any residents. While the Cemex corporation may reap profits, we will suffer. From the environmental destruction to the disruption that will be caused by the blasting, this is not going to benefit any of Fresno's citizens. And I'd hate to think this will be approved because those in power will personally benefit financially while the rest of us suffer. There's too much of that already happening in our country.

Do not allow this plan to go forward!

Response 282-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The potential effects of proposed blasting are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), as updated in this Final EIR. See also Chapter 3, "Draft EIR Errata," for proposed changes to Draft EIR Section 4.10. Additionally, see Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #283 March 5, 2025, Shauna Perenon

Comment 283-1

Please don't allow the CEMEX project to proceed and ruin the beautiful San Joaquin River . It will ruin much in nature including fish, wildlife and the river we all love and enjoy. There must be another way for this business to find success without destroying what is irreplaceable.

Response 283-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential impacts to fish and wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #284 March 5, 2025, David Roberts

Comment 284-1

Do not approve a 100 year lease for Cementex . Do not further destroy the jewel of Fresno, the San Joaquin River.

Response 284-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #285 March 5, 2025, George Saul

Comment 285-1

Allowing the expansion of the CEMEX Expansion will be cause long term and irreversible damage to our entire community.

Hard rock blasting and crushing will create horrendous damage with noise and dust to our neighborhood.

Response 285-1

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as updated in the Final EIR. See also Mitigation Measure 4.3-2b, included in Final EIR Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," and Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, as revised in this Final EIR). See Chapter 3, "Draft EIR Errata."

Comment 285-2

It will destroy the serenity of the San Joaquin River Trail.

Response 285-2

See Collective Response #27 regarding effects of blasting and other operations on users of nearby parks and trails.

Comment 285-3

That pit will pose a threat to the river and its fish and wildlife.

Response 285-3

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential impacts to fish and wildlife species are addressed in Draft EIR Section 4.4, "Biological Resources." See also Collective Response #17 regarding riverbank stability and the potential for breach and Collective Response #25 regarding reduction of river flows.

Comment 285-4

This is wrong for our community and threatens to destroy the years of work devoted to restoring the parkway in a city with precious little green space.

I urge you to stop this.

Response 285-4

See Collective Response #12 regarding project effects on recent San Joaquin River and salmon restoration efforts. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #286 March 5, 2025, Gary Simmons

Comment 286-1

I am strongly opposed to the proposed CEMEX expansion along Friant Road.

Given our ongoing environmental and water challenges, moving forward with this project seems both unnecessary and detrimental. While I understand the need to responsibly utilize natural resources, this area is no longer a remote wilderness. It is now a thriving and rapidly growing community, home to many families—including mine.

Response 286-1

The issues of water supply and quality is address in Draft EIR Section 4.10, "Hydrology and Water Quality." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 286-2

Beyond its residential significance, this area stands as one of the most beautiful parts of our city. Expanding industrial operations here would compromise its natural beauty, quality of life, and long-term sustainability.

I urge you to reconsider this proposal in light of these concerns and prioritize the well-being of our community and environment.

Response 286-2

The project's potential impacts to the visual landscape of the area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #287 March 5, 2025, Terri Soares

Comment 287-1

I am writing to express my strong opposition to the proposed CEMEX Rockfield Expansion Project near the San Joaquin River in Fresno County. This proposal raises significant environmental, recreational, and procedural concerns that I believe warrant serious reconsideration.

Environmental Concerns

The project entails blasting and drilling a 600-foot-deep pit into the river's bedrock, a method unprecedented along the San Joaquin

River. Such extensive mining poses substantial risks to the river's ecosystem, potentially disrupting habitats and affecting water quality. The San Joaquin River has already endured considerable environmental stress due to past developments, and introducing deep-pit mining could exacerbate these issues.

Response 287-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." The issue of water quality and the project's potential effects on the San Joaquin River are addressed in Section 4.10, "Hydrology and Water Quality," of the Draft EIR.

Comment 287-2

Recreational and Community Impact

The San Joaquin River Parkway has been developed to provide recreational opportunities and preserve natural habitats for the community. The proposed expansion by CEMEX conflicts with this vision, as the industrial nature of deep-pit mining is incompatible with recreational activities and wildlife conservation efforts. Approving this project could undermine years of work dedicated to enhancing the river's value as a community asset.

Response 287-2

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 287-3

Procedural and Regulatory Issues

It is concerning that the current operations have been allowed to continue under outdated environmental reviews. The lack of a dedicated Environmental Impact Report (EIR) for the existing quarry operations raises questions about the adequacy of oversight and environmental protection. Granting an extension or approval for expansion without a comprehensive, up-to- date EIR contradicts the principles of responsible environmental stewardship and public transparency.

Response 287-3

See Collective Response #2 regarding the operation's previous use permit extensions and CEQA compliance. See also Collective Response #1 regarding the County's processing of the proposed project.

Comment 287-4

Conclusion

Considering these concerns, I urge the Fresno County Department of Public Works and Planning to reject the CEMEX Rockfield Expansion Project. The potential environmental degradation, conflict with community recreational goals, and procedural shortcomings present compelling reasons to halt this proposal. Protecting the integrity of the San Joaquin River and its surrounding environment should be our priority.

Thank you for considering my comments.

Response 287-4

The comment summarizes the comments in this letter (Comments 287-1 through 287-3). See Responses 287-1 through 287-3 for responses to the previous comments. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #288 March 5, 2025, Jennifer Squire

Comment 288-1

I am reaching out to express my grave concern about the proposed CEMEX expansion and the significant threats it poses to our environment and democratic principles.

The Draft Environmental Impact Report clearly outlines devastating consequences if this project moves forward, including 100 additional years of mining, the creation of a 600-foot deep pit, and a shift to hard rock blasting.

These actions jeopardize water quality in the San Joaquin River, endanger fish and wildlife populations, and risk irreparable harm to the ecosystem.

The San Joaquin River is a cornerstone of our community, and its preservation is vital for both the environment and future generations.

Response 288-1

The project's potential impacts to water quality and the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to fish and wildlife populations and the overall ecosystem are evaluated in Draft EIR Section 4.4, "Biological Resources." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 288-2

Additionally, this review process is one of the last opportunities for public input to be heard and considered. Protecting our democracy means fostering transparent, participatory decision-making, especially when it comes to projects of such magnitude.

We cannot afford to compromise the democratic process, which ensures decisions reflect the community's best interests.

Response 288-2

See Collective Response #1 regarding the County's processing of the proposed project. Additional public comments will be accepted by the County at the public hearing(s) that will be held for the proposed project.

Comment 288-3

I urge you to prioritize the long-term health of our environment and uphold the integrity of the review process by reconsidering this project. Decisions made today will reverberate for generations to come, and we must act as stewards of both our environment and democratic values.

Thank you for your attention to this urgent matter.

Response 288-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #289 March 5, 2025, Linda Tiboni

Comment 289-1

I am writing to ask you not to approve the proposed Cemex Expansion on the San Joaquin River. This is counter productive and a threat to the river, its wildlife and plant life that the San Joaquin River Parkway Conservation and Trust is trying to preserve. They are not compatible. The Cemex plant where it currently stands should not have been allowed to continue to operate and the new

expanded version will desecrate the land further for all who want to enjoy it in all it's beauty now and for generations to come.

For the record I am not a member of the trust but I firmly believe all the area along the river needs to be preserved for the future.

Response 289-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See also Collective Response #12 regarding the project's effects on recent river and salmon restoration projects. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #290 March 5, 2025, Kay Tolladay Pitts

Comment 290-1

I am concerned about Cemex and their attempt to blast a 600 foot pit next to the San Joaquin River for the following reasons:

1. The rock and gravel aren't currently needed. There is plenty but since the sources belong to a different company Cemex would have to purchase materials.

Response 290-1

See Collective Response #3 regarding aggregate demand and the need for the proposed project.

Comment 290-2

2. Cemex has no interest in our river except greed. There is no benefit to to the river or to Fresno. A foreign company wishing to "take the money and run!"

Response 290-2

The comment is noted for the consideration of the decision-makers.

Comment 290-3

3. There are four major issues with their plan: air quality, increased traffic, noise and destruction of the scenery.

4. As an artist I'm particularly concerned about the ruining of the scenic value. Cemex plans to "paint the rocks". Perhaps a mural could be painted of what used to be. Brings to mind

a Joni Mitchell song, "Big Yellow Taxi"…."You don't know what you've got 'til it's gone."

Response 290-3

The issues of air quality and traffic are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.17, "Transportation," as they are updated in the Final EIR. The issues of noise and changes to scenery are addressed in Draft EIR Section 4.13, "Noise," and Section 4.1, "Aesthetics and Visual Resources," respectively. See Chapter 3, "Draft EIR Errata." See also Collective Response #8 regarding proposed visual mitigation. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #291 March 5, 2025, Thao Xiong

Comment 291-1

Dear David Randall,

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the urgent need to address the significant potential environmental and community impacts associated with this project, I have several concerns that you should prioritize and address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed

The proposed mining expansion threatens the integrity of the San Joaquin River, which serves as a vital water source for local communities, agriculture, and wildlife. Excavation and dewatering processes may lower groundwater levels, disrupt the natural hydrology, and contribute to sedimentation and pollution. The river supports sensitive riparian ecosystems, including habitats for migratory birds, fish, and other aquatic species. Any disturbances to the water table could exacerbate drought conditions and harm the broader watershed. The DEIR must provide a more thorough analysis of potential long-term impacts on water flow and quality and enhance mitigation measures to prevent irreversible damage.

Response 291-1

Draft EIR Section 4.10, "Hydrology and Water Quality," presents evaluation of potential surface and groundwater impacts of the project including those associated with the San Joaquin River. Draft EIR Section 4.4, "Biological Resources," presents evaluation of potential biological resources impacts of the proposed project. Please also see Collective

Response #13 pertaining to impacts to offsite wildlife, Collective Response #14 pertaining to Swainson's hawk, Collective Response #15 pertaining to non-nesting birds, Collective Response #16 pertaining to Salmon, Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, and Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity. The comment does not provide evidence of a deficiency in the EIR's analyses of hydrology and water quality or biological resources. The commenter's concerns regarding the San Joaquin River are noted and will be considered by County decision-makers.

Comment 291-2

2. Air Quality and Dust Emissions

The expansion of mining operations will increase particulate matter (PM10 and PM2.5), which can penetrate deep into the lungs and cause or worsen respiratory diseases such as asthma and chronic bronchitis. This poses serious health risks to nearby residents and workers. The fine dust from quarrying, transportation, and processing activities can exacerbate respiratory illnesses, including asthma and other lung conditions. Given that the San Joaquin Valley already suffers from poor air quality and frequent air pollution advisories, the additional emissions from this project could contribute to non-compliance with state and federal air quality standards. The DEIR must ensure that stringent dust control measures, real-time air monitoring, and mitigation strategies are in place to protect public health.

Response 291-2

Contrary to the assertion in the comment, Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), as updated in the Final EIR, finds that after mitigation, the expansion of mining operations would decrease PM_{10} and $PM_{2.5}$ as compared to the levels in the existing physical setting (Draft EIR Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions"). Adverse health effects relating to PM_{10} and $PM_{2.5}$ pollution would decrease and there are no additional emissions from this project that "could contribute to non-compliance with state and federal air quality standards." See Chapter 3, "Draft EIR Errata." The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the A*ir Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan and a health risk assessment. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis of PM_{10} and $PM_{2.5}$ impacts was sufficient and supports the finding of less than significant impacts. Thus, the

proposed mitigation measures are sufficiently stringent to comply with CEQA. Realtime air monitoring is achieved by visual observation of opacity.

Comment 291-3

3. Biological Resource Impacts

The project site and surrounding areas support diverse wildlife, including special-status species such as the Western pond turtle, Swainson's hawk, and various riparian-dependent species. The planned excavation and land disturbance will fragment habitats, disrupt nesting areas, and eliminate vegetation critical for ecosystem stability. The DEIR must provide a more robust conservation strategy to prevent habitat loss, mitigate species displacement, and ensure compliance with state and federal wildlife protection laws. Additionally, long-term monitoring should be required to assess ecological changes over time.

Response 291-3

The Draft EIR evaluates special-status wildlife in the project vicinity in Section 4.4, "Biological Resources," including species identified by the commenter. Western pond turtle is described on Draft EIR pages 4.4-34 and 4.4-35, and Swainson's hawk is also addressed in Section 4.4. Mitigation Measures 4.4-1c, as revised in the Final EIR, would reduce potential impacts to Swainson's hawk and other special-status species to less than significant levels.

The project sites are already disturbed by decades of ongoing mining operations, and the proposed excavation areas would remain within the boundaries of the existing project sites. As such, the proposed project would not result in the loss or fragmentation of high-quality habitat for riparian-dependent species, western pond turtle, or Swainson's hawk.

Potential impacts to nesting birds are addressed in Draft EIR Impact 4.4-1. Mitigation Measure 4.4-1c requires pre-construction surveys and would reduce potential impacts to nesting birds to less than significant (Draft EIR page 4.4-52).

The Draft EIR also evaluates potential impacts to sensitive habitats, including riparian areas, in Impact 4.4-4 and concludes that impacts would be less than significant with implementation of applicable mitigation measures.

The project would comply with all applicable state and federal regulations pertaining to wildlife protection, as well as CEQA requirements. The commenter suggests implementation of a more robust conservation strategy and long-term monitoring; however, the Draft EIR includes pre-construction surveys, avoidance and minimization

measures, and species-specific mitigation to address potential impacts. The comment does not provide specific, feasible mitigation measures beyond those already identified. CEQA does not require that all possible studies or monitoring programs be conducted for the purpose of analyzing environmental impacts (Title 14 CCR Sections 15151, 15204(a)).

Accordingly, the Draft EIR provides a sufficient analysis of biological resources and identifies appropriate mitigation measures to reduce impacts to less than significant levels.

Comment 291-4

4. Traffic and Noise Concerns

The project's expanded truck operations will increase congestion along Friant Road, raising safety concerns for local commuters, cyclists, and pedestrians.

Response 291-4

Please see Collective Response #29 pertaining to project traffic and Collective Response #30 pertaining to traffic safety and road maintenance.

Comment 291-5

The addition of heavy-duty vehicles will also contribute to noise pollution, particularly during nighttime operations.

Nearby residents will experience increased exposure to engine noise, blasting vibrations, and other disturbances that could degrade their quality of life. The DEIR should analyze alternative transportation routes, implement stricter operational limits, and require noise dampening measures to reduce these adverse effects.

Response 291-5

In addition to the response below, see Response 128-3 for a discussion of the evaluation, impact discussion, and mitigation requirements for project blasting.

A detailed analysis of the project-traffic noise impacts, including increases in ambient noise levels resulting from project heavy truck traffic, is provided in Draft EIR Impact 4.13-1 (Draft EIR, pages 4.13-49 through 4.13-57). This analysis, which included all phases of the project, determined that both absolute traffic noise levels and the noise level increases resulting from project traffic, did not exceed thresholds for a finding of significant noise impacts. Specifically, Draft EIR Impact 4.13-1 provides a detailed evaluation of potential noise impacts related to project heavy truck traffic and concludes

that, although project heavy truck traffic would cause an increase in traffic noise levels along the haul routes utilized by project traffic, the increase in noise levels would be below thresholds for a finding of a substantial noise increase. As a result, impacts related to project heavy truck traffic were determined to be less than significant in the Draft EIR.

Regarding plant noise mitigation requirements, extensive noise mitigation options have been identified in Draft EIR Mitigation Measures 4.13-2 and 4.13-3. Please refer to the Responses 58C-13 and 448-28 for specific examples of noise control measures which would be required of the project.

Comment 291-6

5. Cumulative Environmental Effects

This mining expansion is not occurring in isolation—it will exacerbate the cumulative environmental stressors in the region, including climate change, water scarcity, and habitat degradation. Industrial activities have heavily impacted the San Joaquin River, and further exploitation may push the ecosystem beyond a sustainable threshold. The DEIR must take a broader approach to assessing cumulative impacts, including the potential for groundwater depletion, increased carbon emissions, and long-term landscape alterations. Alternative methods, such as limiting the scale of operations or requiring additional environmental offsets, should be explored.

Response 291-6

Draft EIR Chapter 5, "Cumulative Impacts," provides a detailed evaluation of cumulative impacts of the proposed project that explains the methodology including methods for assessing future cumulative conditions as influenced by specifically identified past, present, and reasonably foreseeable future projects as well as regional growth projections (see "Analysis Method" at Draft EIR pages 5-2 and 5-3, and see Table 5-1, "List of Nearby Projects," on Draft EIR pages 5-4 and 5-5). Draft EIR Chapter 5 then provides a detailed evaluation assessing how each of the project impacts identified in Draft EIR Chapter 4, "Environmental Analysis," would have the potential to result in cumulative impacts in consideration of other specific projects and regional growth. The comment does not explain or provide evidence of a deficiency in the Draft EIR cumulative impact evaluation. Additionally, Draft EIR Chapter 6, "Alternatives," describes a range of project alternatives and compares the associated potential environmental impacts to those of the proposed project. The comment does not address the adequacy of the Draft EIR or provide evidence that additional feasible alternatives are available that would address significant environmental impacts while achieving the basic project objectives.

Comment 291-7

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Upholding public transparency and accountability in this review process is not just important but crucial to protecting the long-term health of the San Joaquin River watershed and surrounding communities.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this critical matter.

Response 291-7

Please see responses above for specific issues raised in the comment letter. The commenter's requests and opinions regarding the project are noted and will be considered by County decision-makers.

Letter #292 March 6, 2025, Marian Battles

Comment 292-1

As a member of the Woodward Lake community for over 34yrs I have enjoyed living in this beautiful area. My family has used the trails and waterways from Woodward park to the dam for biking, hiking, running, canoeing, fishing and exploring. We are happy now to pass these adventures down to our grandchildren. I am greatly disappointed that the county supervisors are considering an extension for drilling in this area. For years I've been concerned of the traffic on Friant. Now with the proposal of double the truck deliveries this traffic will be compounded.

Response 292-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #29 regarding traffic congestion and the project's truck trips.

Comment 292-2

We have grown into a huge residential community. Thirty plus years ago this area may have been appropriate for the mining. Now it is not. What other mining project that uses explosives is in a community of homes, churches, hospitals, parks? None I'm sure.

Response 292-2

The issue of land use consistency is addressed in Draft EIR Section 4.11, "Land Use and Planning." The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as they are updated in this Final EIR. See Chapter 3, "Draft EIR Errata."

Comment 292-3

Also what assurance do we have that the mining at that depth (600ft)won't have toxins? Have they done testing down at that depth? Also what contamination is possible with the ground water in the wells at those homes near Lost Lake?

Response 292-3

The issue of groundwater quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-5 and 4.10-7 that evaluate compliance with applicable groundwater quality standards as a result of groundwater ponding in the excavations at the Plant Site and Quarry Site, respectively. See Mitigation Measure 4.10-5a. This measure requires the Operator to implement an adaptive management program at the Plant Site to ensure that pond water meets general water quality parameters to prevent mobilization of naturally occurring iron and manganese that could degrade water quality. Furthermore, Mitigation Measure 4.10-10a requires the Operator to implement an adaptive management program at the Quarry Site to ensure project operations do not significantly reduce groundwater levels at nearby wells. With mitigation, these impacts were determined to be less than significant.

Comment 292-4

Approval for 100yrs is ridiculous. There are too many unknowns.

Response 292-4

See Collective Response #5 regarding the duration of the proposed use permit.

Comment 292-5

This company will have to self report and looking at their track record they seem to have lots of lawsuits paid out over the years.

Response 292-5

See Collective Response #4a regarding CEMEX's regulatory history.

Comment 292-6

I believe in growing the economy of a community as much as the next person. But not with all these risks! This is a gamble I wouldn't take.

Response 292-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #293 March 6, 2025, Joanne Bazarian

Comment 293-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report

(DEIR) for the CEMEX Rockfield Expansion Project.

Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed ~ LEAVE THE RIVER ALONE.

Response 293-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality."

Comment 293-2

2. Air Quality and Dust Emissions ~ Our air quality is horrible and Asthma is at an all time high. Half of the year we are not able to enjoy the outdoors due to high AQI as it is, why make it worse.

Response 293-2

The issues of air quality and dust are addressed in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." See also, Collective Response #9 regarding the project's potential impact on the existing air quality conditions in the region.

Comment 293-3

3. Biological Resource Impacts ~ it will bring so much destruction to such a beautiful place.

Response 293-3

The project's potential impacts to biological resources are evaluated in Draft EIR Section 4.4, "Biological Resources." With mitigation, each of the impacts evaluated in this section were determined to be less than significant. Visual impacts are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources."

Comment 293-4

4. Traffic and Noise Concerns ~ We have too much now, why are we adding more to the congestion we already endure.

Response 293-4

The issues of traffic congestion and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," respectively.

Comment 293-5

5. Cumulative Environmental ~ this is vital for our future and the lives of our children.

Response 293-5

Draft EIR Chapter 5, "Cumulative Impacts," presents the cumulative impact analysis for the proposed project.

Comment 293-6

The San Joaquin River is one of gems we have here in the valley, it is a special area and the impact of your project would disrupt all that we hold sacred for our environment.

I am a regular at the river, walking and hiking and enjoying the beauty of nature in our urban life. The diversity of wildlife, the beauty of the water and a place that brings joy to so many would be threatened.

Response 293-6

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. The issue of visual quality is address in Draft EIR Section 4.1. The project's potential impacts to wildlife are evaluated in Draft EIR Section 4.4. See also Collective Response #27 regarding the effects of project operations on park and trails users.

Comment 293-7

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 293-7

See Collective Response #1 regarding County processing of the proposed project, public transparency, and need for additional analysis. A range of project alternatives are evaluated in Draft EIR Chapter 6, "Alternatives." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #294 March 6, 2025, Judith Castro

Comment 294-1

I'm old-85-but so what the area considered for mining NOT be allowed to happen. We've so much safe area for water quality, fish and wild life. Don't want future generations to suffer because of hard rock blasting. I vehemently say "NO"!

Response 294-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on water quality are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The potential impacts to fish and wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources."

Letter #295 March 6, 2025, Mark Fletcher

Comment 295-1

I believe this proposed project presents such significant risks and harms to Fresno County that it should be considered for cancellation. The significant risks and harms are the following:

1) Friant Avenue is a significant bicycle route with established bicycle lanes in each direction. It is one of the few locations close to Fresno and Clovis where bicycles can ride for considerable distance without interruption from traffic lights and stop signs.

I enjoy riding on this road on my bicycle fairly often. The proposed large increase in truck traffic will pose significant danger to the bicyclists because the trucks will have to merge across the bicycle path. Furthermore, the truck traffic will introduce significant amounts of dirt and rocks into the bicycle path which will be a danger to me and other bicyclists. I do not feel this issue is considered sufficiently in the EIR.

Response 295-1

See Collective Response #30 regarding bicycle and pedestrian safety as well as road debris from haul trucks.

Comment 295-2

2). The noise and vibrations from the blasting will significantly affect wildlife and humans in the area. Wildlife will avoid the river plain due to the noise where efforts have been made to allow greater access and protection for wildlife. The proposed EIR does not adequately address this issue.

Response 295-2

The issue of noise effects on humans is addressed in Draft EIR Section 4.13, "Noise." See Impact 4.13-6 beginning on Draft EIR page 4.13-65 for an evaluation of groundborne vibration resulting from proposed blasting. See Collective Response #13 regarding impacts to wildlife from blasting and other project operations.

Comment 295-3

3). The continuous removal of gravel within the river bed causes increased risk of scouring downstream which can affect structures such as bridge abutments. The EIR does not consider the risk to the bridge abutments on Hwy 41 and the frontage road where it crosses the San Joaquin River downstream of the project area.

Response 295-3

Extraction of aggregate would not occur within the San Joaquin River, and thus, the issue of scouring downstream would not be applicable.

Comment 295-4

4). Studies have shown that the local area already has an abundance of gravel sources that exceed the demand. Thus, I question why this project is being considered if there is already sufficiently developed gravel and granite materials. This seems to be a very high risk project with little actual demand.

Response 295-4

See Collective Response #3 regarding aggregate demand and the need for the proposed project.

Comment 295-5

5). The EIR does not adequately consider the issue of pollution that can result from the hard rock mining. Hard rock mining can generate acidic water that could be contaminated with metals if certain conditions are present. The EIR does not address if this is a possibility and if it can happen, what remediation will be done. Should such remediation be needed, it will be very costly and it does not appear that Cemex will be obligated to do such remediation through bonding.

Response 295-5

The issue of contaminated groundwater pooling in the quarry pit is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impact 4.10-5 beginning on Draft EIR page 4.10-95 and Impact 4.10-7 beginning on page 4.10-101 for an evaluation of groundwater quality in the excavations at the Plant Site and Quarry Site, respectively. With mitigation, these impacts were determined to be less than significant. See also Collective Response #4b regarding liability and funding of remediation in the event of environmental damage resulting from project implementation.

Letter #296 March 6, 2025, Catherine Folwer

Comment 296-1

I am strongly opposed to granting the Unclassified Conditional Use Permits (C.U.P. Application # 3666 & 3667) sought by Cemex Construction Materials Pacific LLC for the purpose of continuing and expanding aggregate mining, processing, and asphalt production in the floodplain of the San Joaquin River. It is time to honor the original reclamation agreement after years of considerable profit and damage.

Response 296-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted. Please see responses below to specific comments.

Comment 296-2

This project is not in the best interest of our community. It will cause significant and irreversible damage to the river bottom

lands. It will negatively impact efforts to restore the river and its environs. It will negatively affect the fisheries, and challenge and endanger local wildlife and both local and migratory birds. It is a huge affront and callous dismissal of years of time, effort, and monies dedicated to the San Joaquin River Trust and Conservatorship allied with local, county, and state agencies and all of the good citizens who have been tireless volunteers dedicated to the restoration and rehabilitation of the river and its environs for the purpose of creating an amazing and accessible recreational asset for all to enjoy.

Response 296-2

Draft EIR Section 4.4, "Biological Resources," presents evaluation of potential biological resources impacts of the proposed project. Please also see Collective Response #12 pertaining to San Joaquin River restoration, Collective Response #13 pertaining to impacts to offsite wildlife, and Collective Response #16 pertaining to Salmon. The comment does not address the adequacy of the Draft EIR. The commenter's opinions and concerns are noted and will be considered by County decision-makers.

Comment 296-3

This plant is not needed. Present and future aggregate demand in the Fresno P-C Region can easily be met by the already existing operations: Vulcan Sanger Centerville Project output: 80 mil. /tons/50 yrs. (1.6 mil. tons annually); CMI Kings River Project output: 28 mil. /tons/50 yrs. (1 mil. tons annually); Carmelita Mine output: 50 mil. /tons/50 yrs. (1 mil. tons annually); Coalinga Mine @ Lost Hills output: (tonnage not available); Madera Quarry output: 900,000 tons/yr. (900,000 tons annually); and the Austin Quarry output: 2.5 mil. /tons 100 yrs. (2.5 mil. /tons annually.)

There is also no shortage of asphalt in the Central Valley. More and more pavers are using portable plants located at the worksite for both cost reduction, time-saving, and convenience. And, with the 2022 passage of AB2953 which mandated incorporation of up to 25% of reclaimed asphalt and concrete - a real plus for extending the life of our landfills, temporary portable plants reduce roundtrip truck traffic emissions to stationary plants.

Response 296-3

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 296-4

Siting a hot mix asphalt (HMA) in a river bottom environment is a recipe for disaster. HMAs have many serious disadvantages

including high energy consumption and high emissions of pollutants. HMA emissions produce large quantities of reactive organic gases (volatile organic compounds), nitrous oxide, carbon monoxide, sulfur dioxide, and PM10 and PM25 particulates. All of these pollutants significantly and adversely contribute to smog formation as they are ozone precursors. HMAs also emit polycyclic aromatic hydrocarbons (PAHs) and fumes from oily bitumen which are proven carcinogens.

Response 296-4

The effects from locating the HMA plant on the project sites including local and regional effects of emissions from the plant are analyzed in the Draft EIR. Specifically, the effect of energy consumption as it relates to greenhouse gas emissions is analyzed in Draft EIR Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), and the project's potential impact on air quality is addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), as they are both updated in this Final EIR. Additionally, Mitigation Measure 4.3-4, as updated in this Final EIR, requires blue smoke control systems on the asphalt plant, a control system that would also be required by APCD as Best Available Control Technology (BACT) during stationary source permitting, to decrease emissions. Further, in response to comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 296-5

Off-gassing may also present a fire hazard. HMAs stink!

Response 296-5

The comment does not provide evidence of any potential fire risk or hazard associated with asphalt plant operation. Draft EIR Impact 4.3-4 on pages 4.3-65 through 4.3-69 presents the assessment of potential odor impacts of the project including odors associated with asphaltic cement production. See Appendix D-4, "Revised Section 4.3, Air Quality," for updates to this Draft EIR Section. The evaluation based on substantial evidence discussed in the Draft EIR, as updated in this Final EIR, concludes that it is not anticipated that the operation of the asphalt plant on the Quarry Site could generate odors that would adversely affect a substantial number of people but conservatively concludes that the impact is potentially significant based solely on the San Joaquin Valley Air Pollution Control District's (2015) *Guidance for Assessing and Mitigating Air Quality Impacts*

presumption that significant odor impacts could occur at sensitive receptors within 1 mile of such plants. To further reduce any potential odor impacts from the proposed operation of the asphalt plant to a less than significant level. Mitigation Measure 4.3-4 has been updated in Appendix D-4. See Chapter 3, "Draft EIR Errata." The comment does not address the adequacy of the Draft EIR's evaluation of potential odor impacts or the efficacy of the recommended mitigation.

Comment 296-6

Sadly, the Central Valley Air Basin is one of the most polluted in our nation. This plant would significantly and adversely affect our air quality daily. The plant's emissions would contribute to global warming and climate change.

These emissions cause serious and sometimes fatal health affects for those with compromised respiratory and coronary systems. PM10 and PM25 particulates are especially harmful to those suffering from asthma. The San Joaquin Valley has the highest childhood asthma rate in our country with one in six children a victim.

Response 296-6

Appendix D-4, "Revised Section 4.3, Air Quality," presents an evaluation of the potential air quality impacts of the proposed project including those associated with air pollutant emissions from asphalt plant operation. Draft EIR Section 4.8, "Greenhouse Gas Emissions," as updated in the Final EIR (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), presents an evaluation of the proposed project's potential impact on climate change. Please see Collective Response #9 pertaining to air quality for additional discussion. No specific comments related to the adequacy of the Draft EIR were made, and no further response can be provided. However, the comment is noted for the consideration of the County decision-makers.

Comment 296-7

HMA emissions also effect our regions biota, by increasing sulfuric rain which has caused significant damage resulting in stress and high tree mortalities and it causes production loss in agricultural operations. Woefully, our air quality index (AQI) has been "normalized." Each morning our local TV news stations report air quality which ranges from good-moderate-unhealthy for sensitive groups-unhealthy-very unhealthy and even hazardous. This plant will add to ground level ozone and particulate pollution. And, while Cemex enjoys sizeable profits, our citizenry essentially pays millions for air quality violations when the San Joaquin Valley Air District is fined for exceeding both the Ca. and the National Ambient Air Quality Standards.

Response 296-7

It is unclear to which fines levied against the San Joaquin Valley Air Pollution Control District (SJVAPCD) the commenter is referring. Regarding particulate pollution, a Fugitive Dust Control Plan has been prepared for the proposed project and would be submitted to the SJVAPCD for review and approval prior to project implementation, consistent with Mitigation Measure 4.3-2b (see Appendix D-4, "Revised Section 4.3, Air Quality," Section 4.3.4, "Project Impacts and Mitigation Measures") As part of Mitigation Measure 4.3-2a, off-road engines shall be retrofitted or upgraded to meet the Tier 4 Interim Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower hour. As part of Mitigation Measure 4.3-2b, unpaved roads shall be controlled by chemical or other dust suppression methods; and stockpiles shall be controlled by daily application of water, covering, or by another method approved by the SJVAPCD.

Regarding ozone, the Operator would contribute its fair share toward reducing cumulative ozone impacts by complying with existing in-use and off-road diesel engine regulations (see Appendix D-4, Section 4.3.2, "Regulatory Setting"). Further, maximum project emissions would not occur until many years in the future, after the diesel engine requirements have been fully implemented. These requirements would reduce emissions below the levels estimated in the Air Quality Assessment, which conservatively evaluates the maximum reasonably foreseeable future project condition.

Regarding health risks, the unmitigated and mitigated health risks assessments for the project were reviewed and re-run and are less than the thresholds of significance (see Appendix D-4, Tables 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts"). These less than significant results would also apply to the biota and local agriculture.

Comment 296-8

Roundtrip diesel truck emissions will add significant loads of the aforementioned pollutants, while compromising the safety and surface conditions of our roadways.

Response 296-8

Draft EIR Section 4.3 as updated in this Final EIR, presents evaluation of potential air quality impacts of the proposed project including those associated with air pollutant emissions from offsite aggregate transport. See Appendix D-4, "Revised Section 4.3, Air Quality." See also, Collective Response #9 pertaining to the proposed project's potential impact on the region's existing air quality. The issues of traffic and wear on roads are addressed in Draft EIR Section 4.17, "Transportation." Please see Collective Response #29 pertaining to project traffic and Collective Response #30 pertaining to traffic safety and

road maintenance. The comment does not address the adequacy of the Draft EIR regarding these issues, and no further response is required.

Comment 296-9

Both the HMA and the quarry site are extremely ill-sited. Cemex knows this: they are putting profits first. I am absolutely amazed that Cemex is seeking approval to dig and blast a 600 foot deep pit, about 345 acres wide, with extreme 45 degree slopes, approximately 1320 feet from the river. This is extremely ignorant. This pit will fill with stormwater runoff, while continually intercepting groundwater flows through the substrata. The water will be polluted by chemical stabilizers and blasting chemicals requiring storage in ponds exposing wildlife to harmful or fatal consequences. Its depth will create a huge cone of depression disrupting groundwater flows impacting both the river , downstream users, and local wells. A gaping 600 foot deep pit is also highly unstable so close to a river and the underlying aquifer. It could collapse in the event of torrential rains, river flooding, or seismic movement. It could possibly influence or change the course of the river ultimately affecting downstream residents and land owners.

Response 296-9

Draft EIR Section 4.10 provides detailed analyses of potential groundwater and water quality effects of the proposed project. The analyses are based on the Hydrology and Water Quality Analysis Report (Draft EIR Appendix G-5, "Hydrology and Water Quality Analysis Report") which utilizes information from groundwater conditions reports included as Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR. Detailed methodology and findings are provided in Appendix G-5. As discussed in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10a and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111). Please also see Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, and Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity. Additionally, Draft EIR Section 4.7, "Geology and Soils," discusses geological conditions and slope stability analyses performed for the proposed project (see Draft EIR Impacts 4.7-6 and 4.7-7 pertaining to slope stability and Mitigation Measures 4.7-6 and 4.7-7). The comment does not address the adequacy of the Draft EIR

evaluation of hydrology, water quality, or slope stability and no further response is warranted.

Comment 296-10

For Cemex to suggest this pit could ever be reclaimed for recreational use is pure folly. It will forever be an enormous gaping hole, perhaps even a death trap for humans and wildlife, filled with water at its bottom where lack of aeration will undoubtedly cause emissions of smelly noxious gases where only mosquitoes and lethal algae prosper. Cemex knows this.

Response 296-10

Draft EIR Impact 4.3-4 on pages 4.3-65 through 4.3-69 presents the assessment of potential odor impacts of the project including potential stagnation and odors under reclamation conditions. The evaluation based on substantial evidence discussed in the Draft EIR concludes that due to groundwater flow through the reclaimed pond on the Plant Site the potential for odors due to stagnation would be minimized. As also discussed, the *Quarry Site Groundwater Conditions Report* (Draft EIR Appendix G-4, "Groundwater Conditions at the Quarry Site") indicates that groundwater would flow through the reclaimed lake from the northeast to the southwest and seasonal vertical movement of water due to temperature differences would preclude stagnation and, therefore, odors due to stagnation would not occur. The comment does not address the adequacy of these Draft EIR impact evaluations.

Moreover, the proposed end uses for the project sites are open space and riparian and open water habitat (see Draft EIR Table 2-1, "Rockfield Modification Project Characteristics," on page 2-5) and do not include recreational uses. All safety requirements are addressed through reclamation, and the project fully complies with SMARA statutes and regulations as discussed in the Draft EIR, including slope stability and safety requirements that minimize hazards to humans lawfully present on the site as well as any trespassers. Wildlife habitat protections are fully analyzed in the Draft EIR. Section 4.4, "Biological Resources," provides evaluation of potential impacts to fisheries, wildlife, and birds. In addition, please see Collective Response #13 pertaining to impacts to offsite wildlife

Comment 296-11

This project will produce both light and noise pollution affecting humans, fisheries, wildlife, and birds. It will either destroy or compromise the quality of recreation along the river and its adjacent lands. Imagine taking your family to Lost Lake Park for a quality nature experience only to have your day negatively

impacted by truck traffic, loud noise, dust, and the prevailing stench of hydrocarbon emissions. Noise reverberates in this canyon.

Response 296-11

Draft EIR Section 4.4 provides evaluation of potential impacts to fisheries, wildlife, and birds. In addition, please see Collective Response #13 pertaining to impacts to offsite wildlife, Collective Response #14 pertaining to Swainson's hawk, Collective Response #15 pertaining to non-nesting birds, and Collective Response #16 pertaining to Salmon. Draft EIR Section 4.13, "Noise," provides evaluation of potential noise impacts of the proposed project including noise generated from onsite project activities and offsite haul trucks. The comment does not address the adequacy of these evaluations in the Draft EIR. Please see Collective Response #6 pertaining to potential nuisance associated with project operations. The commenter's concerns regarding potential nuisance issues are noted and will be considered by County decision-makers.

Comment 296-12

Reclamation takes many years to rehabilitate such immensely damaged lands. Anyone driving Friant Road is acutely aware of the detrimental impacts mining in this river bottom caused. These lands will never return to their former beauty and purpose on God's earth. Perhaps had our leaders one hundred years ago foresaw the future environmental degradation their original approval wrought, they may have instead encouraged rock plant development at a more environmentally sound site. Now we know.

Its high time Cemex concentrated on fulfilling the original agreement to reclaim these lands rather than seeking to further aggravate the existing damages, and delaying reclamation for another one hundred years. Cemex could then donate these reclaimed lands to the San Joaquin River Parkway Trust and Conservatorship and its allies for the benefit of our communities, our tourism industry, and the river and its wild denizens. Just imagine the huge tax write-off and positive public relations such a bold and gallant move this would engender!

Again, please deny the Cemex application for C.U.P. # 3666 & 3667. NO on this proposal!!!

Response 296-12

The commenter's observations, preferences, and request for denial of the proposed project are noted and will be considered by County decision-makers.

Letter #297 March 6, 2025, Steve Fretz

Comment 297-1

I am writing to again oppose the CEMEX application to extend their lease for the next 100 years. I can't believe their audacity! Within the next 50 years the City of Fresno will be built around their current plant. Their constant blasting of the rock bed will be more noise pollution in an urban area and that alone should be enough to disqualify this project, not to mention the noise pollution from their cement and gravel trucks on Friant Road within the City of Fresno.

Response 297-1

The issues of blasting and traffic noise are addressed in Section 4.13, "Noise," of the Draft EIR. See Impact 4.13-1 beginning on Draft EIR page 4.13-49 for an evaluation of traffic noise and Impact 4.13-6 beginning on page 6.13-65 for an evaluation of groundborne vibration resulting from blasting. With mitigation, these impacts were determined to be less than significant. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 297-2

The congestion and the constant drone of trucks is already too much and driving behind these trucks often leaves windshields pitted or worse, cracked!

Response 297-2

See Collective Response #29 regarding traffic congestion and the project's truck trips. See also Collective Response #30 regarding vehicle damage from haul trucks.

Comment 297-3

And the pollution from their diesel exhausts is already polluting enough now.

Response 297-3

The issue of air pollution is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." This comment describes existing conditions that are not evaluated as part of the proposed project. Instead, they form the environmental setting or baseline condition of the project sites. See also Collective Response #9 regarding the proposed project's potential effect on the region's existing air quality.

Comment 297-4

I'm sure there are other sites in the rural parts of Fresno County that can be mined that would be much more appropriate for this type of business.

Response 297-4

See Draft EIR Section 6.4.2.1, "Alternative Site Locations," for a discussion of alternative locations for the proposed project.

Comment 297-5

For all these reasons I remain firmly opposed to CEMEX's application for any extension! It should be denied.

I attended the BOS open meeting when this was requested several years ago and my former Supervisor voted for a 3 year extension even though CEMEX had not updated their EIR for 20 years. As a result, I didn't vote for him in this past election, FYI!

Response 297-5

See Collective Response #2 regarding the extension of the existing use permit and CEQA review. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #298 March 6, 2025, Daniel Griffith

Comment 298-1

My name is Daniel Griffith, I am a District 5 resident living in Clovis at 1930 N. Dartmouth Ave Clovis CA 93619. I can be reached by phone at 559-307-6644.

I am writing this letter to express my opposition to the expansion of the CEMEX contract on Friant Road. The San Joaquin River is arguably the most important natural resource in Fresno County, and allowing a foreign company like CEMEX to dig deep into the riverbed will ruin the landscape of the river forever.

Response 298-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality."

Comment 298-2

That area of the San Joaquin River is directly adjacent to the largest metro area in Fresno County, and has immense potential for conservation and recreation for Fresno County residents. Allowing CEMEX to move forward with their plan will forever rob citizens of Fresno county of that potential, and leave a permanent stain on the record of those who allowed it to happen.

There are plenty of areas that are rich with natural resources that are not directly adjacent to a major metropolitan area where mining can occur. This project should not occur on the San Joaquin as planned.

Response 298-2

The San Joaquin River Parkway is managed in accordance with the Parkway Master Plan. See Collective Response #18 regarding the project's consistency with the Parkway Master Plan. See also Collective Response #22 regarding the proposed easement dedication for future development of recreational trail segments at the project sites. See also Draft EIR Section 6.4.2.1, "Alternative Site Locations," for a discussion of alternative locations for the proposed Project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #299 March 6, 2025, John Hendon

Comment 299-1

NO! The CEMEX operation has existed beyond the time where it is now in the way of population expansion. Friant Road is becoming outdated and will require widening, again, within a few years.

Response 299-1

The issue of increased traffic and needed roadway improvements is addressed in Draft EIR Section 4.17, "Transportation." See also Collective Response #29 regarding traffic congestion and the project's increased truck trips. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 299-2

The San Joaquin River has become a recreational area from the dam all the way to the 41 highway.

Response 299-2

See Collective Response #18 regarding project consistency with the San Joaquin River Parkway Master Plan. See also Collective Response #21 regarding public access to the San Joaquin River and recreational sites.

Comment 299-3

Trucks from CEMEX operations can be hazards.

Response 299-3

See Collective Response #30 regarding traffic safety.

Comment 299-4

NO! It is time for CEMEX to close operations and move elsewhere. To even consider allowing CEMEX to change their mining type to hard rock blasting, allowing the creation of deep pits (up to 600 feet deep), is mind boggling! Then to add another 100 years of mining along /friant road is INSANE! NO!!

Please do not allow the renewal, extension or modification of the CEMEX contract

Response 299-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit.

Letter #300 March 6, 2025, Cordell Jeff

Comment 300-1

I was almost 4 years old in 1955 when my stepfather took me to Lost Lake, a work in progress then. When he showed me the salmon run, there were so many salmon shore to shore, I started to walk on them, aiming to cross the not-so-wide river. He picked me up out of the water. That was the last big salmon run, with much smaller ones for a couple of years, and then none.

Response 300-1

The commenter's recollections are noted. Please see Collective Response #12 pertaining to San Joaquin River restoration.

Comment 300-2

1. Digging for gravel in the San Joaquin River, whose waters are already mostly diverted to Kern County or the westside of Fresno County, has continuously damaged the river bed, sides, water, plant growth, and marine life for twice my entire lifetime. Business for profit has proceeded as "private profit from public property." Taxpayers cover the additional costs to roads, fire and paramedics, police services including traffic accidents (to increase with increased heavy trucks), and various inspections and lawsuits. It is long past time to stop all work by CEMEX and all other aggregate businesses in any place on the river.

2. When these companies say they will pay to repair the damages and restore the river, it's not a credible offer because the costs will be greater than the profits. After more than 100 years already of "gravel mining," the San Joaquin River needs restoration of land, wildlife, and all plant life, and recharging the natural water flow on and below ground level.

Response 300-2

The commenter's observations and opinions are noted and will be considered by County decision-makers. The project's potential impacts to plant growth and marine life, and water quality are evaluated in Draft EIR Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality," respectively. The project's potential impacts related to traffic and transportation safety are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also, Collective Response #29, regarding traffic congestion and funding for road maintenance, and Collective Response #30, regarding transportation safety. The comments do not address the adequacy of the Draft EIR, and no further response is warranted.

Comment 300-3

3. A 600 foot deep mining pit is not compatible with the life of the river or the urban life now built along much of Friant Road and long time neighboring rural buildings along both sides of the river, with active farming, herding, and fishing. Rock blasting is utterly incompatible with any zoning, especially because sound carries long distances by air and ground.

Response 300-3

Draft EIR Section 4.11, "Land Use and Planning," presents evaluation of the project's potential to conflict with adjacent land use and the project's consistency with applicable land use plans. Draft EIR Section 4.13, "Noise," presents evaluation of the project's potential noise impacts, including consideration of blasting. The commenter's opinions are noted. The comment does not address the adequacy of these Draft EIR analyses, and no further response is warranted.

Comment 300-4

> Professors and geologists studying the San Joaquin River say the fault lines under and around Friant Dam present only a low likelihood of danger. Allowing blasting to the area reduces my trust in their assessments.

Response 300-4

See Response 210-8.

Comment 300-5

> 4. For any long term lease, a period of 100 years is absurd. For any lease, 10 years is a long time, maybe negotiable, but not in this case. There are hundreds of other sources of these materials in California. Any further need for the aggregate resources that may be in the San Joaquin River cannot outweigh the public need to return the river to a more natural state, suitable for public recreation, and become a naturally healthy river.

Response 300-5

See Collective Response #5 pertaining to the requested use permit duration. Please see Collective Response #3 pertaining to regional aggregate demand and supply. The commenter's preferences and input are noted and will be considered by County decision-makers.

Letter #301 March 6, 2025, Steven Martinez

Comment 301-1

I absolutely disagree with this proposal to allow CEMEX to destroy our local wildlife, ecosystem, and environment by allowing them to drill 600 ft down into the San Joaquin River. They were not allowed to perform a similar project in Mexico, thence, why would we allow them to do this project reject by the Mexican government here!

It makes no sense and is not in our best interest for our community in the long run. I've already sent a message to my BOS board member. Now Mr. Bredefeld is the Supervisor of our district.

Response 301-1

The proposed project would comply with California state law including the California Surface Mining and Reclamation Act (SMARA) and CEQA. Mexico's mining laws are not relevant and have no jurisdiction over the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 301-2

There are alternatives to this project.

They could go somewhere else to drill

and

Response 301-2

Draft EIR Chapter 6, "Alternatives," describes and evaluates a reasonable range of alternatives to the proposed project. Alternative project locations are discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 6.

Comment 301-3

Give the land to the San Joaquin River Park Way conservatory.

Response 301-3

See Collective Response #18 regarding the project's consistency with the San Joquin River Conservancy's San Joaquin River Parkway Master Plan. See also, Collective Response #21 regarding the suggestion that the project sites should be converted to public parkland.

Comment 301-4

My feelings are the same as in this Fresno Bee Opinion given on 2/15/2025. Here is the link to the article below.

https://urldefense.com/v3/ https://www.fresnobee.com/opinion/opn-columns-blogs/marek-warszawski/article298349908.html ;!!HRg2s0N7wg4sn4Q!sikXhoOkdtzE1iWnxBOc gv2hs1lJENwU-ljR1uyUmtc8SmvuRJFOCbybaMU6sMpaA1aV4AyJV9gMGt51LcFRXAcDgaj9nZ09$

My wife, Cynthia Martinez feels the same as I do regarding this issue.

Please confirm that you have received this message.

Response 301-4

The comment is noted for the consideration of County decision-makers.

Letter #302 March 6, 2025, Sharon Matson

Comment 302-1

I am against the CEMEX request for an extension on their projects along the San Joaquin River.

I believe the environmental impact is too significant to go forward with this project.

Please reject this project for the sake of our land and river.

Response 302-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #303 March 6, 2025, Cheri Matthews

Comment 303-1

I am writing to let you know I oppose the CEMEX expansion project.

I feel it is detrimental to the residents of Fresno County.

It will increase traffic, add wear and tear to the roads, impact recreational areas nearby, impact fish and wildlife, add pollution, while adding no benefit to the tax paying residents of Fresno County.

Please take my opinion into consideration.

Response 303-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of traffic and wear on roads are addressed in Draft EIR Section 4.17, "Transportation." See also Collective Response #29 regarding traffic and funding for road maintenance. The project's potential impacts to recreational facilities and fish and wildlife are addressed in Draft EIR Section 4.16, "Recreation," and Section 4.4, "Biological Resources," respectively. Pollution is a broad topic that is addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), Section 4.9, "Hazards and Hazardous

Materials," Section 4.10, "Hydrology and Water Quality," Section 4.13, "Noise," and Section 4.20, "Wildfire," as they are updated in this Final EIR. See Chapter 3, "Draft EIR Errata." No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #304 March 6, 2025, Jenae McCarthy

Comment 304-1

Dear Fresno County Staff and Decision Makers,

I am writing to *once again strongly oppose* the Rockfield Modification Project as outlined in the Draft Environmental Impact Report (DEIR), particularly regarding Impact 4.18-1, which raises serious concerns about the potential for substantial adverse changes to tribal cultural resources. Assessment and cultural resource searches (sections 4.5.1.3 and 4.5.1.4) reveal critical gaps in the protection of potential burial sites and culturally significant areas.

According to the Burial Site Sensitivity Assessment conducted by Applied EarthWorks, the project sites are situated in areas with high to very high potential for containing *intact anthropogenic paleosols*.

I'd first like to say this section of the DEIR is intentionally vague and confusing. I understand the purpose of an impact statement and the importance of language choices used. That being said, it is unrealistic to expect even an educated, informed member of the public to review this 3,000 plus page document, let alone look into who and what anthropomorphic paleosols are. *So, let me spell it out here:* anthropomorphic paleosols are ancient soils that may (in this case they do) show evidence of human activity. Paleosols are ancient soils that have been preserved in the geologic record. They can be used to reconstruct past climates and environments.

The soils on the project sites have a documented history of containing buried cultural materials. ***The DEIR fails to recognize the risk of encountering buried cultural resources during excavation and construction activities in these high-potential areas.*** When I review the current and mitigation measures, the interpretation relies heavy on the following: 1) Cemex will accurately and diligently conform to the protection measures identified 2) Cemex has already mined extensively and therefore

finding cultural resources is not a significant concern. I feel these statements directly contradict each other.

While River wash soils have a lower likelihood for harboring intact prehistoric material, the proximity of the project sites to these areas, along with the surrounding geological and hydrologic forces, increases the likelihood of disturbance to cultural deposits through construction activities. *Despite these findings, the DEIR's mitigation measures are not enforceable or proactive to protect these resources, particularly in areas where the potential for buried cultural deposits is high. Additionally, when using explosives to create a 600ft pit, how are these mitigation measures relevant?*

Response 304-1

The commenter's opposition to the project is noted. The Draft EIR recognizes the project's ground disturbance activities create the potential to adversely affect Tribal Cultural Resources in its discussion of Impact 4.18-1. The Draft EIR concludes that impacts to TCRs would be less than significant with the implementation of Mitigation Measures 4.5-2 and 4.5-3.

Draft EIR Impact 4.5-3 provides the following:

> As described in Section 4.5.1.3, above, except for Riverwash, all soils at the project sites have been documented elsewhere in the San Joaquin Valley to have high to very high potential at depths up to 30 feet bgs for containing intact anthropogenic paleosols (Asselin et al. 2006; Meyer et al. 2010; Onken 2020). Intact, well-preserved, and deeply buried paleosols have the potential for harboring significant historical resources, including human remains. However, the entire Plant Site and 91.2% of the Quarry Site have been subject to continuous deep mining activity exceeding 30 feet bgs for over 100 years resulting in the removal of these paleosols (see Figure 4.5-5, "Area of Quarry Site Remaining to Be Mined and Relevant Soil Classifications"). Therefore, the potential for inadvertent discovery of human remains within these portions of the project sites would be very low.

To address the 31 acres that have not been mined at great depth at the Quarry Site, Mitigation 4.5-3, "Inadvertent Discovery of Unmarked Burials," would require the project operator to take certain actions if human remains are uncovered during project activities, including halting work within 50 feet of the discovered remains and follow the procedures set forth in CEQA Guidelines Section 15064.5(e)(1) (see Draft EIR page 4.5-32). The usage of blasting would not inhibit the efficacy of Mitigation Measure 4.5-3,

which outlines the procedure the operator must follow in the unlikely scenario that human remains are uncovered during excavation.

Comment 304-2

Questions: Mitigation Measure 4.5-:2

1. "If prehistoric or historic-era cultural resources are encountered during project activities, all ground disturbing activities within 50 feet of the find shall cease." Does fifty (50) feet seem like an adequate buffered to protect cultural resources?

2. Can you site the research that supports a 50ft buffer for mining and major ground disturbance operations? Is it clearly laid out in CEQA Guidelines Section 15126.4(b)(3)(C)?

Response 304-2

Mitigation Measure 4.5-2 requires a fifty (50) foot buffer if any prehistoric or historic-era cultural resources are discovered during excavation or any project-related operational activities on-site (Draft EIR page 4.5-31). The 50-foot buffer is sufficient to protect cultural resources during ground-disturbing activities because the project sites have been in operation with heavy disturbance for over a century and the lead agency has not determined the sites are historic resources. This buffer is a minimum distance around the ground-disturbing activity, ensuring that any disturbance does not impact the cultural resources within the area. If an inadvertent discovery is made and a buffer is required, a qualified archaeologist would evaluate the significance of the resource and recommend appropriate additional mitigation measures (Draft EIR page 4.5-31). For these reasons, Mitigation Measure 4.5-2 is sufficient to reduce potential impacts to cultural resources to less than significant.

Comment 304-3

"Mitigation shall consult with appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature."

3. How many reports written by an archeologist were submitted to Fresno County and the Southern San Joaquin Valley Information Center in the past 100 years?

4. What is the Corporation's history with consulting or working with Native representatives?

5. Which "accredited curational facility" have previous artifacts been investigated at?

6. Who is responsible for hiring the archeologist if a situation would arise?

7. How is this process enforced? How will other significant/ potentially significant impacts be enforced?

8. Does the County of Fresno have the capacity to ensure Cemex's commitment to mitigation measures? Do our local tribal communities have the capacity to ensure there is no loss of cultural resources?

Response 304-3

Inquiry number 3 is not relevant to the subject project. Southern San Joaquin Valley Information Center (SSJVIC) records were searched, and no previously recorded archaeological resource was at the Plant Site, and there was one previously recorded archaeological resource near the Quarry Site but outside the actual boundaries of the Quarry Site (Draft EIR page 4.5-30).

Per inquiry number 4, if a historical, archaeological, cultural, paleontological, or tribal cultural resource is discovered during project ground disturbing activities, the appropriate agency or tribe would be contacted to avoid and minimize impacts to significant resources discovered. If a significant tribal cultural resource is uncovered, Mitigation Measure 4.5-2 would require the operator must work with the tribes to minimize the impacts to that resource. See Response 304-2 above.

Per inquiry number 5, an accredited curational facility refers to a repository that meets specific standards for the care and management of collections. The California State Archaeological Collections Research Facility is one of these facilities.

Per inquiry number 6, the Operator is responsible for reporting historic and cultural resources discovered during implementation of project activities to the appropriate professionals to minimize impacts to the resources discovered. See Response 304-2 above.

Per inquiry numbers 7 and 8, mitigation measures are fully enforceable through permit conditions, agreements, or other legally binding instruments pursuant to CEQA. If a potentially significant cultural resource is discovered during project implementation, the resource must be reported, and an archaeologist and/or Native tribe must be consulted. All tribes are consulted during the CEQA process for projects to protect their cultural heritage in accordance with CA Assembly Bill 52.

Comment 304-4

Records Searches and Cultural Resources Identification

The Plant Site records search revealed one historic-period building and a series of previous pedestrian surveys, noting 12 cultural resources and 11 studies within a half-mile of the site. Similarly, the Quarry Site search identified one cultural resource and **referenced two studies conducted more than 15 years ago.**

Personal Testimony

There are several sets of grinding stones along the San Joaquin River Parkway. GPS: 36.943340, -119.743130 in between the quarry and plant sites at the bottom of the Tesoro Viejo trail. The San Joaquin River was and is the most valuable cultural resource in the area.

Response 304-4

The commenter's personal testimony of grinding stones along the San Joaquin River Parkway is noted. Applied EarthWorks conducted a cultural resource inventory of the project site, as is common practice for CEQA compliance (Draft EIR page 4.5-27). The inventory included a records search at the San Joaquin Valley Information Center of the California Historical Resources Information System, archival research with the Fresno County Historical Society, a search of the Native American Heritage Commission's Sacred Lands File, a desktop buried site sensitivity assessment, and an archaeological pedestrian survey of the project sites. Applied EarthWorks conducted the pedestrian surveys of the Plant Site in 2019 and the Quarry Site in 2017 and 2019. The cultural resources identified are described in Table 4.5-1, "Cultural Resources Within the Project Sites," on page 4.5-19 of the Draft EIR. The commenter's personal testimony does not negate the findings of the pedestrian surveys conducted on the project sites.

Comment 304-5

I watched the San Joaquin River Conservancy Board meeting where a councilmember dismissed and disrespected Native American leaders while they advocated project completion and land stewardship. It was disgraceful. I understand that when this project moves forward it will be passed to the Fresno County Board of Supervisors. A member of both boards will be voting on this matter. *I urge the Supervisors to think about previous choices – and really listen to the public on this matter. When every resident of Fresno and Madera is dead, if this project passes, mining will continue long after we are gone. I urge the officials to examine the legacy they intend to leave behind for their community and loved ones.*

Response 304-5

The commenter's observations regarding a San Joaquin River Conservancy Board meeting do not address the adequacy of the Draft EIR. Please note that as discussed in Draft EIR Section 1.4, "Discretionary Actions," on page 1-11, the Fresno County Planning Commission is the approval authority for the requested land use permits and reclamation plan and the Planning Commission's actions are appealable to the Board of Supervisors. The commenter's input is noted and will be considered by County decision-makers.

Letter #305 March 6, 2025, Brian McNally

Comment 305-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas. Most of the mitigation solutions in the draft EIR amount to crossing our fingers that there won't be substantial impacts to the environment and/or a naive hope that Cemex will comply with the suggested mitigations.

As someone who lives in an adjacent community in Fresno County to the quarry site, and is thus very familiar with the environment in the area, I find that the draft EIR fails to adequately address the following concerns, mostly directed to proposed changes to the quarry site:

Response 305-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The comment is introductory and provides general assertions regarding the sufficiency of the Draft EIR assessment and mitigation. Please see below for responses to specific issues raised in the comment letter.

Comment 305-2

1. Aesthetics and Visual Resources

   a. The analysis prepared by Sespe Consulting is deeply flawed when it comes to photo site selection, photoshopping of potential impacts and rating of visual impacts, so much so that the integrity and credibility of Sespe's lead on this section of the DEIR should be called into question and a new analysis of the visual impact should be conducted by the County. In particular, when you look at the photoshopping of

their original photos intended to show how the project will look in future phases, it's hard to imagine that Cemex could have created more optimistic forecasting of what the project would look like if they had been able to put their own in-house graphic designers on it.

Response 305-2

The Visual Impact Analysis (VIA) was prepared using the Bureau of Land Management's (BLM) Visual Resource Management System, a widely accepted methodology for evaluating scenic quality and visual impacts due to projects. Each viewpoint was assessed using this methodology, which allows for a quantifiable and consistent evaluation of visual impacts (see Draft EIR Section 4.1.3.2 "Analysis Methodology"). Furthermore, the analysis was conducted by qualified professionals and was subject to internal review to ensure accuracy and impartiality.

The selection of viewpoints included both public and private vantage points, exceeding the CEQA requirements that focus on public views only, defined as those views "that are experienced from [a] publicly accessible vantage point." The analysis also selected viewpoints along the proposed future parkway trail easements to account for the future development of recreational areas within the project vicinity (see pages 4.1-15 through 4.1-54 of the Draft EIR for discussion of the selected viewpoints for the VIA).

For these reasons, the County finds the VIA to be objective, defensible, and consistent with the requirements of CEQA.

Comment 305-3

i. A look at the selected photo sites alone on pages 189 through 217 of the Draft EIR PDF makes it clear that the analysis is suspect. They provide before photos from carefully selected sites that minimize what the visual impact of the planned project would be. Most of the photos show flat land that could not capture the planned deep hole Cemex wants to dig, nor the very high and ugly berms Cemex would have to build to hide said hole. The before photos do not manage to show the aesthetic beauty of the area, either from the Friant Road level that would include stunning views of Little Table Mountain, located on the Madera County side of the river, or looking down from the bluffs on both sides of the river. The view of Little Table Mountain from Friant Road, without berms to hide it, is so beautiful that it should put Friant Road in contention as a scenic byway. But there's little chance of that if this project is approved.

1. Remedy: Hire a new consulting company to select new photo sites that would capture the actual impact that would be caused by the Cemex plan to dig a 600-foot hole in the ground (and the required berms or screening that would be necessary to hide the aesthetic impact of that hole) and do not hide the natural beauty that exists in the area. The County should select the new consulting company, with input from the public.

Response 305-3

As discussed in Response 305-2, the VIA was prepared using the BLM's Visual Resource Management System, a widely accepted methodology for evaluating scenic quality and visual impacts due to projects. Each viewpoint was assessed using this methodology, which allows for a quantifiable and consistent evaluation of visual impacts. The selection of viewpoints included both public and private vantage points, exceeding the CEQA requirements that focus on public views only. Furthermore, the viewpoints were selected because they represent areas considered to have potentially high visual sensitivity both surrounding the project sites and along nearby routes of travel. The analysis also evaluated viewpoints located in the future recreational areas of the San Joaquin River Parkway Master Plan, although not currently accessible by the public.

As was documented in the VIA, mining and processing operations have been occurring on the Plant Site since 1924 and mining at the Quarry Site has been permitted since 1960, with active operations continuing since the 1980s. As such the existing environmental baseline under CEQA reflects a landscape that has been shaped over a century of continuous mining and processing activities. The project would be a continuation of this existing use and would be consistent with the operational characteristics of the area, which is already part of the visual context of the area.

As discussed above, the VIA conducted for the Draft EIR is sufficient to estimate the potential impacts of the proposed project upon visual resources. The County does not need to hire an additional consulting company with input from the public.

Comment 305-4

ii. The photoshopping of the before photos to show the visual impact of the first two phases of the 100-year Cemex plan and the reclamation stage is laughable. Where do we see in any of these doctored photos the impact of a 600-foot hole? Where do we see the giant dirt berms required to hide this hole that would block views of Little Table Mountain from Friant Road? Where do we see the enormous,

stadium lighted plant equipment Cemex wants to move to the quarry site? Where do we see the giant plot of dirt surrounding the hole where all natural grasses in trees have been removed, causing a jarring and unnatural contrast with the surrounding area?

1. Remedy: Hire a new consulting company to take new photos from new photo sites and create accurate photoshopping of the undeniable visual impacts that would be caused by the Cemex plan to dig a 600-foot hole in the ground and the required berms or screening that would be necessary to hide the aesthetic impact of that hole. This should include photoshopped views from the bluffs on both sides of the river and from Friant Road, which is used by bicyclists and vehicle traffic. The County should select the new consulting company, with input from the public.

Response 305-4

The VIA was prepared using the BLMs Visual Resource Management System, a widely accepted methodology for evaluating scenic quality and visual impacts due to projects. Each viewpoint was assessed using this methodology, which allows for a quantifiable and consistent evaluation of visual impacts. Furthermore, the analysis was conducted by qualified professionals and was subject to peer review to ensure accuracy and impartiality.

Regarding the concerned visibility of the berm, as depicted on the site plans, the Quarry Site is bordered by an existing landscaped berm along North Friant Road, and the Plant Site is screened by an existing landscape buffer. The proposed berm along the Plant Site would be located behind this existing screen and therefore would not be prominently visible or attract attention of the casual observer. The simulations reflect this existing condition and the anticipated visibility of new features based on topography and screening. The concern regarding the visibility of the excavation pit has also been acknowledged; however, the pit itself would be located below grade and therefore largely screened by intervening topography and vegetation located between the pit and public viewpoints.

Comment 305-5

b. The visual project impact ratings in Table 4.1-3 on pages 221 and 222 need to be conducted by a new third party consultant. The new ratings should include different viewing sites and not ignore the stunning views of Little Table Mountain that will be obstructed by the berms this project

would create. An honest analysis of the visual impact of this project could not possibly conclude there would be more beneficial impacts on the visual aesthetics than there are significant impacts. No one could say that with a straight face and it should not be included in any EIR, draft or final.

i. Remedy: Conduct a new visual project impact analysis with fresh ratings by a new third party consultant selected by the County, with input from the public.

Response 305-5

See Responses 305-2 through 305-4 above. A new visual impact analysis for the project is not warranted. The comment is noted for the consideration of County decision-makers.

Comment 305-6

c. The harmful impact of the proposed 600-foot hole (or even a 300-foot hole should the real intent be to compromise down the road in this process) on the aesthetics of the area cannot be denied. Views from the bluffs on both sides of the river would be irreparably harmed. And it is not only from private lands. There are publicly available trails on the Madera County side of the river that would look straight into this giant hole in the earth. These trails are used by residents from many counties, not just Madera County. Even the very suspect ratings in Table 4.1-3 recognize there will be a potentially significant impact. You can't create a hole that big without ruining the visual aesthetics.

i. Remedy: The only mitigation I can think of if Cemex wants to dig any deeper in the current quarry, for visual aesthetic impacts, is for it to do so by creating a small tunnel entrance into underground tunnels that could be used for mining. There cannot be an open hole at the quarry that goes beyond its current depth, and certainly not to 600-feet deep, without causing significant impacts. A tunnel system would hide this much better {though it would probably not address other concerns caused by the proposed project to things like noise pollution caused by blasting and potential destruction of nearby aquifers used as sources of water by nearby homeowners). The potential of this mitigation should be explored in the final EIR.

Response 305-6

Consistent with the observation in the comment, Draft EIR Section 4.1, "Aesthetics and Visual Resources," concludes that the project would result in a significant and unavoidable impact associated with effects on scenic vistas and degradation of the existing visual character and quality of public views (see Draft EIR Impact 4.1-1 on pages 4.1-51 through 4.1-61 and Impact 4.1-3 on pages 4.1-61 through 4.1-62). Please see Collective Response #8 pertaining to visual impact mitigation. As discussed in the Draft EIR and Collective Response #8, even with all feasible mitigation, the project's visual impacts are found to be significant and unavoidable.

The suggestion in the comment that mitigation for visual impacts should involve mining through a tunnel system instead of an open hole is noted. Underground mining to extract hard rock aggregate would be economically infeasible and not supported by the existing topography at the Quary Site. For these reasons, mitigation or a project alternative requiring underground mining are rejected as infeasible and not meeting the project objectives.

Comment 305-7

d. Moving plant equipment to the quarry site at any stage of the project would cause enormous negative visual impact to the quarry site area. I did not see this seriously considered in the photoshopped images or in the visual impact ratings. This would harm visual aesthetics from both the higher bluff views and from the street view of the quarry site, especially when one considers the proposed nighttime lighting of this equipment.

   i. Remedy: Conduct a new visual analysis, including new photoshopped images of what adding plant equipment to the quarry site would look like and create new visual impact ratings. The analysis should be completed by a new third-party consulting firm selected by the County, with input from the public.

Response 305-7

The relocation of plant equipment was considered in the VIA, and the simulations reflect the anticipated changes based on site topography, and existing and proposed screening (i.e., landscape screening and the perimeter berm). These features would continue to provide visual screening of equipment and operations.

As discussed in the VIA, for areas where nighttime lighting would be required, the lighting would be high-pressure sodium and/or cut-off fixtures, or equivalent

International Dark-Sky Association (IDA) approved fixtures designed to confine lighting illumination to the site and avoid light trespassing into light-sensitive areas. Additionally, the project is designed with features (i.e., existing perimeter screening, landscaped berm, and the below-grade siting of equipment) which reduce the potential for offsite glare or visual intrusion and would comply with Section 858 of the Fresno County Zoning Ordinance (see Draft EIR Impact 4.1-4).

Based on these features, the VIA concluded the project would result in less than significant impacts associated with nighttime lighting and glare and the VIA adequately addresses the visual impacts associated with the relocation of equipment and no new analysis is required (Draft EIR pages 4.1-62 through 4.1-64).

Comment 305-8

ii. Remedy: Adding plant equipment to the quarry site cannot realistically be done without greatly damaging the visual aesthetics of the area. Much of this equipment is very tall, is supposed to be lit at night, and will be extremely displeasing to the eye, both from the road, from publicly accessible trails and from nearby homes. The current analysis states that it will be out of view, but that is not how light works. Picture the lighting in high school football stadiums - you can't see inside the stadiums from the outside, but you see the lighting that comes out at the top. And the homes that look down toward the quarry would definitely see over any berms and into the intense lights. Lighting plant equipment at night would ruin the enjoyment of properties for nearby homeowners and it should not be allowed at all. It is dishonest to say that lighting plant equipment won't cause significant visual impacts in the area and that conclusion needs to be stripped from the draft EIR and changed to a significant impact. There is no mitigation for having lighted plant equipment at the quarry site and the only answer is to prevent moving plant equipment to the quarry site. The plant equipment should not be allowed to exist near the river parkway or near homes in the area. Cemex should find alternative sites for the plant equipment not close to the quarry site, and not within sight of the San Joaquin River.

    1. In the alternative, nighttime lighting other than flashlights and vehicle headlamps should be prohibited at the quarry site. Cemex operations should not be allowed at hours where daylight is not sufficient, without lighting, to do the work safely.

Response 305-8

As discussed in Response 305-7, above, the VIA was prepared by a qualified consulting firm and underwent internal review and peer review to ensure accuracy and impartiality. The relocation of plant equipment and associated nighttime lighting was evaluated and addressed in the analysis (see Draft EIR Impact 4.1-1 on page 4.1-55). While nighttime lighting is essential for safety during operations, the project has been designed with features to ensure nighttime lighting would not impact the surrounding areas. Specifically, lighting would be shielded/confined using IDA-approved lighting fixtures, and the equipment would be located below grade within the Quarry Site, with surrounding pit walls helping to contain light and reduce visibility.

The commenter suggests locating the plant equipment off-site, but does not specify an alternate, feasible location that would not result in additional environmental impacts as to those analyzed in this Draft EIR. The commenter also suggests that flashlights and vehicle headlamps be used as the sole source of nighttime lighting at the Quarry Site. This would be infeasible due to safety concerns.

The hours of operations of the proposed asphalt and ready-mixed concrete plant, once relocated to the Quarry Site, would be 4 a.m.to 6 p.m., Monday through Friday, from May to October and 5:30 a.m. to 6 p.m., Monday through Friday from November to April. The asphalt and ready-mixed concrete plant would also operate on Saturdays from 6 a.m. to 2 p.m. (see Table 2-5, "Proposed Typical Hours and Days of Operation," on page 2-43 of the Draft EIR). As such, most of the proposed hours of operations would occur during daylight hours.

Comment 305-9

2. Air Quality

   a. The Draft EIR states that the level of air quality impact before mitigation is potentially significant. This includes VOC, SVOC, and/or SO2 emissions. It concludes that impacts would be less than significant with various mitigations, such as requiring less harmful types of asphaltic cement to be created on premises and periodic equipment checks and maintenance, outlined on pages 321 and 322 of the PDF. How will the County ensure that these mitigation requirements are followed?

      i. Remedy: Enforcement is key. For all air quality mitigation suggested in the EIR, require a trust or other financial mechanism be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI,

to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County for any legal disputes with Cemex if Cemex does not observe any required mitigation practices and has its operations suspended or terminated by the County for failure to follow all air quality mitigation requirements.

Response 305-9

Pursuant to CEQA Guidelines Section 15041, Fresno County has the authority to require feasible changes in any or all activities involved in the proposed project in order to substantially lessen or avoid significant effects on the environment, consistent with applicable constitutional requirements. The County may also work with the responsible agency, the San Joaquin Valley Air Pollution Control District, to ensure the mitigation measures are being implemented as required.

Ultimately, CEQA requires that mitigation measures be identified and implemented to reduce potentially significant impacts to less than significant levels. As such, the Draft EIR includes mitigation measures to minimize impacts to air quality, and these would be incorporated into the Mitigation Monitoring and Reporting Program (MMRP) as part of project approval. The MMRP ensures that all required mitigation is implemented and monitored for compliance. See Section 3.3, "Mitigation Measures," on page 3-4 of the Draft EIR for discussion of the MMRP.

The commenter's suggestion to establish a financial trust indexed to CPI and cover legal costs is outside of the scope of CEQA and the EIR process. Enforcement of mitigation measures is addressed through permit conditions and compliance monitoring by the County, consistent with CEQA requirements. The County retains full authority to enforce compliance with mitigation measures, including the ability to suspend or revoke permits if the project proponent fails to implement required mitigation. These mechanisms provide accountability and ensure that mitigation measures are implemented.

Comment 305-10

b. Dust control needs to have requirements enforced by the County. We're talking about Cemex, a company that never covers the dirt and debris it hauls in trucks from the quarry site, even though retractable dust covers are often present on their trucks. I'll say it again - they never cover their trucks. So why should we trust Cemex to do all the dust mitigation they claim they'll do?

i. Remedy: Enforcement is key. For all dust mitigation suggested in the EIR, require a trust or other financial mechanism be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI, to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County for any legal disputes with Cemex if Cemex does not observe any required mitigation practices and has its operations suspended or terminated by the County for failure to follow all dust mitigation requirements.

c. Require new study of what the impact of dust and pollutants from the project would be on the homes on the east side of the quarry and create additional screening to prevent dust and airborne pollutants from impacting these properties.

i. Remedy: A combination of walls, trees and any other screening determined to be helpful by consultants to minimize impact on the homes located across Friant Road from the quarry.

d. Dirt berms at the sites need to be replaced with a combination of internal walls with a facade of full-grown, healthy trees. These dirt berms add to the dust pollution problem. They are also eyesores.

Response 305-10

Mitigation measures would be enforced as authorized under CEQA through implementation of the MMRP. The commenter's suggested "remedies" will be considered by the County in its deliberations. The existing project sites operate in compliance with the codes, goals and policies of the Fresno County Zoning Ordinance and Fresno County General Plan. No additional site landscaping is being proposed with the proposed project, nor are they warranted or effective as additional mitigation for air pollutants or to minimize the impacts that were already determined to be less than significant. Further, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 305-11

3. Biological Resources

a. The blasting, project lighting and creation of a 600-foot hole in the ground will clearly impact nearby wildlife and could even destroy the ecology of the San Joaquin River area. All of the wildlife is interdependent and the loss of one type of animal will lead to losses among others. This deserves close attention and further study.

i. Just from my own observations in the area, I've seen a mountain lion, bald eagles nesting very close to the river, roadrunners, and many of the unthreatened animals and birds that are part of the ecology in this area. What happens to this wildlife when Cemex starts blasting?

Response 305-11

The comment is noted as pertaining to local wildlife. Other species and their use of habitats in the project vicinity are discussed in Draft EIR Section 4.4, "Biological Resources." Please see Draft EIR Impact 4.4-2 for discussion of the impacts of blasting on wildlife. Impact 4.4-2 also addresses potential lighting impacts to wildlife. For additional information pertaining to the project's lighting impacts, see Impact 4.1-4 on page 4.1-62 of the Draft EIR.

For further discussion, see collective responses addressing the potential impacts of blasting to wildlife, specifically Collective Responses #12 (river and salmon restoration), #13 (blasting effects on nesting birds and other wildlife), #15 (non-nesting birds and birds outside of nesting season), and #16 (salmon spawning).

Given that the project sites are already disturbed by decades of ongoing mining activities, no significant impacts to wildlife, including mountain lions, bald eagles, roadrunners, and other species, are anticipated.

Comment 305-12

ii. The draft EIR recognizes the presence of many cherished and some threatened animal species, but states that because the current sites maintained by Cemex are essentially wastelands, there shouldn't be any impact. This ignores the impact of blasting on the wildlife that currently lives in the surrounding area. Further study is needed on the impact of blasting on the wildlife in

the river habitat. It is also ridiculous to reward Cemex for the damage they have done to the land to date by saying they can't make it worse for wildlife in the future.

Response 305-12

The Draft EIR does not characterize the project sites as "wastelands," as stated by the commenter. Existing conditions at the Plant and Quarry sites reflect decades of disturbance from ongoing mining operations.

For further discussion of blasting impacts to wildlife and the areas adjacent to the project sites, please see Responses 58-37, 58-38, 58-40, 58-41, and 58-42, which address those issues, as well as Response 305-11, which addresses potential impacts to wildlife resulting from blasting and other quarry activities.

Given that the majority of both project sites are already disturbed by ongoing mining operations, and that blasting events are brief in nature, with each blast lasting approximately one to two seconds, the project's potential impacts to wildlife would be less than significant.

Comment 305-13

iii. The draft EIR states there are potentially significant impacts to certain wildlife but then states mitigation efforts can change the impact to less than significant. Again, enforcement is key. For all wildlife impact mitigation suggested in the EIR, require a trust or other financial mechanism to be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI, to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County for any legal disputes with Cemex if Cemex does not observe any required mitigation practices and has its operations suspended or terminated by the County for failure to follow all wildlife mitigation requirements.

Response 305-13

CEQA requires that mitigation measures be identified and implemented to reduce potentially significant impacts to less than significant levels. As such, the Draft EIR includes mitigation measures to minimize impacts to biological resources, and these would be incorporated into the MMRP as part of project approval. The MMRP ensures that all required mitigation is implemented and monitored for compliance.

The commenter's suggestion to establish a financial trust indexed to CPI and cover legal costs is outside of the scope of CEQA and the EIR process. Enforcement of mitigation measures is addressed through permit conditions and compliance monitoring by the County, consistent with CEQA requirements. The County retains full authority to enforce compliance with mitigation measures, including the ability to suspend or revoke permits if the project proponent fails to implement required mitigation. These mechanisms provide accountability and ensure that mitigation measures are implemented.

Comment 305-14

iv. On page 382, regarding the impacts of blasting, the draft EIR states that an annual blasting plan is to be created by Cemex and provided to the County for review.

1. Remedy: Rather than allowing Cemex to create an annual blasting plan, the County needs to spell out in advance of project approval whether blasting should be allowed at all and, if so, how often, at what time of day, how low the sound and vibration must be, etc. Do not allow them to make an annual plan. The County needs to set limits at the beginning and Cemex must provide funding in advance, for the full 100 years, for the County employees who will enforce these limits.

Response 305-14

Mitigation Measure 4.10-1 on page 4.10-92 incorporates by reference blasting protocols included in Appendix H-9, "Revised Blasting Protocols," which establish monitoring, control, and reporting requirements for ground vibrations and air overpressures associated with blasting at the project sites. As revised in Chapter 3, "Draft EIR Errata," the Blasting Protocols have been clarified and strengthened to further define monitoring, verification, and reporting requirements to ensure blasting remains within established thresholds.

The Annual Blasting Plan would identify the areas proposed for blasting each subsequent year and would include charge weight/delay limits supported by calculations that maintain blast-induced vibrations below specified maximum values. Additionally, the Blasting Protocols require that if blasting becomes necessary outside of the areas indicated in the Annual Blasting Plan, a revised plan would be submitted to the County.

The County anticipates that the Annual Blasting Plan would be prepared in conjunction with the mine operator's annual or ongoing mine planning activities, and it is appropriate and necessary for the operator to prepare the Annual Blasting Plan. As specified, the

County would review the Annual Blasting Plan as part of mitigation monitoring and enforcement to ensure the plan complies with the Blasting Protocols, as updated in the Final EIR.

See Response 305-13 for discussion of funding for County monitoring and enforcement.

Comment 305-15

4. Geology and Soils

   a. Homeowners in the area should know that the County has conducted studies ensuring that the blasting will not cause damage to the walls, foundations or land on which their homes are built.

      i. Remedy: If soil and geological studies have not been conducted for each home located within one mile of the quarry site, that needs to occur and be included in the final EIR to ensure that blasting at the quarry will not cause damage to structures, foundations and land that structures are built on. Homes on the bluffs on each side of the river are built on unique geological foundations and each home should be looked at individually.

      ii. Remedy: Cemex should be required to place funds in a trust or other financial instrument in advance of the project expansion with enough resources to make homeowners whole if any damage to their homes or properties is caused by blasting at the Cemex facility. Cemex should also be required to pay the attorney fees of any homeowners that take legal action against Cemex for damage caused to their homes or properties.

Response 305-15

Section 4.13, "Noise," of the Draft EIR, provides a comprehensive analysis of potential noise impacts from the proposed Project. With implementation of Mitigation Measure 4.13-2, 4.13-3, and 4.10-1, potential noise- and vibration-related impacts at the site boundaries and nearby receptors would be reduced to less-than-significant levels. With implementation of Mitigation Measures 4.9-1 and 4.10-1, including the Flyrock Mitigation Plan established by the Blasting Protocols, potential impacts associated with the release of hazardous materials or flyrock from blasting activities at the Quarry Site would be reduced to less-than-significant levels. Public safety was assessed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," with all potential impacts found to be less than significant with mitigation measures following lead agency guidance.

The mitigation measures would be incorporated into the MMRP as part of project approval. The MMRP ensures that all required mitigation is implemented and monitored for compliance. The commenter's suggestion to establish a financial trust is outside of the scope of CEQA and the EIR process. Enforcement of mitigation measures is addressed through permit conditions and compliance monitoring by the County, consistent with CEQA requirements. The County retains full authority to enforce compliance with mitigation measures, including the ability to suspend or revoke permits if the project proponent fails to implement required mitigation. These mechanisms provide accountability and ensure that mitigation measures are implemented.

Comment 305-16

b. To my knowledge, there is no aggregate or mineral mining project in the country so close to a major river where a government entity has approved anything close to a 600-foot hole. Because of this, neutral third-party research into the geology between the river and the proposed quarry project must be completed and included in the final EIR. We cannot rely on Cemex commissioned studies, as this draft EIR does.

Response 305-16

The comment does not identify a deficiency in any of the studies or technical evaluations prepared by experts and included as appendices or incorporated by reference to the Draft EIR. Please note that a *Blast-Induced Vibration Impact Peer Review of the Quarry Site,* was prepared by Golder/WSP USA Inc. under contract to Benchmark Resources, the consulting firm that assisted the County, under contract to the County, with preparation of the Draft EIR. The December 11, 2024, peer review document is included as Appendix H-7, "Blast Impact Analysis Peer Review," of the Draft EIR.

Comment 305-17

5. Hydrology and Water Quality

a. As seen in Figure 4.10-9 in the draft EIR, the county wells servicing homes immediately east of the quarry site go to depths of 210 and 350 feet. These wells are community wells run by Fresno County and are labeled CSA 44c. They currently collect water at 105 feet bgs. There are other wells that would be impacted, but I'll focus on these wells since they are located immediately across Friant Road from the quarry site. These wells are clearly in danger of being impacted by the quarry site plan to blast and drill down to 600 feet bgs. Blasting and drilling is a threat to the sole water supply of the community across the street from the quarry site.

Response 305-17

Please see Collective Response #23 pertaining to groundwater quality, Collective Response #24 pertaining to groundwater monitoring, and Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity. The comment does not provide evidence of potential impacts beyond those evaluated and discussed in the Draft EIR and the referenced collective responses. As such, the collective responses referenced herein are sufficient to address the commenter's stated concerns.

Comment 305-18

i. In addition to concerns about blasting and other operations causing damage to the quantity of the water supply for surrounding wells, the draft EIR itself lists the potential impacts to water quality on page 651 of the Executive Summary: "Potential effects to surface water quality within both the Plant Site and Quarry Site could occur under the proposed project. Impacts could occur due to erosion and sedimentation caused by land disturbances; the release of uncontained materials associated with processing and production facilities and equipment storage areas; improper handling of hazardous materials, including diesel, gasoline, and asphaltic oil that would be stored on-site; improper handling and detonation of blasting agents that would be brought to the site by a qualified blasting contractor for each blasting event; improper discharge of wash water generated by washing/processing of sand and gravel; and leaking oils and grease from heavy equipment. Similar leaking of oils and grease effects could occur during site reclamation, which would involve land disturbance and the use of heavy equipment as part of reconstruction and revegetation of slopes and during the demolition and removal of structures on the sites, including the removal of processing and production facilities and septic systems, and the abandonment of monitoring and groundwater supply wells." Unfortunately, the conclusion is that Cemex will follow mitigation guidance and change the impacts from potentially significant to less than significant. Reading the risks cited above from the draft EIR and knowing Cemex's record on compliance should not give any of us confidence.

Response 305-18

The comment does not provide evidence of a deficiency in the Draft EIR's evaluation of water quality or conclusions regarding the efficacy of mitigation measures. Please see Collective Response #4a pertaining to CEMEX's regulatory compliance history.

Comment 305-19

ii. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, to ensure that blasting and drilling activities Cemex proposes to use to create the 600-foot-deep mine will not jeopardize the water supply of CSA 44c or any other wells in the area, by collapsing or damaging any underground water aquifers or underground water sources.

iii. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, to ensure that chemicals Cemex plans to use in blasting and drilling and any other chemicals involved in their operations under the proposed plan will not impact water quality to the wells in the surrounding area. One focus should be on recommending an enforcement plan for the County to adopt and how much funding it would require for proper oversight.

iv. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, looking into how the 600-foot hole Cemex wants to create will potentially cut off water seepage from the San Joaquin river to the groundwater supply used by wells in the surrounding area.

Response 305-19

The comment does not identify a deficiency in any of the studies or technical evaluations prepared by experts and included as appendices or incorporated by reference to the Draft EIR, nor does the comment provide evidence that more studies are needed. Draft EIR Section 4.10, "Hydrology and Water Quality," provides detailed analyses of potential groundwater and water quality effects of the proposed project. The analyses are based on the *Hydrology and Water Quality Analysis Report* (Draft EIR Appendix G-5) which utilizes information from groundwater conditions reports included as Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR and groundwater and surface water monitoring and sampling data collected for the project sites to draw conclusions on the existing groundwater hydrology conditions on the project sites and to evaluate the

potential impacts to groundwater hydrology under the proposed project. Detailed methodology and findings are provided in Appendix G-5, "Hydrology and Water Quality Analysis Report." As discussed and presented in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10 and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111). The comment does not address the adequacy of the Draft EIR analysis or the efficacy of these mitigation measures, nor does the comment provide evidence additional expert analyses are required.

Comment 305-20

b. Maps on pages 431, 432, 435, 438 and 444 under file label "Draft EIR Volume 2 Appendices A-K File 2" on the County's Cemex Rockfield Expansion webpage show red arrows that indicate "Direction of Groundwater Flow" going from the areas that would contain wells for homeowners in the area, including County wells for CSA 44c, toward the current depression where the quarry is located. This is evidence that a depression in the earth made for a quarry will impact groundwater levels that will likely impact nearby wells. If the depression in the earth for the quarry is vastly deeper, logic dictates that there will be a greater impact on the "Direction of Groundwater Flow" and that this would likely impact groundwater levels for neighboring wells.

   i. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, looking into how the 600-foot hole Cemex wants to create will potentially cause groundwater flow into the quarry site to escalate and impact the groundwater supply used by wells in the surrounding area.

Response 305-20

Please see responses above pertaining to the adequacy of the Draft EIR's analysis and expert technical studies. The studies prepared for the Draft EIR consider the direction of groundwater flow as indicated on the figures referenced by the commenter, and these studies sufficiently address the concerns as raised as required in accordance with CEQA.

Comment 305-21

c. Mitigation Measure 4.10-6 starting on page 660 of the Executive Summary calls for Cemex to hire its own experts to monitor water quality at the quarry site in order to prevent

potentially significant impacts to water quality for water used by nearby wells and relies on Cemex to honestly report its findings in a timely manner. This cannot be allowed. The County must have its own staff, funded in advance by Cemex by a trust or similar financial instrument, for the entire 100-year period, who can monitor water quality. Water quality should be measured on a weekly basis and reported on the County website, with immediate written notification to homeowners if water quality has been compromised, to prevent serious health conditions among neighboring homeowners.

d. Remedy: If there is any damage or disruption to water supply for homeowners in the surrounding area, Cemex must immediately supply water and water storage units sufficient to provide the same water quantity supplied to homeowners prior to project approval.

    i. Remedy: Because water supply storage is unsightly and undesirable for homeowners to have on their properties and will lower home values, Cemex must agree to purchase properties of any homeowners choosing that option if water supply is damaged or disrupted by their operations. Value of properties shall be determined by independent appraisers prior to any approval of Cemex project extension and indexed to average percentage increases in home values of the 93720 and 93730 zip codes over time.

e. Remedy: For all water supply protections or mitigation suggested in the EIR, require a trust or other financial mechanism be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI, to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County or nearby homeowners for any legal disputes with Cemex if Cemex causes damage or disruption to the water supply of nearby homeowners.

Response 305-21

Please see responses above regarding the adequacy of the Draft EIR, supporting technical studies, and mitigation measures pertaining to groundwater monitoring, water quality, and water supply. Mitigation measures adopted for the project would be incorporated into a MMRP that would provide for County oversight to ensure implementation of adopted mitigation measures. Additionally, the operator is responsible for reclamation of the project sites in accordance with the approved reclamation plan. Both Fresno

County and the state Surface Mining and Reclamation Act (SMARA) require that surface mining operators maintain a financial assurance mechanism payable to the SMARA lead agency (here, Fresno County) and to the State of California sufficient to accomplish reclamation as prescribed by the surface mining operation's approved reclamation plan, including conditions of approval and mitigation measures associated with reclamation. The operator is required to annually prepare and submit for County review and approval a financial assurance cost estimate and evidence of a financial assurance mechanism in an amount at least equal to the cost estimate to ensure reclamation in accordance with the approved reclamation plan would be available in the event of the operator's failure to reclaim the site in accordance with the approved reclamation plan.

Comment 305-22

6. Land Use and Planning

   a. Opportunity costs are important to consider here. If this project is approved, there is no going back and using the land for anything else, ever again. It will always be an unsafe area for recreation, housing or anything else if this project is approved. A better use of the plant and quarry sites will be to eventually include it in an overall plan for recreation and protected land and wildlife.

Response 305-22

Please see Collective Response #21 pertaining to public access to the San Joaquin River. Please also note that in describing the proposed project based on the entitlements requested by the Applicant, the Draft EIR properly characterizes and evaluates the project's environmental effects over the proposed 100-year life of the project in compliance with CEQA. Alternative site uses would not meet the Operator's project objectives and, thus, need not be evaluated in the Draft EIR as alternatives to the proposed project. The commenter's preference pertaining to alternative uses of the project sites are noted and will be considered by County decision-makers.

Comment 305-23

7. Noise

   a. When aggregate or rock is dumped into trucks at the quarry site, the decibel levels exceed acceptable levels under County policy. Increasing the amount of truck hauling will therefore cause a significant impact to the neighborhood immediately east of the quarry site.

i. Remedy: Test noise caused by dumping of aggregate and rock into trucks and do not allow increased truck hauling from current levels at any stage of the project.

ii. Remedy: Limit hours of truck hauling to 8:00 am to 5:00 pm to avoid loud noises in the morning and times people often return home from work. Also, no truck hauling should occur on weekends when families are most likely to be home trying to enjoy their properties.

Response 305-23

The Draft EIR discusses the potential noise impacts of the proposed project in Section 4.13. The proposed project would be required to comply with Fresno County General Plan noise thresholds. Implementation of Mitigation Measure 4.13-2, 4.13, and 4.10-1, would reduce potential noise impacts to a less than significant level.

With Regards to commenter's proposal to limit hours of truck hauling to 8:00 a.m. to 5:00 p.m., this action would not be required to reduce the potential noise impacts to less than significant. The proposed hours of operation are specified in Table 2-5 on page 2-43 of the Draft EIR. Typical loading, unloading and aggregate trucking hours would occur from 4:00 a.m. to 9:00 p.m. Monday through Friday. However, these hours may be extended if major public road projects are required to be completed during night hours or on weekends to avoid traffic conflicts.

Comment 305-24

b. Noise from blasting will cause noise pollution and anxiety among people who live in the area, especially those with PTSD from past events in their lives such as my spouse.

i. Remedy: If blasting is allowed at all, limit it to once per day within a one-hour window of

ii. time so that it does not take people off guard. Also, it should not occur earlier than 10:00 am or after 4:00 pm and never on weekends.

Response 305-24

The project operations would require drilling and blasting activities for mining the hard aggregates. The proposed blasting activities would occur once or twice per week, on weekdays between the hours of 10:00 a.m. and 2:00 p.m. (Draft EIR page 2-43). This schedule poses a more restrictive limit on blasting activities than the commenter recommends. Further, compliance with Fresno County General Plan noise thresholds and Mitigation Measures 4.10-1 would reduce potential noise impacts to a less than significant

level. As described in Chapter 3, "Draft EIR Errata," the Blasting Protocols have been clarified and strengthened to include additional monitoring, verification, and reporting requirements, which further ensure that blasting-related noise impacts would remain less than significant.

Comment 305-25

8. Population and Housing

   a. See comments made in other sections of this letter concerning the impact this will have on people living in the area, especially those on both sides of the bluffs overlooking the quarry.

   b. This project expansion would have a devastating effect on home values in the area and land that could eventually be used for responsible development of housing. This will have an adverse effect on current and future property tax collection for the County.

Response 305-25

Please see responses above pertaining to comments above. Please see Collective Response #7 pertaining to economic effects, including property values.

Comment 305-26

9. Recreation

   a. Potentially the greatest cost to Fresno County if this project is approved would be the loss of recreational opportunities to its residents if the Cemex project prevents the vision for a fully realized river parkway with hiking and biking trails and picnic grounds for all its residents to enjoy.

Response 305-26

Please see Collective Response #18 pertaining to consistency with the San Joaquin River Parkway Master Plan, Collective Response #19 pertaining to park accessibility, and Collective Response #21 pertaining to public access to the San Joaquin River. The commenter's concerns regarding the relationship of the project and the San Joaquin River and its recreational opportunities are noted and will be considered by County decision-makers.

Comment 305-27

b. Another impact to recreation will come from increased truck traffic, dust and air pollution along Friant Road, which is a highly popular road for cyclists to use.

    i. Remedy: Increased trucking traffic from the expanded quarry would be a danger to cyclists. One mitigation would be to require Cemex to construct a two-lane, bicycle and pedestrian only road adjacent to Friant Road from Copper Avenue in Fresno to Northfork Road (Road 206) in Friant.

Response 305-27

Please see Collective Response #30 pertaining to traffic and roadway safety, including bicyclist and pedestrian safety.

Comment 305-28

10. Transportation

a. The Cemex expansion plans include increased vehicle traffic from their trucks, including increasing traffic with large trucks on the already congested and dangerous section of Friant Avenue in Fresno, CA, particularly between Fort Washington and Freeway 41.

b. Remedy: The stretch of Friant Avenue between Fort Washington and Freeway 41, much of it adjacent to Woodward Park, needs decreased traffic rather than the dangerous increase that this project promises. One potential mitigation would be for Cemex to pay for two additional lanes to be constructed on the northbound and southbound sides of the road on this stretch of Friant Avenue. Since this is already a bottleneck with little available land for expansion, Cemex would have to pay for properties in the path of road expansion.

    i. There is no good solution to any project that would increase traffic on this already overburdened and dangerous stretch of road. A better idea is for Cemex to find a new property in another part of the County if it wants to expand production and the amount of truck hauling it does.

Response 305-28

Please see Collective Response #29 pertaining to project traffic impacts and road improvements.

Comment 305-29

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. It should also include independent, third-party study and suggested mitigation that isn't commissioned by Cemex. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long- term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit considering the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

And finally, please use common sense and treat this proposed project how it deserves to be treated. This is a monumental overreach by Cemex. The time for mining, especially deep pit blasting and drilling, along the San Joaquin River has long since passed. It is time for Fresno County to embrace the river for its recreational, wildlife and land preservation opportunities.

Thank you for your time and consideration.

Response 305-29

The commenter's concerns and recommendations are noted and will be considered by County decision-makers.

Letter #306 March 6, 2025, Ryan Mitchum

Comment 306-1

To Whom It May Concern:

I am writing to formally protest the proposed adoption of the Draft Environmental Impact Report (EIR) and the issuance of Conditional Use Permits Nos. 3666 and 3667 for the Rockfield Modification Project. After reviewing EIR's executive summary and numerous appendices, I have significant concerns regarding the adequacy of the proposed mitigation measures in three critical areas: the long-term impacts of the 600-foot deep quarry pit, traffic, noise and vibration, and the potential degradation of water quality and availability in the San Joaquin River and regional groundwater.

Response 306-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted. Please see responses below to specific comments.

Comment 306-2

1. Risks Associated with the 600-Foot Quarry Pit

The EIR indicates that the Quarry Site will be excavated to a depth of approximately 600 feet below ground surface. Although the document presents slope stability analyses and mitigation measures, including periodic inspections by qualified engineers, the potential for slope instability remains a serious concern that may not be adequately addressed by the proposed mitigation measures. The mitigation measures rely heavily on reactive monitoring and periodic reporting. However, given the uncertainties inherent in weathered and fractured bedrock conditions, unforeseen geological variations may lead to rapid onset of instability that these measures cannot adequately address. This raises questions about the long-term safety and environmental impacts of leaving such a deep pit after mining operations conclude.

The near-vertical slopes of the pit will severely limit the development of gradual littoral zones. Shallow areas are critical for spawning, the growth of aquatic vegetation, and for supporting a diverse range of wildlife. Without these transitional areas, the pond may be unlikely to sustain a robust ecosystem. The steep, sheer walls of the pit not only compromise habitat potential but also elevate safety risks. Such slopes can be prone to erosion or even catastrophic failure, especially during heavy rains or seismic events, which would further jeopardize both the environment and public safety. The presence of the pit also conflicts with Fresno County General Plan Policies OS-H.10. Considering the Project's proximity to the San Joaquin River, the final 600' deep pit would create a significant public safety hazard to future users of the San Joaquin River Parkway and individuals recreating on the banks of the San Joaquin and Lost Lake County Park. Additionally, the absence of detailed plans addressing long-term water circulation, sedimentation, and ecological restoration in the final design suggests that the pit may simply become a static, inhospitable reservoir rather than a vibrant ecological asset. The proposed mitigation measures should be further

evaluated by the County, as it may still represent a significant impact even after mitigation measures have been implemented.

Response 306-2

The project's Blasting Protocols are presented in Appendix H-9, "Blasting Protocols," updated April 29, 2026. The Blasting Protocols summarizes the monitoring, control and reporting requirements for ground vibrations and air overpressures emitted from blasting at the project sites. See Impact 4.9-4 on Draft EIR pages 4.9-19 through 4.9-21 and Impact 4.10-1 on Draft EIR pages 4.10-88 through 4.10-92. Mitigation Measure 4.10-1 requires implementation of the Blasting Protocols and their incorporation into the Mitigation Monitoring and Reporting Program (MMRP) and conditions of project approval. The Blasting Protocols are both *proactive* in requiring blasting procedures, monitoring, and other measures for blasting and also *reactive* in requiring that additional measures be implemented as necessary based on the required monitoring. Oversight of the Blasting Protocols and implementation of measures to comply would be overseen by the County through mitigation and conditions of approval compliance monitoring and enforcement.

The Draft EIR addresses slope stability in Section 4.7, "Geology and Soils." See discussion of Impacts 4.7-6 and 4.7-7 regarding the project's potential impacts related to slope stability at the Plant Site and Quarry Site (Draft EIR pages 4.7-30 through 4.7-37). With the implementation of Mitigation Measure 4.7-6, 4.7-7a, 4.7-7b, and 4.7-7c, potential impacts related to slope stability would be reduced to less than significant. The conclusions in the Draft EIR are supported by geotechnical reports presented collectively as Appendix F, "Geology and Soils Reports," to the Draft EIR.

The commenter does not provide information as to how the project would conflict with Fresno County General Plan Policy OS-H.10. The proposed Reclamation Plan, presented as Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," discusses the protection of public health and safety and the protection and enhancement of wildlife habitat (see Draft EIR Appendix B-1 page 59-60). The project would comply with the safety standards set forth in SMARA and in the Fresno County Zoning Ordinance.

Comment 306-3

2.Traffic, Noise and Vibration

The Draft EIR acknowledges that blasting at the Quarry Site poses a risk of generating ground borne vibrations that could exceed the critical threshold necessary to potentially destabilize the San Joaquin River embankment. Although the proposed blasting protocols require monitoring and adjustments in blasting design, these

protocols appear reactive rather than preventative and require little to no oversight from regulators. The reliance on post-blast monitoring, rather than more stringent pre-blast controls, may not fully safeguard sensitive receptors or ensure that vibration and/or levels remain within safe limits during all blasting events. This gap in precautionary measures could result in unforeseen damage to the embankment and nearby structures. Additionally, noise impacts to potential receptors from blasting activities were assessed using modeling and the mitigation measures rely on the operator self-regulating when choosing blasting designs. Both approaches introduce uncertainty and indicate that the potential impacts from noise and vibration may not be mitigated to a less than significant impact.

The EIR concludes that Impact 4.17-1 is significant and unavoidable. The EIR found that the addition of project-related trips to existing conditions, 5-year cumulative conditions, 15-year, and cumulative (year 2040) conditions would contribute to substantial decreases in level of service and substantial increase in queuing at several intersections. Mitigation of these effects relies on the County providing funding for road/signaling improvements. This is an unacceptable mitigation approach that would be avoidable if the projects proponent provided adequate funding for the necessary road improvements. I agree with the EIR's findings that this is a significant impact and implore the County to consider this impact when making a decision regarding whether or not to approve the Conditional Use Permits.

Response 306-3

See Response 306-2 above regarding the comment that blasting protocols are reactive rather than proactive and with little or no oversight by regulators. See also Collective Response #29 pertaining to project-related trips and road improvements.

Comment 306-4

3. Potential Impacts on Water Quality

The EIR's hydrology and water quality sections contend that dewatering, pit pond formation, and potential contaminant discharges will have "less than significant" impacts on groundwater and surface water quality. However, the projected operation involves complex interactions between dewatering processes, blast-induced disturbances and effect groundwater within the fractured bedrock. The assumption that dewatering will not adversely affect the ability of nearby production wells and County Service Area 44C wells to supply adequate water to the service area, and that the

existing recharge areas will remain unaffected, may be overly optimistic. The County Service Area 44C wells tap groundwater from the alluvial deposits, weathered zone and hard rock. Water levels in these wells are similar to those of wells at the Quary Site, suggesting that the two are hydraulically connected. According to the EIR, groundwater levels in the CSA 44C wells average approximately 45 ft below ground surface (bgs). The groundwater level in the CSA 44C well area at the time of maximum dewatering is estimated to be approximately 75 ft bgs if recharge occurs in the northeast area of the Quarry Site or approximately 105 ft bgs if recharge does not occur. Thus, the estimated decrease in the static water level at the CSA 44C wells due to the project would range from 30 feet to 60 feet depending on groundwater recharge. Significant decreases in water levels in these wells have occurred due to pumping, and there may be a significant level of uncertainty regarding the ability of these wells to produce under sustained pumping while the mine is undergoing substantial dewatering. Without clearly defined action thresholds and detailed contingency plans, there is a risk of groundwater quality/availability problems emerging, especially in a setting complicated by the deep pit and aggressive dewatering. Groundwater impacts might not be managed swiftly or effectively enough with the proposed mitigation measures to prevent broader impacts on regional groundwater or adjacent surface waters. This may result in a significant unmitigated impact that should be further evaluated.

I appreciate your attention to these critical issues and look forward to seeing your response.

Response 306-4

As discussed in the Draft EIR, the use of the recharge trenches would limit the drawdown of the water table in the unconfined alluvial. The recharge operations would result in drawdown levels that would be approximately one-half of those which would occur without any recharge operations (Draft EIR Appendix G, KDSA, 2021). The Draft EIR acknowledges reductions in the available groundwater column would occur in the Fresno County CSA 44C wells (Draft EIR page 4.10-107). The estimated decrease in the static water column would range from 30 to 60 feet depending on the recharge operations. If water production volumes from the CSA 44C wells decline to the point where current water demand cannot be met, this would result in a potentially significant impact. Accordingly, Mitigation Measure 4.10-10a is provided as an Adaptive Management Program for Quarry Site Groundwater. As part of the Adaptive Management Program, potential effects on the CSA 44C wells would be assessed through the monitoring of nested wells between the Northeast Pond and the CSA 44C wells, and the CSA 44C wells themselves. Mitigation monitoring reports would be submitted to Fresno County

annually. If monitoring data indicate groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15 percent, corrective measures would be implemented to mitigate potential impacts to less than significant (Draft EIR pages 4.10-108 through 4.10-111).

Mitigation measure 4.10-1 is in place to provide measures to minimize the potential water quality impacts associated with blasting, including the risk of release of contaminants to groundwater and surface water. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. Please see Response 65-28 for further discussion of groundwater quality at the Quarry Site.

Letter #307 March 6, 2025, Jose Palacios

Comment 307-1

Regarding the CEMEX Rockfield expansion project, me and my family as a resident of area, think that the project must stop.

Many reasons came to our mind to oppose to the new project, but I will share just 2.

1. CEMEX Rockfield has been working the area many years, when they started in the Friant road, the area were just fields, but now with new house developments, the mine is in front of our eyes, the traffic of heavy trucks its added to our already crowd regular traffic.

Response 307-1

The commenter describes existing conditions, which are described but not evaluated in the Draft EIR. The project's potential visual impacts are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources," while transportation-related impacts are addressed in Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 307-2

2. The environmental impact that the new project will have in the river will be devastated.

We think that new project expansion needs to be cancelled.

We hope this email from me and my family can help to consider not to the expansion of the project.

If you need have any comments or concerns, please contact me through this email.

Response 307-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #308 March 6, 2025, Jody Palmer

Comment 308-1

I strongly OPPOSE this expansion project because of its environmental impact.

Please record my opposition.

Response 308-1

The effects of the proposed project on the physical environment are disclosed and evaluated throughout the EIR. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #309 March 6, 2025, Maria Pantoja

Comment 309-1

I am writing to express my strong opposition to the proposed Rockfield Quarry modification project, particularly the 100-year mining expansion. This project raises serious concerns about its long-term environmental, community, and regulatory impacts, and I urge decision-makers to reconsider approving such an extensive timeline.

My key concerns:

- 100-Year Timeline is Unmanageable
- No industry or infrastructure project should be approved for an entire century without periodic re-evaluation and accountability.
- Future environmental laws, climate conditions, and community needs are impossible to predict over 100 years.

Response 309-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 309-2

- Environmental Impact on the San Joaquin River Corridor

Response 309-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10.

Comment 309-3

- Expanding mining operations 600 feet below ground risks groundwater contamination, habitat destruction, and soil instability.

Response 309-3

The issues of groundwater contamination, habitat destruction, and soil instability are addressed in Draft EIR Section 4.10, Section 4.4, "Biological Resources," and Section 4.7, "Geology and Soils." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 309-4

- The dust, air pollution, and water consumption required for hard rock mining will have lasting ecological consequences.

Response 309-4

The issues of dust, air pollution, and water consumption are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.19, "Utilities and Service Systems," as they are updated in the Final EIR. See Chapter 3, "Draft EIR Errata." See also cumulative impacts addressed in, Draft EIR Section 5.3.10, "Hydrology and Water Quality," regarding the proposed project's potential cumulative effects on water consumption. No specific comments related to the adequacy of the Draft EIR were made, and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 309-5

- Community Disruptions & Land Use Conflicts

Response 309-5

The issues of community disruption and land use conflicts are broad topics discussed across multiple sections of the Draft EIR. The reader is referred to Draft EIR Section 4.1, "Aesthetics and Visual Resources," for discussion of impacts to local views and light pollution; Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), for discussion of air emissions and public health; Section 4.9, "Hazards and Hazardous Materials," for discussion of public safety; Section 4.11, "Land Use and Planning," for discussion of local land use regulations; Section 4.13, "Noise," for discussion of the project's noise emissions; Section 4.16, "Recreation," for discussion of the project's effect on local recreation; and Section 4.17, "Transportation," for discussion of the project's effect on the local transportation system, including pedestrian and cyclist safety. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of County decision-makers.

Comment 309-6

- Increased blasting, noise, and traffic congestion along North Friant Road will negatively impact residents and recreation areas.

Response 309-6

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality") and Section 4.13, as they are updated in the Final EIR. See Chapter 3, "Draft EIR Errata." The project's potential operational noise impacts are evaluated in Draft EIR Section 4.13. The issue of traffic congestion is addressed in Draft EIR Section 4.17. The proposed project's potential impacts on recreation are discussed in Draft EIR Section 4.16. See also, Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Comment 309-7

- The relocation of the asphalt and concrete plants to the Quarry Site raises air quality concerns.

Response 309-7

The project's potential air quality impacts are addressed in Draft EIR Section 4.3, as updated in this Final EIR. The air quality assessment incorporates location changes for project features, such as roads, stockpiles, vehicles, and manufacturing plants, by including these elements as sources in the dispersion modeling. Modeled concentrations for National Ambient Air Quality Standards (NAAQS), used to evaluate health risks, are dependent on the spatial relationship of activities and equipment to surrounding receptors, both laterally and in elevation. As such, the Draft EIR appropriately accounts for relocation of facilities, including asphalt and concrete plants, in the air quality analysis.

In addition, emissions from the asphalt plant that operated at the site until 2009 were conservatively omitted from the baseline emissions inventory. This approach is conservative because it results in a lower baseline condition against which project emissions are compared.

Please also see Draft EIR Section 4.8, "Greenhouse Gas Emissions," as updated in this Final EIR, regarding the potential greenhouse gas effects of each source, including the proposed asphalt plant. Because greenhouse gas emissions are global in nature, changes in the location of emission sources within the project area would not affect the determination of significance.

See Appendix D-4, "Revised Section 4.3, Air Quality," and Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," for proposed updates to Draft EIR Sections 4.3 and 4.8. Accordingly, the Draft EIR appropriately and conservatively evaluates the project's air quality and greenhouse gas impacts.

Comment 309-8

- The project could interfere with the San Joaquin River Parkway's conservation and recreational goals which I love so much.

Response 309-8

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 309-9

Call to Action:

I urge the County and regulatory agencies to:

1. Reject the 100-year mining approval and implement a shorter, more reasonable review period (e.g., 20-25 years).

Response 309-9

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Draft EIR Chapter 6, "Alternatives," describes and evaluates a reasonable range of alternatives to the proposed project. Alternatives 2 through 5 each propose an alternative project with a shorter duration compared to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 6. See also, Collective Response #5 regarding the duration of the proposed use permit. The comment is noted for the consideration of County decision-makers.

Comment 309-10

2. Mandate stronger environmental protections for water, air, and wildlife.

3. Take care of the people of Fresno and beautify those places instead with nature Stop mining, research for better resources, I appreciate the opportunity to provide public input.

Response 309-10

The issues of water, air, and wildlife are addressed in Draft EIR Section 4.10, Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality,"), and Section 4.4, as they are updated in this Final EIR. See Chapter 3, "Draft EIR Errata." Where necessary, mitigation measures are identified in these sections to address the project's potentially significant impacts. The commenter fails to provide evidence or reasoning to support the assertion that stronger mitigation is needed. The commenter's opposition to the proposed project is noted for the consideration of the County decision-makers.

Letter #310 March 6, 2025, David Roberts

Comment 310-1

I am writing to oppose the approval of CEMEX 100 year lease. The DEIR is inadequate.

Response 310-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter fails to provide evidence or reasoning to support the assertion that the Draft EIR is inadequate. See Responses 310-2 through 310-5 for further discussion of specific concerns.

Comment 310-2

1. Toxic chemicals will leach into the San Joaquin River and affect wildlife and human health. The dig pit is too close to the river

Response 310-2

The project's potential effects on surface water quality are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3 for discussion of the project's potential effect on surface water quality. Mitigation Measure 4.10-1 requires implementation of the Blasting Protocols, which are provided as Draft EIR Appendix H-9, "Revised Blasting Protocols," and specify practices to prevent the contamination of groundwater and surface water. See Draft EIR Section 4.4, "Biological Resources," and Section 4.9 "Hazards and Hazardous Materials," regarding the project's potential effects on wildlife and hazardous materials to human health, respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections as well as the Blasting Protocols.

Comment 310-3

2. Explosions will be heard by cyclists, hikers, boaters, and all other visitors to the San Joaquin River. This will make for quite an unpleasant experience for those hoping to enjoy the river and its wildlife.

Response 310-3

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") and Section 4.13, "Noise," as they are updated in the Final EIR. See Chapter 3, "Draft EIR Errata." See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. As described in Draft EIR Chapter 2, "Project Description," on page 2-42, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m."

Comment 310-4

3. A 600 ft deep pit will not a pleasant site. I do not want to look over the San Joaquin River and see such destruction. The San Joaquin River is the jewel of Fresno. Don't destroy it!!!

Response 310-4

The project's potential visual impacts are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Draft EIR Section 4.10 regarding the project's potential effects on the San Joaquin River. See also, Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The comment is noted for the consideration of County decision-makers.

Comment 310-5

4. The amount of jobs created by this mine is nothing compared to the amount of money brought by visitors to the region who recreate along the San Joaquin River.

Response 310-5

See Collective Response #7 regarding the project's potential economic impacts. The comment is noted for the consideration of the decision-makers.

Letter #311 March 6, 2025, Sasha Roeske

Comment 311-1

Disappointing. Why would Fresno want to nearly demolish one of the only natural waterways we have? I can't imagine the actual cost outweighs the environmental damage. Please reconsider this plan. My children love this river and enjoy it every summer, my children aside how much damage will you cause to the natural animal habitats?

Response 311-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on wildlife habitats and the San Joaquin River are evaluated in Draft EIR Section 4.4, "Biological Resources," and Section 4.10 "Hydrology and Water Quality," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #312 March 6, 2025, Lesa Schwartz

Comment 312-1

It is hard to believe that the Cemex project that so dangerously impacts our environment would be considered - especially for 100 years and 600 feet of drilling.

We are faced with the existential threat of global warming that is now wreaking havoc on our world and do not need to add further destruction. With the amount of trucks that Cemex will be using to continually transport the material and the amount of pollution that will occur from this over so many years is totally unacceptable.

Nowhere is the DEIR is there enough evidence that they will be able to mitigate this situation.

Response 312-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the issue of global climate change is addressed in Draft EIR Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"). The project's proposed truck traffic is evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter does not provide evidence to support the assertion that the project's impacts cannot be mitigated. The comment is noted for the consideration of the decision-makers.

Comment 312-2

Additionally, blasting hard rock and crushing it into gravel going down 600 feet endangers our river and it's wildlife. Again, I see no way or no provision that would be acceptable to prevent this. We must protect this natural treasure.

Response 312-2

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") and Section 4.13, "Noise," as they are updated in the Final EIR. See Chapter 3, "Draft EIR Errata." The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." The commenter does not provide evidence to support the assertion that the project's

impacts cannot be mitigated. The comment is noted for the consideration of the decision-makers.

Comment 312-3

I hope that the agency will require Cemex to provide further analysis and effective mitigations for these issues. We must protect the San Joaquin River watershed, surrounding areas and our environment.

Thank you for your consideration and I look forward to hearing from you and trust you will do your best to protect us.

Response 312-3

See Collective Response #1 regarding the need for additional analysis in the CEQA process. The commenter does not provide evidence of a deficiency in the Draft EIR's analysis or a significant impact that warrants imposition of additional mitigation. The comment is noted for the consideration of County decision-makers.

Letter #313 March 6, 2025, Unnamed Resident

Comment 313-1

PLEASE REJECT THE ENVIRONMENTAL NONSENSE AND LET CEMEX SERVE THE PUBLIC WITH MATERIALS DERIVED FROM THEIR OWN PROPERT. THANKS

Response 313-1

The commenter's support for the proposed project is noted for the consideration of the decision-makers.

Letter #314 March 7, 2025, Kirk Anderson

Comment 314-1

This project is offensive! The permits for this company should have been canceled years ago.

People in this area are already drilling new wells due to new construction. This project will take the water table right down to bedrock, there will be no water even for the deepest wells. There is nothing included in the proposal to help those who loose their water because of this project.

Response 314-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on groundwater supplies are addressed

in Draft EIR Section 4.10, "Hydrology and Water Quality," while the provision of water supplies to the project is addressed in Section 4.19, "Utilities and Service Systems." See Impacts 4.10-8 through 4.10-12 for discussion of the project's potential effects on groundwater levels. Mitigation Measure 4.10-10a requires the Applicant to implement an adaptive management program involving continuous monitoring and periodic reporting of groundwater levels and implementation of corrective measures if a significant impact occurs and is attributable to the project. Implementation of this measure and Mitigation Measure 4.10-10b, which provides a funding mechanism for the adaptive management program, would reduce the project's potential impacts to groundwater levels at the Quarry Site to a less than significant level. Therefore, no impacts to nearby residential wells are anticipated to occur. See also Impact 4.19-2 for evaluation of the adequacy of available water supplies to serve the project. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 314-2

The traffic on Friant is already ridiculous. Many more huge gravel trucks weaving in and out of traffic, as they do, will make Friant Rd. Even more dangerous and congested.

Just tell CEMEX NO, we don't want you.

Response 314-2

The project's potential impacts related to traffic and transportation safety are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also, Collective Response #29 regarding traffic congestion and Collective Response #30 regarding transportation safety.

Letter #315 March 7, 2025, Sandra Aune

Comment 315-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

My husband and I have spent many hours cycling in the early mornings on Old Friant Road and Friant Road. We enjoy the quiet serenity of this special area of Fresno.

While dodging gravel trucks is a scary and jarring part of our trip, we have not yet let it stop us from enjoying this pastoral setting.

Response 315-1

The issue of cyclist safety is addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also, Collective Response #30 regarding transportation safety. The comment is noted for the consideration of the decision-makers.

Comment 315-2

I would like to address the language in the *DEIR* regarding **Noise and Traffic** in this beautiful pastoral part of Fresno. The River Park way and Eaton Trail are sanctuaries in our town for serenity and contemplation.

The absence of a noise ordinance with specific measures to enforce a noise abatement plan for the mining project would result in reliance on CeMex, which may not provide adequate protection for our community.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 315-2

As described on Draft EIR page 4.13-29, the County's Noise Ordinance is provided at Chapter 8.40, "Noise Control," of the Fresno County Ordinance Code. The Noise Ordinance "defines excessive noise levels, establishes acceptable noise level standards for various land uses and noise sources, and provides for enforcement actions in the event that the standards are violated." The project's potential effects on Noise and Traffic are addressed in Draft EIR Sections 4.13, "Noise," and 4.17, respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The comment is noted for the consideration of County decision-makers.

Letter #316 March 7, 2025, Erin Barca

Comment 316-1

There is no need to allow a multinational company to profit off of further environmental harm to the land and watershed of our own home. With 556 million tons of permitted aggregate reserves in the Fresno region, well beyond projected demand, there is no good reason.

Response 316-1

The commenter's opinions are noted and will be considered by County decision-makers. Please see Collective Response #3 pertaining to regional aggregate supply and demand.

Comment 316-2

It deeply troubles me that these open pit blights were blasted into land that was intact enough to eventually be protected as nature reserves. How I wish the San Joaquin river was respected. Bring back the salmon, restore wetlands, help California heal. It would be a joy to have healthier, longer stretches of intact native plant communities/habitat closer to home. We've found happier places below Pine Flat along the Kings. Just yesterday, we observed an immature bald eagle attempting to pilfer a fish from an osprey, whilst a mature bald eagle quietly brooded her eggs or young in a western sycamore on the other bank. Magic. But it is a much farther drive and we are now poor.

Please do not allow CEMEX to further threaten the river, ecosystem, and vulnerable wildlife (Buteo swainsoni, Ambystoma californiense, Agelaius tricolor, Elanus leucurus, Haliaeetus leucocephalus, Athene cunicularia, Actinemys marmorata, etc.). The explosions alone from the constant dynamiting of a pit near twice as deep as Millerton Lake (!) will cause distress to many species. Will we have to listen to that on our hikes? I don't have the heart for that. Responses to noise disturbance might have energetic impacts on wildlife. Habitat loss is another potential impact of noise disturbance, and one must consider all of the species in a trophic cascade. E.g. If individuals of one species habituate and better tolerate the disturbance, but the species they depend on for sustenance, in turn, do not. Problem. Some species may be more sensitive to this disturbance during nesting and cease attempts to raise young in the surrounding habitat. There is a lot of harm to consider, yet no need to allow the expansion.

Ever known a dog that could not adapt to fireworks? A domesticated animal, among the most habituated to people and our loudness, often can't cope. If not confined they would flee and be lost. Imagine the impact on sensitive wildlife.

Response 316-2

The commenter's opposition is noted for the decision-makers. The project's potential impacts to biological resources, including the wildlife species noted by the commenter, are identified and analyzed in Draft EIR Section 4.4, "Biological Resources." Please refer to the Draft EIR's discussion of Impact 4.4-4, which concludes that the project would not

have a substantial adverse effect on any riparian habitat or other sensitive natural community with the implementation of Mitigation Measures 4.10-1, 4.3-2a, and 4.3-2b (Draft EIR pages 4.4-55 through 4.4-58). See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. It should be noted that blasting would occur up to two times per week, and the actual blasting event would be brief in nature, lasting approximately one to two seconds. Given that the project sites are disturbed by decades of previous mining operations and given that blasting events are brief in nature, the proposed project would not result in substantial adverse impacts to wildlife.

See select collective responses addressing the potential impacts of blasting and other quarry activities to wildlife; specifically, Collective Responses #12, #13, #14, #15, and #16. See also Responses 58-37, 58-38, 58-40, 58-41, and 58-42 for further discussion of blasting impacts upon wildlife.

Comment 316-3

What about the human communities nearby? The stress of noise pollution is evidenced to cause disease in humans and take years off of our lifespans. Is CEMEX going to pay for our medical bills?

Response 316-3

Draft EIR Section 4.13, "Noise," presents evaluation of potential noise impacts associated with the project. Impacts 4.13-1 through 4.13-4 on Draft EIR pages 4.13-49 through 4.13-69 assess potential noise impacts associated with onsite activities and offsite project-related vehicle trips in consideration of surrounding communities including consideration of 5 representative sensitive receptor locations in association with the Plant Site (see Draft EIR Figure 4.13-1, "Nearest Sensitive Receptors to Plant Site,") and 15 representative sensitive receptor locations in association with the Quarry Site (see Draft EIR Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site"). The Draft EIR identifies that potentially significant noise impacts associated with operations at the Plant Site would be reduced to less than significant with implementation of Mitigation Measure 4.13-2 presented on Draft EIR page 4.13-58 and 4.13-59 and the Draft EIR identifies that potentially significant noise impacts associated with operations at the Quarry Site would be reduced to less than significant with implementation of Mitigation Measure 4.13-3 presented on Draft EIR page 4.13-61 and 4.13-62. The comment does not provide evidence of a deficiency in the Draft EIR's analysis or a significant impact that warrants imposition of additional mitigation.

Comment 316-4

What of the risks from more traffic? Is CEMEX going to pay for the extra wear and tear on our vehicle from damaged roads? Of course not. My family cannot afford anything extra.

Response 316-4

Please see Collective Response #30 pertaining to traffic safety and road maintenance.

Comment 316-5

CEMEX does not legitimately care about our native wildlife, only insofar as preventing profit. They have already been fined at least more than $43 million for 81 separate environmental violations since 2000. Go away already. They are not welcome by me and mine.

I don't trust this company to prevent the worst impacts from occurring and massively polluting the river. We shouldn't have to worry. There is no need to allow them to further degrade nature and even the built environment (400,000 trucks on Friant Rd. annually! Please, no. My veteran husband recently became disabled with compounded PTSD due to a road-rager's attack, and dangerous driver's behavior in traffic is a key trigger). It is sheer corporate greed. We need the riparian ecosystem and watershed intact, unpoisoned. We do not need more aggregate. There is painfully obviously zero need. Let's celebrate our home by protecting it, restoring it, and only taking what we need when necessary, in the most respectful way possible. This, for the continuing benefit of future generations of all species. We are in the midst of the kind of accelerating biodiversity loss that amounts to a mass extinction event (the sixth). This is the first time it's being primarily driven by a single species (Homo sapiens). It is the collective behavior such as this disregard for other life we share this world with, that contributes to these declines. It's big and overwhelming, but a key is to do right in our own backyards. Please start by rejecting the CEMEX Rockfield Expansion.

Thank you for considering my words.

Response 316-5

See Collective Response #4a pertaining to CEMEX's regulatory history. The comment does not provide evidence of a deficiency in the Draft EIR. The commenter's concerns are noted and will be considered by County decision-makers.

Letter #317 March 7, 2025, Eric Battles

Comment 317-1

I am against the CEMEX expansion project due to the negative impact on the San Joaquin river area, especially the negative impact to recreation activity, wildlife, and increased water needs.

Response 317-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to recreation, wildlife, and water demands are evaluated in Draft EIR Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.19, "Utilities and Service Systems." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 317-2

Additionally, the increase of truck traffic from tis project on this portion of Friant Road would negatively impact other motorists (such as potholes and loose rock/gravel) and cause additional wear on the road.

Response 317-2

The project's potential transportation-related impacts are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also, Collective Response #29 regarding wear on public roadways and funding of road maintenance as well as Collective Response #30 regarding potential vehicle damage from aggregate trucks.

Comment 317-3

My family and I regularly visit this and surrounding areas and this expansion would directly and negatively impact our experience in these sensitive natural areas. Many Fresno and Madera County residents visit this area to get away from the noise and pollution of the more urban areas of Fresno but this expansion, if allowed to move forward, would disrupt this precious, public sanctuary.

Please consider these impacts and do not allow this project to move forward as presented.

Response 317-3

See Draft EIR Section 4.16 regarding the project's potential impacts on recreation and Draft EIR Section 4.13, "Noise," regarding the project's potential impacts on noise. Pollution is a broad topic that is addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), Section 4.9, "Hazards and Hazardous Materials," Section 4.10 and Section 4.20, "Wildfire," as they are updated in this Final EIR. See Chapter 3, "Draft EIR Errata." See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. The comment is noted for the consideration of County decision-makers.

Letter #318 March 7, 2025, Diane Bauman

Comment 318-1

Adamantly "AGAINST* This! Just Now Saw this at Online News! Never on any Local News Channel.

Take This Project Further Away Excessive Noise & Pollution & Disrupts the San Joaquin Parkway Plans

Response 318-1

The project's potential noise impacts are discussed in Draft EIR Section 4.13, "Noise." Pollution is a broad topic that is addressed in Draft EIR Section 4.3, "Air Quality, (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), Section 4.9, "Hazards and Hazardous Materials," Section 4.10, "Hydrology and Water Quality," and Section 4.20, "Wildfire," as updated in this Final EIR. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. See also Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #319 March 7, 2025, Sara Belezzuoli

Comment 319-1

I am writing to express my strong opposition to the proposed expansion of the CEMEX gravel mine on the San Joaquin River. This project poses significant environmental, ecological, and community concerns that outweigh potential benefits.

Response 319-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 319-2 to 319-6 below that address specific issues raised in this comment letter.

Comment 319-2

The San Joaquin River is a vital natural resource, not only for wildlife, but also for recreation for our community. Expanding mining operations in this sensitive area threatens water quality, disrupts fragile ecosystems, and increases the risk of long-term environmental degradation.

Response 319-2

The project's potential effects on the San Joaquin River and water quality are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on wildlife and recreation are evaluated in Draft EIR Section 4.4, "Biological Resources," and Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 319-3

I think expanding mining for the next 100 years is poor policy planning for future generations and according to recent research is unwarranted.

Response 319-3

See Collective Response #5 regarding the duration of the proposed use permit. See also, Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 319-4

My home sits along Friant, I enjoy daily walks on the trail and take great pride in my neighborhood. With the expansion there is an expected increase in truck traffic, this is already an issue for our household and I fear we would want to move if the early morning truck traffic increases. Not only does it disrupt homeowners along Friant, the increase in trucks will also result in significant wear and tear on Friant. One truck creates the equivalent of 5,000 cars. To burden local taxpayers with this cost is outrageous.

Response 319-4

The issues of increased traffic and potential impacts to the transportation system are addressed in Draft EIR Section 4.17, "Transportation." The issue of traffic noise is addressed in Section 4.13, "Noise." See Impact 4.13-1 beginning on Draft EIR page 4.13-49. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #29 regarding the project's truck trips and funding for roadway maintenance. The comment is noted for the consideration of the decision-makers.

Comment 319-5

Finally the change in technique from digging to the use of blasting hard rock will further impact residents and I fear lower property value, which will have a lasting ripple effect in our community, including local education funding.

Response 319-5

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") and Section 4.13 as updated in the Final EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #7 regarding evaluation of the project's economic effects.

Comment 319-6

I urge the County Planning Department to prioritize sustainable land use and environmental stewardship by rejecting the expansion. Our community deserves responsible development that protects our natural resources rather than exploits them for short term gain.

Response 319-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #320 March 7, 2025, Ronald Bohigian

Comment 320-1

I wish to express my strong opposition to the proposed CEMEX mining proposal that would allow hard rock blasting in the San Joaquin River bottom.

My objection to this proposal is as follows:

Response 320-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 320-2 and 320-3 below that address specific issues raised in this comment letter. The commenter's opposition to the proposed project is noted for the consideration of County decision-makers.

Comment 320-2

The project would be situated in the heart of the developing San Joaquin River Parkway. Every time I visit, bike and walk on Woodward Park, the Jensen Ranch, the Eaton Trail and other riverside properties I am impressed at the popularity of these lands. Without fail I see people of all ages and all ethnicities enjoying these public properties. It is no stretch to imagine that the Parkway's expansion upriver over the next many years will be highly popular with the public.

The idea that Fresno County would allow one hundred years of blasting and all that goes with such an activity is grossly anathema to the concept of a parkway which serves the public.

Response 320-2

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan and Collective Response #27 regarding the project's operational effects on users of nearby parks and trails. The project's potential impacts to recreation are evaluated in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.16. See also Collective Response #5 regarding the duration of the proposed use permit.

Comment 320-3

Most important, I spoke with a geologist to confirm what I suspected: **the entire east side of the San Joaquin Valley, up against the Sierra foothills is underlaid by granite. CEMEX should be looking elsewhere for its granite.** Without doubt, **there are thousands of acres of private rangeland in the eastern part of the valley that could be accessed for the acquisition of hard rock material.**

[SIC – part of text is not legible] the environmental impacts would be far less than in the riparian San Joaquin River bottom.

Response 320-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. See also Draft EIR Section 6.4.2.1, "Alternative Site Locations," for a discussion of alternative sites for the project. The comment is noted for the consideration of County decision-makers.

Letter #321 March 7, 2025, Sheila and Sheryl Lund Cary

Comment 321-1

THIS SHOULD NEVER HAPPEN!!

We are once again amazed, shocked and angered by the potential devastation that will be caused by this proposed expansion. How did it even get this far?

What the hell are you thinking?!

100 MORE years of mining

600 foot DEEP mining pit

Changing approach to hard rock BLASTING

All in the beautiful San Joaquin River.

So -- here we are sending our stunned opposition to the Senior Planner, Daid Randall, Fresno County Public Works & Planning Dept., Development Services & Capital Projects Division.

My guess is that it took me more time to write this than it took Daniel and crew to consider the "plan."

There is nothing about this project that could be considered an improvement or positive from an environmental standpoint -- for fish, fowl, wildlife or people. This site is in the middle of a residential area.

Money should not be the consideration.

The answer is NO!!

Response 321-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts

to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also, Collective Response #5 regarding duration of the proposed use permit.

Letter #322 March 7, 2025, Martin Cawthorne

Comment 322-1

Dear planning staff, I would like to voice opposition to the proposed CEMEX conditional use permit for hard rock mining at their owned properties "Quarry & Plant sites" along the San Joaquin river basin south of Lost Lake plant.

Response 322-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 322-2 to 322-12 below that address specific issues raised in this comment letter. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 322-2

I would also like the questions below answered.

I moved to Clovis in 1988 and have seen no end of urban growth and development in that time, North East South and West of the City of Fresno.

With the population growth of this urban area residents need areas to recreate. The San Joaquin River basin allows a perfect place for this all year round especially during the hot summers with access to the cooling waters of the San Joaquin River.

Response 322-2

The project's potential impacts to recreational uses and facilities are evaluated in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.16. See also, Collective Response #27 regarding the project's potential effects on users of nearby parks and trails. The comment is noted for the consideration of County decision-makers.

Comment 322-3

Through the efforts of the San Joaquin River Parkway Trust, individual volunteers, and the various City, County, State partners that have all worked hard and long to make this a more environmentally ecological multi use area for our residents. We should strive to make the vision of the SJRP a reality, and work

carefully to preserve and restore this great treasure along the Fresno Madera County lines to the north of the City - therefore;

Response 322-3

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 322-4

I oppose the conditional use plan to allow CEMEX to operate hard rock mining at either of the current properties for the following reasons;

- Noise during blasting rock crushing
- Dust during rock crushing

Response 322-4

The issue of noise and vibration during project operations is addressed in Draft EIR Section 4.13, "Noise," and the issue of dust is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," which appendix includes a Fugitive Dust Control Plan. See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Comment 322-5

- Increase in transportation of product to/from quarry site

Response 322-5

The project's potential impacts related to traffic and transportation are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #29 regarding the project's truck trips.

Comment 322-6

- Disturbance of resident nesting and migratory avian visitors
- Disturbance of wildlife along the river corridor

Response 322-6

The project's potential impacts to resident nesting and migratory avian species and other wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. See also Collective Response #13, Collective Response #14, and Collective Response #15 regarding the project's potential impacts to bird species.

Comment 322-7

- Visual impact of quarried site

Response 322-7

The project's potential visual impacts are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1. See also, Collective Response #8 regarding the proposed visual mitigation provided in the Draft EIR.

Comment 322-8

- Any potential water impacts to the current and historical flows of the San Joaquin river.

Response 322-8

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also, Collective Response #25 regarding the potential for seepage from the river into the quarry pit and associated affects to surface and groundwater conditions.

Comment 322-9

Questions;

1. Does CEMEX current operations have an Environmental Impact Report on file ?

Response 322-9

The existing operations at both the Plant Site and Quarry Site were originally evaluated under CEQA in an EIR that was certified by Fresno County on July 28, 1987. See also, Collective Response #2 regarding CEQA review and previous extensions of the operation's use permits.

Comment 322-10

2. What arrangements have been made to find CEMEX alternative property where they could operate such a facility within Fresno/Madera counties?

Response 322-10

Evaluation of alternative project locations is discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 6.4.2.1.

Comment 322-11

3. What requirements have been made of CEMEX to restore their said properties back to their natural state after their gravel/rock extraction ?

Response 322-11

The existing operation is subject to the current, approved reclamation plan and, should the proposed project not be approved, the project sites would ultimately be reclaimed in accordance with this plan as open space uses including lakes and grazing land. See Draft EIR Section 6.5.2, "Alternative 1: No Project," for an evaluation of the No Project Alternative, which describes and evaluates the environmental impacts of such a scenario. See Draft EIR Section 2.5.7, "Reclamation," regarding the proposed reclamation plan.

Comment 322-12

4. What monitoring of noise, dust, water and transportation would be in place for the proposed extension?

Please consider and answer these concerns before making decisions to further any quarry operations along said San Joaquin River bottom.

Response 322-12

The issues of noise, dust, water, and transportation are addressed in Draft EIR Section 4.13, "Noise," Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.10, and Section 4.17, as they are updated in the Final EIR. Where significant impacts are identified in these sections, feasible mitigation measures are required to reduce their significance. Monitoring is required as part of mitigation where appropriate to address the associated impact. For instance, Mitigation Measures 4.13-2 and 4.13-3 require noise monitoring to confirm the effectiveness of noise control measures implemented at the Plant Site and Quarry Site, respectively. Mitigation Measure 4.10-5a requires a water quality monitoring and adaptive management program at the Plant Site while Mitigation

Measure 4.10-10a outlines a groundwater monitoring and adaptive management program for the Quarry Site. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Letter #323 March 7, 2025, Wei-Lung Chang

Comment 323-1

I am sending this e-mail to express my opinion of opposing the mining project to the San Joaquin River. This river is such a pretty river around this beautiful city and providing the city with a wonderful environmental contribution for the people of Fresno county. This mining project will be totally destroy this river and surrounding area which will be causing huge negative environmental impact to this whole San Joaquin valley.

Response 323-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to the visual landscape are discussed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #324 March 7, 2025, Aurora Clark

Comment 324-1

Just wanted to add our thoughts to the possible expansion of CEMEX. We live in the vicinity of CEMEX. We are absolutely opposed to the expansion due to noise, pollution, and overall damage to the environment.

The San Joaquin River in this area is where we grew up fishing, camping, and enjoying what the City of Fresno offers us as far as nature. It would be a shame to continue to destroy this beautiful area for future generations.

It is our hope and desire that the City of Fresno hears our voices.

Response 324-1

No specific comments related to the adequacy of the Draft EIR were made. The project's potential noise impacts are addressed in Draft EIR Section 4.13, "Noise." Pollution is a broad topic that is addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-

4, "Revised Section 4.3, Air Quality"), Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), Section 4.9, "Hazards and Hazardous Materials," Section 4.10, "Hydrology and Water Quality," Section 4.13, and Section 4.20, "Wildfire." The project's potential effects on the visual landscape are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #325 March 7, 2025, Asher Cupp

Comment 325-1

I am writing to oppose approval of CEMEX one hundred year lease. I am concerned of the explosions of chemicals that will go directly into the San Joaquin river. Farms in the Central Valley pull water directly from this river.

Response 325-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The presence of hazardous substances on the project sites and other potential hazards associated with the project are discussed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The project's potential to degrade surface water quality is evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3 beginning on Draft EIR page 4.10-88. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #326 March 7, 2025, Matt Davis

Comment 326-1

I would like to know what specific damages to fish and other wildlife are estimated, and if CEMEX plans to replace the fish they kill with equally or better suited fish and wildlife for the area and pay for any further research it takes to find out how to do that…? If they kill any birds with their dust, are they going to replace those with equally or better suited ones for the local environment and pay for any research it takes to find out how to do that? The only kind of birds I approve CEMEX to kill are pigeons. Serious question: Can they guarantee to kill ONLY pigeons?

If any dust is found to cause diseases in the neighboring communities—including but not limited to lung problems, does CEMEX promise to pay for all necessary tests and treatments for any such diseases as determined by doctors?

If CEMEX cause any pollution in the water supply from the San Joaquin River, will they guarantee payment to the affected water

facilities to test all affected water restore its purity to what it was before or better?

If any death of a human being occurs and it is determined by local authorities to be an accidental death that would not have happened if the quarry never existed, will CEMEX agree to compensate each affected immediate family member with one quarter of 1 Bitcoin (BTC) for each year of the life of the victim that was lost, up to 80 years?

I'm going to assume CEMEX will answer "no" to all of these questions, since they have already failed to do compensatory things similar to these in areas where they have mined.

Response 326-1

The project's potential impacts to fish and wildlife species, air quality, and water quality are evaluated in Draft EIR Section 4.4, "Biological Resources," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality," as they are updated in the Final EIR. See Chapter 3, "Draft EIR Errata." See also Collective Response #4b regarding liability and funding for unforeseen environmental damage caused by the project. The comment is noted for the consideration of the County decision-makers.

Comment 326-2

And apparently there is already an ample supply aggregate material mind in the Fresno and Madera areas.

Response 326-2

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 326-3

Though I don't generally oppose free enterprise or market competition to lower prices, I oppose this plan of CEMEX. We have a great need for clean water and air, and we don't need more aggregate materials or another big hole in the ground any more than I need a hole in my head.

I oppose the approval of new or additional mining projects affecting the Madera, CA area.

Response 326-3

The project's potential effects on water and air quality are addressed in Draft EIR Section 4.10 and Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), as they are addressed in the Final EIR. See Chapter 3, "Draft EIR Errata." See also, Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. The commenter's opposition to the proposed project is noted for the consideration of County decision-makers.

Letter #327 March 7, 2025, Julie Evans

Comment 327-1

Please accept this as our formal public comment regarding the proposed CEMEX expansion. We believe this project requires further environmental review, as it poses a potential threat to fish and wildlife populations in the area. The long-term consequences of this expansion could be detrimental, potentially impacting future generations and jeopardizing the water quality of the river.

Thank you for the opportunity to express our concerns.

Response 327-1

The project's potential impacts to fish and wildlife populations in the area are addressed in Draft EIR Section 4.4, "Biological Resources." The project's potential to degrade water quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #328 March 7, 2025, Kathleen Fauver

Comment 328-1

I'm a resident and of Friant CA.

My name is Kathleen Fauver I live at 21267 Ruscello Lane Friant CA.

I am writing to express my opposition to the Cemex expansion. I feel that it will cause harm to our area. We are blessed with a beautiful natural resource with our San Juaquin River. The mining change will impact our area for generations to come. Blasting creating a huge mining pit will impact the surrounding environment and the wildlife. I think approval of this would be a huge mistake. The money the county would get just isn't worth the harm to the

surrounding area. It will impact the water quality the fish and wildlife.

I strongly oppose the approval of the Cemex expansion.

Response 328-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to the visual landscape are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as they are updated in the Final EIR. Potential impacts to wildlife and water quality are discussed in Draft EIR Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality," respectively. See Chapter 3, "Draft EIR Errata."

Letter #329 March 7, 2025, Tiffany Garcia

Comment 329-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 329-1

The commenter's concern regarding the Draft EIR is noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The Draft EIR analyzes the project's potential impacts related to water quality, air quality, recreation, wildlife, and hazards and safety in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Responses 329-2 through 329-11, which address the commenter's specific concerns.

Comment 329-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The

DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 329-2

Please see Draft EIR Section 4.10, "Hydrology and Water Quality," for further discussion of the project's potential impacts to hydrologic resources. With respect to water quality, please see the discussion of Impact 4.10-1 regarding the project's potential impacts upon surface water quality standards during mining and reclamation (Draft EIR 4.10-88 through 4.10-92). See also discussion of Impacts 4.10-2 and 4.10-3 regarding surface water quality at the Plant and Quarry sites after the completion of mining and reclamation (Draft EIR page 4.10-93).

For further discussion of the project's potential impacts to the San Joaquin River flows, please see Impact 4.10-12 on page 4.10-113. With the implementation of Mitigation Measures 4.10-10a and 4.10-10b, potential impacts would be reduced to less than significant (Draft EIR page 4.10-114). As the excavation at the Quarry Site is expanded as part of the project, the thin alluvium and weathered rock layers would no longer exist. Groundwater would still be present, however, in the buffer area between the Quarry Site and the San Joaquin River due to the recharge trenches, and in the alluvium and weathered rock near the Northeast Pond. The currently approved dewatering of the existing Quarry affects most of the alluvium on and adjacent to the Quarry Site. As such, further mining into the weathered rock and hard rock as proposed by the project would not result in any significant additional dewatering or drawdown in the alluvium adjacent to the Quarry Site from the San Joaquin River (Draft EIR page 4.10-114). Further, as discussed in the Draft EIR, dewatering of the deeper geologic units would not affect the quantity of water in the river. The groundwater contours, isotope data, aquifer pumping test measurements, and water quality data provided in the groundwater conditions report for the project demonstrate that the San Joaquin River is not in direct hydraulic communication with the weathered rock and hard rock.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

The water pumped from the excavation area would be primarily pumped to groundwater recharge trenches and ponds along the perimeter of the project sites that face the San Joaquin River (Draft EIR at page 4.10-102). The use of recharge trenches would limit the amount of drawdown of the water table to a less than significant level (Draft EIR at page 4.10-102).

Further, the ponds and water conveyance channels are artificial wetlands constructed and maintained for active surface mining and dewatering of the deeper geologic units and would not affect the water levels in the river. Due to the very low permeabilities of the weathered rock and hard rock at the Quarry Site, the volume and rate of groundwater flow is very low compared to the volume and rate of flows in the river. Implementation of several Draft EIR Mitigation Measures, such as Mitigation Measure 4.10-5a, 4.10-1, and 4.10-10a would reduce impacts on the quantity of water in the river, and no further analysis is required. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Regarding the potential capture of the river during flood events, the 100-year HEC-RAS analysis demonstrates that the San Joaquin River floodplain does not enter into the Quarry Site (see Draft EIR page 4.10-117; see also Draft EIR Appendix G-1, "Hydraulic Analysis," regarding the hydraulic analysis). In addition, Chang Consultants conducted hydraulic analyses evaluating the 200-year flood event, which demonstrate that the 200-year flood would neither enter the Quarry Site nor the Plant Site (see Appendix G-7, "200-Year Flood Hazard Analysis—Quarry Site," and Appendix G-8, "200-Year Flood Hazard Analysis—Plant Site"). The existing topography and berms along the north edge of the Plant Site prevent flooding from Little Dry Creek from entering the Plant Site. All onsite stormwater runoff would be retained within the reclaimed pits. As such, the potential impact associated with capture of the San Joaquin River during flood events is less than significant (see Draft EIR pages 4.10-117 through 4.10-119). Please also see Collective Response #17 for a discussion of the 200-year hydraulic analysis conducted for the project.

Comment 329-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 329-3

Regarding the commenter's first question, the berm separating the San Joaquin River from the Quarry Site is higher than the 100-year water surface (see Draft EIR, Appendix

G-1). The San Joaquin River 100-year floodplain does not encroach onto the Quarry Site. As such, it is unlikely that flood waters would enter the quarry pit (see Draft EIR page 4.10-16). See Draft EIR Appendix G-1. The Draft EIR explains that there are no signs of significant bank erosion, and during the historic January 1997 flood event of approximately 60,300 cubic feet per second, the easterly bank along the Quarry Site did not experience significant erosion, and the bank has never breached into the Quarry Site (Draft EIR, page 4.10-7).

The Draft EIR analyzes the potential for the proposed project to release pollutants in flood hazard, tsunami, or seiche zones due to project inundation in Impact 4.10-17. Given that the 100-year floodplain does not encroach onto the Quarry Site, the Draft EIR concludes the following:

> "…, the resulting inundation due to the unforeseen events would occur far outside the actual flood hazard zones, and thus would not be covered by this impact. In addition, the unforeseen event of the release of water from the Friant Dam or Millerton Lake Reservoir is not required to be addressed under CEQA since the releases are not "reasonably foreseeable." (Draft EIR page 4.10-119.)

The Draft EIR concludes that the potential releases of pollutants due to the inundation of the project sites due to a rapid release of water from Friant Dam would be less than significant due to the enlarged excavation pit's ability to capture water and reduce downstream flooding. Further, the project is required to adhere to the requirements of the SPCC Plan and Industrial General Permit SWPP (see Draft EIR page 4.10-119). The stormwater would be managed in accordance with all applicable requirements of the NPDES program, including site-specific SPPPs prepared in accordance with Industrial General Permit Requirements and updated Waste Discharge Requirements (see Draft EIR, page 4.7-29). Thus, as provided in Appendix G-1 to the Draft EIR, the risk of erosion of the riverbank causing a breach of the easterly bank of the Quarry Site, and the risk of the release of pollutants due to project inundation at the Quarry Site or the Plant Site are less than significant (see Draft EIR, Appendix G-1, page 7).

In response to comments, Chang Consultants conducted additional hydraulic analyses evaluating the San Joaquin River 200-year flood, a more rare and severe flood scenario, and concluded that the 200-year flood would neither enter the Quarry Site nor the Plant Site (Chang 2026a and 2026b, Appendix G-7, "200-year Flood Hazard Analysis – Quarry Site," and Appendix G-8, "200-year Flood Hazard Analysis – Plant Site"). See also Collective Response #17 and Response 65-28, which further address flood concerns.

Comment 329-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 329-4

See Collective Response #25 regarding groundwater/surface water interaction, and Collective Response #26 regarding the baseline conditions for analyzing the project's potential groundwater impacts.

As described in Collective Response #26, the data used in the Draft EIR was collected over a period that included both low and high flows. Groundwater level data have been collected continually since 2017 at the Plant Site and since 2018 at the Quarry Site (except for Well MW-7D, where monitoring began in 2020, immediately after that well was installed), as presented in Appendix G-6, "Addendum to Hydrology and Water Quality Analysis Report," of the Draft EIR. Figure 5 of Appendix G-6 demonstrates that the period over which groundwater level data have been collected covers both wet and dry years. In addition, Figure 4.10-10, "Comparison of San Joaquin River Stage and Daily Rainfall," of the Draft EIR shows that groundwater level monitoring has occurred during periods of both low flow (referred to as base flow) and periods of elevated river releases, with flows at times exceeding planned restoration flows to occur as part of the San Joaquin River Restoration Project (see Responses 6-12 and 6-14). See also Response 59-5.

As discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the project area. Collective Response #25 further demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 329-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.

- The DEIR should describe how the proposed trailsmeet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 329-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 329-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 329-6

Regarding the commenter's concerns regarding outdated information for identifying recreational sites in proximity to the project sites, please see Collective Response #19 and Chapter 3, "Draft EIR Errata."

Portions of the Beck Ranch and Ledger Island properties are located near the northern and southern boundaries of the Quarry Site. It is recognized that there are numerous public and non-profit owned properties along the San Joaquin River, including the properties mentioned in this comment. While these properties were not individually analyzed in the project Draft EIR, residential properties with similar proximity to the Plant and Quarry sites were extensively analyzed. For example, Residential Receptor Q-6 is located less than 400 feet from Beck Ranch, and Receptor Q-14 is located on the opposite bank of the San Joaquin River, approximately 200 feet from Ledger Island. (See Draft EIR Appendix H-1, "Environmental Noise and Vibration Assessment," Figure 4.13-1, "Nearest Sensitive Receptors to Plant Site," of the Draft EIR, and Table 4.13-3, "Existing Ambient Noise Environment at Nearest Receptors to Plant Site," and Table 4.13-4, "Existing Ambient Noise Environment at Nearest Receptors to Quarry Site"). These locations would have similar project noise exposure. With that said, the Fresno County Land-Use Compatibility matrix for community noise exposure (Draft EIR Table 4.13-6, "Land Use Compatibility for Community Noise Exposure"), identifies 70 dBA Ldn as being a normally acceptable noise environment for parks, and 75 dBA Ldn as being

normally acceptable for water recreation areas and riding stables (Draft EIR, Table 4.13-6, pages 4.13-28 through 4.13-29). By contrast, the County identifies 60 dBA Ldn as being normally acceptable for residential land uses (Draft EIR, Table 4.13-6, page 4.13-28). As such, the SJRC and SJR Parkway and Conservation Trust's parcels, although not insensitive to noise, are considered by the County to be 10-15 dBA less sensitive to noise than the nearby residential properties which were extensively analyzed in the Draft EIR.

Furthermore, the properties identified in this comment would be shielded from view of excavation activities by perimeter topography and berms, and noise mitigation required for potentially impacted nearby residences would similarly benefit the Conservancy parcels (see Draft EIR Noise Mitigation Measure 4.13-3). While noise generated by mining and processing activities at the Quarry and Plant sites may be audible at portions of the SJRC and SJRPCT parcels, audibility is not the test of significance under CEQA, and overall noise levels are expected to be satisfactory relative to Fresno County criteria. As a result, no adverse noise impacts are identified for the SJRC and SJRPCT parcels located in the vicinity of either the Plant or Quarry sites.

Please also see Collective Response #27 pertaining to potential noise effects on adjacent parks.

Comment 329-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 329-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 329-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and

safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 329-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to traffic safety and road maintenance.

Comment 329-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 329-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 329-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 329-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures

are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (Draft EIR, page 4.4-27). In any event, blasting events would be brief, lasting approximately 1 to 2 seconds, and are not expected to result in sustained or long-term impacts. The project sites are already severely disturbed by decades of ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore fully and adequately evaluated the impact on each of these species.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16.

Comment 329-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 329-11

With the implementation of mitigation measures, the project would not result in significant impacts to the San Joaquin River, wildlife, public safety, or air quality. Please see Responses 329-1 through 329-10 above for further discussion of the specific issues raised in the comment letter. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to reduce the severity of potentially significant impacts, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required. The commenter's concerns are noted and will be considered by County decision-makers.

Letter #330 March 7, 2025, Michael Goldring

Comment 330-1

I am writing to present my comments on the Draft Environmental Impact Report (EIR) for the CEMEX Reclamation Management Plan (RMP). Given the potential environmental impacts, I propose key mitigation measures to section 4.16 of the DEIR, focusing on the Recreational Element and improving access to the San Joaquin River for Fresno and Madera County residents.

I have concerns regarding other DEIR elements; however, I am certain they are being addressed by others.

As proposed, the project will create a century-long gap in the dream of creating an uninterrupted trail from the Friant Dam to Highway 99 as identified in the San Joaquin River Parkway Master Plan. This creates an untenable delay and essentially destroys the goal of the visioning concept proposed by the Parkway that will benefit every citizen in both Fresno and Madera counties.

Response 330-1

Draft EIR Section 2.5.8, "Trail Easements," describes the proposal to provide trail easements at the Plant Site and Quarry Site to facilitate development of trails consistent with both the *San Joaquin River Parkway Master Plan* and the *Fresno County Regional Bicycle & Recreational Trails Master Plan*. The project's potential impacts to recreational uses and facilities are evaluated in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also, Collective Response #22 regarding funding and construction of the proposed trail easements and Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 330-2

First, I strongly advocate for the extension of the [Eaton] Trail from Lost Lake to Peck Ranch (Proposed Recreation Mitigation Element No. 1) extending from the high-water mark of the San Joaquin River to the width necessary to permit it to be of similar size and scope as the existing [Eaton] Trail. This extension would offer substantial benefits, including enhanced recreational opportunities for the public, improved access to natural areas, and the promotion of outdoor activities. By connecting more members of our community to these scenic areas, we can foster a greater appreciation for our environment and encourage responsible stewardship.

Second, to ensure the long-term viability and sustainability of the extended trail, it is imperative to establish an operations and maintenance fund (Proposed Recreation Mitigation Element No. 2). This dedicated fund would cover the costs associated with regular maintenance, repairs, and enhancements, ensuring that the trail remains safe and enjoyable for all users. A well-maintained trail not only serves the community but also helps protect the surrounding natural resources by preventing erosion and other environmental damage.

Third, providing access to Ledger Island (opposite the project) via the proposed [Eaton] Trail extension via a new bridge or by repairing the existing bridge (Proposed Recreation Mitigation Element No. 3). Ledger Island is a valuable natural asset that should be accessible to the public for recreation and education. Ensuring access to this area would facilitate greater appreciation and understanding of our local ecology while providing additional recreational opportunities. Repairing the bridge is essential and would also enhance safety and connectivity, thereby making it easier for visitors to explore and enjoy the river's natural beauty. Incidentally, Ledger Island contains a stand (*quercetum*) of Valley Live Oak trees, which may arguably be the most magnificent examples of the same in the Valley.

Response 330-2

As determined in Draft EIR Section 4.16 the project would not result in any significant impacts to recreation and no mitigation is required. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.16. See also, Collective Response #22 regarding funding and construction of the proposed trail easements. The comment is noted for the consideration of the decision-makers.

Comment 330-3

In light of these concerns, I urge the agency to mandate that CEMEX provide additional analysis, enhance, and craft mitigation measures to the Recreational Element where none currently exist.

Public transparency and accountability in this review process are crucial to ensuring the long-term health of the San Joaquin River watershed and public benefit.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 330-3

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. The comment is noted for the consideration of the decision-makers.

Letter #331 March 7, 2025, Erilyn Grey

Comment 331-1

I am writing to oppose the approval of CEMEX one hundred year lease. I am concerned of the explosions, the chemicals involved that would pollute the river, and finally how awful it would look.

Response 331-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as they are updated in the Final EIR. The project's potential to degrade surface water quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3. The project's potential impacts to the visual landscape are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata." See also, Collective Response #8 regarding the proposed visual mitigation provided in the Draft EIR.

Letter #332 March 7, 2025, Joseph Haydock

Comment 332-1

I am writing to oppose to the CEMEX expansion, which will cause terrible damage to the San Joaquin River.

I cannot imagine how the County of Fresno could possibly approve this expansion, which offers so much long-lasting damage without any significant benefit to the community.

Response 332-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10.

Letter #333 March 7, 2025, David Horwitz

Comment 333-1

I am writing to express deep concerns over the Draft Environmental Impact Report No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project is an existential crisis for the continued life-giving properties, both to all people in the region and state, and all the local river dependent wildlife. For instance, the pollutants released in the water would not only kill fish, but they also are known to be carcinogenic for swimmers and boating residents. The air quality would be deeply compromised, both by the mining, and the legions of diesel fueled mega trucks trucking materials every day for the next 100 years. Public safety would also be at risk, as people could not only get sick from the polluted water, they could accidentally fall into the pits inside the river, and drown to death.

Response 333-1

The commenter's concerns regarding the Draft EIR and project are noted and will be considered by County decision-makers. The comment is introductory. The Draft EIR analyzes the project's potential impacts to water quality, air quality, recreation, wildlife, and hazards and safety in Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, Hazards and Hazardous Materials," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. Please see Responses 333-2 through 333-17 below for further discussion of the specific issues raised in the comment letter.

Comment 333-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet pails to provide clear solutions. Also, the fact that it is acknowledged that river flows are reduced, means that both groundwater adjacent to the river for farmers and homeowners may be decimated, completely being lost at some point in the 100- year trajectory, endangering food sources, and habitability for residents.

Add to this is the enigma of downstream farmers and residents, and downstream wildlife habitat. They will be inevitably harmed by diversions. Yet the DEIR doesn't identify these impacts to

downstream water users from the dewatering of the pits. Also, they don't identify potential capture of the river during flood events.

Response 333-2

See Collective Response #25, regarding the interconnection of surface and groundwater flows. The water pumped from the excavation area would be primarily pumped to groundwater recharge trenches and ponds along the perimeter of the project sites that faces the San Joaquin River (Draft EIR at page 4.10-102). The use of recharge trenches would limit the amount of drawdown of the water table to a less than significant level (Draft EIR at page 4.10-102).

Further, the ponds and water conveyance channels are artificial wetlands constructed and maintained for active surface mining and dewatering of the deeper geologic units and would not affect the water levels in the river. Due to the very low permeabilities of the weathered rock and hard rock at the Quarry Site, the volume and rate of groundwater flow is very low compared to the volume and rate of flows in the river. Implementation of several Draft EIR Mitigation Measures (such as Mitigation Measures 4.10-5a, 4.10-1:, and 4.10-10a) would reduce impacts on the quantity of water in the river, and no further analysis is required.

Comment 333-3

- What is CEMEX's plan, in the event of major flooding, like the 1997 flood, when water breaches the levee and captures the quarry pit?

- Who will be responsible for cleanup and longterm damage if the pit becomes part of the river system?

Response 333-3

See Response 329-3, which fully addresses this comment. Please also see Collective Response #17 for further discussion of 200-year flood impacts at the Quarry Site.

Comment 333-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 333-4

See Collective Response #25 regarding groundwater/surface water interaction, and Collective Response #26 regarding the baseline conditions for analyzing the project's potential groundwater impacts. See also Response 329-4, which fully addresses this comment.

Comment 333-5

What is more, no geological surveys have been conducted at 600 feet depth; there is a steep potential for **toxic element exposure.** Water quality concerns include:

- Impacts on aquifers and river water.
- Blasting vibrations may affect the **water column and salmon population.**
- Quarry expansion could introduce contaminants into groundwater.
- Use of less toxic chemicals only **"when feasible",** lacking enforceable measures.

Response 333-5

Effects to waters are described in Section 4.10 of the Draft EIR, "Hydrology and Water Quality." See Impacts 4.10-4 through 4.10-7 for discussions of the project's potential to degrade groundwater quality. Draft EIR Appendix E, "Biological Resources," details the potential impacts to biological resources, including salmon. Appendix F, "Geology and Soils," includes a host of geologic, and soil reports specific to the project sites. Appendix G describes site-specific hydrologic analysis. See Chapter 3, "Draft EIR Errata," for proposed revisions to the referenced Draft EIR section and appendices. The above-described appendices address the concerns expressed in this comment. Further, Collective Responses #12 (river and salmon restoration efforts) and Collective Response #16 (effects of vibration on salmon spawning) address these concerns regarding potential impacts to salmon in more detail.

Comment 333-6

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.

- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 333-6

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 333-7

Not only are all these concerns for recreation, but the noise and blasting impacts jeopardize recreation and blasting both, particularly for surrounding parks like Lost Lake. This is because blasting noise carries **over a mile away.** Blasting sends **rocks flying up to 100 yards.** The **explosives to be used are unknown yet.** Thus, there may be a potential for strong seismic impact. **Wells of nearby residents could be affected** by vibrations.

Response 333-7

Please see Collective Response #27 pertaining to potential effects on adjacent parks.

The Draft EIR analyzes blasting impacts and the resulting vibration on structures, and concludes that this impact would be less than significant. See discussion of Impact 4.13-6 on page 4.13-65 of the Draft EIR. See also Impact 4.9-4 on Draft EIR pages 4.9-19 through 4.9-21; and Impact 4.10-1 on Draft EIR pages 4.10-88 through 4.10-92.

Mitigation Measure 4.10-1 would require implementation of the Blasting Protocols, as revised in Final EIR Appendix H-9, "Revised Blasting Protocols," updated April 29, 2026. The Blasting Protocols would be appended to the Mitigation Monitoring and Reporting Program (MMRP) and conditions of project approval. The Blasting Protocols summarize the monitoring, control, and reporting requirements for ground vibrations and air overpressures emitted from blasting at the project sites. In addition, the Blasting Protocols provide "Best Practices" for the control and mitigation of flyrock from rock blasting.

Comment 333-8

On this topic, the DEIR uses out of date information when identifying recreational sites near the quarry. The noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully

analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 333-8

Please see Collective Response #27 pertaining to potential effects on adjacent parks, and please see Collective Response #19 pertaining to public accessibility to parks.

Comment 333-9

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after the mining phases). This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA. An upheaval of dust and rocky detritus and heavy-duty equipment being hauled around is not an aesthetically pleasing viewing, nor is denuded top soil with its exposed rock substrate.

Response 333-9

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 333-10

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards such as toxic mining dust and particulate matter being spurned into the air by corporate owned trucks. Also, there will be significant traffic impact at key intersections, **Friant & Willow, Willow & Copper**. These are vital thorough fares for north Fresno residents, and for all Fresno and Clovis residents seeking to access the river, Woodward Park, and Millerton Lake. Therefore, the unavoidable traffic congestion creates a barrier to health and to community mobility. At the very least, CMEX should fund necessary infrastructure improvements to mitigate traffic issues.

Response 333-10

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to traffic safety and road maintenance.

Comment 333-11

Air Quality: The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

- There will be fugitive dust which poses **health risks to nearby communities.**
- The dust may contain toxic and cancer-causing elements.
- The Air Pollution Control District **monitors equipment emissions,** but **not direct air quality impact on residents.**

Response 333-11

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project. Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR, provides evaluation of potential air quality impacts of the project, including consideration of potential effects associated with fugitive dust and toxic air contaminants and health risk. See Appendix D-4, "Revised Section 4.3, Air Quality." In response to comments regarding air quality, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including preparation of a Fugitive Dust Control Plan and inclusion of a health risk assessment for the proposed project. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See also, Collective Response #9 regarding the project's potential effects on the region's existing air quality.

Comment 333-12

Threats to Wildlife

- The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated.

Response 333-12

Effects to the aforementioned species are found in Draft EIR Section 4.4.1.8, "Special Status Biological Resources." Mitigation measures are required for burrowing owl and nesting birds. See Mitigation Measure 4.4-1a (Burrowing Owl) and Mitigation Measure 4.4-1c (Nesting Birds) to ensure effects to such species are reduced to less than significant levels. Based on comments received on the Draft EIR, a new mitigation measure has been added to the EIR. Mitigation Measure 4.4-1d includes additional information and protection measures pertaining to bats. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view revisions to Draft EIR Section 4.4, "Biological Resources," and the mitigation measures referenced in this response.

For additional discussion, see select collective responses addressing the potential impacts of the proposed project to wildlife, specifically Collective Response #13 (nesting birds), Collective Response #14 (Swainson's hawk), and Collective Response #15 (non-nesting birds and birds outside of nesting season). See also, Responses 65-15, 58-37, and 58-38 regarding the Draft EIR's analysis of Swainson's hawk. See Response 65-16 regarding the Draft EIR's analysis of the proposed project's impacts to nesting and migratory birds as well as discussion of mitigation measures. See Response 58-37 and 58-38 regarding the Draft EIR's analysis of the proposed project's impacts to the tricolored blackbird. Please see Responses 65-6, 65-7, 65-10, 65-11, and 58-51 regarding the Draft EIR's analysis of impacts and proposed mitigation measures for the burrowing owl. Please see Response 58-37 and 58-38 regarding the Draft EIR's discussion of Western red bat. See also Response 58-40 for further discussion of the proposed Project's analysis blasting impacts upon species (including those listed in Comment 329-10) and proposed mitigation measures for nesting birds.

The project sites are already disturbed by decades of ongoing mining operations, and would not have a significant impact upon wildlife species. (Draft EIR Impact 4.4-6)

The commenter has not provided any additional information to support the assertion that the Draft EIR (including revisions to some measures) is inadequate at reducing potential impacts to a less than significant level.

Comment 333-13

- The proposed mitigation measures do not comply with existing regulations for protection. Additionally, the study focuses only on species within the site, not those on adjacent lands.

Response 333-13

The commenter does not name specific regulations for protection to support a claim of non-compliance with regulations, nor does the commenter provide specific examples to illustrate this claim. The analysis and conclusions of the Draft EIR (including revisions to some mitigation measures) are in line with CEQA requirements and adequately reduce potential impacts to a less than significant level.

The mitigation measures contained in the biological resources section of the Draft EIR are adequate to reduce potentially significant impacts to less than significant. The comment does not specify which mitigation measures allegedly do not comply with existing regulations, and thus cannot be responded to with specificity. It should be noted that the Plant Site and Quarry Site are both already disturbed by decades of ongoing mining operations, and would not have a significant impact upon wildlife species (Draft EIR Impact 4.4-6).

To establish baseline conditions of biological resources adjacent to the project sites, the biologists conducted a field survey in 2021. This survey is discussed further in Appendix E-1, "Plant Site Habitat Assessment," and Appendix E-2, "Quarry Site Habitat Assessment," of the Draft EIR. Please see Response 65-5 for further discussion of the 2021 field survey of land adjacent to the project sites.

See select collective responses addressing the potential impacts of project activities to wildlife, including those located off-site: Collective Response #12 (river and salmon restoration efforts), Collective Response #13 (nesting birds and other wildlife), Collective Response #15 (non-nesting birds and birds outside of nesting season), and Collective Response #16 (salmon spawning).

Comment 333-14

- **The buffer zones for protected bird species are inadequate:**
  - Eagles: 500 feet proposed, **should be 660 feet.**
  - Hawks: 500 feet proposed, **should be at least 1/2 mile.**

Response 333-14

See Collective Response #13 addressing potential impacts to nesting birds and Collective Response #14 for a discussion pertaining to Swainson's hawk. The buffer zones selected for nesting birds and raptors, including eagles and hawks, fully comply with the Fresno County General Plan, Policy OS-E.2 and standards set by the U.S. Fish and Wildlife Service and the California Department of Fish and Wildlife (Draft EIR at page 4.4-43).

Moreover, the project sites have already been disturbed by ongoing mining activities and would not have a significant increase in activity.

Comment 333-15

Also, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River? Given the radically different climate and topography of this portion of California's San Joaquin River, I venture it safe to suggest they aren't.

Response 333-15

See Collective Response #16 addressing the standards used in assessing potential impacts to Chinook salmon. The Alaskan Blasting Standards were used in the Draft EIR's evaluation of blasting impacts to salmon because they provide concrete numeric thresholds (psi and in/s) and monitoring/permit expectations. An evaluation of the proposed project's blasting thresholds against the Alaska Dept. of Fish & Game Blasting Standard for the Proper Protection of Fish was prepared by Vibra-Tech in 2021 (see Draft EIR Appendix E-4, "Effects of Blasting on Fish"). This study concluded that the ground vibrations from the project's proposed blasting limits would be well below the limit for the protection of embryos in spawning gravels and the level of overpressure would be significantly below the limit established for the safety of salmon. See Response 65-13 for further discussion of the efficacy of Alaskan blasting standards for evaluating potential impacts to salmon.

Comment 333-16

The biology section of the DEIR leaves more questions than it answers and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Project Overview:

- The CMEX [sic] quarry expansion proposes increasing mining operations, including a shift from mechanical surface removal to drilling and blasting.
- Expansion permit seeks a **100-year approval**, whereas gravel companies typically receive **30-year permits.**
- Plans to **dig up to 600 feet deep**, with a minimal buffer between the San Joaquin River and the quarry.

- **Allowed truck loads:** 225 per day.
- Expected **3 million tons of aggregate production per year.**
- The project will generate approximately **800 vehicle trips per day,** yet **no traffic or bicycle safety analysis has been conducted.**

Response 333-16

Please see responses above pertaining to specific comments regarding the Draft EIR biological resources evaluation. The comment providing a project overview is noted but does not comment on the adequacy of the Draft EIR. Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to traffic safety and bicycle and pedestrian safety.

Comment 333-17

Conclusion

Given the powerful destructive nature of this operation unto the river, the wildlife it supports, human welfare, air quality, and potential flooding and seismic activity initiation, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing of the environmental impact report for the project. If not, there will be powerful grassroots backlash from multiple organizations committed to life in the Valley. Water is life, and the San Joaquin River provides life to farmers, residents, and wildlife. Destroying it seems inevitable given the potent evidence in testimony against the CEMEX operation. Money talks, but the irrevocable death of a civilization based on water, in the heartland of California, talks louder.

Thank you for your time and consideration.

Response 333-17

The commenter's concerns, opinions, and preferences are noted and will be considered by County decision-makers.

Letter #334 March 7, 2025, Barbara Howell

Comment 334-1

I am against this expansion.

!!

1. Will blasts going that deep impact the Millerton Dam? Cracks in the dam will be a major problem for the communities.

Response 334-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Response 210-8 regarding potential effects of blasting on dam safety.

Comment 334-2

2. There are many animals that will be driven out of their habit.

Response 334-2

The project's potential impacts to wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-6, beginning on Draft EIR page 4.4-62, which evaluates potential impacts on wildlife movement and corridors. At the Plant Site, the "continuation of mining and processing activities is not expected to modify or compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor." At the Quarry Site, the proposed "downward direction of mining activities is not expected to compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor." See also, Collective Response #13 regarding the project's operational impacts, including blasting, on wildlife located in areas adjacent to the project sites and Chapter 3, "Draft EIR Errata," for proposed revisions to Section 4.4.

Comment 334-3

3. What impact will there be on the SJ River? I don't want our river destroyed

Response 334-3

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. The comment is noted for the consideration of the decision-makers.

Comment 334-4

4. What impact will blasting have on our local air?

Please do NOT allow this to go through!!

Response 334-4

The project's potential effects on air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." See also Collective Response #9 regarding the evaluation of air emissions from blasting events.

Letter #335 March 7, 2025, Linda Kelsey

Comment 335-1

This letter is to register my protest to the plans by Cemex to further lengthen (again!) their lease and to further degrade the environment. Fresno City and County has finally begun to make progress in protecting the once-mighty San Joaquin and to provide access to this valuable resource to the people of the County and City. Now, Cemex wants to seriously disrupt this process while disrupting the current lives and those of future generations.

Response 335-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The comment is introductory and does not address the adequacy of the Draft EIR. Please see Responses 335-2 through 335-7 below.

Comment 335-2

To make a pit significantly deeper than Millerton Lake is an absolute absurdity. One can see all along Friant Road and from the Eaton Trail the much shallower pits that are more eye sore than anything else. To say it will be made into trails and recreational space is a hollow and likely unattainable promise. And in the umpteen decades that they will degrade the land I'm sure these supposed promises will be long forgotten and what will likely be city/urbanized by then will have a grand hole in the ground to deal with. On that note, that land will be easily surrounded by housing and other development.

Response 335-2

The commenter's opinions and concerns are noted and will be considered by County decision-makers. Note that the project reclamation plan provides requirements and obligations for reclamation of the project sites. The commenter does not provide evidence

of any potential future housing or other development on lands near the project sites and evaluation of such future development would be speculative and is not required for the Draft EIR.

Comment 335-3

Even now, the noise factor of such blasting will be a major disruption. Where I live, the start of dove hunting season makes for the disrupting sounds of gun blasts in my neighborhood. I can imagine what this type of blast mining will be like to the neighborhoods already not far from Cemex.

Response 335-3

The Draft EIR discusses the potential noise impacts of the proposed project in Section 4.13. The proposed project would be required to comply with Fresno County General Plan noise thresholds. Implementation of Mitigation Measures 4.13-2, 4.13, and 4.10-1, would reduce potential noise impacts to a less than significant level.

Comment 335-4

Furthermore, let's not forget the dust and rocks and pebbles that will be in the roadway and the air. Already, as a former cyclist, I can attest to the debris along Friant, especially by the Cemex plant. Take a look in the roadway going up the rise just beyond the plant. Our air is already full of smog and dust and this will certainly add to it from both the mining process and the increased heavy truck traffic going to and from any such expanded project.

Response 335-4

See Collective Response #30 regarding bicycle and pedestrian safety as well as road debris from haul trucks. The commenter's concern that the project "will certainly add" to the smog and dust ignores evidence in the record showing that dust would decrease with the project as compared to the existing physical condition. The Draft EIR quantified particulate matter impacts which were determined to be less than significant after mitigation. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that, after mitigation, the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted (see Appendix D-4, "Revised Section 4.3, Air Quality"). Nevertheless, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 335-5

I have danced with those trucks while on my bicycle, with some drivers being respectful, while others ride the bike lanes or fly past nearly knocking people over with the rush of air as they speed pass. Friant is a major bikeway for any rides of decent length.

Response 335-5

Please see Collective Response #30 pertaining to traffic and bicyclist safety.

Comment 335-6

Finally, there is damage to the river and its wildlife. Access has just been returned/made to the river and surrounding property at Ball Ranch and the old Sumner Peck Ranch. These will be increasingly used as word gets out that these are accessible (again). Walkers, off-road cyclists, and especially, kayakers/canoers will all lose open space access or make such spaces unpleasant or unpassable. There is nothing like being down along or on the river and seeing the deer, hearing the beavers, observing the bird rookeries, etc. And lets not forget the growing evidence of how access to green space is beneficial to mental health and in treatment of mental health disorders.

Response 335-6

Please see Collective Response #19 pertaining to public accessibility to parks, and Collective Response #27 pertaining to potential effects on adjacent parks. The commenter's opinions and preferences are noted and will be considered by County decision-makers.

Comment 335-7

I ask that the County Planning Department and Public Works NOT approve this expansion. Please consider both the current and future lives that will be so negatively impacted.

Response 335-7

The commenter's request that the project not be approved is noted and will be considered by County decision-makers.

Letter #336 March 7, 2025, Sharon Lucero

Comment 336-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental

and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. I am writing to express my strong opposition to the proposed CEMEX mining operation along the San Joaquin River near Fresno. This project poses significant threats to public safety, environmental sustainability, and the well-being of our community.

Please consider the facts with regard to the following: **Impacts on the San Joaquin Viver Watershed; Air Quality and Dust**

Emissions; Biological Resource Impacts; Traffic and Noise Concerns; Cumulative Environmental Effects.

Response 336-1

The commenter's opposition to the proposed project is noted for the consideration of County decision-makers. The project's potential effects on the San Joaquin River Watershed, air quality and dust emissions, and biological resources, are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3 "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.4, "Biological Resources," as updated in this final EIR. The project's potential effects on traffic and noise, as well as the project's cumulative effects are addressed in Draft EIR Section 4.17, "Transportation," Section 4.13, "Noise," and Section 5, "Cumulative Impact Analysis," as they are updated in the Final EIR. See Chapter 3, "Draft EIR Errata." This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 336-2 to 336-5 below that address specific issues raised in this comment letter.

Comment 336-2

First and foremost, the additional traffic generated by heavy gravel trucks and workers along Friant Road presents a severe public safety risk. Friant Road is already overburdened, with a long history of accidents and fatalities. Increasing the volume of large industrial vehicles will only exacerbate these dangers, endangering residents and commuters alike. We cannot handle it.

Response 336-2

The project's potential impacts related to traffic and transportation safety are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #30 regarding transportation safety.

Comment 336-3

Beyond the traffic concerns, Fresno already has one of the largest gravel surpluses in the state, as confirmed by the California Geological Survey. This raises a critical question: Why should our community bear the environmental and social costs of a mining project that is not necessary for local supply? The claim that this project is essential to Fresno's gravel supply chain is misleading and does not justify the irreversible damage it would cause.

Response 336-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 336-4

The San Joaquin River, once a thriving ecosystem, has already suffered a 97% reduction in flow, the complete loss of its salmon runs due to dam construction, and the destruction of its wetlands from decades of mining. This project would further scar an already beleaguered waterway by blasting a crater nearly twice as deep as Millerton Lake into its banks. Given the river's fragile state, allowing CEMEX to inflict further damage would be an egregious mistake.

Response 336-4

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. As discussed in the Draft EIR, the project would not significantly impact the San Joaquin River. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of County decision-makers.

Comment 336-5

This is a critical moment to prioritize responsible environmental stewardship and community safety over corporate interests. I urge you to reject this project and protect the San Joaquin River from further degradation.

Thank you for your time and consideration.

Response 336-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #337 March 7, 2025, Karen Micheli

Comment 337-1

I am reaching out to you regarding the new proposed CEMEX project on the San Joaquin River and why it should not be approved. According to the California Geological Survey, the Fresno metro area currently has nearly 200% more gravel then is needed for the next 50 years coming from local mines. In addition, the Kings River has roughly 2 billion tons of easily available surface gravel, which is enough for 500 years at Fresno's current 4 million-ton annual rate. Why in the world do we need to further decimate the San Joaquin River by blasting a 600 foot deep crater to extract more gravel that is not needed, unless it's to line the pockets of CEMEX? Isn't it time we start working to make the San Joaquin River better, healthier and cleaner? It's time to say enough is enough.

Response 337-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also, Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 337-2

IN ADDITION, if this project is approved it would send an estimated 400,000 trucks down Friant Road annually - up from about 100,000 in the 1980's and 250,000 in 2023!!!! Each truck causes wear equivalent to 5,000 cars, meaning the project would add the impact of 2 billion car trips to north Fresno's streets every year in an area that's already suffering from to many cars, trucks and has become deadly. I can't tell you how many times I have stood at the crosswalk waiting for a green light at Woodward Park to Fort Washington and have seen gravel trucks run the red light.

Response 337-2

The project's potential effects on traffic and the roadway system are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See Collective Response #29 regarding traffic impacts and road maintenance and Collective Response #30 regarding transportation safety.

Comment 337-3

I commend you, Mr. Bredefeld, for returning CEMEX'S political donation. But we have to do more….we have to say enough….we have to say NO!

Response 337-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #338 March 7, 2025, Bob Paul

Comment 338-1

I am opposed to any expansion in the river bed. The only expansion I want see is for recreational use!

Response 338-1

See Collective Response #21 regarding public access to the San Joaquin River. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #339 March 7, 2025, Gordon Renfro

Comment 339-1

As a resident of Fresno living in the vicinity of the proposed project, I have concerns and objections. All too often the public is left out of the decision process and notified after the planning has been decided.

Response 339-1

See Collective Response #1 regarding the County's processing of the project application and public participation.

Comment 339-2

First, I want to point out that the air quality in Fresno is currently very poor. We now have too many days where the air is unhealthy to breath. My concern is that this project will add to the air pollution problem. Are there modifications that can be made to any trucks that might be used to lessen the impact they will have on our air quality?

Response 339-2

The project's potential air quality impacts are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also Collective Response #9 regarding the project's potential impact on the region's existing air quality conditions. As shown in Draft EIR Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," with mitigation, project emissions of PM_{10} and $PM_{2.5}$ are reduced from the existing conditions (i.e. CEQA baseline) and for those pollutants the project would be a benefit to air quality over baseline conditions. Truck engines associated with the project are regulated by CARB. CARB has regulations in place including the Low Carbon Fuel Standard, and the in-use off-road diesel fueled fleets that, as they phase in, would reduce truck emissions over time. See Draft EIR Section 4.8, "Greenhouse Gas Emissions," as they are updated in this Final EIR (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"). Furthermore, the truck emissions when combined with emissions from other project sources result in emissions increases that are less than the significance thresholds set forth by the County. Thus, reducing the impact of truck emissions. Therefore, changes to the Draft EIR to address this concern are unnecessary.

Comment 339-3

What about modifications to the scale of this proposed project?

Response 339-3

Alternatives to the proposed project are described and evaluated in Draft EIR Chapter 6, "Alternatives." Alternatives 2 through 5 each represent a reduced mining depth which would result in a reduced project duration. Alternative 5 would also reduce annual operations and sales. The reader is referred to Draft EIR Chapter 6 for evaluations of the air quality effects of each project alternative.

Comment 339-4

Secondly, I find a one-hundred-year permit request to be unrealistic. I understand CEMEX requesting such a thing but I doubt they believe any planning group would be foolish enough to approve this.

Fresno is rapidly changing and obligating future generations to live with this project is irresponsible in the extreme.

Response 339-4

See Collective Response #5 regarding the duration of the proposed use permit.

Comment 339-5

Large areas of Fresno are currently changing from agriculture to residential/ urban living. One can look to San Jose to get an idea of what we will see in Fresno over the next ten to twenty years. Parks, walking trails, and natural areas such as the San Joaquin River will be extremely important to the quality of life in Fresno. These things need to be developed and enhanced now. The San Joaquin River should be a center piece for any future planning. A one-hundred-year mining project along the San Joaquin River will not improve the river or quality of life here.

Response 339-5

Draft EIR Section 4.16, "Recreation," discusses the project's potential effects on recreational facilities. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.16. See also, Collective Response #21 regarding public access to the San Joaquin River and Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. The comment is noted for the consideration of the decision-makers.

Comment 339-6

Please consider the concerns I have regarding the air quality, the unrealistic permit request by CEMEX and the rapid changes taking place in Fresno as we become more residential and urban. Responsible planning will be needed to guide us to a better, healthier Fresno.

Response 339-6

The comment summarizes the previous comments. See Responses 339-1 through 339-5. The comment is noted for the consideration of the decision-makers.

Letter #340 March 7, 2025, Andy Roberts

Comment 340-1

I am writing to formally challenge the findings under Impact 4.17-3 of the Draft Environmental Impact Report (EIR) for the Rockfield Quarry expansion project. The report fails to account for the real and documented roadway hazards caused by debris from heavy-duty haul trucks, which pose a serious safety risk to motorists, bicyclists, and motorcyclists.

Response 340-1

The commenter's assertions are noted. The Draft EIR analyzes the project's potential to substantially increase hazards due to incompatible uses in Impact 4.17-3 on page 4.17-41

of the Draft EIR and concludes this impact to be less than significant. Please also see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 340-2

Key Concerns:

1. Photo Evidence of Dangerous Truck Debris – Ignored in EIR

- I am submitting a photo of debris found on the roadway at the entrance to the Rockfield Quarry site (14765 N Friant Rd), showing tire marks from when I hit the debris with my vehicle while traveling at approximately 65 MPH.
- This directly contradicts the EIR's claim that the project will not significantly increase roadway hazards.
- The presence of such debris demonstrates that trucking operations at this site already create dangerous conditions

Response 340-2

The photographs submitted with the comment are noted and are included with the original comment letter in Appendix M, "Draft EIR Comment Letters." Although road debris and road hazards are an important concern to the County, evidence of existing periodic debris on Friant Road is not evidence that the project would increase road debris or road hazards.

Comment 340-3

2. Failure to Provide Mitigation Measures

- The report incorrectly concludes that hazards from trucking operations are "less than significant" without analyzing the specific safety risks posed by truck debris.
- Despite clear photographic evidence of roadway hazards, the EIR does not propose any mitigation measures, such as:
  - Regular street sweeping on affected roadways.
  - Stricter enforcement of load-securing regulations.
  - A debris hazard reporting system for public complaints.

Response 340-3

Please see Collective Response #30 pertaining to roadway safety and road maintenance. Regarding the mitigation measures proposed in Comment 340-3, mitigation measures are only required where the Draft EIR identifies a potentially significant impact. Here, the Draft EIR has not identified loose gravel or road debris along public roadways as a potentially significant impact that would require mitigation.

However, the project would be subject to certain rules that may potentially reduce loose gravels on public roads, including SJVAPCD Rule 8041, "Carryout or Trackout." The proposed project would reduce fugitive dust emissions by minimizing carryout or trackout on paved public roads or paved shoulders of public roads. Rule 8041 requires that affected facilities prevent and/or clean up carryout and trackout at the end of each workday (Draft EIR page 4.3-28). The project would also be subject to SJVAPCD Rule 8031, "Bulk Materials," which requires certain measures to limit the opacity of visible dust emissions. One of these measures includes maintaining haul trucks to prevent spillage or loss of bulk materials (Draft EIR page 4.3-28). Although these rules are aimed at reducing fugitive dust emissions and impacts to air quality, the measures would also reduce the potential for the project to increase the amount of gravel or debris on public roads.

Comment 340-4

3. Contradiction in the Safety Analysis

- The EIR states that safety concerns are best handled at a programmatic level but fails to acknowledge that CEQA requires project-specific risks to be assessed.

- The report acknowledges that truck traffic will increase by up to 201 trips per day, yet it does not analyze how that will increase the frequency of debris-related hazards.

Response 340-4

See Response 340-3 regarding the project's potential impacts pertaining to road debris. See also Collective Response #30.

Comment 340-5

4. History of Dangerous Incidents Involving Quarry Trucks

- This is not the first time that truck debris from quarry operations on this roadway has caused safety hazards. In the mid-1990s, I was involved in an incident where rocks fell from a northbound truck and struck multiple vehicles,

including the one I was in. The incidents occurred between the plant site & quarry site.

- Some drivers suffered significant damage. One I recall was a river rock going through a windshield of a van, breaking a coffee mug that was in a cup-holder on the dashboard. This creates an immediate and severe danger to motorists.

- Cemex ultimately settled with insurance companies over these claims, acknowledging liability for the damages caused by unsecured debris.

- Although I do not have official records of this incident, it is well-remembered by those involved and serves as a clear example of the dangers associated with unsecured loads from quarry operations, even trucks that are empty and traveling northbound for an additional load.

- This incident demonstrates that truck debris from quarry operations has been a known hazard for decades, and increasing truck traffic will only heighten the risk. Ignoring this history in the EIR is a major oversight.

- In addition to large debris, smaller gravel falling from trucks has caused frequent windshield damage to passing vehicles. Over the years, many drivers—including myself—have experienced cracked or shattered windshields due to loose gravel escaping from haul trucks. These incidents may not always be formally reported, but they represent a persistent and costly hazard for motorists.

Response 340-5

See Collective Response #30 and Response 340-3 above regarding prevention of debris on public roads.

Comment 340-6

5. Failure to Address Flooding Risks and Hydrologic Impacts

- The Draft EIR does not account for the potential flooding of the quarry site in the event of Friant Dam failure, removal, or extreme flood events affecting the entire watershed. Given that this is an old quarry with potentially exposed materials, sediment, and contaminants, flooding could have significant environmental consequences that must be evaluated.

- The EIR must consider flood scenarios under different conditions, including:
  - With and without Friant Dam to assess the long-term hydrologic risks to the site.
  - Upstream dam failures or extreme releases that could lead to rapid inundation.
  - Changes in sediment transport, groundwater infiltration, and potential contamination risks from flooding a site with past and present industrial activity.

Response 340-6

CEQA does not require analysis of speculative impacts (Title 14 CCR Section 15145). As such, dam failure is not a potential issue that needs to be evaluated under CEQA. See Draft EIR discussion of Impact 4.10-17. Additionally, Friant Dam is not controlled by the project. Further, Friant Dam is owned and maintained by the Bureau of Reclamation, and accordingly, the risk of dam failure is extremely unlikely. Furthermore, Friant Dam is over 3 miles upstream of the project sites, so the flows would be significantly attenuated between the dam and the project sites in the rare event of an extreme release from the dam. The 100-year flood is an extreme flood event that is not likely to occur.

Note that the Draft EIR analyzes the proposed project's potential impacts related to inundation given rapid releases of water from Friant Dam and determined this potential impact to be less than significant (Draft EIR Impact 4.10-17 on page 4.10-118).

In response to comments, Chang Consultants conducted additional hydraulic analyses evaluating the San Joaquin River 200-year flood and concluded that the 200-year flood would neither enter the Quarry Site nor the Plant Site (Chang 2026a, Appendix G-7, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Quarry Site"; Chang 2026b, Appendix G-8, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Plant Site").

Comment 340-7

- Potential Environmental Consequences:
  - Contamination Risks – Floodwaters could mobilize pollutants from the quarry site, introducing harmful chemicals or heavy metals into the San Joaquin River ecosystem.

Response 340-7

In addition to the response below, see Responses 6-44 and 6-79.

The project does not propose to discharge groundwater or surface water to offsite surface water features. The water stored in the onsite ponds and recharge trenches would not leave the facility boundaries. As such, no contamination to surface waters is expected to occur due to the project's design.

Additionally, the berm is higher than both the 100-year and 200-year water surface elevations, which would prevent breaching. The 1997 flood flow rate of 60,300 cubic feet per second (cfs) is lower than the 100-year flow rate of 71,000 cfs studied for the project. See Collective Response #17 for further information regarding the 200-year flood analysis at the Quarry Site.

Comment 340-8

- Disruption of Salmon Spawning Habitats – The Salmon Conservation and Research Facility (SCRF), which supports Chinook salmon restoration efforts, relies on stable water conditions. Flooding of the quarry site could alter water quality, increase sedimentation, and impact the success of salmon spawning.

Response 340-8

All on-site storm runoff, wash water, and sediment would be retained within the reclaimed pits and managed in accordance with all applicable stormwater management requirements under the NPDES program (Draft EIR at page 4.10-116). As such, the project would not impact the success of salmon spawning.

Comment 340-9

- Long-Term Groundwater and Ecosystem Damage – If floodwaters infiltrate the quarry site, they could permanently alter groundwater chemistry, harming local ecosystems that depend on the river.

Response 340-9

Table 4.10-7, "Comparison of San Joaquin River Water Quality to Quarry Site Groundwater Quality," compares water quality parameters in the San Joaquin River with those from several groundwater wells at the Quarry Site. The concentrations of all detected minerals, metals, and salts are lower in the river than in the groundwater (Draft EIR at page 4.10-44 to 4.10-47). This is typically the case for rivers that flow from the Sierra Nevada because the runoff is primarily snow melt, whereas groundwater from within

bedrock formations, such as the weathered rock and hard rock at the Quarry Site, has spent a substantial amount of time in contact with the rocks that make up those formations, resulting in the dissolution of minerals, metals, and salts. Since floodwaters on the upper San Joaquin River generally consist of rainfall runoff and snowmelt, they would not contain significant dissolved concentrations of those parameters. It should also be noted that the ecosystems referred to in this comment that depend on the river would also be exposed to and affected by these same floodwaters.

Comment 340-10

Requested Actions:

- The EIR must be revised to include a comprehensive analysis of the potential environmental risks posed by flooding at the quarry site in the event of Friant Dam failure or removal, or extreme flooding scenarios from upstream dams. This analysis should include:
  - An evaluation of how floodwaters could disturb exposed quarry materials, potentially releasing pollutants, sediment, and contaminants into the San Joaquin River ecosystem.
  - A study of how flooding could alter groundwater quality, creating long-term environmental damage to surrounding ecosystems.

Response 340-10

As explained in Responses 65-20 and 65-22, potentially significant effects or indirect physical changes, for example, related to extreme flooding, are not required to be analyzed or mitigated if those effects would be speculative (CEQA Guidelines Section 15064(d)(3)). "While a lead agency must use its 'best efforts' to evaluate environmental effects, including the use of reasonable forecasting, 'foreseeing the unforeseeable' is not required, nor is predicting the unpredictable or quantifying the unquantifiable" (see *Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, 1060–1061; citing Guidelines, Section 15064, subd. (d)(3)).

The project does not involve the operation or management of Friant Dam, and as such, operational releases from Friant Dam are outside the scope of the project under CEQA. The project has been designed in consideration of regional hydrology and topography. Specifically, Chang Consultants prepared a detailed hydraulic analysis of the 100-year water surface elevations and flow velocities along the San Joaquin River (Draft EIR Appendix G-1, "Hydraulic Analysis"). This 100-year flood event represents an extreme

and conservative scenario for evaluating potential flood risks. Even so, the analysis determined that the 100-year flow is contained within the easterly San Joaquin River channel bank.

In consideration of commenters' concerns pertaining to severe flooding events and in light of County Policy HS-C.12, Chang Consultants evaluated the potential for the 200-year flood to enter the Quarry Site and Plant Site. Upon an initial evaluation, the modeled 200-year floodplain entered the quarry pit at stations 16, 19, and 20 by approximately two feet. To proactively prevent the possibility of a 200-year flood event from entering the quarry pit, CEMEX raised the northerly portion of the berms separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. Topographic mapping was prepared to display the locations where the berms were raised and is included in the 200-year Hydraulic Analysis for the Quarry Site (Chang 2026a; see Appendix G-7, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Quarry Site"). Please see Collective Response #17 for further discussion of the 200-Year Hydraulic Analysis conducted for the Quarry Site, and see Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.11, "Land Use and Planning."

The 2026 Hydraulic Analysis also demonstrated that the existing berms and topography of the Plant Site would prevent both the San Joaquin 200-year flood and the Little Dry Creek 200-year flood from entering the Plant Site (Chang 2026b, Appendix G-8, "200-Year Hydraulic Analysis for CEMEX Rockfield Modification Project—Plant Site"). As such, the project sites are sufficiently protected from flood risks, including from the 200-year flood. See also the Response 329-3 and Collective Response #17 for further discussion of flooding impacts.

The project does not propose to discharge groundwater or surface water to offsite surface water features. The water stored in the onsite ponds and recharge trenches would not leave the facility boundaries. As such, no contamination outside of the project is expected to occur due to the project's design.

Comment 340-11

- A detailed review of salmon spawning habitats near the Salmon Conservation and Research Facility and how flooding from the quarry could impact water quality and sedimentation necessary for successful Chinook salmon spawning.

Response 340-11

See Response 340-8 regarding the proposed project's management of on-site storm runoff, wash water, and sediment.

Because storm and flood waters are not anticipated to alter the water quality of the San Joaquin River, an assessment of salmon spawning habitats near the Salmon Conservation and Research Facility is not necessary.

Comment 340-12

- The EIR must also address the risks posed by truck debris on roadways in the vicinity of the quarry, including:
  - Debris removal and regular street maintenance to address hazards from both large rocks and smaller gravel that have been documented to cause damage to vehicles.
  - Enhanced load-securing regulations and enforcement to prevent material from falling off trucks and becoming a roadway hazard.
  - Development of a public reporting system for motorist and cyclist incidents related to debris on roadways near the quarry site.

Response 340-12

See Response 340-3 above.

Comment 340-13

- The County must require the implementation of mitigation measures to address both roadway hazards and flooding risks, including:
  - Creating a flood risk management and emergency response plan specific to the quarry site.
  - Ensuring contingency plans are in place for environmental monitoring in case of flooding, particularly regarding water quality and sediment runoff.
  - Developing strategies to reduce contaminants and sediment transport from the quarry during flood events.
  - In consultation with the Salmon Conservation and Research Facility, incorporating measures to protect

salmon habitats from potential flooding and sedimentation impacts.

- Requiring routine maintenance of roadways to remove debris and ensure safe conditions for all road users.

Response 340-13

The Draft EIR analyzes impacts related to flooding in Impacts 4.10-15, 4.10-16, and 4.10-17 (Draft EIR, pages 4.10-117 through 4.10-119). As discussed in Impact 4.10-17, the project would be required to store hazardous materials on both sites in accordance with the requirements of the Industrial General Permit SWPPP and SPCC Plan, which requirements minimize the risk of the release of pollutants in the event of site inundation.

The Draft EIR also incorporates adaptive management measures to ensure that the project would not exceed water quality thresholds. See discussion of Impacts 4.10-1 through 4.10-7 (beginning on Draft EIR page 4.10-88) for additional analysis of water quality impacts.

See also Collective Response #17 for further discussion of flooding at the project sites and Chapter 3, "Draft EIR Errata," for updates to Draft EIR Section 4.10.

See Response 340-3 above regarding road debris and maintenance.

Comment 340-14

o The EIR must fully account for the hydrological impacts of potential flooding scenarios on the quarry site and the surrounding ecosystems, including the long-term environmental consequences for water quality and fish habitats.

Response 340-14

In addition to the response below, see Response 340-13, which addresses the project's retention of flood waters within both sites.

As described in Responses 6-15, 6-51, 6-55, 65-23 and 459-2, the project does not discharge to the San Joaquin River. Although the project sites are located near the San Joaquin River, the river's floodplain does not extend into the Plant Site or Quarry Site. The existing topography and berms along the north edge of the Plant Site prevent the Little Dry Creek floodplain from entering the Plant Site. As such, the proposed project would be protected from the 100-year flood. As discussed in Response 340-10 above, the project sites are also protected from the 200-year flood, which is a more severe flood scenario. Please see Collective Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site, and see Chapter 3, "Draft EIR Errata," for proposed revisions to Draft

EIR Sections 4.10 and 4.11. Note that all proposed project improvements would be located outside of the floodplain, and no flood control measures are required. Stormwater runoff would continue to be directed to existing onsite ponds, canals, and trenches as necessary.

Comment 340-15

- The County must ensure the EIR incorporates up-to-date flood risk data and potential impacts to wildlife habitats and public resources, such as the Salmon Conservation and Research Facility. Failure to do so would render the environmental review incomplete and legally deficient.

Response 340-15

As described in Responses 6-15, 6-51, 6-55, 65-23 and 459-2, the project does not discharge to the San Joaquin River. Although the project sites are located near the San Joaquin River, the river's floodplain does not extend into the Plant or Quarry sites. The existing topography and berms along the north edge of the Plant Site prevent the Little Dry Creek floodplain from entering the Plant Site, apart from the northwest corner of the Plant Site, which is used for stockpiles. This area would be graded to drain into a pond upon reclamation of the site. As such, the proposed project would be protected from the 100-year flood. As discussed in Response 340-10 above, the project sites are also protected from the 200-year flood, which is a more severe flood scenario. Please see Collective Response #17 for further discussion of the 200-year flood analysis conducted for the Quarry Site, and see Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Sections 4.10 and 4.11. Note that all proposed project improvements would be located outside of the floodplain, and no flood control measures are required. Stormwater runoff would continue to be directed to existing onsite ponds, canals, and trenches as necessary.

The Quarry Site mine plan (Exhibit C Sheet 6, "Quarry Site Mine Plan") is designed to continue avoidance of the riparian corridor along the San Joaquin River established by the existing CUPs, including the 200-foot setback from the river edge and avoidance of specified native trees.

The proposed project's potential effects related to biological resources were evaluated in Draft EIR Section 4.4, "Biological Resources."

Comment 340-16

Failure to properly evaluate and mitigate this issue would constitute an inadequate environmental review under CEQA. Given the clear photographic evidence, firsthand accounts, and historical incidents of debris-related dangers, the County has a responsibility to address this issue before approving the project.

[Photographs were included as part of Comment 340-16 that are not reproduced here. To view these photos, please see Letter 340 in Appendix M, "Draft EIR Comment Letters"]

Response 340-16

As discussed in the responses above, the Draft EIR adequately analyzes impacts associated with roadway hazards and would not conflict with applicable local transportation plans. Please see responses above to specific issues raised in the comment letter. The commenter's concerns and requests will be considered by County decision-makers.

Letter #341 March 7, 2025, Jennifer Roberts

Comment 341-1

I am writing to oppose the approval of CEMEX 100 year lease. The DEIR is inadequate.

Response 341-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 341-2 to 341-6 below that address specific issues raised in this comment letter.

Comment 341-2

1. Toxic chemicals will leach into the San Joaquin River and affect wildlife and human health. The dig pit is too close to the river.

Response 341-2

The use of hazardous substances on the project sites is addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The project's potential to degrade surface water quality is addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential impacts to wildlife are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 341-3

2. Explosions will be heard by cyclists, hikers, boaters, and home owners. This will make for quite an unpleasant experience for those hoping to enjoy the river and its wildlife.

Response 341-3

As described on Draft EIR page 2-42 of the Draft EIR, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." See Draft EIR Section 4.13, "Noise," for an evaluation of potential blasting noise and vibration impacts. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13. See also, Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Comment 341-4

3. A 600 ft deep pit will not be pleasant site. I do not want to look over the San Joaquin River and see such destruction. The San Joaquin River is the jewel of Fresno. Don't destroy it!!!

Response 341-4

The project's potential impacts to the visual landscape are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The comment is noted for the consideration of the decision-makers.

Comment 341-5

4. The amount of jobs created by this mine is nothing compared to the amount of money brought by visitors to region.

Response 341-5

See Collective Response #7 regarding evaluation of the project's potential economic effects. The comment is noted for the consideration of the decision-makers.

Comment 341-6

5. Why destroy such a beautiful place.

Response 341-6

The project's potential impacts to the visual landscape are evaluated in Draft EIR Section 4.1. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1.

Letter #342 March 7, 2025, Laura Rosenberger Haider

Comment 342-1

My second comment: SJVAPCD assumed there would be 28 ppm of nickel in aggregate processing dust plus 20 ppm of nickel released from material storage plus 19 ppm of nickel in road dust. Using soil samples the empirically determined amount of nickel from aggregate processing is 20.7 ppm. In addition there is nickel in diesel exhaust from the extra truck trips. (Reference: CE01 Rockfield Air Report, December 4, 2019, page 44. Table 14: Fugitive TAC Speciation Assumptions is a listing of toxic air contaminants in aggregate processing dust. and other dust from mining.)

Response 342-1

The Draft EIR assessed nickel emissions using the speciation profiles and parts per million values that are cited by the commenter. Potential effects from nickel emissions were assessed as part of the health risk assessment (HRA) which determined that health risk levels would be less than the SJVAPCD health risk thresholds. Nevertheless, in response to air comments on the Draft EIR, the technical analysis was updated with new information, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including an updated HRA and a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 342-2

"The ARB has estimated that about 70% of the cancer risk that the average Californian faces from breathing toxic air contaminants stems from diesel exhaust particles." (from Rockfield Modification Project DEIR and OEHHA studies)

Response 342-2

As stated in the Draft EIR Section 4.3.2, "Regulatory Setting," as updated in the Final EIR, the EPA regulates emissions from new off-road internal combustion engines by tiered standards and emissions from new on-road engines are regulated using standards by model year, class of vehicle, and fuel type. Additionally, the project would pay its fair share to mitigate the cumulative effects of ozone and PM_{10} by complying with the existing in-use on- and off-road diesel engine State regulations. See Appendix D-4, "Revised Section 4.3, Air Quality." The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including

an updated health risk analysis. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 342-3

One person complained that dust was emitted from CEMEX's rock quarry. What if there is no water to use for controlling the dust?

Response 342-3

Draft EIR Section 4.19, "Utilities and Service Systems," Impact 4.19-2 on pages 4.19-8 through 4.19-10 provides an analysis of the project's estimated water demand and determines that adequate water supplies would be available to serve the proposed project. The commenter does not provide evidence of a deficiency in the Draft EIR analysis and speculation of a future scenario without dust control water is not required.

Comment 342-4

CEMEX company had 43 violations.

Response 342-4

Please see Collective Response #4a pertaining to CEMEX regulatory compliance history.

Comment 342-5

The proposed natural gas powered engines would contribute to climate change and drought.

Response 342-5

The project proposes to use natural gas as a heat-source for a proposed state-of-the-art hot mix asphalt plant equipped with best available control technology. The project does not propose use of natural gas-powered engines as a project feature. Draft EIR Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), as updated in the Final EIR, presents an evaluation of the proposed project's potential impact on climate change. This evaluation includes any emissions from the proposed asphalt plant. See also *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3).

Comment 342-6

I don't want them to wait until damage occurs to mitigate the damage. Mining also produces RCS (harmful silica dust) which is linked to silicosis and fibrotic scaring of the lungs (RMP DEIR, v1 CH 10 p 262).

Response 342-6

Draft EIR Section 4.3, "Air Quality," evaluates potential health effects of toxic air contaminants, including respirable crystalline silica, as presented in Impact 4.3-3 (see Appendix D-4, "Revised Section 4.3, Air Quality"). As discussed therein, Mitigation Measure 4.3-2b requires a Fugitive Dust Control Plan that would reduce pollutant emissions from off-road diesel equipment and dust from on-site roads and soil stockpiles. As shown in Appendix D-4, Impact 4.3-3 was determined to be less than significant with or without the implementation of Mitigation Measure 4.3-2b.

Comment 342-7

Nickel Contamination of the Air or Food Could Lead to Chronic Diseases in Animals and Humans: An Update of Science.

The element nickel does not appear to be needed inside of the human body and, up to recently, it was never considered by researchers to be an essential nutrient for humans. In fact, nickel is well known as a heavy metal, alongside others like lead, mercury and cadmium.

Nickel is also recognized to create serious dysfunctions inside mitochondria (the energy-producing organelles inside most human cells) and to produce massive oxidative stress throughout the body -- as these being well-studied physiological results of its toxicity(1).

Recently researchers found out that epigenetic alterations induced by nickel exposure can damage the human genome. But since healthy changes of human lifestyle are found to influence the Epigenome -- and since the Epigenome determines the health of the human Genome -- there is hope that a healthy lifestyle by itself could lead to the elimination of nickel poisoning from the body and to the reversal of the damage produced by this heavy metal inside human cells.

Sources of Nickel Pollution

Nickel mines and their surroundings are well-known locations with high nickel contamination sites, as well as the companies involved in nickel processing. Marble quarries (and other types of quarries) plus their surroundings are also sources of pollution with heavy metals, including nickel.

However, high quantities of nickel are also released from volcanoes, from the production and burning of fossil fuels of all types, and from municipal and industrial waste.

Examples of Low-Degree Environmental Exposure

Even a low-dose of nickel contamination (as we could find in women wearing nickel jewelry or hand watches daily) appears to lead to pathogenic (disease-creating) changes in the human skin. See Nickel Allergy. Cleveland Clinic website (last reviewed on 12/06/2024)(reference3).

In other studies, nickel leaching from stainless steel pots and pans (only from certain metal alloys containing this heavy metal) seems to trigger a severe allergic reaction in up to 20% of women and 8% of men worldwide. Contact dermatitis could be reversible only by eliminating all contamination sources.

An older study published in 2013(reference4) found out that "After six hours of cooking, Ni [nickel] and Cr [chromium] concentrations in tomato sauce increased up to 26-[fold] and 7-fold respectively, depending on the grade of stainless steel".

Among this study's statements:

-- "Toxicological studies indicate that a single oral dose of Ni as low as 67 □g [micrograms] can cause recurrence of ACD [allergic contact dermatitis], flare up eczema, or lead to systemic dermatitis in individuals sensitive to nickel. Studies have shown the severity of dermatitis has a dose dependent relationship to oral doses of nickel".

-- "Stainless steel grades 304 and 316 are the most commonly used in the food and beverage industry. These SS [stainless steels] grades differ by their chemical compositions of metals including nickel and chromium.

SS grade 304 contains approximately 18–20% mass fraction chromium, and 8–12% nickel, whereas SS grade 316 contains approximately 16–18% chromium, and 10–14% nickel; other metals may also vary within the grades".

The solution for this type of nickel and chromium leaching into foods: purchasing stainless steel pots and pans which do not contain nickel or chromium in the alloy.

Examples of High-Degree Environmental Exposure

A continuous exposure to nickel has been discovered to be the main cause of a specific type of nephropathy (kidney disease) experienced by the population of a certain region of Nicaragua, according to a study published in 2020(reference2).

While nephropathy is known traditionally to exist as a complication of diabetes and high blood pressure, in this study nickel has been isolated from a group of many contaminants as being the only possible root cause of this particular form of kidney disease.

The local medical authorities in Nicaragua consider the source of nickel pollution a mystery. However, it is well-known that near the Pacific shore there are a number of active volcanoes (including Masaya, Ometepe, and Cosigüina) -- all being part of the Ring of Fire, situated on the Pacific side of the continent. We could only speculate that these are the most probable sources of high levels of nickel gases and dust in Nicaragua.

Perhaps the classical form of nickel poisoning exists in specialized workers employed in nickel mines and corporations involved in the processing of this heavy metal.

The degree of severity in affecting the human, as well as animal body, depends on the extent of the dose, as well as the length of exposure. In cases of high-degree of environmental exposure, nickel could cause asthma, kidney failure, cardiovascular diseases, lung fibrosis and cancer of the respiratory tract.

Nickel contamination of other parts of the body contributes also to other forms of cancer, including prostate cancer(reference5).

A study published in 2022(reference6) attempts to delineate the relationship between nickel exposure and kidney function in the U.S. adults.

This study provides "evidence that Ni [nickel] exposure [is] linked with declined kidney function and might interact with Cd [cadmium] exposure".

Many stainless steel pots are made from alloys which include both nickel and cadmium -- in high percentages, up to 20% of the metal alloy -- allowing leaching of these inside foods.

According to the evidence, it is possible that even a low exposure to nickel (like in contact dermatitis) could silently initiate the lowering of human kidney function -- an insidious process which could ultimately lead, if the exposure is not discontinued, to kidney failure.

Kidney disease is an insidious one, having no initial symptoms. Fortunately, early markers like microalbuminuria have the capacity to signal the danger many years in advance. And there are also

urine tests allowing patients to be tested for kidney disease before it is showing symptoms.

Nickel as Imunotoxic and Carcinogen, Promoter of Cardiovascular and Other Chronic Diseases

Depending on the dose amount and the length of impact on the human body, nickel could become a powerful immunotoxic and carcinogen agent(references7,8).

These dangers are based on the activity of nickel against human mitochondria: "Nickel-induced mitochondrial damage can occur, due to impairment of mitochondrial membrane potential, reduction of mitochondrial ATP concentration and destruction of mitochondrial DNA".

However, according to the study "Molecular mechanisms of nickel induced neurotoxicity and chemoprevention", the solutions against powerful oxidation against the body are equally powerful antioxidants like such as L- carnitine, taurine and melatonin, (and perhaps many others) natural compounds that can counteract oxidation and prevent nickel-induced neurotoxicity and carcinogenicity"(reference9).

Most importantly, Vitamin C has been discovered since 1979 to successfully counteract nickel poisoning, when used safely in higher doses. Dr. Thomas E. Levy -- considered today to be one of the most important vitamin C scientists in the world -- mentions in his book "Primal Panacea" (MedFox Publishing, 2011) how nickel and other forms of heavy metal poisoning can be reversed with vitamin C.

This humble vitamin acts as an anti-poison natural substance in animals and humans alike, gently detoxifying the body of many toxins, including nickel. In this study, vitamin C supplementation works successfully (as opposed to other detoxifying agents endangering the kidneys) gently reversing the chromosome damage in workers occupationally exposed to nickel(reference 10).

Nickel Is Employed in the Production of Prescription Medications and Medical Devices

Although nanoparticles in general have been traditionally considered unpredictable and possibly dangerous for the human body, we find them today widely employed in several medical areas, including the production of biological drugs.

Since nickel is a heavy metal, its nanoparticles -- due to their small size -- have the capacity to freely travel through tissues, organs and cell membranes. Many heavy metals (like nickel) induce the formation of powerful free radicals throughout the body, leading to oxidative stress and cellular damage.

When nickel is released into the body in its nanoparticle form, its damaging power can only multiply. It could potentially create havoc inside all cells (sick cells and healthy cells as well), damaging mitochondria (the factories of ATP energy) and lowering their production of electrical voltage(reference1).

This "very low voltage" current is vitally needed for neuron communication in the central nervous system, as well as for the electrical activity of human peripheral nerves.

Therefore we consider the use of nanoparticles of this type to be misguided for the additional, following reasons (quoting from google.com generative AI Overview):

-- "Nickel nanoparticles can trigger the production of reactive oxygen species (ROS) which can damage cell components like proteins, lipids, and DNA, leading to cellular dysfunction and death".

-- "Cancer concerns: The International Agency for Research on Cancer (IARC) classifies some nickel compounds as "carcinogenic to humans"".

-- "Reproductive effects: Studies have shown that nickel nanoparticles can negatively impact male reproductive health, causing sperm damage and abnormalities".

-- "Skin irritation: Contact with nickel nanoparticles can also trigger skin allergies and dermatitis in susceptible individuals".

Nickel is also used in dentistry being employed inside the mouth in orthodontic dental braces for teens. It is also used for various medical devices, including wheelchairs and walking devices for patients.

Response 342-7

Nickel emissions were inventoried and used in the health risk assessment (HRA) resulting in risk levels reported in Draft EIR Table 4.3-25, "Mitigated Project Health Risk Impacts," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." Risk factors for nickel used in the HRA are those adopted by the Office of

Environmental Health Hazard Assessment (OEHHA) and include cancer and non-cancer (acute and chronic) effects from nickel. The health effects of nickel emissions were assessed using current methodologies and when combined with the health effects of other toxic air contaminants are determined in the Draft EIR to result in health risk levels that are less than significant. When impacts are found to be less than significant, no mitigation is required. Nevertheless, in response to comments received, an updated Health Risk Assessment was prepared in the *Air Quality, Health Risk, and Climate Change Impact Assessment* (see Appendix D-3). This updated analysis included cancer burden modeling and demonstrated no new impacts and no changes to the findings in the Draft EIR.

Letter #343 March 7, 2025, Laura Sanford

Comment 343-1

I am writing to express my deep concern about the environmental impact of the proposed CEMEX expansion. As a long-time supporter of the San Joaquin River Parkway, I have seen first-hand how much the public enjoys the preserved and enhanced stretches of the San Joaquin river. Fresno has very few local venues for the enjoyment of nature, and I would assert that the River Parkway is the crown jewel. It's important to preserve the beauty of the river and surrounding area for generations to come. This type of mining not only denigrates the physical beauty of the river area, but also threatens water quality as well as fish and wildlife. I urge that we err on the side of preservation.

Response 343-1

The project's potential effects on the visual landscape of the project area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," while potential impacts to fish and wildlife species are evaluated in Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #344 March 7, 2025, Justin Semrick

Comment 344-1

Why would we consider destroying one of our LAST remaining beautiful recreational areas for the sake of gravel, which we have in abundance? This is an unnecessary ecological assault on what little natural earth remains in Fresno county. Do we not have enough of that going on across the United States as the Trump

administration has declared war on our National Parks? Can nothing in this world be protected from greed? Lost Lake should be considered a historic landmark and should be protected.

Response 344-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. Note that the project sites are currently operated as an aggregate mine as described in Draft EIR Section 2.4, "Existing Conditions." See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. The project's potential impacts to biological resources are addressed in Draft EIR Section 4.4, "Biological Resources." The project's potential effect on recreational facilities, including Lost Lake, are addressed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #345 March 7, 2025, Unnamed Resident 1

Comment 345-1

CEMEX should ABSOLUTELY NOT BE able to expand or even continue operations at the San Joaquin River location. 100 years, OUT OF THE QUESTION!!! Hard Rock Blasting- -NO. Should not be allowed in the area. What we need to do is eliminate the traffic from their trucks that travel on Friant Road and 41. We, the citizens, pay for their operations in many ways and it should not be allowed! Get CEMEX out of the area. Restore the land.

DO NOT ALLOW CEMEX TO CONTINUE TO RUIN OUR LAND AND AREA.

Response 345-1

See Collective Response #5 regarding the duration of the proposed use permit. The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as they are updated in the Final EIR. The project's potential effects on traffic are discussed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #346 March 7, 2025, Unnamed Resident 2

Comment 346-1

Good morning, sir. I'm sending this email along to ask you, please, don't allow CEMEX to damage the homes of our local wildlife. We have one beautiful wild place left in this city at west river access. It's really a gem. Many people such as myself enjoy morning

walks there and kayaking down from Native Park. I beg you to protect it, sir. God bless you and have a lovely day.

Response 346-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." The project's potential effect on recreational facilities is discussed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these sections. See also, Collective Response #21 regarding public access to the San Joaquin River and Collective Response #19 regarding public access to recreational facilities adjacent to the project area.

Letter #347 March 7, 2025, Thomas A. Utecht, MD

Comment 347-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

As noted in the DEIR, there are negative impacts on the San Joaquin River Watershed. The dreamed restoration of the San Joaquin river, the longest in central California will be dashed.

Response 347-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also, Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 347-2

Our air quality will continue to worsen. The impact on wild life, particularly migratory salmon and the Swainson's hawk will contribute to their decline.

Response 347-2

The project's potential impact on air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." See also, Collective Response #9 regarding the project's potential effects on existing air quality conditions.

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources," as updated in the Final EIR. See Chapter 3, "Draft EIR Errata." See also, Collective Response #16 regarding potential impacts on salmon spawning and Collective Response #14 regarding evaluations of impacts to Swainson's hawk.

Comment 347-3

I have driven on Friant road nearly daily for 30 years. This road is already overused and dangerous. Large trucks degrade road conditions and kick up gravel – constantly damaging cars and windshields. This project will escalate these problems.

Response 347-3

The issues of transportation safety and road maintenance are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also, Collective Response #29 regarding funding for road maintenance and Collective Response #30 regarding transportation safety and vehicle damage.

Comment 347-4

The scenery on this drive is beautiful, until passing the large gravel mining operation and buildings. The view from the sky is worse.

Response 347-4

The project's potential impacts to the visual landscape are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1.

Comment 347-5

In my professional career, part of my job is recruiting physicians to the valley. One of Fresno's selling points is the San Joaquin river parkway. This selling point becomes moot with the CEMEX project.

Response 347-5

The comment is noted for the consideration of County decision-makers. See Collective Response #7 regarding evaluation of the project's economic effects.

Comment 347-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. I do not believe the potential small economic benefit comes even close to outweighing all of the negative impacts.

Thank you for your time and consideration of these comments.

I look forward to your response and further discussions on this important matter.

Response 347-6

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. The project's potential effect on the San Joaquin River is discussed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also, Collective Response #7 regarding evaluation of the project's economic effects.

Letter #348 March 7, 2025, Elizabeth Valdez

Comment 348-1

Dear Mr. Randall,

I am writing to submit my comments on the Draft Environmental Impact Report (DEIR) for the proposed CEMEX quarry expansion. My primary concern is the impact on water quality and supply, particularly for neighboring residents and farmers who rely on groundwater wells.

1. Water Quality & Groundwater Concerns:

    - The expansion seeks to mine up to 600 feet deep, yet no geological surveys have been conducted at this depth to assess potential impacts on groundwater.

Response 348-1

The project's potential effect on groundwater quality and supply are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-4 through 4.10-7 regarding groundwater quality. The underlying geology and water quality conditions at

the project sites have been investigated. See Draft EIR Appendix F, "Geology and Soils Reports," and Appendix G, "Hydrology and Water Quality," for the related technical studies. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections and appendices.

Comment 348-2

- Blasting vibrations may disrupt underground aquifers, impacting local wells that provide drinking water and irrigation for farms.

Response 348-2

The effects of blasting vibrations on areas outside of the project boundary are discussed in Draft EIR Section 4.13, "Noise." Draft EIR Impact 4.13-6 addresses the potential effects of vibration due to blasting on surrounding properties and wells. Any potentially significant effects are mitigated by the Blasting Protocols provided in Appendix H-5, "San Joaquin River Embankments Geophysical Investigation," of the Draft EIR. It is also important to note that, as stated on page 2-36 of the Draft EIR, mining and blasting into the hard rock would begin in the center of the Quarry, away from the river and adjacent wells, to establish safe blast designs and to allow on-going groundwater monitoring during blasting and mining. See also Responses 20-8, 22-8, 35-8, 38-8, and 64-8.

The commenter does not provide any substantial evidence or reasoning to support the claim that vibrations would impact a groundwater aquifer.

Comment 348-3

- There is a risk of toxic elements being released into the groundwater, threatening the safety of water sources for residents and agriculture.

Response 348-3

The presence of hazardous substances on the project sites and other potential hazards associated with the project are discussed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The project's potential effect on ground water quality is evaluated in Draft EIR Section 4.10. See Impacts 4.10-4 through 4.10-7 beginning on Draft EIR page 4.10-93. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 348-4

2. Agricultural & Residential Water Impact:

- Farmers in the surrounding area depend on stable groundwater levels for irrigation. How will the county ensure their water supply is not depleted or contaminated by quarry operations?
- Homeowners in the area rely on private wells, which could be compromised by changes in water flow and quality due to deep excavation and blasting.
- There is no clear plan in place for compensating residents and farmers if their water supply is negatively impacted.

Response 348-4

The project's potential effects on groundwater levels are evaluated in Draft EIR Section 4.10. See Impacts 4.10-8 through 4.10-13 beginning on Draft EIR page 4.10-102. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also Response 348-6 below regarding compensation. See also, Collective Response #24 regarding the proposed groundwater monitoring program and Collective Response #25 regarding potential impacts to nearby wells.

Comment 348-5

3. Do We Need Another Quarry?

- According to reports from the State Geologist (published in the Fresno Bee), Fresno County already has permitted quarries producing more than enough sand and gravel for construction needs.
- If we already have sufficient resources, why approve a 100-year expansion for an industry with a typical 30-year permit limit?
- The long-term environmental and water risks outweigh the benefits of allowing another century of mining in this area.

Response 348-5

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. See also, Collective Response #5 regarding the duration of the proposed use permit.

Comment 348-6

Given these concerns, I respectfully request:

- A comprehensive study on how the expansion will impact groundwater availability and quality.
- A clear mitigation plan to protect the wells of nearby residents and farms, including compensation for water loss or contamination.

Response 348-6

A comprehensive study of the project's potential impacts to groundwater availability and quality is provided in Draft EIR Appendix G, "Hydrology and Water Quality." See Impacts 4.10-4 through 4.10-12 for discussion of the project's potential impacts to groundwater levels and quality.

Mitigation Measures 4.10-10a and 4.10-10b establish groundwater monitoring and adaptive management programs to protect nearby wells. These measures require ongoing monitoring and implementation of corrective actions, as necessary, to address potential groundwater drawdown or water quality concerns. Mitigation Measure 4.10-10b provides, in part, that the funding mechanism for the Quarry Site Groundwater Adaptive Management Program shall be sufficient to cover costs associated with annual monitoring and reasonably foreseeable actions, including continued pumping to the Northeast Pond and recharge trenches, if necessary.

The Draft EIR concludes that implementation of the groundwater adaptive management program, in conjunction with Blasting Protocols, would be sufficient to minimize potential impacts to groundwater supply and quality to a less than significant level.

The commenter's suggestion to include compensation for water loss or contamination would not constitute mitigation of groundwater impacts under CEQA. The measures identified in the Draft EIR are designed to avoid or minimize physical environmental impacts and are sufficient to reduce potential impacts to groundwater supplies and quality to less than significant levels.

Comment 348-7

- An extension of the public comment period to allow further review of these critical water issues.

I would also like to request an extension of the comment period, as I was only recently informed about this issue. Given its potential impact on so many people, we need additional time to

properly inform the public. I appreciate your time and consideration of these concerns.

Please confirm receipt of this email, and I look forward to your response.

Response 348-7

See Collective Response #1 regarding extension of the public review period. Comment 348-7 is noted for the consideration of County decision-makers.

Letter #349 March 7, 2025, Cindy Williamson

Comment 349-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 349-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Responses 349-2 through 349-11 below for discussion of the specific issues raised in this comment. The Draft EIR analyzes the project's potential impacts to related to water quality, air quality, recreation, wildlife, and hazards in Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 349-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 349-2

See Response 329-2.

Comment 349-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 349-3

See Collective Response #17. See also Response 329-3.

Comment 349-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period.

The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 349-4

See Collective Response #25 regarding groundwater/surface water interaction, and Collective Response #26 regarding the baseline conditions for analyzing the project's potential groundwater impacts. See also Response 329-4, which fully addresses this comment.

Comment 349-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 349-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 349-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 349-6

Please see Collective Response #27 pertaining to potential effects on adjacent parks.

Comment 349-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- Scenic Degradation: The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 349-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 349-8

- Traffic Congestion: Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 349-8

Please see Collective Response #29 pertaining to the project's traffic impacts and associated mitigation measures, and please see Collective Response #30 pertaining to roadway safety.

Comment 349-9

- Air Quality: The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 349-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 349-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 349-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a

requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, as revised in the Final EIR, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (Draft EIR, page 4.4-27). In any event, blasting events would be brief, with each blast lasting approximately one to two seconds in duration, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore fully and adequately evaluated the impact on each of these species.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4 does not need rewriting or recirculation.

Comment 349-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

I live less than 2 miles from this site and am very concerned on how it will impact me personally being in such close proximity to this site.

Response 349-11

The proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required.

Letter #350 March 7, 2025, Thomas Zynda

Comment 350-1

I am writing regard the CEMEX proposal to expand its mining operation on the San Joaquin River.

I am opposed to this project for a number of reasons:

1. CEMEX, a Mexican company, is proposing this type of mining on the San Joaquin because it is illegal in Mexico.

Response 350-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The proposed project would comply with California state law including the California Surface Mining and Reclamation Act (SMARA) and CEQA. Mexico's mining laws are not relevant and have no jurisdiction over the proposed project. The comment is noted for the consideration of the decision-makers.

Comment 350-2

2. The project will go to a depth of 600 feet, which will destroy that part of the river both for recreation and wildlife habitat.

Response 350-2

The project's potential to impact recreational facilities and wildlife habitat is evaluated in Draft EIR Section 4.16, "Recreation," and Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 350-3

3. The use of blasting for the mining will create intolerable noise for people within miles of the site, frighten pets and wild animals, and ruin the water quality.

Response 350-3

As described on Draft EIR page 2-42 of the Draft EIR, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." The issues of noise and water quality are addressed in Draft EIR Section 4.13, "Noise," and Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Regarding the suggestion that the project could affect wildlife movement, See Impact 4.4-6, beginning on Draft EIR page 4.4-62, which evaluates potential impacts on wildlife movement and corridors. At the Plant Site, the "continuation of mining and processing activities is not expected to modify or compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor." At the Quarry Site, the proposed "downward direction of mining activities is not expected to compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor." See also, Collective Response #13 regarding the project's operational impacts, including blasting, on wildlife located in areas adjacent to the project sites.

Comment 350-4

4. The mining will further prevent access to the river by Fresno area residents--there is already very little access to the river. We need more access to the river, not less.

Response 350-4

See Collective Response #21 regarding public access to the San Joaquin River.

Comment 350-5

5. As the mining is proposed to last 100 years, it will inflict its damage for generations to come, which generations will have no opportunity to protect themselves and their environment from the project.

Response 350-5

See Collective Response #5 regarding the duration of the proposed use permit.

Letter #351 March 8, 2025, Susan Aronson

Comment 351-1

My name is Susan Aronson, and I am a resident of North Fork, a small town situated along the San Joaquin River, in the foothills of the Sierras, about 45 minutes north of Fresno. I have been a resident here for 29 years.

I am an avid outdoor enthusiast, who enjoys the river for kayaking, swimming, and paddling, as well as the numerous trails along the waterway. I am a member of the Fresno Audubon Society, and relish the abundance of birds and animals that make the river their home.

I am reaching out to ask for your highest and wisest considerations, for what is best for the safety and health of the river now, and for its future protection.

My greatest concern is that the CEMEX project is proposing to dig a 600 foot pit, and will blast and drill into the earth along the river. The possibility of irreparable environmental damage to the waterway, groundwater, air quality, and public safety, is not acceptable, nor worth the risk.

Response 351-1

The project's potential impacts to the San Joaquin River and groundwater supplies are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." The issues of air quality are evaluated in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). The issue of public safety is addressed in multiple sections across the Draft EIR including Section 4.7, "Geology and Soils" (seismic shaking and landslide), Section 4.9, "Hazards and Hazardous Materials" (hazardous substances and emergency access), Section 4.10, "Hydrology and Water Quality" (flooding), and Section 4.15, "Public Services." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 351-2

Please consider all alternatives to mediate a better solution. There is too much at stake, that can cause harm to residence in the area, and all wildlife around and downstream.

Response 351-2

Draft EIR Chapter 6, "Alternatives," describes and evaluates a reasonable range of alternatives to the proposed project. The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #352 March 8, 2025, Greg Basila

Comment 352-1

I oppose the Cemex expansion for the following reasons:

1. Water issues

+) water table seepage into the pit will need to be pumped into the San Joaquin. River, affecting water quality in the River.

Response 352-1

The commenter incorrectly states that the project would discharge dewatering water into the San Joaquin River. The project does not propose to discharge any water into the San Joaquin River and the potential for the project to degrade surface water quality was determined to be less than significant. See Impacts 4.10-1 through 4.10-3 beginning on Draft EIR page 4.10-88. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10, "Hydrology and Water Quality."

Comment 352-2

+) underground water flow will be disrupted by the mine likely affecting home and irrigation wells to to west of the mine.

+) the local water table to the mine will be disrupted, allowing separate water stratas to mix, affecting water quality.

Response 352-2

Draft EIR Section 4.10 evaluates groundwater flow conditions and groundwater quality at the Plant Site and Quarry Site. Groundwater occurrence and flow directions are described for the alluvium, weathered rock, and hard rock units, and seasonal groundwater level fluctuations are documented based on long-term monitoring data.

As described in the Quarry Site Groundwater Conditions discussion (Draft EIR, page 4.10-38), ongoing quarry dewatering has resulted in a localized groundwater depression beneath the Quarry Site. However, monitoring data show that groundwater levels respond to seasonal and climatic conditions, and that most groundwater pumped during dewatering is returned to the subsurface through on-site recharge trenches and ponds.

The Draft EIR further explains that groundwater occurrence and movement within the weathered rock and hard rock units is controlled by natural fracturing and does not identify evidence that project activities would cause uncontrolled mixing of groundwater units or degradation of groundwater quality. Groundwater quality data indicate that observed conditions are primarily related to natural geologic materials rather than project-related changes in groundwater flow.

Accordingly, while localized groundwater level changes may occur due to quarry operations, the project would not substantially disrupt groundwater flow patterns or adversely affect groundwater quality, and impacts would be less than significant.

See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also Collective Response #25 regarding impacts of the Quarry Site excavation on surface and groundwater resources.

Comment 352-3

2. Disruption of the river ecosystem in the area of the mine and down stream of the mine.

Response 352-3

The project's potential impacts to fish and wildlife habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 352-4

3. Noise and ground tremors from the blasts will affect area residents, wildlife and domestic animals.

Response 352-4

The issues of noise and groundborne vibration are evaluated in Draft EIR Section 4.13, "Noise." Potential impacts to fish and wildlife species are addressed in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 352-5

4. Dust from blasting will add to poor air quality in the Fresno area

Response 352-5

The project's dust emissions and potential effects on air quality are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." See also, Collective Response #9 regarding the project's potential effects on the region's existing air quality conditions.

Comment 352-6

5. Inadequate plans for returning the River bottom to it's natural state when mining is complete.

Response 352-6

The project's proposed Surface Mining and Reclamation Plan is provided as Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan." The commenter does not specify how the Reclamation Plan is inadequate. No further response can be provided.

Comment 352-7

6. Possible additional truck traffic on Friant Road.

Response 352-7

The project's potential traffic-related impacts are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17.

Comment 352-8

7. Approval of this type of gravel extraction will give a competitive advantage to Cemex over other sand and gravel companies.

Response 352-8

The comment is noted for the consideration of County decision-makers. See Collective Response #7 regarding evaluation of the project's potential economic effects.

Comment 352-9

8. This is a open pit mine, no different than to open pit mines in the eastern U.S. and other areas of the country. It will be an eyesore for future generations.

Response 352-9

The project's potential effects on the visual landscape are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1.

Letter #353 March 8, 2025, Roberta Bavin

Comment 353-1

Dear David, I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Response 353-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 353-2 to 353-6 below that address specific issues raised in this comment letter.

Comment 353-2

1. Impacts on the San Joaquin River Watershed- The River Parkway area is beautiful and well maintained and will be destroyed by the CEMEX expansion.

Response 353-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on views of the project sites from surrounding uses within the San Joaquin River watershed are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The project's potential effects on recreation are addressed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 353-3

2. Air Quality and Dust Emissions- Air Quality in the San Joaquin Valley is already impacted by the geography of the area. Allergens are prevalent throughout. This project will be extremely harmful to that air quality in the area, and will impact anyone with respiratory issues.

Response 353-3

The project's potential effect on dust, air quality, and related public concerns are addressed in Draft EIR Section 4.3, "Air Quality" (see Appendix D-4, "Revised Section 4.3, Air Quality"). See also, Collective Response #9 regarding the project's potential effects on the region's existing air quality conditions.

Comment 353-4

3. Traffic and Noise Concerns- The traffic and noise through the area will destroy some of the peacefulness of the River Parkway area.

Response 353-4

The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 353-5

4. Cumulative Environmental Effects - Our San Joaquin Valley is the home to many species of wildlife that could be destroyed by this project.

Response 353-5

Cumulative project effects are discussed in Draft EIR Chapter 5, "Cumulative Impacts." The project's potential impacts to wildlife are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 353-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 353-6

See Collective Response #1 regarding the need for additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project. See also, Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 6.

Letter #354 March 8, 2025, Mark Bozzo

Comment 354-1

I am writing to express my strong opposition to the proposed **CEMEX Rockfield Quarry Modification Project** (CUP Applications 3666 & 3667). This project, which plans to expand mining operations for the next **100 years**, poses serious environmental, health, and quality-of-life concerns for Fresno County residents.

Response 354-1

This is an introductory comment that does not address the adequacy of the Draft EIR. No further response is warranted. See Responses 354-2 to 354-6 below that address specific issues raised in this comment letter.

Comment 354-2

Key Concerns:

1. **Environmental Degradation**

- The project will likely result in significant **air pollution** from dust and emissions, affecting public health, air quality, and disrupt local natural habitat.
- Expanded mining operations threaten **local wildlife and water resources,** including potential groundwater depletion and contamination.
- The San Joaquin River ecosystem is already at risk due to increased industrial activity. It would be irresponsible for CEMEX to pile on.

Response 354-2

The issues of dust, air quality, and related public health concerns are evaluated in Draft EIR Section 4.3, "Air Quality" (see Appendix D-4, "Revised Section 4.3, Air Quality"), as updated in the Final EIR. The project's potential impacts to fish and wildlife species and associated habitats are evaluated in Draft EIR Section 4.4, "Biological Resources." The project's potential impacts to groundwater depletion and contamination and the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata." See also, Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," including an updated health risk assessment. This updated analysis included cancer burden modeling and demonstrated no new impacts and no changes to the findings in the Draft EIR. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 354-3

2. **Public Health & Safety Risks**

- The increase in **blasting noise, and resulting additional truck traffic** will negatively impact nearby residents and businesses and distress local wildlife.
- Blasting operations may **damage nearby structures** and create hazardous conditions.

Response 354-3

Noise and groundborne vibrations impacts associated with the proposed blasting events are evaluated in Draft EIR Section 4.13, "Noise." The project's potential impacts related to increased truck traffic are evaluated in Draft EIR Section 4.17, "Transportation." Indirect impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, . Potential hazards resulting from blasting events are discussed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #13 regarding operational impacts on offsite wildlife. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 354-4

3. **Limited Economic Benefits**

- The project is expected to create only five (5) long-term jobs. It does **not provide substantial job creation** or long-term economic growth for the community. It seems the only benefactor is CEMEX.
- The negative environmental and health costs drastically outweigh any potential financial benefits.

Response 354-4

See Collective Response #7 regarding evaluation of the project's potential economic effects.

Comment 354-5

4. **Land Use & Community Impact**

- The project is **inconsistent** with the vision of the **San Joaquin River Parkway Master Plan,** which prioritizes conservation and recreation.
- The loss of natural habitat and open space will diminish local property values and the quality of life for residents.

Response 354-5

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. See Collective Response #7 regarding evaluation of the project's potential economic effects.

Comment 354-6

Request for Action:

I urge Fresno County to reject this project in favor of sustainable development and environmental protection. The long-term consequences of expanded mining far outweigh the short-term benefits.

Thank you for considering my concerns. I request that my opposition be included in the public record.

Response 354-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #355 March 8, 2025, Gloria Brough

Comment 355-1

Please, don't let this environmental disaster happen!

Response 355-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #356 March 8, 2025, L Dean Clark

Comment 356-1

Mr. Randall, My comment on the proposal is negative. For a century the gravel and deposition surface mining has operated although the land has been zoned for agriculture. It is out of scope of law to permit hard rock mining. It is prudent and sensible to continue the present gravel and surface operations until the material is used up, within the scope of other applicable environmental laws bearing on this work. Thank You for the opportunity to weigh in.

Response 356-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. As described in Draft EIR Section 4.11.1.4 on page 4.11-3, surface mining operations and related facilities and activities are permitted in the project sites' zoning district of AE-20 (Exclusive Agriculture, 20-acre minimum parcel size), subject to a conditional use permit (CUP). The existing facility operates under multiple CUPs issued by Fresno County as summarized in Draft EIR Table 2-4, "Summary of Conditional Use Permits," on page 2-27.

Letter #357 March 8, 2025, David Cords

Comment 357-1

Friends and I used to float down the river. Those times are great memories. Later I ran along the river and biked. The San Joaquin is beautiful and needs to be protected! What CEMEX is proposing would be disastrous.

Please put the San Joaquin River safety ahead of profit and vote against a destructive future.

Response 357-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River and the surrounding visual landscape are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.1, "Aesthetics and Visual Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #358 March 8, 2025, Carol De Vries

Comment 358-1

It is difficult for me to understand why our local government would even consider giving Cemex a 100 year extension which would involve blasting a 600 foot pit, to put it to scale the equivalent of the Fremont Center in San Francisco (43 stories) or the length of 2 football fields, adjacent to the San Joaquin River. It seems reckless at best.

Response 358-1

The commenter's opposition to the proposed project is noted for the consideration of County decision-makers.

Comment 358-2

With the San Joaquin Parkway we have the opportunity to create something comparable to the American River Trail.

Response 358-2

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 358-3

According to the last updated Aggregate Sustainability in the California Report (2018) we will need 305 million tons of aggregate

for the next 50 years. With that I mind, we have 556 million tons of permitted aggregate reserves – nearly double (180%) the projected demand. The majority are permitted for extraction from the Kings River outside Minkler and from the Austin Quarry near Highways 41 and 145 at facilities owned by Vulcan Materials. The bottom line is we do not need more aggregate! So why is a large multinational corporation going to be allowed to blast 600 foot pit by the San Joaquin River for something we don't need?

Vulcan materials ceased operations in 2917 in the San Joaquin River

because aggregate deposits on the river were almost gone. They left so why doesn't Cemex go. They were suppose to leave in 2005.

Response 358-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 358-4

4-1-1 To mitigate the substantial adverse effect in the scenic vista CEMEX is going to stain the walls of the pit to match the surrounding area. Do you really think staining the walls of a giant 600 foot pit the size of a 43 story building is going to disguise it and make it more attractive?

Response 358-4

The project's potential visual impacts are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1. See also Collective Response #8 regarding proposed Mitigation Measure 4.1-1.

Comment 358-5

What is going to prevent kids and/or people from climbing over the fence and falling in it?

Response 358-5

The proposed project would comply with SMARA and Fresno County requirements pertaining to safety of mines. This would include, for example, the minimum fencing requirements outlined in Fresno County Code and described on page 4.11-43 of the Draft EIR. Fresno County Zoning Code, Section 834.4.220, Material Extraction Sites," requires that security fencing be placed along property lines abutting public rights-of-way in accordance with applicable County standards. The project would comply with these

standards. See discussion of the project's consistency with Fresno County's Surface Mining and Reclamation regulations (Title 15, Chapter 15.48) starting on page 4.11-43 of the Draft EIR.

Comment 358-6

If the wall of the pit collapses or is breached the impact on the water quality will be devastating.

Response 358-6

See Collective Response #17 regarding river bank stability and the potential for breach and flooding of the Quarry Site.

Comment 358-7

There is even a conflict with the zoning.

Response 358-7

As described in Draft EIR Section 4.11.1.4, "Zoning Classifications," on page 4.11-3, surface mining operations and related facilities and activities are permitted in the project sites' zoning district of AE-20 (Exclusive Agriculture, 20-acre minimum parcel size), subject to a conditional use permit (CUP). The existing facility operates under multiple CUPs issued by Fresno County as summarized in Draft EIR Table 2-4, "Summary of Conditional Use Permits," on page 2-27.

Comment 358-8

There is a conflict with the air quality plan with no mitigation measure. Seriously? Fresno's air quality is some of the worst in the nation with one of the highest rates of childhood asthma and there is no mitigation plan.

Response 358-8

The project's potential air quality impacts are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." See also Collective Response #9 regarding the project's potential effects on the region's existing air quality conditions.

Comment 358-9

Consider the adverse effect of the constant noise and added traffic, damage and loss of agricultural and forest land, defacement of the beauty of the area, loss of natural habitat.

Response 358-9

The issues of noise and traffic are discussed in Draft EIR Section 4.13, "Noise," and Section 4.17, "Transportation." The project's potential impacts to agricultural and forest land, visual resources, and natural habitats are addressed in Draft EIR Section 4.2, "Agricultural and Forestry Resources," Section 4.1, "Aesthetics and Visual Resources," and Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 358-10

All will impact the environment and those living in the area as well as those who use the river for recreation.

Response 358-10

See Collective Response #27 regarding the project's potential effects on users of nearby parks and trails. See also Collective Response #21 regarding the project's potential impact on public access to the San Joaquin River and recreational sites.

Comment 358-11

To make matters worse, Cemex has a terrible track record of environmental violations: 43 million dollars in fines for 81 separate violations since 2000 to be exact according to the Good Jobs First, a Washington DC based nonprofit that tracks corporate and government accountability in economic development. It does not sound like Cemex is too trust worthy of cleaning up the messes that they make.

Response 358-11

See Collective Response #4a regarding CEMEX's regulatory history.

Comment 358-12

In closing we have the beautiful San Joaquin River in our backyard. It is our playground. It is an asset to our community. This is an opportunity for the local government to give the people of Fresno a place to recreate, take families on picnics, camp, bird, fish, kayak and canoe among other things. Please do the right thing for our community. Save our rivers!

Response 358-12

This is a conclusory comment that does not address the adequacy of the Draft EIR. See Responses 358-2 through 358-11 for responses to the substantive comments contained in

Letter #358. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #359 March 8, 2025, Renee Denton

Comment 359-1

I appreciate the opportunity to comment on the Draft EIR for the CEMEX Rockfield Expansion Project.

I have lived with my family near the Eaton Trail for over 30 years. I use the Eaten Trail almost every day. I often visit the San Joaquin River Parkway. I love observing wildlife, especially birds. It is unfortunate that this remarkable view shed is marked by mining activity. In my opinion, this trail and parkway are the most valuable recreational and wildlife resource that Fresno has to offer. This puts Fresno on the map as a destination place for living in California. I appreciate the mining reclamation that has been completed. I sincerely believe that the mining should come to a close.

Mining should not be further developed into hard rock mining.

Response 359-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 359-2

I do not support the increase in noise level, air pollution, adverse effects to wildlife species, and the reduced recreational experience.

Response 359-2

The issues of increased noise levels, air pollution, and adverse effects to wildlife species are discussed in Draft EIR Section 4.13, "Noise," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.4, "Biological Resources," as they are updated in this Final EIR. See Chapter 3, "Draft EIR Errata." See Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Comment 359-3

I also do not appreciate the increase in gravel trucks along Friant over the years. Those trucks present a safety concern. I drive the road at least once a week and see this safety hazard first hand.

Response 359-3

The project's potential effects related to truck trips and transportation safety are addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #30 regarding transportation safety.

Comment 359-4

I do not support rock mining in the San Joaquin River.

Response 359-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #360 March 8, 2025, Jeffrey Duncan

Comment 360-1

My wife and I are long-time residents of the city of Fresno, and have enjoyed raising our family here. We have recreated throughout that time in the Sierras, Millerton Lake, and the San Joaquin River area. We oppose the subject project for the following reasons:

Response 360-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 360-2 through 360-5 below that address specific issues raised in this comment letter.

Comment 360-2

(1) CEMEX does not *need* to expand this facility, because as you know there is more than enough capacity in multiple quarries to fulfill the area's need for many years. CEMEX *wants* to expand the plant to increase profits.

Response 360-2

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 360-3

(2) There are numerous environmental concerns including potential negative effects on the habitat of special-status wildlife species, soil management and groundwater contamination. Much of this requires self monitoring and self enforcement, which I understand has not been a priority of CEMEX. In light of this, why

would the County want to assume these risks, as it is almost guaranteed that the County would be made a party to environmental litigation.

Response 360-3

The project's potential impacts to special-status wildlife species and associated habitats are evaluated in Draft EIR Section 4.4, "Biological Resources." Project effects related to soils and groundwater quality are discussed in Draft EIR Section 4.7, "Geology and Soils," and Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #4a regarding CEMEX's regulatory history.

Comment 360-4

(3) By many measures, recent development projects in the area - including desirable higher density housing and related services - have been welcomed in expanding housing options for residents.

Response 360-4

The comment does not relate to the adequacy of the Draft EIR and is noted.

Comment 360-5

(4) The subject project will undoubtedly negatively impact the quality of life in the area through increased noise and increased industrial trucking congestion. Who will pay for road mitigation measures that would be necessary?

Response 360-5

The issues of noise and increased truck trips are addressed in Draft EIR Section 4.13, "Noise," and Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #29 regarding funding for road maintenance.

Comment 360-6

To close, I have no issue with the prudent operation of the plant as currently configured and operating. I scratch my head in wonder as to why the supervisors would vote for anything that binds the community for 100 years and allows explosives to blast open a 600 foot hole in the river area.

Response 360-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #361 March 8, 2025, James Durando

Comment 361-1

4.4.9 Use of Explosives

As previously discussed, mining the hard rock at the Quarry Site would require drilling and blasting.

This section is confusing and incomplete. It references the "Blasting Protocols CEMEX-Rockfield Quarry, Fresno, California, September 8, 2021" document. The Project Specific References under the Blasting heading do not show that document available for review. There is a document "Blasting Protocols, CEMEX-Rockfield Quarry, Fresno, California, Vibra-Tech Engineers, Inc., October 27, 2020" under that Blasting heading but that is a completely different report.

This seems confusing and difficult to unravel. How can anyone be expected to understand the information when the source listed in the DEIR and the Project Specific References do not correspond. Where is that document to review that is needed to understand the "unknown" blasting protocol. This is another of many mistakes in this DEIR that makes me question how sloppy and careless the authors involved in the preparation of this document have been.

The fact that those other copies are on file with the Fresno County Department of Public Works and Planning creates another barrier to accessing the information. A series of links could make those documents simple to access and read. It is not reasonable to make the information available only by either driving to the county offices or by requesting it to be mailed or emailed (although those options were not offered).

"CEMEX contracted with Vibra-Tech to prepare blasting protocols for the Quarry Site (Blasting Protocols, CEMEX-Rockfield Quarry, Fresno, California, September 8, 2021). This blasting protocol document outlines the monitoring, control and reporting requirements for ground vibrations and air overpressures emitted from blasting at the Quarry Site. Mining of the hard rock will begin in the center of the site to establish safe blast designs (Exhibit C, Sheet 6). In addition, it provides "Best Practices" for the control and mitigation of flyrock from rock blasting and

the mitigation of groundwater and surface water contamination from the use of explosive products as outlined below:"

- Blast Vibration Monitoring and Control Plan including:
- Instrument Requirements
- Instrument Setup Procedures including:
- Ground vibration measurements,
- Air pressure measurements, and
- Air overpressure measurements
- Receptor Locations and Frequency of Monitoring
- Application of Particle Velocity and Air Overpressure Control
- Inspection of San Joaquin River Embankment
- Corrective Action Plan
- Complaint Response Procedure
- Record Keeping
- Annual Reporting
- Annual Blasting Plan
- Flyrock Mitigation Plan
- Groundwater and Surface Water Contamination Mitigation Plan with Best Management Practices for Blasting including:
- General Requirements
- Loading Practices
- Explosive Selection
- Muck Pile Management

This information is in the (Blasting Protocols, CEMEX-Rockfield Quarry, Fresno, California, September 8, 2021) document. This document is not available in this DEIR or from the County

Response 361-1

The commenter is incorrect regarding the availability of the September 8, 2021, Blasting Protocols document. Draft EIR Appendix H-6, "Blasting Protocols," contains the *Blasting Protocols, CEMEX—Rockfield Quarry, Fresno, California*, dated September 8, 2021. The commenter may be confusing the document's original date of "October 27, 2020" which is also shown on the cover of the document, but is immediately followed on the cover of the document by "Updated September 8, 2021." The Draft EIR includes the referenced September 8, 2021, Blasting Protocols as an appendix and clearly references the appendix, where applicable, in the text of the Draft EIR (see Draft EIR pages 4.4-57, 4.9-1, and 4.10-92). The reader is further referred to the Revised Blasting Protocols provided as Final EIR Appendix H-9, "Revised Blasting Protocols," which were updated on April 29, 2026.

Comment 361-2

Table 4.3-2 in the Cemex Rockfield Quarry DEIR (Draft Environmental Impact Report) addresses the potential emissions of PM10 (particulate matter with a diameter of 10 micrometers or smaller) and PM2.5 (particulate matter with a diameter of 2.5 micrometers or smaller) from the quarry operations, specifically from activities such as blasting, excavation, material handling, and transportation.

From a scientific perspective, here are several problems or concerns related to PM10 and PM2.5 emissions, as highlighted in the DEIR:

1. Health Impacts on Local Population

- PM10 and PM2.5 are both inhalable particles that can deeply penetrate the respiratory system. While PM10 can lodge in the upper respiratory tract, PM2.5 is small enough to reach the lungs and even enter the bloodstream, leading to a wide range of health problems.
    - Respiratory issues: Long-term exposure to PM2.5 is linked to chronic respiratory conditions, including asthma, bronchitis, and chronic obstructive pulmonary disease (COPD).
    - Cardiovascular problems: Scientific studies have shown a direct link between PM2.5 exposure and an increased risk of cardiovascular diseases like heart attacks and strokes.

    - Premature mortality: Higher levels of fine particulate pollution can contribute to premature death from respiratory and cardiovascular diseases.

- Vulnerable populations such as children, the elderly, and individuals with pre-existing respiratory conditions would be most affected by these emissions.

2. Exceeding Ambient Air Quality Standards

- Exceeding the established air quality standards for PM10 and PM2.5 can be a serious issue, particularly if background concentrations are already high. According to Table 4.3-2, if the project contributes to increased PM concentrations above state or federal thresholds, the impact could be classified as significant.

- Scientists' perspective: According to the U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB), consistent exposure to PM levels above the standards (e.g., 50 µg/m³ for PM10 and 12 µg/m³ for PM2.5 annually) is not recommended for long-term public health. The risk of exceeding these standards, especially in an area already prone to air pollution, is a serious concern for public health.

3. Limited Mitigation Effectiveness

- Mitigation measures outlined in the DEIR for controlling dust emissions (such as water spraying, dust suppression systems, etc.) may not be entirely effective in reducing PM10 and PM2.5 to levels that are safe for human health. These measures often address only surface dust, which may not fully control the fine particulate matter that poses the greatest health risks.

- Scientific viewpoint: While dust suppression measures can reduce visible dust and PM10, they are less effective in controlling PM2.5, which can be more difficult to manage. Fine particulate matter can remain suspended in the air for much longer periods, potentially traveling further from the source of emission and affecting a broader area.

Response 361-2

The project's potential impacts on air quality are discussed in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR, (see Appendix D-4, "Revised Section 4.3, Air Quality"). The concentrations of particulate emissions presented in Draft EIR Table 4.3-

2, "Ambient Air Quality in the Project Area," for the Clovis station, which represents an urban area, are elevated. The air quality at the project sites is cleaner than the values in Table 4.3-2. Nevertheless, as the commenter suggests, adding to pollutant concentrations that already exceed an ambient air quality standard deserves special attention. The significant impact levels (SILs) presented in Draft EIR Table 4.3-7, "Significant Impact Level Threshold Values," are designed to be used in that instance (i.e., when the background already exceeds the air quality standard). Absent additional scientific information supporting the commenter's claim, the project would retain the standard practices identified in the Draft EIR. The Draft EIR quantified particulate matter impacts that were determined to be less than significant after mitigation. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than are currently being emitted. For this reason, the Draft EIR did not model PM_{10} and $PM_{2.5}$. Nevertheless, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including preparation of PM_{10} and $PM_{2.5}$ models for comparison to the SILs. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 361-3

4. Cumulative Air Quality Impacts

- The DEIR also discusses the cumulative impact of the quarry's activities in the context of existing air pollution levels in the region. Fresno County already experiences elevated levels of air pollution, including high levels of PM10 and PM2.5.

- Scientific concern: When emissions from multiple sources (such as industrial operations, vehicular traffic, and agricultural activities) accumulate, they can exacerbate air quality problems in the region. A comprehensive approach to mitigating these emissions across all sources is needed. Without this, cumulative impacts could lead to significant degradation of air quality, particularly in areas that already exceed ambient air quality standards.

Response 361-3

The cumulative nature of thresholds used in each air quality impact determined in the Draft EIR Section 4.3 as updated in this Final EIR, (see Appendix D-4, "Revised Section 4.3, Air Quality"), is discussed below.

- Impact 4.3-1 describes how the project would be consistent with applicable air quality plans. Addressing cumulative air quality conditions is the primary role of air quality plans. Therefore, consistency with air quality plans is a cumulative analysis (see Appendix D-4 Section 4.3.4, "Project Impacts and Mitigation Measures").
- Impact 4.3-2 is discussed in Section 7.14 of the GAMAQI (SJVAPCD 2015) which describes the thresholds as levels that would "Result in a Cumulatively Considerable Net Increase of any Criteria Pollutant" (Appendix D-4 Section 4.3.4).
- Impact 4.3-3 is discussed in Section 8.5.2 of the GAMAQI which describes how health risk assessment thresholds that were used to evaluate Impact 4.3-3 are meant to exclude background levels from their application. As such, these levels are the amounts that are cumulatively considerable (Appendix D-4 Section 4.3.4).
- Impact 4.3-4 involves odor. If it would be the case that other odorous sources around the project exist, then cumulative odor may need to be assessed but that is not the circumstance in this case (Appendix D-4 Section 4.3.4).

The Draft EIR quantified particulate matter impacts that were determined to be less than significant after mitigation. Further, Draft EIR Table 4.3-21 demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted under the CEQA baseline. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 361-4

5. Non-Attainment Area Issues

- Fresno County is designated as a non-attainment area for both PM10 and PM2.5 under both state and federal air quality standards, meaning that air quality in the region already does not meet the required levels.

- Scientifically: Even modest increases in PM concentrations due to the project could worsen the area's non-attainment status, making it harder for the region to meet air quality goals. This could result in additional regulatory requirements and restrictions on future development, as well as further public health risks.

From a scientific standpoint, elevated levels of PM10 and PM2.5 from the Cemex Rockfield Quarry project present serious health risks, particularly for those living in the nearby. To minimize these impacts, stronger and more effective mitigation strategies are needed, alongside regular monitoring and adaptive management practices to ensure air quality standards are consistently met.

Response 361-4

As the comment suggests, adding to pollutant concentrations that already exceed an ambient air quality standard deserves special attention. The significant impact levels (SILs) presented in Draft EIR Table 4.3-7, as updated in the Final EIR, are designed to be used in that instance (i.e., when the background already exceeds the air quality standard). See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata." Furthermore, not all particles are created equally toxic. Therefore, health risk assessment was performed for the Draft EIR and reported to result in less than significant health risk after mitigations. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including additional PM_{10} and $PM_{2.5}$ modeling for comparison to the SILs. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 361-5

Health Risks Associated with PM 10/ PM 2.5

From a medical viewpoint, PM10 (particulate matter with a diameter of 10 micrometers or smaller) and PM2.5(particulate matter with a diameter of 2.5 micrometers or smaller) are considered significant environmental health risks due to their ability to penetrate the respiratory system and affect various organs. Below are the health risks associated with these fine particles:

1. Respiratory Diseases

- Asthma: Long-term exposure to PM10 and PM2.5 has been linked to the development and worsening of asthma, particularly in children. These fine particles can trigger asthma attacks and exacerbate symptoms like wheezing, coughing, and shortness of breath.

- Chronic Obstructive Pulmonary Disease (COPD): Prolonged exposure to particulate matter is associated with a higher risk of developing COPD, a progressive lung disease that

includes chronic bronchitis and emphysema. PM2.5, is known to worsen airflow restriction and lung function over time.

- Bronchitis: Both short-term and long-term exposure to elevated levels of particulate matter can lead to chronic inflammation of the bronchial tubes (bronchitis), which causes persistent coughing and difficulty breathing.

2. Cardiovascular Diseases

- Heart Attacks: Studies have shown that long-term exposure to PM2.5 increases the risk of heart attacks (myocardial infarction) and other cardiovascular events. Fine particles contribute to systemic inflammation, which can damage blood vessels, increase blood clotting, and lead to arterial plaque buildup.

- Stroke: Chronic exposure to fine particulate pollution has been linked to an increased risk of stroke. The particles can affect the cardiovascular system, leading to high blood pressure and damage to blood vessels in the brain, increasing the risk of both ischemic and hemorrhagic strokes.

- Arrhythmia: Exposure to PM2.5 has been shown to contribute to heart arrhythmias (irregular heart rhythms), which can increase the risk of sudden cardiac events.

3. Neurological Effects

- Cognitive Decline: Recent research has shown a link between long-term exposure to PM2.5 and cognitive decline, particularly in older adults. Fine particulate matter can cause inflammation in the brain, which may lead to neurodegenerative diseases like Alzheimer's disease and other forms of dementia.

- Developmental Effects in Children: Children are particularly vulnerable to air pollution, as their respiratory and immune systems are still developing. Studies suggest that exposure to PM10 andPM2.5 can interfere with brain development, potentially leading to issues with memory, learning, and behavioral disorders.

- Mental Health Issues: Chronic exposure to air pollution has also been associated with mental health issues, such as anxiety and depression. The physiological stress caused by particulate matter may affect brain function and contribute to mood disorders.

4. Cancer Risks

- Lung Cancer: There is strong evidence linking long-term exposure to PM2.5 with an increased risk of lung cancer. The fine particles can carry carcinogenic chemicals deep into the lungs, leading to DNA damage and potentially the development of cancerous cells.

- Other Cancers: While the most direct link is to lung cancer, long-term exposure to particulate matter has also been associated with increased risks of other cancers, including bladder cancer and cancers of the upper respiratory tract.

5. Premature Mortality

- Increased Mortality Rates: Long-term exposure to PM10 and PM2.5 is a significant risk factor for premature death. Studies have shown that individuals living in areas with high levels of fine particulate pollution have an increased risk of dying from conditions like heart disease, respiratory illnesses, and cancer.

- Life Expectancy: According to various studies, communities exposed to higher levels of particulate matter have a shorter life expectancy compared to those living in areas with cleaner air.

6. Vulnerable Populations

- Children and Infants: Children are particularly vulnerable to the effects of PM10 and PM2.5, as their respiratory systems are still developing. Chronic exposure can result in impaired lung function, developmental delays, and increased susceptibility to respiratory diseases.

- Elderly: Older adults, particularly those with pre-existing heart or lung conditions, are at higher risk for adverse health effects from particulate matter. Aging bodies are less able to cope with inflammation caused by air pollutants, increasing the risk of heart attacks, strokes, and respiratory infections.

- People with Pre-existing Health Conditions: Individuals with chronic conditions such as asthma, COPD, cardiovascular disease, or diabetes are more likely to suffer from exacerbated symptoms or complications when exposed to high levels of PM10 and PM2.5.

7. Pregnancy and Birth Outcomes

- Premature Birth: Pregnant women exposed to high levels of PM2.5 are at increased risk of premature birth and low birth weight. Fine particles can cause inflammation that affects the placenta and fetal development.

- Developmental Issues: In utero exposure to air pollution is associated with developmental delays and health issues in newborns, including problems with lung development and cognitive function.

8. Immune System Disruption

- Immune System Suppression: Prolonged exposure to particulate matter can impair the body's immune response, making individuals more susceptible to infections, including respiratory infections like pneumonia and influenza. The particles can interfere with immune cell function, making it harder for the body to fight off pathogens.

Response 361-5

Whether an exposure is a significant risk depends on the dose and response. The potential health effects listed by the commenter appear to be true. However, the dose that individuals would receive from the project is less than significant as presented in Draft EIR Table 4.3-25, "Mitigated Project Health Risk Impacts," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality." The Draft EIR HRA quantified particulate matter impacts that were determined to be less than significant after mitigation. Further, Draft EIR Table 4.3-21 demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted under the CEQA baseline (Draft EIR, Section 4.3.4, as updated in the Final EIR). The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Comment 361-6

Conclusion

In summary, from a medical perspective, the health risks associated with exposure to PM10 and PM2.5 are extensive and include significant respiratory, cardiovascular, neurological, and cancer-related issues. Particularly vulnerable populations, such as

children, the elderly, pregnant women, and individuals with pre-existing health conditions, are at greater risk. The scientific consensus emphasizes the importance of reducing exposure to fine particulate matter to protect public health, particularly in areas with high pollution levels like those near industrial projects such as the Cemex Rockfield Quarry. As a resident adjacent to the Cemex Rockfield Quarry site I have concerns about the impacts of Blast Hardrock Mining.

Water Quality and Domestic Wells (Section 4.5)

- Concern: The quarry's operations, particularly excavation, blasting, and water usage, may impact local groundwater resources. This could affect domestic wells, particularly if contamination from manganese, nitrates, or other pollutants occurs, or if the water table is altered due to the project's activities.

- Key Impact: Degradation of water quality and reduced water supply are significant concerns, as they could affect your access to clean, safe water for drinking, irrigation, and other uses.

- Recommendation: Ensure the quarry implements effective mitigation measures for groundwater protection, including baseline water quality testing and monitoring of local wells.

Air Quality and Dust Emissions (Section 4.3)

- Concern: Blasting, drilling, and aggregate processing at the quarry could generate significant amounts of dust, particularly PM10 and PM2.5 particles. These fine particles can have detrimental effects on air quality, human health, and the surrounding environment.

- Key Impact: Exposure to high levels of particulate matter can exacerbate respiratory issues, particularly for children, the elderly, and those with pre-existing conditions like asthma. Long-term exposure can contribute to other health problems.

- Recommendation: Advocate for robust mitigation measures to control dust, such as regular water spraying, dust suppression technologies, and air quality monitoring around residential areas

Noise and Vibration from Blasting and Operations (Section 4.9)

- Concern: The quarry's blasting activities, as well as heavy equipment operations, may generate high levels of noise and ground vibrations. These could disrupt daily life, damage nearby structures, and cause stress or health issues due to persistent noise.

- Key Impact: Noise from the quarry could interfere with sleep, work, and leisure activities. Blasting vibrations could potentially damage nearby homes and infrastructure.

- Recommendation: Push for the implementation of noise and vibration limits and ongoing monitoring to minimize disturbances. It would be beneficial to include a system of alerts for residents before blasting events.

In Summary-

Protection of water resources and domestic wells

Ensuring air quality standards to protect health

Minimizing the impact of noise and vibration from quarry activities

Response 361-6

The proposed project would not result in significant impacts to water resources and domestic wells, air quality, or noise and vibration that cannot be mitigated. The commenter's concern is noted for the consideration of the County decision-makers. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA.

Regarding air quality and, specifically, the project's potential to emit particulate matter, Table 4.3-21 and Table 4.3-22, "Mitigated Net Change in Daily Emissions," demonstrate that after mitigation, the project would result in less PM_{10} and $PM_{2.5}$ than is currently being emitted. See Draft EIR Section 4.3.4, (see Appendix D-4, "Revised Section 4.3, Air Quality"), as updated in the Final EIR. Furthermore, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment,* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Further, compliance with Fresno County General Plan noise measures and Mitigation Measure 4.13-2, 4.13-3, and 4.10-1, are required. The Draft EIR found that these mitigation measures would reduce potential noise impacts to a less than significant level.

Further, as discussed in Draft EIR Section 4.10, "Hydrology and Water Quality," Mitigation Measure 4.10-10a provides for monitoring of the MW-3 well cluster to assess groundwater level conditions that might affect wells to the east and northeast of the Quarry Site, and of the MW-1 well cluster to assess groundwater level conditions that might affect the San Joaquin River and wells to the west of the Quarry Site. Each well cluster includes a separate well within the alluvium, the weathered rock, and the hard rock. These wells would continue to be monitored throughout the project duration and after reclamation. Therefore, impacts to water resources and domestic wells would be less than significant with the inclusion of mitigation measures. For these reasons, the Draft EIR analysis was sufficient, and no further response is required.

Letter #362 March 8, 2025, Lonney Edwards

Comment 362-1

I am writing to express my deep concerns regarding the proposed 100-year mining permit for CEMEX by the San Joaquin River in Fresno County in the State of California.

I believe this will have detrimental effects on our local environment. The area in question is vital not only for its natural beauty but also plays a crucial role in maintaining the health of our ecosystem. The mining activities proposed threaten to destroy the landscaping and disturb the delicate balance of our local habitats.

Response 362-1

The project's potential impacts to the visual landscape of the project area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." Potential effects to fish and wildlife species and associated habitats are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 362-2

Furthermore, the potential for pollution is alarming. If any dust or toxic materials from the mining operations enter the nearby river, we risk contaminating our water supply. The impact on the San Joaquin River and its tributaries could be catastrophic, affecting not only wildlife but also the health and safety of our community.

Response 362-2

The use of hazardous substances on the project sites is evaluated in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The project's potential to degrade surface water quality is evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #17 regarding river bank stability and the potential for breach and flooding of the Quarry Site.

Comment 362-3

Given these significant environmental risks, I urge you to consider the long-term consequences of this decision. The effects of such mining activities could last far beyond the duration of the permit, impacting generations to come.

Therefore, I strongly advocate for a NO vote on this proposed mining permit.

Thank you for considering the voices of community members deeply invested in protecting our environment.

Response 362-3

The commenters' opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #363 March 8, 2025, Ingrid Fellows

Comment 363-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1) Noise from Blasting which will significantly impact residents daily lives and their property values

- Impacts to area residents have the potential to be significant

- The DEIR doesn't explain what residents would experience with blasting once or twice a day (which would be within the proposed threshold)

- The analysis lists three potential impacts related to damage to surrounding residential/commercial structures and damage to nearby groundwater wells, disturbance of nearby residents, or destabilization of the San Joaquin River embankment. The DEIR analyses damage to structures and wells and destabilization of the river embankment but barely mentions disturbance to residents.

Response 363-1

Please refer to Response 58C-3 and Appendix H-8, "Blasting and Human Response Technical Memorandum," for discussion of the blasting thresholds applicable to humans. As discussed in Chapter 3, "Draft EIR Errata," the blasting threshold applicable to residents at occupied residences would be 0.60 inches/second peak particle velocity (PPV). Adherence to a threshold of 0.60 inches/second PPV would be sufficient to minimize potential disturbances to nearby humans at occupied residential structures adjacent to the Quarry Site.

Comment 363-2

- It appears that they did not evaluate the impacts of blasting to users of the adjacent park"

Response 363-2

See Collective Response #27 pertaining to the potential effects of blasting and mining activities on users of nearby parks and trails. A Blast Impact Analysis was prepared by Vibra-Tech Engineers to evaluate potential vibration impacts from proposed blasting activities (see Section 4.13, "Noise," of the Draft EIR). The analysis includes the closest structure to the Lost Lake Park. Therefore, impacts of blasting to the adjacent park was considered. Additionally, the project would be required maintain certain thresholds which would not significantly impact people (Draft EIR page 4.13-65). For these reasons, the Draft EIR's analysis was sufficient.

Comment 363-3

"- The mitigation measures for noise impacts should be more specifically be required rather than a laundry list for the applicant to choose from.

- The DEIR should have analyzed how much noise reduction each measure would result in and required particular combinations of measures to ensure noise is adequately reduced.

Response 363-3

In addition to the response below, see Responses 58C-13 and 58-65.

The noise control measures required for consideration under Mitigation Measures 4.13-2 and 4.13-3 have been proven to be effective in reducing noise generated by the aggregate industry. The measures that would be most effective in reducing noise generated by the project cannot be precisely determined until the design and specific equipment types to be utilized have been finalized. For this reason, Mitigation Measures 4.13-2(7) and 4.13-3(12), specifically require noise monitoring to be conducted to demonstrate that the implemented measures have resulted in compliance with the applicable noise standards. As such, the Operator would be required to implement the measures determined to be required to achieve such satisfaction with those standards. Otherwise, Comment 363-3 does not provide any substantial evidence that these mitigation measures fail to adequately reduce noise impacts to a less than significance.

Comment 363-4

- Because the project would increase nighttime noise for area residents, the DEIR should prohibit nighttime operations that increase noise. See pg. 4.13-60."

Response 363-4

See Responses 58C-15 and 112-18.

Comment 363-5

2) VOC and SO2 fumes due to new asphalt plant are hazardous to the local residents

Impact 4.3-4: Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people

"- The DEIR says that project emissions may exceed cancer risk thresholds. DEIR pg. 4.3-63. The DEIR says that because mitigation measures would reduce emissions, the DEIR did not evaluate population-wide cancer burden.

DEIR at pg. 4.3-64. CEQA requires that the analysis be performed before taking into account implementation of mitigation measures."

Response 363-5

The Draft EIR determined that local residents would be exposed to VOC, SO_2, and other pollutants at levels that would be considered less than significant. After mitigation, the cancer risk at the MEIR decreases from the existing CEQA baseline condition (see Draft

EIR, Table 4.3-24, "Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," as updated in this Final EIR). See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata." Thus, the cancer burden, a measure summing effects from each census block, would also show a reduction from the baseline values. Therefore, cancer burden was not calculated in the Draft EIR. Nevertheless, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3). The analysis includes cancer burden modeling and demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 363-6

I have grave concerns about blasting to a depth of 600 ft near several residential communities, not to mention our beloved San Joaquin River. The wildlife impact, the aesthetic impact, the noise, the noxious and carcinogenic fumes generated from the new asphalt plant- these are all items that are going to reduce the local residents quality of life as well as their property values. I strongly urge you not to allow the blasting portion of this project and the implementation of the asphalt plant. We do not wish to pay high property taxes to live in a carcinogenic garbage dump. On a personal level, I truly love the river and hope that we can maintain the few beautiful and wild areas we have in our valley.

Thank you for your time and attention to this matter.

Response 363-6

Please see Responses 363-1 through 363-5 above for discussion of the individual issues raised in the comment letter. The commenter's preferences and concerns are noted and will be considered by County decision-makers.

Letter #364 March 8, 2025, Andrea Gerton

Comment 364-1

Please reconsider this CEMEX Rockfield Expansion Plan. I work from home, and hearing explosives and drilling to excavate up to 600 feet below the surface would be extremely disturbing for me.

Response 364-1

As described in Draft EIR Chapter 2, "Project Description," on page 2-42, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and 2

p.m." Noise and groundborne vibration associated with proposed blasting events are evaluated in Draft EIR Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.13.

Comment 364-2

This change could also lead to further strain on our already limited local resources.

Response 364-2

The commenter does not identify what local resources would be strained by the proposed project. The project's potential impacts to public services and utilities are addressed in Draft EIR Section 4.15, "Public Services," and Section 4.19, "Utilities and Service Systems." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections.

Letter #365 March 8, 2025, Paul Gordon

Comment 365-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 365-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Responses 365-2 through 365-11 below for discussion of specific issues raised in this comment. The Draft EIR analyzes the project's potential impacts to water quality, air quality, recreation, wildlife, and hazards in Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. See Chapter 3, "Draft EIR Errata."

Comment 365-2

Impacts on Water Quality

the San Joaquin River

- The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and

contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

- The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 365-2

See Response 349-2.

Comment 365-3

What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?

Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 365-3

See Collective Response #17. See also Response 329-3.

Comment 365-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 365-4

See Collective Response #25 regarding groundwater/surface water interaction, and Collective Response #26 regarding the baseline conditions for analyzing the project's potential groundwater impacts. See also Response 329-4, which fully addresses this comment.

Comment 365-5

Impacts on the San Joaquin River Parkway

Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed. â€¢ The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master

Planâ€™s [sic] requirement for a 300-foot buffer between mining operations and public access

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 365-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 365-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 365-6

Please see Collective Response #19 pertaining to public accessibility to area parks, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 365-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- Scenic Degradation: The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 365-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 365-8

- Traffic Congestion: Significant traffic impacts are expected, yet there is no Traffic Congestion: Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR. The docu [sic]

Response 365-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 365-9

- Air Quality: The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 365-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 365-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainsons hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 365-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (Draft EIR, page 4.4-27). In any event, blasting activities would be brief, with each blast lasting approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as amplified by the Final EIR, therefore fully and adequately evaluates the impacts on each of these species. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.4.

Regarding the use of Alaskan Blasting Standards for analyzing the Project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Draft EIR Section 4.4, "Biological Resources," does not need rewriting or recirculation.

Comment 365-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 365-11

With implementation of the mitigation measures required in this EIR, the proposed project would not result in significant impacts to water quality or resources, wildlife,

public safety, or air quality. The commenter's concerns and request for additional analysis and recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required.

Letter #366 March 8, 2025, Ann Guevara

Comment 366-1

I'm certain your job isn't easy, though grateful to reach out to you about the CEMEX expansion project.

Is this project necessary or beneficial to the long term resiliency of the Fresno area? Sure money is great, and some say makes the world go round. But does it really (if we put short term greed aside)?

Not only do we probably not need this expansion project (if were being honest with ourselves), but it will do nothing to help our County thrive (economically, socially, environmentally...). I think of Butan and all their new economic growth projects, that also maintain a focus on the community and environment. While Butan is a nation smaller than the population of Fresno, they maintain the clean water source for 1/5 of the world's population. (A pretty impressive fact, that illustrates even small can be mighty.) Fresno is an incredible place. When I first moved here 20 years ago, I was told it was the armpit of California. I've found that is not true, though a project like the CEMEX Rockfield Expansion Project would certainly support that belief.

Response 366-1

No specific comments related to the adequacy of the Draft EIR were made; however, the commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 366-2

Please consider the impacts of this project and any more sustainable alternatives.

Response 366-2

The potential environmental impacts of the proposed project are considered throughout the EIR. Draft EIR Chapter 6, "Alternatives," describes and evaluates a reasonable range of alternatives to the proposed project.

Letter #367 March 8, 2025, Shannon Holmes

Comment 367-1

This is a bad idea for the citizens who live nearby the site, as I do, but mostly the environmental impacts this will create is unacceptable !!

NO TO DRILLING, DIGGING AND MINING OF THE SAN JOAQUIN RIVERBED !!

Response 367-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #368 March 8, 2025, Tom Holyoke

Comment 368-1

I am writing to express my concerns regarding the Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. I really fear that this project will threaten the San Joaquin River, local water quality, air quality, public recreation, wildlife, and even public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 368-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Responses 349-2 through 349-11 below for discussion of the specific issues raised in this comment. The Draft EIR analyzes the project's potential impacts to water quality, air quality, recreation, wildlife, and hazards in Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources, and Section 4.9, "Hazards and Hazardous Materials," respectively. See Chapter 3, "Draft EIR Errata."

Comment 368-2

Impacts on Water Quality and the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows yet fails to provide any solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events. Specifically,

Response 368-2

See Response 349-2.

Comment 368-3

- What is CEMEX's plan if major flooding breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 368-3

See Collective Response #17. See also Response 329-3.

Comment 368-4

Impacts on the San Joaquin River Parkway

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or any kind of timeline. At the very least the DEIR should identify the timeframe and exact location of the trail to be constructed. It should also describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access.

Response 368-4

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 368-5

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts. For instance,

- The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 368-5

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 368-6

- Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 368-6

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 368-7

- The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 368-7

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 368-8

Threats to Wildlife

The DEIR also appears to not adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, it uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Alaska standards? Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River? This section should be completely rewritten and recirculated for public comment.

Response 368-8

The impacts from construction and mining, including blasting, on nesting and migration patterns are adequately analyzed in the Draft EIR. See Response 65-12 for further discussion of the project's potential impacts on wildlife related to blasting and continued mining operations. With the implementation of Mitigation Measure 4.4-1c, which

requires a qualified biologist to conduct pre-construction surveys for nesting birds (including tricolored blackbirds, burrowing owl, and Swainson's hawk) located on the project sites prior to initiation of a mining phase, potential impacts to nesting birds would be less than significant (Draft EIR at page 4.4-49).

See Response 65-16 for further discussion of impacts to migratory birds and 65-17 for further discussion of the project's potential impacts to migratory corridors or linkages.

See Response 65-13 and 124-9 regarding the sufficiency of Alaskan Blasting Standards for determining the project's potential impacts to salmon.

It should be noted that blasting events would be brief, with each blast lasting approximately one to two seconds, and would not result in significant adverse impacts to wildlife. The project sites are already disturbed by decades of ongoing mining activities and would not have a significant increase in activity.

Comment 368-9

Overall, given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Response 368-9

With the implementation of mitigation measures, the proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required.

Letter #369 March 8, 2025, Valerie Johnson

Comment 369-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have specific concern that I urge you to address prior to moving forward with approval.

Air Quality and Dust Emissions: "The DEIR says that project emissions may exceed cancer risk thresholds. DEIR pg. 4.3-63. The DEIR says that because mitigation measures would reduce emissions, the DEIR did not evaluate population-wide cancer burden. DEIR at pg. 4.3-64. CEQA requires that the analysis be performed before taking into account implementation of mitigation measures." This is particularly concerning to me.

Response 369-1

Please see Collective Response #11 pertaining to community cancer risk. Draft EIR Section 4.3, "Air Quality," as updated by the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), evaluates potential air quality impacts of the project, including fugitive dust, toxic air contaminants, and associated health risks (Impact 4.3-3). The air quality technical analysis was updated to clarify and expand upon the information presented in the Draft EIR, as described in the A*ir Quality, Health Risk, and Climate Change Impact Assessment* (see Appendix D-3). This updated analysis includes cancer burden modeling and confirms that there are no new impacts and no changes to the conclusions presented in the Draft EIR. See Chapter 3, "Draft EIR Errata" and Appendix D-4.

The analysis quantifies estimated unmitigated health risk impacts (Appendix D-4, Table 4.3-24, "Unmitigated Project Health Risk Impacts") and mitigated health risk impacts (Appendix D-4, Table 4.3-25, "Mitigated Project Health Risk Impacts"). Appendix D-4 confirms that the project's potential impact regarding increased cancer risk to sensitive receptors was determined to be less than significant.

As shown in Tables 4.3-24 and 4.3-25, implementation of mitigation results in a reduction in cancer risk at the maximally exposed individual receptor compared to the CEQA baseline condition. Because the project would result in a reduction in cancer risk, a corresponding reduction in cancer burden would also be expected.

Comment 369-2

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 369-2

The Draft EIR adequately analyzes the project's potential environmental impacts and identifies mitigation measures, where necessary, to reduce impacts to less than significant levels. The commenter requests additional analysis, enhanced mitigation measures, and less harmful alternatives, but does not provide evidence that the existing analysis is deficient or that additional measures are warranted. The commenter also does not identify or describe specific feasible mitigation measures or alternatives that should be considered. The commenter's concerns are noted and will be considered by County decision-makers.

Under CEQA, project alternatives and mitigation measures are required where potentially significant impacts are identified. Because the Draft EIR concludes that impacts would be mitigated to less than significant levels, no additional alternatives analysis or mitigation measures are required.

Letter #370 March 8, 2025, Chris Julian

Comment 370-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project.

Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Response 370-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 370-2 through 370-10 that address specific issues raised in this comment letter.

Comment 370-2

1. Impacts on the San Joaquin River Watershed. My wife and I have lived directly across from the Cemex plant for the past 25 years in River View Ranch. Our water source is a community well run by Fresno County. We worry about the effect on our water quality and water supply with a 600 foot deep pit being dug between us and the most beautiful natural feature in the San Joaquin Valley, the river. No one can tell us the impact of this with any certainty; expert opinion may be given, but will be an extrapolation of theory and experience limited in accuracy by the complexity of the local environment. In other words, no one can guarantee me that the big pit want hurt our water.

Response 370-2

The project's potential impacts to groundwater supplies and quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." Potential effects on the visual landscape are discussed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections.

Comment 370-3

2. Air Quality and Dust Emissions. Living across from Cemex, we have seen the dust and air quality issues for years. Expanding the scope and nature of the mining will certainly increase these emissions. I am doubtful of meaningful mitigation can be achieved. How will Cemex accomplish this?

Response 370-3

Draft EIR Section 4.3, "Air Quality," as updated by this Final EIR, (see Appendix D-4, "Revised Section 4.3, Air Quality"), evaluates potential air quality impacts of the project. The technical analysis for air quality impacts was updated to clarify and expand upon the information presented in the Draft EIR, as described in the *Revised Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3), which includes additional analysis, modeling, and a draft Fugitive Dust Control Plan. See also Collective Response #9 for further discussion of the project's potential air quality impacts.

Mitigation Measure 4.3-2b as revised in this Final EIR, includes a draft Fugitive Dust Control Plan, subject to the approval of the SJVAPCD, that would effectively address the project's equipment emissions and dust generation. This updated analysis demonstrates no new impacts and no changes to the conclusions presented in the Draft EIR. Mitigation Measure 4.3-4, as updated in the Final EIR, requires the incorporation of specific design features to address air emissions associated with the proposed asphalt plant. See Appendix D-4, "Revised Section 4.3, Air Quality."

Comment 370-4

3. Biological Resource Impacts. I have great concerns for the environment related to the increased mining. We have a wonderful mix of animals that live in and around are yard including currently an owl. In my yard over the past 25 years, I have seen the tiger salamander, a bobcat, coyotes, an osprey, voles, rabbits, field mice, squirrels, snakes, and, not to mention, many redtail hawks. The main corridor of wildlife in our area is the river. I remember the extreme environmental evaluation related to the widening of Friant

Road carried out worrying about many issues but especially the vernal pools and the tiger salamander. Widening the road by ten feet each lane is a minor change to the environment compared to the future destruction of the ecosystem along the side of the river by the expansion of the Cemex mining digging a pit the size of a skyscraper. One wonders if the project could be achieved at a less environmentally sensitive site away from the river-has this been explored or addressed? What about the impact on the tiger salamander and the surrounding vernal pools?

Response 370-4

The project's potential impacts to fish and wildlife species and associated habitats are evaluated in Draft EIR Section 4.4, "Biological Resources." As described there, California tiger salamander is presumed to be absent from the project sites. However, because this species is commonly of concern at sites in the Central Valley it is described in detail on Draft EIR page 4.4-23 and evaluated in Table 4.4-1, "Special-Status Wildlife Species," and on page 4.4-29 through 4.4-31. In addition, no vernal pools occur within the boundaries of either the Plant Site or the Quarry Site as they have both been subjected to ground disturbance for many years (Draft EIR page 4.4-33 and 4.4-34). Additionally, alternative project locations are discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations." See also Final EIR Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections referenced in this response.

Comment 370-5

4. Traffic and Noise Concerns. The trucks are noisy and often pull out with a long trailer behind them that require the surrounding traffic to slow down to avoid them. I always worry about the safety of drivers on Friant Road.

Response 370-5

The issue of traffic noise is addressed in Draft EIR Section 4.13, "Noise." See Impact 4.13-1 beginning on Draft EIR page 4.13-49. The issue of traffic safety is addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections. See also Collective Response #30 regarding transportation safety.

Comment 370-6

I understand that blasting may be used in the future with obvious creation of noise and air quality problems.

How can this be achieved without the loud noise and mess? Again, is there a location not as environmentally sensitive as next to the river?

Response 370-6

Please see Collective Response #9 for further discussion of air quality emissions associated with blasting. The potential effects of proposed blasting (e.g., dust and noise/vibration) are addressed in Draft EIR Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, as updated in this Final EIR. Alternative project locations are discussed in Draft EIR Section 6.4.2.1, "Alternative Site Locations." See Chapter 3, "Draft EIR Errata."

Comment 370-7

5. Cumulative Environmental Effects. I am sure there are other issues not already brought up by me that may affect the environment in the long run like leaching of chemicals or release of toxins that will increase over time.

Response 370-7

Issues related to hazardous substances are evaluated in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The project's potential cumulative effects are described in Draft EIR Chapter 5, "Cumulative Impacts." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.9.

Comment 370-8

What about the fish in the river? The birds of prey that hunt these fields? etc.

Response 370-8

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.4.

Comment 370-9

No human, expert or not, can known the long term damage of the project to me, my wife, our yard and the animals that live in it, the wildlife in and around the river, the air quality and the water quality for decades (10 of them) to come.

Response 370-9

See Collective Response #5 regarding the duration of the proposed use permit. The issues of air and water quality are discussed in Draft EIR Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10. The project's potential impacts to wildlife species are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections.

In accordance with CEQA, the Draft EIR analyzes all reasonably foreseeable environmental impacts based on the best available scientific data, accepted methodologies, and existing regulatory standards at the time of environmental review. Where appropriate, the mitigation measures provided in the EIR require long term monitoring and adaptive management and provide funding sources to ensure implementation. In addition, the project would be subject to ongoing regulatory oversight, permitting requirements, and annual inspection, which provide mechanisms to address changing conditions or new information that may arise during operations.

Comment 370-10

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 370-10

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project.

Letter #371 March 8, 2025, Kent Karsevar

Comment 371-1

Dear David, I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Response 371-1

This is an introductory comment that does not address the adequacy of the Draft EIR. No further response is warranted. See responses below that address specific issues raised in this comment letter.

Comment 371-2

1. Impacts on the San Joaquin River Watershed are significant and damaging.

Response 371-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.10. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 371-3

2. Air Quality and Dust Emissions will be horrific for the area.

Response 371-3

Draft EIR Section 4.3, "Air Quality," as updated by the Final EIR, evaluates potential air quality impacts of the project. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3. See also Collective Response #9 regarding the project's potential effects on existing air quality conditions.

Comment 371-4

3. Biological Resource Impacts will be significant and damaging.

Response 371-4

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.4. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 371-5

4. Traffic and Noise Concerns will be significant.

Response 371-5

The project's potential effects related to traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise." See Chapter 3, "Draft EIR

Errata," of this Final EIR for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 371-6

5. Cumulative Environmental Effects will be significant and damaging.

Response 371-6

The project's cumulative effects are discussed in Draft EIR Chapter 5, "Cumulative Impacts."

Comment 371-7

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 371-7

See Collective Response #1 regarding the need for additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project.

Letter #372 March 8, 2025, David Kawano

Comment 372-1

I support CeMex enlarging their operation here in Fresno. The industry knows how to take care of the environment as well as setting explosives in their mining operation. The Fresno management actively takes part in taking care of their land and helping the community in times unexpected issues for the county arise. They provide employment and keep the cost lower for industry. Please support their operation.

Response 372-1

The commenter's support to the proposed project is noted for the consideration of the decision-makers.

Letter #373 March 8, 2025, Deborah Ledford

Comment 373-1

Thank you for the opportunity to comment on the Draft Environmental Impact Report. I strongly object to the proposed project because of the significant environmental damage and community impact which would result.

The San Joaquin River is our local waterway and it is important both for public recreation and as a habitat for wildlife.

Response 373-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to recreational resources and fish and wildlife species are evaluated in Draft EIR Section 4.16, "Recreation," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections.

Comment 373-2

Extending the mining for another hundred years and changing the depth of the mining as well as blasting hard rock will alter the environment significantly. Water and air quality will deteriorate. The San Joaquin Valley already struggles with these issues and this project will greatly worsen the situation.

Response 373-2

The potential effects of proposed blasting (e.g., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as revised in this Final EIR. The potential impacts on water quality are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these sections of the Draft EIR. See also Collective Response #9 regarding the project's potential effects on the existing air quality conditions of the region.

Comment 373-3

I live near Friant Road and the huge increase in truck traffic will create more noise, pollution and traffic hazards.

Response 373-3

The issue of truck traffic is addressed in Draft EIR Section 4.17, "Transportation." See also Collective Response #29 regarding traffic impacts and mitigation and Collective Response #30 regarding transportation safety. Noise impacts are discussed in Draft EIR Section 4.13, "Noise." Pollution is a broad topic that is addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), Section 4.9, "Hazards and Hazardous Materials," Section 4.10, "Hydrology and Water Quality," Section 4.13, and Section 4.20, "Wildfire." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 373-4

CEMEX borders on the San Joaquin River Conservancy and other public lands. The proposed mining will harm these environmental preserves.

Response 373-4

See Collective Response #20 regarding the claim that the operation encroaches on an ecological preserve. See also Collective Response #18 regarding the proposed project's consistency with the San Joaquin River Parkway Master Plan.

Comment 373-5

At a time in the history of the earth when we face unprecedented global warming, we must do everything we can to protect the climate, resources and environment .

Response 373-5

The project's potential to contribute to climate change is evaluated in Draft EIR Section 4.8, "Greenhouse Gas Emissions." See Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," for proposed revisions to Draft EIR Section 4.8.

Comment 373-6

Given these concerns, I ask the agency to require CEMEX to find less harmful alternatives.

Response 373-6

Draft EIR Chapter 6, "Alternatives," describes and evaluates a reasonable range of alternatives to the proposed project. Each of the alternatives evaluated would lessen one or more of the environmental impacts identified for the proposed project.

Comment 373-7

In the Fresno area we already have more than enough rock available for construction.

Response 373-7

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 373-8

It is essential that we protect the health of the San Joaquin River watershed and the local environment.

Thank you for your time and support!

Response 373-8

The comment does not address the adequacy of the Draft EIR. See Responses 373-2 through 373-7 for responses to the substantive comments contained in this letter.

Letter #374 March 8, 2025, Annabelle Lowndes

Comment 374-1

I am writing to express my strong opposition to the proposed extension of the CEMEX DIER mining operations in Fresno, CA. This extension poses significant risks to public health, the local environment, and the overall well-being of our community. I urge you to deny this extension and prioritize the safety and quality of life for Fresno County residents.

Response 374-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 374-2 through 372-4 that address specific issues raised in this comment letter.

Comment 374-2

The continuation of CEMEX's operations would exacerbate air and water pollution, contributing to Fresno County's already poor air quality. The release of particulate matter and other pollutants from mining activities is linked to respiratory illnesses, cardiovascular disease, and other serious health conditions. Extending this project will disproportionately affect vulnerable populations, including children, the elderly, and low-income communities who already experience environmental burdens. I am a

mother with an infant. Living in the Central Valley is already burdensome on our lungs and health, this plan would greatly exacerbate that.

Response 374-2

Draft EIR Section 4.3, "Air Quality," as updated by the Final EIR, evaluates potential air quality impacts of the project. See Appendix D-4, "Revised Section 4.3, Air Quality." Potential health effects associated with air pollution are described in Draft EIR Section 4.3.1.2, "Pollutants and Health Effects." The project's potential impacts related to water quality are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Draft Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #9 regarding the project's potential air quality impacts in the region.

Comment 374-3

The proposed extension threatens local ecosystems and wildlife. Mining operations consume substantial water resources, further straining our region's limited water supply during a time of ongoing drought and climate change. Additionally, the destruction of natural habitats disrupts local biodiversity and undermines efforts to protect our environment for future generations.

Response 374-3

The project's potential impacts to local habitats and ecosystems, biodiversity, and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources."

Potential impacts to water resources are evaluated in Draft EIR Section 4.10 and Section 4.19, "Utilities and Service Systems." Table 4.19-1, "Existing and Proposed Water Use Summary (Acre-Feet per Year)," on Draft EIR page 4.19-9 provides a water use summary for the project including existing and proposed water demands. Table 4.19-2, "Availability of Water vs Project Use (Acre-Feet Per Year)," on Draft EIR page 4.19-10 provides a comparison of the project's proposed water demands and supplies. The issue of climate change is addressed in Draft EIR Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions").

See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 374-4

Noise pollution, increased traffic from heavy trucks, and the degradation of open spaces reduce the quality of life for nearby

residents. The long-term social and economic costs of this extension outweigh any short-term financial gains. Our community deserves sustainable development that prioritizes environmental justice and public health. I live nearby this quarry and often utilize the outdoor public spaces with my family. I, like many other residents of North Fresno, believe I deserve a life of peace and good health.

Response 374-4

The issues of noise pollution and increased traffic are addressed in Draft EIR Section 4.13, "Noise," and Section 4.17, "Transportation." The project's potential effects on surrounding open spaces and recreational uses are evaluated in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections. See also Collective Response #7, regarding evaluation of the project's potential economic effects, and Collective Response #27, regarding the project's potential operational effects on users of nearby parks and trails.

Comment 374-5

I respectfully urge the Fresno County Board of Supervisors to reject the CEMEX DIER extension. Instead, I encourage you to pursue policies that protect our natural resources, promote public health, and invest in sustainable economic alternatives that benefit all residents. Our collective future depends on decisions that value people over profit and prioritize long-term community well-being.

Thank you for your time and consideration. I trust that you will act in the best interest of

Fresno County residents and the environment by opposing this harmful extension.

Response 374-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #375 March 8, 2025, Kyle Lyman

Comment 375-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and

public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 375-1

The commenter's concerns are noted and will be considered by County decision-makers. Please see Responses 375-2 through 375-11 for discussion of the specific concerns raised in this comment. The Draft EIR analyzes the project's potential impacts to water quality, air quality, recreation, wildlife, and hazards in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources, and Section 4.9, "Hazards and Hazardous Materials," respectively.

Comment 375-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 375-2

See Response 349-2.

Comment 375-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 375-3

See Collective Response #17. See also Response 329-3.

Comment 375-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 375-4

See Collective Response #25 regarding groundwater/surface water interaction, and Collective Response #26 regarding the baseline conditions for analyzing the project's potential groundwater impacts. See also Response 329-4, which fully addresses this comment.

Comment 375-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 375-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 375-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 375-6

Please see Collective Response #19 pertaining to public accessibility to area parks, and see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 375-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 375-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 375-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR. The docu [sic]

Response 375-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 375-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 375-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 375-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 375-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (see Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With the implementation of Mitigation Measures 4.4-1c and 4.4-1a, as revised in the Final EIR, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR, page 4.4-49 through 4.4-50). The Western red bat was not observed on site during the habitat assessment, and only moderate potential exists for suitable foraging and roosting habitat (Draft EIR, page 4.4-27). In any event, blasting events would be brief, each lasting approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR therefore fully and adequately evaluated the impact on each of these species.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need rewriting or recirculation.

Comment 375-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Living near the San Joaquin River most of my life, it would be devastating to our future generations to not receive the same benefits of having this vital resource. I hope the county takes all this into consideration and chooses our people over profits. We need our river to keep Fresno strong.

Response 375-11

With the implementation of mitigation measures, the proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As further discussed in Chapter 3, "Draft EIR Errata," of this Final EIR the County has determined that recirculation of the Draft EIR is not required.

Letter #376 March 8, 2025, Marie Meade

Comment 376-1

Kindly stop ruining the environment by allowing blasting rights to bleed gravel at the cost of beauty, birds, trees snd plants, much less the river in their natural home. Let the earth breathe so we can breathe as well.

Response 376-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as updated by the Final EIR. The proposed

project's potential effects on the visual landscape and plant and wildlife species are addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #377 March 8, 2025, Norell Naoe

Comment 377-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Response 377-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 377-2 through 377-8 that address specific issues raised in this comment letter.

Comment 377-2

1. Impacts on the San Joaquin River Watershed: The San Joaquin River is an important natural resource beloved by Fresno County residents. Generations of Fresnans have spent many a hot summer along the banks of the river during River Camp, learning about the ecology of our environment and learning to appreciate the beauty of Fresno! The CEMEX Rockfield Expansion Project may damage the river preventing future generations from the opportunity to enjoy all that the San Joaquin River has to offer.

Response 377-2

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.10. See Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. See also responses to Letter 128 regarding potential effects on River Camp programming.

Comment 377-3

2. Air Quality and Dust Emissions: As a resident of the Woodward Lake Community, excessive dust is already an issue from the farming fields across the river in Madera. Explosive mining would create additional airborne particulate matter and add to Fresno's already poor air quality.

Response 377-3

The issue of dust and potential air quality effects are addressed in Draft EIR Section 4.3, "Air Quality," as updated by this Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding air emissions from proposed blasting activities and the project's potential air quality impacts.

Comment 377-4

3. Biological Resource Impacts: Lost Lake is also another recreational area that would be greatly impacted by the CEMEX expansion. I can't imagine picnicking or camping at Lost Lake with heavy explosives detonating nearby!

Response 377-4

As described in Draft EIR Chapter 2, "Project Description," on page 2-42, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as updated by the Final EIR, see Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails.

Comment 377-5

4. Traffic and Noise Concerns: Friant Road is busy and dangerous with many heavy construction and cement trucks. Additional heavy trucks along Friant are the last thing this community needs.

Response 377-5

The project's potential effects on transportation and the local roadway system are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.17. See also Collective Response #29 regarding traffic congestion and Collective Response #30 regarding transportation safety.

Comment 377-6

As a resident, I'm extremely concerned about the potential noise from the explosives being proposed at the CEMEX site. It would be extremely unnerving to hear continual blasting, it would feel like we were living in a war zone!

Response 377-6

As described in Draft EIR Chapter 2, "Project Description," on page 2-42, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 377-7

5. Cumulative Environmental Effects: All around, expanding CEMEX with blasting at Lost Lake for the next 100 years would be a tragedy and would end the potential neighborhood expansion in Northeast Fresno and Madera.

Response 377-7

The project's potential cumulative effects are discussed in Draft EIR Chapter 5, "Cumulative Impacts." The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, as updated by this Final EIR. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #5 regarding the duration of the project's requested conditional use permit.

Comment 377-8

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 377-8

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project.

Letter #378 March 8, 2025, Jack Roberts

Comment 378-1

I am writing to oppose the approval of CEMEX 100-year lease. The DEIR is inadequate.

Response 378-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter does not provide evidence or reasoning to support the claim that the Draft EIR is inadequate.

Comment 378-2

1. Toxic chemicals will leach into the San Joaquin River and affect wildlife and human health. The dig pit is too close to the river

Response 378-2

The presence of hazardous substances on the project sites and other potential hazards associated with the project are discussed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." The project's potential to degrade surface water quality is evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3 beginning on Draft EIR page 4.10-88. See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections.

Comment 378-3

2. Explosions will be heard by cyclists, hikers, boaters, and all other visitors to the San Joaquin River. This will make for quite an unpleasant experience for those hoping to enjoy the river and its wildlife.

Response 378-3

As described in Draft EIR Chapter 2, "Project Description," on page 2-42, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as updated by the Final EIR. See Chapter 3, "Draft EIR Errata," for revisions to these Draft EIR sections. See also Collective Response #27 regarding the project's potential effects on users of nearby parks and trails.

Comment 378-4

3. A 600 ft deep pit will not be a pleasant site. I do not want to look over the San Joaquin River and see such destruction. The San Joaquin River is the jewel of Fresno. Don't destroy it!!!

Response 378-4

The project's potential impacts to the visual landscape are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to Draft EIR Section 4.1.

Comment 378-5

4. The number of jobs this mine created is nothing compared to the amount of money brought by visitors to the region who recreate along the San Joaquin River.

Response 378-5

See Collective Response #7 regarding the project's potential economic effects.

Letter #379 March 8, 2025, Bonna Rogers-Neufeld

Comment 379-1

I am writing to express my opposition to the Cemex project.

First of all, the length of the project, 100 years, is way too long for any contract or project. We do not know the environmental or economic impacts of things that may be 10 years down the line, much less 100.

Response 379-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit.

Comment 379-2

This project threatens water quality, impacts fish and wildlife and will lead to noise, air, water and environmental pollution.

Response 379-2

The project's potential impacts related to water quality, fish and wildlife species, noise, and air pollution are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.4, "Biological Resources," Section 4.13, "Noise," and Section 4.3, "Air Quality,"

(see Appendix D-4, "Revised Section 4.3, Air Quality"). See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 379-3

Digging down 600 feet could adversely affect water tables.

Response 379-3

The project's potential effects on groundwater resources are evaluated in Draft EIR Section 4.7, "Geology and Soils," and Section 4.10. See Impacts 4.10-4 through 4.10-7, beginning on Draft EIR page 4.10-93, for potential impacts to groundwater quality. See Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these Draft EIR sections.

Letter #380 March 8, 2025, Erika San Roman

Comment 380-1

As a Fresno County resident and mother who cares deeply about our environment and community, I'm very concerned about the impacts of the proposed CEMEX Rockfield Quarry Modification Project (EIR 7763).

There are serious issues with the project's Draft Environmental Impact Report (DEIR) that I believe need immediate attention:

Response 380-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 380-2 through 380-7 below that address specific issues raised in this comment letter.

Comment 380-2

1. Water Quality Concerns:

The DEIR downplays the risk of major water contamination if the barrier between the San Joaquin River and the mining pit is breached. Given CEMEX's troubling record of environmental violations (over $43 million in fines since 2000), it is alarming that there are no mandatory financial safeguards in place. The DEIR needs stronger protections, including guaranteed funding set aside for cleanup if a disaster occurs.

Response 380-2

The issues of water contamination and flooding are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," of this Final EIR for

proposed revisions to Draft EIR Section 4.10. See Collective Response #17 regarding river bank stability and the potential for breach and flooding of the Quarry Site. See also Collective Response #4b regarding liability and funding for unforeseen environmental damage caused by the project.

Comment 380-3

2. Lack of Need for the Project:

According to the Aggregate Sustainability in California report (2018), Fresno County already has nearly double the aggregate resources needed for the next 50 years. It makes no sense to cause further environmental harm along the San Joaquin River when there's already plenty of supply elsewhere.

Response 380-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 380-4

3. Air Quality and Community Health:

Blasting, drilling, and increased truck traffic will worsen Fresno's air quality and could harm residents' health, especially children and elderly people in nearby communities. The DEIR needs much stronger measures to limit these harmful impacts on air quality.

Response 380-4

The project's potential effects on air quality are evaluated in Draft EIR Section 4.3, "Air Quality," as updated by the Final EIR. Potential health effects associated with air pollution are described in Draft EIR Section 4.3.1.2, "Pollutants and Health Effects." Mitigation Measure 4.3-2a and 4.3-2b would require off-road engines to be retrofitted or upgraded in order to meet the tier 4i particulate emissions standard as well as implementation of a Fugitive Dust Control Plan to reduce dust emissions. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3. See also Collective Response #9 regarding the project's potential to air quality impacts.

Comment 380-5

4. Traffic Problems:

The DEIR admits that traffic congestion at key intersections will significantly increase but does not require CEMEX to fully pay for

necessary improvements. Given CEMEX's profits, it's unfair for residents to bear these traffic issues. The company should fully fund intersection improvements and new traffic signals.

Response 380-5

The project's traffic-related impacts are evaluated in Draft EIR Section 4.17, "Transportation." Mitigation Measures 4.17-1a through 4.17-1r require the Applicant to pay the project's fair share contribution of the cost to implement various roadway and intersection improvements needed to address cumulative traffic increases. See Section 3.2.5.17 of see Chapter 3, "Draft EIR Errata," of this Final EIR for proposed revisions to these mitigation measures. See Collective Response #29 regarding funding of traffic improvements.

Comment 380-6

5. Environmental and Visual Impacts:

The DEIR recognizes the permanent damage this project will cause to our landscape but fails to offer meaningful solutions. We risk losing wildlife habitats, recreational spaces, and the natural beauty of our river parkway.

Response 380-6

Wildlife habitats, recreational spaces, and the visual landscape of the project area are evaluated in Draft EIR Section 4.4, "Biological Resources," Section 4.16, "Recreation," and Section 4.1, "Aesthetics and Visual Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 380-7

I urge the county to require better alternatives, including reduced mining depths, greater setbacks from the river, stronger air quality measures, guaranteed cleanup funds, and fully funded traffic improvements by CEMEX.

Thank you for taking our community's concerns seriously. We must prioritize long-term environmental health and the safety and quality of life of all Fresno County residents.

Response 380-7

See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of alternatives to the proposed project. Alternatives 2 through 5 each represent a reduced mining depth and Alternative 5 would also reduce the disturbance area and reduce annual operations and

sales. This comment otherwise summarizes the prior comments in Letter #380. See Responses 380-2 through 380-6 that address the other specific issues raised in this letter.

Letter #381 March 8, 2025, Cat Sanders-Smith

Comment 381-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Quarrying activities have a negative effect on the surrounding towns, the environment, and the health and safety of the workers and residents of the quarries such as landscape degradation, habitat destruction, air and water pollution, and noise pollution.

Response 381-1

The commenter's concerns are noted and will be considered by County decision-makers. The Draft EIR analyzes the project's potential impacts to water quality, air quality, recreation, wildlife, and hazards in Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources, and Section 4.9, "Hazards and Hazardous Materials," respectively.

Comment 381-2

Furthermore, the fumes and others residues of the blasted explosives have caused biodegradation and hazardous impacts on the ecosystem survival in a quarry environment. Most of the blasted explosives are stable in soil due to their chemical structures and easily binding to the soil organic matter, which making soil remediation difficult. Take for example, Winfield et al (2004), wherein he states the has been presence of 2,4,6-trinitrotoluene (TNT), hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX, hexogen) and octahydro-1,3,5,7-tetranitro-1,3,5,7tetrazocine (HMX, Octogen) in soil, surface water and groundwater in locations where these explosives are being used. Hexogen and Octogen have resulted to decrease in terrestrial plant biomass, abnormality growth in terrestrial plants and decrease in biomass and fertility of earthworm (Best et al., 2006, Rocheleauet al., 2008, Winfieledet al., 2004; Vila et al., 2007, Lachanceet al., 2004, Krishnan et al., 2000).

The direct contamination effects of residual explosive on living inhabitants of an ecosystem include eye irritation, health deterioration, air, water and land pollutions, and the indirect influences are on inanimate living creatures upon which man and animal depend. The plants and vegetation that are responsible for photosynthesis and oxygen production are suffering undergrowth and development which in return have effects on animate creatures that depend upon them. The study therefore suggested that quarry operators should ensure appropriate and proper selection, application and detonation of explosives during quarry operations.

Response 381-2

RDX, HMX, and Octogen are primarily military explosives and not use in commercial explosive for the quarry industry. TNT is primarily used in the cast boosters used to detonate the ANFO or emulsion explosive products in each hole. The use of cast boosters in blasting operations requires additional measures to prevent impacts to groundwater, primarily due to the potential for nitrate and nitrite leaching. This potential would be minimized by removing the blasted muck pile from the blast area as soon as reasonably possible. Mitigation Measure 4.10-1 requires "blasting designs and loading controls to be prepared by qualified blasting contractors to ensure complete detonation, specify appropriate loading practices such as cleaning loading equipment in areas where wastewater can be properly contained, require explosives to be selected that have appropriate water resistance for the site conditions present, and require the management of muck piles (the fragmented pieces of rock left after the blast) to be managed to prevent interaction with stormwater" (Draft EIR at page 4.9-18). The quarry operation's storm water management plan would be managed in accordance with all requirements under the Waste Discharge Permit (WDR) system. Regarding nitrates, there is no evidence that the Quarry Site or Plant Site in the past, or in the future, would contribute to nitrates in the groundwater (see Draft EIR at page 4.10-98 to 4.10-99). Rather, any nitrates found in groundwater wells are relics of past agricultural activity in the area (see Draft EIR at page 4.10-99).

Comment 381-3

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 381-3

The commenter's concerns and request for additional analysis and mitigation are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to minimize potentially adverse impacts.

Letter #382 March 8, 2025, Susan Sanford

Comment 382-1

I know I'm supposed to be specific with my comments, but my obligations as a family caregiver, and much more, preclude my having sufficient time to do so.

I would simply offer that it would be wise to consider all that has transpired in the world since 1925...environmentally, technologically, socio-politically. With the astonishing rate at which all those things continue to change, it makes no sense to grant CEMEX permission for any further extraction of resources for a century.

Children alive now may live to see 2125. I humbly suggest that the decision-makers of today cannot fathom what their world will be like, but need to make the life-affirming choice to deny further extraction activities by CEMEX.

Response 382-1

See Collective Response #5 regarding the duration of the proposed use permit. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #383 March 8, 2025, Laura Silberman

Comment 383-1

I am opposed to the renewal of the CEMEX mining operation.

Response 383-1

The comment does not raise any issues related to the Draft EIR or potential environmental impacts of the proposed Project; therefore, no further response is required. Fresno County will consider these comments as part of its deliberations prior to certification of the Final EIR and any project approval.

Comment 383-2

I am particularly concerned about air pollution as a result of increased truck traffic. The DEIR says that project emissions may exceed cancer risk thresholds. Refer to DEIR pages 4.3-63. I understand that the DEIR did not evaluate the population-wide cancer burden. Refer to pages 4.3-64. CEQA requires that the evaluation be performed before taking into account implementation of mitigation measures.

Will CEMEX be following these CEQA requirements ?

Response 383-2

Please see Collective Response #11 pertaining to community cancer risk. Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), as updated by this Final EIR, evaluates potential air quality impacts of the project, including fugitive dust, toxic air contaminants, and associated health risks (Impact 4.3-3; see Final EIR Appendix D-4). The air quality technical analysis was updated to clarify and expand upon the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3). This updated analysis includes evaluation of cancer burden and health risks along haul routes and confirms that there are no new impacts and no changes to the conclusions presented in the Draft EIR.

The analysis of cancer burden and health risks quantifies estimated unmitigated health risk impacts (Appendix D-4, Table 4.3-24, "Unmitigated Project Health Risk Impacts") and mitigated health risk impacts (Appendix D-4, Table 4.3-25, "Mitigated Project Health Risk Impacts"). Appendix D-4 confirms that the project's potential impact regarding increased cancer risk to sensitive receptors was determined to be less than significant. As shown in Tables 4.3-24 and 4.3-25, implementation of Mitigation Measures 4.3-2a and 4.3-2b would result in a reduction in cancer risk at the maximally exposed individual receptor compared to the CEQA baseline condition. Because the project would result in a reduction in cancer risk, a corresponding reduction in cancer burden would also be expected.

Comment 383-3

In addition, will the DEIR analyze the impacts of blasting on wildlife?

Response 383-3

The Draft EIR analyzes the impacts of blasting on wildlife in Section 4.4, "Biological Resources," at Impact 4.4-2 and 4.4-6. Additional information specific to various taxa are covered in the collective responses (see Chapter 3, "Draft EIR Errata"). The effects of

project operations, including blasting, on wildlife are discussed in Collective Response #12 (river and salmon restoration efforts), Collective Response #13 (nesting birds and other wildlife), Collective Response #15 (non-nesting birds and birds outside of nesting season), and Collective Response #16 (salmon spawning). Blasting events would be brief, with each blast lasting approximately one to two seconds. Thus, blasting is not expected to result in significant impacts to wildlife. Please see Responses 58-37, 58-38, 58-40, 58-41, and 58-42 for further discussion of blasting impacts upon wildlife.

Letter #384 March 8, 2025, Unnamed Resident

Comment 384-1

Hello, I'm wanted to send an email to state my disapproval of this project. This project is bound to destroy the San Joaquin River and we don't need another river or ecosystem destroyed. Please don't let this project happen.

Response 384-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential ecological impacts are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #385 March 8, 2025, John Watkins

Comment 385-1

I live in the Copper River area and I oppose the CMEX expansion on the San Joaquin River. It will have a significant negative impact on the environment.

Response 385-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #386 March 8, 2025, Thomas and Anna Wielicki

Comment 386-1

I have been a resident of Fresno Bluffs for the last 30 years and had numerous close calls while driving on Friant Road due to the heavy truck traffic generated by the CEMEX company in the middle of residential area.

Response 386-1

The project's traffic-related impacts are evaluated in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #30 regarding transportation safety.

Comment 386-2

Vast majority of Fernans believe that a city at our location needs to pivot from polluting heavy industry to a service economy. Why don't you guys?

I can tell you that extension of operating permits for CEMEX will make many of my neighbors in the Bluffs REALLY angry and we will not hesitate to show it.

Please, make a smart decision that is aligned with the will and interest of your constituency and stop CEMEX from operating in our neighborhood.

Response 386-2

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #387 March 8, 2025, Carolyn Yale

Comment 387-1

Below are my comments on the proposed project. Also in the form of an attached file.

FYI: I am retired, and do not live in Fresno, but I have kept up an interest in the SJR and restoration efforts.

At USEPA I worked on SJ RIver issues for several decades, starting with the legal challenge to renewal of Bureau of Rec.water contracts and continuing through water-related plans and projects in the SJ region. Before EPA , I worked in CA as a planner (land use) at the local land and county levels.

Response 387-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 387-2 through 387-4 below that address specific issues raised in this comment letter.

Comment 387-2

I am writing to oppose the Cemex Rockfield proposal to continue and expand mining and processing at sites immediately adjacent to the San Joaquin River. The proposed project would substantially expand these activities under a permit lasting 100 years. Although the site has been used for mining and processing for over a century, these operations are incompatible with the surrounding natural and human environment as it exists today. Expanding the project exacerbates the conflict between an industrial use and a reach of the San Joaquin River corridor that is designated for public use as a Parkway. Rather than approving a new permit, plans should be made to close out the mining and processing operations out at the end of the current 2026 permit.

Response 387-2

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issue of land use conflicts is a broad topic discussed in multiple Draft EIR sections including Section 4.1, "Aesthetics and Visual Resources," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.10, "Hydrology and Water Quality," Section 4.11, "Land Use and Planning," and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan and Collective Response #27 regarding the project's potential effects on users of nearby parks and trails.

Comment 387-3

Times change: If the mining/processing was acceptable years ago, it is now within an area that is valued for its recreational and natural resource values. This fact is barely mentioned in the EIR section on existing conditions, which instead focuses on the project site. There is almost no substantive information about conditions "in the vicinity" of the project (to quote CEQA). The EIR overlooks the fact that there has been major investment of time, effort and funds on the part of many agencies, citizens and various organizations to reestablish more natural conditions in the river (flows) and on functionally connected lands for the benefit of recreation, fish, riverine habitat and floodplains. The vision for river restoration and subsequent planning and projects date from the last century, following passage of the federal Central Valley Project Improvement Act (1992).

Response 387-3

The land uses surrounding each project site are described in Draft EIR Section 2.4.5, "Surrounding Land Uses." The parks and recreational uses near the project sites are further detailed in Draft EIR Section 4.16, "Recreation." The San Joaquin River Parkway Master Plan is also described in the Draft EIR in both Section 4.16 and Section 4.11. See Table 4.11-1, "Project Consistency with Local Planning Documents," for an analysis of the project's consistency with the policies established by the Parkway Master Plan. See Collective Response #18 for further discussion of the project's consistency with the Parkway Master Plan. See also Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 387-4

In terms of policy, the EIR cites a policy overlay relating to the Parkway, suggesting intent of conforming County land use decisions to the San Joaquin River Conservancy plan for the Parkway., but this is qualified. Overall, treatment of state and local policies, standards, County zoning, and the limited impact analysis itself, seem designed to make the case that approval of this project would be perfectly defensible from a legal standpoint. There may well be concerns about project impacts – for example, on base flow in the River resulting from a 600-foot deep, dewatered pit, or how blasting affects fish, birds, people. But the County's decision on the proposal should not revolve around technical details of project operations.

The main question is a matter of policy. Whether or not to permit continuation and expansion of an industrial land use that conflicts with the Parkway river corridor. The County has the discretionary authority to say no to Cemex. I would remind you that the possibility of restoring the San Joaquin River started with a challenge to renewing 40-year water contracts that had dried up reaches below Friant Dam. From a larger, societal perspective, there are other options for gravels mining and processing--but only one San Joaquin River.

Response 387-4

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, as updated by this Final EIR. Impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." The

commenter's opposition to the proposed project is noted for the consideration of County decision-makers.

Letter #388 March 8, 2025, Thomas Zynda

Comment 388-1

This follows up on my message to you of March 8, in which I voiced my opposition to the CEMEX proposal to use blasting to mine our local area of the San Joaquin River , which project would entail extreme destruction of the river as well as other environmental degredation.

It appears that the current Enivorment Impact Study has severely underestemated or simply ignored the extreme deleterious effects of this project on Fresno Air Quality.

In this follow-up message I wish to add my concern about the extremely serious degradation of our Fresno air quality that this project would cause. The use of explosives to mine rock sends an enormous amount of rock duct into our air, as well as the airborne chemical products of the explosives used. There is no way to mitigate that result, so the blasting must not allow to occur.

Fresno already has some of the worst air quality in the United States. I already have to use multiple prescrition medications to attempt to deal with it. And my neighborhood has families with young children, and it's very well known that poor air quality has negative effects on the brain development of children such that it lowers their IQ's.

So I respectfully that you all in your power to reject any proposal of CEMEX to continue its mining of the San Joaquin River in order to protect the lives of those of us who live in the wide Fresno Area.

Response 388-1

See Comment Letter #350 for responses to the commenter's previous comment letter referenced here. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on air quality are evaluated in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), as updated by the Final EIR. Potential health effects associated with air pollution are described in Draft EIR Section 4.3.1.2, "Pollutants and Health Effects." Mitigation Measures 4.3-2a and 4.3-2b would require the project's off-road engines to be retrofitted or upgraded to meet the Tier 4i Particulate Emissions standard as well as implementation of a Fugitive Dust Control Plan to reduce dust

emissions. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #9 regarding air emissions associated with blasting events and the project's potential impacts on air quality. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #389 March 9, 2025, Jacinta Amaral

Comment 389-1

I am deeply concerned that your office and the Fresno County Board of Supervisors is considering this request for a 100 year lease to continue and expand the company's operations near the San Joaquin River. I am against the expansion of the Cemex project.

Response 389-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 389-2

It is my understanding that the p[lan to extract rock which will then be ground to gravel by blasting a 600 foot deep and half a mile wide pit. Many concerned citizens now know that the pit would be twice as deep as Millerton Lake and that the half mile wide which would be similar to the distance from, say, West Avenue to Fruit Avenue. I find it very difficult to imagine a hole of this size. I find it more difficult to come up with sane reasons to blast a hole this size right next to the San Joaquin River and in the flood plain of the San Joaquin River.

For Cemex the sane reason for this incredible excavation is profit.

Response 389-2

The comment is noted.

Comment 389-3

The size of the hole is stunning. The length of the lease is mindboggling. The destruction of the beauty of the San Joaquin River environment is sickening. And there is no such thing as a one hundred year guarantee that river an its environs will be adequately cared for and protected for all those one hundred years.

Thank you for your attention in this matter.

Response 389-3

See Collective Response #5 regarding the duration of the proposed use permit. The project's potential impacts to the visual landscape of the project area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #390 March 9, 2025, Marc Ament and Mary-Elin Kelly

Comment 390-1

We say NO! to the Cemex blast mine project! We strongly OPPOSE this project.

Thank you for bringing this egregious proposal to our attention and giving us a chance to ake our voices heard.

Response 390-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 390-2

We live a stones throw from the beautiful river parkway and wish to preserve the natural beauty and resources of the San Joaquin River.

Response 390-2

The project's potential impacts to the San Joaquin River and surrounding visual landscape are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 390-3

The existing gravel quarry is more than enough already.

Response 390-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 390-4

The idea of expanding that and bringing more destruction to the environment, pollution of the river and the air, noise pollution,

Response 390-4

The issues of water, air, and noise pollution are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions.

Comment 390-5

heavy and dangerous truck traffic on Friant Road, where families are trying to cross the intersection to enjoy Woodward Park and the river trails. Friant Road is currently one of the most dangerous streets in Fresno, with a higher than average number of collisions at several intersections along the park and river trails area. With increased gravel and cement truck traffic there, it is a statistical fact that there will be more and more serious, even fatal, accidents along that corridor.

Response 390-5

The issue of transportation safety is addressed in Draft EIR Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See also Collective Response #30 regarding transportation safety.

Comment 390-6

Also, I am not a civil engineer but I even worry that the impacts of heavy explosives near Friant Dam could bring a high risk of dam collapse.

Response 390-6

See Response 210-8 regarding potential effects of blasting on dam safety.

Comment 390-7

The project is not viable from a benefit/risk calculation. Who benefits? just Cemex, not our community!

Please deny this destructive project. It will do nothing to the betterment of our community and the natural resources of the San Joaquin River parkway and surrounding area.

Let us know if there is anything else we can do to keep this project from going forward.

Response 390-7

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #391 March 9, 2025, Katurah Andrews

Comment 391-1

The CEMEX Rockfield Project is an irresponsible project that will do unnecessary lasting damage to the San Joaquin River and surrounding areas.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 391-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to the San Joaquin River and surrounding visual landscape are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter fails to provide evidence or reasoning to support the assertion that the Draft EIR is inadequate.

Letter #392 March 9, 2025, Saeed Attar

Comment 392-1

I am writing to formally express my strong opposition to the proposed **CEMEX Rockfield Expansion Project in Fresno.** This project, if allowed to proceed, will pose serious and irreversible environmental health hazards to our community, jeopardizing the well-being of residents and the ecological integrity of our region.

Response 392-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 392-2 through 392-4 below that address specific issues raised in this comment letter.

Comment 392-2

The detrimental impacts of this project are extensive and deeply concerning. Scientific evidence and similar case studies have shown that projects of this nature significantly contribute to air and water pollution, increase the risk of respiratory illnesses,

and degrade natural ecosystems. Specifically, the chemical runoff and toxic emissions will expose our community to hazardous substances, leading to increased health risks such as asthma, lung disease, and other long-term medical conditions.

Response 392-2

The project's potential impacts related to air pollution, water pollution, and natural ecosystems are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively. The potential health effects associated with air pollution are described in Section 4.3.1.2, "Pollutants and Health Effects." See Impact 4.3-3, as updated in this Final EIR (Appendix D-4), for discussion of the project's air emissions and potential impacts to sensitive receptors. See Impacts 4.10-1 through 4.10-7 and 4.10-17 for discussion of the project's potential to degrade surface and ground water quality. See also Draft EIR Section 4.9, "Hazards and Hazardous Materials," for a general discussion of the use of hazardous substances on the project sites. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 392-3

Furthermore, the disruption of the San Joaquin River and increased noise and traffic pollution will not only threaten our natural habitat but also negatively impact property values and the quality of life of thousands of residents. The proposed project neither adequately addresses these risks, nor does it offer substantial measures to mitigate the foreseeable damage.

Response 392-3

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. The issues of noise and traffic are discussed in Draft EIR Section 4.13, "Noise," and Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. Evaluation of the project's potential economic effects is discussed in Collective Response #7. The Draft EIR requires mitigation measures for each of the project's potentially significant impacts. The commenter fails to specify which impacts are not adequately addressed in the Draft EIR nor what mitigation measures should be added to the Draft EIR to address these inadequacies.

Comment 392-4

Given the magnitude of these risks, I urge the agency to reject this project and instead advocate for environmentally sustainable alternatives that prioritize public health and safety and to ensure that the long-term health of the San Joaquin River watershed and

surrounding communities is protected. The residents of Fresno County deserve to live in an environment that fosters health, security, and sustainability, rather than one threatened by pollution and industrial hazards.

The well-being of our families, children, and future generations must take precedence over industrial interests. I strongly encourage the agency to reconsider this project's approval and take proactive steps toward more sustainable and community-friendly developments.

Thank you for your attention to this urgent matter. I look forward to your prompt response and action in safeguarding our community.

Response 392-4

Draft EIR Chapter 6, "Alternatives," describes and evaluates a reasonable range of alternatives to the proposed project. Each of the alternatives evaluated would lessen one or more of the environmental impacts identified for the proposed project. See also Draft EIR Section 6.4.2.1, "Alternative Site Locations," for discussion of the Draft EIR's evaluation of reasonable alternative locations for the project. The commenter's opposition to the proposed project is noted for consideration by the decision-makers.

Letter #393 March 9, 2025, Amy Barron

Comment 393-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Response 393-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 393-2 through 393-4 below that address specific issues raised in this comment letter.

Comment 393-2

Drilling in the river for mining purposes is highly problematic for several reasons. Extending mining operations for another 100 years significantly amplifies the environmental impact over time, causing long-term harm to the river's ecosystem.

Response 393-2

The project's potential effects on the San Joaquin River and associated ecosystems are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 393-3

The change in technique from mechanical digging to blasting hard rock and crushing it into gravel increases the potential for habitat destruction and water pollution, as this method creates more disturbance to the surrounding environment and releases harmful sediments into the water.

Response 393-3

The potential environmental effects of changing in mining methods used at the Quarry Site are evaluated throughout the Draft EIR. See Draft EIR Section 4.4 regarding potential habitat destruction and Section 4.10 regarding potential water pollution and sedimentation. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 393-4

Additionally, increasing the mining depth to 600 feet below the ground surface risks destabilizing the riverbed, possibly leading to changes in water flow and threatening aquatic life. These activities not only jeopardize the river's health but also the livelihoods that depend on its natural resources.

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments.

Response 393-4

The issues of ground and slope stability are addressed in Draft EIR Section 4.7, "Geology and Soils." See Collective Response #17 regarding riverbank stability and Collective Response #25 regarding the potential for the project to effect surface water flows in the San Joaquin River. The project's potential impacts to special-status aquatic species are evaluated in Draft EIR Section 4.4. See Collective Response #16 regarding the project's

potential to impact salmon spawning. See Collective Response #7 regarding evaluation of a project's economic effects under CEQA. See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project.

Letter #394 March 9, 2025, Sharon Benes

Comment 394-1

This proposed expansion project by CEMEX Rockfield is a project that needs to be STOPPED. The San Joaquin River Conservancy Trust over the last 30 years or so, has done a remarkable job of preserving land along the SJ River, making it accessible to the public for recreational and educational opportunities.

Response 394-1

See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan and Collective Response #21 regarding the project's potential to affect public access to the river.

Comment 394-2

I work in agriculture and fully appreciate its importance and the role of farmers in land stewardship. But along with that agriculture comes a massively transformed landscape in the San Joaquin Valley from Tule marshes, grasslands and trees to orchards, homes and shopping malls and a great loss of vegetation and wildlife.

The San Joaquin River represents the last truly natural place within the city and surrounding area and it is of tremendous value to the quality of living in Fresno.

I recently went on a canoe trip at Sycamore Island with the SJ River Parkway group to see bald eagles. I arrived within 20 minutes of leaving my home and was on the water and we did see two bald eagles, along with their nest. I also try to do a canoe trip every summer. I do not have to travel far and I have a few hours of tranquility on the river and then I return to my busy life.

Response 394-2

See Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails and Collective Response #21 regarding the project's potential to affect public access to the river.

Comment 394-3

Gravel mining has always been done along the river and the Parkway has worked to reverse some of this damage. Rock mining and a 600 ft. pit is a whole other level of disruption to the river and its hydrology and biology. This will unravel what the work of so many volunteers has achieved along the river such as removal of invasive species, restablishment of native plants, trash removal and flow restoration. The CEMEX Expansion Project represents a huge blow to these conservation efforts and I fail to see how jobs and tax revenue can compensate for this damage. It represents short term gain for long term loss.

Please have the courage to stop the project.

Response 394-3

The project's potential effects on the San Joaquin River and associated ecosystems are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.4, "Biological Resources," respectively. See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. The project sites contain numerous non-native plant species that would be removed through mining activities. As described in Draft EIR Appendix B-2, "Project Description/Operational Statement," Section 5.1.7, "Revegetation," as part of reclamation, the project sites would be reseeded and planted with native grasses, forbs, and trees, and shrubs, using nearby undisturbed riparian areas as reference sites. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #395 March 9, 2025, Perminder Bhatia

Comment 395-1

I appreciate the opportunity to submit comments on DEIR for the Cemex Rockfield Expansion project. This project causes significant dust and environment impact. The dust it produces causes lot of allergies and lung diseases. As living in the neighbor hood close to it (Monte Verdi), We suffer from a lot of allergies due to dust. Fresno Clovis area is always full of allergies and has the largest number of people suffering from chronic allergies. I would ask the County Supervisors to vote against the project.

Response 395-1

The project's anticipated dust emissions and potential impacts to air quality and public health are addressed in Draft EIR Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Section 4.3. See also Collective Response #9 regarding the project's potential impacts on the region's existing air quality

conditions. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #396 March 9, 2025, Veronika Carrillo

Comment 396-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Response 396-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter fails to provide evidence or reasoning to support the claims that the Draft EIR is inadequate. See Responses 396-2 through 396-6 below that address specific issues raised in this comment letter.

Comment 396-2

As someone with experience in Anthropology, I find that the EIR fails to adequately address the following concerns:

The San Joaquin River is an important staple in the valley and is rich with natural and historical resources. It's the life's blood of much of the valley and must be cared for. As an anthropologist, I am concerned with the ramifications of what blast mining could have on the surrounding area. In order to avoid possible destruction of Native cultural sites, the area that CEMEX wishes to blast in needs to have a sanctioned archaeological survey done to ensure that the work being done will not damage or disrupt sites of cultural significance. If this step is ignored, it could result in legal ramifications.

Response 396-2

The project's potential impacts to native cultural sites are evaluated in Draft EIR Section 4.5, "Cultural Resources," and Section 4.18, "Tribal Cultural Resources." See Draft EIR Section 4.5.1.6, "Pedestrian Surveys," for a description of the intensive archaeological surveys conducted on both the Plant Site and the Quarry Site. The cultural resources technical report and peer review memorandum contain confidential information and were not included as appendices to the Draft EIR. However, the documents, with redaction of certain confidential information including site records, are on file with the

Fresno County Planning Department. With mitigation, the Draft EIR determined that the project's potential impacts to cultural and tribal resources would be less than significant.

Comment 396-3

I am a citizen of the valley. I was born here and as such I have heard my family and doctors speak of the poor air quality in the valley. My family and I have asthma from the pollution in the valley's air. As do many other citizens. If blast mining takes place, the air quality of the valley will grow worse and many people will become sicker.

Response 396-3

The project's air quality impacts are evaluated in Draft EIR Section 4.3, "Air Quality." See Collective Response #9 regarding the project's potential impacts on air quality conditions. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Section 4.3 and the associated Draft EIR Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment."

Comment 396-4

There is also the concerns of Valley Fever. People here already contract the sickness from the fungus in the earth. If there is any of the fungus in the soil along the river, it could feel the air and infect countless citizens.

The health risks need to be considered. A survey of that area for the fungus should be done before any blasting takes place.

Response 396-4

"In California, Valley Fever is caused by the fungus *Coccidioides immitis* that lives in the top two to 12 inches of soil …." Generally, this thin layer of topsoil would be suspect only if it were undisturbed from its natural state. Thus, dust emissions that have potential to contain Valley Fever causing spores would only occur during the excavation and storage of topsoil prior to mining. Excavation at greater depths below the ground surface would not cause Valley Fever. The fungal spores can become airborne when soils are disturbed, potentially exposing workers to the disease. According to the Fresno County Department of Public Health (2026), the project sites are located outside the areas of western Fresno County known to have elevated levels of Valley fever activity. Valley fever is primarily a risk to workers that are directly exposed to dust emissions at or near the site of soil disturbance. Thus, it is regulated as a worker health and safety issue by the Occupational Safety and Health Administration (OSHA) and the California Department of Public Health. Required safety measures primarily relate to dust management at work sites

including regular watering of exposed surfaces. The operator would continue to comply with all applicable worker safety measures. Mitigation Measure 4.3-2b, as provided in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), would require implementation of a broader Fugitive Dust Control Plan that would further minimize the risk for spreading fungal spores in dust emissions.

See Appendix D-4 for proposed revisions to Draft EIR Section 4.3 and Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment."

Comment 396-5

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 396-5

See Collective Response #1 regarding the suggestion that further environmental review and analysis is needed. The commenter does not provide substantial evidence or reasoning to support the claim that the Draft EIR is deficient. The commenter's opposition to the proposed project is noted for the consideration of County decision-makers.

Letter #397 March 9, 2025, Robin Cassinerio

Comment 397-1

This is not acceptable and I just received notice this week!

Comments are due tomorrow March 10, 2025??? What the heck??? I can see what they are trying to get away with and

Response 397-1

See Collective Response #1 regarding public participation and the County's processing of the project's application.

Comment 397-2

it makes no sense based on the environmental impact on the water quality, the entire San Joaquin river bottom, public recreation,

fish and wildlife and current housing, ranching or other businesses in the area.

Response 397-2

The project's potential impacts related to water quality and the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The issues of public recreation and fish and wildlife are addressed in Draft EIR Section 4.16, "Recreation," and Section 4.4, "Biological Resources," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #7 regarding evaluation of the economic effects of the proposed project.

Comment 397-3

As a lifelong Fresnan I am completely against this project. It needs to stop. NO NO NO to rock blasting.

Response 397-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 397-4

Even the current CEMEX business is a hazard to the surrounding area traffic and noise pollution.

Response 397-4

The existing, baseline conditions in the project area as they relate to traffic and noise pollution are described in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Letter #398 March 9, 2025, Allyson Chun

Comment 398-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Response 398-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 398-2 through 398-9 below that address specific issues raised in this comment letter.

Comment 398-2

1. Impacts on the San Joaquin River Watershed

Further drilling and excavation will deplete resources of an already fragile ecosystem in a changing climate where wildfires, landslides, and floods are more common than before.

Response 398-2

The project's potential impacts related to ecosystems, climate change, wildfires, landslides, and floods are addressed in Draft EIR Section 4.4, "Biological Resources," Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions"), Section 4.20, "Wildfire," Section 4.7, "Geology and Soils," and Section 4.10, "Hydrology and Water Quality," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 398-3

There are multiple studies linking mental health benefits to spending time outdoors. This project will impact scenic views and make it challenging for people to unplug and enjoy being outside.

Response 398-3

The project's potential impacts to the visual landscape of the project area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1. See Collective Response #27 regarding the project's potential effects on users of nearby parks and trails. See also Collective Response #21 regarding the project's potential to affect public access to the San Joaquin River. The comment is noted for the consideration of the decision-makers.

Comment 398-4

How will the landscape change under this current proposal? Will mining cause erosion and weaken foundations to nearby topography, roadways, and buildings?

Response 398-4

The proposed mine plans for the Plant Site and Quarry Site are shown in on Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan," respectively. The proposed reclaimed conditions at the Plant Site and Quarry Site are shown in Draft EIR Figure 2-9, "Plant Site Final Reclaimed Conditions," and Figure 2-10, "Quarry Site Final Reclaimed Conditions," respectively. The project's visual simulations are shown in Draft EIR Figures 4.1-1 through 4.1-16. Together these graphics and associated text descriptions provide an overview of the anticipated physical changes that would occur to the landscape of the project sites with project implementation. The issues of erosion and ground stability are addressed in Draft EIR Section 4.7. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.7.

Comment 398-5

2. Air Quality and Dust Emissions

The Valley already has some of the poorest air quality in the U.S. due to geographical location and dust from agriculture, not to mention the risk of asthma and Valley Fever. This 100-year project will further degrade air quality with particulates and dust in one of Fresno's most popular areas for outdoor activities. What are the air quality impacts and long-term ramifications of having rock crushing, blasting, and drilling so close to where people commonly recreate?

Response 398-5

The project's potential air quality impacts are evaluated in Draft EIR Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to Draft EIR Section 4.3. See also Collective Response #9 regarding the project's potential impacts on the region's existing air quality conditions, including air quality impacts associated with blasting and drilling. See also Response 396-4 regarding Valley fever.

Comment 398-6

3. Biological Resource Impacts

This project will likely impact nesting and migration for hawks, owls, and bats. The area is also host to many four-legged wildlife such as rabbits, foxes, coyote, and deer, all of which will likely have their habitats fragmented.

Response 398-6

The project's potential impacts to fish and wildlife species are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4, including the addition of Mitigation Measure 4.4-1d addressing the project's potential impacts to bats. See also Collective Response #14 regarding Swainson's hawk and Collective Response #15 regarding potential avian impacts other than nesting impacts.

Comment 398-7

Drilling, blasting and excavation can also damage local water quality which has negative marine life, farming, and potable water impacts. Have studies been done to ensure that wildlife and water quality are not affected?

Response 398-7

The project's potential to degrade surface water quality is addressed in Draft EIR Section 4.10. See Impacts 4.10-1 through 4.10-3 for potential impacts to surface water quality and Impacts 4.10-4 through 4.10-7 for potential impacts to groundwater quality. With implementation of Mitigation Measures 4.10-1 and 4.10-5a the project's impacts to water quality would be less than significant. See Draft EIR Appendix E, "Biological Resources," and Appendix G, "Hydrology and Water Quality," for the project's related technical studies. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections and appendices referenced here.

Comment 398-8

4. Traffic and Noise Concerns

Construction trucks for this project will further congest roadways that have already had the speed limits lowered within the last year due to traffic. Increased traffic will lower air and road quality and amplify noise in those areas. Furthermore, blasting is a noise concern for local residents, especially for those with pets and people suffering from PTSD. What precautions will be taken to mitigate the increased traffic and noise levels from this project?

Response 398-8

The project's traffic-related impacts are evaluated in Draft EIR Section 4.17, "Transportation." The issues of noise and air quality are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. As described on Draft EIR page 2-42 of the Draft EIR, blasts would be limited to "one to two times per week on weekdays between the hours of 10 a.m. and

2 p.m." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See also Collective Response #29 regarding the project's potential contribution to traffic congestion.

Comment 398-9

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 398-9

See Collective Response #1 regarding the need for additional analysis and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 6.

Letter #399 March 9, 2025, Holly Clinard

Comment 399-1

I am writing to express my strong opposition to the proposed CEMEX Rockfield Expansion Project, which threatens to irreversibly damage the San Joaquin River and the surrounding environment for generations to come. As a parent, I have spent countless hours with my children enjoying the natural beauty of the river, and I am deeply concerned that this project will destroy a cherished local resource.

Response 399-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential to impacts the visual landscape of the project area is evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 399-2

The proposed expansion, which includes blasting hard rock instead of traditional sand and gravel mining, represents a significant escalation in environmental harm. The impact of a 600-foot-deep mine—equivalent in scale to a 43-story high-rise—will permanently alter the river bottom, disrupt wildlife habitats, and degrade water quality. The project description fails to adequately address the long-term consequences of such a massive excavation, including how it will affect groundwater levels, sediment transport, and the delicate ecological balance of the region.

Response 399-2

The analysis of the project's potential environmental impacts is provided in Draft EIR Chapter 4, "Environmental Analysis." Potential impacts to wildlife habitats and water quality are addressed in Draft EIR Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality," respectively. Draft EIR Section 4.10 also discusses groundwater levels and sediment transport. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 399-3

Additionally, the need for this expansion is highly questionable. The project proponents have not provided sufficient evidence that additional aggregate resources are necessary at this scale, nor have they justified the supposed economic benefits in terms of jobs. Any short-term economic gain is vastly outweighed by the permanent destruction of an irreplaceable natural area.

Response 399-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. See also Collective Response #7 regarding evaluation of the project's potential economic effects.

Comment 399-4

Furthermore, the Environmental Impact Report (EIR) lacks sufficient mitigation measures to protect local communities from the noise, dust, and vibrations associated with blasting.

Response 399-4

See Collective Response #9 for discussion of the project's potential air quality impacts related to blasting. The Final EIR requires implementation of Mitigation Measures 4.3-2a and 4.3-2b to address the project's potential dust emission impacts and Mitigation Measure 4.10-1 to address noise and vibration resulting from blasting events. See

Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Sections 4.3 and 4.13. The commenter does not describe how these mitigation measures are insufficient or identify new or revised mitigation measures to address these impacts.

Comment 399-5

The transition from mechanical excavation to blasting introduces new hazards, yet the project documents fail to fully account for the risks of airborne particulate matter, potential seismic effects, and the broader environmental footprint.

Response 399-5

The issue of airborne particulate matter is addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Collective Response #9 regarding the project's potential air quality impacts, including impacts related to blasting. Potential seismic effects are discussed in Draft EIR Section 4.7, "Geology and Soils." See Impacts 4.7-1 and 4.7-2, beginning on Draft EIR page 4.7-26. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter does not identify how these analyses are inadequate and no further response can be provided.

Comment 399-6

The San Joaquin River is a vital resource for our community, providing recreation, wildlife habitat, and ecological benefits that cannot be replaced. I urge you to reject this proposal and protect the river for future generations.

Response 399-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #400 March 9, 2025, Priscilla Craft

Comment 400-1

I have lived in Fresno since 1967. I have enjoyed many years along the San Joaquin River hiking, cycling and canoeing. We are so fortunate to have such a beautiful river so close to Fresno. Why do we want to ruin the Lost Lake area with such a horrendous mining project?

The CEMEX proposal for the Rockfield Expansion Project along the San Joaquin River threatens so much. This proposal location is

surrounded by popular picnic areas, hiking trails, biking, and fishing.

Response 400-1

This is an introductory comment that does not address the adequacy of the Draft EIR. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Responses 400-2 to 400-8, below that address specific issues raised in this comment letter.

Comment 400-2

This project is highly unusual and like no other local project in the past because of two main unacceptable factors:

1. 600 Foot Depth over 100 years: Other quarries have typically been only 30 to 50 feet deep and permitted for only 30 to 50 years. No one knows the effects to the river and environment with a 600-foot hole 100 years from now. What sediment is that deep? What potential toxins will seep into the river? How will restoration look with such a deep hole? What assurance do we even have that restoration will ever be enforced and followed through, since none of us will be alive by then?

Response 400-2

This comment describes other existing quarries that are not relevant to the evaluation of the proposed project. The effects of the proposed Quarry Site excavation are disclosed and evaluated throughout the Draft EIR. The issues of sediment and surface water quality degradation are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Draft EIR Section 4.1, "Aesthetics and Visual Resources," for discussion of the project's potential impacts to the post-reclamation visual landscape. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. The project sites would be reclaimed as described in the proposed Surface Mining and Reclamation Plan provided as Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan." Reclamation of the project sites in accordance with this plan would be legally required and would be enforced by Fresno County through its Surface Mining and Reclamation Ordinance and, as necessary, by the California Division of Mine Reclamation under the Surface Mining and Reclamation Act (SMARA).

Comment 400-3

2. Drilling and Blasting: This has NEVER been permitted on the river. While nonprofits are preserving more and more public trust properties all around this proposed site for the purpose of outdoor recreational use, and building more and more trails, CEMEX wants

to blast this area with explosives. This is ABSOLUTELY UNACCEPTABLE and makes no sense. The peaceful enjoyment for recreationists will be ruined by the continued blasting. Lost Lake will no longer be a peaceful getaway. Canoeing down the river will no longer be peaceful. Walking the Eaton Trail or exploring Ledger Island will no longer be peace and quiet. Have you seen the numbers of people that come out to enjoy these popular trails every day?

Response 400-3

The project sites have been permitted and used for mining activities for the past approximately 100 years. Therefore, mining would not be a new use in the project area. The commenter is also referred to the description of proposed blasting procedures on page 2-42 of the Draft EIR Chapter 2, "Project Description," which state that *"[b]lasting would occur one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m."* See Collective Response #27 regarding the project's potential operational effects on nearby parks and trails.

Comment 400-4

Additionally, the fish will be affected by water vibrations, and birds will be misguided by air vibrations.

Response 400-4

See Collective Responses #16 and #13 regarding the potential effects of blasting vibration on salmon spawning and birds, respectively.

Comment 400-5

How far will blasting be heard due to the capacity for water to carry sound? Valley Children's Hosptial? City of Friant? The Parkway River Center? Woodward Park? Will the blasting vibrations affect the integrity of Friant Dam itself?

Response 400-5

See Draft EIR Section 4.13, "Noise," for evaluation of the project's potential operational noise and vibrational effects on surrounding properties, including blasting. Draft EIR Figure 4.13-1, "Nearest Sensitive Receptors to Plant Site," and Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site," show the location of the nearest sensitive receptors to the Plant Site and the Quarry Site, respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.13. With implementation of Mitigation Measures 4.13-2 and 4.13-3, none of these sensitive receptors would be significantly affected by the project's operational noise. Receptors located even further away from the

project sites, such as Valley Children's Hospital mentioned by the commenter, which is over seven miles away, would experience comparatively lesser to no noise impacts.

Comment 400-6

In addition to my two main points, there is also the heavy truck traffic along Friant Road and Willow Avenue, creating noise and safety issues in nearby neighborhoods.

Response 400-6

The issues of truck traffic and transportation safety are addressed in Draft EIR Section 4.17, "Transportation," while the issue of traffic noise is addressed in Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #29 regarding the project's truck trips and Collective Response #30 regarding transportation safety. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 400-7

Yes, I understand our local construction companies need gravel. However, the Fresno area already has 180% of the gravel it needs for the next 50 years. Need for more local gravel is not a valid argument.

Response 400-7

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 400-8

Please vote against this absurd project. It is too deep, too many years, too noisy and too destructive. This popular recreational area along the San Joaquin River is not the proper location for such a massive project.

Response 400-8

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Draft EIR Section 6.4.2.1, "Alternative Site Locations," for a discussion of the Draft EIR's evaluation of reasonable alternative locations for the project.

Letter #401 March 9, 2025, James Crane

Comment 401-1

I understand that monied interests and politics have an influence on how cities and counties regulate business expansion. However, occasionally such influence will attempt to downplay concerns for potential harm to people, neighborhoods, and the environment.

I have briefly reviewed the Draft EIR 7763 and agree with the San Joaquin River Parkway and Conservation Trust's assessment as well as with Marek Warszawski's Op Ed (Fresno Bee 2/18/25), that the CEMEX Corporation should be required to provide additional analysis, stronger mitigation measures, and financial guarantees. All of these issues should be addressed and presented for public review BEFORE the EIR is finalized.

Thank you for your consideration.

Response 401-1

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. The comment is noted for the consideration of the decision-makers.

Letter #402 March 9, 2025, Catherine Curry McNally

Comment 402-1

I am writing to express my strong opposition to the proposed CEMEX mining operation, as outlined in the draft Environmental Impact Report (EIR). My concerns revolve around the severe visual, environmental, and noise-related impacts this project would impose—particularly given its proximity to the San Joaquin River, nearby groundwater wells, and residential communities. I also want to emphasize the critical role you and other decision-makers hold in safeguarding our region's future.

Response 402-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR. The Draft EIR analyzes the project's potential impacts related to aesthetics, noise, water quality, and water supply in Section 4.1, "Aesthetics and Visual Resources," Section 4.13, "Noise," and Section 4.10, "Hydrology and Water Quality," respectively. See also Responses 402-2 through 402-6 below, which address the commenter's specific concerns.

Comment 402-2

As a graphic designer with extensive experience in designing layouts and assisting clients in putting together comprehensive business proposals, I understand that every element included—or omitted—in a presentation carries significant weight. Over the years, I have worked with clients across various industries, which has honed my ability to scrutinize the details that truly matter. That is why I am particularly troubled by the images included in the EIR. **These photos fail to show any evidence of heavy machinery, debris, or transport trucks—essential elements of a large-scale mining operation.** Instead, they depict a pristine, recreational landscape that is entirely unrepresentative of industrial mining. This discrepancy raises serious doubts about the transparency and credibility of the entire report. To highlight the stark contrast between the EIR's portrayal and reality, I plan to submit both actual photos from existing mining sites and photo-shopped images showing what this site would truly look like under CEMEX's proposal.

Response 402-2

The Draft EIR adequately characterizes the existing setting of the Plant and Quarry sites in Section 2.4, "Existing Conditions." The description includes a discussion of the history of mining operations that have occurred on both sites, and includes the acreage that has been disturbed by mining operations (Draft EIR pages 2-8 through 2-23). See also Draft EIR Figure 2-1, "Plant Site Aerial," and Figure 2-2, "Quarry Site Aerial," for a depiction of the current conditions of each site.

Comment 402-3

The EIR's claims regarding noise and other environmental impacts are similarly unconvincing. Suggesting that large-scale mining equipment—such as grinders, front loaders, and hydraulic machinery—will produce only a minimal increase in decibel levels is akin to expecting a lion to meow like a house cat. Such assertions only serve to obscure the real consequences of this operation.

Response 402-3

See Responses 11-27, 58C-13, 58C-14, and 60-15.

Comment 402-4

Furthermore, the proposal's emphasis on operating for 100 years and creating a 600-foot deep pit appears to be a calculated distraction. Rather than addressing these long-term figures, we

must confront the undeniable fact that, from day one, this project will unleash immediate devastation upon our environment and community.

Response 402-4

The Draft EIR's visual impact analysis provides visual depictions of existing conditions from a selected viewpoint, Stage 1 operational view (1-30 years), Stage 2 operational view (31-100 years), and post-reclamation, thus encapsulating the entire duration of the proposed project. See Draft EIR Section 4.1 for further discussion of the project's potential impacts to visual resources. See also Collective Response #5 regarding the duration of the project and Collective Response #8 for further discussion of mitigating the visual impact of the quarry pit.

Comment 402-5

I am also deeply concerned that the operating hours proposed in the EIR contradict Fresno County's own noise ordinance (8.40.040), signed on December 17, 2024. This ordinance was enacted specifically to protect our community from excessive noise and disturbance. By proposing operating hours that violate these standards, the EIR not only undermines local regulations but also calls into question the commitment of those overseeing this project to uphold the community's well-being.

Response 402-5

See Draft EIR Section 4.13 for more information pertaining to the noise impacts analysis. See the Draft EIR's discussion of Impact 4.13-2 and Impact 4.13-3. The noise impact analysis accounts for the project's potential impacts to daytime and nighttime noise thresholds. With the implementation of Mitigation Measures 4.13-2 and 4.13-3, the potential for the project to exceed the noise thresholds set forth in the Fresno County Noise Ordinance and the Fresno County General Plan would be less than significant.

Comment 402-6

I urge you to recognize the significant responsibility that comes with your position. You and your colleagues are fortunate enough to be the decision-makers who can protect our most cherished resources—including the San Joaquin River—from potentially irreversible harm. Approving a project of this nature would not only degrade the environment but also erode public trust in those elected and appointed to serve the best interests of the community.

This project is neither necessary nor beneficial when weighed against its potential damage. If CEMEX or the county truly believes more aggregate is needed, they should seek a more suitable

location—one that is not adjacent to critical waterways, residential areas, or treasured open space.

I respectfully request that the Planning Department reject this permit. The EIR is inadequate, misleading, and fails to address the true scope of this project's environmental and community impacts. A decision to green-light the mining operation would be a disservice to the people of Fresno County, now and for generations to come.

Thank you for your time and consideration. I implore you to uphold your commitment to serving the public interest by rejecting this proposal. Let us protect and preserve our region's natural beauty, rather than surrender it to a mining operation that is out of place and out of touch with our community's needs.

[Graphics and simulations were included as part of Comment Letter 402 that are not reproduced here. To view these graphics please see Letter 402 in Final EIR Appendix M, "Draft EIR Comment Letters."]

Response 402-6

The commenter's opposition to the proposed project is noted for County decision-makers. See Draft EIR Section 6.4.2.1, "Alternative Site Locations," for a discussion of the Draft EIR's evaluation of reasonable alternative locations for the project. See also Responses 402-1 through 402-5. The commenter fails to provide sufficient evidence or reasoning to support the assertion that the EIR is inadequate or misleading.

Letter #403 March 9, 2025, Melissa Dearing

Comment 403-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 403-1

The commenter's concerns are noted and will be considered by County decision-makers. The Draft EIR analyzes the project's potential impacts to water quality in Section 4.10, "Hydrology and Water Quality," air quality in Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), recreation in Section 4.16, "Recreation," wildlife in Section 4.4, "Biological Resources," and hazards in Section 4.9, "Hazards and

Hazardous Materials." Please see Responses 403-2 through 403-11 below for further discussion of the concerns raised in this comment.

Comment 403-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 403-2

See Response 349-2.

Comment 403-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 403-3

See Collective Response #17. See also Response 329-3.

Comment 403-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 403-4

Please see Collective Response #26 regarding baseline groundwater data used in the Draft EIR. Further, as discussed in Collective Response #25, due to the relatively low permeabilities of the underlying weathered rock and hard rock units, short-term intermittent flows do not result in any substantial additional movement of surface water to groundwater in the area of the project sites. Collective Response #25 further

demonstrates that Department of Water Resources criteria for interconnected surface water are not met at the project site.

Comment 403-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 403-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 403-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 403-6

Please see Collective Response #19 regarding the Draft EIR's evaluation of recreational sites adjacent to the project sites, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 403-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 403-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 403-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 403-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 403-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 403-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 403-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western

red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 403-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, as revised in this Final EIR, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and

would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need significant revision or recirculation.

Comment 403-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 403-11

The proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required. As further discussed in Chapter 3, "Draft EIR Errata," of this Final EIR, the County has determined that recirculation of the Draft EIR is not required.

Letter #404 March 9, 2025, Kory Donati

Comment 404-1

I am an avid fisherman. The San Joaquin is a wonderful place to go fishing with my kids. We have many memories there. I am worried the cemex proposal will pollute/damage our favorite water way.

Please reject the plans to expand. I want my kids to be able to make their own memories there some day.

Response 404-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. No specific comments related to the adequacy of the

Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #405 March 9, 2025, Eric Downing

Comment 405-1

I am writing to strongly oppose the proposed CEMEX Rockfield Expansion Project, which poses significant and irreversible harm to the San Joaquin River and surrounding environment.

If approved, this project will:

- **Allow mining operations for 100 more years,** permanently altering the landscape and impacting local communities.
- **Create a massive 600-foot-deep mining pit,** deeper than Millerton Lake, drastically changing the region's natural topography.

Response 405-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #5 regarding the duration of the proposed use permit. See also Draft EIR Section 4.1, "Aesthetics and Visual Resources," for discussion of the project's potential effects on the visual landscape, and Section 4.10, "Hydrology and Water Quality," regarding the project's potential effects on the San Joaquin River. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 405-2

- **Introduce hard rock blasting near the river,** increasing the risk of water contamination, habitat destruction, and harm to fish and wildlife.

Response 405-2

The issues of hazardous substance contamination and water quality degradation are addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," and Section 4.10, respectively. The issues of potential habitat destruction and potential harm to fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 405-3

The San Joaquin River is a vital resource for our community, providing water, recreation, and crucial habitat for countless species. Allowing this expansion would prioritize corporate profit over environmental responsibility and long-term sustainability. I urge Fresno County to reject this proposal and prioritize the health of our natural resources.

Please ensure that community voices are heard and that environmental protections remain a top priority.

Response 405-3

The project's potential impacts on the San Joaquin River, recreation, and wildlife are addressed in Draft EIR Section 4.10, Section 4.16, "Recreation," and Section 4.4, respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #406 March 9, 2025, Jesus Flores

Comment 406-1

My name is Jesus, I'm a resident of the Central Valley and interested in preserving and caring for it, especially the San Joaquin river. What this CEMEX expansion will do is allow for many more years of mining, affecting not only the youth and people of today, but generations to come. We now and the people to come will see the loss of more natural habitats, in a state where many are already in danger of being lost.

Response 406-1

The effects of the proposed project are evaluated throughout the Draft EIR. See Draft EIR Section 4.4, "Biological Resources," for discussion of potential impacts to natural habitats. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 406-2

It will lead to a 600 ft deep mining pit, nearly double the depth of Millerton Lake. If all of that isn't enough, hard rock blasting will become increasingly more common.

Response 406-2

The commenter is referred to the description of proposed blasting procedures on page 2-42 of the Draft EIR, which states that "[b]lasting would occur one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." The frequency and duration of blasting would not deviate from that described in the project description. Regarding hard rock blasting becoming more common, the Draft EIR, as revised in this Final EIR, responds to and analyzes the potential environmental impact of the proposed project. Speculation regarding further blasting from other projects is outside the scope of this EIR.

Comment 406-3

Leading to impacted water quality, as if near yearly droughts aren't enough, and nearby wildlife will be affected as well.

Response 406-3

The issues of water quality and supply are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on wildlife are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 406-4

Overall, this expansion will only cause harm to local people and the environment. Disallow this expansion, prevent harm to the San Joaquin River and its local people.

Response 406-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #407 March 9, 2025, Dennis and Valarie Foley

Comment 407-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed.

My wife and I are both recreational kayakers and enjoy the San Joaquin River from Lost Lake to Fort Washington beach. Our concern is how is Cemex going to mitigate the water quality of the Quarry pit water seepage that will now include new increased sediment, chemical, and mineral levels as Cemex returns this water back into Dry Creek and eventually the San Joaquin River? Why does Cemex need to dig a 600ft. deep gravel pit anyway?

Response 407-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3, beginning on Draft EIR page 4.10-88, for a discussion of potential surface water quality degradation. Mitigation Measure 4.10-1 requires implementation of the Blasting Protocols, as revised in EIR Appendix H-9, "Revised Blasting Protocols," and specify practices to prevent the contamination of groundwater and surface water. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Blasting Protocols.

Comment 407-2

2. Air Quality and Dust Emissions.

How is Cemex planning to mitigate their negative impact on our local Air Quality and Dust Emissions with the implementation of "Blasting" in their mining operations and the increased rock trucks transporting more aggregate on a larger scale in uncovered trailers on Friant, Highway 41, Copper Ave, and other County roads?

Response 407-2

The issues of air quality and dust are addressed in Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. Mitigation Measures 4.3-2a and 4.3-2b would require implementation of measures to reduce pollutant emissions from off-road diesel equipment and to reduce dust from on-site roads and soil stockpiles. See Collective Response #9 regarding the project's potential impact on the existing air quality conditions in the region. See also Collective Response #29 regarding traffic congestion and project truck trips.

Comment 407-3

3. Biological Resource Impacts

How will Cemex's open pit gravel mine expansion request "not" add to further impact in many negative ways; our local and migratory bird populations, river fisheries and native mammal wildlife in

and around this mining project along our beautiful San Joaquin River?

Response 407-3

The project's potential impacts to fish and wildlife populations are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #15 for further discussion of potential impacts to bird species and Collective Response #12 regarding the project's potential impacts to salmon restoration efforts in the area.

Comment 407-4

4. Traffic and Noise Concerns

The city and county of Fresno are expanding housing and commercial business development in a northeast direction along the Friant road corridor. Along with this occurrence, the community of Friant is increasing their housing foot print as well.

How is Cemex's increase in gravel truck trip hours on Friant road not going to have many negative impacts with local traffic safety; regarding commuters, Millerton Lake & Lost Lake recreational users day travels, and bicyclists? The increase in gravel trucks will also further degrade our roads, create more auto windshield repairs, and add to overall negative background noise levels to nearby homes.

Response 407-4

The issues of traffic and noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #30 regarding transportation safety and vehicle damage from aggregate trucks. See Collective Response #29 regarding funding for road maintenance. See Impact 4.13-1 for a discussion of traffic noise. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 407-5

5. Cumulative Environmental Efforts

My wife and I have personally witnessed since 2001, the expansive housing growth that has occurred in Woodward Lake, all be impacted in at least one or more negative ways should Cemex be allowed their

request! Copper River, North Willow Ave., and Friant areas that will

Response 407-5

The project's cumulative effects are described in Draft EIR Chapter 5, "Cumulative Impacts." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter.

Comment 407-6

The Cemex's Aggregate Extraction business can be successfully accomplished in other available and less imposing locations as is evident in the Vulcan Aggregate mining operations near the Kings River, east of Centervillle, CA.

My wife and I, as Woodward Lake homeowners, who are very concerned with this Cemex Rockfield Modification Project DEIR look forward to your response to our questions.

Response 407-6

See Draft EIR Section 6.4.2.1, "Alternative Site Locations," for discussion of the Draft EIR's evaluation of reasonable alternative locations for the project.

Letter #408 March 9, 2025, Linda Garcia

Comment 408-1

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation I request that the Planning Department reconsider this permit.

Thank you for your time and consideration.

Response 408-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #409 March 9, 2025, Acsa Garcia-Aceves

Comment 409-1

My name is Acsa Garcia-Aceves. As a resident of the Central Valley, I am very interested in preserving and caring for it, especially the San Joaquin river. What this CEMEX expansion will do is allow for many more years of mining, affecting us and generations to come.

This project will cause the loss of more natural habitats, in a state where many are already in danger of being lost.

Response 409-1

The effects of the proposed project are evaluated throughout the Draft EIR. See Draft EIR Section 4.4, "Biological Resources," for discussion of potential impacts to natural habitats, and Draft EIR Section 4.10, "Hydrology and Water Quality," for discussion of the project's potential impact on the San Joaquin River. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 409-2

It will lead to a 600 ft deep mining pit, nearly double the depth of Millerton Lake. If all of that isn't enough, hard rock blasting will become increasingly more common.

Response 409-2

The commenter is referred to the description of proposed blasting procedures on page 2-42 of the Draft EIR Section which states that "[b]lasting would occur one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." The frequency and duration of blasting would not deviate from that described in the project description. Regarding hard rock blasting becoming more common, the Draft EIR responds to and analyzes the potential environmental impact of the proposed project. Speculation regarding further blasting from other projects is outside the scope of this EIR.

Comment 409-3

This will impact water quality, which will in turn negatively impact wildlife.

Response 409-3

The issues of water quality and supply are evaluated in Draft EIR Section 4.10. The project's potential effects on wildlife are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 409-4

Overall, this expansion will only cause harm to local people and the environment.

Disallow this expansion, prevent harm to the San Joaquin River and its local people.

Response 409-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #410 March 9, 2025, Paul M. Gibson

Comment 410-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. As a former board member of the San Joaquin River Conservancy, appointed by Governor Brown, I am concerned how often the DEIR inadequately recognizes critical dangers to the San Joaquin River and the State owned San Joaquin Conservancy lands that surround the project.

The conservation and restoration of the San Joaquin River, its flows, its habitat, and its use by the public have been supported by taxpayers for nearly 40 years. For decades, public use of the land has been exponentially increasing. A project that will greatly impact the River and surrounding land use for the next 100 years needs to carefully detail the mitigation measures necessary to protect hundreds of thousands of citizens visiting their public lands each year. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 410-1

The commenter's former position as a board member of the San Joaquin River Conservancy and concerns regarding the Draft EIR are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. Please see Responses 410-2 through 410-13 below for responses to specific concerns raised in this comment. The Draft EIR analyzes the project's potential impacts to water quality, air quality, recreation, wildlife, and hazards in Draft EIR Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced herein.

Comment 410-2

Lack of Mitigation for Rapidly Increasing Public Visitation, Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Contradictions to Master Plan for the San Joaquin River Parkway:** The DEIR does not address the harm the project will do to public access to the San Joaquin River. The Master Plan for the San Joaquin River Parkway calls for dramatic increase in the public access points to the River. The DEIR does not address increased public use of areas surrounding the project. Currently, public visitation to State owned Conservancy lands is increasing by the thousands every year. A 100 year project in the middle of one of the State's fastest growing regions needs to consider that visitors to the River Parkway will likely be in excess of 1 million people per year in the near future.

Response 410-2

Please see Collective Response #18 pertaining to the project's consistency with San Joaquin River Parkway Master Plan, please see Collective Response #21 pertaining to public access to the San Joaquin River, and please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 410-3

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 410-3

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 410-4

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 410-4

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 410-5

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining? In the region with some of the nation's highest rates of child asthma, it is imperative that CEMEX's current operations be seen as a contributor to current health outcomes. The public has a right to see the project's emissions as compared to a no-project scenario.

Response 410-5

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 410-6

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 410-6

See Response 349-2.

Comment 410-7

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?

- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 410-7

See Collective Response #17 regarding flooding and pit capture. See also Response 329-3.

Comment 410-8

- The San Joaquin River Conservancy has spent millions of dollars fixing breached quarry ponds downstream from the project. More public funds have been spent on the restoration of habitat and water flow by the San Joaquin Salmon Restoration project. The DEIR should identify impacts to these projects.

Response 410-8

Please see Collective Response #12 pertaining to San Joaquin River restoration efforts. The Draft EIR addresses potential impacts to the environment as a result of the project and prescribes mitigation measures where necessary to reduce impacts to less than significant levels. An in-depth review of existing conditions and potential effects of the project on hydrology is provided in Draft EIR Section 4.10. Impacts related to biology are evaluated in Section 4.4 at Impact 4.4-2 and 4.4-6, including mitigation measures to reduce effects to salmonids to less than significant levels. Blasting activities would be infrequent and brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in significant impacts to wildlife. Please see Responses 58-37, 58-38, 58-40, 58-41, and 58-42 for further discussion of blasting impacts upon wildlife.

Comment 410-9

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 410-9

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 410-10

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.

- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 410-10

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 410-11

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 410-11

Please see Collective Response #19 regarding the Draft EIR's evaluations of recreational sites adjacent to the project sites, and please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 410-12

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation

measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 410-12

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need significant revision or recirculation.

Comment 410-13

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees

from CEMEX. The additional information will need to be drafted and recirculated for public review before finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 410-13

The proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required.

Letter #411 March 9, 2025, Brandon Gonzalez

Comment 411-1

I am writing to formally document my dissent as a citizen of Fresno towards the proposed 100-year permit for the CEMEX mining operation. Having look through the applicable sections of the EIR, I want to strongly express my concern for the soundness of the EIR.

I have lived my whole life near the San Joaquin River, and make frequent birdwatching trips along its expanse, as I have since I was a child. As I am certain you're aware of, our location in the Central Valley provides prime habitat for many endemic, and often endangered, species.

Response 411-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The commenter does not address the adequacy of the Draft EIR. The Draft EIR analyzes impacts to wildlife and special status species in Section 4.4, "Biological Resources." Please see Responses 411-2 through 411-4 below for discussion of specific concerns. See also Chapter 3, "Draft EIR Errata."

Comment 411-2

One threatened species that I can personally vouch has been present very near the proposed mining site is the Swainson's hawk (*Buteo swainsoni*). A nest has been observed as recently as 2022-2023 along the San Joaquin, in Woodward Park.

I am not an expert and merely a lifelong hobbyist, but I am certain that others with more specific areas of expertise could provide

similar contradictions to the current EIR findings. Additionally, the survey states that Osprey were detected as far back as 2017, another species which I can firsthand attest still nests along the San Joaquin. It is my firm belief that a survey from nearly 8 years ago is completely insufficient in determining the status of vulnerable species. Furthermore, whether a particular species is sighted directly on either of the proposed sites is an incredibly short-sighted plan of approach, as actions as drastic as blast mining the riverbed would obviously have much further reaching effects than those that may be observed directly in their borders.

Response 411-2

The Draft EIR analyzes impacts to nesting birds, including raptors like Swainson's hawk and osprey, in Draft EIR Section 4.4. Due to the moderate potential of certain raptor species' (e.g. Swainson's hawk and osprey) to forage over the project sites, the Draft EIR includes Mitigation Measure 4.4-1c, which sufficiently reduces impacts to these species to less than significant. See discussion of Draft EIR Impact 4.4-1 on page 4.4-48. The Draft EIR analyzes potential blasting impacts to wildlife species in the riparian area surrounding the Plant and Quarry sites in Impact 4.4-2 and concluded that these impacts would be less than significant. See Response 65-12 for further discussion of blasting impacts to wildlife. See also Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.4.

The conclusions regarding the presence of certain species at the project sites are supported by literature searches and by multiple field surveys conducted on and adjacent to the project sites. The field surveys conducted in 2017, 2019, and 2021 for the purposes of analyzing the project's potential impacts to biological resources are sufficient under CEQA. See Response 65-5 regarding the sufficiency of the above-mentioned field surveys.

Comment 411-3

According to publicly accessible records (such as https://www.conservation.ca.gov/cgs/Documents/Publications/Map-Sheets/MS_052_California_Aggregates_Report_201807.pdf)

Response 411-3

Response Text

Comment 411-4

Fresno has no need for this project and already has more than adequate access to locally sourced gravel. Attempts to frame this operation as empowering our community with locally sourced materials are a blatant exaggeration of the truth.

Response 411-4

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 411-5

The San Joaquin River has sustained sever damage already, and it is my firm belief that this operation would set any conservation efforts back immensely as well as desecrate the natural beauty that all in our community should have access to. The current EIR is not nearly comprehensive enough in its studies of the local impact of this project. As a citizen of Fresno and lifelong admirer of the river habitat we are lucky enough to still have, I implore the Planning Department to reconsider this hasty proposal.

Response 411-5

Please see Responses 411-1 through 411-3 above for discussion of the specific issues raised in the comment letter. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project, and provides mitigation measures where necessary to minimize adverse effects. The commenter's concerns, requests, and opinions regarding the project are noted and will be considered by County decision-makers.

Letter #412 March 9, 2025, Carol Hansen

Comment 412-1

I would like to express my concern regarding CEMEX Rockfield Quarry site northeast of Fresno seeking an extension of its sand and gravel mining operations. My husband and I have a home in the subdivision of Copper River Country Club and are alarmed that this expansion will cause new harm to the San Joaquin River, not to mention to the health of our community and the environmental impact that it has on those living and working in the area.

Response 412-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 412-2 through 412-4, below that address specific issues raised in this comment letter.

Comment 412-2

The California Geological Survey Report clearly shows that there are other local sources available to CEMEX that will provide aggregates.

Response 412-2

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 412-3

All along Friant Road and Copper Avenue continuing north, the city population has grown tremendously. The impact of CEMEX's continuing to mine and blast in this area negatively impacts the environment. It is a negative impact to air quality, water quality, fish and wildlife, the San Joaquin River, traffic, recreation, land use and planning, and visual aesthetics.

Response 412-3

The comment lists numerous potential environmental issue areas that could be impacted by the proposed project. These environmental issues areas are evaluated in the following Draft EIR sections in the order they appear in the comment: Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.10, Hydrology and Water Quality," Section 4.4, "Biological Resources," Section 4.17, "Transportation," Section 4.16, "Recreation," Section 4.11, "Land Use and Planning," and Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 412-4

In addition, in this proposal, CEMEX wants to dynamite hundreds of feet below ground in close proximity to one of the country's endangered rivers. We oppose this project and hope that the Fresno County Board of Supervisors does not grant an extension to CEMEX. Thank you for the opportunity to respond to this proposal.

Response 412-4

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #413 March 9, 2025, Keith Hawkyard

Comment 413-1

Dear Mr. Randall, help us preserve the beauty and serenity of the San Joaquin river. Every natural resource does not need to be exploited to depletion we have already reduced the water flow such that the river no longer flowed to the delta and only does now seasonally because of law suits. Let's not destroy the natural beauty of the riparian environment around the river by further expanding the gravel mining operation. Fresno County consistently misses opportunities to enhance the quality of life of its residents by neglecting to create and maintain public spaces for recreation do not turn the river bottom into a desolate polluted and cratered mess.

Response 413-1

The project's potential effects on the visual landscape of the project area are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." The project's potential effects on the San Joaquin River and recreation are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.16, "Recreation," respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #25 addressing the potential for seepage to impact river flows. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, this comment is noted for the consideration of the decision-makers.

Letter #414 March 9, 2025, Lori Hawkyard

Comment 414-1

Please stop the Cemex expansion to retain the beauty of the San Joaquin River corridor.

Response 414-1

The project's potential effects on the visual beauty of the project area are discussed in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #415 March 9, 2025, Harris and Pam Hays

Comment 415-1

I am writing to express my deepest condolences about Cemex Rockfield's expansion project in the San Joaquin Riverbed.

I have many concerns, not the least of which is the very lengthy proposed life of this permit for 100 years. This is totally unprecedented and should not be allowed!

Ten years be a far more reasonable time frame. A lot happen during this period. It is best to be cautious and evaluate their performance, in addition, new regulations may be adopted that should be applied to their permit, as well.

Response 415-1

See Collective Response #5 regarding the duration of the proposed use permit. The proposed project would be inspected annually by County staff or a County-retained consultant to ensure that the operation is in compliance with all applicable regulations, permits, and conditions of approval (including mitigation measures) in accordance with the County's Surface Mining Ordinance (Section 834.4.220 of the Fresno County Zoning Code).

Comment 415-2

The other major concern is the depth that they propose to mine, 600 feet deep into the riverbed! That has never been done before and what environmental damage can be done with digging 600 feet deep below the surface. I'm sure they don't, they just assume that they be able to deal with if it happens. We can't trust them. It could be a monument disaster and they just walk away do nothing! There is a very real risk and there will be no accountability on their part. What they want is a blank permit to do their thing and trust they will do the right thing. No way they have a history of failure!

Response 415-2

The potential effects of the proposed project, including the Quarry Site excavation, are evaluated throughout the Draft EIR and, where necessary, mitigation measures are provided to address identified significant impacts. The project would be inspected by County staff or consultants to determine compliance with applicable regulations, permits, and conditions of approval, and any violations would be managed in accordance with the requirements of the County's Surface Mining Ordinance. See Collective Response #4a regarding CEMEX's regulatory history.

Comment 415-3

The mining industry within the San Joaquin River has a poor history of mining responsibly and restoring the land to an environmentally responsible condition. It would be completely appropriate and necessary to require a BOND to assure They comply with all conditions and do not abandon the site when they are completed.

Please give serious consideration to these issues and comments as the San Joaquin River should not be destroyed but preserved.

Response 415-3

See Collective Response #4b regarding liability and funding for unforeseeable damages caused by the project. See also the proposed reclamation plan provided in Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan," and the summary in Draft EIR Section 2.5.7.2, "Quarry Site Reclamation Plans." The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #416 March 9, 2025, Clay Howell

Comment 416-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 416-1

The commenter's concerns regarding the Draft EIR and the project are noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The Draft EIR analyzes the project's potential impacts related to water quality, air quality, recreation, wildlife, and hazards in Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. Please see Responses 416-2 through 416-11 below for further discussion of the issues raised in this comment. See also Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 416-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 416-2

See Response 349-2.

Comment 416-3

What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?

Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 416-3

See Collective Response #17. See also Response 329-3.

Comment 416-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 416-4

See Response 403-4 and Collective Response #24, which explain that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 416-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

The DEIR should identify the timeframe and exact location of the trail to be constructed. The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 416-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 416-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 416-6

See Collective Response #19 regarding updates to the Draft EIR's descriptions of parks in the vicinity of the project sites. See also Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. The commenter erroneously claims that the Draft EIR does not evaluate noise impacts at adjacent parks. As shown on Draft EIR Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site," Lost Lake Park is identified as sensitive receptor Q-5 while Sumner Peck Ranch is identified as sensitive receptor Q-15. Table 4.13-17, "Estimated Quarry Site Noise Levels (dBA) at Nearest Receptors," on Draft EIR page 4.13-60 indicates that the applicable noise impact thresholds would not be exceeded at either of these locations with project implementation. Implementation of Mitigation Measure 4.13-3 would further reduce noise effects by requiring a combination of noise-reducing measures to ensure applicable noise thresholds are not exceeded at any of the surrounding sensitive receptor sites.

Comment 416-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

Scenic Degradation: The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock

staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 416-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 416-8

Traffic Congestion: Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

Response 416-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 416-9

Air Quality: The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 416-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 416-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 416-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, as revised in this Final EIR, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need rewriting or recirculation.

Comment 416-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 416-11

The proposed project would not result in significant impacts to water quality or water resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required. See also Chapter 3, "Draft EIR Errata," of this Final EIR for further discussion of recirculation.

Letter #417 March 9, 2025, Blue Kalmbach

Comment 417-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project.

Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. 1. Impacts on the San Joaquin River Watershed. The San Joaquin River Watershed provides a lot of water to crops and people, as well as a space to learn, explore and recreate. The CEMEX Rockfield Expansions Project will impede upon the river and leave lasting damage for futures to come. 2.

Response 417-1

The project's potential effects on the San Joaquin River watershed are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on recreation are discussed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 417-2

2. Biological Resource Impacts

The project would damage the waterway and surrounding riparian zones. Not enough analysis has been done on the project's impacts to the Swainson's Hawk.

Response 417-2

The project's potential effects on riparian habitat are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-4, beginning on Draft EIR page 4.4-55, for a discussion of riparian habitat and other sensitive natural communities. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #14 regarding the Draft EIR's analysis of impacts to Swainson's hawk.

Comment 417-3

Great progress has been made on increasing and restoring Chinook Salmon to the river but the project would set that back and increase harm and pollution.

Response 417-3

See Collective Response #12 regarding the project's potential effects on recent river and salmon restoration projects along the San Joaquin River.

Comment 417-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 417-4

See Collective Response #1 regarding the need for additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project.

Letter #418 March 9, 2025, Pamela Kammen

Comment 418-1

I am writing to express my strong objection to the proposed expansion of CEMEX. Allowing expansion would very likely threaten the river, fish, wildlife, air quality, and the quality of life for the people, including myself, who live close to the CEMEX concrete plant. As a long time Fresno resident I urge (and plead) you to vote no on this project.

Response 418-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The commenter lists numerous potential environmental effects of the proposed project each of which are evaluated in the following Draft EIR sections: Section 4.10, "Hydrology and Water Quality," Section 4.4, "Biological Resources," and Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3 "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. Quality of life is not a physical effect on the environment and therefore need not be considered in a CEQA analysis.

Letter #419 March 9, 2025, Cheryl and Terry Kershaw

Comment 419-1

My husband and I are long time residents of Sanger. We respectively have worked for the Community College District and CSU Fresno with expertise in ecology. We oppose the 100 year permit for the CEMEX mining operation particuilarly on grounds of the long term impact of wildlife habitat and community impacts.

Response 419-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts to wildlife habitats and communities are evaluated in Draft EIR Section 4.4, "Biological Resources." See also Draft EIR Section 5.3.4 "Cumulative Impacts," for a discussion of the project's potential cumulative impacts on biological resources. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 419-2

The San Joaquin river is an important recreational resources our Fresno and Madera community. A project of this scale requires a thorough analysis of the long term impact for our community.

Therefore we request that the Planning Department reconsider this permit so that a more thorough EIR is conducted.

Response 419-2

See Collective Response #1 regarding additional analysis and addressing requests for a more thorough EIR. See also Draft EIR Section 4.16, "Recreation," for a discussion of the project's potential effects on recreation. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The comment is noted for the decision-makers.

Letter #420 March 9, 2025, Ricky Kline

Comment 420-1

I am writing to express my strong opposition to the proposed Cemex company plan to blast a 600-foot deep pit near the San Joaquin River. As a concerned citizen, I am deeply troubled by the potential environmental, social, and economic impacts this project could have on the river and surrounding communities.

Response 420-1

This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 420-2 through 420-6, below that address specific issues raised in this comment letter.

Comment 420-2

The San Joaquin River is a critical waterway that supports local ecosystems, agriculture, and provides vital resources for thousands of residents. Blasting such a large pit near its banks threatens the integrity of this invaluable resource. The resulting disruption to the river's natural flow, along with the risk of contamination, could have long-term consequences on water quality and the health of local wildlife.

Response 420-2

The project's potential impacts to the San Joaquin River are primarily addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #17 regarding riverbank stability and the potential for breach and flooding of the Quarry Site excavation.

Comment 420-3

Additionally, this excavation poses an increased risk of soil erosion and landslides, which would further compromise the land and water surrounding the area.

Response 420-3

The issues of soil erosion and landslides are evaluated in Draft EIR Section 4.7, "Geology and Soils. See Impact 4.7-4, beginning on Draft EIR page 4.7-29, for a discussion of the project's potential to cause soil erosion. See Impact 4.7-3, beginning on Draft EIR page 4.7-28, for a discussion of the limited potential for the project to cause landslides. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.7. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 420-4

Furthermore, the environmental degradation caused by noise, air pollution, and dust from the blasting could negatively affect local communities and the health of residents living near the project site.

Response 420-4

The potential effects of proposed blasting (i.e., dust/air pollution and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 420-5

The disruption to the environment would likely impact property values, the livelihoods of those who depend on the river for farming and fishing, and could even harm the local tourism industry that benefits from the river's natural beauty and resources.

Response 420-5

See Collective Response #7 for a discussion of the evaluation of economic impacts under CEQA.

Comment 420-6

I urge you to reconsider this project and explore more sustainable alternatives. It is critical that we prioritize the long-term health of the San Joaquin River and the surrounding communities.

Our collective responsibility is to preserve and protect these natural resources, ensuring they remain accessible and viable for generations to come.

Thank you for considering my concerns. I look forward to your response and hope for a more sustainable solution to the needs of the Cemex company and the well-being of our environment.

Response 420-6

See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 6. The project would have no direct effect on any existing river access points in the project area. See Collective Response #21 regarding public access to the San Joaquin River (SJR). The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #421 March 9, 2025, Kathleen Klitz

Comment 421-1

I am a 40 yr resident of Woodward Lake who is horrified by the prospect of the expansion of these companies on the river bottom expanding. This is not the area to have blasting that can potentially affect the river environment. I'm very concerned not only of the noise and dust toxins but what this will surely do to the river's water table

Response 421-1

The potential effects of proposed blasting (i.e., dust and noise/vibration) are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.13, "Noise," as revised in this Final EIR. Potential effects to groundwater levels are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-8 through 4.10-13 beginning on Draft EIR page 4.10-102. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #25 regarding the potential for seepage to impact river flows. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 421-2

affecting wildlife and flora that we as residents have tried very hard to not disturb as we enjoy the beautiful trails.

Response 421-2

The project's potential effects on wildlife and plant species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #18 regarding the project's consistency with the San Joaquin River Conservation Master Plan.

Comment 421-3

I see a future of expensive litigation by these communities surrounding the precious river. We hope that future generations can continue to enjoy a healthy lifestyle in nature I disturbed by expansion for profit.

Response 421-3

The comment is noted for the consideration of the decision-makers.

Letter #422 March 9, 2025, Sarah Knight

Comment 422-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all. I am also concerned about the time of this project which goes 100 years into the future. This seems like too long of a time commitment when so many things can change in the next 100 years.

Response 422-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures. The Draft EIR analyzes the project's potential impacts to water quality, air quality, recreation, wildlife, and hazards in Section 4.10, "Hydrology and Water Quality," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality), Section 4.16, "Recreation," Section 4.4, "Biological Resources," and Section 4.9, "Hazards and Hazardous Materials," respectively. See also Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Please see Responses 422-2 through 422-11 below for discussion of the specific issues raised in this comment. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 422-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 422-2

See Response 349-2.

Comment 422-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 422-3

See Collective Response #17. See also Response 329-3.

Comment 422-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 422-4

See Response 403-4 and Collective Response #26, which explain that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 422-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.

- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 422-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 422-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The Noise from the rock crushing, blasting, and drilling will carry beyond the recreational areas to suburban housing areas. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 422-6

Please see Collective Response #19 regarding the Draft EIR's evaluation of recreational sites adjacent to the project sites. See also Collective Response #27 pertaining to the project's potential effects on adjacent parklands and recreational use areas.

Comment 422-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA. The view of a 600 foot deep open pit mine will be a blight on the landscape near the proposed project area.

Response 422-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 422-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR.

  CEMEX is not being held accountable for the road damage, gravel hitting windshields, and traffic congestion from its current operations before any new projects are added. Friant Road is already a dangerous road without any additional gravel trucks.

Response 422-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 422-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 422-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 422-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 422-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered. (Draft EIR, page 4.4-51.) With implementation of Mitigation Measures 4.4-1c and 4.4-1a, as revised in the Final EIR, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4 of the Draft EIR does not need rewriting or recirculation.

Comment 422-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 422-11

The proposed project would not result in significant impacts to water quality or water resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required. See also Chapter 3, "Draft EIR Errata," of this Final EIR for further discussion of recirculation.

Letter #423 March 9, 2025, Sandra Knudson

Comment 423-1

Please do not approve CEMEX expansion. It will harm the San Joaquin River.

Response 423-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Letter #424 March 9, 2025, Asgy Lame

Comment 424-1

My name is James, I'm a resident of the Central Valley and interested in preserving and caring for it, especially the San Joaquin river. What this CEMEX expansion will do is allow for many more years of mining, affecting not only the youth and people of today, but generations to come. We now and the people to come will see the loss of more natural habitats, in a state where many are already in danger of being lost.

Response 424-1

The effects of the proposed project are evaluated throughout the Draft EIR. See Draft EIR Section 4.4, "Biological Resources," for discussion of potential impacts to natural habitats. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 424-2

It will lead to a 600 ft deep mining pit, nearly double the depth of Millerton Lake. If all of that isn't enough, hard rock blasting will become increasingly more common.

Response 424-2

The commenter is referred to the description of proposed blasting procedures on page 2-42 of the Draft EIR which states that "[b]lasting would occur one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." The frequency and duration of blasting would not deviate from that described in the project description. Regarding hard rock blasting becoming more common, the Draft EIR responds to and analyzes the potential environmental impact of the proposed project. Speculation regarding further blasting is outside the scope of the EIR.

Comment 424-3

Leading to impacted water quality, as if near yearly droughts aren't enough, and nearby wildlife will be affected as well.

Response 424-3

This comment describes existing conditions along the San Joaquin that are not evaluated as part of the proposed project. The issues of water quality and supply are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential effects on wildlife are evaluated in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 424-4

Overall, this expansion will only cause harm to local people and the environment. Disallow this expansion, prevent harm to the San Joaquin River and its local people.

Response 424-4

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #425 March 9, 2025, Patricia Libby

Comment 425-1

Thank you for the opportunity to submit comments on the CEMEX Rockfield Expansion Project EIR.

Fresno and Fresno County are at a crossroads and it is critical that we take the right path.

In the last few days I have done quite a bit of study and have learned that:

- Fresno was founded several miles from the San Joaquin River in 1872 by the California Pacific Railroad.

- Cemex, a Mexican multinational company, began mining the San Joaquin in 1913.

- According to online journalist Gregory Weaver, Fresnoland, March 7, 2025, "The San Joaquin River, one of California's most beleaguered waterways, has endured over a century of exploitation. The river's flow reduced by 97%, its salmon runs were erased by dams, its wetlands stripped by decades of mining, and its floodplain in the heart of Freno carved into barren pits."

- Since my birth family moved to Fresno in 1965, Fresno growth has now reached the River, so the negative impact of Cemex on the River and our citizenry is too great for Cemex to continue at all.

- The San Joaquin River is our most precious resource for both nature and people. A DEIR is a distraction from what we really must do - end Cemex's operations on our River!

Response 425-1

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 425-2

- There are stockpiles from previous mining which will provide aggregate for decades to come.

Response 425-2

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 425-3

For their next 100 years, CEMEX proposes an even more dangerous and destructive type of mining than they have done in their past 112 years - going from mechanical digging of sand and gravel to blasting and crushing hard rock from a pit that goes 600 feet deep (2 football fields stacked vertically).

Response 425-3

The proposed project would at all times fully comply with California state law including the California Surface Mining and Reclamation Act (SMARA) and CEQA, and all applicable County and local rules, ordinances, and regulations. This includes the proposed method of mining.

Comment 425-4

"CEMEX has been fined more than $43 million for 81 separate environmental violations since 2000, according to Good Jobs First, a Washington, D.C.-based nonprofit that tracks corporate and government accountability in economic development," stated Marek Warszawski in an opinion article in the Fresno Bee, February 16, 2025.

Response 425-4

See Collective Response #4a regarding CEMEX's regulatory history.

Comment 425-5

- We should not be committing future generations to another 100 years of River destruction, along with visual, air and noise pollution; harm to wildlife and vegetation; decreased water quality; and, among others, traffic congestion and damage to vehicles from Cemex trucks.

Response 425-5

See Collective Response #5 regarding the duration of the proposed use permit. The comment lists numerous potential environmental effects of the project. These effects are addressed in the following Draft EIR sections: Section 4.10, "Hydrology and Water Quality," Section 4.1, "Aesthetics and Visual Resources," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13, "Noise," Section 4.4,

"Biological Resources," and Section 4.17, "Transportation." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 425-6

Over the years, we citizens of Fresno and Fresno County have developed pride in our community. A lot of that pride is connected to the San Joaquin River. Let's take the steps needed to restore the River and adjacent areas. Let's fulfill our dreams for the San Joaquin River Parkway and Conservation Trust. Let's end mining along the river!

Response 425-6

See Collective Response #18 regarding the project's consistency with the San Joaquin River Conservation Master Plan. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #426 March 9, 2025, Alana Little

Comment 426-1

I want to express my strong dislike for the CEMEX Expansion Project. I am a kayaker and small business owner here in Fresno. I take my kids to the waterways in our county and j cannot express to you how meaningful they are to me. I implore you to decline this proposal and keep our river clean!

Response 426-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section.

Letter #427 March 9, 2025, Alycia Mariano

Comment 427-1

I am writing to formally and clearly express my disgust with the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological,

and community impacts that this long-term operation will have on the San Juaquin Reiver and surrounding areas.

Response 427-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR. Please see Responses 427-2 through 427-7 below for further discussion of the commenter's specific concerns.

Comment 427-2

As someone with familiarity with the location, I find that the EIR fails to adequately address the following concerns:

1. **Impacts on wildlife habitat**

Response 427-2

Draft EIR Section 4.4, "Biological Resources," presents a sufficient evaluation of potential biological resources impacts of the proposed project, in accordance with CEQA standards. Please also see Collective Response #13 pertaining to impacts to offsite wildlife, Collective Response #14 pertaining to Swainson's hawk, Collective Response #15 pertaining to non-nesting birds, and Collective Response #16 pertaining to Salmon. The comment does not provide evidence of a deficiency in the EIR's analyses of biological resources that requires additional evaluation.

Comment 427-3

2. **Water quality for the wildlife and humans that enjoy the river's water.**

Response 427-3

Draft EIR Section 4.10, "Hydrology and Water Quality," presents a sufficient evaluation of potential water quality impacts of the project. Draft EIR Section 4.4, "Biological Resources," presents evaluation of potential biological resource impacts of the proposed project. The Draft EIR concluded that all potential impacts related to water quality, water supply, and wildlife would be less than significant with the implementation of mitigation measures. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 427-4

3. **Noise pollution for the wildlife, humans, and surrounding areas**

Response 427-4

Draft EIR Section 4.13, "Noise," provides a sufficient evaluation of potential noise and vibration impacts of the project. Draft EIR Section 4.4 presents evaluation of potential biological resource impacts of the proposed project. The Draft EIR concluded that the project's potential noise impacts would be less than significant. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 427-5

4. **Community health concerns, not just for those of us that enjoy the waters that flow down river but for the wildlife that lives in and around the river.**

Response 427-5

Draft EIR Section 4.10 presents a sufficient evaluation of potential water quality impacts of the project. Draft EIR Section 4.4 presents an evaluation of potential biological resource impacts of the proposed project. The Draft EIR concluded that all potential impacts to water quality, water supply, and wildlife would be less than significant with the implementation of mitigation measures. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 427-6

5. **Future impacts on the next generations that will live and benefit from the great San Juaquin River and surrounding areas.**

Response 427-6

The commenter's concerns regarding future generations and the San Joaquin River are noted and will be considered by County decision-makers. The Draft EIR provides a detailed analysis of potential impacts to hydrologic resources (See Draft EIR Section 4.10) and concludes that the project would not result in significant impacts to water quality or flows of the San Joaquin River.

Comment 427-7

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessmentsm [sic] and meaningful mitigation strategies. The EIR, as it stands,

does not meet these standards, and I strongly urge Fresno County to require revisions that fully account for the longOterm consequences of textending CEMEX's mining operations.

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Response 427-7

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required. See also Chapter 3, "Draft EIR Errata," of this Final EIR for further discussion of recirculation.

Letter #428 March 9, 2025, Julie Marlow

Comment 428-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project.

The San Joaquin River Parkway Trust has been working to restore the San Joaquin River for many years. This would take away from that effort.

Given the significant potential environmental and community impacts associated with this project,

I urge you to strongly consider not moving forward with approval.

Response 428-1

See Collective Response #18 regarding the project's consistency with the San Joaquin River Conservation Master Plan and Collective Response #12 regarding the project's potential effects on local salmon restoration efforts. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 428-2

I'm very concerned about the impact of blasting so close to the San Joaquin River Parkway. It appears there will be adverse effects such as noise, air and water quality, and the physical landscape itself.

Response 428-2

See Collective Response #27 regarding the project's operational effects, including blasting, on users of nearby parks and trails. The issues of noise, air quality, and water quality are addressed in Draft EIR Section 4.13, "Noise," Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10, "Hydrology and Water Quality." Changes to physical landscape are primarily addressed in Draft EIR Section 4.1, "Aesthetics and Visual Resources," and Section 4.7, "Geology and Soils." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 428-3

To avoid the impact on the land, and human and animal residents, is there an alternative site to continue mining? Ideally one that that is not so detrimental to the environment, air quality and the surrounding areas? What has already been researched?

Response 428-3

See Draft EIR Section 6.4.2.1, "Alternative Site Locations," for discussion of the Draft EIR's evaluation of reasonable alternative locations for the project. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Chapter 6, "Alternatives."

Comment 428-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments.

Response 428-4

See Collective Response #1 regarding the need for additional analysis, enhanced mitigation measures, and public transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a reasonable range of alternatives to the proposed project. The project's potential impact on the San Joaquin River is addressed in Draft EIR Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Letter #429 March 9, 2025, Janice Marshall

Comment 429-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

First of all, I am greatly concerned about a negative impact on air quality in the region. The DEIR states project emissions may exceed cancer risk thresholds (pg. 4.3-63).

The surrounding public lands are used by outdoor enthusiasts for hiking, canoeing, walking on the many trails adjacent to the River, and by school children on outings to Ball Ranch, Lost Lake, and the Madera side of the River on educational and recreational trips. As I am sure you are aware, Fresno County struggles with air quality for much of the year. The impact of the CEMEX expansion project may shorten the window of opportunity for students to enjoy these outings simply due to the fact the air is not safe to breathe.

Response 429-1

The issue of air quality is addressed in Draft EIR Section 4.3, as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this section of the EIR. The commenter identifies the discussion of the project's potential unmitigated health risk impacts summarized in Draft EIR Table 4.3-24, "Unmitigated Project Health Risk Impacts," on page 4.3-63. Table 4.3-25, "Mitigated Project Health Risk Impacts," as updated in this Final EIR, summarizes the reduction in the project's potential health risk impacts with the implementation of Mitigation Measures 4.3-2a and 4.3-2b, which would require the reduction of pollutant emissions from off-road diesel equipment and measures to reduce dust from on-site roads and soil stockpiles. With mitigation, the project would not result in cancer, chronic, or acute health risks. See also Collective Response #9 regarding the project's potential impact on the existing air quality in the region and Collective Response #27 regarding the project's potential operational effects on users of nearby parks and trails. The comment is noted for the consideration of the decision-makers.

Comment 429-2

Secondly, I am having difficulty reconciling the great opportunities for recreation, wine tasting, outdoor events and live music, Respite by the River events with the possibility that

within a distance of less than 2-3 miles CEMEX could simultaneously be blowing a massive pit nearly twice as deep as Millerton Lake. I want to continue to enjoy events at Solitary Cellars, take friends hiking at Ball Ranch, and attend events at the River Center knowing that CEMEX is required to employ enhanced mitigation measures while ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions of this important matter.

Response 429-2

The commenter is referred to the description of proposed blasting procedures on page 2-42 of the Draft EIR, which states that "[b]lasting would occur one to two times per week on weekdays between the hours of 10 a.m. and 2 p.m." See also Collective Response #27 regarding the project's potential operational effects, including blasting, on users of nearby parks and trails. The comment is noted for the consideration of the decision-makers.

Letter #430 March 9, 2025, Ivory Maxwell

Comment 430-1

Hello , my name truly doesn't matter in these battles but one thing is for sure I AM APART OF THE COMMUNITY OF SAN JOAQUIN BORN AND RAISE . I DO NOT AGREE WITH THE PROJECT OF BLOWING A **600ft deep hole pit** , what are you trying to find that deep that's not above? I consistently question the TRUE PURPOSE of using explosives. In physics Explosive =heat+ energy = vibration = motion, binding , bending =creating chaos/pressure to the tonic plates . EVERY ACTION HAS A REACTION THATS LAW! So It's truly upsetting to see 2 male adolescents (CEO's) having horrible imaginations and lazy ideas that potential leave a hazardous situation for the community that devotes time and energy blood sweat and tears for San Joaquin to be . I bet the 2 billionaire ceos don't live in San Joaquin so why would they care about the reaction from their actions ? They leave when disaster hits but natives stay to Rebuild . Last but not least say if the hole is exploded and nothing is to be found 600ft deep . Then what does San Joaquin do with a 600ft deep hole?? I HIGHLY SUSPECT THIS PROJECT HAS A SECRET AGENDA it's to many red flags to not have a concern and the ones who don't have a concern are the ones doing ZERO labor work just pointing fingers and giving quotas . Boo this world sucks :(

Response 430-1

No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the commenter's opposition to the project is noted for the consideration of the decision-makers.

Letter #431 March 9, 2025, Laura Menendez

Comment 431-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

Mining processes release large amounts of dust and particulate matter into the air, which can significantly deteriorate air quality and contribute to respiratory issues for those living in nearby areas.

Response 431-1

The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See also Collective Response #9 regarding the project's potential impact on the existing air quality conditions in the region. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 431-2

Furthermore, mining waste often finds its way into water systems, contaminating drinking water, agricultural land, and aquatic ecosystems. This pollution could result in an increase in diseases and health problems within our community, further straining public health resources.

Response 431-2

The issues of hazardous materials and potential water quality degradation are addressed in Draft EIR Section 4.9, "Hazards and Hazardous Materials," and Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-1 through 4.10-3 for discussion of surface water quality impacts. See also Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 431-3

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Response 431-3

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See also Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter. The comment is noted for the consideration of the decision-makers.

Letter #432 March 9, 2025, Inga Minton

Comment 432-1

Dear David,

I am a 40 year resident of Clovis, California and I appreciate the opportunity to submit comments on the Draft Environmental Impact Report for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with this project approval.

1) Impacts on the San Joaquin River Watershed

Our residence is reasonably close to the Cemex plant. We have drilled 4 wells on our rural property, chasing an ever declining water table. What will be the impact of continuously pumping water out of a 600' hole near the river? Will all that water pumping further deplete an already impacted water table? An environmental impact statement for CEMEX needs to address impacts to our limited underground water supply.

Response 432-1

The project's potential impacts on groundwater levels are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impact 4.10-10, beginning on Draft EIR page 4.10-105, for a discussion of potential impacts to groundwater levels at the Quarry Site. Mitigation Measure 4.10-10a would require implementation of an adaptive management program at the Quarry Site including groundwater modeling and implementation of corrective measures if significant impacts to groundwater levels occur. Mitigation

Measure 4.10-10b would provide a funding mechanism for the adaptive management program to ensure its implementation as long as it is necessary. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also Collective Response #24 regarding implementation and funding of the adaptive management program.

Comment 432-2

2) Air quality and dust emissions

Working as an RN in this highly polluted air basin, I have seen first hand the impacts of air pollution. One in 4 children in our county have asthma and numerous studies link proximity to busy streets and freeways with asthma severity. 3 of oir grandchildren growing up in Clovis have asthma. The emissions of diesel trucks and dust contribute enormously to the disease burden of our children. The Cemex plant is a major contributor of these emissions.

Response 432-2

The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See Impact 4.3-3, as revised in the Final EIR, for a discussion of the project's potential health risk impacts related to air emissions. Appendix D-4 confirms that Impact 4.3-3 was determined to be less than significant. Additionally, Mitigation Measures 4.3-2a and 4.3-2b would require the implementation of measures to reduce pollutant emissions from off-road diesel equipment and to reduce dust from on-site roads and soil stockpiles (see Appendix D-4, Table 4.3-25, "Mitigated Project Health Risk Impacts"). See also Collective Response #9 regarding the project's potential impact on existing air quality conditions in the region.

Comment 432-3

3) Biological Resource impacts

Clear cold water is essential to fish habitat, including restoring Salmon to the San Joaquin River. Loss of the fishery impacts the entire riparian ecosystem, including the birds and even river otters that rely on fish. We kayak the San Joaquin river almost weekly and see these beautiful birds including Bald Eagles, Swainson's hawks and Osprey on a regular basis. What a tragedy it would be for these birds to disappear from our area due to noise pollution and water quality degradation.

Response 432-3

The project's potential impacts to fish habitat, riparian habitat, and bird species are evaluated in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #12 regarding the project's potential effects on local salmon restoration efforts. See Impact 4.4-4 for a discussion of impacts to riparian habitat. See Collective Response #14 regarding analysis of impacts to Swainson's hawk. See also Collective Response #15 regarding impacts to birds beyond those associated with nesting.

Comment 432-4

4) Traffic and noise concerns

We live on Behymer Ave which is a busy and narrow 2 lane road. As Clovis subdivisions are rapidly approaching Behymer, this congestion will increase markedly. I already see numerous CEMEX trucks traveling this road, adding to the noise and congestion. The limited infrastructure in this area does not support expansion of the CEMEX plant.

Response 432-4

The issues of traffic congestion and traffic noise are addressed in Draft EIR Section 4.17, "Transportation," and Section 4.13, "Noise." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Impact 4.17-1 and Mitigation Measures 4.17-1a through 4.17-1r requiring various roadway and intersection improvements to address the project's contribution to cumulative transportation impacts. See Section 3.2.5.17. "Errata to Draft EIR Section 4.17, Transportation," of Chapter 3, "Draft EIR Errata," for proposed revisions to Mitigation Measures 4.17-1a through 4.17-1r. See also Collective Response #29 regarding the project's truck trips and road maintenance.

Comment 432-5

5) Cumulative Environmental Effects

In addition to air and noise pollution and impacts to local traffic, there is an even more important reason to not grant CEMEX a 100 year lease extension. This has to do with the limited opportunity for outdoor recreation in Fresno. The San Joaquin River is the only natural green space for our City. Having lived in areas such as Boulder Colorado, with extensive open spaces around the city, I have seen how access to natural areas impacts quality of life as well as improves property values. The Parkway trust should be allowed to expand the only natural area adjacent to our city

for all to enjoy. Hearing the blasts and machinery noise from an expanded CEMEX plant is not compatible with creating a natural area space for all of our area residents to enjoy!

Response 432-5

The project's potential impacts to recreational uses are evaluated in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #21 regarding river access and Collective Response #27 regarding the project's operational effects, including from blasting, on users of nearby parks and trails. See also Collective Response #5 regarding the duration of the proposed use permit, and Collective Response #7 regarding the project's economic effects. See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 432-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 432-6

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter. The comment is noted for the consideration of the decision-makers.

Letter #433 March 9, 2025, Brooke Nelson

Comment 433-1

I write to you as a resident of North Fresno who frequently travels Friant Road and as someone who values our native fauna and flora in the San Joaquin River floodplain.

I am writing in regard to the DEIR for the Cemex Rockfield proposed expansion. I urge you to deny this project because the applicant has failed to provide answers for mitigating for blasting, noise

and water pollution and habitat destruction on native species, such as the Swanson's hawk, bald eagle and salmon,

Response 433-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of noise and water pollution are addressed in Draft EIR Section 4.13, "Noise," and Section 4.10, "Hydrology and Water Quality," respectively. Mitigation measures are required in both sections to address the project's identified impacts. The project's potential impacts to native habitats and the referenced species are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See Collective Response #14 regarding the analysis of impacts to Swainson's hawk in the Draft EIR. See Collective Response #15 for further discussion of potential impacts to bird species beyond those associated with nesting. See also Collective Response #16 for further discussion of potential impacts to salmon populations. The commenter does not provide evidence or reasoning to support the claim that the Draft EIR fails to mitigate any impacts; thus, no further response can be provided.

Comment 433-2

and has failed to provide answers for other impacts, such as increased traffic and potential flooding in the river bottom encroaching into the site.

Response 433-2

The commenter refers to Impact 4.17-1, beginning on Draft EIR page 4.17-27, of Draft EIR Section 4.17, "Transportation," which was determined to be significant and unavoidable. Mitigation Measures 4.17-1a through 4.17-1r require the Operator to pay the project's fair share contribution of the cost to implement various roadway and intersection improvements to address regional traffic increases. It is because implementation of those measures cannot be guaranteed prior to project initiation that the impact is determined to be significant and unavoidable. See Section 3.2.5.17, "Errata to Draft EIR Section 4.17, Transportation," of Chapter 3, "Draft EIR Errata," for proposed revisions to these mitigation measures. The issue of site flooding is addressed in Draft EIR Section 4.10. See Section 4.10.1.5, "Flood Hazards," for relevant descriptions. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #17 addressing the potential for breach of the quarry pit wall and flooding. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Comment 433-3

I am still shocked that the county would entertain the thought of an expansion of this dirty, polluting, destructive project. We need to rehabilitate the river for recreational and environmental purposes, not further destroy it.

As a former board member of Tree Fresno and of the local chapter of the California Native Plant Society, I am deeply concerned that yet more quarry activity on the river will further degrade the water quality, air quality and ecology of the surrounding areas.

Response 433-3

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The issues of water quality, air quality, and ecological impacts are addressed in Draft EIR Section 4.10, Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 433-4

Separately, I have nearly been run off the road by gravel trucks on Friant Road multiple times. A family friend was almost killed last year on Highway 41 in Madera County when a John Lawson Rock and Oil gravel truck failed to stop at a red light, crushing multiple vehicles and killing an elderly man. A few weeks later, another person was killed by one of the same company's semis in the same area. An expansion of the Cemex operation would only worsen this traffic hazard.

Response 433-4

The issue of transportation safety is addressed in Draft EIR Section 4.17. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #30 regarding transportation safety.

Comment 433-5

We have enjoyed orange picking with our child at Sumner Peck Ranch, exploring the interpretive trail at the fish hatchery, the River Center trail and museum, and the Lewis Eaton Trail north of Woodward Park.

Response 433-5

The project's potential impact on the listed recreational facilities are addressed in Draft EIR Section 4.16, "Recreation." See Chapter 3, "Draft EIR Errata," for proposed revisions

to this Draft EIR section. See Collective Response #27 regarding the project's operational effects on users of nearby parks and trails. No specific comments related to the adequacy of the Draft EIR were made and no further response can be provided.

Comment 433-6

The river bottom viewshed is already a disgrace, with numerous pits and blasting scars, inadequate tree cover and native plant restoration and few public access points. Handing over more of this precious natural resource to an extractive foreign mining company for 100 years beggars belief.

Response 433-6

The commenter describes existing conditions in the project area that are not evaluated as part of the proposed project. Instead, they form the environmental setting or baseline condition of the project sites. The project sites have been permitted and used for mining activities for the past approximately 100 years. Therefore, mining would not be a new use in the project area. See Collective Response #21 regarding public access to the San Joaquin River. The comment is noted for the consideration of the decision-makers.

Comment 433-7

I have suffered with asthma for many years in a city with nation-leading air pollution scores, and it is clear that a blast pit the depth of a skyscraper will only exacerbate air quality hazards.

Response 433-7

The project's potential air quality impacts are addressed in Draft EIR Section 4.3, as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. See Collective Response #9 regarding the project's potential impact on the existing poor air quality conditions in the region.

Comment 433-8

Cemex's reporting is lacking in scope, fails to address multiple areas of impact, including soil quality, air quality, wildlife, traffic and noise impacts.

Open-pit blasting should be a relic of the past for a growing city like Fresno, and should be entirely phased out.

Response 433-8

The comment does not provide evidence or reasoning to support the claim that the Draft EIR is inadequate. Soil quality, air quality, wildlife, traffic and noise impacts are all

addressed in Draft EIR Section 4.7, "Geology and Soils," Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.4, Section 4.17, and Section 4.13, respectively. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Responses 433-1 through 433-7, above. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #434 March 9, 2025, Jesse Nieves

Comment 434-1

My name is Jesse Nieves. I own the home at 461 E. Pebble Beach Dr. in the Woodward Lakes community. I do not support any mining or other activity by CEMEX or any other similar company in area. Please do not allow their plans to go forward. I am sure you want what is best for the health and wellbeing of the community and environment over corporate profits.

Response 434-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #435 March 9, 2025, Carolyn Nolan

Comment 435-1

My husband and I moved to the San Joaquin Valley from San Francisco in May, 1970. We owned and operated Central Coating Co Inc., a licensed contracting business working for wineries in northern California and specializing in industrial coatings, insulation and roofing. We had contracts with Gallo, Constellation Wines and other large wineries in the area. We settled in Madera County and raised two children there. I was the Chief Financial Officer of this business. In addition, I became active in the local community and was elected to the Madera Unified School District Board of Trustees.

We fell in love with the San Joaquin Valley and particularly the San Joaquin River. My husband's hobby was fishing and we spent lots of time on the river in the headwaters of the river as well as canoeing in the area below Millerton Dam. We consider the river to be the soul of the San Joaquin Valley as it is the lifeblood of the region, supporting agriculture, providing water, and shaping the landscape, making it a vital resource for the valley's economy and ecosystem. I served as a board trustee of the San Joaquin River Parkway Trust for 19 years and also represented Madera County on the San Joaquin River Conservancy for a time.

My husband passed away unexpectedly in 2009. I became a resident of Fresno in 2014.

I am writing to express my deep concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 435-1

The commenter's background and concerns regarding potential effects of the project are noted and will be considered by County decision-makers. The commenter's concerns regarding mitigation are also noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Responses 435-2 through 435-10 below for further discussion of the commenter's specific concerns.

Comment 435-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 435-2

See Response 349-2.

Comment 435-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 435-3

See Collective Response #17 and Response 329-3.

Comment 435-4

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 435-4

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 435-5

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. **The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch,** but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 435-5

Please see Collective Response #19 regarding the Draft EIR's evaluation of recreational sites adjacent to the project sites. See also Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 435-6

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views.

Response 435-6

Draft EIR Section 4.1, "Aesthetics and Visual Resources," provides evaluation of the project's visual impacts including assessment of the project's visibility from scenic view locations. The comment does not address the adequacy of the Draft EIR analysis. Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and mitigation.

Comment 435-7

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 435-7

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 435-8

- **Air Quality:** I am particularly concerned about how this blast mining project with resulting dust will affect our area's air quality. How will the impact of increased dust be mitigated?

Response 435-8

Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR, evaluates the potential air quality impacts of the proposed project including those associated with air pollutant emissions from onsite mining activities and offsite aggregate transport. Mitigation Measure 4.3-2b requires a Fugitive Dust Control Plan, subject to the approval of the SJVAPCD, which would be sufficient to reduce potential impacts associated with fugitive dust and criteria air pollutant emissions to less than significant. See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to this Draft EIR section. Please also see Collective Response #9 regarding the project's potential impact on the region's existing air quality.

Comment 435-9

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting

and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 435-9

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 435-10

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 435-10

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. As explained in responses to individual comments above, the Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required.

Letter #436 March 9, 2025, Rebecca Patel

Comment 436-1

I am writing as an active community member of Fresno, asking you to deny the CEMEX proposal for expansion. I have been following the proposal process through news articles over the past few years, and am frankly surprised it has made it this far. The environmental impact to our green spaces would be substantially negative. Why are we considering any project that could so negatively impact our water and air quality, as well as the future of the San Joaquin River? More than ever, it is our duty to be good stewards to the land and to the health and public safety of the residents of Fresno County.

Response 436-1

The issues of water quality and air quality are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality," and Section 4.3, "Air Quality." See Appendix D-4, "Revised Section 4.3, Air Quality," for proposed revisions to these Draft EIR sections. See

Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. The comment is noted for the consideration of the decision-makers.

Comment 436-2

Part of the proposal offers alternatives to their initial request. Most of those alternatives are offering essentially the same plan, with varying depths for their giant hole. My personal opinion is the first alternative is the only appropriate option: No project. Despite arguments to the contrary, this is not a necessary project for our community.

I appreciate the great responsibility you and your team have in determining how to move forward. Please put the health and well-being of our residents and our land first.

Response 436-2

The commenter's support for the No Project Alternative is noted for the consideration of the decision-makers.

Letter #437 March 9, 2025, Keving and Marisa Ploog

Comment 437-1

The proposed CEMEX Rockfield Quarry Modification Project (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667) has raised significant concern among residents of the River View Ranch community and those dependent on the CSA 44c wells.

In 2012, my husband and I purchased our property to build our home in the River View Ranch community. At that time, the existing mining efforts conducted by CEMEX at the Rockfield Quarry were set to expire. We felt comfortable knowing that those operations would be concluded within a short period of time after we built and moved into our new home.

We have many concerns about continued mining, its expansion, and impacts on water, noise, air quality, property values, and community well-being. The DEIR increases our concerns with its vague identification of issues and lack of detailed mitigation recommendations.

Response 437-1

The commenter's background and concerns regarding the project, Draft EIR, project effects, and mitigation are noted and will be considered by County decision-makers. The

comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. The Draft EIR analyzes the project's potential impacts to water quality and air quality in Section 4.10, "Hydrology and Water Quality," and Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), respectively. Please see Responses 437-2 through 437-14 below for further discussion of the concerns raised in this comment.

Comment 437-2

Relocation of Existing Aggregate Plant Location

The DEIR states that CEMEX plans to relocate its plant to the Rockfield Quarry within 30 years, starting with "Stage 1." Figure 2-8 of the DEIR shows the mining divided into five stages over the proposed contract. Phases one and two are directly in front of the River View Ranch community. If the project lasts 100 years in five phases, Phases one and two would span the next forty years. This means CEMEX would blast, drill, mine, crush, and transport directly across from the River View Ranch community for the next forty years. The proposed relocation of the CEMEX processing activities will have a significant negative impact on the environment of River View Ranch.

The DEIR reveals that CEMEX plans to immediately relocate most of its processing activities to the Rockfield Quarry and use portable and temporary equipment in the first phase of Stage 1. The *current* mining activities by CEMEX have already significantly impacted our daily lives. The noise from excavation and transport equipment alone is so loud that we cannot have a conversation in our backyard without significantly raising our voices. The sound levels drop considerably during the weekends and the days CEMEX is not operational. The proposed modification project will significantly increase noise levels in the surrounding areas. CEMEX projects to more than double its activity from that currently being performed; immediately increasing its activity from 1.4 MT/year to 2.0 MT/year within the first five years and an additional 1 MT/year beginning in year ten. The unavoidable increased noise from blasting, drilling, and the operation of heavy machinery used to transport and crush materials will not only further disturb the peace of the River View Ranch community but also potentially impact the health and well-being of its residents.

Response 437-2

The Draft EIR analyzes the project's potential noise impacts in Section 4.13, "Noise." The noise analysis of the Quarry Site accounts for the establishment of the aggregate

processing plant, asphalt plant, ready-mix plant, and the recycle plant at the Quarry Site (Draft EIR page 4.13-45). See also Appendix H-1, "Environmental Noise and Vibration Assessment," for further analysis of the project's noise impacts.

The Draft EIR provides the following:

> For a conservative assessment of potential noise impacts related to Quarry Site operations, it was assumed that all sources except recycle plant operations could be in operation during nighttime hours (as indicated in Table 2-5, "Proposed Typical Hours and Days of Operation," in Chapter 2, "Project Description," of this Draft EIR, recycle operations would be limited to daytime hours). Furthermore, it was assumed that initial excavation activities would not be shielded from the elevated residences to the west (receptors Q-1 through Q-4 on Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site"). However, as excavation activities progress deeper into the mining pit, shielding by intervening topography (the pit edge) would reduce excavation-related noise at those receptors. (Draft EIR page 4.13-47.)

See Draft EIR Impact 4.13-3, which analyzes the project's potential to generate a substantial or permanent increase in ambient noise levels from the Quarry Site at Stage 1, Stage 2, and Final Reclamation, in excess of the County's noise standards. With the implementation of Mitigation Measure 4.13-3 this impact would be less than significant.

Comment 437-3

Increased Noise

The DEIR lacks a thorough analysis of how blasting may impact residents, families, and pets. It insufficiently addresses the concern about vibrations and fails to provide adequate monitoring or mitigation measures for neighboring properties and occupants.

Response 437-3

See Response 363-1.

Comment 437-4

Dust, Diesel Fumes, Air Pollution and Other Airborne Particulate Materials

The project is expected to generate substantial amounts of dust and diesel fumes, which will adversely affect the air quality in the vicinity of the quarry. While CEMEX currently tries to reduce the amount of dust generated by ongoing mining and excavation

activities, we experience an unreasonable amount of residual dust released into our community. Currently, we battle high levels of dust and silt that cover interior and exterior surfaces alike. We believe the particulate matter released by CEMEX's current activities presents risks to our respiratory health. We expect that the proposed increased mining activities will exacerbate these issues.

Response 437-4

To address commenters concerns pertaining to potential air quality impacts, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment,* (Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), and includes additional health risk modeling and a draft Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR. As demonstrated in Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," as updated in Appendix D-4, "Revised Section 4.3 Air Quality," the project would result in less dust emissions than in the existing CEQA baseline setting, especially at the Quarry Site, and would therefore not result in significant impacts.

Comment 437-5

- The DEIR says that project emissions may exceed cancer risk thresholds. What analysis has been conducted to determine the risk of cancer-causing exposure to those residing directly across from the quarry site?

- What specific monitoring procedures will be implemented to ensure homeowners are protected from any identifiable increased risk?

- If the risks cannot be mitigated, who will be responsible for the impact on resident health?

Response 437-5

The Draft EIR HRA quantified particulate matter impacts which were determined to be less than significant after mitigation. To address commenters' concerns pertaining to potential air quality impacts, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the "Air Quality, Health Risk and Climate Change Technical Report" (see Appendix D-3), and includes additional health risk modeling and a draft Fugitive Dust Control Plan. The Draft EIR, as updated by this Final EIR, reports on health risk in Table 4.3-24,

"Unmitigated Project Health Risk Impacts," and Table 4.3-25, "Mitigated Project Health Risk Impacts," at locations where applicable guidance requires the maximum risk level to be reported. Chronic cancer and non-cancer risks are reported at structures where an individual or worker could reasonably spend a year or more. Acute risk is reported at the fence line because there is the possibility of public access at that location for a period of one-hour. The mitigation measures proposed would reduce health risks to less than significant levels as shown in Table 4.3-25, "Mitigated Project Health Risk Impacts." See Chapter 3, "Draft EIR Errata," and Appendix D-4.

CEQA Guidelines Section 15126.4(a) requires lead agencies to consider feasible mitigation measures to avoid or substantially reduce a project's significant environmental impacts. When the analysis supports that the proposed project's potential environmental impacts would be less than significant, mitigation measures are not required. When potential impacts are reduced to less than significant levels by mitigation measures, additional mitigation measures are not required. Because, the impacts to air quality mentioned above would be reduced to less than significant with the project's proposed mitigation measures, the further mitigation measures requested in this comment would not be required.

Comment 437-6

Over the years, we have submitted multiple complaints to the San Joaquin Valley Air Pollution Control District (SJVAPCD). Unfortunately, these reports have historically yielded no resolution. We have repeatedly submitted complaints to the San Joaquin Valley Air Pollution Control District (SJVAPCD) without success. Despite providing photos and videos, SJVAPCD requires their representatives to witness the issues firsthand. By the time they arrive, the dust has settled, so no violations are observed. As a result, CEMEX only receives verbal warnings. (A sample of photo's are attached at the end of this letter and videos accompany this email).

- Current dust mitigation efforts are ineffective. What measures will be implemented to address this under the proposed contract?
- Who will be responsible for monitoring? It should not be the public's responsibility to oversee this matter.

[A series of photographs were included as part of Comment 437-6 that are not reproduced here. To view these photographs please see Letter 437 in Final EIR Appendix M, "Draft EIR Comment Letters"]

Response 437-6

The Draft EIR, as updated by this Final EIR, contains mitigation measures and a mitigation measure reporting program that would be enforced by the County (see Appendix D-4, "Revised Section 4.3 Air Quality," Mitigation Measures 4.3-2a and 4.3-2b). The project would be subject to SJVAPCD Regulation VIII and required by Mitigation Measure 4.3-2b to implement a Fugitive Dust Control Plan (see Appendix K of Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The Fugitive Dust Control Plan has been prepared and would be submitted to the SJVAPCD for review upon approval of the project. The SJVAPCD is the responsible agency to monitor compliance with and enforce rules and policies related to air quality including the approved plan. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment,* (see Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 437-7

Strong winds in the Friant corridor often raise dust from the quarry site, even without mining activities. The dust and fine silt coat our windows, solar panels and interior areas of our home at an unreasonable level.

- How will dust and other air pollutants from blasting and mining be monitored?
- How will dust and other air pollutants from blasting and mining be mitigated?

Response 437-7

Dust would be monitored by visual observation of opacity as specified in applicable SJVAPCD rules. Mitigation of dust would be as described in the Draft EIR, as updated by this Final EIR (i.e., Mitigation Measures 4.3-2a and 4.3-2b). Further control of dust would be as required by SJVAPCD Regulation VIII including the Fugitive Dust Control Plan required by existing rules within Regulation VIII (see Appendix D-4, page 4.3-29). Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," as updated in Final EIR Appendix D-4, demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted, and thus would not contribute to an exceedance of applicable Ambient Air Quality Standards. The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see

Appendix D-3), including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 437-8

Diesel exhaust fumes on some days are overwhelming in the River View Ranch neighborhood across Friant Rd. SJVAPCD has been called out for this and stated that they do not address exhaust fumes coming from "Construction Sites" and do not know who to contact that does.

- What measures will be implemented to monitor the emissions of all equipment used by CEMEX?
- What will be the procedure for reporting air pollution issues?
- What steps will be taken to ensure tractors, scrapers and other equipment have appropriate emission controls?
- How will the levels of diesel exhaust fumes be controlled to avoid interfering with the enjoyment of neighboring residential outdoor environment?

Response 437-8

The Draft EIR includes a number of measures the project would implement to reduce emissions and overall impacts, including the Blue Smoke Control collector, designed for controlling blue smoke that typically comes from in-plant transferring and loading hot mix asphalt and best performance standards for reduced impacts from new continuous mix asphalt dryers (see Impact 4.3-4, as updated in Appendix D-4). Additionally, the project would implement Mitigation Measures 4.3-2a, 4.3-2b, and 4.3-4 for further emission reductions, including off-road engine upgrades to meet Tier 4i Particulate Emissions standards. Procedures for reporting air pollution issues would be made through the SJVAPCD, the responsible agency.

The Draft EIR HRA, as updated in the Final EIR, quantified particulate matter impacts which were determined to be less than significant after mitigation. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see Appendix D-3), including preparation of a Fugitive Dust Control Plan. Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," as updated in the Final EIR, demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ as compared to existing conditions. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 437-9

Proposed Hours of Operation

CEMEX is proposing to increase the hours of operation at the quarry location. Existing permitted hours of operation for excavation activities at the Quarry site currently run from 7:00 am to 6:00 pm, Monday through Friday. Maintenance of equipment has slightly expanded hours to 8:00 pm, including weekends. CEMEX proposes expanding its excavation operations at the Quarry location by two hours each weekday, starting at 6:00 am and ceasing at 7:00 pm. Further, CEMEX proposes adding recycle processing during that timeframe, which can be expected to increase the level of noise interference. CEMEX also seeks to extend hours of operation for loading and unloading and aggregate trucking, beginning at 4:00 am and extending until 9:00 pm. The proposed introduction of new lighting at the quarry's proposed plant location will destroy the beauty of our evening and nighttime skies. These proposed extended hours and activities virtually eliminate any weekday peace in our neighborhood. CEMEX operates at the limits of the current hours of operation. Although excavation may not commence until 7:00 am, dirt haulers are often positioned and ready as early as 6:30 am.

CEMEX's scrapers emit exhaust fumes while moving soil in the quarry, negatively affecting our neighborhood. Some days, the fumes are so strong that we can't enjoy our backyard until the wind direction changes or the scrapers end their days work.

- WE do not feel sufficient analysis was done to determine the need for effective noise reduction measures.
- We do not believe the impact of increased noise from quarry activities, such as blasting, drilling, crushing, and excavating, on nearby residential neighborhoods was adequately studied and/or mitigated.
- We do not believe the impact of diesel emissions on nearby residential neighborhoods was adequately studied and/or mitigated.

Response 437-9

See Responses 58C-15 and 112-18. See also Responses 363-1, in regard to the impact of blasting on residents, and Response 473-8 in regard to potential project emissions.

Comment 437-10

Risks Associated With Proposed Blasting

The proposed location for the new plant at the CEMEX Rockfield Quarry is in close proximity to the River View Ranch community and the CSA 44c wells. These wells are crucial for supplying water to the residents. The modification project includes plans for increased mining, including blasting and drilling activities, which poses a direct threat to the stability and quality of the water tables and infrastructure that serve CSA 44c.

Blasting and drilling activities are known to cause significant vibrations and disturbances to the surrounding geological formations. We are very concerned that CEMEX's expanded mining activities could negatively impact the water tables and potentially fracture the aquifers.

Furthermore, the proposed drilling activities could introduce pollutants into the water tables, leading to contamination of the water supply. This is particularly concerning given the reliance of our community on these wells for their daily water needs. This would directly impact our community by disrupting the water supply to CSA 44c wells. The DEIR does not adequately addresses these concerns. The DEIR states that monitoring will occur during the blasting cycle and operations will cease if any damage is detected. This means that blasting activities will stop only **after** damage is observed. This is unacceptable.

- How will the quality of our water be assured?
- What measures will be taken to ensure our water remains safe?
- How will CEMEX be held accountable if the wells, pumps or other related infrastructure become compromised as a result of vibrations, disturbances or any other operations.

Response 437-10

Mitigation Measure 4.10-1 requires implementation of the Blasting Protocols, as revised in Appendix H-9, "Revised Blasting Protocols." See Chapter 3, "Draft EIR Errata," for revisions to Section 4.10. The Blasting Protocols include ground vibration measurements at the quarry pit perimeter between the blast location and receptor locations, which include offsite wells such as the CSA 44C wells for the River View Ranch community. The Blasting Protocols also include a Groundwater and Surface Water Contamination Mitigation Plan to prevent the blasting agents and blasting residuals from degrading water quality. In addition, as stated on page 2-36 of the Draft EIR, mining and blasting

into the hard rock would begin in the center of the Quarry Site, away from the river and adjacent wells, to establish safe blast designs and to allow on-going groundwater monitoring during blasting and mining.

CEQA requires the evaluation of potential environmental impacts caused by a project and the adoption of feasible mitigation measures. CEQA does not establish or assign liability for potential damages. However, CEMEX, as the Operator, remains subject to existing local, state, and federal regulations governing mining, blasting, and groundwater protection. If the proposed project is approved it would be required to implement and comply with various mitigation measures and conditions of approval to help minimize project related impacts. Should unanticipated damage occur, blasting operations would cease until corrective actions are implemented in coordination with the applicable regulatory responsible agency under these existing frameworks.

Comment 437-11

Our neighborhood is situated on land with very sandy soil. There is great concern relative to the vibrations caused from blasting and the potential for land shift causing damage to our private roads, residential foundations, driveways and pools.

- We do not feel the DEIR considers the impact on residential neighborhoods adjacent to the Quarry in any meaningful way.
- How will community members be assured that CEMEX will be held financially accountable for any damages resulting from their activities.

Response 437-11

Please refer to the Draft EIR's discussion of Impact 4.13-6, which describes the vibration thresholds that must be maintained to prevent damage to 1) residences or commercial structures, 2) wells, and 3) to prevent destabilization of the San Joaquin River Bank (Draft EIR page 4.13-65). With the implementation of Mitigation Measure 4.10-1, which requires the project to adhere to the Blasting Protocols, as revised in Appendix H-9, the potential for the project to generate substantial groundborne vibrations would be less than significant (Draft EIR page 4.13-67). See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See Collective Response #4b for discussion of the Operator's financial assurances.

Comment 437-12

Visual Aesthetics and Risk of Property Value Loss

It is clear that the proposed mining expansion will have a significant negative impact on the immediate visual aesthetics of the quarry location. The mitigation outlined in the DEIR are inadequate. Staining the walls of a hole six times deeper than CEMEX's past mining activities over 100+ years will not be sufficient to mitigate the negative impact. This is laughable! We do not feel the DEIR adequately addresses the negative impact of the visual aesthetics of their proposal.

Response 437-12

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 437-13

Increased noise, air quality issues, water contamination, and light pollution will likely lower property values in River View Ranch. Prospective buyers will be put off by these environmental concerns. The neighborhood's amazing views have already been impacted by historical mining. Despite nearing the end of their contract after 100+ years of mining, CEMEX was expected to implement restorative measures. Instead, CEMEX proposes another 100 years of more aggressive mining. This will destroy the natural beauty of the Friant corridor and will likely decrease property demand in the area. This can significantly impact residents' ability to sell their properties at fair market values.

- How will the impact of residential property value loss be mitigated?

We strongly oppose CEMEX's continued mining efforts at the quarry and have concerns relative to many findings and recommended mitigations in the DEIR. While reviewing the DEIR, we found that the mitigation recommendations only appear to move the needle from "Significant" to "Potentially Significant", rather than mitigate issues to a more conservative extent of "Less than Significant" or "No Impact". This indicates that the mitigation recommendations focus on meeting the minimum acceptable range rather than prioritizing the best interests of those directly affected by those activities.

Response 437-13

Please see Collective Response #7 pertaining to economic considerations. The commenter's opposition to continued mining and concerns regarding mitigation are noted. Regarding the efficacy of mitigation measures in the Draft EIR, the Draft EIR identifies mitigation to avoid or reduce significant and potentially significant impacts to levels of less than significant. Under CEQA, impacts that are less than significant do not require mitigation and impacts that are reduced to less than significant through mitigation do not require additional mitigation for further reductions. The comment does not identify a deficiency in the Draft EIR mitigation measures.

Comment 437-14

The opposition to the DEIR for the proposed CEMEX Rockfield Quarry Modification Project is rooted in legitimate concerns about the potential risks and adverse effects on the River View Ranch community and the CSA 44c wells. It is imperative that these issues are thoroughly addressed and mitigated to protect the health, safety, and quality of life of the local residents. We urge the relevant authorities to reconsider the findings in the DEIR and explore more significant mitigation solutions that do not compromise the well-being of the community and the environment.

Response 437-14

The commenter's concerns, requests, and opinions regarding the project are noted and will be considered by County decision-makers. Please see Response 437-10 regarding the project's potential impacts to the CSA 44C wells.

Comment 437-15

[Photos were included as part of Comment 437-15 that are not reproduced here. To view these graphics please see Letter 437 in Final EIR Appendix M, "Draft EIR Comment Letters."]

Response 437-15

Photographs received and filed for the record. The purpose of CEQA is to disclose all environmental impacts and does not require projects and plans to provide additional analysis or additional mitigation of potential environmental impacts that have been established to be less-than-significant based on substantial evidence. Draft EIR Mitigation Measure 4.3-2b requires the project to implement a Fugitive Dust Control Plan which would reduce potential impacts of any criteria pollutant to less than significant. (Draft EIR page 4.3-62.)

Letter #438 March 9, 2025, Georgia Porcella

Comment 438-1

I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed

2. Biological Resource

3. Transportation and traffic impact

4. Cumulative Environmental Effects

Response 438-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." The project's potential impacts to biological resources and transportation are evaluated in Draft EIR Section 4.4, "Biological Resources," and Section 4.17, "Transportation." The project's cumulative effects are evaluated in Draft EIR Chapter 5, "Cumulative Impacts." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 438-2

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 438-2

See Collective Response #1 regarding additional analysis, enhanced mitigation measures, and transparency in the planning process. See Draft EIR Chapter 6, "Alternatives," for an evaluation of a range of reasonable alternatives to the proposed project. See also Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR chapter.

Letter #439 March 9, 2025, Carole D. Putnam

Comment 439-1

I am writing to express my concerns re. DEIR No. 773 for the proposed CEMEX Rockfield Expansion Project. It is astonishing to me that this project is even being considered, especially factoring

in the negative impacts it will have on the land and surrounding the area.

Having grown up and lived in Fresno for most of my 50+ years, outdoor space has not always been easily accessible. Yes, I am fortunate to have a car so that I am able to drive to the many beautiful spaces we have along the river. In particular Sumner Peck Ranch, Ball Ranch and Lost Lake (and the nearby fishery) are all gifts to the community and spaces I have enjoyed over the year. It has been encouraging to see this space expand and available for public use. Taking walks, viewing wildlife, and getting away from the "busy" city has been a blessing.

Response 439-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Draft EIR Section 4.16, "Recreation," regarding the project's potential impact on recreational facilities along the San Joaquin River. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #21 regarding public access to the San Joaquin River.

Comment 439-2

Yet I can only imagine what a nightmare the noise will be, along with all of the other negative impacts that will ensue. Threats to wildlife, traffic congestion, air quality issues and impacts on water quality and the San Joaquin River are real concerns. Blasting a 600-foot deep open pit along this area is truly a nightmare. I don't understand how there could be any positive benefits, besides financial aspects. Even the promises of "jobs" is tainted by the cost to our beautiful river and surrounding community. Who is really making the profits from this project?

Because of these concerns, consider rejecting this proposal altogether. At the very least, I urge you to do further research and think about less harmful alternatives.

Response 439-2

The issues of noise, impacts to wildlife, and transportation are addressed in Draft EIR Section 4.13, "Noise," Section 4.4, "and Section 4.17. The issues of air quality and water quality are addressed in Draft EIR Section 4.3, "Air Quality" (see Appendix D-4, "Revised Section 4.3, Air Quality"), and Section 4.10. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See Collective Response #7 regarding evaluation of the project's economic effects. No specific comments related to

the adequacy of the Draft EIR were made and no further response can be provided. However, the comment is noted for the consideration of the decision-makers.

Letter #440 March 9, 2025, Louise Richardson

Comment 440-1

Please do all you can to keep from letting CEMEX acquire additional aggregate mining rights along the beleaguered San Joaquin River and its environs. More than enough aggregate mining rights have been granted to CEMEX and other companies such at Vulcan Materials to satisfy Fresno County needs.

Response 440-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 440-2

Trucks using County roads to get the aggregate to where needed will greatly contribute to damage of these roads. And who will be responsible for repairing these roads? Why Fresno County, of course, This County does need this added responsibility.

Response 440-2

See Collective Response #30 regarding funding for road maintenance.

Letter #441 March 9, 2025, Donnie Ross

Comment 441-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

The Friant dam was found in violation of California law (CA Fish& Game Code Section 5937) , and a settlement was reached to restore the San Joaquin River. How will this project impact that restoration?

Response 441-1

The project may divert up to 295-acre feet of water from the San Joaquin River (River) per year (Draft EIR, page 4.10-104). As explained in Responses 6-117 and 67-18, the Operator

already holds water rights to draw that water from the River for industrial purposes, and the amount of water drawn is part of the existing baseline and is not increasing (Draft EIR, page 2-16). Therefore, the CEQA baseline of water diverted from the River remains the same under the proposed project and is not required to be analyzed under CEQA (Title 14 CCR Section 15125(a)). The Operator is committed to following all applicable laws and regulations when diverting water from the River.

Furthermore, neither the Operator nor the County is a party to the Settlement in The San Joaquin River Restoration Program, while the Secretary of the Interior is committed to reducing water draws downstream from Friant Dam, they would do so by "[a]quir[ing] water, water rights, or options […] however, such acquisitions shall only be made from willing sellers and not through eminent domain." (*San Joaquin River Restoration Settlement Act*, page 938.) Additionally, "nothing in this [Settlement] shall modify or amend the rights and obligations of the parties to any existing water service." (*Id.* at 942.) In essence, the Operator is not bound by this Settlement, the Operator's water rights are unaffected, and the CEQA baseline is not changed; therefore, the project would not impact the restoration of the San Joaquin River nor the Settlement Agreement.

Comment 441-2

Only 5% of California's riparian habitat is left of what is once was. The river's flow has been reduced by 97%. The proposed sites are adjacent and encroaching on that vital habitat, which will only further its decline. The San Joaquin river is already one of the most polluted rivers in the United States.

Response 441-2

Draft EIR Section 4.4, "Biological Resources," presents an evaluation of potential biological resources impacts of the proposed project including impacts associated with San Joaquin River habitat. The Draft EIR concludes that the project would not result in significant impacts to wildlife or adjacent riparian habitats with implementation of the mitigation measures required in this EIR. Please see Collective Response #12 pertaining to San Joaquin River restoration efforts, see also Collective Response #13 pertaining to offsite impacts to wildlife. Draft EIR Section 4.10, "Hydrology and Water Quality," provides a detailed analysis of the project's potential impacts to water quality and water supply. The commenter does not address the adequacy of the Draft EIR.

Comment 441-3

The residents of Fresno will be left with this mine and it's 600-foot pit forever. When CEMEX moves on, we will be left in the wake. We must protect our natural resources.

Response 441-3

The commenter's request for natural resources protection is noted and will be considered by County decision-makers. The commenter does not address the adequacy of the Draft EIR.

Comment 441-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 441-4

The commenter's concerns and request for additional analysis and mitigation are noted and will be considered by County decision-makers. The Draft EIR provides a sufficient analysis of potential environmental impacts and identifies a reasonable range of alternatives, in accordance with CEQA. Please see Collective Response #1 pertaining to the CEQA process and public input opportunities.

Letter #442 March 9, 2025, Anthony and Frances Salafia

Comment 442-1

First off, we would like to thank you for your work and service on the Fresno County Planning Commission. It surely is a demanding job with much to consider.

We moved to Woodward Lake in November of 2020 and absolutely love the area. Having grown up in Fresno (Old Fig Garden area) and leaving for college in 1984, this part of the city was considered "way north of town" the boondocks! Hasn't that all changed. Though only living here for 4 short years, we have seen tremendous growth North and East of Copper and Friant. Because of this, the traffic is terrible and there have been at least 6 fatalities on Friant between Copper and Audubon. One was directly caused by a commercial truck speeding thru a light and killing a young woman. Very sad, and tragic to say the least.

When CEMEX first began their mining practice in the area, the population was smaller . Since that time it has exploded. Which

causes concern for the various impacts a 600 foot mine dug out by explosives would have.

As mentioned: the traffic would obviously increase with more trucks traveling along Friant and other roads.

Response 442-1

Draft EIR Section 4.17, "Transportation," addresses the project's potential impacts related to increased truck trips and operation of the local roadway system. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.17. See Collective Response #29 regarding increases in truck traffic and Collective Response #30 regarding transportation safety.

Comment 442-2

How would adjacent neighbors wells be affected by the deep pit? What about the San Joaquin River?

Response 442-2

The project's potential impacts to groundwater levels, neighboring domestic wells, and the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Impacts 4.10-8 through 4.10-13 beginning on Draft EIR page 4.10-102. Specifically, Impact 4.10-10, beginning on Draft EIR page 4.10-105, discusses potential impacts to groundwater levels at the Quarry Site. Mitigation Measure 4.10-10a would require implementation of an adaptive management program at the Quarry Site including groundwater modeling and implementation of corrective measures if significant impacts to groundwater levels occur. Mitigation Measure 4.10-10b would provide a funding mechanism for the adaptive management program to ensure its implementation as long as it is necessary. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.10. See also Collective Response #24 regarding implementation and funding of the adaptive management program.

Comment 442-3

This area is deemed an environmental reserve.

Response 442-3

See Collective Response #20 addressing any suggestions that the existing Rockfield operation encroaches on an ecological preserve.

Comment 442-4

There is a chemical that is released, when hitting hard rock similar to the microplastics, which can be absorbed thru the bloodstream. The DEIR mentions an increased cancer risk ---NO ONE wants this.

Response 442-4

It is unclear to what chemical the commenter refers. See Draft EIR page 4.3-10 for a discussion of respirable crystalline silica. As described there, "respirable crystalline silica …does not represent a significant health risk to neighbors of mining projects." See Draft EIR page 4.3-11 and 4.3-47 for a discussion of naturally occurring asbestos, which was determined "unlikely to be a concern." Hexavalent chromium was also determined not to be an issue of concern for the project area as discussed in Draft EIR Section 4.10.1.8, "Groundwater Quality," on page 4.10-42. See also Response 593-4. The project's potential to increase the risk of cancer is evaluated in the updated *Air Quality, Health Risk, and Climate Change Impact Assessment* prepared for the project and provided as Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment." As shown in Table 4.3-25, "Mitigated Project Health Risk Impacts," with the implementation of Mitigation Measures 4.3-2a and 4.3-2b, the project would not increase cancer risks. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 442-5

This is not the area to do a deep mine, there are too many people who live in the area , who would be affected by changes in air quality, possible noise issues , aesthetics, etc. Due to the tremendous residential growth in both Madera and Fresno counties, it is time for CEMEX to move operations.

Response 442-5

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. See Responses 442-1 through 442-4 above. See also Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") and Section 4.13, "Noise," for a discussion of the project's potential effects on air quality and noise respectively. See Draft EIR Section 4.1, "Aesthetics and Visual Resources," for a discussion of the project's effects on the aesthetics of the project area. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #9 regarding the project's potential impact on the existing air quality conditions. No specific comments related to the adequacy of the Draft EIR were made, and no further response can be provided.

Letter #443 March 9, 2025, Ileana Santos-Gonzalez

Comment 443-1

My name is Ileana Santos-Gonzalez and I am a member of our Fresno community. I grew up here in Fresno and returned 5 years ago after moving away for college and work. The San Joaquin River has been a critical part of my childhood memories with family at Lost Lake, as a student with River Camp, and now for peaceful walks and bike rides. As a community member, I have serious concerns about the long term impacts of the CEMEX Rockfield Quarry Modification Project on the San Joaquin River, the water quality, and air quality to name a few.

Response 443-1

The commenter's concerns regarding the project are noted and will be considered by County decision-makers. The comment is introductory and does not address the adequacy of the Draft EIR. Please see Responses 443-2 through 443-7 below for further discussion of the commenter's specific concerns.

Comment 443-2

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

8) The DEIR should identify the timeframe and exact location of the trail to be constructed.

9) The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

10) The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 443-2

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 443-3

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors

to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 443-3

Please see Collective Response #27 pertaining to the project's potential effects on adjacent parklands and recreational use areas. See also Collective Response #19 regarding the Draft EIR's information pertaining to surrounding recreational areas.

The Draft EIR analyzes the Quarry Site's noise impacts to the nearest Receptors, which are located between approximately 250 feet to over 6,000 feet from the Quarry Site, and includes: (1) five Receptors (Q-5 through Q-9) that are closer to the Quarry Site than Lost Lake Recreation Area; (2) Receptor Q-15 which is Sumner Peck Ranch, Solitary Cellars Winery; (3) Receptor Q-6 which is Ball Ranch; and (4) the San Joaquin River as Receptor Q-C (see Figure 4.13-2, "Nearest Sensitive Receptors to Quarry Site"; see Draft EIR, Section 4.13.1.4, "Quarry Site Ambient Noise Environment," pages 4.13-21 through 4.13-23; Section 4.13.3.3, "Analysis Methodology," pages 4.13-43 through 4.13-44 and 4.13-46 through 4.13-48; Impact 4.13-3, pages 4.13-59 through 4.13-62; Impact 4.13-5, pages 4.13-63 through 4.13-64; and Appendix H-1, "Environmental Noise and Vibration Assessment," Appendices B-19 through B-27). Furthermore, with implementation of Mitigation Measures 4.10-1 and 4.13-3, any potential noise impacts to the nearest Receptors to the Quarry Site are mitigated to less than significant. See Final EIR, Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR sections and impacts referenced in this response.

Comment 443-4

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 443-4

See Response 349-2, which addresses the concerns noted in this comment regarding San Joaquin River water loss and contamination.

Comment 443-5

11) What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?

12) Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 443-5

See Collective Response #17. See also Response 329-3.

Comment 443-6

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 443-6

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 443-7

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Response 443-7

The proposed project would not result in significant impacts to water quality or resources, wildlife, public safety, or air quality. The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required.

Letter #444 March 9, 2025, Joan Schoettler

Comment 444-1

I applaud Fresno County Board of Supervisors for rejecting the CEMEX Jesse Morrow Mountain Proposal and hope they have the same

insight to reject the current CEMEX proposal for the San Joaquin River. Already the mine is an eyesore in the San Joaquin River. The River Conservancy continues to develop the San Joaquin River as a place of recreation, a beautiful waterway, and a place where nature can be enjoyed by all. The people of Fresno deserve to have their river to enjoy.

Response 444-1

The project's potential impacts to visual resources are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #445 March 9, 2025, Michael Smith

Comment 445-1

This project should be rejected. The River is an essential part of Fresno County's environment and future. To establish a 100 year (!) right to continue to damage the environment in this sensitive location is an absurd violation of the public trust and public interest, for generations to come.

I regularly use the River area for recreation and access to nature. It is a vital asset to fresno and Fresno County.

Response 445-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. The project's potential impacts on the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See Collective Response #5 regarding the duration of the proposed use permit. See also Collective Response #21 regarding public access to the river and recreational sites.

Comment 445-2

The noise dust and pollution from gravel mining already has scarred this precious part of our environment, and CEMEX plan to expand and continue the damage must be stopped.

I'll leave the technical details to others, but I can say that the peace quiet and beauty of this river must be preserved!

Response 445-2

The issues of noise and dust are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"). Pollution is a broad topic that is addressed in Draft EIR Section 4.3, Section 4.8, "Greenhouse Gas Emissions," (see Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions") Section 4.9, "Hazards and Hazardous Materials," Section 4.10, Section 4.13, and Section 4.20, "Wildfire." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #446 March 9, 2025, Arl Suda

Comment 446-1

My name is Arl Suda, and I am a concerned citizen who deeply cares about the wildlife and natural environment surrounding the San Joaquin River. I am writing to express my concerns regarding the proposed expansion of the CEMEX-Commerce Group's mining operations near this precious area.

As you know, the San Joaquin River is home to diverse ecosystems and provides vital resources for both wildlife and human communities alike. The health and sustainability of this river system are critical not only for the flora and fauna that depend on it but also for the long-term well-being of our environment.

Response 446-1

The proposed project's potential impacts on the San Joaquin River are evaluated in Draft EIR Section 4.10, "Hydrology and Water Quality." Impacts to the surrounding flora and fauna are addressed in Draft EIR Section 4.4, "Biological Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. This is an introductory comment that does not directly address the adequacy of the Draft EIR. See Responses 446-2 through 446-4 for further discussion of specific issues raised in this comment letter.

Comment 446-2

I respectfully request that CEMEX be required to conduct and submit a thorough Environmental Impact Report that specifically addresses the potential harm their proposed expansion might have on the San Joaquin River. This report should carefully evaluate, at a minimum, the following aspects:

1. Air Quality: How will the expansion of the mining operations affect the air quality in and around the San Joaquin River area?

Will dust and emissions from machinery and transportation increase, potentially harming both human health and local wildlife?

Response 446-2

The Draft EIR for the proposed project was released for public review by Fresno County in January 2025. The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality." Potential impacts to wildlife are evaluated in Draft EIR Section 4.4. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 446-3

2. Water Quality: The mining project should be evaluated for its potential impact on the water quality of the San Joaquin River. Will the expansion contribute to runoff or contaminants that could harm the river's delicate ecosystem and the species that depend on it?

Response 446-3

The issue of water quality is addressed in Draft EIR Section 4.10. See Impacts 4.10-1 through 4.10-3 for discussion of potential impacts to surface water quality. The project's potential impacts to certain fish and wildlife species are addressed in Draft EIR Section 4.4. See Impact 4.4-2 for a discussion of the project's potential effects on special-status wildlife species in the riparian habitat surrounding the project sites. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here. See also Collective Response #16 regarding the potential effects of sedimentation on salmon spawning.

Comment 446-4

3. Wildlife: Finally, I urge you to ensure that the report includes an analysis of the impact on local wildlife. This includes both the direct harm that might come from habitat destruction and the indirect consequences of air and water pollution on the health of animals that inhabit the area, including the Swainson's Hawk.

Given the rich biodiversity that relies on the San Joaquin River, it is critical that any development near it be held to the highest environmental standards to ensure that wildlife and the river's ecological balance are not compromised.

Response 446-4

The project's potential direct and indirect effects on local wildlife species are addressed in Draft EIR Section 4.4. See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #14 regarding Swainson's hawk.

Comment 446-5

I trust that, as stewards of our city's natural resources, the City of Fresno will prioritize the protection of our environment and ensure that CEMEX provides the necessary data to demonstrate that their operations will not harm the San Joaquin River area that I love.

Response 446-5

The comment contains concluding remarks that do not address the adequacy of the Draft EIR. See Responses 446-2 through 446-4 that address specific issues raised in Comment Letter 446.

Letter #447 March 9, 2025, Lucy Tecorral

Comment 447-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed

   Do they have a history of beneficial reuse of their former mining sites? What assurance do we have that CEMEX, a foreign corporation will have the resources and commitment to meet proposed restoration efforts at the end of the project?"

Response 447-1

Please see Collective Response #4a pertaining to CEMEX regulatory history. The proposed project would comply with California's Surface Mining and Reclamation Act (SMARA, PRC Section 2710 et seq.) and Fresno County requirements pertaining to reclamation. SMARA requires that mining operations have financial assurances to ensure that reclamation is performed in accordance with the approved reclamation plan.

Comment 447-2

2. Air Quality and Dust Emissions

The DEIR says that project emissions may exceed cancer risk thresholds. DEIR pg. 4.3-63. The DEIR says that because mitigation measures would reduce emissions, the DEIR did not evaluate population-wide cancer burden. DEIR at pg. 4.3-64. CEQA requires that the analysis be performed before taking into account implementation of mitigation measures The central valley has one of the worst air qualities this will affect our health negatively.

Response 447-2

Please see Collective Response #11 pertaining to community cancer risk. See also Collective Response #9 regarding the project's potential impact on the region's existing air quality. Draft EIR Section 4.3, "Air Quality," as updated in the Final EIR provides an evaluation of potential air quality impacts of the project, including consideration of fugitive dust, toxic air contaminants, and health risk at Impact 4.3-3. The impact evaluation quantifies both unmitigated project health risk (Appendix D-4, "Revised Section 4.3, Air Quality," Table 4.3-24, "Unmitigated Project Health Risk Impacts") and mitigated project health risk (Appendix D-4, Table 4.3-25, "Mitigated Project Health Risk Impacts"). Appendix D-4 confirms that Impact 4.3-3 was determined to be less than significant.

As shown in the Tables 4.3-24 and 4.3-25, after mitigation, the cancer risk at the maximally exposed individual receptor (MEIR) decreases from the existing CEQA baseline condition (i.e., cancer risk is a negative value). Accordingly, cancer burden, which represents the cumulative effect across census blocks, would also result in a decrease from existing CEQA baseline conditions and was therefore not calculated in the Draft EIR, as updated in the Final EIR. See Appendix D-4 and Chapter 3, "Draft EIR Errata."

The technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the A*ir Quality, Health Risk and Climate Change Impact Assessment*, (Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). This updated analysis includes cancer burden modeling and confirms that there are no new impacts and no changes to the findings of the Draft EIR.

Comment 447-3

3. Biological Resource Impacts

Inadequate analysis of the potential effects of the project on the state listed as threatened Swainson's hawk. *With more than four dozen breeding season occurrence records of this species within 2 miles of the project site (eBird 2025) and numerous potential nest trees within 0.5 mile, the project could impact Swainson's hawk. Construction activities such as blasting, excavating, trenching, or using other heavy equipment that disturbs or harms a Swainson's hawk or substantially modifies its habitat could constitute a significant impact. To meet California Department of Fish and Wildlife (CDFW) recommendations for mitigation and protection of this species, protocol surveys would need to be conducted within a 0.5-mile radius around all project activities. If active nesting is identified within the 0.5-mile radius, consultation with that agency would be required.*

Response 447-3

CEQA does not require that protocol-level surveys be conducted in order to analyze potential impacts to species. Based on existing site conditions, the majority of the project area is characterized by active mining operations, which provide only limited foraging opportunities for Swainson's hawks. However, areas adjacent to the mining operations, such as fallow fields and open spaces, may offer potential foraging habitat. The site is located within the known nesting range of Swainson's hawk. Project implementation may result in the conversion or loss of marginal foraging habitat; Mitigation Measure 4.4-1c requires preconstruction clearance surveys for nesting birds, including Swainson's hawks and other raptors, which would reduce potential indirect impacts to Swainson's hawk to less than significant. Please see Response 58-36 and 58-38 for further discussion of the project's potential impacts to Swainson's hawk. As described in Collective Response #14, given that active mining activities are a baseline condition within the project sites, there is a baseline level of disturbance from existing mining, and a 0.25-mile (for blasting) or 500-foot (for other mining activities) default buffer is deemed adequate for this species.

Comment 447-4

4. Traffic and Noise Concerns

Cemex states that they will not mitigate the traffic congestion. That is ludicrous, This very wealthy company needs to mitigate the traffic congestion on Willow to Friant Road. There is precedent in this county for this requirement.

Table Mountain helped finance turning Friant Road into a four lane highway. Vulcan at the Austin quarry on road 145 and 41 has been required to make modifications on Road 145. They are required to finance Highway 41to a four lane road when the county is ready to begin construction. 1) At the Friant Willow junction there should be two left lanes made for turning onto Willow from Friant. The trucks should only be allowed to use one lane. 2) A requirement that the entire Willow Road between Friant and Copper be expanded to 4 lanes. 3) A requirement that the north direction on Willow be expanded to two lanes from International to Copper. 4) There is a concern with increased heavy truck traffic effecting the traffic safety near the schools on International and Willow. If Cemex cannot afford this they have no business mining on the river. What happens if there is a catastrophe at the mining site? Will they say we don't have money to repair? This will make traffic even worse.

Response 447-4

See Responses 111-1, 111-2, and 12-69. Contrary to the commenter's assertion, the Draft EIR provides mitigation measures for traffic impacts in the form of equitable contributions for road improvements. See Draft EIR Section 4.17, "Transportation," for further discussion of the project's potential impacts to traffic. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR section referenced here. See also Collective Response #29 pertaining to project traffic impacts, and Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 447-5

5. Cumulative Environmental Effects

The issue pertains to the public safety hazard that the quarry will represent after the project is complete 100 years or so from now (and maybe before). With the stepped but vertical walls and a surface water elevation more than 400 below the trail elevation, the open quarry will not be suitable for fishing, swimming, boating, kayaking, canoeing, floating or anything else. But it will be ATTRACTIVE, especially to preteens and teenagers. There is not a fence that will keep them out. What will happen if one or more of the public falls into the pit? They won't fall all the way down - just 50 feet. That is a sure death.

Response 447-5

See Response 358-5 regarding public safety at the quarry pit.

Comment 447-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 447-6

The Draft EIR provides a sufficient analysis of the project's potential environmental impacts and describes a reasonable range of alternatives, in accordance with CEQA standards. The commenter's concerns and request for additional analysis and mitigation are noted and will be considered by County decision-makers. Please see Collective Response #1 pertaining to the CEQA process and public input opportunities.

Letter #448 March 9, 2025, Venus Warner

Comment 448-1

This letter is in response to the public comment period relating to the CEMEX Rockfield Quarry:

Rockfield Modification Project (EIR 7763) and Unclassified Conditional Use Permit
Applications Nos. 3666 and 3667
Draft Environmental Impact Report
Volume 1: Executive Summary-Chapter 10
State Clearinghouse No. 2020060123

My name is Venus Warner, I live with my husband, and my mom in the River View Ranch community that is directly across from the CEMEX Quarry site alongside Friant Road, in Fresno County. **We are all absolutely opposed to the proposed 4-year extension of this quarry site and mine, as well as the 100-year extension or what is being called the "CEMEX Rockfield Expansion"!**

When my husband and I bought our home 5 years ago we were told by the old homeowners and our realtor that that all "mining" operations at the Quarry Site would cease in July 2023. We have yet to see this happen! Had we known that such ludicrous proposals by CEMEX and then to be voted on by our Fresno City and County Officials that would allow the Rockfield Quarry a continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operations that is literally directly across

from our "new home" would be entertained, we would have never bought our home nor in this part of the Fresno City or County area.

Since moving to this community 5 years ago, my family and I as well as our neighborhood friends have repeatedly shared the following concerns regarding the Quarry Site adjacent to our homes via phone calls, emails and Zoom call/meetings when asked to do so, though our chance to respond is always given last minute and the timeframe to respond is very limited, only about a month or so to respond.

Response 448-1

The commenter's background and opposition to the project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR. Please see Responses 448-2 through 448-46 below for responses to specific comments.

Comment 448-2

I'll do my best to address the Quarry Sites Project Objectives as well as so of my own concerns on how deep quarry mining could impact the following:

1. Provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand (100yrs) for construction materials in the Fresno region.

    a. Vulcan Materials Company is the nation's largest producer of construction aggregates—primarily crushed stone, sand and gravel—and a major producer of aggregates-based construction materials, including asphalt and ready-mixed concrete. Their coast-to-coast footprint and strategic distribution network align with and serve the nation's growth centers.

Response 448-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply. The commenter's reference to Vulcan Materials Company is not relevant to the Draft EIR's analysis of environmental impacts of the proposed project.

Comment 448-3

2. Continue to utilize known aggregate reserves from existing partially mined properties, including those designated by the state and county as Mineral Resource Zone 2 (MRZ-2) (Mineral

Resource Zone areas where adequate information indicates that significant mineral resources are present, i.e., sand and gravel).

a. Yes, for the next couple of years there will be enough sand and gravel to mine without having to blast and then crushing the rocks that were blasted. I am against the use of explosives/blasting in order for CEMEX to extract the raw material.

Response 448-3

Please see Collective Response #3 pertaining to regional aggregate demand and supply. The commenter's opposition to the use of explosives/blasting is noted. The project proposes blasting at the Quarry Site to extract the hard rock that lies beneath the alluvial reserves. Thus, the project proposes to mine the remaining alluvial reserves by traditional excavation methods and implement blasting to extract the hard rock deposits (Draft EIR page 2-4). The Draft EIR appropriately considers potential environmental impacts associated with the project's proposed mining methods and blasting. Please see Chapter 3, "Draft EIR Errata," page 3-69, for proposed revisions to the Draft EIR section referenced here.

Comment 448-4

3. Continue to utilize high quality aggregate resources that meet the California Department of Transportation's specifications for use in Portland Cement Concrete (PCC) and Asphaltic Concrete (AC), which aggregate is important for quality infrastructure growth and maintenance because of its versatility, value, and relative scarcity.

   a. No one can deny the high quality aggregate resources that come from the Quarry Site, but this raw material can be sourced in other areas that are not so close to a major river and communities of people that rely on well water for their everyday living. The deep mining can put hundreds if not thousands of people at great health risks if the river water or any well waters are contaminated by the work being done by CEMEX at the Quarry Site.

   b. Who will be responsible for the river water quality contamination checks?

   c. How often will the river water quality checks happen, every three months, six months or yearly. I think it should be every three months.

d. Can we request that a third-party company test the river water every three months?

e. Can we request that a third-party company test our well water every three months?

f. If there is water contamination, will we be notified, how quickly. Will work stop at the Quarry Site until everything is resolved.

Response 448-4

Please see Collective Response #3 pertaining to regional aggregate demand and supply. The Draft EIR analyzes impacts to water quality and water supply in Section 4.10, "Hydrology and Water Quality."

The potential for conditions during mining, reclamation, and after all activities at the Quarry Site are completed (i.e., post-reclamation) to violate water quality standards or waste discharge requirements, or to otherwise substantially degrade water quality, for both surface water and groundwater, is evaluated in the Draft EIR as part of Impacts 4.10-1, 4.10-3, 4.10-6, and 4.10-7.

Since there would be no discharges from the Quarry Site to the San Joaquin River, there would be no potential for impacts to water quality to the river. As such, water quality monitoring of the San Joaquin River is outside of the scope of this EIR. Mitigation Measure 4.10-1 would require implementation of Blasting Protocols, which addresses groundwater quality control measures. Once mining is completed, the primary source of water inflow to the Quarry would be from direct rainfall and local stormwater runoff from the reclaimed Quarry high walls and deep groundwater inflow. These water sources would contain no contaminants and, therefore, would not affect groundwater quality. Mitigation Measure 4.10-5a and 4.10-5b, the Plant Site Pond Adaptive Management Program and Funding Mechanism, would also be implemented to ensure that water quality standards are not exceeded at the Plant Site. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here

Comment 448-5

4. Maintain a local source of construction aggregate with enough annual sales capacity (3.0 MT) to encourage a healthy, competitive market.

   a. The blasting should not start, because the aggregate (rock, sand and gravel)can be sourced by Vulcan Materials Company.

Response 448-5

The commenter's preference for no blasting is noted. Please see Collective Response #3 pertaining to regional aggregate demand and supply. Aggregate sources by Vulcan Materials Company does not serve to achieve the project objectives sought by the project applicant, CEMEX.

Comment 448-6

5. Continue to provide aggregate resources with access to an efficient local road network.

    a. The Quarry Site on Friant Road is an efficient local road, but within the last 5 years of living in our home we have noticed the traffic has jumped significantly upwards due to all the homes near Millerton Lake and Table Mountain Casino. Traffic is a huge issue!

Response 448-6

Please see Collective Response #29 pertaining to project traffic, please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 448-7

6. Continue to provide an environmentally sound project that would balance the recovery of the aggregate resource with the protection of other resources including wildlife habitat, groundwater, surface water, and air quality.

    a. Using explosives in quarry mining can pose significant environmental risks, including gas and dust emissions, noise pollution, and the potential for flyrock, which can harm local wildlife and human populations. Look up recent deaths due to flyrock.

    b. What type of explosives will be used to break the rock away from the ground surface.

    c. How often will the explosions happen? Will we be notified before they happen?

    d. If our homes or property are damaged due to the explosions, what is our recourse of action to make our claim against CEMEX?

Response 448-7

The Draft EIR describes and evaluates the project and mining methods including the use of blasting agents. The comment does not discuss the adequacy of the Draft EIR. Please see Collective Response #4b pertaining to liability and funding for potential damages.

The Draft EIR provided a comprehensive environmental analysis of the project in accordance with CEQA Guidelines. See Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality") for discussion of air quality impacts and Section 4.13, "Noise," for discussion of noise impacts. See discussion of Impact 4.9-4 beginning on Draft EIR page 4.9-19 regarding flyrock. Mitigation Measure 4.10-1 requires implementation of the Blasting Protocols, including the Flyrock Mitigation Plan established therein. The Blasting Protocols, as updated April 29, 2026, are provided in Final EIR Appendix H-9. See Chapter 3, "Draft EIR Errata," for revisions to the Draft EIR related to the updated Blasting Protocols. Implementation of the revised Blasting Protocols would minimize the risk of substantial groundwater quality degradation from expanded blasting activities at the Quarry Site.

Regarding the commenter's second bullet, blasting agents typically used for mining include both an oxidizer and an accelerant; generally, in the form of nitrate-based compounds and flammable liquids. Regarding the commenter's third bullet, all blasting activities are scheduled for one to two times per week on weekdays and would occur between the hours of 10:00 a.m. and 2:00 p.m., and additional notification would not be required.

With regards to the commenter's concerns about structural damage related to blasting activities, please refer to Section 4.13 of the Draft EIR. The project would maintain groundborne vibration thresholds that are not likely to result in damage to structures (see Impact 4.13-6 beginning on Draft EIR page 4.13-65).

Comment 448-8

7. Continue local quality jobs, while also benefiting local downstream businesses and creating an enhanced tax revenue to the county.

   a. Yes, jobs are created by CEMEX all the while benefiting local downstream businesses which in turn enhances tax revenue to the county, but it could be at great health and safety risks to local residents up and down the area near the Quarry Site.

   b. How will those health and safety risks be abated?

Response 448-8

The commenter does not specify the health and safety risks of which the comment asks about abatement. The comment does not address the adequacy of the Draft EIR.

Comment 448-9

8. Maintain consistency with the San Joaquin River Parkway Master Plan.

    a. In no way will the Quarry Site or the Plant Site ever be able to maintain consistency with the San Joaquin River Parkway Master Plan, that is just a flat out lie of a statement.

Response 448-9

Please see Collective Response #18 pertaining to the project's consistency with San Joaquin River Parkway Master Plan.

Comment 448-10

9. Reclaim both sites to wildlife habitat in a manner similar to the reclaimed mine sites that make up the majority of the San Joaquin River Parkway Properties.

    a. CEMEX hasn't done a good job of reclaiming any of the old mine sites. Any wildlife habitation on those sites is null and void. From north Fresno, take a drive on Friant Road into the town of Friant then turn around and head back the same way you came to look at the awful views of their so-called reclamation for the wildlife habitation.

    b. An actual Landscape Architect and local Environmental Clubs should be hired now to reclaim the old mine sites as well as draw up plans for the Quarry Site when it is no longer in use.

    c. For the current Quarry Site, monies should be put aside now into a safe investment, under the representation of a third party, so when the time comes the monies within those investments can be used to help reclaim the area for wildlife. The starting amount should be $250,000.00. The initial investment should grow at a reasonable rate a year and the monies can only be used for the reclamation of the current Quarry Site.

Response 448-10

The commenter's observations and opinions are noted. The comment does not address the adequacy of the Draft EIR. Note that under the State of California Surface Mining and Reclamation Act (SMARA, PRC Section 2710 et seq.), surface mine operators are required to maintain financial assurances in an amount sufficient to provide for reclamation of the surface mining operation in accordance with the approved reclamation plan. The amount of the financial assurance must be estimated and updated annually and approved by the SMARA lead agency, in this case, Fresno County.

Comment 448-11

10. Provide potential Parkway trail easements.

    a. When will the potential Parkway trail easements come into fruition?

    b. How long will the potential Parkway easements last?

    c. If the easements are given, who will maintain the easement portion of land from the CEMEX area to the Parkway?

Response 448-11

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 448-12

1. We oppose the 4-year extension, due to CEMEX not being able to provide a current EIR.

    1. This vital document, the EIR, should be current and available for us to review before the 4-year extension is passed, so we can know how our quality of life may be affected, due to the drastic eradication CEMEX is proposing for our environment. All work should cease at this site until an EIR is completed!

2. We oppose the 100-year extension, due to CEMEX not being able to provide a current EIR.

    1. All work should cease at this site until an actual EIR is completed!

Response 448-12

The commenter's opposition to a four-year extension is noted. The current mining operations are covered by an EIR certified on July 28, 1987. Please see Collective Response #2 for further discussion of the previous permit extensions. The Draft EIR analyzes the potential impacts associated with the proposed mining project. The commenter's opposition to the 100-year requested permit duration of the proposed project is also noted. Please see Collective Response #5 pertaining to the requested use permit duration.

Comment 448-13

3. **What are Cemex's specific guidelines for Hard Rock Mining for this specific quarry site?**

    1. How can I receive a copy of these guidelines?

    2. When can I receive a copy of these guidelines?

Response 448-13

Draft EIR Chapter 2, "Project Description," provides a detailed explanation of proposed mining and processing that would be performed under the proposed project. Regarding the guidelines for excavation of hard rock mining, blasting protocols are presented in Final EIR Appendix H-9, "Revised Blasting Protocols," in a blasting protocol document that summarizes the monitoring, control and reporting requirements for ground vibrations and air overpressures emitted from blasting at the project sites. Draft EIR Appendix H-9 is referenced and summarized in the Draft EIR (e.g., see Impact 4.9-4 on pages 4.9-19 through 4.9-21; see Impact 4.10-1 on pages 4.10-88 through 4.10-92) and Draft EIR Mitigation Measure 4.10-1 requires that the blasting protocols be implemented and that the protocols be appended to the Mitigation Monitoring and Reporting Program (MMRP) and conditions of project approval. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Blasting Protocols referenced here.

Comment 448-14

4. **Water Quality**

    1. Since my family and I moved to this neighborhood 5 years ago, we have already experienced significant water issues, low pressure to no pressure (no water), significant amounts of sand and tiny pebbles in the water lines. Fresno County is aware of these issues because they are who we are to call when something goes wrong, which it has many many times!

2. There has never been deep quarry mining near any part of the San Joaquin River, per a recent article in The Fresno Bee.

3. How is Cemex going to assure us that the aquifer water levels will not be significantly reduced or depleted altogether for my neighborhood, the surrounding homes and housing developments within a few miles away (Friant, Fresno & Madera), due to quarry dewatering and rock removal at the Quarry site?

    4. **Note:** The only homes that were notified of the possible CUP for the deep quarry mining were only within 1 mile from the quarry site, and only on Fresno County's side, not Madera County. This is appalling, because the homes and agricultural businesses on the Madera County side also rely on water and good water at that!

4. How is Cemex going to assure my neighborhood, the surrounding homes and housing developments within a few miles that our water quality will not be contaminated?

    i. **Note:** See above note.

5. Does Cemex have a plan to provide an alternative water supply to property owners in the surrounding communities (Friant, Fresno and Madera) whose wells will be significantly impacted, due to Cemex blasting a 600-foot deep mine?

Response 448-14

Draft EIR Section 4.10 provides detailed analyses of potential groundwater and water quality effects of the proposed project. The analyses are based on the Hydrology and Water Quality Analysis Report (Draft EIR Appendix G-5, "Hydrology and Water Quality Analysis Report"), which utilizes information from groundwater conditions reports (included as Appendix G-3, "Groundwater Conditions at the Plant Site," and Appendix G-4, "Groundwater Conditions at the Quarry Site," of the Draft EIR). Detailed methodology and findings are provided in Draft EIR Appendix G-5. See also Chapter 3, "Draft EIR Errata," for revisions to Section 4.10 and supporting technical reports provided in Draft EIR Appendix G. As discussed, and presented in Draft EIR Section 4.10, mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92, Mitigation Measures 4.10-5a and

4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10a and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111).

Additionally, please see Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity, please see Collective Response #24 pertaining to groundwater monitoring, and please see Collective Response #23 pertaining to groundwater quality.

The comment does not address the adequacy of the Draft EIR analysis or the efficacy of mitigation measures.

Comment 448-15

6. Does Cemex know if there will be Temperature Changes in the ground water?

   i. How often will Cemex or a third party be monitoring the Temperature Changes in the ground water?

   ii. Has Cemex conducted research (EIR) on the effects of Temperature Changes to the ecosystem and aquatic life in and around the San Joaquin River? Is Cemex prepared financially to continue the use of the thermal impact monitoring at the quarry site after the project ends in 100 years? Will the surrounding communities (Friant, Fresno and Madera) be notified if Temperature Changes occur? Who will be notified if Temperature Changes occur? How will the surrounding communities (Friant, Fresno and Madera) be notified if Temperature Changes do occur?

7. Does Cemex know what the possible affects deep quarry mining might have on the ground-water flow paths for the San Joaquin River. How do they plan to monitor any possible changes in the ground-water flow path? How often will they monitor any possible changes in the ground-water flow path? Will they use Dye Tracing to monitor any changes? Is Dye Tracing safe or unsafe for humans, the ecosystem, aquatic life, and other wildlife such as deer, birds, coyotes, foxes, rabbits, squirrels, lizards, and snakes? Will the surrounding communities (Friant, Fresno and Madera) be notified if Dye Tracing needs to be used to monitor the ground-water flow path? Who will be notified if there are changes to the ground-water flow path? How will the surrounding communities (Friant, Fresno and Madera) be notified?

Response 448-15

As described in Appendix G-4, "Groundwater Conditions at the Quarry Site," and Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR, groundwater that is currently removed from the quarry excavation for dewatering is pumped to recharge ditches between the quarry and the San Joaquin River, where it percolates back into the subsurface. Approximately half of the water that is pumped to the recharge ditch is estimated to flow to the river or to groundwater beyond the edge of the project sites (see Draft EIR Appendix G-4, Table 11). The recharge ditches would continue to be used during the active mining phase of the project while the quarry is being dewatered. Thus, pumping of groundwater to the recharge ditches is an existing condition at the site and would not change under the project.

Groundwater in the subsurface is isolated from atmospheric conditions and weather changes. Thus, groundwater temperatures remain relatively constant throughout the year. As the quarry is mined deeper, the groundwater would be pumped to the recharge ditches as it seeps into the mining excavation. Large ponds would not form in the bottom of the quarry while it was being mined and the groundwater would not be subject to appreciable temperature variations. Therefore, deeper mining would not significantly alter the temperature of the water being pumped to the recharge ditches. As a result, any potential effects on the temperature of the water in the recharge ditches, and to the river and off-site groundwater, would be the same under the project as they are under existing conditions at the quarry.

Once mining ceases, dewatering would no longer occur and groundwater would not be pumped to the recharge ditches adjacent to the San Joaquin River. Groundwater would partially fill the quarry excavation after dewatering stops, but the final elevation of the pond that would form in the quarry would be far below the elevation of the river. As a result, there would be no potential for discharge from the reclaimed quarry excavation to the San Joaquin River.

In addition, as shown in the water balance for the Quarry Site (Draft EIR Appendix G-4, Table 11), outflow of groundwater from the reclaimed mining excavation would be only 15 acre-feet per year, compared to a total inflow from rainfall and groundwater seepage of 600 acre-feet per year. Since the groundwater outflow would be only 2.5 percent of the flow into the quarry, any seasonal fluctuations of temperature within the water in the reclaimed quarry would be negligible once the outflow mixes with the rainfall and groundwater inflow.

Based on the above, temperature monitoring of the river or groundwater is unnecessary because the project would not alter existing conditions related to the recharge ditches and there would be no effect after the quarry is reclaimed.

In response to Item #7 of Comment 448-15, the groundwater flow paths at the Quarry Site vary depending on the geologic unit. The alluvium layer at the Quarry Site has been almost completely mined within the quarry boundary and no further mining of the alluvium would occur as part of the project. Therefore, the deeper mining within the quarry would not alter the current groundwater flow paths within the alluvium.

In the weathered rock and hard rock, groundwater flow paths have been identified using two different approaches. On a regional basis, stable isotope methods were used to evaluate water samples collected from wells around the Quarry Site (see Appendix N within Appendix G-4 of the Draft EIR). The stable isotope evaluation indicated that the groundwater within the weathered rock and hard rock geologic units is sourced from high elevation snowmelt in the Sierra Nevada.

On a more local basis, groundwater elevation measurements in wells at and adjacent to the Quarry Site area were used to develop groundwater contour maps, which then define the direction of groundwater flow (see Appendix E within Appendix G-4 of the Draft EIR). The groundwater contour maps indicate that the groundwater within the weathered rock and hard rock geologic units is flowing from north to south, sub-parallel to the river.

Measurement of groundwater elevations would continue during the project as described in Mitigation Measure 4.10-10a. This data can then be used to evaluate the groundwater flow directions over time as mining progresses. The results would be reported to Fresno County in accordance with Mitigation Measure 4.10-10a.

Dye tracing has not and would not be used to assess groundwater flow paths at the project site. The primary reason that dye tracing would not be used is because groundwater flow within the weathered rock and hard rock geologic units occurs within individual fractures. For dye tracing to be effective in fracture flow aquifers, the wells in which the presence of dye was being monitored would need to intersect the same fracture sets into which the dye had been injected. However, there is no way to be sure that the same fracture sets are present at each well location. In addition, as indicated on the groundwater contour maps in Appendix E within Appendix G-4 of the Draft EIR, the groundwater flow direction within the weathered rock and hard rock can vary seasonally and from year to year. Therefore, it would be very uncertain as to whether the dye injected into one of the upgradient wells at the Quarry Site would consistently flow toward any

of the wells farther downgradient. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here

Comment 448-16

8. How is Cemex already handling stagnation on ground water in the "reclaimed ponds"?

   i. Is stagnated ground water good for wildlife because we know it's not for humans?

Response 448-16

The existing setting of the project is described in Draft EIR Section 2.4, "Existing Conditions." Presently, at the Plant Site water diverted from the San Joaquin River (under existing water rights) that is used to wash aggregate is sent to the silt ponds, where silts and fines settle out. The water from the silt ponds is then recycled back to the plant as process water. The silt pond also serves as a source of recharge to groundwater. At the Quarry Site, groundwater and surface water runoff from rainfall accumulates in ponded pits from historic and current mining, and is pumped out to accommodate mining operations. The water is used by water trucks for dust control, and is pumped to the existing groundwater recharge pond or existing recharge trenches. The continuous flow of water through the ponds and basins at the Plant and Quarry sites currently minimizes and would continue to minimize stagnation. Please refer to Draft EIR Section 4.10, which provides baseline water quality data of the water stored in these pre-existing features.

Comment 448-17

9. Blasting at the quarry site could cause increases in turbidity levels. Is Cemex going to monitor the turbidity levels and how often? Will the surrounding communities (Friant, Fresno and Madera) be notified if the turbidity levels increase or decrease? What Turbidity Levels are considered safe by the State and local governments? What Turbidity Levels are considered unsafe by the State and local governments? How will the surrounding communities (Friant, Fresno and Madera) be notified of the safe or unsafe Turbidity Levels?

Response 448-17

Section 4.10, evaluated the project's potential impacts to water resources, including the San Joaquin River and its parkway resources. As discussed in the Draft EIR, both the Quarry Site and Plant Site are designed as zero-discharge facilities with respect to offsite discharges. Therefore, the project would not significantly impact surface water quality.

With regards to the San Joaquin River, water flows by gravity through the ditch from the river to the Plant Site. There is currently no discharge of water from the Plant Site operations to the ditch and there is no proposed future discharge to the ditch as part of the project. Thus, any turbid sediment visible in the ditch at the intersection with Little Dry Creek would not have originated from the Plant Site.

The project would be required to implement Adaptive Management Programs to monitor changes, collect data and submit reports of the findings to the lead agency for their review and record keeping. Adoption of Mitigation Measures 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b would reduce impacts on groundwater quality at the Plant and Quarry sites to less than significant. If any thresholds are exceeded, the Lead Agency must be notified within 48 hours. Appendix H-9, "Revised Blasting Protocols," of this Final EIR required to be implemented by Mitigation Measure 4.10-1, specify practices to prevent the contamination of groundwater and surface water as a result of blasting. With implementation of Mitigation Measure 4.10-1, this potential impact would be reduced to a less than significant level. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 448-18

5. Air Quality

1. What are safe and unsafe air quality measurements for Fresno and Madera Counties?

   i. Can we receive information on the safe and unsafe air quality measurements for Fresno and Madera Counties?

2. Good Safe air quality is important no matter who you are or where you live, but especially to those that live with severe respiratory diseases.

3. Nine out of ten people now breathe polluted air, which kills 7 million people every year, per the World Health Organization (WHO)*.

   i. *The health effects of air pollution are serious – one third of deaths from stroke, lung cancer and heart disease are due to air pollution.

4. The winds in our area typically come in on a southwesterly route, so any dust, dirt, or debris will typically be pushed into the path of our neighborhood (homes). How is Cemex going to mitigate the air pollution that could be caused by this quarry site?

Response 448-18

Updated safe and unsafe air quality metrics and monitored data from a nearby station are presented in Final EIR Table 4.3-1, "Ambient Air Quality Standards," and Table 4.3-2, "Ambient Air Quality in the Project Area." Additional information can be found on the SJVAPCD Air Quality Information webpage (https://www.valleyair.org/air-quality-information/air-quality-information/). As the responsible agency, the SJVAPCD is a public health agency whose mission is to improve the health and quality of life for all Valley residents through efficient, effective and entrepreneurial air quality management strategies. The SJVAPCD has information and guidelines related to air quality for public use. One of the core values of the SJVAPCD is the protection of public health through efforts to meet health-based state and federal ambient air-quality standards and using health-risk reduction strategies.

The County agrees that clean air is important especially for those individuals suffering from respiratory disease. WHO does state that 7 million people die from air pollution each year, but that same article goes on to say, "More than 90% of air pollution-related deaths occur in low- and middle-income countries, mainly in Asia and Africa, followed by low- and middle-income countries of the Eastern Mediterranean region, Europe and the Americas."(https://www.who.int/news/item/02-05-2018-9-out-of-10-people-worldwide-breathe-polluted-air-but-more-countries-are-taking-action).

The project would implement Best Performance Standards (BPS) and Mitigation Measures 4.3-2a, 4.3-2b, and 4.3-4 for further emission reductions beyond those required by SJVAPCD Regulation VIII. The mitigation measures proposed already reduce health risks to less than significant levels as shown in Table 4.3-25, "Mitigated Project Health Risk Impacts." Thus, additional mitigation is unwarranted. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3) including preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 448-19

5. Has Cemex completed a neutral study on air quality for this area and the adverse impacts on humans near the proposed quarry and for the type of work they are proposing to do such as; deep mine blasting, an asphalt plant, crushing of large rocks into smaller gravel or pebbles, bringing in reclaimed cement to break it up, and all transportation vehicles and heavy equipment that might be used to bring the material to the surface?

i. If Cemex did complete a neutral study on air quality for this area for the type of work they are proposing, then who reviewed this possible report? What were their findings? Were/will any of the surrounding communities (Friant, Fresno & Madera) be notified of this possible air quality report?

Response 448-19

Draft EIR Section 4.3 as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality") presents an evaluation of potential air quality impacts of the proposed project including those associated with air pollutant emissions from onsite mining activities and offsite aggregate transport. Please see Collective Response #9 pertaining to air quality for additional discussion. The comment does not address the adequacy of the Draft EIR air quality analysis and the commenter's questions do not pertain to the adequacy of the Draft EIR. Please see Draft EIR Chapter 8, "List of Preparers," for a list of consultants and other individuals involved in preparation of the Draft EIR. Please see Draft EIR, Chapter 9, "References and Resources," pages 9-3 through 9-5 for a list of resources used in preparing the Draft EIR air quality section. Please see Collective Response #1 pertaining to the CEQA process and public input opportunities.

Comment 448-20

6. There is a proposed residential Retirement Community for 5,000 residents called Friant Ranch that will be within a mile or two of this proposed quarry site, they are currently being challenged, due to questions of impact to air quality in this area?

   i. Since the proposed Friant Ranch Retirement Community is being challenged due to their possible impacts on this areas air quality, the County of Fresno and Cemex both need to take serious looks at the potential impacts that the deep mining quarry will have on our areas air quality.

Response 448-20

The Friant Ranch Project and associated litigation is not relevant to the Draft EIR's analysis of the proposed project's environmental impacts. The Draft EIR discusses the project's potential air quality impacts in Section 4.3 (see Appendix D-4, "Revised Section 4.3, Air Quality"). The comment does not provide evidence that the Draft EIR's analysis of the project's potential air quality impacts is deficient.

Comment 448-21

7. If health issues do arise for people that live in the surrounding communities(Friant, Fresno & Madera) from the proposed deep mining quarry, then how does Cemex plan to compensate those people and within what time frame?

Response 448-21

The purpose of CEQA is to provide substantial evidence supporting findings of the potential environmental impacts of a project. The Draft EIR HRA quantified particulate matter impacts which were determined to be less than significant after mitigation.

Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment") including preparation of a Fugitive Dust Control Plan. The analysis demonstrated no new impacts and no changes to any of the findings in the Draft EIR. Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3 Air Quality"), demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted under the CEQA Baseline and, therefore, would not result in significant impacts to air quality.

Comment 448-22

8. Does Cemex have any proposed plans to monitor the air quality that might cause unwanted air pollution from the type of work they are proposing such as deep mine blasting, an asphalt plant, crushing of large rocks into smaller gravel or pebbles, bringing in reclaimed cement to break it up, and all transportation vehicles and heavy equipment that might be used to bring the material to the surface?

9. Does Cemex plan to monitor the air quality at this quarry site and the surrounding communities (Friant, Fresno & Madera)?

    i. How long will Cemex have the air quality monitored for?

    ii. How many proposed monitoring locations will there be?

    iii. Where are the proposed locations for the air quality monitoring?

iv. Will the surrounding communities (Friant, Fresno & Madera) be notified of the air quality monitoring by Cemex or a neutral party, the proposed monitoring locations and how many locations there will possibly be?

Response 448-22

The Draft EIR analyzed air emissions from both on- and off-site sources, and potential impacts would be less than significant with implementation of Mitigation Measures 4.3-2a, 4.3-2b, and 4.3-4. Mobile sources of emissions were also evaluated and determined to result in less than significant impacts. See Section 4.3, as updated in the Final EIR (see Appendix D-4, "Revised Section 4.3 Air Quality"), for detailed information pertaining to the project's potential air quality impacts.

Air quality at the Quarry Site would be monitored through visual observation of opacity and process parameters affecting air emissions, as required by rules and operating permits issued by the San Joaquin Valley Air Pollution Control District (SJVAPCD). In addition, SJVAPCD maintains an air monitoring network designed to characterize exposures and protect communities throughout the Air Basin, including surrounding communities referenced by the commenter.

Mitigation Measure 4.3-2b requires implementation of a Fugitive Dust Control Plan subject to SJVAPCD approval pursuant to Regulation VIII. A Fugitive Dust Control Plan has been prepared for the project, as documented in the *Air Quality, Health Risk and Climate Change Impact Assessment,* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), and would be implemented to reduce fugitive dust emissions. The project would comply with this plan and all applicable air quality regulations throughout construction and operations.

Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in Appendix D-3. This updated analysis, including the prepared Fugitive Dust Control Plan, demonstrates no new impacts and no changes to any of the findings in the Draft EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," for revisions to Draft EIR Section 4.3 and the mitigation measures referenced in this response.

Comment 448-23

10. Has Cemex conducted a study on how air quality might affect and wildlife, either aquatic or on land?

i. If the wildlife, aquatic or on land, is affected by the air quality due to the deep mining quarry, what is Cemex's proposal to help the wildlife that has been affected? And how do they plan to prevent health defects to any live beings in the future?

Response 448-23

The analysis of impacts to biological resources, including both terrestrial and aquatic wildlife, is contained in Draft EIR Section 4.4, "Biological Resources." This section analyzes the project's potential impacts to wildlife based on, among other criteria, whether the project would "have a substantial adverse effect, either directly or through *habitat modifications*, on any species identified as a candidate, sensitive, or special-status species in local or regional plans" (see Draft EIR at page 4.4-47) (Emphasis added). Further, the project sites have already been disturbed by decades of ongoing mining activities, and the continuation of mining activities would not have a significant adverse impact upon wildlife. With regards to the commenter's concerns pertaining to health defects, the Draft EIR analyzes public hazards in Section 4.9, "Hazards and Hazardous Materials." See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR sections referenced in this response.

Comment 448-24

6. Aesthetics

1. There will be significant negative aesthetic to my neighborhood, my home, my neighbor's homes and let us not forget the San Joaquin River if this quarry site is able to dig a 600-foot-deep hole! Talk about a devastating scar that will never go away.

2. Due to a significant number of houses in and around, meaning high on the hills that can already see the proposed quarry site,

3. The terrain, topography, wildlife, vegetation, and ecosystem will all be drastically changed if there is a 600-foot-deep hole in the ground.

Response 448-24

Draft EIR Section 4.1, "Aesthetics and Visual Resources," presents the visual impact analysis for the project. As discussed, in Draft EIR Impacts 4.1-1 and 4.1-3, the analyses conclude that the project would have significant and unavoidable impacts associated with adverse effects on a scenic vista and degradation of the character or quality of public

views. Mitigation Measure 4.1-1 is identified to reduce the severity of the impacts but would not reduce the impacts to less than significant. See Chapter 3, "Draft EIR Errata," for proposed revisions to Draft EIR Section 4.1 and Mitigation Measure 4.1-1. For additional discussion, please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation. The comment does not address the adequacy of the Draft EIR aesthetic impact analyses, nor does the comment provide alternative or additional visual impact mitigation measures for consideration. The commenter's concerns are noted and will be considered by County decision-makers.

Comment 448-25

4. The wind in our area typically impacts come in on a Southwesterly route, so any dust, dirt, or debris will typically be pushed in the path of our neighborhood. How is Cemex going to mitigate the air pollution that could be caused by this quarry site?

Response 448-25

The project would be subject to a Fugitive Dust Control Plan required by existing rules. The San Joaquin Valley Air Pollution Control District (SJVAPCD) would be the responsible agency to monitor compliance with the plan. As discussed in Section 4.3.2.3, "Local," of the Draft EIR, as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), the project would comply with fugitive dust prohibitions in SJVAPCD Regulation VIII, which includes requirements that reduce fugitive dust from earthmoving activities (Rule 8021), stockpiles (Rule 8031), and open areas (Rule 8051). Specifically, Rule 8031 requires maintenance of stabilized surfaces on stockpiles when they are inactive using one of several effective control methods. The rules in Regulation VIII were developed in the context of the air basin's nonattainment status and compliance with the rules is sufficient to control fugitive dust without additional restrictions like those listed.

Additionally, the Draft EIR HRA quantified particulate matter impacts which were determined to be less than significant after mitigation. Blasting emissions calculations used AP-42 methodology, and Appendix G (Aggregate Emissions) of the Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," contains the emissions calculations. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ than currently being emitted. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (see

Appendix D-3), which included preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 448-26

5. There is no barrier of large enough trees to stop the view of a possible 600-foot-deep hole.

Response 448-26

Please see Response 448-24 regarding the Draft EIR analyses and conclusions that the project's aesthetic impacts would be significant and unavoidable.

Comment 448-27

7. Property Values

1. How will deep quarry mining impact the surrounding communities (Friant, Fresno & Madera) property values?

2. Is Cemex willing to make the property owners of all the surrounding communities (Friant, Fresno and Madera) whole, if their property values drop below a certain percent in a reasonable Real Estate Market, due to the deep quarry mining?

3. We live in an HOA Community, our home prices are all independent of one another, but they are closely related in upkeep and value, our home prices could significantly drop in value, due to this possible deep quarry mining site.

Response 448-27

Please see Collective Response #7 pertaining to the evaluation of economic issues, including property values, under CEQA.

Comment 448-28

8. Noise Pollution

1. We can hear the dumping of gravel into the large gravel trucks from at least 3 of four bedrooms (Master bedroom, our daughter's room, and our son's room) in our home.

    1. How does Cemex plan to mitigate this noise.

2. We can hear the dumping of gravel into the large gravel trucks from our back yard and our front yard.

1. How does Cemex plan to mitigate this noise.

3. What are the Typical Sound Levels Measured in the Environment and for this type of Industry that will be blasting, transportation of the "materials" from one site or area to the next, idling of trucks before "work actually starts"?

Response 448-28

In addition to the response below, see Responses 60-13 and 363-1.

Virtually every physical process generates noise that contributes to the local ambient noise environment. Whether it be a tractor operating in an agricultural field, a distant aircraft overflight, a power boat on a lake or river, or a garbage truck in a residential neighborhood, to name a few. It is recognized that excavation, processing, and hauling activities associated with project operations at the Plant and Quarry locations would generate sound that is audible within the project vicinity. However, as noted in Response 60-13, CEQA requires that a noise level increase be substantial to result in a finding of a significant noise impact, rather than just audible.

Mitigation measures for reducing noise generated by the project to a state of compliance with the Fresno County noise standards and applicable standards of other jurisdictions were developed and include limitations on excavation and processing operations to daytime hours (6 a.m. to 7 p.m.); limitations on asphalt and ready-mix operations to daytime hours, unless construction contracts specifically require the delivery of materials during nighttime hours; use of sound dampeners, barriers, and quieter equipment; replacement of traditional backup warning devices with less-intrusive models; use of acoustic silencers; etc. (See Draft EIR Mitigation Measures 4.13-2 and 4.13-3.)

Typical sound levels measured in the vicinity of the Plant and Quarry sites are detailed in the noise study prepared for the project found within Draft EIR Appendix H-1, "Environmental Noise and Vibration Assessment." As part of that study, 24-hour ambient noise monitoring was conducted at 9 locations for a total period of 65 days. Those results are documented in Draft EIR Appendix H-1 both in terms of table summaries, hour-by-hour tabulated results, and hour-by-hour graphs for each site and each day.

Comment 448-28 does not address the adequacy of these mitigation measures.

Comment 448-29

4. How load will the blasting be at the quarry site?

Response 448-29

Appendix H-3, "Blast Impact Analysis," of the Draft EIR evaluated the air and vibration impacts from blasting. As detailed in the analysis, the U.S. Bureau of Mine's (USBM's) air borne vibration criteria was utilized to assess impacts associated with air vibrations produced by blasting, which are typically referred to as noise levels. The analysis details that air overpressures from blasting rarely exceed 0.01 psi which equates to an instantaneous noise level of 130 dB. The analysis also details blasting procedures to ensure air pressure (i.e., noise levels) occur with no adverse effect on surrounding structures and residents. Detailing that windowpanes are designed to safely withstand changes of 1.0 psi (170 dB) when properly installed, as such the level of air pressures associated with blasting is about one one-hundredth of the overpressure that a window can safely withstand. Further, the project is required to implement Mitigation Measures 4.13-2, 4.13-3, and 4.10-1. With implementation of these measures, all potential noise impacts would be reduced to a less than significant level.

Comment 448-30

5. How is Cemex going to mitigate the Noise Levels at nighttime, since the quarry site will be in operation 17 hours a day and people react to nighttime noise exposures as though they were twice as loud as daytime exposures.

6. How will Cemex mitigate the noise from blasting, heavy equipment and additional gravel trucks that is being used at the quarry site or coming to and from the quarry site?

Response 448-30

See Responses 58C-15 and 112-18.

Comment 448-31

7. Has Cemex conducted a study on how noise pollution might affect and wildlife, either aquatic or on land?

Response 448-31

The project's potential impacts relating to noise are further analyzed in Draft EIR Section 4.13. Section 4.13 analyzes whether the project would generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project that would exceed local standards and concludes that this impact would be less than significant (Draft EIR at page 4.13-31). See also Response 11-27 regarding noise impacts to adjacent habitat. Mitigation Measures 4.13-2, 4.13-3, and 4.10-1, are each designed to reduce impacts from noise to less than significant levels.

The Draft EIR assesses potential impacts on wildlife due to the proposed activities at the project sites, where mining activities have occurred habitually for decades and where no substantial impacts to wildlife are anticipated. The commenter has not provided substantial evidence that additional studies on noise/acoustic impacts are needed to reduce potential impacts to a less than significant level. See also Collective Responses #15 and #16 addressing potential impacts to birds generally and to salmon spawning, respectively.

Comment 448-32

8. Some people are sensitive to Vibration Noise, how will Cemex address this issue for any of the people in the surrounding communities (Friant, Fresno and Madera)?

Response 448-32

See Response 363-1.

Comment 448-33

9. Recreation

1. What types of environmental impacts could this deep quarry mining have on Recreation along the San Joaquin River, Lost Lake, Millerton Lake, and let us not forget the front and back yards of all the surrounding communities (Friant, Fresno and Madera)?

2. Has anyone from Cemex talked to anyone with the San Joaquin River Parkway about Cemex wanting to blast a 600-foot-deep hole next to the river and two lakes?

Response 448-33

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. The project sites are located downstream of Friant Dam which forms the Millerton Lake reservoir. Millerton Lake is located over 3 miles northeast of the project sites and no potential for adverse effects on Millerton Lake surface water or shoreline recreation has been identified. The Draft EIR was made available for review and comment by agencies, organizations, and individuals. A complete list of organizations that commented on the Draft EIR is included in the Introduction of Final EIR Chapter 4, "Responses to Comments," and includes the San Joaquin River Parkway & Conservation Trust, Inc.

Comment 448-34

3. Could possible blasting at the quarry site cause any or significant damage to Friant Dam?

4. Will Cemex pay for a third-party inspection of Friant Dam, due to possible blasting?

5. How often will Friant Dam need to be inspected, due to possible blasting?

6. Will the surrounding communities (Friant, Fresno and Madera) be notified of the third-party inspection of Friant Dam?

7. How will the surrounding communities (Friant, Fresno and Madera) be notified of the third-party inspections and how often?

8. What would be considered safe or unsafe damage to Friant Dam, due to possible blasting?

9. What possible impacts could ground-water flow paths have on the San Joaquin River?

10. Could the blasting at the quarry site cause Headward erosion in the San Joaquin River

Response 448-34

See Response 210-8. Responses to the questions posed in this comment are presented by the number indicated preceding the question posed.

3. The distance to Friant Dam from the project sites is considered beyond the engineering influence of the proposed blasting. The Draft EIR is not required to analyze impacts which are speculative in nature or unlikely to occur. See Title 14 CCR Section 15064(d)(3).
4. Third party inspections would not be needed as the proposed project would not adversely impact or cause damage to Friant Dam. CEQA only requires mitigation for significant environmental impacts (PRC Section 21002.1(a)).
5. The proposed project would not impact the structural integrity of Friant Dam. As such, the proposed project does not need to require third-party inspection of the Friant Dam as a result of blasting activities. Friant Dam is owned and operated by the Bureau of Reclamation, a federal agency that implements its own dam safety

procedures, which include periodic facility reviews and comprehensive reviews of federally maintained dams.

6. The County is not required to implement third-party inspections of Friant Dam for this project. As such, notification of surrounding communities of third-party inspections is also not required.
7. No third-party inspections of Friant Dam are necessary. See answer to #6.
8. The Draft EIR provides certain significance thresholds that the project would be required to maintain in order to reduce potential impacts of groundborne vibration due to blasting. For further information, see discussion of Impact 4.13-6 of the Draft EIR on page 4.13-65.) Implementation of Mitigation Measure 4.10-1 would reduce potential groundborne or airborne vibration as a result from blasting to less than significant.
9. The potential effects of the project on flows within the San Joaquin River are discussed in Section 3.2.2 of Appendix G-5, "Hydrology and Water Quality Analysis Report," of the Draft EIR and in Section 4.10.1.9, "Groundwater-Surface Water Interaction at the Quarry Site," within the Draft EIR. As described in Collective Response #25, and Responses 6-12 and 6-14, the California Department of Water Resources criteria for the definition of interconnected surface water are not met at the project site. Nevertheless, the amount of groundwater that would be pumped from the Quarry Site is a very small fraction of the base flows within the San Joaquin River, such that even if there was a connection between groundwater within the deep bedrock units and the river, any effect of flows within the river would be miniscule.
10. Proposed blasting is anticipated to be limited to hard bedrock exposures where conventional earth moving equipment is not effective in removal of aggregate materials for processing. This condition would result in a horizontal buffer consisting of bedrock between the San Joaquin River and the location of blasting.

Comment 448-35

11. If Headward erosion is a possibility for the San Joaquin River, how does Cemex plan to stop this?

Response 448-35

Potential headward erosion of the San Joaquin River is outside the scope of the proposed project. The Draft EIR Hydraulic Analyses (found in Appendix G-1, "Hydraulic Analysis") provides a comprehensive evaluation of the 100-year floodway, floodplain, and flow velocities, and fully complies with CEQA requirements. The analyses concluded that the current activities and proposed project would not encroach within the 100-year

floodplain and, therefore, would not alter the river's flow velocities. Chang Consultants conducted additional hydraulic analyses evaluating the San Joaquin River 200-year flood, a more extreme flooding event, and concluded that the 200-year flood would neither enter the Quarry Site nor the Plant Site (Chang 2026b; see Final EIR Appendix G-8, "200-year Flood Hazard Analysis – Plant Site"). Additionally, there were no signs of significant bank erosion along the project sites. Potential project impacts would be reduced to less than significant with implementation of Mitigation Measures 4.10-1, 4.10-5a, 4.10-5b, 4.10-10a, and 4.10-10b. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10 and the mitigation measures referenced in this response.

Comment 448-36

10. Wildlife Preservation

9. What possible impacts could changes to ground-water flow paths have on the wildlife?

10. Has Cemex conducted a study on how air quality might affect and wildlife, either aquatic or on land?

    1. If the wildlife, aquatic or on land, is affected by the air quality due to the deep mining quarry, what is Cemex's proposal to help the wildlife that has been affected? And how do they plan to prevent health defects to any live beings in the future?

11. Has Cemex conducted a study on how noise pollution might affect and wildlife, either aquatic or on land?

12. He is Cemex already handling stagnation on ground water in the "reclaimed ponds"?

    1. Is stagnated ground water good for wildlife?

Response 448-36

See Responses 448-23 and 448-31. The Draft EIR assesses potential impacts to wildlife due to the proposed activities at the project sites, where mining activities have occurred habitually for decades. The commenter has not provided substantial evidence that a dedicated study on air quality or noise/acoustic impacts is needed to reduce potential impacts to a less than significant level. See also select collective responses addressing incidental impacts, including Collective Response #12 (river and salmon restoration efforts), Collective Response #13 (nesting birds and other wildlife), Collective Response #15 (non-nesting birds and birds outside of nesting season), and Collective Response #16 (salmon restoration).

The issue of stagnated water in project site excavations post-reclamation is discussed in the proposed reclamation plan (see Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan"), which states that the anticipated groundwater exchange is sufficient to prevent stagnation.

The Draft EIR analyzes impacts to groundwater in Section 4.10.4,"Project Impacts and Mitigation Measures," of the Draft EIR. As discussed, there are no known sources of contamination for the groundwater at the project sites (Draft EIR at page 4.10-94). Further, water pumped from the Plant Site for dewatering purposes would primarily be pumped to the recharge trenches along the western and southern perimeters of the site to mitigate the effects of this dewatering on the groundwater table (Draft EIR at page 4.10-102). Thus, there are not expected to be impacts to wildlife resulting from a change in the water table. Further, the project sites are already disturbed by ongoing mining activities, and would not have a significant increase in activity.

Comment 448-37

11. Transportation/Heavy Equipment

1. Has Cemex conducted a study on how air quality might be affected, due to additional transportation and the added heavy equipment used to source the materials.

Response 448-37

Yes, an Air Quality, Health Risk, and Climate Change Impact Assessment was prepared for the proposed project impacts. This Assessment concluded that particulate matter impacts were determined to be less than significant after mitigation. Further, Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," demonstrates that after mitigation the project would result in less PM_{10} and $PM_{2.5}$ emissions than are currently emitted. Further, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment* (Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"), including an updated health risk analysis and preparation of a Fugitive Dust Control Plan. The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

The GHG emissions are presented in Table 4.8-8, "Maximum Annual Operation Phase GHG Emissions," and further discussed in Appendix D-5, "Revised Section 4.8, Greenhouse Gas Emissions," at Section 4.8.4.

Regarding the concerns of the possibility of increased transportation on Friant Road resulting in higher levels of diesel particulate exposure, additional modeling was

undertaken and shows that the potential increase in trucks on any road would not expose receptors to significant levels of health risk (see Appendix D-3, Section 3.5.3).

Draft EIR Section 4.3.2.3, "Local," describes each local rule that applies to project sources including Rule 2201 (New and Modified Stationary Source Review) and Rule 4309 (Dryers, Dehydrators, and Ovens). New source review would result in the application of best available control technology (BACT) which is determined by the air district at the time of the permit application. Because the best is constantly subject to change, the process of determining BACT involves review of various sources (commonly called clearinghouses) of new permits approved by air agencies. To the extent that a permit has required a certain control technology and it is achieved in practice, the permit issued by the air district would also include that control technology provided that it is cost-effective in this case.

Comment 448-38

2. How will Cemex mitigate additional gravel truck noises and heavy equipment noises that they will make at the quarry site or bring to and from the quarry site?

Response 448-38

See Response 291-5.

Comment 448-39

3. There will be extra wear and tear on at least a 2 mile stretch of Friant Road from all the additional hauls from the large gravel trucks and private vehicles that will enter this possible quarry site. Will Cemex be responsible for the extra upkeep of Friant Road?

Response 448-39

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to vehicle safety precautions, roadway safety, and road maintenance.

Comment 448-40

4. Since January 2020 there has already been at least 3-4 crashes or gravel spills (gravel and large river rocks) all over Friant Road, due to the large gravel trucks traveling from one site to the next. What is Cemex doing to make sure their drivers are taking every driving safety precaution they can to prevent future crashes or spills?

Response 448-40

Please see Collective Response #30 pertaining to vehicle safety precautions, roadway safety, and road maintenance. Moreover, as discussed in the Draft EIR at Impact 4.17-3, all employees, trucks, and other motor vehicles associated with the proposed project are subject to the California Vehicle Code and local regulations intended to provide an appropriate degree of safety for motorists, bicyclists, and pedestrians.

Comment 448-41

12. Safety Issues and Miscellaneous (Fly Rock Travel, Flooding, Earthquakes)

1. There are a number of homes within a mile or two of the quarry site, since they are planning on blasting, what kinds of proper planning and protection is Cemex willing to put in place so NO property damage or human casualties occur to these surrounding areas, due to Flyrock?

Response 448-41

Blasting protocols are presented in Final EIR Appendix H-9, "Revised Blasting Protocols," in a blasting protocol document that summarizes the monitoring, control and reporting requirements for ground vibrations and air overpressures emitted from blasting at the project sites. In addition, the blasting protocol document provides "Best Practices" for the control and mitigation of flyrock from rock blasting and the mitigation of groundwater and surface water contamination from the use of explosive products. The Blasting Protocols are referenced and summarized in the Draft EIR (e.g., see Impact 4.9-4 on pages 4.9-19 through 4.9-21; see Impact 4.10-1 on pages 4.10-88 through 4.10-92).

Comment 448-42

2. Our neighborhood already has erosion issues for a few homes, if there is blasting at the quarry site, what types of impacts could the blasting have on these erosion issues? If it is found that the blasting caused additional erosion issues, how will Cemex remedy these issues.

Response 448-42

The commenter provides no evidence or explanation of how project-related blasting might contribute to existing erosion issues in the commenter's neighborhood. The Draft EIR analyzes the project's potential impacts on erosion both on-site and off-site and concludes that this impact would be less than significant. See discussion of Impact 4.7-4 on page 4.7-29 of the Draft EIR. For additional information please see Collective Response

#4b pertaining to liability and please see Collective Response #6 pertaining to operational nuisance.

Comment 448-43

3. If there is damage done to Friant Dam, due to the blasting, how fast is Cemex going to take to fix it? Will the surrounding communities (Friant, Fresno and Madera) be notified of any damages to the Friant Dame, due to the blasting? How fast will we be notified? How will we be notified?

4. Will Cemex conduct seismic testing or monitoring, due to possible blasting and being in such close proximity of Friant Dam? How often will Cemex conduct monitoring of the Friant Dam for any damages that might have been caused due to possible blasting?

Response 448-43

Responses to the questions posed in Comment 448-43 are presented by the number indicated preceding the question posed.

3. The proposed project would not impact the Friant Dam due to the distance between the Quarry Site and the location of the dam. See Response 300-4. The Draft EIR is not required to analyze impacts which are speculative in nature or unlikely to occur. See Title 14 CCR Section 15064(d)(3). Further, as discussed in Response 448-34, the Bureau of Reclamation owns Friant Dam and implements its own dam safety procedures, which include comprehensive facility reviews and reviews of federally maintained dams.
4. Mitigation Measure 4.10-1 would require monitoring of ground vibrations to ensure that the project is within the established significance thresholds of noise and vibrations (Draft EIR page 4.13-66). Due to the extremely low likelihood of the project impacting Friant Dam, no additional monitoring of Friant Dam is required.

Comment 448-44

5. Could there be any possible chance of flooding, due to possible blasting at the quarry site?

    1. If a flood is found to be caused by Cemex and their blasting, how do they plan to compensate those flood victims?

Response 448-44

The Friant Dam is over 15,000 feet (about 3 miles) from the closest blasting at the Rockfield quarry. Based upon the blast designs that need to be used to meet vibration limits at nearby structures, wells, and the San Joaquin river embankment the projected ground vibration at the dam would be 0.01 in/sec or less. This level of ground vibration would not damage or compromise the dam (see Draft EIR at page 4.13-39).

Comment 448-45

6. Will there be an impact to the Surface Air Temperature, due to the deep quarry mining?

Response 448-45

No evidence is available to the County that indicates any potential measurable effects, nor any significant impacts related to changes in ambient surface air temperature associated with the project's proposed mining.

Comment 448-46

My family and I are not against CEMEX or the work they do, we are against where they are doing and how they want to continue doing it. All work should be stopped at the Quarry Site along Friant Road until a current EIR is produced and provided to all residents and community members that can and will be affected by the mining being proposed at the site.

Could it be that the destruction and devastation done to the environment would not allow for a good report within the EIR, which in turn could completely halt all work at the Quarry Site.

I respectfully request that you strongly consider my/our concerns before any contract extension/expansion is approved especially since there happens to be a pending EIR. Please understand, my husband and I are not against big business, nor do we want to stand in the way of progress, if progress is in the best interest of all people not just a select few. We are expecting that all state and local offices do the proper due diligence before anything is approved.

Thank you for your time and crucial consideration into the health and wellbeing of human lives, our wildlife, and our environment.

Response 448-46

See Response 448-12 above regarding previous permit extensions and the existing EIR. The Draft EIR sufficiently analyzes the proposed project's potential impacts to the environment. The commenter's concerns and requests regarding the project are noted and will be considered by County decision-makers.

Letter #449 March 9, 2025, Eddie and Claudia West

Comment 449-1

We appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR)

for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have concerns that I urge you to address prior to moving forward with approval.

According to this March 6, 2025 article by Fresnoland - San Joaquin River Officials refuse to debate CEMEX's billion-dollar blast mine mystery - Fresno has a gravel surplus:

"According to the California Geological Survey, the Fresno metro area currently has nearly 200% more gravel than is needed for the next 50 years coming from local mines. The Kings River has roughly 2 billion tons of easily available surface gravel – enough for 500 years at Fresno's current 4 million-ton annual rate."

This alone begs the question of why this project is seen as necessary.

Response 449-1

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 449-2

Additionally, as homeowners in the Copper River area we are seriously concerned about noise, air pollution and other environmental impacts that could very well reduce the quality of life in our neighborhood, and also depress or reduce our home's value.

We hope you will use your authority to help in all ways possible to halt this project.

Thank you for your time and consideration.

Response 449-2

The issues of noise and air pollution are addressed in Draft EIR Section 4.13, "Noise," and Section 4.3, "Air Quality," as updated in the Final EIR. See Appendix D-4, "Revised Section 4.3, Air Quality," and Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. See Collective Response #9 for further discussion of the project's potential impacts to air quality. CEQA requires an EIR to evaluate a project's effects on the physical environment. Thus, the topics of quality of life and economic effects are not addressed in the Draft EIR. See also Collective Response #7 regarding the evaluation of economic effects under CEQA.

Letter #450 March 10, 2025, Cathy Aguilera

Comment 450-1

It is my understanding that the proposal to blast a 600-foot deep pit to mine aggregate in the Fresno region is simply not necessary since we have nearly double the projected demand for the next 50 years. Those reserves are owned by a competitor of CEMEX.

Response 450-1

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 450-2

To destroy the area so close to the San Joaquin River by such an archaic method is an example of taking an action with extreme disregard for the ecology of the river and surrounding area, the air quality, noise and traffic congestion ALL IN THE NAME OF MONEY for Cemex and who knows who else.

Response 450-2

The project's potential impacts related to air quality, noise, and traffic congestion are addressed in Draft EIR Section 4.3, "Air Quality," (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13, "Noise," and Section 4.17, "Transportation." The potential impacts to the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections.

Comment 450-3

Look who we are dealing with. CEMEX is totally unreliable. The company shows disregard for the environment having been fined for 81 environmental violations since 2000.

Response 450-3

See Collective Response #4a regarding CEMEX's regulatory history.

Comment 450-4

Potential problems: the wall of earth separating the river and the open pit could collapse, traffic delays, fish and wildlife, people living in the area with dynamite blasts.

Response 450-4

See Collective Response #17 regarding riverbank stability and the potential for breach and flooding. The issue of potential traffic delays is addressed in Draft EIR Section 4.17. See also Collective Response #29 regarding the project's truck trips. The project's potential effects on certain fish and wildlife species are evaluated in Draft EIR Section 4.4, "Biological Resources." Public hazards associated with the project are discussed in Draft EIR Section 4.9, "Hazards and Hazardous Materials." See Impact 4.9-4 beginning on page 4.9-19 regarding the potential risk of flyrock. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 450-5

It is unbelievable that CEMEX would not even be held accountable financially even though money would not be able to undo the consequences of a 600-foot deep open pit mine.

Response 450-5

See Collective Response #4b regarding liability and funding of corrective actions should the project result in unforeseen damage.

Comment 450-6

I lived in a city with an open-pit copper mine that was a example of the devastation that CEMEX's proposal would have. Mr. Randall, please pay attention to the devastating repercussions as well as the lack of accountability financially and morally this proposal has. Thank you for your close and honest attention to this matter.

Response 450-6

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #451 March 10, 2025, Susan Allred Simpson

Comment 451-1

I am writing to express my concern and displeasure regarding DEIR No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project not only threatens the San Joaquin River, it also threatens our local and San Joaquin Valley environments in ways that will be immediate and long-term.

Response 451-1

The commenter's opposition to the proposed project is noted for the consideration of the decision-makers. This is an introductory comment that does not address the adequacy of the Draft EIR. See Responses 451-2 through 451-6 for further discussion of specific issues raised in this comment letter.

Comment 451-2

It is unconscionable to think that any company would be granted a 100-year permit to destroy an ecological preserve as well as an aesthetic environment.

Response 451-2

See Collective Response #20 addressing any suggestion that the proposed project would affect an ecological preserve. The project's potential impacts to the aesthetic environment are evaluated in Draft EIR Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #5 regarding the duration of the use permit for the proposed project.

Comment 451-3

I reviewed a significant portion of DEIR No. 7763, and in its more than one thousand pages I found it woefully lacking in important details. There are a number of issues around traffic, lighting, noise, wildlife preservation, water quality, safety, cultural resources, recreational resources, and esthetics that will be "monitored". Really? Totally unacceptable!

Response 451-3

Although several mitigation measures in the Draft EIR include monitoring as a specific element of mitigation, none of the mitigation measures in the Draft EIR are solely limited to monitoring. For instance, as discussed and presented in Draft EIR Section 4.10, "Hydrology and Water Quality," mitigation measures are identified in the Draft EIR that require groundwater quality protection measures and groundwater monitoring and adaptive management (see Mitigation Measure 4.10-1 on Draft EIR page 4.10-92,

Mitigation Measures 4.10-5a and 4.10-5b on Draft EIR pages 4.10-96 through 4.10-98, and Mitigation Measures 4.10-10a and 4.10-10b on Draft EIR pages 4.10-108 through 4.10-111, each of which include monitoring and adaptive management in response to conditions observed through monitoring). See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10. The comment does not identify any specific mitigation measures in the Draft EIR for which monitoring is a sole component, nor does it specify a particular mitigation measure that is insufficient.

Comment 451-4

CEMEX is a multi-national company that trades on the NYSE. Their net income for 2024 for the US alone was just shy of a trillion dollars. At minimum, CEMEX should be required to mitigate and pay for any and all damage or modification to the site, surroundings, roadways, and intersections if, by some terrible joke played on the Valley's residents, this project is approved. **A generously funded maintenance and restoration plan must be required for the project.**

Response 451-4

Please see Collective Response #4b pertaining to liability and funding for potential damages. The Operator is responsible to reclaim the project sites in accordance with the approved reclamation plan. Both Fresno County and the California Surface Mining and Reclamation Act (SMARA) require that surface mining operators maintain a financial assurance mechanism payable to the SMARA lead agency (here, Fresno County) and to the State of California sufficient to accomplish reclamation as prescribed by the surface mining operation's approved reclamation plan, including conditions of approval and mitigation measures associated with reclamation. The Operator is required to annually prepare and submit for County review and approval a financial assurance cost estimate and evidence of a financial assurance mechanism in an amount at least equal to the cost estimate. Therefore, sufficient funding to ensure reclamation in accordance with the approved reclamation plan would be available in the event of the Operator's failure to reclaim the site in accordance with the approved reclamation plan.

Comment 451-5

I will leave the technical disqualifications of this project to those more qualified to document and comment on why this is a bad idea. However, I reviewed the Aggregate Sustainability in California Geological Survey Report of 2018. Fresno and the surrounding area currently have 182% in reserve of aggregate compared to the next 50-years' demand. That alone should be a disqualifier; **a need for the project is not documented.**

Response 451-5

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project.

Comment 451-6

I found it disturbing, but unfortunately not surprising, that four of the five current members of the Fresno County Board of Supervisors accepted campaign funds from CEMEX (Bredefeld claims to have returned his donation as a potential conflict of interest, unconfirmed).

Supervisors Masig, Mendes, and Pacheco must disqualify themselves from voting on this permit request.

Response 451-6

The comment does not relate to the adequacy of the Draft EIR. The comment is noted for the consideration of the decision-makers.

Comment 451-7

What is the benefit to the San Joaquin River, the San Joaquin Valley, Fresno and Madera for this project? Why would we permit a company to destroy a rich ecological preserve, taint our environment, and create an ugly eyesore? Why would we perpetuate the impression that Fresno is the stepchild to the State of California? **We must do better for future generations.**

Response 451-7

This comment summarizes the previous comments in Letter #451. See Responses 451-2 through 451-6. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #452 March 10, 2025, Mary Barajas

Comment 452-1

My name is Mary Barajas. I'm a resident of Fresno county and I am writing to express my opposition to the cemex expansion project. I strongly believe that it would be detrimental to the environment and to the San Joaquin River and I asked that you consider my written statement to not proceed with this project. We must prioritize thoughtful planning when it comes to our natural resources and delicate ecosystem. Thank you for your time and consideration.

Response 452-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #453 March 10, 2025, Susan Bartel

Comment 453-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 453-1

The commenter's concerns regarding project effects and the Draft EIR and mitigation measures are noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR and no further response is warranted here. Please see Responses 453-2 through 453-11 below for further discussion of the concerns raised in this comment letter.

Comment 453-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 453-2

See Response 349-2.

Comment 453-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?

- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 453-3

See Collective Response #17. See also Response 329-3.

Comment 453-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the

document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 453-4

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 453-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 453-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 453-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these

noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts. The San Joaquin River should be a resource for the enjoyment of the Fresno community, not for multinational corporations to exploit and destroy.

Response 453-6

Please see Collective Response #27 pertaining to the project's potential effects on adjacent parklands and recreational use areas. See also Collective Response #19 regarding the Draft EIR's information pertaining to surrounding recreational areas.

Comment 453-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 453-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 453-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 453-8

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 453-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-

project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 453-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 453-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 453-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection. (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 453-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Response 453-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the project's potential environmental impacts and provides mitigation measures where necessary to reduce potential impacts, in accordance with CEQA. As such, recirculation is not required. See also Chapter 3, "Draft EIR Errata," of this Final EIR for further discussion of recirculation.

Letter #454 March 10, 2025, Joanne Bazarian

Comment 454-1

After attending the community meeting at the River Parkway Trust on March 6th and hearing all the issues related to the DEIR and to

Cemex's track record and especially their extensive list of violations,

I am now even more passionate about this project NEVER getting approved.

Response 454-1

See Collective Response #4a regarding CEMEX's regulatory history. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Comment 454-2

They don't have a mitigation plan in place,

Response 454-2

Mitigation measures are provided throughout the EIR, where identified as necessary to address a potentially significant impact. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view any proposed revisions to the mitigation measures presented in the Draft EIR.

Comment 454-3

the county has 181% of the amount of cement needed for construction and NO one needs to dig a 600 foot hole. Please make sure this project stops here and never gets close our the beloved river.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Response 454-3

See Collective Response #3 regarding aggregate supplies in the region and the need for the proposed project. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #455 March 10, 2025, Caroline Bergren

Comment 455-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all. I live in Madera County and recreate at the San Joaquin River frequently.

While I would like to raise my family in this area, we already face so many air and water quality concerns in Madera and Fresno counties and I can't believe we are considering this project that will contaminate our surroundings. I strongly disagree with this mining project which will worsen the quality of life of ourselves and our children. Please don't be shortsighted in this decision.

Response 455-1

The commenter's opposition to the project and concerns regarding the Draft EIR, potential effects of the project, and the efficacy of mitigation are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see Responses 455-2 through 455-8 for further discussion of the commenter's concerns.

Comment 455-2

CEMEX is currently encroaching on an Environmental Reserve.

Response 455-2

Please see Collective Response #20 for discussion of the project boundaries.

Comment 455-3

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat.

Response 455-3

See Responses 58-36 and 58-38 regarding the Draft EIR's analysis of impacts to Swainson's hawk. See Response 58-37 and 58-40 regarding the Draft EIR's analysis of impacts to tricolored blackbird. See Response 58-36, 58-38, 58-40, 58-50, 65-6, 65-10 regarding the Draft EIR's analysis of impacts to burrowing owls. See Response 58-37 regarding the Draft EIR's analysis of impacts to the Western red bat.

Comment 455-4

Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Response 455-4

See Collective Response #13. The project's operational effects on wildlife are evaluated in Draft EIR Section 4.4, "Biological Resources." See Impact 4.4-1 beginning on Draft EIR page 4.4-48 related to wildlife on the project sites and Impact 4.4-2 beginning on page 4.4-52 related to wildlife within riparian habitat surrounding the project sites. After reviewing the public comments and potential effects of the project, the Draft EIR was revised to reflect a more stringent survey requirement for nesting birds and other wildlife in the vicinity of the project sites. Surveys for nesting raptors, specifically Swainson's hawk and bald eagle or other large raptors required by Mitigation Measure 4.4-1c, were expanded to a buffer of 0.25 miles prior to a blasting event. Mitigation Measure 4.4-1c was further revised to increase the number of surveys to be conducted before any blasting events from one to three. Expansion of the survey buffer area, and increased rigor of surveying or monitoring would help ensure that effects are minimized to the extent possible given site-specific criteria. See Chapter 3, "Draft EIR Errata," of this Final EIR, to view these proposed revisions to the Draft EIR.

Comment 455-5

Additionally, this project will permanently alter the little scenic landscape we have around Fresno, and their proposed restoration efforts at the end of the project will be too little, too late.

Response 455-5

The commenter's observations are noted and will be considered by County decision-makers. The visual impacts of the project are discussed in Draft EIR Section 4.1, "Aesthetics and Visual Resources."

Comment 455-6

I am extremely concerned about the air and water quality issues this project will have. The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

Response 455-6

Please see Section 4.3, "Air Quality," for discussion of the proposed project's potential impacts to air quality. With the implementation of mitigation measures, the project would have a less than significant impact upon air quality. See Section 4.10, "Hydrology and Water Quality," of the Draft EIR, "Hydrology and Water Quality," for discussion of the project's potential impacts to water quality and hydrologic resources. Please see Response

349-2 for further discussion about the proposed project's impacts to San Joaquin River flows and water quality. See Appendix D-4, "Revised Section 4.3, Air Quality," and Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment," for the updated air quality technical study.

Comment 455-7

The DEIR says that project emissions may exceed cancer risk thresholds. DEIR pg. 4.3-63. The DEIR says that because mitigation measures would reduce emissions, the DEIR did not evaluate population-wide cancer burden. DEIR at pg. 4.3-64. CEQA requires that the analysis be performed before taking into account implementation of mitigation measures.

Response 455-7

Please refer to Collective Response #11 regarding evaluation of cancer burden. After mitigation, the cancer risk at the maximum exposed individual sensitive receptor (MEIR) decreases from the CEQA baseline condition (i.e., cancer risk is a negative value). Thus, the cancer burden, a measure summing effects from each census block, would also decrease from the baseline condition. Therefore, cancer burden was not calculated in the Draft EIR. Nevertheless, to address commenters' concerns pertaining to potential air quality impacts, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment,* (see Appendix D-3). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 455-8

I understand this project has proposed jobs, but at what cost? As I understand, there are various other local sites that are not on critical habitat and recreational space that can provide more than enough gravel for future needs in the Fresno area. It seems incredibly short sighted and sad that you would even consider using explosives to create a huge mining site right along our San Joaquin River. Please listen to local residents that this project needs to be reconsidered.

Response 455-8

The commenter's concerns, opinions, and requests are noted and will be considered by County decision-makers. With regard to alternative sites, the comment does not provide any alternative sites. Please see Draft EIR Section 6.4.2.1, "Alternative Site Locations," for discussion of the County's rejection of an alternative site as a feasible project alternative.

Please also see Collective Response #3 pertaining to regional aggregate demand and supply.

Letter #456 March 10, 2025, Kathy Bian

Comment 456-1

It is pertinent that this project for the expanse of mining around the San Joaquin River is not approved. This would destroy countless of the very few ecosystems that have withstood human impact on the land. The water quality would be severely threatened, impacting the health and hygiene of all inhabitants around the area. The outcome of this expansion would be, from a regulatory standpoint, another EPA SuperFund site. The San Joaquin River area is currently managing to thrive, providing community and livelihood for various flora, fauna, and all people who visit the area. I truly hope you take the time to listen to this public comment, and reject CEMEX expansion in this area.

Response 456-1

The project's potential impacts to ecosystems and water quality are addressed in Draft EIR Section 4.4, "Biological Resources," and Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #457 March 10, 2025, Tom Biglione

Comment 457-1

I am a property owner or parcel #300-320-12s on Biglione Drive one mile east of the proposed quarry hole.

One of the worst things that can happen to a living river is a breakthrough into an active or abandoned quarry hole.

This project's plans call for a 600-ft deep hole that will exist long after the 100-year projected active phase of the quarry.

Why, in this day of enlightened awareness of the importance of preserving what little we have left of our magnificent state's river flows and corridors would we want to risk any further environmental harm?

Response 457-1

The project's potential effects on the San Joaquin River are addressed in Draft EIR Section 4.10, "Hydrology and Water Quality." See Chapter 3, "Draft EIR Errata," for proposed revisions to this Draft EIR section. See also Collective Response #17 regarding river bank stability and the potential for breach at the Quarry Site. The commenter's opposition to the project is noted for the consideration of the decision-makers.

Letter #458 March 10, 2025, Janine Blake-Quisenberry

Comment 458-1

The River Parkway has been working very hard to restore the San Joaquin River bottom so that it can be enjoyed by people of all ages. I enjoy walking down by the river on a weekly basis. It is very peaceful and provides much needed relief from everyday stress.

The CEMEX Project would not only increase pollution to our air, that already already makes it unhealthy for all of us, but especially for those that are asthmatic or have sensitivities.

Response 458-1

The issue of air quality is addressed in Draft EIR Section 4.3, "Air Quality," as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"). See Impact 4.3-3, as updated in the Final EIR, for a discussion of the potential effect of the project's air emissions on public health, as well as the health risk assessment prepared for the project and provided as Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment." Final EIR Appendix D-4, "Revised Section 4.3 Air Quality," presents the proposed revisions to Draft EIR Section 4.3. See also Collective Response #18 regarding the project's consistency with the San Joaquin River Parkway Master Plan.

Comment 458-2

Fresno County needs to increase our green space and opportunities to spend time outdoors. Fresno County has very few parks and places for families and people of all ages to enjoy the outdoors. Spending time in outdoor spaces like the Parkway is critically important for physical and mental health.

Digging more ugly pits, noisey trucks, increase in air pollution, and a decrease of limited greenspace all for CEMEX profits. CEMEX can find another place for their building materials.

Response 458-2

The project's potential impacts related to air quality, noise, and aesthetic environment are evaluated in Draft EIR Section 4.3, as updated in this Final EIR (see Appendix D-4, "Revised Section 4.3, Air Quality"), Section 4.13, "Noise," and Section 4.1, "Aesthetics and Visual Resources." See Chapter 3, "Draft EIR Errata," for proposed revisions to these Draft EIR sections. The commenter's opposition to the proposed project is noted for the consideration of the decision-makers.

Letter #459 March 10, 2025, Tom Boroujeni

Comment 459-1

Cemex's proposed expansion of its mining operations near the San Joaquin River raises significant concerns about environmental degradation, legal liabilities, and economic burdens on the surrounding communities. As an industrial operation with a well-documented history of regulatory violations, Cemex's intensified mining activities will have far-reaching consequences that extend beyond Fresno County. The expansion poses threats to surface and groundwater resources, transportation infrastructure, and local economies, all while being unnecessary given the existing surplus of gravel in the region. This document examines the key risks associated with Cemex's expansion and why its approval would be a costly mistake for both the environment and the public.

Response 459-1

The commenter's concerns and opinions are noted and will be considered by County decision-makers. Please see Collective Response #4a pertaining to CEMEX regulatory history, and please see Collective Response #3 pertaining to regional aggregate demand and supply. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR and no further response is warranted here. Please see Responses 459-2 through 459-10 below for responses to specific comments.

Comment 459-2

Surface and Groundwater Impacts

Cemex's operations will inevitably introduce pollutants into the San Joaquin River, a shared natural resource that flows through multiple counties before reaching the Sacramento-San Joaquin Delta and ultimately the San Francisco Bay. Given the river's extensive reach— beginning in the Sierra Nevada, feeding into Millerton Lake, and then flowing through Fresno, Madera, Merced, Stanislaus, and San Joaquin Counties—any contamination originating from Cemex's site in Fresno County will not remain localized. Instead,

pollutants will travel downstream, affecting water quality, ecosystems, and public health across a vast region.

Industrial mining operations like Cemex's generate multiple sources of water pollution, including:

1. Sediment runoff from excavation and blasting, which can cloud water, block sunlight, and harm aquatic life.

2. Heavy metals and chemicals from industrial machinery, which can seep into groundwater and surface water supplies.

3. Fuel, oil, and other industrial byproducts that contaminate the river through surface runoff during storms or equipment failures.

Because the San Joaquin River serves as a critical water source for agriculture, drinking water, and wildlife habitats, these pollutants pose a serious risk not just to Fresno and Madera Counties, but also to every downstream community. Farmers in Merced, Stanislaus, and San Joaquin Counties rely on river water for irrigation, and contamination could lead to crop damage, soil degradation, and financial losses. Additionally, the Sacramento-San Joaquin Delta, which provides drinking water to millions of Californians, would be directly affected by upstream pollution.

Response 459-2

As discussed in Section 4.4.16 of the *Modification Project Surface Mining and Reclamation Plan* (Draft EIR Appendix B-1, "Surface Mining and Reclamation Plan"), a range of programs and practices would be employed to prevent pollution of surface water and groundwater from operational practices and polluted sediment. These programs and practices, as detailed in Draft EIR Appendix B-1 and to be incorporated in the Stormwater Pollution Prevention Plan (SWPPP) and the Spill Prevention, Control, and Countermeasure (SPCC) Plan, would prevent degradation of surface water and groundwater quality from the use of chemicals and hazardous materials for equipment operation and maintenance. Accordingly, any potential impacts would be less than significant (see Draft EIR Appendix G-5, "Hydrology and Water Quality Analysis Report").

So, with respect to the potential for increases in concentration levels for constituents associated with mining and aggregates processing, and specifically blasting agents and petroleum products used in the equipment, the project would include spill prevention, controls and countermeasure plans, as well as best management practices, which when implemented would eliminate or reduce water quality impacts to levels that would not

have any adverse effect to the San Joaquin River or groundwater. Further, the project is designed to be a zero-discharge facility with respect to offsite discharges. With continued compliance of the State Industrial General Permit, should there be a discharge to the San Joaquin River or other surface water bodies, there would be no significant impairment since this permit is based on water quality criteria deemed to be protective to aquatic species and habitats. However, to prevent introduction of these constituents into the groundwater, notably increased levels of iron and manganese that could potentially increase through time as processing of the aggregates occurs, or the introduction of nitrate for example, in the event of residual blasting agents, the project would require an adaptive management strategy to mitigate such impacts to levels that are less than significant. See Mitigation Measure 4.10-1 beginning on Draft EIR page 4.10-92 and Mitigation Measures 4.10-5a and 4.10-5b beginning on Draft EIR page 4.10-96. See also Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.10, "Hydrology and Water Quality."

Comment 459-3

Beyond the ethical concerns of polluting neighboring counties, Cemex also exposes itself to significant legal liabilities. There is legal precedent for intrastate lawsuits over water pollution and usage, where counties, cities, or state agencies sue upstream polluters for damages.

Several key cases demonstrate this risk:

1. Missouri v. Illinois (1906) – Missouri sued Illinois over sewage pollution in the Mississippi River, showing early precedent for downstream entities taking legal action.

2. City of Chicago v. City of Milwaukee (1972) – Chicago sued Milwaukee for discharging pollutants into Lake Michigan, emphasizing the legal consequences of upstream pollution affecting downstream communities.

3. Los Angeles County Flood Control District v. Natural Resources Defense Council (2013) – Environmental groups successfully sued L.A. County over stormwater pollution, reinforcing the idea that local governments and industries are liable for water contamination.

Even if such lawsuits do not result in a ruling against Cemex, they can drag on for years, leading to excessive legal fees, regulatory scrutiny, and reputational damage. In some cases, companies settle out of court, costing millions in environmental mitigation measures, cleanup efforts, and penalties.

This is a preventable liability. Cemex's decision to intensify mining operations near the San Joaquin River is not just an environmental issue—it is a legal and financial risk that extends far beyond Fresno and Madera Counties. By polluting a critical, shared waterway, the company could face lawsuits from downstream counties, environmental organizations, and even the State of California.

Rather than inviting costly litigation and burdening taxpayers with the consequences of industrial pollution, Cemex should be required to implement stringent pollution controls, invest in sustainable water management practices, and take financial responsibility for potential environmental harm. Failing to do so could result in legal battles, economic damages, and irreparable harm to one of California's most vital waterways.

Response 459-3

The comment incorrectly alleges that the Operator is subjecting themselves to lawsuits over water pollution discharges. As provided in Impact 4.10-1, the existing surface water quality at the Plant and Quarry sites generally meets water quality standards, and the project does not propose to discharge water to the San Joaquin River (Draft EIR, Impact 4.10-1, page 4.10-88).

Additionally, as provided in Response 65-20, the Draft EIR describes the regulatory requirements that the mine is already subject to, such as the site's current waste discharge requirements No. 90-083 (WDR), its Industrial stormwater pollution prevention plan (SWPPP), its hazardous materials business plan (HMBP) and its spill prevention and countermeasure plan (SPCC), among others. (Draft EIR, pages 4.10-66 through 4.10-74; see also Draft EIR Impact 4.10-1, pages 4.10-88 through 4.10-92.) Impact 4.10-1 further discusses these in the context of the proposed project. For example, the Draft EIR at page 4.7-29, and 4.10-89 notes that the SWPPP and WDR would need to be updated to reflect the proposed project, while the Draft EIR at page 4.10-90 notes that the HMBP and SPCC would need to be updated. The Draft EIR at 4.10-90 also notes that the Blasting Protocols (see Appendix H-9, "Revised Blasting Protocols," of the Draft EIR) "specify practices to prevent the contamination of groundwater and surface water as a result of blasting." In addition, the SWPPP provides that both the Plant and Quarry Site are surrounded by berms/levees that separate onsite drainage from offsite drainage (Draft EIR, page 4.10-68). Upon completion of reclamation, all stormwater would flow into the Plant Site or Quarry Site (Draft EIR at 4.7-29).

In addition, see Response 65-37, which provides substantial support that the adaptive approaches in Mitigation Measures 4.7-6, 4.7-7a, 4.7-7b, 4.7-7c, and 4.10-1, which

adequately address the potential of pit failure and its impacts on groundwater quality and flow. Furthermore, see Responses 12-76, B-97, and B-100, which provide the requirements of Mitigation Measure 4.10-5a that are supported by substantial evidence that Mitigation Measure 4.10-5a would be effective and commits to a detailed plan for monitoring groundwater quality by sampling every six months until manganese levels have fallen to within the following threshold for a five-year period, and commits the Operator to complying with regulations relating to groundwater quality thresholds which may change (see Draft EIR at pages ES-34 through ES-35 and pages 4.10-95 through 4.10-96; see also CEQA Guidelines Section 15384(b)).

Finally, the Draft EIR adequately assures financial responsibility for potential environmental impacts, which are provided as Reclamation Plan financial assurances pursuant to California Surface Mining and Reclamation Act (Draft EIR, pages 4.10-76, 4.11-9), Mitigation Measure 4.10-10b's funding mechanism for Mitigation Measure 4.10-10a (Draft EIR, page 4.10-111), and Mitigation Measure 4.10-5b's funding mechanism for Mitigation Measure 4.10-5a (Draft EIR, page 4.10-98).

Comment 459-3 fails to acknowledge or analyze why these water quality requirements, mitigation measures, and financial assurances are deficient.

Comment 459-4

Furthermore, if Cemex is allowed to move forward with its expansion plans, the company's planned increased reliance on groundwater and its impact on local infrastructure have sparked serious concerns. In an article published by Stanford University's *Stanford Report*, researchers found that the San Joaquin Valley has been sinking at an average rate of nearly an inch per year between 2006 and 2022. This phenomenon, known as land subsidence, is largely attributed to excessive groundwater extraction, particularly for industrial and agricultural purposes. Given this context, Cemex's proposal to rely more heavily on groundwater rather than surface water from the river during their expansion raises serious environmental and economic concerns.

One of the primary reasons groundwater depletions is so concerning is that once the land sinks due to excessive water withdrawal, the underground aquifers lose their capacity to store water efficiently. Unlike surface water sources that can be replenished more predictably through seasonal rainfall or managed reservoirs, groundwater recharge is a slow process that takes decades, if not centuries, to restore aquifers to their original levels. When the ground compacts due to over-extraction, the structural integrity of the aquifers is permanently altered, reducing their ability to

hold water in the future. This means that even if groundwater extraction were later reduced, the damage to the system would already be irreversible, leading to long-term water scarcity issues for the region.

Additionally, the uneven nature of land subsidence exacerbates the problem by causing differential settlement, where some areas sink at a faster rate than others. This inconsistency places immense strain on infrastructure, resulting in costly damage to roads, bridges, pipelines, and buildings. According to the same *Stanford Report* article, millions of dollars have already been spent repairing these damages, and continued over-extraction of groundwater would only worsen the situation. Cracked roadways, misaligned bridges, and damaged water conveyance systems create significant safety hazards for communities and disrupt essential services.

Considering these consequences, Cemex's increased reliance on groundwater for expansion is highly problematic. Not only does it accelerate subsidence, but it also places an additional financial burden on local governments, businesses, and residents who must pay for infrastructure repairs. Furthermore, as groundwater becomes more difficult to access due to depletion, future water costs are likely to rise, putting economic strain on industries and agricultural operations that depend on it.

Response 459-4

See Collective Response #28 pertaining to groundwater pumping and land subsidence as well as Response 65-35.

Section 4.7.1.2 of the Draft EIR has a subsection titled "Subsidence" on page 4.7-11 of the Draft EIR. This subsection on subsidence describes the causes and potential effects of subsidence and concludes that "[b]elow the groundwater level, the subsurface soils at the Plant Site and Quarry Site generally consist of dense to very dense alluvial sands and gravels underlain by sedimentary and/or granitic rock, which have low potential for subsidence."

In addition, Section 3.2.6 of the 2025 Update to the North Kings Groundwater Sustainability Plan states that "the compression of clay as a result of groundwater extraction from confined aquifers is the cause of the vast majority of subsidence documented in the San Joaquin Valley. Most of the permanent subsidence in the San Joaquin Valley has historically been correlated to overdraft in the confined aquifer below the Corcoran Clay."

Dewatering at the Plant Site would be temporary and would occur in an unconfined aquifer zone. Specifically, there are no clay layers that overlay the alluvial aggregate deposits to be mined at the Plant Site, such that a confined aquifer is not present within the depths to be dewatered and mined. As noted on page 3-75 of the 2025 Update to the North Kings Groundwater Sustainability Plan, the Corcoran Clay is only present near the western edge of the groundwater subbasin, more than 25 miles from the project area, and there has been only minimal subsidence within the North Kings GSA boundary.

Granitic bedrock formations such as the weathered rock and hard rock at the Quarry Site are not subject to subsidence due to the extraction of groundwater because such formation do not contain compressible clays and the groundwater occurs within individual fracture zones within the massive rock.

Comment 459-5

Lowering groundwater levels in Fresno County will have severe consequences for local residents who rely on wells for their water supply. As aquifers are depleted, water tables drop, forcing homeowners, farmers, and businesses to drill deeper wells in search of reliable water sources. This process is not only expensive but also unsustainable in the long run. The cost of drilling new wells increases significantly with depth, often ranging from tens to hundreds of thousands of dollars per well. Many residents, especially those in rural areas who depend on private wells, may struggle to afford these high costs, leading to water insecurity and financial hardship.

Furthermore, deeper wells require more powerful pumps to extract water, which increases electricity costs for well owners. The deeper the well, the more energy is needed to lift water to the surface, placing an additional economic burden on households and agricultural operations. Small-scale farmers who rely on groundwater for irrigation may be disproportionately affected, as they must either invest in costly infrastructure upgrades or face reduced crop yields due to water shortages. This, in turn, can impact local food production and prices, creating ripple effects throughout the region.

Additionally, drilling deeper wells comes with the risk of tapping into lower-quality water sources. Deeper aquifers often contain higher levels of contaminants such as arsenic, nitrates, and other naturally occurring heavy metals, which pose serious health risks if not properly treated. Water treatment systems to remove these contaminants are expensive and not always feasible for all residents. Those who cannot afford such systems may be exposed to

unsafe drinking water, exacerbating public health concerns in Fresno County.

As groundwater levels continue to decline, well failures will become more common, leaving some residents with no immediate access to water. In past drought years, many homeowners and farmers in the Central Valley reported dry wells, forcing them to rely on costly emergency water deliveries or move to areas with more stable water supplies. If Cemex and other industries increase their reliance on groundwater, the problem will only worsen, accelerating depletion and making it even harder for residents to secure affordable and clean water. Given these challenges, local and state take action to regulate groundwater usage more effectively and encourage sustainable water management practices. Without intervention, Fresno County residents will face mounting financial, environmental, and public health crises in the years to come.

Response 459-5

With respect to groundwater depletion at the Plant Site, the use of the recharge trenches would limit the amount of drawdown of the water table in the unconfined alluvial aquifer to six to eight feet at a distance of 500 feet from the excavation (KDSA 2021). There are no supply wells within 500 feet of the excavation. As discussed in the Draft EIR, the level of drawdown is not an appreciable portion of the available water column in the existing wells in surrounding areas, representing no more than five percent of the total available water column in any of the wells. The project would therefore not result in a substantial depletion of water supplies that could impede the use of groundwater in the basin.

At the Quarry Site, the recharge operations would result in drawdown levels that would be approximately one-half of those which would occur without any recharge operations (KDSA 2021). The Draft EIR acknowledges reductions in the available groundwater column would occur in the Fresno County CSA 44C wells. The estimated decrease in the static water column would range from 30 to 60 feet depending on the recharge operations. Due to the larger distance to the domestic wells along North Friant Road, the effects on the available water column in these wells are relatively small. On a percentage basis, the reduction in the water column would be approximately three percent with recharge. If water production volumes from the CSA 44C wells decline to the point where current water demand cannot be met, this would result in a significant impact. Accordingly, Mitigation Measure 4.10-10a is provided as an Adaptive Management Program for Quarry Site Groundwater (Draft EIR, pages 4.10-108 through 4.10-111). As part of the Adaptive Management Program, potential effects on the CSA 44C wells would be assessed through the monitoring of nested wells between the Northeast Pond and the

CSA44C wells, and the CSA 44C wells themselves. Additionally, if access can reasonably be gained to any of the five private wells in Table 4.10-9, "Estimated Drawdown of Groundwater Levels in Wells Near the Quarry Site," located to the west of the Quarry Site from the private owners, then those wells should also become part of the monitoring program as well. Annual mitigation monitoring reports would be submitted to Fresno County annually.

If the monitoring data indicate that groundwater levels drop such that the available water column decreases by more than 15 percent, a potential impact would have occurred. If the data and assessment confirm a decrease in water levels greater than 15 percent is exclusively attributable to mine dewatering, then CEMEX would implement corrective measures.

The initial corrective measure would be to divert additional water from the excavation into the Northeast Pond or to a recharge trench to enhance groundwater recharge. If all available water is being pumped to the Northeast Pond or recharge trench, and the water level remains 15 percent or more below baseline levels, then mining would not progress to greater depths at the quarry (Draft EIR, pages 4.10-108 through 4.10-111).

Further, the water budget developed for the site and discussed in the EMKO Environmental Inc. Reports consider the rate of groundwater use for the project. CEMEX would continue to use a combination of surface water, recycled water, water from ponded pits, and groundwater from the supply wells. The Draft EIR determined there would be a less than significant impact related to the decrease in groundwater supplies that may impede sustainable groundwater management of the basin (see Draft EIR, Impacts 4.10-11 and 4.10-13, pages 4.10-112 through 4.10-115). The increase in groundwater consumption of 20 acre-feet per year during project operation and post-reclamation increase in net consumption of groundwater and in lieu supplies of 110 acre-feet per year are several orders of magnitude smaller than fluctuations in the water balance of the North Kings Groundwater Sustainability Agency (GSA). See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 459-6

Cemex's plan to depend more heavily on groundwater poses a severe threat to both the environment and the economy of the region. Given the challenges of replenishing aquifers and the substantial costs associated with land subsidence, a more sustainable water management approach is essential. Rather than exacerbating groundwater depletion, Cemex should be required to implement water conservation strategies, explore alternative sources, or invest in infrastructure that mitigates its impact on subsidence. Failing to

do so will only contribute to the ongoing crisis, making long-term recovery increasingly difficult and expensive.

Response 459-6

In addition to the response below, see Response 459-5.

The water budget developed for the site and discussed in the EMKO Environmental Inc. Reports consider the rate of groundwater use for the project. CEMEX would continue to use a combination of surface water, recycled water, water from ponded pits, and groundwater from the supply wells.

The Draft EIR determined there would be a less than significant impact related to the decrease in groundwater supplies that may impede sustainable groundwater management of the basin (see Draft EIR, Impacts 4.10-11 and 4.10-13, pages 4.10-112 through 4.10-115). The increase in groundwater consumption of 20 acre-feet per year during project operation and post-reclamation increase in net consumption of groundwater and in lieu supplies of 110 acre-feet per year are several orders of magnitude smaller than fluctuations in the water balance of the North Kings Groundwater Sustainability Agency (GSA).

Additionally, in regard to subsidence, per the Draft EIR, the subsurface soils at the Plant Site and Quarry Site generally consist of dense to very dense alluvial sands and gravels underlain by sedimentary and/or granitic rock, which have low potential for subsidence (see Draft EIR Section 4.7.1.2, "Soils, Geologic, and Seismic Hazards").

Comment 459-7

Transportation Infrastructure Impacts.

Cemex's expansion also creates a burden on the transportation infrastructure. Cemex has explicitly acknowledged in their Draft Environmental Impact Report (DEIR) that the proposed increase in mining operations will significantly heighten traffic congestion in the area surrounding the quarry. Furthermore, they have conceded that they have no intention of mitigating the effects of their transportation equipment on the local roads. This stance is entirely unacceptable.

Heavy commercial vehicles, particularly the large trucks used for hauling mined materials, impose a disproportionate burden on public infrastructure compared to personal vehicles. These trucks exert far greater stress on roads, leading to accelerated deterioration, increased maintenance costs, and a shortened lifespan for existing transportation infrastructure. Despite this,

Cemex appears unwilling to take financial or logistical responsibility for the damage their fleet will inevitably cause. This means taxpayers and local government funds will ultimately bear the brunt of these expenses—a burden that should, in fairness, fall on Cemex as the direct contributor to the problem.

Beyond infrastructure degradation, Cemex's expanded operations will introduce significant safety risks. Increased truck traffic, especially from heavily loaded semi-trailers, poses substantial hazards in an area already congested with commuters, local businesses, and pedestrians. These vehicles have long stopping distances, making them particularly dangerous in unexpected traffic slowdowns or emergency situations. This risk is especially concerning given that the proposed expansion will take place adjacent to Fresno's largest public park, an area frequented by families, cyclists, and pedestrians. The presence of massive gravel-hauling trucks navigating such a densely traveled corridor raises serious concerns about public safety that Cemex has not adequately addressed.

It is both irresponsible and negligent for Fresno County to allow this project to proceed without mandating that Cemex implement measures to mitigate these negative impacts. At a minimum, Cemex should be required to contribute to road maintenance funds, implement traffic management solutions, and ensure that their operations do not create disproportionate risks for the local community. Ignoring these consequences in favor of corporate convenience would set a dangerous precedent, prioritizing private profit over public well-being. The county must hold Cemex accountable for the real-world effects of their operations and require meaningful action to minimize harm to infrastructure, traffic flow, and public safety.

Response 459-7

The effects of project trips on the transportation infrastructure and traffic congestion were analyzed in the Draft EIR and the significant transportation impacts were disclosed. See Section 4.17, "Transportation," of the Draft EIR. The City of Fresno identifies Friant Road as a truck route, including the part of the road adjacent to Woodward Park, capable of accommodating the types of trucks accessing the project. The project would be required to mitigate its equitable share of the impacts and would contribute funds for transportation improvements. See discussion of Impact 4.17-1 on pages 4.17-27 through 4.17-40 of the Draft EIR. See Chapter 3, "Draft EIR Errata," for revisions to Draft EIR Section 4.17. See also Collective Response #29 pertaining to project traffic, and Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 459-8

Fresno Already has Sufficient Gravel

Cemex's push for a massive new mining expansion along the San Joaquin River is entirely unnecessary given the overwhelming surplus of gravel already available in Fresno County. The company claims that additional mining is crucial to sustain the region's construction industry, but state geological records prove otherwise.

According an article by Gregory Weaver in *Fresnoland*, Fresno County currently has nearly 200% more gravel than it needs for the next 50 years. Additionally, the Kings River alone contains 2 billion tons of surface gravel, a volume that could meet regional demand for the next 500 years without requiring any further mining expansions.

These figures make it abundantly clear: the demand for gravel has already been met many times over. There is no legitimate economic or infrastructural need for additional gravel extraction along the San Joaquin River. If local demand is already secured for centuries, what purpose does Cemex's expansion actually serve? I argue that the only entity that stands to gain from this project is Cemex itself. Unlike projects that meet clear public needs—such as infrastructure development, job creation, or economic stimulus—this expansion would have no meaningful impact on Fresno's construction industry, housing market, or workforce. The availability of gravel is not a limiting factor for development in the region, making this expansion redundant.

Rather than benefiting the public, Cemex's expansion would oversaturate the market with gravel that is not needed, creating a scenario where mining operations continue without purpose. If this project is approved, it won't make construction materials more accessible or improve infrastructure—it will only extend Cemex's corporate control over an already oversupplied resource, ensuring continued profits at the community's expense.

If Fresno were facing a severe shortage of gravel, this project might at least warrant discussion. But given the massive surplus, allowing Cemex to further exploit the region's resources would amount to needless environmental destruction. Expanding mining operations near Lost Lake Park would cause permanent damage to an already fragile ecosystem, harming air and water quality while further polluting one of the most degraded rivers in the country.

The San Joaquin River has already endured decades of environmental abuse due to mining, agriculture, and industrial pollution. Given that Fresno's construction industry does not need additional gravel, there is no rational argument for continuing to sacrifice the river's health for Cemex's bottom line.

Response 459-8

Please see Collective Response #3 pertaining to regional aggregate demand and supply. The Draft EIR impacts to water quality and water resources in Section 4.10. The proposed project would not result in significant impacts to the San Joaquin River.

Comment 459-9

Cemex is a Known Bad Actor

Cemex has a well-documented history of violating regulations, suggesting a persistent pattern of noncompliance that raises serious concerns about its ability or willingness to adhere to regulatory agreements in the future. According to data from violationtracker.goodjobsfirst.org, Cemex has committed 667 violations, accumulating a total of $52,384,115 in penalties. These infractions span multiple areas, including environmental regulations, workplace safety, and employment practices, demonstrating a broad and systemic disregard for legal and ethical standards.

A closer examination of these violations highlights the extent of the issue:

- Environmental Violations: Cemex has been penalized 81 times, paying $43,564,276 in fines for environmental infractions. These violations likely include breaches of air and water quality regulations, hazardous waste management failures, and other environmentally destructive practices. The sheer scale of these penalties suggests that environmental harm is not an occasional oversight but a recurring consequence of Cemex's operations.

- Workplace Safety Violations: The company has been cited 577 times, resulting in $6,356,849 in fines. Such a high number of safety violations indicates a consistent failure to maintain proper workplace conditions, putting employees at risk. This raises further concerns about Cemex's operational priorities—if worker safety is compromised despite repeated penalties, it stands to reason that environmental and regulatory commitments may also be neglected.

- Employment-Related Violations: Cemex has faced 9 employment-related penalties, totaling $2,462,990. These infractions likely involve labor law violations such as wage theft, discrimination, or failure to comply with fair labor standards. While this category has fewer recorded violations, it adds to the overall picture of a corporation that struggles—or refuses—to operate within legal boundaries.

These statistics are not isolated incidents; rather, they indicate a consistent, long-term pattern of noncompliance across multiple regulatory domains. A company with such an extensive record of violations has demonstrated, time and again, that it prioritizes its business interests over regulatory compliance, often opting to pay fines rather than invest in meaningful reforms. This pattern should not be dismissed as a series of unfortunate mistakes but rather recognized as a systemic issue within the company's corporate culture and operational framework.

Given this track record, it is entirely reasonable to be skeptical of Cemex's assurances regarding the expansion of its Rockfield quarry, even if it promises to implement mitigation practices. Regulatory agreements rely on trust—that is, trust that the company will uphold the stipulated conditions and not engage in future violations. However, Cemex's history suggests that even when faced with financial penalties, it continues to disregard regulations rather than alter its practices meaningfully.

If Cemex is granted permission to expand the Rockfield quarry, there is little reason to believe it will adhere strictly to mitigation requirements. Past behavior is often the best predictor of future actions, and Cemex's history suggests that it may either fail to implement the required safeguards or cut corners to maximize profitability, potentially causing environmental degradation and safety hazards.

Response 459-9

See Collective Response #4a pertaining to CEMEX's regulatory history. The majority of the comment is not germane to the Draft EIR, or the analysis or impact determinations found therein. The Draft EIR provides a detailed evaluation of potential project impacts associated with environmental issues related to air quality, water quality, health and safety, etc.

Comment 459-10

Conclusion

Cemex's proposed expansion serves no public purpose, offers no economic benefits to Fresno's residents, and directly contradicts existing geological data. With ample gravel supplies available for centuries to come, the only party that stands to benefit from this expansion is Cemex itself—at the cost of environmental degradation, community interests, and long-term sustainability. If this project moves forward, it will not be because Fresno needs more gravel—it will be because corporate interests have been allowed to dictate land use policy at the public's expense. Instead of permitting unnecessary destruction, local authorities should reject this expansion outright and prioritize environmental conservation and responsible resource management.

Response 459-10

The commenter's concerns, opinions, and recommendation that the project be denied are noted and will be considered by County decision-makers. Please see Responses 459-2 through 459-9 above for responses to specific issues raised in the comment letter. The commenter included a list of references appended to the end of his comment letter, these have been included with the rest of the comment letter in Final EIR Appendix M, "Draft EIR Comment Letters."

Letter #460 March 10, 2025, Karen Bosch Cobb

Comment 460-1

I am writing to express my strong opposition to the proposed CEMEX Rockfield Expansion Project. As a resident of Fresno County for 53 years, I am deeply concerned about the potential environmental and community impacts of this project, particularly its proximity to the San Joaquin River, Fresno, and the Friant community.

Response 460-1

The commenter's opposition to the project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR and no further response is warranted here. Please see Responses 460-2 through 460-10 below for responses to specific comments.

Comment 460-2

Environmental Concerns

The plan to excavate a 600-foot deep pit along the San Joaquin River raises significant environmental issues. This extensive excavation could disrupt local ecosystems, affect water quality, and pose risks to wildlife habitats. When mining rights were first granted in 1913, and the area in question was miles from urban areas, gravel mining was appropriate. Mining rights expired in 2013. During that 100+ years the Friant Dam was built, and the need to preserve the San Joaquin River as an oasis for residents of Fresno and Madera County arose. Lost Lake is a beautiful area for swimming, camping, and birding. There are wonderful birds all along the San Joaquin River. The Ball Ranch Nature Preserve is popular with fishers and birders. The San Joaquin River Parkway Beck Ranch Nature Preserve is situated between the existing gravel mining and the proposed "pit."

Response 460-2

The commenter's discussion of background and quality of the project area is noted. Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. The commenter incorrectly suggests that "mining rights expired in 2013." For discussion of the existing conditional use permits at the project sites, see Draft EIR Table 2-4, "Summary of Conditional Use Permits," on page 2-27. See also Collective Response #2 for discussion of the permit extensions at the project site. The comment does not address the adequacy of the Draft EIR, and no further response is warranted here.

Comment 460-3

Furthermore, as the crow flies this site is very close to the Austin Quarry owned by Vulcan Materials in Madera County (Hwys 41 and 145). Why do we need yet another hard rock site especially along Friant Road which is already has housing and commerce in Friant, and which in the next 100 years will be fully urbanized as Millerton New Town, Clovis, and Friant grow?

Response 460-3

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 460-4

Community Impact

The expansion is expected to increase truck traffic on Friant Road, which could lead to congestion, safety hazards, and diminished quality of life for existing and future residents.

Response 460-4

The effects of project trips on the transportation infrastructure and traffic congestion were analyzed in the Draft EIR, and the significant transportation impacts were disclosed. See discussion of Impact 4.17-1 on pages 4.17-27 through 4.17-40 of the Draft EIR. The project would be required to mitigate its equitable share of the impacts and would contribute funds for transportation improvements. See Collective Response #29 pertaining to project traffic, and Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 460-5

Additionally, the project's proximity to the San Joaquin River will affect recreational areas and public access to the river.

Response 460-5

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas.

Comment 460-6

The EIR sites traffic concerns at the intersection of Willow and Friant Road, but it does not delve enough into additional impacts which include

1. Ramp ways which will have to be built to accommodate trucks arriving and leaving the sites, which incidentally lead to rocks damaging windshields.

Response 460-6

Friant Road is a designated truck route; the geometry of intersections and driveways is designed to accommodate heavy vehicles, including consideration of the design vehicle by way of application of truck turning templates. Please see Collective Response #30 in regard to rocks damaging windshields.

Comment 460-7

2. As a person who drove Friant Road nearly daily for 46 years, I can attest to the changes I saw on Friant Road as it changed from a 2 line road, to a 4 lane road. This is a major

thoroughfare to recreation at Millerton Lake, Table Mountain, and into the Sierra Foothill and Mountains. Friant Road is only going to get busier, and mining will be even less compatible.

Response 460-7

Please see Collective Response #29 pertaining to project traffic, and please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 460-8

3. There is also no mention of traffic for the residents of Friant, and more critically for gravel/rock trucks driving through Friant, and turning on North Fork Road to connect to Highway 145 (Ironically going right past the Austin Quarry at Highways 145 and 41) and out to Highway 99.

Response 460-8

Section 4.17, *Transportation*, of the Draft EIR analyzes the traffic impacts from the proposed project. Friant Road is designated as an expressway adjacent to the project sites. The Traffic Impact Study indicates that all of the study intersections in the project vicinity are currently operating at acceptable Levels of Service and no deficiencies were identified. Measures to reduce traffic congestion effects are implemented through Mitigation Measures 4.17-1a through 4.17-1r and primarily consist of the payment of equitable share of costs of future roadway improvements in the County.

Comment 460-9

4. Hard Rock mining which includes drilling and blasting beneath an alluvial deposit is likely to impact residents with sound, possible changes in their well levels, and of course the unsightliness of the site for the next **100 years.**

Response 460-9

Draft EIR Section 4.13, "Noise," evaluates potential noise and vibration impacts of the project. Draft EIR Section 4.10, "Hydrology and Water Quality," evaluates potential water quality impacts of the project. Draft EIR Section 4.1, "Aesthetics," evaluates potential visual resources impacts of the project. Please also see Collective Response #24 pertaining to groundwater monitoring, Collective Response #25 pertaining to the proposed project's relationship and potential effects associated with surface water and groundwater interconnectivity, and Collective Response #8 pertaining to the visual resource impact analysis and mitigation. The comment does not address the adequacy of the Draft EIR's

evaluation of these issues nor does the comment provide evidence of impacts not already discussed in the Draft EIR.

Comment 460-10

Regulatory and Procedural Concerns

The Draft Environmental Impact Report (EIR) for this project has been extended for public review until March 10, 2025. I urge the County to thoroughly consider all public comments and ensure that the EIR adequately addresses all potential environmental and community impacts.

Conclusion

Given the significant environmental and community concerns associated with the CEMEX Rockfield Expansion Project, I respectfully request that the County of Fresno deny approval for this project. Protecting our natural resources and ensuring the well- being of local communities for the next 100 years should remain a top priority.

Thank you for considering my concerns.

Response 460-10

The County has thoroughly considered all public comments on the Draft EIR. The commenter's concerns and request for denial of the project are noted and will be considered by County decision-makers.

Letter #461 March 10, 2025, Elizabeth Brewer Lichty

Comment 461-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Let me begin by sharing a personal experience relevant to the area in which CEMEX is planning the expansion project. My daughter attended the outdoor preschool program (Young Explorers Enrichment Program), offered through the San Joaquin River Parkway and Conservation Trust, before her kindergarten year, and it was a very enriching, engaging, and thoughtfully formed environment with local nature woven throughout the daily experiences. She had many

wonderful experiences with the river and surrounding areas, and visited Lost Lake at least twice each season, right near where the CEMEX site is planned. Among quality developmentally appropriate early childhood activities and interactions, the children were also exposed to stewardship, responsibility and respect for nature and its inhabitants.

I cannot imagine what the quality of her experiences would have deteriorated to if she were constantly surrounded by the potential noise/air/river pollution from the deep mining for which CEMEX has plans.

The DEIR is lacking research and detailed data on water quality of the San Joaquin River, the impacts of the river parkway and recreation, the effects of potential visual, auditory, air quality and traffic pollution from the project, and the threat to wildlife in the area— we need to do whatever we can to protect these creatures and the land we all share.

Response 461-1

The commenter's concerns regarding the Draft EIR and mitigation are noted. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures and no further response is warranted here. Please see below Responses 461-2, 461-3, and 461-4 for discussion of the project's impacts to water quality and the San Joaquin River. See below Responses 461-5 and 461-6 regarding the project's potential impacts to the San Joaquin River Parkway and recreation. See below Responses 461-7, 461-8, and 461-9 regarding the project's potential visual, noise, air quality, and traffic impacts. See below Response 461-10 regarding the project's potential impacts to wildlife.

Comment 461-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 461-2

See Response 349-2.

Comment 461-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 461-3

See Collective Response #17. See also Response 329-3.

Comment 461-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 461-4

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 461-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 461-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 461-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 461-6

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. See also Collective Response #19 regarding the Draft EIR's information pertaining to surrounding recreational areas.

Comment 461-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 461-7

Please see Collective Response #8 pertaining to the visual resource impact analysis and mitigation.

Comment 461-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR.

Response 461-8

Please see Collective Response #29 pertaining to project traffic, please see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 461-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 461-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 461-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 461-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (see Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered (Draft EIR, page 4.4-51). With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored

blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (see Draft EIR, pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 461-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 461-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR adequately analyzes the potential environmental impacts of the proposed project and provides mitigation measures where necessary to minimize the impacts to less than significant, where feasible. As discussed in Chapter 3, "Draft EIR Errata," of this Final EIR, the County has determined that recirculation of the Draft EIR is not required.

Letter #462 March 10, 2025, Sirley Carballo

Comment 462-1

I wanted to reach out to express my heartfelt concerns regarding the CEMEX Rockfield Expansion Project and its potential impact on the environment and surrounding communities. After reviewing the Draft Environmental Impact Report (DEIR), I believe there are several critical issues that need to be addressed before moving forward with any approvals.

Response 462-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not address the adequacy of the Draft EIR and no further response is warranted here. Please see Responses 462-2 through 462-5 below for responses to specific comments.

Comment 462-2

According to the California Geological Survey, the Fresno metro area already has nearly 200% more gravel than needed for the next 50 years from local mines. Despite claims that the region would suffer from a lack of locally sourced gravel, CEMEX has declined to provide further clarification, raising concerns about transparency and intent. Additionally, the company has a history of pursuing controversial mining projects, including a past attempt to mine Jesse Morrow Mountain—a sacred Native American burial site—despite viable alternatives nearby.

Response 462-2

Please see Collective Response #3 pertaining to regional aggregate demand and supply.

Comment 462-3

The DEIR itself acknowledges significant risks. It states that emissions from the project may exceed cancer risk thresholds but does not evaluate the broader population-wide cancer burden, citing the presence of mitigation measures (DEIR pg. 4.3-63).

Response 462-3

Please see Collective Response #11 for further discussion pertaining to the evaluation of cancer risk. After mitigation, the cancer risk at the maximum exposed individual sensitive receptor (MEIR) decreases from the CEQA baseline conditions (i.e., cancer risk is a negative value). Thus, the cancer burden, a measure summing effects from each census block, would also show a decrease from the CEQA baseline. Therefore, cancer burden

was not calculated in the Draft EIR. Nevertheless, the technical analysis for air quality impacts was updated to amplify and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment,* (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 462-4

Moreover, with over four dozen recorded breeding season occurrences of the Swainson's hawk within two miles of the project site, and numerous potential nesting trees within half a mile, the project could significantly impact this already vulnerable species.

Response 462-4

As described in Section 4.4, "Biological Resources," of the Draft EIR, based on site conditions, the majority of the project area is characterized by active mining operations, which provide limited foraging opportunities for Swainson's hawks. However, areas adjacent to the mining operations, such as fallow fields and open spaces, may offer potential foraging habitat. The Draft EIR recognizes that the site is located within the known nesting range of Swainson's hawk therefore, *Mitigation Measure 4.4-1C: Nesting Birds* has been incorporated as necessary to reduce potential indirect impacts to Swainson's hawk foraging in accordance with CDFW guidance.

Comment 462-5

Given these concerns, I urge the agency to require CEMEX to conduct additional environmental analysis, strengthen mitigation measures, and explore less harmful alternatives. Transparency and accountability in this process are essential to protecting the long-term health of the San Joaquin River watershed and the surrounding communities.

I appreciate your time and consideration of these concerns, and I look forward to your thoughts on this matter.

Response 462-5

The commenter's concerns, requests, and opinions regarding the project are noted and will be considered by County decision-makers. The comment does not provide specific recommendations for strengthening mitigation measures or alternatives not already discussed and evaluated in the Draft EIR, and no further response is warranted.

Letter #463 March 10, 2025, Lisa Castaneda-Perez

Comment 463-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Response 463-1

The commenter's concerns are noted and will be considered by County decision-makers. The comment is introductory and does not provide evidence of a deficiency in the adequacy of the Draft EIR or mitigation measures, and no further response is warranted here. Please see Responses 463-2 through 463-11 for further discussion of the issues raised in this letter.

Comment 463-2

Impacts on Water Quality & the San Joaquin River

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Response 463-2

See Response 349-2.

Comment 463-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Response 463-3

See Collective Response #17. See also Response 329-3.

Comment 463-4

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Response 463-4

See Response 403-4, which explains that the Draft EIR groundwater data was collected during low and high flow periods.

Comment 463-5

Impacts on the San Joaquin River Parkway & Recreation

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Response 463-5

Please see Collective Response #22 pertaining to the project's proposed dedication of trail easements along the San Joaquin River.

Comment 463-6

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Response 463-6

Please see Collective Response #27 pertaining to potential effects on adjacent parklands and recreational use areas. See also Collective Response #19 regarding the Draft EIR's information pertaining to surrounding recreational areas.

Comment 463-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.

Response 463-7

Please see Collective Response #8 pertaining to the Draft EIR's visual resource impact analysis and Mitigation Measure 4.1-1.

Comment 463-8

- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on how mitigation takes place is just one example of the inadequacy of the DEIR. The docu [sic]

Response 463-8

See Collective Response #29 pertaining to the project's potential traffic impacts, and see Collective Response #30 pertaining to roadway safety and road maintenance.

Comment 463-9

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Response 463-9

Please see Collective Response #10 pertaining to the baseline used for evaluation of potential air quality impacts of the project.

Comment 463-10

Threats to Wildlife

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Response 463-10

Mitigation Measure 4.4-1c requires the implementation of pre-construction surveys for nesting birds, including the Swainson's hawk and tricolored blackbird, prior to the initiation of a mining phase as shown on Draft EIR Figure 2-7, "Proposed Plant Site Mining Plan," and Figure 2-8, "Proposed Quarry Site Mining Plan." Extensive measures are described in detail regarding actions to be taken upon observation of these species for their protection (Draft EIR at pages 4.4-50 through 4.4-51). Mitigation Measure 4.4-1a requires the implementation of pre-construction surveys for the burrowing owl, including consultation with CDFW and relocation of any species discovered. (Draft EIR, page 4.4-51.) With implementation of Mitigation Measures 4.4-1c and 4.4-1a, the potential for the proposed project to result in adverse impacts to the Swainson's hawk, tricolored blackbird, or burrowing owl at or near the Plant Site and Quarry Site would be less than significant (Draft EIR pages 4.4-49 through 4.4-50).

The Western red bat was not observed on site during the habitat assessment; however, moderate potential exists for suitable foraging and roosting habitat (see Draft EIR, page 4.4-27). As discussed in Chapter 3, "Draft EIR Errata," the Final EIR provides additional

analysis of potential impacts to bats and adds Mitigation Measure 4.4-1d to require pre-construction surveys and measures to avoid or minimize impacts to active bat roosts. With implementation of Mitigation Measure 4.4-1d, potential impacts to bats, including the Western red bat, would be less than significant.

In any event, blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and are not expected to result in sustained or long-term impacts. The project sites are already disturbed by ongoing mining activities and would not have a significant increase in activity. The Draft EIR, as revised in this Final EIR, therefore adequately evaluates potential impacts to the species discussed above.

Regarding the use of Alaskan Blasting Standards for analyzing the project's potential impacts to salmon, see Response 65-13 and Collective Response #16. Section 4.4, "Biological Resources," of the Draft EIR does not need rewriting or recirculation.

Comment 463-11

Conclusion

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Response 463-11

The commenter's concerns and request for additional analysis and mitigation and for recirculation of the Draft EIR are noted. The Draft EIR sufficiently analyzes the potential environmental impacts of the proposed project, in accordance with CEQA. As discussed in Chapter 3, "Draft EIR Errata," the County has determined that recirculation of the Draft EIR is not required.

Letter #464 March 10, 2025, Karen Cawthorne

Comment 464-1

My husband and I have raised our family in Fresno County over the past 35 years. We have enjoyed canoeing on the San Joaquin River and camping at Lost Lake Park. It has been gratifying to see more areas of the river protected over the years and to see wildlife at the river including bobcat, deer and eagles. The San Joaquin River

is a habitat for wildlife and an important nearby natural resource for the community to enjoy.

I am opposed to the CEMEX Rockfield Expansion Project and have the following comments on the Draft Environmental Impact Report:

Response 464-1

The commenter's background and opposition to the project is noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR, and no further response is warranted here. Please see Responses 464-2 through 464-5 below for responses to specific comments.

Comment 464-2

1) Potential impacts of blasting on wildlife. There are examples cited of habituation of wildlife to mining operations, but these examples for habituation are for surface mining, not the deep rock blasting proposed by CEMEX. The DEIR does not really analyze potential impacts of blasting on wildlife.

Response 464-2

For discussion of blasting impacts to wildlife, please refer to Responses 58-37, 58-38, 58-40, 58-41, 58-42, 65-8, 65-12, 65-16, and 65-17. Blasting activities would be brief, with each blasting event occurring for approximately one to two seconds, and would not significantly impact wildlife adjacent to the project sites. The project sites are already disturbed by decades of ongoing mining operations and the continuation of mining activities, such as drilling and excavating, would not result in significant impacts to wildlife (see Draft EIR page 4.4-52).

Comment 464-3

2) Impacts on air quality and dust emissions. The DEIR indicates project emissions may exceed cancer risk thresholds. There is mention of mitigation to reduce emissions, but the DEIR did not evaluate cancer burden of the population. Analysis of project emissions impact was also not performed before taking into account implementation of mitigation efforts.

Response 464-3

Please see Collective Response #11 for further discussion pertaining to the evaluation of cancer risk. After mitigation, the cancer risk at the maximum exposed individual sensitive receptor (MEIR) decreases from the CEQA baseline conditions. Accordingly, other locations would have even less cancer risk. Therefore, cancer burden was not calculated in the Draft EIR. The technical analysis for air quality impacts was updated to amplify

and clarify the information presented in the Draft EIR, as described in the *Air Quality, Health Risk and Climate Change Impact Assessment*, (see Appendix D-3, "Revised Air Quality, Health Risk and Climate Change Impact Assessment"). The analysis demonstrates no new impacts and no changes to any of the findings in the Draft EIR.

Comment 464-4

3) Noise and traffic concerns. Noise along area roadways used by truck traffic exceeds the usually acceptable standard in residential areas. The threshold used in the DEIR doesn't make sense in an area where residents are already exposed to high levels of noise. Impacts to area residents are potentially significant and as well as impacts to users of the adjacent park. Mitigation measures for noise impacts should be more specifically required. There should be an analysis in the DEIR of how much each noise reduction strategy would impact noise levels.

Response 464-4

Transportation is discussed in Section 4.17, "Transportation," of the Draft EIR. Section 4.13, "Noise," of the Draft EIR provides a comprehensive analysis of potential noise impacts from the proposed project. The Fresno County General Plan Health and Safety Element establishes the thresholds allowed for noise exceedance levels factoring in the time of day. Draft EIR Table 4.13-1, "Typical Noise Levels Associated with Common Activities," displays typical noise levels associated with common activities and heavy traffic at 300 feet away has a noise level of 60 dBA.

The Draft EIR includes a traffic noise assessment. The Federal Highway Administration Highway Traffic Noise Prediction Model was used in the Traffic Impact Study to describe existing noise levels due to project traffic (see Draft EIR Appendix I-1, "Traffic Impact Study") (Draft EIR page 4.13-44). Impact 4.13-1 addresses the project's potential to generate increases in ambient noise levels from project-generated traffic in excess of noise standards set forth in the County General Plan or noise ordinance (Draft EIR page 4.13-49). The Draft EIR concludes that this impact would be less than significant (Draft EIR page 4.13-57).

Finally, with the implementation of Mitigation Measures 4.13-2, 4.13-3, and 4.10-1, all potential noise and vibration related impacts at the site boundaries and nearby receptors would be reduced to a less than significant level. See Chapter 3, "Draft EIR Errata," for proposed revisions to the Draft EIR sections referenced here.

Comment 464-5

I have listed some of my deep concerns about the proposed CEMEX hard rock blasting. I am also quite concerned about granting approval for 100 years.

I would ask that Fresno County at least require CEMEX to provide more analysis, further mitigation efforts, and most importantly, explore less harmful alternatives.

Thank you for your time and for your consideration.

Response 464-5

The commenter's concerns and requests are noted and will be considered by County decision-makers. Please see Collective Response #5 pertaining to the requested use permit duration. The comment does not provide specific recommendations for more analysis, further mitigation, or alternatives not already discussed and evaluated in the Draft EIR.

Letter #465 March 10, 2025, Vicki Cheney

Comment 465-1

Thank you for the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project that I have learned about at meetings with the River Parkway Trust and with homeowners and environmentalists, and as a long-time resident of Fresno who has visited Lost Lake Park with my children and grandchildren, who became familiar with and who still enjoys visiting the fish hatchery and hopes the new salmon hatchery will soon open as well as the trail from there to Lost Lake, and who has been a cyclist since the 1980s cycling the Friant Road corridor from Woodward Park to Friant for 40 years, I have several concerns that I urge you to address prior to moving forward with approval. I am writing also on behalf of my mother and an old friend who I wish were here to write instead of me as they are much better and more informed advocates. But Selma Layne and Glenn Kottcamp, this is the best I can do.

Response 465-1

The commenter's background and concerns regarding the project are noted and will be considered by County decision-makers. The comment does not address the adequacy of the Draft EIR. Please see Responses 465-2 through 465-14 for further discussion of the commenter's specific concerns.

Comment 465-2

1. Impacts on the San Joaquin River Watershed

How can drilling 600 feet deep so close to the river, not to mention access to the river for the mining operation not impact the watershed? What happens if there is a breach? There is nothing that seems to suggest a plan to avoid mishaps but only "we'll worry about it if something happens." Too late.

Response 465-2

In addition to the response below, see Collective Response #25 and Responses 6-12, 6-14, and 6-56.
