TABLE OF CONTENTS

VOLUME I: FINAL ENVIRONMENTAL IMPACT REPORT

(provided under separate cover)

VOLUME II: APPENDICES

APPENDIX A **NOTICE OF PREPARATION** *(provided in Draft EIR)*

Appendix A-1 Notice of Preparation *(provided in Draft EIR)*

Appendix A-2 NOC of the Notice of Preparation *(provided in Draft EIR)*

Appendix A-3 NOP Comment Letters

APPENDIX B **APPLICATION MATERIALS** *(provided in Draft EIR)*

Appendix B-1 Surface Mining and Reclamation Plan *(provided in Draft EIR)*

Appendix B-2 Project Description/Operational Statement *(provided in Draft EIR)*

Appendix B-3 CEMEX Production Limit Letter

APPENDIX C **VISUAL IMPACT ANALYSIS** *(provided in Draft EIR)*

APPENDIX D **AIR QUALITY, GHG, AND HEALTH RISK ASSESSMENT** *(provided in Draft EIR)*

Appendix D-1 Air Quality, Health Risk, and Climate Change Impact Assessment *(provided in Draft EIR)*

Appendix D-2 Addendum No. 2 to the Air Quality, Health Risk, and Climate Change Impact Assessment *(provided in Draft EIR)*

Appendix D-3 Revised Air Quality, Health Risk and Climate Change Impact Assessment

Appendix D-4 Revised Section 4.3, Air Quality

Appendix D-5 Revised Section 4.8, Greenhouse Gas Emissions

APPENDIX E **BIOLOGICAL RESOURCES** *(provided in Draft EIR)*

Appendix E-1 Plant Site Habitat Assessment *(provided in Draft EIR)*

Appendix E-2 Quarry Site Habitat Assessment *(provided in Draft EIR)*

Appendix E-3 Focused Special-Status Plant Survey Report *(provided in Draft EIR)*

Appendix E-4 Effects of Blasting on Fish *(provided in Draft EIR)*

Appendix E-5 Groundwater Dependent Vegetation Survey *(provided in Draft EIR)*

Appendix E-6 WRA Supplemental Biological Resources Evaluation Memorandum

APPENDIX F GEOLOGY AND SOILS REPORTS *(provided in Draft EIR)*
Appendix F-1 Plant Site Geotechnical Report *(provided in Draft EIR)*
Appendix F-2 Quarry Site Geotechnical Report *(provided in Draft EIR)*
Appendix F-3 Quarry Site Geotechnical Memorandum *(provided in Draft EIR)*
Appendix F-4 Paleontological Technical Memorandum *(provided in Draft EIR)*

APPENDIX G HYDROLOGY AND WATER QUALITY *(provided in Draft EIR)*
Appendix G-1 Hydraulic Analysis *(provided in Draft EIR)*
Appendix G-2 Surface Runoff and Drainage Plan *(provided in Draft EIR)*
Appendix G-3 Groundwater Conditions at the Plant Site *(provided in Draft EIR)*
Appendix G-4 Groundwater Conditions at the Quarry Site *(provided in Draft EIR)*
Appendix G-5 Hydrology and Water Quality Analysis Report *(provided in Draft EIR)*
Appendix G-6 Addendum to Hydrology and Water Quality Analysis Report *(provided in Draft EIR)*
Appendix G-7 200-year Flood Hazard Analysis – Quarry Site
Appendix G-8 200-year Flood Hazard Analysis – Plant Site

APPENDIX H NOISE ASSESSMENT *(provided in Draft EIR)*
Appendix H-1 Environmental Noise and Vibration Assessment *(provided in Draft EIR)*
Appendix H-2 Noise and Vibration Assessment Addendum *(provided in Draft EIR)*
Appendix H-3 Blast Impact Analysis *(provided in Draft EIR)*
Appendix H-4 Blasting Effects on San Joaquin River Embankments *(provided in Draft EIR)*
Appendix H-5 San Joaquin River Embankments Geophysical Investigation *(provided in Draft EIR)*
Appendix H-6 Blasting Protocols *(provided in Draft EIR)*
Appendix H-7 Blast Impact Analysis Peer Review *(provided in Draft EIR)*
Appendix H-8 Blasting and Human Response Technical Memorandum
Appendix H-9 Revised Blasting Protocols

APPENDIX I TRANSPORTATION *(provided in Draft EIR)*
Appendix I-1 Traffic Impact Study *(provided in Draft EIR)*
Appendix I-2 Estimates of Vehicle Miles Travelled *(provided in Draft EIR)*
Appendix I-3 Response to Comments on Traffic Impact Study *(provided in Draft EIR)*
Appendix I-4 Additional Responses to Comments on Traffic Impact Study *(provided in Draft EIR)*
Appendix I-5 Pavement Hazard Identification and Mitigation Technical Memorandum
Appendix I-6 State Route 41/Friant Road Interchange Analysis Technical Memorandum

APPENDIX J **AB 52 TRIBAL NOTIFICATION LETTERS** *(provided in Draft EIR)*

APPENDIX K **COMPARISON OF DRAWDOWNS RESULTING FROM PROJECT ALTERNATIVES** *(provided in Draft EIR)*

APPENDIX L **REVISED NOTICE OF AVAILABILITY**

APPENDIX M **DRAFT EIR COMMENT LETTERS**

Sent: Friday, June 26, 2020 7:24 PM
To: Monfette, Christina
Subject: Cemex proposal

We live in the area of Woodward Lake. We hear the traffic on Friant, we hear the heavy cement trucks and other heavy equipment rolling by on Friant. We are totally against Cemex's proposal to continue and now expand by using dynamite. It is ruining the scenery, air, and area with all the pollution and now increased noise pollution.

Monfette, Christina

Subject: RE: Cemex proposal (EIR 7763)

Good afternoon,

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR. The Draft EIR will provide a discussion on the extent of potential impacts identified by the scoping process and may propose mitigation measures to reduce such impacts.

If you have any questions or if you would like to submit additional comments, please don't hesitate to reach out to me at the contact information below. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date. Please note that we are in receipt of your comments submitted to this email address and through our online comment system.

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Art Avakian

2. Organization/Business

Home owener

3. What is your address?

15338 Mesa View

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

No

5. Please provide your email address.

artavakian@yahoo.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I am concerned not just about the area and the impact that this project is posing to the neighborhoods like mine, but is will be unacceptable damage to th landscape and entire development in the Friant city. The other substantial issues that are concerning me as a resident of the immediate area of the proposed plan is heavy industrial negative impact to the area. The presence of this type of plant is going to have irreversible impact on bio-population of the entire stretch of Friant road neighboring other developments and water resources.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

I am protesting acceptance of such a disastrous development project.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

All of the above is concerning me. I have very sensitive lungs and can not take the dust that is going to be big part of the project. The noise is another factor that is going to be absolute NO to this project. Otherwise Cemex has to arrange to relocate my family, purchase my house and arrange all the moving expenses to similar Luxury setting as my property is. I am against the expansion and development of the site for the future mining. Voting NO.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Subject: Confirmation of Receipt of Comments (EIR 7763)

Good morning,

I am sending you this email to confirm receipt of the comments you submitted regarding the Cemex Rockfield Modification Project through our online comment system. Your comments were received prior to the deadline and therefore will be considered as part of the scoping review for this project. This part of the process helps to determine where the Environmental Impact Report should focus in order to address potentially significant environmental impacts.

Your email address has been added to the list to receive digital notice regarding this application.

If you have any questions about this project, please feel free to reach out to me with the contact information below.

Thank you,

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I am responding back to you regarding the project that has been put on the table for the discussion. I am not sure if I have to explain to anyone about this horrible idea to even plan to relocate or consider that for the such a pristine preserved natural site as we are blessed in Friant. I have short answer to that discussion NO. We are NOT going to allow that disaster to happen here. Where are the environmentalists, where are the people from air pollution department. I am convinced that everyone who is going to learn about this project will see the negative impact hat it will have on Air, water will be contaminated and poisoned, depleted. What is going to happen then?
NO to the project.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Air and water quality. The water sources will be depleted due to aggressive and invasive methods of excavation. It will be unacceptable geological damage and wound created in the middle of newly developing city. NO to the project.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

EIR 7763

Increased emissions of pollutants and greenhouse gases

Impacts to protected plant and animal species and their habitats

Impacts to soil conditions and slope stability

Impacts to hydrology and water quality related to the proposed deeper mining, including blasting

Increased traffic between project sites

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Board of Supervisors, please do not allow Cemex to extend their contract and mining in this area. We currently live in Tuscan Bluffs off Friant Road and strongly oppose the Cemex project extension. Please do not allow air, noise, and water pollution to affect our community. The San Joaquin River Parkway should be restored. Further, Friant Road is already very dangerous and we can't imagine what adding more truck traffic to it would cause.

Thank you for your time and consideration,

The Agellon Family

Subject: CEMEX project opposition

County Planners, please do not allow Cemex to extend their contract and mining in this area. We currently live in Tuscan Bluffs off Friant Road and strongly oppose the Cemex project extension. Please do not allow air, noise, and water pollution to affect our community. The San Joaquin River Parkway should be restored. Further, Friant Road is already very dangerous and we can't imagine what adding more truck traffic to it would cause.

Thank you for your time and consideration,

The Agellon Family
(Concerned neighbors)

Subject: EIR 7763 Confirmation of Receipt of Comments

Good afternoon,

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex which were sent to the Clerk to the Board of Supervisors. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR. The Draft EIR will provide a discussion on the extent of potential impacts identified by the scoping process and may propose mitigation measures to reduce such impacts.

If you have any questions or if you would like to submit additional comments, please don't hesitate to reach out to me at the contact information below. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date.

Chrissy Monfette | Planner
Department of Public Works and Planning | Development Services and Capital Projects Division

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Adriana Gonzalez

2. Organization/Business

Concerned citizen

3. What is your address?

6338 N Cleo Ave Fresno CA 93722

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

adriana104862@yahoo.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

My concern first and foremost is the Environmental, ecological damage, and pollution to both people, plants, and animals. STOP! - NOW!

The Notice of Preparation notes anticipated environmental impacts include:

Increased emissions of pollutants and greenhouse gases

Impacts to protected plant and animal species and their habitats

Impacts to soil conditions and slope stability

Impacts to hydrology and water quality related to the proposed deeper mining, including blasting

Increased traffic between project sites

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

No blasting.

No more contamination of our water and land.

Stop polluting.

Respect land, water, and species.

The environmental damage is evident.

EIR 7763.

Stop expanded mining Now!

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The San Joaquin River has been mined enough. We do not need granite fragments to lodge in the gills of our nascent salmon run. We do not need more down stream obstruction during floods. Abandon the whole project. AHH

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Give up the whole project.

Subject: Cemex / San Joaquin River

Good afternoon,

I am emailing to strongly oppose the approval of the Cemex plan to mine the San Joaquin River. I am a resident that lives downwind of the site and all of the ultra fine particulate matter that will be sent into the air as well as the noise and potential water pollution will be very harmful to myself and our community. I respectfully request that the Fresno County board of supervisors deny the Cemex request.

Best regards,

Aaron Hill

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I have many concerns regarding this project, primarily those that impact the environment and the length of time that Cemex is requesting.
This project will negatively impact the River, the habitat bordering the river and the community adjacent to the quarry. Mitigation may reduce some of the impacts but not nearly enough.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

The only measure that can be taken to alleviate the negative impacts of a project like this is to fully deny this project.
The impacts are too many and too serious,
this project should never been considered feasible , it does far too much environmental damage.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

My objection to the CEMX Rockfield Expansion Project (EIR 7763) are based on the following concerns:

1. Project negates decades of downstream river restoration for native fish habit and seasonal migrations.

2. Under estimations for impacts of secondary emissions/traffic caused from excavation and transport traffic emissions.

I am also concerned about the effects of such a deep excavation on surface river flow and ground water levels and quality during the life of this project.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Submitted by email to: cmonfette@fresnocountyca.gov

RE: CEMEX Rockfield Expansion Project
EIR 7763, CUP 3666 and 3667

Dear Ms Monfette:

I am writing to share my concerns regarding the CEMEX Rockfield Expansion Project. I am a county resident who lives near the San Joaquin River. I have been in the area for over 20 years and one of the crown jewels is the river, it's associated parks, trails, water sports, and fishing. Expanding the Cemex operation will certainly have a negative impact on the residents of Fresno County.

I already spend nearly every day driving past the Cemex operation on Friant road. It is nothing but an eyesore that creates heavy equipment traffic, dusty conditions, and damage to existing roads. The surface scarring detracts from the river beauty that remains. Fresno already has some of the worst air in the country and is routinely pointed out on local news sources. Adding further trucking operations and blasting will have a negative impact on the air quality and health of our residents.

Spending time on the river, either by canoe, kayak, or walking its banks is truly one of the last peaceful retreats many county and city residents have. Please do not let short term private financial gains leave a lasting impact for current and future generations to deal with.

Sincerely,

Brian Austin
18767 Via Mira Bella

Good afternoon,

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR.

If you have any questions, please don't hesitate to reach out to me at the contact information below.

Thank you again,

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Of course we need jobs in Fresno county but not at the expense of air and water quality. I also don't believe we should encourage projects and developments that do further damage to the salmon habitat. The Friant area Is an important one for outdoor recreation in our valley. Let's not take away from the few places that are generally accessible for fishing and recreation in the Central Valley. Finally I regard the depletion of clean water and subsequent lowering of the water table as a huge concern to our community and the most serious issue that should be addressed. Please stop this project!

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Subject: EIR 7763 - Confirmation of Receipt of Online Comments

Good morning,

Thank you for providing comments on this application through our online comment card system. This email is being provided as receipt of your submission of comments and confirms that those comments were received during the public comment period for this application. Your submission will help guide the development of the Draft EIR, which is being prepared to determine the likely impacts from this project.

As requested, your email address has been added to our list to receive digital notices relating to this project.

Please let me know if you have any questions. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date.

Chrissy Monfette| Planner

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Brian Esquivel

2. Organization/Business

Concerned Civillian

3. What is your address?

No Answer

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

No

5. Please provide your email address.

Not answered

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Why is this happening near the San Joaquin River? Now that you read that, I hope you have a great answer. Mining would have a negative consequence no matter if it is small or large scale. My primary concern is the contamination of the water. As there is various ground water channels that are interconnected and I'm sure feed into the river.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

I don't believe in mitigation. Please don't make it come into fruition.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I am vehemently opposed to the Cemex EIR No. 7763 for the following reasons. The mining that has taken place over the past 100 years or so has done significant damage to eco-system of the San Joaquin River. This practice should stop sooner not later. The proposed mining will make the Lost Lake Camp Ground, one of the few available campgrounds along the river below Friant Dam, less enjoyable. Given the limited natural recreation opportunities in the Fresno metro area the County should be making a greater effort to expand on what little there is rather than locking a significant amount of land away for 30 years. The plan under the EIR is going in the wrong direction and future generations will pay for this should the plan be approved.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

The proposed 30 year life of the plan is far too long. The mitigation measures outlined at the end of the projects life span are so vague as to make them unenforceable. Cemex has detailed what it wants to get from the site but has not detailed what it will do with the site when it is no longer profitable. How much money will Cemex dedicate to this site once they are done with it, no one knows. No bonds have been proposed to ensure that the mitigation measures will carried out to the satisfaction of the community.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I am interested in specifically how Cemex ascertained that this area would need 6 million tons of construction aggregate over the next 50 years and what specific distributing area that Cemex is referring to.

I think a traffic study would need to be done, considering that they are tripling the loads coming out of the plant within 10 years. Within 30 years there will be 3 trucks coming or going every minute.

With Fresno having some of the worst air quality in the nation, when will Fresno step up and say no more. Our children and elderly are already subject to every respiratory ailment imaginable. This effects life expectancy, as well as quality of life.

It doesn't seem reasonable to draw 240 acre feet of ground water out of the San Joaquin River for the next 100 years. There are several developments going into the area as well as housing going in all around the area. They need to ascertain if the wells in the area, as well as water pressure can withstand that kind of pressure.

Cemex claims to be a good steward of the river. Were they good stewards of the Sacramento River in 2018 when they discharged polluted storm water int the river. Were they good neighbors when 4 adjacent wells went dry at the Stillwell mine in Lemon Cove. Were they good neighbors in 2016 when they were sued by Alabama, Kentucky , Tennessee and Texas for emitting Sulfur Dioxide and nitrogen emissions into the atmosphere. Were they good neighbors in Colorado in 2004-2006 for violating for dust and temperature violations.

Since 2000 they have been fined 47 million dollars for penalties for various issues involving environmental (49 issues), safety and health issues(403),wage and hour issues(2),labor relations(5) and 1 discrimination issue.

Cemex needs to be specific on how much noise is going to be generated, how far blast vibrations are allowed, and air quality emissions.

I am not only concerned about the dynamiting, but also the use of gas fracturing next to the river.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Since Cemex has had issues outside of the parameters of their Environmental impact of their operations, if their proposal is allowed, their needs to be constant monitoring of all environmental issues at the plant.

Cemex's application for a new conditional use permit to continue mining operations near the San Joaquin River for 100 years is appalling. The San Joaquin River has suffered enough already. I thought we were in the process of restoring the river, including bringing back the salmon. The blasting of a 600-foot-deep pit into hard rock near the San Joaquin is hardly a way of protecting the river.

Detrimental effects would be numerous- common sense tells us that there will be trouble for the nearby wildlife (let alone the local residents having to pu up with noise, traffic and pollution).

It seems to me that our politicians and bureaucrats have their priorities mixed up; we need protection NOT destruction of the San Joaquin River. What about the San Joaquin River Parkway-is not this supposed to be part of the general plan? The Parkway is designed to be a natural and recreational area- in harmony with the environment. Blasting a 600-foot deep hole would certainly NOT be compatible with the Parkway. Please, no more damage to the San Joaquin.

7.

Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex Mining Project proposes to drill and blast approximately 600 feet down into the bedrock adjacent to the San Joaquin River. Noise pollution from said drilling and blasting will disrupt the wildlife habitat in the river basin and cause migration of birds and land animals from the area.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Drilling and blasting should not be permitted in this important wildlife habitat.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex Mining Project proposes to drill and blast approximately 600 feet down into the bedrock adjacent to the San Joaquin River. Unintended consequences from the drilling and blasting vibrations could do damage to the structural integrity of nearby Friant Dam, which could require expensive repairs to the dam or, worse, cause the dam to fail and flood the river basin.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Drilling and blasting should not be permitted by the County due to the unimaginable damage this could cause to an aging Friant Dam.

The Cemex Mining Project proposes to drill and blast approximately 600 feet down into the bedrock adjacent to the San Joaquin River. Unintended consequences from the drilling and blasting methods will include harm to the water quality in nearby aquifers and wells relied upon by neighboring residents for drinking water.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Drilling and blasting should not be permitted by the County due to the impact on drinking water this will likely have to residents in the area.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Brian McNally

2. Organization/Business

Not answered

3. What is your address?

15310 Bluff View Ave Friant, CA 93626

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

union.brian@gmail.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex Mining Project proposes to drill and blast approximately 600 feet down into the bedrock adjacent to the San Joaquin River. Extreme noise pollution from the drilling and blasting will make nearby homes uninhabitable. Since the initial gravel project began in the river basin decades ago, the County has approved several residential projects in the area. Some are in the works. All will become uninhabitable during Cemex operating hours. This will make it impossible to work from home, as my wife does, or simply to wake up to anything but the blasts, scraping and drilling of the mine. We really have no precedence for this level of noise pollution in the County and the project proposes to do this in a residential area normally known for peace and quiet.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Drilling and blasting should not be permitted by the County due to the extreme noise pollution this will cause throughout the river basin, rendering residential properties, which have been approved by the County for this area, uninhabitable and not fit for those who work from home, during Cemex operating hours.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex Mining Project proposes to drill and blast approximately 600 feet down into the bedrock adjacent to the San Joaquin River, as well as relocate gravel production and transportation to the same area. Extreme noise pollution from the drilling, blasting and heavy trucking activity will cause great harm to the property values of homes in the surrounding area. This noise pollution would force me to sell my home for the sanity of my family, while at the same time causing the property value to sink dramatically. Other neighbors would be in the same predicament. Who would want to own a home across the street from a 600-foot deep mine that blasts and drills hard rock and then turns it into gravel for large trucks to freight away?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Drilling and blasting should not be permitted by the County due to the extreme noise pollution this will cause throughout the river basin, rendering residential properties, which have been approved by the County for this area, uninhabitable and greatly devalued.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex Mining Project proposes to relocate gravel production and distribution/transportation to the same area as the proposed mine, which will cause a dramatic increase in heavy trucking activity further north on Friant Road. The increased heavy trucking activity will require expensive widening c Friant Road, and the bridge just north of the current Cemex plant, and require regular upkeep of the road. What will this cost over the proposed 100-yeai term of this project? Will Cemex pay the full cost of the road widening and repairs for the next 100 years at the outset? I wouldn't trust anything less than that or Fresno County taxpayers will be stuck with the bill.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Require Cemex to pay into an impound account or irrevocable trust the cost of all projected road improvements and repairs for the remainder of the proposed plan extension. This must be a precondition to moving gravel distribution to the northern property to prevent taxpayers from having to pay these hefty road repair and improvement costs.

The Cemex Mining Project proposes to drill and blast approximately 600 feet down into the bedrock adjacent to the San Joaquin River, as well as relocat gravel production and transportation to the same area. This will cause enormous amounts of dust, perhaps mingled with elements from the explosives, tc be air born and coat the homes, pools and lawns played on by the children in the surrounding residential areas. It will make going outside unsafe for people with trouble breathing in bad air conditions, such as my son who has asthma.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

There can be no mitigation of the dust pollution this drilling and blasting, as well as increase in trucking activity, would cause.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex Mining Project proposes to drill and blast approximately 600 feet down into the bedrock adjacent to the San Joaquin River. There is a high risk of pollutants used in the drilling and blasting methods finding its way through damaged bedrock and aquifers to the San Joaquin River itself, where i would cause grave damage to the ecology of one of our greatest resources in the valley.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Drilling and blasting should not be permitted in such close proximity to the San Joaquin River.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex Mining Project proposes to blast approximately 600 feet down into the bedrock in a region known for its earthquakes. Blasting of this magnitude should not be practiced in an area that is already at risk for earthquakes. Fracking, a different but similar process, has been known to cause earthquake activity in regions previously not know for earthquakes, such as the midwest. Why would we want to introduce the risk of increased earthquake activity here in the Central Valley?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Blasting of this magnitude should not be permitted in a region surrounded by fault lines.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

I am concerned that this project, if approved by the County, would be a tremendous missed opportunity for the County to assert river preservation and al of the related recreational activities as priorities for our community. Our representatives should not vote to squander the most beautiful natural resource we have, the San Joaquin River corridor. We do not need to approve a mining project in such a delicate and beautiful area. We can instead tell Cemex tha they can finish out the term of their current gravel excavation project and then return the land to its natural beauty as repayment to our community for the riches it has already extracted or sell the land now to the River Parkway Trust. It is time for Fresno County to seize this moment and imagine how the River Parkway can transform our region for all of its residents and wildlife.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Work with Cemex to sell the land to the San Joaquin River Parkway Trust.

Subject: EIR 7763 - Confirmation of Receipt of Online Comments

Good morning,

Thank you for providing comments on this application through our online comment card system. This email is being provided as receipt of your submission of comments and confirms that those comments were received during the public comment period for this application. Your submission will help guide the development of the Draft EIR, which is being prepared to determine the likely impacts from this project. We received 14 comment card submissions from your email address.

As requested, your email address has been added to our list to receive digital notices relating to this project.

Please let me know if you have any questions,

Chrissy Monfette| Planner
Department of Public Works and Planning | Development Services and Capital Projects Division
2220 Tulare St. 6th Floor Fresno, CA 93721
Main Office: (559) 600-4540 Direct: (559) 600-4245

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The San Joaquin River is already heavily degraded, dammed and industrialized, and was deemed "America's Most Endangered River" in 2014. I urge you to deny this project because of its environmental impact on the river and the air and noise pollution impact from heavy vehicle traffic on Friant Road and the Fresno/Clovis area. It should be common sense that a 600-foot-deep open pit mine next to the river is a bad idea. Fresno County's efforts should be directed towards rehabilitating the river and improving public access as Fresno ranks near the bottom in public park rankings and near the top in childhood asthma. The San Joaquin River provides habitat for native plants and animals and potential for nature-focused recreation. Friant Road is already congested and the site of frequent accidents. Polluters such as Cemex target communities like Fresno because their residents are heavily minority and politically disengaged. Please take the environmental racism factor into account when deciding to deny this project.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Deny the proposal. No mitigation would be acceptable. Furthermore, Cemex is seeking a 100-year contract to plunder our river. Please deny this nonsensical project and help Fresno remedy its reputation as a laughingstock when it comes to rubber-stamping polluting, extractive projects. Thank you

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

Subject: EIR 7763 -- Confirmation of Receipt of Online Comments

Good morning

Thank you for providing comments on this application through our online comment card system. This email is being provided as receipt of your submission of comments and confirms that those comments were received during the public comment period for this application. Your submission will help guide the development of the Draft EIR, which is being prepared to determine the likely impacts from this project.

As requested, your email address has been added to our list to receive digital notices relating to this project.

Please let me know if you have any questions,

Chrissy Monfette | Planner
Department of Public Works and Planning | Development Services and Capital Projects Division
2220 Tulare St. 6th Floor Fresno, CA 93721
Main Office: (559) 600-4540 Direct: (559) 600-4245

Submission Recorded On	07/02/2020 8:13 PM
Time to Take the Survey	17 minutes, 31 secs.

Page 1

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Bob Papazian

2. Organization/Business

3rd generation Fresno citizen

3. What is your address?

565 E Everglade Ave, Fresno 93720

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

bobpapazian@att.net

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I sent the following comments to my County Supervisor, Steve Brandau earlier this week. Thanks to the San Joaquin River Parkway folks for sharing this site for comments.

Hello Mr Brandau,

I'm a 3rd generation Fresnan. I'm also a long time board member of Fly Fishers for Conservation. And yes, I'm still a little miffed that vehicle access to River West via the road through the neighborhood isn't open, however, I'm also a lifetime republican & it didn't keep me from voting for you without reservation. I'm hoping you will help put the brakes on this Cemex project. I'm still scratching my head on how a 100 year deep pit mine will benefit Fresnan's, not to mention the vision of a continuous greenbelt along the San Joaquin River from Friant to 99. And Foreign owned too? Steve, I don't believe everything I read or hear in our local news. Quite the opposite. I just don't see why the hurry or where the Cemex project fits. Please let the public voice be completely heard. We shouldn't have to feel any time pressure to approve something that is going to be here for 100 years. Thank you for listening, Bob Papazian

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

No mitigation can make up for a 100 year project of this type. I'm going to be very disappointed if the County doesn't shut this project down immediately I'm also curious what, if any, elected officials are in favor of this project. I will not be voting for anyone in my district that is in favor of it, under any circumstances....mitigation or not.

Good morning,

Thank you for providing comments on the subject application. This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments were not received during the Scoping Period, which ended at 5:00 on July 6, 2020; however, they will be made a part of the final project record

If you have any questions, please don't hesitate to reach out to me at the contact information below.

Thank you again,

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

No

5. Please provide your email address.

Not answered

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I want CEMEX to stop the excavation of hard rock to 600 feet deep at the Quarry site located adjacent to Ledger Island and Lost Lake Park. Priority should be given the Fresno country to make it possible for me, my family and other concerned Fresnians to enjoy the area as a public park.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

None. It should be parkland.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

The San Joaquin River is a wonderful natural resource for families and boaters to recreate. It is also the habitat for much wildlife. How will this project impact hydrology and water quality with the deeper mining and blasting? What impact will all that noise have on the wildlife and people trying to recreate. What impact will it have on the slope stability and the soil? Why destroy this wonderful resource we have in our backyard for people to enjoy with commercial project? Is money more important than people and preserving our natural resources for the future?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Move the project some other place.

Subject: Proposed CEMEX/Rockfield Quarry Modification Project

Dear Chrissy,

We are homeowners in the River View Ranch Development on the east side of Friant Road between the Plant Site and the Quarry Site.

Needless to say, we are very concerned about the CEMEX proposed project. And please let us be clear, this is not a continuation of the existing project, it is a totally new 100 year project that will in effect leave us with a huge 600 foot hole!

The mining operations between the two sites have been continuous for the past106 years (1913-2019). Enough is enough!

Our concerns are many and warranted.

* The Friant Dam is getting quite old and is already in need of repairs. Mining operations of this extent could undermine the Friant Dam.

* Fracturing of the earth to a depth of 600 feet is absurd! There is no way to predict the damage this could cause to the earth, to our water wells and to the stability of our property.

* We have a specific concern for the probable air pollution, especially the particulate matters and the prevailing north westerly winds towards our residence, on our health and the health of our grandchildren, several who suffer from asthma.

* We have specific concerns about the odors emitted, especially the asphalt plant. An asphalt plant will have, not only offensive odors but will have particulate matters that will easily be carried to our community, by the prevailing winds. Not to mention annoying bright lights.

* The plant and quarry sites will run over 12 hours per day, with constant trucks and trailers running up and down Friant Road. This is a notoriously busy road as it is, we cannot imagine that much more traffic. Its also a very fast and dangerous roadway. Please note we have two Indian Casinos that are quite close and generate lots of traffic.

We are appalled that this CEMEX Project is even being proposed. It is time to put an end to this type of project in our neighborhood.

Respectfully,

Larry and Carol Edde
15226 Bluff View Ave.

Cemex Rockfield Quarry Modification Project Comments

I am strongly against the proposed Cemex Rockfield Quarry Modification Project. This 100 year pit is not in the best interest of the health & safety of Fresno County residents and their regional neighbors. It will cause serious and significant, direct and indirect, immediate and long-term adverse impacts to our environment, its denizens, and our quality of life.

A 600 ft. deep mine (footprint unknown, but realistically 500 acres) located 200 ft. from the San Joaquin River and within its floodplain is a sure recipe for an environmental disaster. This mine would create a large cone of depression whereby surface and subterranean waters would constantly flow into, lowering the surrounding water table, and possibly changing both the surface and subterranean course of the river. This would have a significant and negative impact on the environment, neighboring and nearby properties, as well as downstream users. The thousands of acre feet of water collected in this immense pit will be contaminated by the mining process, and will require continual removal and storage in detention ponds. Stormwater historically finding its way into the San Joaquin will be intercepted affecting the riparian habitat and vernal pools. If this project were approved, how would the amount of thousands of acre feet of water being used and wasted be calculated and paid for? How will it be contracted from a river already over allocated? How will pollutants in the detention ponds be prevented from polluting local groundwater, the river, and harming wildlife? How does this comply with the Groundwater Sustainability Act? How will a 600 ft. deep pit ever be realistically reclaimed?

Loud blasting and constant noise from the mining operation and continuous truck traffic would significantly and adversely impact the area and its environment. It will ruin the outdoor experience for those visiting Lost Lake Park, and those who enjoy fishing, swimming, hiking, kayaking, canoeing, bird-watching, etc. along the river and its riparian environment. It will be an annoyance for residents. And, because the river is framed by hillsides, the noise and vibrations will be amplified by the canyon effect. This noise pollution will cause significant and adverse harm to wildlife, birds, and fish including some listed as endangered and threatened species.

Light pollution from the mining operation will significantly and adversely affect both nocturnal and diurnal species, and destroy the natural ambiance for both visitors and neighbors. It will ruin the visual panorama by 360 degrees.

Dust and PM10 & PM2.5 particulates from both mining and truck traffic will add significant and adverse tonnages of these pollutants into an air district and region already beset with serious non-attainment issues. Particulate pollution is a pre-cursor for ozone formation creating unhealthful air for those without respiratory problems, and severe consequences for those with existing respiratory conditions such as asthma, heart disease, emphysema, and stroke history. Dust and particulates are also injurious to wildlife and plant life, agricultural operations, and will contribute to the amount of total dissolved solids in the river causing water quality issues.

Both truck traffic and mining machinery will generate significant and adverse tonnages of greenhouse gases, including CO, CO2, NOx, SOx, and ozone-forming volatile organic compounds (VOCs) into our air further elevating criteria air pollution emissions. Aside from health and environmental consequences, and the economic impacts thereof, can the San Joaquin Valley Air Pollution Control District really afford multi-million dollar fines for air quality violations of the Ca. and National Ambient Air Quality Standards?

An increase in heavily-loaded trucks and bobtails on our local roadways will imperil motorists and bike riders. It will destroy our tax-payer supported road infrastructure, and increase our county road maintenance costs. The under-construction Austin Quarry on the corner of Highway 145 & SR41 in Madera County is only 9 miles away, it will be adding 846 truck trips daily. The pending closure of the Vulcan Plant on Friant Road in 2017 provided a convenient excuse for the Madera County Board of Supervisors to approve by 3/2 vote the Austin Quarry Project, despite overwhelming regional and community-wide opposition and a litany of errors, false and misleading information, and voodoo math in their Draft & Final EIRs, which Benchmark Resources assuaged and tinted for approval. Fresno County assured an attendee at the 6/24/20 Zoom meeting that Benchmark Resources was going to be employed to certify the EIR's accuracy. This is not reassuring.

Cemex is an international corporation headquartered in Mexico, greatly easing its U.S. tax liability. In June 2020 Cemex's business profile had a BB Rating due to a large need for debt repayment; payment is due in 2022. Its cash flow was weak prior to the Covid-19 Pandemic due to its reliance on "hedging" (gambling) to offset currency risk in cost and revenue.

Demand for cement and rock has fallen in Mexico, Central America, and the United States. Market analysts predict a large contraction in commercial and residential construction activity, and a considerable reduction in state and federal highway construction due to overwhelmed budgets and substantial decrease of gasoline tax revenue. It is amazing, given our current dilemma which will take years to find economic relief and recovery, that Cemex would propose such a huge undertaking when our region and our world is experiencing the accelerating throes of climate change coupled with the collateral realities of Covid-19: high unemployment, business closures, bankruptcies, school closures, historic downturns in the stock market; evictions; food insecurity, definite declines in new housing permits (Fresno County down 51%), and an uncertain future. Is Cemex using this project to gain capital investment in order to pay off or leverage existing debt?

Cemex claims part of its mission is "to build value for its stakeholders by becoming the world's most efficient and profitable cement company." Apparently in chasing that dream, it has failed many times and in many places to demonstrate good stewardship and responsibility for maintaining environmental quality. The USEPA and a number of air pollution control districts have filed numerous complaints against Cemex. One such complaint involved a seven year release of cancer-causing hexavalent chromium gas adjacent to the Pacific Elementary School in Monterey, Ca. Another violation in 2016 resulted in the issuance of a Cease & Desist Order filed by the Ca. Coastal Commission to halt Cemex's mining operation that was destroying beach and sensitive habitat in Marina, Ca.

This project's timing is especially suspect given citizens are struggling to survive the Covid-19 plague, and public meetings cannot be physically held. Instead public participation in this process is being relegated to the internet and limited by the participant's type of device, data plan, and ease of connectivity or lack of internet connection. Participants are also being isolated from important human interaction in a public setting, handouts, powerpoint and other visual presentations. And many citizens' only internet access source is their phone. When I tried on June 24th to access the Zoom meeting via the Fresno County page, I was unable to get past the Covid-19 page, even though the Cemex Rockfield Expansion was listed. After 15 unsuccessful minutes, I googled it and was able to locate the meeting after opening a couple of related sites. Other interested people were unable to do so. Any future meetings, presentations, hearings, etc. using the internet need to comply with the Brown Act. As citizens cannot visit their public libraries, and cannot download EIRs, or view them in the library, they should be mailed free-of-charge copies of the EIR in either book or CD form (whichever is requested) so the process is open and transparent. The meetings should also be archived and available on youtube on the following day. Participants' internet addresses and/or phone numbers should be logged by Fresno County's Planning Dep't. to keep them informed of upcoming meetings, hearings, resource availability, etc. There should also be county-sponsored internet tutorials to assist inexperienced or non-tech savvy internet users on how to access the aforementioned. Again, the timing is suspect.

This project is an affront to all individuals, organizations, government agencies, and our representatives who spent years invested in realizing the San Joaquin River Restoration Settlement Act. It is also an egregious and self-centered act of corporate enrichment at the expense of those who have worked diligently for years to create an incredible 22 mile parkway along the San Joaquin for all to enjoy now and in the future.

There are already enough quarries in our area to more than satisfy future aggregate demand in the Fresno P-C Region. Cemex should donate or entrust this land to the San Joaquin River Parkway and Conservation Trust and/or Fresno County for the purpose of completing the San Joaquin River Parkway.
They would benefit in many ways!

Subject: RE: Comments on Cemex Rockfield Quarry Modification (EIR 7763)

Good afternoon,

Thank you for providing these comments on the subject application. I also appreciate your call this morning regarding these comments - Now that I have had a chance to see how they were submitted, I would like to request that you send in a hard copy of the comments so that I can scan a clean version into the project record. While the pictures are legible, some areas are a little blurry and a scanned version would vastly improve their quality.

However, since these comments were received prior to today's deadline they are submitted during the public comment period and will be considered in preparation of the scope. Sending a hard copy of these comments would not affect their status as 'submitted within the deadline'.

Please give me a call if you have any questions,

It will be an annoyance for residents. And, because the river is framed by hillsides, the noise and vibrations will be amplified by the canyon effect. This noise pollution will cause significant and adverse harm to wildlife, birds, and fish including some listed as endangered and threatened species.

Light pollution from the mining operation will significantly and adversely affect both nocturnal and diurnal species, and destroy the natural ambiance for both visitors and neighbors. It will ruin the visual panorama by 360 degrees.

Dust and PM10 & PM2.5 particulates from both mining and truck traffic will add significant and adverse tonnages of these pollutants into an air district and region already beset with serious non-attainment issues. Particulate pollution is a pre-cursor for ozone formation creating unhealthful air for those without respiratory problems, and severe consequences for those with existing respiratory conditions such as asthma, heart disease, emphysema, and stroke history. Dust and particulates are also injurious to wildlife and plant life, agricultural operations, and will contribute to the amount of total dissolved solids in the river causing water quality issues.

Both truck traffic and mining machinery will generate significant and adverse tonnages of greenhouse gases, including CO, CO2, NOx, SOx, and ozone-forming volatile organic compounds (VOCs) into our air further elevating criteria air pollution emissions. Aside from health and environmental consequences, and the economic impacts thereof, can the San Joaquin Valley Air Pollution Control District really afford multi-million dollar fines for air quality violations of the Ca. and National Ambient Air Quality Standards?

An increase in heavily-loaded trucks and bobtails on our local roadways will imperil motorists and bike riders. It will destroy our tax-payer supported road infrastructure, and increase our county road maintenance costs. The under-construction Austin Quarry on the corner of Highway 145 & SR41 in Madera County is only 9 miles away; it will be adding 846 truck trips daily. The pending closure of the Vulcan Plant on Friant Road in 2017 provided a convenient excuse for the Madera County Board of Supervisors to approve by 3/2 vote the Austin Quarry Project, despite overwhelming regional and community-wide opposition and a litany of errors, false and misleading information, and voodoo math in their Draft & Final EIRs, which Benchmark Resources assuaged and tinted for approval. Fresno County assured an attendee at the 6/24/20 Zoom meeting that Benchmark Resources was going to be employed to certify the EIR's accuracy. This is not reassuring.

Cemex is an international corporation headquartered in Mexico, greatly easing its U.S. tax liability. In June 2020 Cemex's business profile had a BB Rating due to a large need for debt repayment; payment is due in 2022. Its cash flow was weak prior to the Covid-19 Pandemic due to its reliance on "hedging" (gambling) to offset currency risk in cost and revenue.

Demand for cement and rock has fallen in Mexico, Central America, and the United States. Market analysts predict a large contraction in commercial and residential construction activity, and a considerable reduction in state and federal highway construction due to overwhelmed budgets and substantial decrease of gasoline tax revenue. It is amazing, given our current dilemma which will take years to find economic relief and recovery, that Cemex would propose such a huge undertaking when our region and our world is experiencing the accelerating throes of climate change coupled with the collateral realities of Covid-19: high unemployment; business closures; bankruptcies; school closures; historic downturns in the stock market; evictions; food insecurity; definite declines in new housing permits (Fresno County down 51%); and an uncertain future. Is Cemex using this project to gain capital investment in order to pay off or leverage existing debt?

RECEIVED
JUL 21 2020
FRESNO COUNTY
DEPT. OF
PUBLIC WORKS & PLANNING

Cemex claims part of its mission is "to build value for its stakeholders by becoming the world's most efficient and profitable cement company." Apparently in chasing that dream, it has failed many times and in many places to demonstrate good stewardship and responsibility for maintaining environmental quality. The USEPA and a number of air pollution control districts have filed numerous complaints against Cemex. One such complaint involved a seven year release of cancer-causing hexavalent chromium gas adjacent to the Pacific Elementary School in Monterey, Ca. Another violation in 2016 resulted in the issuance of a Cease & Desist Order filed by the Ca. Coastal Commission to halt Cemex's mining operation that was destroying beach and sensitive habitat in Marina, Ca.

This project's timing is especially suspect given citizens are struggling to survive the Covid-19 plague, and public meetings cannot be physically held. Instead public participation in this process is being relegated to the internet and limited by the participant's type of device, data plan, and ease of connectivity or lack of internet connection. Participants are also being isolated from important human interaction in a public setting, handouts, powerpoint and other visual presentations. And many citizens' only internet access source is their phone. When I tried on June 24th to access the Zoom meeting via the Fresno County page, I was unable to get past the Covid-19 page, even though the Cemex Rockfield Expansion was listed. After 15 unsuccessful minutes, I googled it and was able to locate the meeting after opening a couple of related sites. Other interested people were unable to do so. Any future meetings, presentations, hearings, etc. using the internet need to comply with the Brown Act. As citizens cannot visit their public libraries, and cannot download EIRs, or view them in the library, they should be mailed free-of-charge copies of the EIR in either book or CD form (whichever is requested) so the process is open and transparent. The meetings should also be archived and available on youtube on the following day. Participants' internet addresses and/or phone numbers should be logged by Fresno County's Planning Dep't. to keep them informed of upcoming meetings, hearings, resource availability, etc. There should also be county-sponsored internet tutorials to assist inexperienced or non-tech savvy internet users on how to access the aforementioned. Again, the timing is suspect.

This project is an affront to all individuals, organizations, government agencies, and our representatives who spent years invested in realizing the San Joaquin River Restoration Settlement Act. It is also an egregious and self-centered act of corporate enrichment at the expense of those who have worked diligently for years to create an incredible 22 mile parkway along the San Joaquin for all to enjoy now and in the future.

There are already enough quarries in our area to more than satisfy future aggregate demand in the Fresno P-C Region. Cemex should donate or entrust this land to the San Joaquin River Parkway and Conservation Trust and/or Fresno County for the purpose of completing the San Joaquin River Parkway.
They would benefit in many ways!

Good morning,

I wanted to confirm to you that we received the hard copy submission of your comments earlier this week. As we discussed because a digital copy was made within the scoping period, the comments are considered to be timely submitted. A copy of the comments are attached for your convenience.

Let me know if you have any questions,

Chrissy Monfette| Planner
Department of Public Works and Planning | Development Services and Capital Projects Division
2220 Tulare St. 6th Floor Fresno, CA 93721

Subject: RE: Comments on Cemex Rockfield Quarry Modification (EIR 7763)

Good afternoon,

Thank you for providing these comments on the subject application. I also appreciate your call this morning regarding these comments - Now that I have had a chance to see how they were submitted, I would like to request that you send in a hard copy of the comments so that I can scan a clean version into the project record. While the pictures are legible, some areas are a little blurry and a scanned version would vastly improve their quality.

However, since these comments were received prior to today's deadline they are submitted during the public comment period and will be considered in preparation of the scope. Sending a hard copy of these comments would not affect their status as 'submitted within the deadline'.

Please give me a call if you have any questions,

Chrissy Monfette| Planner
Department of Public Works and Planning | Development Services and Capital Projects Division
2220 Tulare St. 6th Floor Fresno, CA 93721
Main Office: (559) 600-4540 Direct: (559) 600-4245
Your input matters! Customer Service Survey

Please note that our offices are currently closed to the public. If you would like to drop off files or make an in-person submission, you must call ahead and make arrangements with staff. Per the Governor's Order, masks will be required. We apologize for any inconvenience this may cause and thank you for your help to reduce the spread of Covid-19.

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

Californianativegirl@yahoo.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Although I do not reside in Fresno County, I depend on the San Joaquin River for traditional Native American plant gathering. I have seen the destructio Cemex and Volcan have done, it's changed our water ways, it's inhabitants, and the entire ecosystem in that area. Enough destruction! What's the point o re introducing salmon and doing all this other work to the river if it's going to continuously be destroyed!? Please do not renew or grant any further destruction to the river. Let it heal.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Mitigation? I understand some of the previously destroyed area is supposed to go back to nature soon already. What I don't understand is why parts of th river keep getting ruined while another part can heal. Leave the river alone already. There's already a dam. That's damage enough. If destruction continues along the river it will be hundreds of years before it will be left alone. Your asking how to mitigate damage to a river that has not had a chance t be a river since the gold rush.

Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Thanks for hearing my concerns about the Cemex plant being moved and expanded to affect me and my neighbors. This link is for more information about the location being moved from it's current location to across from our development:https://www.co.fresno.ca.us/departments/public-works-and-planning/divisions-of-public-works-and-planning/development-services-and-capital-projects/planning-and-land-use/environmental-impact-reports/cemex-rockfield-expansion . My wife and I moved to our current house twenty years ago to enjoy our beautiful view to the west and the peace and quiet of country life. I was reassured that the area of the Friant corridor was reserved from any development along the river. There has been great concern about the environmental issues along Friant road including the tiger salamander and the kit fox that limited Cal Trans expansion of the vital Friant road expansion in the past. The scope of the Cemex plan is huge and will likely have significant impact on the river and its wildlife, me and my family, our house value, and our neighborhood. The project cannot be allowed to proceed with a 600 foot hole planned, around the clock noise and pollution, and other potential consequences. The Cemex expansion seems completely inconsistent with the plan outlined by Fresno County over history. I appreciate any help in preventing this project from happening. What is the noise level projected at my house in decibels? What is the light pollution level at my house projected at night? What is the effect on my view which is only to the west and is beautiful of the back side of Sumner Hill at sunset?
Thank you,
Christopher Julian

7.

Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

The project cannot proceed in the scope and size of it's current plan. It will completely disrupt the fragile river ecosystem and have direct severe impact o my neighborhood with noise, light, and pollution.

The level of disturbing loud noise is a major concern. Due to a break in and nearly being killed, I am extremely sensitive to sudden loud noise. My door was kicked in and the perpetrator nearly shot my head off. I moved to the foothills to find peace and quiet so I could further heal from the PTSD the breal in caused. The extreme noise pollution, in particular the sudden blasts, this project will produce will certainly be detrimental to my daily life. I work from home, so the hours of this proposed operation will coincide with my workday.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Perhaps you could just blow out my eardrums so I can't hear anything.

Spend some time observing the wildlife in our foothills. If you think this project won't impact them, try shooting a gun into the air near their homes. Thei behavior is a natural survivor response. I wouldn't expect much different from the people in proximity to this project. It's irrational to think any good can come from this location. I am certain there are plenty of rocks to blow up somewhere else.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Replicate surrounding neighborhood, rebuild homes with our Owls, our Red Tail Hawks, King Snakes, Lizards, Road Runners, Black Phoebe's, Coyotes and all, and place us all 50 miles away from this insane project. Don't forget to build the River, our wildlife needs it!

The project will negatively impact all the progress I have made as an independent businesswoman and concerns me greatly in terms of caring for my son and continuing my business. Ask the Fresno County EDC, City of Fresno, City of Kingsburg, Fresno State, to name a few..., if they are willing to pay much higher rates for design work. If this project is approved, I will not be able to move due to the property values being driven down, and in order to continue business I would have to be willing to lease office space. This project will likely put me out of business for good.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

May as well implement eminent domain, buy us out of our homes for their current worth, because the conditions this project would expect us to live under, are unlivable. I would lose my trust in this County and would choose to quickly never support this county again in my work, in my spending, in my child's education.

Our nurses, doctors, firefighters, front line workers, who work late nights, will sadly be coming home to turbulent noises impacting the quality of their sleep. I would assume nobody would want a tired surgeon to perform surgery on a loved one. A stretch?; no, I really don't think so.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Mitigate it by finding those you've displaced, a peaceful home with all the appeals that drew them here in the first place. Peace and quiet.

The San Joaquin River is such a treasure, who is Cemex to destroy this? We cannot run the risk of destroying the one natural beauty that runs through ou county. We've seen proposals for parks to be built around the river. These very projects have been touted by the County Supervisors as a sincere objective for our city. And Now, they're equally being manipulated to allow discourse of explosions in dangerous proximity to our one natural gems.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Sell the land to the San Joaquin River Parkway trust. It belongs to those who will protect it, not to those who deplete it and destroy it.

Our well, which is across the street, already has problems with production and pressure. Loud explosions in proximity, will not be a benefit our County managed well. The Hazardous materials used, and hazardous solvents produced from this project, will certainly impact the quality of the water and air.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

You could mitigate the impacts by utilizing land somewhere else that doesn't displace thousands of people and animals. Pretty simple solution. OR Build bubble around every home nearby. Fuel our bubbles with oxygen and rain flow. (This suggestion is only half as ridiculous as blowing up the San Joaquin River.)

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I find it absolutely disheartening that Fresno has encouraged so much growth to go North, while abandoning the heart of our city. Meanwhile, now considering a project to make the foothills uninhabitable. Can the County of Fresno implement plans that will help us thrive?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Please exercise caution. The term "if you build it, they will come" doesn't apply here.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

I worry for the children who live nearby, and the impact this will make on their outdoor adventures. Even more dusty air and toxic pollutants, surrounding an already Asthmatic generation.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Fresno County has such an opportunity here. Reclaiming this property and nurturing it back to health, give us all a gift of your respect, and live up to the honorable role you were elected to perform.

I can't believe Fresno County is even considering this project. The San Joaquin River is a treasure for all residents to enjoy. It is a peaceful place to hike and canoe. It has abundant wildlife. It mitigates air pollution. Salmon are returning. Industry has been allowed to pock mark this river bed for too long. Truck traffic has increased air pollution for too long.
Wildlife has been threatened for too long.

Please deny this application for the good of all the residents of Fresno County

To:	Monfette, Christina
Subject:	Rockfield Quarry Modification Project - EIR 7763
Date:	Sunday, June 14, 2020 11:18:07 PM

Dear Ms. Christina Monfette,

Thank you for your Environmental Impact Report EIR 7763. There were factors which I had not considered. Below are my thoughts:

My husband and I have residential property just to the west and within sight of the Quarry Site. The proposed quarry Modification Project could impact us in the following ways:

- <!--[endif]-->Drinking water quality. We receive our drinking water from the San Joaquin River, downstream of the Quarry site. For several years, we have received notices from the Madera County Public Works Department stating that our drinking water system violated drinking water standards. The byproducts in the water "may lead to an increased risk of getting cancer." Blasting and deeper mining may exacerbate the water contamination which even now does not meet present drinking water standards.

<!--[if !supportLists]-->• <!--[endif]-->Noise. We purchased the property to be close to the quiet of nature and away from traffic. We and the wildlife will be impacted by the blasts.

- <!--[endif]-->Air Quality. The air quality is already some of the worst in California. We need to improve it rather than add to it. Valley Children's Hospital is downwind of the Quarry sites. The children with developing lungs do not need to be further challenged.

- <!--[endif]-->Geology and Soils. Blasting and mining may make the surrounding slopes unstable. There are some very expensive houses on the nearby slopes. Will homeowner's insurance cover damage from blasting and man-made landslides?

- <!--[endif]-->Plant and Animal Species. The habitat of the wildlife will definitely be impacted by the blasting, more trucks and equipment.

I would ask that their proposal be rejected and that they submit another proposal that mitigates the many negative impacts to the environment.

Respectfully,

Carolyn Sakauye, M.D.

Good afternoon,

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR. The Draft EIR will provide a discussion on the extent of potential impacts identified by the scoping process and may propose mitigation measures to reduce such impacts.

If you have any questions or if you would like to submit additional comments, please don't hesitate to reach out to me at the contact information below.

Subject: CEMEX

Dear Ms. Monfette,

I read the Fresno Bee Sunday paper and began thinking about the blasting and mining of the "hard rock" planned by CEMEX. I know nothing about the geology of the area, but there is a dam just upstream from where they will be blasting. Have there been any studies to determine what would happen if the bedrock was destroyed and any faults below or around Friant Dam disturbed?

An other major disturbance would be to the wildlife and water quality which even

now is not the best. It will be for 100 years which means it will never be the same, even though CEMEX says that they will restore the habitat in the mined sites.

I see nothing good to come of allowing CEMEX to "modify" the Rockfield Quarry and many reasons to not further disturb the area. I am strongly opposed to allowing expansion of the quarrying.

Sincerely,

Carolyn Sakauye, M.D.

Subject: Please stop CEMEX

To whom it may concern,

My name is Christian Sorondo and I am a local Indigenous activist and student at Fresno State. I recently traveled to Sonoma to learn about the environmental devastation caused by mining. Blast mining poses the greatest threat to our ecosystem here in the valley. It has the potential to onset earthquakes, it accounts for massive amounts of lead/mercury poisoning in our local fish and crops, as well as creates an impossible ground level of sediment that many quarries since the Gold Rush have yet to recover from.

By allowing an already wealthy company like CEMEX to essentially disrupt and destroy our ecosystem to make a profit, Fresno residents will be subjected to grand scale dangers. The threats this project poses include contaminated fish/wildlife, air pollution, and polluted water. This "business transaction" would also disrupt the very lives of our culturally enriched indigenous communities. The Yokuts and Mono peoples of this land have witnessed first hand the dangers of mining and the endangerment of their traditional foodstuffs such as the salmon from the San Joaquin River.

If you pursue this endeavor you will be damaging not only our native communities who have already suffered enough but also allow Fresno residents to potentially drink poisioned water, eat contaminated local produce, and kill animals who are sustained by their undisrupted environments. Not to mention, potentially disrupting our supply of rain by crippling the riparian forest along the river.

I urgently ask that you stop this project.

I hope to see a time where the well-being of people, and all life for that matter, is chosen over profit. Thank you for your time.

Sincerely,
Christian Sorondo

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Dear Board of Supervisors,

I am a resident of Fresno and deeply concerned about the blast mining project proposed by the CEMEX company. I understand tomorrow is the last day to notify you of any grievances we have with the project. That being said, I have already contacted Mr. Pacheco as well as Ms. Christina Monfette of the Public Works and Planning Department regarding the issues posed by the project. I have also attached the signatures of those who agreed to sign a petition a peer and I started in opposition of the CEMEX permits. Within less than a week, we have gathered over 100 signatures. I hope this email finds you all well and that you stop this project before we experience the very real dangers of water/air pollution, obstruction of the water cycle that grants us rain, as well as the loss of habitat for fish and wildlife.

Best wishes,
Christian Sorondo

Subject: EIR 7763 - Cemex Rockfield Modification Project: Confirmation of Receipt of Comments.

Good afternoon,

Thank you for providing comments on this application to the Board of Supervisors. This email is being provided as receipt of your submission of comments and the petition opposing this application. This email confirms that those comments and petition were received during the public scoping period for this application. Your submission will help guide the development of the Draft EIR, which is being prepared to determine the likely impacts from this project.

Please let me know if you have any questions,

Thank you,

Chrissy Monfette| Planner
Department of Public Works and Planning | Development Services and Capital Projects Division
2220 Tulare St. 6th Floor Fresno, CA 93721
Main Office: (559) 600-4540 Direct: (559) 600-4245

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Clare Statham

2. Organization/Business

Resident of Fresno

3. What is your address?

3977 N. Mariposa St., Fresno, 93726

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

stathamolin@sbcglobal.net

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Cemex's proposal to increase its mining activity should be rejected by the County of Fresno. The proposal is to increase production at the two-part facility from 1.4MT at present to 3.0MT within ten years. That is a more than 100% increase in production. The new level of production would require substantial increases in all the activities involved in mining. Truck traffic on Friant Road would increase to over a thousand trips per day. The haul trucks used for this operation are highly polluting, noisy, destructive to the road surface, dangerous for the many cyclists who use this road, and dangerous for motorists The two mile interplant haul that is a 30-year feature of this proposal creates a traffic flow that is dangerous for the residents and commuters for whom Friant Road is a main arterial road.

The air pollution generated by Cemex's 100% increase in mining will affect people living in the area as well as the thousands of citizens who use the Eator Trail and Lost Lake Park. In a region woefully lacking in parks and trails, the County should do its utmost to protect two of the best easily-accessible recreational destinations our citizens have.

The proposal calls for blasting and drilling to the depth of 600 feet. Millerton Lake at capacity is 319 feet deep. The process of making a hole nearly twice the depth of Millerton and the flow of water into that hole will have a negative impact on the San Joaquin River. It is after all immediately adjacent to the mining site. The San Joaquin River is recognized as one of the most abused rivers in the United States. Cemex's proposal is completely at odds with the work being done to rehabilitate the river and river corridor. It is at odds with the mission of the San Joaquin River Conservancy and with federal and stat laws protecting the San Joaquin River. Cemex's plan to reclaim this acreage in a 100 years is meaningless when weighed against the ecological and aesthetic damage it will inflict on the land for the next century.

To grant a Conditional Use Permit the County states in its NOP that it must find "that the proposed use will have no adverse effect on abutting property and surrounding neighborhood." Whether we are speaking of the people who live in the area, those who recreate in the area, the river itself, or the riparian plants and wildlife, it is clear this mining expansion would have many adverse effects. I urge the County to reject this proposal.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

I'm writing to plead with Fresno County to reconsider renewing the contract with Cemex. The San Joaquin River is a treasure to California. It's the backbone of Fresno and is the home to a wealth of important wildlife. Every morning I walk to the Coke Hollowell River Center and see eagles, red tailed hawks, egrets, etc. It's surreal to see the Cemex trucks loaded up with their loads and the accompanying destruction of the river with the eagle right above them. Please protect the future of Fresno County, California and our world. Do your part, please, and "be the change". Do the right thing!

Good afternoon,

Thank you for providing comments on the subject application. Please continue to include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR. The Draft EIR will provide a discussion on the extent of potential impacts identified by the scoping process and may propose mitigation measures to reduce such impacts.

If you have any questions or if you would like to submit additional comments, please don't hesitate to reach out to me at the contact information below. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date.

Subject: CEMEX Rockfield Expansion Project EIR 7763, CUP 3666 and 3667

Ms. Christina Monfette County of Fresno Department of Public Works and Planning Development Services and Capital Projects Division 2220 Tulare Street, Sixth Floor Fresno, CA 93721 Submitted by email to: cmonfette@fresnocountyca.gov RE: CEMEX Rockfield Expansion Project EIR 7763, CUP 3666 and 3667 Dear Ms Monfette: I am writing to share my concerns regarding the CEMEX Rockfield Expansion Project. I am a county resident who lives near the San Joaquin River. I have been in the area for nearly 20 years and one of the crown jewels is the river, it's associated parks, trails, water sports, and fishing. Expanding the Cemex operation will certainly have a negative impact on the residents of Fresno County. I already spend nearly every day driving past the Cemex operation on Friant road. It is nothing but an eyesore that creates heavy equipment traffic, dusty conditions, and damage to existing roads. The surface scarring detracts from the river beauty that remains. Fresno already has some of the worst air in the country and is routinely pointed out on local news sources. Adding further trucking operations and blasting will have a negative impact on the air quality and health of our residents. Spending time on the river, either by canoe, kayak, or walking its banks is truly one of the last peaceful retreats many county and city residents have. Please do not let short term private financial gains leave a lasting impact for current and future generations to deal with. Sincerely, Denise Davis 18933 Via Mira Bella Friant, CA 93626

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I live less than 1 mile from the quarry site.

1.) I am concerned about my residential well going dry. My residential well is about 1 mile from the quarry site. Since the quarry site uses no surface wate from the San Joaquin River and uses substantial amounts of water from groundwater wells, I am concerned that increased water usage at the quarry site will reduce the water in the aquifer/water table servicing my well, and I will be left without water.

2.) I am concerned about the cumulative impacts this project will have on the water table, traffic, air pollution and water pollution, when combined with other projects such as the Friant Ranch project planned nearby.

3.) I am concerned about the project emitting or causing increases in airborne particulate matter, oxides of nitrogen, air contaminants from diesel-powered engines and/or reactive organic compounds, posing a health risk to my family. I have athsma and have several young children at my home.

4.) Living less than 1 mile from the quarry site, I am concerned about the noise impacts from mining and related operations, as described in the report entitled, Environmental Noise and Vibration Assessment, CEMEX Rockfield Modification Project, Fresno County, California, by Bollard Acoustical Consultants, dated November 15, 2019.

5.) Living less than 1 mile from the quarry site, I am concerned about emissions and operations that would result in unpleasant odors at my home.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

1.) A requirement that Cemex fund the creation of a recharge ditch and be required to pump water into the recharge ditch, to ensure surrounding wells (including my residential well) do not go dry. Cemex is required to pump water into a recharge ditch for its gravel mine in Lemon Cove, something simila here would be appropriate. Incorporate this requirement as a condition of approval for applicable conditional use permits.

2.) A requirement that Cemex pay to deepen nearby private wells to mitigate their increased water usage and impacts to the aquifer/water table. Incorporate this requirement as a condition of approval for applicable conditional use permits.

3.) A requirement that Cemex pay to have nearby homes connected to a nearby public water system. Incorporate this requirement as a condition of approval for applicable conditional use permits.

4.) A requirement that Cemex pay a traffic impact fee or some other contribution a fund for improvements to Friant Road to ensure traffic impacts are mitigated. Incorporate this requirement as a condition of approval for applicable conditional use permits.

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Aesthetics: Comment on 16 A, points 1-4. Theses are the opinion of a person. My concern is the aesthetics. To have large equipment for processing the cement and asphalt , large parking lots full of cement delivery trucks, cars and so forth will have a negative effect the scenic highway. This area has also been designated residential and many of the homes will have an unsightly view. At the current, CEMEX Processing facility at the junction of Willow and Friant Roads the major equipment is back from the road and screened by some tree plantings. The proposed site has only a 5 foot berm and is located adjacent to the road .

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Have an independent company do a graphic visual projection, so the aesthetics can be more fairly evaluated by a committee of people. This needs to include a visual for how the proposed project will look as well as a visual as to how it would appear if mining is stopped today and the grading from the last CUP of the pits and landscaping to returned to the area.

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Diane Durando

2. Organization/Business

Resident

3. What is your address?

15462 N Friant Road

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

jimdiane@netptc.net

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

LAND VALUES-- No where in the CUP does it address the impact of property and home values on the current properties. It appears from studies I have read that we could expect a significant reduction in our value.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Property and home appraisals as of today as if this project was not under consideration. So we have a base line property value. How will the individual resident be compensated for the loss of value in their property to include future property appreciation that would occur? Would this be held in bond so the property owners are guaranteed payment?

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

Subject: EIR 7763 - Confirmation of Receipt of Online Comments

Good afternoon,

Thank you for providing comments on this application through our online comment card system. This email is being provided as receipt of your submission of comments and confirms that those comments were received during the public comment period for this application. Your submission will help guide the development of the Draft EIR, which is being prepared to determine the likely impacts from this project.

As requested, your email address has been added to our list to receive digital notices relating to this project.

Please let me know if you have any questions. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date. Staff is currently in receipt of 8 sets of comments submitted by this email address, which includes comments from you, Diane Durando, and one comment submitted with both names attached.

Homes and populations. This project has a huge impact on the current residence within 1 mile of this project. I know you did the best you could with the initial EIR scoping meeting. BUT the people of Friant deserve a more transparent meeting with the ability to see complete reports, appendices, visuals, ability to talk eye to eye with the planning committee or any people conducting a meeting. This is a 100 year project. What is a few months to trea the citizens of Friant with respect?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

The next meeting needs to be arranged in person. Either wait until spring 2021 when vaccines should be available or arrange a very large meeting area with room for social distancing. Microphones so everyone that wants to be heard can speak, rather than only a chosen number being allowed to express their concerns to the persons making decisions that will affect their quality of living, degraded the environment and loss of personal property value.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Noise- I feel the noise form the blasting, drop ball aggregate sorters and additional traffic will cause excessive noise. The hours of operation are very excessive. CEMEX just wants free range to do as they please.

7. Mitigation measures arc changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

In Stage 1- which is to last 30 years from when the project begins they say there will only be rock removal from the current quarry. To reduce the effect on the current property owners since the plant will not be moved to this site for 30 years. I believe the hours should remain the current hours at the quarry for 30 years 7 am to 4 pm. No work on Sundays. They can not move the plant or other portable equipment to the quarry until the 30 years has elapsed.

Also the residence shall be notified in writing 48 hours before each blasting session. This would be by notes delivered to their doors. The USP mail is usually a day or 2 slower out here so mailing notices would need to be 1 week prior to blasting. This would need to include how many blasts and the time of expected blasts. This is only "neighborly".

This allows the current residence to live out the current aggregate plan and future residence after 30 years, would then be aware of the plant moving to the site before they purchase a property.

I still not agree to the proposed expansion. But this might make it more palatable. This would need to be very specific because as we know CEMEX ignores what they think they can get away with. As they have been starting before 6 am for many years. We were not aware of the start time of this until we saw the proposed plan. By the way the last 3 days they have started at 7 am. So it indicates they were aware that they were not following the last CUP. They should be fined for this infraction. Who is responsible to monitor and and carry out discipline?

Soon after we decided to retire to Fresno, we learned that the idea of a park in the San Joaquin River Valley had been in gestation already for many years. We enthusiastically applaud that idea, with the caveat that the park should be a welcoming place for ALL Fresnians, whether from south of Shaw, west of the railroad tracks, or wherever.

Sure, the Comex proposal may be good for a local business, but approving would be a terrible idea for the city and its people. Ms Brown and I urge rejection of any plan to extend commercialization of the river's surrounds. We urge the sensible, prompt and inclusive development of the river valley as a playground for all.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Really, 'mitigation' would be like asking a python and a rabbit to co-exist. Deny the Comex proposal, please, and move on energetically with the SJ River Valley Park.

Current permits for conditional use of this site in the San Joaquin River floodplain should be allowed to expire. Anything else is inconsistent with the Fresno County General plan and will have adverse effects on abutting property, surrounding neighborhoods, and the region as a whole. Restoration should begin as agreed in the original permit.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

There are no mitigation efforts that would make this project acceptable. Increased haul traffic, dust and diesel exhaust will exacerbate already wretched air quality, and the continued mining of alluvial deposits promises to degrade the environmental conditions of the San Joaquin River and its floodplains.

And a six hundred foot deep hole is beyond the pale. A pit several hundred feet below sea level can't help but impact water quality and river flow.

To: Monfette, Christina
Subject: Please Consider The San Joaquin River's Future--And the People's

Dear Ms. Christina Monfette,

It's come to my attention, as a Fresno County resident, that you among other Fresno County officials are weighing a proposal by the multi-national corporation, Cemex, to mine the San Joaquin River. The company is planning on mining down 600 feet, according to news coverage, and is asking for a duration of 100 years to be allowed to fulfill their labors for the sake of our industrial era's rampant need for resources that enable building and maintenance work. I understand their hope is to be able to keep infrastructure functioning into the future, including that of our county's, but I am quite frankly opposed to an endeavor that would cost our community's quality of life. This effort would pollute our river's clean water, increase air pollution in our already beleaguered region, annihilate precious wildlife corridors that depend on a healthy riparian woodland ecosystem unmolested by industrial despoliations of the soil life and water needed to support such biological communities, potentially poison the Fresno aquifer, Fresno's water supply, to the extent the San Joaquin River waters contribute to it, potentially increase seismic activity as has been observed with similar deep Earth penetrations like fracking, and decimate quality of life with heavy traffic and devastating noise and air pollution for those members of the county who live on or near the San Joaquin River. Not only does such an endeavor cause these detrimental effects, but the riparian forests, like all forests, have the capacity to actually sequester rainfall and increase precipitation, acting as cloud seeders through foliar water transpiration up into the atmosphere, and doubling precipitation where they immediately grow through canopy drip, and improvements to soil water carrying capacity. This has been observed in the Amazon, in N. America's forests, and even in California's Oak woodland and Oak Savanna. **Should we lose the health of the San Joaquin Valley, it's rivers**, with the inevitable damage to riparian woodland, **we will lose snowpack too, and lose precipitation in the Valley as winter rain, over time of course. All public officials ought to know that the Central Valley can use all the water it can get, for *farms*,** for **residents**, and *for wild ecosystems* that give services such as clean water and biodiversity to counterbalance pest insects and animals. So the hard truth is this -- do you and your colleagues support human life in your county, which depends on a healthy San Joaquin River, or do you and your colleagues support short term financial gain by a multi-national corporation that has no investment whatsoever in the region, other than to gain profits at the expense of we who live in this county? If you truly represent the people, you will choose us, over Cemex.

-David, a Fresno County resident

Subject: Please Protect The San Joaquin Valley and River

Dear Supervisor Sal Quintero,
It's come to my attention, as a resident in your district, that you among other Fresno County Board of Supervisor members are weighing a proposal by the multi-national corporation, Cemex, to mine the San Joaquin River. The company is planning on mining down 600 feet, according to news coverage, and is asking for a duration of 100 years to be allowed to fulfill their labors for the sake of our industrial era's rampant need for resources that enable building and maintenance work. I understand their hope is to be able to keep infrastructure functioning into the future, including that of our county's, but I am quite frankly opposed to an endeavor that would cost our community's quality of life. This effort would pollute our river's clean water, increase air pollution in our already beleaguered region, annihilate precious wildlife corridors that depend on a healthy riparian woodland ecosystem, by industrial despoliations of the soil life and water needed to support such biological communities, potentially poison the Fresno aquifer, Fresno's water supply, to the extent the San Joaquin River waters contribute to it, potentially increase seismic activity as has been observed with similar deep Earth penetrations like fracking, and decimate quality of life with heavy traffic and devastating noise and air pollution for those members of the county who live on or near the San Joaquin River. Not only does such an endeavor cause these detrimental effects, but the riparian forests, like all forests have the capacity to do, as has been observed in the Amazon, and in N. America's forests, actually sequester rainfall and increase precipitation,

acting as cloud seeders through foliar water transpiration up into the atmosphere. Forests, and trees, no matter how seemingly insignificant, have been shown to increase rainfall, and the riparian woodland is no different. Should we lose the health of the San Joaquin, with the inevitable damage to riparian woodland, we will lose snowpack, and lose precipitation in the Valley as winter rain, with time of course. All public officials ought to know that the Central Valley can use all the water it can get, for farms, for residents, and for wild ecosystems that give services such as clean water and biodiversity to counterbalance pest insects and animals. So the hard truth is this -- do you and your colleagues support human life in your county, which depends on a healthy San Joaquin River, or do you and your colleagues support short term financial gain by a multi-national corporation that has no investment whatsoever in the region, other than to gain profits at the expense of we who live in this county? If you truly represent the people, you will choose us, over Cemex.

Respectfully,

David, a concerned Fresno County resident

Subject: RE: Please Consider The San Joaquin River's Future--And the People's (EIR 7763)

Good afternoon,

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR. The Draft EIR will provide a discussion on the extent of potential impacts identified by the scoping process and may propose mitigation measures to reduce such impacts.

If you have any questions or if you would like to submit additional comments, please don't hesitate to reach out to me at the contact information below. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date.

Subject: Please Consider The San Joaquin River's Future--And the People's

Dear Ms. Christina Monfette,

It's come to my attention, as a Fresno County resident, that you among other Fresno County officials are weighing a proposal by the multi-national corporation, Cemex, to mine the San Joaquin River. The company is planning on mining down 600 feet, according to news coverage, and is asking for a duration of 100 years to be allowed to fulfill their labors for the sake of our industrial era's rampant need for resources that enable building and maintenance work. I understand their hope is to be able to keep infrastructure functioning into the future, including that of our county's, but I am quite frankly opposed to an endeavor that would cost our community's quality of life. This effort would pollute our river's clean water, increase air pollution in our already beleaguered region, annihilate precious wildlife corridors that depend on a healthy riparian woodland ecosystem unmolested by industrial despoliations of the soil life and water needed to support such biological communities, potentially poison the Fresno aquifer, Fresno's water supply, to the extent the San Joaquin River waters contribute to it, potentially

increase seismic activity as has been observed with similar deep Earth penetrations like fracking, and decimate quality of life with heavy traffic and devastating noise and air pollution for those members of the county who live on or near the San Joaquin River. Not only does such an endeavor cause these detrimental effects, but the riparian forests, like all forests, have the capacity to actually sequester rainfall and increase precipitation, acting as cloud seeders through foliar water transpiration up into the atmosphere, and doubling precipitation where they immediately grow through canopy drip, and improvements to soil water carrying capacity. This has been observed in the Amazon, in N. America's forests, and even in California's Oak woodland and Oak Savanna. **Should we lose the health of the San Joaquin Valley, it's rivers**, with the inevitable damage to riparian woodland, **we will lose snowpack too, and lose precipitation in the Valley as winter rain, over time of course. All public officials ought to know that the Central Valley can use all the water it can get, for *farms*,** for **residents**, and *for wild ecosystems* that give services such as clean water and biodiversity to counterbalance pest insects and animals. So the hard truth is this -- do you and your colleagues support human life in your county, which depends on a healthy San Joaquin River, or do you and your colleagues support short term financial gain by a multi-national corporation that has no investment whatsoever in the region, other than to gain profits at the expense of we who live in this county? If you truly represent the people, you will choose us, over Cemex.

-David, a Fresno County resident

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Dustin Lee

2. Organization/Business

Residential Home Owner

3. What is your address?

15918 N. Friant Rd Friant, CA

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

dustingarrettlee@gmail.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

• I have concerns with the proposed reclamation plan for the 600 ft deep Quarry site pit and how that will comply with the existing CUP to restore the existing habitat back to natural riparian habitat. The Quarry site would primarily be exposed hardrock benches that would be exposed granite with no vegetation. How would the benches be restored back to riparian and open water habitat? There is only a small 50 ft deep pond proposed at the bottom of the pit.

• How will the wildlife be able to use the reclaimed site when there's no access or vegetation that will grow on the hardrock benches.

• I have concerns with the effects of the active mining and blasting site on the surrounding residential properties and future residential properties. Madera and Fresno County have zoned properties adjacent to the River and along the bluff tops for residential homes.

• I have concerns with the proposed blasting and the effects that will have on the surrounding wildlife and aquatic life. How will the air, noise, and water effects on the wildlife be mitigated or avoided?

• I have concerns with the blasting and mining of the Quarry site and the effects that will have on the San Joaquin River ecosystem and the surrounding wildlife. The blasting will deter wildlife away from the vicinity.

• I have concerns with excavating a 600 ft deep pit and the effects that will have on the groundwater table and the surrounding hydrology. How will they excavate down below the groundwater table and not contaminate the water with their proposed equipment and blasting methods?

• I have concerns with the water that will collect or seep into the pit and the contaminants that the water will be exposed to from the active blasting and mining site. How will the water be captured, cleaned, and returned back into the environment?

Note: The Vision System did not print the comments below in a legible manner due to their length, so they have been reproduced here. -Chrissy

Submitter ID 17543 – Dustin Lee

Comments about the project:

• I have concerns with the proposed reclamation plan for the 600 ft deep Quarry site pit and how that will comply with the existing CUP to restore the existing habitat back to natural riparian habitat. The Quarry site would primarily be exposed hardrock benches that would be exposed granite with no vegetation. How would the benches be restored back to riparian and open water habitat? There is only a small 50 ft deep pond proposed at the bottom of the pit.

• How will the wildlife be able to use the reclaimed site when there's no access or vegetation that will grow on the hardrock benches.

• I have concerns with the effects of the active mining and blasting site on the surrounding residential properties and future residential properties. Madera and Fresno County have zoned properties adjacent to the River and along the bluff tops for residential homes.

• I have concerns with the proposed blasting and the effects that will have on the surrounding wildlife and aquatic life. How will the air, noise, and water effects on the wildlife be mitigated or avoided?

• I have concerns with the blasting and mining of the Quarry site and the effects that will have on the San Joaquin River ecosystem and the surrounding wildlife. The blasting will deter wildlife away from the vicinity.

• I have concerns with excavating a 600 ft deep pit and the effects that will have on the groundwater table and the surrounding hydrology. How will they excavate down below the groundwater table and not contaminate the water with their proposed equipment and blasting methods?

• I have concerns with the water that will collect or seep into the pit and the contaminants that the water will be exposed to from the active blasting and mining site. How will the water be captured, cleaned, and returned back into the environment?

• How will the use of explosives and blasting be controlled and not released into the groundwater and contaminate the aquifer. The pit is located directly adjacent to the river and there is shallow groundwater there that the 600 ft deep pit would encounter.

• How will the blasting affect the aquatic wildlife in the river?

• I have concerns that a 600 ft deep pit directly adjacent to the San Joaquin River will pull water away from the aquifer and river and seep into the pit thus making the water not usable anymore.

• How will this affect the overall San Joaquin River Parkway Master Plan proposed recreation use of the River with having trails adjacent to an active mining pit?

• I have concerns with the proposed blasting and the effects on the surrounding properties through noise pollution. How will the increase in sound be mitigated to within acceptable ranges?

• The mining pit has direct line of sight to several adjacent property homes. I have concern with the noise that will be created from mining and blasting at the Quarry Site. How will the shockwaves and noise from the blasting be mitigated to below acceptable ranges?

• How will the blasting and mining affect the state mandated salmon restoration? Will the mining be prohibitive during certain active spawning months?

• How will the blasting and mining affect the surrounding wildlife? Will mining be prohibitive during certain times of the year during mating season and times when animals are raising their offspring? It seems like this would drive all animals away from the active mining site creating a negative effect on the ecosystem.

• I have concerns with the proposed blasting and the effects on the surrounding properties through ground movement/shaking. Blasting and the use of explosives will send seismic shockwaves through the granite and potentially shake and damage the surrounding properties.

• I have concerns with the groundwater disruption that the Quarry site pit would cause by mining the existing granite bedrock. The surrounding properties within several miles use this granite bedrock to obtain their water and have wells that pull water from fissures (cracks) in the granite. There is a big concern that mining a deep pit at the downstream end of these properties will create an open face for the water used by these residences to drain out and thus dry up the existing wells. How will this be mitigated and assured will not happen?

• I have concerns with the extended operation hours from the existing permitted operation hours and the effects that will have on the adjacent residences (noise, traffic, pollution)

• I have concerns with the air pollution and the smell of the asphalt plant on the adjacent properties, especially that the westerly winds will blow any emissions/odors onto those properties.

• I have concerns with the air quality and how this proposed project will release additional pollution, gas emissions, and dust into the environment and the effects that will have on overall County air quality as well as the air quality of the surrounding adjacent properties.

• How will this new proposed mining operation affect greenhouse gas emissions?

• How will this new proposed mining operation affect the air and noise quality of the surrounding areas?

• How will this new proposed mining operation affect the watershed, groundwater table, and aquifer?

• How will the site be secured once reclaimed? It's assumed that a fence would need to be installed around the pit to provide safety to the public. If a fence is installed how would that permit wildlife to use the reclaimed land?

• How does the new proposed mining operations at the Quarry site comply with the Surface Mining and Reclamation Act of 1975 which requires mined lands be reclaimed to a usable condition. The site would be void of vegetation and be exposed granite benches (50 ft wide by 50 ft deep).

Suggested Mitigation Measures:

- I would suggest that the existing CUP not be modified to permit hard mining through the use of blasting & drilling and that the existing permit of mining alluvial deposits be allowed to continue similar to all the other adjacent mining sites in the greater Fresno area.
- I would reduce the proposed expanded operation hours down to the previously approved operation hours.

Subject: EIR 7763 - Confirmation of Receipt of Online Comments

Good morning,

Thank you for providing comments on this application through our online comment card system. This email is being provided as receipt of your submission of comments and confirms that those comments were received during the public comment period for this application. Your submission will help guide the development of the Draft EIR, which is being prepared to determine the likely impacts from this project.

As requested, your email address has been added to our list to receive digital notices relating to this project.

Please let me know if you have any questions. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date.

Chrissy Monfette| Planner
Department of Public Works and Planning | Development Services and Capital Projects Division
2220 Tulare St. 6th Floor Fresno, CA 93721

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Please do not allow this destructive mining to take place so close to homes, farms and wildlife. The blasting and dust will ruin the environment and further harm the river.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Do not proceed. Save the river and environment.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

NOTE: I have focused on issues related to Friant Road, but some of these issues also apply to Willow Ave.

TRAFFIC SAFETY

1. Despite improvements completed to improve traffic flow and safety along Friant Road (See California Dept. of Transportation document https://ops.fhwa.dot.gov/wz/resources/final_rule/wz_impcts_inter_ex/sec1.htm), there continue to be occasions when traffic backs-up onto NB SR 41 from the Friant Road despite the 5-lane off-ramp. This situation has the potential for deadly heavy-duty truck collisions with passenger vehicles stopped on the freeway.

2. The on-ramp from on the north side of Friant Road onto southbound SR 41 has been slightly improved, but is narrow and has the potential for collisions between fully-loaded sand and gravel trucks and passenger vehicles.

3. Although Friant Road is occasionally repaved, there have been unsafe conditions from uneven or missing pavement from time to time, in part due to gravel truck traffic. This hazard is especially dangerous for motorcycle riders.

AIR QUALITY from vehicle traffic, and including heavy-duty diesel gravel trucks, is detrimental to neighborhoods along Friant Road, and to users of commercial areas, Woodward Park, the Eaton Trail, and the San Joaquin River Parkway.

GREENHOUSE GAS (GHG) EMISSIONS Increased GHG emissions from gravel truck exhaust and passenger vehicles idling in congested traffic along Friant Road.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

1.The major mitigation measure I am suggesting is that any studies, or data, used in environmental documents must be thorough, objective, based on rigorous scientific and statistical analysis, and provided by independent parties. These studies should NOT be provided by the applicant, its customers or affiliates, or the County of Fresno. Potential sources for this information could include State agencies, the UC and CSU systems, and the USGS. The applicant , and not the County taxpayers, should pay for these independent studies.

2. Because the draft environmental documents may be released early in 2021 while the Covid 19 pandemic is still going on, the data used in traffic, air quality and GHG studies must be carefully analyzed so that the information is not skewed due to atypical patterns during the pandemic.

Subject: EIR 7763

Dear Christina, I am writing to you in regard of the recent application from Cemex to continue mining and blasting 600 foot-hole in our city for the next 100 years. My concern is the negative impact that mining will create in our already bad air quality. I moved here from Gilroy last year and I am already suffering breathing problems from the bad air quality. Our officials should think about the impact that the mining will create in our drinking water and trafic.
Please forward my email to our official in charge of making that decision.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

What will Fresno County and Madera County (Tesoro Viejo/Riverstone) look like 30 to 100 years from now? Much different. And because of this, a 22 mile natural and recreational area along the river would be an essential use of land. Why otherwise would Fresno County, the City of Fresno, and Madera County have previously adopted the San Joaquin River Parkway concept as part of their general plans? Therefore, this proposal is inconsistent and incompatible.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

This proposal is incompatible with previous agreed to land use decisions.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I have multiple environmental concerns. The paramount one relates to water, both river and ground sourced. To deep mine rock will require considerable water. There are already increased water needs from new communities in Madera County, as well as ongoing drought concerns. This makes it obvious to me that Cemex needs to be last in line when water is being allotted. I strongly urge the Board of Supervisors to vote against the Cemex mining proposal.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

The only mitigation I see is to deny the Cemex proposal to deep mine the San Joaquin river for rock.

As a Realtor with more than 34 years experience, I see the expansion of the CEMAX Mining Project as a detriment to the health, safety, and property values of the residents in the area from Nees Ave to Friant. While there is probably no question that there is need for cement, CEMEX should look to places that are further removed from major population sites to mine for it. It shouldn't take an EIR, just logic, to see all of the negative impacts the expansion of their existing site will cause.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Subject: EIR 7763 - Confirmation of Receipt of Online Comments

Good morning

Thank you for providing comments on this application through our online comment card system. This email is being provided as receipt of your submission of comments and confirms that those comments were received during the public comment period for this application. Your submission will help guide the development of the Draft EIR, which is being prepared to determine the likely impacts from this project.

As requested, your email address has been added to our list to receive digital notices relating to this project.

Please let me know if you have any questions,

Subject: Cemex

I am writing to express my concern over the possible expansion of Cemex. This would be an environmental disaster! At this stage in the game we do not need more production of concrete, cement, gravel, etc. What we do need is the preservation of the San Joaquin River and the green space it offers. The mining and drilling which Cemex proposes will increase air pollution, noise pollution, and traffic on Friant Rd. This is not a step in the right direction for the city of Fresno! Instead, a wise step would be to conserve and protect the natural environment in and around the San Joaquin River. As the coronavirus pandemic grinds on, Fresnans will increasingly need spaces in nature where they can find refreshment and peace of mind. Please help them in this pursuit by saying NO to Cemex. Thank-you.

Subject: RE: Cemex (EIR 7763)

Good afternoon,

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR.

If you have any questions, please don't hesitate to reach out to me at the contact information below.

Thank you again,

Chrissy Monfette| Planner
Department of Public Works and Planning | Development Services and Capital Projects Division
2220 Tulare St. Suite A, Fresno, CA 93721 Main Office: (559) 600-4230 Direct: (559) 600-4245

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Emily Freeman

2. Organization/Business

None specifically

3. What is your address?

1770 N Twinberry Ave Clovis

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

No

5. Please provide your email address.

Not answered No response email sent - emm

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

What a mess. Where do I start? There is a wide range of potential problems: how does explosive mining next to a primary water source impact water quality and resource availability? How is promising to 'donate' back a completely altered 'wildlife habitat' any kind of compensation for the loss of existin riverine habitat? and what is the point of giving back a few ponding basins if there is no plan for public access/use of the GREATEST NATURAL RESOURCE in our area? And why should a handful of people be allowed to irrevocably alter that resource for their own profit with zero concessions to what should be a shared community resource? I want my kids and my community to have a clean, accessible river someday! I want to know how digging a 600ft hole next to a river is going to affect an already tenuous water system—How about in drought years? How will EVEN MORE gravel trucks/rigs impact the traffic and safety of surrounding roads for drivers and cyclists?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Not allowing this project to go forward is the mitigation measure I suggest.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

It is unbelievable that a project that would devastate what is left of the San Joaquin River could even be considered. The environment of the San Joaquin valley is so degraded and so damaged. How can a project that will not only risk the water quality for downstream communities and fish and wildlife, but also affect the already limited opportunities that local residents have for recreation and access to the river, possibly be acceptable? This project would never be allowed to go forward in a wealthier part of the state; this is environmental racism, plain and simple. Local governments can't even provide clean and safe drinking water to local communities. How on earth can they consider this project that further threatens water quality and extracts even more wealth from the land while giving nothing in return. Leave the river alone. We must do better.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

This project can not be allowed to go forward. Invest in restoring the environment and creating safe and sustainable recreation opportunities for local residents.

I have great concern for this proposal! I fear the damage to the environment, the wildlife. the lack of concern for the people of Fresno. We need to encourage preservation of the San Joaquin River and its surrounding lands and its availability to the population of our city, not add to its degradation. Under the current contract which Cemex has with the City of Fresno, operations will be concluded in the nearer future and this land could be returned to natural conditions even with the historic damage to the surface and hopefully to public use.
This city is in dire need of open space, parks and recreation areas. whywould the city council approve a contractwhich takes this valuable natural resource out of the possibility of public use?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Do not allow mining 600 feet below the surface. The necessary explosive technique to remove rock from this level will cause noise and percussive effect tc both humans and wildlife in the area.

Office 365

Your message to ehenink@aol.com couldn't be delivered.

When Office 365 tried to send your message, the receiving email server outside Office 365 reported an error.

cmonfette	**Office 365**	**ehenink**
Sender		**Action Required**
		Policy violation or system error

How to Fix It

Check the "Reported Error" from the "Error Details" section shown below for more information about the problem. The error might tell you what went wrong and how to fix it. For example, if the error states that the message was blocked due to a potential virus or because the message was too large, try sending the message again without attachments.

If you're not able to fix the problem, it's likely that only the recipient's email admin can fix it. Contact the recipient by some other means (by phone, for example) and ask them to tell their email admin about the problem. Give them the "Reported Error" from the "Error Details" section below.

Was this helpful? Send feedback to Microsoft.

More Info for Email Admins

Status code: 550 5.0.350

The error reported by the receiving server wasn't specific enough to determine the exact nature of the problem. These errors often indicate the message violates a security or policy setting configured on the recipient's email servers.

Subject: CEMEX Rockfield Modification Project (Project) (EIR 7763)
Notice of Preparation
State Clearinghouse No. 2020060123

Dear Ms. Monfette:

The California Department of Fish and Wildlife (CDFW) received a Notice of Preparation from the Fresno County Department of Public Works and Planning for the above-referenced Project pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.[1]

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, CDFW appreciates the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under Fish and Game Code.

CDFW ROLE

CDFW is California's **Trustee Agency** for fish and wildlife resources and holds those resources in trust by statue for all the people of the State (Fish and G. Code, §§ 711.7, subd. (a) & 1802; Pub. Resources Code, § 21070; CEQA Guidelines § 15386, subd. (a)). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (*Id.*, § 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

[1] CEQA is codified in the California Public Resources Code in section 21000 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

CDFW is also submitting comments as a **Responsible Agency** under CEQA (Pub. Resources Code, § 21069; CEQA Guidelines, § 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority (Fish & G. Code, § 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & G. Code, § 2050 et seq.), related authorization as provided by the Fish and Game Code will be required.

Nesting Birds: CDFW has jurisdiction over actions with potential to result in the disturbance or destruction of active nest sites or the unauthorized take of birds. Fish and Game Code sections that protect birds, their eggs and nests include, sections 3503 (regarding unlawful take, possession or needless destruction of the nest or eggs of any bird), 3503.5 (regarding the take, possession or destruction of any birds-of-prey or their nests or eggs), and 3513 (regarding unlawful take of any migratory nongame bird).

Fully Protected Species: CDFW has jurisdiction over fully protected species of birds, mammals, amphibians, reptiles, and fish, pursuant to Fish and Game Code sections 3511, 4700, 5050, and 5515. CDFW prohibits and cannot authorize take of any fully protected species.

In this role, CDFW is responsible for providing, as available, biological expertise during public agency environmental review efforts (e.g., CEQA), focusing specifically on project activities that have the potential to adversely affect fish and wildlife resources. CDFW provides recommendations to identify potential impacts and possible measures to avoid or reduce those impacts.

PROJECT DESCRIPTION SUMMARY

Proponent: CEMEX Construction Materials Pacific, LLC

Objective: The Project proposes a continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operations located on two properties, the Plant Site and the Quarry Site, between North Friant Road and the San Joaquin River in Fresno County.

The Plant Site operates under several Conditional Use Permits (CUP) allowing aggregate mining of the alluvial deposit; plant operations including an aggregate processing plant, a ready-mix concrete plant, a hot-mix plant and relate supportive facilities; and the processing of raw aggregate mined from CEMEX's current Quarry Site. A portable plant is brought in periodically to recycle come-back concrete (unused concrete in mixer truck upon return to plant) into crushed miscellaneous base (CMB).

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Aggregate from the alluvial deposit has been partially mined from portions of the Plant Site.

At the Quarry Site, aggregate mining of the alluvial deposit has been permitted under several CUPs. Since there are no plant operations permitted at the Quarry Site, the CUPs allow the interplant haul of approximately 1.4 million tons per year of raw aggregate to the Plant Site for processing.

The Project would occur in two stages:

- Stage 1 would continue concurrent operations at both the Quarry Site and Plant Site for up to 30 years. At the Plant Site, the existing aggregate processing plant would continue to be used to wash, screen, and sort aggregate mined from the Plant Site. The existing ready-mix concrete plant would continue to operate and the existing inactive asphalt plant would be replaced with a modern asphalt plant. Aggregate products from the Plant Site and ready-mix concrete would continue to be sold to customers and asphalt sales would resume. Periodic use of a portable crushing plant to recycle come-back concrete would continue with the addition of asphalt recycling and the import of concrete debris to recycle into CMB and asphalt debris to be recycled asphalt product (RAP). The remaining alluvial deposit would be mined to a depth of approximately 85 feet below ground surface (bgs). The ready-mix concrete plant and the hot-mix asphalt plant may be relocated from the Plant Site to the Quarry Site in less than 30 years in order to recover the remaining alluvial deposit under the plants. Upon completion of mining at the Plant Site, operations at the Plant Site would cease, all equipment would be removed and the site reclaimed as 122 acres of open space, riparian and open water wildlife habitat.

  At the Quarry Site, mining would be modified to include the hard rock (granite) that lies beneath the alluvial deposit currently being mined. Mining of the hard rock would require drilling and blasting and would occur to a depth of approximately 600 feet bgs. An aggregate processing plant would be added to the Quarry Site to wash, screen, crush and sort the aggregate. A portable aggregate processing plant for the asphalt and ready-mix plants would be transported approximately 2 miles south to the Plant Site via an interplant haul on Friant Road. Other aggregate products produced at the Quarry Site not used by the asphalt and ready-mix plants at the Plant Site (e.g. road base, various-sized crushed rock, sand, etc.) would be sold directly from the quarry.

- Stage 2 would continue hard rock mining and processing operations only at the Quarry Site for approximately 70 more years. The ready-mix concrete plant and the hot-mix asphalt plant would be relocated from the Plant Site to the Quarry Site. The periodic use of a portable plant to recycle concrete and asphalt debris

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

(including imported) into CMB and RAP would be added to the Quarry Site. Upon completion of mining at the Quarry Site, operations at the Quarry Site would cease and all equipment would be removed. Reclamation of the Quarry Site would create approximately 349 acres of open space, riparian, and open water wildlife habitat.

Location:
Plant Site: The Plant Site is located on approximately 122 acres on the west side of North Friant Road (APNs 300-070-56S, 57S, 58S, 59S, and 60S), approximately 1.5 miles north of the City of Fresno and approximately 0.7 miles north of the intersection of North Willow Avenue and North Friant Road (including portions of Section 36 of T11N/R21E MDB&M).

Quarry Site: The Quarry Site is located on approximately 349 acres on the west side of North Friant Road (APNs 300-040-19 and 20, 300-080-01S, 300-250-12 and portion of 300-310-01) approximately 2.0 miles north of CEMEX's current Plant Site and approximately 2.0 miles south of the town of Friant (including portions of Sections 24 and 25 of T11N/R20E MDB&M and Sections 19 and 30 of T11N/R21E MDB&M).

Timeframe: The total Project life of the combined Stages 1 and 2 is estimated to be up to 100 years.

COMMENTS AND RECOMMENDATIONS

CDFW offers the following comments and recommendations to assist Fresno County Department of Public Works and Planning in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions may also be included to improve the document.

Currently, an Environmental Impact Report (EIR) is being prepared to determine the likely environmental impacts associated with the Project's expansion of use. CDFW is concerned regarding adequacy of mitigation measures for special-status species including, but not limited to, the State threatened Swainson's hawk (*Buteo swainsoni*), the State and federally threatened California tiger salamander (*Ambystoma californiense*), the State candidate endangered tricolored blackbird (*Agelaius tricolor*), the State fully protected white-tailed kite (*Elanus leucurus*), the State endangered and fully protected bald eagle (*Haliaeetus leucocephalus*), the following species of special concern burrowing owl (*Athene cunicularia*), and western pond turtle (*Actinemys marmorata*). In addition, CDFW is concerned regarding adequacy of mitigation measures for Project activities which are subject to CDFW's lake and streambed alteration regulatory authority.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

I. Environmental Setting and Related Impact

Would the Project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status-species in local or regional plans, policies, or regulations, or by CDFW or the United States Fish and Wildlife Service (USFWS)?

COMMENT 1: Swainson's Hawk (SWHA)

Issue: SWHA have the potential to nest adjacent to or near the Project site. The proposed Project will involve activities near large trees that may serve as potential nest sites.

Specific impacts: Without appropriate avoidance and minimization measures for SWHA, potential significant impacts that may result from Project activities include nest abandonment, loss of nest trees, loss of foraging habitat that would reduce nesting success (loss or reduced health or vigor of eggs or young), and direct mortality. Any take of SWHA without appropriate incidental take authorization would be a violation of Fish and Game Code.

Evidence impact is potentially significant: SWHA exhibit high nest-site fidelity year after year and lack of suitable nesting habitat in the San Joaquin Valley limits their local distribution and abundance (CDFW 2016). The Project as proposed will involve noise, groundwork, and movement of workers that could affect nests and has the potential to result in nest abandonment, significantly impacting local nesting SWHA.

Recommended Potentially Feasible Mitigation Measure(s)
Because suitable habitat for SWHA is present adjacent to the Project site, CDFW recommends conducting the following evaluation of the Project site and that the following mitigation measures be made conditions of approval for the Project.

Recommended Mitigation Measure 1: SWHA Surveys

To evaluate potential impacts, CDFW recommends that a qualified wildlife biologist conduct surveys for nesting SWHA following the survey methods developed by the Swainson's Hawk Technical Advisory Committee (SWHA TAC, 2000) prior to project implementation. The survey protocol includes early season surveys to assist the project proponent in implementing necessary avoidance and minimization measures, and in identifying active nest sites prior to initiating ground-disturbing activities.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Recommended Mitigation Measure 2: No-disturbance Buffer

If ground-disturbing Project activities are to take place during the normal bird breeding season (March 1 through September 15), CDFW recommends that additional pre-activity surveys for active nests be conducted by a qualified biologist no more than 10 days prior to the start of Project implementation. CDFW recommends a minimum no-disturbance buffer of ½-mile be delineated around active nests until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or parental care for survival.

Recommended Mitigation Measure 3: SWHA Take Authorization

CDFW recommends that in the event an active SWHA nest is detected during surveys and the ½-mile no-disturbance buffer around the nest cannot feasibly be implemented, consultation with CDFW is warranted to discuss how to implement the project and avoid take. If take cannot be avoided, take authorization through the acquisition of an Incidental Take Permit (ITP), pursuant to Fish and Game Code section 2081(b) is warranted to comply with CESA.

COMMENT 2: California Tiger Salamander (CTS)

Issue: CTS are known to occur in the Project vicinity (CDFW 2020). Excavation of any small mammal burrow within the Project site could result in take of CTS through capture, crushing as a result of burrow collapse, entombment, etc. Please be advised that any take that occurs without prior acquisition of an Incidental Take Permit (ITP) (pursuant to Fish and Game Code section 2081(b)) from CDFW would result in a violation of CESA.

Specific Impacts: Aerial photos show that the proposed Project site is within the vicinity of both upland and breeding habitat. Due to the proposed ground-disturbing activities, potential Project-related impacts include collapse of small mammal burrows, inadvertent entrapment, direct mortality of individuals, and displacement due to sound or vibration.

Evidence impact would be significant: Up to 75% of historic CTS habitat has been lost to development (Searcy et al. 2013). Loss, degradation, and fragmentation of habitat are the primary threats to CTS. Contaminants and vehicle strikes are also sources of mortality for the species (CDFW 2015a, USFWS 2017). The Project site is within the range of CTS and is adjacent to suitable habitat (i.e., aquatic breeding habitat, grasslands interspersed with burrows). CTS have been determined to be physiologically capable of dispersing up to approximately 1.5 miles from seasonally flooded wetlands (Searcy and Shaffer 2011) and have the potential to occur near the Project site (CDFW 2020). Given the presence of suitable habitat adjacent to the

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Project site, Project activities have the potential to significantly impact local populations of CTS.

Recommended Potentially Feasible Mitigation Measure(s)
Because suitable habitat for CTS is present near the Project site and CTS has been documented adjacent to the Project site, CDFW recommends conducting the following evaluation of the Project site and that the following mitigation measures be made conditions of approval for the Project.

Recommended Mitigation Measure 4: Focused CTS Protocol-level Surveys

CTS are known to occur adjacent to the Project site (CDFW 2020). Therefore, protocol-level surveys are advised to be conducted in accordance with the USFWS' Interim Guidance document (USFWS 2003). CDFW advises that the survey include a 100-foot buffer around the Project area in all areas of wetland and upland habitat that could support CTS. CDFW recommends that survey findings be submitted for review. In order for a negative finding for CTS to be accepted, CDFW must make a determination on whether there has been sufficient rainfall to accept negative finding results. In addition, acceptance of a negative finding for CTS requires protocol-level surveys for two consecutive wet seasons.

Recommended Mitigation Measure 5: CTS Avoidance

CDFW recommends that a minimum 50-foot no-disturbance buffer be delineated around all small mammal burrows within and/or adjacent to the Project construction footprint and occupied breeding pools within and/or adjacent to the Project site footprint. CDFW also recommends avoiding any impacts that could alter the hydrology or result in sedimentation of breeding pools. If avoidance is not feasible, consultation with CDFW is warranted to determine if the Project can avoid take.

Recommended Mitigation Measure 6: CTS Take Authorization

If through surveys it is determined that CTS are occupying or have the potential to occupy the Project site and take cannot be avoided, acquisition of take authorization would be warranted prior to initiating ground-disturbing activities. Take authorization would occur through issuance of an ITP by CDFW, pursuant to Fish and Game Code section 2081(b). Alternatively, in the absence of protocol surveys, the applicant can assume presence of CTS within the Project site and obtain an ITP from CDFW. Due to known CTS occurrences adjacent to the Project site, CDFW recommends that an ITP will be pursued.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

COMMENT 3: Tricolored Blackbird (TRBL)

Issue: TRBL have the potential to occur near the Project site. Review of aerial imagery indicates that the Project site is near dense low vegetation fields that may serve as nest colony sites.

Specific impact: Without appropriate avoidance and minimization measures for TRBL, potential significant impacts include nest and/or colony abandonment, reduced reproductive success, and reduced health and vigor of eggs and/or young.

Evidence impact would be significant: TRBL aggregate and nest colonially, forming colonies of up to 100,000 nests (Meese et al. 2014). Approximately 86% of the global population is found in the San Joaquin Valley (Kelsey 2008, Weintraub et al. 2016). Increasingly, TRBL are forming larger colonies that contain progressively larger proportions of the species' total population (Kelsey 2008). In 2008, for example, 55% of the species' global population nested in only two colonies, which were located in silage fields (Kelsey 2008). In 2017, approximately 30,000 TRBL were distributed among only 16 colonies in Merced County (Meese 2017). Nesting can occur synchronously, with all eggs laid within one week (Orians 1961). For these reasons, depending on timing, disturbance to nesting colonies can cause abandonment, significantly impacting TRBL populations (Meese et al. 2014).

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential Project-related impacts to TRBL, CDFW recommends conducting the following evaluation of the Project site and that the following mitigation measures be made conditions of approval for the Project.

Recommended Mitigation Measure 7: TRBL Habitat Assessment

CDFW recommends that a qualified biologist conduct a habitat assessment adjacent to the Project site in advance of Project implementation, to determine if the Project site or its vicinity contains suitable habitat for TRBL.

Recommended Mitigation Measure 8: TRBL Surveys

CDFW recommends that Project activities be timed to avoid the typical bird breeding season (February 1 through September 15). However, if Project activities must take place during that time, CDFW recommends that a qualified wildlife biologist conduct surveys for nesting TRBL, within a minimum 500-foot buffer from the Project site, no more than 10 days prior to the start of implementation to evaluate presence/absence of TRBL nesting colonies in proximity to Project activities and to evaluate potential Project-related impacts.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Recommended Mitigation Measure 9: TRBL Avoidance

If an active TRBL nesting colony is found during pre-activity surveys, CDFW recommends implementation of a minimum 300-foot no-disturbance buffer in accordance with CDFW's "Staff Guidance Regarding Avoidance of Impacts to Tricolored Blackbird Breeding Colonies on Agricultural Fields in 2015" (CDFW 2015b). CDFW advises that this buffer remain in place until the breeding season has ended or until a qualified biologist has determined that nesting has ceased, the birds have fledged, and are no longer reliant upon the colony or parental care for survival. It is important to note that TRBL colonies can expand over time and for this reason, the colony may need to be reassessed to determine the extent of the breeding colony within 10 days prior to Project initiation.

Recommended Mitigation Measure 10: TRBL Take Authorization

In the event that a TRBL nesting colony is detected during surveys, consultation with CDFW is warranted to discuss how to implement the Project and avoid take, or if avoidance is not feasible, to acquire an ITP, pursuant to Fish and Game Code Section 2081(b), prior to any ground-disturbing activities.

COMMENT 4: Fully Protected Raptors

Issue: The State fully protected white-tailed kite and the State endangered and fully protected bald eagle have the potential to nest and/or forage adjacent to the Project site. Without appropriate mitigation measures, Project activities conducted within occupied territories have the potential to significantly impact these species.

Specific Impacts: Potentially significant impacts that may result from Project activities include nest abandonment, loss of nest trees, and/or loss of foraging habitat that would reduce nesting success (loss or reduced health or vigor of eggs or young), and direct mortality.

Evidence impact would be significant: The Project will involve noise, groundwork, and movement of workers that may occur directly adjacent to large trees and other features with potential to serve as nest sites have the potential to significantly impact fully protected raptor populations.

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to fully protected raptors, CDFW recommends conducting the following evaluation of the Project site and that the following mitigation measures be made conditions of approval for the Project.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Recommended Mitigation Measure 11: Fully Protected Raptor Habitat Assessment

CDFW recommends that a qualified biologist conduct a habitat assessment in advance of Project implementation, to determine if the Project site or its vicinity (within ½ mile) contains suitable habitat for fully protected raptors.

Recommended Mitigation Measure 12: Fully Protected Raptor Surveys

CDFW recommends that focused surveys be conducted by experienced biologists at the Project site prior to Project implementation. To avoid impacts to these species, CDFW recommends conducting these surveys in accordance with protocols developed by CDFW (CDFG 2010). If Project activities are to take place during the typical bird breeding season (February 1 through September 15), CDFW recommends that additional pre-activity surveys for active nests be conducted by a qualified biologist no more than 10 days prior to the start of Project activity.

Recommended Mitigation Measure 13: Fully Protected Raptor Avoidance

In the event a fully protected raptor species is found within ½ mile of the Project site, implementation of avoidance measures is warranted. CDFW recommends that a qualified wildlife biologist be on-site during all Project-related activities and that a ½-mile no-disturbance buffer be implemented. If the ½-mile no-disturbance buffer cannot feasibly be implemented, contacting CDFW for assistance with additional avoidance measures is recommended. Fully addressing potential impacts to fully protected raptor species and requiring measurable and enforceable mitigation in the EIR is recommended.

COMMENT 5: Burrowing Owl (BUOW)

Issue: BUOW may occur near the Project site (CDFW 2020). BUOW inhabit open grassland or adjacent canal banks, ROWs, vacant lots, etc., containing small mammal burrows, a requisite habitat feature used by BUOW for nesting and cover. Habitat adjacent to the Project site supports grassland habitat.

Specific impact: Potentially significant direct impacts associated with subsequent activities and development include burrow collapse, inadvertent entrapment, nest abandonment, reduced reproductive success, reduction in health and vigor of eggs and/or young, and direct mortality of individuals.

Evidence impact is potentially significant: BUOW rely on burrow habitat year-round for their survival and reproduction. Habitat loss and degradation are considered the greatest threats to BUOW in California's Central Valley (Gervais et al. 2008). The Project site contains and is bordered by some of the only remaining

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

undeveloped land in the vicinity, which is otherwise intensively managed for agriculture or housing developments. Therefore, subsequent ground-disturbing activities associated with Project approval have the potential to significantly impact local BUOW populations. In addition, and as described in CDFW's "Staff Report on Burrowing Owl Mitigation" (CDFG 2012), excluding and/or evicting BUOW from their burrows is considered a potentially significant impact under CEQA.

Recommended Potentially Feasible Mitigation Measure(s)

To evaluate potential impacts to BUOW, CDFW recommends conducting the following evaluation of the Project site and that the following mitigation measures be made conditions of approval for the Project.

Recommended Mitigation Measure 14: BUOW Surveys

CDFW recommends assessing presence/absence of BUOW by having a qualified biologist conduct surveys following the California Burrowing Owl Consortium's (CBOC) "Burrowing Owl Survey Protocol and Mitigation Guidelines" (CBOC 1993) and CDFW's "Staff Report on Burrowing Owl Mitigation" (CDFG 2012). Specifically, CBOC and CDFW's Staff Report suggest three or more surveillance surveys conducted during daylight with each visit occurring at least three weeks apart during the peak breeding season (April 15 to July 15), when BUOW are most detectable.

Recommended Mitigation Measure 15: BUOW Avoidance

CDFW recommends no-disturbance buffers, as outlined in the "Staff Report on Burrowing Owl Mitigation" (CDFG 2012), be implemented prior to and during any ground-disturbing activities. Specifically, CDFW's Staff Report recommends that impacts to occupied burrows be avoided in accordance with the following table unless a qualified biologist approved by CDFW verifies through non-invasive methods that either: 1) the birds have not begun egg laying and incubation; or 2) that juveniles from the occupied burrows are foraging independently and are capable of independent survival.

Location	Time of Year	Level of Disturbance		
		Low	Med	High
Nesting sites	April 1-Aug 15	200 m*	500 m	500 m
Nesting sites	Aug 16-Oct 15	200 m	200 m	500 m
Nesting sites	Oct 16-Mar 31	50 m	100 m	500 m

* meters (m)

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Recommended Mitigation Measure 16: BUOW Passive Relocation and Mitigation

If BUOW are found within these recommended buffers and avoidance is not possible, it is important to note that according to the Staff Report (CDFG 2012), exclusion is not a take avoidance, minimization, or mitigation method and is considered a potentially significant impact under CEQA. However, if necessary, CDFW recommends that burrow exclusion be conducted by qualified biologists and only during the non-breeding season, before breeding behavior is exhibited and after the burrow is confirmed empty through non-invasive methods, such as surveillance. CDFW recommends replacement of occupied burrows with artificial burrows at a ratio of one burrow collapsed to one artificial burrow constructed (1:1) as mitigation for the potentially significant impact of evicting BUOW. BUOW may attempt to colonize or re-colonize an area that will be impacted; thus, CDFW recommends ongoing surveillance, at a rate that is sufficient to detect BUOW if they return.

COMMENT 6: Western Pond Turtle (WPT)

Issue: WPT have the potential to occur adjacent to the Project site. WPT are known to nest in the spring or early summer within 100 meters of a water body, although nest sites as far away as 500 meter have also been reported (Thomson et al. 2016).

Specific impact: Without appropriate avoidance and minimization measures for WPT, potentially significant impacts associated with Project activities could include nest reduction, inadvertent entrapment, reduced reproductive success, reduction in health or vigor of eggs and/or young, and direct mortality.

Evidence impact is potentially significant: The Project involves ground-disturbing activities adjacent to the San Joaquin River. Additionally, noise, vegetation removal, movement of workers, and ground disturbance as a result of Project activities have the potential to significantly impact WPT populations.

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to WPT, CDFW recommends conducting the following evaluation of the Project site and that the following mitigation measures be made conditions of approval for the Project.

Recommended Mitigation Measure 17: WPT Surveys

CDFW recommends that a qualified biologist conduct focused surveys for WPT no more than ten days prior to Project implementation. In addition, CDFW recommends that focused surveys for nests occur during the egg-laying season (March through

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

August) and that any nests discovered remain undisturbed until the eggs have hatched.

Would the Project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS?

COMMENT 7: San Joaquin River and Riparian Impacts

Issue: The Project involves work activities, including blasting, adjacent to the San Joaquin River and other waterways that may feed into it. These activities have the potential to remove riparian habitat, impact Chinook salmon, and disrupt San Joaquin river hydrology.

Specific impact: Potential direct impacts to riparian vegetation include removal either prior to or during blasting and/or construction activity or change subsurface flows between the San Joaquin River and the Project site and alter the hydrology of the river, adjacent floodplain areas, and nearby tributaries. Indirect impacts could occur as a result of blasted material becoming projectiles that hit riparian vegetative features causing breakage or other damage, or by fine materials and dust settling on riparian vegetation. Sound or vibration from blasting activities have the potential to disturb or displace fish and wildlife species relying on the San Joaquin River and its associated riparian habitat.

Evidence impact is potentially significant:
Riparian and associated floodplain and wetland areas along the San Joaquin River and its tributaries are valuable for their ecosystem processes such as protecting water quality by filtering pollutants and transforming nutrients; stabilizing stream banks to prevent erosion and sedimentation/siltation; and dissipating flow energy during flood conditions, thereby spreading the volume of surface water, reducing peak flows downstream, and increasing the duration of low flows by slowly releasing stored water into the channel through subsurface flow. The river and riparian vegetation in the Project area provide potential habitat for many species, including those with special status. In addition, dust creation from Project activities could settle on plant material in riparian habitats on site or off site and affect processes such as respiration, photosynthesis, pollination, and seed set.

Recommended Potentially Feasible Mitigation Measure(s)
CDFW recommend implementing the following mitigation measures.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Recommended Mitigation Measure 18: Riparian Habitat Assessment

CDFW recommends that the riparian habitats of the San Joaquin River and any offsite streams potentially impacted by the Project, including habitat within the blasting radii, be described to establish the baseline condition. CDFW also recommends that the potential direct and indirect impacts to riparian habitat be analyzed according to each Project activity.

Recommended Mitigation Measure 19: Geology Habitat

CDFW recommends that a qualified engineering geologist evaluate the geology at and surrounding the Project site and the subsurface flow between the Project site, the San Joaquin River, and any tributaries be analyzed, quantified, and fully discussed to establish the baseline conditions. CDFW also recommends that the potential direct and indirect impacts to the geology and subsurface flow between the Project site and the San Joaquin River and its tributaries be analyzed according to each Project activity. CDFW recommends that related direct and indirect impacts to fish and wildlife species as result of any changes also be analyzed according to each Project activity.

Recommended Mitigation Measure 20: Riparian Vegetation Avoidance and Replacement

If Project activities will occur in the riparian environment, CDFW recommends avoidance of tree and shrub removal whenever possible. If Project activities cannot avoid the riparian environment, CDFW recommends preparation of a revegetation plan that incorporates native tree and shrub plantings within the San Joaquin River Restoration Area to replace removed vegetation.

COMMENT 8: Spring- and Fall-Run Chinook Salmon

Issue: Activities such as vegetation removal within the riparian zone, landscaping, access roads, etc., could impact the San Joaquin River and adjacent riparian habitat, especially in areas that are seasonally flooded away from the main stem of the river. These floodplain areas provide seasonal habitat for rearing and holding of juvenile spring- and fall-run Chinook salmon and are potential breeding habitat for spring- and fall-run Chinook salmon.

Specific impact: Without appropriate avoidance and minimization measures, potential impacts to Chinook salmon include disrupted spawning behavior, reduced reproductive success, and inability to reproduce.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Evidence impact would be significant: The Project area contains a part of the San Joaquin River; ground-disturbing activities or in-water work have the potential to impact salmon. Spring-run Chinook salmon are believed to have been the more abundant run and once spawned as high in the watershed as Mammoth Pool, the San Joaquin River represents the southernmost extent of the spring-run Chinook salmon geographic range and was once the largest such population in California (SJRRP 2018).

Recommended Potentially Feasible Mitigation Measure(s)
To evaluate potential impacts to Chinook salmon associated with the Project, CDFW recommends conducting the following evaluation of Project sites, incorporating the following mitigation measures for this Project, and that these measures be made conditions of approval for the Project.

Recommended Mitigation Measure 21: Chinook Salmon Habitat Avoidance

CDFW recommends Project activities avoid work in water and floodplains whenever possible, conduct Project activities during less critical times of the year (late June through August), and avoid spawning riffles or holding pools.

Recommended Mitigation Measure 22: Chinook Salmon Habitat Mitigation

If Project activities will occur in the Floodplain, CDFW advises consultation with us to determine how to minimize and mitigate impacts to juvenile salmon utilization.

COMMENT 9: Impacts to Adjacent State Protected Lands

Issue: The Willow Unit of CDFW's San Joaquin River Ecological Reserve (SJRER) surrounds the current Cemex batch plant on three sides (the fourth side being Friant Road). The Willow Unit was acquired with State Bond Funds, for the intended purpose of perpetual protection of riparian habitat and associated wildlife. The Willow Unit supports high quality riparian habitat for both nesting and migratory bird species. While the existing batch plant was present at the time of CDFW's acquisition of the Willow Unit, the proposed Project will result in significant impacts (noise, traffic, hydrology, etc.) beyond baseline conditions. We are concerned with potential Project-related impacts to riparian habitat and associated wildlife on these adjacent properties, specifically impacts associated with noise, traffic, and blasting. In addition, deep mining activities could severely impact the underlying hydrology on which the San Joaquin River riparian vegetation depends. We recommend that the DEIR prepared for the project evaluate these specific impacts and include appropriate avoidance, minimization, and mitigation measures.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

Lastly, a portion of the existing batch plant impact acreage is on property owned by the State of California (both CDFW and the San Joaquin River Conservancy). This encroachment outside of lands now owned by Cemex was a condition present at the time of CDFW's acquisition of the Willow Unit from the Ball Family. However, the condition was to be remedied within a certain timeframe of purchase but the intended retraction and restoration of the State-owned acreage never occurred. Cemex and CDFW have had preliminary discussions about this issue, which could be resolved with a property exchange and parcel boundary adjustment, but final resolution will be needed prior to any expanded activities at the batch plant.

II. Editorial Comments and/or Suggestions

Lake or Streambed Alteration: The Project contains activities that may result in the Project site being subject to CDFW's regulatory authority pursuant Fish and Game Code section 1600 et seq. Fish and Game Code section 1602 requires an entity to notify CDFW prior to commencing any activity that may (a) substantially divert or obstruct the natural flow of any river, stream, or lake; (b) substantially change or use any material from the bed, bank, or channel of any river, stream, or lake; or (c) deposit debris, waste or other materials that could pass into any river, stream, or lake. "Any river, stream, or lake" includes those that are ephemeral or intermittent, such as the unnamed stream within the Project site, as well as those that are perennial in nature.

For additional information on notification requirements, please contact our staff in the Lake and Streambed Alteration Program at (559) 243-4593. It is important to note, CDFW is required to comply with CEQA, as a Responsible Agency, when issuing a Lake or Streambed Alteration Agreement (LSAA). If inadequate, or no environmental review, has occurred, for the Project activities that are subject to notification under Fish and Game Code section 1602, CDFW will not be able to issue the Final LSAA until CEQA analysis for the project is complete. This may lead to considerable Project delays.

Nesting Birds: The Project is adjacent to habitat that provide nesting habitat for birds. CDFW encourages that Project implementation occur during the bird non-nesting season. However, if ground-disturbing or vegetation-disturbing activities must occur during the breeding season (February through mid-September), the Project applicant is responsible for ensuring that implementation of the Project does not result in violation of the Migratory Bird Treaty Act or relevant Fish and Game Codes as referenced above.

To evaluate Project-related impacts on nesting birds, CDFW recommends that a qualified wildlife biologist conduct pre-activity surveys for active nests no more than 10 days prior to the start of ground or vegetation disturbance to maximize the probability that nests that could potentially be impacted are detected. CDFW also recommends that surveys cover a sufficient area around the Project site to identify nests and determine

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

their status. A sufficient area means any area potentially affected by the Project. Prior to initiation of Project activities, CDFW recommends that a qualified biologist conduct a survey to establish a behavioral baseline of all identified nests. Once Project activities begins, CDFW recommends having a qualified biologist continuously monitor nests to detect behavioral changes resulting from the Project. If behavioral changes occur, CDFW recommends halting the work causing that change and consulting with CDFW for additional avoidance and minimization measures.

If continuous monitoring of identified nests by a qualified wildlife biologist is not feasible, CDFW recommends a minimum no-disturbance buffer of 250 feet around active nests of non-listed bird species and a 500-foot no-disturbance buffer around active nests of non-listed raptors. These buffers are advised to remain in place until the breeding season has ended or until a qualified biologist has determined that the birds have fledged and are no longer reliant upon the nest or on-site parental care for survival. Variance from these no-disturbance buffers is possible when there is compelling biological or ecological reason to do so, such as when the Project site would be concealed from a nest site by topography. CDFW recommends that a qualified wildlife biologist advise and support any variance from these buffers and notify CDFW in advance of implementing a variance.

Federally Listed Species: CDFW recommends consulting with the USFWS on potential impacts to federally listed species including, but not limited to, California tiger salamander. Take under the Federal Endangered Species Act (FESA) is more broadly defined than CESA; take under FESA also includes significant habitat modification or degradation that could result in death or injury to a listed species by interfering with essential behavioral patterns such as breeding, foraging, or nesting. Consultation with the USFWS in order to comply with FESA is advised well in advance of any ground-disturbing activities.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations (Pub. Resources Code, § 21003, subd. (e)). Accordingly, please report any special status species and natural communities detected during Project surveys to CNDDB. The CNDDB field survey form can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data. The completed form can be mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. The types of information reported to CNDDB can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Plants-and-Animals.

DocuSign Envelope ID: 25EB53C4-3B30-48B7-A11A-89FEEE0212F8

FILING FEES

If it is determined that the Project has the potential to impact biological resources, an assessment of filing fees will be necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying project approval to be operative, vested, and final (Cal. Code Regs, tit. 14, § 753.5; Fish & G. Code, § 711.4; Pub. Resources Code, § 21089).

CDFW appreciates the opportunity to comment on the Project to assist Fresno County Department of Public Works and Planning in identifying and mitigating the Project's impacts on biological resources.

More information on survey and monitoring protocols for sensitive species can be found at CDFW's website (https://www.wildlife.ca.gov/Conservation/Survey-Protocols). If you have any questions, please contact Kelley Nelson, Environmental Scientist, at the address provided on this letterhead, or by electronic mail at Kelley.Nelson@wildlife.ca.gov.

Sincerely,

CEMEX CONSTRUCTION MATERIALS PACIFIC, LLC; ROCKFIELD QUARRY MODIFICATION PROJECT ENVIRONMENTAL IMPACT REPORT NO. 7763 AND UNCLASSIFIED CONDITIONAL USE PERMIT APPLICATION NOS. 3666 AND 3667; FRESNO COUNTY

Central Valley Water Board staff has reviewed the Notice of Preparation (NOP) for the proposed Rockfield Quarry Modification Project (Project) (SCH # 2020060123). CEMEX Construction Materials Pacific, LLC (CEMEX) is proposing to expand its current aggregate (rock, sand, and gravel) mining and processing operations at the CEMEX Friant Plant (Plant). According to the NOP, the County of Fresno (County) will be the lead agency and will prepare an Environmental Impact Report (EIR) for the proposed project. A summary of our comments is provided below. The Central Valley Water Board is responsible for protecting water quality; therefore, our comments specially address water quality matters.

The NOP proposes changes to the Plant (CUP 3666) and the Quarry (CUP 3667) in two stages. During Stage One, CEMEX proposes to mine a hard rock deposit at the Quarry. The mining (via drilling and blasting) will occur at a depth of approximately 600 feet. An aggregate processing plant will also be added to the Quarry to wash, screen, crush, and sort the mined hard rock. At the Plant, the existing asphalt plant will be replaced with a hot-mix asphalt plant. Stage One is estimated to span 30 years and increase annual aggregate production from the current 1.4 million tons per year to eventually 3.0 million tons per year. Stage Two is proposed to span 70 years. During stage 2 aggregate production will continue to be 3.0 million tons per year. Also, during Stage Two, processing operations will only continue at the Quarry Site and the ready-mix concrete plant and hot-mix asphalt plant will be relocated to the Quarry Site.

The EIR for the Project should include a description of all solid and/or liquid waste that might be generated by the proposed project and how it will be handle, treated, and dispose of. Furthermore, the final EIR also needs to evaluate potential impacts to groundwater water and surface water associated with the Project. The following sections discuss various programs/requirements that may be applicable to the Project.

Waste Discharge Requirements (WDRs)

The discharge of process/wash water to land is subject to regulation under individual WDRs. WDRs Order 90-083 currently regulates the discharge of 1.5 million gallons per day of wash water generated by the washing/processing of sand and gravel at the Plant. Due to the proposed changes to the Plant and Quarry discussed in the NOP, WDRs Order 90-083 needs to be updated to reflect the proposed changes at the Plant and Quarry and ensure the discharge is consistent with Central Valley Water Board plans and policies.

In accordance with California Water Code section 13260, CEMEX is required to submit a Report of Waste Discharge (RWD) to apply for updated WDRs. The RWD must be submitted to the Central Valley Water Board at least 140 days prior to any discharge of wastewater from the project pursuant to California Water Code section 13264. The RWD needs to, at a minimum, include the following:

1) A Form 200 signed and certified by a duly authorized person at CEMEX;
2) A technical report that describes the treatment process and characterizes the wastewater discharge.

A technical report accompanying the RWD must be prepared and certified by a person registered to practice in California pursuant to California Business and Professions Code sections 6735, 7835, and 7835.1. A guidance document for applying for individual waste discharge requirements is attached to this letter.

Construction Storm Water General Permit

Dischargers whose project disturbs one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP).

For more information on the Construction General Permit, visit the State Water Resources Control Board website (https://www.waterboards.ca.gov/water_issues/programs/stormwater/construction.html).

Industrial Storm Water General Permit

Certain industries that discharge storm water to waters of the United States require coverage under a federally mandated permit. In California, the applicable permit is the Industrial Storm Water General Permit Order 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the State Water Resources Control Board website (https://www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.html).

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material to waters of the United States, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACOE). If a Section 404 permit is required by the USACOE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water alterations, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACOE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACOE permit, or any other federal permit, is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. Water Quality Certification must be obtained prior to initiation of project activities. Water Quality Certification information can be obtained by going to the State Water Resource Control Board Water Quality Certification and Wetlands Program website.

Salt and Nitrate Control Programs

As part of the Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS) initiative, the Central Valley Water Board adopted Basin Plan amendments (Resolution R5-2018-0034) incorporating new programs for addressing ongoing salt and nitrate accumulation in the Central Valley at its 31 May 2018 Board Meeting. On 16 October 2019, the State Water Resources Control Board adopted Resolution 2019-0057 approving the Central Valley Water Board Basin Plan amendments and also directed the Central Valley Water Board to make targeted revisions to the Basin Plan amendments within one year from the approval of the Basin Plan amendments by the Office of Administrative Law. The Office of Administrative Law approved the Basin Plan amendments on 15 January 2020 (OAL Matter No. 2019-1203-03).

Pursuant to the Basin Plan amendments, discharges will receive a Notice to Comply with instructions and obligations for the Salt Control Program within one year of the effective date of the amendments. Upon receipt of the Notice to Comply, the Discharger will have no more than six months to submit their Notice of Intent informing the Central Valley Water Board of their choice between Option 1 (Conservative Salinity Permitting Approach) or Option 2 (Alternative Salinity Permitting Approach). For the Nitrate Control Program, the Project is within Groundwater Basin 5-22.06 (San Joaquin Valley – Madera), a Priority 2 basin/sub-basin.

More information on the Salt and Nitrate Control Program may be found on the internet (https://www.cvsalinity.org/public-info).

If you have any questions regarding this matter, please contact Denise Soria by phone at (559) 444-2488, by email at dsoria@waterboards.ca.gov.

Senior Engineer

Enclosure:
- Technical Information for a Report of Waste Discharge for Discharges to Land in the WDRs (Non 15) Program

TECHNICAL INFORMATION
FOR A REPORT OF WASTE DISCHARGE

For

Discharges to Land in the WDR (Non 15[1]) Program (Individual WDRs Only)

This document provides guidance for applying for individual waste discharge requirements only. If you believe that your discharge would be appropriately regulated under general waste discharge requirements or general waiver, please see the links below and contact Central Valley Water Board staff for guidance.

General WDRs: http://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/#General
Waivers: http://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/#Waivers

What is a Report of Waste Discharge?
A Report of Waste Discharge (ROWD) is an application for waste discharge requirements. A ROWD consists of the following:

1. A completed and signed Form 200, which can be down loaded from the internet at http://www.waterboards.ca.gov/publications_forms/forms/docs/form200.pdf.
2. A technical report prepared by a California registered Civil Engineer that presents the information listed in the table below.
3. For a new or previously unpermitted discharges, a check for the first annual fee made payable to the *State Water Resources Control Board*. Consult with staff to determine the required fee. There is no fee if you are applying for revised or updated WDRs because you are already subject to an annual permit fee. The current fee schedule can be viewed at the following link: http://www.waterboards.ca.gov/resources/fees/index.shtml#wdr

Compliance with the California Environmental Quality Act (CEQA)
Although not required as part of the ROWD, for new, previously unpermitted, or expanding/changing discharges, you must also submit a copy of any draft and final environmental review documents prepared to comply with the California Environmental Quality Act (CEQA).

If the local planning agency (city or county, as applicable) or another public agency has determined that the project (or expansion, changes, etc.) does not require any discretionary action by that agency, the Central Valley Water Board may be the lead agency for the purposes of CEQA, and you will be required to submit an Initial Study and pay all fees and other costs associated with the CEQA process unless the Board determines that the action falls within the scope of a categorical or statutory exemption. Fees associated with the filing of an Initial Study may include a California Department of Fish and Game fee, County Clerk recording fees, and costs for publishing the CEQA Notice of Intent in a local newspaper. Consult with your local planning agency and Central Valley Water Board staff if you

[1] The Non 15 Program regulates discharges to land that are exempt from Title 27 of the California Code of Regulations. See the following link for a brief explanation of Title 27 and exemptions that may be used: http://www.waterboards.ca.gov/water_issues/programs/land_disposal/waste_discharge_requirements.shtml

have any questions about CEQA. Additional information about CEQA is also available at the following link: http://opr.ca.gov/m_cega.php.

What is Required for the ROWD Technical Report?
Please note the following tips to expedite the ROWD review and waste discharge requirements development:

- Providing the information in the same order as the list below will help to expedite the ROWD review. Staff will use this as a checklist.
- If any of the information is missing or incomplete, the ROWD will be deemed incomplete and the process (and your project) will be delayed until all of the required information is submitted. You will be notified in writing of the ROWD status after it has been reviewed. If the ROWD is incomplete, we will specify the additional information that is required to complete the ROWD.
- All numerical data presented in tables and calculations performed using spreadsheets should be provided in digital form (MS Excel compatible spreadsheet) as well as hard copy.
- If some of the information listed below can be found in a previous technical report prepared by a registered professional, the ROWD can incorporate the report as an appendix, but the ROWD text must specify where in the report the required information can be found. However, if appended reports contain information that conflicts with the body of the ROWD, it may cause further delays.

	A. General Information
	1. Is this a new/proposed or existing facility?
	2. If this is an existing facility, is the discharge currently regulated under Waste Discharge Requirements (WDRs) issued by the Central Valley Water Board?
	a. If so, provide the WDRs order number.
	b. If not, provide the name of the local agency that issued the current permit.
	3. Provide a copy of any other permits that reference or relate to the wastewater disposal system. This includes Use Permits and Surface Mining and Reclamation Act (SMARA) reclamation plans, etc.
	4. Provide the following for the facility that generates the waste and the site where the waste is discharged:
	a. Street address (provide street name and distance from nearest cross street if there is no street number).
	b. The approximate latitude and longitude of the facility that generates the wastewater, wastewater treatment facilities, and wastewater land disposal areas.
	c. Township, Range, and Section.
	d. Assessor's parcel numbers.

	B. Wastewater Facility and Discharge Complete this section for both new/proposed facilities and existing facilities.
	1. A description of the sources and types of wastewater flowing into the system from:
	a. residential (population served and number of connections or equivalent dwelling units).
	b. commercial (number of connections by type).
	c. industrial (number of connections by type).
	2. Design influent flow rates (average daily, dry weather daily, peak hour, peak day, and peak month), and the design treatment capacity of the system with respect to each of these. For new/proposed facilities, provide the methods used to estimate these design parameters and copies of all calculations.
	3. For existing facilities, a summary table of monthly influent flow totals and monthly precipitation totals for the last five years. Explain any data gaps, outliers, and/or unusual circumstances that might affect measured flow rates. If sewer inflow and infiltration (I/I) contributes significantly to influent flow, provide an I/I analysis to project I/I as a function of total annual precipitation and/or groundwater level as appropriate.
	4. A detailed description of the facilities that generate wastewater, and all wastewater conveyance, treatment, and disposal systems. Use site plans and conceptual drawings as appropriate to illustrate locations and typical construction. Include all treatment processes. The following maps, plans, and illustrations are needed:
	a. A facility location map showing local topography, the facility location and/or boundaries, streets, and surface waters (including storm water drainage ditches, irrigation canals, and irrigation/tailwater ditches).
	b. A process flow schematic for the entire treatment and disposal system. Include existing and proposed flow monitoring devices and sampling locations proposed to determine compliance with the WDRs.
	c. A scaled treatment plant site plan.
	d. A scaled map showing the limits of all proposed wastewater treatment, storage and disposal areas.
	5. Characterization of the source water (the community or process water supply), influent wastewater quality (prior to treatment or discharge), and treated effluent quality. See Table 1 for a minimum list of constituents to be analyzed.
	6. For POTWs and domestic wastewater facilities, a description of the sewer system, sewer materials and age, and lift station details (type, location, capacity, backup systems, and alarm features). Discuss potential inflow and infiltration (I/I) rates in light of local groundwater conditions and sewer system materials/design. For industrial facilities, a description of the industrial wastewater collection and conveyance system.
	7. A description of proposed alarm systems, emergency wastewater storage facilities, and other means of preventing treatment system bypass or failure during reasonably foreseeable overload conditions (e.g., peak flows, power failure, sewer blockage). Consider both potential problems at the treatment system and within the conveyance system.

	8. Preventive and contingency measures for controlling spills and accidental discharges.
	9. Flood and frost protection measures (structural and operational) employed at the facility.
	10. For debris, grit and screenings, sludge, and biosolids the following:
	a. A description of solids generation rates, on-site treatment and handling systems, and short-term storage procedures.
	b. A description of solids disposal practices.
	c. For facilities that do not have continuous sludge wasting systems (i.e., where sludge accumulates in treatment and/or storage ponds), the frequency of assessing accumulated sludge volume, the date of the last sludge volume assessment, the date of the last sludge cleanout, and expected frequency of future sludge cleanout activities
	11. For each wastewater treatment, storage, or disposal pond and containment structure, provide the following information:
	a. Identification (name) and function of the pond.
	b. Surface area, depth, and volumetric capacity at two feet of freeboard.
	c. Height (relative to surrounding grade), crest width, interior slope, and exterior slope of each berm or levee.
	d. Materials used to construct each berm or levee.
	e. Description of engineered liner, if any. Include a copy of the Construction Quality Assurance (CQA) Report if one was prepared.
	f. Estimated steady state percolation rate for each unlined pond.
	g. Depth to shallow groundwater below the base and pond inverts.
	h. Overfilling/overflow prevention features.
	i. Operation and maintenance procedures.
	12. For subsurface disposal systems, provide the design basis and documentation demonstrating that the system has been designed in accordance with applicable regulations, codes, ordinances, and guidelines. If the design deviates from these requirements, provide justification in terms of system longevity, maintainability, and groundwater protection.
	13. If treated domestic effluent will be recycled for beneficial reuse or if wastewater will reused or land-applied[2], provide a complete description of the following:
	a. Ownership and contact information for each landowner[3].
	b. Effluent disinfection system.
	c. Effluent conveyance systems.

[2] Uses of recycled water that are limited to landscape irrigation (including golf courses) can be regulated under General WDRs issued by the State Water Board. See this webpage for more information: http://www.waterboards.ca.gov/water_issues/programs/water_recycling_policy/landscape_irrigation_general_permit.shtml.

[3] Landowners are typically named in WDRs as co-dischargers, and the WDRs may include separate requirements with which co-dischargers must comply.

	d. Water recycling/Land application areas (LAA) areas.
	e. Cropping plans.
	f. Planned operations (planting and harvest, irrigation method, irrigation frequency, irrigation amounts).
	g. Expected nutrient loadings (pounds per acre per year total nitrogen).
	h. Expected salt loadings (pounds per acre per year total dissolved solids).
	i. Tailwater management methods.
	j. Storm water runoff management methods.
	k. Setback distances from the edge of each recycling/land application area from the property boundary, public streets, occupied structures owned by others, and surface waters/surface water conveyances.
	l. Plans that illustrate items c, d, i, j, and k above
	14. If wastewater effluent will be recycled pursuant to Title 22 of the California Code of Regulations (e.g., if domestic wastewater is recycled to grow crops, irrigate landscaping, provide pasture for livestock, or for landscape or recreational impoundments, including reclamation sites owned by a POTWs, unless water is recycled solely for irrigation of landscaping at the POTW site) a Title 22 Engineering Report must be submitted to both the Central Valley Water board and California Department of Public Health[4].
	15. Projected monthly water balances demonstrating adequate containment capacity for both the average rainfall year and the 100-year return period total annual precipitation, including consideration of at least the following:
	a. For POTWs and private domestic wastewater facilities, initial baseline influent and I/I flows as well as baseline influent and I/I flows at full build out with an aging sewer system.
	b. A minimum of two feet of freeboard in each pond at all times (unless a registered civil engineer determines that a lower freeboard level will not cause overtopping or berm failure).
	c. Historical local evapotranspiration, pan evaporation, and lake evaporation data (monthly average values).
	d. Local precipitation data with the 100-year return period annual total distributed monthly in accordance with mean monthly precipitation patterns.
	e. Proposed recycling area/land application area/disposal system hydraulic loading rates distributed monthly in accordance with expected seasonal variations based on crop evapotranspiration rates.
	f. Projected long-term percolation rates (including consideration of percolation from unlined ponds and the effects of solids plugging on all ponds).
	16. Proposed flow limits and basis for the limits. Consider dry weather flows vs. peak flows and seasonal variations. Include the technical basis for the proposed flow limit (e.g., design

[4] To the extent this information is already presented in the Title 22 Engineering Report, the RWD may incorporate that report by reference. The Title 22 Engineering Report must also be submitted to the California Department of Public Health for review and approval.

	treatment capacity; hydraulic capacity of a main lift station, headworks, or other system element; and demonstrated effluent storage/disposal capacity).
	17. A narrative description of treatment system operation and maintenance procedures to be employed, including those associated with effluent storage and disposal.
	18. For POTWs, the level of operator certification and staffing; the names and grade levels of all certified operators, and the hours that the facility is manned.
	19. For privately owned domestic wastewater treatment facilities, the names and grade levels of all certified operators, and the hours that the facility is manned. If the facility does not have a certified operator, provide justification for not retaining one.
	C. Planned Changes in the Facility and Discharge (for existing facilities only)
	1. Describe in detail any and all planned changes in the facility or discharge, addressing each of items listed in Section B above.
	D. Local and Site-Specific Conditions (Illustrate with maps as appropriate)
	1. Neighboring land uses.
	2. Typical crops grown (if agricultural area).
	3. Irrigation water source(s) and volume and quality data (if agricultural area).
	4. Terrain and site drainage features.
	5. Nearest surface water drainage course.
	6. FEMA floodplain designation(s).
	7. Average Annual precipitation (inches)
	8. 100-year 365-day precipitation (inches)
	9. Reference evapotranspiration (monthly and annual total)
	10. Pan evaporation (monthly and annual total)
	11. A description of the types and depths of soil underlying ponds and/or effluent disposal areas (include a copy of the geotechnical report and/or NRCS soil report). Include at least the following:
	a. Depth of unsaturated soil when groundwater is closest to the surface.
	b. Soil types based on site-specific information, sampling locations (accurately measured and recorded), description and results of percolation tests or other tests used to estimate soil long-term infiltration rates. Include depth, thickness, and soil horizons. Soils must be described at a minimum of five feet below the bottom of any disposal unit.
	c. Bedrock type and condition encountered in disposal area, if any.
	d. A scaled map depicting soil/rock types and test locations.
	12. Provide the following information about hydrogeology and groundwater:
	a. Stratigraphy, groundwater elevation and gradient, transmissivity, and influence of all recharge and pumping sources (site conceptual model).
	b. Elevation and gradient of first groundwater at the facility
	c. Depth to highest anticipated groundwater based upon onsite measurements taken

	during wet season.
	d. Shallow groundwater quality for typical waste constituents, up/down gradient. (See Table 1)
	e. Information on monitoring well locations, construction details, and locations of any geological features (e.g. aquitards, subterranean channels, faults) and aquifer characteristics.
	f. Summary of historical groundwater monitoring results (last 5 years for existing facilities, 2 years for new/planned facilities).
	E. Antidegradation Analysis
	The State Water Resources Control Board Resolution No. 68-16 (the Antidegradation Policy) requires that the Central Valley Water Board maintain the high quality of waters of the state until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the state, will not unreasonably affect beneficial uses, and will not result in exceedances of one or more water quality objectives. If a discharge will degrade groundwater quality but will not cause an exceedance of one or more water quality objectives, the discharger must demonstrate that all practicable treatment or control measures have been implemented or will be implemented such that the Board can consider these measures to represent the **"best practicable treatment or control"** (BPTC) of the constituents of concern. Demonstrating that BPTC has been, or will be, implemented at the site can provide justification for the Board to allow the current level of degradation to continue or increase (as applicable), or for the Board to allow any degradation in the case of a new discharge. The Antidegradation Policy is incorporated into our Basin Plans, which also include implementation plans that we follow. See the following link for the Basin Plans and other important policy documents: http://www.waterboards.ca.gov/centralvalley/plans_policies/
	The Antidegradation Analysis must include the following:
	1. For existing facilities, whether the discharge has caused degradation. If so, for which constituents, to what degree, and whether the discharge has caused exceedance of a water quality objective.
	2. The potential for the discharge to degrade groundwater quality (for new discharges) or further degrade groundwater quality (for existing discharges, whether or not the discharge is expanding).
	The assessment must be made based on site-specific data and shall include the following items for each constituent listed in the effluent category on Table 1:
	a. Characterization of all waste constituents to be discharged that have the potential to degrade groundwater quality;
	b. Characterization of shallow groundwater quality (i.e., the uppermost layer of the uppermost aquifer) for typical waste constituents[5] upgradient and downgradient of the site and

[5] Include analyses for the following: total coliform organisms, total dissolved solids, fixed dissolved solids, electrical conductivity, nitrate nitrogen, total nitrogen, and major anions and cations.

	comparison to established water quality objectives [6] (include tabulated historical groundwater monitoring data and groundwater elevation contour maps for the last eight monitoring events);
	c. A description of the geology and hydrogeologic conditions of the site including groundwater elevation and gradient, transmissivity, influence of all known recharge and pumping sources, and subsurface conditions at the facility, including any proposed new disposal site or storage ponds;
	d. Groundwater degradation , if any, that has resulted from existing operations, other nearby discharges, or natural occurrences;
	e. The areal extent that the discharge has impacted or will impact the quality of the shallow groundwater, if any;
	f. The concentration found and/or expected increase in concentration in shallow groundwater for each constituent.
	g. If degradation has occurred or is expected to occur describe the following:
	i. Any facility design features and operational practices that reduce the potential for groundwater degradation (treatment or control). Such features might include salinity source control, other pollutant source control, advanced treatment, disinfection, concrete treatment structures, and pond lining systems, etc.
	ii. Additional treatment or control measures that could be implemented and a preliminary capital and annual operations and maintenance cost estimate for each.
	iii. How current treatment and control measures are justified as BPTC (i.e., what justifies not implementing additional measures);
	iv. How no water quality objectives will be exceeded; and
	v. Why allowing existing and/or anticipated degradation is in the best interest of the people of the state.
	F. Industrial Storm Water Permit
	The State Water Resources Control Board adopted Order 97-03-DWQ (NPDES General Permit CAS000001) specifying waste discharge requirements for discharges of storm water associated with industrial activities, and requiring submittal of a Notice of Intent by all affected industrial dischargers. Many industrial facilities and some domestic wastewater treatment facilities are required to obtain coverage under this permit. Provide evidence that the facility is exempt or has applied for coverage under the Industrial Storm Water Permit. See the following link for more information: http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/
	G. General WDRs for Sanitary Sewer Systems.

[6] Compare to Basin Plan water quality objectives, including drinking water standards, agricultural water quality goals, etc.

	The State Water Resources Control Board adopted Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Order 2006-0003-DWQ). The permit requires all public agencies that own or operate sanitary sewer systems greater than one mile in length to obtain coverage. Provide evidence that the facility is exempt or has applied for coverage under the General WDRs for Sanitary Sewer Systems. See the following link for more information: http://www.waterboards.ca.gov/water_issues/programs/sso/index.shtml
	H. Department of Water Resources Well Standards
	The California Department of Water Resources sets standards for the construction and destruction of groundwater wells (hereafter DWR Well Standards), as described in *California Well Standards Bulletin 74-90* (June 1991) and *Water Well Standards: State of California Bulletin 94-81* (December 1981). These standards, and any more stringent standards adopted by the State or county pursuant to Water Code section 13801, apply to all monitoring wells. Discuss whether existing monitoring wells at the facility were constructed in accordance with the Department of Water Resources Well Standards. See the following link for more information: http://wwwdpla.water.ca.gov/sd/groundwater/california_well_standards/well_standards_content.html

Table 1

The Report of Waste Discharge must characterize the groundwater (G), source water (S), treatment system influent (I), and effluent discharge (E) for, at minimum, the constituents indicated in the list below. The characterization must be based on a statistically significant number of representative samples as determined by an appropriately registered and/or licensed professional. All media must also be characterized for all additional waste constituents that may be in the discharge based on the facility processes employed but not listed below.

Constituent [1]	Units	Minimum Recommended Characterization Data			
		POTW/ Domestic	Food Processor	Sand and Gravel	Other Industry
Biochemical Oxygen Demand	mg/L	I, E	I, E		E
Chemical Oxygen Demand	mg/L	G, E	I, E		E
Settleable Matter	ml/L	E	E		E
Total Suspended Solids	mg/L	I, E	I, E		E
Total Dissolved Solids	mg/L	G, S, I, E	G, S, E	G	G, S, E
Fixed Dissolved Solids	mg/L		E		G, S, E
Electrical Conductivity	umhos/cm	G, S, I, E	G, S, I, E	G, S, I, E	G, S, I, E
Total Kjeldahl Nitrogen as N	mg/L	G, S, E	G, S, E		G, S, E
Ammonia Nitrogen as N	mg/L	G, S, E	G, S, E		G, S, E
Nitrate Nitrogen as N	mg/L	G, S, E	G, S, E		G, S, E
pH	pH Units	G, S, I, E	G, S, E	G, S, I, E	G, S, I, E
General Minerals[2]					
Alkalinity	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Hardness	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Bicarbonate	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Carbonate	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Calcium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Magnesium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Chloride	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Potassium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Sodium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Sulfate	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Metals[3]					
Aluminum	ug/L	E			E
Antimony	ug/L			S, E	

Constituent [1]	Units	Minimum Recommended Characterization Data			
		POTW/ Domestic	Food Processor	Sand and Gravel	Other Industry
Arsenic	ug/L	G, S, E	G, S, E	G, S, E	G, S, E
Barium	ug/L			S, E	
Beryllium	ug/L			S, E	
Boron	ug/L	G	G	G, S, E	G
Cadmium	ug/L			S, E	
Chromium (IV)	ug/L			S, E	
Chromium (III)	ug/L			S, E	
Total Chromium	ug/L	G	G	G, S, E	G
Cobalt	ug/L			S, E	
Copper	ug/L	E	E	S, E	E
Fluoride	ug/L			S, E	
Iron	ug/L	G, S, E	G, S, E	G, S, E	G, S, E
Lead	ug/L	E		S, E	E
Mercury	ug/L	E		S, E	E
Manganese	ug/L	G, S, E	G, S, E	G, S, E	G, S, E
Molybdenum	ug/L			S, E	
Nickel	ug/L			S, E	
Selenium	ug/L			S, E	
Silver	ug/L			S, E	
Thallium	ug/L			S, E	
Vanadium	ug/L			S, E	
Zinc	ug/L	E		S, E	E
Disinfection By-Products[4]	ug/L	G, E	E		E
Formaldehyde[5]	ug/L	G, E	E		E
Phenols[5]	ug/L	G, E			E
Priority Pollutants[6]	Various	G, E			E

[1] With the exception of wastewater samples, samples for metals analysis must first be filtered using a 0.45-micron filter. If filtering in the field is not feasible, samples shall be collected in unpreserved containers and submitted to the laboratory within 24 hours with a request (on the chain of custody form) to immediately filter then preserve the sample.

[2] General minerals analyses shall be accompanied by a cation/anion balance demonstrating complete analyses.

[3] Where constituents are analyzed as part of other suites of constituents, the results may be substituted to avoid redundant analyses (i.e., arsenic results collected to fulfill the metals suite requirements may also be used to fill the Priority Pollutant suite requirements provided appropriate detection limits are used.).

[4] If wastewater is disinfected using chlorination or chlorination is used in internal disinfection processes.

[5] If the facility accepts holding tank waste from RVs, boats, or portable toilets.

[6] The Discharger must determine which priority pollutants, if any, are likely to be present in the discharge at concentrations that might degrade groundwater quality, and must provide characterization data for those constituents.

Property Owner(s): CEMEX Construction Materials Pacific, LLC

Project Location Address: 13475 N Friant Road and, 14765 North Friant Road, Friant, California, 93626

Project Title: SCH #2020060123 CEMEX Rockfield Quarry Mod Project EIR No. 7763 Unclassified CUPs 3666 and 3667

Public Resources Code (PRC) § 3208.1 establishes well reabandonment responsibility when a previously plugged and abandoned well will be impacted by planned property development or construction activities. Local permitting agencies, property owners, and/or developers should be aware of, and fully understand, that significant and potentially dangerous issues may be associated with development near oil, gas, and geothermal wells.

The Division of Oil, Gas, and Geothermal Resources (Division) has received and reviewed the above referenced project dated 6/15/2020. To assist local permitting agencies, property owners, and developers in making wise land use decisions regarding potential development near oil, gas, or geothermal wells, the Division provides the following well evaluation.

The project is located in Fresno County, within the boundaries of the following fields:

Our records indicate there are 0 known oil or gas wells located within the project boundary as identified in the application.

- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 0
- Number of wells Not Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0
- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Projected to Be Built Over or Have Future Access Impeded by this project: 0
- Number of wells Abandoned to Current Division Requirements as Prescribed by Law and Not Projected to Be Built Over or Have Future Access Impeded by this project: 0

As indicated in PRC § 3106, the Division has statutory authority over the drilling, operation,

Gavin Newsom, Governor
David Shabazian, Director
801 K Street, MS 18-05
Sacramento, CA 95814
T: (916) 445-9686

maintenance, and abandonment of oil, gas, and geothermal wells, and attendant facilities, to prevent, as far as possible, damage to life, health, property, and natural resources; damage to underground oil, gas, and geothermal deposits; and damage to underground and surface waters suitable for irrigation or domestic purposes. In addition to the Division's authority to order work on wells pursuant to PRC §§ 3208.1 and 3224, it has authority to issue civil and criminal penalties under PRC §§ 3236, 3236.5, and 3359 for violations within the Division's jurisdictional authority. The Division does not regulate grading, excavations, or other land use issues.

If during development activities, any wells are encountered that were not part of this review, the property owner is expected to immediately notify the Division's construction site well review engineer in the Inland district office, and file for Division review an amended site plan with well casing diagrams. The District office will send a follow-up well evaluation letter to the property owner and local permitting agency.

Should you have any questions, please contact me at (661) 326-6016 or via email at Victor.Medrano@conservation.ca.gov

Re: 2020060123, Rockfield Quarry Modification Project Environmental Impact Report No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667 Project, Fresno County

Dear Ms. Monfette:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Nancy.Gonzalez-Lopez@nahc.ca.gov.

Sincerely,

Nancy Gonzalez-Lopez

Fresno, CA 93721

Project: Notice of Preparation of a Draft Environmental Impact Report for the Rockfield Quarry Modification Project Environmental Impact Report No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667

District CEQA Reference No: 20200535

Dear Ms. Monfette:

The San Joaquin Valley Unified Air Pollution Control District (District) has reviewed the project referenced above from the County of Fresno (County). CEMEX is proposing a continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operation located on two sites between North Friant Road and the San Joaquin River in Fresno County (Project). The Project is located at two sites: 13475 N. Friant Road and 14765 N. Friant Road in Fresno, CA.

Project Scope

CEMEX is proposing continuation of its current aggregate mining and processing operation that are estimated to span over 100 years in two stages. The proposed expansion would occur at CEMEX operational sites currently on two sites (i.e. Plant Site and Quarry Site) between North Friant Road and the San Joaquin River.

The Project will occur in two stages:

- Stage 1 will be continued operations of aggregate processing (washing, screening, crushing, and sorting) and hard rock mining processing at both sites for 30 years. Aggregate products produced at Quarry Site will be transported approximately two miles to Plant Site. This includes combined annual sales of aggregate from both sites that are estimated to increase from 1.4 MT allowed under current permits to 2.0 MT in approximately five years and 3.0 MT in 10 years. In addition, CEMEX is

Printed on recycled paper.

proposing to replace existing asphalt plant at Plant site, with modern Hot Mix Asphalt (HMA) plant.

- Stage 2 consists of continued hard rock mining and processing operation only at the Quarry site for approximately 70 more years and the relocation of the HMA from Plant site to Quarry site. Aggregate products produced at Quarry site will be used on-site or sold directly from facility.

The District's initial review of the Project concludes that emissions resulting from construction and operation of the Project may exceed the following criteria pollutant emissions thresholds of significance: 100 tons per year of carbon monoxide (CO), 10 tons per year of oxides of nitrogen (NOx), 10 tons per year of reactive organic gases (ROG), 27 tons per year of oxides of sulfur (SOx), 15 tons per year of particulate matter of 10 microns or less in size (PM10), or 15 tons per year of particulate matter of 2.5 microns or less in size (PM2.5). Therefore, the Project may have a significant impact.

Other potential significant air quality impacts related to Toxic Air Contaminants (see information below under Health Risk Assessment), Ambient Air Quality Standards, Hazards and Odors, may require assessments and mitigation. More information can be found in the District's Guidance for Assessing and Mitigating Air Quality Impacts at: https://www.valleyair.org/transportation/GAMAQI_12-26-19.pdf

The District offers the following comments:

1) Project Related Criteria Pollutant Emissions

The District recommends that a more detailed preliminary review of the Project be conducted. The additional environmental review of the Project's potential impact on air quality should consider the following items:

1a) Recommended Model

Project related criteria pollutant emissions from construction and operational sources should be identified and quantified. Emissions analysis should be performed using CalEEMod (**Cal**ifornia **E**mission **E**stimator **Mod**el), which uses the most recent approved version of relevant Air Resources Board (ARB) emissions models and emission factors. CalEEMod is available to the public and can be downloaded from the CalEEMod website at: www.caleemod.com.

1b) Project Related Construction Emissions

Construction emissions are short-term emissions and should be evaluated separately from operational emissions. Equipment exhaust, as well as fugitive dust emissions should be quantified. For reference, the District's annual criteria thresholds of significance for construction are listed above.

The District recommends that the County consider the use of the cleanest reasonably available off-road construction practices (i.e. eliminating unnecessary idling) and fleets, as set forth in §2423 of Title 13 of the California Code of Regulations, and Part 89 of Title 40 Code of Federal Regulations as a mitigation measure to reduce Project related impacts from construction related exhaust emissions.

1c) Project Related Operational Emissions – Cleanest Available Truck:

Emissions from stationary sources and mobile sources should be analyzed separately. For reference, the District's annual criteria thresholds of significance for operational emissions are listed above.

The San Joaquin Valley will not be able to attain stringent health-based federal air quality standards without significant reductions in emissions from heavy-heavy duty (HHD) Trucks, the single largest source of NOx emissions in the San Joaquin Valley. The District recently adopted the 2018 PM2.5 Plan, which includes significant new reductions from HHD Trucks, including emissions reductions by 2023 through the implementation of the California Air Resources Board (CARB) Statewide Truck and Bus Regulation, which requires truck fleets operating in California to meet the 2010 0.2 g/bhp-hr NOx standard by 2023. Additionally, to meet the federal air quality standards by the 2020 to 2024 attainment deadlines, the District's Plan relies on a significant and immediate transition of heavy duty truck fleets to zero or near-zero emissions technologies, including the near-zero truck standard of 0.02 g/bhp-hr NOx established by the California Air Resources Board.

For an aggregate mining and processing operation facility, there are heavy duty trucks traveling to-and-from from the project location. Since the project may exceed the District significance thresholds, the District recommends that the following mitigation measures be considered by the County for inclusion in the EIR for project related operational emissions.

- Advise fleets associated with Project operational activities to utilize the cleanest available HHD truck technologies, including zero and near-zero (0.02 g/bhp-hr NOx) technologies as feasible.

- Advise all on-site service equipment (cargo handling, yard hostlers, forklifts, pallet jacks, etc.) to utilize zero-emissions technologies as feasible.

- Advise fleets associated with future development projects to be subject to the best practices (i.e. eliminating unnecessary idling).

In addition, the District recommends that the County include mitigation measures to reduce project related operational impacts through incorporation of design elements, for example, increased energy efficiency, reducing vehicle miles traveled, etc. More information on mitigation measures can be found on the District's website at: http://www.valleyair.org/transportation/ceqa_idx.htm.

1d) Project Related Operational Emissions – Truck Routing

Truck routing involves the path/roads heavy-duty trucks take to and from their destination. The air emissions from heavy-duty trucks can impact residential communities and sensitive receptors.

The District recommends the County consider evaluating heavy-duty truck routing patterns to help limit emission exposure to residential communities and sensitive receptors. More specifically, this measure would assess current truck routes, in consideration of the number and type of each vehicle, destination/origin of each vehicular trip, time of day/week analysis, vehicle miles traveled and emissions. The truck routing evaluation would also identify alternative truck routes and their impacts on VMT, GHG emissions, and air quality.

1e) Project Related Operational Emissions – Permitted Stationary Source Emission Units

The District issues permits for many types of air pollution sources and regulates some activities not requiring permits. A project subject to District rules and regulation would reduce its impacts on air quality through compliance with regulatory requirements. In general, a regulation is a collection of rules, each of which deals with a specific topic. Here are a couple of example, Regulation II (Permits) deals with permitting emission sources and includes rules such as District permit requirements (Rule 2010), and New and Modified Stationary Source Review (Rule 2201).

1f) District Rules 2010 and 2201 - Air Quality Permitting for Stationary Sources

Stationary Source emissions include any building, structure, facility, or installation, which emits or may emit any affected pollutant directly or as a fugitive emission. District Rule 2010 requires operators of emission sources to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) from the District. District Rule

2201 requires that new and modified stationary sources of emissions mitigate their emissions using best available control technology (BACT).

This Project will be subject to District Rule 2010 (Permits Required) and Rule 2201 (New and Modified Stationary Source Review) and will require District permits. Prior to construction, the Project proponent should submit to the District an application for an Authority to Construct (ATC). For further information or assistance, the project proponent may contact the District's Small Business Assistance (SBA) Office at (559) 230-5888.

1g) Other District Rules and Regulations

The Project may also be subject to the following District rules: Regulation VIII, (Fugitive PM10 Prohibitions), Rule 4102 (Nuisance), and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations). In the event an existing building will be renovated, partially demolished or removed, the project may be subject to District Rule 4002 (National Emission Standards for Hazardous Air Pollutants).

The list of rules above is neither exhaustive nor exclusive. Current District rules can be found on the District's website at: www.valleyair.org/rules/1ruleslist.htm. To identify other District rules or regulations that apply to this Project or to obtain information about District permit requirements, the applicant is strongly encouraged to contact the District's Small Business Assistance (SBA) Office at (559) 230-5888

2) Health Risk Screening/Assessment

A Health Risk Screening/Assessment identifies potential Toxic Air Contaminants (TAC's) impact on surrounding sensitive receptors such as hospitals, daycare centers, schools, work-sites, and residences. TAC's are air pollutants identified by the Office of Environmental Health Hazard Assessment/California Air Resources Board (OEHHA/CARB) (https://ww2.arb.ca.gov/resources/documents/carb-identified-toxic-air-contaminants) that pose a present or potential hazard to human health. A common source of TACs can be attributed to diesel exhaust emitted from both mobile and stationary sources.

The District recommends the Project be evaluated for potential health impacts to surrounding receptors (on-site and off-site) resulting from operational and multi-year construction TAC emissions.

i) The District recommends conducting a screening analysis that includes all sources of emissions. A screening analysis is used to identify projects which may have a significant health impact. A prioritization, using CAPCOA's updated methodology, is the recommended screening method. A prioritization score of 10 or greater is considered to be significant and a refined Health Risk Assessment (HRA) should be performed.

For your convenience, the District's prioritization calculator can be found on the District's website at: http:www.valleyair.org/busind/pto/emission_factors/Criteria/Toxics/Utilities/PRIORITIZATION%20RMR%202016.XLS.

ii) The District recommends a refined HRA for projects that result in a prioritization score of 10 or greater. Prior to performing an HRA, it is recommended that the Project proponent contact the District to review the proposed modeling protocol. The Project would be considered to have a significant health risk if the HRA demonstrates that the Project related health impacts would exceed the Districts significance threshold of 20 in a million for carcinogenic risk and 1.0 for the Acute and Chronic Hazard Indices, and would trigger all feasible mitigation measures. The District recommends that Projects that result in a significant health risk not be approved.

For HRA submittals, please provide the following information electronically to the District for review:

- HRA AERMOD model files
- HARP2 files
- Summary of emissions source locations, emissions rates, and emission factor calculations and methodology.

More information on toxic emission factors, prioritizations and HRAs can be obtained by:

- E-Mailing inquiries to: hramodeler@valleyair.org; or
- The District can be contacted at (559) 230-6000 for assistance; or
- Visiting the Districts website (Modeling Guidance) at: http://www.valleyair.org/busind/pto/Tox_Resources/AirQualityMonitoring.htm.

3) Health Impact Discussion

As required by the recent decision in Sierra Club v. County of Fresno (2018) 6 Cal.4th 502, a reasonable effort to discuss relevant specifics regarding the connection between potential adverse air quality impacts from the Project with the likely nature and magnitude of potential health impacts. If the potential health impacts from the Project cannot be specifically correlated, explain what is known and why, given scientific constraints, potential health impacts cannot be translated.

4) Ambient Air Quality Analysis

An ambient air quality analysis (AAQA) uses air dispersion modeling to determine if emissions increases from a project will cause or contribute to a violation of the ambient air quality standards. The District recommends that an AAQA be performed for the Project if emissions exceed 100 pounds per day of any pollutant.

If an AAQA is performed, the analysis should include emissions from both Project specific permitted and non-permitted equipment and activities. The District recommends consultation with District staff to determine the appropriate model and input data to use in the analysis.

Specific information for assessing significance, including screening tools and modeling guidance is available online at the District's website www.valleyair.org/ceqa.

5) Cumulative Air Impacts

In addition to the discussions on the topics identified above, the District recommends the EIR also include a discussion of whether the Project would result in a cumulatively considerable net increase of any criteria pollutant or precursor for which the San Joaquin Valley Air Basin is in non-attainment. More information on the District's attainment status can be found online by visiting the District's website at: http://valleyair.org/aqinfo/attainment.htm.

6) Voluntary Emission Reduction Agreement

If the Project is expected to have a significant impact, the District recommends the EIR also include a discussion on the feasibility of implementing a Voluntary Emission Reduction Agreement (VERA) for this Project.

A VERA is a mitigation measure by which the project proponent provides pound-for-pound mitigation of emissions increases through a process that develops, funds, and implements emission reduction projects, with the District serving a role of administrator of the emissions reduction projects and verifier of the successful mitigation effort. To implement a VERA, the project proponent and the District enter into a contractual agreement in which the project proponent agrees to mitigate Project specific emissions by providing funds for the District's incentives programs. The funds are disbursed by the District in the form of grants for projects that achieve emission reductions. Thus, project-specific regional impacts on air quality can be fully mitigated. Types of emission reduction projects that have been funded in the past include electrification of stationary internal combustion engines (such as agricultural irrigation pumps), replacing old heavy-duty trucks with new, cleaner, more efficient heavy-duty trucks, and replacement of old farm tractors.

In implementing a VERA, the District verifies the actual emission reductions that have been achieved as a result of completed grant contracts, monitors the emission reduction projects, and ensures the enforceability of achieved reductions. After the project is mitigated, the District certifies to the Lead Agency that the mitigation is completed, providing the Lead Agency with an enforceable mitigation measure demonstrating that project-specific regional emissions have been mitigated to less than significant. To assist the Lead Agency and project proponent in ensuring that the environmental document is compliant with CEQA, the District recommends the Draft EIR include an assessment of the feasibility of implementing a VERA.

The District recommends that a copy of the District's comments be provided to the Project proponent. If you have any questions or require further information, please contact Keanu Morin by e-mail at Keanu.Morin@valleyair.org or by phone at (559) 230-5805.

Sincerely,

Jacob Whitson
Program Manager

Dear Ms. Monfette,

Thank you for your insightful "Notice of Preparation" addressing the Rockfield Quarry EIR No. 7763 and Conditional Use Permit Applications Nos 3666 and 3667. After analyzing your summary and a letter from CEMEX, I urge the County of Fresno to reject those proposed modifications described in Modification Report No. 7763.

I have property which looks down on the Rockfield Quarry Site and derives its major water source downstream from that quarry. Consequently, my primary concerns are the change in appearance of the waterway, any increased noise and the possible degradation of San Joaquin River water quality.

While wishing to support our local businesses and agreeing that unnecessary transportation of gravel into our community may not make environmental or economic sense, I urge CEMEX to submit a plan which will minimize these concerns.

Sincerely yours,

Ernest Kazato, M.D.

Subject: Comments Received Relating to EIR 7763 (Cemex Mining Proposal)

Dear Dr. Kazato,

This letter is being sent to confirm receipt of your comment letter relating to the subject application. A copy of your letter with the County's date stamp has been enclosed as proof of receipt.

Your comments will be considered in the development of the scope of impacts for the subject application. After the scoping process has been completed, Benchmark Resources will prepare a Draft Environmental Impact Review to quantify impacts from those items identified during this scoping process. The Draft EIR will be posted on the County's website for public review.

If you have any questions regarding the information in this letter, please contact me at cmonfette@co.fresno.ca.us or (559) 600-4245.

Sincerely,

Chrissy Monfette, Planner
~~Development Services and Capital~~ Projects Division

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

No

5. Please provide your email address.

frankhhoran@gmail.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

The Cemex gravel mine is a threat to the San Joaquin River, which is a resource belonging to all Californians. You and the Fresno County of Public Works and Planning asked for private citizens to submit comments that address environmental concerns, so this is mine. The river is almost dead as it is, and now you are preparing to let Cemex keep devastating it for another 100 years? The San Joaquin River Parkway has been adopted by all our county governments and should have long since been built, but the will of the people in that will be useless if a self-serving company is allowed to blast and trench and mine until the river is inhospitable. Deny Cemex. Kick them out. The San Joaquin must be restored for the good of Fresno County and all California.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Deny Cemex's attempts to expand through blasting and drilling. The permits are also set to expire on their Rockfield plant, so let them expire.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

Subject: Mining/ Gravel Operation Proposals near Lost Lake Nature Trail and Lost Lake County Park

Ms. Monfette, This trail is adjacent to the proposed site at the south end of Lost Lake County Park.

The Nature Trail is critical habitat for migration stop-over in wintering months (Novl.-March), and Prime water/access/nesting habitat in spring/summer months for over 200 species of birds going up and down The Pacific Flyway from Canada, the U.S. coast, and Mexico.

The expansion mining, blasting, noise, and resulting effects with air and water quality would severely Impact this critical area involving the Nature Trail and Lost Lake Park itself.

Shore/wading birds (sandpipers, egrets, herons), small tree birds to large raptors/birds of prey (eagles, hawks, vultures) Constantly go through this habitat between the Sierra foothills and the high Sierra.

Fresno Audubon Society and San Joaquin River Parkway/Conservation Trust have assisted Fresno County Parks Department in maintaining Lost Lake Nature Trail and Lost Lake Park over the last forty plus years since 1973.

It would also endanger important wildlife corridor passage along the fiver between Friant Dam and the Freeway 99 bridge.

The San Joaquin River Parkway has accomplished many goals over the last 35 years in protecting habitat and building the recreational, economic, and natural values to enhance our quality of life.

American River Parkway in Sacramento has proven to be a sound and successful example that the San Joaquin River Parkway has sought to emulate, and use as a model in its success so far in accomplishing its goals as a contribution to our Valley.

Thank you, Fred Peterson
Former member and chair of Fresno Audubon Conservation Committee
2003-2008

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Griffin Carter

2. Organization/Business

Student

3. What is your address?

9381 N Woodmont Dr

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

griffinwcarter@gmail.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I live near Friant rd and Woodward park. In addition to the environmental degradation that comes with excavation projects like these, I do not want massive freight trucks moving up and down Friant constantly as it will cause more traffic, pollution, and noise in my area.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

A mitigation method is to not do this project at all and move it away from the San Joaquin that my family, friends, and community members use.

You can review the Notice of Preparation (NOP) for this project at: http://www.co.fresno.ca.us/EIR. If you have questions about this project, please contact:

Subject: CEMEX contract/lease renewal

To whom it may concern:

We are 30 year residents in Woodward Lake and frequent users of the Lewis Eaton trail. We strongly feel it is time for the San Joaquin River bottom, where CEMEX operates its gravel operation, to be restored to its previous state and condition. Please do not approve their request for a new contract/lease.
We understand the cost of moving/relocating an operation of this size and the cost to restore the natural habitat can be expensive.
The area has changed so much in just the last 30 years with more neighborhoods further north on Friant Road.
It is a different time and a different neighborhood from when CEMEX was awarded the current contract. It is time for CEMEX to find a river area that is not in a rapid growth area such as we have here in Northeast Fresno along the Friant Road corridor and the beautiful San Joaquin River.

Good morning

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex. Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR. The Draft EIR will provide a discussion on the extent of potential impacts identified by the scoping process and may propose mitigation measures to reduce such impacts.

If you have any questions or if you would like to submit additional comments, please don't hesitate to reach out to me at the contact information below. Comments relating to the scope of the application are being accepted through July 6, 2020, so if you have any additional comments, we request that you submit them before that date.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Doesn't anyone just value the beauty of the San Joaquin river and treasure what it gives us? River banks, open space, water, birds, fish, flowers, trees, mountain views, long walks, and even picnics!

How can anyone even think of renewing the Cemex lease and allowing rock quarry mining? The noise, air pollution, degradation of water quality is enough to make this a very easy answer. Absolutely, no. Please, this is not a business decision! Five new jobs and 92 old jobs are not worth it! Nothing is.

This is not a financial decision for the county, it is a recognition of the quality of life that we all deserve.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

There are no mitigation measures for this proposal. Cemex will find another solution, it might be more costly, but there are other solutions.

Warner9272@gmail.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Aesthetics Concerns:

There is a high probability that there will be a significant negative aesthetic impact to the area due to having a 600-foot-deep hole in the middle of the San Joaquin River Corridor. The topography of this area will make this difficult to mitigate the negative impact as the proposed mine location is in a river valley easily seen by surrounding residential communities on the surrounding hills that look down on the proposed site. If allowed to proceed there will be deep visual scars that will never heal.

The Fresno County General Plan states that the County shall support the policies of the San Joaquin River Parkway Master Plan to protect the aquatic habitat, recreational amenity, aesthetic resource, and water source. This proposed mining project does not appear to align with the County's commitment to support the policies of the San Joaquin River Parkway Master Plan.

The General Plan also designates Friant Road from the city of Fresno to Lost Lake Road as a "Designated Scenic Drive". The proposal substantially increases use by diesel trucks for transportation, the continued use of the large mining plant near Friant Road, and deep mine itself appears to conflict with a "Designated Scenic Drive". However, wrapping up current the sand and gravel operations with quarries which that can be filled full of water may be consistent with this designation.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

CEMEX may propose high sound and vegetation barriers, but from past conversations with neighbors in the area they have not been good at maintaining such barriers. The best mitigation would be for CEMEX to find another location that has flatter surrounding topography so the aesthetics mitigation step may actually work and possibly where they will not need to blast to mine the gravel and sand. There is very little chance that at the current site that they would be able to conceal a 600-ft deep hole from view for the surrounding residents on the adjacent hilltops.

Hydrology/Water Quality Concerns:

I live in a residential community that is directly across Friant road from the quarry site. I have lived in this community for less than a year and we have already experienced multiple water issues with the community well in which the County has been called out to address. Because of this, I have serious concerns that the nearby wells will be severely impacted by both a large 600 ft deep hole depleting the potential water supply, but also by the drilling and blasting techniques used to dig the mine possibly contaminating the water supply. I am not an expert in this area, so I forwarded my concerns to a close friend of mine, Doug Harrison, who is an expert in Hydrology and Water Quality. Mr. Harrison was the Manager of the Fresno Metropolitan Flood Control District for much of his career. His expertise was highly regarded in Fresno, surrounding areas, and even nationally, so much so that he represented our valley with statements before the US House of Representatives Committee on Appropriations Subcommittee on Energy and Water Development. His response to me about my concerns, "It is absolutely a legitimate concern and depending on proximity to your well, it could destroy you water supply". I will be talking with Doug next week and will follow-up with more specifics regarding these concerns. I would also like to note that there are multiple residential communities and recreational sites that are in very close proximity of the current quarry site that could have their water impacted Part of the County's General Plan is Resource Protection which includes water supply and quality.

Also, it is material to consider that CEMEX has been in the news in recent years as not being trustworthy stewards of community water supplies near thei mining operations. There are news articles that the CEMEX Stillwell Project in the town of Lemon Cove directly impacted wells to dry up around the mining operation. CEMEX tried to blame the wells running dry on the drought, but the article points out facts that suggests otherwise.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

I will follow up with additional comments (if permitted) after I talk with Mr. Harrison.

Landuse/Planning

The CEMEX proposal appears to be incompatible with the Fresno County General Plan for the Land Use Designation for the San Joaquin River Corridor Overlay. The General Plan states this overlay provides for agricultural activities with incidental homesites, sand and gravel extraction, various recreational activities, wildlife habitat areas, and uses which serve the San Joaquin River Parkway. The request to do hard rock mining and blasting resulting a permanent 600 ft deep scar in the heart of the corridor is very different that sand and gravel extraction and does not seem to fit with the stated land use designations in the General Plan and will scar the surrounding community for centuries for come.

How is this plan compatible with the commitment of the County to San Joaquin River Parkway Master Plan?

Is this the only location that CEMEX can get these resources?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Have they explored other locations that will have less of an impact on the environmental concerns, the San Joaquin River Parkway Master Plan?

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Gary Warner

2. Organization/Business

Nearby Resident

3. What is your address?

15264 Mesa View Ave, Friant CA, 93626

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

Warner9272@gmail.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Noise Concerns:

One of the many disturbing parts of the imposed plan is the use of blasting and other techniques to dig the 600-foot mine and crush rock into gravel. My home is in a community directly across from the quarry site where the blasting will occur. Multiple homes in the area are likely less than 1000 ft from the blasting site. My research on these techniques raise serious concerns as my research on the noise impact of blasting indicates that the decibels for residents within close proximity from the blasting site. Rock Crushers, Loaders, Rock Breakers, and Blasting all have the potential to produce excessive sound for nearby residents.

They are requesting operations from 4am to 9 pm 5 days a week...that 17 hours of noise pollution for the surrounding communities like mine with would significantly impact the quality of life. In addition to humans, the areas directly adjacent to the blast site are home to many different types of wildlife, and large grazing fields for hundreds heads of cattle.

What are the decibels of sound for Blasting, Loaders and Rock Crushers for the surrounding area at 500 ft, 1000 ft? How will this be monitored and enforced to protect the surrounding community and not disturb surrounding wildlife?

7.

Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Air Quality Concerns:

It goes without saying that Air Quality is major concern for Fresno County. The Friant Ranch Development which is in close proximity of the quarry site was approved by the County but was challenged in court and went all the way to the California Supreme Court. I am not experienced in legal matters, but it appears to me that the Supreme Court has postponed over expressed concerns regarding the negative impacts of the air quality on humans along with ability to monitor and enforce the standards over the long term. These same issues would seem to apply in the case of a mining operation that will be putting additional contaminants into the air daily through blasting, rock crushing, and more than doubling the amount of diesel truck traffic on local roads. I would like the scoping process to address these questions:

What are the current AQI (Air Quality Index) levels for the surrounding areas during different months?

What are the anticipated increases in the AQI levels from the proposed operations?

If the Friant Ranch Development proceeds how does the combination of the development and the proposed operation impact the AQI levels of the surrounding areas?

If the Friant Ranch Development is not able to move forward due to area quality concerns how can the County approve a mining operation that will likely have even further impacts on the air quality?

If mining operation is approved will it be allowed to operate when the AQI Levels are Unhealthy for Sensitive Groups?

How will the long-term air quality issues be monitored and enforced?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Limit Operations when the AQI is Moderate or Good.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Local residents like myself have made significant home purchases with the understanding that operations at the current Quarry site would expire in 2023 and CEMEX would honor their promise to restore the land like they did with their Beck Ranch operation when it was mined out in 2009. We understood the possibility that an extension for sand and gravel excavation could be approved, but nowhere in their previous proposals or in the Fresno General Plan was there any indication that deep rock mining with blasting would occur along the San Joaquin River corridor.

I am concerned that the lasting aesthetics scars of a 600 foot deep hole, increased air pollution, increase noise from blasting, and the potential damaging impacts of the water supply will likely have negative impacts on residential property values in the surrounding area. This project could devastate the quality of life and property values of existing residents and future residents in planned communities like Friant Ranch mentioned in the General Plan. I have seen studies that indicate that Residential Property Values near (within 1 mile) Gravel Mining operations have decreased some nearby properties by over 30%. I fear that property value declines could be worse for property owners near deep mine blasting operations with 100 years of operations. This proposal if approved could financially devastate many residents. I request further research by impartial parties (not CEMEX) on the potential impacts on the property values and potential ways for CEMEX to make impacted residents whole.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Have appraisals of all residences and other impacted properties within 1 mile of the proposed site completed prior to the operation starting and then again after 10 years of the operation commencing or the sale of the property whichever is sooner and if there is a decline in value from the original appraisal CEMEX should make the residents whole.

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Hydrology/Water Quality Concerns:

I live in a residential community that is directly across the road from the quarry site on Friant Road. I have lived in this community for less than a year and we have already experienced multiple water issues with the community well in which the County has been called out to address.

CEMEX's proposal will dramatically increase the nature, depth and quantity of sand, gravel, and hard rock mining on the subject sites. This increase fron 1.4 MT to 3.0 MT per year will require increased excavation plus new massive drilling and blasting of the underlying bedrock which forms the "floor" of the aquifer that feeds existing water supply wells, including ours.

I believe, as do the experts I have consulted, that any increased mining activity at the quarry site will damage the fragile yield of our well, and others in th area. We also believe that any significant mining of the bedrock will irreparably damage the aquifer feeding that well, and others. In addition, hard rock mining exposes rock which may have high concentrations of minerals and heavy metals that are known contaminate the water in the surrounding areas. I am concerned such mining practices will introduce contamination into the aquifer that feeds any nearby wells of the surrounding community.

Speaking to these experts I learned that this could impact wells within a 3-mile radius! Have all those residents been notified? The experts informed us that this project has the potential to impact both the above ground flow and underground flow of the San Joaquin River. Not only does this pose a potential threat to the nearby wells but it could also impact the San Joaquin River and all that it supplies down river.

Additionally, the CEMEX proposal does not consider the additional impact on the water supply for the area as a result of the pending Friant Ranch Development near the quarry site that was approved by the County

Because of all of this, I have serious concerns that nearby wells will be severely impacted by the process of blasting and cutting through bedrock to produce a large 600 ft deep hole resulting in a depleted and/or contaminated water supply.
It was recommended by the experts we spoke with that the following items be looked at during the scoping process:

- What is the current depth of groundwater now within the impacted area?
- What is the historical depth to groundwater trend within the impacted area?
- What is the depth to bedrock of the current wells within the impacted area?
- What is the depth of bedrock at the current quarry site?
- What is the currentwater quality of the wells within in the impacted area?
- What is the thickness of the aquifers that supply the wells in the impacted area?
- What are the potential impacts on depth to groundwater and aquifers above the bedrock after the bedrock is fractured?
- What is the potential migration of contaminants, natural and manmade thru fractured bedrock?
- What are proposed mitigations to keep the current home sites whole?
- What is the current status and future plans for the Friant Ranch Development already approved by the County?
- What are the impacts on Friant Ranch Development from the mining operation and if the County proceeds with the development how does that community put additional stress on the surrounding water supply?
- Is this the only location that CEMEX can get these resources? Have they explored other locations that will have less of an impact on the environmental concerns, including water supply and quality, of the surrounding communities?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

The San Joaquin River between Fresno and Friant has been mined for over 100 years. The best mitigation may be for CEMEX to realize, like their competitor Vulcan, that it is time to consider other locations that would have less environmental impact on the surrounding community and wildlife.

Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Please do not do this project! One of the most significant impacts from this project isn't the size of the hole that will be blasted into the earth, but the number of trucks that will be moving rock around if the project is approved as proposed. The enormous increase in truck traffic on Friant Road from an average of 690 trips per day now, to 1,076 trips per day after the first five years of operation is terrible for our community.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I have major concerns on this project, I do not want the hard rock mining around our neighborhood. It will affect the air quality, there will be air pollutio which will be harmful for my mother and my child health who are asthma patients.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

It will effects the land, air, and wildlife. We don't want to distorted the view and wildlife. mining will effects our houses and water. we already having issues with the our wells not prolific producers of water. The dust, noise, night time lighting will be disturbing our life style. It will increase the crime rate in our neighborhood.

If this project moves forward, I am extremely concerned about the environmental impact. There will be increased truck traffic leading to increased exhaust/emissions and noise. The construction will also lead to noise, dust/worsened air quality and ultimately likely destruction of our San Joaquin rive area.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

I'm am opposed to the expansion by the company. It will adversely affect the my property value by creating more loose dust, increasing heavy truck traffi -along Friant road, act as an environmental threat to the water quality of the San Joaquin River, crate unwanted and dangerous noise levels with explosions it will also create earthquake like disturbances that could cause damage to the foundations and structures of buildings and homes.
It also creates potential liability for the company and the city/county for purposely allowing a nuisance to be created in our neighborhoods and communities.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Move the plant to an isolated location away from Fresno's water table and the San Joaquin River.

Limit the size of the excavation if approved to 1/10 of the current proposal.

Deny the use of explosives for excavation.

Provide financial compensation to supporting the San Joaquin River Parkway, the surrounding neighborhoods, businesses and residents.

Thank you for taking time to provide scoping comments on Environmental Impact Report (EIR) No. 7763 - CEMEX Mining Project. All comments received become a part of the public record.

1. What is your name?

Joanne Allen

2. Organization/Business

Retired educator

3. What is your address?

645 e Champlain dr. #139, 93730

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

Joannealleno@me.com

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

1. The traffic on Friant is already a hazard due to the amount of traffic. The traffic is greatly impacted already by the trucks from the existing rock busines (soon to close I believe.) Woodward Park is a major destination for Fresno families and parking there is often overcrowded causing many families crossing Friant rd. To cross fearfully.

2. The disregard to the environment and resource of the San Joaquin River would negatively and permanently scar our already depressed area.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Fresno is a depressed, economically weak hub of the valley. To save what we can to attract economic development we have to enhance what positive features we already have. .ie. San Joaquin River and Parkway conservatory.

The longterm health of the river will surely be impacted by this operation. Okay, I know we need cement and I recognize we have to get it from somewhere, but consider this very seriously: if and when (likely 'when') the river is affected, all these people with families moving into this development area in the north will be seriously disillusioned. The temporary disturbances made by the work of the new site (could be pretty loud), would also be an issue. I think it's a bad idea and I think must be other potential sites which might serve the community better for the long-term. Thanks for reading

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Let's find a different site and do the same thing there, I think it might be annoying for the company to have the site be maybe slightly further away but I think it's vital to re-evaluate this.

As an area resident, I am extremely concerned about the negative impacts of this project, including damage to our air quality, our water supply, the river environment, and our roads. The impact on traffic alone could be awful. Please do not permit this massive, one-hundred-year commitment to damage my neighborhood, the river, our water supply, and our precious air quality.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Land Use/Planning: When the current residences on Friant Road were built it was under a use permit for aggregate mining until the supply was exhausted. The permitting of hard rock mining of depths up to 600 ft with blasting exceeds and dramatically changes the original intent of the existing county plan.

The county Planning Commission has zoned this location for housing. You are aware John Thomason has received a variance on the AE20 zoning to allow him to subdivide into smaller parcels the land next to Friant Road. How can the planning commission promote housing in this area and then switch to an entirely different use? This does not appear ethical. A mining operation of this type is incompatible within a residential setting causing health health issues, well documented in numerous studies, and economic depression of property. I would ask you to evaluate other blasting and deep mining operations in residential settings to see how the residents feel this impacts their homes and lives. One such community is Thompson Connecticut. The current blasting is disturbing residents in Thompson. I am asking for at least evaluations of 3 such locations where blasting is in a residential area. This will enable the planning commission to get a realistic understanding of how this will impact the lives of the current residents and constituents of Fresno County on Friant Road.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

To stop the planning until adequate reviews and studies can be completed by independent sources. Not just the study that CEMEX paid for. This is being pushed too fast. People did not have time to respond. From receipt of the first letter to the first hearing was less than 2 weeks. The Fresno Bee had an article in the paper on January 13, 2020 regarding the proposed plant. Why was it taken 6 months for official notification of this proposal to be sent to residence?.

Scoping Comments

11 June 2020

J. Durando

Land Use/Planning

I have concerns with the CUP for the Cemex Rockfield site and how it fits in with the County of Fresno's General Plan. The Friant Community Plan was originally formulated to provide an organized set of guidelines for the development of this community. It is one of only two areas of redevelopment in the county, the other being Laton.

The Friant Community Plan was initially created on July 23, 1964, with updates on September 25, 1975, June 29, 1978, October 20, 1983 and most recently according to the Fresno County website in 2011 in conjunction with the Friant Ranch Development. The Friant Ranch Development calls for 2,683 single family homes, 263 multiple family units, and over 250,000 square feet of commercial development with 50 more residential units within the area.

Included in the development will be 15 miles of trails for the estimated final population of approximately 7,000 people. The southern boundary for this project is within less than .5 miles from the current aggregate extraction site. The number of people living and working within the influence area of the mining operations will be very substantial.

In 1992 the County of Fresno adopted the Friant Specific Plan which called for the development of a sewage treatment facility to serve the existing residents of Friant and future residents. This has never occurred, but is still in the plan for the future. The Friant Specific plan boundary is contiguous with the northern boundary of the proposed CUP Cemex Rockfield site. It seems like these two components are not compatible. The plan calls for residential development and the CUP Cemex Rockfield calls for an industrial rock processing site to be adjacent to the adopted Friant Specific Plan.

There are 27 houses in Fresno County within less than a mile radius from the center of the site. If deep hard rock mining and processing occur those will impact the area in a number of negative ways. This is a residential area and the CUP Cemex Rockfield proposes would violate 5 of the 12 themes as stated in the County of Fresno General Plan.

Those themes are:

Efficient Functional Land use pattern-Industrial Mining and Processing is not compatible with a residential area

Resource protection-Air quality, water quality, hydrologic systems, noise and light pollution with be impacts

Health and Safety Protection-Exposure to particulates, heavy metals like Manganese, greenhouse gas emissions

Health-Well Being-Emotional Stress, Air Quality,

Enhanced Quality of Life-An Industrial Mining and Processing Operation in an area of thousands of houses eventually will NOT improve the quality of life.

How does the County Intend to solve the situation with their apparently conflicting ideas regarding zoning? What solutions will they have?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Mitigation would be to allow the gravel extraction to continue until the resource is extracted, and then rehabilitate the area as required by the original CUP from circa 1980.

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Aesthetics: Comment on 16 A, points 1-4. Theses are the opinion of a person. My concern is the aesthetics. To have large equipment for processing the cement and asphalt , large parking lots full of cement delivery trucks, cars and so forth will have a negative effect the scenic highway. This area has also been designated residential and many of the homes will have an unsightly view. At the current, CEMEX Processing facility at the junction of Willow and Friant Roads the major equipment is back from the road and screened by some tree plantings. The proposed site has only a 5 foot berm and is located adjacent to the road .

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Have an independent company do a graphic visual projection, so the aesthetics can be more fairly evaluated by a committee of people. This needs to include a visual for how the proposed project will look as well as a visual as to how it would appear if mining is stopped today and the grading from the last CUP of the pits and landscaping to returned to the area.

14 June 2020

Hydrology/Water Quality

I am deeply concerned about the impact of the Rockfield Mine on the Hydrology and Water Quality at the site and the impacts if will have in the area. As retired Biologist I understand how natural geologic systems work and how they can be impacted by anthropormorphic activities. The subsurface rock in this area were formed during a Pre-Tertiary Period over 65 million years ago. This basement complex is very deep and overlain by much younger strata, with the last few hundreds of feet in this area being granite and alluvial deposits.

Mining to 600 feet will create some changes in the water table through fracturing and changing infiltration rates, through compaction and disrupted soil profiles. It is possible to have decreased surface run off when permeable rock strata are exposed,impacting the natural hydrologic processes. These will have an impact of the already sensitive water table in the area and the subterranean inflow into the San Joaquin River. The water table flows to the south west in this area so the multiple impacts on water quality at the mine site will be transported into the river. Mining creates some unnatural impacts on water quality. When material is exposed and extracted it allows soluble salts to more easily go into solution and exposure to air with oxygen present creates a set up for REDOX reactions that can form and release toxic compounds into air, water and soil.

The Clean Water Act (1972) prohibits the contamination of surface waters. The San Joaquin River is already impacted along the course from Friant Dam downstream. With a number of section 303d violations-ranging from heavy metals, group A pesticides, Chlorpyrifos, Selenium and others and does not need another point source of pollution in the form of the Rockfield Mine.

Water table disruption, contamination, and degradation need to be avoided.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Testing for water, soil, and air need to be done at the Plant Site to see what impacts have been created during the operation of the sorting, washing, crushing, and storage of the materials. The settling pond water, invertebrate animals and phytoplankton, soil and adjacent vegetation need to be tested fc contaminants.

Water flow studies need to be completed to see the direction and rate of flow that the aquifer exhibits.The impacts of mining on infiltration, soil profile disruption and compaction throughout the Rockfield Mine site need to be modeled and shared with the public.

Water table studies need to be performed on all domestic wells in a two- mile radius of the site. Sounding tubes can be used to measure water levels and provide a baseline reference on all domestic wells and a plan must be created to mitigate the dropping of the water table if mining occurs.

Calculations for water loss due to evaporation need to calculated, and shared with the public to give an idea of how much evapotransportive loss will occur, also impacting the water table

Subject: Confirmation of Receipt of Comments (EIR 7763)

Good morning,

I am sending you this email to confirm receipt of the comments you submitted regarding the Cemex Rockfield Modification Project through our online comment system. Your comments were received prior to the deadline and therefore will be considered as part of the scoping review for this project. This part of the process helps to determine where the Environmental Impact Report should focus in order to address potentially significant environmental impacts.

If you have any questions about this project, please feel free to reach out to me with the contact information below.

Thank you,

Chrissy Monfette| Planner

Yes

5. Please provide your email address.

jimdiane@netptc.net

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

LAND VALUES-- No where in the CUP does it address the impact of property and home values on the current properties. It appears from studies I have read that we could expect a significant reduction in our value.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Property and home appraisals as of today as if this project was not under consideration. So we have a base line property value. How will the individual resident be compensated for the loss of value in their property to include future property appreciation that would occur? Would this be held in bond so the property owners are guaranteed payment?

Scoping Comment Quarry Restoration

I am not able to locate the Exhibits (Located in back of Report) in the Project Description/Operational Statement for the CEMEX Rockfield Modification Project. I was curious to look at both C Sheet 3: Quarry Site Existing Conditions and C Sheet 8: Quarry Site Reclamation Plan. It seems like those have been omitted from this report along with all of the Exhibits.

I am curious as to the Quarry Restoration Plan as it is poorly covered in the Project Description. It consists of two paragraphs that are vague and as stated do not complement or benefit the San Joaquin River Parkway Master Plan. The restoration plan states they will reclaim 122 acres of open space, riparian and open water wildlife habitat surrounding the 95-acre reclaimed pond. The slopes of the pond will be seeded with native grasses and forbs in addition to native vegetation that will be planted. Without seeing the exhibits missing in the report that Cemex provided to the county it is hard to see how this will be carried out.

If the 95-acre pond is at the bottom of the excavated pit it will be almost 600 feet below ground surface and inaccessible. Will the sides be stepped into the bottom or the mine? Any planting on the benches as stated in the plan will not grow if just seeded into the granite surface and surely would need irrigation for a period of time to get established. The water could have high levels of heavy metals like Manganese after 100 years of continual mining, crushing and concentrating in the waters that fill that basin. The Restoration Plan will do nothing to complement or enhance the goals of the SJRP Master Plan. The fact that it would not occur for 100 years and just be an operational quarry and processing plant is not in line with their master plan. The restoration plan is not well thought out and will not create any quality wildlife habitat. Why can't we see the plan that should have been included in the report?

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

There is no way to restore the quarry project to be complementary or enhancing to the SJRP Master Plan. The huge hole in the ground, the 100 year time frame, and the degrading of the area through the mining process are the opposite of factors that would benefit the Parkway.

Subject: Confirmation of Receipt of Online Comments (EIR 7763)

Good afternoon,

Thank you for providing comments on the subject application. Please include the project reference (EIR 7763) in the subject line of all communications with the County regarding this project. Doing so allows staff (and our supervisors, including elected officials) to locate relevant project information and provide a prompt response to inquiries.

This email is being provided to confirm receipt of your comments relating to the Rockfield Modification Project proposed by Cemex (submitted June 17, 12: 44 PM). Your comments will be considered in the development of the scope of impacts to be considered by the Draft EIR.

If you have any questions or if you would like to submit additional comments, please don't hesitate to reach out to me at the contact information below.

resident

3. What is your address?

15462 North Friant Road

4. Would you like to be added to the mailing list for this project? If so, please provide your email address below.

Yes

5. Please provide your email address.

jimdiane@netptc.net

The Environmental Impact Report (EIR) could evaluate impacts to the following environmental topics:

Aesthetics	Agriculture/Forestry	Air Quality
Biological Resources	Cultural Resources	Geology/Soils
Hazards/Hazardous Materials	Land Use/Planning	Hydrology/Water Quality
Mineral Resources	Noise	Population/Housing
Public Services	Recreation	Transportation
Utilities/Service Systems	Greenhouse Gas Emmissions	Tribal Cultural Resources

6. Please provide your comments about the project here. Do you have concerns or suggestions? Are there any existing conditions on the site or in the vicinity of the project site we should consider in the EIR analysis? If so, please describe them.

Scoping Comment Regarding Hours of Operation

The CUP for the Cemex Rockfield project has indicated that they would have operations running from 4 am to 9 pm 5 days of the week, and a reduced operating period on Saturday. That is a seventeen-hour period Monday through Friday which will create a nuisance for all of the residents and users of Friant Road in the vicinity of the site.

The current CUP for the quarry has operating times listed as 7 am to 4 pm but they do not abide by those hours and start with their operations well before 6 am on the majority of days. If they are so blatant about ignoring the current times set in the CUP agreement why would anyone expect them to pay attention to the new CUP?

This will create a long continuous series of noise impacts for the vicinity that is unacceptable

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Mitigation measures would be reducing the time period in which they are able to operate. If a reduced time period-like the current 7 am to 4 pm is too short for all of the new operations then they may need to rethink their plan and eliminate some of those. It is unreasonable to have almost 75% of each week day be impacted by continuous noise created by the varied operations in this residential area.

This project will directly violate at least five of the major themes set forth in the Vision Statement of the Fresno County General Plan. It also completely ignores the LU-C which states;

"To preserve and enhance the value of the river environment as a multiple-use, open-space resource; maintain the environmental and aesthetic qualities of the area; protect the quality and quantity of the surface and groundwater resources; provide for long-term preservation of productive agricultural land conserve and enhance natural wildlife habitats; and maintain the flood-carrying capacity of the channel at a level equal to the one (1) percent flood event (100-year flood). "

Scoping Comment-Hydrology-Water Table Disruption

"Is anyone grateful for the drought? CEMEX is. Founded in Mexico in 1906, CEMEX, one of the world's largest building material suppliers and cement producers, runs operations all across the globe. It is conveniently blaming the drought on the fact that residential wells in Lemon Cove are drying up – when in fact the evidence suggests otherwise."

This is the first paragraph of an article written by Catherine Doe and published on 18 July 2014 in the Valley Voice. Cemex mined an area at Stillwell Lak and excavated a 60-foot-deep hole. The hole has filled up with at least 1000 acre-feet of water from the aquifer that those wells in Lemon Cove depended on for water.

I am concerned that the destruction of the aquifer at our home site, and our neighbors to the north and south will be impacted by the mining operations that plan to create a 600-foot-deep hole. What mitigation is in place to prevent this from occurring. Without water all of the properties on the east side of Friant Road will become unlivable. Cemex tried to shift the blame to a drought year but those same wells had been through previous drought events and not been impacted. The mining process caused the failure of those well.

There is no mention of a plan prevent the loss of our domestic wells that we depend on to make our homes habitable. Just ignoring the problem does not make it go away. There will be a negative impact from the mining operation on the water table, and that is documented in numerous cases in situations like the proposed project.

7. Mitigation measures are changes to the design, phasing, or operation that would reduce or avoid environmental impacts. Please suggest mitigation measures that could address impact related to the development and operation of this project.

Guarantees must be put in place, and enforced to ensure that there is no disruption to the domestic water supplies to our home or those of our neighbors. Cemex should post a bond to provide for damages that their mining will cause to all of our wells. They should be responsible for the complete cost of drilling new wells and water systems for each house as needed. Their offer to cover half the cost in Lemon Cove is an example of them not wanting to be responsible for the damages they cause. None of us should have to spend any money to mitigate damages that the project will cause.

COUNTY OF FRESNO
JAN 2 1 2020
DEPARTMENT OF PUBLIC WORKS AND PLANNING
DEVELOPMENT SERVICES DIVISION
CUP 3666 + 3667
EIR 7763

January 20, 2020

The Honorable Nathan Magsig
Fresno County Board of Supervisors
2281 Tulare Street, Room 300
Fresno, CA 93721

Dear Supervisor Magsig:

As local developers and contractors we recognize that the cost of construction is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure.

The demand for new construction in the Fresno region is projected to grow, requiring over 6.1 million tons of construction aggregate a year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped from outside the region. Without the benefit of local quarries, transportation costs can increase $0.22 cents per ton, per mile. These higher construction costs are passed on to public businesses, homeowners and in the case of public infrastructure, taxpayers.

CEMEX has been a critical partner in our efforts to meet this demand and growing our region's economy. Aggregate from their Rockfield (Friant) Quarry has supplied the Save Mart Center at California State University Fresno, the Chukchansi Ball Park, Clovis Community College, Clovis Medical Center and the many businesses, homes, roads and schools found in most neighborhoods in your district.

In December of 2019, CEMEX submitted an application that addresses the county's growing demand for construction aggregate, open space and habitat restoration. We urge your favorable consideration of their application without delay.

Thank you for recognizing the benefits of having a quarry located in your community.

Sincerely,

Nicole Goehring
V.P. Government and Community Affairs

Re: Cemex Rockfield Modification Project EIR

Dear Mr. Mtunga:

I am writing on behalf of RMC Pacific Materials, LLC ("Cemex") regarding the County of Fresno ("County") Draft Environmental Impact Report ("DEIR") dated December 2024 as part of the Rockfield Modification Project (EIR 7763) and Unclassified Conditional Use Permit Applications Nos. 3666 and 3667, currently in preparation of the Final EIR by the County.

In Chapter 2 of the DEIR, "Project Description," Section 2.2.3, "Summary of Project Characteristics," on page 2-5 of the DEIR at Table 2-1, "Rockfield Modification Project Characteristics," Cemex's "Estimated Maximum Annual Processed Aggregate Volume (including waste/fines)" was listed as 3.3 million tons, or "3.3 MT" of aggregate. (Attachment A.) Cemex understands that this 3.3 MT number is inconsistent with the analysis set forth in the air quality section which used the 3.0 MT number from Table 2-1 annual sales. (See EIR Appendix D-1, Air Quality, Health Risk, and Climate Change Impact Assessment, December 4, 2019, at p. i of the Executive Summary [Attachment B].)

This is to advise that Cemex is aware of this discrepancy between the 3.3 MT and 3.0 MT numbers, and Cemex is willing to accept a Condition of Approval for the Rockfield project that will cap the maximum production (including waste/fines) at 3.0 MT annually, which is the amount analyzed in the DEIR.

///

Please do not hesitate to reach out to me if you have any questions.

Sincerely yours,

MITCHELL CHADWICK LLP

Patrick G. Mitchell

2.2.3 Summary of Project Characteristics

Table 2-1, "Rockfield Modification Project Characteristics," provides a summary of the project features.

Table 2-1
Rockfield Modification Project Characteristics

Item/Activity	Description[1]		
Existing Permits, Acres	Plant Site: CUPs 367, 2209, 3063, and 3093. Approximately 138.5 acres. Quarry Site: CUPs 367, 2032, 3063, and 3093. Approximately 352.4 acres. Total Both Sites: Approximately 490.9 acres		
Proposed Mining Acres	Plant Site: Approximately 117.6 acres Quarry Site: Approximately 281.9 acres Total Both Sites: Approximately 399.5 acres		
Mining Depth Allowed Under Existing CUPs	Plant Site: no maximum depth specified Quarry Site: no maximum depth specified		
Proposed Mining Depth	Plant Site: Approximately 85 feet bgs Quarry Site: Approximately 600 feet bgs		
Interplant Haul Via North Friant Road	Existing = 1.4 MT/year Stage 1 = 0.7 MT/year Stage 2 = None		
Estimated Aggregate Reserves Volume	Plant Site: 12 MT Quarry Site: 215 MT		
Estimated Total Sales	195 MT		
Estimated Maximum Annual Processed Aggregate Volume (including waste/fines)	3.3 MT		
Estimated Maximum Annual Aggregate Sales Volume[2] (excluding waste/fines)	Existing = 1.4 MT Stage 1 (first 5 to 10 years) = 2.0 MT Stage 1 and 2 (after 10 years) = 3.0 MT		
Estimated Annual Sales at Total 3.0 MT[3]	**Existing**	**Stage 1—Combined from both Sites**	**Stage 2—Quarry Site Only**
Aggregate[2]	1,400,000 Tons	3,000,000 Tons	3,000,000 Tons
Hot-Mix Asphalt	0 Tons (Historically 230,800 Tons)	500,000 Tons	500,000 Tons
Ready-Mix Concrete	189,500 Cubic Yards	300,000 Cubic Yards	300,000 Cubic Yards
Concrete and Asphalt Recycling	25,000 Tons (concrete only)	200,000 Tons	200,000 Tons
Depth to Groundwater	Plant Site: 10-30 feet bgs (current surface) Quarry Site: 15-40 feet bgs (current surface)		
Reclamation End Uses: Open Space, Riparian and Open Water Habitat[4]	Plant Site: Approximately 138.5 acres Quarry Site: Approximately 352.4 acres		

Item/Activity	Description[1]
Project Life	Plant Site: Up to 30 Years Quarry Site: Up to 100 Years

Table Source: CEMEX 2021.
Table Notes:
feet bgs = feet below ground surface (i.e. original ground surface before historical mining); MT = million tons; MT/year = million tons per year

1. All values are approximate.
2. Includes sales to on-site hot-mix asphalt plant and ready-mix concrete plant.
3. Typical mix of products. Actual sales mix will vary based on demand.
4. Actual final reclamation and areal extent at each site will depend on the volume and availability of overburden and process fines suitable for use as fill occurring on site.

2.3 PROJECT PURPOSE AND OBJECTIVES

The project purpose is to continue and expand existing mining and processing operations at the Plant Site and Quarry Site and reclaim the two sites when mining operations are complete.

The objectives for the proposed project are to:

1) continue to provide a reliable and sustainable, local source of high-quality aggregate to help meet the current and long-term demand (100 years) for construction materials in the Fresno region;
2) continue to utilize known aggregate reserves from existing partially mined properties, including those designated by the state and county as Mineral Resource Zone 2 (MRZ-2) (Mineral Resource Zone areas where adequate information indicates that significant mineral resources are present, i.e., sand and gravel);
3) continue to utilize high quality aggregate resources that meet the California Department of Transportation's specifications for use in Portland Cement Concrete (PCC) and Asphaltic Concrete (AC) which aggregate is important for quality infrastructure growth and maintenance because of its versatility, value, and relative scarcity;
4) maintain a local source of construction aggregate with enough annual sales capacity (3.0 MT) to encourage a healthy competitive market;
5) continue to provide aggregate resources with access to an efficient local road network;
6) continue to provide an environmentally sound project that would balance the recovery of the aggregate resource with the protection of other resources including wildlife habitat, groundwater, surface water, and air quality;

AIR QUALITY, HEALTH RISK, AND CLIMATE CHANGE IMPACT ASSESSMENT

Rockfield Modification Project
Fresno County California

December 4, 2019

EXECUTIVE SUMMARY

This Air Quality, Health Risk, and Climate Change Impact Assessment (Report) has been prepared to quantify and determine the significance of air quality, health risk, and climate change impacts associated with the proposed mining method adjustments, processing plant relocations, and production increases that would occur with the Rockfield Modification Project (Project). The Project would continue operations on two non-adjacent sites, a northern "Quarry Site", and a southern "Plant Site".

The following Project features would affect air emissions and are assessed.

- Change of the excavation method from alluvial mining to hard rock mining. This would have the following effects:
  - Add drilling and blasting;
  - Add a primary crusher and hydraulic shovel in the pit; and
  - Add processing plant equipment to manufacture sand.
- Relocation of the ready-mix concrete and asphalt plants on the Plant Site 2 miles north to the Quarry Site.
- Increase in aggregates production from historical levels of 1,374,272 tons per year to 3,000,000 tons per year.
- Increase in Ready Mix Concrete production from historical levels of 189,550 cubic yards per year to 300,000 cubic yards per year.
- Increase in recycled materials processing from historical levels of 25,000 tons per year to 200,000 tons per year.
- Addition of a state-of-the-art asphalt plant, burning natural gas or propane and equipped with best available control technology (BACT) which would produce up to 500,000 tons per year.

Project emissions are quantified by subtracting existing emissions occurring at the Quarry and Plant Sites (Baseline) from emissions with the Project (Future). Baseline emissions are estimated using historical fuel use data from off-road vehicles, aggregates production records, and other specifications (e.g. engine information) provided by Cemex.

AIR QUALITY, HEALTH RISK, AND CLIMATE CHANGE IMPACT ASSESSMENT

Rockfield Modification Project
Fresno County California
State Clearinghouse No. 2020060123

Revised, May 13, 2026

EXECUTIVE SUMMARY

This Air Quality, Health Risk, and Climate Change Impact Assessment (Report) was prepared for inclusion in the Final Environmental Impact Report (FEIR) for the subject Project. It incorporates prior technical documentation included in Appendices D-1, Air Quality, Health Risk, and Climate Change Impact Assessment (Sespe, December 4, 2019), and D-2, Addendum No. 2 to the Air Quality, Health Risk, and Climate Change Impact Assessment, Revision 2 (Sespe, March 7, 2022) of the Draft Environmental Impact Report (DEIR). The following topics in this report are summarized below:

- Project features in the DEIR.
- Technical differences between this Report and the DEIR documents.
- Regional and localized air quality impacts including health risk assessment (HRA) and odor.
- Climate change impacts.

Project features described in the DEIR and assessed in this analysis, which emit air pollutants and/or greenhouse gases (GHGs) include the following:

- Change of the excavation method from alluvial mining to hard rock mining. This would have the following effects:
    - Add drilling and blasting;
    - Add a primary crusher and hydraulic shovel in the pit; and
    - Add processing plant equipment to manufacture sand.
- Increase mining and sales rates to 3 million tons per year (tpy).
- Relocate the ready-mix concrete (RMC) and hot-mix asphalt (HMA) plants from the Plant Site 1.8 miles north to the Quarry Site.
- Increase RMC production from the historical rate of 189,550 cubic yards per year (cy) to 300,000 cy.
- Increase the recycled materials processing rate from historical levels of 25,000 tpy to 200,000 tpy.
- Add a state-of-the-art HMA plant, burning natural gas or propane and equipped with best available control technology (BACT) that would produce up to 500,000 tpy.

Project features that have been clarified in this analysis and are different from what was analyzed in the DEIR are described below in Table ES0.

Table ES0 – Differences Between This **Report** and the DEIR

Project Feature Described in the DEIR	**Project Feature in This Report**	**Explanation**
Baseline Activity Levels. Excavation: 1,374,272 tpy. Sales: 1,374,272 tpy.	 Excavation: 1,580,413 tpy. Sales Rate: 1,374,272 tpy.	DEIR analysis assumed the same baseline rate of excavation and sales, without considering a waste factor. Waste factors of 15% for alluvial mining and 10% for hard rock mining are used to calculate emissions from transport and placement of waste fines.
Future Activity Levels. Excavation: 3.0 million tpy. Sales: 3.0 million tpy. Waste fines handling emissions are omitted.	 Project will accept a Condition of Approval that limits the excavation rate to 3.0 million tpy or less. Emissions from onsite transport and placement of waste fines included.	Future excavation rate remains 3.0 million tpy and waste factor is now accounted for. 3.0 million tpy sales rate is conservative because waste fines are double counted (i.e., waste fines are both placed on-site and sold as product). Emissions related to waste fines are assessed as discussed above for the Baseline.
Particulate emissions from drilling are omitted.	Particulate emissions from drilling are included.	Drilling emissions added in response to comments on the DEIR and as needed to be consistent with the methodology referenced in the DEIR.
Maximum Daily Rates Baseline: 3,166 tons per day (tpd). Project: 7,333 tpd.	 Baseline: 6,000 tpd. Project: 14,000 tpd.	Original daily rates in the DEIR were too low. Operation at the DEIR daily rates would prevent achievement of DEIR annual rates. Daily rates were updated to be consistent with the annual rates which are unchanged from the DEIR.

Project Feature Described in the DEIR	Project Feature in This Report	Explanation
Engine Emissions from Offsite Diesel Engines Potential to emit (PTE) methodology and EMFAC2017 Fresno County fleet average emission factors for the following years are used. Baseline: 2005. Project (Phase 1): 2019. Project (Phase 2) 2049.	 Regional Increment Analysis methodology (Appendix J) and EMFAC2025 Fresno County fleet average emissions factors for the following years are used. Baseline: 2018. Project (Phase 1): 2026. Project (Phase 2): 2056.	Revised methodology accounts for the Project's regional impact. The Project's approval would not result in increased demand for aggregates in the region – if the Project is not approved, regional aggregates buyers would simply purchase aggregates from other locations in the same region. A regional increment analysis was conducted to determine the Project impact on regional emissions. The regional increment analysis is consistent with methods used by the County in the previously approved Riverbend Sand and Gravel Mine Project Final EIR (2015), Clearinghouse No. 2013071097. EMFAC version was updated to better represent the current best practice and circumstances surrounding the Project.
Engine Emissions from On-Site Diesel Engines. EMFAC2017 Fresno County fleet average emission factors (all speeds) for on-road engines operating in the following years are used. Baseline: 2005. Project (Phase 1): 2019. Project (Phase 2): 2049.	 EMFAC2025 Fresno County fleet average emission factors (15 mph) for on-road engines operating in the following years are used. Baseline: 2018. Project (Phase 1): 2026. Project (Phase 2): 2056.	EMFAC version was updated to better represent the current best practice and circumstances surrounding the Project. The 15 mph factors are more representative of conditions on-site because speed is limited to less than 15 mph.

Project Feature Described in the DEIR	Project Feature in This Report	Explanation
Effect of GHG Regulations on Diesel Engine Emissions Qualitative analysis based on the regulatory setting in 2019 with the Project purchasing California compliant fuel produced by entities subject to State GHG regulations (i.e., Cap-and-Trade and/or Low Carbon Fuel Standard(LCFS)).	Quantitative analysis based on the regulatory setting in 2026 wherein the amount of renewable diesel (RD) in ultra-low sulfur diesel (ULSD) is benchmarked and offroad fleets are required to use only RD (see Appendix L).	Off-site on-road engines use fuel that meets the benchmarks established for each future year. For instance, in 2018 the carbon intensity of ULSD is reduced by 2% as compared to pre- LCFS levels reported by EMFAC. In 2026, the carbon intensity of ULSD is reduced by 18.6% as compared to pre-LCFS levels reported by EMFAC. Offroad engine requirement to use only RD results in approximately a 50% reduction in carbon intensity as compared to the pre-LCFS levels that were quantified in DEIR (Appendix L).
Dust control methods and efficiencies in the DEIR are documented by reference.	Dust control methods and efficiencies are documented in a Fugitive Dust Control Plan (Appendix K) that incorporates best management practices reassessed in 2026.	The DEIR acknowledges that a fugitive dust control plan is required to be approved by SJVAPCD and explains efficiencies assigned for various controls but does not collect the information into a plan. The updated report includes a draft dust control plan prepared in response to comments on the DEIR and which is amplified to reflect changes in the circumstances surrounding the Project by updating best management practices to those available in 2026. The final dust control plan is subject to review by the SJVAPCD.
Criteria pollutant modeling is conducted to determine concentration of carbon monoxide because carbon monoxide emissions exceed the SJVAPCD screening threshold of 100 lb/day.	In response to comments, criteria pollutant modeling is conducted for each criteria pollutant and compared to state and national ambient air quality standards as required by SJVAPCD policy (APR 2030, 6/2018) that was adopted after air quality analysis commenced for the Project.	SJVAPCD policy APR 2030 requires that each criteria pollutant be modeled when emissions of one criteria pollutant exceed the screening threshold of 100 lb/day.

Project Feature Described in the DEIR	Project Feature in This Report	Explanation
Cancer risk is assessed for a 60-year exposure and cancer burden is omitted because residential cancer risk is determined to be a negative value at each census block centroid.	Cancer risk is assessed for a 70-year exposure duration. Two 70-year analyses are performed. Specifically, the following durations are included: 1. Years 1 thorough 70 (Phase 1 and part of Phase 2); and 2. Years 31 through 100 (Phase 2). Cancer burden is reported including a figure showing the census block centroids geographic relation to Project cancer risk isopleths.	Updated based on comments received on the DEIR.
HRA evaluates risk from on-site emissions to receptors located near the Project site(s).	HRA evaluates risk from on-site emissions to receptors located near the Project sites and from off-site emissions to receptors located along truck haul routes.	Updated based on comments received on the DEIR.
Dispersion models contain receptor grids that are sparce.	Dispersion models align with current SJVAPCD guidance on receptor grid density.	Updated based on comments received on the DEIR as needed to conform with current SJVAPCD guidance.
Dispersion and HRA models use software, data, and guidance available in 2019 when the original report was prepared.	Current (2026) software versions, methods, and meteorological/monitoring data is used.	Updated to be consistent with currently available software and data.

Using refined methods and parameters described above, the emissions inventory was revised, models updated, and significance determinations reviewed. The revised assessment shows the impact conclusions from the DEIR remain unchanged.

Each air quality and climate change impact statement from CEQA Guidelines Appendix G Environmental Checklist Form (California Code of Regulations, Title 14) is used to determine the significance of Project impacts and each impact is discussed below in the following order:

- Impact statement.
- Project impact significance determination.
- Mitigation measures, if necessary.
- Mitigated Project impact results and significance determination.

1. Air Quality

Summary of Impact AQ-1) **The Project would not conflict with or obstruct implementation of any applicable air quality plan. Potential conflicts with applicable air quality plans have been analyzed and ruled out (see Section 3.5.1).**

The Project would not conflict with or obstruct specific control measures and is consistent with attainment goals in an air quality plan. The Air Quality Management Plans (AQMP) represent a broader legislative agenda which can be represented in the form of SJVAPCD rules and thresholds such as the ones which are analyzed in this Report. See report sections 3.1.4.2 Rules and Regulations and 3.3 Significance Thresholds.

Summary of Impact AQ-2) **The Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable Federal or State ambient air quality standard.**

Table ES1 presents Project annual emissions for each criteria pollutant and the associated significance criteria established by SJVAPCD which are applied to total emissions from permit-required stationary sources and permit-exempt sources separately though the significance criteria for each are equivalent. As shown in Table ES1.

Table ES1. Annual Project Emissions and Comparison to APCD Significance Criteria

Criteria Pollutant	Permit – Required Sources (tons/yr)			Permit - Exempt Sources (tons/yr)		
	Project	Significance Criteria	Project Exceeds?	Project	Significance Criteria	Project Exceeds?
ROG	6.2	10	No	-0.1	10	No
CO	34.3	100	No	49.4	100	No
NO_X	3.4	10	No	5.2	10	No
PM_{10}	9.8	15	No	-25.4	15	No
$PM_{2.5}$	2.9	15	No	-6.3	15	No
SO_X	0.9	27	No	1.4	27	No

Source: Appendix G.

Note: Negative values represent emissions reductions due to newer technology and lower emission equipment as would be expected from phase in of existing engine regulations.

Impact analysis for a project's potential to exceed or contribute to exceedance of an ambient air quality standard (AAQS) normally involves modeling the mass of emissions to predict ground-level concentrations

that would occur for each pollutant's averaging period(s) at the location of the maximum concentration offsite (typically the property boundary). SJVAPCD has established a screening level of 100 lb/day that is used to screen out of modeling for impacts that are unlikely to exceed a threshold. Baseline emissions from sources currently located at the Rockfield properties were subtracted from future emissions at the property to determine the Project increase in emissions on-site for comparison to the 100 lb/day screening level as shown in Table ES2. (Appendix G, Dataset 2).

Table ES2. Project On-site Daily Emissions and Model Screening Level Comparison

Scenario	CO (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	$PM_{2.5}$ (lb/day)	SO_X (lb/day)
On-Site Baseline	228.4	544.0	1,023.5	238.2	0.5
On-Site Future	1,323.4	669.6	1,057.8	257.1	26.6
On-Site Project	1,095.0	125.4	34.3	18.8	26.1
Screening Criteria	**100**	**100**	**100**	**100**	**100**
Exceeds Criteria?	**Yes**	**Yes**	**No**	**No**	**No**

Source: Appendix G.

As shown in Table ES2, emissions increases associated with the Project exceed the screening levels for CO and NOX.

Mitigation Measures

The Mitigated Project incorporates control of off-road engine PM_{10} emissions, and an increase in the level of control on sources of fugitive dust (roads, stockpiles) using the control methods described in the Fugitive Dust Control Plan, Appendix K.

Mitigation Measure AQ-1: Off-road Engines

Off-road engines shall be retrofitted or upgraded in order to meet the Tier 4i Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower-hour.

Mitigation Measure AQ-2: Fugitive Dust Control

Implement controls for fugitive dust as described in the fugitive dust control plan ("FDCP"), Appendix K. Unpaved roads shall be controlled at a level of 90% by application of chemical dust suppressants or other equivalent methods. Stockpiles shall be controlled at a level of 90% by application of water or other equivalent methods. Hard rock excavation process shall be controlled at a level of 90% by application of water or other equivalent methods.

Mitigated Project emissions are summarized in Tables ES3 and ES4.

Table ES3. Mitigated Annual Emissions and Comparison to APCD Significance Criteria

Criteria Pollutant	Permit – Required Sources (tons/yr)			Permit - Exempt Sources (tons/yr)		
	Project	Significance Criteria	Project Exceeds?	Project	Significance Criteria	Project Exceeds?
ROG	6.2	10	No	-0.1	10	No
CO	34.3	100	No	49.4	100	No
NO_X	3.4	10	No	5.2	10	No
PM_{10}	4.3	15	No	-67.4	15	No
$PM_{2.5}$	1.3	15	No	-17.1	15	No
SO_X	0.9	27	No	1.4	27	No

Source: Appendix H.

Note: Negative values represent emissions reductions due to newer technology and lower emission equipment as would be expected from phase in of existing engine regulations and implementation of Mitigation Measures AQ-1 through AQ-3.

Table ES4. Mitigated On-site Daily Emissions and Model Screening Level Comparison

Scenario	CO (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	$PM_{2.5}$ (lb/day)	SO_X (lb/day)
On-Site Baseline	228.4	544.0	1,010.9	234.5	0.5
On-Site Future	1,323.4	669.4	573.4	136.7	26.6
On-Site Project	1,095.0	125.4	-437.5	-97.8	26.1
Screening Criteria	**100**	**100**	**100**	**100**	**100**
Exceeds Criteria?	**Yes**	**Yes**	**No**	**No**	**No**

Source: Appendix H.

As shown in Table ES-4 Project increases in onsite daily emissions of CO and NOx remain greater than the screening level after mitigation. In accordance with SJVAPCD Policy APR-2030, when any one of the criteria pollutants surpasses its established screening threshold, air dispersion modeling is required for all criteria pollutants. Therefore, the off-site concentration of each criterion pollutant was modeled, and results are presented in Table ES5.

Air dispersion modeling was performed using the latest version of AERMOD to ensure accurate and reliable air quality predictions. Short term effects of blasting were modeled separately from other sources because mining and related operations cease during blasting. Long term effects of blasting are assessed in a model that includes other sources.

Table ES5. Mitigated Criteria Pollutant Concentrations and AAQS Comparison

Pollutant	Period	Background (ug/m³)[a]	Project Contribution[b] (ug/m3)		Proposed Project + Background (ug/m³)	NAAQS[c] (ug/m³)	CAAQS[c] (ug/m³)	SJVAPCD Significant Impact Level (SIL)[e] (ug/m³)	Significant?
NO2	1-hour	25.46	H1H	79.93	105.39	—	339	NA	No
	1-hour	25.46	H8H	69.29	94.75	188	—	NA	No
	Annual	11.31	H1H	5.17	16.48	100	57	NA	No
SO2	1-hour	1.59	H1H	9.96	11.55	196	655	NA	No
	Annual	1.59	H1H	1.09	2.68	26	—	NA	No
CO	1-hour	301	H1H	231	533	40,000	23,000	NA	No
	8-hour	308	H1H	255	563	10,000	10,000	NA	No
PM10	24-hour	—[d]	H8H	0.2365	N/A	150	50	10.4	No
	Annual	—[d]	H1H	-0.1101	N/A	—	20	2.08	No
PM2.5	24-hour	—[d]	H8H	-0.0152	N/A	35	—	2.5	No
	Annual	—[d]	H1H	0.0825	N/A	9	12	0.63	No
Pb	3-month	0.003	Max Ave	0.003	0.006	0.15	—	NA	No

Source: Appendix I.

a) Background concentration is obtained from Site No. 11.

b) HIH = 1st Highest High (highest modeled result). Where a pollutant and averaging period has a NAAQS and CAAQS standard, the most stringent standard is selected.

c) San Joaquin Valley APCD is in attainment for these pollutants (excluding PM10 and PM2.5) and averaging periods; therefore, the most stringent AAQS (CAAQS or NAAQS) is used for the significance determination.

d) San Joaquin Air Basin is classified as "non-attainment" for PM10 and PM2.5. Therefore, San Joaquin Valley APCD Significant Impact Level (SIL) is used for determining significance and does not require background concentrations (APR 1925) (SJVAPCD, 2024).

e) SIL is defined as "a concentration threshold used to determine whether a proposed source's emissions will have a "significant impact on air quality in an area" (APR 1925) (SJVAPCD, 2024).

As shown in Table ES3, mitigated annual emissions are less than applicable significance thresholds. As shown in Table ES5, future concentrations of criteria pollutants (Project + Background) would be less than each AAQS. Therefore, the Project would not contribute to an exceedance of an AAQS and the impact is less than significant.

Summary of Impact AQ-3) The Project would not expose sensitive receptors to substantial pollutant concentrations.

Table ES6 presents the health risk assessment ("HRA") results for the Project.

Table ES6. Project Health Risk Impacts and Comparison to APCD Significance Thresholds

Model Receptor # – Type	Excess Cancer Cases per Million People Exposed (Years 1-70)	Excess Cancer Cases per Million People Exposed (Years 31-100)	Max Chronic Hazard Index	Max Acute Hazard Index
23 – Residence (MEIR – Cancer, Chronic)	5.05	2.17	0.01	0.106
25 – Residence (MEIR – Acute)	0.41	-0.007	0.003	0.18
20 – Worker (MEIW – Cancer, Chronic)	-2.39	-2.10	<0.001	0.05
6772 – Fenceline Receptor (PMI-Acute)	N/A	N/A	N/A	0.85
Significance Threshold	**20**	**20**	**1.0**	**1.0**
Threshold Exceeded?	**No**	**No**	**No**	**No**

Source: Appendix I

Note: These receptors represent locations of highest exposure. Discrepancies between table and appendix values may exist due to rounding. Off-site receptors were assessed as worker receptors under the conservative assumption that residences may be used as workplaces and agricultural workers may be present in fields surrounding the site.
See Figure 8b for locations of receptors in this Table.
MEIR: Maximum Exposed Individual Receptor occurs for non-cancer chronic hazard and cancer risk at the same receptor (#23).
MEIW: Maximum Exposed Individual Worker occurs for non-cancer chronic hazard and cancer risk at the same receptor (#20).
Acute hazard is evaluated for the PMI: Point of Maximum Impact. The Acute MEIR is presented for informational purposes.
Offsite Grid PMI located in UTM Zone 11.

Negative numbers in Table ES6 are the result of the Future condition having lower health risk impact than the Baseline condition. Project emissions reductions occur as a result of CARB regulations and standards that mandate cleaner engines over time, as well as the facility-wide incorporation of new technologies generally that are more efficient and result in lower emissions such as phase in of higher tier engines.

Mitigation Measures

Mitigation measures AQ-1 and AQ-2 are outlined above (page iv). Mitigation Measure AQ-3 described under Impact Statement AQ-4 is also included in Table ES7. Mitigated analysis calculations can be found in Appendix H. Health risk associated with the Mitigated Project is summarized in Table ES7, which shows health risk does not exceed thresholds.

Table ES7. Project Health Risk Impacts After Mitigation

Model Receptor # – Type	Excess Cancer Cases per Million People Exposed (Year 1-70)	Excess Cancer Cases per Million People Exposed (Year 31-100)	Max Chronic Hazard Index	Max Acute Hazard Index
23 – Residence (MEIR – Cancer, Chronic)	5.03	2.12	0.008	0.104
25 – Residence (MEIR – Acute)	0.41	0.01	0.002	0.18
20 – Worker (MEIW – Cancer, Chronic)	-2.39	-3.29	<0.000	0.05
6772 – Fenceline Receptor (PMI-Acute)	N/A	N/A	N/A	0.84
Significance Threshold	**20**	**20**	**1.0**	**1.0**
Threshold Exceeded?	**No**	**No**	**No**	**No**

Source: Appendix I.

Note: These receptors represent locations of highest exposure. Discrepancies between table and appendix values may exist due to rounding. No worker receptors exist in vicinity of the Project site. Potential residential locations were chosen to represent the maximum worker exposure under the assumption that residences may be used as workplaces.
See Figure 8b for locations of receptors in this Table.
MEIR: Maximum Exposed Individual Receptor occurs for non-cancer chronic hazard and cancer risk at the same receptor (#23).
MEIW: Maximum Exposed Individual Worker occurs for non-cancer chronic hazard and cancer risk at the same receptor (#20).
Acute hazard is evaluated for the PMI: Point of Maximum Impact. The Acute MEIR is presented for informational purposes.

Negative numbers in Table ES7 are the result of the Future condition having lower health risk impact than the Baseline condition. Project emissions reductions occur as a result of CARB regulations and standards that mandate in cleaner engines over time, as well as the facility-wide incorporation of new technologies generally that are more efficient and result in lower emissions. Moreover, mitigation measures that reduce fugitive dust in the Future condition also result in a decrease in modeled health risk at receptors.

As outlined in Table ES7, HRA demonstrates that the Mitigated Project would have a less than significant impact on nearby receptors, including sensitive receptors.

Summary of Impact AQ-4) The Project would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

The asphalt plant operated on the Plant Site prior to the Baseline period and did not receive complaints about odor from a substantial number of people. The new asphalt plant will have lower emissions. Therefore, odor complaints are unlikely to occur with the Project and impact on odor is less than significant. Further, the following mitigation measure will be implemented as included in the DEIR.

Mitigation Measure AQ-3: Asphalt Plant Emissions Controls

The following design features will mitigate VOC, SVOC, and/or SO2 emissions:

1. The type of asphaltic cement produced by on-site plants affects odorous emissions. Some asphaltic cements have lower VOC/SVOC emissions than others. Therefore, asphaltic cements with lower VOC/SVOC emissions will be used to the extent feasible.
2. In accordance with SJVAPCD Rule 4309, the Project will implement "periodic burner tune-ups" that may reduce VOC emissions from the asphalt plant.
3. Mixing drum vapors will be routed back to the dryer burner.

2. Greenhouse Gasses

Summary of Impact GHG a) The Project would not generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment. (see Section 4.5.1).

Climate change is caused by cumulative GHG emissions. An individual project or emission source typically does not cause a significant climate change effect; it is caused by a large number of sources around the world emitting GHGs that collectively create a significant cumulative impact. Under 14 CCR 15130(a)(3), "An EIR may determine that a project's contribution to a significant cumulative impact will be rendered less than cumulatively considerable and thus is not significant. A project's contribution is less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact. The lead agency shall identify facts and analysis supporting its conclusion that the contribution will be rendered less than cumulatively considerable." Project emissions of GHGs are presented in Table ES8.

The GHG analysis in the Final EIR was revised, as envisioned by CEQA, to address comments on the DEIR by several commenters, including the Center for Biological Diversity. The DEIR was released on December 20, 2024 and the comment period closed on March 10, 2025. In the DEIR, the GHG analysis relied in part on an analysis used in an EIR certified by Kern County in approving the modification to an oil refinery. That DEIR acknowledged that certain GHG emissions related to the consumption of fuel and the use of electricity were offset upstream of those uses pursuant to California's Cap-and-Trade Program. This approach was upheld in a decision by the Fifth District Court of Appeal, which appellate court has jurisdiction over Fresno County, in *Association of Irritated Residents v. Kern County Board of Supervisors*, 17 Cal.App.5th 798 (2017) ("AIR"). However, on June 26, 2025 a new California appellate case out of Los Angeles County reviewing the use of offsets under the Cap-and-Trade Program as part of an EIR used to evaluate a housing development program was filed by the 2nd District Court of Appeal, *Center for Biological Diversity v. County of Los Angeles*, 112 Cal.App.5th 317 (2025) ("LA County Decision"). The LA County Decision distinguished the AIR Decision and held that Los Angeles County could not rely on the fact that transportation fuels and electricity that would be used as part of the project were subject to the Cap-and-Trade Program. In an abundance of caution, Fresno County decided to revise the GHG analysis in the Draft EIR to conform to the more recent LA County Decision. Accordingly, all emissions, including those involving the consumption of fuel and the use of electricity, are included in determining whether total emissions would exceed the DEIR GHG significance threshold of 10,000 MTCO2e/yr.

The operation of the Project within Fresno County would likely reduce regional VMT and thus GHG emissions according to Peter Berck in his January 2005 Working Paper 994, "A Note on the Environmental Costs of Aggregate" (Appendix B). That is to say that if the Project was not approved, the aggregate needed for on-going construction activities in Fresno County as well as the San Joaquin Valley Air Basin would have to come from mines farther away and would thereby increase regional VMT and GHG emissions.

In order to accurately address the impact of the Project, a regional increment analysis, was conducted which

characterizes the Project contribution to cumulative regional GHG emissions (Appendix J). The methodology of the regional increment analysis responds to current regulatory guidance and reflects how aggregate demand and associated emissions are projected and managed at the regional level. The regional increment analysis is based on Project activity levels, as well as regional aggregate demand as forecast in the California Department of Conservation Map Sheet 52.

State and regional planning forecasts indicate that aggregate demand is driven by population growth and overall regional development, rather than by the maximum production capacity of any single facility. Accordingly, while the Project is capable of supplying aggregate to meet regional needs, its operation would not create a net increase in regional aggregate demand beyond that already forecast. Any increase in production from the Project would be offset by corresponding reductions in production from other facilities serving the same regional market, resulting in no substantial change in total regional output. Consistent with this framework, the GHG analysis evaluates emissions based on the Project's proportional share of regional demand growth, rather than calculating emissions based on continuous operation at maximum throughput. This approach ensures that the Project's GHG emissions are attributed in a manner that reflects realistic market conditions and real-world impacts. Emissions from on-road, off-site vehicles associated with the Project are calculated in terms of the Project's regional increment, and are included in Table ES8.

Emissions from non-employee off-site, on-road vehicles associated with the project were calculated by summing the operational regional increment with the Baseline condition (709MT CO_2e/yr and 5,359 MT CO_2e/yr, which comes out to a total of 6,068 CO_2e/yr). As described in Appendix L, renewable diesel (RD) went from negligible in 2005 to 16% in 2018 to 70% today and is expected to achieve close to 90% in 2045. Based on 2025 reporting, RD has approximately 40% of the carbon intensity of low sulfur diesel fuels and is contributing to reducing the carbon intensity (CI) of the available ultra-low sulfur diesel available on the market in accordance with the LCFS benchmarks (Appendix L). Accordingly, Project-related off-site on road fleet emissions were reduced by the CI reductions established in the LCFS benchmarks; for the years between 2016 and 2018 the realized CI reduction was 2% and for the years from 2016 to 2026, it was 18.6% (See Figure 2 in Appendix L).

Further, California's in-use off-road diesel fueled fleets regulations require the use of RD; to be reasonably conservative and based on the LCFS benchmark data, an adjustment of 50% was applied to estimated Project-related off-road diesel emissions operating onsite (see Appendix L). This is less than the 55% reduction in CI measured in 2025 between RD and LSDF (Appendix L, Tables 3 and 4) and the approximately 90% in ULSD projected for 2045 (Appendix L, Table 2). This shift has been driven in part by the California Low Carbon Fuel Standard, adopted by the California Air Resources Board in 2009 and implemented beginning in 2011, which requires progressively lower lifecycle carbon intensity for transportation fuels used in the state. Project Impacts represent the difference between the baseline condition and the operating condition. As shown in Table ES8, Project operations minus the Baseline conditions result in GHG impacts that are less than the significance threshold.

Based on the analysis presented above and as shown in Table ES8, the Project's net increase in GHG emissions would be less than the SCAQMD significance threshold of 10,000 MTCO_2e per year. This conclusion reflects the use of a regional increment methodology that accounts for regional aggregate demand, the

absence of a net increase in regional production, and compliance with statewide programs that reduce the carbon intensity of fuels and electricity. This analysis does not rely on the California Cap and Trade program, given recent CEQA case law. Accordingly, the Project's impact on climate change would be less than significant under CEQA.

Table ES8. Mitigated Project GHG Emissions

Activity		**CO_2e (MT/yr)**
Construction Phase (Maximum Year)		6.6
Operation Phase Total		21,301
On-site On-road Sources (1)(a)	927	
On-site Offroad Sources (2)(b)	4,236	
Non-Employee Off-site On-road Sources (regional increment) (c)	6,068	
Employee Off-site On-road Sources (d)	302	
Stationary Sources (Asphalt Plant) (e)	8,394	
Electricity (f)	1,373	
Baseline Condition Total		13,737
On-site On-road Sources (1)(a)	954	
On-site Offroad Sources (2)(b)	5,212	
Non-Employee Off-site On-road Sources (regional increment) (c)	5,359	
Employee Off-site On-road Sources (d)	293	
Stationary Sources (e)	-	
Electricity (g)	1,919	
Project Emissions (Operation Phase Minus Baseline Condition)		7,564
GHG Threshold of Significance		10,000
Significant?		**No**

1) Off-road units comply with offroad engine rules which require renewable diesel and adjusted by 50% (see Appendix L)
2) Off-site on-road units evaluated based on incremental share of regional increase in emissions (see Appendix J)

Summary of Impact GHG b) The Project would not conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs. Potential conflicts with applicable air quality plans have been analyzed and ruled out (see Section 4.5.2).

Project emissions are evaluated with respect to consistency primarily with the plans and policies outlined in Table ES9 below, as well as other plans and policies, as outlined in Appendix E, that have been adopted to reduce GHG emissions.

Table ES9 Adopted GHG Policies

Plan/Policy	Consistent?
A local jurisdiction's qualified climate action plan or GHG reduction plan.	As detailed in section 4.1.5, the Project is consistent because no local climate action or GHG reduction plans apply to the project.
AB 32, SB 32 and the Scoping Plan	AB 32 requires that the CARB adopt regulations to require the reporting and verification of statewide greenhouse emissions and monitor and enforce compliance with the program. The Project is in compliance with the 2022 Scoping Plan as demonstrated in Table 42 Project Greenhouse Gas Emissions. In the preparation of this Report, the calculation of emissions from fuel and electricity subject to AB 32 and SB 32 were no longer used to reduce GHG emissions for determining the level of significance given recent CEQA case law. Fresno County utilized the SCAQMD 10,000 $MTCO_2e$/yr significance threshold. As noted in Section 4.1.4, this threshold of 10,000 $MTCO_2e$/yr has been previously utilized to determine significance in an approved EIR in the SJVAPCD area. Referring to Table ES8 above, total applicable Project GHG emissions are estimated to be 7,564 $MTCO_2e$/yr, less than the 10,000 $MTCO_2e$/yr threshold. As such, the Project is consistent with the emissions reductions targets outlined in AB 32 and the 2017 and 2022 Scoping Plan.
CA Executive Order B-30-15 goals.	The Project is consistent with the Executive Order B-30-15 goals which apply to the fuel and electricity sectors as a whole. The fuels and electricity used by the Project would be subject to the Cap-and-Trade program as well as other Scoping Plans and related control measures (e.g., renewable energy portfolio, low carbon fuel standard) that are applied higher up in the supply chain. (There is no plan, policy or regulation adopted for the purpose of reducing emissions of GHGs specifically from mining projects).

As outlined in Table ES9, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Moreover, Appendix E details additional plans, policies, and regulations that have been reviewed to ensure the Project would not result in a conflict.

Air Quality, Health Risk, and Climate Change Impact Assessment
Rockfield Modification Project
Fresno County, California

Revised, May 13, 2026

1.0 INTRODUCTION

This Air Quality, Health Risk, and Climate Change Impact Assessment (Report) was prepared for inclusion in the Final Environmental Impact Report (FEIR) for the subject Project. It incorporates prior technical documentation found in Appendices D-1 and D-2 of the Draft Environmental Impact Report (DEIR).

This Report has two primary sections: air quality and greenhouse gas (GHG). Each is divided into the following sub-sections:

- **Regulatory Setting**. This subsection describes the characteristics of pollutants as well as federal, state [1], and local regulations that apply to the Project.
- **Environmental Setting**. This subsection describes the existing physical environment (i.e., CEQA baseline) [2] for the region and areas adjacent to the Project site.
- **Significance Thresholds**. This subsection presents the state CEQA Guidelines Appendix G checklist items which are the primary thresholds used along with the SJVAPCD significance criteria that are applied to determine the significance of the Project.
- **Methodology**. This subsection describes the design features of the Project, emissions calculation methods, emissions that are in the Baseline for the Project, and health risk assessment (HRA) methods.
- **Project-Level Impacts and Mitigation Measures**. This subsection presents the results of Project impact analyses; compares each impact to significance thresholds; determines significance of Project effects; proposes mitigation measures to reduce significant impacts to less than significant levels or the maximum extent feasible.

[1] The words “federal,” “national,” and “state” are capitalized when referring to a specific rule, regulation or other item that could be unique (e.g., State CEQA Guidelines in preceding paragraph). The words are not capitalized when describing items in general terms not specific to this nation or state. As presented in this bullet; federal, state and local are levels of government/regulation; and thus, are not capitalized.

[2] The word “baseline” is capitalized in this report when referring to the Project Baseline and is not capitalized when referring to the concept of baseline under CEQA and/or baselines for other projects, plans, regulations, etc.

2.0 PROJECT DESCRIPTION

The Rockfield Modification Project is a modification of CEMEX Construction Materials Pacific, LLC's (CEMEX) existing aggregate (sand and gravel) mining and processing operations located on two properties between North Friant Road and the San Joaquin River in Fresno County (the Project). The Project includes the existing approximately 122 acre Plant Site located approximately 1.5 miles north of the City of Fresno and the existing approximately 349 acre Quarry Site located approximately 2.0 miles north of the Plant Site and approximately 2.0 miles south of the town of Friant. Figures 1 and 2 (Appendix A) represent the regional and local location of the sites respectively.

Aggregate mining and processing have been continuous at the Plant Site since 1924. Existing operations at the Plant Site are permitted under several Fresno County Conditional Use Permits (CUP) and include aggregate mining, an aggregate processing plant, a ready-mix concrete plant, a hot-mix asphalt plant (currently inactive), related supportive facilities, and the processing of raw aggregate mined from the Quarry Site. A portable plant is brought in periodically to recycle come-back concrete (unused concrete in mixer upon return to plant) into crushed miscellaneous base. Aggregate from the alluvial deposit has been partially mined from portions of the Plant Site. The entire Plant Site is disturbed by mining and processing operations with the exception of required setbacks from Friant Road.

Aggregate mining has been permitted at the Quarry Site since 1960 under several Fresno County CUPs. There has been active mining on the site since the 1980's. Existing operations at the Quarry Site include aggregate mining of the alluvial deposit. There are no plant operations at the Quarry Site. An interplant haul of raw aggregate up to 1.4 million tons per year (mtpy) has been transported via Friant Road approximately 2 miles south to the Plant Site for processing. Most of the Quarry Site has been partially mined and is almost entirely disturbed (approximately 90%) by the current and historical mining operations with the exception of required setbacks from the San Joaquin River and Friant Road. During mining operations, surface and/or groundwater encountered within the excavation is pumped to an existing pond in the northeast corner of the Quarry Site for recharge to the groundwater and to existing groundwater recharge trenches along the western boundaries of the Quarry site.

The Project would occur in two phases as described below:

Phase 1 would include concurrent operations at both the Quarry Site and the Plant Site for up to 30 years. At the Plant Site, the existing aggregate processing plant would continue to be used to wash, screen, crush and sort aggregate mined from the Plant Site. The existing RMC plant would continue to operate and a modern asphalt plant would be installed and operated. Aggregate products from the Plant Site and ready-mix concrete would continue to be sold to customers. Periodic use of a portable crushing plant to recycle come-back concrete would continue with the addition of imported concrete and asphalt debris for recycle into crushed miscellaneous base and recycled asphalt product (RAP). The remaining alluvial deposit would be mined to a depth of approximately 85 feet below ground surface (bgs). Surface and/or groundwater encountered within the excavation would be pumped to groundwater recharge trenches along boundaries of the Plant Site.

At the Quarry Site, mining would be modified to include the hard rock (granite) that lies beneath the alluvial deposit that has historically been mined. Mining of the hard rock would require drilling and blasting and would occur to a depth of approximately 600 feet bgs. Surface and/or groundwater encountered within the excavation would continue to be pumped to an existing pond in the northeast corner of the Quarry Site for recharge to the groundwater and to existing groundwater recharge trenches along the western boundaries of the Quarry site. An aggregate processing plant would be added to the Quarry Site to wash, screen, crush and sort the aggregate. The plant would be located in a previously mined pit approximately 30 feet bgs in the northern portion of the Quarry Site. A portable aggregate processing plant may be used initially. A primary crusher, hydraulic shovel, and a dozer used to rip ground and push rock to the crusher would be located in the bottom of the pit. Mined rock would be transported to the on-site processing plant by conveyor.

Combined annual processing throughput of aggregate from both sites is estimated to increase from the 1.4 mmtpy in the Baseline to 2.0 mmtpy within five years and 3.0 mmtpy within 10 years. Phase 1 operations are estimated to be on-going for up to 30 years. The RMC plant and the HMA plant may be relocated from the Plant Site to the Quarry Site in less than 30 years in order to recover the remaining alluvial deposit under the plants. Upon completion of mining at the Plant Site, operations at the Plant Site would cease, all equipment would be removed and the site reclaimed as 122 acres of open space, riparian and open water wildlife habitat.

Phase 2 would continue hard rock mining and processing operations at the Quarry Site. The RMC plant and the HMA plant would be relocated from the Plant Site to the Quarry Site adjacent to the aggregate processing plant and interplant haul would cease. The periodic use of a portable plant to recycle concrete and asphalt debris (including imported) into crushed miscellaneous base and RAP would occur at the Quarry Site. Phase 2 operations are estimated to have annual aggregate processing rate of 3.0 mmtpy and be on-going for at least 70 years. Since the interplant haul would cease beginning with Phase 2, traffic would be less than for Phase 1. Upon completion of mining at the Quarry Site, operations at the Quarry Site would cease and all equipment would be removed. Reclamation of the Quarry Site would create approximately 349 acres of open space, riparian and open water wildlife habitat.

The Project (Phases 1 and 2 combined) is estimated to take 100 years. Materials production increases are outlined in Table 1. The proposed actions are analyzed in this Air Quality, Health Risk, and Climate Change Impact Report (Report) and heretofore referred to as the "Project". Project features described in the Report are those that affect air quality and greenhouse gas emissions.

This Report presents technical information and analysis describing reasonably foreseeable changes to the environment that would occur with the Project. Project impacts on regional and local environmental setting are assessed for construction and operation phases of the Project using current standard practices and the State CEQA Guidelines (14 CCR §15000 et. seq.). Features of the Project that affect air quality and/or GHG are analyzed are summarized in Table 1.

Table 1 Cemex Rockfield Project Summary

Activity	Description
Construction	
Aggregates Plant Construction	Construction of aggregates processing plant at the Quarry Site. Expected schedule of 10 months.
Grading	Expected schedule of 20 days.
Paving	Paving of approximately one mile of road (Appendix A, Figure 6). Expected schedule of 10 days.
Site Preparation	Clearing of site and site preparation. Expected schedule of 10 days.
Resource Recovery and Processing	
Mining Method	Addition of hard rock mining to Quarry Site activities. Addition of primary crusher in pit. Increased use of excavator and dozer operations, in addition to excavation by hydraulic shovel or front-end loader. Addition of blasting will be required.
Processing	Extracted resources at the Quarry Site will be processed onsite rather than being transported to the Plant Site for processing.
Estimated Annual Aggregates Throughput	Increase from 1,374,272 tons per year to 3,000,000 tons per year
Estimated Annual Ready Mix Production	Increase from 189,550 cubic yards per year to 300,000 cubic yards per year
Estimated Annual Recycle Plant Production	Increase from 25,000 tons per year to 200,000 tons per year
Estimated Annual Asphalt Plant Production	Increase from 0 tons per year to 500,000 tons per year
Hours of Operation	6 days per week, Monday through Saturday (For health risk assessment, modeled conservatively as 7 days per week, 12 hours per day, per standard practice. For criteria pollutant emissions, modeled based on maximum hour and day, by activity levels.)

3.0 AIR QUALITY

This Report primarily follows the *APR – 1906 Framework for Performing Health Risk Assessments* (SJVAPCD, 2015), *Air Toxics Hot Spots Program Guidance Manual for the Preparation of Risk Assessments* (OEHHA, 2015), *APR 1905 – Risk Management Policy for Permitting New and Modified Sources* (SJVAPCD, 2015)*, and Guidance for Assessing and Mitigating Air Quality Impacts* (SJVAPCD, 2015).

3.1 Regulatory Setting

3.1.1 Characteristics of Air Pollutants

Both the State and the Federal governments have established health-based criteria called Ambient Air Quality Standards (AAQS) for six air pollutants. These "criteria pollutants" are ozone (O_3), carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), lead (Pb), and suspended particulate matter ($PM_{2.5}$ and PM_{10}). Each criteria pollutant is described more fully below and associated AAQS are presented in Table 2.

Many constituents in air emissions other than criteria pollutants may result in health effects and are regulated as TACs using health risk assessment methods (i.e., as opposed to comparing concentration of criteria pollutant to an AAQS). Diesel particulate matter (DPM) and respirable crystalline silica (RCS) are two TACs of concern associated with Project sources and are also discussed below. Appendix D contains information from the American Thoracic Society (ATS) on what constitutes an adverse health effect from air pollution which is the standard used by the Office of Environmental Health Hazard Assessment (OEHHA) and CARB in setting AAQS and exposure levels used for health risk assessment (HRA).

Ozone – Ozone (smog) is formed by photochemical reactions between oxides of nitrogen (NO_X) and volatile organic compounds (VOC), rather than being directly emitted. Generally, air districts prioritize NOx reductions over VOC reductions because NOx reductions would have greater effect on reducing ozone concentrations and be more protective of public health.

O_3 is a pungent, colorless gas typical of photochemical smog. Elevated O_3 concentrations may result in reduced lung function, particularly during vigorous physical activity. This health effect is particularly acute in sensitive receptors such as the sick, the elderly, and young children. O_3 levels peak during summer and early fall.

Breathing ground-level ozone can result in a number of health effects that are observed in broad segments of the population. Some of these effects include: induction of respiratory symptoms; decrements in lung function; and inflammation of airways. Respiratory symptoms may include: coughing; throat irritation; pain, burning, or discomfort in the chest when taking a deep breath; and chest tightness, wheezing, or shortness of breath. In addition to these effects, evidence from observational studies indicates that higher daily ozone concentrations are associated with increased asthma attacks, increased hospital admissions, increased daily mortality, and other markers of morbidity. The consistency and coherence of the evidence for effects upon asthmatics suggests that ozone can make asthma symptoms worse and can increase sensitivity to asthma triggers.

Carbon Monoxide – Carbon monoxide (CO) is formed by the incomplete combustion of fossil fuels, almost entirely from automobiles. It is a colorless, odorless gas that can cause dizziness, fatigue, and impairments to central nervous system functions.

The severity of symptoms due to CO exposure increases with the blood carboxyhemoglobin (COHb) level. The first signs of CO exposure include mild headache and breathlessness with moderate exercise. Continued exposure may lead to more severe headache, irritability, impaired judgment and memory, and rapid onset of fatigue. Persons that may be more sensitive to CO exposure include those having an existing cardiovascular disease or anemia; fetuses of pregnant women; smokers; and persons exposed to methylene chloride.

Nitrogen Oxides – Nitrogen oxides (NO_X) is a generic term for the mono-nitrogen oxides which include nitric oxide (NO) and nitrogen dioxide (NO_2). NO is a colorless, odorless gas and NO_2 is a reddish brown gas. NO_X is formed from fuel combustion under high temperature or pressure. NO_X is a primary component of the photochemical smog reaction. It also contributes to other pollution problems, including a high concentration of fine particulate matter, poor visibility, and acid deposition (i.e., acid rain). NO_X decreases lung function and may reduce resistance to infection. Acute exposure to NO_2 may cause pulmonary edema, pneumonitis, and bronchitis. NO_2 is considered a relatively insoluble, reactive gas, such as phosgene and ozone. Once inhaled, NO_2 reaches the lower respiratory tract, affecting mainly the bronchioles and the adjacent alveolar spaces, where it may produce pulmonary edema within hours.

Sulfur Dioxide – Sulfur dioxide (SO_2) is a colorless, irritating gas formed primarily from combustion of fuels containing sulfur. Industrial facilities also contribute to gaseous SO_2 levels. SO_2 irritates the respiratory tract, can injure lung tissue when combined with fine particulate matter, and reduces visibility and the level of sunlight. People with asthma and children are particularly sensitive to and are at increased risk from the effects of SO_2 air pollution

Lead – Lead (Pb) was phased out of use in gasoline and paint. It is present at trace concentrations in a variety of other materials including most natural materials extracted from the earth's crust. Once in the bloodstream, Pb can cause damage to the brain, nervous system, and other body systems. Children are highly susceptible to the effects of Pb.

Particulate Matter – Particulate matter (PM) pollution consists of very small liquid and solid particles floating in the air. Some particles are large or dark enough to be seen as soot or smoke. Others are so small they can be detected only with an electron microscope. Particulate matter is a mixture of materials that can include smoke, soot, dust, salt, acids, and metals. Particulate matter also forms when gases emitted from motor vehicles and industrial sources undergo chemical reactions in the atmosphere. PM_{10} refers to particles less than or equal to 10 microns in aerodynamic diameter. $PM_{2.5}$ refers to particles less than or equal to 2.5 microns in aerodynamic diameter and are a subset of PM_{10}.

There are sources of PM_{10} in both urban and rural areas. PM_{10} and $PM_{2.5}$ are emitted from stationary and mobile sources, including diesel trucks and other motor vehicles, power plants, industrial processing, wood burning stoves and fireplaces, wildfires, dust from roads, construction, landfills, and agriculture, and fugitive windblown dust. Because particles originate from a variety of sources, their chemical and physical

compositions vary widely. In addition, it is now believed that $PM_{2.5}$ concentrations are highly dependent on several precursors which, like NOx and ROG for ozone, undergo chemical reactions in the environment that changes them to $PM_{2.5}$.

PM_{10} and $PM_{2.5}$ particles are small enough to be inhaled into, and lodge in, the deepest parts of the lung, evading the respiratory system's natural defenses. Health problems may occur as the body reacts to these foreign particles.

Acute and chronic health effects associated with high particulate levels include the aggravation of chronic respiratory diseases, heart and lung disease, and coughing, bronchitis, and respiratory illnesses in children. Recent mortality studies have shown a statistically significant direct association between mortality and daily concentrations of particulate matter in the air. Non health-related effects include reduced visibility and soiling of buildings. PM_{10} can increase the number and severity of asthma attacks, cause or aggravate bronchitis and other lung diseases, and reduce the body's ability to fight infections. PM_{10} and $PM_{2.5}$ can aggravate respiratory disease, and cause lung damage, cancer, and premature death.

Although particulate matter can cause health problems for everyone, certain people are especially vulnerable to adverse health effects of PM_{10}. These "sensitive populations" include children, the elderly, exercising adults, and those suffering from chronic lung disease such as asthma or bronchitis. Of greatest concern are recent studies that link PM_{10} exposure to the premature death of people who already have heart and lung disease, especially the elderly. Acidic PM_{10} can also damage manmade materials and is a major cause of reduced visibility in many parts of the United States.

Respirable Crystalline Silica – Respirable crystalline silica (RCS) refers to crystalline silicon dioxide with aerodynamic diameter less than four (4) microns (i.e., 0.0004 cm). Crystalline silica or quartz is ubiquitous in nature. Most dust generated by construction and mining activities including blasting produces dust particles larger than 4 microns. These particles are too large to reach the alveoli of the lungs which are the target organ. Thus, RCS constitutes a tiny fraction of the dust from these sources and does not represent a significant health risk to neighbors of these types of projects. In order to result in toxic effects the silica needs to be crystalline, smaller than 4 microns, inhaled, and not exhaled.

Inhalation of RCS initially causes respiratory irritation and an inflammatory reaction in the lungs. Silicosis results from chronic exposure; it is characterized by the presence of histologically unique silicotic nodules and by fibrotic scarring of the lung. Lung diseases other than cancer associated with silica exposure include silicosis, tuberculosis/silicotuberculosis, chronic bronchitis, small airways disease, and emphysema. Ambient air exposures do not cause concern but levels to which workers (e.g., miners, sandblasters) may be exposed have been shown to cause cancer.

Diesel Particulate Matter – Diesel particulate matter (DPM) is used as a surrogate for the mixture of compounds in diesel exhaust that have the potential to contribute to mutations in cells which can lead to cancer. These compounds include, but are not limited to, arsenic, benzene, formaldehyde, and nickel.

Long-term exposure to diesel exhaust particles poses the highest cancer risk of any TAC evaluated by OEHHA. CARB has estimated that about 70 percent of the cancer risk that the average Californian faces from breathing TACs stems from diesel exhaust particles. In a comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely than workers who were not exposed to diesel emissions to develop lung cancer. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Other researchers and scientific organizations, including the National Institute for Occupational Safety and Health (NIOSH), have calculated similar cancer risks from diesel exhaust as those calculated by OEHHA.

Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. People with allergies, existing cardiovascular disease, the elderly, and children considered sensitive populations for DPM exposure. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

3.1.2 Federal

The Clean Air Act (CAA) is the comprehensive Federal law that regulates air emissions from stationary and mobile sources. Congress established much of the basic structure of the CAA in 1970, and made major revisions in 1977 and 1990. Table 2 presents Federal and State AAQS. "The Clean Air Act in a Nutshell: How It Works" (EPA, 2013) contains a thorough yet concise summary of how US EPA implements the CAA. Table 3 also identifies how the CAA applies to the Project.

New Source Performance Standards – Title 40, Code of Federal Regulations (CFR), Part 60

Subpart OOO (Nonmetallic Mineral Processing Plants) is applicable to new, modified, or reconstructed nonmetallic mineral processing facilities (with certain exceptions, such as fixed sand and gravel plants and crushed stone plants with capacities of 25 tons per hour or less, or portable sand and gravel plants and crushed stone plants with capacities of 150 tons per hour or less). Subpart OOO restricts emissions from affected facilities equipped with capture systems used to capture and transport particulate matter to a control device. Emissions are prohibited in excess of 0.032 grams per dry standard cubic meter (g/dscm) (0.014 grains per dry standard cubic feet (gr/dscf)), and from exhibiting visible emissions based on quarterly monitoring. Subpart OOO also prohibits the discharge of any fugitive emissions from affected facilities without capture systems and the discharge of fugitive emissions escaping capture systems that exhibit greater than 7 percent opacity (12 percent for crushers without capture systems).

Subpart I (Standards of performance for Hot Mix Asphalt Facilities) is applicable to facilities that are used to manufacture hot mix asphalt by heating and drying aggregate and mixing it with asphalt cements. Subpart I prohibits emissions that:

- contain particulate matter in excess of 90 mg per dry standard cubic foot, or
- Exhibit 20 percent opacity or greater.

EPA Test Method 5 is used to determine particulate matter concentration and outlines sampling methodology.

Regulations Affecting New Diesel Engines

US EPA regulates emissions from new non-road (i.e., off-road, portable, and stationary) internal combustion engines by tiered standards (e.g., compression-ignition engines in 40 CFR 89.112, 40 CFR 1039.101, and 40 CFR 1039.102). Emissions from new on-road engines are regulated using standards that apply by model year, class of vehicle, and fuel type (e.g. heavy-heavy duty diesel engines in 40 CFR 86.004-11, 40 CFR 86.007-11, and 40 CFR 86.099-11). These regulations affect manufacturers but are relevant to the Project because diesel engines are the primary source of Project combustion emissions.

3.1.3 State

3.1.3.1 Criteria Pollutants

The State of California began to set California ambient air quality standards (CAAQS) in 1969. The CAAQS are generally more stringent than the NAAQS. In addition to the six criteria pollutants covered by the NAAQS, there are CAAQS standards for sulfates, hydrogen sulfide, vinyl chloride, and visibility reducing particles. These standards are listed in Table 2**.**

Originally, there were no attainment deadlines for the CAAQS. However, the California Clean Air Act (CCAA) provided a timeframe and a planning structure to promote their attainment. The CCAA required nonattainment areas in the State to prepare attainment plans and proposed to classify each such area on the basis of the submitted plan. CAAQS attainment plans require a minimum 5 percent annual reduction in the emissions of nonattainment pollutants unless all feasible measures have been implemented.

Table 2 State and Federal Ambient Air Quality Standards

Pollutant	Averaging Time	California Standards[1]		National Standards [2]		
		Concentration [3]	Method [4]	Primary [3,5]	Secondary [3,6]	Method [7]
Ozone (O_3) [8]	1 Hour	0.09 ppm (180 µg/m^3)	Ultraviolet Photometry	—	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m^3)		0.070 ppm (137 µg/m^3)		
Respirable Particulate Matter (PM_{10}) [9]	24 Hour	50 µg/m^3	Gravimetric or Beta Attenuation	150 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m^3		—		
Fine Particulate Matter ($PM_{2.5}$) [9]	24 Hour	—	—	35 µg/m^3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m^3	Gravimetric or Beta Attenuation	9.0 µg/m^3	15 µg/m^3	
Carbon Monoxide (CO)	1 Hour	20 ppm (23 mg/m^3)	Non-Dispersive Infrared Photometry (NDIR)	35 ppm (40 mg/m^3)	—	Non-Dispersive Infrared Photometry (NDIR)
	8 Hour	9.0 ppm (10 mg/m^3)		9 ppm (10 mg/m^3)	—	
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m^3)		—	—	
Nitrogen Dioxide (NO_2)[10]	1 Hour	0.18 ppm (339 µg/m^3)	Gas Phase Chemi-luminescence	100 ppb (188 µg/m^3)	—	Gas Phase Chemi-luminescence
	Annual Arithmetic Mean	0.030 ppm (57 µg/m^3)		53 ppb (100 µg/m^3)	Same as Primary Standard	
Sulfur Dioxide (SO_2)[11]	1 Hour	0.25 ppm (655 µg/m^3)	Ultraviolet Fluorescence	75 ppb (196 µg/m^3)	—	Ultraviolet Flourescence; Spectro-photometry (Pararosaniline Method)
	3 Hour	—		—	0.5 ppm (1,300 µg/m^3)	
	24 Hour	0.04 ppm (105 µg/m^3)		0.14 ppm (for certain areas)[11]	—	
	Annual Arithmetic Mean	—		0.030 ppm (for certain areas)[11]	—	
Lead[12,13]	30 Day Average	1.5 µg/m^3	Atomic Absorption	—	—	High Volume Sampler and Atomic Absorption
	Calendar Quarter	—		1.5 µg/m^3 (for certain areas)[12]	Same as Primary Standard	
	Rolling 3-Month Average	—		0.15 µg/m^3		
Visibility Reducing Particles[14]	8 Hour	See footnote 14	Beta Attenuation and Transmittance through Filter Tape	**No National Standards**		
Sulfates	24 Hour	25 µg/m^3	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m^3)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 µg/m^3)	Gas Chromatography			

Footnotes on next page. Table up to date as of 1/6/2026. Source: CARB, July 16, 2024

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM_{10}, $PM_{2.5}$, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m3 is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the US EPA for further clarification and current National policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent measurement method, which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard, may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.
6. Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the US EPA. An “equivalent method” of measurement may be used but must have a “consistent relationship to the reference method” and must be approved by the US EPA.
8. On October 1, 2015, the National 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
9. On February 7, 2024, the National annual $PM_{2.5}$ primary standard was lowered from 12.0 µg/m^3 to 9.0 µg/m^3. The existing National 24- hour $PM_{2.5}$ standards (primary and secondary) were retained at 35 µg/m^3, as was the annual secondary standard of 15 µg/m^3. The existing 24-hour PM_{10} standards (primary and secondary) of 150 µg/m^3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
10. To attain the 1-hour National standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the National 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the National 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the National standard of 100 ppb is identical to 0.100 ppm.
11. On June 2, 2010, a new 1-hour SO_2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour National standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO_2 National standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved. Note that the 1-hour National standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the 1-hour National standard to the California standard the units can be converted to ppm. In this case, the National standard of 75 ppb is identical to 0.075 ppm.
12. The CARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
13. The National standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m^3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
14. In 1989, CARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Table 3 Applicability of US EPA Activities under the CAA to the Project

US EPA Activity	Applicable to Project Sources?
Establish air quality standards.	Yes, see **Impact AQ-2**.
Designate quality of air in attainment areas.	No, the Project is not an attainment area.
Administrate state implementation plans.	No, the Project is not a SIP.
Require additional programs in nonattainment areas.	Yes, the Project would comply with SJVAPCD programs and rules that address nonattainment.
Provide guidance on control techniques.	Yes, a Dust Control Plan is provided, see Appendix K.
Regulate interstate air pollution.	No, the Project is not a state.
Require plans to maintain clean air after a nonattainment area meets the standard.	Yes, the Project would comply with SJVAPCD programs and rules that maintain attainment.
Preserve clean air in attainment areas.	Yes, the Project would comply with SJVAPCD programs and rules that preserve attainment.
Adopt National standards for new stationary sources.	Yes, see Table 4 and Table 5 for standards.
Adopt National standards or guidelines for consumer and commercial products.	No, the Project does not buy products that emit air pollutant from vendors outside the country.
Adopt National standards for new vehicles and engines, and fuels.	No, the Project does not manufacture vehicles, engines, or fuels.
Regulate emissions from oil drilling on the Outer Continental Shelf.	No, the Project is not located on the Outer Continental Shelf.
Regulate hazardous air pollutants.	Yes, see **Impact AQ-3**.
Protect visibility in National parks by regulating regional haze.	No, does not include a major stationary source.
Control acid rain by regulating NO_2 and SO_2 emissions from power plants.	No, the Project does not include a power plant or other major source of combustion pollutants.
Protect stratospheric ozone by regulating ozone-depleting compounds (e.g., chlorofluorocarbons).	No, the Project would purchase refrigerants and other classes of products from a U.S. vendor.
Regulate major sources of air pollution by administrating a Federal operating permit program.	No, the Project is a minor source that does not require a Federal operating permit.

Source: (EPA, 2013).

3.1.3.2 Toxic Air Contaminants

California's comprehensive air toxics program was established in the early 1980s. The Toxic Air Contaminant Identification and Control Act (AB 1807, 1983) created California's program to reduce exposure to air toxics. The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987) requires a Statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks.

Under AB 1807, CARB is required to use certain criteria when prioritizing pollutants for control of air toxics. In selecting substances for review, CARB must consider criteria relating to "the risk of harm to public health, amount or potential amount of emissions, manner of, and exposure to, usage of the substance in California, persistence in the atmosphere, and ambient concentrations in the community." AB 1807 also requires CARB to use available information gathered from the AB 2588 program to include in the prioritization of compounds. The list of TACs includes all Federal HAPs plus the following pollutants: 1,2-dibromoethane, 1,2-dichloroethane, hexavalent chromium, cadmium, inorganic arsenic, nickel, inorganic lead, diesel particulate matter, and environmental tobacco smoke (17 CCR § 93000 and §93001).

Under AB 2588, industrial facilities are required to report air toxic emissions, ascertain health risks and notify nearby residents of significant risks. In September 1992, the Hot Spots Act was amended by Senate Bill 1731, which required facilities that pose a significant health risk to reduce their risk through a risk management plan. The emissions inventory and risk assessment methodologies from the AB 2588 Program are used in this Report as discussed in the methodology subchapter (Sections 0).

Diesel Emissions

In July 2007, CARB adopted an airborne toxic control measure (ATCM) for in-use off-road diesel vehicles (13 CCR § 2449 et seq.). This regulation requires that fleets meet requirements for NO_x and particulate matter emissions rates. Where fleet average requirements cannot be met, best available control technology (BACT) requirements apply. The regulation also includes recordkeeping and reporting requirements. In response to AB 8 2X, the regulation was revised in July 2009 (effective December 3, 2009) to postpone compliance in 2011 and 2012 for existing fleets. On December 17, 2010, CARB adopted additional revisions to further delay the compliance deadlines, reflect reductions in diesel emissions due to the poor economy, and rectify overestimates of diesel emissions that supported previous rulemaking. The 2010 revisions delayed the first compliance date until January 1, 2014 for large fleets, with final compliance by January 1, 2023. The compliance dates for medium fleets were delayed until January 1, 2017, and final compliance date of January 1, 2023. The compliance dates for small fleets were delayed until January 1, 2019, and final compliance date of January 1, 2028. The fleet average targets were made more stringent in future compliance years, to compensate for reductions that would not occur in early years. The revisions also accelerate the phase-out of equipment, preventing older equipment from being added to fleets over time.

On October 28, 2011 (effective December 14, 2011), the Executive Officer of CARB approved amendments to the ATCM regulation that included revisions to the applicability section, definitions, and fleet average schedule by combining the PM and NO_x fleet average targets. The amended fleet average targets are based on the NO_x fleet average emissions factors from previous versions of the rule with credit given for PM reduction. The PM

performance requirements were removed. The BACT requirements, which apply when a fleet cannot comply with the fleet average requirements, were restructured and clarified. Other amendments to the regulations included minor administrative changes.

Naturally Occurring Asbestos (NOA)

ATCMs for naturally-occurring asbestos (NOA) that have been adopted by CARB include the following:

- Asbestos ATCM for Surfacing Applications (17 CCR § 93106) restricts the asbestos content of material used in surfacing applications such as unpaved roads, parking lots, driveways, and walkways. The ATCM excludes "sand and gravel operations" from requirements except for those allowing the Air Pollution Control Officer (APCO) to require geologic evaluation or asbestos testing. "Sand and gravel operation" means any aggregate-producing facility operating in alluvial deposits.
- Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations (17 CCR § 93105) requires the implementation of mitigation measures to minimize emissions of asbestos-laden dust. Applicable to the Plant Site Project, the ATCM states that the "APCO may provide an exemption for crushing, screening and conveying equipment, stockpiles, and off-site material transport at a sand and gravel operation if the operation processes only materials from an alluvial deposit."

While previous mining took place only within alluvial deposits, on the Quarry Site, the Project proposes to mine underlying hard rock. It is possible that geologic evaluation or asbestos testing may be required by the APCO.

3.1.4 San Joaquin Valley Air Pollution Control District

The 1976 Lewis Presley Air Quality Management Act established the SJVAPCD and other air districts throughout the State. The Federal Clean Air Act Amendments of 1977 required that each state adopt an implementation plan outlining pollution control measures to attain the Federal standards in nonattainment areas of the state.

CARB coordinates and oversees both State and Federal air pollution control programs in California. CARB oversees activities of local air districts and is responsible for incorporating air quality management plans developed by each air district into the State Implementation Plan (SIP) for Federal EPA approval. CARB maintains air quality monitoring stations throughout the State in conjunction with local air districts. Data collected at these stations are used by CARB and EPA to classify areas as "attainment" or "nonattainment" with respect to each pollutant and to monitor progress towards attaining air quality standards. CARB has divided the State into 15 air basins. Significant authority for air quality control is delegated to local air districts that regulate emissions from stationary sources and develop attainment plans. In addition, the CCAA provides the SJVAPCD with the authority to manage transportation activities and regulate stationary source emissions. Indirect sources of pollution are those sources related to a stationary facility or development project (see Rule 9510) but otherwise outside District authority to regulate. An example of this would be the motor vehicles at an intersection, a mall, and on highways. As a State agency, CARB regulates motor vehicles and fuels for their emissions.

The SJVAPCD and Fresno Council of Governments (FCOG) are responsible for formulating and implementing the air quality and transportation plans for the Fresno County area of the SJVAB. The SJVAPCD has adopted several attainment plans to achieve State and Federal air quality standards. The SJVAPCD continuously monitors the region's progress implementing attainment plans and periodically reports to CARB and the EPA. Finally, SJVAPCD periodically revises attainment plans to reflect new conditions and requirements in accordance with schedules mandated by the CCAA and Clean Air Act Amendments (CAAA).

3.1.4.1 Attainment Plans

Attainment plans prepared by SJVAPCD are grouped by pollutant and each is discussed briefly in the following subsections.

Ozone Plans

2004 Extreme 1-Hour Ozone Attainment Demonstration Plan

This Plan, adopted by the SJVAPCD in 2004, sets forth measures and emission reduction strategies designed to attain the Federal 1-hour ozone standard by November 15, 2010. This Plan was approved by the EPA on March 8, 2010; however, the EPA's approval was subsequently withdrawn effective November 26, 2012, in response to a decision issued by the U.S. Court of Appeals for the Ninth Circuit (Sierra Club v. EPA, 671 F.3d 955) remanding EPA's approval of these State Implementation Plan revisions. Concurrent with EPA's final rule, CARB is withdrawing the Plan. On May 6, 2014, the SJVAPCD submitted a formal request to the U.S. EPA, asking that the EPA determine the SJVAB has attained the Federal 1-hour ozone standard which was revoked in 1997.

2007 8-Hour Ozone Plan

This Plan sets forth measures and a "dual path" strategy to attain the Federal 8-hour ozone standard in the SJVAB by reducing emissions of ozone and particulate matter precursors. The Plan includes provisions that improve pollution control technologies for mobile and stationary sources, and Federal funding for incentive-based measures that reduce emissions. Local measures were to be adopted by the SJVAPCD before 2012. This Plan was approved by the EPA on March 1, 2012. On November 26, 2012, however, the EPA withdrew its determination that the Plan satisfied the Clean Air Act requirements due to emission growth caused by growth in vehicle-miles traveled (VMT). Other determinations in the EPA's March 1, 2012 rule approving the Plan remain unchanged and in effect.

2016 Ozone Plan for 2008 8-Hour Ozone Standard

In order to meet the December 31st 2031 deadline for attainment, this plan incorporates emissions reduction strategies for stationary sources including regulatory actions; incentive programs; technology advancement programs; policy and legislative activities; public outreach, education, and communication; and undefined strategies under "black box" provisions. The Plan demonstrates that existing regulations go above and beyond the Federal Reasonably Available Control Technology (RACT) requirement. The Plan also emphasizes that mobile source emissions, which fall under State and Federal jurisdiction, make up over 85% of the

Valley's NOx emissions. For this reason, the District request that CARB and EPA adopt and implement strategies so that sources outside District authority would be controlled enabling the standard to be met without the need for "black box" provisions. Moreover, the plan states that CARB and EPA action will be essential to attainment with the AAQS.

2022 Ozone Plan for the 2015 8-Hour Ozone Standard

The 2022 Ozone Plan for the San Joaquin Valley establishes a comprehensive strategy to attain the Federal 2015 8-hour ozone standard of 70 ppb by the 2037 deadline. Developed using advanced air quality modeling and the best available science, the plan builds on decades of emission reduction efforts by the San Joaquin Valley Air Pollution Control District and CARB. It demonstrates that a 72% reduction in NOx emissions by 2037 will enable attainment as expeditiously as practicable. The plan integrates regulatory development, outreach, research, and incentive programs.

Particulate Matter Plans

2007 PM_{10} Maintenance Plan

On October 25, 2007, CARB approved the 2007 PM_{10} Maintenance Plan and Request for Re-designation with modifications to the transportation conformity budgets. On September 25, 2008, the EPA approved the PM_{10} maintenance plan.

2008 $PM_{2.5}$ Plan

The US EPA set the first $PM_{2.5}$ standard in 1997 and in 2005 designated the Valley as nonattainment for the 1997 standard. The 1997 standard has two metrics for attainment: an annual average of 15 µg/m³ and a 24-hour average of 65 µg/m³. The SJVAPCD adopted the 2008 $PM_{2.5}$ Plan in April 2008 to demonstrate how the Valley would come into attainment of the 1997 $PM_{2.5}$ standard by no later than April 2015. US EPA subsequently lowered the 24-hour standard to 35 µg/m³ in 2006 and re-issued the nonattainment designation for the Valley in 2009.

The 2008 Plan is designed to assist the SJVAB in attaining each $PM_{2.5}$ standard, including the ones adopted by EPA in 1997 and 2006, and the State standard. On July 13, 2011, the EPA issued a proposed rule partially approving and disapproving the 2008 $PM_{2.5}$ Plan. Subsequently, on November 9, 2011, the EPA issued a final rule approving most of the Plan with an effective date of January 9, 2012. However, the EPA disapproved the plan's contingency measures because they would not provide sufficient emission reductions.

2012 $PM_{2.5}$ Plan

The 2012 $PM_{2.5}$ Plan builds on the prior $PM_{2.5}$ plans and demonstrates attainment of the newer 2006 24-hour $PM_{2.5}$ standard by the Federal attainment deadline of 2019, with the majority of the Valley actually experiencing attainment before 2019. Using the SJVAPCD Governing Board's guiding principles adopted in February 2012, this plan emphasizes public health as the number one priority in meeting National ambient air quality standards (NAAQS).

The 2012 $PM_{2.5}$ Plan is a multifaceted strategy that utilizes a combination of conventional and innovative control strategies to reduce emissions of $PM_{2.5}$ and other pollutants that form $PM_{2.5}$. The SJVAPCD's successes in adopting regulations and other strategies that have improved air quality provide the foundation for the Plan. In developing the Plan, the SJVAPCD claims to have left "no stone unturned" in evaluating potential strategies to reduce emissions.

In addition to reducing direct emissions of $PM_{2.5}$, the 2012 $PM_{2.5}$ Plan focuses on reducing oxides of nitrogen (NO_x) emissions, which is a predominant pollutant not only in the formation of $PM_{2.5}$ but also ozone. This overlapping effect and emphasis on reducing NO_x emissions addresses the area's primary air quality challenges, $PM_{2.5}$ and ozone. Along with comprehensive efforts at the local level to reduce emissions, reducing mobile source emissions that are not under the direct authority of SJVAPCD are critical to attaining the standard. The 2012 $PM_{2.5}$ Plan includes State and Federal measures that will provide significant new emissions reductions in the coming years. As outlined below, the Plan's comprehensive control strategy includes regulatory actions, incentive programs, technology advancement, policy and legislative positions, public outreach, participation and communication, and additional strategies.

2015 Plan for the 1997 $PM_{2.5}$ Standard

The 2015 Plan for the 1997 $PM_{2.5}$ Standard was adopted on April 16, 2015, and addresses the EPA annual $PM_{2.5}$ standard of 15 µg/m3 as well as the EPA 24-hour $PM_{2.5}$ standard of 65 µg/m3 both of which were established in 1997. The plan's strategy focuses on attaining the standard quickly, as well as prioritizing $PM_{2.5}$ emissions that pose the most health risk to residents.

2016 Moderate Area Plan for the 2012 $PM_{2.5}$ Standard

The 2016 Moderate Area Plan for the 2012 $PM_{2.5}$ Standard was adopted by the District on September 15, 2016. This Plan addresses the $PM_{2.5}$ NAAQS of 12 µg/m^3 with an attainment deadline of December 31, 2021, established in 2012. This Plan demonstrates the impracticability of attainment before the deadline and requests the area be reclassified from moderate to serious nonattainment.

2018 Plan for the 1997, 2006 and 2012 $PM_{2.5}$ Standards

Adopted on November 15, 2018, the plan includes significant incentive based control measures as well as control measures for stationary and area industrial sources. The plan also calls on CARB to act in order to achieve reductions of mobile sources.

SB 656 Particulate Matter Control Measure Implementation Schedule

Senate Bill (SB) 656 was enacted in 2003 and codified as Health and Safety Code Section 39614. SB 656 seeks to reduce exposure to PM_{10} and $PM_{2.5}$ and make further progress toward attainment of the NAAQS and CAAQS for PM_{10} and $PM_{2.5}$. SB 656 required CARB, in consultation with local air districts, to develop and adopt lists of "the most readily available, feasible, and cost-effective" particulate matter control measures. Subsequently, air districts were required to adopt implementation schedules for relevant control measures.

In June 2005, The SJVAPCD adopted its SB 656 Particulate Matter Control Measure Implementation Schedule, and has adopted each relevant strategy into their rules.

2024 Plan for the 2012 Annual PM2.5 Standard

The 2024 Plan for the 2012 PM2.5 Standard was adopted to address the annual PM2.5 NAAQS of 12 µg/m³ established in 2012. The plan outlines BACM and BACT measures, incentive programs, and requests an attainment deadline extension due to the impracticability of meeting the standard on time. It emphasizes continued collaboration with CARB and EPA to reduce emissions from sources beyond District authority.

3.1.4.2 Rules and Regulations

The following SJVAPCD rules and regulations are applicable to Project sources. Rule summaries are provided to clarify applicability, and excludes rules that do not apply which are numerous and exhaustive.

Regulation I (General Provisions)

Rule 1160 (Emission Statements)

Rule 1160 requires owners/operators of stationary sources that emit NOX or ROG to submit annual emission inventories. More information can be found in the Air Resources Board's "Instructions for the Emission Data System Review and Update Report" document. (California Air Resources Board, 1988)

Regulation II (Permits)

Rule 2010 (Permits Required)

Rule 2010 requires newly proposed non-exempt sources of emissions to obtain an Authority to Construct prior to construction. Prior to operation of the new source, the SJVAPCD also requires that a Permit to Operate be obtained. Permits to Operate must be posted and maintained on or near the source of the air pollution.

Rule 2201 (New and Modified Stationary Source Review)

Rule 2201 establishes SJVAPCD's program to limit emissions at new and modified sources so that there is no net increase in emissions within the SJVAB. Rule 2201 uses BACT and mechanisms such as emissions offsets, to ensure that AAQS are met or maintained. Criteria pollutants are regulated under this Rule, including VOC, NO_x, SO_x, PM_{10}, $PM_{2.5}$, and CO. Under Rule 2201, BACT is required if the emissions of a regulated pollutant would exceed two (2) pounds per day. In addition, emission offsets to mitigate an increase in emissions from a new or modified stationary source would be required if the facility's emissions exceed the following amounts:

- 20,000 pounds per year of NO_x or VOC;

- 54,750 pounds per year of SO_x; or
- 29,200 pounds per year of PM_{10}.

Rule 2280 (Portable Equipment Registration)

Rule 2280 outlines the procedure and requirements associated with the registration of portable emissions units. Sand and gravel screening, rock crushing, and RAP crushing operations are among operations eligible for registration of portable equipment, if a portable diesel-fired engine will be used to power processing equipment. Rule 2280 would be applicable to the Project if temporary construction requires equipment (such as a generator set) under Rule 2280.

Rule 2530 (Federally Enforceable Potential to Emit)

The purpose of Rule 2530 is to restrict a facility's potential to emit so that the facility may be exempt from the requirements of Rule 2520 (Federally Mandated Operating Permits). This Rule applies to any stationary source that would be a major source of regulated air pollutants or of hazardous air pollutants if limitations were not imposed. Rule 2530 also includes recordkeeping and reporting requirements. Rule 2530 allows facilities to be excluded from the Title V program (see Rule 2520) by taking limits or keeping records to demonstrate that their emissions are below the applicable thresholds. This process is also referred to as a "synthetic minor" or Federally Enforceable State Operating Permit (FESOP).

Regulation III (Fees)

Regulation III contains rules related to District fees. The Project may be subject to fees related to permitting, air toxics, dust, ozone, as well as others.

Regulation IV (Prohibitions)

Rule 4001 (New Source Performance Standards)

Rule 4001 codifies the SJVAPCD's adoption and incorporation of Federal New Source Performance Standards (NSPS) as set forth in 40 CFR Part 60. NSPS apply to a variety of stationary sources, including asphalt plants and aggregate processing plants. The regulation imposes emissions standards for relevant pollutants and requires that specified emission performance standards, control equipment, and monitoring devices be installed at all new, modified, or reconstructed facilities to limit emissions. The regulation includes test methods, monitoring, notification, and recordkeeping requirements. The asphalt plant and aggregate plant are subject to 40 CFR Part 60, Subparts I and OOO, respectively; those regulations are discussed in previous sections.

Rule 4101 (Visible Emissions)

Rule 4101 prohibits emissions of visible air contaminants, other than water vapor, from resulting in greater than Number 1 on Ringelmann Chart (i.e. 20% opacity) for a combined period of more than 3 minutes in any hour.

Rule 4102 (Nuisance)

To protect the public health, Rule 4102 prohibits any person from discharging such quantities of air contaminants that cause injury, detriment, nuisance, or annoyance to a considerable number of persons or to the public.

Rule 4201 (Particulate Matter Concentration)

Rule 4201 establishes a particulate matter concentration standard governing release or discharge of dust, fumes, or total suspended particulate matter emissions into the atmosphere from any single-source operation exceeding 0.1 grains/dry standard cubic foot of gas (gr/dscf).

Rule 4202 (Particulate Matter Emission Rate)

Rule 4202 limits the weight rate of particulate matter emissions. The Rule specifies allowable emissions rates based on a process weight rate equation and calculations for various rates in an associated table within the rule.

Rule 4301 (Fuel Burning Equipment)

Rule 4301 limits the emission of air contaminants from fuel burning equipment. Included in this rule are requirements that fuel burning equipment not discharge:

- Combustion contaminants exceeding 0.1 gr/dscf at 12% carbon dioxide;
- Discharge greater than 200 lbs per hour of sulfur compounds;
- Discharge greater than 140 pounds per hour of nitrogen compounds; or,
- Discharge greater than 10 pounds per hour of combustion contaminants.

Rule 4307 (Boilers, Steam Generators, and Process Heaters)

Rule 4307 establishes NO_x and CO emissions limits for boilers, steam generators, and process heaters. This rule applies to units fired on gaseous or liquid fuel, having heat input of between 2.0 and 5.0 million British thermal units per hour (MMBtu/hr) or greater. The applicable limits for new units are 9 ppmv NO_x at 3% oxygen and 400 ppmv CO at 3% oxygen. The rule includes monitoring and recordkeeping requirements. Compliance with the emission limits must be determined by periodic source testing. This rule applies to the hot oil heater in the asphalt plant.

Rule 4309 (Dryers, Dehydrators, and Ovens)

Rule 4309 establishes NO_x and CO emissions limits for dryers, dehydrators, and ovens. This Rule applies to units fired on gaseous or liquid fuel, having a total rated heat input of 5.0 MMBtu/hr or greater. The applicable limits for burners at asphalt plants are 4.3 ppmv NO_x at 19% oxygen and 42 ppmv CO at 19% oxygen when fired on gaseous fuel. The Rule includes monitoring and recordkeeping requirements. Compliance with the emission limits must be determined by periodic source testing or an approved alternate emissions monitoring system.

Regulation VIII (Fugitive PM_{10} Prohibitions)

The rules under Regulation VIII are intended to reduce ambient concentrations of particulate matter (PM_{10} or larger) and were developed pursuant to EPA guidance for Serious PM_{10} Nonattainment Areas. These rules are applicable to specified anthropogenic sources. Applicability of each rule is discussed below and requirements are presented for rules that apply to the Project. Rule 8081 is omitted because it only applies to agricultural sources.

Rule 8021 (Construction, Demolition Excavation, Extraction, and Other Earthmoving Activities)

Rule 8021 prohibits construction, demolition, excavation, extraction, or other earthmoving activities unless the appropriate requirements are sufficiently implemented to limit visible dust emissions (VDE) to 20% opacity. Blasting emissions are exempt from this rule.

Rule 8031 (Bulk Materials)

Rule 8031 requires facilities that perform outdoor handling, storage, and transport of bulk materials to use prescribed methods to limit VDE to 20 percent opacity or to comply with the conditions for a stabilized surface as defined in Rule 8011 (General Requirements). Methods to limit VDE listed in Rule 8031 include:

- Applying water or chemical/organic stabilizers/suppressants;
- Constructing and maintaining sufficient barriers to obstruct wind;
- Maintaining stabilized surfaces on piles; covering bulk materials with tarps, plastic, or other suitable material; limiting on-site vehicle speed;
- Loading haul trucks to limit VDE;
- Applying water on the top of loads to limit VDE;
- Covering haul trucks with tarps or other covers to limit VDE; and
- Maintaining haul trucks to prevent spillage or loss of bulk materials.

Rule 8041 (Carryout and Trackout)

The purpose of Rule 8041 is to prevent or limit fugitive dust emissions from carryout and trackout on paved public roads or the paved shoulders of paved public roads. Facilities subject to Rules 8021, 8031,

8061, or 8071 must also comply with this rule. Rule 8041 requires that affected facilities prevent and/or clean up carryout and trackout at the end of each workday. Cleanup of carryout and trackout is accomplished by manually sweeping and picking up, operating a rotary brush or broom accompanied by sufficient wetting to limit VDE to 20% opacity, operating a PM_{10}-efficient street sweeper that has a pick-up efficiency of at least 80%, or flushing with water if curbs and gutters are not present and where the use of water will not result in a source of trackout material or other adverse impacts, such as a water quality violation under the National Pollutant Discharge Elimination System program. Rule 8041 requires that owners/operators of sites with paved interior roads use a trackout control device to reduce carryout and trackout. Rule 8041 prohibits the use of blower devices, dry rotary brushes, or brooms for removal of carryout and trackout on public roads.

Rule 8051 (Open Areas)

The purpose of Rule 8051 is to limit fugitive dust emissions from open areas. The rule applies to open areas 0.5 acre or more within urban areas, and 3.0 acres or more within rural areas, that contain at least 1,000 square feet of disturbed surface area. Whenever open areas are disturbed or vehicles are used in open areas, control measures are required to comply with the conditions of a stabilized surface and to limit VDE to 20% opacity. Control measures to be used include: applying and maintaining water or other chemical dust suppressants to unvegetated areas; establishing vegetation on previously disturbed areas; or paving, applying, and maintaining gravel. Where open areas are disturbed due to trespass, such activities should be prevented by posting “No Trespassing” signs or installing physical barriers such as fences.

Rule 8061 (Paved and Unpaved Roads)

The purpose of Rule 8061 is to limit fugitive dust emissions from paved and unpaved roads by implementing control measures and design criteria. This rule applies to any new or existing public or private paved or unpaved roads, road construction projects, and road modification projects. Rule 8061 requires that new or modified paved roads have certain specifications based on the road’s existing or projected annual average daily trips (AADT). Requirements include minimum paved or stabilized shoulder widths, as well as curbing, intersection, and median specifications. The Rule prescribes requirements for maintenance of public paved roads, including specifications for PM_{10}-efficient sweepers and road cleanup. Rule 8061 requires unpaved road segments with 26 or more AADT to stabilize surfaces by application of water, chemical dust suppressant, washed gravel, or similar measures. Unpaved roads with fewer than 26 AADT are exempt from some requirements of this rule.

Rule 8071 (Unpaved Vehicle/Equipment Traffic Areas)

This rule limits fugitive dust emissions from unpaved vehicle and equipment traffic areas with 50 or more AADT by stabilizing road surfaces with water, chemical dust suppressant, washed gravel, or similar measures. Unpaved vehicle and equipment traffic areas with less than 50 AADT are exempt from Rule 8071.

3.1.4.3 SJVAPCD CEQA Air Quality Analysis and Modeling Guidance

The SJVAPCD Air Quality Modeling: Permitting and CEQA webpage [3] links to documents prepared by the District and others and notes that modeling guidance provided by the District is dated and may not be the best approach if one is trying to use currently accepted methods such as those employed by OEHHA. For this reason, this Report has been written utilizing the Air Toxics Hotspots Program Guidance Manual for the Preparation of Risk Assessments (OEHHA, 2015).

3.1.4.4 Voluntary Emissions Reduction Agreement (VERA) Program

SJVAPCD creates ROG, NOx and PM_{10} emissions reductions by providing incentive funding primarily to owners of engines who volunteer to replace older, high polluting engines with lower emitting alternatives (e.g., new engine, electric/battery, etc.). Emissions reductions administered by the District satisfy requirements for banking emissions reduction credits (ERC) under Rule 2301 insofar as the emissions reductions are real, surplus, permanent, quantifiable, and enforceable. Some of the funding for these projects comes from VERAs between the District and developers of land use projects that require additional mitigation of these pollutants in order to reduce their project emissions impacts to less than the significance thresholds in the associated CEQA document (e.g., EIR). Section 9.2 in the GAMAQI (SJVAPCD, 2015) states:

> *"Design elements, mitigation measures, and compliance with District rules and regulations may not be sufficient to reduce project - related impacts on air quality to a less than significant level. In such situations, project proponents may enter into a Voluntary Emission Reduction Agreement (VERA) with the District to reduce the project related impact on air quality to a less than significant level. A VERA is a mitigation measure by which the project proponent provides pound - for - pound mitigation of air emissions increases through a process that funds and implements emission reduction projects. A VERA can be implemented to address impacts from both construction and operational phases of a project.*
>
> *To implement a VERA, the project proponent and the District enter into a contractual agreement in which the project proponent agrees to mitigate project specific emissions by providing funds to the District. The District's role is to administer the implementation of the VERA consisting of identifying emissions reductions projects, funding those projects and verifying that emission reductions have been successfully achieve. The VERA implementation process also provides opportunity for the project proponent to identify specific emission reduction projects to be administered by the District. The funds are disbursed by the District in the form of grants. Types of emission reduction projects that have been funded in the past include electrification of stationary internal combustion engines (such as agricultural irrigation pumps), replacing old heavy - duty trucks with new, cleaner, more efficient heavy - duty trucks, and replacement of old farm tractors.*
>
> *The District verifies the actual emission reductions that have been achieved as a result of completed grant contracts, monitors the emission reduction projects, and ensures the*

[3] http://valleyair.org/busind/pto/Tox_Resources/AirQualityMonitoring.htm#modeling_guidance

enforceability of achieved reductions. The initial agreement is generally based on the projected maximum emissions increases as calculated by a District approved air quality impact assessment, and contains the corresponding fiscal obligation. However, the District has designed flexibility into the VERA such that the final mitigation can be based on actual emissions related to the project as determined by actual equipment used, hours of operation, etc. After the project is mitigated, the District certifies to the Lead Agency that the mitigation is completed, providing the Lead Agency with an enforceable mitigation measure demonstrating that project specific emissions have been mitigated to less than significant. [Underline added].

To ensure all feasible mitigation measures are incorporated into the project to reduce project air quality impact to less than significant, the District recommends the project proponent (and/or Lead Agency) engage in discussion with the District to have the VERA adopted by the District prior to the finalization of the environmental document. This process will allow the environmental document to appropriately characterize the project emissions and demonstrate that the project impact on air quality will be mitigated to less than significant under CEQA as a result of the implementation of the adopted VERA.

The District has been developing and implementing VERA contracts with project proponents to mitigate project specific emissions since 2005. It is the District's experience that implementation of a VERA is a feasible mitigation measure, which effectively achieves the emission reductions required by a Lead Agency, including mitigation of project-related impacts on air quality by supplying real and contemporaneous emissions reductions.

Therefore, Lead Agencies should require the project proponent to negotiate a VERA with the District prior to the Lead Agency's final approval of the CEQA document. This allows the Lead Agency to disclose to the public the certainty that the VERA is assuring full mitigation of air quality impacts as specified in the environmental review document or equivalent documentation certified by the Lead Agency. The 2017 Annual Financial Report states:

Under a VERA, two mitigation approaches are available: "pollutant-by-pollutant" and "net zero". The mitigation of project emissions impacts "pollutant-by-pollutant" means that each NOx, VOC and PM_{10} project emission will be mitigated individually to their respective significance threshold level. The mitigation of project emissions impacts to "net zero" means that the sum of NOx, VOC and PM_{10} combined project emissions will be fully mitigated by the sum of NOx, VOC and PM_{10} combined emission reductions achieved under the VERA. The "net zero" concept is limited to the three pollutants NOx, VOC and PM_{10}, due to their strong interrelatedness. NOx is the driving pollutant for both the wintertime PM problem and the summertime ozone problem (in combination with VOC). The District considers "net zero" mitigation to result in a less than significant air quality impact for these three pollutants, even if VOC or PM_{10} emissions remain above their individual significance thresholds after mitigation, because this means that the mitigation has achieved excess reductions of NOx, the critical component to the Valley's air quality issues. [Underline added].

> *The District strongly recommends the "net-zero" approach. This method results in a significantly larger amount of NOx reduction, which is the primary driver to the formation of ozone and PM in the Valley."*

The 2017 Financial Report describes the amount of funding and emissions reductions that have occurred in the Program and during the last year as follows:

> *"The District has entered into thirty-two VERAs since 2005. One hundred percent (100%) of all off-site mitigation fees are used by the District to fund emission reduction projects through its Incentives Programs, achieving emission reductions on behalf of the project. Additionally, developers pay an administrative fee equal to four percent (4%) of the required off-site fees. This fee is to cover the District's cost of administering the off-site emission reduction projects.*
>
> *To date, in addition to avoiding approximately 12,500 tons of NOx and PM_{10} emissions from new development through the incorporation of on-site mitigation and clean-air design measures into projects subject to Rule 9510, the District has confirmed approximately 6,900 tons of reductions in NOx and PM_{10} emissions have been achieved through the investment of ISR and VERA funds in its emission reduction incentive programs.*
>
> *This year the District achieved emission reductions totaling 501 tons NOx and 102 tons PM_{10}, for a combined total of 603 tons at a cost effectiveness of $ 8,123 per ton of emissions reduced.*

Based on language in recent Governing Board approved VERAs, the applicant proposes to pre-pay for potential excess emissions of NOx, VOC, and/or PM_{10} (i.e., "criteria pollutants") should emissions from permit-exempt sources exceed an applicable ton per year significance threshold. Similarly, permitted sources would purchase emissions credits if they exceed applicable significance thresholds except that the emissions reductions would need to have been banked by another facility and issued certificates by the District as Emissions Reduction Credits (ERCs) under the District's stationary source permitting program.

Applicants that enter a VERA may pay up-front for potential excess emissions predicted for the entire project; or for shorter periods called "project phases." Project phases as short as three months or long as one year have been allowed in VERAs with the choice of duration left to the applicant's discretion. Project phases in context of a VERA are periods for which emissions are pre-paid and after which the actual excess emissions above the significance thresholds may be calculated by the applicant and reconciled with the amount of emissions reductions achieved by the District with applicant funds. If actual emissions during a project phase were less than the significance thresholds in the environmental document, then the emissions reductions purchased would roll-over to serve as a pre-payment for a future project phase. If actual emissions exceed one or more significance thresholds, then pre-paid emissions reductions equal to the actual excess project emissions for each pollutant would be deducted from the amount of emissions reductions achieved by the District. Remaining reductions achieved by the District after subtracting the actual excess emissions above the significance threshold would then roll-over to a future project phase. Alternatively, the applicant may

transfer emissions reductions to another project within the District that requires mitigation of emissions impacts under CEQA.

The Project would pay its fair share to mitigate the cumulative effects of ozone (VOC, NOx) and PM_{10} by complying with the existing in-use on- and off-road diesel engine regulations. In addition, it is likely that the maximum production amounts analyzed for the Project would first occur many years in the future after the diesel engine requirements are fully implemented potentially reducing emissions from those presented in this Report which follow conservative methodologies to ensure they represent the maximum reasonably foreseeable future condition with the project.

3.1.5 County of Fresno

General Plan

The County of Fresno General Plan contains numerous air quality policies and goals that are summarized in Appendix E for convenience. Policies OS-G.2 and OS-G.14 apply to the Project as they respectively identify the Project as subject to the CEQA review process, and require minimization of particulate emissions from industrial driveways.

Policy OS-G.2

The County shall ensure that air quality impacts identified during the CEQA review process are fairly and consistently mitigated. The County shall require projects to comply with the County's adopted air quality impact assessment and mitigation procedures. (County of Fresno, 2024)

The Project is consistent with this goal, as appropriate environmental analysis has been conducted in preparation of this report. Therefore, while this policy applies to the Project, its requirements are satisfied by the existence of this Report and compliance with Rule 8041.

Policy OS-G.14

The County shall require all access roads, driveways, and parking areas serving new commercial and industrial development to be constructed with materials that minimize particulate emissions and are appropriate to the scale and intensity of use. (County of Fresno, 2024)

Because it would follow SJVAPCD particulate emissions control rules and ensure compliance with applicable Fresno County Ordinances, The Project would be consistent with this goal.

Policy EJ-A.3

The County shall during the development review land use process coordinate with local commercial and industrial developments to review and require incorporation into their projects the latest technologies and best practices to reduce emissions.

The county has reviewed feasible technologies and best practices for the Project and they are incorporated where appropriate.

Policy EJ-A.8

The County shall provide residents within disadvantaged communities the opportunity to review and comment on discretionary development projects within their communities.

A EIR has been prepared for the Project and communities within the County have had the opportunity to review and comment.

Policy EJ-A.12

New industrial development, which has the potential to create compatibility conflicts with surrounding sensitive uses, shall incorporate measures such as landscaped setbacks along road frontage, block walls, signage disclosing on-site emergency contact information, enclosed loading docks, and placement of loading docks and idling areas away from sensitive receptors in order to minimize potential impacts.

The Project has incorporated measures that minimize potential impacts. Mitigation measures include a dust control plan and other requirements that would minimize potential impacts to less than significant levels.

Policy EJ-A.13

Automobile parking areas for new industrial development shall be planted with trees in a manner to provide adequate shade cover of at least 35% of the parking area utilizing trees or a combination of trees and photovoltaic solar shade structures. Landscaping for new industrial development shall use drought tolerant species with low biogenic emissions.

The Project would have parking for employees and would provide adequate shade cover for those vehicles.

Policy EJ-A.15

Consistent with the provisions contained in the California Air Resources Board (CARB) Air Quality and Land Use Handbook, project applicants shall identify appropriate measures for projects with sensitive uses located within 500 feet of freeways, heavily traveled arterials (daily vehicle trips of 10,000 or more), railways, and other sources of diesel particulate matter (DPM) and other known carcinogens. The County shall require development projects that are located within 500 feet of freeways, heavily traveled arterials (daily vehicle trips of 10,000 or more), railways, and other sources of DPM and other known carcinogens to retain a qualified air quality consultant to prepare a health risk assessment

(HRA)in accordance with the CARB and the California Environmental Protection Agency's Office of Environmental Health and Hazard Assessment requirements to determine the exposure of nearby sensitive receptors to emission sources resulting from the project. Measures identified in the HRA shall be enforced by the County.

The referenced Handbook omits industrial development projects from consideration. It is unclear if this applies to the Project. Nevertheless, a HRA was prepared for this project.

Code of Ordinances

15.04.120 Public Nuisance in Construction and Demolition

Any person to whom a permit has been issued as provided herein for the repair, alteration, demolition or construction of any structure shall comply with each of the following:

A. Take reasonable precaution to prevent or control the movement of wind born dust created by such activities;

B. Promptly remove all dust and mud tracked into a public street by the movement of vehicles, equipment, materials and personnel;… (Fresno County, CA, 2026)

3.2 Environmental Setting

The environmental setting includes the existing physical setting that is compared to future conditions with the Project to determine the Project's impact. In addition to pollutant emissions, the air quality environment is affected by terrain and meteorology.

Terrain plays a role in air dispersion dynamics, and the resulting levels of air pollutants in a given area. Mountains that surround valley areas tend to retain air within the valley and limit the dispersion of pollutants. Meteorology causes year-to-year changes in air quality trends that can mask or overstate the benefits of emission reductions. Unlike terrain, meteorology affects pollutant concentrations differently depending upon the pollutant as discussed in the following examples:

- Ozone is formed in the atmosphere as sunlight initiates a complex set of chemical reactions. On hot sunny days, the abundant sunlight starts the ozone-forming processes and high temperatures promote fast chemical reactions. If the air is stagnant, the ozone formed is not dispersed or diluted by cleaner air from outside the area, thus, the highest ozone concentrations usually occur on hot and sunny days with light breezes or calm air. In some areas, high ozone levels may result from transport of pollutants from upwind regions. Since hot and sunny summer days typically lead to high ozone, it is un-surprising that cold and cloudy winter days have much lower ozone concentrations. (CARB, 2014).
- Ambient PM is comprised of primary PM that is directly emitted and secondary PM that forms in the atmosphere through chemical and physical processes. Primary PM includes dust and soot, while secondary PM includes particulate nitrates and sulfates. Some areas are subject to strong winds that

lift dust into the air resulting in high concentrations of primary PM. In other situations, cold, calm, and humid air can promote the buildup of secondary PM. Relatively high PM levels in valley areas usually occur in the winter under these meteorological conditions. The lowest PM concentrations often occur on rainy winter days when winds disperse PM and rain washes PM out of the air. (CARB, 2014).

3.2.1 Regional Setting

The Project site is located in the central portion of the San Joaquin Valley Air Basin (SJVAB or Basin). Air pollution is directly related to several factors including a region's topographic features. The SJVAB is defined by the Sierra Nevada mountain range in the east (8,000 to 14,000 feet in elevation), the Coast Range in the west (averaging 3,000 feet in elevation), and the Tehachapi Mountains in the south (6,000 to 8,000 feet in elevation). The valley is basically flat with a slight downward gradient to the northwest. The Valley opens to the Pacific Ocean at the Carquinez Strait, where the San Joaquin-Sacramento Delta discharges into San Francisco Bay.

Although marine air generally flows into the basin from the San Joaquin River delta, the region's topographic features restrict air movement within the basin. The Coast Range hinders wind access into the Valley from the west, the Tehachapi Mountains prevent southerly passage of air, and the Sierra Nevada mountain range to the east is a barrier to air movement. These topographic features result in weak air flow, which becomes blocked vertically by high barometric pressure over the Valley. As a result, the SJVAB is susceptible to pollutant accumulation over time. Most of the surrounding mountains are above the normal height of summer inversion layers (1,500 to 3,000 feet).

During the summer season, wind usually originates at the north end of the Valley, passing through Tehachapi Pass into the Mojave Desert Air Basin. During the winter, wind occasionally originates from the south end of the Valley and flows in a north-northwesterly direction. During the winter months, the Valley experiences light, variable winds, which are usually less than 10 miles per hour (mph). Low wind speeds combined with low inversion layers during the winter creates a climate conducive to the accumulation CO and PM_{10}.

According to Western Regional Climate Center, the Fresno Airport, located approximately 12 miles south of the Project Site, is the nearest meteorological station to the Project. Average monthly temperatures range from a minimum of 37°F to a maximum of 98°F. December and January are typically the coldest months with July and August the warmest in Fresno County. Annual rainfall totals approximately 11 inches and mostly occurs between November and April. Summer rainfall is minimal and generally limited to scattered thundershowers over the Sierra Nevada mountain range ((WRCC, 2016).

3.2.2 Project Site and Local Setting

The Modification Project consists of two sites both located east of the San Joaquin River and west of Friant Road. The approximately 122 acre Plant Site is located 2.0 miles north of the City of Fresno and the approximately 349 acre Quarry site is located 2.0 miles north of the Plant site. Activities were quantified using production/sales records, vehicle fleet information, and other site-specific data (Appendix C).

The SJVAPCD maintains ambient air quality monitoring stations throughout the SJVAB. Air pollutants monitored at each station may differ; thus, data from the closest representative station that monitors each pollutant is used as background concentrations for purposes of impact assessment. Air quality monitoring stations located within urban areas take ambient measurements which generally reflect community exposure levels. Air quality at the Project site is almost certain to be better than air quality in the Project vicinity because the Project site and surrounding lands are characterized as rural with few air emissions sources. Accordingly, the Project site is generally characterized as having lower concentrations of air pollutants than more urban areas where there are more emissions sources and where ambient measurements are often collected.

The closest ambient air quality monitoring station to the Project site is the Clovis North Villa Ave. station (AQS ID 06-019-5001). This station is located approximately 9 miles south of the Project site and measures O_3, CO, NO_2, CH_4, Total Hydrocarbons, Total NMHC, PM_{10}, $PM_{2.5}$, and select TACs. The Station is constructed to monitor at a neighborhood scale covering an area between 0.5 and 4.0 kilometers in range. Data is collected for the purpose of observing the highest concentration of pollutants in the area. (SJVAPCD, 2018)
SO_2 is recorded at the Fresno–Garland monitoring station located approximately 12 miles south of the Project site. The station is constructed to monitor at neighborhood and urban scales covering an area between 0.5 and 50 kilometers in range. Data is collected for the purpose of observing the concentration experienced by the population in the community. (SJVAPCD, 2018)

Ambient concentrations and number of days when the AAQS were exceeded in 2020-2024 are presented in Table 4 and Table 5. In summary, CO, SO2, and NO2 levels have not exceeded State or Federal standards over the past five years. O3 exceeded the State one-hour and eight-hour standards and the Federal eight-hour standard in each of the past five years. PM10 levels exceeded the 24-hour and annual State standard in each of the last five years and the 24-hour Federal standard in 2020. PM2.5 levels exceeded the 24-hour Federal standard in four of the last five years. Furthermore, PM2.5 exceeded the annual Federal standard in 2020 and 2021 and exceeded the annual State standard in only 2020.

Table 4 Number of Days Exceeding Air Quality Standards

Monitoring Site	Year	Days Exceeding State 1-Hour O_3	Days Exceeding State 8-Hour O_3	Days Exceeding Federal 8-Hour O_3	Days Exceeding State 24-Hour PM_{10}[a]	Days Exceeding Federal 24-Hour $PM_{2.5}$[a]
Clovis North Villa Ave	2020	12	41	36	117.5	40
	2021	9	37	34	112.4	22
	2022	3	26	23	73.8	4.3
	2023	3	23	21	44	0
	2024	16	51	45	66	7

Source: CARB iADAM Statistical Analysis Tool

a Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and 3 days, respectively. “Number of days exceeding the standards” are mathematical estimates.

Table 5 Ambient Air Quality in the Project Area

Concentration Averaging Period	Monitoring Station	Ambient Air Quality Standard	2020	2021	2022	2023	2024

Sources: California Air Resources Board (CARB) iADAM Air Quality Data Analysis (California Air Resources Board, n.d.)
EPA Air Quality Data (Environmental Protection Agency, 2025)

As shown in Table 5, predicted concentrations of criteria pollutants are less than each AAQS and mitigated annual emissions are less than applicable significance thresholds. Therefore, the Project would not, by itself, cause an exceedance. When added to background concentrations reported for the closest air monitoring station, the cumulative concentration of each pollutant is less than the associated AAQS (Table 5).

3.2.3 Health Effects Setting

NAAQS/CAAQS and Reference Exposure Levels (REL) that are used for health risk assessment are designated for each pollutant at a level where no "adverse health effect" would occur to sensitive populations. The OEHHA relies upon the definition of "adverse health effect" published by American Thoracic Society (ATS). ATS published a definition in 1985 and then amended the definition in 2000 to address issues not covered by the 1985 definition. From the 1985 definition, "adverse respiratory health effect" means:

> *Medically significant physiologic or pathologic changes generally evidenced by one or more of the following:*
>
> 1. *Interference with the normal activity of the affected person or persons;*
> 2. *Episodic respiratory illness;*
> 3. *Incapacitating illness;*
> 4. *Permanent respiratory injury; and/or*
> 5. *Progressive respiratory dysfunction.* (OEHHA, 2004).

The 2000 ATS publication (see copy in Appendix D) recommends that the following "dimensions" of adverse effects be considered when determining whether an effect is an adverse health effect:

1. *Biomarkers: These should be considered, however it must be kept in mind that few biomarkers have been validated sufficiently to establish their use for defining a point at which a response becomes adverse, consequently, not all changes in biomarkers should necessarily be considered adverse.*
2. *Quality of life: In recent years, decreased health-related quality of life has become widely accepted as an adverse health effect. The review committee concluded that reduction in quality of life, whether in healthy persons or persons with chronic respiratory disease, should be considered as an adverse effect.*
3. *Physiological impact: The committee recommended that small, transient reductions in pulmonary function should not necessarily be regarded as adverse, although permanent loss of lung function should be considered adverse. The committee also recommended that reversible loss of lung function in conjunction with symptoms should be considered adverse.*
4. *Symptoms: Air pollution-related symptoms associated with reduced quality of life or with a change in clinical status (i.e., requiring medical care or a change in medications) should be considered adverse at the individual level. At the population level, the committee suggested that any detectable increase in symptom frequency should be considered adverse.*
5. *Clinical outcomes: Detectable effects of air pollution on clinical measures should be considered adverse. More specifically, the ATS committee cited as examples increases in emergency department visits for asthma or hospitalizations for pneumonia, at the population level, or an increased need to use bronchodilator medication, at the individual level. The committee recommended that: "no level of effect of air pollution on population-level clinical indicators can be considered acceptable."*

6. *Mortality: Increased mortality should clearly be judged as adverse.*
7. *Population health versus individual risk: The committee concluded that a shift in risk factor distribution, and hence the risk profile of an exposed population, should be considered adverse when the relationship between the risk factor and the disease is causal, even if there is no immediate occurrence of obvious illness*. (OEHHA, 6/2004).

Based on ATS recommendations above, many health outcomes found to be associated with criteria pollutants could be considered adverse, including pulmonary function changes accompanied by symptoms, pulmonary function changes and respiratory symptoms that reduce quality of life, large changes in pulmonary function, clinical outcomes such as emergency department visits for asthma, hospitalization for respiratory and cardiovascular disease, and mortality. In addition, outcomes such as increase in airway reactivity and inflammation may be considered adverse if they signify increases in the potential risk profile of the population.

> *With regard to sensitivity, the 1970 Clean Air Act recognized that some persons were so ill as to need controlled environments, e.g., persons in intensive care units or newborn infants in nurseries; the act stated that the standards might not necessarily protect such individuals. It further stated, however, that the standards should protect "particularly sensitive citizens such as bronchial asthmatics and emphysematics who in the normal course of daily activity are exposed to the ambient environment.* (ATS, 2000).

Finally, according to ATS, research now shows that some highly susceptible individuals may respond to common exposures at or close to natural background pollutant levels that are often unavoidable. A copy of the relevant ATS document, "WHAT CONSTITUTES AN ADVERSE HEALTH EFFECT OF AIR POLLUTION?" is provided in Appendix D.

3.3 Significance Thresholds

The CEQA Guideline Appendix G checklist was used along with the SJVAPCD CEQA Guidelines and the GAMAQI to determine whether the Project would result in a significant air quality impact. Project impacts represent the change between baseline and the future conditions associated with the proposed operations, and are the metrics compared to thresholds to determine significance.

3.3.1 CEQA Guidelines Appendix G

The Environmental Checklist Form in Appendix G of the CEQA Guidelines presents questions about projects that, if true for a particular project, would be considered a significant impact. This Report considers the following Environmental Checklist Form questions to be the Significance Thresholds against which Project air quality impacts are judged.

Would the project:

a) *Conflict with or obstruct implementation of applicable air quality plan?*

b) *Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable Federal or State ambient air quality standard?*

c) *Expose sensitive receptors to substantial pollutant concentrations?*

d) *Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?*

3.3.2 SJVAPCD CEQA Significance Criteria

Significance thresholds used when SJVAPCD is the lead agency under CEQA are presented in Table 6 and used by the County as criteria in evaluating the Environmental Checklist Form questions presented Section 3.3.1 above.

Table 6 SJVAPCD Air Quality Significance Thresholds

Criteria Pollutants			
Pollutant	Construction Phase [b] (ton/yr)	Operation Phase Permit-Required [c] (ton/yr)	Operation Phase Permit-Exempt [c] (ton/yr)
CO	100	100	100
NOx	10	10	10
ROG	10	10	10
SOx	27	27	27
PM_{10}	15	15	15
$PM_{2.5}$	15	15	15
Recommended Toxic Air Contaminants (TACs), Odor Thresholds[b]			
TACs (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 20 in 1 million Chronic & Acute Hazard Index ≥ 1.0 (project increment)		
Odor	More than one confirmed complaint per year averaged over a three-year period, or three unconfirmed complaints per year averaged over a three-year period. (Screening distance is one mile for HMA plants.)		
Ambient Air Quality Standards [d]			
Screening Criteria	100 lb/day of any criteria pollutant after implementation of mitigation measures.		
Modeling Criteria	If modeling is required because emissions exceed the screening criteria (100 lb/day), then the project would have a significant impact on an AAQS if the project concentration plus background concentration measured at the closest air monitoring station exceeds the most stringent AAQS (see Table 2 above) or Significant Impact Level (SIL, see Table 7 below) in cases where background concentration already exceeds or nearly exceeds the AAQS.		

a Based on SJVAPCD "Air Quality Thresholds of Significance – Criteria Pollutants". (San Joaquin Valley Air Pollution Control District, 2015)

b Based on SJVAPCD "Recommended Thresholds of Significant Impact". (San Joaquin Valley Air Pollution Control District, 2012)

c Based on SJVAPCD "Ambient Air Quality Standards & Valley Attainment Status" (San Joaquin Valley Air Pollution Control District, n.d.)

d Based on SJVAPCD "Guidance for Assessing and Mitigating Air Quality Impacts". (SJVAPCD, 2015)

Table 7 Significant Impact Level (SIL) Threshold Values

Pollutant [a]	Averaging Period	Class I (μg/m³)	Class II (μg/m³)	Class III (μg/m³)
$PM_{2.5}$	Annual	0.03	0.13	0.13
	24-hr	0.27	1.2	1.2
Fugitive $PM_{2.5}$	Annual	--	0.63	--
	24-hr	--	2.5	--
PM_{10}	Annual	0.32	1	--
	24-hr	0.2	5	--
Fugitive PM_{10}	Annual	--	2.08	--
	24-hr	--	10.4	--
Carbon Monoxide (CO)	Annual	--	500	--
	24-hr	--	2000	--
Nitrogen Dioxide (NO_2)	Annual	0.1	1	--
	24-hr	--	7.5	--
Sulfur Dioxide (SO_2)	Annual	0.08	1	--
	24-hr	0.2	5	--
	3-hr	1	25	--
	1-hr	--	7.8	--

a Based on SJVAPCD "APR-1925" (SJVAPCD, 2024). Classes refer to the type of receptor being protected and correspond to the primary and secondary AAQS standards presented in Table 2. Up to date as of 5/6/2024.

-- = No SIL exists.

** A court decision has vacated EPA's $PM_{2.5}$ SILs. Until such time as new SIL values are approved, the District will use the corresponding PM_{10} SILs for both PM_{10} and $PM_{2.5}$ analyses (as the appropriate surrogates for all $PM_{2.5}$ modeling).

3.4 Methodology

This analysis evaluates and reports historical and potential future emissions from on-site sources including aggregates mining, aggregates processing, ready mix concrete production, asphaltic concrete production, as well as off-site mobile source emissions.

3.4.1 Project Design Features and Assumptions

Impacts assessment incorporates the following general assumptions:

- The excavation and associated equipment would operate in compliance with applicable air quality regulations.
    - Diesel engines would continue to comply with applicable State regulations (e.g., ATCM) including establishment of an idling policy, and limiting idle time to less than five minutes (13 CCR §2449).
    - Fugitive dust emissions would continue to be controlled through implementation of controls and compliance measures within Rules 8011, 8021, 8031, 8041, 8051, 8061, and 8071. A formalized dust control plan has been provided, and the emissions reduction achieved as a result of the plan are included in the emissions calculations (See Appendix K, Dust Control Plan.)
- Permitted equipment would comply with Best Available Control Technology (BACT) requirements.
- The Project would not store hazardous substances or acutely hazardous substances in quantities that would trigger chemical accident prevention provisions of the CAA or the implementing regulation (40 CFR Part 68).

Design features of the Project include:

- Emissions characteristics of off-road vehicle engines in any particular year match those in CalEEMod. Specific assumptions with for vehicle engines are in Appendix C.
- Paving of roads on the Quarry Site prior to the year 30 of the project. CalEEMod was run in order to determine the emissions associated with construction of paved roads (Appendix F).

3.4.2 Emissions Calculations Methodologies

Emissions from combustion sources associated with the Project primarily consist of non-road diesel engines in off-road vehicles. Exceptions may include water and service trucks, which are on-road but assumed to have off-road engines for purposes of this analysis. This is a conservative assumption because on-road engines generally emit less pollutants as compared to off-road engines manufactured in the same calendar year (i.e., an on road 2010 model year engine is cleaner than a 2010 off-road engine). Emissions from dust sources associated with Project include windblown dust and other storage pile area emissions (e.g., loading and handling), dozer/quarrying emissions, drop emissions from material transfer, and processing plants. Figures 4, 5, and 6 (Appendix A) contain evidence for assumptions made regarding on-site stockpiles and haul roads. Emissions are calculated in Appendix G using the methods presented below.

Non-Road Engines

Emissions from off-road engines were calculated using the CalEEMod default method and emissions factors. Engine emissions rates decrease over time as the fleet is turned over and controls are implemented to comply with CARB regulations (i.e., In-Use Off-Road ATCM). Appendix A of the CalEEMod User's Guide contains the following equation for quantifying off-road engine emissions.

$$Emissions_{DieselEx} = \sum_{i} (EF_i \times Pop_i \times AvgHP_i \times Load_i \times Activity_i)$$

Where:

EF = Emission factor (g/bhp-hr) as processed from OFFROAD2011 or engine data.
Pop = Population, or the number of pieces of equipment.
AvgHP = Maximum rated average horsepower.
Load = Load factor.
Activity = Hours of operation.
i = Equipment type.

Blasting and Quarrying

Blasting emissions calculations used San Diego Air Pollution Control District (SDAPCD) standard emissions factors based on (ammonia nitrate fuel oil) ANFO used (see Appendix G.3). The factor assumed one pound ANFO per ton quarried. These emission factors were utilized in the absence of specific blasting emission factors from the SJVAPCD. Assuming one pound of explosive was used per ton of material quarried, emissions factors for NOx, CO, and SOx were 0.0085 lb/ton quarried, 0.0335 lb/ton quarried, and 0.001 lb/ton quarried respectively. Quarrying/mining emissions were calculated using the SDAPCD standard mining emissions factor (0.021 lbs fugitive dust per ton quarried). Moreover, SDAPCD Calculation Methods O20-D01, O29-B04 were utilized to account for PM-10 emissions from pre-blast drilling, as well as PM-10 emissions on a per-blast basis (Appendix G).

Storage Pile Emissions

Storage pile emissions were calculated using the SJVPCD SSP1610 emission factor (5.27 lb/acre-day). The factor of 0.2635 lb-PM10/acre/day was determined by applying 90% control to the uncontrolled emissions factor. Baseline stockpile acreage was determined to be 30 acres using Google Earth aerial imagery (Appendix A, Figure 4). Future stockpiles were scaled based on increases in materials handled. For more information see Appendix G.

Aggregates Handling

Each time aggregates are handled and then dropped dust emissions are generated in an amount predicted by the following equation (AP-42 Section 13.2.4). The mean wind speed variable in this report was assumed to be the CalEEMod default appendix value for the Project area.

$$EF = k(0.0032)\frac{\left(\frac{U}{5}\right)^{1.3}}{\left(\frac{M}{2}\right)^{1.4}}$$

Where: EF = emission factor (lb/ton).
k = particle size multiplier (dimensionless: 0.35 for PM_{10}).
U = mean wind speed, (miles per hour [mph]).
M = material moisture content (%).

Travel on Roads

Road dust emissions are calculated using AP-42 equations (Appendix E). AP-42 Section 13.2.2 (for unpaved roads) and Section 13.2.1 (for paved roads).

$$(Unpaved)\ EF = \ E_{ext} = \left[k\left(\frac{s}{12}\right)^{0.9} \times \left(\frac{W}{3}\right)^{0.45}\right]$$

Where for Unpaved Roads:
Eext = particulate emission factor (having units matching the units of k),
k = particle size multiplier units of interest (e.g. 1.5 lb/VMT for PM_{10}),
s = surface material silt content (%), and
W = average weight (tons) of the vehicles traveling the road

$$(Paved)\ \ EF\ (\frac{lb}{vmt}) = [k(sL)^{0.91} \times (W)^{01.02}]$$

Where for Paved Roads:
K = particle size multiplier (having units of lb/VMT),
sL = road surface silt loading (g/m^2), and
W = average truck weight.

A control factor of 90% was applied based on compliance with Rules 8061 and 8071 regarding road based fugitive dust emissions. All parameters for road dust calculations are available in the Appendix G (Dataset 19) and a completed Dust Control Plan is available in Appendix K.

See also Appendix J, Regional Increment Analysis, and Section 4.4.4 below, for additional discussion of on-road off-site emission calculation methods.

3.4.3 CEQA Baseline

Baseline consists of physical conditions prior to preparing this Report. Sespe calculated the Baseline emissions by analyzing fuel use data, engine information, and production records provided by Cemex (Appendix C).

Historical data for production, fuel use, and pollutant emissions were chosen to represent maximum activity levels onsite and utilized to determine the CEQA Baseline. Historical production data is summarized in Table 8. Baseline emissions calculations results are demonstrated below in Table 9, Table 10, and Table 11. Permitted and **permit-exempt equipment emissions are separated as they have separate significance thresholds. For detailed calculations of Baseline emissions, see Appendix G.**

Table 8 Historical Production Data

Material Produced	Max Hour	Max Day	Annual
Aggregate (tons)	475	6,000	1,580,413
Recycled Material (tons)	225	1,500	25,000
Asphalt (tons)	0	0	0
Ready Mix (cubic yards)	190	1,267	189,550

Source: Appendix C

Note: Values in table may differ slightly from those in Appendix C due to rounding.

Table 9 Baseline Maximum Hourly Emissions

Source	ROG (lb/hr)	CO (lb/hr)	NO_X (lb/hr)	PM_{10} (lb/hr)	$PM_{2.5}$ (lb/hr)	SO_X (lb/hr)

Note: Baseline on-road emission estimates used 2005 production data; however, Year 2018 emission factors from the current version of EMFAC were applied for on-road sources; this produces lower baseline values than if Year 2005 emissions were applied. Numbers in table may differ slightly from calculation results due to rounding, and have been converted into tons from lbs. "0.0" indicates values that are less than 0.05.

*Non-stationary source per SJVAPCD criteria pollutant thresholds. Dashes indicate source does not have emissions.

3.4.4 Construction Phase Emissions

Construction phase emissions are shown in Table 12**.** Construction consists of building the aggregate processing plant and preparing the site.

Table 12 Construction Phase Emissions

Units	ROG	CO	NO_X	PM_{10}	$PM_{2.5}$	SOx
Pounds per Day	4.8	5.04	4.87	1.23	0.64	0.01
Tons per Year	0.0478	0.92	0.89	0.22	0.12	0.00

Source: Appendix F.

Note: Numbers in table may differ slightly from calculation results due to rounding. "0.00" indicates values less than 0.005. NaN indicates that CalEEMod had no value for that pollutant.

3.4.5 Operation Phase Emissions

Maximum operation phase activity is outlined in Table 13. Emissions are quantified in Table 14, Table 15**,** and Table 16, and in Appendix G using the methodology and assumptions discussed above. Significance of the operation phase emissions is determined in Section 3.5.

Table 13 Operation Phase Maximum Activity

Material Produced	Max Hour	Max Day	Annual

3.4.6 Health Risk Assessment

HRA was performed using current best practices including methods from the HRA Guidelines (OEHHA, 2015). The four steps involved in the risk assessment process are: 1) hazard identification, 2) exposure assessment, 3) dose-response assessment, and 4) risk characterization. These four steps were used to assess health risk for the Project and each is discussed in the subchapters below.

Hazard Identification and Quantification

For air toxics sources, hazard identification involves the pollutant(s) of concern emitted by a facility, and the types of adverse health effects associated with exposure to the chemical(s), including whether a pollutant is a potential human carcinogen or is associated with other types of adverse health effects. Appendix A of the HRA Guidelines includes a list of TACs that are used for HRA in California.

Diesel particulate matter ("DPM") is the primary TAC emitted by off-road engines used in mining projects. DPM has an assigned cancer potency factor (CPF) and a non-cancer reference exposure level (REL) that are used to evaluate the health risk.

Soil Sampling

Fugitive dust is generally inert but does contain trace metals and RCS. In absence of site-specific soil data, local air district or ARB standard TAC speciation's are used to determine the health risk associated with fugitive dust emissions. These speciation's are intentionally conservative, and replacing them with data obtained via on-site sampling allows for a more accurate HRA. Table 17 shows TAC concentrations in soil assumed in this analysis. Concentrations are based on soil sample results available in Appendix C. It was conservatively assumed that TACs are present in soil onsite at the highest concentration reported by the laboratory throughout the samples taken. TACs that were not detected during sampling are assumed to be present at the Minimum Detection Level (MDL).

Table 17 Fugitive TAC Speciation Assumptions

Emission Source	Constituent (TAC)	SJVAPCD Standard Value (ppm)	Empirically Determined Value (ppm)
Road Dust	Arsenic	21.0	1.0*
Road Dust	Nickel	19.0	20.7
Road Dust	Hexavalent Chromium	0.0	0.25*
Aggregate Processing	Arsenic	22.0	1.0*
Aggregate Processing	Nickel	28.0	20.7
Aggregate Processing	Hexavalent Chromium	1.4	0.25*
Material Storage	Arsenic	20.0	1.0*
Material Storage	Nickel	20.0	20.7
Material Storage	Hexavalent Chromium	2.5	0.25*

Source: Appendix C Laboratory Sampling Data

*TAC was not detected, therefore MDL is assumed.

SJVAPCD standard speciation profiles and data determined via sampling were combined with calculated PM_{10} emissions to determine the mass of each TAC, and dispersion coefficients to quantitatively predict the ground level concentration (GLC) of each TAC, to which individuals may be exposed (see exposure assessment subsection below). The concentrations were then combined with exposure parameters to quantify the dose received by each receptor and for each exposure pathway. In the case of non-cancer risk, the exposures were then summed on a target organ by target organ basis using HARP2 to determine the maximum hazard index (HI) among the target organs in the body. The maximum target organ HI was then compared to the non-cancer significance criteria (i.e., 1.0 HI) as discussed in the following subsections.

The HRA considered whether health risk from asbestos should be quantified. It was determined based on review of available maps (California Department of Conservation, Division of Mines and Geology, 2000) and language in the Asbestos ATCM's (17CCR §93105 and §93106) that asbestos is unlikely to be a concern and so was not included as part of the HRA.

Exposure Assessment

The purpose of exposure assessment is to estimate the extent of public exposure to emitted substances. For the Hot Spots program, in practice this means estimating exposures for those emitted substances for which potential cancer risk or noncancer health hazards for acute, repeated 8-hour, and chronic exposures are required to be evaluated. This involves emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels.

Hot Spots Analysis and Reporting Program (HARP2) software developed by CARB can be used to model ground level concentrations at specific off-site locations. HARP2 incorporates the US EPA-approved dispersion model, American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD). AERMOD is a gaussian steady-state plume model based on planetary boundary layer turbulence structure and scaling concepts, including treatment of both surface and elevated sources, and both simple and complex terrain. CARB recommends AERMOD for HRA performed under Hot Spots risk assessments (OEHHA, 2015).

In this HRA, the air dispersion modeling was performed using AERMOD View by Lakes Environmental (Version 13.0.0 running AERMOD executable Version 24142). The HARP2 ADMRT version 22118 was used to determine health risk impacts based on ground level concentrations of TACs. Air dispersion modeling consisted of four steps:

:

1. Annual average and maximum one-hour GLCs are estimated. Air dispersion modeling results are expressed as concentration for each source receptor combination per amount of substance emitted per time in units of micrograms per cubic meter per gram per second, or $(\mu g/m^3)/(g/s)$. This value, referred to as Chi over Q and sometimes written as (X/Q) is referred to as the dilution factor.

2. When multiple substances are evaluated, the X/Q is normally utilized since it is based on an emission rate of one gram per second. The X/Q at the receptor point of interest is multiplied by the substance-specific emission rate (in g/s) to yield the substance-specific GLC in units of µg/m^3. The following equations illustrate this point.

$$GLC = \left(\frac{X}{Q}\right) \times Q_{Substance}$$

$$\frac{X}{Q} = (Chi\ over\ Q)\ in\ \left(\frac{{}^{\mu g}/_{m^3}}{{}^{g}/_{s}}\right), from\ model\ results\ with\ unit\ emission\ rate$$

$$Q_{Substance} = substance\ emission\ rate\ \left({}^{g}/_{s}\right)$$

3. The applicable exposure pathways (e.g., inhalation, soil contact, fish consumption) are identified for the emitted substances, and the receptor locations are identified. This determines which exposure algorithms are ultimately used to estimate dose. After the exposure pathways are identified, the fate and transport algorithms are used to estimate concentrations in the applicable exposure media (e.g., soil or water) and the exposure algorithms are used to determine the substance-specific dose.

4. The dose is used with cancer and noncancer health values to calculate the potential health impacts for the receptor. An example calculation using the high-end point-estimates for the inhalation (breathing) exposure pathway can be found in Appendix I of the HRA Guidelines (OEHHA, 2015).

Health risk assessments were conducted using the latest version of HARP2 for both residential and worker receptors. Variable emissions were modeled in AERMOD to capture differences in operating conditions and their influence on risk outcomes. Two distinct AERMOD projects were developed:

Chronic and Cancer Risk Modeling: Applied hourly variable emissions with a scaling factor of 2.0 during the operational hours. This approach provides a conservative evaluation of long-term exposure risks under typical operating conditions.

Acute Risk Modeling: Applied a uniform hourly scaling factor of 1.0 during operational hours to represent short-term exposure scenarios, consistent with OEHHA acute risk guidance.

AERMOD was used as described above to calculate a X/Q for each source-receptor combination by setting the emission rate for each source in the model to one gram per second (1 g/s). Other parameters used in AERMOD describe overall control of the model domain and functionality (e.g., coordinate system, terrain, non-default options, etc.), receptors (e.g., location, height), sources (e.g., size, location, exhaust velocity, temperature, operating schedule), meteorology (hourly wind speed and direction, surface and upper air files provided by SJVAPCD), and output file options. The Control Pathway of AERMOD was set to provide output in concentration units of µg/m^3; and both wet and dry plume depletion were disabled. Terrain Options within AERMOD were set to "Flat & Elevated" and digital terrain files were downloaded through AERMOD from the National Elevation

Database in geotiff format "NED GEOTIFF". Averaging options were set to 1-hour and the period of the meteorological data file (i.e., five years) as provided by SJVAPCD. The ADJ_U* setting was used pursuant to current EPA Guidelines in Appendix W of 40 CFR Part 51 (82 FR 5182, 1/17/2017), and as included in the AQMD meteorological file. Figure 3 (Appendix A) contains a wind-rose representation of the meteorological data. The rural dispersion coefficient was used. Algorithms to include deposition, exponential decay and low wind (beta) were not used.

Receptors were modeled at ground level (i.e. no flagpole height). 26 discrete receptors and 6857 fence-line grid receptors were modeled. Residential and worker receptors can be found in Table 18**.** Potentially sensitive, non-residential receptors that were considered are identified in Figure 7. The modeled receptors, sources that existed in the Baseline, and sources proposed by the Project are illustrated in Figures 8, 9, and 10 (Appendix A). Source parameters are summarized in Table 19. Project sources were assigned positive emissions values and Baseline sources were assigned negative values (i.e., to represent sink) so that the HRA results represent the change in health risk with the Project. In order to obtain the most conservative possible health risk assessment, the model assumes mining takes place as close as possible to residential receptors, meaning that only two (2) of the nine (9) mining model volume objects were utilized. Concentration of mining emissions into a small area near receptors allows the model to demonstrate potential risk in the worst-case scenario. Chronic and cancer risks were evaluated at locations where long-term occupancy is reasonably expected (≥1 year), while maximum acute risk was assessed at the Project fence line, with risk attenuation documented as distance increases.

The model was segmented into 2 (two) intervals based on the Project specifications, consolidating on the Quarry Site after 30 years. The segments of the HRA model were chosen to coincide with onsite activity changes and represent years 1 – 70 for Phase 1 (years 1-30) and parts of Phase 2 (years 31-70); and years 31-100 for Phase 2 when operations occur only at the quarry site. Each HRA phase was evaluated separately to reflect changes in onsite activities and emission locations. To capture the full Project duration, the risks from each phase were combined by summing the risks from both phases, resulting in a cumulative risk estimate that reflects continuous exposure over a 70-year operational period (Phase 2). Although the Project represents 100 years of operation, the preparation of two 70-year HRA models meets SJVAPCD guidance to use a 70-year analysis.

Output of the dispersion model in the form of plot files, one for each combination of source and averaging period, containing X/Q values were combined with pollutant emissions rate by the AERMOD View multichemical batcher. Exposure parameters discussed below were assigned to HRACalc.exe input file (HRAInput.hra) that was used with the GLC plot files to predict the cancer and non-cancer risk at each receptor. Modeling files are provided in electronic format, **Appendix I**.

SAPLT	Future	Plant Site Asphalt Plant Emissions	Volume Source
SASTK	Future	Plant Site Asphalt Stack Emissions	Point Source

Note: The model divided mining emissions equally between NMINE8 and NMINE9 volume sources, and other mine sources were assigned zero emissions. The result of this approach is a more concentrated plume in an area that is most impactful to receptors, which is conservative.

After emissions exit the source, the substances are dispersed in the air. In addition to being inhaled, particulates deposit on vegetation, on soil, and in water at a rate that is dependent on the particle size. A controlled deposition rate of 0.02 m/s was used for the Project HRA and the Mitigated Project HRA. Other model pathways used to estimate concentrations in environmental media include air, soil, water, vegetation, and animal products.

The concentration of the substance in soil (Cs) is a function of the deposition, accumulation period, chemical specific soil half-life, mixing depth, and soil bulk density. Concentrations in vegetation, animal products, and mother's milk are predicated on the concentrations estimate to be in the air, water, and soil. The Project HRA includes air, soil ingestion, home grown produce, and mother's milk as pathways of exposure. Detailed discussion of the methodologies used to determine the concentrations in various media to which receptors may be exposed is located in Subchapter 5.3 of the HRA Guidelines.

Once the concentrations of substances are estimated in air, soil, water, plants, and animal products, they are used to evaluate estimated exposure to people. Exposure is evaluated by calculating the daily dose in milligrams per kilogram of body weight per day (mg/kg/d). The HRA Guidelines describe the algorithms used by HARP2 to calculate this dose for exposure through inhalation, dermal absorption, and ingestion pathways. All chemicals are assessed for exposure through inhalation. Semi and non-volatile multi-pathway substances (e.g., earth metals in fugitive dust), the soil ingestion pathway, and the dermal soil exposure pathway are assessed. The mother's milk pathway is used depending on the multi-pathway substance released. The Project HRA assessed each of these four pathways.

Inhalation Dose

The dose through the inhalation route is estimated for cancer risk assessment and noncancer hazard assessment. Both residential and off-site worker exposures are considered. Since residential exposure includes near-continuous long-term exposure at a residence and workers are exposed only during working hours (i.e., 8 hours/day), treating all receptors as residential results in a conservative assessment of health risk.

Exposure through inhalation is a function of the breathing rate, the exposure frequency, and the concentration of a substance in the air. For residential exposure, the breathing rates are determined for specific age groups, so inhalation dose (Dose-air) is typically calculated for each of these age groups: 3rd trimester, 0<2, 2<9, 9<16, 16<30 and 30<70 years though short projects may not affect all age groups. OEHHA used the mother's breathing rates to estimate dose for the 3rd trimester fetus assuming the dose to the fetus during the 3rd trimester is the same as the mother's dose. These age-specific groupings are needed in order to properly use the age sensitivity factors for cancer risk assessment. Tier 1 evaluations and the Project HRA use the high-end point estimate (i.e., the 95th percentiles) breathing rates for the inhalation pathway in order to avoid underestimating cancer risk to the public, including children. The following equation is used to determine dose for the inhalation pathway.

$$Dose_{Air} = C_{Air} \times \left\{\frac{BR}{BW}\right\} \times A \times EF \times 10^{-6}$$

Where:

$Dose_{Air}$ = Dose through inhalation (mg/kg/d)
C_{Air} = Concentration in air (µg/m^3)
{BR/BW} = Daily breathing rate normalized to body weight (L/kg body weight-day)
A = Inhalation absorption factor (unitless)
EF = Exposure frequency (unitless), days/365 days
10^{-6} = Micrograms to milligrams conversion, liters to cubic meters conversion

The breathing rate normalized to body weight term, {BR/BW}, has several values used to assess cancer risk for each age bin designated in the HRA Guidelines (i.e., third trimester, 0 to 2, 2 to 16 and 16 to 70 years). These values and the parametric model distributions from which they are derived are provided in the HRA Guidelines. The inhalation absorption factor, A, is recommended to be assigned a value of one (i.e., 100% of dose is absorbed) but may also be assigned the value determined by the toxicological study upon which the CPF for the substance is based. Exposure frequency is recommended to be 350 days for residential exposures. Table 20 presents the mean and high-end point estimates for intake rates that were assumed in the Project HRA.

Table 20 Point Estimates of Residential Daily Breathing Rates by Age Group

Estimate	3rd Trimester[1] (L/kg BW-day)[2]	0<2 Years (L/kg BW-day)	2<16 Years (L/kg BW-day)	16<70 Years (L/kg BW-day)
Mean (65%ile)[3]	225	658	452	210
High-End (95%ile)	361	1090	745	335

Source: (OEHHA, 2015, pp. 5-25).

1 3rd trimester breathing rates based on breathing rate of pregnant women using the assumption that the dose to the fetus during the 3rd trimester is the same as that to the mother.

2 Values are in units of liters of air per kilogram of body weight per day.

3 Mean values were not used in the HRA and are provided for informational purposes only.

Non-cancer health risks were unaffected by age and determined in HARP2 by dividing the GLC of each pollutant at each receptor by the corresponding reference exposure level (REL, units of $\mu g/m^3$) resulting in a hazard index (HI). The HIs for pollutants affecting each target organ were then summed to determine the total HI for each target organ. The target organ with the greatest HI is reported as the non-cancer health risk at each receptor.

Annual residential dose was calculated by HARP2 using the GLC (mg/m^3), the intake rate (L/kg-day), 350 days/yr exposure frequency, and an assumption that the entire mass of pollutants inhaled is absorbed into the body of the individual exposed (i.e., no pollutants are exhaled). A fraction of time at home (FAH) was not applied for individuals of any age, and therefore the conservative assumption of 100% of time at home was used for risk determination.

Inhalation dose of each pollutant at each receptor was then multiplied in HARP2 by the inhalation cancer slope factor for the pollutant to estimate annual cancer risk in units of excess cancer cases per million individuals exposed. The total cancer risk from inhalation was then calculated by summing the annual risk from each pollutant and year of exposure. Residential cancer risk assumed exposure duration of 70 years total and exposure was assessed using OEHHA Derived Method.

The Derived Method of dose calculation in HARP2 was used. It consists of the high-end point estimate (i.e., 95th percentile) for the two driving (dominant) exposure pathways (e.g., soil and breast milk) and the mean (65th percentile) point estimate for the remaining pathways. In non-cancer chronic assessments, the inhalation pathway is always considered a driving pathway, the next two risk driving pathways use the 95th percentile, and the remaining pathways use the mean intake rate.

Ingestion Pathway

The average concentration of pollutants in soil is a function of the deposition, accumulation period, chemical specific half-life, mixing depth, and soil bulk density. As discussed above, the controlled deposition rate (0.02 m/s) was applied. Equations and parameters used to estimate the concentration of pollutant in the soil from the GLC can be found in the HRA Guidelines (p. 5-6 to 5-8).

The dose from residential soil ingestion was calculated for each age group. The dose is calculated by HARP2 based on the concentration in soil, pollutant specific gastrointestinal relative absorption fraction (GRAF, unitless), soil ingestion rate (mg/kg-day), and exposure frequency using the equation presented in the HRA Guidelines (p. 5-43). For simplicity, GRAF was assigned a value of one which represents the entire mass of pollutant being absorbed. Soil ingestion rates estimates are shown in Table 21**.**

Table 21 Soil Ingestion Rate Point Estimates by Age Group

Estimate	3rd Trimester[1] (mg/kg BW-yr)[2]	0<2 Years (mg/kg BW-yr)	2<16 Years (mg/kg BW-yr)	16<70 Years (mg/kg BW-yr)
Mean (65%ile)[3]	0.7	20	3	0.7
High-End (95%ile)	3	40	10	3

Source: (OEHHA, 2015, pp. 5-44).

1 3rd trimester is assumed to be the mother's soil ingestion rate.

2 Values are in units of milligrams of pollutant ingested per kilogram of body weight per year.

3 Geometric mean (GM) values were not used in the HRA and are provided for informational purposes only.

Dermal Pathway

Exposure through dermal absorption (dose-dermal) is a function of the soil or dust loading of the exposed skin surface, the amount of skin surface area exposed, and the concentration and availability of the pollutant. The annual dermal load (ADL) is a composite of the body surface area per kg body weight, exposure frequency, and soil adherence to the skin. High-end point estimates of ADL for individuals located in a mixed climate were used.

Table 22 Annual Dermal Loading Point Estimates by Age Group

Estimate	3rd Trimester[1] (mg/kg BW-yr)[2]	0<2 Years (mg/kg BW-yr)	2<16 Years (mg/kg BW-yr)	16<70 Years (mg/kg BW-yr)
Mean (65%ile)[3]	1,100	2,200	5,700	1,100
High-End (95%ile)	2,400	2,900	8,100	2,400

Source: (OEHHA, 2015, pp. 5-37).

1 3rd trimester based on ADL of mother normalized to body weight assuming exposure to the mother and feus are the same.

2 Values are in units of milligrams of pollutant on skin per kilogram of body weight per year.

3 Mean values were not used in the HRA and are provided for informational purposes only.

High-end ADL was combined with the concentration of pollutant in soil, the fraction absorbed across skin (pollutant-specific factor), the exposure duration (i.e., 70-year residency) using equations presented in the HRA Guidelines (pg. 5-41) to estimate the dermal dose for each residential receptor. Worker receptors used the adult ADL and a 40-year exposure duration for the health risk calculation.

Mother's Milk Pathway

Estimates of the concentration of pollutants in mother's milk require the use of the air, water, and soil environmental fate evaluations. Infants would be exposed to the pollutants in concentrations equal to the concentrations at which the mother is exposed from birth up to 25 years of age when the infant is assumed to be born. The exposed infant is assumed to be fully breastfed for the first year of life. The summed average dose daily dose (mg/kg-day) from each pathway is calculated for the nursing mother using equations in the HRA Guidelines (p. 5-59). Breast milk intake rates of 101 and 139 g/kg-day are used by HARP2.

Dose-Response Assessment

Dose-response assessment is the process of characterizing the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations. The health database applied in this modeling containing risk factors was developed by OEHHA (Version 25268, September 2025).

In quantitative carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency slope that is used to calculate the probability or risk of cancer associated with intensity of the exposure. Cancer potency factors (CPF) are expressed as the 95^{th} percent upper confidence limit of the slope of the dose response curve estimated assuming continuous lifetime exposure to a substance. Typically, potency factors are expressed as units of inverse dose (e.g., $(mg/kg\ BW/day)^{-1}$) and as a Unit Risk Factor (URF) for a 70-year lifetime exposure in units of inverse concentration (e.g., $(\mu g/m3)^{-1}$). It is assumed in cancer risk assessments that risk is directly proportional to dose and that there is no threshold for carcinogenesis. (OEHHA, 2015).

For noncarcinogenic effects, dose-response data developed from animal or human studies are used to develop acute, repeated 8-hour, and continuous exposure Reference Exposure Levels (RELs). The non-cancer RELs are defined as the concentration at which no adverse noncancer health effects are anticipated even in sensitive members of the general population, with infrequent one-hour exposures, repeated 8-hour exposures over a significant fraction of a lifetime, or continuous exposure over a significant fraction of a lifetime, respectively. The most sensitive health effect is chosen to develop the REL when the chemical affects multiple organ systems. Unlike cancer health effects, noncancer health effects are generally assumed to have thresholds for adverse effects. In other words, injury from a pollutant would not occur until exposure to that pollutant has reached or exceeded a certain concentration (i.e., threshold) and/or dose. The acute, 8-hour, and chronic RELs are air concentrations intended to be less than the threshold for health effects in the general population. (OEHHA, 2015).

The actual threshold for health effects in the general population is generally not known with precision. Uncertainty factors are applied to the Lowest Observed Adverse Effects Level (LOAEL) or No Observed Adverse Effects Level (NOAEL) or Benchmark Concentration values from animal or human studies ensure that the RELs

are set lower than the threshold for health effects in nearly all individuals. Table H.1 in Appendix H summarizes the health values (CPFs, RELs) that were used in the dose-response assessment.

Risk Characterization

Risk characterization is the final step of the HRA. In this step, information developed through the exposure assessment is combined with information from the dose-response assessment to characterize risks at each receptor. OEHHA conducts the dose-response assessment during the development of CPFs and RELs. These are used in conjunction with the exposure estimates to assess cancer risk and hazard from noncancer toxicity of emitted chemicals. Under the Hot Spots program, risk characterizations present both individual and population-wide health risks.

A general summary of the risk characterization components includes the following:

- The locations of the point of maximum impact (PMI), the maximum exposed individual receptor (MEIR), and the maximum exposed individual worker (MEIW) are identified. The PMI, MEIW, and MEIR for cancer risk and for noncancer hazard indices may not occur at the same location; and should be identified.
- The location of any specified sensitive receptors (e.g., schools, hospitals, daycare, or eldercare facilities) are identified.
- Estimates of population-wide cancer burden are assessed.

Cancer Risk

Cancer risk is calculated by multiplying the daily inhalation or oral dose, by a CPF, the age sensitivity factor (ASF), the frequency of time spent at home (FAH) (for residents only), and the exposure duration divided by averaging time, to yield the excess cancer risk. As described below, excess cancer risk is calculated separately for each age grouping and summed to yield cancer risk at the receptor location. A brief description of the age sensitivity factors, exposure duration, and frequency of time spent at home are included below. These factors are discussed in various technical support documents to the HRA Guidelines.

OEHHA has determined that young animals are more sensitive than adult animals to exposure to many carcinogens. Therefore, OEHHA developed age sensitivity factors (ASFs) to take into account the increased sensitivity to carcinogens during early-in-life exposure. In the absence of chemical-specific data, OEHHA recommends a default ASF of 10 for the third trimester to age 2 years, and an ASF of 3 for ages 2 through 15 years to account for potential increased sensitivity to carcinogens during childhood. These values manifest in the intake parameters presented below.

FAH during the day can be used to adjust exposure duration and cancer risk from a specific facility's emissions, based on the assumption that exposure to the facility's emissions are not occurring away from home. From the third trimester to age <2 years, 85% of time is spent at home. From age 2 through <16 years, 72% of time is spent at home. From age 16 years and greater, 73% of time is spent at home. Facilities with a school within the 1×10^{-6} (or greater) isopleth are directed to use FAH = 1 for the child age groups (3rd Trimester, 0<2 years, and 2<16 years). FAH was not applied for Project cancer risk modeling, conservatively assuming 100% of time at home.

For residential inhalation exposure, cancer risk must be separately calculated for specified age groups because of age differences in sensitivity to carcinogens and age differences in intake rates (per kg body weight). Separate risk estimates for these age groups provide a health-protective estimate of cancer risk by accounting for greater susceptibility in early life, including both age-related sensitivity and amount of exposure. The following equation illustrates the formula for calculating residential inhalation cancer risk.

$$RISK_{inh-res} = DOSE_{air} \times CPF \times ASF \times \frac{ED}{AT} \times FAH$$

Where:

$RISK_{inh-res}$ = Residential inhalation cancer risk
$DOSE_{air}$ = Daily inhalation dose (mg/kg-day)
CPF = Cancer potency factor $(mg/kg\text{-}day)^{-1}$
ASF = Age sensitivity factor for a specified age group (unitless)
ED = Exposure duration (in years) for a specified age group
AT = Averaging time for lifetime cancer risk (years)
FAH = Fraction of time spent at home (unitless)

Cancer risks calculated for individual age groups are summed to estimate the total cancer risk over the exposure duration. Cancer risk is expressed in "chances per million" (cancer risk × 10^{-6}) but may also be expressed in other ways, such as "chances per 100,000" or "chances per 10 million" (cancer risk × 10^{-7}).

Residential exposure was modeled using a 70-year duration, and worker exposure was modeled using a 40-year duration, with a worker adjustment factor of 2.33, consistent with regulatory guidance.

For assessment of off-site worker cancer risk at the MEIW, the default assumes working age begins at 16 years. The daily inhalation dose ($DOSE_{air}$) is based on the adjusted 8-hour concentration at the MEIW (for non-continuous sources) and amount of time the off-site worker's schedule overlaps with the facility's emission schedule. Additional consideration for off-site worker cancer risk assessment is whether there are women of child bearing age at the MEIW location and whether the MEIW has a daycare center. Under most circumstances, cancer risk accumulated by inhalation is calculated using the following equation:

$$RISK_{inh-work} = DOSE_{air} \times CPF \times ASF \times \frac{ED}{AT}$$

Where:

$RISK_{inh-work}$ = Worker inhalation cancer risk
$DOSE_{air}$ = Daily inhalation dose (mg/kg-day)
CPF = Cancer potency factor $(mg/kg\text{-}day)^{-1}$
ASF = Age sensitivity factor for a specified age group (one for working age 16 to 70)
ED = Exposure duration (in years) for a specified age group (40 years)
AT = Averaging time for lifetime cancer risk (70 years)

As discussed previously, some substances (e.g., semi-volatile organics and metals) are carcinogenic regardless of how they enter the body. Exposures to these substances are called multi-pathway. HRA for a facility that emits a multi-pathway pollutant must, at a minimum, evaluate doses from soil ingestion and dermal exposure. If polycyclic aromatic hydrocarbons, lead, dioxins, furans, or polychlorinated biphenyls are emitted, then the breast-milk consumption pathway becomes mandatory for residential receptors. OEHHA has developed transfer coefficients for these chemicals from the mother to breast milk. The other exposure pathways (e.g., ingestion of homegrown produce or fish) are only evaluated for if the facility impacts that exposure medium and the receptor under evaluation can be exposed to that medium or pathway. For example, if the facility does not impact a fishable body of water, or the impacted water body does not sustain fish that are consumed by anglers, then the fish pathway will not be considered for that facility or receptor.

Non-inhalation residential cancer risk is calculated using the same steps as inhalation cancer risk. The pathway under evaluation (e.g., soil ingestion) is multiplied by the substance-specific oral slope factor, expressed in units of inverse dose (i.e., $(mg/kg/day)^{-1}$), the appropriate ASF, and exposure duration divided by averaging time to yield the cancer risk for a specified age grouping. Cancer risk for each age group is summed as appropriate for the exposure duration.

If multiple substances are emitted, the substance-specific cancer risks for each exposure pathway are summed to give the (total) multi-pathway cancer risk at the receptor location. HARP2 displays the multi-pathway risk for each carcinogenic substance and a breakdown of the cancer risk from each exposure pathway.

This HRA evaluates mother's milk due to the presence of lead in fugitive dust. The default assumption inherent in the intake rate is that the infant's only source of food is breast milk for the first year (e.g., is fully breastfed), which is one-half of the 0<2 year age group used in the Hot Spots program. Thus, the cancer risk by the mother's milk pathway is calculated with a slightly modified equation using a different exposure duration. Once the cancer risk is determined for the mother's milk pathway then it is summed with the other risks to calculate the total cancer risk for the receptor.

For facilities with large emission footprints (e.g., refineries, ports, or rail yards, etc.), population-based health impacts provide a better illustration of the potential population-wide impacts of emissions since large numbers of people may be exposed to the emissions. The individual cancer risk approach discussed up to this point has some inherent limitations in terms of protecting public health. A small facility with a single stack can impact a few individuals with an individual cancer risk that is unacceptable, whereas a large facility may have an individual cancer risk that is less than the acceptable limit for individual risk but exposes many more people. Thus, the population-wide impacts are larger for the large facility. Population-wide risk is independent of individual risk and assumes that a population (not necessarily the same individuals) will live in the impacted zone over a 70-year period.

To evaluate population risk, the cancer burden method accounts for the number of excess cancer cases that could occur in a population. The cancer burden is calculated by multiplying the cancer risk at a census block centroid by the number of people who live in the census block, and adding up the estimated number of potential cancer cases across the zone of impact. The result of this calculation is a single number that is

intended to estimate of the number of potential cancer cases within the population that was exposed to the emissions.

Cancer burden is independent of how many people move in or out of the vicinity of an individual facility. For example, if 10,000 people are exposed to a carcinogen at a concentration with a 1×10^{-5} cancer risk for a lifetime the cancer burden is 0.1, and if 100,000 people are exposed to a 1×10^{-5} risk the cancer burden is 1.

OEHHA recommends that exposure from projects longer than 2 months but less than 6 months be assumed to last 6 months (e.g., a 2-month project would be evaluated as if it lasted 6 months). Exposure from projects lasting more than 6 months should be evaluated for the duration of the project. In all cases, for assessing risk to residential receptors, the exposure should be assumed to start in the third trimester to allow for the use of the ASFs. Thus, for example, if one is evaluating a proposed 10-year project, the cancer risks for the residents would be calculated based on exposures starting in the third trimester through the first ten years of life.

HRA performed for the Project follows the methodology described above for the Operation Phase which was modeled for 70 years per SJVAPCD policy. Emissions calculated for the Baseline (see Section 3.4.3) and Project (see Section 3.4.5) were determined for each time segment during the Project's life corresponding to cancer risk age bins. Cancer risk results for each time segment were then summed to determine the Project cancer risk impact at each receptor.

Non-Cancer Risk

Estimates of noncancer inhalation health impacts are determined by dividing an airborne concentration at the receptor by the appropriate REL. This is termed the Hazard Index (HI) Approach. A REL is used as an indicator of potential noncancer health impacts and is defined as the concentration at which no adverse noncancer health effects are anticipated. When a health impact calculation is performed for a single substance, then it is called the hazard quotient (HQ). Each REL for a substance will have one or more target organ systems (e.g., respiratory system, nervous system, etc.) where the substance can have a noncancer health impact. Thus, all HQs have specified target organ systems associated with them. The sum of the HQs of all chemicals emitted that impact the same target organ is the HI. Inhalation RELs for noncancer health impacts have been developed for acute, 8-hour chronic, and continuous chronic exposures to a number of substances.

Acute RELs are designed to protect against the maximum 1-hour ground level concentration at a receptor. Chronic RELs protect against long-term exposure to the annual average air concentration spread over 24 hours/day, 7 days/week. 8-hour RELs are designed to protect people with daily 8-hour schedules, such as off-site workers, in an impacted zone. The 8-hour RELs are used for typical daily work shifts of 8 hours and represent concentrations at or below which health impacts would not be expected even for sensitive subpopulations in the general population with repeated chronic daily 8-hour exposures. The 8-hour RELs can be used to evaluate the potential for health impacts (including effects of repeated exposures) in off-site workers, and to children and teachers exposed during school hours.

Acute, 8-hour, and chronic RELs are needed because the dose metrics and even the health impact endpoints may be different with the different exposure durations of acute, daily 8-hour, and chronic exposures. Also,

although chronic REL values are lower or set the same as 8-hour RELs, there are some cases such as special meteorological situations (e.g., significant diurnal-nocturnal meteorological differences) or intermittent exposures where the 8-hour REL may be more protective than the chronic REL.

As discussed above, in order to calculate the acute, 8-hour, or chronic HQ, the maximum ground-level concentration (in units of µg/m^3) during the appropriate period of time (i.e., 1-hour acute, 8-hour, and 1-year chronic) is divided by the corresponding REL (in µg/m^3) for the substance. If a receptor is exposed to multiple substances that target the same organ system, then the HQs for the individual substances are summed to obtain a Hazard Index (HI) for that target organ as shown in the following equations.

$$HI_{Organ1} = \frac{C_{air,1}}{REL_1} + \frac{C_{air,2}}{REL_2} + \cdots + \frac{C_{air,n,}}{REL_n}$$

or

$$HI_{Organ1} = HQ_1 + HQ_2 + \cdots + HQ_n$$

A HI of 1.0 or less indicates that adverse health effects are not expected to result from exposure to emissions of that substance. As the HI increases above one, the probability of human health effects increases by an undefined but relative amount. However, HI above one is not necessarily indicative of health impacts due to the application of uncertainty factors in deriving the RELs.

There are non-cancer multi-pathway pollutants that are assessed for inhalation, ingestion, and other non-inhalation pathways. Nickel and arsenic are two that are found in fugitive dust and so the non-inhalation exposures to these metals are assessed for the corresponding target organs. Specifically, nickel effects the respiratory, hematologic, and alimentary systems while arsenic affects development, the skin, the nervous system, and the cardiovascular system.

3.5 Project-Level Impacts and Mitigation Measures

Project impact is compared to each threshold of significance (Section 3.3) and is evaluated in the following subsections. Mitigation measures are proposed for impacts where Project impact is predicted to exceed a threshold. Mitigated impact is then assessed to evaluate the effect of the mitigation and determine if additional mitigation is necessary.

3.5.1 Conflict With or Obstruction to the Implementation of an Air Quality Plan

Impact Statement

Impact AQ-1: *Would the Project conflict with or obstruct implementation of the applicable air quality plan?* **(CEQA Appendix G Threshold Criteria (a))**

Impact Analysis

The SJVAPCD AQMPs are discussed above in Section 3.1.4.1. Potential control measures that may be pursued to reduce emissions are described in the AQMP. These measures would be implemented as rules and therefore would undergo the associated public rulemaking process, which allows for a discussion of their compliance with applicable requirements. Thus, it is unlikely that such a process would result in a requirement that the Project could not comply with. In the end, the Project would be required to comply with regional air quality rules promulgated by the SJVAPCD and participate in reducing air pollutant emissions. Aggregates production is proportional to population growth, which is a factor that is accounted for in AQMPs. Therefore, the Project would not obstruct implementation of an air quality plan because growth in the emissions would be an amount proportional to population growth, thus, growth in the regional aggregates market is included in the air quality plans.

In summary, the Project would not conflict with or obstruct specific control measures and is therefore consistent with attainment goals in an air quality plan. The AQMPs represent a broader legislative agenda which can be represented in the form of district rules and thresholds such as the ones which are analyzed in this Report. See report sections 3.1.4.2 Rules and Regulations and 3.3 Significance Thresholds.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

None required.

Level of Significance After Mitigation

Less than significant.

3.5.2 Net Increase of any Criteria Pollutant

Impact Statement

Impact AQ-2: *Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable Federal or State ambient air quality standard?* **(CEQA Appendix G Threshold Criteria (b))**

Impact Analysis

CEQA defines cumulative impacts as two or more individual effects which, when considered together, are either significant or "cumulatively considerable", meaning they add considerably to a significant environmental impact. An adequate cumulative impact analysis considers a project over time and in conjunction with other past, present, and reasonably foreseeable future projects whose impacts might compound those of the project being assessed.

By its very nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development. Future attainment of State and Federal ambient air quality standards is a function of successful implementation of the SJVAPCD's attainment plans. Consequently, the SJVAPCD's application of thresholds of significance for criteria pollutants is relevant to the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality.

A Lead Agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project will comply with the requirements in a previously approved plan or mitigation program, including but not limited to an air quality attainment or maintenance plan that provides specific requirements that will avoid or substantially lessen the cumulative problem within the geographic area in which the project is located (CCR §15064(h)(3)).

Thus, if project emissions (change from baseline) exceed thresholds for NOx, ROG, SOx, CO, PM_{10} or $PM_{2.5}$, then the project would result in a cumulatively considerable net increase of a criteria pollutant for which the SJVAPCD is in non-attainment under applicable Federal or State ambient air quality standards. This does not imply that if the project impact is less than those significance criteria, it cannot be cumulatively significant. SJVACPD attainment significance criteria are presented in Table 6 alongside non-attainment pollutants for disclosure purposes. Thresholds are applied separately to construction and operation phases of a project. Project emissions are summarized and compared to significance criteria in Table 23 and Table 24.

Table 23 Construction Phase Criteria Pollutant Annual Emissions

	ROG (ton/yr)	CO (ton/yr)	NO_X (ton/yr)	PM_{10} (ton/yr)	$PM_{2.5}$ (ton/yr)	SOx (ton/yr)
Construction	0.0478	0.92	0.89	0.22	0.12	0.00
Threshold	10	100	10	15	15	27
Significant?	**No**	**No**	**No**	**No**	**No**	**No**

Source: Appendix F.

Note: Numbers in table may differ slightly from calculation results due to rounding.

Table 24 Operation Phase Criteria Pollutant Annual Emissions

Criteria Pollutant	Permit – Required Sources (tons/yr)			Permit - Exempt Sources (tons/yr)		
	Project	Significance Criteria	Project Exceeds?	Project	Significance Criteria	Project Exceeds?
ROG	6.2	10	No	-0.1	10	No
CO	34.3	100	No	49.4	100	No
NO_X	3.4	10	No	5.2	10	No
PM_{10}	9.8	15	No	-25.4	15	No
$PM_{2.5}$	2.9	15	No	-6.3	15	No
SO_X	0.9	27	No	1.4	27	No

Source Appendix G

Notes: Negative values in this table result in part from the fact that off-road engines will be replaced or retrofit, resulting in lower emissions. Max hour was assumed to represent 15% of max day. Numbers in table may differ slightly from calculation results due to rounding.

Impact analysis for a project's potential to exceed or contribute to exceedance of an ambient air quality standard (AAQS) normally involves modeling emissions to predict the concentration of pollutant(s) off-site. SJVAPCD has established a screening level of 100 lb/day that may be used to avoid modeling impacts that are unlikely to result in exceedances. Baseline emissions from sources located at Rockfield properties were subtracted from future emissions at the Rockfield properties to determine the Project increase in emissions on-site for comparison to the 100 lb/day screening level as shown in Table 25.

Table 25 Project On-site Daily Emissions and Model Screening Level Comparison

Scenario	CO (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	$PM_{2.5}$ (lb/day)	SO_X (lb/day)
On-Site Baseline	228.4	544.0	1,023.5	238.2	0.5
On-Site Future	1,323.4	669.4	1,057.8	257.1	26.6
On-Site Project	1,095.0	125.4	34.3	18.8	26.1
Screening Criteria	**100**	**100**	**100**	**100**	**100**
Exceeds Criteria?	**Yes**	**Yes**	**No**	**No**	**No**

Source Appendix G

Notes: Negative values are a result of lower future emissions. Max hour was assumed to represent 15% of max day. Numbers in table may differ slightly from calculation results due to rounding.

Level of Significance Before Mitigation

As shown in Table 24 and Table 25, the total on-site Project emissions increase. Regional effects are less-than-significant as shown in Table 24. The localized effects of the Project surrounding the Project site are potentially significant as shown in Table 25,because they exceed the screening level for CO and NOx. Table 25 findings lead to the requirement for additional criteria air pollutant dispersion modeling for each criteria pollutant. The additional analysis is presented below in Table 28.

Mitigation Measures

The Mitigated Project incorporates newer engines to reduce off-road engine PM_{10} emissions, and an increase in the level of control on sources of fugitive dust (roads, stockpiles) using the control methods described in the Fugitive Dust Control Plan, Appendix K.

Mitigation Measure AQ-1: Off-road Engines

Off-road engines shall be retrofitted or upgraded in order to meet the Tier 4i Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower-hour.

Mitigation Measure AQ-2: Fugitive Dust Control

Implement control for fugitive dust as described in the FDCP (Appendix K). Unpaved roads shall be controlled at a level of 90% by application of chemical dust suppressants or other equivalent methods. Stockpiles shall be controlled at a level of 90% by application water or other equivalent methods.

Level of Significance After Mitigation

Table 26 presents mitigated Project annual emissions for each criteria pollutant and the associated significance criteria established by SJVAPCD which are applied to total emissions from permit-required stationary sources

and permit-exempt sources separately though the significance criteria for each are equivalent. As shown in Table 26**,** mitigated Project emissions for each criteria pollutant do not exceed the significance criteria.

Table 26 Mitigated Criteria Pollutant Annual Emissions

Criteria Pollutant	Permit – Required Sources (tons/yr)			Permit - Exempt Sources (tons/yr)		
	Project	Significance Criteria	Project Exceeds?	Project	Significance Criteria	Project Exceeds?
ROG	6.2	10	No	-0.1	10	No
CO	34.3	100	No	49.4	100	No
NO_X	3.4	10	No	5.2	10	No
PM_{10}	4.3	15	No	-67.4	15	No
$PM_{2.5}$	1.3	15	No	-17.1	15	No
SO_X	0.9	27	No	1.4	27	No

Source: Appendix H.

Notes: Negative values represent emissions reductions due to newer technology and lower emission equipment as would be expected from phase in of existing engine regulations and implementation of Mitigation Measures AQ-1 through AQ-3 that are discussed in the Report.

Impact analysis for a project's potential to exceed or contribute to exceedance of an ambient air quality standard (AAQS) normally involves modeling emissions to predict the concentration of pollutant(s) at the property line. SJVAPCD has established a screening level of 100 lb/day that is used to screen out of modeling for impacts that are unlikely to exceed a threshold. Baseline emissions from sources located at the Rockfield properties were subtracted from future emissions at the property to determine the Project increase in emissions on-site for comparison to the 100 lb/day screening level. The impact of mitigation on daily criteria pollutant emissions is demonstrated in Table 27.

Table 27 Mitigated On-site Daily Emissions and Model Screening Level Comparison

Scenario	CO (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	$PM_{2.5}$ (lb/day)	SO_X (lb/day)
On-Site Baseline	228.4	544.0	1,010.9	234.5	0.5
On-Site Future	1,323.4	669.4	573.4	136.7	26.6
On-Site Project	1,095.0	125.4	-437.5	-97.8	26.1
Screening Criteria	**100**	**100**	**100**	**100**	**100**
Exceeds Criteria?	**Yes**	**Yes**	**No**	**No**	**No**

Source: Appendix H

Notes: Negative values in this table result in part from the fact that off-road engines will be replaced or retrofit, resulting in lower emissions. Max hour was assumed to represent 15% of max day. Numbers in table may differ slightly from calculation results due to rounding.

As demonstrated in Table 27, Project increases in emissions of CO and NOx from sources remain greater than the screening level after mitigation. In accordance with SJVAPCD Policy APR-2030, when any one of the criteria pollutants surpasses its established screening threshold, air dispersion modeling is required for all criteria pollutants. Therefore, the off-site concentration of each criterion pollutant was modeled, and results are presented in Table 28.

Air dispersion modeling was performed using the latest version of AERMOD to ensure accurate and reliable air quality predictions. Short term effects of blasting were modeled separately from other sources because mining and related operations cease during blasting. Long term effects of blasting are assessed in a separate model that includes only sources related to blasting and are presented in the next section.

Table 28 Mitigated Criteria Pollutant Concentrations and AAQS Comparison

Pollutant	Period	Background (ug/m^3)[a]	Project Contribution[b] (ug/m3)		Proposed Project + Background (ug/m^3)	NAAQS[c] (ug/m^3)	CAAQS[c] (ug/m^3)	SJVAPCD SIL[e] (ug/m^3)	Significant?
NO2	1-hour	25.46	H1H	79.93	105.39	—	339	NA	No
	1-hour	25.46	H8H	69.29	94.75	188	—	NA	No
	Annual	11.31	H1H	5.17	16.48	100	57	NA	No
SO2	1-hour	1.59	H1H	9.96	11.55	196	655	NA	No
	Annual	1.59	H1H	1.09	2.68	26	—	NA	No
CO	1-hour	301	H1H	231	533	40,000	23,000	NA	No
	8-hour	308	H1H	255	563	10,000	10,000	NA	No

	Annual	—[d]	H1H	-0.1101	N/A	—	20	2.08	No
PM2.5	24-hour	—[d]	H8H	-0.015	N/A	35	—	2.5	No
	Annual	—[d]	H1H	0.0825	N/A	9	12	0.63	No
Pb	3-month	0.003	Max Ave	0.003	0.006	0.15	—	NA	No

Source: Appendix I

a) Background concentration is obtained from Site No. 11.

b) HIH = 1st Highest High (highest modeled result). Where a pollutant and averaging period has a NAAQS and CAAQS standard, the most stringent standard is selected.

c) San Joaquin Valley APCD is in attainment for these pollutants (excluding PM10 and PM2.5) and averaging periods; therefore, the most stringent AAQS (CAAQS or NAAQS) is used for the significant determination.

d) San Joaquin Air Basin is classified as "non-attainment" for PM10 and PM2.5. Therefore, San Joaquin Valley APCD Significant Impact Level (SIL) is used for determining significance and does not require background concentrations (APR 1925) (SJVAPCD, 2024).
e) SIL is defined as "a concentration threshold used to determine whether a proposed source's emissions will have a "significant impact on air quality in an area" (APR 1925) (SJVAPCD, 2024).

As shown in Table 26, mitigated annual emissions are below applicable significance thresholds. As shown in Table 28**,** future concentrations of criteria pollutants (Project + Background) would be less than each AAQS and PM10 and PM2.5 emissions are less than the applicable SJVAPCD SILs. Therefore, the Project would not contribute to an exceedance of an AAQS and the impact is less than significant with implementation of Mitigation Measures AQ-1 and AQ-2.

Blasting

To evaluate the environmental impact of above-ground blasting at the Rockfield Quarry, a separate blasting model was conducted. Meteorological and blasting data were collected and analyzed. Five years of temperature, barometric pressure, and wind speed data (2018-2022) from Fresno County were used to model atmospheric conditions. Explosive parameters, including the maximum weight per blast and fuel heat content, were sourced from the DEIR, with conservative values selected to ensure safety. A maximum weight of 2,925 lbs per delay was calculated for a vibration analysis prepared for the DEIR.

Dispersion modeling was conducted exclusively for the quarry site, where nine emission sources were placed around the perimeter to simulate blasting events. Receptors were distributed throughout the surrounding area, with higher density near the site boundary to improve accuracy. Background NO_2 concentrations (17.7 ppb) were incorporated. **Figure 11** (see **Appendix A**) illustrates the AERMOD modeling scenario for this project. Green markers indicate receptor locations, while blue squares represent potential blasting areas within the Project site. Modeling focused on designated blasting hours (10:00 a.m. to 2:00 p.m. PST), during which no other emission sources were considered.

Table 29 summarizes the dispersion modeling results from blasting for NO_2. The 98th percentile of 1-hour maximum concentrations was compared to the National standard, while the highest 1-hour concentration was compared to the state standard, reflecting the different regulatory approaches. The National criterion is based on the 98th percentile of daily maximum 1-hour values, whereas the state standard uses the single highest 1-hour concentration. Across all nine scenarios, modeled NO_2 concentrations ranged from 56 to 216 $\mu g/m^3$, which are well below both National and State 1-hour limits. These findings confirm that blasting operations at the Rockfield Quarry would comply with current air quality regulations.

Table 29 Maximum Nitrogen Dioxide Dispersion Concentration Values at Different Blasting Sites

Quarry Blasting	NO_2 Concentrations
1st Highest Max Daily 1-hr Average of NO_2 Concentration (µg/m^3)	216
CAAQS Threshold	339
Exceeded	**NO**
8th Highest Max Daily 1-hr Average of NO_2 Concentration (µg/m^3)	134
NAAQS Threshold	188
Exceeded	**NO**

Note: The model conservatively accounted for various areas of mining throughout the Quarry Site that were possible and chose the highest NO_2 concentration. Modeling files are provided in Appendix I.

Overall, the Project would not result in a cumulative net increase of any criteria pollutant for which the Project region is designated non-attainment. In addition, emissions from the Project's blasting activities would not contribute to an exceedance of an applicable Ambient Air Quality Standard (AAQS).

3.5.3 Exposure of Sensitive Receptors to Substantial Pollutant Concentrations

Impact Statement

Impact AQ-3: *Would the Project expose sensitive receptors to substantial pollutant concentrations?* **(CEQA Appendix G Threshold Criteria (c))**

Project Impact Analysis at Project Site

Determination of whether project emissions would expose sensitive receptors to substantial pollutant concentrations is a function of assessing potential health risks. Sensitive receptors are facilities that house or attract children, the elderly, people with illnesses, or others who are especially sensitive to the effects of air pollutants. Hospitals, schools, convalescent facilities, and residential areas are examples of sensitive receptors. When evaluating whether a development proposal has the potential to result in localized impacts, the nature of the air pollutant emissions, the proximity between the emitting facility and sensitive receptors, the direction of prevailing winds, and local topography must be considered. Figures 7 and 8 in Appendix A contain non-residential sensitive receptors and receptors modeled in this HRA respectively.

A Health Risk Assessment was performed as discussed in Section 3.4.6 to evaluate the effects of TACs including DPM from vehicles and various substances found in fugitive dust emissions (i.e., metals and crystalline silica). Health risks from operation of the Project are presented in Table 30.

Table 30 Project Health Risk Impacts

Model Receptor # – Type	Excess Cancer Cases per Million People Exposed (Year 1-70)	Excess Cancer Cases per Million People Exposed (Year 31-100)	Max Chronic Hazard Index	Max Acute Hazard Index
23 – Residence (MEIR – Cancer, Chronic)	5.05	2.17	0.01	0.106
25 – Residence (MEIR – Acute)	0.41	-0.007	0.003	0.18
20 – Worker (MEIW – Cancer, Chronic)	-2.39	-2.10	<0.001	0.05
6772 – Fence-line Receptor (PMI-Acute)	N/A	N/A	N/A	0.85
Significance Threshold	**20**	**20**	**1.0**	**1.0**
Threshold Exceeded?	**No**	**No**	**No**	**No**

Source: Appendix I

Note: These receptors represent locations of highest exposure. Discrepancies between table and appendix values may exist due to rounding. Off-site receptors were assessed as worker receptors under the conservative assumption that residences may be used as workplaces and agricultural workers may be present in fields surrounding the site.
See Figure 8b for locations of receptors in this Table
MEIR: Maximum Exposed Individual Receptor occurs for non-cancer chronic hazard and cancer risk at the same receptor (#23).
MEIW: Maximum Exposed Individual Worker occurs for non-cancer chronic hazard and cancer risk at the same receptor (#20).
Acute hazard is evaluated for the PMI: Point of Maximum Impact. The Acute MEIR is presented for informational purposes.

Negative numbers in Table 30 are the result of the Future condition having lower health risk impact than the Baseline condition. Project emissions reductions occur as a result of CARB regulations and standards that mandate in cleaner engines over time, as well as the facility-wide incorporation of new technologies generally that are more efficient and result in lower emissions.

Level of Significance Before Mitigation

Less than significant.

Mitigated Project Analysis

As previously detailed, a mitigated analysis was performed, which approximated the health risk impact levels of the Project that would result from mitigation of off-road engine PM_{10} emissions, increasing the level of control on sources of fugitive dust (roads, stockpiles), as those measures are stated in Mitigation Measures AQ-1 and AQ-2.

Level of Significance Post Mitigation

Table 31 demonstrates health risk impacts that result from the Mitigated Project would be less than significant with the mitigation measures.

Table 31 Mitigated Impact Analysis Health Risk Impacts

Model Receptor # – Type	Excess Cancer Cases per Million People Exposed (Year 1-70)	Excess Cancer Cases per Million People Exposed (Year 31-100)	Max Chronic Hazard Index	Max Acute Hazard Index
23 – Residence (MEIR – Cancer, Chronic)	5.03	2.12	0.008	0.104
25 – Residence (MEIR – Acute)	0.41	0.01	0.002	0.18
20 – Worker (MEIW – Cancer, Chronic)	-2.39	-3.29	<0.000	0.05
6772 – Fence-line Receptor (PMI-Acute)	N/A	N/A	N/A	0.84
Significance Threshold	20	20	1.0	1.0
Threshold Exceeded?	**No**	**No**	**No**	**No**

Source: Appendix I

Note: These receptors represent locations of highest exposure. Discrepancies between table and appendix values may exist due to rounding. Off-site receptors were assessed as worker receptors under the conservative assumption that residences and may be used as a workplaces and agricultural workers may be present in fields surrounding the site.
See Figure 8b for locations of receptors in this Table
MEIR: Maximum Exposed Individual Receptor occurs for non-cancer chronic hazard and cancer risk at the same receptor (#23).
MEIW: Maximum Exposed Individual Worker occurs for non-cancer chronic hazard and cancer risk at the same receptor (#20).
Acute hazard is evaluated for the PMI: Point of Maximum Impact. The Acute MEIR is presented for informational purposes.

As demonstrated by Table 31, impacts are less than significant cancer, chronic, and acute health risk. Therefore, the Mitigated Project would not expose sensitive receptors to substantial pollutant concentrations. Negative numbers in Table 31 represent reduced risk in the future compared to the Baseline.

In this scenario, each offsite receptor experienced reduced cancer risk compared to the Baseline. This decrease in risk associated with the Project is primarily due to increased control on fugitive dust, as well as cleaner off-road engines which result in reductions of diesel particulate matter emissions. Moreover, in many cases, receptors are farther from emissions given the larger Project mine area compared to the Baseline facility. Cancer Burden analysis is available below. Modeling results related to the mitigated analysis are available in Appendix H.

Cancer Burden

To evaluate potential health impacts, population data from HARP2 census records was used to identify nearby communities, which were modeled as sensitive receptors in AERMOD View. Terrain data from AERMAP and meteorological data from Fresno Station (2018-2022) were incorporated to support accurate dispersion modeling. Emission sources were standardized to 1 g/s for proper health risk analysis, and modeled emissions were processed through HARP2 to assess cancer risk over a 70-year exposure period. This analysis was done for both mitigated and unmitigated emissions results. When cancer burden is equal to or greater than 0.5, mitigation strategies must be employed to reduce the cancer burden.

Cancer burden is measured using census receptors, which represent a community of individuals living in an area, based on census data. The locations of census receptors are determined based on census data.

The final cancer burden analysis for unmitigated emissions resulted in a total cancer risk sum of -0.258. Each of the 3,643 census receptors showed a negative cancer risk, indicating that the cumulative cancer burden on the population of approximately 253,997 located in a radius of 10 miles from the center of the project from unmitigated emission increases is effectively zero. While risk at individual receptors was above zero in the initial health risk modeling, the aggregated risk at each census receptor location was less than zero. Similarly, the analysis for mitigated emissions produced a total cancer risk sum of -0.259, with each receptor again showing negative values. Because the calculated cancer risk is negative for both scenarios, the overall cancer burden would be negative and less than the 0.5 threshold. These results confirm that, under the modeled conditions and with the proposed mitigation measures, the Project does not present a measurable cancer risk to the surrounding population and therefore does not pose a significant health concern for nearby communities. Full cancer burden results are provided in Appendix G for non-mitigated results and Appendix H for mitigated results.

On-Road Vehicle Emissions HRA

To evaluate the potential health impacts of increased heavy duty tractor class vehicles for product haulage on off-site roads leading into and out of Fresno, CA, on-road emissions were calculated for these heavy class vehicles along with the paved road dust that results from their haulage. To do this, three separate emissions sources were considered; the on road exhaust emissions from Tier 7 Tractor Class 8 vehicles, the fugitive paved road dust, and the idling emissions of the Tier 7 Tractor Class 8 vehicles spent at intersections controlled by traffic lights. These emission sources were modeled in AERMOD as one long strip of roadway, with receptors included 25 meters away from the roadway sources to simulate emission data from and near the road.

For idling and exhaust emissions, data was gathered from EMFAC's database to determine emission factors specific to Fresno County. Fugitive road dust emission factors were determined using SJVAPCD estimation methods for paved roads. Total number of trips and vehicle miles traveled (VMT) were estimated using information from the DEIR in tandem with the updated yearly throughput for the Project.

The road segment chosen for analysis was a short segment of Friant Rd and Willow Rd. A total length of 9.94 miles of road was modeled, with 7 intersections included. The intersections included can be found in Table 32

below. Percentages of vehicle traffic and idling times at intersections were taken from the DEIR to determine the estimated number of haul trucks travelling on the segmented Fresno roads. This roadway was selected as a conservative worst-case scenario for the health risk analysis, as it represents the segment of road anticipated to experience the highest throughput of haul vehicles as the result of the Project.

Table 32 List of the Project Intersections Chosen for Haul Truck Trip Modeling

Traffic Intersections
North Fork x Friant Road
Quarry Site x Friant Road
Plant Site x Friant Road
Friant Road x Willow Ave
Copper River x Friant Road
Copper Ave x Friant Road
Copper Ave x Willow Ave

This information was combined to conduct a health risk assessment on this road, assessing cancer, chronic, and acute risks using the OEHHA method and the inhalation only pathway with no control. The results for these health risks can be seen summarized in Table 33 and Table 34 below.

Table 33 On-Road Vehicle Emissions Health Risk Summary for Phase 1 (2.0 million Tons Per Year)

Risk Analysis	Max 70 Year Cancer Risk in One Million	Max Chronic Hazard Index	Max Acute Hazard Index
Individual Resident Exposure	3.19	0.009	0.007
Significance Threshold	20	1.0	1.0
Threshold Exceeded?	No	No	No

Source: Appendix I.

Table 34 On-Road Vehicle Emissions Health Risk Summary for Phase 2 (3.0 million Tons Per Year)

Risk Analysis	Max 70 Year Cancer Risk in One Million	Max Chronic Hazard Index	Max Acute Hazard Index
Individual Resident Exposure	3.86	0.013	0.013
Significance Threshold	20	1.0	1.0
Threshold Exceeded?	No	No	No

Source: Appendix I.iu

Table 33 and Table 34 show that during the two different production phases of the project, health risk caused

by on-road haul truck traffic off-site would not exceed significant thresholds established by the SJVAPCD anywhere along the 9.94 mile road from the North Fork Rd. and Friant Rd. intersection down to the Friant Rd. and Copper Avenue intersection.

3.5.4 Odors Affecting a Substantial Number of People

Impact Statement

Impact AQ-4: *Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?* **(CEQA Appendix G Threshold Criteria (d))**

Impact Analysis

Due to the subjective nature of odor impacts, the number of variables that can influence the potential for an odor impact and the variety of odor sources, there are no quantitative or formulaic methodologies to determine the presence of a significant odor impact. SJVAPCD screening thresholds state that receptors greater than one mile from asphalt plant sites screen out of analysis, however local residences exist less than one mile from the project. SJVAPCD Significance Thresholds state that a significant impact would occur if the Project receives "More than one confirmed complaint per year averaged over a three-year period, or three unconfirmed complaints per year averaged over a three-year period."

The intensity of an odor source's operations and its proximity to sensitive receptors influences the potential significance of odor emissions Odor intensity would decrease rapidly with distance and is not expected to be frequently (or at all) detectable at locations outside of the Project site boundary. The asphalt plant that would be installed as part of the Project would be newer and cleaner than the previous plant. Blue smoke controls indicates that the Project results in less odor causing emissions. The new asphalt plant would also be fired on natural gas in the long-term (and initially there may be propane used, which has equivalent emissions characteristics to natural gas on a heat content basis). Given the large site upon which the odors will dissipate, and the fact that the existing facility has not generated an odor that generated complaints; objectionable odors affecting a substantial number of people are unlikely to result from the Project.

Blue smoke control efficiency of 95% was chosen based on manufacturer specifications outlined in "Blue Smoke Control Permitting Parameters" (Appendix H). Blue smoke control collectors are designed for controlling blue smoke that typically comes from in-plant transferring and loading hot mix asphalt. The collectors are high efficiency cartridge mist collectors. Constructed with a steel housing, the filtration is accomplished in cells with each cell having multiple stages; each more efficient than the previous. The first few stages are metal and designed to be cleaned when necessary. Other later stages may be disposable and replaced when they become plugged.

Level of Significance Before Mitigation

Less than significant.

Mitigation Measures

Mitigation Measure AQ-3: Asphalt Plant Emissions Controls

The following design features will mitigate VOC, SVOC, and/or SO2 emissions:

1. The type of asphaltic cement produced by on-site plants affects odorous emissions. Some asphaltic cements have lower VOC/SVOC emissions than others. Therefore, asphaltic cements with lower VOC/SVOC emissions will be used to the extent feasible.
2. In accordance with SJVAPCD Rule 4309, the Project will implement "periodic burner tune-ups" that may reduce VOC emissions from the asphalt plant.
3. Mixing drum vapors will be routed back to the dryer burner.

Level of Significance After Mitigation

Less than significant.

4.0 GREENHOUSE GASES

This section of the Report assesses GHG impacts of the Project. The methodologies used and the information provided in this section are supported by calculations in Appendix G.

4.1 Regulatory Setting

4.1.1 Characteristics of Climate Pollutants

The accumulation of GHGs in the atmosphere contributes to the regulation of the earth's temperature. Some GHGs can remain in the atmosphere for long periods of time (i.e., long-lived). The following six GHGs are recognized under the Kyoto Protocol and have been found by the International Panel on Climate Change (IPCC) to have an effect on global climate change. In addition, California has identified "short-lived" climate pollutants.

Long-Lived Climate Pollutants

In general, there are six (6) compounds/classes of GHGs that are counted when emissions are inventoried. Each GHG exhibits a different global warming potential (GWP). The mass of emissions of each GHG is multiplied by its GWP to determine the carbon dioxide equivalent (CO_2e) potential for global warming. GWPs have changed over time by the Intergovernmental Panel on Climate Change (IPCC) which is considered an authority on GHGs and their effects. The CAP and CARB emissions inventories and plans use GWPs that are an iteration or two behind and the most recent IPCC publication. Characteristics of each long-lived GHG and the associated GWP is presented below.

Carbon Dioxide (CO_2) is an odorless, colorless natural GHG. CO_2 is emitted from natural and anthropogenic sources. Natural sources include the following: decomposition of dead organic matter; respiration of bacteria, plants, animals, and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources include burning coal, oil, natural gas, and wood. By definition, CO_2 has a GWP equal to one (1).

Methane (CH_4) is a flammable GHG. A natural source of CH_4 is from the anaerobic decay of organic matter. Geological deposits, known as natural gas fields, also contain CH_4, which is extracted for fuel. Other sources include landfills, fermentation of manure, and ruminants such as cattle. CH_4 has a GWP equal to 25.

Nitrous Oxide (N_2O) is a colorless GHG. N_2O is produced by microbial processes in soil and water, including those reactions that occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. N_2O has a GWP equal to 298.

Hydrofluorocarbons (HFCs) are synthetic chemicals that are used as a substitute for chlorofluorocarbons (CFCs). Of all the GHGs, they are one of three groups with the highest global warming potential. HFCs are human made for applications such as air conditioners and refrigerants. HFCs have GWPs that range from 124 (HFC 125a) to 14,300 (HFC 23).

Perfluorocarbons (PFCs) have stable molecular structures and do not break down through the chemical processes in the lower atmosphere; therefore, PFCs have long atmospheric lifetimes, between 10,000 and 50,000 years. The two main sources of PFCs are primary aluminum production and semiconductor manufacturing. PFCs have GWPs that range from 7,390 (PFC 14) to 12,200 (PFC 116).

Sulfur Hexafluoride (SF_6) is an inorganic, odorless, colorless, nontoxic, nonflammable gas. SF_6 is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection. SF_6 has a GWP equal to 22,800.

Short-Lived Climate Pollutants

Short-lived climate pollutants are climate forcers that remain in the atmosphere for a much shorter period of time than longer-lived climate pollutants, such as carbon dioxide (CO_2). Their relative potency, when measured in terms of how they heat the atmosphere, can be tens, hundreds, or even thousands of times greater than that of CO_2. The impacts of short-lived climate pollutants are especially strong over the short term. Reducing these emissions can make an immediate beneficial impact on climate change.

Black carbon is a component of fine particulate matter, which has been identified as a leading environmental risk factor for premature death. It is produced from the incomplete combustion of fossil fuels and biomass burning, particularly from older diesel engines and forest fires. Black carbon warms the atmosphere by absorbing solar radiation, influences cloud formation, and darkens the surface of snow and ice, which accelerates heat absorption and melting. Diesel particulate matter emissions are a major source of black carbon and are also toxic air contaminants that have been regulated and controlled in California for several decades in order to protect public health.

Fluorinated gases (F-gases) are the fastest growing source of greenhouse gas emissions in California and globally. They include ozone-depleting substances that are being phased out globally under the Montreal Protocol, and their primary substitute, hydrofluorocarbons (HFCs). Most F-gas emissions come from leaks of these gases in refrigeration and air-conditioning systems. Emissions also come from aerosol propellants, fire suppressants, and foam-expansion agents.

Methane (CH_4) is the principal component of natural gas. Its emissions contribute to background ozone in the lower atmosphere (troposphere), which itself is a powerful greenhouse gas and contributes to ground level air pollution. The atmospheric concentration of methane is growing as a result of human activities in the agricultural, waste treatment, and oil and gas sectors. Capturing methane from these sources can improve pipeline safety, and provide fuel for vehicles and industrial operations that displaces fossil natural gas use.

4.1.2 Federal

In 2007 the Supreme Court found that GHGs are air pollutants covered by the Clean Air Act, and the EPA Endangerment Findings concluded the elements CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6 threatened public health for both current and future generations. Since, 04 CFR Part 98 has been amended to require collection of GHG data to inform future policy decision. Additional Federal actions have included the implementation of

standards for vehicles, biofuel production, and power generation. Federal actions relating to GHG emissions are summarized in Appendix E, Table E.2.

4.1.3 State

The following tables were copied from the California government website for climate change (climatechange.ca.gov) and California Air Resources Board (ww2.arb.ca.gov) and list the California legislation (Table 35), regulations, (Table 36), and executive orders (Table 37) through the end of 2022. More recent developments are discussed immediately following the tables.

Table 35 California Climate Change Legislation

Date	Legislation	Description
September 16, 2022	Assembly Bill 1279 (Muratsuchi, Chapter 337, Statutes of 2022)	The California Climate Crisis Act AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires CARB to ensure that Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage (CCUS) technologies.
September 16, 2022	Senate Bill 905 (Caballero, Chapter 359, Statutes of 2022)	Carbon Capture, Removal, Utilization, and Storage Program SB 905 requires CARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate CCUS and carbon dioxide removal (CDR) projects and technology. The bill requires CARB, on or before January 1, 2025, to adopt regulations creating a unified state permitting application for approval of CCUS and CDR projects. The bill also requires the Secretary of the Natural Resources Agency to publish a framework for governing agreements for two or more tracts of land overlying the same geologic storage reservoir for the purposes of a carbon sequestration project.
September 2, 2022	Senate Bill 846 (Dodd, Chapter 239, Statutes of 2022)	Diablo Canyon Powerplant: Extension of Operations SB 846 extends the Diablo Canyon Power Plant's sunset date by up to five additional years for each of its two units and seeks to make the nuclear power plant eligible for federal loans. The bill requires that the California Public Utilities Commission (CPUC) not include and disallow a load-serving entity from including in their adopted resource plan, the energy, capacity, or any attribute from the Diablo Canyon power plant.

Date	Legislation	Description
September 16, 2022	Senate Bill 1020 (Laird, Chapter 361, Statutes of 2022)	Clean Energy, Jobs, and Affordability Act of 2022 SB 1020 adds interim renewable energy and zero carbon energy retail sales of electricity targets to California end-use customers set at 90 percent in 2035 and 95 percent in 2040. It accelerates the timeline required to have 100 percent renewable energy and zero carbon energy procured to serve state agencies from the original target year of 2045 to 2035. This bill requires each state agency to individually achieve the 100 percent goal by 2035 with specified requirements. This bill requires the CPUC, California Energy Commission (CEC), and CARB, on or before December 1, 2023, and annually thereafter, to issue a joint reliability progress report that reviews system and local reliability. The bill also modifies the requirement for CARB to hold a portion of its Scoping Plan workshops in regions of the state with the most significant exposure to air pollutants by further specifying that this includes communities with minority populations or low-income communities in areas designated as being in extreme federal non-attainment.
September 16, 2022	Senate Bill 1137 (Gonzales, Chapter 365, Statutes of 2022)	Oil & Gas Operations: Location Restrictions: Notice of Intention: Health protection zone: Sensitive receptors SB 1137 prohibits the development of new oil and gas wells or infrastructure in health protection zones, as defined, except for purposes of public health and safety or other limited exceptions. The bill requires operators of existing oil and gas wells or infrastructure within health protection zones to undertake specified monitoring, public notice, and nuisance requirements. The bill requires CARB to consult and concur with the California Geologic Energy Management Division (CalGEM) on leak detection and repair plans for these facilities, adopt regulations as necessary to implement emission detection system standards, and collaborate with CalGEM on public access to emissions detection data.

Date	Legislation	Description
September 16, 2022	Senate Bill 1075 (Skinner, Chapter 363, Statutes of 2022)	Hydrogen: Green Hydrogen: Emissions of Greenhouse Gases SB 1075 requires CARB, by June 1, 2024, to prepare an evaluation that includes: policy recommendations regarding the use of hydrogen, and specifically the use of green hydrogen, in California; a description of strategies supporting hydrogen infrastructure, including identifying policies that promote the reduction of GHGs and short-lived climate pollutants; a description of other forms of hydrogen to achieve emission reductions; an analysis of curtailed electricity; an estimate of GHG and emission reductions that could be achieved through deployment of green hydrogen through a variety of scenarios; an analysis of the potential for opportunities to integrate hydrogen production and applications with drinking water supply treatment needs; policy recommendations for regulatory and permitting processes associated with transmitting and distributing hydrogen from production sites to end uses; an analysis of the life-cycle GHG emissions from various forms of hydrogen production; and an analysis of air pollution and other environmental impacts from hydrogen distribution and end uses.
September 16, 2022	Assembly Bill 1757 (Garcia, Chapter 341, Statutes of 2022)	California Global Warming Solutions Act of 2006: Climate Goal: Natural and Working Lands AB 1757 requires the California Natural Resources Agency (CNRA), in collaboration with CARB, other state agencies, and an expert advisory committee, to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions, that reduce GHG emissions in 2030, 2038, and 2045 by January 1, 2024. These targets must support state goals to achieve carbon neutrality and foster climate adaptation and resilience. This bill also requires CARB to develop standard methods for state agencies to consistently track GHG emissions and reductions, carbon sequestration, and additional benefits from natural and working lands over time. These methods will account for GHG emissions reductions of CO_2, methane, and nitrous oxide related to natural and working lands and the potential impacts of climate change on the ability to reduce GHG emissions and sequester carbon from natural and working lands, where feasible.
September 30, 2022	Senate Bill 1206 (Skinner, Chapter 884, Statutes of 2022)	Hydrofluorocarbon gases: sale or distribution SB 1206 mandates a stepped sales prohibition on newly produced high-global warming potential (GWP) HFCs to transition California's economy toward recycled and reclaimed HFCs for servicing existing HFC-based equipment. Additionally, SB 1206 also requires CARB to develop regulations to increase the adoption of very low-, i.e., GWP < 10, and no-GWP technologies in sectors that currently rely on higher-GWP HFCs.

Date	Legislation	Description
September 23, 2021	Senate Bill 27 (Skinner, Chapter 237, Statutes of 2021)	Carbon Sequestration: State Goals: Natural and Working Lands: Registry of Projects SB 27 requires CNRA, in coordination with other state agencies, to establish the Natural and Working Lands Climate Smart Strategy by July 1, 2023. This bill also requires CARB to establish specified CO_2 removal targets for 2030 and beyond as part of its Scoping Plan. Under SB 27, CNRA is to establish and maintain a registry to identify projects in the state 48 that drive climate action on natural and working lands and are seeking funding. CNRA also must track carbon removal and GHG emission reduction benefits derived from projects funded through the registry. This bill is reflected directly in this Scoping Plan as CO_2 removal targets for 2030 and 2045 in support of carbon neutrality.
September 23, 2021	Senate Bill 596 (Becker, Chapter 246, Statutes of 2021)	Greenhouse Gases: Cement Sector: Net zero Emissions Strategy SB 596 requires CARB, by July 1, 2023, to develop a comprehensive strategy for the state's cement sector to achieve net-zero-emissions of GHGs associated with cement used within the state as soon as possible, but no later than December 31, 2045. The bill establishes an interim target of 40 percent below the 2019 average GHG intensity of cement by December 31, 2035. Under SB 596, CARB must: • Define a metric for GHG intensity and establish a baseline from which to measure GHG intensity reductions. • Evaluate the feasibility of the 2035 interim target (40 percent reduction in GHG intensity) by July 1, 2028. • Coordinate and consult with other state agencies. • Prioritize actions that leverage state and federal incentives. • Evaluate measures to support market demand and financial incentives to encourage the production and use of cement with low GHG intensity.

Date	Legislation	Description
September 27, 2019	Senate Bill 576 (Umberg, Chapter 374, Statutes of 2019)	Coastal Resources: Climate Ready Program and Coastal Climate Change Adaptation, Infrastructure and Readiness Program Sea level rise, combined with storm-driven waves, poses a direct risk to the state's coastal resources, including public and private real property and infrastructure. Rising marine waters threaten sensitive coastal areas, habitats, the survival of threatened and endangered species, beaches, other recreation areas, and urban waterfronts. SB 576 mandates that the Ocean Protection Council develop and implement a coastal climate adaptation, infrastructure, and readiness program to improve the climate change resiliency of California's coastal communities, infrastructure, and habitat. This bill also instructs the State Coastal Conservancy to administer the Climate Ready Program, which addresses the impacts and potential impacts of climate change on resources within the conservancy's jurisdiction.
September 27, 2019	Assembly Bill 65 (Petrie-Norris, Chapter 347, Statutes of 2019)	Coastal Protection: Climate Adaption: Project Prioritization: Natural Infrastructure: Local General Plans This bill requires the State Coastal Conservancy, when it allocates any funding appropriated pursuant to the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access For All Act of 2018, to prioritize projects that use natural infrastructure in coastal communities to help adapt to climate change. The bill requires the conservancy to provide information to the Office of Planning and Research on any projects funded pursuant to the above provision to be considered for inclusion into the clearinghouse for climate adaption information. The bill authorizes the conservancy to provide technical assistance to coastal communities to better assist them with their projects that use natural infrastructure.

Date	Legislation	Description
September 10, 2018	Senate Bill 100 (De León, Chapter 312, Statutes of 2018)	California Renewables Portfolio Standard Program: emissions of greenhouse gases SB 100 mandates that the CPUC, CEC, and CARB plan for 100 percent of total retail sales of electricity in California to come from eligible renewable energy resources and zero carbon resources by December 31, 2045. This bill also updates the state's Renewables Portfolio Standard (RPS) to include the following interim targets: • 44% of retail sales procured from eligible renewable sources by December 31, 2024. • 52% of retail sales procured from eligible renewable sources by December 31, 2027. • 60% of retail sales procured from eligible renewable sources by December 31, 2030. Under SB 100, the CPUC, CEC, and CARB shall use programs under existing laws to achieve 100 percent clean electricity. The statute requires these agencies to issue a joint policy report on SB 100 every four years. The first of these reports was issued in 2021.
September 13, 2018	Assembly Bill 2127 (Ting, Chapter 365, Statutes of 2018)	Electric Vehicle Charging Infrastructure: Assessment This bill requires the CEC, working with CARB and the CPUC, to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 million zero-emission vehicles on California roads by 2030 and of reducing emissions of GHGs to 40% below 1990 levels by 2030. The bill requires the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure.
September 21, 2018	Senate Bill 30 (Lara, Chapter 614, Statutes of 2018)	Insurance: Climate Change This bill requires the Insurance Commissioner to convene a working group to identify, assess, and recommend risk transfer market mechanisms that, among other things, promote investment in natural infrastructure to reduce the risks of climate change related to catastrophic events, create incentives for investment in natural infrastructure to reduce risks to communities, and provide mitigation incentives for private investment in natural lands to lessen exposure and reduce climate risks to public safety, property, utilities, and infrastructure. The bill requires the policies recommended to address specified questions.

Date	Legislation	Description
September 20, 2018	Assembly Bill 2061 (Frazier, Chapter 580, Statutes of 2018)	Near-zero-emission and Zero-emission Vehicles Existing state and federal law sets specified limits on the total gross weight imposed on the highway by a vehicle with any group of two or more consecutive axles. Under existing federal law, the maximum gross vehicle weight of that vehicle may not exceed 82,000 pounds. AB 2061 authorizes a near-zero emission vehicle or a zero-emission vehicle to exceed the weight limits on the power unit by up to 2,000 pounds.
July 26, 2017	Assembly Bill 617 (Christina Garcia, Chapter 136, Statutes of 2017)	Companion to Cap-and-Trade Extension Establishes a groundbreaking program to measure and reduce air pollution from mobile and stationary sources at the neighborhood level in the communities most impacted by air pollutants. Requires the Air Resources Board to work closely with local air districts and communities to establish neighborhood air quality monitoring networks and to develop and implement plans to reduce emissions. The focus on community-based air monitoring and emission reductions will provide a national model for enhanced community protection.
July 25, 2017	Assembly Bill 398 (Eduardo Garcia, Chapter 135, Statutes of 2017)	Cap-and-Trade Extension Extends and improves the Cap-and-Trade Program, which will enable the state to meet its 2030 emission reduction goals in the most cost-effective manner. Furthermore, extending the Cap-and-Trade Program will provide billions of dollars in auction proceeds to invest in communities across California.
September 19, 2016	Senate Bill 1383 (Lara, Chapter 395, Statutes of 2016)	Short-lived Climate Pollutants Establishes statewide reduction targets for short-lived climate pollutants.
September 8, 2016	Assembly Bill 197 (Eduardo Garcia, Chapter 250, Statutes of 2016)	Greenhouse gas regulations Prioritizes direct emission reductions from large stationary sources and mobile sources.
September 8, 2016	Senate Bill 32 (Pavley, Chapter 249, Statutes of 2016)	Greenhouse Gas emission reduction target for 2030 Establishes a statewide greenhouse gas (GHG) emission reduction target of 40 percent below 1990 levels by 2030.
October 7, 2015	Senate Bill 350 (De León, Chapter 547, Statutes of 2015)	Clean Energy and Pollution Reduction Act of 2015 Establishes targets to increase retail sales of renewable electricity to 50 percent by 2030 and double the energy efficiency savings in electricity and natural gas end uses by 2030.
September 21, 2014	Senate Bill 605 (Lara, Chapter 523, Statutes of 2014)	Short-lived climate pollutants Requires the State Air Resources Board to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants by January 1, 2016.

Date	Legislation	Description
September 21, 2014	Senate Bill 1275, (De León, Chapter 530, Statutes of 2014)	Charge Ahead California Initiative Establishes a State goal of 1 million zero-emission and near-zero-emission vehicles in service by 2020. Amends the enhanced fleet modernization program to provide a mobility option. Establishes the Charge Ahead California Initiative requiring planning and reporting on vehicle incentive programs, and increasing access to and benefits from zero-emission vehicles for disadvantaged, low-income, and moderate-income communities and consumers.
September 21, 2014	Senate Bill1204 (Lara, Chapter 524, Statutes of 2014)	California Clean Truck, Bus, and Off-Road Vehicle and Equipment Technology Program Creates the California Clean Truck, Bus, and Off-Road Vehicle and Equipment Technology Program funded by the Greenhouse Gas Reduction Fund for development, demonstration, precommercial pilot, and early commercial deployment of zero- and near-zero emission truck, bus, and off-road vehicle and equipment technologies, with priority given to projects benefiting disadvantaged communities.
September 28, 2013	Assembly Bill 8 (Perea, Chapter 401, Statutes of 2013)	Alternative fuel and vehicle technologies: funding programs Extends until January 1, 2024, extra fees on vehicle registrations, boat registrations, and tire sales in order to fund the AB 118, Carl Moyer, and AB 923 programs that support the production, distribution, and sale of alternative fuels and vehicle technologies and air emissions reduction efforts. The bill suspends until 2024 ARB's regulation requiring gasoline refiners to provide hydrogen fueling stations and appropriates up to $220 million, of AB 118 money to create a hydrogen fueling infrastructure in the State.
September 28, 2013	Assembly Bill 1092 (Levine, Chapter 410, Statutes of 2013)	Building standards: electric vehicle charging infrastructure Requires the Building Standards Commission to adopt mandatory building standards for the installation of future electric vehicle charging infrastructure for parking spaces in multifamily dwellings and nonresidential development.
September 30, 2012	Senate Bill 535 (De León, Chapter 830, Statutes of 2012)	Greenhouse Gas Reduction Fund and Disadvantaged Communities Requires the California Environmental Protection Agency to identify disadvantaged communities; requires that 25% of all funds allocated pursuant to an investment plan for the use of moneys collected through a cap-and-trade program be allocated to projects that benefit disadvantaged communities and 10 those 25% be use within disadvantaged communities; and requires the Department of Finance to include a description of how these requirements are fulfilled in an annual report.
September 30, 2012	Assembly Bill 1532 (J. Perez, Chapter 807, Statutes of 2012)	Greenhouse Gas Reduction Fund in the Budget Requires the Department of Finance to develop and submit to the Legislature an investment plan every three years for the use of the Greenhouse Gas Reduction Fund; requires revenue collected pursuant to a market-based compliance mechanism to be appropriated in the Annual Budget Act; requires the department to report annually to the Legislature on the status of projects funded; and specifies that findings issued by the Governor related to "linkage" as part of a market-base compliance mechanism are not subject to judicial review.

Date	Legislation	Description
April 12, 2011	Senate Bill X1-2 (Simitian, Chapter 1, Statutes of 2011)	Governor Edmund G. Brown, Jr. signed Senate Bill X1-2 into law to codify the ambitious 33 percent by 2020 goal. SBX1-2 directs California Public Utilities Commission's Renewable Energy Resources Program to increase the amount of electricity generated from eligible renewable energy resources per year to an amount that equals at least 20% of the total electricity sold to retail customers in California per year by December 31, 2013, 25% by December 31, 2016 and 33% by December 31, 2020. The new RPS goals applies to all electricity retailers in the State including publicly owned utilities (POUs), investor-owned utilities, electricity service providers, and community choice aggregators. This new RPS preempts the California Air Resources Boards' 33 percent Renewable Electricity Standard.
September 29, 2011	Assembly Bill 1504 (Skinner, Chapter 534, Statutes of 2010)	Forest resources and carbon sequestration. Bill requires Department of Forestry and Fire Protection and Air Resources Board to assess the capacity of its forest and rangeland regulations to meet or exceed the State's greenhouse goals, pursuant to AB 32.
September 30, 2008	Senate Bill 375 (Steinberg, Chapter 728, Statutes of 2008)	Sustainable Communities & Climate Protection Act of 2008 requires Air Resources Board to develop regional greenhouse gas emission reduction targets for passenger vehicles. ARB is to establish targets for 2020 and 2035 for each region covered by one of the State's 18 metropolitan planning organizations. For more information on SB 375, see the ARB Sustainable Communities page (https://ww2.arb.ca.gov/our-work/topics/sustainable-communities).
October 14, 2007	Assembly Bill 118 (Núñez, Chapter 750, Statutes of 2007)	Alternative Fuels and Vehicles Technologies The bill would create the Alternative and Renewable Fuel and Vehicle Technology Program, to be administered by the Energy Commission, to provide funding to public projects to develop and deploy innovative technologies that transform California's fuel and vehicle types to help attain the State's climate change policies.
August 24, 2007	Senate Bill 97 (Dutton, Chapter 187, Statutes of 2007)	Directs Governor's Office of Planning and Research to develop CEQA guidelines "for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions." For more information see the OPR CEQA and Climate Change page (https://lci.ca.gov/ceqa/ceqa-climate-change.html).
July 18. 2006	Assembly Bill 1803 (Committee on Budget, Chapter 77, Statutes of 2006)	Greenhouse gas inventory transferred to Air Resources Board from the Energy Commission.
August 21, 2006	Senate Bill 1 (Murray, Chapter 132, Statutes of 2006)	California's Million Solar Roofs plan is enhanced by PUC and CEC's adoption of the California Solar Initiative. SB1 directs PUC and CEC to expand this program to more customers, and requiring the State's municipal utilities to create their own solar rebate programs. This bill would require beginning January 1, 2011, a seller of new homes to offer the option of a solar energy system to all customers negotiating to purchase a new home constructed on land meeting certain criteria and to disclose certain information.

Date	Legislation	Description
September 26, 2006	Senate Bill 107 (Simitian, Chapter 464, Statutes of 2006)	SB 107 directs California Public Utilities Commission's Renewable Energy Resources Program to increase the amount of renewable electricity (Renewable Portfolio Standard) generated per year, from 17% to an amount that equals at least 20% of the total electricity sold to retail customers in California per year by December 31, 2010.
September 27, 2006	Assembly Bill 32 (Núñez, Chapter 488, Statutes of 2006)	California Global Warming Solutions Act of 2006. This bill would require Air Resources Board (ARB) to adopt a statewide greenhouse gas emissions limit equivalent to the statewide greenhouse gas emissions levels in 1990 to be achieved by 2020. ARB shall adopt regulations to require the reporting and verification of statewide greenhouse gas emissions and to monitor and enforce compliance with this program. AB 32 directs Climate Action Team established by the Governor to coordinate the efforts set forth under Executive Order S-3-05 to continue its role in coordinating overall climate policy. See more information on AB 32 at ARB (https://ww2.arb.ca.gov/resources/fact-sheets/ab-32-global-warming-solutions-act-2006).
September 12, 2002	Senate Bill 1078 (Sher, Chapter 516, Statutes of 2002)	This bill establishes the California Renewables Portfolio Standard Program, which requires electric utilities and other entities under the jurisdiction of the California Public Utilities Commission to meet 20% of their renewable power by December 31, 2017 for the purposes of increasing the diversity, reliability, public health and environmental benefits of the energy mix.
September 7, 2002	Senate Bill 812 (Sher, Chapter 423, Statutes of 2002)	This bill added forest management practices to the California Climate Action Registry members' reportable emissions actions and directed the Registry to adopt forestry procedures and protocols to monitor, estimate, calculate, report and certify carbon stores and carbon dioxide emissions that resulted from the conservation-based management of forests in California.
July 22, 2002	Assembly Bill 1493 (Pavley, Chapter 200, Statutes of 2002)	The "Pavley" bill requires the registry, in consultation with ARB, to adopt procedures and protocols for the reporting and certification of reductions in greenhouse gas emissions from mobile sources for use by the ARB in granting the emission reduction credits. This bill requires the ARB to develop and adopt, by January 1, 2005, regulations that achieve the maximum feasible reduction of greenhouse gases emitted by passenger vehicles and light-duty trucks. For more information on AB 1493 Pavley I, see the ARB Clean Car Standards page (https://ww2.arb.ca.gov/californias-greenhouse-gas-vehicle-emission-standards-under-assembly-bill-1493-2002-pavley).
October 11, 2001	Senate Bill 527 (Sher, Chapter 769, Statutes of 2001)	This bill revises the functions and duties of the California Climate Action Registry and requires the Registry, in coordination with CEC to adopt third-party verification metrics, developing GHG emissions protocols and qualifying third-party organizations to provide technical assistance and certification of emissions baselines and inventories. SB 527 amended SB 1771 to emphasize third-party verification.

Date	Legislation	Description
September 30, 2000	Senate Bill 1771 (Sher, Chapter 1018, Statutes of 2000)	SB 1771 establishes the creation of the non-profit organization, the California Climate Action Registry and specifies functions and responsibilities to develop a process to identify and qualify third-party organizations approved to provide technical assistance and advice in monitoring greenhouse gas emissions, and setting greenhouse gas (GHG) emissions baselines in coordination with CEC. Also, the bill directs the Registry to enable participating entities to voluntarily record their annual GHG emissions inventories. Also, SB 1771 directs CEC to update the State's greenhouse gas inventory from an existing 1998 report and continuing to update it every five years.
September 28, 1988	Assembly Bill 4420 (Sher, Chapter 1506, Statutes of 1988)	The California Energy Commission (CEC) was statutorily directed to prepare and maintain the inventory of greenhouse gas emissions (GHG) and to study the effects of GHGs and the climate change impacts on the State's energy supply and demand, economy, environment, agriculture, and water supplies. The study also required recommendations for avoiding, reducing, and addressing related impacts - and required the CEC to coordinate the study and any research with federal, state, academic, and industry research projects.

Source: (climatechange.ca.gov, 2017) (CARB, 2022 Scoping Plan for Achieving Carbon neutrality, 2022) Up to date as of 1/7/2026.

Table 36 California Climate Change Regulations

Regulations	Description
Greenhouse Gas Reduction Fund	State program allocating proceeds from cap-and-trade auctions to support investments and projects that reduce greenhouse gas emissions throughout California.
General Plan Guidelines Update	The update addresses greenhouse gas emissions in CEQA or a Climate Action Plan. The update contains a new chapter on Climate Change. The Safety Element requires adaptation.
Cap & Trade Amendments	The September 2016 amendments to the cap-and-trade regulation included: Emission caps for the post-2020 program Post-2020 continuation of the allowance price containment reserve Linking with Ontario's cap-and-trade program Compliance with the federal Clean Power Plan Modifications to allowance allocation
Low Carbon Fuel Standard (LCFS)	In September 2015, the Air Resources Board re-adopted the Low Carbon Fuel Standard, to settle issues arising from lawsuits. The requirement is still a 10 percent reduction in the carbon intensity of transportation fuels. The regulations are designed to reduce the carbon intensity (CI) of transportation fuels used in California by at least 10 percent by the year 2020. The Air Resources Board approved the LCFS regulation for adoption on April 23, 2009. The regulation entered into full effect on April 15, 2010. Amendments were approved in 2011, 2019, 2024, 2025 and 2026.

Regulations	Description
Cap & Trade Offset Protocols	The Air Resources Board has adopted five protocols for offset compliance projects. In addition to the original four protocols adopted in 2011, ARB has adopted: Mine Methane Capture (MMC) Projects Compliance Offset Protocol, adopted April 2014 (https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2013/capandtrade13/ctmmcprotocol.pdf)
Cap & Trade Link with Quebec	California linked its cap-and-trade program with Quebec's program in January 2014. Linkage allows for the use of compliance instruments from Quebec's greenhouse gas emission trading system to meet compliance obligations pursuant to the California Cap-and-Trade Regulation, and the reciprocal approval of compliance instruments issued by California to meet compliance obligations in the external trading program.
Building Energy Efficiency Standards	The Energy Commission's 2013 Building Energy Efficiency Standards are 25 percent more efficient than previous standards for residential construction and 30 percent better for nonresidential construction. The Standards, which took effect on January 1, 2014, offer builders better windows, insulation, lighting, ventilation systems and other features that reduce energy consumption in homes and businesses.
Advanced Clean Cars Standard	The Advanced Clean Cars Program, approved in January 2012, will achieve additional GHG reductions from passenger vehicles for model years 2017-2025. This Program represents a new approach to passenger vehicles – cars and light trucks -- by combining the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards known as Low Emission Vehicles (LEV) III. The new approach also includes efforts under the Zero-Emission Vehicle Program to support and accelerate the numbers of plug-in hybrids and zero-emission vehicles in California.
Water Appliance Standards	The Energy Commission's 2015 Water Appliance Standards are projected to save 10 billion gallons in the first year, increasing over time to 100 billion gallons of water per year. The energy efficiency and water standards require water appliances to consume less water thereby using less energy while performing the same function. The standards apply to: toilets and urinals; residential lavatory faucets; kitchen faucets; public lavatory faucets.
Cap & Trade Rulemaking Activities	A proposed California cap on greenhouse gas emissions and a market-based compliance mechanisms, including compliance offset protocols. OAL approved the rulemaking and filed it with the Secretary of State on December 13, 2011. The regulation will become effective on the January 1, 2012.
33% Renewable Portfolio Standard	On May 5, 2011, the Commission adopted the Order Instituting Rulemaking (R.) 11-05-005 to open a new proceeding for the implementation and administration of the 33% RPS Program. The primary focus of the R.11-05-005 proceeding was the implementation of the new 33% RPS law, Senate Bill (SB) 2 (1X) (Simitian), stats. 2011.
Mandatory Commercial Recycling	This regulation addresses recycling requirements for businesses that generate 4 or more cubic yards of commercial solid waste per week and multifamily residential dwellings with 5 or more units, regardless of the amount of waste generated; local jurisdiction requirements for education, outreach, monitoring and reporting; and CalAsphalt and concrete recycling review. The regulations were approved on May 7, 2012.

Table 37 California Climate Change Executive Orders

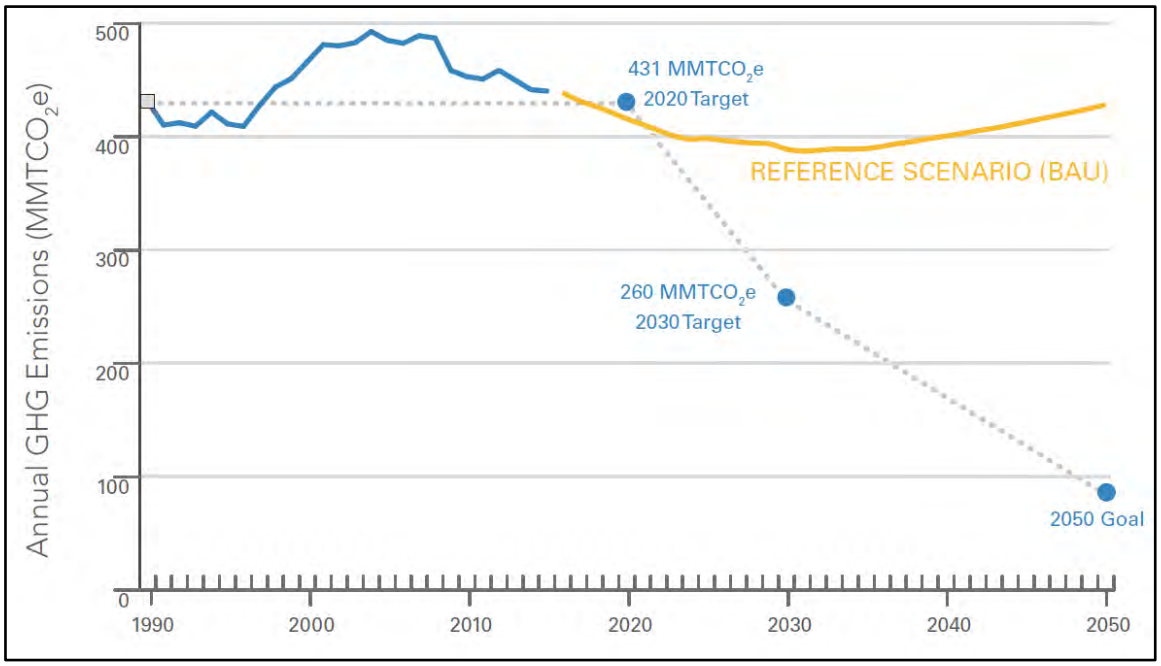
Date	Executive Order	Description
October 7, 2020	N-82-20	Governor Newsom signed Executive Order N-82-20 in October 2020 to combat the climate and biodiversity crises by setting a statewide goal to conserve at least 30 percent of California's land and coastal waters by 2030. The Executive Order also instructed the CNRA, in consultation with other state agencies, to develop a Natural and Working Lands Climate Smart Strategy that serves as a framework to advance the state's carbon neutrality goal and build climate resilience. In addition to setting a statewide conservation goal, the Executive Order directed CARB to update the target for natural and working lands in support of carbon neutrality as part of this Scoping Plan, and to take into consideration the Natural and Working Lands Climate Smart Strategy.
September 23, 2020	N-79-20	EO-N-79-20 requires all California vehicles to be emissions free; cars and passenger trucks by 2035, medium and heavy duty trucks by 2045.
September 20, 2019	N-19-19	Governor Newsom signed Executive Order N-19-19 in September 2019 to direct state government to redouble its efforts to reduce GHG emissions and mitigate the impacts of climate change while building a sustainable, inclusive economy.
September 10, 2018	B-55-18	Governor Brown signed Executive Order B-55-18 in September 2018 to establish a statewide goal to achieve carbon neutrality as soon as possible, and no later than 2045, and to achieve and maintain net negative emissions thereafter.
July 17, 2015	B-32-15	EO-B-32-15 directs State agencies to develop an integrated freight action plan by July 2016. Among other things, the plan calls for targets for transportation efficiency and a transition to near-zero-emission technologies.
April 29, 2015	B-30-15	EO-B-30-15 sets a greenhouse gas (GHG) emissions target for 2030 at 40 percent below 1990 levels.
April 25, 2012	B-18-12	EO-B-18-12 calls for significant reductions in State agencies' energy purchases and GHG emissions. The Executive Order included a Green Building Action Plan, which provided additional details and specific requirements for the implementation of the Executive Order. (https://archive.gov.ca.gov/archive/gov39/wp-content/uploads/2017/09/Green_Building_Action_Plan_B.18.12.pdf)
March 23, 2012	B-16-12	EO-B-16-12 orders State agencies to facilitate the rapid commercialization of zero-emission vehicles (ZEVs). The Executive Order sets a target for the number of 1.5 million ZEVs in California by 2025. Also the Executive Order sets as a target for 2050 a reduction of GHG emissions from the transportation sector equaling 80 percent less than 1990 levels.
November 14, 2008	S-13-08	EO-S-13-08 directs State agencies to plan for sea level rise and climate impacts through coordination of the State Climate Adaptation Strategy.
January 18, 2007	S-01-07	EO-S-01-07 establishes the 2020 target and Low Carbon Fuel Standard. The EO directs the Secretary of Cal/EPA as coordinator of 2020 target activities and requires the Secretary to report back to the Governor and Legislature biannually on progress toward meeting the 2020 target.
October 18, 2006	S-20-06	EO-S-20-06 establishes responsibilities and roles of the Secretary of Cal/EPA and State agencies in climate change.
April 25, 2006	S-06-06	EO-S-06-06 directs Secretary of Cal/EPA to participate in the Bio-Energy Interagency Working Group and addresses biofuels and bioenergy from renewable resources.

Date	Executive Order	Description
June 1, 2005	S-03-05	EO-S-3-05 establishes greenhouse gas emission reduction targets, creates the Climate Action Team and directs the Secretary of Cal/EPA to coordinate efforts with meeting the targets with the heads of other State agencies. The EO requires the Secretary to report back to the Governor and Legislature biannually on progress toward meeting the GHG targets, GHG impacts to California, Mitigation and Adaptation Plans.
December 14, 2004	S-20-04	EO-S-20-04 (Green Buildings) directs State agencies to reduce energy use in State owned buildings by 20% by 2015 and increase energy efficiency.

Source: (climatechange.ca.gov, 2017) (CARB, 2022 Scoping Plan for Achieving Carbon neutrality, 2022) Up to date as of 1/7/2026.

On December 14, 2017, CARB approved the 2017 Climate Change Scoping Plan Update (Scoping Plan) which aims to reduce GHG emissions according to the following graphic. The Scoping Plan "is a package of economically viable and technologically feasible actions to not just keep California on track to achieve its 2030 target, but stay on track for a low- to zero-carbon economy by involving every part of the state. Every sector, every local government, every region, every resident is part of the solution. The Plan underscores that there is no single solution but rather a balanced mix of strategies to achieve the GHG target. This Plan highlights the fact that a balanced mix of strategies provides California with the greatest level of certainty in meeting the target at a low cost while also improving public health, investing in disadvantaged and low-income communities, protecting consumers, and supporting economic growth, jobs and energy diversity. Successful implementation of this Plan relies, in part, on long-term funding plans to inform future appropriations necessary to achieve California's long-term targets." (2017 Scoping Plan, p. ES4).

Chart 1 2030 Target Scoping Plan Reference Scenario



Source: Figure 6 (2017 Scoping Plan, p. 24)

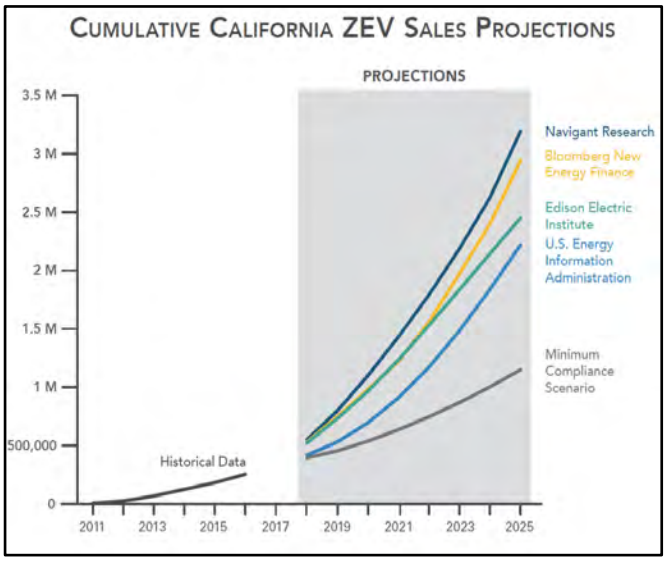
> *The development of the Scoping Plan began by first modeling a Reference Scenario (BAU). The Reference Scenario is the forecasted statewide GHG emissions through 2030 with existing policies and programs, but without any further action to reduce GHGs. [2017 Scoping Plan] Figure 6 [above] provides the modeling results for a Reference Scenario for this Scoping Plan. The graph shows the State is expected to reduce emissions below the 2020 statewide GHG target, but additional effort will be needed to maintain and continue GHG reductions to meet the mid- (2030) and long-term (2050) targets. Figure 6 depicts a linear, straight-line path to the 2030 target. It should be noted that in any year, GHG emissions may be higher or lower than the straight line. That is to be expected as periods of economic recession or increased economic activity, annual variations in hydropower, and many other factors may influence a single or several years of GHG emissions in the State. CARB's annual GHG reporting and inventory will provide data on progress towards achieving the 2030 target.*
> (2017 Scoping Plan, p. 23).

The Scoping Plan states that the California Legislature has shaped the State's climate change program, setting out clear policy objectives over the next decade including:

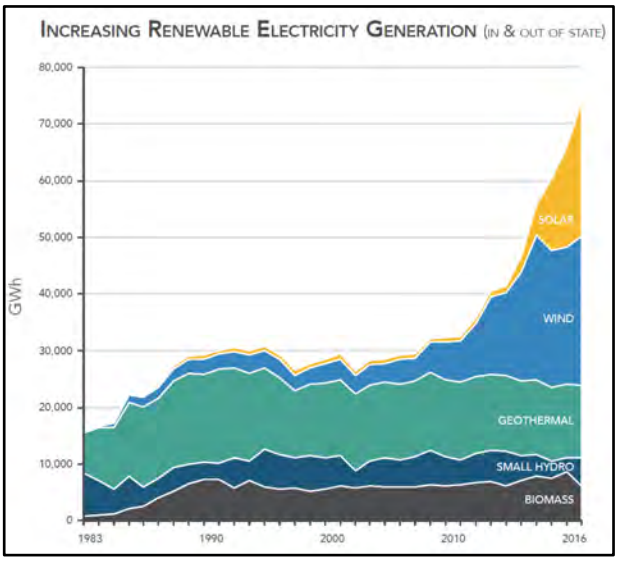
> - *40% reduction in GHG emissions by 2030;*
> - *50% renewable electricity;*
> - *Double energy efficiency savings;*
> - *Support for clean cars;*
> - *Integrate land use, transit, and affordable housing to curb auto trips;*
> - *Prioritize direct reductions;*
> - *Identify air pollution, health, and social benefits of climate policies;*
> - *Slash "super pollutants" (i.e., hydrofluorocarbons or HFCs);*
> - *Protect and manage natural and working lands;*
> - *Invest in disadvantaged communities; and*
> - *Strong support for Cap-and-Trade.*
>
> (2017 Scoping Plan, p. ES6).

Illustrations from the Scoping Plan that pertain to future emissions from the sectors representing the greatest GHG emissions, transportation and electricity use, are reproduced below.

Chart 2 2017 Scoping Plan GHG Exhibits



Source: **(2017 Scoping Plan, p. ES5)**



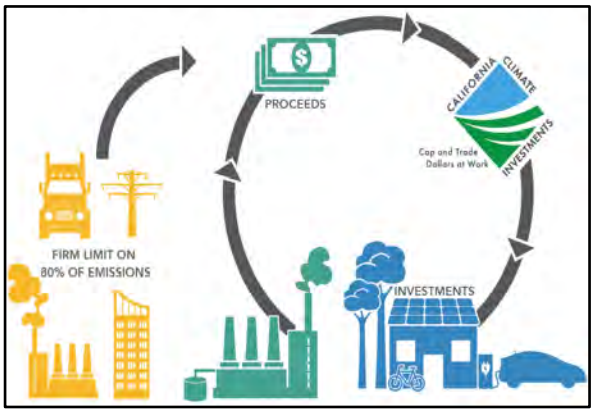
Source: (2017 Scoping Plan, p. ES9)

In addition to technology forcing and incentivizing regulations, the Cap-and-Trade Program is critical to meeting the Scoping Plan objectives. CARB states:

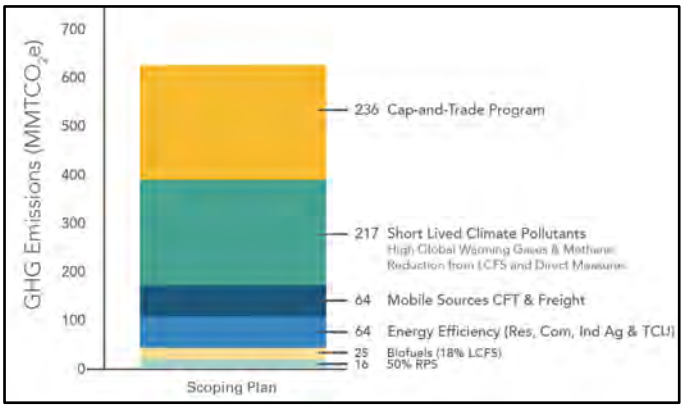
> *The Cap-and-Trade Program is fundamental to meeting California's long-range climate targets at low cost. The Cap-and-Trade Program includes GHG emissions from transportation, electricity, industrial, agricultural, waste, residential and commercial sources, and caps them while complementing the other measures needed to meet the 2030 GHG target. Altogether, the emissions covered by the Cap-and-Trade program total 80 percent of all GHG emissions in California. California's response to climate change has led to many innovative programs designed to reduce GHG emissions, including the Renewable Portfolio and Low Carbon Transportation Standards, but the Cap-and-Trade Program guarantees GHG emissions reductions through a strict overall emissions limit that decreases each year, while trading provides businesses with flexibility in their approach to reducing emissions. The Cap-and-Trade Program also generates revenue when the allowances to emit pollution are auctioned. Some of the revenue is returned directly to electricity ratepayers, and the rest is dedicated to reducing GHG emissions by making Legislatively directed investments in California with an emphasis on programs or projects that benefit disadvantaged and low-income communities.* (2017 Scoping Plan, p. ES16).

The following illustrations presents how CARB believes money will flow from the Cap-and-Trade program to enable state-funded investments and the amount of GHG emissions reduction that will be achieved overall and from Cap-and-Trade which is required to cover the gap between reductions from other measures in the Scoping Plan and the 2030 Target.

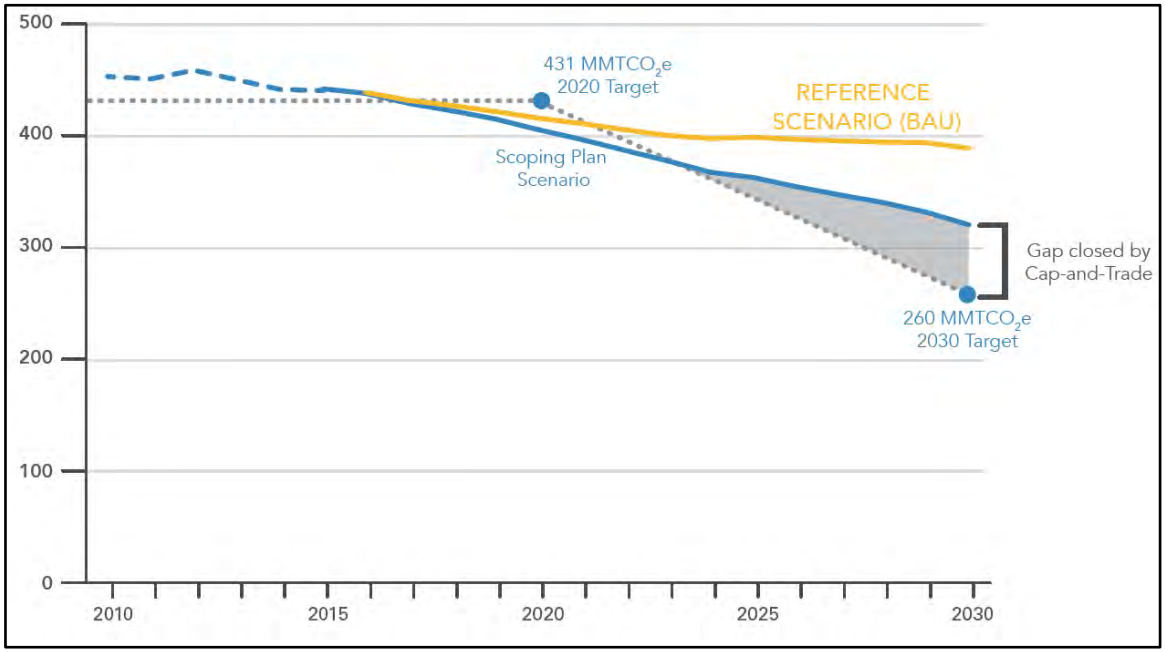
Chart 3 2017 Scoping Plan Cap-and-Trade Exhibits



Source: California's Carbon Pricing and Investment Overview (2017 Scoping Plan, p. ES16).



Source: Scoping Plan Scenario – Estimated Cumulative GHG Reductions by Measure (2021 – 2030) (2017 Scoping Plan, p. 28).



Source: 2017 Scoping Plan Reference Scenario (2017 Scoping Plan, p. 24).

Reference Scenario 2030 emissions estimate of 389 $MMTCO_2e$ to the 2030 target of 260 $MMTCO_2e$ and the level of 2030 emissions with the known commitments, estimated to be 320 $MMTCO_2e$. The known commitments are expected to result in emissions that are 60 $MMTCO_2e$ above the target in 2030, and have a cumulative emissions reduction gap of about 236 $MMTCO_2e$. This means the known commitments do not decline fast enough to achieve the 2030 target. The remaining 236 $MMTCO_2e$ of estimated GHG emissions reductions would not be achieved unless further action is taken to reduce GHGs. Consequently, for the Scoping Plan Scenario, the Post-2020 Cap-and-Trade Program would need to deliver 236 $MMTCO_2e$ cumulative GHG emissions reductions from 2021 through 2030. If the estimated GHG reductions from the known commitments are not realized due to delays in implementation or technology deployment, the post-2020 Cap-and-Trade Program would deliver the additional GHG reductions in the sectors it covers to ensure the 2030 target is achieved.

Table 38 Climate Change Policies and Measures, Actions from the 2017 Scoping Plan

Recommended Action	Applies to Project?
Implement SB 350 by 2030: • Increase the Renewables Portfolio Standard to 50 percent of retail sales by 2030 and ensure grid reliability. • Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030. • Reduce GHG emissions in the electricity sector through the implementation of the above measures and other actions as modeled in IRPs to meet GHG emissions reductions planning targets in the IRP process. Load-serving entities and publicly- owned utilities meet GHG emissions reductions planning targets through a combination of measures as described in IRPs.	No, Project will purchase grid electricity, not administrate it.
Implement Mobile Source Strategy (Cleaner Technology and Fuels): • At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025. • At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030. • Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean Cars regulations. • Medium- and heavy-duty GHG Phase 2. • Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20 percent of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100 percent of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low-NO_X standard. • Last Mile Delivery: New regulation that would result in the use of low NO_X or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for class 3-7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5 percent of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10 percent in 2025 and remaining flat through 2030. • Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document “Potential VMT Reduction Strategies for Discussion.”	No, Project vehicles are heavy-heavy duty and were not subject to heavy-duty GHG Phase 1 regulations. Thus, they would be unlikely to be subject to these measures.
Increase stringency of SB 375 Sustainable Communities Strategy (2035 targets).	No, Project does not affect SB 375 targets.
By 2019, adjust performance measures used to select and design transportation facilities. • Harmonize project performance with emissions reductions, and increase competitiveness of transit and active transportation modes (e.g. via guideline documents, funding programs, project selection, etc.).	No, Project does not affect viability of transit or active modes.

Recommended Action	Applies to Project?
By 2019, develop pricing policies to support low-GHG transportation (e.g. low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts).	No, Project does not affect government pricing policies.
Implement California Sustainable Freight Action Plan: • Improve freight system efficiency. • Deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.	No, Project does not affect whether Freight Action Plan can be implemented.
Adopt a Low Carbon Fuel Standard with a CI reduction of 18 percent.	No, Project does not affect CARB's ability to adopt standards.
Implement the Short-Lived Climate Pollutant Strategy by 2030: • 40 percent reduction in methane and hydrofluorocarbon emissions below 2013 levels. • 50 percent reduction in black carbon emissions below 2013 levels.	No, Project does not affect whether SLCP strategy can be implemented.
By 2019, develop regulations and programs to support organic waste landfill reduction goals in the SLCP and SB 1383.	No, Project does not affect CARB's ability to adopt regulations.
Implement the post-2020 Cap-and-Trade Program with declining annual caps.	No, Project does not affect CARB's ability to implement Cap-and-Trade.
By 2018, develop Integrated Natural and Working Lands Implementation Plan to secure California's land base as a net carbon sink: • Protect land from conversion through conservation easements and other incentives. • Increase the long-term resilience of carbon storage in the land base and enhance sequestration capacity • Utilize wood and agricultural products to increase the amount of carbon stored in the natural and built environments • Establish scenario projections to serve as the foundation for the Implementation Plan	No, Project does not affect ability to develop such a plan.
Establish a carbon accounting framework for natural and working lands as described in SB 859 by 2018.	No, Project does not affect ability to establish such a framework.

Recommended Action	Applies to Project?
Implement Forest Carbon Plan	No, Project does not affect ability to implement such a plan.
Identify and expand funding and financing mechanisms to support GHG reductions across all sectors.	No, Project does not affect whether CARB can identify and expand funding.

Source: (CARB, 2017, pp. 103-104).

Table 39 shows the amount of change in GHG emissions by Scoping Plan sector. Note that Project sources mainly fall into the electric power and transportation sectors with exception of the portable generator which would be in the industrial sector but is likely to be owned and operated by a contractor.

Table 39 Estimated Change in GHG Emissions by Sector

Scoping Plan Category	1990 ($MMTCO_2e$)	2030 Scoping Plan Ranges ($MMTCO_2e$)
Agriculture	26	24–25
Residential and Commercial	44	38–40
Electric Power	108	30–53
High GWP	3	8–11
Industrial	98	83–90
Recycling and Waste	7	8–9
Transportation (Including TCU)	152	103–111
Natural Working Lands Net Sink*	-7***	TBD
Sub Total	431	294–339
Cap-and-Trade Program	n/a	34–79
Total	**431**	**260**

Source: (2017 Scoping Plan, p. 31).

* Work is underway through 2017 to estimate the range of potential sequestration benefits from the natural and working lands sector.

** The SLCP will reduce emissions in this sector by 40 percent from 2013 levels. However, the 2030 levels are still higher than the 1990 levels as emissions in this sector have grown between 1990 and 2013.

*** This number reflects net results and is different than the intervention targets discussed in Chapter 4.

The 2022 Scoping plan outlines updates that build on the successes of the previous 2017 Scoping Plan. As the updated plan notes, “Meeting the AB 32 2020 GHG emissions reduction target several years earlier than mandated demonstrated that developing mitigation strategies through a public process, where all

stakeholders have a voice, leads to effective actions that address climate change and yields a series of additional economic and environmental co-benefits to the state."

The relationship between Statewide and local action is a major topic of the 2022 Scoping Plan. "When a local CAP complies with CEQA requirements, individual projects that comply with the CAP are allowed to streamline the project-specific GHG analysis… Jurisdictions without formal CAPs also have important opportunities within this context. These jurisdictions can still take actions that effectively translate key State plans, goals, and targets, including those articulated in this Scoping Plan for local action."

The proposed plan emphasizes that lead agencies are tasked with a large part of the CEQA process when it comes to GHG emissions but are able to use State priorities as a guide. "One challenge local jurisdictions have faced is how to evaluate and adopt quantitative, locally appropriate goals that align with statewide goals. An effective response to this challenge is to focus on goals that can help implement overall State priorities—enabling the key transformations California needs."

It is also clear that the scoping plan places authority with the lead agency with regards to GHG emissions and mitigation, stating, "When a lead agency determines that a proposed project would result in potentially significant GHG impacts due to its GHG emissions or a conflict with State climate goals, the lead agency must impose feasible mitigation measures to minimize the impact." The 2022 Scoping Plan Update assesses progress towards achieving the SB 32 2030 target of a 40% GHG reduction and lay out a path to achieve carbon neutrality by 2045.

The 2022 Scoping Plan integrates ongoing efforts to transition away from fossil fuels by identifying and planning for the phase in of clean technologies and sustainable fuels. This comprehensive plan outlines a technologically feasible and cost-effective path to achieve carbon neutrality by 2045, aligning with California's goal to reduce GHG emissions by at least 40 percent below 1990 levels by 2030. The plan emphasizes the critical importance of the coming decade for transformative action and introduces new strategies, including the consideration of Natural and Working Lands as both emission sources and carbon sinks. It outlines specific actions, evaluates their impact on air quality and the economy, and emphasizes the importance of partnerships to drive investment in a low-carbon economy.

The 2022 Scoping Plan involves the following principles which inform the approach to addressing the climate challenge (CARB, 2022):

1. *Unprecedented Investments in a Sustainable Future*

   The California Climate Commitment is an initiative aimed at using investment as a tool to achieve 2030 and carbon neutrality goals. It allocates $10 billion for zero-emission vehicles, focusing on electric school buses and an accessible charging network, emphasizing heavy-duty vehicles and port electrification to reduce emissions in low-income communities. Additionally, it earmarks $2.1 billion for clean energy, $13.8 billion for transportation sector emissions reduction, over $720 million for climate innovation in higher education, nearly $1 billion for sustainable housing, and $9 billion for wildfire risk reduction and resilience. These investments incentivize emission

reduction strategies and align with federal and state programs while ensuring market stability for automakers transitioning to zero-emission vehicles.

2. *Centering Equity*

   The plan aligns with the governor's Executive Order to embed equity considerations, focusing on historically underserved and marginalized communities. The plan emphasizes climate and air initiatives with the focus of prioritizing equity by reducing air pollution disparities, reducing costs for low-income residents, and fostering high-quality jobs. Per AB32, the development of the Scoping plan involves the convening of an Environmental Justice Advisory Committee comprised of representatives from communities with the most significant exposure to air pollution, including communities with minority populations and/or low-income populations. Moreover, the Plan reaffirms a commitment to partnering with the 109 federally recognized tribes and over 60 non-federally recognized tribes in California. Laws like Senate Bill 535 and AB 1550 guide investments to assist vulnerable communities, further reinforcing the state's commitment to a resilient, just, and equitable future while addressing the climate crisis.

3. *Maximizing Air Quality and Health Benefits*

   The Scoping Plan outlines actions that offer both immediate air quality improvements for communities with the highest exposure to pollution and long-term greenhouse gas (GHG) benefits. Many of these actions align with the 2022 State Strategy for the State Implementation Plan, which focuses on meeting federal air quality standards and reducing harmful air pollution.

4. *Economic Resilience*

   The State is investing in workforce training and supporting workers transitioning from fossil fuel industries. A $1 billion investment aims to create new jobs and assist communities during this transition. The Community Economic Resilience Fund Program focuses on sustainable job creation. To ensure a smooth shift, ongoing dialogue with workers and affected communities is a priority. Additionally, California is updating funding guidelines to reinforce job creation and workforce development within clean energy through Assembly Bill 680.

5. *Partnering Across Government*

   The federal government's Inflation Reduction Act of 2022 allocates $369 billion to bolster domestic energy production and manufacturing, with an expected 40 percent reduction in U.S. greenhouse gas emissions by 2030. This legislation includes incentives for clean vehicles, ENERGY STAR appliances, and enhancements in transportation and clean energy accessibility for underserved communities. State agencies are encouraged to use the Scoping Plan to assess and update their own programs and policies to align with the identified actions.

6. *Partnering with the Private Sector*

   The plan emphasizes that Public funds and clear policies should drive private-sector efforts in emissions reduction and community resilience. Governor Newsom aims to collaborate with businesses, including small ones, to leverage their innovation and resources in tackling climate challenges. The plan describes public private partnerships such as the Catalyst Fund, which has areas of investment including forest biomass management and utilization, climate-smart

agriculture, and clean energy transmission.

7. *Supporting Innovation*

   The plan outlines the need for innovation in non-combustion technologies, clean energy, CO_2 removal options, and alternatives to short lived climate pollutants. The plan emphasizes the impact of AB32 policies and programs which support both the supply and demand side to build new markets in California, especially in the fields of zero emissions vehicles, low carbon fuels, and small scale energy storage.

8. *Engagement with Partners to Develop, Coordinate, and Export Policies*

   The plan outlines cases in which California has collaborated with other states, tribal governments, the federal government, and international jurisdictions to develop effective strategies for reducing greenhouse gases (GHGs) and to manage GHG control programs. The goal is to create integrated and cost-effective GHG reduction initiatives at regional, national, and international levels.

9. *Working Toward Carbon Neutrality*

   The 2022 scoping plan has been expanded to include new sources and sinks within the context of achieving carbon neutrality. While natural and working lands have a crucial role in sequestering carbon, modeling indicates that they alone cannot achieve carbon neutrality by 2045. Therefore, the plan also explores the role of carbon capture and sequestration, along with biological and mechanical carbon sequestration processes outlined in the IPCC Sixth Assessment Report.

10. *Supporting Healthy and Resilient Lands*

    The plan focuses on the impact of natural and working lands. Healthy lands, including forests, grasslands, soils, and wetlands, can store carbon dioxide and reduce emissions. The plan addresses the need for climate-smart land management, which promotes healthy ecosystems and supports carbon neutrality, emission reduction, and climate resilience.

11. *Maintaining the Focus on Methane and Short-Lived Climate Pollutants*

    The plan identifies efforts to reduce short-lived climate pollutants (SLCPs) as a crucial part of the plan. SLCPs, such as methane, black carbon, and fluorinated gases (including hydrofluorocarbons or HFCs), are highly detrimental to both human health and the global climate. They have a more potent and immediate impact on climate change than CO_2, despite having a shorter atmospheric lifespan. This makes them significant contributors to near-term climate change and global warming.

Actions identified in the 2022 Scoping plan are outlined in Table 40 below, and Project applicability to each action is determined.

Table 40 Actions for the 2022 Scoping Plan Scenario: AB 32 GHG Inventory Sectors

Sector	Action	Statues, Executive Orders, Other Direction, Outcome	Does the Project Conflict with this element of the Scoping plan?
GHG Emissions Reductions Relative to the SB 32 Target	40% below 1990 levels by 2030	SB 32: Reduce statewide GHG emissions. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will follow rules and regulations promulgated by SB 32 and AB 197 to reduce statewide GHG emissions.
Smart Growth / Vehicle Miles Traveled (VMT)	VMT per capita reduced 25% below 2019 levels by 2030, and 30% below 2019 levels by 2045	SB 375: Reduce demand for fossil transportation fuels and GHGs, and improve air quality. In response to Board direction and EJ Advisory Committee recommendations	No, the Project will not impact CARB's ability to work with local officials and municipalities to implement GHG reductions as outlined in SB 375.
Light-duty Vehicle (LDV) Zero Emission Vehicles (ZEVs)	100% of LDV sales are ZEV by 2035	EO N-79-20: Reduce demand for fossil transportation fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory 2035 target aligns with the EJ Advisory Committee recommendation.	No, the Project will not impact ZEV sales.
Truck ZEVs	100% of medium-duty (MDV)/HDV sales are ZEV by 2040 (AB 74 University of California Institute of Transportation Studies [ITS] report)	EO N-79-20: Reduce demand for fossil transportation fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources	No, the Project will not impact Truck ZEV sales.

Sector	Action	Statues, Executive Orders, Other Direction, Outcome	Does the Project Conflict with this element of the Scoping plan?
		covered by the AB 32 Inventory	
Aviation	20% of aviation fuel demand is met by electricity (batteries) or hydrogen (fuel cells) in 2045. Sustainable aviation fuel meets most or the rest of the aviation fuel demand that has not already transitioned to hydrogen or batteries.	Reduce demand for petroleum aviation fuel and reduce GHGs. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter to CARB Chair Liane Randolph	No, the Project will not affect aviation fuel use.
Ocean-going Vessels (OGV)	2020 OGV At-Berth regulation fully implemented, with most OGVs utilizing shore power by 2027. 25% of OGVs utilize hydrogen fuel cell electric technology by 2045.	Reduce demand for petroleum fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will not affect ocean going vessels.
Port Operations	100% of cargo handling equipment is zero-emission by 2037. 100% of drayage trucks are zero emission by 2035.	Executive Order N-79-20: Reduce demand for petroleum fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will not affect port cargo handling GHG emissions.
Freight and Passenger Rail	100% of passenger and other locomotive sales are ZEV by 2030. 100% of line haul locomotive sales are ZEV by 2035. Line haul and passenger rail rely primarily on hydrogen fuel	Reduce demand for petroleum fuels and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will not impact emissions reductions rules for locomotives.

Sector	Action	Statues, Executive Orders, Other Direction, Outcome	Does the Project Conflict with this element of the Scoping plan?
	cell technology, and others primarily utilize electricity.		
Oil and Gas Extraction	Reduce oil and gas extraction operations in line with petroleum demand by 2045.	Reduce GHGs and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will not interfere with the State's ability to direct reduce oil and gas extraction via direct emissions reductions.
Petroleum Refining	CCS on majority of operations by 2030, beginning in 2028 Production reduced in line with petroleum demand.	Reduce GHGs and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will not interfere with the State's regulation of petroleum.
Electricity Generation	Sector GHG target of 38 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) in 2030 and 30 $MMTCO_2e$ in 2035 Retail sales load coverage[134] 20 gigawatts (GW) of offshore wind by 2045 Meet increased demand for electrification without new fossil gas-fired resources.	SB 350 and SB 100: Reduce GHGs and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter, Board direction, and EJ Advisory Committee recommendation	No, the Project will not impact the State's implementation of GHG reductions through electricity generation policies.
New Residential and Commercial Buildings	All electric appliances beginning 2026 (residential) and 2029 (commercial), contributing to 6 million heat pumps installed statewide by 2030	Reduce demand for fossil gas and GHGs, and improve ambient and indoor air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project is not a new residential or commercial building.

Sector	Action	Statues, Executive Orders, Other Direction, Outcome	Does the Project Conflict with this element of the Scoping plan?
		In response to Governor Newsom's July 2022 letter	
Existing Residential Buildings	80% of appliance sales are electric by 2030 and 100% of appliance sales are electric by 2035. Appliances are replaced at end of life such that by 2030 there are 3 million all-electric and electric-ready homes—and by 2035, 7 million homes—as well as contributing to 6 million heat pumps installed statewide by 2030.	Reduce demand for fossil gas and GHGs, and improve ambient and indoor air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory. In response to Governor Newsom's July 2022 letter	No, the Project is not a Residential building.
Existing Commercial Buildings	80% of appliance sales are electric by 2030, and 100% of appliance sales are electric by 2045. Appliances are replaced at end of life, contributing to 6 million heat pumps installed statewide by 2030.	Reduce demand for fossil gas and GHGs, and improve ambient and indoor air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory In response to Governor Newsom's July 2022 letter	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable, and will not conflict with the State's ability to enact appliance sales mandates.
Food Products	7.5% of energy demand electrified directly and/or indirectly by 2030; 75% by 2045	Reduce demand for fossil gas and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.
Construction Equipment	25% of energy demand electrified by 2030 and 75% electrified by 2045	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.

Sector	Action	Statues, Executive Orders, Other Direction, Outcome	Does the Project Conflict with this element of the Scoping plan?
		covered by the AB 32 Inventory	
Chemicals and Allied Products; Pulp and Paper	Electrify 0% of boilers by 2030 and 100% of boilers by 2045. Hydrogen for 25% of process heat by 2035 and 100% by 2045. Electrify 100% of other energy demand by 2045.	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.
Stone, Clay, Glass, and Cement	Carbon capture storage ("CCS") on 40% of operations by 2035 and on all facilities by 2045 Process emissions reduced through alternative materials and CCS	SB 596: Reduce demand for fossil energy, process emissions, and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.
Other Industrial Manufacturing	0% energy demand electrified by 2030 and 50% by 2045	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.
Combined Heat and Power	Facilities retire by 2040.	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.
Agriculture Energy Use	25% energy demand electrified by 2030 and 75% by 2045	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.

Sector	Action	Statues, Executive Orders, Other Direction, Outcome	Does the Project Conflict with this element of the Scoping plan?
Low Carbon Fuels for Transportation	Biomass supply is used to produce conventional and advanced biofuels, as well as hydrogen.	Reduce demand for petroleum fuel and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.
Low Carbon Fuels for Buildings and Industry	In 2030s biomethane[135] blended in pipeline Renewable hydrogen blended in fossil gas pipeline at 7% energy (~20% by volume), ramping up between 2030 and 2040. In 2030s, dedicated hydrogen pipelines constructed to serve certain industrial clusters	Reduce demand for fossil energy and GHGs, and improve air quality. AB 197: direct emissions reductions for sources covered by the AB 32 Inventory	No, the Project will comply with rules, regulations, or laws promulgated under AB 197 if applicable.
Non-combustion Methane Emissions	Increase landfill and dairy digester methane capture. Some alternative manure management deployed for smaller dairies. Moderate adoption of enteric strategies by 2030. Divert 75% of organic waste from landfills by 2025. Oil and gas fugitive methane emissions reduced 50% by 2030 and further reductions as infrastructure components retire in line with reduced fossil gas demand.	SB 1383: Reduce short-lived climate pollutants.	No, the Project does not emit non-combustion methane.
High GWP Potential Emissions	Low GWP refrigerants introduced as building electrification increases, mitigating HFC emissions	SB 1383: Reduce short-lived climate pollutants.	No, the Project will comply with rules, regulations, or laws

Sector	Action	Statues, Executive Orders, Other Direction, Outcome	Does the Project Conflict with this element of the Scoping plan?
			promulgated under SB1383 if applicable

4.1.4 San Joaquin Valley Air Pollution Control District

SJVAPCD document, *District Policy Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency* (SJVAPCD, 2009) outlines a methodology to determine if a project meets the Best Performance Standards (BPS) for GHG emissions. The SJVAPCD document states, "Projects implementing BPS would be determined to have a less than significant individual and cumulative impact on global climate change and would not require project specific quantification of GHG emissions". When serving as the lead agency, the SJVAPCD requires stationary sources that do not comport with a BPS to demonstrate GHG reductions of 29% as compared to Business-as-Usual. Business-as-Usual is defined by the SJVAPCD as "The emissions for a type of equipment or operation within an identified class and category projected for the year 2020, assuming no change in GHG emissions per unit of activity as established for the baseline period". This policy, however, is outdated and is not applicable to the Project.

CARB regulations adopted in 2010 established a cap-and-trade program for the largest sources of GHG emissions in the State. Included in cap-and-trade are electrical power and fuels that are utilized by the Project. This is explicitly outlined in the more recent SJVAPCD APR 2025 (June 2014) which states the following:

> *… all GHG emission increases resulting from the combustion of any fuel produced, imported, and/or delivered in California are mitigated under Cap-and-Trade… Therefore, GHG emission increases caused by fuel use (other than jet fuels) are determined to have a less than significant impact on global climate change under CEQA.*

In practice, projects in the SJVAPCD sometimes uses the South Coast Air Quality Management District (SCAQMD) 10,000 $MTCO_2e$/yr threshold. For example, the recent environmental impact report for the McKay Point Reservoir Project in Tulare County (Tulare Irrigation District, 2024) compares Project emissions to the threshold of 10,000 $MTCO_2e$/yr, consistent with SCAQMD policy presented in Table 36. Under CEQA, Fresno County as the lead agency has similarly decided to use 10,000 $MTCO_2e$/yr as the threshold of significance for GHG for this Project. Such lead agency threshold choice is permissible under CEQA, *Cuyama Valley v. County of Santa Barbara 213 Cal. App 4th 1059 (2013)*.

4.1.5 County of Fresno

General Plan

The Fresno County General Plan contains a GHG related goal, Goal HS-G, and 13 policies in support of that goal. The goal itself is listed below. (County of Fresno, 2024)

Fresno County General Plan, Goal HS-G
To improve the sustainability and resilience of the County through continued efforts to reduce the causes of and adapt to climate change.

Priority Climate Action Plan

The Fresno Council of Governments approved the final Priority Climate Action Plan (PCAP) on February 29, 2024, which includes a regional GHG inventory, a public outreach process, identification and quantification of priority GHG emissions reduction measures, a benefit analysis for low-income and disadvantaged communities, and identification of implementation authorities (Fresno Council of Governments, 2024). The PCAP contains a 2019 GHG emissions inventory that quantifies emissions from the following sources:

- Transportation (including on-road, offroad, and aircraft sources);
- Industrial emissions;
- Energy use (residential and commercial);
- Waste and wastewater;
- Agriculture; and
- Fugitive emissions.

The PCAP scope includes both public and private sources within the County. Thus, emissions from Project sources are present in the PCAP inventory. The inventory finds that in Fresno County approximately 13.2 million metric tons (MT) of CO_2e was emitted in 2019, with most emissions coming from the transportation, agriculture, and energy use sectors at 44%, 19%, and 17%, respectively. Of the transportation sector, approximately 40% of the emissions inventory results from on-road sources such as passenger cars and trucks, buses, and delivery vans.

Based on the emissions inventoried, the PCAP identifies the priority GHG reduction measures for each sector and associated GHG emissions reductions that would result from their implementation. Appendix E contains a table describing each GHG reduction measure in the PCAP and discusses why each measure would not apply to the project.

4.2 Environmental Setting

Gases that trap heat in the atmosphere are GHGs, analogous to the way a greenhouse retains heat. Consequently, these GHG emissions are believed to directly affect the global climate.

Climate change refers to global changes in the average weather of the Earth as measured by changes in wind patterns, storms, precipitation, and temperature. While climate change is global in scale, California-specific impacts from predicted changes in the climate may result in a loss of snow-pack, increased risk of large wildfires, and a potential reduction in the quality and quantity of certain agricultural products.

4.2.1 Effects Attributed to GHG Emissions

The Scoping Plan is a living document that is updated every five years. The 2022 Scoping Plan (published December 2022 after the release of this Project's NOP) follows Governor Newsom's call for more aggressive climate measures providing a path to achieve both the 2030 climate goal and state carbon neutrality by 2045

with new efforts to advance offshore wind, clean fuels, climate-friendly homes, carbon removal and addressing methane leaks (CARB, 2022 Scoping Plan for Achieving Carbon neutrality, 2022).

At the time of the release of the Project NOP, the GHG policy document issued by CARB was the 2017 Scoping Plan update published in November 2017 (2017 Scoping Plan) and was summarized above.

4.2.2 Emissions Inventories

CARB's most recent GHG emission inventory, the 2025 Edition, tracks the emissions of seven GHGs identified in the California Health and Safety Code for the years 2000 to 2023. In 2023, total GHG emissions were 360.4 $MMTCO_2e$, a decrease of 11.2 $MMTCO_2e$ (3.0%) compared to 2022. Overall trends in the inventory also continue to demonstrate that the carbon intensity of California's economy (the amount of carbon pollution per million dollars of gross state product (GSP)) is declining. From 2000 to 2023, the carbon intensity of California's economy decreased by 56.6% percent while the GSP increased by 81.2%. In 2023, GSP grew 2.1% while the emissions per GSP declined 5.0% from 2022 to 2023. (CARB, GHG Trend Report, 2025)

The transportation sector remains the largest source of GHG emissions in the State, accounting for 37.1% of the inventory. On-road transportation emissions decreased 4.1%, mainly from the reduced use of fossil distillate (27.4%). Emissions from the electricity sector continue to decline due to growing zero-GHG energy generation sources. Emissions from the remaining sectors have remained relatively constant. The industrial sector trend saw a decrease of 3.4 $MMTCO_2e$ compared to 2022. (CARB, GHG Trend Report, 2025)

4.3 Significance Thresholds

The Environmental Checklist Form in Appendix G of the CEQA Guidelines presents questions about projects that, if true for a particular project, would be considered a significant impact. This document considers the following Environmental Checklist Form questions to be the Significance Thresholds for GHG emissions from this Project.

Would the project:

a) Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

The GHG analysis in the Final EIR was revised, as envisioned by CEQA, to address comments on the Draft EIR by several commenters. In addition, the Draft EIR was released on December 20, 2024 and the comment period closed on March 10, 2025. In the Draft EIR, the GHG analysis relied in part on an analysis used in an EIR certified by Kern County in approving the modification to an oil refinery. That EIR acknowledged that certain GHG emissions related to the consumption of fuel and the use of electricity were offset upstream of those uses pursuant to California's Cap-and-Trade Program. This approach was upheld in a decision by the Fifth District

Court of Appeal, which appellate court has jurisdiction over Fresno County, in *Association of Irritated Residents v. Kern County Board of Supervisors*, 17 Cal.App.5th 798 (2017) ("AIR"). However, on June 26, 2025 a new California appellate case out of Los Angeles County reviewing the use of offsets under the Cap-and-Trade Program as part of an EIR used to evaluate a housing development program was filed by the 2nd District Court of Appeal, *Center for Biological Diversity v. County of Los Angeles*, 112 Cal.App.5th 317 (2025) ("LA County Decision"). The LA County Decision distinguished the AIR Decision on the basis that the refinery subject to the Kern County EIR was a "covered entity" for purposes of the Cap-and-Trade Program, whereas the housing development at issue in the LA County Decision was not a "covered entity" for purposes of the Cap-and-Trade Program. The LA County Decision accordingly held that Los Angeles County could not rely on the fact that transportation fuels and electricity that would be used as part of the project were subject to Cap-and-Trade offsets and allowances as a mitigation measure under CEQA. Since the Project is also not a "covered entity" under the Cap-and-Trade program, in an abundance of caution, Fresno County decided to revise the GHG analysis in the Draft EIR to conform to the more recent LA County Decision. Accordingly, all emissions, including those involving the consumption of fuel and the use of electricity, are included in determining whether total emissions will exceed the GHG significance threshold of 10,000 MTCO2e/yr.

4.4 Methodology

4.4.1 CEQA Baseline

The Baseline was determined based on historical production records for the year 2005 (for more information see Appendix C). Off-road engine GHG emissions factors were determined using CalEEMod 2012 emission factors which are available in Appendix G, Dataset 7. On-road haul truck engine and employee vehicle emissions factors were determined using EMFAC 2018 emissions factors, see Appendix G, Datasets 8 – 13. Asphalt dryer emissions were based on SJVAPCD Standards, see Appendix G, Dataset 14.

Baseline aggregate plant electricity use is calculated below, based on the conservative assumption of a 1,625 hp Baseline aggregates plant (Appendix G). It was assumed that aggregate plants were operated 16 hours per day using grid electricity, which was assumed to emit 641 pounds of CO_2 per megawatt-hour in 2008, based on Pacific Gas and Electric Companies specific electrical utility emission factor provided in CalEEMod's 2016 User's Guide (CalEEMod, CalEEMod Appendix D: Default Data Tables, 2017). This calculation is intentionally conservative, as neither equipment load factor (75%) or electrical motor efficiency (Approximately 85%) are incorporated into the calculation. Excluding these factors results in a higher electricity demand and therefore a higher GHG estimate.

$$1625\ hp * 16\frac{hr}{day} * 312\frac{days}{yr} * 0.00074\frac{MW}{hp} * 641\frac{lb\ CO2E}{MWhr} * \frac{1\ MT}{2204.62\ lb} = 1{,}745\frac{MT\ CO2E}{yr\ Bsln.Plt.Op.}$$

A similar methodology was employed for calculating the baseline ready mix plant electricity use. Based on the maximum annual throughput of the ready mix plant, 189,550 yd^3/yr, the electricity usage could be calculated based on the 2007 study done by the Portland Cement Association titled the Life Cycle Inventory of Portland Cement Concrete (Marceua, NIsbet, & VanGeem, 2007) which provided a representative electricity usage factor for ready mix facilities per unit volume of concrete processed. This calculation is intentionally

conservative, as neither equipment load factor or electrical motor efficiency are incorporated into the calculation. Excluding these factors results in a higher electricity demand and therefore a higher GHG estimate.

$$189{,}550\,\frac{yd^3}{year} * 3.15\,\frac{kWh}{yd^3} * \frac{1\ MWh}{1{,}000\ kWh} * 641\,\frac{lbs\ CO2E}{MWh} * \frac{1\ MT}{2204.62\ lbs} = 174\,\frac{MT\ CO2E}{yr\ Future\ Plt.Op.}$$

Under Baseline conditions, the proposed asphalt plant is not operational. Accordingly, no greenhouse gas emissions from asphalt plant operations would be generated in the Baseline.

4.4.2 Construction Phase

As shown in the CalEEMod results (Appendix F), Project construction would be expected to take place over approximately 10 months and would generate an estimated **197 metric tons of CO2e** per year.

Construction-related greenhouse gas emissions would occur over a short-term period and are, by nature, temporary. Nevertheless, for purposes of evaluating long-term climate change impacts under CEQA, construction emissions are often amortized over the anticipated life of the Project. When amortized over a 30-year Project lifetime, construction emissions would result in an annualized contribution of approximately 6.6 metric tons of CO2e per year.

4.4.3 Operation Phase

Operation Phase aggregate plant electricity use is calculated below, based on a 3,456.5 hp Baseline aggregates plant (Appendix G). It was assumed that aggregate plants were operated 16 hours per day using grid electricity, which was assumed to emit 206 pounds of CO_2 per megawatt-hour in 2021, based on Pacific Gas and Electric Companies specific electrical utility emission factor provided in CalEEMod's 2020 User's Guide (CalEEMod, CalEEMod Appendix D: Default Data Tables, 2021). This calculation is intentionally conservative, as neither equipment load factor (75%) or electrical motor efficiency (Approximately 85%) are incorporated into the calculation. Excluding these factors results in a higher electricity demand and therefore a higher GHG estimate.

$$3456.5\ hp * 16\,\frac{hr}{day} * 312\,\frac{days}{yr} * 0.74\,\frac{kW}{hp} * \frac{1\ MWhr}{1000\ kWhr} * 206\,\frac{lb\ CO2E}{MWhr} * \frac{1\ MT}{2204.62\ lb}$$
$$= 1{,}193\,\frac{MT\ CO2E}{yr\ Future\ Plt.Op.}$$

A similar methodology was employed for calculating the Project ready mix plant electricity use. Based on the maximum annual throughput of the ready mix plant, 300,000 yd^3/yr, the electricity usage could be calculated based on the 2007 study done by the Portland Cement Association titled the Life Cycle Inventory of Portland Cement Concrete (Marceua, NIsbet, & VanGeem, 2007) which provided a representative electricity usage factor for ready mix facilities per unit volume of concrete processed. This calculation is intentionally conservative, as neither equipment load factor or electrical motor efficiency are incorporated into the calculation. Excluding these factors results in a higher electricity demand and therefore a higher GHG estimate.

$$300{,}000\,\frac{\text{yd}^3}{\text{year}} * 3.15\,\frac{\text{kWh}}{\text{yd}^3} * \frac{1\text{ MWh}}{1{,}000\text{ kWh}} * 206\,\frac{\text{lbs CO2E}}{\text{MWh}} * \frac{1\text{ MT}}{2204.62\text{ lbs}} = 88\,\frac{\text{MT CO2E}}{\text{yr Future Plt. Op.}}$$

Finally, the same methodology was used to calculate the electricity use for the asphalt plant. The maximum throughput possible for the Project's asphalt plant, 500,000 tons/yr, was chosen to represent maximum possible load. An electricity conversion factor, transforming kWh, based on annual throughput of an asphalt plant in tons, was based on a SJVAPCD Best Performance Standard report from 2010 (SJVAPCD, 2010). The calculation determined the total metric tons of CO2e that could be emitted from the asphalt plant per year of the Project.

$$500{,}000\,\frac{tons}{yr} * 1.96\,\frac{kWh}{ton} * \frac{1\,MWh}{1{,}000\,kWh} * 206\,\frac{lbs\,CO2E}{MWh} * \frac{1\,MT}{2204.62\,lbs} = 92\,\frac{MT\,CO2E}{yr\,Future\,Plt.Op.}$$

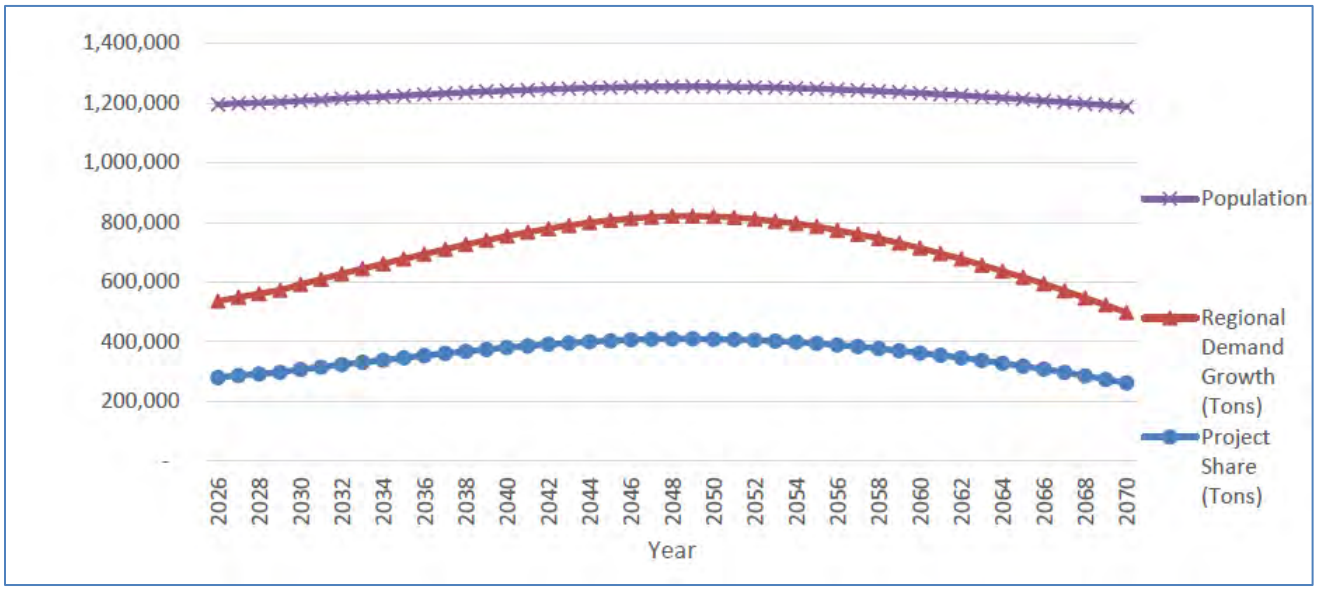
4.4.4 Regional Increment Analysis

In order to accurately address the GHG impact, a regional increment analysis, was conducted which characterizes the Project contribution to cumulative regional GHG emissions (Appendix J). This methodology responds to current regulatory guidance and reflects how aggregate demand and associated emissions are projected and managed at the regional level. The regional increment analysis is based on Project activity levels, as well as regional aggregate demand as forecast in the California Department of Conservation Map Sheet 52, as revised to account for current conditions.

As outlined in Map Sheet 52, state and regional planning forecasts indicate that aggregate demand is driven by population growth and overall regional development, rather than by the maximum production capacity of any single facility. Accordingly, while the Project is capable of supplying aggregate to meet regional needs, its operation would not create a net increase in regional aggregate demand beyond that already forecast. Any increase in annual production from the Project would be offset by corresponding reductions in production from other facilities serving the same regional market, resulting in no substantial change in total regional output.

Consistent with this framework, the GHG analysis evaluates emissions based on the Project's proportional share of regional demand growth, rather than calculating emissions based on continuous operation at maximum throughput. This approach ensures that the Project's GHG emissions are attributed in a manner that reflects realistic market conditions and real world impact. Chart 4 summarizes the aggregate demand in the Fresno and Madera County Production-Consumption Region (P-C Region). Appendix J outlines how population growth and aggregate demand region wide will drive consumption, rather than any one project.

Chart 4.Population Change and Aggregate Demand



Source: Appendix J

The regional increment analysis also clarifies the Project's role in meeting its share of regional GHG reduction obligations. The Project would comply with existing and future regulations governing greenhouse gas emissions, including Air District requirements, statewide climate policies, and new standards adopted during the life of the Project. Compliance with these regulatory programs would contribute to reducing cumulative GHG impacts at the regional and statewide level.

Moreover, as analyzed by Peter Berck in his January 2005 Working Paper 994, "A Note on the Environmental Costs of Aggregate" (Appendix B) when regional demand is a constant, the inclusion of additional aggregate quarry locations within the region can reduce total GHG emissions by reducing the average distance aggregates need to be hauled.

By incorporating the regional increment analysis, the GHG impact analysis provides a more accurate, and policy-consistent assessment of the Project's greenhouse gas impacts, while aligning the analysis with current forecasting methodologies and regulatory expectations. Appendix J includes Sespe's regional increment analysis calculations and memo (November 2024). Table 41 summarizes the emissions quantified in the regional increment analysis, including the Project's regional increment of anticipate GHG emissions increases in the region.

Table 41. Regional Increment Analysis Non-Employee Off-Site Transportation Emissions

Pollutant	PTE (MT/yr)	Reasonably Foreseeable Increase (MT/yr)
CO_2e	3,614	708

Source: Regional Increment Analysis, Regional Aggregates Demand and Effect on Air Quality Environment (Appendix J)

4.5 Project-Level Impacts and Mitigation Measures

4.5.1 Generate GHG Emissions That May Have a Significant Impact on the Environment

Impact Statement

Impact GHG-1: *Would the Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?* **(CEQA Appendix G Threshold Criteria (a)).**

Impact Analysis

Climate change is caused by cumulative GHG emissions. An individual project or emission source typically does not cause a significant climate change effect; it is caused by a large number of sources around the world emitting GHGs that collectively create a significant cumulative impact. Under 14CCR 15130(a)(3), "An EIR may determine that a project's contribution to a significant cumulative impact will be rendered less than cumulatively considerable and thus is not significant. A project's contribution is less than cumulatively considerable if the project is required to implement or fund its fair share of a mitigation measure or measures designed to alleviate the cumulative impact. The lead agency shall identify facts and analysis supporting its conclusion that the contribution will be rendered less than cumulatively considerable." Project emissions of GHGs are presented in Table 42 Project Greenhouse Gas Emissions.

SJVAPCD adopted thresholds of significance for GHG emissions on December 17, 2009, "Guidance for Valley Land-use Agencies in Addressing GHG Emission Impacts for New Projects under CEQA." These thresholds were tied to the CARB Scoping Plan at that time and established a method in determining the significance of a project-specific GHG emission impacts using established specifications or project design elements referred to as "Best Performance Standards" (BPS). While the SJVAPCD has not specifically established BPS for a quarry or asphalt plant, the Project includes many elements that will lead to a reduction in GHG emissions from the 1990 "business as usual" scenario. These elements include use of electricity and fuels that are subject to the statewide rules that reduce carbon intensity of electricity and fuels in California and thus GHG emissions from sources that consume electricity.

SJVAPCD guidance on impact analysis for GHGs includes a broad exemption of fuel based GHG emissions that was considered inconsistent with recent CEQA case law. For example, SJVAPCD Policy APR 2025 states the following:

> *… all GHG emission increases resulting from the combustion of any fuel produced, imported, and/or delivered in California are mitigated under Cap-and-Trade… Therefore, GHG emission increases caused by fuel use (other than jet fuels) are determined to have a less than significant impact on global climate change under CEQA.*

Therefore, Fresno County is utilizing the SCAQMD significance threshold of 10,000 $MTCO_2e$ per year to evaluate the significance of GHG impacts. Under the SCAQMD threshold, the Project's GHG emissions are less than significant.

Furthermore, the operation of the Project within Fresno County would likely reduce regional VMT and thus GHG emissions according to Peter Berck in his January 2005 Working Paper 994, "A Note on the Environmental Costs of Aggregate" (Appendix B). That is to say that if the Project was not approved, the aggregate needed for on-going construction activities in Fresno County as well as the San Joaquin Valley Air Basin would have to come from mines farther away and would thereby increase regional VMT and GHG emissions.

Project operations emissions from non-employee off-site, on-road vehicles associated with the project were calculated by summing the operational regional increment with the Baseline condition (709MT CO2e/yr and 5,359 MT CO2e/yr, which comes out to a total of 6,068 CO2e/yr). As described in Appendix L, renewable diesel (RD) went from negligible in 2005 to 16% in 2018 to 70% today and is expected to achieve close to 90% in the future. Based on 2025 reporting, RD has approximately 40% of the carbon intensity of low sulfur diesel fuels and is contributing to reducing the CI of the available ultra-low sulfur diesel available on the market in accordance with the Low Carbon Fuel Standard (LCFS) benchmarks (Appendix L). Accordingly, Project-related off-site on road fleet emissions were reduced by the CI reductions established in the LCFS benchmarks; for the years between 2016 and 2018 the realized CI reduction was 2% and for the years from 2016 to 2026, it was 18.6% (See Figure 2 in Appendix L).

Further, California's in-use off-road diesel fueled fleets regulations require the use of RD; to be reasonably conservative and based on the LCFS benchmark data, an adjustment of 50% was applied to estimated Project-related off-road diesel emissions operating onsite (see Appendix L). This is less than the 55% reduction in CI measured in 2025 between RD and LSDF (Appendix L, Tables 3 and 4) and the approximately 90% in ULSD projected for 2045 (Appendix L, Table 2).This shift has been driven in part by the California Low Carbon Fuel Standard, adopted by the California Air Resources Board in 2009 and implemented beginning in 2011, which requires progressively lower lifecycle carbon intensity for transportation fuels used in the state.

Project Impact represents the difference between the baseline condition and the operating condition. As shown in Table 42, Project operations minus the Baseline conditions result in GHG impacts that are less than the significance threshold.

Table 42 Project Greenhouse Gas Emissions

Activity		CO_2e (MT/yr)
Construction Phase (Maximum Year)		6.6
Operation Phase Total		21,301
On-site On-road Sources (1)(a)	927	
On-site Offroad Sources (2)(b)	4,236	
Non-Employee Off-site On-road Sources (regional increment and accounting for RD) (c)	6,068	
Employee Off-site On-road Sources (d)	302	
Stationary Sources (Asphalt Plant) (e)	8,394	
Electricity (f)	1,373	
Baseline Condition Total		13,737
On-site On-road Sources (a)	954	
On-site Offroad Sources (b)	5,212	
Non-Employee Off-site On-road Sources (regional increment) (c)	5,359	
Employee Off-site On-road Sources (d)	293	
Stationary Sources (e)	-	
Electricity (g)	1,919	
Project Emissions (Operation Phase Minus Baseline Condition)		7,564
GHG Threshold of Significance		10,000
Significant?		No

Source: a) Appendix H Datasets 8 & 10 b) Appendix H Dataset 7 c) Appendix J d) Appendix H Dataset 2a
e) Appendix H Datasets 14a & 14c f) Section 4.4.3 g) Section 4.4.1
1) Off-road units comply with offroad engine rules which require renewable diesel and adjusted by 50% (see Appendix L)
2) Off-site on-road units evaluated based on incremental share of regional increase in emissions (see Appendix J)

Based on the analysis presented above and as shown in Table 42, the Project's net increase in GHG emissions would be less than the SCAQMD significance threshold of 10,000 MT CO_2e per year. This conclusion reflects the use of a regional increment methodology that accounts for regional aggregate demand and the absence of a net increase in regional production. This analysis does not rely on the CA Cap-and-Trade program, given recent CEQA case law. Accordingly, the Project's impact on climate change would be less than significant under CEQA.

Level of Significance Before Mitigation

Less than significant

4.5.2 Conflict With an Applicable Plan, Policy or Regulation that Reduces GHGs

Impact Statement

Impact GHG-2: *Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?* **(CEQA Appendix G Threshold Criteria (b)).**

Impact Analysis

Project emissions are evaluated with respect to consistency with the following plans and policies that have been adopted to reduce GHG emissions:

Table 43 Adopted Greenhouse Gas Policies

Plan/Policy	Consistent?
A local jurisdiction's qualified climate action plan or GHG reduction plan.	As detailed in section 4.1.5, the Project is consistent because no local climate action or GHG reduction plans apply to the project.
AB 32, SB 32 and the Scoping Plan	As described previously, AB 32 requires that the CARB adopt regulations to require the reporting and verification of statewide greenhouse emissions and monitor and enforce compliance with the program. The Project is in compliance with the 2022 Scoping Plan as demonstrated above in Table 40 Actions for the 2022 Scoping Plan Scenario: AB 32 GHG Inventory Sectors and Table 42 Project Greenhouse Gas Emissions. In the preparation of this Report, the calculation of emissions from fuel and electricity subject to AB 32 and SB 32 were no longer used to reduce GHG emissions for determining the level of significance given recent CEQA case law. Fresno County utilized the SCAQMD as noted in Section 4.1.4, this threshold of

Plan/Policy	Consistent?
	10,000 $MTCO_2e$/yr has been previously utilized to determine significance in an approved EIR within the SJVAPCD. Referring to Section 4.5.1 above, total applicable Project GHG emissions are estimated to be 7,564 $MTCO_2e$/yr, less than the 10,000 $MTCO_2e$/yr threshold. As such, the Project is consistent with the emissions reductions targets outlined in AB 32 and the 2017 and 2022 Scoping Plan.
CA Executive Order B-30-15 goals.	The Project is consistent with the Executive Order B-30-15 goals which apply to the fuel and electricity sectors as a whole. The fuels and electricity used by the Project would be subject to the Cap-and-Trade program as well as other Scoping Plans and related control measures (e.g., renewable energy portfolio, low carbon fuel standard) that are applied higher up in the supply chain. (There is no plan, policy or regulation adopted for the purpose of reducing emissions of GHGs specifically from mining projects)
PCAP Reduction Measures	Emissions from sources and source sectors associated with the Project were included in the emissions inventory and thus informed the reduction measures chosen by the County to mitigate the cumulative impact of climate change. The PCAP measures do not affect sources associated with the Project. Therefore, the Project is consistent with the PCAP.

As outlined in Table 43, the Project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Moreover, Appendix E details additional plans, policies, and regulations that have been reviewed to ensure the Project would not result in a conflict.

A Note on the Environmental Costs of Aggregates

by Peter Berck[*]
January 10, 2005

Abstract:

The opening of a new site for the production of aggregates has both direct and indirect impacts on the environment. The indirect impacts include changes in the environmental costs of hauling aggregates and possible changes in the level of construction activity. In this note, we show that the most likely effect of a new aggregate site is to reduce the truck miles used for aggregate hauling, which is an environmental benefit. We also show that the change in construction activity induced by a new site is likely to be extremely small.

[*] Peter Berck is Professor of Agricultural and Resource Economics. I would like to thank Atanu Dey for able research assistance. The remaining errors are mine.

A Note on the Environmental Costs of Aggregates

The opening of a new quarry for aggregates will change the pattern of transportation of aggregates in the area served by the quarry. In this note, we will show that, so long as aggregate producers are cost minimizing, the new pattern of transportation requires less truck transport than the pattern of transportation that existed before the opening of the new quarry. Since the costs of providing aggregates falls, it is reasonable to assume that the price of delivered aggregates also will fall. This note also shows that the demand expansion effect is of very small magnitude. Since the demand increase from a new quarry is quite small, the dominant effect is that the quarries are on average closer to the users of aggregates and, as a result, the truck mileage for aggregate hauling decreases. To summarize the effects of a new quarry project:

a) The project in itself will not significantly increase the demand for construction materials in the region through market forces, which include the downward pressure on pricing.
b) Truck traffic (i.e. vehicle miles traveled) in the region will not increase and may decrease as a result of the project.

As a result, the effect of a new quarry project will be to reduce the air emissions from aggregate trucking. The reduction in emissions should be included as a positive impact of a quarry project in any analysis of the environmental consequences of a new quarry.

The remainder of this note provides a brief description of the economics of construction materials and explains why these points must be true.

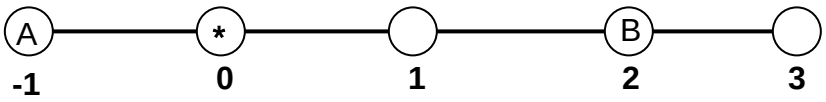
Based upon the available evidence, a project would decrease haul distances for aggregates and would therefore decrease emissions from trucks, rather than increase them.

There are two economic facts that are important to understand in evaluating the likely addition or subtraction to truck traffic from a new quarry. One is the economics of location. The second is the demand for aggregates, which is the quantity of aggregates used as a function of price.

That a new site leads to smaller haul distance is a matter of geometry and economics. Transportation is a major element in the cost of delivered aggregate, so new sites are chosen, within the limits placed by the natural availability of aggregates, to minimize transport costs.

An example should make this fact clear. Consider diagram 1. Circles represent aggregate-using projects of equal size. The five projects shown are located at miles marked –1, 0, 1, 2, and 3. Two of the project sites are marked with the letters A and B, and they are potential locations for aggregate production. The location at mile 0 is an existing aggregate production site and it is marked by an asterisk (*). The scale is in miles. For simplicity, each project uses one unit of aggregate.

Diagram 1



With only one aggregate production site at mile 0, the miles traveled to supply the five projects is seven: zero miles for project at mile 0, one mile for each for the projects at mile –1 and 1, two miles for the project at 2 and three miles for the project at 3 for a total of 7 miles. If an additional aggregate production site is started at A, the miles traveled decreases to six, because there is no transportation required for the aggregate-using project at A and all other projects are served by the original site. However, if the new site is placed at B instead of being placed at A, transport distance falls to three miles because then two projects have aggregate production at their location and thus have zero

transportation requirements, and the three remaining sites each require a one-mile transport. Each aggregate production site supplies 2.5 units of aggregates, that is, half the total required by the five projects. Since cost depends on distance and, markets minimize costs, the free market system always will choose a point like B, the one with the lowest cost. In this case it is also the lowest transport distance.

Other forms of industrial organization lead to higher prices being charged for aggregates, but the effect of additional suppliers is to lower prices and haul distances. Appendix A elucidates the case where the price depends upon the delivered costs of the second most efficient producer.

The second issue for the siting of aggregate production is the possibility that lower delivered costs lead to more projects or more use of aggregates in existing projects. The degree to which decrease in the price of a good, in this case construction material, leads to an increase in the quantity of that material used is described by the elasticity of demand. The elasticity of demand is the percent increase in use caused by a one percent decrease in price.

A search of the economic literature found no articles estimating a positive elasticity of demand for aggregates. A review by the Susan Kohler[†] finds that only population and not price is correlated with aggregate usage. In other words, a reduction in the price of aggregate does not lead to an increase in demand for it.

While it is a theoretical possibility that the quantity of aggregates demanded (that is, the quantity used in projects) is responsive to price, two facts about construction make this unlikely. First, the cost of aggregates is usually a tenth or less of the cost of a project. Second, the building of projects -- housing, roads, and commercial construction -- is not very sensitive to the costs of producing them.

[†] *Map Sheet 52. Aggregate Availability in California.* by Susan L. Kohler. California Department of Conservation. California Geological Survey. Sacramento. 2002.

Although we have not found literature on the elasticity of demand for either public projects or contract construction, there is an empirical literature on the elasticity of demand for housing[‡]. In these studies, a one percent change in the price leads to about a half percent change in the quantity of housing consumed. Public projects, like roads, are budgeted, often from specials funds, like road taxes. In that case, a one percent decrease in the costs of *all* projects in a taxing jurisdiction would lead to a one percent increase in the quantity of roads built. Since aggregates are very expensive to ship, the quarry being considered likely would only change the costs of nearby road construction, perhaps for just one county.

For example, Monterey County has a population of 400,000 while the state population is 33.9 million people.[§] Assuming that road construction is roughly proportional to population, about 1.2 percent of road construction would be in Monterey. So, if a new quarry in Monterrey decreased the price of aggregates in Monterrey by 1 percent and left the price the same in the rest of the state, then the average price in the whole state would fall by about 0.01 percent, which is negligible. A project that affects only a small part of a taxing jurisdiction has only a small effect on that jurisdiction's costs and can have no major affect on the quantity of services supplied by that jurisdiction.

We know of no evidence of elasticities for construction work as high as one. We estimate the elasticity of demand for projects using aggregates to be much less than one, likely under a half in the private sector and near zero in the public sector.

Given that projects will be built, there is some possibility of substituting of other structural materials for aggregates in buildings. However these substitute materials too would be trucked. The realistic possibility for roads is that there are no materials to substitute for aggregates. I do not believe this pathway to greater use of aggregates in building would be triggered by the transport savings from a new aggregate source or that it would result in an increase in net truck miles.

[‡] Hanushek, Eric A., John Quigley. "What is the price elasticity of housing demand?" *Review of Economics and Statistics.* August, 1980.

[§] Population figures are for the year 2000.

Since a change in price of aggregates does not lead to either a substantial substitution of other materials for aggregates or a substantial increase in the quantity of projects, the demand for aggregates is very inelastic. This inelasticity of demand is exactly the reason that the State of California can use a fixed per-capita consumption rate for forecasting the need for construction materials.

An example will make clear how the transport advantage and elasticity of demand arguments fit together. Let us consider a new quarry that, through its transportation advantage over existing quarries, would save 12.5 miles of trucking on each and every project in the study area. We shall assume that the average truck haul pre-project was 25 miles.

According to the *Map Sheet 52: Aggregate Availability in California,* the cost of construction aggregate doubles every 25-35 miles from the point of production. The following calculations are carried out assuming that a 25 mile haul doubles the cost. Assuming that a unit of aggregate costs $1 at the production site, then its delivered cost at a project site 25 miles away is $2. If the haul distance were to be reduced to 12.5 miles due to a new quarry, then half of the transportation costs – or $0.50 – would be saved. This represents a cost savings of 25 percent in the delivered cost of aggregate and is entirely due to a 50 percent decrease in miles traveled.

The only way for a new quarry to influence the quantity of construction is through the price of aggregates. This example presents the competitive case, where the delivered price decreases by the full amount of the transport cost savings. In the competitive case, the effect on the quantity of construction will be extremely moderate, as demonstrated below. (Appendix A presents a less than perfectly competitive example.)

In keeping with the fact that the cost of aggregate accounts for less than 10 percent of the total cost of a construction project, a price reduction of 25 percent on aggregate is a cost saving of 2.5 percent or less on the project. Let us assume a very liberal price elasticity of

demand for construction of 0.5. In other words, 2.5 percent reduction in the cost of construction would lead to 1.25 percent increase in the quantity of construction demanded. This increased quantity of delivered aggregate leads to additional truck haul miles. The number of increased miles from the increased aggregate sales is 1.25 percent of the original quantity times the new haul distance which is 50% of the original distance. Therefore, the percentage increase in truck haul miles occasioned by a decrease in aggregate price will be 0.625 percent because the new aggregate location is only half as far away.

In this example, the new quarry saves 50 percent of truck trip miles through location and contributes 0.625 percent of new truck trip miles from demand increase. This leads to a net decrease of 49.375 percent in truck miles. The following Table 1 summarizes the net reduction of truck haul miles for three different scenarios – the new aggregate project site located at 12.5, 6.25, and 2.5 miles from a construction site.

Table 1

Distance to New Quarry (miles)	**Decrease in haul miles (%)**[**]	**Decrease in delivered aggregate cost (%)**	**Decrease in construction cost (%)**	**Increase in construction quantity (%)**	**Increase in haul miles from additional construction(%)**[††]	**Net decrease in miles hauled (%)**
12.5	50	25	2.5	1.25	0.62	**49.4**
6.25	25	37.5	3.75	1.85	0.46	**74.5**
2.5 miles	90	45	4.5	2.25	0.22	**89.8**

There is a general rule to be deduced from the example: The percent decrease in cost for the delivery of aggregates equals the percent decrease in miles driven, while the increase in the use of aggregates equals the elasticity of demand for a final product (such as roads) times the cost share of aggregates in making the product times the decrease in cost. Since the elasticity of demand for a final product is much less than one, and the cost

[**] This decrease is with respect to the pre-project haul miles.
[††] This increase is with respect to the pre-project haul miles.

share of aggregates in making the product is about 8 percent, a new quarry must decrease truck miles and decrease NOX and other emissions from trucks.

Appendix A

Spatial Models with Imperfect Competition

When a producer has a price advantage over other producers because of lower transport costs, the producer can exploit that advantage by charging consumers a price greater than its marginal cost. Marginal cost is the cost of producing one incremental unit.
In this appendix, I will briefly investigate one model of spatial competition that is derived from a classical model of Hotelling [‡‡]

In Hotelling's model, two stores (which are analogous to production sites) can relocate at no cost and then compete based on price. Since consumers are some distance from the store, they see the price of a product as the amount they pay for the product plus the cost of travel. They go to the store with the least total cost (cost of product plus cost of travel). The stores seek to make the most money they can make. The price the consumer will pay is the largest price that the store the consumer goes to can charge without losing the customer to the other store.[§§] In Hotelling's model, the two stores will locate next to each other, split the market in half, and charge the competitive price. While the pricing rule of the Hotelling model may well apply to aggregates, the assumption of complete location flexibility is not applicable.

Returning to the model of diagram 1, shown above., I now consider the effects on pricing of adding one aggregate production site with competition in prices. Consider the case where both aggregate production sites and aggregate-using projects exist at location A and *. The production site at * would be willing to supply the project at location A at its marginal cost of production (mc) plus the cost of transport for one mile, for a total of mc + 1 c. This is higher than the marginal plus transport costs that production site A has for

[5] Hotelling, Harold. 1929. "Stability in Competition." Economic Journal 39:41-57
[6] Salop, Steven C. 1979. "Monopolistic Competition with Outside Goods." *The Bell Journal of Economics.* Salop models the competition between stores in terms of quantity, so that the price for consumers near a store is determined as a monopolist would determine price. With a very low elasticity of demand as is true for aggregates, the price competition model of Hotelling seems more appropriate.

supplying the project at A. However, the site at A can charge up to mc+c without losing the customer. The site charges mc+c while its costs are mc and makes c units of pure profit. The site at * prices in the same way—a price just high enough to avoid the site at A from taking the customer. For the sites to the right of *, the prices are mc+2, mc+3, and mc+ 4. In each case, this is the highest price site * can charge without losing the customer to site A.

In this model, one of the best places for a new site would be at B. The new site would sell ½ unit to the project between it and * at a price of mc + c, a whole unit to the project located at B at a price of mc + 2c (the price at which the site at * would be willing to supply aggregate), and a whole unit to the project located to its right at a price of mc + 3c. The result of adding the new site would be that the price for each project to the right of the project at * fell by c.

With competitive (marginal cost) pricing as described in the body of the note, the addition of the new site at B would result in the prices paid by projects decreasing by four, while with imperfect competition as described in this appendix, the new site would result in the prices paid by projects decreasing only by three. Compared to the competitive case cited above, the imperfect competition example results in smaller changes in prices and therefore a larger decrease in truck traffic.

INTRODUCTION

Sand, gravel, and crushed stone are “construction materials.” These commodities, collectively referred to as aggregate, provide the bulk and strength to Portland Cement Concrete (PCC), Asphaltic Concrete (AC, commonly called “black top”), plaster, and stucco. Aggregate is also used as road base, subbase, railroad ballast, and fill. Aggregate normally provides 80 to 100 percent of the material volume in the above uses.

The building and paving industries in California consume large quantities of aggregate and future demand for this commodity is expected to increase throughout California. Aggregate materials are essential to modern society, both to maintain the existing infrastructure and to provide for new construction. Therefore, aggregate materials are a resource of great importance to the economy of any area. Because aggregate is a low unit-value, high-bulk-weight commodity, it must be obtained from nearby sources to minimize economic and environmental costs associated with transportation. If nearby sources do not exist, then transportation costs can quickly exceed the value of the aggregate. Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, air pollution, traffic congestion, and road maintenance.

To give an idea of the scale of these impacts, from 1987 to 2016, California consumed an average of about 180 million tons of construction aggregate (all grades) per year. Moving in 25 ton truckloads that is 7.2 million truck trips per year. With an average 25-mile haul (50-mile round trip) that amounts to 360 million truck miles traveled, more than 51 million gallons of diesel fuel used, and more than 570,000 tons of carbon dioxide emissions produced annually. If the haul distance is doubled to 50 miles (100-mile round trip) the numbers double to 720 million truck miles traveled, more than 102 million gallons of diesel fuel used, and over 1.1 million tons of carbon dioxide emissions produced.

Land-use planners and decision makers in California are faced with balancing a wide variety of needs in planning for a sustainable future for their communities and regions. Mining is often seen as a controversial land use during the permitting process. However, there are benefits to having local sources of construction aggregate. Increasingly, as existing permitted aggregate supplies are depleted, local land-use decisions regarding aggregate resources can have regional impacts that go beyond local jurisdictional boundaries.

These factors, universal need, increasing demand, the economic and environmental costs of transportation, and multiple land-use pressures make information about the availability and demand for aggregate valuable to land-use planners and decision makers charged with planning for a sustainable future for California’s citizens.

California Geological Survey (CGS) Map Sheet 52 and this accompanying report provide general information about the current availability of, and future demand for, California’s permitted aggregate reserves. Map Sheet 52 was originally published in 2002 (Kohler, 2002) and subsequently updated in 2006 (Kohler, 2006) and 2012 (Clinkenbeard, 2012). Map Sheet 52 (2018) is an update of the version published in 2012.

Map Sheet 52 updates data from 49 reports compiled by the CGS for more than 30 aggregate study areas throughout the state (see Appendix). These study areas cover about 30 percent of the state and provide aggregate for about 85 percent of California's population. This report is divided into three parts:

- Part I - provides data sources and methods used to derive the information presented.
- Part II - compares the updated 2018 Map Sheet 52 to the prior (2012) map.
- Part III - an overview of construction aggregate.

All aggregate data and any reference to "aggregate" in this report and on the map, pertain to "construction aggregate," defined as alluvial sand and gravel or crushed stone that meets standard specifications for use in PCC or AC unless otherwise noted.

The estimates of permitted resources, aggregate demand, and years of permitted reserves remaining on Map Sheet 52 (2018) and in this report, are based on conditions as of January 1, 2017 and do not reflect changes, such as production, mine closures, or new or expanded permits, that may have occurred since that time. Although the statewide and regional information presented on the map and in this report may be useful to decision-makers, it should not be used as a basis for local land-use decisions. The more detailed information on the location and estimated amounts of permitted and non-permitted resources, and future regional demands contained in each of the aggregate studies employed in the compilation of Map Sheet 52 should be used for local land-use and decision-making purposes.

PART I: DESCRIPTION OF MAP SHEET 52, AGGREGATE SUSTAINABILITY IN CALIFORNIA

Map Sheet 52 is a statewide map showing a compilation of data about aggregate availability collected over a period of about 40 years and updated to January 1, 2017. The purpose of the map is to compare projected aggregate demand for the next 50 years with currently permitted aggregate reserves in various regions of the state. The map also shows the projected years of permitted reserves remaining and highlights regions where less than 10 years of permitted aggregate supply remain. The following sections describe data sources and methodology used in the development of the map.

Mineral Land Classification Reports and Aggregate Studies

Aggregate reserves and projected aggregate demand shown on Map Sheet 52 are updated from mineral land classification reports published by CGS between 1979 and 2017 (see Appendix). They were prepared in response to California's Surface Mining and Reclamation Act of 1975 (SMARA) that requires the State Geologist to classify land based on the known or inferred mineral resource potential of that land. SMARA, its regulations and guidelines, are described in Special Publication 51 (State Mining and Geology Board, 2000). The regulations and guidelines can be found on the State Mining and Geology Board website at http://www.conservation.ca.gov/smgb.

The Mineral Land Classification process identifies lands that contain economically significant mineral deposits. The primary goal of mineral land classification is to ensure that the mineral resource potential of lands is recognized and considered in land-use planning. The classification process includes an assessment of the quantity, quality, and extent of aggregate deposits in a study area.

Mineral land classification reports may be specific to aggregate resources, may contain information about both aggregate and other mineral resources, or they may only contain information on minerals other than aggregate. Reports that focus on aggregate include aggregate resource classification and mapping, estimates of permitted and non-permitted aggregate resources, projected 50-year demand for aggregate resources, and an estimate of when the permitted reserves will be depleted. Map Sheet 52 is a statewide updated summary of 50-year demands and permitted resources for all regional SMARA classification reports pertaining to construction aggregate.

Mineral land classification studies for aggregate may use either a Production-Consumption (P-C) region or a county as the study area boundary. A P-C region is one or more aggregate production districts (a group of producing aggregate mines) and the market area they serve. P-C regions sometimes cross county boundaries. Mineral land classification reports include information from one or more P-C regions, or from a county. For ease in discussion, the area covered by each P-C region or county aggregate study is referred to as an "aggregate study area." SMARA guidelines recommend that the State Geologist periodically review the mineral land classification in defined study regions to determine if new classifications are necessary. The projected 50-year forecast of aggregate demand in the region may also be revised.

The index map of aggregate studies shown in the lower left-hand corner of Map Sheet 52 shows the latest reports that cover an aggregate study area. Earlier reports covering the same areas or portions of areas are referenced in the Appendix with an asterisk ("*"). Original mineral land classification reports and update reports are listed in the Appendix and can be found on the CGS Information Warehouse at http://maps.conservation.ca.gov/cgs/informationwarehouse/.

Fifty-Year Aggregate Demand Forecast

The fifty-year aggregate demand forecast for each of the aggregate study areas is presented on Map Sheet 52 as a pie chart (See *Fifty-Year Aggregate Demand Compared to Permitted Aggregate Reserves* section), and is presented in Table 1 of this report. The demand information may be new, or updated from previously published mineral land classification reports. The demand forecast information depicted on Map Sheet 52 is for the period January 1, 2017 through December 2066.

The aggregate study areas with the greatest projected future demand for aggregate are the South San Francisco Bay and Temescal Valley-Orange County areas. Each is expected to require more than a billion tons of aggregate by the end of 2066. Other areas with projected high demands are Western San Diego County, San Gabriel Valley, San Bernardino, Sacramento County, and Palmdale. Each of these areas is projected to need more than 500 million tons of aggregate in the next 50 years. Aggregate study areas having smaller demands generally are in rural, less populated areas. The aggregate study areas of El Dorado County, Glenn County, Nevada County, Shasta County, and Tehama County are all projected to require less than 100 million tons of aggregate over the next 50 years.

Methodology

The steps used for forecasting California's 50-year aggregate needs using the per capita consumption model are:

1. Collecting yearly historical production and population data.

2. Dividing yearly aggregate production by the population for that same year to determine annual historical per capita consumption.

3. Determining the average of the annual historical per capita consumption values for the range of years being used.

4. Projecting yearly population for a 50-year period from the beginning of 2017 through 2066.

5. Multiplying each year of projected population by the average historical per capita consumption and adding the results for each year to obtain the 50-year aggregate demand.

Table 1. Comparison of 50-Year Demand to Permitted Aggregate Reserves for Aggregate Study Areas as of January 1, 2017.

AGGREGATE STUDY AREA[1]	50-Year Demand (million tons)	Permitted Aggregate Reserves (million tons)	Permitted Aggregate Reserves Compared to 50-Year Demand (percent)	Projected Years Remaining
Bakersfield P-C Region	338	1,708	505	More than 50
Barstow-Victorville P-C Region	163	117	72	31 to 40

Tulare County	130	53	41	21 to 30
Ventura County[2]	241	84	35	11 to 20
Western San Diego County P-C Region	763	265	35	11 to 20
Yuba City-Marysville P-C Region	344	679	197	More than 50
Total	11,045	7,628	69	

[1] Aggregate study areas follow either a Production-Consumption (P-C) region boundary or a county boundary. A P-C region includes one or more aggregate production districts and the market area that those districts serve. Aggregate resources are evaluated within the boundaries of the P-C Region. County studies evaluate all aggregate resources within the county boundary.

[2] Two P-C regions have been combined into one study area.

Bold = study area with ten or fewer years of permitted reserves.

For this update, the range of years of historical production and population data used were generally from 1980-2016.

The per capita consumption model has proved to be effective for projecting aggregate demand in major metropolitan areas. However, the per capita model may not work well in county aggregate studies or in P-C regions that import or export a large percentage of aggregate resulting in a low correlation between P-C region production and population. In such areas, projections may be made based on historical production or, multiple projections based on differing assumptions may be used to better characterize a range of future demand.

For regions that export large amounts of aggregate to neighboring P-C regions, projections are based on an historical production model where 50-year aggregate demand is determined by extending a best-fit line of historical aggregate production data for a county or region. This model was used to project Yuba City-Marysville's 50-year demand because the region exports about 70 percent of its aggregate into neighboring areas such as Sacramento County and Placer County. The 50-year demand for Glenn and Tehama counties, the Palmdale P-C Region, and the Temescal Valley-Orange County area was also projected using this method.

Permitted Aggregate Reserves

Approximately 7.6 billion tons of permitted aggregate reserves lie within the aggregate study areas shown on Map Sheet 52. Permitted aggregate reserves are aggregate deposits that have been determined to be acceptable for commercial use, exist within properties owned or leased by aggregate producing companies, and have permits allowing mining of aggregate material. A "permit" is a legal authorization or approval by a lead agency, the absence of which would preclude mining operations. Although some permitted reserves face legal challenges, these reserves are included in this study pending resolution of those challenges.

In California, mining permits usually are issued by local lead agencies (county or city governments). Map Sheet 52 shows permitted aggregate reserves as a percentage of the 50-year demand on each pie chart (See *Fifty-Year Aggregate Demand Compared to Permitted Aggregate Reserves* section). Beneath the study area name located next to its corresponding pie chart is the permitted resource in tons along with the 50-year demand. These figures are also given in Table 1.

Permitted aggregate resource calculations shown on the map and in Table 1 initially were determined from information provided in reclamation plans, mining plans, and use permits issued by the lead agencies. When information was inadequate to make reliable independent calculations, CGS staff used resource estimates provided by mine operators or owners. These data were checked against rough calculations made by CGS staff, and any major discrepancies were discussed with the mine operators or owners. Permitted reserve calculations have been updated to account for production from 2010-2016 and are current as of the beginning of 2017.

Fifty-Year Aggregate Demand Compared to Permitted Aggregate Reserves

Fifty-year aggregate demand compared to the currently permitted aggregate reserves is represented by a pie chart for each aggregate study area on Map Sheet 52. Each pie chart is in the approximate center of the aggregate study area it represents. There are four different sizes of charts, each representing a 50-year demand range. The smallest pie chart represents 50-year demands of less than 200 million tons, while the largest chart represents demands of over 800 million tons. The 50-year demand (in tons) is shown on the map with the amount of permitted reserves beneath the study area name located next to its corresponding pie chart (permitted reserves, left / 50-year demand, right). The whole pie represents the total 50-year aggregate demand for a particular aggregate study area. The blue portion of the pie represents the permitted aggregate resource (shown as a percentage of the 50-year demand) while the purple-colored portion of the pie represents that portion of the 50-year demand that will not be met by the currently permitted reserves. For example, if the blue portion is 25 percent and the purple portion is 75 percent of a pie chart that represents a total demand of 400 million tons, the permitted reserves are 100 million tons, and the region will need an additional 300 million tons of aggregate to supply the area for the next 50 years. The pie representing the Bakersfield aggregate study area is completely colored blue, showing permitted aggregate reserves are equal to or greater than the area's 50-year aggregate demand. Detailed examples are provided in the legend of Map Sheet 52.

Except for the Bakersfield P-C Region, Fresno P-C Region, Nevada County, Placer County, and the Yuba City-Marysville P-C Region, all the aggregate study areas have less permitted aggregate reserves than they are projected to need for the next 50 years. Fifteen of the aggregate study areas shown on the map have less than half of the permitted reserves they are projected to need in the next 50 years.

Estimates of Years of Permitted Reserves Remaining

The right-hand column of Table 1 indicates the projected years of permitted reserves remaining for the various aggregate study areas. Calculations of depletion years are made by comparing the currently permitted reserves to the projected annual aggregate consumption in the study area on a year-by-year basis. This is not the same as dividing the total projected 50-year demand for aggregate by 50 because, as population increases, so does the projected annual consumption of aggregate for a study area. Data are presented as ranges; 10 or fewer, 11-20, 21-30, 31-40, 41-50, and more than 50 years. This information is included on Map Sheet 52 beneath the study area name along with the permitted reserves and the projected 50-year demand. These estimates are based on conditions as of January 1, 2017 and do not reflect changes, such as new or expanded permits, that may have occurred since that time.

Only one of the aggregate study areas in Table 1, the San Fernando Valley-Saugus Newhall area, is projected to have less than 10 years of permitted aggregate reserves remaining as of January 1, 2017.

Seven of the aggregate study areas in Table 1 have between 11 and 20 years of permitted aggregate reserves remaining, ten have between 21 and 30 years of permitted aggregate reserves remaining, four have 31 to 40 years remaining, two have 41 to 50 years, and five have more than 50 years of permitted reserves remaining.

These numbers are estimates and the actual lifespan of existing permitted reserves in a study area can be influenced by many factors. In periods of high economic growth, demand may increase, shortening the life of permitted reserves. Large projects, such as the construction or maintenance of major infrastructure, or rebuilding after a disaster such as an earthquake could also deplete permitted reserves more rapidly. Increased demand from neighboring regions with dwindling or depleted permitted reserves may also accelerate the depletion of permitted reserves in a study area. Conversely, a slow economy may reduce demand for a period of time, extending the life of permitted reserves, or new or expanded permits may be granted in a study area, increasing the permitted reserves and the lifespan of permitted reserves in that area.

Non-Permitted Aggregate Resources

Non-permitted aggregate resources are deposits that may meet specifications for construction aggregate, are recoverable with existing technology, have no land use overlying them that is incompatible with mining, and currently are not permitted for mining. While not shown on Map Sheet 52, non-permitted aggregate resources are identified and discussed in each of the mineral land classification reports used to compile the map (See Appendix).

There are approximately 74 billion tons of non-permitted construction aggregate resources in the aggregate study areas shown on Map Sheet 52. While this number seems large, it is unlikely that all of these resources will ever be mined because of social, environmental, or economic factors. The location of aggregate resources too close to urban or environmentally sensitive areas can limit or prevent their development. Resources may also be located too far from a potential market to be economic. Despite such possible constraints, non-permitted aggregate resources are the most likely future sources of construction aggregate potentially available to meet California's continuing demand. Factors used to calculate non-permitted resource amounts and to determine the aerial extent of these resources, are given in each of the mineral land classification reports listed in the Appendix.

Aggregate Production Areas and Districts

Aggregate production areas are shown on Map Sheet 52 by five different sizes of triangle. A triangle may represent one or more active aggregate mines. The relative size of each symbol corresponds to the amount of yearly production for each mine or group of mines. Yearly production was based on data from the Department of Conservation's Division of Mine Reclamation (DMR) records for the calendar year 2016.

The smallest triangle represents an area that produced less than 0.5 million tons of aggregate in 2016. These triangles often represent a single mine operation and many are in rural parts of the state. The largest triangle represents aggregate mining districts

with production of more than 5 million tons in 2016. Only two aggregate production districts fall into this category – the Temescal Valley District in western Riverside County and the San Gabriel Valley District in Los Angeles County.

PART II: COMPARISONS BETWEEN THE PRIOR (2012) AND THE UPDATED (2018) MAP SHEET 52

The prior version of Map Sheet 52 was published in 2012. Permitted aggregate resource data for that map were current as of January 1, 2011. Work conducted for that study took place during 2011/2012. The latest aggregate production and location data available for the prior map were from 2010 records. The aggregate demand projections for the prior map were based on California Department of Finance (DOF) county population projections from the 2010 U.S. census. Fifty-year aggregate demand from January 1, 2011 through the year 2060 was determined for the included study areas.

This updated Map Sheet 52 was completed and published in 2018. Permitted aggregate resource data for the updated map is current as of January 1, 2017. All work conducted for the updated study took place during 2017/2018. The latest aggregate production and location data available for the updated map are from 2016 records. The aggregate demand projections for the updated map were based on DOF county population estimates and projections for 2010 to 2060 (DOF, 2018). Fifty-year aggregate demand from January 1, 2017 through the year 2066 was determined for the included study areas.

Changes have occurred in both aggregate supplies (permitted aggregate reserves) and in 50-year aggregate demand since Map Sheet 52 (2012) was completed. Changes in permitted aggregate reserves are shown in Table 2. Changes in 50-year demand are shown in Table 3.

Aggregate Study Area Changes

Six aggregate study areas on the original (2002) Map Sheet 52 were modified for the 2006 map, resulting in three fewer study areas. They included the Southern California P-C regions of Orange County, Temescal Valley, San Fernando Valley, Saugus-Newhall, Western Ventura County, and Simi Valley. These regions were combined into three regions when they began to run out of permitted reserves and became dependent on aggregate sources from neighboring regions. The importation of aggregate from neighboring regions typically results in longer haul distances, higher costs, and increased carbon dioxide emissions, air pollution, traffic congestion, and highway maintenance. The shift in supply area also results in more rapid depletion of permitted reserves in neighboring regions.

In the 2006 and 2012 versions of Map Sheet 52, information for eastern and western Merced County and northern and southern Tulare county were reported. This was because separate market regions existed in those study areas. While those separate market regions may still exist, in this update, information is reported for Merced and Tulare counties and not for the eastern and western or northern and southern areas, respectively.

Table 2. Comparison of Permitted Aggregate Reserves Between Map Sheet 52, 2012 and Map Sheet 52, 2018.

AGGREGATE STUDY AREA	Map Sheet 52, 2012 Permitted Aggregate Reserves as of 1/1/11 (million tons)	Map Sheet 52, 2018 Permitted Aggregate Reserves as of 1/1/17 (million tons)	Percent Difference

Yuba City-Marysville P-C Region	403	344	-15
Total	12,047	11,045	-8

* Two P-C Regions have been combined into one study area.
** In Map Sheet 52 (2012) separate values for east and west Merced County and north and south Tulare County were presented. In this update, information is given only for the counties as a whole and not the parts.

No additional study areas have been combined in this update. It is likely that in some future update the San Fernando Valley-Saugus Newhall aggregate study area and the Palmdale study area may be combined as permitted reserves in the San Fernando Valley-Saugus Newhall aggregate study area are depleted. In addition, a study of the Greater Sacramento Area currently nearing completion will likely result in the combination of several previously existing study areas.

Changes in Permitted Aggregate Reserves

Fifteen of the study areas shown on the updated map experienced a decrease in permitted aggregate reserves since the 2012 map was completed (See Table 2). Most of these decreases likely represent aggregate production within those study areas since the last update of Map Sheet 52.

A large part of the reduction in the San Fernando Valley-Saugus Newhall study area is due to the subtraction of the 56 million tons of permitted aggregate reserves previously associated with the CEMEX Soledad Canyon Sand and Gravel Mining Project. In 2015, the Bureau of Land Management withdrew the contracts that would have allowed mining. The issue is currently under appeal with the Interior Board of Land Appeals. If, at a future date, the contracts are restored then the permitted reserves will be restored.

Twelve of the study areas shown on the updated map had increases in permitted aggregate reserves. Most of these increases are because of newly permitted or expanded mining operations within the various study areas. An expansion may increase the footprint of the mine or increase permitted mining depth. Some of these increases may be the result of recalculation of the permitted aggregate reserves in a study area.

Total permitted reserves for all the included study areas increased to 7,628 million tons from 4,067 million tons – an apparent increase of 3,561 million tons. The actual increase was likely slightly more because of production since 2010. Approximately two-thirds of the increase is due to permitting activities in the Bakersfield, Fresno, and Sacramento study areas.

Changes in Fifty-Year Demand

Of the study areas shown on the updated Map Sheet 52, five had increases in 50-year demand, two had less than a one percent change, and 20 showed decreases in projected 50-year demand (See Table 3). The large number of study areas with decreasing 50-year demand is likely due in part to incorporation of lower per capita consumption rates caused by the slow recovery of the construction industry in California in the years following the economic recession of 2007-2009.

Comparison of Areas with Less than 10-Years of Permitted Aggregate Reserves

The 2018 Map Sheet 52 shows only one aggregate study area with less than a 10-year supply of permitted aggregate reserves – San Fernando Valley-Saugus Newhall.

Compared to the 2012 version of the map, which showed four aggregate study areas with less than a 10-year supply of aggregate – Sacramento County and the Fresno, San Fernando Valley-Saugus Newhall, and Western San Diego P-C regions.

PART III: OVERVIEW OF CONSTRUCTION AGGREGATE

Construction aggregate was the leading non-fuel mineral commodity produced in California in 2016. Valued at $1.42 billion, aggregate made up about 42 percent of California's $3.4 billion non-fuel mineral production in 2016.

Aggregate Quality and Use

Aggregate normally makes up 80 to 100 percent of the material volume in PCC and AC and provides the bulk and strength to these materials. Rarely, even from the highest-grade deposits, is in-place aggregate physically or chemically suited for every type of aggregate use. Every potential deposit must be tested to determine how much of the material can meet specifications for a particular use, and what processing is required. Specifications for PCC, AC, and various other uses of aggregate have been established by several agencies, such as the U.S. Bureau of Reclamation, the U.S. Army Corps of Engineers, and the California Department of Transportation to ensure that aggregate is satisfactory for specific uses. These agencies and other major consumers test aggregate using standard procedures of the American Society for Testing Materials (ASTM), the American Association of State Highway Officials, and other organizations.

Most PCC and AC aggregate specifications have been established to ensure the manufacture of strong, durable structures capable of withstanding the physical and chemical effects of weathering and use. For example, specifications for PCC and concrete products prohibit or limit the use of rock materials containing mineral substances such as gypsum, pyrite, zeolite, opal, chalcedony, chert, siliceous shale, volcanic glass, and some high-silica volcanic rocks. Gypsum retards the setting time of portland cement; pyrite dissociates to yield sulfuric acid and an iron oxide stain; and other substances contain silica in a form that reacts with alkali substances in the cement, resulting in cracks and "pop-outs."

Specifications also call for precise particle-size distribution for the various uses of aggregate that is commonly classified into two general sizes: coarse and fine. Coarse aggregate is rock retained on a 3/8-inch or a #4 U.S. sieve. Fine aggregate passes a 3/8-inch sieve and is retained on a #200 U.S. sieve (a sieve with 200 weaves per inch). For some uses, such as asphalt paving, particle shape is specified. Aggregate material used with bituminous binder (asphalt) to form sealing coats on road surfaces shall consist of at least 90 percent by weight of crushed particles. Crushed stone is preferable to natural gravel in AC because asphalt adheres better to broken surfaces than to rounded surfaces and the interlocking of angular particles strengthens the AC and road base.

The material specifications for PCC and AC aggregate are more restrictive than specifications for other applications such as Class II base, subbase, and fill. These restrictive specifications make deposits acceptable for use as PCC or AC aggregate the scarcest and most valuable aggregate resources. Aggregate produced from such deposits can be, and commonly is, used in applications other than concrete. PCC- and AC-grade aggregate deposits are of major importance when planning for future

availability of aggregate commodities because of their versatility, value, and relative scarcity.

Factors Affecting Aggregate Deposit Quality

The major factors that affect the quality of construction aggregate are the rock type and the degree of weathering of the deposit. Rock type determines the hardness, durability, and potential chemical reactivity of the rock when mixed with cement to make concrete. In alluvial sand and gravel deposits, rock type is variable and reflects the rocks present in the drainage basin of the stream or river. In crushed stone deposits, rock type is typically less variable, although in some types of deposits, such as sandstones or volcanic rocks, there may be significant variability of rock type. Rock type may also influence aggregate shape. For example, some metamorphic rocks such as slates tend to break into thin platy fragments that are unsuitable for many aggregate uses, while many volcanic and granitic rocks break into blocky fragments more suited to a wide variety of aggregate uses. Deposit type also affects aggregate shape. For example, in alluvial sand and gravel deposits, the natural abrasive action of the stream rounds the edges of rock particles, in contrast to the sharp edges of particles from crushed stone deposits.

Weathering is the in-place physical or chemical decay of rock materials at or near the Earth's surface. Weathering commonly decreases the physical strength of the rock and may make the material unsuitable for high strength and durability uses. Weathering may also alter the chemical composition of the aggregate, making it less suitable for some aggregate uses. If weathering is severe enough, the material may not be suitable for use as PCC or AC aggregate. Typically, the older a deposit is, the more likely it has been subjected to weathering. The severity of weathering commonly increases with increasing age of the deposit.

Comparison of Alluvial Sand and Gravel to Crushed Stone Aggregate

The preferred use of one aggregate material over another in construction practices depends not only on specification standards, but also on economic considerations. Alluvial gravel is typically preferred to crushed stone for PCC aggregate because the rounded particles of alluvial sand and gravel result in a wet mix that is easier to work than a mix made of angular fragments. Also, crushed stone is less desirable in applications where the concrete is placed by pumping because sharp edges will increase wear and damage to the pumping equipment. The workability of a mix consisting of portland cement with crushed stone aggregate can be improved by adding more sand and water, but more cement must then be added to the mix to meet concrete durability standards. This results in a more expensive concrete mix and a higher cost to the consumer.

In addition, aggregate from a crushed stone deposit is typically more expensive than that from an alluvial deposit due to the additional costs associated with the ripping, drilling and blasting necessary to remove material from most quarries and the additional crushing required to produce the various sizes of aggregate. Manufacturing sand by crushing is costlier than mining and processing naturally occurring sand. Although more care is required in pouring and placing a wet mix containing crushed stone, PCC made with this aggregate is as satisfactory as that made with alluvial sand and gravel of comparable

rock quality. Owing to environmental concerns and regulatory constraints in many areas of the state, it is likely that extraction of sand and gravel resources from instream and floodplain areas will become less common in the future. If this trend continues, crushed stone may become increasingly important to the California market.

Aggregate Price

The price of aggregate throughout California varies considerably depending on location, quality, and supply and demand. The highest quality aggregate, and typically most costly, is that which meets the specifications for use in PCC or AC. All prices discussed in this section are for PCC/AC-grade aggregate at the plant site or FOB (freight on board). Transportation cost, which adds to the final cost of aggregate, is discussed in the next section.

Regional variations make it difficult to estimate the average price of PCC-grade aggregate for the state. Over the last decade, prices have varied from more than $20 per ton in areas with depleting or depleted aggregate supplies and high demands such as San Diego and parts of the Bay Area, to $9 to $12 per ton in areas such as Yuba City-Marysville with abundant aggregate supplies and low to moderate demands. In many areas of the state it is likely that prices fall between these two endmembers.

Transportation and Increasing Haul Distances

Transportation plays a major role in the cost of aggregate to the consumer. Aggregate is a low-unit-value, high-bulk-weight commodity, and it must be obtained from nearby sources to minimize both the dollar cost to the aggregate consumer and other environmental and economic costs associated with transportation. If nearby sources do not exist, then transportation costs may significantly increase the cost of the aggregate by the time it reaches the consumer.

This makes the mining of aggregate much more competitive than most other mined commodities. The location, distance to market, and access to major transportation routes greatly influence the economic feasibility of an aggregate mine.

Most aggregate in California moves to its final point of use by truck. Trucking is typically charged at an hourly rate and rates may vary in different regions of the state. The typical distance traveled per hour may also vary, being greater in less congested or more rural areas, and less in densely populated urban areas. Other factors that affect hauling rates include fuel costs, toll bridges and toll roads, road conditions, and terrain. Transportation cost is the principal constraint defining the market area for an aggregate mining operation and the cost of transporting aggregate over long distances can equal or exceed the base cost of the aggregate.

Throughout California, aggregate haul distances have gradually increased as more local sources of aggregate diminish. Consequently, older P-C regions, most of which were established in the late 1970s, have changed considerably since their boundaries were drawn. This is especially evident in Los Angeles, Orange, and Ventura counties where aggregate shortages have led to the merging of six P-C regions shown on the original

(2002) map into three regions for the updated maps. In some parts of the state, one-way haul distances that were 20-30 miles decades ago are now sometimes 100 miles or more. Increased aggregate haul distances not only increase the cost of aggregate to the consumer, but also increase environmental and societal impacts such as increased fuel consumption, carbon dioxide (CO_2) emissions, air pollution, traffic congestion, and road maintenance.

Imported Aggregate

In some regions, local aggregate production is sufficient to meet the local demand, but in others, there is more demand than can be met by local production leading to a shortfall that is typically met by importing construction aggregate from neighboring aggregate producing regions.

There are both advantages and disadvantages to importing construction aggregate. Imports can provide needed aggregate in areas with depleted reserves/resources and can supply specific types of aggregate that are in short supply in the region. However, imported aggregate is often more expensive because of additional transportation costs. Increased costs for aggregate leads to more expensive construction projects in both the public and private sectors. Importing aggregate from neighboring regions also leads to more rapid depletion of reserves/resources in those regions, potentially contributing to price increases or aggregate shortages in those regions.

In addition to the greater economic costs, there are often increased environmental and societal costs associated with the import of aggregate when compared to local production. The environmental impacts include higher emissions of greenhouse gases, such as CO_2, and air pollution. The societal impacts include increased traffic congestion and road wear and maintenance due to increased truck traffic. In the case of imports, these environmental and societal impacts occur both within the importing region and in the neighboring regions that supply the material and through which the material is transported.

Currently almost all aggregate produced or imported into California is transported to its final point of use by truck. In discussions of aggregate import, other modes of transportation such as rail, barge, or ship are often mentioned as alternative methods of moving aggregate. In 2011, the San Diego Association of Governments (SANDAG) Service Bureau published the San Diego Region Aggregate Supply Study (SANDAG Service Bureau, 2011). This study included an evaluation of fuel use and CO_2 emissions for several scenarios involving different transport options for importing aggregate into the San Diego area. While the published study is specific to the San Diego region, it provides an interesting analysis of the impacts of importing construction aggregate. The following discussion is adapted from Special Report 240 (Gius, Busch, and Miller, 2017).

The SANDAG study looked at the impacts based on various combinations of transport options for the following five scenarios:

- In region production
- Import by truck from neighboring regions
- Import by rail/truck from San Bernardino County
- Import by barge/truck from Baja California, Mexico
- Import by ship/truck from British Columbia, Canada.

Fuel consumption, CO_2 emissions, and some other pollutant emissions (nitrogen oxides (NO_x) and particulate matter (PM)) were estimated based on round-trip travel, with aggregate transported to the point of use and the vehicle returning empty. For scenarios involving non-truck transport (rail, barge, and ship), delivery to the final point of use by truck was included. The transport scenarios and transport type and mileage considerations are presented in Table 4. More detail can be found in the SANDAG study (SANDAG Service Bureau, 2011).

Table 4. Summary of SANDAG Aggregate Transport Scenarios

SANDAG AGGREGATE TRANSPORT SCENARIOS	
TRANSPORT OPTION	**MILEAGE BY MODE**
Local: Truck	26 miles one way / 52 miles round trip
Import: Truck	100 miles one way / 200 miles round trip
Import: Rail + Truck	Rail: 200 miles one way / 400 miles round trip Truck: 20 miles one way / 40 miles round trip
Import: Barge + Truck	Barge: 70 miles one way / 140 miles round trip Truck: 20 miles one way / 40 miles round trip
Import: Ship + Truck	Ship: 1,540 miles one way / 3,080 miles round trip Truck: 20 miles one way / 40 miles round trip

Adapted from SANDAG Service Bureau, 2011

Transportation methods that move larger amounts of aggregate per load can be more efficient in terms of fuel consumption (gallons of fuel consumed per net ton-mile traveled) and CO_2, NO_x, and PM emissions (grams of CO_2, NO_x, and PM emitted per net ton-mile traveled). However, even though these transport options may be more efficient on a net ton-mile basis, the total fuel consumption and emissions are dependent on the distance traveled. If those distances are large, total fuel consumption and emissions may exceed those of less efficient transportation methods over shorter distances. This is demonstrated by SANDAG's findings. Even though transport by rail, barge, and ship

have lower fuel consumption and CO_2 emissions per net ton-mile than transport by truck (Table 5), the total fuel usage and CO_2 emissions for those transport scenarios are greater than in-region production with truck delivery because of the distances involved (Table 6).

Table 5. Fuel Consumption and CO_2 Emissions from Aggregate Transport with Payload

Mode	Payload	Fuel Consumption (gallons/net ton per mile)	CO_2 Emissions (grams/net ton per mile)
Truck	25 tons	0.0086	86.9
Rail	100 tons per hopper car	0.0021	21.4
Barge	1,500 tons	0.0068	69.6
Ship	72,786 tons	0.0004	5.3

Adapted from Tables 4-2 and 4-4, SANDAG Service Bureau, 2011

Table 6. Fuel Consumption and Emissions for Aggregate Transport Scenarios – Estimates per Million Tons of Aggregate Transported

Transport Option	Total Fuel Consumption (gallons)	Total CO_2 Emissions (metric tons)	Total NO_x Emissions (metric tons)	Total PM Emissions (metric tons)
Local: Truck	296,000	3,000	26.5	1.1
Import: Truck	1,138,000	11,537	102	4.4
Import: Rail + Truck	788,000	7,985	120.4	3.3
Import: Barge + Truck	804,000	8,210	147.1	5.1
Import: Ship + Truck	1,406,000	16,703	282.2	16.3

Adapted from SANDAG Service Bureau, 2011

Table 6 shows that, per million tons of aggregate transported, local production with transport by truck consumes less fuel and produces less CO_2, NOx, and PM than the other transport options investigated by SANDAG. Transport Option 2, import of one million tons of aggregate by truck from neighboring regions, consumes almost four times as much fuel and produces almost four times the emissions as the local production and delivery of a similar amount of aggregate. In addition, the impacts occur not only in the Western San Diego County P-C Region, but in neighboring regions through which the materials are transported.

While this analysis pertains to San Diego County, similar analyses, with appropriate parameters, could be done for other regions. What it does point out is that, even though some methods of transportation may be more efficient on a per ton-mile basis, if the transport distances are great enough, the overall impacts may be greater than those of local production.

Factors Affecting Aggregate Demand

Several factors may influence aggregate demand. In periods of high economic growth, demand may increase, depleting permitted reserves more rapidly than expected. Large projects, such as the construction or maintenance of major infrastructure, or rebuilding after a disaster such as an earthquake could also deplete permitted reserves more rapidly. Increased demand from neighboring regions with dwindling or depleted permitted reserves may also accelerate the depletion of permitted reserves in a study area. Conversely, a period of declining economy or of low economic growth, such as that during the recession of 2007 to 2009 and the subsequent slow economic recovery, can reduce demand for a period of time, extending the life of permitted reserves. In some cases, importation of aggregate from other areas may extend the life of a region's permitted reserves.

SUMMARY AND CONCLUSIONS

Aggregate is essential to the needs of modern society, providing material for the construction and maintenance of roadways, dams, canals, buildings, and other parts of California's infrastructure. Aggregate is also found in homes, schools, hospitals, and shopping centers.

In the 30-year period from 1987 to 2016, Californians consumed an average of about 180 million tons of construction aggregate (all grades) per year or about 5.3 tons per person per year. Demand for aggregate is expected to increase as the state's population continues to grow and infrastructure is maintained, improved, and expanded. For example, the Road Repair and Accountability Act of 2017 (SB1) will provide approximately 5 billion dollars annually for a variety of maintenance, rehabilitation, and other transportation related projects over the next decade. Because aggregate is a low unit-value, high-bulk-weight commodity, it must be obtained from nearby sources to minimize the dollar cost to the aggregate consumer and other environmental and economic costs associated with transportation.

Comparing regional needs to available reserves and resources demonstrates the important aggregate resource issues facing lead agencies in California. These issues include the need to plan carefully for the use of lands containing these resources and the need to consider the permitting of additional aggregate resources before currently permitted deposits are depleted.

Increasingly, as existing permitted aggregate supplies are depleted, local land-use decisions regarding aggregate resources are having regional impacts that go beyond local jurisdictional boundaries. Planning for future construction aggregate needs in our communities should take into consideration not only the needs of the community, but also the needs of the region and neighboring regions. Importing aggregate from neighboring regions leads to more rapid depletion of reserves/resources in those regions, potentially contributing to price increases or aggregate shortages in those regions.

In addition to the greater economic costs, there are often increased environmental and societal costs associated with the import of aggregate when compared to local production. The environmental impacts include higher emissions of greenhouse gases, such as CO_2, and air pollution. The societal impacts include increased traffic congestion and road maintenance due to increased truck traffic. In the case of imports, these environmental and societal impacts occur both within the importing region and in the neighboring regions that supply the material and through which the material is transported. Finally, reliance on imports places responsibility and authority for permitting related to the local aggregate supply in the hands of decision makers in other jurisdictions.

For more than 40 years, under SMARA, CGS has conducted on-going studies that identify and evaluate aggregate resources throughout the state. Map Sheet 52 (2018) is an updated summary of supply and demand data from these studies. The map presents a statewide overview of projected future aggregate needs and currently permitted reserves.

The following conclusions can be drawn from Map Sheet 52 (2018) and this accompanying report:

- In the next 50 years, the study areas identified on Map Sheet 52 (2018) will need approximately 11 billion tons of aggregate.

- The study areas shown on Map Sheet 52 currently have about 7.6 billion tons of permitted reserves, which is about 69 percent of the total projected 50-year aggregate demand identified for these study areas. This is about 10 percent of the total aggregate resources located within the study areas.

- One aggregate study area is projected to have 10 or fewer years of permitted aggregate reserves remaining as of January 2017 (San Fernando Valley / Saugus Newhall area).

- Seven aggregate study areas have between 11 and 20 years of aggregate reserves remaining.

- Ten aggregate study areas have between 21 and 30 years of aggregate reserves remaining.

- Four aggregate study areas have between 31 and 40 years of aggregate reserves remaining.

- Two aggregate study areas have between 41 and 50 years of aggregate reserves remaining.

- Five aggregate study areas (Bakersfield, Fresno, and Yuba City-Marysville P-C regions, and Nevada and Placer counties) have more than 50 years of aggregate reserves remaining.

The information presented on Map Sheet 52 (2018) and in the referenced reports is provided to assist land use planners and decision makers in identifying those areas containing construction aggregate resources, and to estimate potential future demand for these resources in different regions of the state. This information is intended to help planners and decision makers balance the need for construction aggregate with the many other competing land use issues in their jurisdictions, and to provide for adequate supplies of construction aggregate to meet future needs.

APPENDIX: MINERAL LAND CLASSIFICATION REPORTS BY THE CALIFORNIA GEOLOGICAL SURVEY (Special Reports and Open-File Reports, with information on aggregate resources)

SPECIAL REPORTS

SR 132: Mineral Land Classification: Portland Cement Concrete-Grade Aggregate in the Yuba City-Marysville Production-Consumption Region. By Habel, R.S., and Campion, L.F., 1986.

*SR 143: Part I: Mineral Land Classification of the Greater Los Angeles Area: Description of the Mineral Land Classification Project of the Greater Los Angeles Area. By Anderson T. P., Loyd, R.C., Clark, W.B., Miller, R.M., Corbaley, R., Kohler, S.L., and Bushnell, M.M., 1979.

*SR 143: Part II: Mineral Land Classification of the Greater Los Angeles Area: Classification of Sand and Gravel Resource Areas, San Fernando Valley Production-Consumption Region. By Anderson T.P., Loyd, R.C., Clark, W.B., Miller, R.M., Corbaley, R., Kohler, S.L., and Bushnell, M.M., 1979.

*SR 143: Part III: Mineral Land Classification of the Greater Los Angeles Area: Classification of Sand and Gravel Resource Areas, Orange County-Temescal Valley Production-Consumption Region. By Miller, R.V., and Corbaley, R., 1981.

*SR 143: Part IV: Mineral Land Classification of the Greater Los Angeles Area: Classification of Sand and Gravel Resource Areas, San Gabriel Valley Production-Consumption Region. By Kohler, S.L., 1982.

*SR 143: Part V: Mineral Land Classification of the Greater Los Angeles Area: Classification of Sand and Gravel Resource Areas, Saugus-Newhall Production-Consumption Region and Palmdale Production-Consumption Region. By Joseph, S.E, Miller, R.V., Tan, S.S., and Goodman, R.W., 1987.

*SR 143: Part VI: Mineral Land Classification of the Greater Los Angeles Area: Classification of Sand and Gravel Resource Areas, Claremont-Upland Production-Consumption Region. By Cole, J.W., 1987.

*SR 143: Part VII: Mineral Land Classification of the Greater Los Angeles Area: Classification of Sand and Gravel Resource Areas, San Bernardino Production-Consumption Region. By Miller, R.V., 1987.

*SR 145: Part I: Mineral Land Classification of Ventura County: Description of the Mineral Land Classification Project of Ventura County. By Anderson, T.P., Loyd, R.C., Kiessling, E.W., Kohler, S.L., and Miller, R.V., 1981.

*SR 145: Part II: Mineral Land Classification of Ventura County: Classification of the Sand, Gravel, and Crushed Rock Resource Areas, Simi Production-Consumption Region. By Anderson, T.P., Loyd, R.C., Kiessling, E.W., Kohler, S.L., and Miller, R.V., 1981.

*SR 145: Part III: Mineral Land Classification of Ventura County: Classification of the Sand and Gravel, and Crushed Rock Resource Areas, Western Ventura County Production-Consumption Region. By Anderson, T.P., Loyd, R.C., Kiessling, E.W., Kohler, S.L., and Miller, R. V., 1981.

*SR 146: Part I: Mineral Land Classification: Project Description: Mineral Land Classification for Construction Aggregate in the San Francisco-Monterey Bay Area. By Stinson, M.C., Manson, M.W., and Plappert, J.J., 1987.

*SR 146: Part II: Mineral Land Classification: Aggregate Materials in the South San Francisco Bay Production-Consumption Region. By Stinson, M.C., Manson, M.W., and Plappert, J.J., 1987.

*SR 146: Part III: Mineral Land Classification: Aggregate Materials in the North San Francisco Bay Production-Consumption Region. By Stinson, M.C., Manson, M.W., and Plappert, J.J., 1987.

*SR 146: Part IV: Mineral Land Classification: Aggregate Materials in the Monterey Bay Production-Consumption Region. By Stinson, M.C., Manson, M.W., and Plappert, J.J., 1987.

*SR 147: Mineral Land Classification: Aggregate Materials in the Bakersfield Production-Consumption Region. By Cole, J.W., 1988.

*SR 153: Mineral Land Classification: Aggregate Materials in the Western San Diego County Production-Consumption Region. By Kohler, S.L., and Miller, R.V., 1982.

SR 156: Mineral Land Classification: Portland Cement Concrete-Grade Aggregate in the Sacramento-Fairfield Production-Consumption Region. By Dupras, D.L., 1988.

*SR 158: Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region. By Cole, J.W., and Fuller, D.R., 1986.

*SR 159: Mineral Land Classification: Aggregate Materials in the Palm Springs Production-Consumption Region. By Miller, R.V., 1987.

*SR 160: Mineral Land Classification: Portland Cement Concrete-Grade Aggregate in the Stockton-Lodi Production-Consumption Region. By Jensen, L.S., and Silva, M.A., 1989.

*SR 162: Mineral Land Classification: Portland Cement Concrete Aggregate and Active Mines of All Other Mineral Commodities in the San Luis Obispo-Santa Barbara Production-Consumption Region. By Miller, R.V., Cole, J.W., and Clinkenbeard, J.P., 1989.

SR 164: Mineral Land Classification of Nevada County, California. By Loyd, R.C., and Clinkenbeard, J.P., 1990.

*SR 165: Mineral Land Classification of the Temescal Valley Area, Riverside County, California. By Miller, R.V., Shumway, D.O., and Hill, R.L., 1991.

SR 173: Mineral Land Classification of Stanislaus County, California. By Higgins, C.T., and Dupras, D.L., 1993.

SR 198: Update of Mineral Land Classification for Portland Cement Concrete-Grade Aggregate in the Palm Springs Production-Consumption Region, Riverside County, California. Busch, L.L., 2007.

SR 199: Update of Mineral Land Classification for Portland Cement Concrete-Grade Aggregate in the Stockton-Lodi Production-Consumption Region, San Joaquin and Stanislaus Counties, California. Smith, J.D. and Clinkenbeard J.P., 2012.

SR202 Update of Mineral Land Classification for Portland Cement Concrete-Grade Aggregate in the Claremont-Upland Production-Consumption Region, Los Angeles and San Bernardino Counties, California. Miller, R.V. and Busch, L.L., 2007.

SR 205 Update of Mineral Land Classification of Aggregate Resources in the North San Francisco Bay P-C Region: Sonoma, Napa, and Marin Counties and Southwestern Solano County, California. Miller, R.V. and Busch, L.L., 2013

SR 206 Update of Mineral Land Classification for Portland Cement Concrete-Grade Aggregate in the San Bernardino Production-Consumption Region, San Bernardino and Riverside Counties, California. Miller, R.V. and Busch, L.L., 2008.

SR 209 Update of Mineral Land Classification for Portland Cement Concrete-Grade Aggregate in the San Gabriel Valley Production-Consumption Region, Los Angeles County, California. Kohler, S.L., 2010.

SR 210 Update of Mineral Land Classification: Aggregate Materials in the Bakersfield Production-Consumption Region, Kern County, California. Busch, L.L., 2009.

SR 215 Update of Mineral Land Classification: Aggregate Materials in the San Luis Obispo-Santa Barbara Production-Consumption Region, California. Busch, L.L. and Miller, R.V., 2011.

SR 231 Update of Mineral Land Classification for Portland Cement Concrete-Grade Aggregate in the Temescal Valley Production Area, Riverside County, California. Miller, R.V. and Busch, L.L., 2014.

SR 240 Update of Mineral Land Classification: Portland Cement Concrete-Grade Aggregate in the Western San Diego County Production-Consumption Region, California. Gius, F.W., Busch, L.L., and Miller, R.V. 2017.

State of California
DEPARTMENT OF TRANSPORTATION

Business, Transportation and Housing Agency

Memorandum

Flex your power!
Be energy efficient!

To: DISTRICT DIRECTORS

Date: November 18, 2011

From: MALCOLM DOUGHERTY
Acting Director

Subject: **Aggregate Resource Policy Statement and Tools**

This memo is in response to multiple requests from resource developers, planning departments, and California Department of Transportation (Caltrans) staff about our policy toward mining projects. It clarifies the policy and provides tools for districts to encourage an increased supply of aggregate materials statewide.

Our policy is that Caltrans will continue to work with local and State agencies to help gain approval of new aggregate mining sites throughout the state, acknowledging the need for an increased aggregate supply. As a responsible agency under the California Environmental Quality Act, however, we do not endorse specific mining projects. In light of this, Caltrans will provide the technical assessment and information pertaining to availability locally as well as infrastructure needs of aggregate projects in your region, including education of local stakeholders and early public engagement regarding long-term aggregate issues.

The following tools are attached to aid you in this regard:

- A sample letter that can be addressed to our local and regional transportation planning partners. This letter outlines our policy toward mineral resource development in general.
- The 2011 update of the Construction Aggregate Supply Limitations Fact Sheet.
- The 2006 Department of Conservation Map Sheet 52, which shows the permitted aggregate materials supply in relation to projected demand over 50 years.

The above tools were developed in support of an ongoing consortium known as the Aggregate Availability Group. This group, as per its 2009 charter, includes management and staff-level representatives from the Caltrans Divisions of Planning, Design, and Construction, the California Business, Transportation and Housing Agency, the California Department of Conservation, the California Construction and Industrial Materials Association, and the Governor's Office of Planning and Research. One of the main goals of this effort has been to produce maps and other tools to engage the public, legislators, and local jurisdictions. These staff will apprise you of new materials as they become available.

Please take the time to review the attached tools. This issue is as important as ever, and it is my hope that ongoing collaboration will help us secure the resources that we need to provide world-class transportation options for years to come.

Dear<RECIPIENT>:

As you are aware, aggregate resources play a vital role in our efforts to build and improve our State's infrastructure. Indeed, our State's mineral resource development is essential to our economic well-being, as well as our intentions to grow more responsibly and provide the safest, fastest, and most efficient transportation options possible. While it is important that we find ways to meet our current needs for construction materials, we must also anticipate future demand and expand our aggregate supply in an environmentally appropriate and culturally circumspect manner. In doing so, we prepare our future generations to navigate the challenges that our State will face as population increases and accessible resources grow scarce.

Throughout the State, attention is being given to what is increasingly seen as an urgent resource issue. The recently enrolled Assembly Bill 566 (Galgiani, 2011) codified several legislative findings, among them that mineral extraction is essential to the needs of society, and that the development of local mineral resources is vital in reducing truck emissions in our State.

The California Department of Transportation (Caltrans) continues to coordinate with public decision-makers, the construction industry, and government officials in exploring opportunities to improve the reclamation and permitting processes and increase California's aggregate supply. While the pressure for resources has eased for the last three years due to a sharp decline in residential construction, the transportation sector continues to build projects and the housing market is showing signs of regaining strength. This is not a time to relax our efforts, but to redouble them in anticipation of full economic recovery.

In the last five years, Caltrans has delivered approximately 1,700 highway projects worth $19 billion that were moved into construction. There are currently 825 construction contracts underway with a contract value that exceeds $10 billion. Highway projects are only one part of the story, however, as local and regional agencies continue to maintain and improve the roads in their jurisdictions.

In addition to the outlay of the traditional transportation agencies, the California High Speed Rail Authority expects to break ground on the first 179 mile stretch of its high-speed railway in fall 2012. This section, from Merced to Bakersfield, will require over five million tons of sand, gravel, and crushed stone, which is about four percent of the total production that the State saw in 2009.

With the passage of SB 391 (Liu, 2009) and SB 375 (Steinberg, 2008), Caltrans and local

transportation agencies were challenged to conceive of new ways to reduce greenhouse gas (GHG) emissions while providing world class transportation facilities for our constituents. The statewide modal plans and Regional Transportation Plans, which shape California's transportation future, outline extensive improvements to the current system. Yet, between long truck hauls averaging 50 miles and international importing of materials, the GHG impact of aggregate delivery continues to mount. An increased aggregate reserve that is closer to construction sites is key to addressing our dire air quality and climate change concerns.

While we are continuing to work with local and State agencies to help gain approval of new aggregate mining sites throughout the state, there is still much to be done to ensure that these essential resources will be available for development in the far reaches of our long-range plans. I would like to encourage you to explore new strategies to increase aggregate reserves in your region, including education of local stakeholders, early public engagement, and willingness to collaborate in the mitigation of environmental and transportation system impacts from aggregate production and distribution.

The attached Fact Sheet provides information on the potential economic, social, air quality, and environmental factors that are affected by local aggregate supply. This is a good starting point for collaborative discussions that aim to find solutions to issues regarding aggregate availability. Also attached is a map that shows statewide aggregate supply and demand.

Finally, I would like to invite you to contact <CALTRANS DISTRICT REPRESENTATIVES> (http://www.dot.ca.gov/localoffice.htm), who are available upon request to speak at public meetings in your area regarding the importance of increasing California's aggregate supply in an environmentally sustainable manner. While the permitting of new mining facilities must be done with attention to all of the possible impacts to surrounding areas, Caltrans encourages the development of new sources for construction aggregate. Our economy and our environment depend on it.

Please share this information with your planning commissions, city councils, and county boards of supervisors.

Thank you in advance for helping to improve mobility across California.

Sincerely,

<Signature Block Name>
District Director

Construction Aggregate Supply Limitations
Some Estimates of Economic Impact–November 2011

- Aggregates are low-value, heavy-weight building materials used in construction, including sand, gravel, crushed stone, and recycled concrete. Aggregates are mined and either used as raw material (for example, as foundations) or serve as composite materials in the production of concrete and asphalt. The main end markets for aggregates include private residential construction (34 percent), commercial construction (17 percent), and public infrastructure projects (43 percent, including 26 percent for public highways, streets and transit).

- Aggregates are usually shipped from quarries or production sites close to their end market because transportation is a major element in the cost of delivered aggregates and the cost depends on the distance of the delivery. According to the industry, shipping costs for aggregates can outweigh production costs if the material is trucked more than 20 miles.[1] Permitting new aggregate sites would lead to shorter haul distance to minimize transport/shipping cost.

- According to the California Geological Survey (CGS), California has an estimated 74 billion tons of aggregate resources underlying mineral lands classified by the State Geologist. However, only about six to seven percent have actually been permitted by local agencies for mining activities. Permitting of mining sites is difficult and time consuming due to environmental, land development, and zoning laws, and could take between five and ten years. At the current rate of production, available aggregate supply in some areas in the State could be depleted in a decade.

- According to the California Department of Finance, housing construction activity in California more than doubled between 1996-2005, the longest sustained growth period in recent history; but experienced more than 80 percent decline during 2006-2009 (from 209 to 36 thousand units). Despite a 23 percent rebound in housing construction spending in 2010, overall construction industry in California remains depressed. This has contributed to a significant reduction in both production and value of construction aggregate in recent years.

- According to the CGS, California produced 133.5 million tons (valued at $1.4 billion) of construction sand, gravel, and crushed stone in 2009, compared to 237.3 million tons (valued at $1.9 billion) in 2006, an almost 44 percent drop since 2006. The transportation of 133.5 million tons of construction aggregates generates about 5.3 million truckloads (@ 25 tons per truck), or a total of 10.7 million truck trips a year (including empty trucks returning to the aggregate sites) related to the transportation of construction aggregates in the State.

- According to the Teichert Construction and West Coast Aggregates, Inc. the average hauling distance for aggregates in California may be as high as 50 miles. Truck transportation accounts for about 99 percent of shipping aggregates for 40 miles or less.[2] At an average 50-mile distance, the total aggregate-truck VMT would be 535 million miles per year (10.7 million trucks x 50 miles).

- Let us assume that permitting additional mining facilities would reduce the average hauling distance from 50 to 35 miles statewide. Using an average hauling distance of 35 miles, the total annual aggregate-truck miles of travel would be 375 million miles (10.7 million trucks x 35 miles). The 15-mile shorter hauling distance would reduce aggregate-truck miles of travel by 160 million miles per year (535-375), and annual diesel fuel consumption by 20 million gallons [using California Air Resources Board (CARB) diesel fuel consumption rate of 0.13 gallons per vehicle-mile at 55-60 mph speed].

---

[1] Therese Dunphy, "Evening the Playing Field," *Aggregates Manager*, August 2006.
[2] Tina Grady Barbaccia, "Off-highway Transportation," *Aggregates Manager*, July 2006.

- A recent University of California, Berkeley study[3] confirms that the most likely, and dominant, effect of the opening of new sites for the production of construction aggregates would be a reduction in truck miles of travel for hauling aggregates (i.e., new quarry will be located closer to the users to minimize transportation costs), thus a reduction in emissions from trucks.

- Based on the CARB emission factors estimates, and assuming an average 55-60 miles per hour speed, a reduction of 160 million miles of truck travel (or 20 million gallons of diesel fuel consumption) would reduce truck emissions (CO, NOx, PM10, SOx, VOC, and CO2) by about 22,436 tons a year.

- The total transportation cost of aggregates (at $0.10 per ton per mile) shipped 35-miles average distance throughout California would be $936 million (10.7 million trucks x 25 tons x 35 miles x $0.1), and over $1.3 billion if shipped an average distance of 50 miles. The statewide transportation cost savings of reduced hauling distance would amount to $376 million a year (or a 30 percent cost savings).

- The California Department of Transportation (Caltrans) estimates that on average, about $2.5 billion is spent on State and local capital outlay projects each year, and on average, aggregates account for 8-10 percent of total project costs, or about $250 million annually. A 30 percent increase/decrease in shipping cost of aggregates would increase/decrease the total annual project costs by $75 million per year.

- The reduction in aggregate-related truck miles of travel would also reduce traffic congestion and traffic accidents on roads, but these impacts would be difficult to estimate. An additional benefit from truck trip reduction would be reduced pavement deterioration. Caltrans expects to spend about $700 million annually on pavement rehabilitation projects. Assuming trucks account for 60 percent of the pavement damage on the State highways, and aggregate-trucks on average account for 5 percent of all heavy truck travel on the State highways, the trucks shipping aggregates would account for about $20 million of cost savings in the pavement rehabilitation each year.

- Project delays due to lack of aggregate supply in the area, would also result in project cost escalation and reduced user benefits (reduced travel time and accidents) that would have otherwise been generated. A delay of 10 percent of the projects (or $250 million in capital outlay expenditures) for one year would increase the cost of the State and local capital outlay program by $13 million a year (at 5 percent average cost escalation factor).

- Generalizing, and pro rating, the user benefits estimated for the 2008 Interregional Transportation Improvement Program projects, a delay of ten percent of the capital outlay program for one year could also cost California about $97 million in increased roadway congestion and traffic accidents.

In conclusion, the overall picture may indicate that the concerns over the limited supply of construction aggregates may have eased for now due to the severe housing decline and economic slowdown. However, over the long run, with the eventual housing and economic rebound, the supply-demand imbalance will continue for many areas. Meanwhile, for some specific localities and construction projects, the challenge of adequate and cost-effective supply of construction aggregates persists.

COOLER RECEIPT FORM

Client Name: Twining Inc.
Project Name:
AETL Job Number: 95517
Date Received: 12/14/18 Received by: sergey
Carrier: ☐ AETL Courier ☐ Client ☐ GSO ☑ FedEx ☐ UPS
☐ Others:

Samples were received in: ☐ Cooler ( ) ☑ Other (Specify): box
Inside temperature of shipping container No 1: 3.3, No 2: , No 3:
Type of sample containers: ☐ VOA, ☐ Glass bottles, ☐ Wide mouth jars, ☐ HDPE bottles, ☐ Metal sleeves, ☑ Others (Specify): baggy
How are samples preserved: ☐ None, ☑ Ice, ☐ Blue Ice, ☐ Dry Ice
✓ None, _ HNO_3, _ NaOH, _ ZnOAc, _ HCl, _ $Na_2S_2O_3$, _ MeOH
_ Other (Specify):

	Yes	No, explain below	Name, if client was notified.
1. Are the COCs Correct?	✓		
2. Are the Sample labels legible?	✓		
3. Do samples match the COC?	✓		
4. Are the required analyses clear?	✓		
5. Is there enough samples for required analysis?	✓		
6. Are samples sealed with evidence tape?		✓	
7. Are sample containers in good condition?	✓		
8. Are samples preserved?	✓		
9. Are samples preserved properly for the intended analysis?	✓		
10. Are the VOAs free of headspace?		✓	
11. Are the jars free of headspace?		✓	

Explain all "No" answers for above questions:

Subject: Re: Sample list

Here is their response

Hi Anthony,
Please reply as follows to the lab:
For As, Ni, Cr – perform EPA method 6010B
For Hex Cr – perform EPA 7196A
Also, please instruct the lab to hold the samples (after running the tests) until directed by CEMEX. This is in case we need them to re-run something after we get the results back. Thanks!

Subject: RE: Sample list

Hi Anthony,

Got your email & also in contact with Twining.

Question.

What method would you like us to perform?

For As, Ni, Cr – We can perform EPA method 6010B or 6020.

For Hex Cr – EPA method 7199 or 7196A.

Please advise.

Thank you.

Jim, AETL
818-845-8200

12/17/18

Test to perform:

HARD ROCK – QUARRY
ROC 1 Box 11 – Arsenic, Nickel, Total Chromium
ROC 1 Box 20 – Arsenic, Nickel, Total Chromium, Hex Chromium
ROC 4 Box 20 – Arsenic, Nickel, Total Chromium
ROC 5 Box 11 – Arsenic, Nickel, Total Chromium
ROC 6 Box 8 – Arsenic, Nickel, Total Chromium, Hex Chromium
ROC 7 Box 12 – Arsenic, Nickel, Total Chromium

DG – QUARRY
ROC 2 Box 2 – Arsenic, Nickel, Total Chromium, Hex Chromium
ROC 1 Box 3 – Arsenic, Nickel, Total Chromium
ROC 3 Box 3 – Arsenic, Nickel, Total Chromium
ROC 5 Box 3 – Arsenic, Nickel, Total Chromium, Hex Chromium
ROC 6 Box 3 – Arsenic, Nickel, Total Chromium
ROC 7 Box 3 – Arsenic, Nickel, Total Chromium

S&G PLANT
RKF18-1 30-35' – Arsenic, Nickel, Total Chromium
RKF18-5 25-30' – Arsenic, Nickel, Total Chromium, Hex Chromium
RKF18-12 60-65' – Arsenic, Nickel, Total Chromium
RKF18-14 85-90' – Arsenic, Nickel, Total Chromium
RKF18-21 65-70' – Arsenic, Nickel, Total Chromium
RKF18-22 25-40' – Arsenic, Nickel, Total Chromium, Hex Chromium

SILT PLANT
RKF18-13 9-19' – Arsenic, Nickel, Total Chromium
RKF18-15 11-21' – Arsenic, Nickel, Total Chromium, Hex Chromium
RKF18-18 25-35' – Arsenic, Nickel, Total Chromium
RKF18-20 32-42' – Arsenic, Nickel, Total Chromium
RKF18-21 22-32' – Arsenic, Nickel, Total Chromium, Hex Chromium
RKF18-22 13-23' – Arsenic, Nickel, Total Chromium

American Environmental Testing Lab, 12/14/18

The samples are through Yiwen Bu at Twining, we need to have Arsenic, Nickel and Chromium testing done on each product, 24 samples total. If you have any questions, please feel free to call.

Data Qualifiers and Descriptors

Data Qualifier:

#:	Recovery is not within acceptable control limits.
*:	In the QC section, sample results have been taken directly from the ICP reading. No preparation factor has been applied.
B:	Analyte was present in the Method Blank.
D:	Result is from a diluted analysis.
E:	Result is beyond calibration limits and is estimated.
H:	Analysis was performed over the allowed holding time due to circumstances which were beyond laboratory control.
J:	Analyte was detected . However, the analyte concentration is an estimated value, which is between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL).
M:	Matrix spike recovery is outside control limits due to matrix interference. Laboratory Control Sample recovery was acceptable.
MCL:	Maximum Contaminant Level
NS:	No Standard Available
S6:	Surrogate recovery is outside control limits due to matrix interference.
S8:	The analysis of the sample required a dilution such that the surrogate concentration was diluted below the method acceptance criteria.
X:	Results represent LCS and LCSD data.

Definition:

%Limi:	Percent acceptable limits.
%REC:	Percent recovery.
Con.L:	Acceptable Control Limits
Conce:	Added concentration to the sample.
LCS:	Laboratory Control Sample
MDL:	Method Detection Limit is a statistically derived number which is specific for each instrument, each method, and each compound. It indicates a distinctively detectable quantity with 99% probability.

Data Qualifiers and Descriptors

MS:	Matrix Spike
MS DU:	Matrix Spike Duplicate
ND:	Analyte was not detected in the sample at or above MDL.
PQL:	Practical Quantitation Limit or ML (Minimum Level as per RWQCB) is the minimum concentration that can be quantified with more than 99% confidence. Taking into account all aspects of the entire analytical instrumentation and practice.
Recov:	Recovered concentration in the sample.
RPD:	Relative Percent Difference

APPENDIX D WHAT CONSTITUTES AN ADVERSE HEALTH EFFECT OF AIR POLLUTION?

THIS PAGE IS INTENTIONALLY BLANK

American Thoracic Society

What Constitutes an Adverse Health Effect of Air Pollution?

THIS OFFICIAL STATEMENT OF THE AMERICAN THORACIC SOCIETY WAS ADOPTED BY THE ATS BOARD OF DIRECTORS, JULY 1999

PURPOSE OF THE STATEMENT

As the twentieth century ends, the health effects of outdoor air pollution remain a public health concern in developing and developed countries alike. In the United States, the principal pollutants monitored for regulatory purposes (carbon monoxide, nitrogen dioxide, sulfur dioxide, particles, ozone, and lead; see Table 1) show general trends of declining concentrations, although ozone pollution now affects many regions of the country besides southern California (1). Yet, even at levels of air pollution now measured in many cities of the United States, associations between air pollution levels and health indicators are being demonstrated at concentrations around those set by standards of the U.S. Environmental Protection Agency (2, 3). In many countries of the developing world, concentrations of air pollutants are rising with industrialization and the increasing numbers of motor vehicles (4, 5). Extremely large and densely populated urban areas, often referred to as "megacities," have the potential to generate unprecedented air quality problems.

There are common principles to air quality management throughout the world. Public health protection unifies all approaches, whether based on voluntary guidelines, mandated standards for concentrations, or source control. The intent is to limit or to avoid any impact of air pollution on the public's health. Air quality management is thus based on a scientific foundation built from the epidemiologic, toxicologic, and clinical evidence on health effects of air pollution. In interpreting this evidence for public health protection, there is a need to identify those effects that are considered "adverse" and to separate them from those effects not considered adverse.

The American Thoracic Society has previously provided guidance on the distinction between adverse and nonadverse health effects of air pollution in its 1985 statement, "Guidelines as to What Constitutes an Adverse Respiratory Health Effect" (6). Definitions of adverse effects have also been offered by the World Health Organization (7–10), but the guidance of the American Thoracic Society has received particular emphasis in the United States. Preparation of the original statement was intended to coincide with consideration of the passage of an amended Clean Air Act and to provide a framework for interpreting scientific evidence relevant to the mandate of the act. In particular, the Clean Air Act requires that the Administrator of the Environmental Protection Agency promulgate, for certain pollutants, standards that will be sufficient to protect against adverse effects of the air pollutants on health. The act is silent on the definition of "adverse effect" and, at the time of the 1985 statement, there was considerable controversy around the interpretation of this language as revision of the act was being considered. Recognizing the need of policy makers for expert guidance, the American Thoracic Society released the 1985 statement, which to date constitutes the sole set of recommendations on this issue from an expert panel convened by a health organization.

The American Thoracic Society has revised the 1985 statement because new scientific findings, published since the original statement, have again raised questions as to the boundary between adverse and nonadverse in considering health effects of air pollution. These new findings reflect improved sensitivity of research approaches and the application of biomarkers that can detect even subtle perturbations of biologic systems by air pollutants. Epidemiologic research designs have been refined and large sample sizes and increasingly accurate methods for exposure assessment have increased the sensitivity of epidemiologic data for detecting evidence of effects. New statistical approaches and advances in software and hardware have facilitated analyses of large databases of mortality and morbidity information. The design of clinical studies-including controlled exposures of volunteers-has also advanced and biologic specimens may be obtained after exposure, for example, by fiberoptic bronchoscopy, to identify changes in levels of markers of injury. Toxicologic studies have also gained in sophistication through incorporation of more sensitive indicators of effect and the careful tracing of the relationship between exposure and biologically relevant doses to target sites, which may now be considered at a molecular level.

New dimensions have been added to the array of outcome measures. Medical outcomes research now recognizes that patient well-being should be broadly conceptualized and measured rigorously, in addition to considering the biological process of the disease itself. As a result, health-related quality of life, the perception of well-being, is now considered a necessary component of outcomes research. Validated instruments have been developed to assess the impact of health-related symptoms and impairment on functional status and quality of life (11-14). The formalization of the concept of environmental justice acknowledges that the effects of specific pollutants cannot be evaluated in isolation without giving consideration to the overlapping exposures of populations, often minority group members of low socioeconomic status, who live in neighborhoods that are heavily exposed to multiple environmental contaminants (15).

This new statement, like the 1985 statement, is intended to provide guidance to policy makers and others who interpret the scientific evidence on the health effects of air pollution for the purpose of risk management. The statement does not offer strict rules or numerical criteria, but rather proposes principles to be used in weighing the evidence and setting boundaries between adverse and nonadverse health effects. Even if the technical tools were available for scaling the consequences of air pollution on the multiple relevant axes, the placement of dividing lines should be a societal judgment and consequently

* For detailed information on scientific bases and policy considerations underlying decisions establishing the NAAQS listed here, see the AQCDs, staff papers, and NAAQS Promulgation notices cited in text. Such information can also be obtained from several internet websites (e.g., http://www.epa.giv/airs/criteria.html; http://www.epa.gov/oar/oaqps/publicat.html; and http://www.epa.gov/ncea/biblio.htm).

TABLE 2

ADVERSE RESPIRATORY HEALTH EFFECTS

A. Increased mortality (*Increased* as used here and subsequently means significantly [$p < 0.05$] increased above that recorded in some standard, comparable population. In selected situation, $p < 0.1$ may be appropriate)
B. Increased incidence of cancer
C. Increased frequency of symptomatic asthmatic attacks
D. Increased incidence of lower respiratory tract infections
E. Increased exacerbations of disease in persons with chronic cardiopulmonary or other disease that could be reflected in a variety of ways
   1. Less able to cope with daily activities (i.e., shortness of breath or increased anginal episodes)
   2. Increased hospitalization, both frequency and duration
   3. Increased emergency ward or physician visits
   4. Increased pulmonary medication
   5. Decreased pulmonary function
F. Reduction in FEV_1 or FVC associated with clinical symptoms
   1. Chronic reduction in FEV, or FVC associated with clinical symptoms
   2. A significant increase in number of persons with FEV_1 below normal limits: chronically reduced FEV, is a 'predictor of increased risk of mortality. Transient or reversible reductions that are not associated with an asthmatic attack appear to be less important. It should be emphasized that a small but significant reduction in a population mean FEV, or $FEV_{.75}$ is probably medically significant, as such a difference may indicate an increase in the number of persons witn respiratory impairment in the population. In other words, a small part of the population may manifest a marked change that is medically significant to them, but when diluted with the rest of the population the change appears to be small
   3 An increased rate of decline in pulmonary function (FEV,) relative to the predicted value in adults with increasing age or failure of children to maintain their predicted FEV, growth curve. Such data must be standardized for sex, race, height, and other demographic and anthropometric factors
G. Increased prevalence of wheezing in the chest apart from colds, or of wheezing most days or nights. (The significance of wheezing with colds needs more study and evaluation.)
H. Increased prevalence or incidence of chest tightness
I. Increased prevalence or incidence of cough/phlegm production requiring medical attention
I. Increased incidence of acute upper respiratory infections that interfere with normal activity
K. Acute upper respiratory tract infections that do not interfere with normal activity
L. Eye, nose, and throat irritation that may interfere with normal activity (i.e., driving a car) if severe
M. Odors

this committee does not propose specific boundaries for separating adverse from nonadverse effects.

OVERVIEW OF THE 1985 STATEMENT

The 1985 statement of the American Thoracic Society was directed at respiratory health effects of air pollution and emphasized the interpretation of the epidemiologic evidence. The statement recognized the spectrum of responses to air pollution, which begins with exposure and evidence of exposure and ends at death. This spectrum has been characterized as a pyramid, based in the most common consequence-exposure-and having mortality, the least common and most severe consequence, at its tip. The statement included a table that lists adverse respiratory health effects, seemingly in order of declining severity (Table 2). The 1985 statement hinged the distinction between adverse and nonadverse effects on medical considerations. The committee recognized that the boundary is further influenced by societal considerations: "Where one draws the line to categorize it as an adverse health effect or an action level between pathophysiologic or physiologic change is probably best left to the individual or the community."

The committee's definition of adverse respiratory health effects was ". medically significant physiologic or pathologic changes generally evidenced by one or more of the following: (*1*) interference with the normal activity of the affected person or persons, (2) episodic respiratory illness, (3) incapacitating illness, (4) permanent respiratory injury, and/or (5) progressive respiratory dysfunction." The committee noted that all changes are not adverse, citing the example of carboxyhemoglobin. The level of carboxyhemoglobin, beyond that from endogenous production, is indicative of exposure but it is not predictive of adverse effects until reaching threshold levels, depending on the effect and the susceptibility of the exposed person. The statement recognized that a distinction should be drawn between effects to individuals and effects to populations and that populations are heterogeneous in their susceptibility. The comment was offered that a change in a population could be "medically significant" for that group. The statement also provides guidance on interpretation of'reversible effects and on interpreting irreversible effects. In acknowledging that research would continue to address uncertainties, the committee recommended that the guidelines should be periodically reviewed and updated.

METHODOLOGY FOR DEVELOPING THIS STATEMENT

Following the recommendation of the committee that authored the 1985 statement, the Environmental and Occupational Health Assembly of the American Thoracic Society recognized a need to reconvene a group to review and revise the prior statement. The statement had been used for more than a decade and new investigative approaches were being used to identify effects of air pollution that were not considered by the first committee. In addition, societal perspectives had shifted since the early 1980s and a forma1 concern for the impact of air

pollution on specific groups had been expressed through the environmental justice movement.

To revise the statement, a multidisciplinary committee was convened in 1997 that included expertise in pulmonary medicine, public health, epidemiology, both clinical and animal toxicology, biochemistry, and cellular and molecular biology. This committee conducted several planning meetings and consulted experts in environmental economics and in ethics. In addition, a multidisciplinary workshop was convened to gain input from the range of groups potentially interested in the statement and its application. The committee's approach was discussed at a symposium held at the 1999 Annual Meeting of the American Thoracic Society. After further revisions, the statement was reviewed and submitted to the Board of the American Thoracic Society.

BACKGROUND ON THE CLEAN AIR ACT

The preparation of the original statement was largely motivated by potential ambiguity in interpreting the language of the Clean Air Act, which addresses adverse effects of air pollution without providing clear guidance as to the distinction between adverse and nonadverse effects. In addition, questions regarding this distinction arise repeatedly in interpreting the findings of research studies, whether observational or experimental. Consequently, the 1985 statement has had broader application than just the interpretation of evidence on air pollution and health for the purpose of promulgating air quality regulations. Nonetheless, the committee found the legislative history of the Clean Air Act to be relevant to its charge.

The first national legislation on air pollution, the Air Pollution Control Act, was passed in the mid-1950s; the original Clean Air Act was passed in 1963 and last revised in 1990. The act is lengthy and complex in its provisions; most relevant to considerations in defining an adverse health effect are Sections 108 (Air Quality Criteria and Control Techniques), 109 (National Ambient Air Quality Standards), and 112 (Hazardous Air Pollutants). National Ambient Air Quality Standards (NAAQS) are set individually for six prevalent pollutants (Table 1), often referred to as "criteria pollutants." They are so designated because of the requirement for comprehensively reviewing relevant information in a criteria document. The primary NAAQS are to be set at a level that protects the public health with an adequate margin of safety, regardless of economic or technical feasibility of attainment. The secondary standards are concerned with welfare and environmental consequences.

The hazardous air pollutants, as defined in Section 112, are not covered under Sections 108 and 109 as criteria pollutants. In 1990, the Congress offered a list of 189 such pollutants and a process for listing and delisting substances. The 1990 Clean Air Act states: "The Administrator shall periodically review [and revise] the list [of 189 hazardous air pollutants] by. adding pollutants which present, or may present, through inhalation or other routes of exposure, a threat of adverse human health effects (including, but not limited to substances which are known to be, or may reasonably be anticipated to be, carcinogenic, mutagenic, teratogenic, neurotoxic, which cause reproductive dysfunction, or which are acutely or chronically toxic). ." Section 112(f)(2) further directs the Environmental Protection Agency to assess whether the emissions standards for the listed hazardous air pollutants required under other subsections "provide an ample margin of safety to protect public health" and if not, then the agency is to develop standards that will address the "remaining risk."

The historical record provides an indication of the intent of the Congress in framing the language of the Clean Air Act with regard to protection of the public's health. Research now shows that the most highly susceptible individuals may respond to common exposures that are often at or close to natural background pollutant levels.

With regard to sensitivity, the 1970 Clean Air Act recognized that some persons were so ill as to need controlled environments, e.g., persons in intensive care units or newborn infants in nurseries; the act stated that the standards might not necessarily protect such individuals. It further stated, however, that the standards should protect "particularly sensitive citizens such as bronchial asthmatics and emphysematics who in the normal course of daily activity are exposed to the ambient environment." The act further suggested that the adequacy of any standard could be tested in a statistically representative sample of sensitive individuals. The hearing record on the 1970 act is informative. Dr. Hon T. Middleton (Commissioner, National Air Pollution Control Administration, Department of Health, Education, and Welfare) addressed the Senate Subcommittee on Air and Water Pollution of the Committee on Public Works on May 27, 1970. He testified that the intent of any national air quality standard is to be "protective of health in all places" and set at a level below which effects have not been observed. Dr. Middleton recognized the difficulty of finding a demarcation point of exposure below which there is no effect and he noted that there may be subtle effects and evolving scientific understanding.

Further difficulties in the language of the Clean Air Act were later noted in ***A Legislative History of the Clean Air Act Amendments of 1977: A Continuation of the Clean Air Act Amendments of 1970.*** This document noted the difficulty of applying the margin of safety and the erosion of margins of safety by advancing scientific knowledge. The document also commented on the implicit assumption of a safe threshold in the language of the act and the implausibility of this assumption. The report questioned whether the NAAQS (I) protect against genetic mutations, birth defects, and cancer, (2) take sufficient account of the consequences of long-term low-level exposures or short-term peaks, and (3) sufficiently consider synergism among pollutants and the formation of secondary pollutants, e.g., sulfates, with their own toxicity. These considerations remain relevant more than 20 years later.

This selective review of the historical record indicates that Congress intended that the NAAQS would afford health protection not only to the general population but to subgroups with enhanced susceptibility to air pollution, including people with asthma and people with chronic obstructive lung disease. Nevertheless, it is also clear that some exquisitely susceptible individuals might remain outside the ambit of protection of the NAAQS. A margin of safety was to be provided but quantitative specification was not offered. The evolutionary nature of the supporting scientific evidence was repetitively acknowledged and the need to distinguish adverse from nonadverse effects was at least implicitly recognized. The current language of Section 112 explicitly acknowledges the possibility of shifting understanding of risks of specific hazardous air pollutants.

GENERAL CONSIDERATIONS

In preparing the statement, the committee identified several general considerations that are relevant to interpreting evidence on the health effects of air pollution. Each of these considerations and the committee's judgment as to their proper weighting are detailed below.

Population Health versus Individual Risk

The effects of air pollution can be viewed in the complementary contexts of the increment of an individual's risk for disease—the clinician's measure of impact-and of the additional risk incurred by a population, which is the public health perspectivc (16). Both perspectives arc relevant to interpreting research findings on air pollution and to regulations that are protective of the public's health. Any risk incurred by an exposed individual beyond some boundary, determined by the individual or on a societal basis, could be deemed unacceptable. For example. prolonged exposure to a respiratory carcinogen could result in an individual-level incremental risk of exposure of 10^{-4}, more than two orders of magnitude lower than the baseline lifetime individual risk in the United States. Nevertheless, among an exposed population of IO', the estimated number of cancer cases that might result from such an exposure would number 10^{3}, illustrating that minute individual risks may be significant from the standpoint of population exposures.

Exposure could also enhancc risk for a population to an unacceptable degree, perhaps without shifting the risks of any particular individuals to an unacceptable level. Figure 1 illustrates the distinction. In Figure l A, the population's distribution of exposure shifts toward a higher level and some members of thc population cross the boundary to an unacceptable risk. In Figure lB, the shift affects the position of the population distribution, but no individuals move to an unacceptable level of risk. Effects on persons with asthma are illustrative. A population of children with asthma could have a distribution of lung function such that no individual child has a level associated with significant impairment. Exposure to air pollution could shift the distribution toward lower levels without bringing any individual child to a level that is associated with clinically relevant consequences. Individuals within the population would, however, have diminished reserve function and are at potentially increased risk if affected by another agent, e.g., a viral infection. Assuming that thc relationship between the risk factor and the disease is causal, the committee considered that such a shift in thc risk factor distribution, and hence the risk profilc of the exposed population. should be considered adverse, even in thc absence of the immediate occurrence of frank illness.

Ethics and Equity

The past decade has brought increasing concern over the ethics of heterogeneous, inequitable distributions of environmental and occupational exposures (IS). Within the United States, some groups receive disproportionate exposures to environmental agents that arc injurious to health; the environmental justice movement seeks to redress these inequities. The exposures of concern originate in breathing polluted outdoor air, living in substandard housing with indoor air pollution problems, including exposures to certain bioacrosols and combustion products, and working in jobs with occupational respiratory risks. Groups encompassed by this movement in the United States include various racial and ethnic minority populations. particularly thosc living within urban areas, and the socioccconomically disadvantaged. In the developing world, such exposures can occur at substantially higher levels and may, in some instances, extend to a majority of a given nation's population. Limited access to care and medications may enhance susceptibility to pollution.

The concept of environmental equity had not been formally voiced when the 1985 statement was written. The present committee viewed inequities of exposure as potentially representing a form of susceptibility to air pollution. In other words, individuals within the target groups may be at increased risk of experiencing adverse effects from a given level of ambient air pollution because their baseline risk level may have been raised by other exposures. Moreover, in some instances there may be genetic and nutritional factors enhancing susceptibility as well. It should be noted, however, that there are other exposure scenarios and other subpopulations with increased baseline risks that are not formally included within the environmental justice movement. The heterogeneity of populations needs full acknowledgment, whether it reflects disproportionate noxious exposures or other factors. Observing that there have been few investigations of the effects of other exposures, genetics, or nutrition on susceptibility to air pollution-related effects, either in the United States or internationally, the committee issued a call for additional research in these areas.

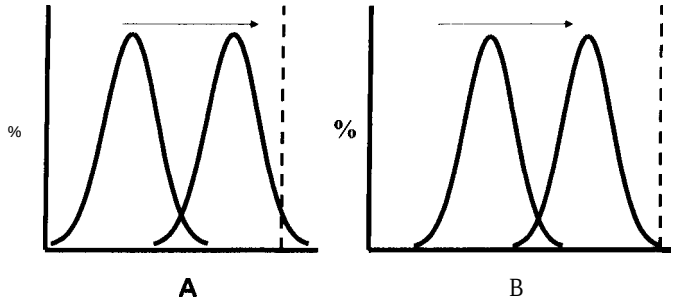

Figure 7. Hypothetical distributions **of exposure for two populations, *A* and *B*. (See text for explanation.)**

Economic Costs

Adverse health effects of air pollution incur costs, including direct costs of providing treatment for illness and indirect costs of lost work time and productivity. Cost-benefit analysis provides an estimate of the balancing of the costs of controls against the benefits; cost effectiveness analysis provides an indication of the level of control accomplished in relation to costs. Cost-benefit and cost-effectiveness analysis are assumption-laden tools now being used for policy-making purposes. Cost estimates depend on the valuation given to illness, lost work time and productivity, and even to lost life. It has been proposed that cost-benefit analysis may facilitate the process of deciding whether a given air pollution-related health impact should be considered adverse. The legislative history of the Clean Air Act explicitly excludes consideration of economic factors in setting ambient air quality standards or in developing emissions standards for hazardous air pollutants. In the context of air quality regulation, cost-benefit analysis is a multistep process involving the articulation of value judgments regarding potential costs (expenditures of public and private resources to reduce pollutant emissions and exposures) versus benefits (avoidance of specified adverse health impacts in a designated population). Benefits, in theory, should be quantified as the willingness of beneficiaries to pay to avoid the adverse impact. In practice, quantification of such health impacts from exposure to air pollution is often based on direct costs related to medical treatment and indirect costs such as school absenteeism, lost work time, decreased productivity, and, at the extreme, person-years of life lost. Valuations of a given effect may vary internationally, as differences in population age distributions, comorbidity, nutritional status, and other circumstances can affect this process. Ideally, cost–bene-

fit analysis should make explicit the value judgments underlying these assessments, highlighting distinctions among alternative pollution control strategies to achieve specific air quality standards. Willingness of individuals to pay to avoid adverse health effects is also estimated from responses to contingent valuation surveys and from market data concerning choices about employment that carries health risks.

Nevertheless, the committee concurred that the specification of which health effects should be considered adverse must precede the application of cost-benefit analysis for evaluation of air pollution control strategies. That is, once a given outcome is designated as adverse, this information can be used as input to cost-benefit analysis. Estimates of costs associated with a given health outcome. while useful from a public policy perspective, cannot be translated into any clinical or biological framework to distinguish adverse from nonadverse effects. Therefore, the committee concluded that however valuable this economists' tool may be for regulatory decision-making, cost-benefit analysis lay outside the scope of this position paper and, indeed, the expertise of the American Thoracic Society.

Susceptibility

The issue of susceptibility has been recognized throughout the history of our initiatives to regulate outdoor air pollution. Susceptibility, broadly defined, may include extrinsic factors, including the profile of exposures to other pollutants, for example, in the workplace or at home, and intrinsic factors, for example, genotype. The size of the population of individuals susceptible to indoor air pollution is large, potentially including infants and the elderly, persons with chronic heart and lung diseases, and the immunocompromised. Persons with multiple deleterious exposures may also be considered as having heightened susceptibility, particularly if the combined effects of the agents are synergistic. Even with the populations considered as susceptible there is a distribution of the degree of susceptibility. For example, levels of nonspecific airway responsiveness in persons with asthma span several orders of magnitude.

The current explosive growth in knowledge of the genetic basis of lung disease, including responses to environmental agents, will provide increasing insights into the mechanistic basis of susceptibility and provide markers of risk status. We already have evidence of between-person variation in the pulmonary function response to ozone and interstrain variation in the pulmonary effects of environmental exposures, including criteria pollutants, in rodent species. As we develop the capacity to more precisely identify those at risk, we may find it increasingly challenging to assure protection for all individuals against adverse health effects.

The present committee agreed with the principle espoused in the Clean Air Act: that regulations should extend protection to include those with enhanced susceptibility to air pollution, recognizing that some highly susceptible individuals may still respond to low-level exposures. Research now shows that some highly susceptible individuals may respond to common exposures that are often unavoidable. Furthermore, by definition, susceptible individuals cannot have the same margin of safety as the nonsusceptible groups within the population.

Heterogeneity of Perspectives

In society there is an extraordinary range of views on environmental issues and tolerance of risk. Looking more globally to other developed countries and to the developing countries, the range of perspectives is even broader. The committee acknowledges that any defined boundaries for distinguishing adverse health effects may not be embraced by all groups. This heterogeneity and the possibility that some may reject the committee's proposal challenged the committee to recommend in principle that control measures should maximize public health benefits while assuring equity.

DIMENSIONS OF ADVERSE EFFECTS

Biomarkers

Biomarkers are indicators of exposure, effect, or susceptibility that are measured in biologic materials, such as blood or bronchoalveolar lavage fluid. The concept of biomarkers has been formalized since the 1985 statement (17) and since then. a continuously increasing number of candidate indicators of exposure, effect, and susceptibility have been developed and applied in laboratory studies of humans and animals and in both occupational and environmental population studies. The progressive refinement of techniques in the field of cellular and molecular biology, and the burgeoning understanding of the complex chemical intracellular and cell-to-cell signaling pathways collectively termed "cytokines" (18), have rapidly expanded the spectrum of candidate markers of effects. It is now possible to detect very early, or initiating phases of responses at the molecular level, such as the production of mRNA for cytokines. Similarly, the progressive development of genetic assays and understanding of the human genome have provided numerous candidate markers of both effects and susceptibility (19).

Biomarkers relevant to air pollution have been measured in blood, exhaled air, urine, sputum, and in bronchoalveolar lavage fluids and tissue specimens collected by bronchoscopy. Bronchoalveolar lavage fluids, for example, are now frequently analyzed for cell numbers and types, cytokines (e.g., several interleukins and tumor necrosis factor α), enzymes (e.g., lactate dehydrogenasc and β-glucoronidase), fibronectin, protein, arachidonic acid metabolites, and reactive oxygen species. Because many of the epithelial cell types of the nasopharyngeal region are similar to epithelia and responses in the trachea, bronchi, and bronchioles, responses of nasal cells have been examined as potential biomarkers for their ability to predict parallel responses in lung airways, which are more difficult to sample.

Biomarkers have been extensively applied in toxicologic studies of air pollution, both in animals and in clinical studies involving exposures of human volunteers. The biomarkcrs are examined for their ability to provide evidence of "biologically effective" doses, including the earliest phases of homeostatic responses, the occurrence of injury, outcomes that are intermediate between injury and disease, and the presence of established disease processes. Genetic markers of susceptibility have begun to be applied to the respiratory system, and this application will undoubtedly expand rapidly. A frequent goal of biomarker development is the ability to readily measure changes that precede and predict continued or progressive events leading to clinical effects and disease (Figure 2).

To date, although biomarkers have proved informative about homeostatic adjustments to exposure and the mechanisms of injury and disease, lack of validation against previously established measures of effect. such as clinical status or even physiologic impairment, remains an important weakness. We do not know if elevations of biomarkers during short-term experimental exposures signal risk for ongoing injury and clinical effects or simply indicate transient responses that can provide insights into mechanisms of injury. The utility of some older biomarkers is well established, such as the relationships among carboxyhemoglobin. exposure to carbon monoxide,

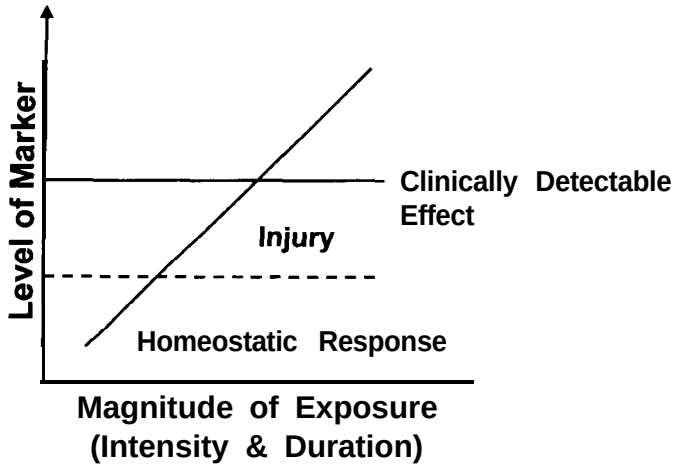

figure 2. Schema for considering biomarkers of response.

impairment of oxygen-carrying capacity, and the risk for angina in the presence of ischemic heart disease. However, the interpretative value for the majority of the many promising new cytokine and genetic biomarkers remains to be established. Not only is it difficult to assess the value of many biomarkers for distinguishing between physiological, homeostatic responses and injury, but it is also difficult to judge the value of changes during short-term exposures for predicting ongoing injury or risk for longer-term clinical effects.

The committee concluded that the continued development of biomarkers is an important need because of their considerable potential not only for detecting the adverse effects of air pollution exposure, but also for aiding the determination of the types and levels of response that should be considered adverse. We often do not know in a parallel, iterative manner, whether the exploration and validation of biomarkers will unquestionably advance our understanding of the mechanisms of homeostatic and injury responses. At this time, however, few of the rapidly growing list of candidate biomarkers have been validated to such an extent that their responses can be used with confidence to define the point at which a response should be equated to an adverse effect warranting preventive measures. Thus, we presently have only a very modest ability to translate evidence from biomarkers directly into a taxonomy of adverse health effects. Consequently, the committee cautions that not all changes in biomarkers related to air pollution should be considered as indicative of injury that represents an adverse effect.

Quality of Life

Health, in its broadest definition, includes not only the absence of disease but the attainment of well-being. Since the preparation of the 198.5 statement, the National Institutes of Health, the Centers of Disease Control, the Food and Drug Administration, and the World Health Organization have broadened their perspective of health to incorporate the concept of health-related quality of life as a valid and important health outcome. Health-related quality of life (HRQL) refers to the individual's perception of well-being, and includes such factors as self-care functioning, mental health, pain, and sense of overall well-being. Decreased health-related quality of life is widely accepted to be an adverse health effect. For this reason, measurable negative effects of air pollution on quality of life, whether for persons with chronic respiratory conditions or the population in general, were consequently considered by this committee to be adverse health effects. Air pollution exposure can adversely affect several domains of quality of life including physical functioning (particularly for persons with respiratory or cardiovascular conditions) and general well-being. Stinging, watery eyes resulting from air pollution not only reflect a chronic physical symptom but may decrease overall quality of life. Outdoor air pollution and odors have been associated with psychiatric symptoms, including anxiety and depression. Increased levels of some air pollutants have been reported to be associated with an increase in psychiatric admissions. The potential effects of air pollution and respiratory symptoms on different domains of quality of life are illustrated in Figure 3.

Measurement of the impact of air pollution on health-related quality of life can be accomplished either by measuring specific domains that may be influenced by air quality (e.g., anxiety, functional status), or by using specific quality of life instruments designed to measure multiple health-related domains (e.g., MOS-SF-36, St. George's Respiratory Questionnaire). The cost-benefits of improved air quality on health-related quality of life could also be measured by the use of quality of life measures that employ utility rating scales. The effects of air pollution of a magnitude considered to be clinically significant with these instruments should be regarded as adverse in interpreting evidence on the health effects of air pollution, regardless of the affected dimension. Additional research is needed to develop an information base for interpreting data from new and more sensitive instruments directed specifically at air pollution.

Physiological impact

The 198.5 statement acknowledged a distinction between reversible and irreversible effects. Healthy persons may sustain transient reductions in pulmonary function associated with air pollution exposure, e.g., reduction of the forced vital capacity (FVC) with exercise at times of higher levels of ozone pollution. However, the committee recommends that a small, transient loss of lung function, by itself, should not automatically be designated as adverse. In drawing the distinction between adverse and nonadverse reversible effects, this committee recommended that reversible loss of lung function in combination with the presence of symptoms should be considered as adverse. This recommendation is consistent with the 1985 statement. The Environmental Protection Agency has also needed to address the interpretation of such data. The Envi-

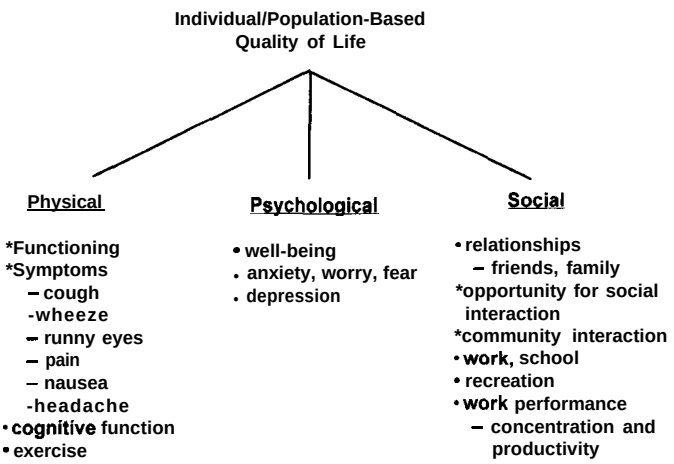

Figure 3. Quality of life domains vulnerable to the adverse health/respiratory effects of air pollution.

ronmental Protection Agency, in its 1989 review of ozone (20), offered a graded classification of lung function changes in persons with asthma. Reduction of the forced expiratory volume in 1 s (FEV_1) was graded as mild, moderate, or severe for reductions of less than 10%, 10–20%, and more than 20%, respectively. This classification has not been validated for acceptability or against other measures.

There is also epidemiologic evidence that air pollution may adversely affect lung growth or accelerate the age-related decline of lung function. Epidemiologic studies are limited in their power to detect such permanent effects and any evidence of association between air pollution exposure and permanent loss of function is indicative of an adverse effect at the population level. Some individuals may sustain clinically relevant, permanent losses of lung function. This committee considered that any detectable level of permanent lung function loss attributable to air pollution exposure should be considered as adverse.

Symptoms

Air pollution exposure can evoke symptoms in persons without underlying chronic heart or lung conditions and also provoke or increase symptom rates in persons with asthma and chronic obstructive lung disease. The Environmental Protection Agency also offered a scale for cough and pain on taking a deep breath in its 1989 ozone review (20). "Infrequent cough" was classified as "None/Normal."

Do all levels of increased symptom occurrence constitute an adverse health effect? The committee judged that air pollution-related symptoms associated with diminished quality of life or with a change in clinical status should be considered as adverse at the individual level. Characterizing the degree of symptomatology associated with diminished quality of life is an appropriate focus for research and a topic that could be investigated using new approaches for assessing quality of life. A change in clinical status can be appropriately set in a medical framework as one requiring medical care or a change in medication. At the population level, any detectable increment in symptom frequency should be considered as constituting an adverse health effect.

Clinical Outcomes

A wide range of clinical outcome measures has been considered in relation to air pollution, including population-level effects, such as increases in numbers of emergency room visits for asthma or hospitalizations for pneumonia, and individual-level effects, such as increased need for bronchodilator therapy. The present committee shared the view of the previous group: detectable effects of air pollution on clinical measures should be considered adverse.

At the population level, the magnitude of the detectable air pollution effect will depend on the extent of the data available for evaluation and methodological aspects of the data, including the degree of error affecting exposure and outcome variables. With large databases, seemingly modest effects may be detectable. However, the committee recommends that no level of effect of air pollution on population-level clinical indicators can be considered acceptable.

Mortality

Following the development of new approaches for the analysis of time-series data, extensive analyses have now been reported on the relationship between daily mortality counts and levels of air pollution on the same or prior days. Several prospective cohort studies have also addressed the effect of longer-term indicators of air pollution exposure on mortality, controlling for relevant individual factors, including age, sex, cigarette smoking, and occupational exposures, among others. Cross-sectional studies-comparing mortality across locations having different levels of air pollution while controlling for a variety of potential confounding factors-have also been conducted. The air pollution-associated mortality findings figured prominently in the recent revision of the U.S. NAAQS for particulate matter.

Associations between air pollution levels and daily mortality counts have been interpreted by some as reflecting the impact of air pollution on a pool of frail individuals with severe underlying heart or lung disease. One explanation for the day-to-day associations attributes them to a brief advancement of the time of death for extremely frail individuals who would have been expected to die soon even in the absence of an air pollution-related insult (21). Work has shown, however, that while this phenomenon of advancement, referred to as mortality displacement, may occur, it cannot provide a full explanation of the associations repeatedly found between daily fluctuations of air pollution and mortality (22, J. Schwartz, "Harvesting and long term exposure effects in the relationship between air pollution and mortality" [1999, unpublished manuscript]). In addition, some mortality time-series studies have found effects across all age strata, not just among the elderly or the very young, suggesting potentially substantial effects on person-years of life lost. Finally, studies of long-term exposures have shown a gradient of mortality risk from cardiopulmonary disease as well as differences in life expectancy across cities with different long-term pollution levels. Thus, although we still have little insight into the extent to which mortality displacement occurs, the evidentiary ensemble from several types of study designs consistently shows that air pollution can shorten the life span to an unacceptable degree.

Risk Assessment

Since the publication of the 1985 statement, quantitative risk assessment has emerged as a key tool for summarizing information on risks to health from environmental agents. Quantitative risk assessment offers a framework for organizing information on risks within its four elements: hazard identification, exposure assessment, dose-response assessment, and risk characterization. The findings of a risk assessment, encompassed in the risk characterization component, may include an overall assessment of impact, a description of the distribution of risk in the population, and an evaluation of risk for susceptible persons within the population. Quantitative risk assessment has been a cornerstone in evaluating risks of environmental carcinogens and we anticipate increasing application to non-carcinogenic health effects of environmental agents, including air pollution.

In interpreting the findings of risk assessments, guidance can be found in precedents offered by key interpretations of regulatory requirements, including the Supreme Court's decision on the benzene standard proposed by the Occupational Safety and Health Administration, and in pollutant-specific regulatory actions. Risks may be couched as the numbers of attributable events in the population and also as the level of risk incurred by individual members of the population.

The committee recognized the rising use and potential utility of quantitative risk assessment in characterizing the health effects of air pollution. However, the committee noted that the results of quantitative risk assessment can often be sensitive to assumptions regarding the distribution and magnitude of exposure, the choice of an appropriate dose-response relationship, and other input decisions. Judgments on acceptability of risk are societal and made through complex regulatory

processes involving extensive public input. The committee did not consider that its mandate extended to offering specific guidance on acceptable risk levels for populations or individuals, nor is risk assessment an appropriate basis for determining what constitutes an adverse effect.

CONCLUSIONS

Since the preparation of the 1985 statement of the American Thoracic Society, there have been tremendous advances in the scientific methods used to investigate the health effects of air pollution. These advances range from the molecular to the behavioral levels of inquiry. As a result, this statement covers topics that are new since the 1985 statement. Yet, this committee, like the 1985 group, was confronted by a lack of formal research or investigation on the very topic of this statement: the boundary between adverse and nonadverse effects. Consequently, the committee needed to exercise its collective judgment on matters that should be based in some broader, societal decision-making **process. Its recommendations are summarized below.**

- ***Biomarkers.*** Few of the rapidly growing list of candidate biomarkers have been validated sufficiently that their responses can be used with confidence to define the point at which a response should be equated to an adverse effect warranting preventive measures. The committee cautions that not all changes in biomarkers related to air pollution should be considered as indicative of injury that represents an adverse effect.
- ***Quality of life.*** Decreased health-related quality of life is widely accepted as an adverse health effect. For this reason, measurable negative effects of air pollution on quality of life, whether for persons with chronic respiratory conditions or for the population in general, were consequently considered to be adverse by this committee.
- ***Physiological impact.*** The committee recommends that a small, transient loss of lung function, by itself. should not automatically be designated as adverse. In drawing the distinction between adverse and nonadverse reversible effects, this committee recommended that reversible loss of lung function in combination with the presence of symptoms should be considered adverse. This committee considered that any detectable level of permanent lung function loss attributable to air pollution exposure should be considered adverse.
- ***Symptoms.*** The committee judged that air pollution-related symptoms associated with diminished quality of life or with a change in clinical status should be considered adverse at the individual level.
- ***Clinical outcomes.*** The present committee shared the view of the previous group: detectable effects of air pollution on clinical measures should be considered as adverse.
- ***Mortality.*** This committee agreed with the conclusion articulated by the 1985 group that any effect on mortality should be judged as adverse. In addition, we are now faced with the challenge of interpreting the findings of time-series studies of effects on short time frames. In interpreting this type of evidence, consideration needs to be given to the extent of life-shortening underlying the association.
- ***Population health versus individual risk.*** Assuming that the relationship between the risk factor and the disease is causal, the committee considered that such a shift in the risk factor distribution, and hence the risk profile of the exposed population, should be considered adverse, even in the absence of the immediate occurrence of frank illness.

This statement was prepared by an ad-hoc committee of the Assembly on Environmental and Occupational Health. Members of the committee are:

APPENDIX E POLICY, PLANS, AND POTENTIAL FUTURE RULES

(https://www.valleyair.org/rules-and-planning/rules-under-development/)

THIS PAGE IS INTENTIONALLY BLANK

POLICY, PLANS, AND POTENTIAL FUTURE RULES

The following regulatory measures are scheduled for consideration by the San Joaquin Air Pollution Control District during 2026.

- Rule 4550 (Conservation Management Practices). Potential amendments will satisfy commitments in the *2024 PM2.5 Plan* to evaluate potential emission reductions of PM2.5 from agricultural operations, to the extent that further controls and/or work practices are technologically and economically feasible.
- Rules 4601 (Architectural Coatings), 4603 (Surface Coating of Metal Parts and Products, Plastic Parts and Products, and Pleasure Crafts), 4604 (Can and Coil Coating Operations), 4653 (Adhesives and Sealants), and 4663 (Organic Solvent Cleaning, Storage, and Disposal) Potential amendments will satisfy commitments in the District's *Ozone Contingency Measure SIP Revision for the 2008 and 2015 8-Hour Ozone Standards*, to further strengthen the District's contingency measure strategy for these standards.
- Rule 4901 (Wood-Burning Fireplaces and Wood-Burning Heaters) Potential amendments will satisfy commitments in the *2024 PM2.5 Plan* to further reduce PM2.5 emissions from wood-burning devices, including the extension of the wood-burning season through March 31.
- Rule 4905 (Natural Gas-Fired, Fan-Type Central Furnaces) Potential amendments will include an extension of the emission fee period for the manufactured homes furnace category to provide additional time for the development of compliant furnace technologies, as no current feasible compliant technology exists for manufactured homes to meet applicable emission limits at this time.

Table E.1 Summary of County of Fresno General Plan Air Policies

Policy or Program		Applies to Project?
Policy OS-G.1:	The County shall develop standard methods for determining and mitigating project air quality impacts and related thresholds of significance for use in environmental documents. The County will do this in conjunction with the San Joaquin Valley Air Pollution Control District (SJVAPCD) and the cities in Fresno County.	No, project does not interfere with the County's ability to develop methods or thresholds.
Policy OS-G.2:	The County shall ensure that air quality impacts identified during the CEQA review process are fairly and consistently mitigated. The County shall require projects to comply with the County's adopted air quality impact assessment and mitigation procedures.	Yes, however, the appropriate environmental analysis has been conducted and is the purpose of this report. Therefore, while this policy applies to the project, its requirements are satisfied by the existence of the Report.
Policy OS-G.3:	The County shall participate with cities, surrounding counties, and regional agencies to address cross-jurisdictional and regional transportation and air quality issues.	No, project does not interfere with the County's ability to participate with other entities regarding transportation and air quality issues.
Policy OS-G.4:	The County shall consult with the SJVAPCD during CEQA review for projects that require air quality impact analysis and ensure that the SJVAPCD is on the distribution list for all CEQA documents.	No, project does not interfere with the County's ability to consult with the SJVAPCD
Policy OS-G.5:	The County shall participate with cities, surrounding counties, and regional agencies in the San Joaquin Valley in efforts to promote consistent air quality programs and implementation programs to the extent possible (e.g., transportation control measures, trip reduction ordinances, indirect source programs, etc.).	No, project does not interfere with the County's ability to promote consistent air quality programs.
Policy OS-G.6:	The County shall develop and implement employer-based trip reduction programs for County employees.	No, project does not interfere with the County's ability to develop trip reduction programs.
Policy OS-G.7:	The County shall encourage its departments to consider telecommuting programs as a trip reduction strategy.	No, project does not interfere with the County's ability to consider telecommuting.

Policy or Program		Applies to Project?
Policy OS-G.8:	The County fleet vehicle operators shall implement vehicle replacement practices that place a priority on replacement of older higher-emission vehicles and on purchasing new vehicles with engines using best available technologies and advanced fuels where feasible, consistent with cost effective management of the program.	No, project does not interfere with the County's ability to implement vehicle replacement practices.
Policy OS-G.9:	The County shall support the use of teleconferencing in lieu of employee travel to conferences and meetings when feasible.	No, project does not interfere with the County's ability to support the use of teleconferencing.
Policy OS-G.10:	The County shall encourage the establishment of public/private partnerships to develop satellite and neighborhood work centers for telecommuting.	No, project does not interfere with the County's ability to develop satellite and neighborhood work centers.
Policy OS-G.11:	The County shall continue, through its land use planning processes, to avoid inappropriate location of residential uses and sensitive receptors in relation to uses that include but are not limited to industrial and manufacturing uses and any other use which have the potential for creating a hazardous or nuisance effect.	No, project does not interfere with the County's ability to avoid inappropriate location of residential uses.
Policy OS-G.12:	The County shall require future development projects under the GPR/ZOU, to the maximum extent feasible, to use architectural coating materials, as defined in the San Joaquin Valley Air Pollution Control District's (SJVAPCD) Rule 4601, that are zero-emission or have a low-ROG content (below 10 grams per liter). Where such ROG coatings are not available, or feasible, the coating with the lowest ROG rating available shall be used. These measures shall be noted on all construction plans, and the County shall perform periodic site inspections during construction to verify compliance.	Possibly, the project may include application of architectural coatings during maintenance activities for proposed facility features that would need to comply with Rule 4601.
Policy OS-G.13:	The County shall continue to promote public awareness of Valley Fever risks relating to ground disturbing activities through the provision of educational materials, webpages and resource contact information. For projects involving ground disturbance on unpaved areas left undisturbed for 6 months or more, the County shall require developers to provide project-specific Valley Fever training and training materials.	Yes, the project would affect unpaved areas left undisturbed for 6 months or more. Therefore, the Project would need to provide project-specific Valley Feber training and training materials to employees that may be exposed.
Policy OS-G.14:	The County shall include fugitive dust control measures as a requirement for subdivision maps, site plans, and grading permits. This will assist in implementing the SJVUAPCD's particulate matter of less than ten (10) microns (PM10) regulation (Regulation VIII). Enforcement actions can be coordinated with the Air District's Compliance Division.	No, does not apply to project.

Policy or Program		Applies to Project?
Policy OS-G.15:	The County shall require all access roads, driveways, and parking areas serving new commercial and industrial development to be constructed with materials that minimize particulate emissions and are appropriate to the scale and intensity of use.	Potentially applies to project. The Report considers minimization and appropriate materials in project.
Policy OS-G.16:	The County shall continue to work to reduce PM10 and PM2.5 emissions from County-maintained roads by considering shoulder treatments for dust control as part of road reconstruction projects.	No, project does not interfere with the County's ability to consider shoulder treatments for dust control.
Policy OS-G.17:	The County shall require the use of natural gas or the installation of low emission, EPA-certified fireplace inserts in all open hearth fireplaces in new homes. The County shall promote the use of natural gas over wood products in space heating devices and fireplaces in all existing and new homes.	No, project does not interfere with the County's ability to require low emission fireplace inserts.

Policy or Program		Applies to Project?
Policy EJ-A.1.	The County, during the development review process, shall require proposed new sensitive land uses (such as residential uses, schools, senior care facilities, and day care facilities) to be located an appropriate distance, to be. determined during the development review process, from freeways, major roadways, and railroad tracks based on analysis of physical circumstances of the project location so as to minimize potential impacts including, but not limited to, air and water pollution exposure, odor emissions, light, and glare.	No, the project is not a new sensitive land use.
Policy EJ-A.2.	The County shall require buffering and screening requirements as part of the development review process for all new potentially pollution producing land uses proposed to be located adjacent to existing sensitive land uses that have historically been associated with heightened levels of pollution. These land uses associated with pollution include industrial land uses, agricultural operations using pesticides applied by spray techniques, wastewater treatment plants, and landfills and waste treatment facilities.	No, the project may be adjacent to sensitive receptors but those receptors have CalEnviroScreen 3.0 scores less than the 75th percentile as presented in Figure EJ-5 (Pg. 2-196, General Plan) and are not considered disadvantaged communities.
Policy EJ-A.3.	The County shall during the development review land use process coordinate with local commercial and industrial developments to review and require incorporation into their projects the latest technologies and best practices to reduce emissions.	Yes, the County has reviewed feasible technologies and best practices for the project and they are incorporated where appropriate.
Policy EJ-A.4.	The County shall partner with the Fresno County Tobacco Free Coalition, and local nonprofits to educate and enhance public awareness on improving resident air quality, including lead mitigation and clean air technologies (HEPA filters and ventilation systems) and reducing secondhand smoke exposure to residents in multi-unit housing as funding allows.	No, the project will not affect the County's ability to partner with the Coalition and other non-profits.

Policy or Program		Applies to Project?
Policy EJ-A.5.	The County shall seek funding, such as the Congestion Mitigation and Air Quality Improvement Program (CMAQ), to develop projects to mitigate roadway pollution, such as widening roadway shoulders, the creation of green barriers and the prohibition of truck routing near or through sensitive land uses in an effort to improve Diesel Particulate Matter pollution along major thoroughfares the County.	No, the project will not affect the County's ability to seek funding.
Policy EJ-A.6.	The County shall coordinate with Caltrans to encourage the development of projects to mitigate roadway pollution along major interstates, such as the development of green barriers near existing sensitive land uses.	No, the project will not affect the County's ability to coordinate with Caltrans.
Policy EJ-A.7.	During the development review process, the County shall direct project applicants for projects located within the South-Central Fresno area to coordinate with the San Joaquin Valley Air Pollution Control District (District) to ensure review by the District regarding implementation of the strategies outlined within the District's Community Emissions Reduction Program (CERP) for the South-Central Fresno area. Prior to action on applicable development permits, the County shall require the applicant to provide documentation from the District verifying that CERP strategies have been reviewed/addressed.	No, the project is located outside of the South-Central Fresno area.
Policy EJ-A.8.	The County shall provide residents within disadvantaged communities the opportunity to review and comment on discretionary development projects within their communities.	Yes, a EIR has been prepared for the project and communities within the County have had the opportunity to review and comment.
Policy EJ-A.9.	The County shall partner with the San Joaquin Valley Air Pollution Control District to support dispersing public education and information regarding the threat of air quality hazards and options for increasing personal health and safety related to pollution exposure.	No, the project will not affect the County's ability to partner with the air district.
Policy EJ-A.10.	Annually, the County shall coordinate a meeting with community water and sewer providers to identify system upgrade, expansion, and consolidation of funding opportunities to ensure all community members have access to safe drinking water and wastewater services.	No, the project will not affect the County's ability to coordinate meetings.
Policy EJ-A.11.	The County shall give priority to disadvantaged communities when seeking infrastructure and active transportation funding opportunities.	No, the project will not affect the County's ability to give priority to disadvantaged communities.
Policy EJ-A.12.	New industrial development, which has the potential to create compatibility conflicts with surrounding sensitive uses, shall incorporate measures such as landscaped setbacks along road frontage, block walls, signage disclosing on-site emergency contact information, enclosed loading docks, and placement of loading docks and idling areas away from sensitive receptors in order to minimize potential impacts.	Yes, the project has incorporated measures that minimize potential impacts. Mitigation measures include a dust control plan and other requirements that will minimize potential impacts to less than significant levels.

Policy or Program		Applies to Project?
Policy EJ-A.13.	Automobile parking areas for new industrial development shall be planted with trees in a manner to provide adequate shade cover of at least 35% of the parking area utilizing trees or a combination of trees and photovoltaic solar shade structures. Landscaping for new industrial development shall use drought tolerant species with low biogenic emissions.	Yes, the project would have parking for employees and will provide adequate shade cover for those vehicles.
Policy EJ-A.14.	The County shall prohibit truck traffic from new industrial development to traverse through existing residentially zoned areas.	No, the project will not affect the County's ability to prohibit truck traffic from residentially zoned areas.
Policy EJ-A.15.	Consistent with the provisions contained in the California Air Resources Board (CARB) Air Quality and Land Use Handbook, project applicants shall identify appropriate measures for projects with sensitive uses located within 500 feet of freeways, heavily traveled arterials (daily vehicle trips of 10,000 or more), railways, and other sources of diesel particulate matter (DPM) and other known carcinogens. The County shall require development projects that are located within 500 feet of freeways, heavily traveled arterials (daily vehicle trips of 10,000 or more), railways, and other sources of DPM and other known carcinogens to retain a qualified air quality consultant to prepare a health risk assessment (HRA)in accordance with the CARB and the California Environmental Protection Agency's Office of Environmental Health and Hazard Assessment requirements to determine the exposure of nearby sensitive receptors to emission sources resulting from the project. Measures identified in the HRA shall be enforced by the County.	Maybe, the referenced Handbook omits industrial development projects from consideration. It is unclear if this applies to the project. Nevertheless, a HRA was prepared for this project.
Policy EJ-A.16.	The County shall, within one year of General Plan adoption, prepare a chart based on General Plan Amendment No. 559 (SB 244 Analysis), approved by the County in 2020 summarizing infrastructure deficits in disadvantaged unincorporated communities, and funding sources that could be used to remedy the infrastructure deficits. In each annual general plan progress report, the County shall report on what funding was sought and whether the funding was appropriated or awarded.	No, the project will not affect the County's ability to prepare a chart.

Table E.2 Fresno County Council of Governments Priority Climate Action Plan

GHG Reduction Measure		Applies to Project?
Transportation 1.	Develop a robust public electric vehicle charging network in Fresno County, including in the disadvantaged communities, to increase electric vehicle adoption in Fresno County. (Implementing measures could include a neighborhood electric vehicle (NEV) network).	No, the project will not affect the County's ability to develop a robust public electric vehicle charging network.
Transportation 2.	Continue to convert the municipal fleet (including transit) into zero emission vehicles and provide a sustainable and reliable	No, the project will not affect the County's ability to

GHG Reduction Measure		Applies to Project?
	support system for such zero-emission fleet which could include, but not limited to maintenance, charging facilities, training of personnel, etc. (Implementing measures could include fleet electrification, installation of electric vehicle charging infrastructure, etc.)	convert the municipal fleet into zero-emission vehicles.
Transportation 3.	Build a well-connected bike and pedestrian system that provides alternative transportation options including micromobility such as shared e-bike and e-scooter. (Implementing measures could include pedestrian network improvements, bike parking, expanded bikeway networks, electric bikeshare program, scooter share program, dedicate land for bike trails)	No, the project will not affect the County's ability to build a well-connected bike and pedestrian system.
Transportation 4.	Enhance the public transportation system by maintaining/expanding the existing transit system and implementing other transit strategies such as micro transit.	No, the project will not affect the County's ability to enhance the public transportation system.
Transportation 5.	Provide incentives for carpool and vanpool, and other shared mobility options. (Implementation measures could include commute trip reduction programs, end-of trip facilities, car-sharing program, employer-sponsored vanpool/shuttle, priced workplace parking, and/or employee parking "cash-out" programs.)	No, the project will not affect the County's ability to provide incentives for shared mobility options.
Building Energy 1.	Incentive programs for the purchase of certified energy efficient appliances, heating and cooling equipment, lighting, and building products to replace inefficient products. (Implementation could include air distribution system updates such as right-sizing fan system equipment and converting to a variable-air-volume system, heating and cooling system upgrades, reductions in supplemental energy load consumption by installing ENERGY STAR equipment, window films, and adding insulation or reflective roof coating and/or installation of energy-efficient lighting.)	No, the project will not affect the County's ability to provide incentives for energy efficient appliances and building systems.
Building Energy 2.	Incorporate water efficiency measures that reduce water heating energy consumption by installing alternative types of water heaters in place of gas storage tank heaters in residences.	No, the project is industrial and uses primarily unheated water.
Building Energy 3.	Bundle on-site renewable energy generation with energy efficiency improvements in residences and commercial buildings. (Implementation could include establishment of on-site renewable energy systems such as solar power with fuel cells and battery storage, biomass combustion, and/or wind power, limitations on non-renewable energy sources.)	No, the project is industrial and has no residences or commercial buildings.
Solid Waste and Wastewater 1.	Programs and incentives to reduce or divert waste (including food and/or yard waste) through improved production practices, improved collection services, and increased reuse or recycling rates. (Implementation measures could include organics diversion	No, the project does not affect the County's ability to create programs and incentives to reduce or divert waste. However, the project does include

GHG Reduction Measure		Applies to Project?
	program, educational programs to inform residents about reuse, recycling, composting, waste to energy, and zero waste programs. Local recycling and composting initiatives at the neighborhood level, expansion of local business recycling and composting efforts.)	equipment that would divert and recycle waste concrete debris generated by construction projects in the region.
Solid Waste and Wastewater 2.	Installation of renewable energy and energy efficiency measures at wastewater treatment facilities.	No, the project is not a wastewater treatment facility.
Agriculture 1.	Programs and incentives to reduce GHG emissions associated with manure management from livestock and poultry operations.	No, the project does not involve manure management.
Agriculture 2.	Programs and incentives to reduce GHG emissions associated with agricultural burning, including orchards and vineyards, through chipping and use for soil incorporation, on-site land application on agricultural land, off-site beneficial re-use, or other approved methods. (Implementation measures could include additional funding or outreach support for existing programs available through the San Joaquin Valley Air Pollution Control District (SJVAPCD) and USDA-NRCS, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)	No, the project does not affect the County's ability to administrate programs or incentives; and does not involve agricultural burning.
Agriculture 3.	Programs and incentives to reduce GHG emissions associated with the operation of various agricultural equipment, such as tractors, harvesting equipment, utility terrain vehicles, dairy feed mixing electrification and agricultural pumps through zero-emission replacement as well as the installation of charging or re-fueling stations to support deployment. (Implementation measures could include additional funding or outreach support for existing programs available through USDA-NRCS and the SJVAPCD, educational programs, or other direct funding opportunities for projects proposed as part of PCAP development.)	No, the project does not affect the County's ability to administrate programs or incentives; and does not involve agricultural equipment.

Table E.3 Federal GHG Actions

Date	Action	Description
April 2, 2007	*Massachusetts v. EPA*, 549 U.S. 497	Supreme Court found that GHGs are air pollutants covered by the Clean Air Act. (528-29.)
September 22, 2009	Mandatory Reporting Rule	This rule and subsequent rules which amend 40 CFR Part 98 require and govern the collection accurate and timely data on GHG emissions that can be used to inform future policy decisions.

Date	Action	Description
December 7, 2009	EPA Endangerment Findings	• Elevated concentrations of GHGs—CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations. This is referred to as the "endangerment finding." • Combined emissions of GHGs—CO_2, CH_4, N_2O, and HFCs—from new motor vehicles and new motor vehicle engines contribute to the GHG air pollution that endangers public health and welfare. This is referred to as the "cause or contribute finding." (*Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act* (Dec. 15, 2009) 74 Fed. Reg. 66496, 546.)
December 19, 2007	Energy Independence and Security Act (EISA)	• Increase the supply of alternative fuel sources by requiring fuel producers to use at least 36 billion gallons of biofuel in 2022. • Set a target of 35 miles per gallon (mpg) for the combined fleet of cars and light trucks by model year 2020 and establish a fuel economy program for medium and heavy duty vehicles. • Prescribe or revise standards affecting regional efficiency for heating and cooling products.
April 2010, September 2011, and August 2012	EPA and NHTSA Joint Final Rules for Vehicle Standards	• In 2010, established a National program consisting of new standards for light-duty vehicles model years 2012 through 2016 which achieve the 250 g CO_2/mile (35 mpg) target in the EISA beginning with the 2016 model year fleet. • In 2011, approved GHG emissions standards for medium and heavy duty trucks model years 2014 through 2018. • In 2012, approved standards for model year 2017 and beyond light duty vehicles to 163 g CO_2/mile (i.e., 54.5 mpg if achieved only by fuel efficiency) for model year 2025.
January 2, 2011	Clean Air Act Permitting for GHGs	On June 23, 2014, the U.S. Supreme Court issued its decision in Utility Air Regulatory Group v. EPA, 134 S. Ct. 2427 (2014) ("UARG"). The Court held that EPA may not treat GHGs as an air pollutant for purposes of determining whether a source is a major source required to obtain a PSD or title V permit. The Court also held that PSD permits that are otherwise required (based on emissions of other pollutants) may continue to require limitations on GHG emissions based on the application of Best Available Control Technology (BACT).
August 3, 2015	Clean Power Plan	The Plan provides standards for power plants, customized goals for states to cut the carbon pollution from power plants, national consistency, accountability and a level playing field while reflecting each state's energy mix. On February 9, 2016, the Supreme Court stayed implementation of the Clean Power Plan pending judicial review. EPA claims "The Court's decision was not on the merits of the rule. EPA firmly believes the Clean Power Plan will be upheld when the merits are considered because the rule rests on strong scientific and legal foundations."

Table E.3 Climate Change Policies and Measures

Recommended Action	Applies to Project?
Implement SB 350 by 2030: • Increase the Renewables Portfolio Standard to 50 percent of retail sales by 2030 and ensure grid reliability. • Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030. • Reduce GHG emissions in the electricity sector through the implementation of the above measures and other actions as modeled in IRPs to meet GHG emissions reductions planning targets in the IRP process. Load-serving entities and publicly- owned utilities meet GHG emissions reductions planning targets through a combination of measures as described in IRPs.	No, Project will purchase grid electricity.
Implement Mobile Source Strategy (Cleaner Technology and Fuels): • At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025. • At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030. • Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean Cars regulations. • Medium- and heavy-duty GHG Phase 2. • Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20 percent of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100 percent of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low-NO_X standard. • Last Mile Delivery: New regulation that would result in the use of low NO_X or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for class 3-7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5 percent of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10 percent in 2025 and remaining flat through 2030. • Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document "Potential VMT Reduction Strategies for Discussion."	No, Project vehicles are heavy-heavy duty and were not subject to heavy-duty GHG Phase 1 regulations. Thus, they would be unlikely to be subject to these measures.
Increase stringency of SB 375 Sustainable Communities Strategy (2035 targets).	No, Project does not affect SB 375 targets.
By 2019, adjust performance measures used to select and design transportation facilities. • Harmonize project performance with emissions reductions, and increase competitiveness of transit and active transportation modes (e.g. via guideline documents, funding programs, project selection, etc.).	No, Project does not affect viability of transit or active modes.
By 2019, develop pricing policies to support low-GHG transportation (e.g. low-emission vehicle zones for heavy duty, road user, parking pricing, transit discounts).	No, Project does not affect government pricing policies.

Recommended Action	Applies to Project?
Implement California Sustainable Freight Action Plan: • Improve freight system efficiency. • Deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.	No, Project does not affect whether Freight Action Plan can be implemented.
Adopt a Low Carbon Fuel Standard with a CI reduction of 18 percent.	No, Project does not affect CARB's ability to adopt standards.
Implement the Short-Lived Climate Pollutant Strategy by 2030: • 40 percent reduction in methane and hydrofluorocarbon emissions below 2013 levels. • 50 percent reduction in black carbon emissions below 2013 levels.	No, Project does not affect whether SLCP strategy can be implemented.
By 2019, develop regulations and programs to support organic waste landfill reduction goals in the SLCP and SB 1383.	No, Project does not affect CARB's ability to adopt regulations.
Implement the post-2020 Cap-and-Trade Program with declining annual caps.	No, Project does not affect CARB's ability to implement Cap-and-Trade.
By 2018, develop Integrated Natural and Working Lands Implementation Plan to secure California's land base as a net carbon sink: • Protect land from conversion through conservation easements and other incentives. • Increase the long-term resilience of carbon storage in the land base and enhance sequestration capacity • Utilize wood and agricultural products to increase the amount of carbon stored in the natural and built environments • Establish scenario projections to serve as the foundation for the Implementation Plan	No, Project does not affect ability to develop such a plan.
Establish a carbon accounting framework for natural and working lands as described in SB 859 by 2018.	No, Project does not affect ability to establish such a framework.
Implement Forest Carbon Plan	No, Project does not affect ability to implement such a plan.
Identify and expand funding and financing mechanisms to support GHG reductions across all sectors.	No, Project does not affect whether CARB can identify and expand funding.

5.6.2. Construction Earthmoving Control Strategies

Non-applicable. No control strategies activated by user.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	31.3700	annual days of extreme heat
Extreme Precipitation	1.85000	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	11.5600	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Unit represents a single road system covering a total area of 1.2 acres.

Construction Phase -

Road Dust - Area will not be paved prior to contstruction of paved roads.

Consumer Products -

Construction Off-road Equipment Mitigation - Assuming 3% moisture content due to continuous watering. Per AP-42 Section 13.2.2 this is approximately equivalent to 80% control as outlined in The Report.

Shaded Cells represent lack of source or source with de mimimis emissions
Production based on email from John Buada Dated 7/18/19
Annual Trips and Baseline aggregates production based on TIS Tables 4.1 - 4.4 Dated 11/15/19 (Appendix C)
Daily Trips calculated based on maximum day and may differ from TIS tables
Site Services and Visitor Trips Include Diesel Delivery for Onsite Mobile Equiptment
Trip lenghts based on Google Earth Measurments and Email from John Buada Dated 5/3/18
Site Services and Visitor Trips Devided by site based on produced
tonnage for Years 0 - 30, and are assumed to take the longest possible path
Assumes 1 Asphalt plant diesel delivery and 2 mobile equiptment diesel deliveries in Max Day
a - based on 0.05 tons liquid asphalt/ton asphalt
b - based on 0.140 ton cement and supplment/ton concrete

d - based on historic peak sales document
General Assumptions:

9.5	yards RMC per load
27	tons asphalt oil per load
27	tons cement and/or supplement per load
25	tons asphalt per load
25	tons aggregate or recycled material per load
7500	gal diesel per load
2.012	tons/yd3 concrete
1.15	Scaling factor to account for 15% waste

		Years 0 - 30

Note: San Diego Air Pollution Control District (SDAPCD) Emissions factors are utilized for Drilling/Blasting/Quarry Emissions as SJVAPCD does not have applicable guidance for emissions calculations from these emissions source types

Quarrying Emissions Factors (SDAPCD Calculation Method Q01, Quarry Operations, General)

Standard factor lb pm10/ton quarried :	0.021
Control Factor Applied for Watering:	80%
lb pm10/ton quarried (mitigated)	0.0042

Blasting Emissions Data (SDAPCD Calculation Methods O20-D01, O29-B04)

3,000,000	Ua - annual quarry material blasted (tons)
0.00008	EF - Particulate emissions factor for wet drilling (lbs/ton quarried)
52	N - Annual Number of blasts (DEIR Pg 2-42, 2-43 states 1 - 2 blasts per week, 1 larger blast is more conservative)
19231	A - Average blast area (ft^2/blast)
19	lbs PM10 Emissions per blast
50	Avg borehole depth (ft) (DEIR Pg 2-42, 2-43)
50	Avg Bench Width (DEIR Pg 2-42, 2-43)
57,692	tons material blasted/blast
961,538	ft^3 material blasted/blast
385	Avg Bench Length (ft) (Calculated)
2	days of drilling per blast
16	hours of drilling per blast
1010	Annual PM10 Emissions from blasting (lbs)

Criteria Pollutant Blasting Emissions Factors - (SDAPCD Calculation Method O29-B04 Blasting Operations, Ammonium Nitrate With Fuel Oil, Bumping)

Factor Description	NOx	CO	SOx
District emissions factor, lbs pollutant/ton explosive	17	67	2
Calculated emissions factor in lbs pollutant/ton quarried	0.0085	0.0335	0.001

Note: Calculated emissions factor assumes 1 lb explosive used per ton Quarried

MT CO2e in Peak Year	261.0

Plant kW draw based on assumptions in G.6b
0.000427 MT CO2e per kWh based on CARB Green House Inventory Documentation
https://bit.ly/2SE6XKF

Throughput Information

Annual Production =	300000.0	yd^3
Density of Concrete =	2.0	$tons/yd^3$
Annual Concrete Production =	603600.0	tons
Amount of Sand and Gravel =	492900.0	tons
Amount of Cement =	73650.0	tons
Amount of Cement Supplements =	10950.0	tons

AP-42 Table 11.12-2, Footnote a.

1865	lb gravel	46%
1421	lb sand	35%
491	lb cement	12%
73	lb supplement	2%
174	lb water	4%
4024	lb concrete	100%

[1] PM2.5 emission factor assumed to be 29.2% of PM10 for material drops based on SCAQMD's Updated CEIDARS Table with PM2.5 Fractions for mineral products - loading

GHG/Electrical Calculation

Plant kW	612.8
Op-Hours in Peak Year	1578.9
kW-hrs in peak year	967578.9
MT CO2e in Peak Year	413.2

Plant kW draw based on assumptions in G.6b
0.000427 MT CO2e per kWh based on CARB Green House Inventory Documentation

Notes: 1. Project emisisons of CO2e would be maximum in Year 1 of the project as demonstrated in Appendix J for off-site travel.
2. The carbon intensity of ULSD in 2026 is less than unmodified ULSD by this amount (see also Appendix L): 18.6%
3. The carbon intensity of ULSD in 2018 is less than the unmodified ULSD by this amount (see also Appendix L): 2%
4.. PM2.5 values include 21.2% of PM10 that is fugitive dust (CEDARIS), exhaust, and tire/brake wear.

Notes: 1. Project emisisons of CO2e would be maximum in Year 1 of the project as demonstrated in Appendix J for off-site travel.

2. The carbon intensity of ULSD in 2026 is less than unmodified ULSD by this amount (see also Appendix L): 18.6%

3. The carbon intensity of ULSD in 2018 is less than the unmodified ULSD by this amount (see also Appendix L): 2%

The emission factors were taken from a worst case summation of CARB Speciation Profiles 715, 716.
Pollutants required for toxic reporting: HAPS w/o Risk Factor or Non - HAPs Current as of 5/14/2013.
SJVAPCD Silo VOC speciation also applied to Loadout VOC emissions and the sum is represented in this table.
PM emissions omitted from SJVAPCD guidance are calculated elsewhere using AP-42 methodology.

that do not contribute to health risk are attributed to the Quarry Site, despite being present on both sites.
Shaded Cells represent lack of source or source with de mimimis emissions

Aggregates Fugitive Mining, Storage, and Sitewide Drop Emissions

Drops from stationary equipment (i.e., conveyors) are included in the plant emissions calculations.

Drop and Mining Emission Factors, Storage Pile Emissions

Material Transfer Point Controlled Emission Factor from SSP1610:

PM10 EF (lb/ton) =	0.000046
PM2.5 EF[2] (lb/ton) =	0.000013

PM2.5 emission factor assumed to be 29.2% of PM10 based on SCAQMD's Updated CEIDARS

Storage Pile Emissions (Controlled Factor from SSP1610 - Aggregate Processing)

lb PM10/acre/day (mitigated) 0.527 lb PM10/acre/day (baseline) 1.054

	Site	Area (acres)	Hourly Emissions (lbs)	Daily Emissions (lbs)	Annual Emissions (lbs)
Basline Storage (Acres)	South	30.0	1.3	31.6	11541.3

Note: San Diego Air Pollution Control District (SDAPCD) Emissions factors are utilized for Drilling/Blasting/Quarry Emissions as SJVAPCD does not have applicable guidance for emissions calculations from these emissions source types

Quarrying Emissions Factors (SDAPCD Calculation Method Q01, Quarry Operations, General)

Standard factor lb pm10/ton quarried :	0.021
Control Factor Applied for Watering:	90%
lb pm10/ton quarried (mitigated)	0.0021

Blasting Emissions Data (SDAPCD Calculation Methods O20-D01, O29-B04)

3,000,000	Ua - annual quarry material blasted (tons)
0.00008	EF - Particulate emissions factor for wet drilling (lbs/ton quarried)
52	N - Annual Number of blasts (DEIR Pg 2-42, 2-43 states 1 - 2 blasts per week, 1 larger blast is more conservative)
19231	A - Average blast area (ft^2/blast)
19	lbs PM10 Emissions per blast
50	Avg borehole depth (ft) (DEIR Pg 2-42, 2-43)
50	Avg Bench Width (DEIR Pg 2-42, 2-43)
57,692	tons material blasted/blast
961,538	ft^3 material blasted/blast
385	Avg Bench Length (ft) (Calculated)
2	days of drilling per blast
16	hours of drilling per blast
1010	Annual PM10 Emissions from blasting (lbs)

Criteria Pollutant Blasting Emissions Factors - (SDAPCD Calculation Method O29-B04 Blasting Operations, Ammonium Nitrate With Fuel Oil, Bumping)

Factor Description	NOx	CO	SOx
District emissions factor, lbs pollutant/ton explosive	17	67	2
Calculated emissions factor in lbs pollutant/ton quarried	0.0085	0.0335	0.001

Note: Calculated emissions factor assumes 1 lb explosive used per ton Quarried

Hard Rock Excavation and Blasting Emissions - Years 0 - 29

Notes: 1. Project emisisons of CO2e would be maximum in Year 1 of the project as demonstrated in Appendix J for off-site travel.
2. The carbon intensity of ULSD in 2026 is less than unmodified ULSD by this amount (see also Appendix L): 18.6%
3. The carbon intensity of ULSD in 2018 is less than the unmodified ULSD by this amount (see also Appendix L): 2%
4.. PM2.5 values include 21.2% of PM10 that is fugitive dust (CEDARIS), exhaust, and tire/brake wear.

Notes: 1. Project emisisons of CO2e would be maximum in Year 1 of the project as demonstrated in Appendix J for off-site travel.

2. The carbon intensity of ULSD in 2026 is less than unmodified ULSD by this amount (see also Appendix L): 18.6%

3. The carbon intensity of ULSD in 2018 is less than the unmodified ULSD by this amount (see also Appendix L): 2%

References:

The emission factors were taken from a worst case summation of CARB Speciation Profiles 715, 716.
Pollutants required for toxic reporting: HAPS w/o Risk Factor or Non - HAPs Current as of 5/14/2013.
SJVAPCD Silo VOC speciation also applied to Loadout VOC emissions and the sum is represented in this table.
PM emissions omitted from SJVAPCD guidance are calculated elsewhere using AP-42 methodology.

Blue Smoke Control *is a division of* Butler-*Justice Inc.*

Blue Smoke Control Permitting Parameters
Model 6S20C

The Blue Smoke Control collector, designed for controlling blue smoke that typically comes from in-plant transferring and loading hot mix asphalt, is a patented product of Butler-Justice Inc., Anaheim California. The equipment is marketed under the registered trade name BLUE SMOKE CONTROL.

With installations in several states, we have learned that each state has their own unique set of permitting requirements. Nevertheless, the following specifications will likely meet the needs of most agencies.

GENERAL DESCRIPTION

The Blue Smoke Control collectors are high efficiency cartridge mist collectors. Constructed with a steel housing, the filtration is accomplished in cells with each cell having seven stages. Each stage is more efficient than the previous. The first three stages are metal and designed to be cleaned when necessary. Stages four, five, six and 7 are disposable and are to be replaced when they become plugged.

Model 6S20C

Number of cells … 20 with maximum capacity each cell … 2,000 CFM

Maximum collector rated capacity for the Model 6S20C … 40,000 CFM

Fan …75 HP, rated for 40,000 CFM at 8 inches SP

Number of Primary and secondary filters … 20 sets (Stages 6&7)

Primary stage 6 filter dimensions … 25.5" Long x 26" Diameter. (This is a pleated cartridge type filter with a 220 sq ft of filter media per cartridge.)

Filter efficiency is 98% on 1.8 Micron (Refer to filter manufacturer's data sheet-Dryflo filter),

Secondary Stage 7 filter insert is 95% efficient at .3 microns (refer to manufacturer's data sheet 95-DOP)

Number of pre-filters … 100 (Stages 1-5 including a 5th stage wrap around stage 6)

Plan and elevation views of this equipment are illustrated on Blue Smoke Control drawing number BSC-PB-20C. Also, refer to the product brochure for photographs of typical installations, explanation of the equipment, and illustrations of the six stages of filtration. For further information, call 714-696-7599.

Pollution Control Systems for the Hot Mix Asphalt Industry.

$$E = [k(sL)^{0.91} \times (W)^{1.02}] \times (1 - P/4N)$$

Where:
E = the particulate emission factor in units of pounds of particulate matter per VMT
k = the U.S. EPA AP-42 particle size multiplier (PM_{10} = 0.0022 lb/VMT),[1]
sL = the roadway-specific silt loading in grams/square meter (g/m^2),[2,3,4,5]
W = the average weight of vehicles traveling the road (California statewide default = 2.4 tons),[5]
P = number of "wet" days, when at least one site per county received at least 0.01 inch of precipitation during the annual averaging period,[9] and
N = the number of days in the annual averaging period (default = 365)

Operations

THIS PAGE IS INTENTIONALLY BLANK

Table 1

- Program Input Data -

- Program Models Selected -

- Concentration
- Using final cloud rise ht. for all calc. distances.
- Flat terrain is assumed.
- Grid system origin is not added to source rectangular coordinates
- Instantaneous sources can use both stable and adiabatic plume rise.
- Grid receptor system is ----------Rectangular

- Print Output Options -

- Print and save data using Detailed processing mode
- Print concentration output units ---------- Micrograms/Cubic Meter

- Receptor Grid System Geometry -

Grid system orientation angle (Degrees) ---------- .0
Receptor X coordinate units ---------- Meters
Y coordinate units ---------- Meters
Z coordinate units ---------- Meters
X origin ---------- .00
Y origin ---------- .00
X Axis of the grid system (Meters)---------- 100.00,
Y Axis of the grid system (Meters)---------- 100.00,

- Source Geometry/Emission Strength -

Material or fuel/explosive ---------- ANFO
Pollutant/species ---------- NO2
Total number of sources ---------- 1

Source Number	Ident	Reference System	Source Type	Emission Type
1	Single Blast	Rectangular	Volume	Instantaneous

Source Number	X Coordinate	Y Coordinate	Z Elevation	Release Height	Emission Strength
1	.0 m	.0 m	.0 m	3.6~ m	5.50000E+01 lb

~ Means the value is defaulted for each hour of met. data.

Source Number	Rect. Expan. Dist. / Reference Dist. /Crosswind	Vertical/Crosswind	Air Entrain-/Dispersion Coeff. Vertical/ment Coeff. /Crosswind	Vertical

1	50.00 m	50.00 m	.00 m	.00 m	.640	1.000	1.000

Table 1 (cont.)

- Program Input Data -

- Source Geometry/Emission Strength -

Source Number	Fuel Heat Content	Fuel Burn Rate	Fuel Burn Time	Initial Diameter
1	890.0 ca/g	9979.03 g/s	2.5 s	7.18~ m

~ Means the value is defaulted for each hour of met. data.

- Pollutant/Species Material Characteristics -

Pollutant/species name ---------- NO2
Pollutant/species is ---------- Gaseous
Particle material half-life ---------- infinite
Molecular weight (g/g-mol) ---------- 46.0
Density of species (g/cm**3) ---------- .00118
Fraction of exhaust cloud constituting pollutant/species ----- 1.0

- Meteorological Data -
([#-#] min-max limits)

Year [1900-2099]---------- 2025
Month [1-12]---------- 8
Day [1-31]---------- 12
Hour (PDT) [00-23]---------- 1300
Minute ---------- 45
Julian day [1- 1]---------- 224
West longitude (degrees) ---------- 119.73070
North latitude (degrees) ---------- 36.95313
Time zone difference from GMT (hours) ---------- 8.
Surface pressure (mb) [600.0-1100.0]---------- 986.00
Cloud cover (8ths) [0-8]---------- .00
Cloud ceiling (m) [.0-20000.0]---------- 10000.00
Net radiation index [-2- 4]---------- 2.
Pasquill stability category [A-F]---------- C
Wind speed reference height (m) ---------- 10.00
Surface roughness length (cm) [.00-100.00]---------- .000
Vertical grad. of pot. temp. (C/m) [-5.000- 5.000]--------- .0

Table 1 (cont.)

- Program Input Data -

- Meteorological Data -
([#-#] min-max limits)

Reference wind speed (m/s) [1.0- 50.0]---------- 2.990
Minimum (at 2m) wind speed (m/s) ---------- 2.167
Air temperature (K) [213.1-333.1]---------- 318.800
Standard dev. of wind direction angle (d) [1.0000-80.0000]------ 16.0000
Standard dev. wind elevation angle (d) [1.0000-50.0000]--------- 6.0000
Longitudinal turbulence intensity (d) [1.0000-106.4000]--------- 21.2800
Measurement time for std. dev. wind dir. angle (s) [2.5-3600.0]- 600.00
Air humidity (%) (.0-100.0)---------- 50.0
Surface mixing layer height (m) [1.0-20000.0]---------- 1200.00
Wind direction (From) (deg) [.0- 360.0]---------- 270.0
Wind-direction shear (d/m) [-45.0- 45.0]---------- .00
Wind-speed power law exponent [.000-5.000]---------- .2
Wind-speed shear (m/s) [.00- 20.00]---------- Compute

- Input/Output Files Used -

Input save data file name ---------- ROCK_IN.INP
Print solution output file name ---------- CEMEX1.OUT
Graphics/solution input/output file ---------- CEMEX1.SOL

Table 2
NO2 Peak Concentration (Micrograms/Cubic Meter)

- X Axis (Meters) -
100.000
Y A

*** MODELOPTs: CONC ELEV FLGPOL ARM2 RURAL ADJ_U*

*** MODEL SETUP OPTIONS SUMMARY ***

** Model Options Selected:
* Model Allows User-Specified Options
* Model Is Setup For Calculation of Average CONCentration Values.
* NO GAS DEPOSITION Data Provided.
* NO PARTICLE DEPOSITION Data Provided.
* Model Uses NO DRY DEPLETION. DDPLETE = F
* Model Uses NO WET DEPLETION. WETDPLT = F
* Stack-tip Downwash.
* Model Accounts for ELEVated Terrain Effects.
* Use Calms Processing Routine.
* Use Missing Data Processing Routine.
* No Exponential Decay.
* Ambient Ratio Method Ver 2 (ARM2) Used for NO2 Conversion
with a Minimum NO2/NOx Ratio of 0.500
and a Maximum NO2/NOx Ratio of 0.900
* Model Uses RURAL Dispersion Only.
* ADJ_U* - Use ADJ_U* option for SBL in AERMET
* CCVR_Sub - Meteorological data includes CCVR substitutions
* TEMP_Sub - Meteorological data includes TEMP substitutions
* Model Accepts FLAGPOLE Receptor . Heights.
* The User Specified a Pollutant Type of: NO2

**Note that special processing requirements apply for the 1-hour NO2 NAAQS - check available guidance.
Model will process user-specified ranks of daily maximum 1-hour values averaged across the number of years modeled.
For annual NO2 NAAQS modeling, the multi-year maximum of PERIOD values can be simulated using the MULTYEAR keyword.
Multi-year PERIOD and 1-hour values should only be done in a single model run using the MULTYEAR option with a single multi-year meteorological data file using STARTEND keyword.

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates ANNUAL Averages

**This Run Includes: 9 Source(s); 10 Source Group(s); and 6883 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 9 VOLUME source(s)
and: 0 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with a total of 0 line(s)
and: 0 SWPOINT source(s)

**This Run Includes BACKGRND Values for 0 Source Group(s) for a Single Sector
Non-HOURLY BACKGRND Values are Available Varying by: ANNUAL

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 21112

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by Day (MAXDAILY Keyword)
Model Outputs External File(s) of Maximum Daily 1-hr Values by Year (MXDYBYYR Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 101.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 43.6 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**Detailed Error/Message File: NO2BLASTING.ERR
**File for Summary of Results: NO2BLASTING.SUM
