On behalf of Braswell, I am writing in support of Cemex's Rockfield Quarry Modification Project.

Comment 31-1

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor

Thank you for recognizing the benefits of having a quarry located in your community.

Sincerely,

Allan Braswell

RE: Support CEMEX's Modification Plan for the Rockfield Quarry

Dear Mr. Randall,

On behalf of Heavy Road & Rail Inc., I am writing to express our strong support for Cemex's Rockfield Quarry Modification Project. For the past 100 years, Cemex's Rockfield Quarry has been a reliable and indispensable source of construction aggregate in the Fresno region. Access to a local and affordable aggregate supply is essential for businesses considering expansion or relocation to Fresno County, as well as for public agencies investing taxpayer dollars in infrastructure projects.

Comment 32-1

The Fresno region is expected to see increased demand for new construction in the coming decades, requiring over 6 million tons of construction aggregate annually for the next 50 years. This demand must be met locally, rather than relying on transportation from outside the region. Transporting aggregates from distant sources not only increases construction costs, fuel consumption, and greenhouse gas emissions but also contributes to worsening traffic congestion. According to the Department of Conservation, transportation costs alone can rise by 22 cents per ton for every additional mile traveled, leading to higher costs that are ultimately passed on to businesses, homeowners, and taxpayers.

Cemex has long been a dependable supplier of the building materials essential for the region's growth and the county's public infrastructure investments. Aggregates from the Rockfield Quarry have been integral to the construction of homes, businesses, roads, and schools throughout our neighborhoods.

Notably, Cemex's proposed modification plan includes extensive resources for wildlife and habitat protection, covering 470 acres of open space with riparian areas, ponds, lakes, and native vegetation. Additionally, the plan includes an easement for the Parkway Plan, which will expand the existing pedestrian and bike trail along the San Joaquin River, benefiting the local community.

Cemex has developed a thoughtful, balanced approach that addresses the region's need for construction materials, water conservation, environmental protection, and recreational spaces, all while remaining a responsible corporate citizen and neighbor.

Thank you for considering the essential benefits of having a quarry in our community. We fully support the Rockfield Quarry Modification Project and its potential to foster sustainable growth for Fresno County.

Sincerely,

David Cruce

RE: Support CEMEX's Modification Plan for the Rockfield Quarry

Dear Mr. Randall,

On behalf of Jim Crawford Const. Co. Inc., I am writing in support of Cemex's Rockfield Quarry Modification Project. Comment 33-1

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

RE: Support Cemex's Modification Plan for the Rockfield Quarry

Dear Mr. Chairman and Planning Commissioners,

On behalf of the Operating Engineers Local Union #3, I am writing in support of Cemex's Rockfield Quarry Modification Project.

Comment 34-1

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region. Cemex directly supports over 90 people in the Fresno region, providing high quality, high paying jobs, many of them union jobs, as a source of economic security for their families.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Again, on behalf of our members and the communities who depend on a local source of construction aggregate to build homes, businesses and public sector infrastructure, we urge the Fresno County Planning Commission to approve the modification plan without delay.

Thank you for recognizing the benefits of having a quarry located in your community.

Sincerely,

Wyatt Meadows

District Representative OE3

Subject: Opposition to the CEMEX Rockfield Quarry EIR 7763 Proposal and the Future of the San Joaquin River

Dear David Randall,

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years. Comment 35-1

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource. Comment 35-2

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations. Comment 35-3

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts. The increased truck traffic, potential river pollution, and habitat destruction would be devastating for local wildlife. Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells. Comment(s) 35-4 35-5 35-6

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability. Moreover, the current agreement lacks measurable performance oversight, and reports indicate repeated violations of work schedules and environmental standards. The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences. Comment(s) 35-7, 35-8 35-9 35-10

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs. Comment 35-11

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century. Comment 35-12

Thank you for your time and consideration. I look forward to your response on this critical issue.

Sincerely,

Larry N Odell

Public Comments

TO: Delivered by Email to: tmtunga@fresnocountyca.gov
Also, by mail to: David Randall, Senior Planner, Fresno Public Works and Planning Department, Divisions of Public Works and Planning, 2220 Tulare Street, 6th Floor, Fresno, CA 93721

SUBJECT: Draft Environmental Impact Report, EIR No. 7763 (the "Draft", "Draft EIR", or "EIR") , and Unclassified Conditional Use Permit Application Nos. 3555 and 3667 ("UCUP" or "Permit Applications"), Proposed CEMEX Rockfield Quarry Modification Project ("Cemex", "Quarry", or the "Project").

Other References: Current Plant Site, N. Willow/Little Dry Reek ("Current Plant Site", or "Site 1") Quarry Site, N. Friant Road-Bluff View Avenue ("Quarry Site", "New Plant" or "Proposed Plant Site", or "Plant Site 2").
Fresno County (the "County"), Board of Supervisors ("Supervisors", or By Named Supervisor)

FROM: Dr. Joseph J. Penbera and Mrs. Wendy Penbera. Residents of Fresno County. Residing immediately across and facing the CEMEX proposed Quarry and Plant 2 site, at 15302 Mesa View Avenue, Friant, CA 93626. Telephone: 559-360-3535. Email: jpenbera@comcast.net.

Background of Persons Providing Comments:

Dr. Joseph Penbera is Chairman and founder of the California Energy Investment Center (CEIC) which has assisted in bringing millions of dollars of capital investment and creating thousands of new jobs for environmentally friendly projects in targeted employment areas. He is a member of the National Association of Forensic Economists (NAFE), a former Fulbright Senior Scholar in Economics, and recognized as a top economist by professional and media organizations and as a qualified forensic expert in virtually all court jurisdictions and by many government agencies. Dr. and Mrs. Penbera have deep ties to the Fresno area. Dr. Penbera served as Dean of The Craig Business School and on the San Joaquin River Parkway Board at its inception. He has studied the region for more than three decades and produced the first Statistical Abstract for the Central California counties, and the Population Forecast for Fresno County, among others. Wendy Penbera is a former Regional Director for Special Olympics, served on the State Legislative Committee for Junior League, and is a life-long resident of the Central Valley. All three of the Penbera children graduated from Fresno County schools.

Comment 36-1

Part A: General Comments:

1. **EIR Review Process.**
   Much respect is accorded to the County staff. CEMEX has proposed a project which is by its very nature complex and challenging as to its scope. However, the EIR review process and an analysis of a 1000-page Draft EIR document is inherently even more overwhelming when considered by people unfamiliar with such matters. Very few people in the general public have experience with the historical and public policy context of the current application made by Cemex. All in all, this can seem daunting as to even where to start and to believing whether spending the time will be worth it. Intended or not, the review process, handling of public comments, and the meeting and hearing logistics related to the Cemex extension several years ago, muted public participation, disadvantaged interaction and sharing of comments and feedback among individuals and groups, and put major holes in public confidence. Comment 36-2

   Let's not let that happen again by recognizing that CEMEX has had years to formulate a strategy based on making contact with staff, collateral agencies, and Supervisors. Cemex and its consultants have a head start in terms of influencing the process and the outcomes, so some meaningful steps should be taken to create a more level playing field. We suggest the following:

   - **The comments made by the public should be posted by the County on its website so that everyone can see them. This information is necessary to coalesce public opinions and interactions and towards properly gauging public sentiment.** Comment 36-3
   - **The identities of the agencies or entities that have either formally seen the Draft EIR or have worked with CEMEX consultants directly or indirectly through County staff should be made public, and the dates and subject matter and agreements or compromises reached during these contacts should be disclosed. This information is necessary to determine if various organizations are or have been working to meet their respective mandates, and which should be contacted.** Comment 36-4
   - **The names and backgrounds of each of the technical experts used by Cemex in working on the Draft EIR and on any collateral documents or process related to the proposed Quarry, and related current and future Cemex operations, should be disclosed. This information should be provided so that the independence of these persons or organizations can be determined.** Comment 36-5
   - **As reported in The Fresno Bee, CEMEX failed in its attempt to gain approval in Mexico of the blasting methods it wishes to deploy here. If CEMEX has provided information and independent studies associated with deep blast mining to the County, this information should be publicly shared. If it has not provided such information, then this should also be disclosed. Even if such information was forthcoming from Cemex, it would be helpful if the County staff would produce a White Paper about the risks associated with deep blast mining.** Comment 36-6
   - **With a proposal of this magnitude, the proponent and/or the County should provide video and audio simulations relating to deep blast mining methods, and the light, traffic, water, and air pollution and other effects from the Quarry and the proposed plant on the Parkway zone and on residents proximate to plant 2, and at various other distances from the site. The visual perspective of these simulations should not be based solely on current conditions, but also from a forward perspective which** Comment 36-7 Comment 36-8

includes, among others, important trends like future projected residential growth of the area and the increases in hours and extent of operations.

Comment 36-8 Cont.

- **For decades now, the existing plant has been operating without an EIR. An extension was granted several years ago that ignored the changed conditions of the area even though changes in conditions is supposed to be at the heart of every extension given. The public deserves to know why the continuation of that plant should not be addressed <u>prior</u> to when the Quarry proposal and the Draft EIR are even considered. Again, an overlay of the conditions that exist now at site 1 versus those that existed decades ago would represent an objective approach to assessing if mining operation of ANY kind should be permitted in the river bottom.**

Comment 36-9

Comment 36-10

- **The public hearing meetings need to be held at times that better accommodate public participation. When the Ball Ranch development was proposed, Supervisors like Sharon Levy, seemed to make it easier for multiple voices to be heard. Even prior to the hearings, Supervisors should make themselves available to hear comments and questions at a series of open public meetings.**

Comment 36-11

The governmental process used which resulted in Cemex obtaining its last extension raised the public's awareness of things that impact decision-making in the County. First, CEMEX has many more resources in terms of time and money at its disposal to communicate what it wants. Second, CEMEX served up payroll for less than 60 people as the only thing that mattered which had the effect of being dismissive the views of not only many other stakeholders, but also contradicted the principle of changed conditions which had implications for how the findings of the staff were treated. If that process and result is repeated in any form or function, then this entire EIR process should be viewed as an accommodation to a foreign company and that the real decisions were made in a dark room.

Comment 36-12

Comment 36-13

2. **EIR Flaws: In reviewing the EIR itself, there are two things that appear to be missing:**

Comment 36-14

- **Oversight, Sanctions, Financial Reserves: CEMEX is requesting—among other things--to use risky drilling methods, increase traffic, expand operating times, and for a 100-year period. This is such an overreach that it seems like a corporate strategy which aims very high with the expectation that negotiations could be characterized as give and take, and, seemingly, resulting in a compromise solution, when, in fact, getting the project through in just about any form and over any time frame is really the CEMEX objective.**

What is missing in the EIR is any systematic discussion of what happens if the current major assumptions and claims made by CEMEX prove wrong, or even if CEMEX just exhibits bad operational behavior.

Comment 36-15

We view the omission of oversight as a very serious shortcoming. Planners may suggest that the EIR is not required to address this matter, but that has proven to be a very dangerous position to take. It this cannot be addressed directly in the EIR, then there should be a collateral document which does provide for oversight, sanctions, and financial reserves. The Draft EIR invites bad assumptions because there are no consequences for making them. There is no requirement for CEMEX to set aside annually a portion of its revenues. There is no provision for CEMEX to pay for

Comment 36-16

inspectors; we must all rely on CEMEX's good faith that they will self-report and self-correct. There is no provision for sanctioning CEMEX if it violates operating tenets. The Draft EIR lacks common sense based on first, that things go wrong, and second, that the longer the perspective, the less valid are the assumptions underlying that perspective.

Comment 36-16 Cont.

Ignoring oversight, sanctions, and financial reserves based on negotiations which reduce the timeline of the project would not resolve anything' in fact, that should be considered as somewhat of a red herring. Approval of the project in any form or timeline must still be viewed as generating risks and insecurity for the people of Fresno County.

Comment 36-17

The degree of oversight, specifying violations which would generate sanctions (including work stoppages or a total closure), and the amount of reserves that should be very high on the list of the County's responsibilities and should not be ignored or even delayed. Considering the project as it is now proposed, nothing today in the Friant corridor or north Fresno or across the river in Madera or in downturn Fresno is likely to look exactly like it does today 100 years from now, and everyone involved will be gone in 100 years.

Comment 36-18

- **Taken as a whole, the quarry project is a completely different project than the current project. The proposed project is not simply an extension of current operations and simply moving these to a different site.**

Comment 36-19

The Draft EIR should, at least, contain a discussion that the current operations have existed for decades without an EIR and have been extended. It should point out that the staff analysis regarding the changed conditions in the areas-- even though changed conditions in the given area are supposed to be the basis for extending or denying operations in the river bottom – was effectively ignored.

It should also discuss changed conditions around site 2 as well. As will be discussed later, the existence of the River Parkway alone represents a major change in area conditions.

This discussion in the EIR will set the record straight and would resolve a basic question about the legitimacy of the Draft EIR process. Before this Draft EIR is even considered, should a question be put to the Planning Staff and the public which asks whether ANY industrial operation is compatible with respect to the conditions extant in north Fresno, Friant Road, and river corridor, and which, of course, considers the current and future growth prospects and the plans for the River Parkway?

Comment 36-20

Part B: Comments Relating to Environmental Issues

Comment 36-21

Most of our comments are going to relate to untrue statements or implied claims made by Cemex, or the insufficiency of mitigation, or that the assumptions about cause and effect related to a particular issue are too speculative to be relied upon.

1. **CEMEX claims that the Quarry and Plant Site 2 is an "extension" of its current *aggregate surface mining operations* and its current plant at Willow and Friant.**
   Comment: This is untrue.
   The project utilizes vastly different methods, is not surface mining, and has much larger environmental impacts.

2. **The Conditional Use Applications are a continuation and modification of its current mining and processing operations.**
   Comment: This statement is somewhat misleading.
   The current method of mining is not the planned method. Also, the current uses are not based on an approved EIR and, thus, the conceptualization of an application for continuing and modifying current operations that is not supported by an EIR is a false proposition.

Comment 36-22

3. **Cemex wants to obtain a conditional use permit for 100 years.**
   Comment: This time period represents a gross over-reach and calls into question the basic assumptions and claims of mitigation into question. This period represents such a mismatch with respect to business and economic cycles that plans and risk assessment which utilize this time period should be viewed as speculative and, therefore, unreliable.
   It is a commonly accepted principle of planning, and associated attempts to forecast outcomes and consequences of plans, that the longer time period assigned to the forecast, the less accurate the current assumptions and conclusions become.
   The corollary of that principle is that long-term forecasts are inherently riskier than shorter ones.
   When rooted in the concept of considering changing conditions which serves as one of the core principles to be applied to a project approval or extension, the Cemex project contradicts this principle. Instead, it serves to improperly instruct the reviewer to abandon consideration of changing conditions and to put a private company's benefit in its place.

Comment 36-23

4. **CEMEX wants approval to blast a 600-foot deep hole in the land in the San Joaquin River bottom for *hard rock mining.***
   (Note: We do not have direct experience in hard rock mining with blasting; however, Dr. Penbera is drawing on experience with lateral well drilling in hard rock formations).

   Comment: The use of blasting in hard rock mining (sometimes called deep-rock mining), presents significant, unpredictable risks to humans, inanimate objects (like structures, equipment and machinery), and the environment, including other forms of life.
   The following environmental impacts regarding hard rock mining are not sufficiently considered or mitigated in the EIR. Assumptions made in the context of hard rock mining and over a 100-year time frame do not appear to have been empirically tested.

   - **Destruction of habitats**

Comment 36-24

Comment(s)

- **Preservation of river bottom parkway trail connectivity** 36-25
- **Above ground level energy bursts** 36-26
- **Fracturing of ground level rock** 36-27
- **Fracturing and caving in of blast area walls** 36-28
- **Release of blast energy and seismic waves weakening rock stability, based on topography, at distances beyond the plant site** 36-29
- **Noise abatement and open noise carry and reverberation** 36-30
- **Leaking of chemicals and explosive charge materials into groundwater** 36-31
- **Water contamination from rock fracturing and acid leeching into area wells used by humans and livestock** 36-32
- **Dust and rock and other particulate matter diffusion into the air** 36-33
- **Loss of asset value of properties proximate to the quarry and plant site** 36-34
- **Long-term health issues and risks associated with air or water contamination** 36-35
- **Fumes emanating from blasting, equipment machinery, trucks and traffic** 36-36
- **Light pollution effects on habitat and on residents proximate to the quarry** 36-37

5. **Cemex wants to move open pit mining operations to what it is calling a quarry site and shut down its current processing site. This implies some mitigation effect by shutting one site and moving to another.**
   Comment. The implication is untrue. The EIR does not adequately compare the effects of operations on the current site to the new site. As such, it does not directly address the massive increase in the scale of operations that will occur at the quarry site, and along the Friant Road corridor.
   Viewing project site 2 as merely an extension of current operations is misleading. Cemex wants to more than double rock production to 3 million metric tons annually, double the amount of direct and collateral truck trips, expand operating hours, and move all of its operations which brings a massive amount of buildings and equipment to site 2.

   Comment 36-38

6. **The effects of the Quarry site with respect to impacts on existing residential areas and planned growth areas, and effects of increased Fraint Road traffic, have been properly assessed, are not material, and can be sufficiently mitigated.**
   Comment: This claim is --either by fact or implication --not true.
   Friant Road represents a major residential growth corridor. Major new residential construction includes hundreds of residences at Copper River. Friant Rd. joins with Willow Ave. and to major residential developments in all directions along Willow. Fraint Road leads to major residential developments occurring around and above Friant Dam and Millerton Dam. There are 13 houses directly across Friant Road facing the site. There are 2 residences on the same side of Friant close to the Quarry site.
   Friant Road is the main traffic artery along the River Parkway and leads from Woodward Park entrances and a growing retail area at Audubon to new residential and commercial areas as well as to route 41. The newly opened Table Mountain Casino has materially increased traffic. Friant Rd. leads to the Millerton Lake recreation area which has experienced great demand and to new developments on 145.
   The number of accidents and damages caused by debris on Friant Road has increased significantly over the last 10 years.
   In terms of changing conditions and growth, the Quarry site would be placed on one of Fresno's highest growth corridors and a main artery for transit of residents and visitors.

   Comment 36-39

Industrial operations should be regarded as among the most unsuitable and incompatible activities for such corridors.

Comment 36-39 Cont.

C. The River Parkway: A Much Better Choice

Comment 36-40

The direct and indirect impacts on the River Parkway are not the focus of the EIR. Although this is a seemingly neutral statement, the reality is that there is only an EIR under review because Cemex wants to plunk an industrial operation right down in the middle of the River Parkway.

The EIR process is of little value if one does not appreciate the extent to which Cemex's corporate interests conflict with the River Parkway and good planning. Cemex's proposal clearly conflicts with the peace and serenity of the bordering Ledger Island Nature Reserve and the Beck Ranch Nature Reserve, as well as adjacent and proximate ag land and private homes. While other rock operations have been good citizens in terms of avoiding such conflicts by locating their operations away from the river corridor, river bottom, and the Parkway, CEMEX has proposed a project that is so risky in it approach and so grandiose in its scale that it virtually disregards what the River Parkway is and represents.

The San Joaquin River Parkway is a 23-mile stretch of land along the San Joaquin River which is the 3rd longest river in California. The Parkway came into existence through certain core values that we should encourage in our children: preservation and public stewardship of various natural habits and open space, supporting the work and perseverance of volunteers and the entire community in gathering the land, getting influential and enlightened business and public leaders to share the vision of creating a place for all, and securing the resources to put it all together. This job is not done. The Parkway is developing further through its professional staff, Board and volunteers who work diligently towards educating and involving the public through events held at the Hallowell Center (about 3 miles from the quarry site), and in public buildings and in private homes.

The Parkway embodies all that is good and hopeful about Fresno. It represents one of our area's greatest (if not the greatest) most recognizable and patronized local natural asset. We know this because it is a point of interest that brings people together from all walks of life from dawn to dusk. Families from all cultures hold events there. Bicyclists often comment about how much they enjoy the "nature ride" on Friant Road from Woodward Park to Millerton Lake. During Covid, the Parkway proved to be a haven for children and families. We are hopeful that the Planning Department staff will see that the CEMEX project ---no matter how one tries to dress it up-- is not only dismissive of responsible planning, but it is also an attack on the public interest.

We are aware that attempts may be made to pigeonhole public comments as being either for or against business and jobs. We are by no means anti-business people and we are not novices in creating jobs. When it comes right down to it, were it not for the Draft EIR, it would be unimaginable that some foreign company would even suggest putting an industrial project of the kind and magnitude that Cemex has proposed in the river bottom. Fresno deserves better. And the best way for us to get better is to preserve and protect the great natural asset that we have. The Parkway enhances the quality of life for virtually all people of our area. And that, in the end, holds the greatest attraction for people to come to live and work here.

RE: Support CEMEX's Modification Plan for the Rockfield Quarry

Dear Mr. Randall,

On behalf of Jim Crawford Construction Co., Inc., I am writing in support of Cemex's Rockfield Quarry Modification Project.

I have been working with Cemex personnel for over 30 years. Cemex has been one of our main suppliers of aggregates in the Fresno Metropolitan area for many projects throughout the years. Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Comment 37-1

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

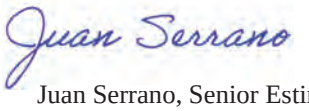
Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Sincerely,



Juan Serrano, Senior Estimator / Project Manager.

Subject: Opposition to the CEMEX Rockfield Quarry EIR 7763 Proposal and the Future of the San Joaquin River

Dear David Randall,

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years. Comment 38-1

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource. Comment 38-2

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations. Comment 38-3

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts. The increased truck traffic, potential river pollution, and habitat destruction would be devastating for local wildlife. Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells. Comment(s) 38-4 38-5 38-6

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability. Moreover, the current agreement lacks measurable performance oversight, and reports indicate repeated violations of work schedules and environmental standards. The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences. Comment(s) 38-7, 38-8 38-9 38-10

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs. Comment 38-11

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century. Comment 38-12

Thank you for your time and consideration. I look forward to your response on this critical issue.

RE: Support CEMEX's Modification Plan for the Rockfield Quarry

Dear Mr. Randall,

On behalf of B & B SURPLUS, I am writing in support of Cemex's Rockfield Quarry Modification Project.

Comment 39-1

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Dear David & Bernice,

Attached is a letter supporting the modification plan for the Rockfield Quarry. Dellavalle Laboratory has provided services for Cemex for the last 10+ years. Our experience has been that Cemex is a group of professionals trying to accomplish their goals in a clear and upfront manner. Through the monitoring services Dellavalle Laboratory has provided we have seen that Cemex is committed to maintaining environmental sustainability in the projects they manage. We look forward to working with Cemex in the years to come and support the Modification Plan for the Rockfield Quarry.

Subject: Opposition to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report

Dear Mr. Randall,

Comment 45-1

We are writing to formally express our opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project.

The Environmental Impact Report (EIR) fails to adequately address key concerns including air quality, water impacts, and threats to local bird populations such as the endangered Tricolored Blackbird.

We request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Re: Support CEMEX's Modification Plan for the Rockfield Quarry

Dear Mr. Randall,

It is my pleasure to write a letter in support of Cemex's Rockfield Quarry Modification Project.

Comment 46-1

As a contractor, I have worked with Cemex for many years and have found them reliable and efficient to work with. Their leadership in health and safety and attention to environmental needs are exceptional.

As the county and city grow continue to grow and demand for construction aggregate rises, it would benefit Fresno County to supply this demand locally instead of sourcing from outside of the area. By using a local company, we can reduce transportation costs, product prices and greenhouse gas emissions. It also provides more local job opportunities. Cemex will help meet the future demands for our area thoughtfully and responsibly.

In conclusion, I fully support CEMEX's modification plan for the Rockfield Quarry. This venture will be exciting and beneficial for local contractors such as myself, as well as the local community's development.

Sincerely,

Bart Jones

David Randall, Senior Planner
Fresno County Public Works & Planning Department Development Services & Capital Projects Division
2220 Tulare St., 6th Floor
Fresno, CA 93721

Dear Fresno County,

I am writing to strongly oppose Cemex and provide a summary of key environmental impact findings. After reviewing the document, it is clear that the project poses significant risks to water availability, water quality, air quality, recreation, and land use planning that have not been adequately addressed. Below, I have outlined specific areas where the DEIR falls short, and I urge you to reconsider this project in its entirety.

Comment 48-1

Water Availability and Quality (Section 4.10)

Comment 48-2

The DEIR fails to sufficiently account for the significant impacts the Rockfield Modification Project will have on **water resources**, **particularly groundwater levels**. According to **Impact 4.10-12**, the project has the potential to **substantially decrease groundwater levels** in a manner that could result in the **flow of substantial volumes of water from the San Joaquin River** to the Quarry Site. Currently, “no surface water from the San Joaquin River is used at the Quarry Site… Similar to the Plant Site, these ponds are all temporary water features that contain surface runoff from rainfall and/or groundwater (4.10.1.4).

Questions:

- Where does Cemex think groundwater, approximately 200ft from the San Joaquin River, comes from?
- If Cemex does not currently use “surface water” why shouldn’t they be held to the same standard?
- What is the current water quality of the “temporary water features” which are being used as groundwater recharge?
- Is the San Joaquin River labeled “groundwater”?

Comment 48-3

Comment 48-4

Comment 48-5

This is unacceptable and not what the San Joaquin River should be used for. Mitigation measures are proposed but they are not sufficient to ensure the long-term preservation of water resources in the region. The report does not adequately address the broader implications of this water loss on surrounding communities or agricultural operations that rely on these vital water sources. The inadequate mitigation and lack of clear, enforceable measures to safeguard water supply and quality are particularly concerning, as this is a **critical resource** for the area.

Comment(s) 48-6 / 48-7

Comment 48-8

Comment 48-9

Groundwater recharge is a long-term, and slow-moving process like so much of conservation efforts. Additionally, if toxic or hazardous materials (4.9-2) enter the groundwater system, this could create expensive and dire consequences for the entire community. To quote, “The transport, transfer, storage, and use of these substances would create a potential for their

Comment 48-10

accidental uncontrolled release. Such releases could result in contamination to soils or surface waters if not properly controlled and cleaned-up. Flammable or other hazardous materials improperly stored or disposed or accidently released to the environment would create fire hazard, risk to human health, and environmental degradation, including surface and groundwater contamination. This is a potentially significant impact."

Comment 48-10 Cont.

Air Quality Impact (Section 4.3)

Comment 48-11

The DEIR states their will be a **cumulatively considerable net increase** of criteria pollutants, particularly in areas where the region is in nonattainment under federal or state ambient air quality standards (Impact 4.3-2). Specifically, **Impact 4.3-2** notes that the project could result in a **cumulatively considerable net increase** of criteria pollutants, exacerbating existing air quality issues in an already nonattainment area for federal and state air quality standards. While a Fugitive Dust Control Plan is proposed, the mitigation measures are **insufficient** and do not fully address the long-term air quality impacts.

The project's reliance on construction-related emissions and dust generation will contribute to elevated levels of particulate matter (PM10 and PM2.5), which are known to have serious health implications for local communities.

- In 2024, Fresno County received failing grades for ozone, short-term particle pollution, and long-term particle pollution, according to the American Lung Association
- In 2024, Fresno County ranked 7th among the most polluted counties in the United States, according to GV Wire

Residents, educational program participants, recreationalists, and community members are suffering. Extending Cemex mining operations in our community is detrimental to the health and quality of life of residents.

Recreation and Land Use (Sections 4.11 and 4.16)

Comment 48-12

The project's potential to increase demand on existing recreational facilities and lead to physical deterioration (Impact 4.16-1) has not been fully evaluated. The DEIR dismisses the potential strain on local parks (Ball Ranch, Sumner Peck, Woodward Park) and other recreational facilities without considering the cumulative impact of ongoing mining operations and associated traffic, noise, and air pollution. The increase in industrial activity and truck traffic is likely to negatively affect the **quality of life** for residents, including their access to safe, clean recreational spaces. The DEIR mentions the Parkway Master Plan (2018) and discusses trail easements in section 2.5.8. Cemex had 100 years to create a trail easement to connect communities- they did not. I'd like a significant more detail on the proposed plan. At the time the DEIR was released, Sumner Peck Ranch was open the public and now- Ball Ranch is open 7 days a week, free of charge. This project is not consistent with the Parkway Master Plan.

Comment 48-13

Comment 48-14

Questions:

- Is Cemex has not prioritized recreational access, why would they now? Especially if they receive approval?
- Anyone who has driven on N. Friant Road knows the **dangers of driving** during mining activities, why would recreationalists want to use a trail that endangers their lives and is listed as a significant impact to scenic and natural landscapes?

Comment 48-15

- My understanding is Cemex had brief conversations with SJRC in 2021. Have they built relationships with current leadership? Have they shown any active participation in the Parkway effort and Master Plan? Have attend PACE meetings? What is their track record for river protection and participation? Comment 48-16
- If this project stops the creation of the most used facilities and trails in the County, why does that not qualify as dividing an established community? (Impact 4.11-1) Comment 48-17

In terms of land use planning (Impact 4.11-2), the project fails to demonstrate that it will not conflict with existing land use plans, policies, and regulations. Despite the claim **of** consistency with local policies, the project introduces substantial risks to surrounding land uses by threatening local communities with increased pollution, noise, and disruption, particularly in areas that are already struggling with recreational infrastructure and air quality issues. Comment 48-18

The DEIR also does not adequately address the **fragmentation** of natural habitats (4.4.1.6) and recreational spaces that could result from project expansion and land disturbance. While some mitigation measures are proposed, they do not go far enough to **protect vital community assets** and ensure sustainable land use in the area. Comment 48-19

Conclusion and Request for Action Comment 48-20

The Rockfield Modification Project poses substantial risks to **local water resources**, **air quality**, **recreational spaces**, and **land use planning**, which the DEIR has not properly addressed. The mitigation measures proposed are insufficient and fail to ensure long-term protection of public health, the environment, and local communities. **I strongly urge the lead agency and County Board of Supervisors to: stop this project from moving forward!** Ensure that land use planning concerns are fully incorporated into the project's design, with a focus on maintaining local community integrity and preserving natural habitats. The current DEIR, as written, fails to meet these critical standards and should be reconsidered.

Thank you for your attention to this urgent matter. I look forward to your response and to further discussions on how we can protect the community and the environment from the significant adverse effects of the Rockfield Modification Project.

Sincerely,

Jenae McCarthy

Subject:	CEMEX Expansion - San Joaquin River Draft EIR Report
Date:	Thursday, March 6, 2025 9:05:29 AM
Attachments:	image001.png image002.png image003.png image004.png

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Mr. Randall,

I am writing to you today in regard to the proposed CEMEX mining pit expansion that is currently seeking entitlement approvals and for which the county is seeking public comments. Comment 49-1

I live at 10672 N. Lanes Rd., Fresno, CA on the San Joaquin River, approximately 7 miles downstream of the proposed mining pit. My wife and I have been at this location for 33 years. While I am generally not opposed to CEMEX continuing their operations and deepening their mining pit, I do have a few concerns that I would like to have the county address in their Conditions of Approval (COA's).

We have 2 wells on our property. Both wells have a fairly high ground water level (20-30 feet) and have historically never varied much over the years we've lived on the river bottom. We've also enjoyed a great water quality in both wells with no issues with contaminants . We suspect that the ground water in our area remains high due to natural ground seepage due to the influence of the river. Comment 49-2

My concerns are as follows:

- What mitigation measures will the county impose upon CEMEX to ensure the deepening of their mining pit will not adversely impact surrounding domestic water wells? I recommend the following measures be a part of the COA's: Comment 49-3
  - Require a series of monitoring wells around the pit site
  - Require CEMEX to regularly test the wells, both from a water level as well as water quality
  - Require the testing be performed by an independent third-party testing lab (Krazan, Kleinfelder, etc)
  - Require CEMEX to publicly post the results on their website
  - Require periodic testing of private domestic wells surrounding the mining pit
  - If the ground water drops in the testing wells or the quality is adversely impacted, require CEMEX to immediately cease operations

- Should issues arise with neighboring domestic wells due to CEMEX mining activities, how does the county plan to mitigate those issues in their COA's? Would the only recourse of the Comment 49-4

impacted property owners be to sue CEMEX? To avoid unreasonable legal costs by owners of impacted wells, I would recommend the following:

- As part of the COA's, require CEMEX to post a bond to pay for any domestic wells adversely impacted by their activities, including the cost for drilling new wells and/or the installation of water treatment systems to remove any contaminants.

Comment 49-4 Cont.

As I'm in a construction related industry, I agree with the need for a steady, sustainable and cost-effective supply of sand and gravel for the construction industry. I have no concerns with the proposed drilling and blasting activities due to the distance from our home to the proposed mining pit. In general, I am supportive of CEMEX's plans, and I would encourage the Planning Commission to approve their application, provided that mitigation measures are put in place to address potential impacts to surrounding domestic water wells.

Comment 49-5

Thank you,

Clay Davis

Re: Notice of Availability of a Draft Environmental Impact Report (EIR) for the Proposed CEMEX Rockfield Quarry Modification Project (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

Dear Director White,

Table Mountain Rancheria, a federally recognized Tribe (Tribe), is in receipt of a letter from the Fresno County Public Works and Planning Department, dated January 2, 2025, regarding the proposed CEMEX Rockfield Quarry Modification Project. As part of the Tribe's initial response, Tribal Cultural Resources staff submitted a request for consultation pursuant to AB-52 in a letter dated January 9, 2025, requesting a site visit, copies of all cultural resources reports, and the results of a record search. Tribal staff was able to secure a site visit on February 24, following outreach by the Tribal Liaison with the California Department of Conservation-Division of Mine Reclamation. Please understand that the Tribe strongly opposes the extension of mining operations at this site and submits formal comments for your consideration. The Tribe feels that this project will continue to pose significant adverse impacts to Fresno County's human population, biological resources, air, water, and Native American cultural heritage.

Comment 50-1

Environmental and Safety Violations

Comment 50-2

CEMEX, a Mexican multinational building materials company, has a long history of environmental and safety violations. According to GoodJobsFirst.org, a Washington, DC-based nonprofit, CEMEX has amassed over $43 million in environmental penalties and more than $6 million in safety-related violations in the US and Puerto Rico, including $2,348,916 in environmental penalties and $1,695,972 in safety penalties incurred in California alone. In 2017, CEMEX Construction Materials Pacific LLC settled with the California Air Resources Board(ARB), paying $59,063 to the ARB and $59,062 to the San Joaquin Valley Air Pollution Control District for failing to comply with cargo-handling equipment regulations. Additionally, in 2009,

Post Office
Box 410
Friant
California
93626
(559) 822-2587
Fax
(559) 822-2693

CEMEX was forced to pay $2 million in settlement fees after increasing emissions at one of its California facilities without obtaining required permits or installing mandated controls. These actions resulted in increased nitrogen oxide pollution, a harmful contaminant that contributes to smog and respiratory problems, in violation of the Clean Air Act. CEMEX's long pattern of environmental neglect and regulatory non-compliance underscores their unfitness for further operations. This history raises deep concerns about their suitability for expanding operations at this location, a mere 200 feet from edge of the San Joaquin River, as required by the existing CUP and the CUP currently under consideration. Please be aware that since at least 2014, it appears that heavy equipment mining operations have occurred at the Rockfield Quarry site less than 100 feet from the proximal edge of the San Joaquin River.

Comment 50-2 Cont.

Adverse Impacts on Biological Resources

Comment 50-3

The proposed mining activities pose significant threats to Fresno County's biological resources, particularly the threatened spring-run Chinook Salmon that is protected by the Endangered Species Act (ESA) and the San Joaquin River Restoration Settlement Act (PL 111–11, MAR. 30, 2009). Excavating a 600-foot-deep pit adjacent to the San Joaquin River raises serious concerns under the ESA, which prohibits the "take" of threatened species. The term "take" encompasses actions that harm, harass, or kill listed species.

The noise and vibrations from heavy machinery and blasting bedrock can disrupt salmon spawning and migration, as they are highly sensitive to environmental disturbances. The DEIR references a study on fish in Alaska. However, landscape, biological diversity and wildlife are very different in Central California from those in Alaska. Additionally, excavation of a 600-foot-deep hard rock pit immediately adjacent to the San Joaquin River poses a significant risk of introducing pollutants such as sediment, heavy metals, oil, and fuel spills into the river, threatening water quality and salmon habitats. The threat increases when the required minimum 200-foot setback is violated, as it appears to have been in the past. Increased sedimentation from continued mining could smother salmon eggs and reduce oxygen levels, while changes to groundwater and surface water flow from excavation may deplete vital water sources. Habitat destruction near the river could further harm salmon by increasing water temperatures, reducing shade, and disturbing aquatic vegetation. These potential impacts violate both state and federal environmental laws, including the California Environmental Quality Act (CEQA) and the Clean Water Act (CWA), which mandate the protection of water quality and aquatic habitats.

Comment 50-4

Comment 50-5

Comment(s) 50-6 / 50-7

Comment(s) 50-8 / 50-9

Cultural Resource Concerns under CEQA and AB-52

Comment 50-10

The Rockfield Quarry project fails to adequately address the protection of Tribal Cultural Resources (TCRs), as required by AB-52 and CEQA. This location includes the site of one of the Tribe's ancestral villages and salmon spearing places in use before the construction of Friant Dam in 1941. Fresno County, as the lead agency, must consult with local Tribes to identify, avoid, and mitigate impacts to sacred sites, landscapes, and cultural artifacts. The continued excavation disregards the significance of these resources, violating CEQA Guidelines §21084.3 and the legislative intent of AB-52. Please be aware that the entire stretch of the San Joaquin River in this

area of Fresno County is a sacred and Traditional Cultural Landscape pursuant to Public Resources Code § 21074.

Comment 50-10 Cont.

Overproduction and Unsustainability

Local aggregate production levels far exceed Fresno County's needs for the foreseeable future. According to the 2018 report, Aggregate Sustainability in California by the California Geological Survey, the Fresno Production-Consumption (P-C) Region is projected to need 305 million tons of aggregate over the next 50 years. As of January 1, 2017, the region possessed 556 million tons of permitted aggregate reserves, representing 182% of the projected demand and ensuring a supply exceeding 90 years. If there is no extension of the Rockfield aggregate mine operation, production levels will still significantly surpass the Fresno PC Region's aggregate needs. If allowed to continue, within 50 years, the region will have extracted over 200% of the region's aggregate requirements. This excessive extraction would be unsustainable and conflicts with CEQA's mandate to prevent unnecessary environmental degradation.

Comment 50-11

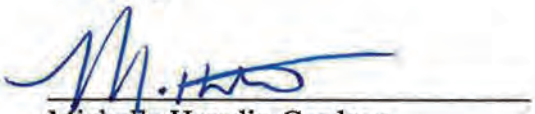
Request for Action

The Tribe firmly believes that Fresno County has a legal and ethical obligation to reject this project in its current form. As the lead agency under CEQA, the County must uphold its responsibility to protect endangered biological resources, water quality, air quality, human safety, and Tribal Cultural Resources. The continuation of CEMEX's mining operations along the San Joaquin River Corridor will result in irreversible harm to our environment, community, and cultural heritage. Additionally, the once beautiful San Joaquin River viewshed has suffered almost irreparable harm from a century of surface aggregate mining. Another century of mining on the river, including blasting bedrock on 493 acres down to 600 feet, is inconceivable. The Tribe urges the County to deny this permit and prioritize sustainable and legally compliant alternatives.

Comment 50-12

Thank you for your time and consideration.

Sincerely,



Michelle Heredia-Cordova
Chairperson, Table Mountain Rancheria

Re: Notice of Availability of Draft Environmental Impact Report (EIR) for the Proposed CEMEX Rockfield Quarry Modification Project (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

Dear Director White,

On behalf of the Table Mountain Rancheria, we are writing to express our vehement opposition to the proposed 100-year lease for the Cemex Rockfield Quarry Modification Project. This project poses an unacceptable threat to the ecological integrity of the San Joaquin River, the biological resources it sustains, and the cultural heritage deeply tied to this land. We urge you to consider the profound and irreversible consequences this lease would have on the environment, our community, and our cultural identity. Comment 52-1

This land is not just a resource to be exploited - it is a place of profound cultural significance. It is home to culturally identified sites that connect Table Mountain and other Tribes to our ancestors and our heritage. These sites are irreplaceable, and their destruction would sever our ties to the land and the traditions that define us. The river and the land are intertwined with our identity, providing sustenance, spiritual nourishment, and a sense of belonging. To allow this project to proceed would be to disregard the cultural and historical value of this place. Comment 52-2

The proposed 100-year lease is not only environmentally reckless but also morally indefensible. It prioritizes short-term economic gain over the long-term health of our planet and the well-being of future generations. We have a responsibility to protect this land and the San Joaquin River, not only for ourselves but for those who will come after us. There are alternatives that do not require sacrificing our environment and our cultural heritage. I implore you to explore these options and to reject this destructive proposal. Comment 52-5

We stand with countless others in our community who oppose this project. We urge you to listen to our voices, to honor the cultural and ecological significance of this land, and to take immediate action to protect it. Please deny the 100-year lease for the Cemex Rockfield Quarry Modification Project and instead work with us to preserve this invaluable resource for generations to come.

Thank you for your attention to this critical matter. We trust that you will make the right decision and prioritize the health of our environment, the protection of our cultural heritage, and the well-being of our community.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Hello Mr. Randall,

I'm not sure if this message will reach you regarding the public comments against the Cemex Rockfield Expansion proposal, but I just learned about this project this morning. Comment 53-1

My wife is a former Fresno County employee, we own and operate a small business in Fresno and we currently live Madera County within a 5-mile radius of this mining operation, I strongly oppose the expansion and the method of rock quarrying.

My wife and I often hike and bike to the San Joaquin River from the Tesoro Viejo community. From the hills overlooking the river, you can see, hear, and smell the quarry, even in its current state. Comment 53-2

With the proposed changes, I am concerned that the noise pollution from the quarry operations will worsen, negatively affecting both humans and wildlife in the area. Comment 53-3

This location is one of the few places where people can visit for peace and serenity without needing to travel far out of town. Comment 53-4

Additionally, the destruction of the beautiful natural habitats surrounding the river and the plant will lead to other harmful consequences. I strongly suspect that if this quarry were a completely new operation, rather than a century-old, grandfathered facility, the permit would likely be denied. Comment 53-5

Please take my concerns seriously. I do not want this expansion project in my backyard. It is detrimental to the people and wildlife who live and thrive in this area.

Sincerly,

Joe Salazar

Report Suspicious

Mr. Randall-

Please register my opposition to the proposed expansion plans for the CEMEX project on the San Joaquin river. Comment 54-1

The proposed 100 year operation, the new pits and the new mining methods will continue to do irreparable harm to not only the SJ river, but, to miles of it's banks, add more air pollution and allow CEMEX to pollute even more water. Comment 54-2

The Project does not need to proceed, but needs to be halted, and a plan to close the CEMEX facility needs to be in place-especially due to the coming decrease in building and construction projects due to other costs. Comment 54-3

Fresno County needs to be serious about our air, water and soil environment, and stop the CEMEX destruction. Comment 54-4

Subject:	Possible Expansion of the CEMEX Project along our San Juaquin River
Date:	Sunday, March 9, 2025 5:39:03 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

My name is Diane Dimon. I have been a residence of Fresno County for 37 years. I am very concerned about the possibility of the Country approving the CMEX Drilling Project. Here are my concerns: Comment 55-1

1. **Blasting and drilling** for such a large, deep, and potentially destructive project just don't make sense. Sound, vibration, noise, air, water, and traffic pollution. And as yet unforeseen pollution.

2. **Truck Traffic**: If approved, CEMEX will not only continue to transport their existing quota (and surplus) of aggregate, but will increase substantially, potentially damaging Friant Road, as well as increase truck traffic. Note: Friant Road is a residential road. Comment 55-2

3. **Air Pollution**: Fresno already has horrible air quality. If CEMEX is approved, this project will add significant and unnecessary impact by way of exploding debris particles and other unforeseen events. Comment 55-3

4. **Breach of our precious River Banks**: If the water seeps into the wall of CEMEX's pit(s), it could easily breach the wall's structural integrity, pollute ground water, collapse, and who knows what kind of damage that would create downstream to human, wildlife, and agricultural life in the San Juaquin Valley. Comment 55-4

5. **Contaminating Groundwater**: As state above, Fresno residents are dependent upon well waters, and a potential CMEX disaster would destroy ability to live in the area.

6. **Effect upon neighboring real estate**. I have heard arguments lobbying for CEMEX to guarantee reimbursement for real estate value that have been damaged by any kind of mismanagement by CEMEX. This is a real possibility, and therefore should not be entertained. Comment 55-5

All of these very real environmental threats seem to me to require an obvious denial of approval of CEMEX expansion. As our community leaders, please respond to this CEMEX request with farsightedness and wisdom. Please vote NO. Comment 55-6

Sincerely,

Diane Dimon

Re: **ROCKFIELD MODIFICATION PROJECT (EIR 7763) AND UNCLASSIFIED CONDITIONAL USE PERMIT APPLICATIONS NOS. 3666 AND 3667**

COMMENTS OF FRESNO AUDUBON SOCIETY

Dear Mr Randall:

Please accept the following comments from the Fresno Audubon Society regarding the draft Environmental Impact Report (EIR 7763). Comment 56-1

Background

The Central Valley is one of the major migratory bird routes in the United States. In the spring of 2024 an estimated 44,028,000 migrating birds traversed Fresno County according to Cornell's Lab of Ornithology's BirdCast[1] migration monitoring system. This was followed last fall by an estimated 44,088,000 birds.

The San Joaquin River Corridor is a critical component in California's bird migration framework, providing essential stop-over habitat that enables transitory birds the opportunity to rest, recover, and replenish along their long journeys, many of which extend over several thousand miles. The DEIR itself recognizes its importance:

> The San Joaquin River corridor is considered a significant wildlife movement corridor that provides natural areas for wildlife to move through the region in search of food, shelter, or nesting habitat. Additionally, the San Joaquin River can

[1] BirdCast is an avian nocturnal migration monitoring system developed by the Cornell Lab of Ornithology. It utilizes weather radar data and computer analysis to provide real-time bird migration data as well as migration forecasts across the United States. It tracks both spring migration (from March 1 to June 15) and fall migration (August 1-November 15). Its information is available on both a county-specific and statewide basis, and is freely accessible by the general public.

be used as a wildlife movement corridor to facilitate movement further into the Central Valley. (DEIR 4.4.1.6, p. 4.4-19)

Comment 56-1 Cont.

The projected 100 year duration of the CEMEX Project and the massive physical scale of the Project, when coupled with its location in the heart of the biologically sensitive San Joaquin River Corridor, require a most thoughtful and thorough consideration of the environment consequences to birds and other wildlife species. The DEIR has not provided an adequate analysis of these impacts as the following will demonstrate.

Comment 56-2

Inadequacies of Avian Species Surveys

Comment 56-3

The DEIR undertook only two field surveys of wildlife in the area: April 30, 2019 and June 14, 2021. (DEIR 4.4.1.2, PDF p. 346) These generated counts of 27 bird species for the Plant Site (Appendix E-1 Table B-2, PDF p. 1160) and 31 bird species for the Quarry Site (Appendix E-2 Table B-2, PDF p. 1237).

Fresno Audubon Society (FAS) members and others have been actively birding along the San Joaquin River for many years, particularly at Lost Lake Park, which borders the northern edge of the Quarry Site. Data accumulated from over two thousand such observations along the San Joaquin River Corridor is maintained with eBird, the global database of avian observations developed by the Cornell Lab of Ornithology.[2]

Several eBird "hotspots"—specific geographic birding locations—abut either the Plant or Quarry Sites. These are: Ball Ranch, Fresno, US-CA (corresponding to Ball Ranch Natural Reserve in DEIR); Sumner Peck Ranch, Fresno, US-CA (Peck Ranch Pkwy Trust in DEIR); Ledger Island, Madera, US-CA (Ledger Island Natural Reserve in DEIR); and Lost Lake Rec Area (FRE Co.), Fresno, US-CA (Lost Lake Park and Beck Ranch in DEIR) (See maps, DEIR Figure 2-5 [PDF p. 127] and Figure 4.1-1 [PDF p. 187].)

- **San Joaquin River Parkway Surveys**. Monthly surveys sponsored by FAS encompass areas along the river both upstream downstream near the CEMEX mining operations. These have been undertaken over a number of years. eBird data for these surveys document the presence of 185 species along the River Corridor.

[2] eBird's searchable database of bird observations (checklists) contain the date, time, location, and count for each species reported by the observers. eBird employs statistical analysis as well as expert review of rare or unusual species observations to assure accuracy of its data. eBird data has been utilized for scientific research and environmental policy issues, among other things.

- **Ball Ranch eBird Hotspot**. Ball Ranch eBird checklists report161 bird species from 160 checklists as of February 2025. Ball Ranch is immediately to the north of the Plant Site. (**https://ebird.org/hotspot/L4131177**)

Comment 56-3 Cont.

- **Sumner Peck/Ledger Island Hotspots**. Sumner Peck Ranch is immediately to the south of the Quarry Site. Ledger Island is directly across the river from the Quarry Site. eBird data documents 120 bird species from 96 checklists at Sumner Peck Ranch and 98 species from 16 checklists from Ledger Island as of February 2025. (**https://ebird.org/hotspot/L13905811**, **https://ebird.org/hotspot/L4931237**)

- **Lost Lake Rec. Area Hotspot**. The Lost Lake Hotspot encompasses both Lost Lake Park and adjoining Beck Ranch. Both lie to the immediate north of the Quarry Site. eBird checklist data for this Hotspot records the observation of 228 bird species as the result of 1886 observations as of February 2025. (**https://ebird.org/hotspot/L188972**) It is particularly noteworthy that the the historical monthly species count observed at the Lost Lake Hotspot during April are 158 species and 103 species for June. This contrasts sharply to the 27 species for the Plant Site and 31 species for the Quarry Site from the combined April 2019 and June 2021 field surveys relied upon for the DEIR.

Additional local avian population data is available from the Audubon **Christmas Bird Count (CBC)** which has been conducted annually for decades within the geographic area encompassing the Project and the adjacent river corridor. Survey results for the CBC from December 2023 reflect a count of 127 bird species within the Lost Lake CBC zone. As with the eBird data, CBC data is publicly accessible. (**https://netapp.audubon.org/CBCObservation/Historical/ResultsByCount.aspx#** Count code: CALL)

The treatment of Species of Special Concern in the DEIR is also problematic. The DEIR states that governmental agency databases for Special Status plant and wildlife species were examined for four USGS quadrangle areas to determine the possible presence of such species on Project properties. The searches generated a total of 15 avian species of Special Concern between the two sites. (Table C-1 Appendix E-1 PDF page 1163 for the Plant Site and Table C-1 Appendix E-2 PDF page 1240 for the Quarry Site.)

Comment 56-4

Fresno Audubon has compared the observation data for the Lost Lake Rec Area eBird Hotspot with the January 3, 2025 California Department of Fish and Wildlife's CNDDB Special Animals List. Twenty-eight CNDDB bird species of interest have been reported at Lost Lake Park, thirteen more than is reflected in the DEIR. (One species in the DEIR inventory has not been reported at Lost Lake.) (See Table 1 attached to this letter.) This discrepancy needs to be examined and explained. Moreover, the failure to consider the impact of the Project on non-specially designated bird species needs to be justified given the number of species known to be in the area.

Comment 56-5

The understatement of avian species, both specially designated or general species, is problematic as the DEIR specifically declines to address impacts on any species not identified as having been "known to be present or have a moderate or higher potential for occurrence on the Plant Site and/or Quarry Site…" (DEIR 4.4.1.8, p. 4.4-20). Thus limited, the DEIR does not evaluate the effects of the project on well over one hundred fifty bird species known to have been observed at the adjoining Lost Lake Park, including thirteen bird species recognized by CDFW as deserving special consideration. Therefore, the assessment of the impacts and proposed mitigation measures under the Biological Resources component of the DEIR is deficient. (See Impacts 4.1-1 to 4.4-7 [ES-14 to ES-19; PDF pp. 39-43])

Comment 56-6

The DEIR Does Not Adequately Address the Impacts on Birds of Noise, Air Pollution and Other Project-Related Disturbances

Comment 56-7

An understanding of bird migratory behavior is necessary to fully consider the impact of the CEMEX project on the health of avian species. Migration is a nocturnal activity. Birds travel at night in order to avoid predators and to take advantage of usually more favorable weather conditions. Consequently, birds must rest and forage during the daylight hours. Foraging is particularly critical to birds during migration, given the tremendous amount of energy prolonged flight requires. This daylight stop-over time, however, will be occurring during the peak operations of the CEMEX Plant and Quarry Sites, when Project-generated disturbances of noise, vibration, dust and air pollution levels will be at their highest.

The DEIR analysis of the effects of these disturbances merely asserts that some bird species have become habituated to activities, providing a list of 19 birds—almost every one of which is commonly found in urban settings. The fact that pigeons frequent parking lots does not establish the the parking lot as suitable bird habitat. Because of the underreporting of bird species known to the area, the DEIR does not address how the mining activities and disturbances may affect over 150 bird species. The examples of other mining projects are presented without any proof of comparability.

There is a significant body of scientific knowledge on the effects of noise for birds.[3] However, none of the numerous studies were consulted for the DEIR. These studies have documented the following negative consequences for birds of noise and sound disturbances:

[3] See, for example Francis CD, Ortega CP, Cruz A. Noise pollution changes avian communities and species interactions. Curr Biol. 2009 Aug 25;19(16):1415-9. doi: 10.1016/j.cub.2009.06.052. Epub 2009 Jul 23. PMID: 19631542.

Physiological: cardiovascular consequences such as heart rate increase, immune response decline, hearing loss, increase in stress hormone levels.

Comment 56-7 Cont.

Behavioral: habitat abandonment, changes in foraging behavior, reduced vigilance, territory shift, navigation difficulties

Acoustic Perception: frequency interference, vocal adjustments, vocalization timing adjustment, impaired song learning, mate attraction.

The DEIR must include a comprehensive and scientifically supported assessment of the impacts of noise and other Project-generated disturbances on the variety of bird species that are actually present in and around the Project sites. This must include adopting acoustic testing measures calculated to take into account the projection of noise into areas where impacted wildlife species are likely to reside in the Corridor areas, such as tree-level monitoring.

Comment 56-8

Further, the mitigation requirements for noise monitoring program under the DEIR for the Plant Site (DEIR 4.13-2, PDF p. 802) and the Quarry Site (DEIR 4.13-3, PDF p. 804) as well as those relating to the blasting protocols, must be revised to address the consequences of Project-generated disturbances to wildlife in the adjacent habitat. Monitoring stations, equipment and monitoring protocols must take into account the requirements necessary to protect animal species known to the area.

Comment 56-9

The Riparian Corridors

Comment 56-10

The DEIR considers riparian and wildlife corridors at 4.4.1.6 (p. 4.4-18 to -19, PDF pp. 343-344). It recognizes wildlife corridors as "significant features for dispersal, seasonal migration, breeding, and foraging" which "can provide a buffer against both human disturbance and natural fluctuations in resources." It acknowledges the San Joaquin River Corridor as "a significant wildlife movement corridor that provides natural areas for wildlife to move through the region in search of food, shelter, or nesting habitat…." The DEIR discusses three wildlife or riparian corridors in the area:

(1) The area extending approximately 0.6 miles to the west of the Plant site consisting of a portion of the Willow Unit of California DWF (Willow Unit Corridor)

(2) Little Dry Creek, being a portion of the Willow Unit, lying to the north of the Plant Site and between the Plant Site and Ball Ranch

Comment 56-10 Cont.

(3) An approximate 1.4 mile section of river frontage along the western boundary of the Quarry Site featuring a 200 foot wide area between the western boundary of the Quarry site and the San Joaquin River.

The Willow Unit Corridor

Comment 56-11

This corridor lies to the west of the Plant Site. The DEIR assumes the constancy of this area as providing "abundant nesting sites," etc., for birds. However, given the protracted duration of the Project, the long term viability of the Corridor as wildlife habitat is a relevant consideration. Therefore, the impact of climate change and projected increasing significance of drought conditions should be considered. Although the Report appears to tout the Willow Unit as an ecologically redeeming feature of this area, it's relevance as an ameliorative consideration in the overall scheme of the project will diminish as the focus of operations shift from the Plant Site to the Quarry Site some distance away.

The Little Dry Creek Corridor

Comment 56-12

The DEIR identifies Little Dry Creek as a "riparian corridor with a connection to the San Joaquin River." It consists of a seasonal creek bed with sparse vegetation, featuring a number of dead trees and dead shrubs. The creek bed largely sits at a lower elevation than the adjacent Plant Site and Ball Ranch and provides virtually no acoustic or aesthetic buffer from the Plant Site's activities. It offers little meaningful cover for wildlife so it cannot be considered to be a "wildlife corridor" as defined in the DEIR. If it is intended by CEMEX to suggest that Little Dry Creek is a biological mitigating consideration for its project, then it should be required to implement a program for its revegetation.

As is the case with the Willow Unit Corridor, the DEIR does not address how climate change and drought may further affect this area. The creek appears particularly vulnerable to these factors given the seasonality of the water flow and the notable presence of dead trees and plant materials. Here again, the relevance of Little Dry Creek as an ameliorative consideration, if it may be considered such, will decline with the shift of activities from the Plant Site to the Quarry Site.

The Quarry Site Corridor

Comment 56-13

The DEIR identifies the area adjacent to the western boundary of the Quarry Site as part of the San Joaquin River Corridor. This riverfront is approximately 1.4 miles in length. The width of the area between the Quarry Site and the River is stated to be 200 feet, however, that will be reduced by the anticipated grant of an an easement for the River Parkway trail which size requirements are undetermined. The DEIR does not disclose the condition of the riverfront on the opposite bank.

Comment 56-14

The Project proposes a qualitative change in the operations of the Quarry Site which will include a significant increase in mining activity accompanied by extensive excavation and blasting, and in turn, an extraordinary increase in Project-generated disturbances (noise, vibration, dust, air and water pollution) from which the Corridor must shield wildlife, both resident and migratory, over the course of the projected 100 years. Additionally, the shift in the locus of operations from the Plant Site a half mile from the San Joaquin River to the Quarry Site only 200 feet from the river requires special attention be given to the adequacy of this portion of the Corridor to protect wildlife. The following must be considered in the DEIR, especially with reference to the Quarry Site area:

Comment 56-15

- The width of corridor necessary to buffer wildlife from the Project-related disturbances. The DEIR does not consider the scientific research on features such as corridor width, although a number of studies exist. Much of the research indicates the necessity of corridors well in excess of the 200 foot width proposed. Rather than address the research, the DEIR merely adopts the minimum standard width required under the Fresno County General Plan. This requires further study, including consideration of the science relating to the effects of noise and other disturbances, as discussed above.

- How will the development of the anticipated multi-use River Parkway trail impact the suitability of the corridor as a wildlife corridor, given the proposed initial width of only 200 feet for the boundary?

Comment 56-16

- What mitigation measures, such as ongoing revegetation programs, soil conservation projects and the like, are necessary to sustain an appropriate buffer to protect wildlife over the lifespan of the Project? How will these measures be determined and monitored? How will performance of mitigation measures be enforced and how will that performance be secured?

Comment 56-17

- What mitigation measures should be required in order to restore suitable biological buffer zone in the event of collapse or compromise due to flooding or other geologic or hydraulic event causing the berm to collapse?

Comment 56-17 Cont.

The DEIR is incomplete in its assessment of the impacts likely to result from the CEMEX Project. Substantial data and research are available from which a comprehensive and accurate impact report can be generated. Our community deserves to have a fully-developed analysis to consider.

Comment 56-18

On behalf of Fresno Audubon Society, I thank you for this opportunity to present the foregoing comments.

Respectfully submitted,

Rick Grijalva
President

California DFW CNDDB Listed Birds of Interest (2025) Observed at Lost Lake Rec Area

	Bird Observed at Lost Lake	Included in EIR List of Species of Interest (C-1 tables)
1	American White Pelican	No
2	Bald eagle	Yes
3	Black-crowned night heron	No
4	Burrowing owl	Yes
5	Cooper's hawk	Yes
6	Double-crested cormorant	No
7	Golden eagle	Yes
8	Great blue heron	Yes
9	Great egret	Yes
10	Horned lark	Yes
11	Lawrence's goldfinch	No
12	Lewis's woodpecker	No
13	Loggerhead shrike	Yes
14	Long-billed curlew	No
15	Merlin	No
16	Northern harrier	Yes
17	Osprey	Yes
18	Peregrine falcon	No
19	Prairie falcon	No
20	Sharp-shinned hawk	No
21	Snowy Egret	No
22	Swainson's hawk	Yes
23	Tricolored blackbird	Yes
24	Vesper sparrow	No
25	White-tailed kite	Yes
26	Willow Flycatcher	No
27	Yellow warbler	No
28	Yellow-headed blackbird	Yes
	Not observed at Lost Lake: Western yellow-billed cuckoo

Fresno, CA 93721

SUBJECT: DRAFT ENVIRONMENTAL IMPACT REPORT (SCH No. 2020060123) FOR THE CEMEX ROCKFIELD QUARRY MODIFICATION PROJECT (DECEMBER 2024)

Dear Mr. Randall:

The League of Women Voters of Fresno (League) is a nonpartisan political organization that encourages the informed and active participation of citizens in government, works to increase understanding of major public issues and helps shape public policy through education and advocacy. Comment 57-1

In preparing these comments, the League reviewed the following documents: Comment 57-2

- Surface Mining and Reclamation Act of 1975
- Special Report 158 (Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region, California Department of Conservation – Division of Mines and Geology, 1988)
- Fresno County General Plan Policy Document (February 2024)
- Fresno County Zoning Ordinance, Division 6 of the Fresno Ordinance Code (February 2024)
- San Joaquin River Parkway Master Plan Update (April 2018)
- Draft Environmental Impact Report for the CEMEX Rockfield Quarry Modification Project (December 2024)

CEMEX proposes to modify its Rockfield mining operation to include hard rock mining.

The League asserts that such use is inconsistent with current land use plans and, therefore, that the Draft EIR is incorrect in concluding that the proposed project will not conflict with current land use plans. With respect to the use of river bottom land below Friant Dam, current plans do not entertain, embrace, encourage, envision, or even mention such use. Comment 57-3

The only type of mining addressed in local land use plans is the excavation of alluvial deposits — not the blasting and crushing of bedrock.

Surface Mining and Reclamation Act of 1975 (SMARA)

Comment 57-4

The principal aim of the Surface Mining and Reclamation Act of 1975 (SMARA) is to protect the environment while allowing responsible mineral extraction. More specifically, the act ensures that the adverse environmental impacts from mining are minimized, that mined lands are reclaimed to a usable condition and that lands bearing mineral resources are protected from encroachment by land uses that could preclude future mining.

With regard to protecting mineral bearing lands from encroachment, SMARA § 2761 requires the Office of Planning and Research to identify areas within the state that are being urbanized or are subject to urban expansion or other irreversible land uses that could preclude mineral extraction. The State Geologist is required to map those areas, and local jurisdictions are required to incorporate that information into their respective general plans and zoning codes. Areas known to contain PCC-grade aggregate (aggregate suitable for making high-quality portland cement concrete) are classified as Mineral Resource Zone 2 (MRZ-2).

Special Report 158 — Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region

Comment 57-5

In 1988, the State Geologist published Special Report 158, which described in detail the location of aggregate resources on the valley floor that could be extracted and used in the Fresno area. The State Geologist mapped 31 square miles containing in excess of 2.1 billion tons of aggregate — nearly all which was located within floodplains created by the San Joaquin and Kings Rivers.

In 1988, mining permits in the Fresno area allowed the excavation of 119 million tons of aggregate — only 44% of the projected need for the Fresno area for the next 50 years.[1] Absent the approval of additional mining permits, the projection was that the Fresno area would run out of mined aggregate by 2010. But that shortfall never occurred. Over the next 30 years, a considerable amount of new acreage was opened to mining, and by 2018, although the 50-year need had grown to 306 million tons, aggregate resources under permit totaled 556 million tons, which was 182% of the Fresno area need through 2068.[2]

For this discussion it's important to note that the only aggregate resources evaluated by the State Geologist were those found in alluvium — the particulate rock material (sand and gravel) deposited by streams and rivers.[3] Special Report 158 did not assess the excavation (blasting) of bedrock.

---

[1] Special Report 158 - Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region, prepared by the State Geologist, 1988, page x.

[2] Map Sheet 52 – Aggregate Sustainability in California (updated 2018), published by the California Department of Conservation, page 5.

[3] Page ix of the Executive Summary for Special Report 158 reads, " This report presents the results of the classification of aggregate resources by the Division of Mines and Geology (DMG) in the Fresno Production-Consumption (P-C) Region. **The primary goals of the study were…to delineate within the P-C region all land containing sand and gravel deposits** suitable for production as high-quality, Portland cement concrete (PCC) aggregate. (Highlighting added.)

In accordance with SMARA and Special Report 158, the County included in its General Plan update in 2000[4] several policies designed to conserve and protect sand and gravel resources.

Policy OS-C.1	The County shall not permit incompatible land uses within the impact area of existing or potential surface mining areas.
Policy OS-C.2	The County shall not permit land uses incompatible with mineral resource recovery within areas designated as Mineral Resource Zone 2 (MRZ-2). (See Figures 7-9, 7-10, and 7-11 in Fresno County General Plan Background Report.)
Policy OS-C.3	The County shall require that the operation and reclamation of surface mines be consistent with the State Surface Mining and Reclamation Act (SMARA) and special zoning ordinance provisions.
Policy OS-C.4	The County shall impose conditions as necessary to minimize or eliminate the potential adverse impact of mining operations on surrounding properties.
Policy OS-C.5	The County shall require reclamation of all surface mines consistent with SMARA and the County's implementing ordinance.
Policy OS-C.6	The County shall accept California Land Conservation (Williamson Act) contracts on land identified by the State as containing significant mineral deposits subject to the use and acreage limitations established by the County.
Policy OS-C.7	The County shall require that new non-mining land uses adjacent to existing mining operations be designed to provide a buffer between the new development and the mining operations. The buffer distance shall be based on an evaluation of noise, aesthetics, drainage, operating conditions, biological resources, topography, lighting, traffic, operating hours, and air quality.
Policy OS-C.8	The County shall, where feasible along the San Joaquin River, site recreational trails, bikeways, and other recreation areas at least three hundred (300) feet from the edge of active aggregate mining operations and separate them by physical barriers. Recreational trail/bikeway crossings of active haul routes should be avoided whenever possible; if crossings of haul routes are necessary, separate where feasible.
Policy OS-C.9	The County shall require that any proposed changes in land use within areas designated MRZ-2 along the San Joaquin and Kings Rivers comply with the provisions of the State Surface Mining and Reclamation Act (SMARA).
Policy OS-C.10	The County shall not permit land uses that threaten the future availability of mineral resource or preclude future extraction of those resources.
Policy OS-C.11	The County shall undertake a comprehensive, watershed-based planning effort to assess future extraction of the aggregate resources and recreation uses along the Kings River as a part of an update of the Kings River Regional Plan. Such a planning effort would help to facilitate use of the resource while protecting other Kings River watershed resources and functions, including floodplain areas. (See Policy OS-H.10, Policy LU-C.5, and Program LU-C.A)

These same policies remained unchanged when, in 2024, the County updated its General Plan Policy Document.

[4] 2000 General Plan Policy Document, pages 5-9 and 5-10.

Fresno County Zoning Ordinance, Division 6 of the Fresno Ordinance Code (February 2024)

Comment 57-7

On May 18, 1999, the Board of Supervisors added to the County's Zoning Ordinance Section 858 — *Regulations for the Development of Material Extraction Sites in all Districts*.[5]

Section 858 describes the process for permitting new mines, lists standards for mine operation and reclamation and explains obligations related to annual inspections and financial assurances.

The ordinance does not mention hard rock mining, It does, however, directly refer to sand and gravel operations. As shown below, for example, Section 858(D)(3) states that a mining plan must include cross section drawings showing the extent of **sand and gravel** deposits.

> 3. Mining plan.
> a. A site plan which includes all of the following:
> (1) Existing and proposed roads, including ingress-egress roads and on-site roads; proposed surface treatment and means to limit dust.
> (2) Processing and storage areas including locations of equipment, structures, and facilities.
> (3) Proposed setbacks, screening, fencing, gates, parking, and signs.
> (4) Proposed phasing for the mining operation and reclamation work.
> (5) Cross section (typical) defining planned slopes, extent of overburden, extent of sand and gravel deposits, and water table." (Highlighting added.)

At the time the County was preparing the Draft EIR for the CEMEX Rockfield Quarry Modification Project, it was also reviewing Ordinance Section 858 as part of the County's 2024 update of its Zoning Ordinance. Although the opportunity presented itself, the County did not revise Section 858 to include a discussion of hard rock mining.

San Joaquin River Parkway Master Plan Update (April 2018)

Comment 57-8

The San Joaquin River Conservancy last updated its Parkway Master Plan in April of 2018. Just as with the Fresno County Zoning Ordinance, the San Joaquin River Master Plan refers to sand and gravel operations — not to blasting operations.

Printed below are the Parkway Master Plan's two mineral resource goals.[6]

> Goal MR1: Work with gravel mining companies to acquire high priority properties after they have been reclaimed. Promote reclamation plans that enhance and complement Parkway goals and are Parkway-ready to the extent practicable. (Highlighting added.)
>
> Goal MR2: Design, construct, and manage the Parkway in a manner that will not conflict with sand and gravel mining operations. (Highlighting added.)

[5] With the update of the Zoning Ordinance in February 2024, Section 858 was renamed 834.4.220 - Material Extraction Sites

[6] Citation from the San Joaquin River Parkway Master Plan, Section 6 (Goals and Policies) as adopted by the San Joaquin River Conservancy by Resolution 18-01 on April 11, 2018.

Comment 57-9

The Draft EIR for the CEMEX Rockfield Quarry Modification Project does not discuss the fact that there is no accommodation for hard rock mining in the San Joaquin River floodplain in either the Fresno County General Plan, the Fresno County Zoning Ordinance or the San Joaquin River Parkway Master Plan. Nonetheless, the Draft EIR claims that the proposed use is consistent with these plans.

Comment 57-10

The Draft EIR claims "the proposed project would be consistent with each of the applicable Fresno County General Plan goals and policies,"[7] but this claim is incorrect. The County promotes mining activities only where aesthetic impacts can be adequately mitigated. General Plan Goal OS-C[8] reads as follows:

> Fresno County General Plan Goal OS-C: To conserve areas identified as containing significant mineral deposits and oil and gas resources for potential future use, while promoting the reasonable, safe, and orderly operation of mining and extraction activities within areas designated for such use, where environmental, aesthetic, and adjacent land use compatibility impacts can be adequately mitigated. (Highlighting added.)

According to the Draft EIR, the project's impact on aesthetic and visual resources cannot be mitigated.[9] The impact remains significant and unavoidable even with the application of feasible mitigation. Plainly, the Draft EIR erred in finding consistency with the County's General Plan.

In addition, the Fresno County General Plan contains two identical, unequivocal directives that the County support policies of the San Joaquin River Parkway Master Plan that protect the Parkway as an aesthetic resource.[10]

> Fresno County General Plan Policy OS-A.15: San Joaquin River Protection. The County shall support the policies of the San Joaquin River Parkway Master Plan to protect the San Joaquin River as an aquatic habitat, recreational amenity, aesthetic resource, and water source. (Highlighting added.)

> Fresno County General Plan Policy OS-H.10: San Joaquin River Parkway Master Plan. The County shall support the policies of the San Joaquin River Parkway Master Plan to protect the San Joaquin River as an aquatic habitat, recreational amenity, aesthetic resource, and water source. (RDR/PSP)

Comment 57-11

The Draft EIR also claims that the proposed project "would be consistent with the Fresno County Zoning Ordinance"[11] due to the fact that the company's current permits comply with Zoning Ordinance Section 834.4.220 - Material Extraction Sites (Formerly Section 858). But the these entitlements only permit the excavation of alluvial deposits (sand and gravel). And as previously explained, the County's surface mining ordinance was primarily designed to accommodate the extraction of the high quality sand and gravel deposits identified in Special Report 185.

[7] Draft EIR Volume 1, page 4.11-49.
[8] Draft EIR Volume 1, page 4.11-26.
[9] Draft EIR Volume 1, page ES-11.
[10] Draft EIR Volume 1, Volume 1, page 4.11-23; 2024 Fresno County General Plan Policy Document, page 2-137.
[11] Draft EIR Volume 1, page 4.11-49.

The Draft EIR also lists reasons why "the project would be consistent with the policies of the San Joaquin River Parkway Master Plan."[12] They are these:

Comment 57-12

- The project applicant will offer potential trail easements at the Plant Site and the Quarry Site.
- The project applicant has installed and now maintains nest boxes for cavity-nesting songbirds.
- The proposed project will not disturb wildlife corridors along the river any more than it already has.
- Revegetation would include native plant species that provide food and habitat for wildlife.
- Reclamation will create approximately 500 acres of open water wildlife habitat (fenced with barbed wire).

While it is true that Parkway policies embrace constructing trails and improving wildlife habitat, it's also important to note that the Parkway Master Plan only acknowledges the existence of sand and gravel mining operations within its perimeter, not hard rock mining.

Furthermore, the Draft EIR fails to acknowledge that in an effort to protect wildlife along the river corridor, the San Joaquin River Conservancy, by law,[13] can only provide low-impact recreation for the visiting public. It's difficult to imagine how the Parkway's mandate to protect wildlife through low-impact recreation is enhanced by a mining operation that is permitted to blast bedrock underlying the Parkway to the year 3025.

Comment 57-13

And finally, the claim in the Draft EIR that the Rockfield Quarry Modification Project is consistent with the Parkway Master plan because it conserves gravel reserves along the San Joaquin River needed for the San Joaquin River Restoration Program[14] is specious in that the mine operation has no control whatsoever over land uses on neighboring properties.

Conclusion

Comment 57-14

The Draft EIR is incorrect in concluding that the project will not conflict with current land use plans. The Fresno County General Plan and Zoning Ordinance only support the mining of alluvium (sand and gravel) in the San Joaquin River floodplain — not hard rock mining. This is made abundantly clear in General Plan Policy LU-C.2,[15] which reads…

> Fresno County General Plan Policy LU-C.2: San Joaquin River Corridor Overlay
> Within the San Joaquin River Corridor Overlay, the County shall accommodate agricultural activities with incidental homesites, recreational uses, sand and gravel extraction, and wildlife habitat and open space areas. (See Figure LU-2) (RDR)

[12] Draft EIR Volume 1, page 4.11-23, 4-11-44 through 4-11.47.

[13] Public Resources Code § 32510. The San Joaquin River Conservancy is hereby established in the Resources Agency to acquire and manage public lands within the San Joaquin River Parkway….The conservancy shall acquire and manage these lands in the parkway to provide a harmonious combination of low-impact recreational and educational uses and wildlife protection through the preservation of the San Joaquin River, existing publicly owned lands, the wildlife corridor, and natural reserves. *(Amended by Stats. 1994, Ch. 605, Sec. 1. Effective January 1, 1995.)*

[14] Draft EIR page 4.11-46

[15] Fresno County General Plan Policy Document (2024), page 2-36.

Curing the inconsistency with existing plans necessitates revision of the Fresno County General Plan, the Fresno County Zoning Ordinance and the San Joaquin River Parkway Master Plan. Environmental information in the accompanying EIRs would need to be updated as well.

FOREWORD

Special Report 158, "Mineral Land Classification: Aggregate Materials in the Fresno Production-Consumption Region," is the first analysis of mineral resources in the San Joaquin Valley to be developed by the California Department of Conservation, Division of Mines and Geology under authority of the Surface Mining and Reclamation Act of 1975 (SMARA). This classification is provided to the State Mining and Geology Board for transmittal to the local governments that regulate land use in this region, and for consideration of areas, if any, to be designated as regionally significant. SMARA was enacted by the State Legislature to assure mineral resource conservation and adequate mined land reclamation.

The Mining and Geology Board adopted guidelines in June 1978 to be employed by the Division in its mineral resource classification. This report was prepared in conformance with those directives. The undertaking is of great importance in economic geology because it deals with very specific mineral resource conservation issues in areas of intensive competing land use.

James F. Davis
State Geologist

PREFACE

Reserve tonnage data presented in this report was accurate as of January 1985. In 1986, a preprint version of the report was circulated to lead agencies and made available to the public. Changes in reserves resulting from either the premature closure of mines active in 1985, or the permitting of new mines since that time, may have impacted forecasted depletion dates for the production-consumption region studied. However, the material presented and the fundamental conclusions of the report remain valid and useful.

EXECUTIVE SUMMARY

This report presents the results of the classification of aggregate resources by the Division of Mines and Geology (DMG) in the Fresno Production-Consumption (P-C) Region. The primary goals of the study were:

1. To delineate within the P-C region all land containing sand and gravel deposits suitable for production as high-quality, Portland cement concrete (PCC) aggregate.
2. To calculate the quantity of the resources in these deposits that are on lands considered by the State to be available for possible aggregate production based upon evaluation of land uses.
3. To evaluate the adequacy of the current aggregate reserves (aggregate resources on land permitted for mining by local government) for meeting the future needs of the P-C region.

In the Fresno area, as in any rapidly urbanizing area, it is important that land-use decisions are made with full recognition of the natural resources of the area. This is especially true when the resource in question is high-grade construction aggregate, an indispensable building material which is costly to transport.

The Fresno area has been fortunate in that adequate quantities of low-cost, high-quality aggregate materials have been available locally. However, the amount of this material is diminishing as active aggregate producers deplete their deposits and land containing suitable sand and gravel resources is utilized for urban development.

The loss of regionally significant mineral deposits to land uses that preclude mining is one of the problems that the California Surface Mining and Reclamation Act of 1975 (SMARA) was framed to address. SMARA mandates a two-phased mineral resource conservation process called classification-designation. The objective of the classification-designation process is to provide information on future resource availability to the urban population centers which depend upon it for future growth. This perspective will hopefully provide a context for land-use decisions by local government within which mineral resource availability is acknowledged as a pertinent factor.

The DMG is responsible under SMARA for carrying out the classification phase of the classification-designation process. Classification of land for aggregate resources in the Fresno area is presented in this report. The State Mining and Geology Board (the Board) is responsible for the second phase of SMARA. In this phase, the Board may designate areas within a P-C region that contain significant deposits of PCC-grade aggregate that may be needed to meet the region's future demand. The Board's decision to designate an area is based upon information in the classification report prepared by DMG and input received from lead agencies and the public. Through designation, the Board provides formal recognition of regionally significant deposits of aggregate resources.

As with many forecasts of economic activity, the forecasts in this report should not be viewed as offering unqualified predictions of how the future will unfold. They are based upon the assumption that the data base is accurate and that the development trends of the past three decades will continue into the five decades ahead.

Assuming, however, the correctness of DMG's forecasts regarding the consumption of aggregate, the following conclusions were reached:

- The consumption of aggregate resources in the P-C region through the year 2034 is forecast to be 268.4 million tons, of which approximately 50 percent or 134.2 million tons must be of PCC quality.
- Unless additional resources are permitted for mining, or alternative resources are utilized, total existing PCC reserves would be depleted by mid-2010.
- More than 119.3 million tons of permitted PCC-grade reserves exist in the P-C region.

- In total, the 119.3 million tons of permitted PCC-grade aggregate reserves could provide only 44 percent of the anticipated consumption of all aggregate during the next 50 years.
- The expected longevity of the existing PCC reserves is based upon the assumption that mining of these reserves will continue to be permitted until the reserves are depleted.
- In excess of 2.1 billion tons of aggregate resources (including reserves) have been identified within the Fresno P-C Region. Twenty-eight million tons of the nonpermitted resources occur in dedicated parklands and are unlikely to be permitted for mining.
- The Fresno P-C Region covers an area of 1,400 square miles, of which 39 square miles (3 percent of the total area) were classified MRZ-2. Only 31 square miles (2 percent of the total area) have been sectorized as having current land uses which do not preclude mining. Almost 3½ square miles of the sectorized areas are currently under mining permits.
- The 31 square miles of sectorized lands considered in this study to be available for meeting future aggregate needs may be greater than the amount local governments consider to be available for mining. The reason for this discrepancy is that sectorized lands may have already been committed by local governments to purposes other than aggregate mining. The significance of this difference of opinion regarding availability is that the projected available resources (as defined by the Board) may be optimistic, and the problem of meeting future aggregate needs could be greater than that described in this report.

It is important, therefore, that local governments promptly review the sector areas shown as available for future aggregate extraction. Local governments will then be able to verify or amend as necessary the conclusions reached in this report.

MINERAL LAND CLASSIFICATION: AGGREGATE MATERIALS IN THE FRESNO PRODUCTION-CONSUMPTION REGION

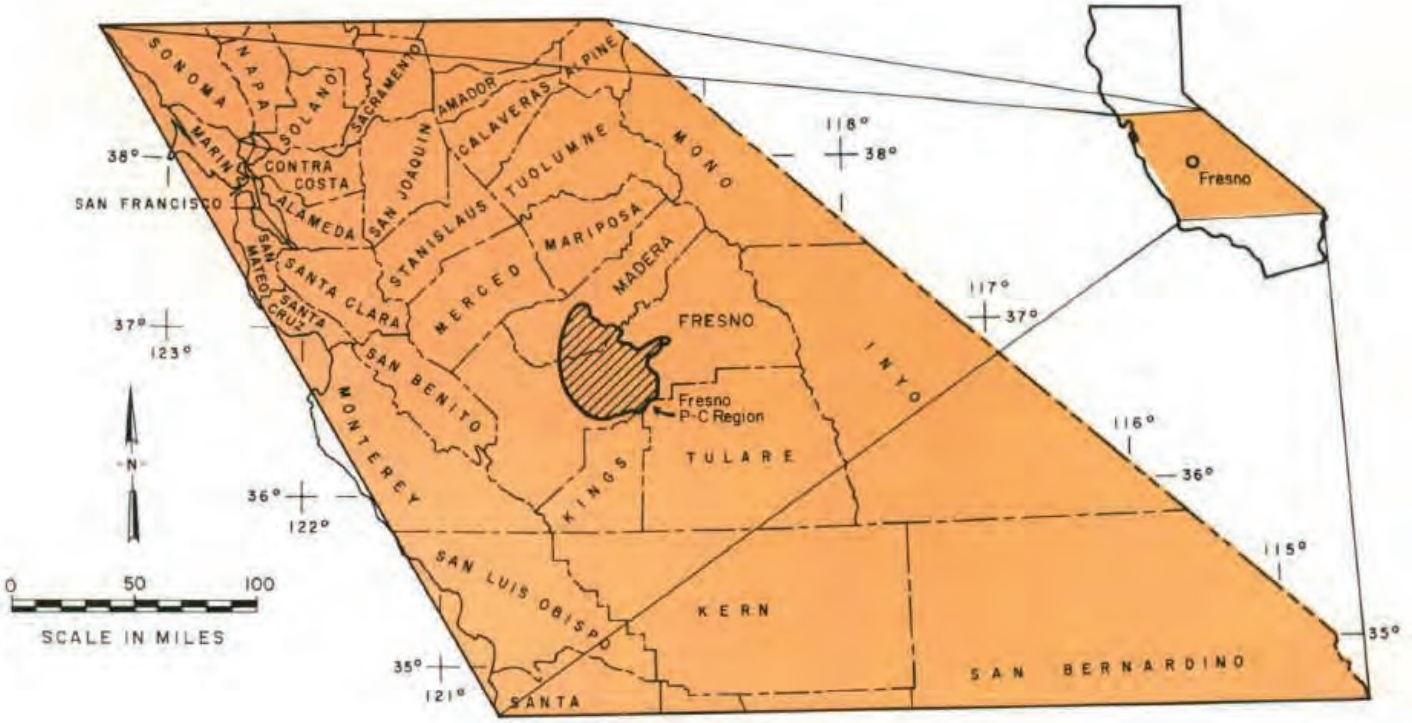

Figure 1. General location of the Fresno P-C Region.

INTRODUCTION

In the Fresno area (Figure 1 and Plate 1), as in any rapidly urbanizing area, it is important that land-use decisions are made with full recognition of the natural resources of the area. This is especially true when the resource in question is high-grade construction aggregate used in Portland cement concrete (PCC). This type of aggregate is an indispensable building material and is costly to transport.

The Fresno area has been fortunate in having adequate quantities of low-cost, high-quality aggregate materials locally available. However, the amount of these materials available for future development is diminishing as active aggregate producers deplete their deposits and land containing suitable sand and gravel resources is utilized for urban development.

The loss of access to regionally significant mineral deposits as a result of land uses that preclude mining is one of the problems that the California Surface Mining and Reclamation Act of 1975 (SMARA) was framed to address. SMARA mandates a two-phased mineral resource conservation process called classification-designation. The objective of this process is to establish an awareness of the availability of important resources to urban population centers through communication with the appropriate lead agencies regarding the location and significance of mineral deposits within their region.

Overview of Classification

The DMG is responsible under SMARA for carrying out the classification phase of the classification-designation process. Classification entails six distinct but interrelated steps. These six steps are described below.

1. *Determination of Production-Consumption (P-C) Region Boundaries*. The boundaries of the P-C region are drawn along the limits of the marketing area of the active aggregate operations supplying the urban center under study.

The Fresno area was chosen for study as an urban center anticipated by the State Office of Planning and Research (OPR) to experience expansion. The marketing area of the production sites supplying Fresno was determined by interviews of aggregate operators and analysis of the transport rates set by the Public Utilities Commission (PUC).

2. *Establishment of Mineral Resource Zones (MRZ).* All lands within the Fresno P-C Region are assigned Mineral Resource Zone classifications (MRZ-1, MRZ-2, MRZ-3, or MRZ-4) based upon a geologic appraisal of the aggregate resource potential of the land. This appraisal includes study of pertinent geologic reports and maps, field investigation and sampling at outcrops and at active and inactive pits and quarries, and analysis of water-well logs and drill records.

3. *Identification of Available Aggregate Source Areas as Sectors.* Lands containing significant deposits of PCC-grade sand and gravel (areas classified MRZ-2 in step 2) are evaluated to determine whether or not current uses of these lands preclude possible future mining. Areas currently permitted for mining and areas found to have land uses compatible with possible future mining are considered available for mining. Sectors which identify available land are delineated and described in detail. Criteria for sectorization of MRZ-2 areas, established by the Board, are given in the Appendix.

4. *Calculation of Resource Tonnages within Sectors.* Investigation and analysis of on-site conditions, measurement of the areal extent of deposits, drill-hole information, waste-material percentages, and deposit densities are used to calculate total tonnages of PCC-grade aggregate *reserves* (deposits in land owned by an aggregate producer and permitted for mining by local government at the end of 1984) and *resources* (all deposits of PCC quality, including the reserves) within each sector. Calculations generally reflect conditions of the deposits at the end of 1984, so resource depletion since that time has not been considered.

5. *Forecast of 50-Year Needs and the Life Expectancy of Current Reserves.* The total tonnage of aggregate needed to satisfy demand in the Fresno P-C Region over the next 50 years is estimated based on a comparison of the projected population over that period with the average annual per capita rate of total aggregate consumption from 1960-1983. Even though all identified reserves are of PCC quality, other aggregate commodities are routinely produced and marketed from them. The projected life expectancy of the reserves is based on the assumption that this practice will continue. Results of this forecast are used to determine the life expectancy of the P-C region's current reserves.

6. *Identification of Alternative Resources.* Alternative sources of aggregate to meet the forecast 50-year demand are identified and briefly considered.

Brief Overview of Designation

The present report is concerned with the classification phase of the two-step process mandated by SMARA. The designation phase, the second phase of the SMARA process, follows receipt and acceptance of this classification report by the State Mining and Geology Board. Based upon the sector descriptions provided by DMG, and input from local lead agencies and the public, the Board may adopt regulations which "designate" certain mineral resource deposits as being regionally significant to satisfy future needs. Such designation, if made, would be included as part of state policy.

Overview of Aggregate Uses

Sand, gravel, and crushed stone are "construction materials." These commodities, collectively referred to as aggregate, provide bulk and strength to Portland cement concrete, asphaltic concrete, plaster and stucco. Aggregate is also used as road base, subbase, railroad ballast, and fill. Aggregate normally provides from 80 to 100 percent of the material volume in the above uses.

Aggregate material is essential to the needs of a modern society. It is a resource of great importance to the economy of any metropolitan area.

During 1983, about 2.7 million tons of aggregate, an amount worth between $10 and $11 million, were mined from the San Joaquin River and Kings River deposits in the Fresno P-C Region. Nearly 95 percent of this amount was consumed within the P-C region, and there are no known imports of PCC-grade aggregate into the region. Approximately 50 percent of the aggregate produced from 1960 to 1982 was used as Portland cement concrete aggregate (U.S. Bureau of Mines statistics). Enormous tonnages of high-quality PCC-grade aggregate are used in concrete highways, dams, canals, airport runways, bridge abutments, foundations, buildings, and general construction.

In this aggregate resource classification study, special emphasis is given to aggregate that meets the specifications used in making Portland cement concrete. The material specifications for PCC-grade aggregate are more restrictive than the specifications for aggregate for other applications. The restrictiveness of these specifications makes deposits acceptable for use as PCC aggregate the scarcest and most valuable of aggregate resources. This also means that aggregate produced from such deposits can be and is commonly used in applications other than concrete. Because of its versatility, its value, its importance in construction, and its relative scarcity, PCC-grade aggregate deposits are of the most concern when planning for the future availability of aggregate commodities.

In past years, the population in the Fresno area has been served by high-quality, relatively low-cost aggregate deposits from the San Joaquin and Kings rivers. However, the high-quality deposits are rapidly being depleted, and many of the potential sources are becoming inaccessible as urbanization encroaches on lands once used solely for mining and agriculture.

Rarely, even from the highest-grade deposits, is in-place aggregate raw material physically or chemically suited for every type of aggregate use. Every potential deposit must be tested to determine how much of its material can meet specifications for a particular use and for what processing is required. Specifications for various uses of aggregate material have been established by several agencies, such as the U.S. Bureau of Reclamation, the U.S. Army Corps of Engineers, and the California Department of Transportation (Caltrans), to ensure that aggregate is satisfactory for specific uses. These agencies and other major consumers of concrete test aggregate for acceptance by standard test procedures outlined by such organizations as

the American Society for Testing Materials and the American Association of State Highway Officials.

Most aggregate specifications have been established to ensure the manufacture of strong, durable structures capable of withstanding the physical and chemical effects of weathering and use. For example, specifications for Portland cement concrete and concrete products prohibit or limit the use of rock materials containing mineral substances such as gypsum, pyrite, zeolites, opal, chalcedony, chert, siliceous shale, volcanic glass, and some high-silica volcanic rocks. Gypsum shortens the setting time of Portland cement, pyrite dissociates to yield sulfuric acid and an iron oxide stain, and other substances contain silica in a form that reacts with alkali substances in the cement, resulting in cracks and "pop-outs."

Specifications also call for precise particle-size distributions for the various uses of aggregate. Aggregate is commonly classified into two general sizes: coarse aggregate and fine aggregate. Coarse aggregate is rock retained on a 3/8" or a #4 U.S. sieve. Fine aggregate passes a 3/8" sieve and is retained on a #200 U.S. sieve (a sieve with 200 weaves per inch). For some uses, such as asphalt paving, particle shape is specified. Caltrans Standard Specifications (1981) require that at least 25 percent by weight of coarse aggregate (1/4 inch to 3/4 inch diameter) used as Class 2 aggregate base material shall be crushed particles. Furthermore, aggregate material used with bituminous binder to form sealing coats on road surfaces shall consist of at least 90 percent by weight of crushed particles. Crushed stone is preferable to natural gravel in asphaltic concrete because asphalt adheres better to broken surfaces than to rounded surfaces, and the interlocking of angular particles strengthens the asphaltic concrete and road base.

The preferred use of one aggregate material over another in construction practices depends not only on specification standards, but also on economic considerations. Alluvial gravel is preferred to crushed stone for Portland cement concrete aggregate because the rounded particles of alluvial sand and gravel result in a mix that is easier to work than a mix composed of angular fragments. The workability of a mix consisting of Portland cement with crushed stone aggregate can be improved by adding more sand, water, and cement which must be added to the mix to maintain concrete durability standards. At the present time, the additional cement amounts to about a quarter of a 94 pound sack per cubic yard of concrete at an additional cost of about $0.75 per yard of mix. Although more care is required in pouring and placing mix containing crushed stone, Portland cement concrete made with this aggregate is as satisfactory as that made with alluvial sand and gravel of comparable rock quality.

In the Fresno area, PCC aggregate sells in bulk for about $4.00 per ton at the plant site (in mid-1984). However, this selling price reflects only part of the costs to the consumer. Transport costs are a significant part of the final delivery price. In areas that lack nearby aggregate sources, the delivery charges alone may be greater than the sale price of the material at the plant site.

Background and Purpose

Urban expansion has been a major contributing factor to the loss of significant mineral resources in past years. In response to the problem of conflicting land use, the need for essential mineral products and for information concerning their location and quantity, the California State Legislature enacted the Surface Mining and Reclamation Act of 1975. SMARA requires the State Geologist to classify,* according to the presence or absence of significant mineral deposits, certain areas of the state which are subject to urban expansion or other irreversible land uses incompatible with mining. Urbanizing areas are identified by the State Office of Planning and Research. The boundaries of the areas are modified to reflect current land use through consultation with local lead agencies and selected on-site field inspection.

The State Mining and Geology Board, upon receipt of the classification information from the State Geologist, transmits the classification report to the appropriate lead agencies and makes it available to other interested parties. Upon receipt of the classification report, each lead agency must develop and adopt mineral resource management policies to be incorporated in its general plan within 12 months. These policies will:

1. Recognize the mineral classification information, including the classification maps, transmitted by the Board.
2. Emphasize the conservation and development of identified mineral deposits.

After receipt of mineral classification information from the State Geologist, the State Mining and Geology Board may designate specific geographic areas that contain mineral deposits of regional significance. Procedures for the designation** of lands containing significant mineral deposits are specified in Section II.2 of the State Mining and Geology Board's "Guidelines for Classification and Designation of Mineral Lands," which is included as Part II of California Division of Mines and Geology Special Publication 51, "California Surface Mining and Reclamation Policies and Procedures" (1983). This publication is available free from the Division of Mines and Geology.

The objective of the classification and designation process is to ensure, through appropriate lead agency policies and procedures, that raw material is available when needed and does not become inaccessible as a result of a lack of information during land-use decision-making actions.

The "Guidelines for Classification and Designation of Mineral Lands" were adopted by the State Mining and Geology Board on June 30, 1978. The purpose of the guidelines is to implement SMARA by providing direction to the State Geologist in carrying out mineral resource classification, and to establish procedures by which the Board may designate mineral-bearing lands of statewide or regional significance. Section I.1.a of the guidelines requires that the State Geologist classify specified areas into *Mineral Resource Zones* (MRZ) or *Scientific Resource Zones* (SZ) as defined in Section I.2 of the guidelines. Although California has a wide range of mineral commodities within its

---

*Classification is the process of identification of lands containing significant mineral deposits based solely on geologic factors, and without regard for present land use or land ownership.

**Designation is the formal recognition by the State Mining and Geology Board, after consultation with lead agencies and other interested parties, of areas containing mineral deposits of regional or statewide significance that should be considered for protection from land uses incompatible with mineral extraction. These deposits are deemed to be of prime importance in meeting the future needs of the region or the state.

borders, the State Mining and Geology Board recognizes that construction materials (sand, gravel, and crushed stone) are produced regionally, are used in every urban area of the state, and require special classification data. Section I.3 of the guidelines requires that classification reports that pertain to deposits of construction materials include the following information: (1) the location and estimated total quantity of construction material that is geologically available for mining; (2) limits of the market (production-consumption) region which the potential resource would serve; and (3) an estimate of the total quantity of material that will be needed to supply the requirements of the consumption region for the next 50 years. This information will assist the State Mining and Geology Board in determining the statewide or regional significance of these types of deposits.

The Mineral Land Classification of the Fresno Production-Consumption Region was initiated in 1984 by the State Geologist. Included in the project area are parts of Fresno and Madera counties. Portland cement concrete-grade aggregate resources of the area were selected for initial classification.

Each aggregate deposit was evaluated separately, and then considered as part of a single production-consumption region established on the basis of existing aggregate consumption patterns. The Fresno marketing region is served by two production districts with overlapping market regions, the San Joaquin River production district and the Kings River production district.

DETERMINATION OF THE FRESNO PRODUCTION-CONSUMPTION REGION

The city of Fresno was targeted by the Office of Planning and Research as an area experiencing significant urban expansion (OPR, 1975), and the State Mining and Geology Board scheduled it for an aggregate study by the Division of Mines and Geology. To determine the aerial limits of such a study, the Division must accommodate several factors. Ideally, both the production districts and 95 to 100 percent of the areas served by these districts are included in this study. Usually, this more than encircles the area identified by the OPR as that anticipated to be urbanized by 1990. This is the case in Fresno.

A study of sand and gravel production and consumption showed that all aggregate used in the urbanizing portions of Fresno County is produced from the San Joaquin and Kings rivers. (The only other active deposit within Fresno or Madera counties is adjacent to Los Gatos Creek, north of Coalinga. It serves an area within a 30-mile radius of the deposit site and so does not contribute aggregate to the city of Fresno.)

It was found that aggregate consumption, though centered on the city of Fresno, reaches outward, encircling an area within a 20-mile radius. Thus the production-consumption region was delineated (Plate 1), encompassing: (1) the entire metropolitan area of Fresno, Clovis and Sanger and surrounding areas anticipated by the OPR and/or the local lead agency to urbanize in the next 10 to 30 years; (2) outlying towns such as Madera, Selma, and Kingsburg; (3) rural areas not anticipated to urbanize but which are sparsely populated and consume aggregate from the San Joaquin and Kings rivers; and (4) the two resource areas. The eastern boundary of the area roughly matches the break in slope between the foothills and the Sierra Nevada Mountains and follows census tract boundaries to allow use of existing census and other population data for forecasting. Lead agencies with jurisdiction within the P-C region are shown on Table 1.

Transportation Rates

Because aggregate is a low-value, high bulk-weight commodity, a major part of the cost of aggregate to the consumer is for transportation. In fact, transport costs are one of the major constraints on the marketing area for a production district.

All aggregate marketed in the Fresno P-C Region is transported by truck. Minimum rates for independent aggregate truckers are set by the California Public Utilities Commission. Rates for the Central Valley are published in "Minimum Rate Tariff 7-A," sections 1 through 3 and supplement 24. Charges are calculated based on either an hourly rate or a distance rate. If the hourly rate is used, the carrier and debtor must enter into a written agreement prior to transport.

TABLE 1. Lead agencies (counties and incorporated city governments) located within the Fresno P-C Region.

AGENCIES	
CITIES	COUNTIES
Clovis	Fresno*+*
Kingsburg	Madera*+*
Madera	
Reedley	
Sanger	
Selma	
Fresno*+*	

* Agencies with active aggregate operations within their jurisdictional boundaries.
+ Agencies that have land classified MRZ-2 within their jurisdiction.
* Lead agencies containing sectors.

Table 2 contains the distance rates for selected increments and the hourly rates, as specified in Minimum Rate Tariff 7-A. Increasing the distance between a production area and a market area will increase the consumer's cost. Hauling aggregate from Coalinga to downtown Fresno (approximately 60 miles), for example, would result in a transport cost greater than the product cost. Total cost per delivered ton of PCC aggregate would increase from around $5.50 per ton to around $10 per ton.

TABLE 2. Minimum rates for transport of aggregate in the Fresno area.

DISTANCE RATES* (for selected increments)		HOURLY RATES**	
MILES	RATES ($/ton)	NO. OF AXLES PER UNIT OF EQUIPMENT	RATES ($)
11	1.55	2	37.00
21	2.49	3	41.50
31	3.39	4	43.00
41	4.27	5+	46.90
52	5.23		
63	6.08		
80	7.50		
85	7.89		

* includes November 1984 increase in surcharge; rates are higher for work done on holidays or weekends and if equipment other than a "... tractor with bottom dump doubles in train" are required at the destination.

** current as of July 9, 1984; rates are higher for work done on holidays and weekends.

ESTABLISHMENT OF MINERAL RESOURCE ZONES

The DMG has classified land in the Fresno P-C Region according to the presence or absence of significant PCC-grade aggregate deposits. The land classification is presented in the form of Mineral Resource Zones or MRZ s. Directions for the identification of Mineral Resource Zones are set forth in DMG's Special Publication 51 in the section entitled "Guidelines for Classification and Designation of Mineral Lands" (CDMG, 1983).

The guidelines for establishing the Mineral Resource Zones are as follows:

MRZ-1 Areas where adequate information indicates that no significant mineral deposits are present, or where it is judged that little likelihood exists for their presence. This zone shall be applied where well-developed lines of reasoning, based upon economic-geologic principles and adequate data, demonstrate that the likelihood for occurrence of significant mineral deposits is nil or slight.

MRZ-2 Areas where adequate information indicates that significant mineral deposits are present, or where it is judged that a high likelihood for their presence exists. This zone shall be applied to known mineral deposits or where well-developed lines of reasoning, based upon economic-geologic principles and adequate data, demonstrate that the likelihood for occurrence of significant mineral deposits is high.

MRZ-3 Areas containing mineral deposits, the significance of which cannot be evaluated from available data.

MRZ-4 Areas where available information is inadequate for assignment to any other mineral resource zone.

Mineral Resource Zones in the Fresno P-C Region are presented on a Mineral Resource Zone map (Plate 2) and on seven U.S. Geological Survey topographic maps (Plates 3-9) that cover in detail those areas classified MRZ-2. Figure 2 shows the quadrangle maps that cover the Fresno area.

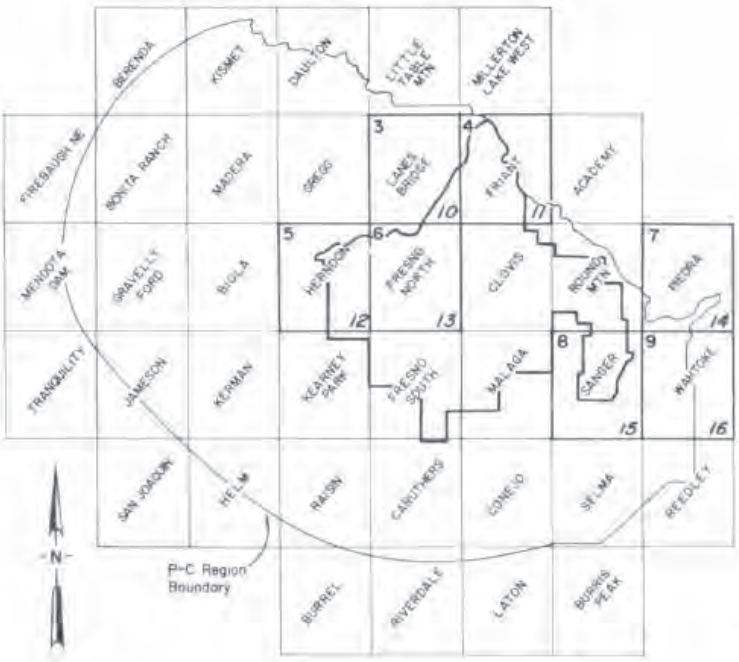

Figure 2. Index of U.S. Geological Survey quadrangles covering the Fresno P-C Region; the detailed Mineral Land Classification maps (Plates 3-9); Resource sector maps (Plates 10-16); and, the P-C region boundary. Urbanized and urbanizing portions of the P-C region are shown with the stippled pattern.

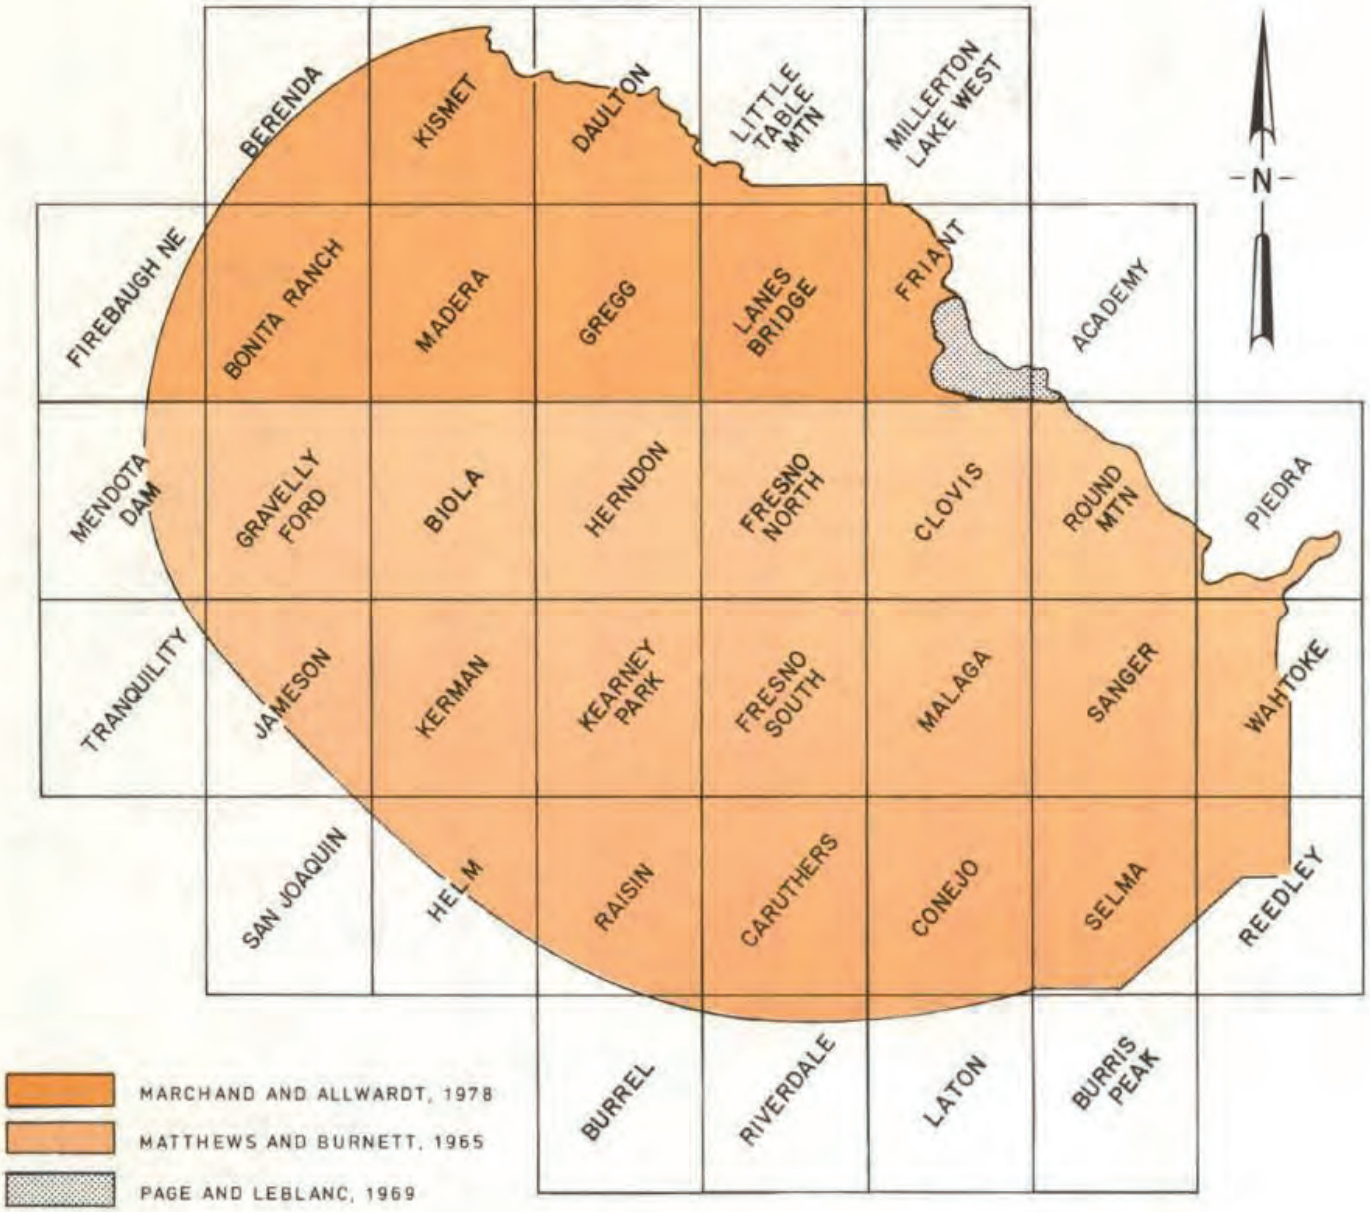

Figure 3. Quadrangle index indicating geologic maps used in classification of the Fresno P-C Region.

Mineral resource zones within the Fresno P-C Region were established on the basis of an aggregate appraisal that included the following tasks for assessing the quantity, quality, and extent of the aggregate deposits:

1. Examination and compilation of relevant geologic maps, aerial photos, geologic literature, aggregate industry data (some of which is proprietary) and aggregate engineering test data. The geologic maps used in classification of the Fresno P-C Region are indicated on Figure 3.
2. Interviews with aggregate operators, company geologists, and consultants.
3. Compilation and analysis of subsurface well-log data and drilling records.
4. Field investigation of active and depleted aggregate quarries.

Areas Classified MRZ-1

Areas classified MRZ-1 were judged on the basis of available data to have little likelihood of containing significant deposits of PCC-grade aggregate. Deposits that have excessive amounts of clay, silt, organic matter, absorptive rock, alkali-reactive rock, platy rock, or soft rock are unsuitable for use in PCC aggregate; areas containing such deposits are classified MRZ-1.

The areas in the Fresno P-C Region that are classified MRZ-1 (see Plate 2) are underlain by alluvial material judged to contain too much clay, silt, tuffaceous or pumiceous sediments. These include Quaternary basin deposits in the center of the San Joaquin Valley and the Friant Pumice Member of the Turlock Lake Formation which crops out on both sides of the San Joaquin River in the Friant, Lanes Bridge, and Millerton Lake West quadrangles (Marchand and Allwardt, 1978). The location of

the basin deposits was determined from a compilation of all three maps listed on Figure 3. Additionally, areas depleted of gravel and reclaimed as ponds or landfill are also classified as MRZ-1. Land falling in the latter category is present within the floodplains of both the San Joaquin and Kings rivers.

Areas Classified MRZ-2

Two areas within the Fresno P-C Region are classified as MRZ-2 (see Plate 2). These are areas for which data indicate that there is a high likelihood that significant deposits of PCC-grade aggregate exist.

SMARA guidelines set forth two requirements to be used to determine if land should be classified as MRZ-2:

1. The deposit must be composed of material that is suitable as a marketable commodity.
2. The deposit must meet threshold value. The projected value (gross selling price) of the deposit, based on the value of the first marketable product, must be at least $8,500,000 (which is equal to 5 million 1978 dollars).

Areas classified MRZ-2 contain aggregate resources that are either proven PCC-grade or highly likely to be of PCC-grade. Much of the aggregate in the MRZ-2 areas has not been identified as PCC-grade aggregate through formal engineering tests. Aggregate deposits in untested, unproven areas identified as MRZ-2 are believed to contain PCC-grade aggregate for either of the following reasons:

- The aggregate in unproven areas is similar in age and lithology, and was deposited under similar geologic conditions to that of the proven PCC-grade aggregate.
- The unproven deposit is a lateral extension of an alluvial formation from which PCC-grade aggregate has been produced.

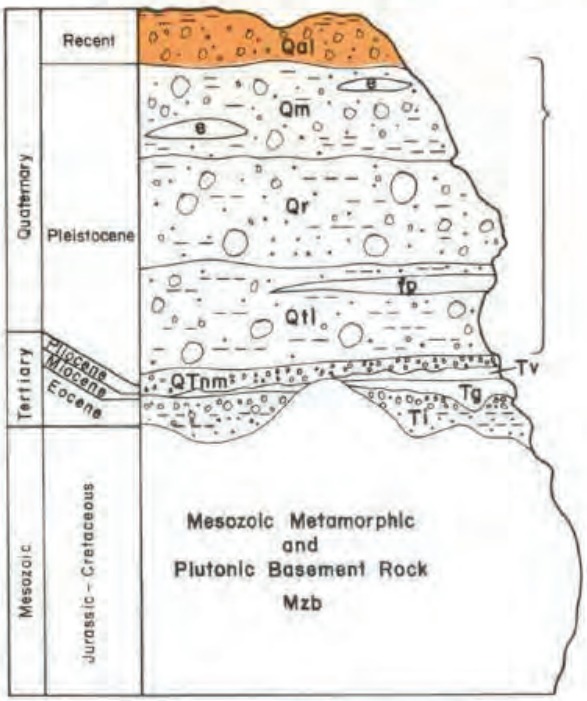
Areas classified MRZ-2 in the Fresno P-C Region are underlain by Holocene river channel and floodplain deposits. These include parts of the San Joaquin River floodplain from Herndon to Lost Lake, and the Kings River floodplain from Central Avenue to Avocado Lake.

Areas Classified MRZ-3

Areas classified MRZ-3 are those containing aggregate deposits, the significance of which cannot be evaluated from available data.

Sedimentary, metamorphic, and igneous rock types are often included in this category. Positive indications in the geologic literature, and a petrologic field examination that shows a rock unit to contain abundant, hard, durable material without excessive amounts of deleterious materials are necessary for a unit to be considered a suitable candidate for an MRZ-3 classification. Additional information regarding the quality of material in these areas could either upgrade the classification to MRZ-2 or downgrade the classification to MRZ-1. Formations and rock types located within the Fresno P-C Region that are classified MRZ-3 include (see Figure 4): the Ione Formation, an unnamed Tertiary basalt and gravel unit, the North Merced Gravels (Marchand and Allwardt, 1978), and metasedimentary and granodioritic rocks of the Sierra Nevada Mountains (Matthews and Burnett, 1965).

A large percentage of the areas classified MRZ-3 in the Fresno P-C Region are located in the San Joaquin Valley and are



Qal: Basin, river channel and alluvial deposits. Alluvial sand, silt and gravel deposited in terraces, fans and basins. Deposition is hypothesized to have occurred during, and was controlled by, glaciation in the Sierra Nevada Mountains (1) and (2).

Qm: Modesto Formation

e: eolian deposits

Qr: Riverbank Formation

Qtl: Turlock Lake Formation

fp: Friant Pumice Member

QTnm: North Merced pediment gravels

Tv: variously described as olivine basalt (3) or trachyandesite (4)

Tg: pre-volcanic gravels deposited by San Joaquin River

Tl: Ione Formation - strongly indurated and cemented sandstone and conglomerate with clay interbeds. Primarily fluvial

Mzb: Basement rocks within the Fresno P-C Region consist of pre-Cretaceous metasedimentary rocks, granodiorite and granite. (5)

GEOLOGIC UNITS THAT CONTAIN SAND AND GRAVEL SUITABLE FOR USE AS PCC-GRADE AGGREGATE (MRZ-2 AREAS)

Figure 4. Generalized columnar section of the stratigraphy in the San Joaquin River area.

composed of Quaternary alluvial deposits. Though these sediments were deposited under similar conditions and derived from the same source rocks as those classified MRZ-2, they are older and have undergone too much weathering to consistently meet the specifications for MRZ-2. An exploration and testing program, however, might locate areas of PCC-grade material within these sediments. Stratigraphic relationships of these units are shown on Figure 4.

Portions of the San Joaquin and Kings rivers floodplains (see Plate 2) were classified MRZ-3, due to a variety of factors. In some cases, these areas have been previously mined and the remaining quantity of aggregate could not be shown to meet the minimum threshold value stipulated in SMARA. Other portions of the floodplains were classified MRZ-3 due to the size gradation of the deposits. The aggregate upstream of Avocado Lake (Kings River) is composed of oversized clasts. The aggregate downstream of Highway 99 (San Joaquin River) and in the vicinity of where the Kings River floodplain narrows (Plate 8), contains a significant amount of sand and fine sand. Exploration may allow these deposits to be utilized in Portland cement concrete.

Areas Classified MRZ-4

Areas classified MRZ-4 are those areas for which available information is lacking or incomplete for assignment into the other MRZ categories. No areas were classified MRZ-4 in the Fresno P-C Region.

EVALUATION OF PCC-GRADE AGGREGATE IN THE FRESNO P-C REGION

An assessment of aggregate resources in the Fresno P-C Region is presented in this section of the report. The assessment was conducted on the basis of a quantitative evaluation of available and suitable aggregate resources classified MRZ-2.

Concepts Used in Identifying Available Aggregate Resource Areas

The State Geologist is responsible for calculating aggregate resources for those areas classified MRZ-2. Recognizing that there are lands within MRZ-2 areas that have already been urbanized and that, therefore, have a limited opportunity for mineral resource conservation and extraction, the State Geologist has limited the calculation of aggregate resource tonnages to portions of MRZ-2 areas that have not been urbanized.

For purposes of classification, incompatible uses are urbanized lands containing high-cost improvements such as high-density residential developments, intensive industrial developments, commercial developments, and major public facilities (see Appendix, Interim Criteria for Sectorization of MRZ-2 Areas for Aggregate). Compatible uses are nonurbanized land comprised of very low density residential land (approximately one unit or less per ten acres), recreational land that does not have high-cost improvements, agricultural land, silvicultural land, grazing land, and open space.

For this report, the determination of which MRZ-2 land is nonurbanized was based upon conditions of the land at the time of the study (January 1984 through October 1984). The use of the land was determined by the authors after consultations with lead agencies, reference to aerial photographs and photo-revised topographic maps, and field reconnaissance.

SECTORS

Sectors are areas that have been classified MRZ-2 by the State Geologist, and that are deemed to be available for mining based upon criteria for availability provided by the State Mining and Geology Board.

A sector is an area within which the geometrical configuration of the deposit is sufficiently regular to permit reliable calculation of the tonnage of the mineral resource present. Thus, for example, sector boundaries would be established between that part of a natural deposit formed on a fan, and that part within the confines of an adjacent modern stream channel and its floodplain. Mineral land classification, which is done without regard for current land use, results in a delineation of the resource areas on maps, but this by itself does very little to put into perspective the resource base that is available to meet the future needs of a region. Sectors have been employed to focus the attention of land planners and local governments on just those areas that remain accessible for mineral extraction. The State Geologist calculates the available resources of each sector, and identifies the amount of remaining resources that have been permitted for mining. These latter resources are termed reserves. The resources present in other (non-sectorized) MRZ-2 resource areas are not calculated because they are regarded as unavailable.

The calculated reserves and resources of all the sectors of a region are compared with the State Geologist's forecast of the 50-year needs of a region for the mineral resources. The comparison of regional needs with the available reserves and resources provides the opportunity to focus attention on the mineral resource issues confronting the region; *viz.*, the need to plan carefully for the use of any lands containing mineral resources and the need to consider the permitting of additional mining operations in the region as currently mined deposits are depleted.

Each sector meets or exceeds the Board's threshold values for deposits of significant size, and each sector may be considered for designation as an area of regional or statewide significance by the State Mining and Geology Board pursuant to Section 2790 SMARA. Areas that have not been sectorized by the State Geologist are not considered for designation by the Board.

Although the classification by the State Geologist and the designation by the Board are actions explicitly provided for by SMARA, and although the results of such actions yield reports

that must be acted upon by affected local governments, the sectorization and sector maps do not in and of themselves carry with them specific obligations imposed on local governments by SMARA.

The sector maps and the resource base calculations, however, contain the essential facts that are needed to focus the attention of planners on the mineral availability problems and the alternative solutions to meet the mineral resource needs of the region. Without the sector maps and the accompanying calculations, the primary objectives of SMARA could not be achieved.

Because the Board's criteria for sectorization focus on the apparent suitability of the land for mining and do not take into account commitments that may have been made to restrict the accessibility of some of the sectors for mining, it is possible that the available resource base as calculated by the State Geologist may be overestimated and the problems confronting local government may be understated. Considering these possibilities, it becomes important for local governments to carefully review the sectors and the associated estimates of resources to ensure that previously unrevealed problems are not overlooked and that planning decisions are made using a correct perspective on available resources.

RESOURCE SECTORS WITHIN PARKS

Dedicated parklands are recognized as having a special status. Resource sectors within parks have, therefore, been treated as a special class of sectors, and the quantifications of the resources in them are presented separately in Table 5.

Calculation of Available Resources

RESERVES AND RESOURCES

In this report, *reserves* are estimates of tonnages of aggregate that have been determined to be acceptable for commercial use that exist within properties owned or leased by aggregate producing companies, and for which permits have been granted to allow mining and processing of the material. *Resources* include *reserves* as well as all similar potentially usable aggregate materials that may be mined in the future, but for which no permit allowing mining has been granted.

FACTORS CONSIDERED IN CALCULATIONS

The resource estimates given here are limited to those PCC-grade aggregate resources present in resource sectors, which are, as explained in the previous section, the nonurbanized portions of the areas classified MRZ-2. The resource sectors defined in this study are shown on the sector maps (Plates 10-16) that accompany this report.

The sectors are subdivided into numbered subsectors to recognize the location of existing freeways, canals, bridges, dams, major powerlines, and major pipelines. These criteria allowed for the calculation of more realistic resource tonnages. Subsectors S-1 through S-20 identify resource areas in the San Joaquin River; Subsectors K-1 through K-32 delineate resource areas in the Kings River.

The following factors were used to determine the areal extent and tonnage of PCC-grade aggregate resources within the sectors:

1. Sector resource tonnage estimates for the Kings River were based on measurements taken from base maps that have a scale of 1:24,000. Estimates for the San Joaquin River were based on aerial photogaphs that have a scale of 1:9,600.
2. Even in proven PCC-grade aggregate deposits, a small percentage of the aggregate cannot be used in concrete and is referred to in this study as "waste." Waste includes pit-run and production waste, both of which may be utilized in non-PCC uses, primarily as fill. Known waste percentages were extrapolated to deposits in untested sector areas from proven, nearby PCC-grade deposits.
3. Thicknesses of PCC-grade deposits were determined through use of water-well log data and information provided by persons who have knowledge concerning aggregate deposits and exploration in this region.
4. Typical setbacks from utility and rail lines, urban developments and roads, as stipulated in lead agency mining ordinances, were used in determining the areal limits of sectors that border areas not available for mining.

Resource Sector Descriptions

The total area of the resource sectors in the Fresno P-C Region is 31 square miles, of which almost 3½ square miles are currently permitted for mining. As previously noted, sectors are delineated only within areas classified MRZ-2 and that are available for mining. The estimated total of PCC-grade aggregate resources in these sectors is 2.17 billion tons (29 million tons of which is in dedicated parklands). As of November 1985, 119.3 million tons of these resources were permitted for mining, and therefore qualified as reserves. Annual depletion of reserves for 1985 has not been subtracted from this figure.

The resource sectors are described below:

SAN JOAQUIN RIVER AREA — SECTOR S

The San Joaquin River has provided PCC-grade aggregate since the early 1920s. The earliest mining occurred in the upstream portion of the river, near the town of Friant. Lost Lake, just west of Friant, was formed by the excavation of aggregate used in the construction of Friant Dam (completed in 1934). PCC-grade aggregate was also mined as far downstream as one mile west of Highway 99. Mining from this area ceased in the mid-1960s. Both areas still contain some high-quality aggregate. However, it could not be shown that the remaining aggregate resources meet the minimum threshold value established by the Board; thus, they are classified MRZ-3. The remainder of the downstream portion of the floodplain within the P-C region is also classified MRZ-3. This portion is composed predominantly of sand and could not, with the available information, be proven to be coarse enough for PCC-grade aggregate. However, this area undoubtedly contains a large volume of sand.

Six companies process aggregate from the San Joaquin River for use in Portland cement concrete, asphaltic concrete, road base, plaster sand, fill, etc. River Rock Products has two sites, one near Herndon (Sectors S-2a and S-2b, Plates 12 and 13) and another on Old Friant Road (Sectors S-10a and S-10b, Plate 10). Stewart and Nuss has a large part of the floodplain permitted between Scout Island and Highway 41 (Sectors S-5a, S-5b, S-5c, and S-6, Plate 13) and has been active at this

site since 1963. However, the company may not be allowed by the landowner to completely mine that part of its lease which lies south of the river and west of the highway. River Rock Products is active only in Fresno County, whereas Stewart and Nuss has permits in both Fresno and Madera counties.

San Joaquin Rock and Sand, the next producer upstream, is active only in Madera County (Sectors S-7a and S-7b, Plates 10 and 13). This company's lease and permitted area is located just west of Highway 41 on the northern side of the river. The company has been active here for a little over two years, having obtained the plant from a prior operator. Brueckner Sand and Gravel (Sector S-8, Plate 10) has been working on a 29-acre area adjacent to Rice Road since 1974.

Sequoia Rock Company's lease abuts the northern line of River Rock Products on Old Friant Road (Sectors S-11a and S-11b, Plate 10). The company also controls Cobbs Island and "Island No. 1" in Madera County (Sector S-14, Plate 10). North from Sequoia Rock along the Friant Expressway is Lonestar Industries' rock plant (Sector S-16, Plate 11). The plant was built prior to 1960, and most of the land surrounding it has been mined. Lonestar is currently mining from a new permit in subsector S-19 (Plate 11). The landowners of the northern half of subsector S-19 (Plate 11) have also obtained a conditional use permit, but nearby homeowners have a lawsuit pending against the permit.

No unusual specialty products are sold from the San Joaquin River deposits. However, secondary gold recovery is occurring at most aggregate plants.

None of the individual rock clasts contained in either the sand or gravel fractions of the deposits classified MRZ-2 contain minerals deleterious to the production of PCC-grade aggregate.

Between 40 and 60 percent of the rock clasts within the San Joaquin River between Herndon and Friant are composed of medium- to coarse-grained granitic rock types: granite, granodiorite and quartz monzonite. This includes rocks with these compositions but with a gneissoid texture or with the addition of secondary chlorite and epidote. Clasts of diorite and gabbro were rarely observed. Metamorphic rock types, such as amphibolite, schist, phyllite and slate, compose 5 to 10 percent of the clasts. Another 10 percent consists of very hard, well-lithified conglomerate derived from metasedimentary units in the Sierra Nevada Mountains or from outcrops of the Ione Formation in Little Table Mountain. Volcanic and metavolcanic clasts compose another 10 to 20 percent. These consist mostly of fine-grained to porphyritic basalt or andesite, scoriaceous basalt, or welded light-colored tuffs. Quartzite clasts and various other rock types compose the remainder of the clasts. The sand fraction is composed of quartz, biotite, and rock fragments with occasional grains of epidote and pumice. The latter is probably derived from reworking of the Friant Pumice Member of the Turlock Lake Formation which crops out in the river bluffs north of Copper Avenue. All the sediments are subrounded to rounded and oblong to spherical in shape.

Aggregate from the San Joaquin River is mined from a floodplain which developed throughout late Pleistocene to Recent time, in fact, probably until completion of the Friant Dam. The characteristics of the deposit seem to vary along the length and width of the floodplain. For instance, on Ledger Island (Plate 4 of 11) bedrock of the Sierra Nevada batholith comes within 15 feet of the surface. A northwest trending fault mapped through the older alluvium, concealed by the Recent deposits (Marchand and Allwardt, 1978) north of Ledger Island, may be the reason for this shallow occurrence of the bedrock in the river channel.

The production zone consists of a gravel-rich layer which, where present, varies in thickness from 15 to 59 feet. Below the gravel-rich layer is a clay layer which varies in thickness from 1 foot to more than 20 feet thick (the bottom of the clay layer has not been found when it is this thick). On a portion of the Stewart and Nuss lease, the gravel layer was at one time totally excavated, leaving the top of the clay daylighted. The latter appeared to be terraced in three distinct levels (personal communication with Stewart and Nuss personnel). The cause of the terracing is unknown. This clay is described by the operators as being hard, and they have mostly found it infeasible to excavate through it to any underlying gravels. However, there are a few exceptions to the occurrence of this clay layer. Excavation for aggregate at what is now Lost Lake is said to have extended 60 to 70 feet below the ground surface. Obviously the clay layer either did not occur here or was of such minimal thickness and hardness that it was ignored. Similarly, the clay layer is said to be a foot or less in the Brueckner pit, allowing mining to occur to a greater depth.

As would be expected, the floodplain deposits generally become finer as one moves downstream. The maximum clast size near Friant is 10 inches, whereas downstream near Herndon, it is 4 inches. However, not far downstream from Friant, on land leased to Lonestar Industries, there are areas where gravel does not exist and the fine size of the sand is believed to make it infeasible for the deposit to be mined (personal communication with Lonestar employees). This area is classified MRZ-3 (Plate 4). It is unknown if there are other areas with this anomalous size-gradation.

Most of the operators use 1.5 tons per cubic yard as a rule of thumb for in-place density. However, Stewart and Nuss cites 1.8 tons per cubic yard for the density of their reserves. It is not known if this company has better data than the other operators or if the deposit really is denser in their area. The higher density value was used for subsectors containing their leases (see Table 3).

The other factors used in calculating resource tonnages also vary, due to the variability of the San Joaquin River deposit. The estimates of percent waste, production-zone and overburden thickness and, as previously noted, in-place density were based on field observations and information supplied by active producers, and occasionally on water-well logs. This information was extrapolated to sectors without active or historic mining from adjacent and geologically similar sectors where data was available.

KINGS RIVER AREA — SECTOR K

The Kings River is geomorphically similar to the San Joaquin River except that it has a broader floodplain and a thicker section of Recent sand and gravel. Unlike the San Joaquin River, a persistent underlying clay layer has not been reported by the operators nor described in water-well logs.

There are only two operators currently producing aggregate from the Kings River. Central Valley Ready Mix is located adjacent to Annadale Road, with the aggregate plant south of the road and their current mining site north of the road (Sectors K-18

and K-11b, Plate 15). The company began operating in 1945. Sanger Rock and Sand began in the late 1940s at their site south of Highway 180 and east of Trimmer Springs Road (Sectors K-10a and K-10b, Plate 16). Both companies process aggregate for use in PCC and asphaltic concrete. Industrial Asphalt used to mine aggregate from a site along the river just north of Goodfellow Avenue. However, the company abandoned this site several years ago.

Aggregate was excavated from the area that is now Avocado Lake, southwest of Piedra, for use in Pine Flat Dam which was completed in 1954. Just upstream of Avocado Lake the floodplain of the Kings River consists mainly of boulders. These large-sized clasts are difficult to work with and hard on mining and processing equipment. Therefore, this area was classified MRZ-3. Conversely, where the river turns southward and the floodplain narrows (Plate 9), water-well logs indicate that gravel no longer occurs in the subsurface. Due to the lack of gravel, these more distal deposits are classified MRZ-3, but sand of PCC-grade might be found here with an exploration program. Maximum clast size within the area classified MRZ-2 varies from 12 inches near Avocado Lake to 5 inches at the intersection of Trimmer Springs Road and Belmont Road to 2 inches near the southern part of the MRZ-2 area. Clasts are rounded to well-rounded and oblong to spherical in shape.

Due to the smaller number of producers on the Kings River, less is known about the variability of production-zone and overburden thickness than on the San Joaquin River. The factors used in resource calculations were obtained from the two active producers and from selected logs of water wells. Waste was assumed to be 15 percent, and in-place density 1.5 tons per cubic yard in all subsectors. The production-zone thickness, which varies between 25 and 80 feet as shown in Table 4, was determined from water-well logs.

As with the rock clasts in the San Joaquin River, no minerals deleterious to the production of PCC-grade aggregate were found in the Kings River deposits.

Granitic rock types compose the majority of clast types observed at localities along the Kings River. Plutonic rocks more intermediate in composition, such as diorite, constitute a greater portion of the deposit than on the San Joaquin River. Ultramafic rock types, such as peridotite and serpentine, were also found. The majority of the remainder of the deposit appears to be composed of quartzite, fine-grained basaltic volcanic rocks, and fine-grained metavolcanic rocks of various compositions.

Both the San Joaquin and the Kings rivers are dammed just upstream from the P-C region. This means that neither is re-

ceiving bed load recharge and the deposits are not being replenished. Another important point is that once a pit is abandoned, and allowed to refill with water, it is not economically feasible (today) to re-open the pit and resume the mining of any remaining gravel. This fact should be considered before closing down operations at one site and permitting another.

PARKLANDS

In the Fresno P-C Region two parks have been sectorized. China Creek Park (Subsector K-31) constitutes 120 acres within the Kings River floodplain. It is currently unimproved land which serves as a wildlife sanctuary, though improvements are planned. Subsector S-20 consists of a portion of the Fresno County Park at Lost Lake. This area contains river and lake frontage, picnic tables, lawn and shade trees, and restrooms. Resource volumes calculated within these two subsectors are given in Table 5.

Other MRZ-2 Areas

Specific sites of current, on-going production of aggregate for use in other applications than PCC may also be classified MRZ-2. The production level for these sites must be significant enough to be reported to the U.S. Bureau of Mines. No such sites have been found in the Fresno P-C Region.

TABLE 6. Summary of PCC-Grade aggregate resources compared with the estimated 50-year demand (all aggregate types): Fresno P-C Region.

Nonpermitted Resources	
San Joaquin River	
Fresno County	70,300,000
Madera County	52,200,000
Kings River	1,899,100,000 tons
Permitted Resources (Reserves)	
San Joaquin and Kings rivers	119,300,000 tons
TOTAL	2,140,900,000 tons
Resources (nonpermitted) in Parklands (Sectors S-20 and K-31)	28,600,000 tons
GRAND TOTAL	2,169,500,000 tons
50-year demand	268,400,000 tons

ESTIMATED 50-YEAR CONSUMPTION OF AGGREGATE

Basis of 50-Year Forecasts

The State Mining and Geology Board, as specified in CDMG Special Publication 51 in the section entitled "Guidelines for Classification and Designation of Mineral Lands," (CDMG, 1983) requires that mineral land classification reports for regions containing construction materials classified as MRZ-2 include "An estimate of the total quantity of each such construction material that will be needed to supply the requirements of both the county and the marketing region in which it occurs for the next 50 years. The marketing region is defined as the area within which such material is usually mined and marketed. The amount of each construction material mineral resource needed for the next 50 years shall be projected using past consumption rates adjusted for anticipated changes in market conditions and mining technology." In the "Guidelines" the Board also specifies that these estimates be reviewed periodically (every 10 years or less).

Fifty-year forecasts of PCC-grade aggregate needs in the Fresno P-C Region were made on the basis of reported aggregate production records during the years 1960-1983. For the purpose of this study, P-C region boundaries were defined to ensure that nearly all PCC-grade aggregate produced in the Fresno area will be consumed in the study area,[1] and that imports of PCC-aggregate from outside the study area are insignificant.

[1]Nearly 95 percent of all aggregate produced in the Fresno P-C Region is consumed within the P-C region boundaries.

Correlations Between Aggregate Production and Consumption

Past studies of aggregate marketing regions in California have shown that there is a strong correlation between the amount of aggregate produced and the population in a given aggregate production-consumption region. On this basis, aggregate production and population figures in the Fresno P-C Region were correlated for the years 1960 through 1983. Correlations between the annual aggregate production records and the population statistics were used to obtain per capita consumption rates of aggregate in the study area. The historical aggregate production data in the study area was obtained from mining records of the U.S. Department of the Interior, Bureau of Mines (1960 to 1983). The historical population data for the Fresno area were taken from the 1980 census data, obtained from Fresno and Madera counties.

The average per capita consumption rate in the Fresno P-C Region is 7 tons of aggregate per year over the period from 1960 to 1983 (see Table 7 and Figure 5). Due to the erratic variations in aggregate production from year to year (see Figure 6), a three-year moving average of the annual aggregate production was used in conjunction with population statistics (for purposes of curve smoothing) to compute the per capita consumption rates for the P-C region. The moderately high consumption rates in the Fresno area are characteristic of aggregate marketing regions in which the overall population density is relatively low and the rate of urban development is high. A moderately high consumption rate probably will be maintained within the Fresno

P-C Region until the onset of urban maturity, then it will decrease and eventually drop to a general maintenance level. Urban maturity is the point in the development of an area at which construction materials are used primarily to maintain what has already been developed, rather than to provide for further development.

Projected Population and Per Capita Consumption through the Year 2034

A simple analysis of the historical aggregate production and population statistics was conducted to forecast basic trends in the per capita consumption rate of aggregate within the Fresno area through the year 2034. The total aggregate needs of the study area through the year 2034 were calculated on the basis of two factors: (1) a projected average annual per capita consumption rate of 7 tons (the average per capita consumption rate for the years 1960 to 1983); and (2) the projected population of the region for future years through the year 2034. Population projections for the years 1980 to 2020 (Figure 7) were obtained from the California Department of Finance (1983). This data was extrapolated by DMG for the study area on a straight line basis through the year 2034 to provide the 50-year population projection as specified under the SMARA guidelines. The results of these calculations (Table 8) reveal that an estimated 268 million tons of aggregate will be needed to satisfy the projected future demand for this construction material in the Fresno P-C Region through the year 2034. Of this total, 134 million tons must be of PCC grade.

Factors Affecting Per Capita Consumption Rates

The wide variations from year to year in the per capita consumption rate (Table 7) (4.97 to 8.44 tons per year) are probably reflections of changes in urban growth rates with time, and the construction of major facilities (for example, freeways). In part, these variations also result from incomplete and inaccurate production records supplied to the U.S. Bureau of Mines. Certainly the economic climate is a powerful variable that influences the annual per capita consumption rates for aggregate. Very high interest rates, for example, such as existed in California during the 1980 to 1982 period, tend to lower the amount of new construction in an area and consequently lower the demand for aggregate.

At some point in the future, the average annual per capita consumption rate of 7 tons for the Fresno P-C Region will probably decrease with the onset of urban maturity and then stabilize at a lower rate. However, should unforeseen events occur, such as massive urban renewal, disaster reconstruction, or a major recession, the per capita consumption rate could change radically.

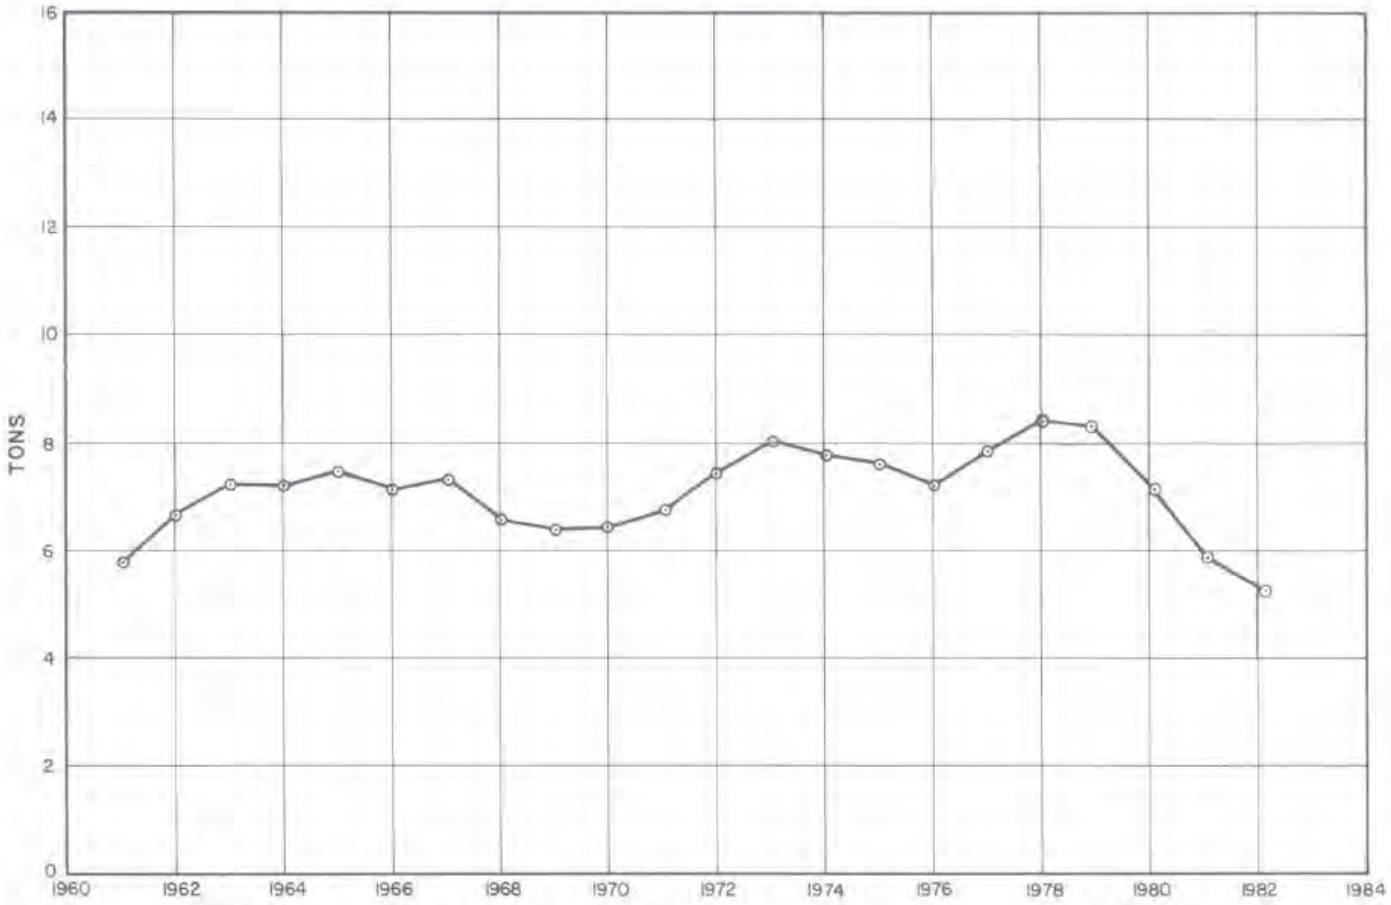

Figure 5. Annual per capita consumption of aggregate in the Fresno P-C Region. Based on population and 3 year averages of production, as shown on Figure 6.

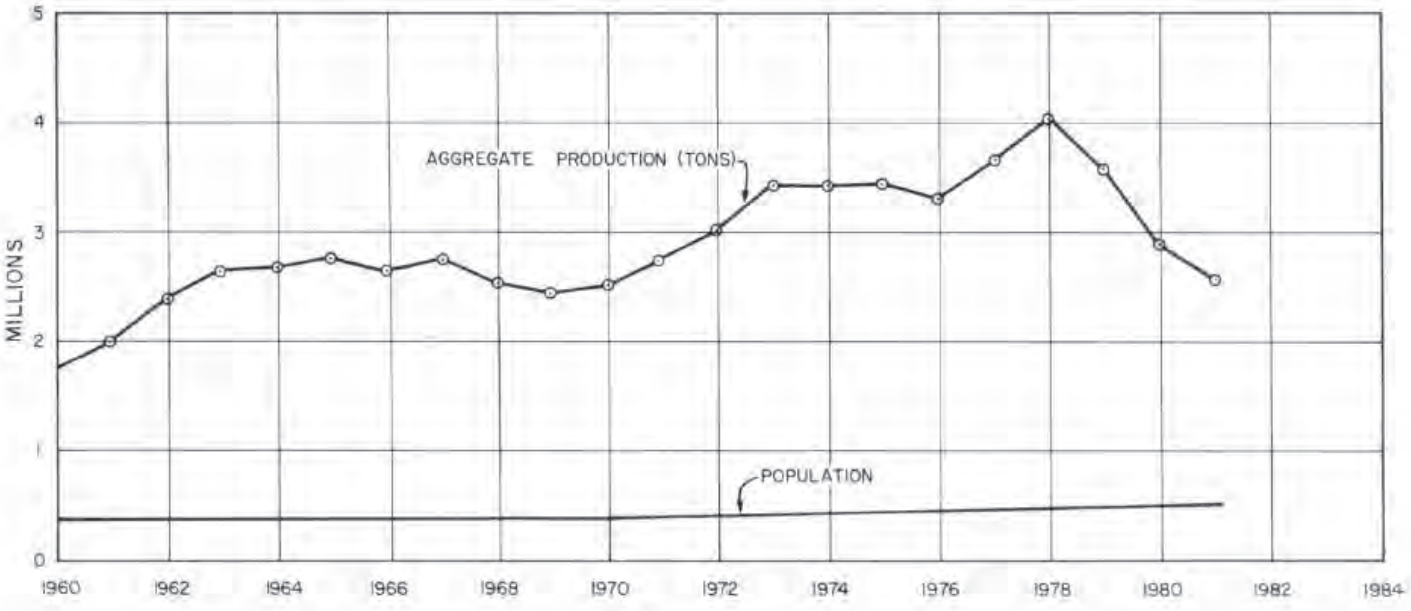

Figure 6. Fresno P-C Region: Population and aggregate production records for years 1960-83. Annual aggregate production has been smoothed through use of a 3-year rolling average.

TABLE 7 — Population, aggregate consumption and per capita consumption in the Fresno P-C Region during the period 1960-1983.

YEAR	POPULATION	AGGREGATE CONSUMPTION (rounded to nearest 1,000 tons)	3-YEAR AVERAGE OF CONSUMPTION (tons)	ANNUAL PER CAPITA CONSUMPTION (tons)
1960	351,400	1,774,000		
1961	355,600	2,017,000	2,051,000	5.77
1962	359,900	2,362,000	2,334,000	6.60
1963	364,100	2,623,000	2,529,000	6.95
1964	368,400	2,602,000	2,527,000	6.86
1965	372,600	2,356,000	2,720,000	7.30
1966	376,900	3,202,000	2,656,000	7.05
1967	381,100	2,409,000	2,777,000	7.29
1968	385,400	2,720,000	2,536,000	6.58
1969	389,600	2,480,000	2,473,000	6.35
1970	393,900	2,218,000	2,533,000	6.43
1971	404,100	2,900,000	2,718,000	6.73
1972	414,200	3,036,000	3,092,000	7.47
1973	424,400	3,339,000	3,405,000	8.02
1974	434,500	3,840,000	3,403,000	7.83
1975	444,700	3,031,000	3,413,000	7.68
1976	454,900	3,369,000	3,306,000	7.27
1977	465,000	3,517,000	3,679,000	7.91
1978	475,200	4,150,000	4,012,000	8.44
1979	485,300	4,368,000	4,077,000	8.40
1980	495,500	3,714,000	3,573,000	7.21
1981	505,600	2,636,000	2,902,000	5.74
1982	515,800	2,356,000	2,563,000	4.97
1983	526,000	2,695,000		

Average annual per capita consumption for 1961-1982 is 7.04 tons per person per year.
Calculations may not replicate precisely due to rounding.

Comparison of the 50-Year Aggregate Demand with Current Reserves

The total PCC-grade aggregate reserves for the Fresno P-C Region were estimated to be 119.3 million tons (this figure does not reflect reserve depletion by any producers since December 1984). At the average rate of past aggregate consumption in the region (7 tons per person annually), these reserves are theoretically sufficient to satisfy the total aggregate demands of the P-C region to mid-2010.

According to U.S. Bureau of Mines aggregate production statistics for the years 1960 to 1983 and information from aggregate operators in the P-C region, roughly 50 percent of the total aggregate consumed in the study region has been PCC-grade. If the region continues to require the same percentage of PCC-grade aggregate, the total amount of PCC-grade aggregate that would be needed to supply the Fresno area through the year 2034 is estimated to be 134 million tons. Thus, in addition to the current reserves, 14.7 million tons of PCC-grade aggregate will be needed to supply the projected needs for this commodity in the Fresno P-C Region for the next 50 years.

TABLE 8. Projected aggregate consumption through the year 2034 for the Fresno P-C Region. Five-year per capita consumption = 35.2 tons/person (One-year per capita consumption = 7.0 tons/person).

YEARS	*AVERAGE POPULATION (millions)	AGGREGATE CONSUMPTION ALL AGGREGATE (million tons)	AGGREGATE** CONSUMPTION PCC AGGREGATE (million tons)
1985-1989	.576	20.3	10.2
1990-1994	.625	22.0	11.0
1995-1999	.670	23.6	11.8
2000-2004	.710	25.0	12.5
2005-2009	.747	26.3	13.2
2010-2014	.785	27.6	13.8
2015-2019	.822	28.9	14.4
2020-2024	.860	30.3	15.1
2025-2029	.898	31.6	15.8
2030-2034	.931	32.8	16.4
TOTAL		268.4	134.2

*Population projections for the years 1985-2020 were obtained from the California Department of Finance Report 83-P-3. Population projections for the years 2021-2034 were linearly projected from data in Report 83-P-3.

**This estimate is based on the fact that approximately 50 percent of the aggregate consumed from 1960 to 1980 was PCC quality.

ALTERNATIVE SOURCES OF AGGREGATE

Potential sources of aggregate, in addition to the deposits classified MRZ-2, exist within the Fresno P-C Region. These potential sources lie within areas that are classified MRZ-3 and include areas underlain by Quaternary alluvial deposits, Tertiary sedimentary and volcanic rocks, and pre-Cretaceous intrusive and metamorphic basement rocks.

Potential Alluvial PCC-Grade Aggregate

Alluvium classified MRZ-3 includes Quaternary stream channels and alluvial fans built by the San Joaquin and Kings rivers prior to Recent time. The modern rivers have dissected these deposits — forming the bluffs along both channels — while developing their current grade and course. These deposits were probably built over a period of one million years or more, in response to the glaciation of the Sierra Nevada Mountains (Marchand, 1976). The source rocks and the energy of the depositional environment may have varied as the drainage basin developed and evolved. Such changes will cause variability in the hardness, lithic and mineralogic composition, grain size and shape, and sorting of the alluvium. Furthermore, the difference in composition and age will cause variances in the degree of weathering of the alluvium. Thus, though sand and gravel exist within these units, their suitability as concrete aggregate is questionable and variable. None of this material is known to have been used for PCC in the Fresno area. However, beds in the Modesto and Riverbank formations have been utilized for PCC aggregate in Sacramento. As is obvious from Plate 2, a tremendous volume of material is included in these older deposits. Much of this volume consists of sand that may be coarse enough for PCC-grade aggregate. Proper testing and beneficiating may prove that suitable aggregate is available from these formations in the Fresno area.

Part of the Fresno P-C Region classified MRZ-3 is underlain by an unnamed Tertiary gravel unit which marks the course of the San Joaquin River in Miocene time, about 5 to 23 million years ago (Marchand, 1976). It crops out intermittently along the eastern side of the P-C region from approximately one mile north of Dry Creek south to Copper Avenue (on the Friant quadrangle), and south of China Garden (on the Daulton quadrangle).

The gravel also crops out on the west side of Little Table Mountain and east of Highway 41, between Road 204 and Avenue 12. This might provide a suitable source of sand and gravel or sand and crushed rock, but because of its age, its durability may be low. It is in part tuffaceous, so careful site-specific evaluation is required.

A second late Tertiary unit, mapped as the North Merced Gravel (Marchand and Allwardt, 1978), may also provide suitable aggregate. It is a Pliocene or Pleistocene deposit of lag gravels on an erosion surface and is found on the northern and western slopes of Little Table Mountain. Thickness of the deposit is unknown, as is rock quality. Neither this nor the previously discussed Tertiary gravel have been historically mined, so data to evaluate their suitability as PCC-grade aggregate is lacking.

Potential Crushed Rock Aggregate

It is important to note that crushed rock may be significant in this area for the future. Sand sources are abundant within and adjacent to the Fresno P-C Region in both active streams and in the bluffs and fans. However, the coarse aggregate fraction is in much shorter supply. As the gravel supplies are depleted, the more abundant sand could be mixed with crushed rock. Basement rocks of the Sierra Nevada crop out along the eastern side of the P-C region, adjacent to the Friant Kern and Madera canals. Within the P-C region the basement rock consists of granodiorite and metasedimentary rocks (Matthews and Burnett, 1965) which may be a suitable source for crushed rock aggregate. Metavolcanics, meta-gabbro, granite, tonalite, and diorite can be found within 10 miles of the P-C region, and could represent additional exploration targets for quarry sites.

Another source of crushed rock is the oversized cobbles and boulders of the Kings River. This material is concentrated upstream from a point below Avocado Lake. It is a potentially important alternate source of PCC-grade aggregate because blasting will not be required to diminish the rock.

Potential Sources of PCC-Grade Aggregate Outside the P-C Region

PCC-grade aggregate could be obtained for use in the Fresno P-C Region from active resource areas outside the P-C region. The closest of these resource areas, which are 50 miles from downtown Fresno, are shown on Table 9. The additional transport costs (see Table 2) incurred by bringing in aggregate from these other sites would substantially increase the price of construction materials for the Fresno consumer. Utilization of these deposits by the Fresno market could cause supply problems in the urbanizing areas they already serve.

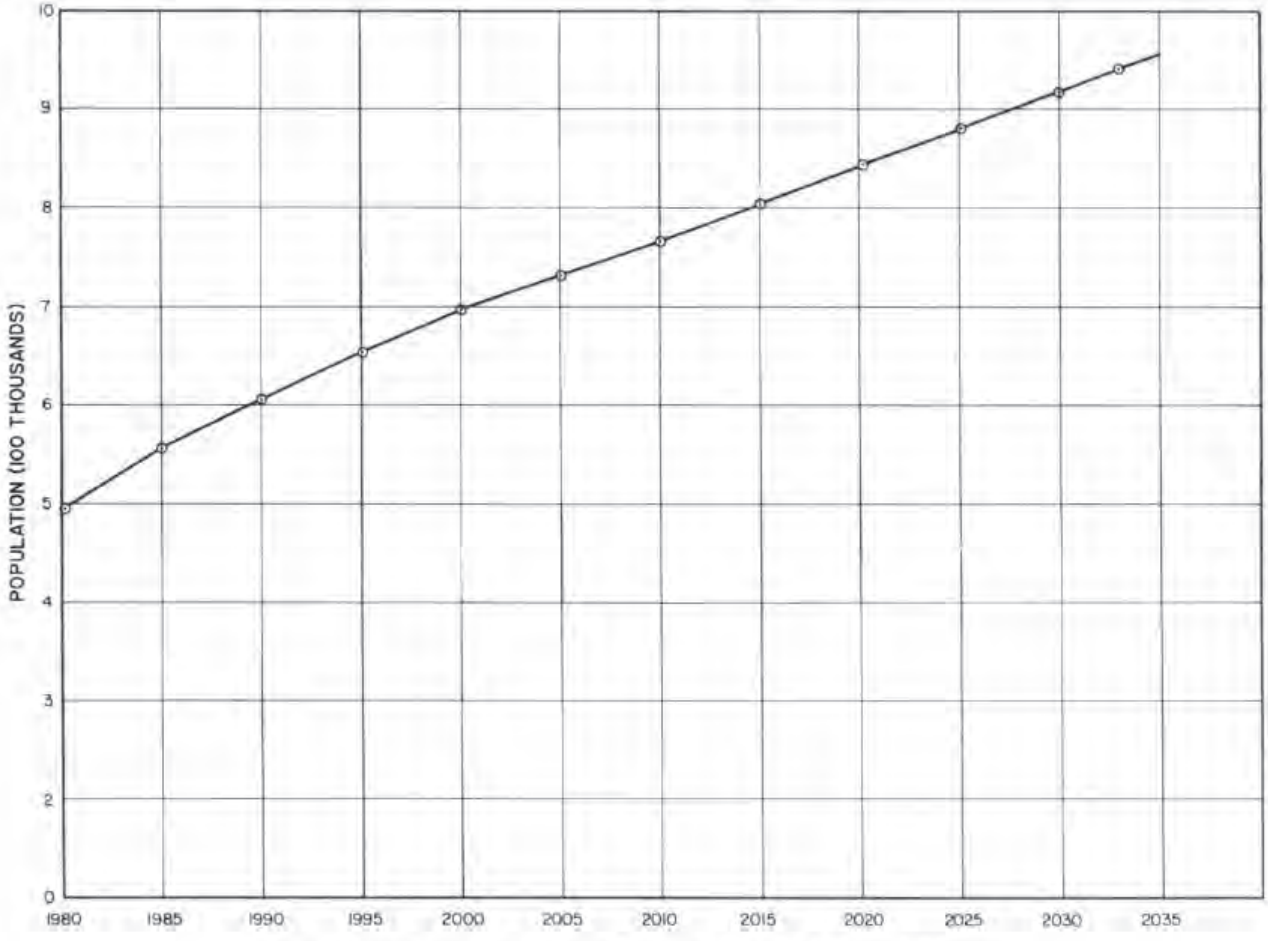

Figure 7. Projected population (50 years from date of study) of the Fresno P-C Region.

TABLE 9. Transport distance from the active deposits nearest the Fresno P-C Region.

AREA	COUNTY	*DISTANCE FROM DOWNTOWN FRESNO	INCREASE IN HAUL DISTANCE OVER LOCAL DEPOSITS	ADDITIONAL COST PER TON FOR TRANSPORT
Mariposa Creek	Merced	50	40	$3.68
Kaweah River	Tulare	50	40	$3.68
Coalinga	Fresno	60	50	$4.53
Los Banos	Merced	70	60	$5.95
Merced River	Merced	80	70	$6.34

*Rounded to nearest ten miles; measured along major roads.

CONCLUSIONS

Within the Fresno P-C Region, two sectors, subdivided into 65 subsectors, have been identified that contain in excess of 2.1 billion tons of aggregate resources.

Based upon available production data and population projections, the Fresno P-C Region will need 268.4 million tons of aggregate during the next 50 years. Of this projected demand, approximately 50 percent (approximately 134 million tons) must be suitable for Portland cement concrete. The approximately 119 million tons of aggregate reserves determined to exist within the P-C region amount to only 44 percent of the projected demand over the next 50 years. Unless new resources are permitted for mining, or alternative resources are utilized, existing reserves will be depleted during the year 2010. If a major earthquake were to affect the P-C region and necessitate reconstruction, the depletion date of existing reserves will arrive before 2010.

APPENDIX

Interim Criteria for Sectorization of MRZ-2 Areas for Aggregate

The purpose of sectorizing MRZ-2 areas is to provide a semi-quantified estimate of construction aggregate resources which are likely to be available to satisfy society's needs during the next 50 years. This estimate, when compared to DMG projected needs for the next half century, provides the context for communities to plan for future resource availability in their land-use policies. The determination of sectors is intended for the use of the State Mining and Geology Board in identifying areas that are candidates for designation under SMARA. The development of sectors provides a perception of future mineral resource availability in the face of future needs and also portrays where these available minerals are generally located. This information is distributed by the Board to all affected lead agencies to provide them with the data necessary to plan for future resource availability in their land-use policies.

Areas within MRZ-2 classifications are sectorized if they have current land uses which are similar to those in areas which have undergone mineral extraction in the past. Areas within MRZ-2 classifications which have generally not been available for surface mining in the past for specified social or economic reasons are not sectorized. Since such areas are unlikely to be used for surface mining during the foreseeable future, their inclusion in estimates of future resource availability would be misleading.

The estimation of future mineral resource availability in sectors is not a precise analysis, but rather is the best general estimate which can be made with the data presently available. Areas within and without sectors can be used for mining or other land uses at the discretion of the local governments which are charged with responsibility for making land-use decisions. Establishment of sectors in no way infringes on this authority. Rather, it provides a perception of future mineral resource availabilities in the face of future needs and also portrays where these available minerals are generally located.

The following criteria were used by DMG in identifying mineral resource areas which are available for future use. These criteria, in conjunction with the geologic and geometric characteristics of specific mineral deposits, were used in sectorizing MRZ-2 areas. Use of these criteria assures that sectors contain geologically homogenous mineral deposits which, based upon current land use, will be available for future use.

The following specific land uses are considered to be generally incompatible with mining and have been excluded from sectorized lands. Mineral resource areas containing land uses not specifically listed will be considered for sectorization. The criteria are to be applied only to lands classified MRZ-2.

There are two general categories of exclusion: (I.) Economic Exclusion, and (II.) Social Exclusion.

I. *Economic Exclusion*
Specific excluded land uses are:

1. Residential areas
2. Commercial areas with land improvements (buildings)
3. Industrial areas (buildings and adjacent needed storage and parking facilities)
4. Major public or private engineering projects, including:

   a. canals
   b. freeways
   c. bridges
   d. airports and associated developments such as parking lots
   e. dams
   f. railroads
   g. major pipelines
   h. major power transmission lines

II. *Social Exclusion*
Specific excluded land uses are:

1. Cemeteries,
2. Geologic scientific zones,
3. Public parks, developed historical sites and structures, and public recreation areas of all types,*
4. Public or private schools, institutions, hospitals, and prisons, including adjacent grounds and related structures,
5. Military bases and reservations.

---

* *NOTE:* Since the development of these interim criteria, a policy change regarding parklands has occurred. Parklands are now sectorized if they are not excluded on the basis of economic criteria. Sectorized parklands are, however, treated separately in the classification reports, and their mineral resources are not mixed with those occurring on other types of land.

INTRODUCTION

Sand, gravel, and crushed stone are "construction materials." These commodities, collectively referred to as aggregate, provide the bulk and strength to Portland Cement Concrete (PCC), Asphaltic Concrete (AC, commonly called "black top"), plaster, and stucco. Aggregate is also used as road base, subbase, railroad ballast, and fill. Aggregate normally provides 80 to 100 percent of the material volume in the above uses.

The building and paving industries in California consume large quantities of aggregate and future demand for this commodity is expected to increase throughout California. Aggregate materials are essential to modern society, both to maintain the existing infrastructure and to provide for new construction. Therefore, aggregate materials are a resource of great importance to the economy of any area. Because aggregate is a low unit-value, high-bulk-weight commodity, it must be obtained from nearby sources to minimize economic and environmental costs associated with transportation. If nearby sources do not exist, then transportation costs can quickly exceed the value of the aggregate. Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, air pollution, traffic congestion, and road maintenance.

To give an idea of the scale of these impacts, from 1987 to 2016, California consumed an average of about 180 million tons of construction aggregate (all grades) per year. Moving in 25 ton truckloads that is 7.2 million truck trips per year. With an average 25-mile haul (50-mile round trip) that amounts to 360 million truck miles traveled, more than 51 million gallons of diesel fuel used, and more than 570,000 tons of carbon dioxide emissions produced annually. If the haul distance is doubled to 50 miles (100-mile round trip) the numbers double to 720 million truck miles traveled, more than 102 million gallons of diesel fuel used, and over 1.1 million tons of carbon dioxide emissions produced.

Land-use planners and decision makers in California are faced with balancing a wide variety of needs in planning for a sustainable future for their communities and regions. Mining is often seen as a controversial land use during the permitting process. However, there are benefits to having local sources of construction aggregate. Increasingly, as existing permitted aggregate supplies are depleted, local land-use decisions regarding aggregate resources can have regional impacts that go beyond local jurisdictional boundaries.

These factors, universal need, increasing demand, the economic and environmental costs of transportation, and multiple land-use pressures make information about the availability and demand for aggregate valuable to land-use planners and decision makers charged with planning for a sustainable future for California's citizens.

California Geological Survey (CGS) Map Sheet 52 and this accompanying report provide general information about the current availability of, and future demand for, California's permitted aggregate reserves. Map Sheet 52 was originally published in 2002 (Kohler, 2002) and subsequently updated in 2006 (Kohler, 2006) and 2012 (Clinkenbeard, 2012). Map Sheet 52 (2018) is an update of the version published in 2012.

Map Sheet 52 updates data from 49 reports compiled by the CGS for more than 30 aggregate study areas throughout the state (see Appendix). These study areas cover about 30 percent of the state and provide aggregate for about 85 percent of California's population. This report is divided into three parts:

- Part I - provides data sources and methods used to derive the information presented.
- Part II - compares the updated 2018 Map Sheet 52 to the prior (2012) map.
- Part III - an overview of construction aggregate.

All aggregate data and any reference to "aggregate" in this report and on the map, pertain to "construction aggregate," defined as alluvial sand and gravel or crushed stone that meets standard specifications for use in PCC or AC unless otherwise noted.

The estimates of permitted resources, aggregate demand, and years of permitted reserves remaining on Map Sheet 52 (2018) and in this report, are based on conditions as of January 1, 2017 and do not reflect changes, such as production, mine closures, or new or expanded permits, that may have occurred since that time. Although the statewide and regional information presented on the map and in this report may be useful to decision-makers, it should not be used as a basis for local land-use decisions. The more detailed information on the location and estimated amounts of permitted and non-permitted resources, and future regional demands contained in each of the aggregate studies employed in the compilation of Map Sheet 52 should be used for local land-use and decision-making purposes.

PART I: DESCRIPTION OF MAP SHEET 52, AGGREGATE SUSTAINABILITY IN CALIFORNIA

Map Sheet 52 is a statewide map showing a compilation of data about aggregate availability collected over a period of about 40 years and updated to January 1, 2017. The purpose of the map is to compare projected aggregate demand for the next 50 years with currently permitted aggregate reserves in various regions of the state. The map also shows the projected years of permitted reserves remaining and highlights regions where less than 10 years of permitted aggregate supply remain. The following sections describe data sources and methodology used in the development of the map.

Mineral Land Classification Reports and Aggregate Studies

Aggregate reserves and projected aggregate demand shown on Map Sheet 52 are updated from mineral land classification reports published by CGS between 1979 and 2017 (see Appendix). They were prepared in response to California's Surface Mining and Reclamation Act of 1975 (SMARA) that requires the State Geologist to classify land based on the known or inferred mineral resource potential of that land. SMARA, its regulations and guidelines, are described in Special Publication 51 (State Mining and Geology Board, 2000). The regulations and guidelines can be found on the State Mining and Geology Board website at http://www.conservation.ca.gov/smgb.

The Mineral Land Classification process identifies lands that contain economically significant mineral deposits. The primary goal of mineral land classification is to ensure that the mineral resource potential of lands is recognized and considered in land-use planning. The classification process includes an assessment of the quantity, quality, and extent of aggregate deposits in a study area.

Mineral land classification reports may be specific to aggregate resources, may contain information about both aggregate and other mineral resources, or they may only contain information on minerals other than aggregate. Reports that focus on aggregate include aggregate resource classification and mapping, estimates of permitted and non-permitted aggregate resources, projected 50-year demand for aggregate resources, and an estimate of when the permitted reserves will be depleted. Map Sheet 52 is a statewide updated summary of 50-year demands and permitted resources for all regional SMARA classification reports pertaining to construction aggregate.

Mineral land classification studies for aggregate may use either a Production-Consumption (P-C) region or a county as the study area boundary. A P-C region is one or more aggregate production districts (a group of producing aggregate mines) and the market area they serve. P-C regions sometimes cross county boundaries. Mineral land classification reports include information from one or more P-C regions, or from a county. For ease in discussion, the area covered by each P-C region or county aggregate study is referred to as an "aggregate study area." SMARA guidelines recommend that the State Geologist periodically review the mineral land classification in defined study regions to determine if new classifications are necessary. The projected 50-year forecast of aggregate demand in the region may also be revised.

The index map of aggregate studies shown in the lower left-hand corner of Map Sheet 52 shows the latest reports that cover an aggregate study area. Earlier reports covering the same areas or portions of areas are referenced in the Appendix with an asterisk ("*"). Original mineral land classification reports and update reports are listed in the Appendix and can be found on the CGS Information Warehouse at http://maps.conservation.ca.gov/cgs/informationwarehouse/.

Fifty-Year Aggregate Demand Forecast

The fifty-year aggregate demand forecast for each of the aggregate study areas is presented on Map Sheet 52 as a pie chart (See *Fifty-Year Aggregate Demand Compared to Permitted Aggregate Reserves* section), and is presented in Table 1 of this report. The demand information may be new, or updated from previously published mineral land classification reports. The demand forecast information depicted on Map Sheet 52 is for the period January 1, 2017 through December 2066.

The aggregate study areas with the greatest projected future demand for aggregate are the South San Francisco Bay and Temescal Valley-Orange County areas. Each is expected to require more than a billion tons of aggregate by the end of 2066. Other areas with projected high demands are Western San Diego County, San Gabriel Valley, San Bernardino, Sacramento County, and Palmdale. Each of these areas is projected to need more than 500 million tons of aggregate in the next 50 years. Aggregate study areas having smaller demands generally are in rural, less populated areas. The aggregate study areas of El Dorado County, Glenn County, Nevada County, Shasta County, and Tehama County are all projected to require less than 100 million tons of aggregate over the next 50 years.

Methodology

The steps used for forecasting California's 50-year aggregate needs using the per capita consumption model are:

1. Collecting yearly historical production and population data.

2. Dividing yearly aggregate production by the population for that same year to determine annual historical per capita consumption.

3. Determining the average of the annual historical per capita consumption values for the range of years being used.

4. Projecting yearly population for a 50-year period from the beginning of 2017 through 2066.

5. Multiplying each year of projected population by the average historical per capita consumption and adding the results for each year to obtain the 50-year aggregate demand.

Table 1. Comparison of 50-Year Demand to Permitted Aggregate Reserves for Aggregate Study Areas as of January 1, 2017.

AGGREGATE STUDY AREA[1]	50-Year Demand (million tons)	Permitted Aggregate Reserves (million tons)	Permitted Aggregate Reserves Compared to 50-Year Demand (percent)	Projected Years Remaining
Bakersfield P-C Region	338	1,708	505	More than 50
Barstow-Victorville P-C Region	163	117	72	31 to 40
Claremont-Upland P-C Region	202	90	45	21 to 30
El Dorado County	82	15	18	11 to 20
Fresno P-C Region	305	556	182	More than 50
Glenn County	41	22	54	21 to 30
Merced County	154	61	40	21 to 30
Monterey Bay P-C Region	333	297	89	41 to 50
Nevada County	41	52	127	More than 50
North San Francisco Bay P-C Region	492	263	53	21 to 30
Palmdale P-C Region	569	163	29	11 to 20
Palm Springs P-C Region	238	163	68	31 to 40
Placer County	188	387	206	More than 50
Sacramento County	724	327	45	21 to 30
Sacramento-Fairfield P-C Region	295	109	37	21 to 30
San Bernardino P-C Region	939	156	17	11 to 20
San Fernando Valley/ Saugus-Newhall[2]	**387**	**17**	**4**	**10 or fewer**
San Gabriel Valley P-C Region	751	297	40	21 to 30
San Luis Obispo-Santa Barbara P-C Region	226	58	26	11 to 20
Shasta County	82	49	60	31 to 40
South San Francisco Bay P-C Region	1,320	506	38	21 to 30
Stanislaus County	160	39	24	11 to 20
Stockton-Lodi P-C Region	409	203	50	21 to 30
Tehama County	49	30	61	31 to 40
Temescal Valley-Orange County[2]	1,079	862	80	41 to 50
Tulare County	130	53	41	21 to 30
Ventura County[2]	241	84	35	11 to 20
Western San Diego County P-C Region	763	265	35	11 to 20
Yuba City-Marysville P-C Region	344	679	197	More than 50
Total	11,045	7,628	69	

[1] Aggregate study areas follow either a Production-Consumption (P-C) region boundary or a county boundary. A P-C region includes one or more aggregate production districts and the market area that those districts serve. Aggregate resources are evaluated within the boundaries of the P-C Region. County studies evaluate all aggregate resources within the county boundary.

[2] Two P-C regions have been combined into one study area.

Bold = study area with ten or fewer years of permitted reserves.

For this update, the range of years of historical production and population data used were generally from 1980-2016.

The per capita consumption model has proved to be effective for projecting aggregate demand in major metropolitan areas. However, the per capita model may not work well in county aggregate studies or in P-C regions that import or export a large percentage of aggregate resulting in a low correlation between P-C region production and population. In such areas, projections may be made based on historical production or, multiple projections based on differing assumptions may be used to better characterize a range of future demand.

For regions that export large amounts of aggregate to neighboring P-C regions, projections are based on an historical production model where 50-year aggregate demand is determined by extending a best-fit line of historical aggregate production data for a county or region. This model was used to project Yuba City-Marysville's 50-year demand because the region exports about 70 percent of its aggregate into neighboring areas such as Sacramento County and Placer County. The 50-year demand for Glenn and Tehama counties, the Palmdale P-C Region, and the Temescal Valley-Orange County area was also projected using this method.

Permitted Aggregate Reserves

Approximately 7.6 billion tons of permitted aggregate reserves lie within the aggregate study areas shown on Map Sheet 52. Permitted aggregate reserves are aggregate deposits that have been determined to be acceptable for commercial use, exist within properties owned or leased by aggregate producing companies, and have permits allowing mining of aggregate material. A "permit" is a legal authorization or approval by a lead agency, the absence of which would preclude mining operations. Although some permitted reserves face legal challenges, these reserves are included in this study pending resolution of those challenges.

In California, mining permits usually are issued by local lead agencies (county or city governments). Map Sheet 52 shows permitted aggregate reserves as a percentage of the 50-year demand on each pie chart (See *Fifty-Year Aggregate Demand Compared to Permitted Aggregate Reserves* section). Beneath the study area name located next to its corresponding pie chart is the permitted resource in tons along with the 50-year demand. These figures are also given in Table 1.

Permitted aggregate resource calculations shown on the map and in Table 1 initially were determined from information provided in reclamation plans, mining plans, and use permits issued by the lead agencies. When information was inadequate to make reliable independent calculations, CGS staff used resource estimates provided by mine operators or owners. These data were checked against rough calculations made by CGS staff, and any major discrepancies were discussed with the mine operators or owners. Permitted reserve calculations have been updated to account for production from 2010-2016 and are current as of the beginning of 2017.

Fifty-Year Aggregate Demand Compared to Permitted Aggregate Reserves

Fifty-year aggregate demand compared to the currently permitted aggregate reserves is represented by a pie chart for each aggregate study area on Map Sheet 52. Each pie chart is in the approximate center of the aggregate study area it represents. There are four different sizes of charts, each representing a 50-year demand range. The smallest pie chart represents 50-year demands of less than 200 million tons, while the largest chart represents demands of over 800 million tons. The 50-year demand (in tons) is shown on the map with the amount of permitted reserves beneath the study area name located next to its corresponding pie chart (permitted reserves, left / 50-year demand, right). The whole pie represents the total 50-year aggregate demand for a particular aggregate study area. The blue portion of the pie represents the permitted aggregate resource (shown as a percentage of the 50-year demand) while the purple-colored portion of the pie represents that portion of the 50-year demand that will not be met by the currently permitted reserves. For example, if the blue portion is 25 percent and the purple portion is 75 percent of a pie chart that represents a total demand of 400 million tons, the permitted reserves are 100 million tons, and the region will need an additional 300 million tons of aggregate to supply the area for the next 50 years. The pie representing the Bakersfield aggregate study area is completely colored blue, showing permitted aggregate reserves are equal to or greater than the area's 50-year aggregate demand. Detailed examples are provided in the legend of Map Sheet 52.

Except for the Bakersfield P-C Region, Fresno P-C Region, Nevada County, Placer County, and the Yuba City-Marysville P-C Region, all the aggregate study areas have less permitted aggregate reserves than they are projected to need for the next 50 years. Fifteen of the aggregate study areas shown on the map have less than half of the permitted reserves they are projected to need in the next 50 years.

Estimates of Years of Permitted Reserves Remaining

The right-hand column of Table 1 indicates the projected years of permitted reserves remaining for the various aggregate study areas. Calculations of depletion years are made by comparing the currently permitted reserves to the projected annual aggregate consumption in the study area on a year-by-year basis. This is not the same as dividing the total projected 50-year demand for aggregate by 50 because, as population increases, so does the projected annual consumption of aggregate for a study area. Data are presented as ranges; 10 or fewer, 11-20, 21-30, 31-40, 41-50, and more than 50 years. This information is included on Map Sheet 52 beneath the study area name along with the permitted reserves and the projected 50-year demand. These estimates are based on conditions as of January 1, 2017 and do not reflect changes, such as new or expanded permits, that may have occurred since that time.

Only one of the aggregate study areas in Table 1, the San Fernando Valley-Saugus Newhall area, is projected to have less than 10 years of permitted aggregate reserves remaining as of January 1, 2017.

Seven of the aggregate study areas in Table 1 have between 11 and 20 years of permitted aggregate reserves remaining, ten have between 21 and 30 years of permitted aggregate reserves remaining, four have 31 to 40 years remaining, two have 41 to 50 years, and five have more than 50 years of permitted reserves remaining.

These numbers are estimates and the actual lifespan of existing permitted reserves in a study area can be influenced by many factors. In periods of high economic growth, demand may increase, shortening the life of permitted reserves. Large projects, such as the construction or maintenance of major infrastructure, or rebuilding after a disaster such as an earthquake could also deplete permitted reserves more rapidly. Increased demand from neighboring regions with dwindling or depleted permitted reserves may also accelerate the depletion of permitted reserves in a study area. Conversely, a slow economy may reduce demand for a period of time, extending the life of permitted reserves, or new or expanded permits may be granted in a study area, increasing the permitted reserves and the lifespan of permitted reserves in that area.

Non-Permitted Aggregate Resources

Non-permitted aggregate resources are deposits that may meet specifications for construction aggregate, are recoverable with existing technology, have no land use overlying them that is incompatible with mining, and currently are not permitted for mining. While not shown on Map Sheet 52, non-permitted aggregate resources are identified and discussed in each of the mineral land classification reports used to compile the map (See Appendix).

There are approximately 74 billion tons of non-permitted construction aggregate resources in the aggregate study areas shown on Map Sheet 52. While this number seems large, it is unlikely that all of these resources will ever be mined because of social, environmental, or economic factors. The location of aggregate resources too close to urban or environmentally sensitive areas can limit or prevent their development. Resources may also be located too far from a potential market to be economic. Despite such possible constraints, non-permitted aggregate resources are the most likely future sources of construction aggregate potentially available to meet California's continuing demand. Factors used to calculate non-permitted resource amounts and to determine the aerial extent of these resources, are given in each of the mineral land classification reports listed in the Appendix.

Aggregate Production Areas and Districts

Aggregate production areas are shown on Map Sheet 52 by five different sizes of triangle. A triangle may represent one or more active aggregate mines. The relative size of each symbol corresponds to the amount of yearly production for each mine or group of mines. Yearly production was based on data from the Department of Conservation's Division of Mine Reclamation (DMR) records for the calendar year 2016.

The smallest triangle represents an area that produced less than 0.5 million tons of aggregate in 2016. These triangles often represent a single mine operation and many are in rural parts of the state. The largest triangle represents aggregate mining districts

with production of more than 5 million tons in 2016. Only two aggregate production districts fall into this category – the Temescal Valley District in western Riverside County and the San Gabriel Valley District in Los Angeles County.

PART II: COMPARISONS BETWEEN THE PRIOR (2012) AND THE UPDATED (2018) MAP SHEET 52

The prior version of Map Sheet 52 was published in 2012. Permitted aggregate resource data for that map were current as of January 1, 2011. Work conducted for that study took place during 2011/2012. The latest aggregate production and location data available for the prior map were from 2010 records. The aggregate demand projections for the prior map were based on California Department of Finance (DOF) county population projections from the 2010 U.S. census. Fifty-year aggregate demand from January 1, 2011 through the year 2060 was determined for the included study areas.

This updated Map Sheet 52 was completed and published in 2018. Permitted aggregate resource data for the updated map is current as of January 1, 2017. All work conducted for the updated study took place during 2017/2018. The latest aggregate production and location data available for the updated map are from 2016 records. The aggregate demand projections for the updated map were based on DOF county population estimates and projections for 2010 to 2060 (DOF, 2018). Fifty-year aggregate demand from January 1, 2017 through the year 2066 was determined for the included study areas.

Changes have occurred in both aggregate supplies (permitted aggregate reserves) and in 50-year aggregate demand since Map Sheet 52 (2012) was completed. Changes in permitted aggregate reserves are shown in Table 2. Changes in 50-year demand are shown in Table 3.

Aggregate Study Area Changes

Six aggregate study areas on the original (2002) Map Sheet 52 were modified for the 2006 map, resulting in three fewer study areas. They included the Southern California P-C regions of Orange County, Temescal Valley, San Fernando Valley, Saugus-Newhall, Western Ventura County, and Simi Valley. These regions were combined into three regions when they began to run out of permitted reserves and became dependent on aggregate sources from neighboring regions. The importation of aggregate from neighboring regions typically results in longer haul distances, higher costs, and increased carbon dioxide emissions, air pollution, traffic congestion, and highway maintenance. The shift in supply area also results in more rapid depletion of permitted reserves in neighboring regions.

In the 2006 and 2012 versions of Map Sheet 52, information for eastern and western Merced County and northern and southern Tulare county were reported. This was because separate market regions existed in those study areas. While those separate market regions may still exist, in this update, information is reported for Merced and Tulare counties and not for the eastern and western or northern and southern areas, respectively.

Table 2. Comparison of Permitted Aggregate Reserves Between Map Sheet 52, 2012 and Map Sheet 52, 2018.

AGGREGATE STUDY AREA	Map Sheet 52, 2012 Permitted Aggregate Reserves as of 1/1/11 (million tons)	Map Sheet 52, 2018 Permitted Aggregate Reserves as of 1/1/17 (million tons)	Percent Difference

Yuba City-Marysville P-C Region	403	344	-15
Total	12,047	11,045	-8

* Two P-C Regions have been combined into one study area.
** In Map Sheet 52 (2012) separate values for east and west Merced County and north and south Tulare County were presented. In this update, information is given only for the counties as a whole and not the parts.

No additional study areas have been combined in this update. It is likely that in some future update the San Fernando Valley-Saugus Newhall aggregate study area and the Palmdale study area may be combined as permitted reserves in the San Fernando Valley-Saugus Newhall aggregate study area are depleted. In addition, a study of the Greater Sacramento Area currently nearing completion will likely result in the combination of several previously existing study areas.

Changes in Permitted Aggregate Reserves

Fifteen of the study areas shown on the updated map experienced a decrease in permitted aggregate reserves since the 2012 map was completed (See Table 2). Most of these decreases likely represent aggregate production within those study areas since the last update of Map Sheet 52.

A large part of the reduction in the San Fernando Valley-Saugus Newhall study area is due to the subtraction of the 56 million tons of permitted aggregate reserves previously associated with the CEMEX Soledad Canyon Sand and Gravel Mining Project. In 2015, the Bureau of Land Management withdrew the contracts that would have allowed mining. The issue is currently under appeal with the Interior Board of Land Appeals. If, at a future date, the contracts are restored then the permitted reserves will be restored.

Twelve of the study areas shown on the updated map had increases in permitted aggregate reserves. Most of these increases are because of newly permitted or expanded mining operations within the various study areas. An expansion may increase the footprint of the mine or increase permitted mining depth. Some of these increases may be the result of recalculation of the permitted aggregate reserves in a study area.

Total permitted reserves for all the included study areas increased to 7,628 million tons from 4,067 million tons – an apparent increase of 3,561 million tons. The actual increase was likely slightly more because of production since 2010. Approximately two-thirds of the increase is due to permitting activities in the Bakersfield, Fresno, and Sacramento study areas.

Changes in Fifty-Year Demand

Of the study areas shown on the updated Map Sheet 52, five had increases in 50-year demand, two had less than a one percent change, and 20 showed decreases in projected 50-year demand (See Table 3). The large number of study areas with decreasing 50-year demand is likely due in part to incorporation of lower per capita consumption rates caused by the slow recovery of the construction industry in California in the years following the economic recession of 2007-2009.

Comparison of Areas with Less than 10-Years of Permitted Aggregate Reserves

The 2018 Map Sheet 52 shows only one aggregate study area with less than a 10-year supply of permitted aggregate reserves – San Fernando Valley-Saugus Newhall.

Compared to the 2012 version of the map, which showed four aggregate study areas with less than a 10-year supply of aggregate – Sacramento County and the Fresno, San Fernando Valley-Saugus Newhall, and Western San Diego P-C regions.

PART III: OVERVIEW OF CONSTRUCTION AGGREGATE

Construction aggregate was the leading non-fuel mineral commodity produced in California in 2016. Valued at $1.42 billion, aggregate made up about 42 percent of California's $3.4 billion non-fuel mineral production in 2016.

Aggregate Quality and Use

Aggregate normally makes up 80 to 100 percent of the material volume in PCC and AC and provides the bulk and strength to these materials. Rarely, even from the highest-grade deposits, is in-place aggregate physically or chemically suited for every type of aggregate use. Every potential deposit must be tested to determine how much of the material can meet specifications for a particular use, and what processing is required. Specifications for PCC, AC, and various other uses of aggregate have been established by several agencies, such as the U.S. Bureau of Reclamation, the U.S. Army Corps of Engineers, and the California Department of Transportation to ensure that aggregate is satisfactory for specific uses. These agencies and other major consumers test aggregate using standard procedures of the American Society for Testing Materials (ASTM), the American Association of State Highway Officials, and other organizations.

Most PCC and AC aggregate specifications have been established to ensure the manufacture of strong, durable structures capable of withstanding the physical and chemical effects of weathering and use. For example, specifications for PCC and concrete products prohibit or limit the use of rock materials containing mineral substances such as gypsum, pyrite, zeolite, opal, chalcedony, chert, siliceous shale, volcanic glass, and some high-silica volcanic rocks. Gypsum retards the setting time of portland cement; pyrite dissociates to yield sulfuric acid and an iron oxide stain; and other substances contain silica in a form that reacts with alkali substances in the cement, resulting in cracks and "pop-outs."

Specifications also call for precise particle-size distribution for the various uses of aggregate that is commonly classified into two general sizes: coarse and fine. Coarse aggregate is rock retained on a 3/8-inch or a #4 U.S. sieve. Fine aggregate passes a 3/8-inch sieve and is retained on a #200 U.S. sieve (a sieve with 200 weaves per inch). For some uses, such as asphalt paving, particle shape is specified. Aggregate material used with bituminous binder (asphalt) to form sealing coats on road surfaces shall consist of at least 90 percent by weight of crushed particles. Crushed stone is preferable to natural gravel in AC because asphalt adheres better to broken surfaces than to rounded surfaces and the interlocking of angular particles strengthens the AC and road base.

The material specifications for PCC and AC aggregate are more restrictive than specifications for other applications such as Class II base, subbase, and fill. These restrictive specifications make deposits acceptable for use as PCC or AC aggregate the scarcest and most valuable aggregate resources. Aggregate produced from such deposits can be, and commonly is, used in applications other than concrete. PCC- and AC-grade aggregate deposits are of major importance when planning for future

availability of aggregate commodities because of their versatility, value, and relative scarcity.

Factors Affecting Aggregate Deposit Quality

The major factors that affect the quality of construction aggregate are the rock type and the degree of weathering of the deposit. Rock type determines the hardness, durability, and potential chemical reactivity of the rock when mixed with cement to make concrete. In alluvial sand and gravel deposits, rock type is variable and reflects the rocks present in the drainage basin of the stream or river. In crushed stone deposits, rock type is typically less variable, although in some types of deposits, such as sandstones or volcanic rocks, there may be significant variability of rock type. Rock type may also influence aggregate shape. For example, some metamorphic rocks such as slates tend to break into thin platy fragments that are unsuitable for many aggregate uses, while many volcanic and granitic rocks break into blocky fragments more suited to a wide variety of aggregate uses. Deposit type also affects aggregate shape. For example, in alluvial sand and gravel deposits, the natural abrasive action of the stream rounds the edges of rock particles, in contrast to the sharp edges of particles from crushed stone deposits.

Weathering is the in-place physical or chemical decay of rock materials at or near the Earth's surface. Weathering commonly decreases the physical strength of the rock and may make the material unsuitable for high strength and durability uses. Weathering may also alter the chemical composition of the aggregate, making it less suitable for some aggregate uses. If weathering is severe enough, the material may not be suitable for use as PCC or AC aggregate. Typically, the older a deposit is, the more likely it has been subjected to weathering. The severity of weathering commonly increases with increasing age of the deposit.

Comparison of Alluvial Sand and Gravel to Crushed Stone Aggregate

The preferred use of one aggregate material over another in construction practices depends not only on specification standards, but also on economic considerations. Alluvial gravel is typically preferred to crushed stone for PCC aggregate because the rounded particles of alluvial sand and gravel result in a wet mix that is easier to work than a mix made of angular fragments. Also, crushed stone is less desirable in applications where the concrete is placed by pumping because sharp edges will increase wear and damage to the pumping equipment. The workability of a mix consisting of portland cement with crushed stone aggregate can be improved by adding more sand and water, but more cement must then be added to the mix to meet concrete durability standards. This results in a more expensive concrete mix and a higher cost to the consumer.

In addition, aggregate from a crushed stone deposit is typically more expensive than that from an alluvial deposit due to the additional costs associated with the ripping, drilling and blasting necessary to remove material from most quarries and the additional crushing required to produce the various sizes of aggregate. Manufacturing sand by crushing is costlier than mining and processing naturally occurring sand. Although more care is required in pouring and placing a wet mix containing crushed stone, PCC made with this aggregate is as satisfactory as that made with alluvial sand and gravel of comparable

rock quality. Owing to environmental concerns and regulatory constraints in many areas of the state, it is likely that extraction of sand and gravel resources from instream and floodplain areas will become less common in the future. If this trend continues, crushed stone may become increasingly important to the California market.

Aggregate Price

The price of aggregate throughout California varies considerably depending on location, quality, and supply and demand. The highest quality aggregate, and typically most costly, is that which meets the specifications for use in PCC or AC. All prices discussed in this section are for PCC/AC-grade aggregate at the plant site or FOB (freight on board). Transportation cost, which adds to the final cost of aggregate, is discussed in the next section.

Regional variations make it difficult to estimate the average price of PCC-grade aggregate for the state. Over the last decade, prices have varied from more than $20 per ton in areas with depleting or depleted aggregate supplies and high demands such as San Diego and parts of the Bay Area, to $9 to $12 per ton in areas such as Yuba City-Marysville with abundant aggregate supplies and low to moderate demands. In many areas of the state it is likely that prices fall between these two endmembers.

Transportation and Increasing Haul Distances

Transportation plays a major role in the cost of aggregate to the consumer. Aggregate is a low-unit-value, high-bulk-weight commodity, and it must be obtained from nearby sources to minimize both the dollar cost to the aggregate consumer and other environmental and economic costs associated with transportation. If nearby sources do not exist, then transportation costs may significantly increase the cost of the aggregate by the time it reaches the consumer.

This makes the mining of aggregate much more competitive than most other mined commodities. The location, distance to market, and access to major transportation routes greatly influence the economic feasibility of an aggregate mine.

Most aggregate in California moves to its final point of use by truck. Trucking is typically charged at an hourly rate and rates may vary in different regions of the state. The typical distance traveled per hour may also vary, being greater in less congested or more rural areas, and less in densely populated urban areas. Other factors that affect hauling rates include fuel costs, toll bridges and toll roads, road conditions, and terrain. Transportation cost is the principal constraint defining the market area for an aggregate mining operation and the cost of transporting aggregate over long distances can equal or exceed the base cost of the aggregate.

Throughout California, aggregate haul distances have gradually increased as more local sources of aggregate diminish. Consequently, older P-C regions, most of which were established in the late 1970s, have changed considerably since their boundaries were drawn. This is especially evident in Los Angeles, Orange, and Ventura counties where aggregate shortages have led to the merging of six P-C regions shown on the original

(2002) map into three regions for the updated maps. In some parts of the state, one-way haul distances that were 20-30 miles decades ago are now sometimes 100 miles or more. Increased aggregate haul distances not only increase the cost of aggregate to the consumer, but also increase environmental and societal impacts such as increased fuel consumption, carbon dioxide (CO_2) emissions, air pollution, traffic congestion, and road maintenance.

Imported Aggregate

In some regions, local aggregate production is sufficient to meet the local demand, but in others, there is more demand than can be met by local production leading to a shortfall that is typically met by importing construction aggregate from neighboring aggregate producing regions.

There are both advantages and disadvantages to importing construction aggregate. Imports can provide needed aggregate in areas with depleted reserves/resources and can supply specific types of aggregate that are in short supply in the region. However, imported aggregate is often more expensive because of additional transportation costs. Increased costs for aggregate leads to more expensive construction projects in both the public and private sectors. Importing aggregate from neighboring regions also leads to more rapid depletion of reserves/resources in those regions, potentially contributing to price increases or aggregate shortages in those regions.

In addition to the greater economic costs, there are often increased environmental and societal costs associated with the import of aggregate when compared to local production. The environmental impacts include higher emissions of greenhouse gases, such as CO_2, and air pollution. The societal impacts include increased traffic congestion and road wear and maintenance due to increased truck traffic. In the case of imports, these environmental and societal impacts occur both within the importing region and in the neighboring regions that supply the material and through which the material is transported.

Currently almost all aggregate produced or imported into California is transported to its final point of use by truck. In discussions of aggregate import, other modes of transportation such as rail, barge, or ship are often mentioned as alternative methods of moving aggregate. In 2011, the San Diego Association of Governments (SANDAG) Service Bureau published the San Diego Region Aggregate Supply Study (SANDAG Service Bureau, 2011). This study included an evaluation of fuel use and CO_2 emissions for several scenarios involving different transport options for importing aggregate into the San Diego area. While the published study is specific to the San Diego region, it provides an interesting analysis of the impacts of importing construction aggregate. The following discussion is adapted from Special Report 240 (Gius, Busch, and Miller, 2017).

The SANDAG study looked at the impacts based on various combinations of transport options for the following five scenarios:

- In region production
- Import by truck from neighboring regions
- Import by rail/truck from San Bernardino County
- Import by barge/truck from Baja California, Mexico
- Import by ship/truck from British Columbia, Canada.

Fuel consumption, CO_2 emissions, and some other pollutant emissions (nitrogen oxides (NO_x) and particulate matter (PM)) were estimated based on round-trip travel, with aggregate transported to the point of use and the vehicle returning empty. For scenarios involving non-truck transport (rail, barge, and ship), delivery to the final point of use by truck was included. The transport scenarios and transport type and mileage considerations are presented in Table 4. More detail can be found in the SANDAG study (SANDAG Service Bureau, 2011).

Table 4. Summary of SANDAG Aggregate Transport Scenarios

SANDAG AGGREGATE TRANSPORT SCENARIOS	
TRANSPORT OPTION	**MILEAGE BY MODE**
Local: Truck	26 miles one way / 52 miles round trip
Import: Truck	100 miles one way / 200 miles round trip
Import: Rail + Truck	Rail: 200 miles one way / 400 miles round trip Truck: 20 miles one way / 40 miles round trip
Import: Barge + Truck	Barge: 70 miles one way / 140 miles round trip Truck: 20 miles one way / 40 miles round trip
Import: Ship + Truck	Ship: 1,540 miles one way / 3,080 miles round trip Truck: 20 miles one way / 40 miles round trip

Adapted from SANDAG Service Bureau, 2011

Transportation methods that move larger amounts of aggregate per load can be more efficient in terms of fuel consumption (gallons of fuel consumed per net ton-mile traveled) and CO_2, NO_x, and PM emissions (grams of CO_2, NO_x, and PM emitted per net ton-mile traveled). However, even though these transport options may be more efficient on a net ton-mile basis, the total fuel consumption and emissions are dependent on the distance traveled. If those distances are large, total fuel consumption and emissions may exceed those of less efficient transportation methods over shorter distances. This is demonstrated by SANDAG's findings. Even though transport by rail, barge, and ship

have lower fuel consumption and CO_2 emissions per net ton-mile than transport by truck (Table 5), the total fuel usage and CO_2 emissions for those transport scenarios are greater than in-region production with truck delivery because of the distances involved (Table 6).

Table 5. Fuel Consumption and CO_2 Emissions from Aggregate Transport with Payload

Mode	Payload	Fuel Consumption (gallons/net ton per mile)	CO_2 Emissions (grams/net ton per mile)
Truck	25 tons	0.0086	86.9
Rail	100 tons per hopper car	0.0021	21.4
Barge	1,500 tons	0.0068	69.6
Ship	72,786 tons	0.0004	5.3

Adapted from Tables 4-2 and 4-4, SANDAG Service Bureau, 2011

Table 6. Fuel Consumption and Emissions for Aggregate Transport Scenarios – Estimates per Million Tons of Aggregate Transported

Transport Option	Total Fuel Consumption (gallons)	Total CO_2 Emissions (metric tons)	Total NO_x Emissions (metric tons)	Total PM Emissions (metric tons)
Local: Truck	296,000	3,000	26.5	1.1
Import: Truck	1,138,000	11,537	102	4.4
Import: Rail + Truck	788,000	7,985	120.4	3.3
Import: Barge + Truck	804,000	8,210	147.1	5.1
Import: Ship + Truck	1,406,000	16,703	282.2	16.3

Adapted from SANDAG Service Bureau, 2011

Table 6 shows that, per million tons of aggregate transported, local production with transport by truck consumes less fuel and produces less CO_2, NOx, and PM than the other transport options investigated by SANDAG. Transport Option 2, import of one million tons of aggregate by truck from neighboring regions, consumes almost four times as much fuel and produces almost four times the emissions as the local production and delivery of a similar amount of aggregate. In addition, the impacts occur not only in the Western San Diego County P-C Region, but in neighboring regions through which the materials are transported.

While this analysis pertains to San Diego County, similar analyses, with appropriate parameters, could be done for other regions. What it does point out is that, even though some methods of transportation may be more efficient on a per ton-mile basis, if the transport distances are great enough, the overall impacts may be greater than those of local production.

Factors Affecting Aggregate Demand

Several factors may influence aggregate demand. In periods of high economic growth, demand may increase, depleting permitted reserves more rapidly than expected. Large projects, such as the construction or maintenance of major infrastructure, or rebuilding after a disaster such as an earthquake could also deplete permitted reserves more rapidly. Increased demand from neighboring regions with dwindling or depleted permitted reserves may also accelerate the depletion of permitted reserves in a study area. Conversely, a period of declining economy or of low economic growth, such as that during the recession of 2007 to 2009 and the subsequent slow economic recovery, can reduce demand for a period of time, extending the life of permitted reserves. In some cases, importation of aggregate from other areas may extend the life of a region's permitted reserves.

SUMMARY AND CONCLUSIONS

Aggregate is essential to the needs of modern society, providing material for the construction and maintenance of roadways, dams, canals, buildings, and other parts of California's infrastructure. Aggregate is also found in homes, schools, hospitals, and shopping centers.

In the 30-year period from 1987 to 2016, Californians consumed an average of about 180 million tons of construction aggregate (all grades) per year or about 5.3 tons per person per year. Demand for aggregate is expected to increase as the state's population continues to grow and infrastructure is maintained, improved, and expanded. For example, the Road Repair and Accountability Act of 2017 (SB1) will provide approximately 5 billion dollars annually for a variety of maintenance, rehabilitation, and other transportation related projects over the next decade. Because aggregate is a low unit-value, high-bulk-weight commodity, it must be obtained from nearby sources to minimize the dollar cost to the aggregate consumer and other environmental and economic costs associated with transportation.

Comparing regional needs to available reserves and resources demonstrates the important aggregate resource issues facing lead agencies in California. These issues include the need to plan carefully for the use of lands containing these resources and the need to consider the permitting of additional aggregate resources before currently permitted deposits are depleted.

Increasingly, as existing permitted aggregate supplies are depleted, local land-use decisions regarding aggregate resources are having regional impacts that go beyond local jurisdictional boundaries. Planning for future construction aggregate needs in our communities should take into consideration not only the needs of the community, but also the needs of the region and neighboring regions. Importing aggregate from neighboring regions leads to more rapid depletion of reserves/resources in those regions, potentially contributing to price increases or aggregate shortages in those regions.

In addition to the greater economic costs, there are often increased environmental and societal costs associated with the import of aggregate when compared to local production. The environmental impacts include higher emissions of greenhouse gases, such as CO_2, and air pollution. The societal impacts include increased traffic congestion and road maintenance due to increased truck traffic. In the case of imports, these environmental and societal impacts occur both within the importing region and in the neighboring regions that supply the material and through which the material is transported. Finally, reliance on imports places responsibility and authority for permitting related to the local aggregate supply in the hands of decision makers in other jurisdictions.

For more than 40 years, under SMARA, CGS has conducted on-going studies that identify and evaluate aggregate resources throughout the state. Map Sheet 52 (2018) is an updated summary of supply and demand data from these studies. The map presents a statewide overview of projected future aggregate needs and currently permitted reserves.

The following conclusions can be drawn from Map Sheet 52 (2018) and this accompanying report:

- In the next 50 years, the study areas identified on Map Sheet 52 (2018) will need approximately 11 billion tons of aggregate.
- The study areas shown on Map Sheet 52 currently have about 7.6 billion tons of permitted reserves, which is about 69 percent of the total projected 50-year aggregate demand identified for these study areas. This is about 10 percent of the total aggregate resources located within the study areas.
- One aggregate study area is projected to have 10 or fewer years of permitted aggregate reserves remaining as of January 2017 (San Fernando Valley / Saugus Newhall area).
- Seven aggregate study areas have between 11 and 20 years of aggregate reserves remaining.
- Ten aggregate study areas have between 21 and 30 years of aggregate reserves remaining.
- Four aggregate study areas have between 31 and 40 years of aggregate reserves remaining.
- Two aggregate study areas have between 41 and 50 years of aggregate reserves remaining.
- Five aggregate study areas (Bakersfield, Fresno, and Yuba City-Marysville P-C regions, and Nevada and Placer counties) have more than 50 years of aggregate reserves remaining.

The information presented on Map Sheet 52 (2018) and in the referenced reports is provided to assist land use planners and decision makers in identifying those areas containing construction aggregate resources, and to estimate potential future demand for these resources in different regions of the state. This information is intended to help planners and decision makers balance the need for construction aggregate with the many other competing land use issues in their jurisdictions, and to provide for adequate supplies of construction aggregate to meet future needs.

Re: Rockfield Quarry Modification Project Environmental Impact Report No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667; SCH# 2020060123

Dear Mr. Randall:

This firm represents the San Joaquin River Parkway & Conservation Trust, Inc. ("the Trust") in connection with the proposed Rockfield Quarry Modification Project ("Project"). We submit these comments to inform the County that this draft Environmental Impact Report ("DEIR"), is inadequate under the California Environmental Quality Act ("CEQA"), Public Resources Code § 21000 et seq., and the CEQA Guidelines, California Code of Regulations, title 14, § 15000 et seq. ("CEQA Guidelines"). Comment 58-1

The Project as proposed will have significant, adverse impacts on both the natural and the human environment in Fresno County. These impacts include, but are not limited to, potentially devastating effects on: local hydrology and water quality, habitat and movement corridors for both terrestrial and aquatic wildlife, local traffic, air quality, and noise. But none of these impacts or the inconsistencies of the Project can be discerned from reading the DEIR. With regard to each of CEQA's substantive requirements—a complete and stable project description, a thorough analysis of significant impacts, identification of feasible and enforceable mitigation measures, an analysis of a reasonable range of alternatives—the DEIR falls woefully short. As a result, the DEIR fails to meet CEQA's fundamental purpose of providing disclosure to the public of the Project's environmental effects. The County and the applicant need to start over—beginning with Comment 58-2 Comment 58-3

revised Project objectives that allow for consideration of a reasonable range of alternatives that would be consistent with the General Plan—and prepare and recirculate a new, legally adequate DEIR. Comment 58-3 Cont.

This letter is submitted along with the reports prepared by Greg Kamman, Hydrogeologist with CBEC Eco Engineering, attached as Exhibit A ("CBEC Report"); Jeff Davis, Biologist with Colibri Environmental, attached as Exhibit B ("Colibri Report"); and Jeremy Decker, Acoustical Engineer with Salter and Associates attached as Exhibit C ("Salter Report"). We respectfully refer the County to the aforementioned attached reports, both here and throughout these comments, for further detail and discussion of the DEIR's inadequacies. We request that the County reply to each of the comments in this letter and to each of the comments in the attached reports. Comment 58-4

I. Introduction and Background

The Project site is located within Fresno County's jurisdiction on land designated as 'Agricultural' and falls within the San Joaquin River Corridor Overlay, which allows agricultural activities with incidental homesites, sand and gravel extraction, various recreational activities, wildlife habitat areas, and uses which serve the San Joaquin River Parkway. Fresno County General Plan at 2-25 and DEIR at 2-2. The Project site is zoned AE-20 Exclusive Agriculture, 20-acre minimum parcel size, which allows "surface mining" operations but not hard rock mining. We note that County General Plan Table LU-1 at p. 2-25 similarly allows "Surface Mining Operations" in AE and other agricultural zones, but omits any reference to hard rock mining. Comment 58-5

The proposed Project includes: two Conditional Use Permits (one to expand surface mining and processing for another 30 years and one to allow hard rock mining over a period of 100 years; approval of a Surface Mining and Reclamation Plan (SMRP) and the associated Financial Assurance Mechanism (FAM), a Landscape Plan (for revegetation), right-of-way permits; and a host of discretionary permits from resource agencies. DEIR at 2-52 and 2-53. The Project would expand extraction of material by almost double (from the current 1.4 million tons per year to 3 million tons) and would allow a total extraction of approximately 300 million tons of material from the plant and quarry sites over a period of 100 years. DEIR at ES-4 and 2-5. Comment 58-6

The project site has been mined by various companies for many decades. The community anticipated that operations would be completed sometime between 2005 and 2008 and the site restored in accordance with the Project Reclamation Plan. Instead, the County granted several extensions and operations continue today. Now, CEMEX proposes to extend and expand operations for *another* 100 years. The proposed Project Comment 58-7 Comment 58-8

would result in an enormous increase in the amount of material to be excavated and would include a substantial change from mining alluvial sands and gravel (i.e., surface mining) to hard rock mining (blasting for granite). CEMEX proposes to mine to a depth of 600 feet, which will result in much worse impacts to both human residents and wildlife and to the river and riparian ecosystems as a whole. As discussed throughout this letter, the DEIR fails to adequately evaluate the project's impacts, fails to identify feasible mitigation measures, and presents an inadequate alternatives analysis.

Comment 58-8 Cont.

Comment 58-9

The DEIR for the proposed Project suffers from several major problems. First, the DEIR generally downplays the importance of the Project site as part of the San Joaquin River Restoration Program and the site's location adjacent to conserved lands including Ledger Island to the west, Lost Lake County Park to the north, and Ball Ranch and Sumner Peck Ranch to the south. As discussed in detail below, the Project's expansion of operations, especially the change to allow hard rock mining, has the potential to result in significant, long-term impacts to both people and wildlife, yet the DEIR fails to conduct a thorough analysis of impacts to these areas.

Comment 58-10

This Project will have serious long-term consequences, not only for area residents, but for the hydrology of the river and the ecology of the region. Those consequences include, but are not limited to: potentially devastating effects related to changes in drainage patterns and river flow; impacts to water quality; impacts to groundwater recharge and groundwater quality; impacts to recreational use in adjacent areas, impacts to multiple sensitive species and their habitats; visual impacts; increased truck traffic; increased noise; and increased air pollution. Moreover, as the DEIR acknowledges, the Project would result in significant, unmitigable impacts to visual resources. DEIR at ES-9.

Comment 58-11

In addition, as discussed in more detail below, the DEIR presents overly narrow project objectives that preclude uses other than the project being proposed, as well as an incomplete description of the project setting and of the project itself. It also substantially understates the severity and extent of a range of environmental impacts and fails to provide adequate mitigation. These inadequacies require that the DEIR be revised and recirculated so that the public and decision-makers are provided with a proper analysis of the Project's significant environmental impacts and feasible mitigation for those impacts. *See* CEQA Guidelines § 15002(a)(1) (listing as one of the "basic purposes" of CEQA to "[i]nform governmental decision makers and the public about the potential, significant environmental effects of proposed activities").

Comment 58-12

To ensure that the public and the County's decision-makers have adequate information to consider the effects of the proposed Project—as well as to comply with the

Comment 58-13

law—the County must require revisions in the Project to make it compliant with the General Plan and other applicable plans, then prepare and recirculate a revised DEIR that properly describes the Project, analyzes its impacts, and considers meaningful alternatives and mitigation measures that would help ameliorate those impacts.

Comment 58-13 Cont.

II. The DEIR's Flawed Description of the Existing Setting and the Project Does Not Permit Meaningful Public Review of the Project.

Comment 58-14

A. Project Setting

Accurate and complete information pertaining to the setting of the project and surrounding uses is critical to an evaluation of a project's impact on the environment. *San Joaquin Raptor/Wildlife Center v. Stanislaus County*, 27 Cal.App.4th 713, 728 (1994); *see also Friends of the Eel River v. Sonoma County Water Agency*, 108 Cal.App.4th 859, 875 (2003) (incomplete description of the Project's environmental setting fails to set the stage for a discussion of significant effects). Here, the DEIR's deficiencies in describing the Project's setting undermine its adequacy as an informational document.

The DEIR fails to present important contextual information related to biological and hydrological resources on the Project site. For instance, as described by American Rivers:

> [T]he health of the San Joaquin River has suffered the impacts of hundreds of dams, levees stretching thousands of miles, and countless water diversions. More than 95 percent of floodplain and freshwater tidal marsh habitat has been converted to development or agriculture. Once-iconic salmon runs teeter on the brink of extinction. The problems are so acute that American Rivers named the San Joaquin River one of America's Most Endangered Rivers® in 2014. In 2016, it rose to the No. 2 position on the list.[1]

The majority of the proposed Project site is located in the flood plain for the San Joaquin River. The plant site is located approximately 2,800 feet from the River and encroaches on the San Joaquin River Willow Unit of the San Joaquin River Ecological Reserve managed by the CA Department of Fish and Wildlife. The Plant site is

Comment 58-15

[1] American Rivers, San Joaquin River, at https://www.americanrivers.org/river/sacramento-and-san-joaquin-rivers/ (attached as Ex. D).

surrounded by the Willow Unit, which is adjacent to Ball Ranch, conservation lands owned by the State of California San Joaquin River Conservancy (SJR Conservancy) and operated by the Trust. The quarry site is adjacent to Lost Lake Recreation Area, which is land purchased by the Wildlife Conservation Board[2] and operated by the County; and Sumner Peck Ranch, which is owned by the SJR Parkway & Conservation Trust, Inc. Ledger Island, which is also owned by the SJR Conservancy, is located immediately to the southwest of the quarry site.

Comment 58-15 Cont.

Furthermore, the Project site is located within Reach 1A of the San Joaquin River Restoration Program ("SJR Restoration Program"), which is a comprehensive, long-term effort to "restore flows to the San Joaquin River from Friant Dam to the confluence of the Merced River and restore a self-sustaining Chinook salmon fishery in the river while reducing or avoiding adverse water supply impacts from Restoration Flows."[3] The restoration came out of a legal settlement following an 18-year lawsuit and was signed into federal law as the SJR Restoration Act in 2009. Pub. L. 111-11, 123 Stat. 1349 (Mar. 30, 2009). Both the Federal and State Governments have invested substantial effort and funds to establish and maintain the Restoration Program, and the result is a successful fishery for a species widely protected under laws including the federal Endangered Species Act (ESA).[4]

Comment 58-16

Despite the importance of the SJR Restoration Program, the DEIR mentions it only twice. It is mentioned once in an isolated sentence about the reintroduction of Chinook salmon under the program (DEIR at 4.4-63), and in another instance where the DEIR evaluates the Project's consistency with SJR Parkway Master Plan Policies. DEIR 4.11-46. In both cases, the DEIR fails to provide any context about the importance of the habitat areas in and around the River to the success of the Restoration Program. The DEIR also fails to disclose that under the federal ESA, San Joaquin River Spring-Run Chinook are listed as an experimental population. *See* 78 Fed. Reg. 79622 (Dec. 13,

---

[2] The Wildlife Conservation Board is a state grant-making agency dedicated to safeguarding California's spectacular biological diversity and wild spaces for the benefit of present and future generations. Cal. Wildlife Conservation Board, About WCB, at https://wcb.ca.gov/About.

[3] *See* San Joaquin River Restoration Program, Annual Report (2007) (attached as Ex. E); *see also generally* San Joaquin River Restoration Program, at https://www.restoresjr.net/.

[4] *See, e.g.*, 64 Fed. Reg. 50394 (Sept. 16, 1999) (listing Central Valley Spring-Run Chinook salmon as threatened under the federal ESA); Cal. Dept. of Fish & Wildlife, Chinook Salmon, at https://wildlife.ca.gov/Conservation/Fishes/Chinook-Salmon (attached as Ex. F).

2013). Finally, the DEIR does not mention steelhead at all, even though San Joaquin River steelhead are listed as threatened in the Project area. 50 C.F.R. § 223.102(a)(16); 71 Fed. Reg. 834 (Jan. 5, 2006). Comment 58-16 Cont.

Perhaps most egregiously, the DEIR fails to adequately describe the existing hydrologic setting of the site and the vicinity. Specifically, the DEIR fails to accurately describe baseline groundwater conditions especially at the quarry site. Kamman Report at 1. This is important information from which to establish a baseline. As explained in the Kamman report, without a proper description of baseline conditions, the DEIR is unable to provide an adequate analysis of Project-related increases or decreases in groundwater recharge relative to existing conditions. *Id.* A revised analysis must include a Hydrology and Water Quality section that adequately describes the hydrologic and hydraulic setting. Comment 58-17

B. Project Description

Under CEQA, the inclusion in the EIR of a clear and comprehensive description of the proposed project is critical to meaningful public review. *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193 ("*Inyo II*"). The court in *Inyo II* explained why a thorough project description is necessary: Comment 58-18

> A curtailed or distorted project description may stultify the objectives of the reporting process. Only through an accurate view of the project may affected outsiders and public decision-makers balance the proposal's benefit against its environmental cost, consider mitigation measures, assess the advantage of terminating the proposal (i.e., the "no project" alternative) and weigh other alternatives in the balance.

Id. at 192-93. Thus, "[a]n accurate, stable and finite project description is the sine qua non of an informative and legally sufficient EIR." *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818, 830.

Here, the DEIR lacks sufficient detail on specific activities needed to mine and process the aggregate material. The DEIR references these activities at only the most general level. *See e.g.*, DEIR at 2-36 ("The hardrock would then be mined in approximately 50-foot-high benches by drilling and blasting of the hardrock material to a depth of approximately 600 feet bgs using a drill rig and truck with blasting supplies" but provides no information on the amount of area to be disturbed each day); at 2-39 ("If necessary, secondary breakage of oversize material within the quarry pit would be accomplished by conventional methods including, but not limited to, drop ball or hydraulic breaker," but provides no information on either one of these types of equipment

or the process involved with each); at 2-42 ("The estimated borehole depth at the Quarry Site quarry would be approximately 50 feet. Boreholes would be drilled using a percussion drill rig" but provides no information on the length of time the drilling process to prepare for each blast day would take). Comment 58-18 Cont.

These gaps in the project description are important because they implicate other inadequate analysis in the DEIR. For example, the amount of daily ground disturbance implicates the air quality analysis; and the use of drop balls or hydraulic breakers and the amount of time required for drilling boreholes in preparation for each blast implicate the noise analysis. On the latter point, the DEIR states that blasting would occur up to twice a week, but if drilling boreholes for explosives took a day to complete, receptors would suffer increased noise from drilling and blasting four days a week. Therefore, the DEIR fails to give the reader a clear sense of what these activities entail and how these activities would affect particulate matter emissions and noise impacts to nearby receptors. Comment 58-19

Moreover, the DEIR indicates that the Project has a lighting design, but fails to provide it. DEIR at 2-40. Instead, it states only that "[H]igh pressure sodium and/or cut-off fixtures (or equivalent International Dark-Sky Association [IDA]-approved fixtures) would be used instead of mercury-vapor fixtures," and that illumination would be confined to the Quarry Site. *Id.* If the Project has a lighting design, it should have been disclosed as part of this DEIR so that the public and decision-makers can understand the planned illumination for the Quarry Site. Lighting on the site would affect light and glare experienced by nearby residents, yet these impacts cannot be properly evaluated because the lighting design has not been included. Comment 58-20

III. The DEIR Fails to Analyze and Mitigate the Project's Significant Environmental Impacts. Comment 58-21

CEQA requires that an EIR be detailed, complete, and reflect a good faith effort at full disclosure. CEQA Guidelines § 15151. The document should provide a sufficient degree of analysis to inform the public about the proposed project's adverse environmental impacts and to allow decision-makers to make intelligent judgments. *Id.* Consistent with this requirement, an EIR must contain "extensive, detailed evaluations of the impacts of the proposed plans on the environment in its current state" in order to serve its function as an "informative document." *Environmental Planning and Information Council of Western El Dorado County v. County of El Dorado*, 131

Cal.App.3d 350, 358 (1982) (finding an EIR for a general plan amendment inadequate where the document did not make clear the effect on the physical environment). Comment 58-21 Cont.

Meaningful analysis of impacts effectuates one of CEQA's fundamental purposes: to "inform the public and responsible officials of the environmental consequences of their decisions before they are made." *Laurel Heights Improvement Ass'n v. Regents of the University of California*, 6 Cal.4th 1112, 1123 (1993) (*Laurel Heights II*). To accomplish this purpose, an EIR must contain facts and analysis, not just an agency's bare conclusions. *Citizens of Goleta Valley v. Board of Supervisors*, 52 Cal.3d 553, 568 (1990). Nor may an agency defer its assessment of important environmental impacts until after the project is approved. *Sundstrom v. County of Mendocino*, 202 Cal.App.3d 296, 306-07 (1988). An EIR's conclusions must be supported by substantial evidence. *Laurel Heights Improvement Ass'n v. Regents of the University of California*, 47 Cal.3d 376, 409 (1988) (*Laurel Heights I*). Comment 58-22

CEQA does not allow a lead agency to defer critical studies regarding environmental impacts until after project approval. *See Sundstrom*, 202 Cal.App.3d 296. Nor may a lead agency satisfy CEQA by approving a project subject to conditions requiring the applicant to prepare future studies and mitigation measures, because in so doing the agency would be improperly delegating its legal responsibility to assess a project's environmental impact. *Id.* at 307. In contrast, CEQA requires the lead agency itself to prepare or contract for the preparation of impact assessments (citing CEQA § 21082.1) that reflect the agency's "independent judgement." *Id.* The fundamental concern underlying *Sundstrom* was that even if the required conditions of project approval had been adequate, the need for post-approval studies demonstrated the inadequacy of the County's environmental review prior to project approval. *Id.*

Finally, the DEIR may not avoid conducting a thorough analysis of the Project's impacts under the assumption that such impacts would be temporary. CEQA requires analysis of temporary or short-term impacts. CEQA Guidelines § 15126.2(a) (agency must analyze both short- and long-term impacts). CEQA defines a "significant effect on the environment" as "a substantial or potentially substantial adverse change in the environment." Pub. Resources Code § 21068. The CEQA Guidelines expand on the statute and define "significant effect on the environment" as:

> a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic and aesthetic significance.

CEQA Guidelines § 15382. As a leading CEQA treatise explains,

Comment 58-22 Cont.

> An effect on the environment need not be "momentous" or "important" to meet the CEQA test for significance. . The term "significant" covers a spectrum ranging from "not trivial" through "appreciable" to "important" and even "momentous." See *No Oil, Inc. v City of Los Angeles* (1974) 13 Cal.3d 68, 83. An agency has discretion to find a project's impacts insignificant on the basis of the scale of the project, particularly when the project's impacts are indirect and cannot reliably be predicted. *Save the Plastic Bag Coalition v City of Manhattan Beach* (2011) 52 Cal.4th 155. An effect need not be either long term or permanent to be significant, but duration is a factor that may affect the significance of an environmental impact. *Running Fence Corp. v Superior Court* (1975) 51 Cal.App.3d 400, 416.

1 Kostka and Zischke, Practice Under the California Environmental Quality Act (Cont.Ed.Bar 2024) §6.44. As documented below, the Rockfield Modification Project fails to identify, analyze, or support with substantial evidence its conclusions regarding the Project's significant environmental impacts.

Comment 58-23

A. The DEIR's Evaluation of Hydrology and Water Quality Impacts is Inadequate.

The DEIR's analysis of the Project's impacts to hydrology, water quality, and flooding is inadequate because it: (a) presents an inaccurate hydraulic analysis; (b) presents an inaccurate estimate of impacts on groundwater resources; (c) fails to analyze downstream impacts; (d) fails to support its conclusions with the necessary facts and analysis; and (e) fails to identify mitigation capable of minimizing the Project's significant environmental impacts.

Comment 58-24

Greg Kamman, Senior Ecohydrologist with CBEC Eco Engineering, reviewed the Rockfield Modification Project DEIR hydrology and water quality analysis and the document's hydrological appendices. His report (CBEC Report), attached as Appendix A, provides a detailed evaluation of the DEIR's Hydrology and Water Quality section. We summarize some of the most critical points of that report below.

Comment 58-25

1. The DEIR Presents an Inaccurate Hydraulic Analysis of the Project's Flood Impacts.

As explained in the CBEC Report, the DEIR fails to accurately analyze the Project's potential impacts related to flooding. CBEC Report at 2. The DEIR's analysis of Project-related flood impacts used the Federal Emergency Management Agency ("FEMA")100 -year flow rate estimate to conclude that that existing floodplain does not encroach into the Quarry site or the western portion of the Plant site. *Id.* However, the DEIR's approach to the analysis failed to account for the long-term climate change effects on the River flood flow rates at both sites. *Id.* When the analysis is conducted using more recent data models by the California Department of Water Resources ("DWR") that include climate change information, the result indicates drastically higher 100-year flow rates.

The related DWR report discussed in the CBEC Report[5] states that under climate change, peak flows in the snow-dominated upper San Joaquin River watershed will shift to earlier in the winter and spring. CBEC Report at 2. This change in peak flows will result in high flow events (like the 100-year flow) that cannot be fully contained by Lake Millerton and will be released downstream. *Id.* Specifically, future (year 2072) 100-year flow rates will increase to 126,800 cubic feet per second because of climate change[6]. This is a flow rate that is 179% of the FEMA estimate used in the DEIR. *Id*.

According to the CBEC Report, an increase of flow rate of this magnitude would encroach into and inundate both the Quarry and Plant sites. CBEC Report at 2. Importantly, the estimated increase in 100-yr flood flow rates under climate conditions represents a condition only halfway through the life of the Project. *Id.* In fact, 100-year flood flow rates are likely to continue to rise even further through the second 50 years of proposed Project operations. *Id.* Therefore, the DEIR's analysis of flood hazards evaluating the potential impacts from encroachment of the Project site into the floodplain is erroneous.

---

[5] Nemeth, K., Tjernell, K.A., and Lippner, G. (2021). *Revised Draft Central Valley Flood Protection Plan Conservation Strategy 2022 Update*. California Department of Water Resources.

[6] The related DWR report states that under climate change, peak flows in the snow-dominated upper San Joaquin River watershed will shift to earlier in the winter and spring and high flow events like the 100-year flow cannot be fully contained by Lake Millerton and will be released downstream. CBEC Report at 2.

Comment 58-26

2. The DEIR's Analysis of Groundwater-Surface Water Interaction at the Project Site Is Inaccurate and Unsupported.

As the DEIR explains, understanding the interaction between groundwater on the site and surface water during different river stages[7] is important because when the water level in the river is high enough that the water surface is above the adjacent groundwater table surface, there is seepage of water from the river into groundwater flowing towards the quarry. DEIR Appendix G-5 at 20-21 and CBEC Report at 3. The DEIR's analysis inappropriately uses stream gage data from below Friant Dam, which is located 4.0 miles and 6.5 miles from the Quarry site and Plant sites respectively, to compare river stages to on-site groundwater levels. CBEC Report at 3. As explained in the CBEC Report, extrapolating data from these distances results is an invalid comparison because of differences in channel geometry and water flow between the sites. *Id.* Instead, to make an accurate comparison between river water levels and groundwater levels at the Quarry and Plant Sites, the DEIR should have included monitoring of channel geometry and flow differences immediately adjacent to the project sites. The DEIR concludes that there is no correlation between river stage and pond water levels at the Quarry site location; however, this conclusion is unsupported. *Id.*

Until the analysis is revised to correct the aforementioned flaws, the DEIR's conclusions regarding the interaction between groundwater and surface water, and the corresponding potential for river water to seep into the Quarry site, are unsupported and the DEIR is inadequate under CEQA.

Comment 58-27

3. The DEIR Fails to Provide Evidence to Support Mitigation Measures Related to Lowering Groundwater Levels.

The DEIR purportedly analyzes the groundwater drawdown that would occur in the areas surrounding the Quarry Site due to dewatering of the quarry pit. DEIR Impact 4.10-10 at 4.10-105. The DEIR indicates that because the alluvium has already been removed from the Quarry site, no further effects related to dewatering (such as seepage of alluvial groundwater into the mining pit) can occur. *Id.* As explained in the CBEC report, this statement is incorrect because alluvial groundwater in off-site areas adjacent to and surrounding the Quarry site would still seep into the mining pit. CBEC Report at 4.

Nonetheless, the DEIR concludes that impacts to groundwater supplies related to the development of a large cone of depression radiating around the site due to pit dewatering and groundwater seepage into the Quarry site mining pit would be potentially

[7] The water level in the River, in this case, above the alluvium on the river bed.

Comment 58-27 Cont.

significant. DEIR at 4.10-107 and 4.10-108. In addition, the DEIR concludes that potential impacts to the groundwater supply wells will occur "due to the local decrease in static groundwater levels as a result of the flow of groundwater to the proposed quarry pit." *Id*.

To mitigate these impacts of lowered groundwater levels in the cone of depression and increased groundwater seeping into the mining areas, the DEIR proposes Mitigation Measure 4.10-10a, which prescribes preparation of a Groundwater Adaptive Management Program. *Id.* The project includes recharge trenches along portions of the outer edge of the mining pit. As described in the CBEC report, water from mine pit dewatering would be discharged into the recharge trenches and various recharge ponds with the idea that 50% of the water delivered to the recharge trenches would recharge the underlying groundwater and reduce the amount of drawdown by fifty percent, reducing the amount of groundwater level decline around the pits to less than significant levels. CBEC Report at 4.

The DEIR does not substantiate the benefits and effectiveness of the recharge trenches. *Id*. As explained in the CBEC Report, the DEIR presents no data or analysis to support the claim that 50% of the water delivered to the trenches will recharge the underlying groundwater and the amount of drawdown would be reduced by fifty percent. *Id*. Even if the fifty percent estimate of trench infiltration to recharge the underlying groundwater was accurate, which has not been demonstrated, the drawdown effects would not be fully mitigated. *Id*. The DEIR fails to evaluate how the residual drawdown (after assumed benefits of the recharge trenches) would impact surrounding Groundwater Dependent Ecosystems ("GDE") or increased groundwater flow gradients between the San Joaquin River and mining sites. *Id*.

In sum, the DEIR must revise the necessary analyses as described in the CBEC Report to accurately disclose Project-related impacts to groundwater systems, and substantiate with data and/or analysis the benefits of the recharge trenches. Without this information the DEIR's analysis of the Project's impact related to on-site groundwater impacts is inadequate. As to downstream impacts, the DEIR's analysis is wholly inadequate. A revised DEIR must include an analysis of the aforementioned significant impacts and identify feasible, effective mitigation or alternatives to avoid or minimize the impacts.

Comment 58-28

4. The DEIR's analysis of potential impacts on Groundwater Dependent Ecosystems Is Inadequate.

As discussed above, in the CBEC report, and further in sections III.B.2(a) and III.B.3 below, the DEIR's incomplete analysis of potential impacts to groundwater dependent ecosystems ("GDEs") is a glaring flaw. CBEC at 5. The DEIR presents contradictory information regarding the effects of dewatering on groundwater supplies and GDEs. In one instance the DEIR erroneously claims that the effects of dewatering would be the same as effects already occurring because alluvium on the Quarry Site has already been removed. *Id*. and DEIR at 4.4-56.

As discussed above and in more detail in the CBEC Report, this statement in the DEIR is incorrect. *Id*. The GDEs located adjacent to the river and north of the Quarry site are rooted in alluvium with rooting depths of less than 30 feet below ground service. *Id*. Far from being identical to current conditions, lowering the alluvium groundwater levels, dewatering remaining alluvium, and ending operation of the infiltration trenches after mining is completed would result in effects that are significantly different. *Id*. The effects would be complete dewatering of the alluvium and associated GDE rooting zone adjacent to the river and north of the quarry. *Id*. This would result in potential adverse impacts on the GDE after, and possibly during, mining operations.

The CBEC Report shows that the DEIR itself presents evidence to support a conclusion that impacts to GDEs would be significant and would threaten the viability and sustainability of existing and future GDEs. A revised DEIR must correct these errors and identify mitigations or alternatives to avoid these significant impacts.

Comment 58-29

5. The DEIR Fails to Conduct A Quantitative Analysis of Streamflow Depletions From the San Joaquin River.

The DEIR at 4.10-114 and 4.10-115 presents an incomplete and inadequate analysis of the Project's potential to interfere with groundwater recharge at both mining sites such that the Project would conflict with the requirements of the California Sustainable Groundwater Management Act (SGMA) and sustainable management of the Basin. It claims that related impacts at both sites would be less than significant. However, as explained in detail in the CBEC Report, the DEIR itself presents findings and conclusions that show this conclusion to be inconsistent. CBEC Report at 7 and 8.

The DEIR shows that the San Joaquin River and groundwater in the alluvium, weathered rock and hard rock beneath and adjacent to the river are in hydraulic connection. CBEC Report at 7. For example, as discussed in detail in the CBEC Report

Comment 58-29 Cont.

and above, the DEIR indicates that mining operations in the Quarry and Plant Sites will increase the water table flow gradients moving from the river towards the mining pits. DEIR at 4.10-114. The result of an increased groundwater hydraulic gradient causing an increased rate of groundwater flow holds true for any saturated aquifer material, whether it is alluvium, weathered rock or fractured hard rock. CBEC Report at 7 and 8. Therefore, when groundwater that is in hydraulic connection to the San Joaquin River experiences an increase in hydraulic gradient toward the Quarry or Plant Sites, there will be an increase in the rate of depletion of water from the river into the groundwater system. *Id.*

Similarly, the DEIR acknowledges that San Joaquin River flows will be depleted due to mining operation. CBEC Report at 8 and DEIR Appendix G-3 at 48 (acknowledging that groundwater and river water are connected so that river water would enter the reclamation pond or mining pit). Therefore, the DEIR fails to demonstrate that it complies with SGMA requirements regarding interconnected surface water depletions because it presents no data or analyses that: a) identify potential unreasonable impacts to beneficial uses of surface water; b) quantify the amount of depletions; or c) develop mitigations for any potential undesirable results due to Project depletions of San Joaquin River flow.

Comment 58-30

B. The DEIR's Evaluation of Biological Resources Is Inadequate.

The DEIR's treatment of biological impacts suffers from substantial deficiencies and fails to meet CEQA's well established standards for impacts analysis. The document's analysis both understates the severity of the potential harm to biological resources within and adjacent to the proposed Project site and neglects to identify sufficient mitigation to minimize these impacts. Given that analysis and mitigation of such impacts are at the heart of CEQA, the DEIR will not comply with these laws until these serious deficiencies are remedied. *See Sundstrom v. County of Mendocino*, 202 Cal.App.3d 296, 311 (1988) ("CEQA places the burden of environmental investigation on government rather than the public.").

As discussed above, the proposed Project site is surrounded by conserved lands that protect habitat important to biodiversity and long-term sustainability of river and adjacent lands ecosystems. Furthermore, the Project site is located in Reach 1 of the San Joaquin River Restoration Program.[8] The Project will result in significant direct and indirect impacts to sensitive habitats, especially adjacent to the Quarry site and downstream. *Id*.

[8] *See* Ex. E (San Joaquin River Restoration Program Annual Report) at 3 (Fig. 1).

Comment 58-30 Cont.

Given the importance of the affected biological resources, one would expect the DEIR's analysis to provide careful and thorough evaluation of the Project's potential impacts. Unfortunately, the DEIR's analysis is nowhere close to meeting CEQA's well-established standards for evaluating biological resource impacts. As detailed in the attached Colibri Report, and summarized below, the DEIR presents a cursory and incomplete evaluation and lacks evidence for its conclusions. The DEIR downplays the Project Site's importance to the ecological health of the region; is based on an inadequate search radius for records of special-status species; inadequately analyzes impacts to sensitive species such as burrowing owl, Swainson's hawk, tricolored blackbird, and western red bat; fails to analyze impacts to sensitive species from blasting and fugitive dust emissions; neglects to analyze impacts to riparian areas and downstream habitats; and proposes vaguely defined mitigation measures that do not address all the impacts to species that the Project will cause.

Under CEQA, decision-makers and the public must be given sufficient information about impacts and mitigation to be able to evaluate the impacts of a proposed project for themselves. *See* Pub. Res. Code 21061. Furthermore, analysis of impacts cannot be deferred to a later date but must be performed prior to project approval. *Sundstrom,* 202 Cal. App. 3d at 307 ("By deferring environmental assessment to a future date, the conditions run counter to that policy of CEQA which requires environmental review at the earliest feasible stage in the planning process."). Accordingly, a revised DEIR must fully analyze and disclose these impacts and propose and evaluate feasible mitigation measures for each significant impact.

The report prepared by Colibri provides detailed comments on the DEIR's biological resources analysis. *See* Colibri Report attached as Appendix B. The discussion below highlights the most egregious deficiencies.

Comment 58-31

1. The DEIR's Description of the Existing Biological Setting Is Incomplete and Misleading.

An EIR's description of a project's environmental setting crucially provides "the baseline physical conditions by which a Lead Agency determines whether an impact is significant." CEQA Guidelines § 15125(a). Here, the DEIR fails to accurately portray the site's underlying environmental conditions and therefore undercuts the legitimacy of the environmental impact analysis. Specifically, the DEIR lacks sufficient information regarding the biological resources at the Project site. It therefore fails to provide important contextual information and lacks a sufficient baseline for determining impacts.

Comment 58-31 Cont.

As discussed in section I above, the DEIR dismisses the site's location adjacent to conserved lands and wildlife corridors. As explained in the attached Colibri Report, the Project site is located near conserved lands that play a key role in promoting biodiversity and the long-term sustainability of ecosystems in the area. Federally designated Critical Habitat for California tiger salamander, succulent owl's clover, and San Joaquin Valley Orcutt grass are located across the San Joaquin River from the Plant Site and Quarry Site, and Critical Habitat for California tiger salamander is located roughly 2.0 miles northeast of the eastern boundary of the project sites. DEIR at 4.4-37. Moreover, the San Joaquin River corridor—a significant wildlife movement corridor that provides critical natural areas—encompasses the western boundary of the Quarry Site and is roughly 0.6 miles west of the Plant Site. Little Dry Creek, which includes a riparian corridor with a connection to the San Joaquin River, is located approximately 0.1 mile north of the Plant Site. *Id.* at 4.4-18-19. These areas are likely to be impacted by the Project. As explained in the attached CBEC and Colibri Reports, mining to 600 feet below ground surface at the Quarry Site adjacent to the San Joaquin River may impact river flows, leading to adverse impacts to sensitive species like Chinook salmon. Colibri Report at 6. And common sense dictates that fugitive dust emissions from blasting—which results in a significant amount of particulate matter—would be highly likely to carry to off-site areas, including these conserved lands and wildlife corridors, on windy days. The DEIR ignores this latter impact entirely.

Comment 58-32

Notwithstanding the acknowledged rich array of biological resources on and adjacent to the Project site, the DEIR fails to sufficiently describe these resources because it relies on insufficient biological surveys. In some cases, surveys are impermissibly deferred until after Project approval. It seems, for example, that the County did not conduct surveys for western pond turtle or western spadefoot. Rather, the DEIR merely notes that western spadefoot and western pond turtle were not observed on-site during a habitat assessment conducted *six years* ago, and relies on unsubstantiated presumptions to conclude that the species are unlikely to occur on the Project Site. DEIR at 4.4-35. Even though silt ponds are located on the Plant Site and pits that accumulate water are located on the Quarry Site, creating potential habitat for western pond turtle and western spadefoot, the DEIR presumes that western pond turtle and western spadefoot are unlikely to occur on the sites because the level of disturbance throughout the sites "severely limits movement opportunities" for spadefoot and pond turtle. *Id.* at 4.4-35, 3.3-36. This conclusory statement is no substitute for the analysis required under CEQA. Simply presuming the absence of western spadefoot and western pond turtle without conducting surveys constitutes deferred analysis, which is impermissible. *Sundstrom,* 202 Cal. App. 3d at 307. A revised DEIR must properly analyze whether western pond turtle

and western spadefoot are present and in what numbers, and determine whether the project will result in permanent loss of habitat for these species. Comment 58-32 Cont.

The DEIR's description of the existing setting also mischaracterizes jurisdictional waters on the Project Site. The DEIR does not characterize the wash water conveyance ditch at the Plant Site at a stream. But as explained in the Colibri Report, the California Department of Fish and Wildlife generally considers a stream to be any feature with a bed, channel, and banks that conveys water and supports stream dependent life, regardless of the origins and use of that feature. The wash water conveyance ditch meets those criteria, and therefore likely qualifies as a stream—meaning that diverting or obstructing its natural flow, altering its bed, channel, or bank, or depositing any materials into the ditch is subject to the provisions of California Fish and Game Code Section 1600 et seq. Colibri Report at 3. By neglecting to characterize the conveyance ditch as a stream—and consequently failing to consider the impacts associated with the removal of the wash water conveyance ditch at the Plant Site—the DEIR fails to adequately portray the existing setting at the Plant Site. Comment 58-33

Moreover, the entire DEIR relies on outdated record searches and an inadequate search radius for records of special-status species. *See* Colibri Report at 3. The record searches cited in the DEIR were conducted in 2019—*six years* ago—meaning that any records added since 2019 were not considered. *Id.* Moreover, as the Colibri Report explains, the industry standard for EIR-level record searches is a nine-quadrangle search radius, including the topographic quadrangle containing the project site and the eight surrounding quadrangles. But the County only searched *four* quadrangles when preparing the DEIR. The DEIR's reliance on this insufficient, sub-standard search radius means that special-status species that may occur on or near the project site were almost certainly overlooked, and potential impacts to them were not considered. *Id.* Comment 58-34

These errors result in a DEIR that does not accurately reflect the existing setting. Searching the California Natural Diversity Database today and extending the search radius to encompass nine quadrangles, for example, reveals several species not addressed in the DEIR that may occur on or near the Project Site, including California glossy snake, western mastiff bat, pallid bat, spotted bat, and Townsend's big-eared bat. *Id.* A revised DEIR must conduct a new record search using more up-to-date data and, at minimum, a nine-quadrangle search radius. Comment 58-35

Because the DEIR does not provide an accurate description of the existing physical conditions on the Project site, it is incapable of adequately evaluating the Project's impact on sensitive biological resources.

Comment 58-36

2. Analysis of Significant Impacts on Biological Resources Is Incomplete and Cursory.

In some instances, the DEIR determines that the Project may have significant impacts, but then fails to determine the extent and severity of those impacts. Merely stating that an impact will occur is insufficient; an EIR must also provide "information about how adverse the adverse impact will be." *Santiago County Water District v. County of Orange*, 118 Cal. App. 3d 818, 831 (1981). This information, of course, must be accurate and consist of more than mere conclusions or speculation. *Id*. The DEIR's analysis of impacts to biological resources fails to fulfill this mandate in several instances.

(a) Failure to Disclose The Extent and Severity of Impacts to Sensitive Wildlife

For example, the DEIR concludes that construction of the Project has the potential to result in significant adverse impacts to a host of sensitive animal species, several of which are state-listed as threatened or proposed for federal listing. Nonetheless, the document fails to explain the actual and specific consequences to these species. *See, e.g.*, DEIR at 4.4-48. These sensitive species include burrowing owl, western pond turtle,[9] western spadefoot,[10] Swainson's hawk,[11] bald eagle,[12] and osprey. *Id.* Further, the DEIR notes that "[a]bundant nesting habitat for raptor species" is found along the San Joaquin River west of the project site and along Little Dry Creek north of the Plant site, and that ground disturbances and noise impacts from mining could thus disturb nesting birds on or near the sites. *Id.*, at 4.4-49. Despite this disclosure, the DEIR fails to discuss the specific consequences to nesting birds. *Id.*, at 4.4-49. The DEIR provides insufficient information

---

[9] The U.S. Fish & Wildlife Service has proposed to list both the northwestern and southwestern pond turtle as "threatened" under the federal ESA. 88 Fed. Reg. 68370 (Oct. 3, 2023).

[10] The U.S. Fish & Wildlife Service has proposed to list both the northern and southern distinct population segments of the western spadefoot as "threatened" under the Federal ESA. 88 Fed. Reg. 84252 (Dec. 5, 2023).

[11] Swainson's hawk is listed as "threatened" under the California ESA. Cal. Dept. of Fish & Wildlife, Cal. Natural Diversity Database Special Animals List 18 (Jan. 2025), available at https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=109406&inline (attached as Ex. G).

[12] Bald eagle is a fully protected species under California law and listed as endangered under the California ESA. *Id.* at 18.

regarding the number of individuals of each species that will be affected or the degree to which the populations will be impacted.

Comment 58-36 Cont.

Moreover, the DEIR fails to adequately assess impacts to several listed species that have the potential to be harmed by the project. Tricolored blackbirds (a state-listed threatened species)[13] have over a dozen breeding season occurrence records within two miles of the project site and potential nesting habitat in the southeastern portion of the Plant Site, but the DEIR ignores possible significant indirect impacts due to activities like blasting, excavating, trenching, or use of heavy equipment. Colibri Report at 5. These activities could cause tricolored blackbird nests to fail, constituting a significant impact. *Id.* Western red bats, a sensitive species, have a moderate potential to occur on the project site, DEIR at Appendix C, Table C-1, yet the DEIR fails entirely to address the potential effects of the project on this species—including likely significant impacts from blasting given the western red bat's sensitivity to noise and vibration. Because bats are acoustic predators, noise from blasting could compromise their ability to effectively forage. Colibri Report at 5.

Comment 58-37

Swainson's hawks have more than four dozen breeding season occurrence records within two miles of the Project Site and numerous potential nest trees within half a mile of the Project Site, yet the DEIR fails to address potential indirect effects of the Project on nesting Swainson's hawks. *Id* at 4. Noise and dust from blasting and other Project activity could cause Swainson's hawks' nests to fail, constituting a significant impact. *Id.* Similarly, the DEIR neglects to address potential indirect impacts to burrowing owls that could result from the Project. Noise and dust from blasting, excavating, scraping, or use of heavy equipment could cause burrowing owl nests to fail and/or substantially modify their habitat, constituting a significant impact. *Id.* The DEIR also presumes Sanford's arrowhead, a California Rare Plant, to be absent—even though this species occurs in aquatic habitats like those in the southeastern portion of the Plant Site, and could be present. *Id.* at 6.

Comment 58-38

As explained in the attached CBEC Report, the DEIR also fails to adequately consider potentially significant impacts to species in groundwater dependent ecosystems that will result from the Project's interference with groundwater levels. CBEC Report at 5. Although groundwater dependent ecosystems are located near the Project Site, the DEIR contains no quantitative analysis of potential impacts to these ecosystems. *Id.* Groundwater dependent ecosystems are rooted in the alluvium extending outside the Project boundary. The Project may result in lowering the alluvium groundwater levels and dewatering remaining alluvium—which would totally dewater the alluvium and

Comment 58-39

[13] *Id.* at 22.

associated groundwater dependent ecosystem rooting zone adjacent to the San Joaquin River and north of the Quarry Site. This would result in potentially significant adverse impacts to groundwater dependent ecosystems, and the species that inhabit them, after—and possibly during—mining operations. *Id.* The DEIR fails to analyze these impacts.

Comment 58-39 Cont.

A revised DEIR must properly document the biological resources on site and thoroughly evaluate the Project's impacts to both on- and off-site biological resources.

(b) Failure to Analyze and Mitigate Impacts from Blasting and Fugitive Dust Emissions

Comment 58-40

The DEIR fails to analyze, let alone mitigate, impacts on sensitive wildlife and vegetation from dust emissions generated during blasting, aside from a cursory analysis of potential impacts to riparian habitats. DEIR at 4.4-57. The DEIR concludes that project operations associated with mining, processing, and reclamation activities would emit criteria air pollutants "from construction equipment and from mobile equipment and motor vehicles associated with excavation and blasting, and operation of an aggregate plant, ready-mix concrete plant, asphalt plant, and portable recycle plant on the Plant Site and Quarry Site." *Id.* at 4.3-57. However, the DEIR fails to consider particulate matter impacts of blasting on species—even though it admits in later sections that the generation of dust resulting from blasting would cause fine materials and dust to settle on vegetation, thereby indirectly harming habitats. *Id.* at 4.4-58. To address blasting impacts the DEIR proposes a Fugitive Dust Control Plan (Mitigation Measure 4.3-2), which prescribes upgrades to off-road engines, use of chemical dust suppressants, and daily application of water to stockpiles, but does not include any mitigation measures aimed at protecting sensitive wildlife and vegetation. *Id.*at 4.3-62

As the Colibri Report illustrates, fugitive dust emissions from the Project may adversely impact plants, and animals that depend on those plants, because fugitive dust may make plants unsuitable as habitat for insects and birds. Blasting results in a significant amount of particulate matter and would certainly carry to off-site areas on windy days. Blasting could thus harm or substantially modify the habitat of sensitive species like Swainson's hawks, tricolored blackbirds, burrowing owls, and western red bats, resulting in potentially significant impacts. Colibri Report at 4-6. The DEIR fails to address these impacts entirely (although it does admit, in its discussion of Project alternatives, that the no project alternative would "not create any new impacts to wildlife or associated habitat" because there would be "no expansion of mining operation and no blasting." DEIR at 6-14).

The DEIR *does* conclude that the generation of dust by blasting could indirectly impact riparian habitats when fine materials and dust settle on vegetation. DEIR at 4.4-58. To address this, the DEIR proposes the Fugitive Dust Control Plan, which would require upgrades to off-road engines and would require that stockpiles be controlled through the application of dust suppressants. But as discussed further below, the Fugitive Dust Control Plan does not ensure that dust control measures will be properly implemented, let alone effective to reduce impacts to less-than-significant levels. A revised DEIR must include the prescribed analysis and identify feasible mitigation measures that ensure minimization of impacts. Comment 58-41

In addition to inadequately analyzing the impacts of fugitive dust emissions, the DEIR fails to fully analyze the impacts of noise and vibration on wildlife. As described in the attached Salter Report, aside from its analysis of impacts to fish, the DEIR includes virtually no noise or vibration thresholds, analysis, or mitigation for wildlife in areas near the Project Site. Salter Report at 2. Although the DEIR concludes that "[g]round disturbance and noise impacts from mining could disturb nesting birds located on or near the project sites," DEIR at 4.4-49, and that mining could "result in potential adverse impacts to special-status species in the riparian habitat surrounding the project sites" due to substantial disturbances caused by noise and vibration, *Id.* at 4.4-52, it provides insufficient substantive analysis. Salter Report at 10. The County did not measure existing ambient noise levels in the neighboring wildlife areas; nor did it predict Project operational noise levels for these areas. Absent such analysis, the potential noise increase and ensuing impacts to wildlife cannot be evaluated adequately. *Id.* Indeed, the DEIR completely omits any analysis of blasting impacts on wildlife and other nearby riparian habitat. Because the DEIR's analysis of noise and vibration impacts is so deficient, impacts to wildlife remain largely unknown. *Id.* And since there are no noise and vibration mitigation measures that control operational noise or blasting vibration—such as stopping blasting during times when birds are nesting near the Project Site—noise and vibration from the Project will likely disrupt nearby wildlife. *Id.* Comment 58-42

(c) Failure to Disclose Impacts to Special Status Species After Reclamation of the Site. Comment 58-43

The DEIR's analysis of impacts to special-status plant and wildlife species after mining and reclamation are complete suffers from similar deficiencies. The DEIR concludes that there would be no significant impacts once reclamation is complete because "all activities would cease, and all equipment would be removed," sources of lighting, noise, and vibration would be removed, and the area would be reverted to open space. DEIR at 4.4-53. However, the current reclamation plan in place for completion of alluvial mining and the sites does not match the proposed one. The existing reclamation

plan would leave a large, but comparatively shallow (approximately 20 feet deep) lake at the Quarry site; the proposed reclamation plan would leave an 108-acre, 600-foot-deep pit with a water surface elevation of approximately 500 feet below the surrounding grade. *Id.* at 4.4-53-54. Compared to the proposed reclamation plan, the existing reclamation plan would offer better opportunities for aquatic plant and animal life, as habitat value is often inversely related to water depth. Colibri Report at 6. But the DEIR ignores likely impacts to wildlife that would result from the creation of the 600-foot-deep pit and fails to analyze the impacts of the proposed reclamation plan compared to the existing plan. Similarly, the DEIR notes that the formation of quarry pit ponds that would cover the majority of the Plant and Quarry Sites would constitute an "irreversible" environmental change that would preclude future land uses, but fails to analyze whether this change would result in impacts to sensitive species or their habitats. *Id.* at 7-3.

Comment 58-43 Cont.

3. The DEIR Fails to Adequately Evaluate the Project's Adverse Impacts on On-Site and Downstream Habitat Areas.

Comment 58-44

As described in both the CBEC and the Colibri Reports, the Project's effects on site hydrology would result in water stress to existing riparian habitat areas on-site and downstream of the Project site. The Project would result in myriad changes including a substantial loss of groundwater due to increased evapotranspiration from large numbers of wetland and riparian plants proposed as part of the revegetation plan and increased evaporation in ponded areas. In addition, changes in Project site topography, hydraulics, and flow that will redirect flood waters have the potential to impact existing riparian areas on-site and sensitive habitat downstream. CBEC Report at 5 and Colibri Report at 6. The DEIR fails to evaluate these impacts.

Comment 58-45

The San Joaquin River to the west of the project site supports a Great Valley Mixed Riparian Forest, and riparian habitat is also located just north of the Plant Site and south of Little Dry Creek. DEIR at 4.4-55, The DEIR notes that pumping of quarry pits on the project sites and the ensuing formation of a quarry pit pond on the Plant Site and quarry pit lake on the Quarry Site "would result in decreased groundwater levels in the areas surrounding the project sites," which could lead to adverse impacts to riparian habitat should plant species lose access to groundwater or river flow water important to their survival. *Id.* at 4.4-55. Mulefat and sandbar willow, for instance, are groundwater dependent species that have been identified within 500 feet of the Plant Site. *Id.* at 4.4-11. As explained in the attached CBEC Report, the Project will interfere with groundwater dependent ecosystems, resulting in potentially significant impacts on these ecosystems after, and possibly during, mining operations. CBEC Report at 5.

Comment 58-46

Moreover, blasting at the Quarry Site could impact riparian habitat by destabilizing the San Joaquin River bank, or by generating projectiles that could damage riparian habitat. *Id.* at 4.4-57. To address this, the DEIR proposes Mitigation Measure 4.10-1, which would implement blasting protocols that would require blasting to begin at the center of the Quarry Site so that "monitoring of groundborne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibration measurements and allow for adjustments in blasting design to occur based on the monitoring results." *Id.* If it is determined that blasting is causing instability (of the river bank), a "corrective action plan must be developed that identifies changes to the blasting program to prevent future exceedances." *Id.* at 4.4-58. The blasting protocol would also require the development of an annual Blasting Plan submitted to the county each year for review. *Id.* These mitigation measures are both vague and impermissibly deferred. Indeed, these measures would allow significant impacts to occur before any steps are taken to avoid or minimize impacts; corrective action would be taken only after the damage is already done. CEQA prohibits a delay in implementation of mitigation until after a significant impact occurs. *See King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 860, 862; *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 738, 740. Compounding the problem, the DEIR fails to articulate exactly *what* corrective action must be taken if significant impacts occur. This is also unlawful. *See, e.g.*, *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 195-96; *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 280-81.

Comment 58-47

The DEIR also reaches unsupported and unreasonable conclusions about impacts to on-site and downstream wildlife from mining operations and blasting. For instance, it concludes that the project's interference with native resident or migratory fish or wildlife species movement, corridors, or nursery sites would be less than significant, DEIR at 4.4-63, but justifies this conclusion by discussing post-operating conditions; the DEIR claims that mining operations on the Plant Site will not compromise wildlife movement, in part, because "[u]pon completion of mining and reclamation, the final reclaimed use on the site would be open space." *Id.* But the Project envisions operation for a period of 100 years. *Id.* at ES-4 and 2-5. That reclamation would take place at the end of this period does not mean that there will not be significant impacts in the interim. Disruption of the site over a 100-year period will cause significant impacts, even if the site will one day be

reclaimed. The DEIR may not just ignore a century of adverse impacts to wildlife simply because the Project Site will be converted to open space thereafter.[14]

Comment 58-47 Cont.

Furthermore, the DEIR's discussion of impacts to special-status wildlife species in riparian habitat surrounding the Plant and Quarry sites during mining operations is devoid of any real analysis. Without providing a single citation to back its claims, the DEIR asserts that "wildlife is often observed to habituate well to daily recurring activities and noise associated with the operations," DEIR at 4.4-52. The DEIR provides several examples of species habituating—again, without offering any citations to substantiate these claims. *Id.* at 4.4-52-53. Many of these examples, including the primary example offered, Cajon Creek Conservation Bank, were projects involving alluvial surface mining without blasting, and are therefore not reflective of whether species exposed to blasting on the Quarry Site are likely to habituate or not. *Id.* The DEIR's conclusion that impacts to special-status wildlife species in riparian habitat surrounding the Plant and Quarry sites during mining operations will be less than significant lacks any basis.

Comment 58-48

In addition, as discussed above, the Project proposes to excavate hard rock to a depth of 600 feet, leaving a large pit even after reclamation has taken place. As described in the attached CBEC report, groundwater in the alluvium beneath off-site areas will likely flow into the Quarry Site pit, resulting in potential groundwater contamination as well as potentially significant impacts to neighboring groundwater dependent ecosystems. CBEC Report at 4. The DEIR ignores these impacts to water quality and to downstream aquatic habitats. *Id.*

Comment 58-49

4. The Project's Approach to Mitigation of Impacts on Biological Resources is Inadequate.

Comment 58-50

The DEIR not only fails to adequately analyze potentially significant impacts on biological resources on-site and off-site in the adjacent wildlife refuges due to project-related hydrologic changes, fugitive dust emissions, and direct impacts from removal of habitat, but also fails to provide adequate mitigation to address all of the ways that biological resources will be impacted. An EIR is inadequate if it fails to suggest mitigation measures, or if its suggested mitigation measures are so undefined that it is impossible to evaluate their effectiveness. *San Franciscans for Reasonable Growth v. City and County of San Francisco* (1984) 151 Cal.App.3d 61 at 79. The County may not use the inadequacy of its impacts review to avoid mitigation: "The agency should not be

[14] Nor is there any guarantee that the site actually will be reclaimed even after another century of operation. As discussed above, the site would have been reclaimed decades ago had the County not repeatedly extended the expiration of existing permits.

allowed to hide behind its own failure to collect data." *Sundstrom*, 202 Cal.App.3d at 306. The formulation of mitigation measures may not properly be deferred until after Project approval; rather, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally binding instruments." CEQA Guidelines § 15126.4(a). Here, the DEIR's identification and analysis of mitigation measures, like its analysis of biological impacts, are legally inadequate.

Comment 58-50 Cont.

The DEIR concludes that the project could result in significant impacts to special-status species—including burrowing owls, western pond turtles, western spadefoot, Swainson's hawks, bald eagles, and ospreys—on the Plant Site or Quarry Site during mining operations, DEIR at 4.4-48-49, and that ground disturbance and noise impacts from mining could disturb nesting birds on or near the sites. *Id.* at 4.4-49. But the mitigation measures it proposes, which involve conducting preclearance surveys and relocating any members of these species found on the Project Site, fail to mitigate potential irreversible impacts to these species' habitat. *Id.* at 4.4-50 to 4.4-52, 4.4-57 to 4.4-58. Activities such as mining operations, blasting, and the creation of the 600-foot deep pit could result in the irrevocable destruction of habitat. Even if sensitive species are relocated, loss of their habitat is nevertheless an impact that requires evaluation and mitigation. A revised DEIR should include mitigation measures that adequately address potential irreversible harms to species habitat.

The DEIR's biological mitigation measures are inadequate for additional reasons. For example, the measures calling for relocation of burrowing owls, western pond turtles, and spadefoot (4.4-1a and 4.4-1b) fail to discuss any potential adverse impacts on these species resulting from capture and relocation. An EIR must evaluate whether mitigation measures may cause significant environmental impacts of their own (CEQA Guidelines § 15126.4(a)(1)(D)), but this EIR fails to do so. Nor do these measures cite any evidence that suitable habitat is available in areas where relocation would be feasible and the relocated species would not be further disturbed.

Comment 58-51

Measure 4.4-1c for nesting birds is also arbitrary, inadequate and inconsistent. Although the measure contemplates that a buffer zone of 300 to 500 feet may be necessary to protect nests from disturbance, it would require surveys only within 50 feet of "the immediate area of the mining phase where construction is to be initiated." DEIR at 4.4-50. Nests outside this 50-foot buffer, but within the 300- to 500-foot radius where nest protection is necessary, would receive no protection at all. This arbitrary limitation on survey distance is unlawful. *See Sierra Watch v. County of Placer* (2021) 69 Cal.App.5th 86, 106-07.

Comment 58-52

Comment 58-53

C. The DEIR's Analysis of Project-Related Air Quality Impacts Is Inadequate.

The DEIR's analysis of Project-related air quality impacts contains numerous deficiencies that must be remedied in order for the public and decision-makers to fully understand the Project's impacts. Specifically, the evaluation of the Project's air quality impacts must be revised to address: (1) inadequate analysis of direct and indirect impacts of fugitive dust emissions, (2) an insufficient mitigation plan for particulate matter emissions; and (3) deficient analysis and mitigation of project-related public health impacts. These issues, and other deficiencies, are discussed in greater detail below.

1. The DEIR Fails to Adequately Evaluate the Project's Direct and Indirect Impacts Resulting from Particulate Matter Emissions.

The DEIR concludes that Project-related particulate matter emissions (specifically fugitive dust emissions) would be significant. DEIR at 4.3-60. However, the DEIR fails to provide adequate details about dust-producing elements of the Project. As a result, readers of the evaluation cannot know whether all direct impacts were evaluated. For example, the DEIR fails to provide information about the area that would be disturbed at both sites each day; the anticipated size, number, and location of stockpiles; and how material would be transported to avoid fugitive dust emissions. This information is important for readers to understand the daily volume of exposed material and how handling of the material may or may not result in additional pollutant emissions.

Comment 58-54

Similarly, the DEIR states that if topsoil or overburden stockpiles are expected to remain *longer than one year*, the stockpiles would be protected from wind and erosion with planted grasses. DEIR at 2-29, 2-36 (for both the Plant and Quarry sites; emphasis added). This suggests that unused stockpiles could be subject to uncontrolled wind erosion for up to 12 months before being seeded, which could generate substantial dust emissions that were not accounted for in the DEIR analysis.

Comment 58-55

In addition, the DEIR fails to adequately evaluate the indirect impacts related to Project-related fugitive dust. Specifically, as discussed above and in the attached Colibri Report, the DEIR ignores potential impacts of particulate matter on adjacent wildlife and plant habitats. *See* Colibri Report at 3. The DEIR fails to evaluate the effects of fugitive dust drifting into immediately proximate ecological reserves and other open space.

A revised analysis must properly evaluate the Project's particulate emissions, disclose the corrected emissions of particulate matter, and identify feasible, effective mitigation to minimize the impacts.

Comment 58-56

2. The DEIR's Proposed Mitigation for Significant Project-Related Particulate Matter Emissions Is Insufficient.

The DEIR proposes Mitigation Measure 4.3-2 to address the Project's significant impact due to particulate matter emissions. DEIR at 4.3-62. However, as presented, the measure fails to ensure that impacts will be minimized to a less-than-significant level. The measure indicates that a Fugitive Dust Control Plan will be prepared sometime in the future. The deferred plan would include three elements. However, the measure is generic, vague, and fails to provide any mitigation at all for several potential sources of particulate pollution. As discussed above, the DEIR fails to address fugitive dust control in the mining pit area. DEIR at ES-13 and 4.3-62. During dry weather conditions, wind erosion and excavation equipment operation would generate a substantial amount of fugitive dust emissions if not properly controlled. Blasting also produces large amounts of particulate matter, and yet the mitigation measure fails to address these emissions. Finally, although the measure provides for controlling unpaved roads with dust suppressants, it fails to specify how often or under what conditions.

Comment 58-57

In addition, the DEIR fails to evaluate the effectiveness of the control measures proposed in the Fugitive Dust Control Plan. Measures to mitigate the substantial amount of particulate matter that would result from this Project should be specific and substantially more stringent. For example, the measures should include periodic air monitoring by a third party (when triggered by complaints), and should include specific information about how unpaved roads, stockpiles, and disturbed areas would be stabilized to prevent wind erosion.

Comment 58-58

As discussed above, impacts from these fugitive dust emissions are not only harmful to people but can also impact animals and plants on adjacent sites. See Colibri Report at 3. The County must identify effective, enforceable measures that will minimize impacts to the sensitive plant and animal communities on- and off-site as well as sensitive receptors in adjacent residential areas.

Comment 58-59

3. The DEIR's Health Risk Assessment Lacks Substantial Evidence to Support Conclusions.

The DEIR presents a Health Risk Assessment evaluating cancer risk from exposure to Project-generated toxic air contaminants (TACs) of concern, including diesel particulate matter, silica dust and trace heavy metals. DEIR at Appendix D-1. However, giving that the Project more than doubles production from the mines, it is unclear how the evaluation concludes there would be a net reduction in cancer risk at the maximum exposed individual sensitive receptor (or MEIR). Specifically, the DEIR identifies an

Comment 58-59 Cont.

unmitigated cancer risk of 281 in a million. DEIR Table 4.3-24 at p. 4.3-63. However, the DEIR then claims that the cancer risk after implementation of mitigation measures would be reduced to less than zero. DEIR at Table 4.3-25 at p. 4.3-64. This seems to suggest that the mitigation causes a beneficial net reduction relative to baseline conditions, but the DEIR fails to explain how the analysis arrives at this confounding conclusion.

Comment 58-60

Furthermore, the health risk analysis assumptions are unclear. For example, it is unclear what baseline health risk scenario is assumed for the existing condition. The DEIR, at Appendix D, indicates that baseline data is based on data in Appendix G to Appendix D1. A review of that data, however, fails to clarify the baseline assumptions.

A revised DEIR must clearly state the baseline health risk scenario and how it was derived, and must include an apples-to-apples comparison between the existing conditions and the proposed net change for to project operations. The assumptions must also be clearly articulated so that the public and decisionmakers can understand the basis for the analysis

Comment 58-61

D. The DEIR's Noise Analysis Is Inadequate.

1. The DEIR Uses Inappropriate Thresholds of Significance to Evaluate Blasting-Related Impacts on People.

The Project proposes frequent blasting (once or twice a week) for a period of approximately 70 years during the hard rock mining phase. DEIR at 2-42 and 2-43. Blast waves, or pressure waves, are also referred to as airblast. Salter Report at 3 through 7.

The DEIR acknowledges that the nearest sensitive receptors to the Project site are located approximately 250 feet from the noisiest operations at the Quarry site. DEIR at 4.13-59. While the DEIR purports to evaluate the impacts of blasting on nearby residents, it fails to actually do so. DEIR at 4.13-65. As further explained in the Salter Report, the DEIR's thresholds of significance for blasting-related impacts are based on U.S. Bureau of Mines thresholds that focus only on building damage resulting from blast waves, not on the potential for human disturbance. Salter at 3; DEIR at 4.13-65. As the Salter Report shows, human disturbance from vibration and "airblast" can occur at levels far below those that may cause structural damage. Indeed, multiple agencies in the United States and elsewhere have established standards addressing blasting impacts on people that are different from, and far more stringent than, thresholds for assessing the potential for structural damage. Salter at 3. By using a structural damage threshold to assess the potential for human disturbance, the DEIR effectively omits any analysis of potential vibration and airblast impacts on people.

Comment 58-61 Cont.

Given that the DEIR's thresholds of significance for the project's ground-borne vibration and airblast impacts only address structural damage, it follows that the analysis of this impact is also limited only to structural damage. This approach does not comport with CEQA. People can perceive levels of motion and sound that are well below (by a factor of 100 to 1000 or more) those levels that could cause damage to the average structure.[15] People can detect the effects of airblast from a distance up to 2,000 feet. Salter at 8. The DEIR's analysis is therefore incomplete and inadequate.

Under CEQA, the public has a right to know just how disruptive noise and vibration from the Project's operations will be. California courts are clear on this subject. A DEIR may not "travel the legally impermissible easy road to CEQA compliance . . . [by] simply labeling the effect 'significant' without accompanying analysis . . . ." *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.*, 91 Cal.App.4th 1344, 1371 (2001). Rather, "a more detailed analysis of how adverse the impact will be is required." *Galante Vineyards v. Monterey Peninsula Water Management Dist.*, 60 Cal.App.4th 1109, 1123 (1997).

The revised DEIR must use thresholds of significance that account for effects on people (not just structures) to evaluate and disclose the full extent and severity of the Project's blasting impacts on adjacent sensitive receptors. Absent identification of applicable thresholds, the DEIR's conclusions regarding the significance of human disturbance impacts fail to inform the public and lack evidentiary support.

Comment 58-62

2. The DEIR Fails to Adequately Analyze the Project's Impacts Related to Nighttime Noise and Extended Operational Hours.

The DEIR analysis indicates that operational noise at night is projected to exceed thresholds of significance, resulting in significant impacts. DEIR Tables 4.13-16 and 4.13-17, DEIR 4.13-57 through 4.13-60). Making things worse, the Project site would extend operational hours (DEIR at 4.1-62 and 4.1-63) to allow loading/unloading and aggregate trucking to regularly occur between the hours of 4 a.m. and 9 p.m. under the proposed project, compared to existing conditions where the earliest operations begin between 4 a.m. and 6 a.m. seasonally, and end at 6:00 p.m. year-round. As the Salter Report explains, extended operations before 6 a.m. and after 7 p.m. come with increased risk and potential for sleep and speech disturbance for the nearby sensitive receivers. Salter at 10. The DEIR omits analysis of these impacts. A revised DEIR should include

[15] See Wesley L. Bender, Understanding Blast Vibration and Airblast, Their Causes, and Their Damage Potential at 9 (2019), available at http://www.iseegoldenwest.org/articles/Blast%20Effects.pdf (attached as Exhibit H).

an analysis of nighttime noise and the potential for sleep disturbance at nighttime hours (4 a.m. to 7 a.m.). The sleep disturbance study should evaluate both average and single-event maximum noise (i.e., Leq/L50 and Lmax noise levels) from processing, truck loading, and truck pass-by noise. Salter at 10.

Comment 58-62 Cont.

3. The DEIR Proposes Inadequate Mitigation and Fails to Provide Evidence That The Proposed Measures Will Reduce Noise to Less Than Significant Levels.

Comment 58-63

Notwithstanding the DEIR's deficient noise impact analysis, the document recognizes the need to mitigate for the Project's significant noise impacts. DEIR at ES-45 to ES-49; 4.13-58; and 4.13-61 and 4.13-62. Specifically, the DEIR concludes that changes in ambient noise levels at both the Plant Site and at the Quarry site, would be potentially significant during both stages of production. *Id.* The DEIR identifies two mitigation measures that it claims will reduce impacts to less-than-significant levels. *Id.*

Under CEQA, "[m]itigation measures must be fully enforceable through permit conditions, agreements, or legally binding instruments." CEQA Guidelines § 15126.4(a). Here, the DEIR's identification and analysis of mitigation measures are legally inadequate. The identified mitigation measures for the significant noise impacts at both sites include a laundry list of elements. DEIR at ES-45 and ES-46; 4.13-58; and 4.13-61 and 4.13-62. The measures provide that the facility operator "shall implement one or more of the following measures…" so that the operator can choose to implement measures at their discretion. *Id*. The measures include no performance standards to ensure that the combination of elements implemented would control noise to any particular level. *Id.* Without such standards, the measure is not enforceable and the DEIR cannot rely on either measure to conclude that noise would be reduced to less-than-significant levels. *See, e.g.*, *King and Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 872-79.

In addition, the DEIR fails to provide any analysis of the proposed mitigation measures' efficacy, and fails to provide evidence to support the conclusion that, with the mitigation, impacts would be reduced to less-than-significant levels. Instead, the DEIR defers analysis of the measures' efficacy until after project approval. Specifically, item 7 in Mitigation Measure 4.13-2 and item 12 in Mitigation Measure 4.13-3 call for noise monitoring to determine if the measures adequately lower noise levels. However, under well-established caselaw, when a lead agency relies on mitigation measures to find that project impacts will be reduced to a level of insignificance, there must be substantial evidence in the record demonstrating that the measures are feasible and will be effective. *Sacramento Old City Assn. v. City Council of Sacramento*, 229 Cal.App.3d 1011, 1027

Comment 58-64

(1991); *Kings County Farm Bureau v. City of Hanford*, 221 Cal.App.3d 692, 726-29 (1990). Because the DEIR defers analysis regarding the effectiveness of the proposed measures, there is no such evidence in the record for this Project.

Comment 58-64 Cont.

Furthermore, as discussed above, the DEIR's mitigation measure for blasting impacts is impermissibly deferred, overly vague, and insufficient to support a conclusion that impacts will be less than significant. In particular, the measure relies on inadequate monitoring of blasting to determine whether thresholds are exceeded and requires preparation of a "Corrective Action Plan" if they are. See DEIR at 4.10-91 (MM 4.10-1); DEIR Appendix H-6 ("Blasting Protocols"). This measure thus impermissibly defers both analysis and mitigation of significant impacts; indeed, the DEIR proposes to allow significant impacts to occur before mitigation is even proposed, much less implemented. Compounding the problem, the mitigation measure does not identify any specific measures that must be included in a "Corrective Action Plan." Mitigation measure 4.10-1 is mentioned several times in the DEIR as the basis for concluding numerous impacts are less than significant. These conclusions are without evidentiary support, and the DEIR's failure to identify and describe adequate mitigation renders the document inadequate as a matter of law.

Comment 58-65

4. The DEIR Fails to Analyze Noise Impacts on Area Recreational Users.

Comment 58-66

Finally, the DEIR completely ignores Project-related noise impacts to recreational users of the San Joaquin River (e.g., kayaking, canoeing) and of nearby Sumner Peck Ranch, Ball Ranch, and Lost Lake Recreation Area, the southern border of which is adjacent to the Quarry site. Sumner Peck Ranch is open to the public daily from 12-5 pm thanks to Solitary Cellars Winery, which offers an outdoor wine tasting area. Ball Ranch is also open to the public daily and is operated by the Trust under contract to the Conservancy. In addition to recreation, Lost Lake County Park is the location of many elementary school field trips during the school year. According to the County's website, "[T]he primitive nature study area and 38 acre lake make Lost Lake one of the most popular County parks."[16] Lost Lake Recreation Area provides multiple features and activities, such as group picnic areas, softball field, volleyball courts, hiking trails, nature study area and trail, bird watching, hiking, kayaking, canoeing, fishing, camping and

[16] *See* Fresno County, Lost Lake Recreation Area, at https://www.fresnocountyca.gov/Departments/Public-Works-and-Planning/divisions-of-public-works-and-planning/resources-and-parks-division/parks/lost-lake-recreation-area (attached as Ex. I).

playgrounds, and serves various members of the community, including individuals, groups, students, scouts, and families. *Id.*

Comment 58-66 Cont.

It is therefore improper for the DEIR to omit any analysis of impacts to recreational River users and to users of the park. A project that calls for blasting and hard rock mining operations would clearly impact recreational users because it would interfere with their use and enjoyment of the area and may result in safety concerns. One of the purposes of open space and parks is to provide urban users access to spaces away from the noise of urban life. The noise associated with drilling, blasting, excavation, and aggregate processing activities for 100 years would result in the loss of connection to the natural environment. Industrial noise – like second-hand smoke – is indiscriminating; there would be no way to escape the noise except to leave the area altogether. The revised DEIR must address this serious impact.

IV. The DEIR Fails to Comply with CEQA's Mandate Regarding Alternatives Analysis.

Comment 58-67

Under CEQA, an EIR must consider a "reasonable range" of alternatives "that will foster informed decision making and public participation." CEQA Guidelines § 15126.6(a); *Laurel Heights I*, 47 Cal.3d at 404. ("An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision making."). The discussion of alternatives must focus on alternatives that are capable of avoiding or substantially lessening any significant effects of the Project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly. CEQA Guidelines § 15126.6(b). In addition, a "lead agency may not give a project's purpose an artificially narrow definition," to shape this determination but rather must "structure its EIR alternative analysis around a reasonable definition of underlying purpose and need." *In re Bay-Delta etc.*, 43 Cal.4th 1143, 1166 (2008). In particular, using overly narrow objectives to dismiss reasonable and feasible alternatives constitutes prejudicial error. See *North Coast Rivers Alliance v. Kawamura*, 243 Cal.App.4th 647, 669-70 (2015) (where the lead agency's overly narrow project purpose caused it to "dismiss[] out of hand" a relevant alternative, this error "infected the entire EIR").

As a preliminary matter, the DEIR's failure to disclose the extent and severity of the Project's broad-ranging impacts necessarily distorts the document's analysis of Project alternatives. As a result, the alternatives are evaluated against an inaccurate representation of the Project's impacts. Proper identification and analysis of alternatives is impossible until Project impacts are fully disclosed.

Moreover, the DEIR's alternatives analysis fails to live up to CEQA standards because: 1) it defines the Project objectives too narrowly and 2) it fails to analyze a reasonable range of alternatives that could significantly reduce the Project's impacts.

Comment 58-67 Cont.

A. The DEIR Presents Overly Narrow Objectives.

Comment 58-68

An EIR violates CEQA if it defines project objectives so narrowly as to preclude any alternatives at all (*see North Coast Rivers Alliance v. Kawamura (2015) 243 Cal.App.4th 647, 667*), or proposes purported alternatives that conflict with project objectives only so they can be easily eliminated (*see Watsonville*, 183 Cal.App.4th at 1089).

As discussed above, the DEIR presents overly narrow and self-fulfilling project objectives. The DEIR characterizes the "overall goal" of the Project as "continu[ing] and expand[ing] existing mining and processing operations at the Plant Site and Quarry Site." DEIR at 6-3. Objectives 2 and 4 effectively circumscribe and mandate selection of the Project or an alternative that is substantively similar. In particular, Objective 2 requires the project to continue to use "known aggregate reserves from existing partially mined properties." *Id*. Objective 4 demands the Project "maintain a local source of construction aggregate with enough annual sales capacity (3.0 million tons [MT])." *Id.* These objectives leave no room for consideration of anything other than expansion of the existing operation, at the capacity proposed, at this location.

Indeed, the DEIR rejects the possibility of using alternative site locations because use of a different location would "result in eliminating aggregate production and reclamation impacts that would occur at the project site," "introduce new impacts to a site with no previous aggregate mining activity," and "restrict the full mineral development of the Quarry Site." *Id.* at 6-7. Similarly, the DEIR dismisses the reduced operational life alternative because it would restrict the full mineral development of the Project Site, *id.* at 6-8, and rejects reduced mining depth (200 feet) alternative because this option would require finding "another aggregate source to supply the County's and Fresno regional needs." *Id.* at 6-9.

Because the objectives leave no room to consider—and are used to justify dismissal without analysis of—relevant, feasible alternatives, they preclude consideration of a reasonable range of alternatives and violate CEQA. *North Coast Rivers Alliance v. Kawamura*, 243 Cal.App.4th 647 at 669-70 (2015). The County should withdraw the DEIR and proceed with analysis of a reasonable range of alternatives, and recirculate the EIR for a complete and adequate environmental review.

B. The DEIR Fails to Consider a Reasonable Range of Alternatives

Comment 58-69

The DEIR analyzes four alternatives to the Project, aside from the No Project Alternative. The alternatives presented are:

- Alternative 2: Reduced Mining Depth Alternative (400 feet);
- Alternative 3: Reduced Mining Depth Alternative (300 feet);
- Alternative 4: Reduced Mining Depth Alternative (300 feet) with Additional Setback (100 feet); and
- Alternative 5: Reduced Mining Depth Alternative (400 feet) with Reduced Annual Sales (2.5 MT/Y). DEIR at 6-10.

However, these alternatives do little to address the DEIR identified significant impacts to visual resources and safety impacts to pedestrians and bicyclists. Indeed, the DEIR concludes that adverse impacts to the scenic vista and degradation of the existing visual character in nonurbanized areas would be the same in Alternatives 2, 3, and 5 as in the Project. DEIR at 6-60.

Critically, each of these alternatives would still include blasting and hard rock mining and would still result in significant impacts that have not been disclosed. Specifically, Alternatives 2 through 5 would conduct hard rock mining with blasting to a reduced depth of 300 or 400 feet. DEIR at 6-10. Thus, Alternatives 2, 3, 4, and 5 would still continue mining operations for 86, 68, 63, and 86 years respectively. DEIR at 6-20, 6-30, 6-39, 6-52.

Furthermore, the alternatives presented fail to address the undisclosed significant impacts to people and sensitive habitat and species in the area associated with blasting and changes in hydrology. Therefore, the alternatives fail to reduce the Project's significant biological, hydrological, and noise impacts and fail to meet CEQA standards for alternatives analysis. CEQA Guidelines § 15126.6. Similarly, Alternative 4 would allow hard rock mining to a depth of 300 feet and increase the setback from the river by 100 feet. DEIR at 6-39.

Comment 58-70

The DEIR should have also considered other feasible alternatives that would actually *substantially lessen* the Project's multiple significant impacts. The document provides no reasonable explanation as to why additional alternatives that reduce the inevitable damage from the proposed Project were not proposed. In this case, where the proposed Project would result in many significant environmental impacts for 100 years, it is especially important that the DEIR analyze alternatives that could avoid or lessen those impacts. *See* CEQA Guidelines § 15126.6(c).

Comment 58-70 Cont.

As discussed above, the Project will result in significant impacts related to hydrology, biological resources, air quality, and noise. Given the site's location in close proximity to residences, immediately adjacent to a river that provides important aquatic and riparian habitat for multiple sensitive wildlife species, the DEIR should have considered additional alternatives that would reduce impacts to a substantive degree. For example, the DEIR should have analyzed a reduced extraction alternative that would allow further shallow mining of aggregate resources at the Plant and Quarry sites, but limit the operation to excavation of shallow sand and gravel resources only. Such an alternative would reduce impacts to groundwater resources, avoid changes to hydraulics and flood flows, avoid on-site and downstream impacts to habitat through changes in flow and water temperature, and avoid impacts to people and wildlife from blasting. Analysis of such an alternative would also reduce visual impacts and impacts to cyclists and pedestrians, which the current slate of alternatives fail to mitigate. DEIR at 6-60. A revised EIR should analyze these and other alternatives that will avoid or reduce the Project's impacts.

In short, the DEIR's alternatives analysis is riddled with flaws that improperly constrain to the County's consideration of project alternatives. Moreover, the DEIR fails to consider a reasonable range of alternatives that would "avoid or substantially lessen" the significant effects of the project. CEQA Guidelines § 15126.6.

Comment 58-71

V. The Project Is Inconsistent with the County's General Plan and Zoning Ordinance.

Neither the General Plan nor the Zoning Ordinance expressly allow hard rock mining and blasting in agricultural land use designations or the Exclusive Agriculture (AE) zone. The type of mining proposed in this Project is categorically different from the "surface mining" operations contemplated in the County's land use documents. The Project is therefore inconsistent with the General Plan and Zoning Ordinance.

As discussed above, General Plan Table LU-1 (at 2-25) allows "Surface Mining Operations" in AE and other agricultural zones, but does not expressly allow hard rock mining. The Zoning Ordinance similarly lists "Surface Mining Operations" as an allowable use in the AE zone (with a conditional use permit), but does not authorize hard rock mining. Zoning Ord. § 808.2.020, Table 2-2 (at 2-14).

In the AE zone, "[f]or land uses not listed in Table 2-2, the provisions of Section 802.1.020 (Rules of Interpretation) shall apply." *Id.*, § 808.2.020(D). Those "Rules of Interpretation" require specific findings regarding uses of land that are not specifically listed as allowable in particular zones. *See id.*, § 802.1.020(E). Among other things, the

Director has to make a determination that "[t]he characteristics of, and activities associated with, the proposed use are equivalent to those of one or more of the uses listed in the zone as allowable, and will not involve a greater level of activity, dust, intensity, noise, parking, population density, or traffic generation than the uses listed in the zone." *Id.*, § 802.1.020(E)(1)(a).

Comment 58-71 Cont.

Here, the Project will entail a fundamental shift from surface mining of aggregates to hard rock mining of granite. Hard rock mining involves regular blasting and entails a "greater level" of intensity, activity, dust, and noise than surface mining. These uses are not "equivalent" as required by the Zoning Ordinance.

Nor does hard rock mining fit within the definition of "surface mining" in the Zoning Ordinance: "All, or any part of, the process involved in the mining of minerals on mined lands by removing overburden and mining directly from the mineral deposits, open-pit mining of minerals naturally exposed, mining by the auger method, dredging and quarrying, or surface work incident to an underground mine." Zoning Ord. § 834.4.220. Nothing in this definition contemplates continuous, regular blasting and removal of materials from areas far deeper than those typically involved in surface mining operations. The proposed Project therefore cannot be found consistent with the General Plan or Zoning Ordinance.

Comment 58-72

VI. Conclusion

The Project will have a number of potentially significant impacts on the environment, including (but not limited to) impacts on groundwater resources, water quality, special status biological resources, noise, and air quality. Yet these impacts and others were not adequately analyzed and mitigated in the DEIR. As a result, the DEIR fails to serve as an adequate informational document and its conclusions are not supported by substantial evidence. For the foregoing reasons, the Trust urges the County to delay further consideration of the Project unless and until the County prepares and recirculates a revised DEIR that fully complies with CEQA and the CEQA Guidelines.

Subject: Review of Draft Environmental Impact Report
CEMEX Rockfield Quarry Modification Project, Fresno County, California

Dear Ms. Borg:

Comment 58A-1

I am a hydrologist with thirty-five years of technical and consulting experience in the fields of geology, hydrology, and hydrogeology. I have been providing professional hydrology and geomorphology services in California since 1991 and routinely manage projects in the areas of surface- and groundwater hydrology, water supply, water quality assessments, water resources management, and geomorphology. Most of my work has been in the Central Valley and Coast Range watersheds of California. My areas of expertise include: characterizing and modeling watershed-scale hydrologic and geomorphic processes; evaluating surface- and ground-water resources/quality and their interaction; assessing hydrologic, geomorphic, and water quality responses to land-use changes in watersheds and causes of stream channel instability; assisting and leading in the development of CEQA environmental compliance documents and project environmental permits; and designing and implementing field investigations characterizing surface and subsurface hydrologic and water quality conditions. I earned a Master of Science degree in Geology, specializing in sedimentology and hydrogeology as well as an A.B. in Geology from Miami University, Oxford, Ohio. I am a Certified Hydrogeologist (CHG #360) and a registered Professional Geologist (PG #5737) in the state of California. A copy of my resume is attached.

I have been retained by Shute, Mihaly & Weinberger LLP (SMW) to review the Draft Environmental Impact Report (DEIR) for CEMEX Rockfield Quarry Modification Project located in Fresno County, California, and evaluate if the proposed project may impact surrounding properties and the environment. Specifically, I have reviewed the DEIR, supporting technical reports, and

2544 Industrial Blvd., West Sacramento, CA 95691 USA
T 916.231.6052 F 916.669.8886 info@cbecoeng.com
www.cbecoeng.com

reports cited in this letter. Based on my review of these materials, it is my professional opinion that the DEIR is inadequate in evaluating the potential significant impacts of project actions on surface water and groundwater supply and associated biological resources dependent on that water. The rationale for this opinion is presented in the comments below.

Comment 58A-1 Cont.

1. No consideration of Climate Change in Flood Hazard Analysis

Comment 58A-2

The hydraulic modeling analysis of existing conditions presented in Appendix G-1 of the DEIR used FEMA's effective 100-year flow rate of 71,000 cubic feet per second (cfs) to determine if the flooding along the San Joaquin River would encroach into the Quarry Site. The results of the flood hazard analysis indicate that the existing conditions floodplain does not encroach into the Quarry Site. Using FEMA's water surface elevations and a 2018 topographic map, the flood hazard analysis also determined that the 100-yr event floodplain during a flow rate of 71,000 cfs does not encroach into the western portion of the Plant Site.

The flood hazard analysis does not consider or analyze the effects of long-term climate change on San Joaquin River flood flow rates at the Quarry and Plant Sites over the 100-year life of the project. A recent study completed by the California Department of Water Resources (DWR) (Nemeth et al., 2021) completed climate modeling analyses to inform the Central Valley Flood Protection Plan Conservation Strategy 2022 Update. An objective of these analyses is to identify current climate modeling data and results that can be used to assess the spectrum of changes in hydrologic and geomorphic processes that could impact Conservation Strategy's measurable objectives and target species. Appendix H of the Update report contains results of climate and hydrologic model analyses that quantify the changes in peak flood rates using regulated hydrology on the Upper San Joaquin River below Friant Dam for the year 2072. Results of these analyses indicate that future (2072) 100-year flow rates will increase to 126,800 cfs because of climate change[1], a flow rate that is 179% of the FEMA estimate used in the DEIR.

Based on my hydrologic and hydraulic modeling experience and review of the floodplain inundation maps and water surface elevations for the 100-year flow rate of 71,000 cfs presented in Appendix G-1 of the DEIR, it is my professional opinion that an increase in the flow rate to 126,800 cfs would encroach into and inundate both the Quarry and Plant Sites. It is also important to note that this estimated increase in 100-yr flood flow rates under climate conditions represents a condition halfway through the life of the Quarry Modification Project and 100-year flood flow rates would likely continue to increase through the second half of the project lifespan.

Given this new information developed by DWR and the lack of considering and analyzing the effects of climate change, it is my opinion that the DEIR has not completed a flood hazard analysis that evaluates the potential impacts from encroachment of the project into the floodplain.

[1] The report states that under climate change, peak flows in the snow-dominated upper San Joaquin River watershed will shift to earlier in the winter and spring and high flow events like the 100-year flow can't be fully contained by Lake Millerton and will be released downstream.

2. Inappropriate extrapolations of river level data below Friant to the Project sites

Comment 58A-3

With regards to groundwater-surface water interactions, page 20-21 in Appendix G-5 of the DEIR contains the following statement.

> *The stage data can also be used to identify conditions or periods when the water surface in the San Joaquin River is above the geologic contact between the alluvium and underlying weathered rock. This is an important relationship to understand because the alluvium has a much higher transmissivity (i.e., permeability) than the underlying weathered rock and hard rock. Thus, when the stage of the river is high enough that the water surface is above the base of the alluvium, there may be a higher potential for seepage of water from the river into the quarry.*

The stage data referred to in this paragraph was measured on the San Joaquin River at a stream gage located below Friant, which was then applied to the river adjacent to the project site. Extrapolating these data over 4.0- and 6.5-miles to the Quarry and Plant sites, respectively, is not a valid comparison as the stage at the below Friant gage can be totally different than in the river adjacent to the mining site due to differences in channel geometry and potential gains or losses in flow between sites. To make an accurate comparison between river levels and hydrogeologic conditions at the Project site, monitoring these variables needs to be completed at the sites being compared.

Similarly, in Figure 16 of Appendix G-5, a comparison of San Joaquin River water levels (stage) at the below Friant gage are compared to pond water levels in a former mining pond at the Beck Ranch to conclude there isn't any hydraulic connection between the pond and adjacent river. However, to make this comparison, the river stage datum is shifted by 290-feet to transpose these data approximately 4.0 miles downstream to the San Joaquin River adjacent to the pond site. Again, transposing stage data from one river location to another over this distance is fraught with potential uncertainties and errors.

The bed elevation of the channel adjacent to the pond appears to be derived from a 2-foot contour interval map for the project dated November 6, 2018. The mean daily flow rate on the San Joaquin River measured at the USGS stream gage below Friant (USGS gage No. 11251000) was 386 cfs on this date. This type of topographic mapping is not capable of capturing channel bed elevations submerged under water and thus does not accurately represent the channel bed surface elevation. Depending on local river channel geometry at the location adjacent to the Beck Ranch mining pond, the deepest part of the channel could feasibly be well below the 290-foot datum, and the stage levels could be lower than the bed of the pond. This would explain why there is no correlation between river stage and pond level at this location over the graphed period in Figure 16. It also means that it is quite feasible that Figure 16 does not support the conclusion that the pond and river are not in hydraulic connection, when in fact they could be.

Comment 58A-4

3. No quantitative analysis supports mitigation measures for lowering groundwater levels

In the description of Impact 4.10-10 on page 4.10-105[2], the DEIR states that because most of the upper alluvium has already been removed at the Quarry Site, there will be no groundwater seepage from the alluvium into the mining pit. This is incorrect as groundwater in the alluvium beneath off-site areas surrounding the site will still flow into the Quarry Site pit. Pumping water into the recharge trenches and ponds surrounding the Quarry and Plant Sites are stated to provide protection from this happening but the limited extent of these features may only prevent groundwater inflow in localized areas around the pits, especially the Quarry site. This is because the stated benefits of the recharge trenches are completely unfounded and based on speculation.

DEIR Appendices G-3 and G-4 present detailed analyses that quantify the amount of excavation dewatering required during mining operations of the Plant and Quarry sites, respectively. Based on the volume and rates of dewatering required, the appendices present calculations that estimate the amount of drawdown in alluvium and hard rock water table elevations radiating away from the mining pits (i.e., quantifying the distance and depth of the cone of depression created by mine dewatering). The dewatering of the mining pits will create a cone of depression in the groundwater surrounding the mining sites. These cones of depression will increase the groundwater flow gradients and flow rates towards and into the mining pits. To mitigate this increase of groundwater inflow into the mining areas, the DEIR proposes the installation of recharge trenches along selected sections of the mining pit perimeters. Water from mining pit dewatering would be discharged into the recharge trenches and various ponds with the idea that these features would recharge the underlying groundwater and reduce the amount of drawdown, reducing the rate and volume of groundwater inflow to the pits.

The DEIR states (page 41-42 of Appendix G-3 to the DEIR), "*Overall, operation of the recharge ditches would decrease the projected off-site drawdowns by fifty percent, as half of the pumped water would recharge the off-site groundwater*." The DEIR continues (page 42 of Appendix G-3), "*Operation of the recharge ditches would decrease the projected drawdowns to insignificant (less than one foot)*." Page 49 of Appendix G-5 states, "*Due to the recharge trenches along the west side of the quarry, groundwater levels in the alluvium and the weathered rock will be maintained consistent with existing conditions*." These statements lack factual basis. First, there are no data or analyses presented in the DEIR that substantiates the claims that the recharge ditches would decrease off-site drawdown by fifty percent or maintain groundwater levels consistent with existing conditions- these claims are based on speculation. The quantification of groundwater recharge through trench infiltration is controlled by many variables including but not limited to: the infiltration rate through the trench bed; hydraulic properties of underlying unsaturated soil; heterogeneities of the underlying medium; and distance between trench bed and underlying groundwater table. Quantifying the amount of trench recharge and how that recharge alters the underlying groundwater table level is complex and highly variable based on localized conditions. Second, even assuming the estimate of fifty percent of trench infiltration would recharge the underlying groundwater, that does not completely mitigate the drawdown effects on underlying groundwater. The DEIR does not evaluate how the residual drawdown (after assumed benefits of the recharge trenches) would impact surrounding Groundwater Dependent Ecosystems (GDE) or increased groundwater flow gradients between the San Joaquin River and mining sites.

[2] The statement that alluvium has been removed from the Quarry Site is contradicted elsewhere in the DEIR. Page 4.4-56 of the DEIR includes the statement, "*Since almost all (90%) of the alluvium has already been removed from the Quarry Site*". Page 4.10-37 of the DEIR includes the statement, "*In most of the Quarry Site, the alluvium has been removed by mining. Where present, alluvium on the Quarry Site is up to 60 feet thick*."

The assumed benefits of the recharge trenches weigh heavily in the DEIR's evaluation of potential impacts to surrounding water supply wells and mining pit water budgets. Given the benefits of recharge trenches have not been substantiated with data or technical analyses, it is my professional opinion that the DEIR has not provided the evidence necessary to reach valid conclusions pertaining to potential impacts to surrounding water supply wells, GDE, and streamflow depletions from the San Joaquin River.

Comment 58A-4 Cont.

4. No quantitative analysis of potential impacts on Groundwater Dependent Ecosystems

Comment 58A-5

Quarry Site

Section 5.0 b) (Evaluation of Potential Impacts) of the DEIR addresses the question, "*Would the Project substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin?*" Page 56 of this Section includes the following statement.

> *On a more local basis, dewatering and subsequent reclamation of the Quarry Site would lower groundwater levels outside of the Project boundary. However, this effect would be focused primarily within the weathered rock and the hard rock. As discussed above, the alluvium has already been removed from most areas of the Quarry Site and the remaining alluvium is being dewatered. Thus, any effects on groundwater dependent ecosystems within the alluvium or river-flow dependent ecosystems adjacent to the Quarry Site along the river and north of the quarry due to the Project would be identical to those that are already occurring.*

This statement is contradictory. As demonstrated further below, the riparian vegetation that makes up the GDE adjacent to the river and north of the quarry are rooted in the alluvium that extends outside of the project boundary[3]. Lowering the alluvium groundwater levels, dewatering remaining alluvium, and terminating operation of the infiltration trenches after mining operations would result in effects that are **not identical** to those that are already occurring, but significantly different. The effects would be to totally dewater the alluvium and associated GDE rooting zone adjacent to the river and north of the quarry. This would result in potential adverse impacts on the GDE after, and possibly during, mining operations.

Figure 1 illustrates the location of potential GDE relative to the Quarry and Plant Sites. The GDEs mapped in **Figure 1** were taken from the North Kings Groundwater Sustainability Agency Groundwater Sustainability Plan (Provost & Pritchard, 2022). **Figure 2** depicts the post-reclamation grades and maps some individual trees that will be retained by the Project on the alluvial terrace between the Quarry Site and San Joaquin River. These trees constitute some of the riparian GDE mapped on **Figure 1** and are rooted in the underlying alluvium. **Figure 2** also indicates the location of the groundwater recharge trenches on the alluvial terrace above the river.

Figure 3 is a location map of groundwater wells completed in and around the Quarry Site and alignments of subsurface cross-sectional profiles A-A' and B-B'. Profile A-A' is provided in **Figure 4** and depicts the stratigraphy beneath the Quarry Site, well depths, and Hard Rock groundwater table elevational profile on October 1, 2018. Based on review of groundwater level measurements collected from wells screened in the alluvium and hard rock at MW-1, the water level in the alluvium generally ranges 3- to 6-feet higher than the hard rock at the Quarry Site, thus a water table profile for the

[3] These GSP "Potential GDE" were determined to have rooting depths of less than 30 feet below ground surface.

Comment 58A-5 Cont.

alluvium would be that much higher if plotted on **Figure 4**. Although not called out on **Figure 4**, the GDEs illustrated on **Figure 1** and **Figure 2** are located on the riverbank and upper alluvial terrace adjacent to the Northwest "Project Boundary" of profile A-A'. These GDEs are rooted within the alluvium and are fed by the alluvial groundwater.

As stated in the DEIR, "*dewatering and subsequent reclamation of the Quarry Site would lower groundwater levels outside of the Project boundary.*" **Figure 5** is another subsurface geologic profile along A-A' representative of post-reclamation conditions, which plots the range of hard rock groundwater table profiles. As depicted in this profile, the alluvium is completely dewatered beneath the GDEs and recharge trenches bordering the Northwest project boundary along the San Joaquin River. The DEIR also states (cite page/section), the post-reclamation pond level in the Quarry Site would remain approximately 500-feet below current grade, so the groundwater table profiles would remain at the levels depicted in **Figure 5**. Comparison of the groundwater table profiles presented in **Figure 4** and **Figure 5** indicates that, post-reclamation, the alluvium would be dewatered, which would likely result in significant adverse impacts to the GDE on the terrace and banks of the San Joaquin River.

Figure 6 presents a geologic cross-section and hard rock water table profile for section B-B', which would intersect the San Joaquin River just southwest of Well MW-2. As indicated in **Figure 1**, GDE are in the immediate vicinity of well MW-2 and southwest end of cross-section B-B'. Review of groundwater level measurements collected from wells screened in the alluvium and hard rock at MW-2, the water level in the alluvium generally ranges 0.25- to 0.50-feet higher than the hard rock, thus a water table profile for the alluvium would be slightly higher if plotted on **Figure 6.** Although there is no post-mining subsurface cross-sectional profile for section B-B' in the DEIR, there will be a similar degree of water table drawdown in this area as depicted in **Figure 5**. This would completely dewater the alluvium and result in potential significant adverse impacts to GDE in and outside the southwest portion of the Quarry Site.

Given these findings presented herein, it is my opinion that the Project will impart significant adverse impacts to the viability and sustainability of existing and future GDE lying between the Quarry Site and San Joaquin River.

<u>Plant Site</u>

Page 56 of the DEIR Appendix G-5 states the following.

> *At the Plant Site, groundwater levels are currently approximately 30 ft bgs. At this depth, groundwater levels at and adjacent to the Plant Site area are already deeper than depths that could support riparian vegetation, streamflow, and wetlands. Thus, any lowering of groundwater levels at the Plant Site due to dewatering during mining or reclaimed conditions would not have an effect on any groundwater dependent ecosystems.*

This statement blurs the area being referenced. Per **Figure 1**, there are no GDE within the Plant Site boundaries. However, the widening, deepening, and dewatering of the Plant Site mine will create a large cone of depression in the groundwater levels at and surrounding the site, similar to that of a pumping well. The cone of depression in the alluvium and weathered rock extends beyond the project boundaries into surrounding areas that underlie GDEs. The DEIR (Appendix G-3, Figures 11 and 12)

Comment 58A-5 Cont.

demonstrates that the project will increase the depth and extent of the cone of depression beyond the project area during and after mining, thus potentially impacting GDEs outside of the project boundaries.

The project proposes recharge trenches along portions of the project boundaries to lessen the impact of the deepening and expansion of the mining cone of depression. However, nowhere in the DEIR or supporting technical appendices is there any data or quantitative analysis to demonstrate/support the stated benefits - they are based on complete speculation. Regardless, the recharge trenches are not a complete mitigation even if they could achieve the desired effect, as they would only lesson the depth and extent of the cone of depression (Appendix G-3, Figures 11 and 12) and associated impacts - they would not eliminate the potential impacts to surrounding water supply wells, impacts to GDE, and depletions of San Joaquin River flow.

Given these findings presented herein, it is my opinion that the Project will impart significant adverse impacts to the viability and sustainability of existing and future GDE lying between the Plant Site and San Joaquin River.

Comment 58A-6

5. No quantitative analysis of streamflow depletions from the San Joaquin River

The DEIR presents consistent findings and conclusions that the San Joaquin River and groundwater in the alluvium, weathered rock and hard rock beneath and adjacent to the river are interconnected (i.e., in hydraulic or hydrologic connection). In addition, stable isotope analyses of samples collected from surface and groundwater at the Quarry and Plant Sites indicate that these waters originated from snow or rain that fell high in the Sierra Nevada Range before flowing down the upper San Joaquin River toward the Project site (pg. 32, Appendix G-5). Thus, the isotope signature of the groundwater beneath the site indicates it came come San Joaquin River derived recharge and that the river and adjacent alluvium, weathered rock, and hard rock groundwater are in hydraulic connection.

Figure 7 illustrates the typical ways stream flow interacts with underlying groundwater systems whey the stream and groundwater are interconnected. These diagrams indicate that when flow in the San Joaquin River is in hydraulic connection with the underlying alluvium, the river surface is an aerial expression of the water table surface. Diagram B in **Figure 7** illustrates a losing stream where flow seeps out of the stream into the shallow aquifer. **Figure 8** illustrates how a stream and groundwater system interact when they are disconnected by an unsaturated zone. Diagram A in **Figure 8** illustrates how infiltration of stream water into the unsaturated zone migrates vertically to the underlying groundwater. Even when there is no groundwater within the alluvium beneath the river, the river will continue to recharge the lower weathered and hard rock aquifers. The amount of mounding in the water table surface depends on many variables including, but not limited to, the infiltration rate through the stream bed and unsaturated soil, the hydraulic properties of the aquifer, and distance between stream bed and water table. Diagram A in **Figure 8** is also representative of the processes occurring beneath the proposed recharge trenches proposed within the Quarry and Plant Sites.

As determined in the DEIR and discussed above, mining operations in the Quarry and Plant Sites will increase the water table flow gradients moving from the river towards the pits as discussed above. As stated on page 4.10-114 of the DEIR, "*The increased rate of groundwater inflow through the hard rock*

Comment 58A-6 Cont.

into the quarry would be caused by an increase in the hydraulic gradient, or slope of the groundwater surface, toward the quarry." The response of an increased groundwater hydraulic gradient causing an increased rate of groundwater flow holds true for any saturated aquifer material, whether it is alluvium, weathered rock or fractured hard rock. Thus, when groundwater that is in hydraulic connection to the San Joaquin River experiences an increase in hydraulic gradient toward the Quarry or Plant Sites, there will be an increase in the rate of depletion of water from the river into the groundwater system. The DEIR also acknowledges that San Joaquin River flows will be depleted due to mining operations as exemplified in the following statement from page 48 of Appendix G-3.

> "*However, because the shallow groundwater and river water are connected, an estimated 315 acre-feet per year (rounded) of river water would enter the reclamation pond through the subsurface (groundwater inflow) in order to make a water balance.*"

The California Sustainable Groundwater Management Act (SGMA) defines Interconnected Surface Water (ISW) as follows. "*Interconnected surface water refers to surface water that is hydrologically connected at any point by a continuous saturated zone to the underlying aquifer and the overlying surface water is not completely depleted (Title 23 California Code of Regulations § 351[o]).*" The California Department of Water Resources addresses depletions of ISW under SGMA as follows (DWR, 2024).

> *SGMA identifies that an undesirable result occurs if, among other reasons, groundwater use occurring in a basin causes depletions of ISW that significantly and unreasonably impact beneficial uses of the surface water (CWC § 10721(x)(6)). Depletions of ISW under SGMA are only related to impacts caused by groundwater use, although a GSA will likely need to have some understanding of the various causes of reduced surface water flow to accurately determine the component due to groundwater. To comply with SGMA requirements, the GSAs should identify where ISW exists; determine the location, timing, and quantity of depletions; and then develop sustainable management criteria for managing depletions of ISW. Projects and management actions addressing depletions of ISW may also be proposed to support sustainable groundwater management.*

The DEIR has not demonstrated that it complies with SGMA requirements with regards to ISW depletions because there are no data or analyses presented that: identify potential unreasonable impacts to beneficial uses of surface water; quantify the amount of depletions; or develop mitigations for any potential undesirable results due to Project depletions of San Joaquin River flow.

Comment 58A-6 Cont.

Please feel free to contact me with any questions regarding the material and conclusions contained in this letter.

Sincerely,

Greg Kamman, PG, CHG
Senior Consultant/Ecohydrologist

Miami University, Oxford, OH, Field Camp Instructor and Research Assistant, 1986-1989

Greg Kamman is a professional geologist and certified hydrogeologist with over 30 years of technical and consulting experience in the fields of geology, hydrology, and hydrogeology. He specializes in directing and managing projects in the areas of surface and groundwater hydrology, stream and tidal wetland habitat restoration, water supply and water quality assessments, water resources management, and geomorphology. Mr. Kamman has worked extensively throughout California's coastal watersheds and estuaries, and on multiple projects in Oregon and Hawaii.

Mr. Kamman's experience and expertise includes evaluating surface and groundwater resources and their interaction, stream and wetland habitat restoration assessments and design, characterizing and modeling basin-scale hydrologic and geologic processes, assessing watershed hydraulic and geomorphic responses to land-use change , and designing and conducting field investigations characterizing surface and subsurface hydrologic and water quality conditions. Greg commonly works on projects that revolve around sensitive fishery, wetland, wildlife, and/or riparian habitat enhancement within urban and rural environments. Mr. Kamman performs many of these projects in response to local, state (CEQA) and federal statutes (NEPA, ESA), and other regulatory frameworks. Mr. Kamman frequently applies this knowledge to the review and expert testimony on state and federal water operation plan EIR/EIS reports, Groundwater Sustainability Plans, Habitat Conservation Plans, and biological assessments.

Mr. Kamman is accustomed to working multi-objective projects as part of an interdisciplinary team including biologists, engineers, planners, architects, lawyers, and resource and regulatory agency staff. Mr. Kamman is a prime or contributing author to over 360 technical publications and reports in the discipline of hydrology, the majority pertaining to the protection and enhancement of aquatic resources. Mr. Kamman has taught the following courses: stream restoration through U.C. Berkeley Extension (2001-2008); wetland hydrology through San Francisco State University's Romberg Tiburon Center (2007 and 2012-2014); and presented webinars (2020) to California Water Boards staff on hydrologic and hydraulic modeling. He has devoted his career to the protection, enhancement and sustainable management of water resources and associated ecosystems.

SELECTED EXPERIENCE

Floodplain Management Projects

Flood Reduction, Mitigation Planning, and Design on Yreka Creek, Siskiyou County, CA
City of Yreka as subcontractor to WRA, Inc., 2008-2010

Mr. Kamman completed a series of field and hydraulic model investigations for restoration planning and design along Yreka Creek to reduce flood hazards and potential damage to the City's water treatment plant and disposal field infrastructure. This work also addresses and satisfies dike repair mitigation conditions stipulated by state resource agencies. While achieving these goals, Mr. Kamman tailored analyses and study objectives to assist the City in: enhancing the ecological floodplain restoration along Yreka Creek; providing opportunities for expanded public access and trail planning consistent with the goals of the Yreka Creek Greenway Project; and improving the water quality of Yreka Creek.

Key elements of this work included: review and synthesize existing information; identify and analyze the feasibility for three conceptual alternatives; and conceptual design and report preparation. Funding for implementation of restoration work over such a large area was a significant concern to the City. Therefore, designs identify and define phasing in a fashion that gives the City flexibility in implementation.

SELECTED EXPERIENCE *(CONTINUED)*

West Creek Drainage Improvement Assessment, Marin County, CA
Marin County Flood Control, 2006-2008

Mr. Kamman prepared a study focused on characterizing existing flood conditions and developing and evaluating flood reduction measures along West Creek in Tiburon. The work was completed through the implementation of hydrologic and hydraulic feasibility and design assessments. The conceptual design and analysis of potential flood reduction strategies (alternatives) was completed through the development of a HEC-RAS hydraulic model that simulates historic, existing and proposed project flood conditions. It was intended that the conceptual design developed under this scope of work would be of sufficient detail and quality to initiate project permitting and the environmental compliance process and documentation. Opportunities for riparian corridor and aquatic habitat enhancement were also considered and integrated into the conceptual design. Mr. Kamman also developed and assessed six alternative flood hazard reduction measures. The hydraulic model results for each alternative were compared against baseline conditions in order to evaluate their ability to alleviate flood hazards.

Gallinas Creek Restoration Feasibility Assessment, Marin County, CA
San Francisco Bay Institute, 2003-2005

Mr. Kamman completed a feasibility assessment for restoration of Gallinas Creek in northern San Rafael. Restoration will require removal of a concrete trapezoidal flood control channel and replacement with an earthen channel and floodplain in a "green belt" type corridor. Work included the collection of field data and development of a HEC-RAS hydraulic model to evaluate and compare existing and proposed project conditions. Designs must continue to provide adequate flood protection to the surrounding community. The study also includes and evaluation of existing habitat values, potential habitat values, and restoration opportunities and constraints.

Hydrologic and Hydraulic Evaluation for Trinity County Bridge Replacement, Trinity County, CA
Trinity County Planning Department, 2002

Mr. Kamman completed technical peer review of peak flow estimates and hydraulic design parameters associated with the replacement of 4 bridges across the upper Trinity River in Trinity County, California. A primary study component was accurately predicting the magnitude and frequency of flood releases from Trinity Dam. Numerous flood frequency analytical approaches were evaluated and used throughout this study.

Restoration of Lower Redwood Creek Floodway and Estuary, Humboldt County, CA
California State Coastal Conservancy and Humboldt County DPW, 2002-2003

Mr. Kamman provided technical review for the development of a hydraulic model to evaluate river and estuary restoration alternatives along the lower portions of Redwood Creek between Orrick (Highway 1) and the Pacific Ocean. This work was completed to evaluate the feasibility for creek/estuary restoration alternatives developed by the County, and effects on flood hazards along this flood-prone reach.

In order to better address and evaluate the current flood hazards along the entire floodway and identify potential flood hazard reduction measures, Mr. Kamman was retained to update HEC-2 models previously prepared by the Army Corps, and to evaluate the impacts of vegetation encroachment (increased roughness) and sediment deposition on floodway conveyance. Mr. Kamman expanded the Corps hydraulic model with newly completed channel surveys and channel roughness observations. The impetus for this work was to assist the County in identifying mutually beneficial strategies for ecosystem restoration and flood hazard reduction. Technical work was completed under close coordination and communication with county engineers. Study results and findings were presented at public meetings of local area landowners and stakeholders.

Tembladero Slough Small Community Flood Assessment, Monterey County, CA
Phillip Williams & Associates, Ltd., 1997

Mr. Kamman completed a flood information study of Tembladero Slough near Castroville on behalf of the San Francisco District Corps of Engineers. The purpose of this work was to identify and document local flood risks existing in the community and propose potential floodplain management solutions as part of the Corps 1995/1997-flood recovery process. Work centered on conducting a field reconnaissance, reviewing available historical data, and conducting discussions/interviews with local landowners and agency personnel.

Fluvial Projects

Muir Woods National Monument Bank Stabilization Plan for Conlon Creek, Marin County, CA
Golden Gate National Parks Conservancy (GGNPC), 2018-present

Mr. Kamman developed a grading and drainage plan for the Conlon Avenue Parking Lot, located adjacent to Redwood Creek and sensitive Coho salmon habitat. More recently, he has assisted GGNPC and the NPS in assessing the planning and design for creek bank stabilization and ecological enhancement at a failed culvert on a tributary channel at the project site. This work includes constructing a HEC-RAS model to evaluate: culvert removal and channel design; fish passage; and water quality impacts. Work is currently in development of 50% engineering design.

Hydrology and Hydraulic Assessments for Design of Butte Sink Mitigation Bank Project, Colusa County, CA
WRA, Inc., 2017-2018

Mr. Kamman was retained to provide hydrology and hydraulic modeling support in the development of design and Draft Prospectus for the Butte Sink Mitigation Bank (Bank). This work entailed developing the necessary hydrology information, hydraulic model and documentation to support further design, environmental compliance and agency approvals/permitting of the Bank. The main objective of work was to develop a design that provides the necessary ecological conditions and functions for successful establishment and operation of the Bank.

Lagunitas Creek Salmonid Winter Habitat Enhancement Project, Marin County, CA
Marin Municipal Water District, 2013-2018

Mr. Kamman designed and led a study to evaluate opportunities to enhance winter habitat for coho and other salmonids in Lagunitas Creek and its largest tributary - Olema Creek. This work was done as a two-phase assessment and design effort. The first phase (completed in 2013) included a winter habitat assessment to evaluate existing juvenile salmonid winter habitat in Lagunitas Creek and lower Olema Creek. The results of this assessment were used to prioritize winter habitat needs, and identify opportunities for winter habitat enhancement to increase

SELECTED EXPERIENCE *(CONTINUED)*

the winter carrying capacity of coho salmon and steelhead. The second phase (completed in 2017) consisted of a designing winter habitat enhancements. These enhancements focused on restoring floodplain and in-channel habitat structures. Winter habitat enhancement work also needed to consider potential impacts to or benefits for California freshwater shrimp (Syncaris pacifica), a federally endangered species.

This work included field reconnaissance, topographic surveys and the preparation of final design drawings at nine different project sites. An overall self-maintaining design approach was developed to guide individual project plan, with minimal earthwork and disturbance to existing riparian and wetland habitat. Self-sustained, natural evolution of a multi-thread channel within a more active floodplain is a desired outcome of project actions. Design elements and structures are intended to enhance or restore natural hydrologic processes to promote geomorphic evolution of more active high flow (side) channels and floodplain. Design elements include construction of 24 individual log structures.

Lower Miller Creek Management and Channel Maintenance, Marin County, CA
Las Gallinas Valley Sanitary District, 2013-2015

Mr. Kamman was commissioned to formulate and implement a plan for sediment removal and improved flood flow conveyance in the Lower Miller Creek channel. The need for improved flood and sediment conveyance is driven by the following factors. Progressive accumulation of course sediment in the project reach had reduced area wide discharge efficiencies along Miller Creek and at District outfalls. The District had an immediate need to dredge Lower Miller Creek to protect existing operations and facilities. Miller Creek supports a population of federally listed Steelhead, and adjacent wetland areas potentially support other state and federally listed special status species. Therefore, permitting requirements and cost efficiency required minimizing the extent and frequency of channel excavation/maintenance that may adversely impact habitats in the wetland and riparian corridor.

The design objective of the project was to define and optimize an integrated channel maintenance, flood, and sediment management plan, that protects existing facilities from stream and coastal flood hazards. The plan's objective was to minimize costs and ecological impacts of future anticipated and designed maintenance activities required under District operations. Working with District Staff, Mr. Kamman developed a suite of potential project alternatives and identified a preferred approach. Mr. Kamman completed all CEQA compliance (IS/MND) and permitting. Mr. Kamman also managed and directed development of engineered drawings and assisted in bid document preparation.

Mr. Kamman provided site assessment, long term management planning and channel maintenance support to the Sanitary District to maintain flood conveyance, manage sediment aggrading at District outfalls, and improve ecological values in the intertidal Bayland reaches of Miller Creek. The creek supports multiple federal and state listed endangered species. Initial work included completing hydraulic and geomorphic assessments to characterize causes of channel aggradation, and quantify sediment yields. Assessments included evaluation of climate change impacts on habitat and flood hazards, and water quality modeling of District outfalls to quantify tidal exchange and dilution. Based on this analysis and supporting biological resource assessments, Mr. Kamman identified alternatives for channel maintenance, performed a cost benefit assessment of dredging alternatives, and is assisted the District in developing short and long term management objectives. Mr.Kamman also led a multidisciplinary design team in the preparation of engineering plans and specifications as well as permits and environmental compliance documents.

Vineyard Creek Channel Enhancement Project, Marin County, CA
Marin County Department of Public Works, 2007-2013

Mr. Kamman managed the preparation of designs and specifications for a flood conveyance and fish habitat and passage improvement project on Vineyard Creek. Creek corridor modifications included replacing the box culvert at the Center Road crossing with a free span bridge or bottomless arch culvert (civil and structural design by others), providing modifications to the bed and bank to eliminate erosion risks to adjacent properties and improve water quality, promoting active channel conveyance of both water and sediment, and providing improved low and highflow fish passage, improved low flow channel form and enhanced in-stream habitat, repairing eroding banks, and expanding/enhancing adjacent channel floodplains. The riparian corridor was replanted to provide a low-density native understory, "soft" bank erosion protection, and increased tree canopy along the tops of banks. Mr. Kamman prepared the JARPA for the project and conducted permit compliance and negotiations with all participating resource agencies. Designs and permitting also address the known presence of Native American artifacts. This work was contracted under an expedited design schedule and phased construction was initiated the summer of 2008 and continued the summer of 2009.

Bear Valley Creek Watershed and Fish Passage Enhancement Project, Marin County, CA
The National Park Service and Point Reyes National Seashore Association, 2005-2013

Working on behalf of the NPS and PRNSA, Mr. Kamman completed a watershed assessment and fish passage inventory and assessment for Bear Valley Creek. Work included a geomorphic watershed assessment and completing field surveys and hydraulic modeling (including flood simulations) of ten road/trail crossings to identify and prioritize creek and watershed restoration efforts while considering and addressing current flooding problems at Park Headquarters – a major constraint to channel restoration efforts that would likely exacerbate flooding. Mr. Kamman also completed a suite of conceptual restoration designs (Phase 1) including: the replacement of two county road culvert crossings with bridges; channel creation through a ponded freshwater marsh (former tidal marsh); and replacement of 4 trail culverts with prefabricated bridges; and associated in-channel grade control and fishway structures. Engineered drawings and specifications were also developed for some of these sites to assist PORE with emergency culvert replacements after damages sustained during the New Year's Eve flood of 2005. Mr. Kamman also directed geotechnical, structural and civil design of project components.

Two projects were completed in 2006 on emergency repair basis resulting from flood damages suffered during the New Year's Eve storm of 2005. The two most recent projects were constructed in 2013, consisting of a large bank repair and adjacent to main access road/trail and culvert replacement further upstream on same road. The bank repair utilized bioengineering approaches including engineered log revetments and log diversion vanes.

SELECTED EXPERIENCE *(CONTINUED)*

Kellogg Creek Restoration Project, Contra Costa County, CA
Olberding Environmental on behalf of the Contra Costa County Water District, 2012-2013

Mr. Kamman led the development of PS&E to restore 3,000 linear feet of riparian and associated creek corridor habitat. Project was designed as compensatory mitigation for direct and indirect impacts to jurisdictional waters from the Los Vaqueros Reservoir Expansion Project that Contra Costa Water District. Work included field investigations and data analysis to characterize hydrologic/ geomorphic conditions and numerical modeling to optimize desired inundation and hydroperiods. Work was completed under subcontract to.

Miller Creek Sanitary Sewer Easement Restoration, Marin County, CA
Las Gallinas Valley Sanitary District, 2010

Working on behalf of the District, Mr. Kamman completed field surveys and technical feasibility studies to develop engineering plans and specifications for a stream bank restoration project to protect an exposed sanitary sewer pipeline, stabilize incised banks, and promote an ecologically healthy stream corridor along an approximately 50 linear foot damaged reach of Miller Creek. The design includes backfill and materials to accommodate construction of a vegetated stabilized slope. The eroded bank repair included design of a 1:1 Envirolok vegetated slope with geogrid reinforced soil lifts extending eight to ten feet back from the slope face. One-quarter-ton rock will be placed in front of the Envirolok wall at the toe of the reconstructed bank to provide added scour protection. In order to perform the work, the project site will be dewatered. An existing felled tree perpendicular to the creek flow will be relocated and secured into the right creek bank with root wad remaining in active channel. All work on the bank and within the creek bed must be completed pursuant to project permits due to presence of steelhead trout.

California Coastal Trail Planning and Design at Fitzgerald Marine Reserve, San Mateo County, CA
WRA, Inc., 2008-2009

Mr. Kamman provided hydrology and hydraulics expertise in the planning and design for the 0.25-mile segment of the California Coastal Trail at the Fitzgerald Marine Reserve. The project was overseen by the San Mateo County Parks Department. This segment of Coastal Trail provides improved access from the trailhead to the beach as well as a free span bride over Vicente Creek. Greg completed the field surveys and hydraulic modeling to assist an interdisciplinary team to design the project. Understanding the hydrology of Vicente Creek and quantifying flood conditions was critical to successfully designing and constructing the free span bridge. He also evaluated how creek hydrology and coastal wave processes interact at the beach outfall in order to identify opportunities and constraints to beach access improvements (which will include crossing the creek on the beach) during both wet and dry season conditions in order to evaluate both permanent and seasonal crossing design alternatives.

Hydrologic Assessment and Conceptual Design for Conservation and Wetland Mitigation Bank Project, Stanislaus County, CA
WRA, Inc., 2009

Working as a subcontractor to WRA, Inc., Mr. Kamman provided hydrology, geomorphology and engineering support for the planning and design for a Conservation and Wetland Mitigation Bank on the San Joaquin River, in the Central Valley near Newman, California. The property is currently owned by the Borba Dairy Farms. The primary objective of the study was to characterize the hydrologic and geomorphic controls on the spatial distribution of habitat types. To meet this objective, Mr. Kamman's assessment included: (1) collecting and synthesizing hydrologic data to characterize existing and historic streamflow, geomorphic and shallow groundwater conditions; (2) filling a data gap by collecting topographic data of hydrologic features; (3) developing a hydraulic model capable of predicting water surface profiles for a range of design flows; and (4) quantifying the linkage between surface water/groundwater conditions and specific vegetation communities and habitat types through implementation of reference site assessments. Mr. Kamman also provided conceptual design and permitting support in evaluating habitat enhancement and creation opportunities on the site.

Redwood Creek Floodplain and Salmonid Habitat Restoration, Marin County, CA
Golden Gate National Recreation Area and Golden Gate Parks Conservancy, 2005-2008

Mr. Kamman lead development of a preferred project alternative and final project design drawings and specifications for a floodplain and creek restoration and riparian corridor enhancement effort on lower Redwood Creek above Muir Beach at the Banducci Site. A primary objectives of the project was to: improve salmonid passage/rearing/refugia habitat; riparian corridor development to host breeding by migratory song birds; and wetland/pond construction to host endangered red-legged frog. The preferred design includes: excavation along the creek banks to create an incised flood terrace; engineered log deflector vanes; removing and setting back (constructing) approximately 400-feet of levee; creating in- and off-channel salmonid rearing and refugia habitat; reconnecting tributary channels to the floodplain; and creating California red-legged frog breeding ponds. Designs were completed in 2007 and the project constructed in the summer of 2007.

Considerable hydraulic modeling was completed to evaluate and develop means to help reduce chronic flood hazards to surrounding roadways and properties. Alternatives that included set-back levees and road raising were developed and evaluated. Detailed and careful hydraulic (force-balance) analyses and computations were completed as part of engineered log deflector designs. These were unique and custom designed structures, building on past project efforts and in consultation with other design professionals.

This project demonstrates Mr. Kamman's ability to work closely with the project stakeholders to develop a preferred restoration alternative in a focused, cost-effective and expedited fashion. This was achieved through close coordination with the NPS and the effective and timely use of design charrette-type meetings to reach consensus with participating stakeholders. Conceptual through full PS&E were completed on-time and on-budget in 2007 and was project constructed in the fall of 2007. Mr. Kamman worked closely with NPS staff to "field fit" the project, by modifying grading plans to protect existing riparian habitat. Mr. Kamman also provided construction management and oversight to floodplain grading and installation of engineered log structures. Based on field observations, the project is performing and functioning as desired.

Pilarcitos Creek Bank Stabilization Project, San Mateo County, CA
TRC Essex, 2006-2007

Mr. Kamman directed field surveys and technical modeling analyses to develop restoration design alternatives for a Bank Stabilization Project on Pilarcitos Creek

SELECTED EXPERIENCE *(CONTINUED)*

in unincorporated San Mateo County, California. This work included hydrology and hydraulic design and preparation of plan sheets and technical specifications as well as a revegetation plan. Due to the importance of protecting an existing gas mainline, the design package will be completed in close coordination with TRC Essex geotechnical staff and revegetation subcontractor and PG&E civil staff. Design feasibility analyses focused on developing hydraulic design criteria for the project, including: estimates of design flood flow magnitudes (2-, 5-, 10-, 25-, 50- and 100-year floods); water surface elevation estimates for a suite of design floods; associated average channel velocities and shear stresses; and estimates for riprap sizing for channel bank toe protection. Plan sheets, technical specifications and cost estimates were provided for review and approval.

Watershed Assessments

Evaluation of Project Impacts on Oregon Spotted Frog, Klamath County, OR
Oregon Water Watch and Earthjustice, 2016-2019

Mr. Kamman designed a suite of hydrologic, hydraulic and geomorphic studies to evaluate proposed change operations of the Crane Prairie, Wickiup and Crescent Lake dams and reservoirs as related to harm to Oregon spotted frogs. Work began with analyzing impacts associated with proposed water delivery operations and developing a proposed alternative prioritizing protection and enhancement of frog habitat. This work followed with a technical review and critique of the USFWS's Biological Assessment. Work included preparation of four declarations for the clients.

Tennessee Hollow Creek Riparian Corridor Restoration, San Francisco County, CA
Presidio Trust, 2001-present

Mr. Kamman has been leading and assisting the Trust and Golden Gate National Recreation Area (GGNRA) in the planning and design on over a dozen multi-objective riparian corridor restoration and watershed management projects in the Tennessee Hollow/Crissy Marsh watershed since 2001. Specific project objectives include: daylighting creeks; riparian corridor restoration; expanding Crissy Marsh; enhancing recreation, education, archeological, and cultural resource opportunities; improving water quality discharges to San Francisco Bay; and remediation of numerous landfills within the watershed. Typical initial phases of work focus on characterizing surface and groundwater conditions within each project area and identifying opportunities and constraints to restoration of natural wetlands and creek/riparian corridors. Notable challenges of this work include restoring heavily disturbed natural resources in an urban setting while integrating designs with recreation, archeology/cultural resources, education and remediation programs. Mr. Kamman has acted as lead hydrologist and designer on eight separate reaches in the 271-acre Tennessee Hollow Creek watershed and several other projects within and in the vicinity of Mountain Lake.

All task authorizations under these on-call and individual design contracts and included hydrology and water quality assessments and conceptual restoration planning and design. The project areas overlapped both the Presidio Trust and NPS-GGNRA management areas. Preliminary construction cost estimates for project alternatives within the Tennessee Hollow watershed range from $10- to $20- million. Several restoration projects are also tied to providing mitigation for the current San Francisco Airport expansion and Doyle Drive Seismic Improvement projects. Several projects have been constructed since 2012 (Thompson's Reach, El Polin Loop), two projects (East Arm Mtn. Lake and YMCA Reach) were constructed in 2014, and MacArthur Meadow restoration in 2016.

This work illustrates the Mr. Kamman's ability to complete a broad variety of hydrologic analyses, including: multiple years of rigorous and thorough surface water and groundwater hydrologic and water quality monitoring throughout the entire watershed to characterize and quantify existing hydrologic conditions; development of a detailed watershed-scale water budget for existing and proposed land-used conditions (capturing existing and proposed vegetation cover types and land use activities) to calculate groundwater recharge estimates input into the numerical watershed model; preparation of EA sections on water resources and water quality (NEPA compliance) regarding Environmental Conditions, proposed Impacts, and Proposed Mitigations associated with the project; preparing detailed alternative plans; and coordination and preparation of engineered plans/specifications for construction. All work was completed on budget and in a timely fashion.

Mountain Lake Water Budget, San Francisco County, CA
Presidio Trust, 2012-2017

Mr. Kamman was retained to develop a water balance model for Mountain Lake in the Presidio of San Francisco. Through development of a water balance model, the Trust seeks to understand: the major source(s) of inflow to both Mountain Lake; anticipated seasonal (monthly) changes in water level relative to various outflow assumptions; and the relationship of surface and groundwater interaction. This information gained from this study will be used to: 1) better understand and manage lake levels for ecological habitats; 2) identify flood storage capacity of Mountain Lake and fluctuations in lake level under various storm conditions; 3) better understand and maintain wetland habitat in the east arm; and 4) complete mass balance calculations to assess water quality in and feeding into the lake.

To implement this study, Mr. Kamman developed a water budget model to identify and quantify the primary water inputs and outputs to the lake and determine major controls over water storage. Primary water budget variables analyzed includes: precipitation; evaporation/evapotranspiration; groundwater exchange; and surface runoff. This study also included a long-term field investigation completed between 2012 and 2016 to: identify all point source inputs such as culverts and drainage outlets; identify diffused surface runoff inputs from surrounding lands, including a golf course; better characterizing the function and performance of the primary lake outfall structure; monitor groundwater levels surrounding the lake; and continuously monitor lake water level and storage over a mult9i-year period. These data were used to quantify water budget variables used to build the water budget model. Precipitation and barometric pressure data used in the model was provided by the Trust maintained weather station. Model daily evaporation estimates came from a variety of local area gauges maintained by state agencies.

The water budget model developed for this study is successful in accurately simulating historic water level conditions. The model using a daily time-step appears more accurate than model using a weekly time-step, but both provide reasonable agreement with observed conditions. The model is highly sensitive to groundwater exchange with the lake. The water budget is also a proven useful tool for the design and analysis of improvements to the lake outfall structure and establishing flood storage needs to protect the adjacent highway.

SELECTED EXPERIENCE *(CONTINUED)*

Cordilleras Creek Hydrologic Assessment, San Mateo County, CA
City of Redwood City, 2002-2003

Mr. Kamman assisted the Cordilleras Creek Watershed Coordinator in planning, seeking funding, and implementing a hydrologic and biologic assessment of the Cordilleras Creek watershed. Work completed included completing a full creek reconnaissance and channel stability assessment, preparation of a watershed assessment work plan, presentations at public meetings, and study/review of flooding issues in the watershed. Challenges faced in this predominantly privately owned watershed include removal of numerous fish passage barriers and educating/coordinating property owners.

Capay Valley Hydrologic and Geomorphic Watershed Assessment, Yolo County, CA
Yolo County RCD, 2008-2010

Mr. Kamman designed and supervised a hydrologic, geomorphic watershed assessment, and conceptual restoration design for the Capay Valley segment of Lower Cache Creek . Funding for the project was from a CALFED Watershed Program grant. The Capay Valley reach of Cache Creek experiences considerable stream bank erosion, which contributes to downstream sedimentation. The channel instability also threatens adjacent homes and can negatively impact the riparian habitat along the creek that functions as an important wildlife corridor from the Western Coastal Range to the Yolo Bypass. Additionally, a significant proportion of methylmercury transported into the Bay-Delta originates from the Cache Creek watershed. The main goal of this proposed study is to address both the causes and the aforementioned consequences of bank erosion.

The assessment was designed to evaluate and quantify changes in hydrologic and geomorphic conditions in response to historical changes in land-use and water development (e.g., diversions, reservoir construction, groundwater pumping, etc.). This assessment also evaluated how historic human induced changes in hydrologic and geomorphic conditions affect riparian ecology in terms of the lost or altered floodplain area, character, and inundation frequency. A key product of this assessment was to distinguish between “natural” and “accelerated” bank erosion, and to identify the underlying causes (both natural and anthropogenic) so that appropriate solutions can be developed. Desired outcomes of the study included: reduce bank erosion by developing restoration designs for typical trouble sites; produce a ranking system to prioritize sites for stabilization and restoration; contribute to community education through watershed science education and the Yolo STREAM Project outreach program; improve water quality through reduction in accelerated erosion; and contribute to riparian corridor restoration and support the RCD’s Wildlife Conservation Board funded efforts to remove non-native tamarisk and around from the creek corridor. Work was completed through a broad spectrum of field and analytical investigations that received close review by the RCD, stakeholders, and a Technical Advisory Committee.

Ventura River Unimpaired Flow and Habitat Assessment, Ventura County, CA
City of Buenaventura and Nautilus Environmental, 2006-2007

Mr. Kamman completed a hydrology feasibility assessments as part of evaluating the reuse of Ojai Valley Sanitary District (OVSD) effluent for other beneficial uses. Currently, OVSD discharges treatment plant effluent to the lower Ventura River. The City and OVSD recognize that the reduction in the discharge of treated effluent to the Ventura River could have an environmental effect on sensitive and endangered species. In light of these concerns, this study was conducted to determine if a reuse project is feasible without significant environmental harm.

The assessment included hydrologic and geomorphic field and analytical assessments of past (unimpaired), current and proposed surface and groundwater flow conditions over a wide range of dry- through wet water year-types. The main objective if these analyses was to determine the linkage to water quality and aquatic habitat conditions including: flow durations; extent of gaining vs. losing reaches; low flow inundation/wetted area; and influence on barrier beach dynamics. Mr. Kamman collaborated with a team of other professionals to prepare a facility plan documenting the analyses and conclusions of respective water recycling investigations.

Hydrologic Analysis of FERC Minimum Flows on Conway Ranch Water Rights, Mono County, CA
Law Office of Donald Mooney, 2001-2002

Mr. Kamman completed a hydrologic analysis to evaluate if FERC’s proposed Minimum Flow Plan for Mill Creek would interfere with the exercise of the Conway Ranch’s water rights from Mill Creek. The approach to this analysis was to quantify the duration of time the Conway Water right was met under historic gaged and simulated proposed Minimum Flow Plan conditions. The primary objective of the analysis was to evaluate impacts during the winter period when flows are typically limited due to water storage as snow pack. Minimum Flow Plan conditions were simulated by developing a spreadsheet model that redistributes actual (historic) Lundy Lake releases in a fashion that maintains a minimum flow of 4 cfs to Mill Creek to accommodate the downstream Southern California Edison’s (SCE) power plant. The analysis period for both historic and simulated Minimum Flow Plan conditions consisted of water years (WY) 1990 through 1998 to capture an exceptionally diverse range of wet and dry year-types.

The primary method used to quantify changes in flow between historical and simulated Minimum Flow Plan conditions was to prepare and compare flow duration curves for each condition during both the winter and summer periods during a variety of water year types. Model results were tabulated for each conditions to determine the differences in the percentage of time target flows were equaled or exceeded. Based on these findings, Greg was contracted to complete more in-depth monthly modeling.

Groundwater Management Projects

Assessments of Groundwater-Surface Water Interaction, Stanislaus County, CA
The Law Offices of Thomas N. Lippe, APC and California Sportfishing Protection Alliance, 2015-present

Since 2015, Mr. Kamman has been assessing groundwater conditions within Stanislaus County and evaluating potential impacts of groundwater pumping on surface water flow and aquatic habitat of the Stanislaus, Tuolumne and San Joaquin Rivers. Mr. Kamman completed a comprehensive review and synthesis report of available groundwater and interconnected surface water (ISW) reports and data. Using available soils, geology and hydrology information, Mr. Kamman also delineated and mapped subterranean streams and Potential Stream Depletion Areas (PSDAs) to identify stream corridors susceptible to adverse impacts from groundwater pumping. This information is intended to help Groundwater Sustainability Agencies identify potential impacts to ISW.

SELECTED EXPERIENCE *(CONTINUED)*

Most recently, Mr. Kamman has been retained to review and comment on 7 Groundwater Sustainability Plans (GSPs) for critically overdraft groundwater subbasins within or adjacent to Stanislaus County. This review focused on how GSPs address Groundwater Dependent Ecosystems (GDE) and ISW. Comments included recommendations on monitoring and study plans to identify and quantify impacts of groundwater pumping on stream flow rates and associated ecological habitats.

Assessment of Surface Water-Groundwater Interaction, Humboldt County, CA
Friends of the Eel River (FOER), 2020-present

Mr. Kamman is currently providing technical assistance in understanding surface water-groundwater interactions in the Lower Eel River Valley. Work includes reviewing and synthesizing available reports and hydrologic data and providing a science-based opinion on the role groundwater plays in supporting stream flow and aquatic habitats. This analysis addresses conditions and changes associated with seasonal and long-term wet-dry cycles. Data gaps will be identified and documented during the analysis.

This work is being completed to support FOER efforts at protecting aquatic resources within the framework of current water management practices and the public trust doctrine under California law. Additionally, this work includes providing hydrologic and hydrogeologic review, comment and recommendations during development of the basin's Groundwater Sustainability Plan (GSP) under the California Sustainable Groundwater Management Act (SGMA).

Scott Valley Subbasin Technical Hydrogeologist Assistance, Siskiyou County, CA
Klamath Tribal Water Quality Consortium and Quartz Valley Indian Reservation, 2019-present

Mr. Kamman is providing technical review and comment on the groundwater models and associated studies in the Scott Valley groundwater subbasin under the Sustainable Groundwater Management Act (SGMA) process. Work includes: review of groundwater models; synthesis and review of available groundwater quality data; assisting to identify constituents of concern; and review of the planning and technical studies being used to develop a basin Groundwater Sustainability Plan (GSP).

Middle Russian River Valley Shallow Groundwater Storage Enhancement Study, Sonoma County, CA
Friends of the Eel River, 2016

Working on behalf of Friends of the Eel River, Mr. Kamman completed a study to identify and quantify the volume of recoverable aquifer storage along two independent 6-mile reaches within the alluvial fill valley of the Russian River. The approach to this study was to quantify how channel incision has reduced shallow groundwater levels and quantify how much aquifer storage can be increased if channel bed elevations are restored to historic levels. The goal of this investigation was to identify feasible approaches to increase groundwater storage that would off-set losses associated with the termination of out-of-basin diversions from the Eel River. This work was completed through: intensive review and mapping of available groundwater level data; quantification of aquifer hydraulic properties; and calculating the shallow aquifer storage volume. In total, reclaiming the shallow aquifers within these two areas yield a total added storage volume of over 20,000 AF.

Green Gulch Farm (GGF)/Zen Center Water Resources Investigation, Marin County, CA
Green Gulch Farm, 1998-2019

Mr. Kamman completed a multi-phase study to evaluate the short- and long-term water uses and resources at GGF. Work was initiated by developing comprehensive water usage/consumption estimates and assessing available water resources, including spring, surface water, and ground water sources. Water demand estimates included quantifying potable and agricultural water usage/demands. Once reliable water supplies were identified and water usage/demand figures calculated, Mr. Kamman provided recommendation for improvements to water storage and distribution systems, land-use practices, conservation measures, treatment methods, waste disposal, and stream and habitat restoration. The initial phase of work included: in-depth review of available reports and data; review of geology maps and aerial photography; review of water rights and historic land use records; field reconnaissance including year-round spring flow monitoring; mapping and quantifying existing runoff storage ponds; and surface water peak- and base-flow estimates.

The second phase of work included identification of possible groundwater sources and siting and installation of production wells. This included sighting three drilling locations, obtaining County and State well drilling permits for a domestic water supply; coordination and oversight of driller; and directing final well construction. Upon completion of a well, Mr. Kamman directed a well pumping yield test and the collection and analysis of water quality samples (including Title 22) for small water supply system use. The final phase of work included assisting GGF with water treatment system options at the well head and integration of the groundwater supply into an existing ultra-violet light treatment system servicing spring water sources. Work was completed in 2000 with a budget of approximately $25,000, including all driller and laboratory subcontracting fees.

Stanford Groundwater Assessments, Santa Clara County, CA
Stanford University Real Estate Division, 2012-2016

Mr. Kamman provided technical hydrogeologic services to evaluate groundwater conditions and drainage requirements associated with the construction of several new facilities on or near Page Mill Road. The main objective of this study is to determine the seasonal depth to groundwater beneath the project site under existing and potential future conditions and provide an opinion on if the project is required to comply with the City of Palo Alto, Public Works Engineering Basement Exterior Drainage Policy (effective October 1, 2006). This work included obtaining and reviewing available technical reports, maps and literature pertaining to groundwater conditions in the project vicinity. Based on this review, we have prepared a letter report of findings and recommendations.

Bodega Bay Wetland Water Supply, Sonoma County, CA
Friends of Bodega Bay, 2007

Mr. Kamman Conducted an evaluation of the groundwater underflow feeding a large coastal wetland in Bodega Bay and recommended mitigation measures for potential losses in supply associated with proposed residential development in recharge areas. Work included: long-term monitoring of ground water quality and supply; monitoring surface water and spring flow and water quality; assessing and characterizing the interaction between surface and subsurface water sources during different seasons and water year-types; developing a detailed water budget for the site to assess impacts to recharge areas; and developing a number of physical solutions to mitigate for recharge losses.

SELECTED EXPERIENCE *(CONTINUED)*

L.A. Department of Water and Power, Groundwater Recharge Facility Operation Study, Los Angeles County, CA
ICF Consulting, 2006

Working as a subcontractor to ICF Consulting of Laguna Niguel, California, Mr. Kamman provided technical assistance in the hydraulic modeling of sediment accumulation in selected spreading ground facilities owned and operated by the Los Angeles Department of Public Works. The object of this work is to evaluate changes in infiltration and groundwater recharge rates over time within the spreading grounds in association with sediment accumulation from turbid waters.

Corde Valle Golf Club Surface-Groundwater Interaction Study, Santa Clara County, CA
LSA Associates, 2004

On behalf of LSA Associates of Pt. Richmond, CA, Mr. Kamman completed a 3rd party independent review of available reports and data sets (boring logs, well water levels, groundwater quality, aquifer pump-test, and surface water monitoring) to evaluate if pumping of the Corde Valle irrigation well is adversely impacting flow in West Llagas Creek. This investigation was implemented in response to a concern expressed by California Department of Fish and Game staff regarding the potential for differential drying of the West Branch of Llagas Creek along Highland Avenue. The analysis was also complicated by the likely effects of pumping from surrounding off-site wells.

Aquifer Testing for Tennessee Hollow Watershed Project, San Francisco County, CA
Presidio Trust, 2002

The Mr. Kamman assisted in the design and implementation of an aquifer test at the Presidio of San Francisco. We prepared an aquifer test work plan and conducted step-drawdown and constant-rate aquifer tests at the site using both manual and electronic data collection methods. This work included interpretation of the aquifer test results using software-based solution methods and prepared a written summary of methods and findings. In addition, Mr. Kamman located, coordinated and managed a drilling effort for the logging and installation of several groundwater monitoring wells in the project area to address identified data gaps.

San Joaquin River Riparian Corridor Restoration Project, San Joaquin Valley, CA
McBain-Trush, 2002

Mr. Kamman completed an assessment of historic and existing shallow groundwater conditions beneath and adjacent to the San Joaquin River between Friant Dam and the Merced River. This work focused on reviewing available reports and flow/groundwater- level data to characterize surface water and groundwater interaction and implications for riparian vegetation, water quality and fishery habitat restoration. Hydrologic analyses were performed to identify the location and seasonal evolution of losing and gaining reaches an implication on future restoration planning and design efforts. The main deliverable for this analysis was a report section focused on describing the historical changes in regional and local groundwater conditions in the San Joaquin Valley and evolution of anthropogenic activities (e.g., groundwater withdrawals, irrigation drainage systems and return flows, development of diversion structures, changes in land-use; and introduction of CVP/State Water Project deliveries) and associated impacts on deep/shallow groundwater levels, surface water flows, and surface and groundwater quality.

Tidal, Estuarine & Coastal Projects

Quartermaster Reach Wetland Restoration Project, San Francisco County, CA
Presidio Trust, 2006-present

Mr. Kamman was retained in 2006 as part of a multi-disciplinary team to develop restoration alternative designs for a 10-acre filled and paved site marking the historic confluence of Tennessee Hollow Creek and Crissy Marsh adjacent to San Francisco Bay. The Trust's planning documents define the main objectives for Tennessee Hollow restoration as: a) "Restoration [of Tennessee Hollow] will expand riparian habitat and allow for an integrated system of freshwater streams and freshwater, brackish, and tidal marsh, re-establishing a connection to Crissy Marsh" and b) "Restore and protect Tennessee Hollow as a vibrant ecological corridor". The project is located within the setting of a National Park and a National Historic Landmark District. Thus, another goal for the project is to protect the area's historic buildings and sensitive cultural and archeological resources to the extent possible, to enhance visitor experience to the area, and to integrate creek restoration with other urban land uses.

Mr. Kamman provided H&H technical input and consultation to the design team to develop a restoration project consisting of a creek-brackish marsh-salt marsh interface and associated upland habitats. His work included evaluating surface water, groundwater and tidal sources. In addition, the development of a hydrodynamic model has informed and guided a preferred project design, including evaluation of storm surge, road crossing and Tsunami impacts to the project. A technical challenge addressed with the use of the model included predicting and quantifying salt/brackish marsh habitat zones within the restored wetland in response to periodically but prolonged closed-inlet conditions to Crissy Marsh - a water body that serves as the downstream connection to the proposed project.

Another unique challenge to this project includes integrating restoration planning and design efforts with the replacement and retrofit of Doyle Drive, the main on/off-ramp for the Golden Gate Bridge, being replaced along the entire northern boundary of the Presidio. Mr. Kamman is providing long-term technical review of this project to the Trust with respect to impacts to water resources and associated existing ecological habitats. The Quartermaster project also falls within the managerial jurisdiction of both the Presidio Trust and NPS-GGNRA, requiring work in close cooperation with both Presidio Trust and National Park Service (NPS) staff.

Salt River Ecosystem Restoration Project, Humboldt County, CA
Humboldt County RCD, 2005-2019

Mr. Kamman provided hydrology, engineering and environmental compliance services towards the planning and design of river and tidal wetland restoration on the Salt River (Eel River Delta plain) near Ferndale, California, in Humboldt County. The purpose of the Salt River Ecosystem Restoration Project (SRERP) is to restore historic processes and functions to the Salt River watershed. These processes and functions are necessary for re-establishing a functioning riverine, riparian, wetland and estuarine ecosystem as part of a land use, flood alleviation, and watershed management program. The Salt River Project has three components: 1) dredging the lower Salt River and lower Francis Creek from near the Wastewater Treatment Plant downstream for 2.5 miles; 2) restoring 247 acres of wetland estuary habitat in the lower Salt River within the 440-acre former

SELECTED EXPERIENCE *(CONTINUED)*

dairy; and 3) reducing sediment inputs from tributary watersheds. The Salt River Project was designed using an "ecosystem approach" to address hydrology, sedimentation, and fish and wildlife habitat.

As part of project feasibility assessment, Mr. Kamman completed a hydrologic and water quality monitoring program, and developed a MIKE11 hydrodynamic model of the lower Salt River and Eel River estuary in Humboldt County, for the Humboldt County RCD. The purpose of this work was to complete a hydrologic, geomorphic, and hydraulic modeling assessments of the character and dominant physical processes controlling flow of water and sediment through the lower Salt River. Land use changes in the area have caused significant aggradation and infilling of the Salt River, significantly reducing tidal exchange, fish passage, and exacerbating flooding in upland areas. A primary goal of this study is to evaluate the feasibility of proposed restoration elements intended to increase tidal prism and exchange and in-channel sediment scour and transport. The desired outcome is a sustained increase in river conveyance capacity to improve drainage of surrounding flood-prone lands and improve aquatic, wetland, and riparian habitat.

As part of project development and feasibility assessment, Mr. Kamman completed a hydrologic and water quality monitoring program and MIKE11 hydrodynamic model development of the lower Salt River and Eel River estuary in Humboldt County for the Humboldt County RCD. The purpose of this work is to complete a hydrologic, geomorphic, and hydraulic modeling assessments of the character and dominant physical processes controlling flow of water and sediment through the lower Salt River. Land use changes in the area have caused significant aggradation and infilling of the Salt River, significantly reducing tidal exchange, fish passage, and exacerbating flooding in upland areas. A primary goal of this study is to evaluate the feasibility of proposed restoration elements intended to increase tidal prism and exchange and in-channel sediment scour and transport. The desired outcome is a sustained increase in river conveyance capacity to improve drainage of surrounding flood-prone lands and improve aquatic, wetland and riparian habitat.

Western Stege Marsh Restoration Project, Contra Costa County, CA
Tetra Tech, 2008-2010

Mr. Kamman provided technical hydrology and wetland hydraulics support to post-project monitoring of the Western Stege Marsh Restoration Project. His involvement began by providing an independent technical review of previous year's hydrologic monitoring results to evaluate the proposed monitoring success criteria and the rationale used to develop these criteria. This work entailed reviewing historic monitoring data and available natural slough channel geometry data-sets for San Francisco Bay area marshes. Mr. Kamman's study approach was to independently develop desired and sustainable channel geometry relationships for natural, healthy San Francisco Bay salt-marshes and compare them to the published success criteria. Greg was also retained to implement the Year 4 post-project hydrologic monitoring, with modifications to aid in better linking hydrologic processes to ecological conditions and function within the restored marsh. This work consisted of completing more targeted water level monitoring and channel geometry surveys in reference marsh areas containing desired physical and ecological attributes. These data were used to develop geomorphic success criteria (target channel geometry) more tailored to the project marsh and augment the criteria provided in available literature. Working closely with the project team of scientists, Mr. Kamman compared these hydrologic monitoring results to available vegetation surveys to better assess the overall success and evolutionary trend of the marsh.

Giacomini Wetland Restoration Project, Marin County, CA
The National Park Service and Point Reyes National Seashore Association, 2003-2012

Mr. Kamman managed a multi-year project for the NPS in the design and feasibility analysis of a tidal wetland, riparian, and freshwater marsh complex, on the 500-acre Giacomini Dairy Ranch, at the south end of Tomales Bay. The project began in 2003 and included hydraulic, hydrologic, and geomorphic assessments to characterize existing physical conditions, developing restoration alternatives, and completing hydrologic feasibility analyses. Restoration alternatives evaluated creation of a mosaic of subtidal through upland wetland and riparian habitat zones, as well as improvements to salmonid passage, red-legged frog habitat, tidewater goby habitat, and clapper-rail habitat. Emphasis was placed on completing detailed studies to quantify project-induced changes in flood frequency, magnitude and duration, impacts on water quality to local groundwater supply wells, and changes in sediment and water quality conditions in Tomales Bay.

Beginning in 2006, Mr. Kamman managed and assisted design engineers, preparing plans, specification, and cost estimates for a three phased construction schedule, that was completed in the summer of 2008. This project illustrates Mr. Kamman's ability to complete a broad variety of hydrologic feasibility analyses, including flood frequency analyses for contributing watersheds, reproducing historic flood events through numerical modeling, flow duration analysis and evaluation of environmental flow regimes, development of a water budget for created freshwater marsh and frog breeding ponds, sediment yield estimates, completing field monitoring (flow, water level, groundwater level, sediment, and water quality monitoring) to characterize existing site hydrologic and geomorphic conditions (fluvial and tidal), wind-wave setup and run-up for levee stability determination and construction design, coordinating and performing topographic and hydrographic surveys, performing hydrodynamic and water quality modeling of existing and alternative conditions, developing detailed construction cost estimates preparation of technical reports and design drawings and specifications in support of NEPA/CEQA environmental compliance, and public meeting presentation and participation. In addition, Mr. Kamman managed staff in the generation of DEM and TIN models of the existing site and all action alternatives. All work was completed on budget and in a timely fashion, despite repeated expansions to the project boundary and last minute changes driven by endangered species issues.

Critical Dune Habitat Restoration to Protect Threatened and Endangered Species, Marin County, CA
The National Park Service, 2009-2010

Mr. Kamman provided and managed engineering, design, and implementation planning support for the restoration of 300 acres of critical dune habitat at Abbots Lagoon within the NPS Point Reyes National Seashore. He developed engineered drawings, technical specifications and engineer's cost estimates, and assisted NPS in defining a range of methodologies suitable to local conditions and sensitive flora and fauna. This area of the park supports the best remaining intact dune habitat, including some of the largest remaining expanses of two rare native plant communities: American dune grass (Leymus mollis) foredunes, and beach pea (Lathyrus littoralis). European beach grass and iceplant were removed from

SELECTED EXPERIENCE *(CONTINUED)*

the project site using mechanical removal and hand removal techniques. The project goal was to remove these invasive species from approximately 135 acres of prime dune habitat in the 300-acre project site, while not impacting sensitive species and habitats. The intended result was to remobilize this historic dune field and restore their natural form and migratory processes.

This project illustrates Mr. Kamman's ability to work closely with NPS staff to balance habitat protection and restoration across the landscape. As part of project design, he developed grading plans, and specified work flow, equipment movement and access routes which minimize impacts to special status species. Extensive fencing and exclusions zone planning was required to protect existing native habitats, and minimize tracking of plant stock to or through restored sties. In addition work elements had to be structured and prioritized to maximize ground work subject to budgetary constraints and work flow uncertainties. All work has been completed on budget and in a timely fashion, even with repeated expansions to the project boundary and affected area and last minute changes driven by endangered species issues.

Lower Gualala River and Estuary Assessment and Management Plan, Mendocino County, CA

California State Coastal Conservancy and Gualala River Watershed Council, and Sotoyome RCD, 2002-2005

Mr. Kamman worked with fisheries biologists to evaluate the hydrologic and water quality conditions in the lower Gualala River and estuary and identify and evaluate potential impacts to summer rearing habitat for salmonids and other aquatic organisms. This work included: assessing how the impacts of upstream land use (logging and water diversions) have altered water delivery and water quality to the Lower River and estuary over time; characterizing the physical coastal and riverine processes controlling opening and closure of the estuary inlet and lagoon morphology; monitoring and characterizing real-time and seasonal changes in lagoon water level and water quality; and evaluating the sediment transport capacity and geomorphic condition of the lower river and estuary. Mr. Kamman took the lead in developing and editing a management plan for the lagoon, prescribing actions to preserve, protect and enhance ecological habitats (with emphasis on salmonids) within the lagoon and lower Gualala River.

This project was completed on-time and on-budget and demonstrates Mr. Kamman's ability to integrate physical, water quality and biological data and information into a coherent and understandable description of the interrelated processes controlling the aquatic ecology of a lagoon system. A big challenge on this project was completing a high-quality and defensible field monitoring program on a "shoe-string" budget. The outcome of this study provides important understanding on how and why steelhead are surviving in a heavily logged (95% private ownership) watershed. The management plan prescribes recommendations to preserve and protect the lagoon as primary rearing habitat for steelhead.

Suisun Bay Tidal Wetland Restoration Design, Contra Costa County, CA

East Bay Regional Park District and LSA Associates, 1999-2005

Mr. Kamman provided hydrologic design services to the restoration of a 55-acre tidal wetland on Suisun Bay. The design will maximize habitat for special status fish species, and (to the extent possible) habitat for other special status animal and plant species. Working with a multi-disciplinary design team, Mr. Kamman assisted in developing a design based on analysis of habitat needs, tidal hydrodynamic and geomorphic processes, sedimentation rates and soil characteristics. Project tasks included: a site analysis defining existing ecological and hydrologic conditions; a hydrologic and biological restoration opportunities and constraints analysis to define restoration and management objectives; and hydrodynamic and sedimentation modeling to evaluate design alternatives. The final restoration and management plan included a grading plan, landscape revegetation plan and monitoring and maintenance plans. This work again illustrates his capabilities in the characterization of physical site conditions, development and feasibility analysis of project alternatives, and preparation of preliminary designs of sufficient detail to allow for environmental compliance through the CEQA/NEPA process.

Santa Clara River Estuary and Lower River Assessment, Ventura County, CA

Nautilus Environmental on behalf of the City of Ventura, Public Works Department, 2003-2004

Mr. Kamman directed a hydrologic and geomorphic assessment of the lower Santa Clara River and estuary. This work was completed for prime contractor in an effort to assist with re-permitting of treated effluent discharges to the estuary. The proposed study entailed characterizing existing and historic hydrologic and physiographic conditions and an assessment of historic changes in inflow to the estuary. This task included a comprehensive review and evaluation of available hydrologic reports and flow data within the watershed to characterize changes in flow associated with development of numerous water projects within the Santa Clara River basin. The main deliverable from this analysis was the development of a historic unimpaired flow record to the estuary based on regional regression analyses and water operations modeling. Within the estuary, Mr. Kamman designed and conducted a multi-year monitoring program of water levels, water quality (temperature, dissolved oxygen, salinity, and pH), and sand-spit morphology in order to evaluate inlet opening/closure frequency and associated changes in aquatic habitat (esp. tidewater goby) and other ecologic communities. A considerable portion of this subtask included detailed coastal process analysis (including wave power analyses and littoral sand transport), which, considered with the inflow analysis, provides a basis to evaluate the seasonal cycle of barrier beach buildup and destruction.

This project illustrates Mr. Kamman's ability to complete a broad variety of hydrologic and coastal process analyses under strict regulatory oversight. A premier study completed on this project was the development of a detailed water and salinity budget model for the estuary to evaluate the impacts of a wide variety of proposed and modified estuary inflow regimes to determine potential future water level and salinity conditions in the lagoon and impact on frequency of inlet breaching. In addition to coordinating and implementing a variety field monitoring and surveys, Mr. Kamman also provided real-time information and input to informational and negotiation meetings with state resource and regulatory agencies.

Eden Landing Ecological Reserve Restoration, Alameda County, CA

East Bay Regional Park District, 2000-2003

Mr. Kamman developed and completed hydraulic and hydrodynamic modeling assessments for the design of an approximately 1000-acre tidal marsh restoration in former Cargil salt manufacturing ponds, located a mile inland of San Francisco Bay. The restoration goals required balancing the desires to restore tidal marsh conditions to the site, while maintaining and enhancing the open water and salt

SELECTED EXPERIENCE *(CONTINUED)*

panne habitats preferred by resident and migratory shorebirds. The restoration plan also needed to incorporate restoration objectives with remediation of high soil salinities resulting from past salt production, subsided ground elevations, dredging of new channels to the bay, existing infrastructure constraints, public access for the San Francisco Bay Trail, and preservation of several important cultural and historical sites. Hydraulic design objectives include maximizing both interior circulation and tidal exchange between the restoration parcel and the bay. A series of one-dimensional unsteady hydrodynamic models (MIKE11) were used to design the channel network, identify high velocity areas requiring erosion protection, and characterize expected habitat conditions. An important component of this design and feasibility assessment was to translate desired ecological habitat conditions identified in the EIR into specific hydrologic design criteria, considering channel velocities, scour, sediment transport, tidal water inundation frequencies and seasonality of ponding. Mr. Kamman worked closely with EBRPD civil engineers, assisting with the translation of hydraulic design criteria into final engineered drawings and specifications.

Wetland & Pond Projects

Design of California Red-Legged Frog Breeding Ponds, San Francisco Bay Area (various), CA
The National Park Service and Golden Gate National Parks Conservancy, 1997-present

Mr. Kamman has lead or provided hydrologic and engineering design assistance to the sighting and design of nearly two dozen breeding ponds for California red-legged frog throughout the San Francisco Bay Area. Work has been completed in Marin, Sonoma, Solano, Contra Costa, Alameda, and Santa Clara Counties under the auspices of numerous federal, state, and local county/city agencies. A common study approach consists of an initial site reconnaissance of watershed conditions and identification of potential sites. The reconnaissance is followed by a surface water hydrologic sufficiency analysis using available meteorologic and stream flow information. An important variable sought during pond sighting is the presence of migration corridors between known breeding areas and/or perennial water sources. Based on in-depth research and post-project monitoring, Mr. Kamman has refined or developed site-specific evapotranspiration estimates, which commonly do not match standard applied values. Accurate evapotranspiration rates are necessary if ponds are intended to periodically dry-down as a means to preclude undesired species such as bullfrog or mosquito fish. In many instances, a seasonal groundwater-monitoring program is implemented in order to better investigate and quantify potential and seasonal groundwater contributions. Other design challenges we commonly experience include: design of impermeable liners for ponds located in upland areas or highly permeable soils; hydraulic analyses and design of outfalls/spillways; sedimentation management/ maintenance approaches; and requirements of inoculum and water used to line and fill the pond, respectively.

Hydrologic Feasibility Assessment for Mana Plain Wetland Restoration Project, Kauai, HI
State of Hawaii Department of Land and Natural Resources, 2010-2019

Working on behalf of the Mana Plain Wetland Restoration Partnership, Mr. Kamman completed a hydrologic feasibility assessment for the Mana Plain Wetland Restoration Project proposed by the State of Hawaii Department of Land and Natural Resources (DLNR), Division of Forestry and Wildlife (DOFAW) on the island of Kauai. The Mana Plain Wetland Restoration Project site is approximately 105 acres of low-lying abandoned sugarcane fields immediately north of the Kawaiele Waterbird Sanctuary and east of the Pacific Missile Range Facility. The purpose of the Mana Plain Wetland Restoration Project is to maximize the area of constructed wetlands within the restoration site. Palustrine emergent wetlands within the project will create habitat for four species of endangered Hawaiian waterbirds and other sensitive species, including: Hawaiian stilts; Hawaiian ducks; Hawaiian coots; Hawaiian moorhen; migratory waterfowl; and migratory shorebirds. The Mana Plain is of vital importance for the recovery of endangered waterbirds species. This restoration project will be designed to provide important breeding and feeding wetland habitats on an island where; 1) wetlands have been severely degraded, and 2) mongoose, an introduced predator, have not been established.

Mr. Kamman's work on this project included technical assessments and development of proposed restoration alternatives. Analyses completed included: a synthesis of the physical site setting (topography, geology, hydrogeology and soil); reviewing available data to characterize site meteorology, surface water drainage, water quality, and groundwater conditions; preparing a detailed water budget to describe the characteristics and processes of surface water and groundwater movement into and through the project area; evaluating project feasibility, water supply alternatives and costs; and completing a flood hazard impact assessment to evaluate potential project benefits and impacts to local area flooding. Working with the project partners, Mr. Kamman developed a preferred project alternative and supported in preparation of the project Environmental Assessment document. Mr. Kamman's firm was also retained by the State of Hawaii to develop engineering designs of the project.

MacArthur Meadow Wetland Restoration, San Francisco County, CA
Presidio Trust, 2013-2016

Mr. Kamman has been working on over a dozen independent wetland and creek restoration planning and design efforts within the Presidio of San Francisco since 2001. Most recently (2016), he developed a wetland restoration grading plan for the MacArthur Meadow Wetland Restoration Project in the central portion of the Tennessee Hollow watershed. As part of the site assessment, Greg characterized and modeled surface and groundwater interactions and identified a unique opportunity to restore 4 acres of mixed meadow, natural wetlands and creek/riparian corridor. This was possible due to the discovery of shallow groundwater conditions beneath this historically disturbed landscape. Various design components were integrated into the grading plan in order to enhance groundwater recharge and storage in the Meadow, while retarding runoff and drainage out of the wetland, including: daylighting storm drain runoff into the Meadow; reconfiguring internal channel alignments to enhance channel habitat and groundwater recharge; creation of wetland depressions to retain and recharge surface water; and removal of fill material to decrease the depth to the water table. Notable challenges of this work include restoring heavily disturbed natural resources in an urban setting while integrating designs with archeology/ cultural resources, education and remediation programs.

Dragonfly Creek Restoration Project, San Francisco County, CA
Presidio Trust, 2007-2011

Mr. Kamman designed and managed hydrologic monitoring and analysis studies in support of planning and design for riparian and wetland habitat restoration along approximately 500-linear feet of the Dragonfly Creek corridor near Fort Scott of the Presidio of San Francisco. Work has included completing subsurface

SELECTED EXPERIENCE *(CONTINUED)*

investigations including the installation of shallow wells and a sharp-crested weir with recorder to gauge creek flows. Mr. Kamman assisted in the development and selection of a preferred project alternative, considering on-site cultural resource protection, education and resource management issues (including flood control). Mr. Kamman prepared permit applications. Major components of the project included removal of significant fill and building foundations and installation of a new creek road crossing that will maintain the historical alignment, function and architectural character of a culturally significant roadway. Mr. Kamman oversaw development of PS&E for this project, which will create mitigation wetlands for a highway earthquake retrofit project that passes through the Park.

This project illustrates Mr. Kamman's ability to complete a broad variety of hydrologic analyses, including: surface water and groundwater hydrologic monitoring to characterize and quantify existing hydrologic conditions; rainfall-runoff modeling; hydraulic modeling of flood and scour conditions (including road crossing); preservation of existing wetland habitat and vegetation communities; integration with other Presidio Trust programs; and contracting flexibility to assist in conceptual planning and environmental compliance without increasing project design costs.

Mori Point Sensitive Species Habitat Enhancement Project, San Mateo County, CA
Golden Gate National Recreation Area and Golden Gate National Parks Conservancy, 2005-2011

Mr. Kamman provided hydrologic analyses, sighting and engineering design (PS&E) for three California red-legged frog breading ponds within the 105-acre Mori Point area. These efforts were completed in association and collaboration with a larger Coastal Trail improvement and ecosystem restoration effort. Quarrying and off-road vehicle use have left this site heavily scarred. The focus of restoration work was to protect the endangered San Francisco garter snake and the threatened red-legged frog. Most of this work will be focused on invasive species removal and enhancing endangered species habitat. As part of species habitat improvement, Mr. Kamman worked with project ecologists to design the ponds to optimize breeding habitat for California red-legged frog.

Work started with an initial site reconnaissance and study of watershed conditions and identification of potential sites. The reconnaissance was followed by a surface water hydrologic sufficiency analysis using available meteorological and stream flow information and installation and monitoring of shallow piezometers to quantify the proximity and seasonal variability in depth to water table. An important variable sought during pond sighting was the presence of migration corridors between known breeding areas and/or perennial water sources. Based on in-depth research and post-project monitoring for other ponds they created in the San Francisco Bay area, Mr. Kamman refined site-specific evapotranspiration estimates. Accurate evapotranspiration rates are necessary if ponds are intended to periodically dry-down as a means to preclude undesired species such as bullfrog or mosquito fish.

Other design challenges experienced included: design of impermeable liners for ponds located in upland areas or highly permeable soils; hydraulic analysis and design of outfalls/spillways; sedimentation management/maintenance approaches; and requirements of inoculum and water used to line and fill the pond, respectively. Mr. Kamman has designed numerous ponds for the NPS and affiliates within the Bay Area, including Mori Point (constructed 2007), Banducci (constructed 2007) and Giacomini (Phase I and Phase II constructed in 2007 and 2008) project sites.

Hydrologic Assessment and Restoration Feasibility Study for Shadow Cliffs Regional Recreation Area, Alameda County, CA
East Bay Regional Park District, 2009-2010

Mr. Kamman developed and implemented an assessment to identify groundwater levels and supplemental water supplies that will sustain seasonal wetland restoration areas and riparian habitats under an altered future hydrologic regime. This work will inform a forthcoming Land Use Plan Amendment for park occupying a series of former gravel quarry pits. Work included: obtaining and synthesizing available surface water and groundwater data to characterize existing hydrologic and water supply conditions and seasonal variability; quantifying the likely changes in groundwater conditions and quarry pit lake levels in association with changes in regional water transmission and groundwater recharge operations; and identifying, developing and evaluating a suite of ecosystem restoration alternatives. Other important project objectives include: improving habitat for waterfowl and wildlife; broadening recreational use; enhancing visitor education and wildlife interpretation; improve park aesthetics. Mr. Kamman evaluated a preferred park and ecosystem enhancement alternative that involves diverting high winter flows from an adjacent arroyo. This project demonstrates Greg's ability to characterize hydrologic conditions and quantify the relationship between groundwater, surface water and wetland habitat conditions, both under existing conditions and in predicting future hydrologic and ecologic conditions under an altered hydrologic regime (i.e., lower groundwater table).

Laguna Salada Marsh and Horse Stable Pond Restoration Project, San Mateo County, CA
Tetra Tech, 2007-2009

Mr. Kamman provided technical hydrology and hydraulics support to the planning and conceptual restoration design of Laguna Salada marsh and Horse Stable Pond, located adjacent to Sharp Park Golf Course in the town of Pacifica, California. The primary objectives of the project are: to reduce flood impacts within the project vicinity; improve sustainable ecological habitat for the endangered San Francisco garter snake and the threatened California red-legged frog; better understand and characterize the hydrologic and water quality conditions/processes affecting flood and ecological habitat conditions within the project vicinity; provide an effective pumping operation plan to meet ecological objectives; and develop appropriate hydrologic analytical approaches and models to assist Tetra Tech and the San Francisco Recreation and Park Department in the planning and design for marsh, pond, and creek restoration. The project is also a unique opportunity to connect this resource with the California Coastal Trail, the Bay Area Ridge Trail, and the surrounding GGNRA lands.

Mr. Kamman's work included completing a comprehensive review of available hydrologic and site information and implementing selected field investigations to develop and calibrate an integrated hydrology-flood routing-pond water operations model that will quantify the volume and depth of water moving through the project system. The investigation will also further characterize shallow groundwater conditions and water quality with respect to effects on Laguna Salada and Horse Stable Pond. Analytical and numerical modeling tools are being used to better characterize existing hydrologic and water quality conditions and to assist in identifying project opportunities and constraints as well as evaluate potential restoration design components - all necessary to inform a sustainable

SELECTED EXPERIENCE *(CONTINUED)*

and successful restoration design.

Tolay Lake Restoration Feasibility Assessment, Sonoma County, CA
Sonoma County Agricultural Preservation and Open Space District, 2003

Mr. Kamman completed a detailed hydrologic feasibility analysis to evaluate a suite of potential freshwater lake and wetland restoration alternatives. Sites were evaluated under existing watershed land-use practices and under existing and forecasted water demands (in the form of existing water rights/applications). Analysis consisted of developing a detailed water budget model to simulate alternative restored lake inundation areas and depths under median and dry year conditions, as well as a 50-year historic period (1947-1997) displaying highly variable rainfall and runoff supplies. Three lake restoration alternatives were evaluated based on existing topography and likely historic lake configurations. The restoration alternatives include lakes with storage volumes equivalent to 136-, 1100-, and 2550-acre feet.

Haypress Pond Decommissioning and Riparian and Channel Restoration, Marin County, CA
Golden Gate National Recreation Area (GGNRA), 2001-2002

This project restored 170 meters of historic creek and riparian habitat through removal of Haypress Pond dam in Tennessee Valley within GGNRA. The goals of the project were to alleviate long-term maintenance needs and eliminate non-native bullfrog habitat threatening native California red-legged frog habitat in adjacent watersheds.

Working with the Park biologist, Mr. Kamman developed designs to decommission the dam and restore natural riparian and meadow habitat. This work included: characterization of existing topographic conditions; design of a channel profile through the proposed restoration project reach; preparation of a grading plan for the restoration project; and hydrologic and hydraulic analyses to evaluate the performance of the creek channel and flood plain below the former dam during a variety of flows. Challenges of this work included integrating sediment reuse into plans and construction phasing.

Damon Slough Site Seasonal Wetland Design, Alameda County, CA
Port of Oakland, 1999-2001

Working on behalf of the Port of Oakland, Mr. Kamman completed extensive surface and groundwater monitoring and data analyses to develop a detailed water budget to assist in the evaluation and design of a 7.5 acre seasonal freshwater wetland. Primary project objectives included a design that would provide shorebird/waterfowl roosting habitat, minimize impacts to existing seasonal wetland areas, and lengthen the duration of ponding through the end of April to promote use by migratory birds. In addition to developing hydrologic design criteria, responsibilities included development of grading plans to accommodate a local extension of the Bay Trail and wetland outlet works.

Water Quality Projects

Chicken Ranch Beach Soil and Groundwater Quality Investigation and Restoration Planning, Marin County, CA
Tomales Bay Watershed Council, 2007-present

Mr. Kamman is leading scientific and engineering efforts for a wetland and riparian corridor restoration project on Third Valley Creek and Chicken Ranch Beach in Inverness, California. The main project goals are to create a self-sustaining riparian and wetland system (requiring minimal operation and maintenance) and eliminate public exposure to high levels of bacteria that exist in a site drainage ditch discharging to the beach. The design will likely include establishing a blend of habitats, including: riparian stream corridor, seasonal/perennial freshwater marsh, and tidal/saltwater marsh.

Current efforts have included the development and implementation of a soil and groundwater quality investigation to delineate the source of elevated bacteria levels. This work includes: the collection and testing of depth-discrete soil samples; groundwater well installation, sampling and testing; and surface water sampling and testing; analysis of laboratory results; and reporting, including recommendations for further/expanded investigations. Mr. Kamman coordinated this time-sensitive sampling and analysis (six hour hold times) with Brulje and Race Laboratories in Santa Rosa.

Lower Miller Creek Channel Maintenance and Material Reuse Sampling Analysis Plan, Marin County, CA
Las Gallinas Valley Sanitary District, 2015

Mr. Kamman was commissioned to formulate and implement a plan for sediment removal and improved flood flow conveyance in the Lower Miller Creek channel. Accumulation of course sediment in the project reach had reduced discharge efficiencies at District outfalls. Miller Creek supports a population of federally listed Steelhead and adjacent wetland/marsh areas potentially support other state and federally listed special status species. Working with District Staff, Greg developed a suite of potential project alternatives and identified a preferred approach. Mr. Kamman completed all CEQA compliance (IS/MND), permitting and oversaw development of engineered plans and specifications.

In order to evaluate if reuse of excavated material from 2,655 feet of creek corridor in upland areas was feasible, Mr. Kamman developed and implemented a Sampling Analysis Plan (SAP) pursuant to U.S. Army Corps Guidance for Dredging Projects within the San Francisco District. Sample collection, sample handling, and analysis were performed in accordance with the SAP. Results for analytes were compared to a variety of screening criteria to determine the material's suitability for reuse in aquatic environments. A full suite of chemical and physical analyses were performed on soil samples collected from 16 locations, including: metals, PAHs, PCBs, pesticides, TOC, specific conductance, pH, sulfides, percent moisture and grain-size. Mr. Kamman managed all aspects of this effort including reporting and presentations/negotiations at multi-agency meetings through the Corps Dredge Materials Management Office (DMMO).

Lower Pitkin Marsh Hydrologic and Water Quality Monitoring, Sonoma County, CA
Sonoma Land Trust, 2008-2010

Mr. Kamman was retained to develop and implement a hydrologic and water quality monitoring program at Lower Pitkin Marsh outside of Forestville, California. The Pitkin Marsh area is one of the most valuable complexes of mixed riparian woodland and thicket, freshwater marsh, wet meadow, oak woodland and grassland in Sonoma County. The complex interaction of surface water, ground water, and scattered seeps and springs on the site creates unusual hydrologic conditions that promote a rare assemblage of plant species which includes several endemics. The primary objective of the hydrologic monitoring program was to understand the annual and season sources of both surface and ground water supplying wetlands. Hydrologic and water quality monitoring was

SELECTED EXPERIENCE *(CONTINUED)*

initiated during the winter wet season of 2008/09 and will be conducted for a 12-month period through the ensuing summer dry-down and into the following wet season. Understanding how groundwater levels, spring flow and creek flow rates recede from winter wet to summer dry conditions will provide an important understanding and quantification of the seasonal variability in water supplies feeding selected wetland types. General water quality parameters (temperature, pH, specific conductance, and ORP) are measured at all monitoring locations during each visit. Nutrients (N and P) are measured in selected surface water and groundwater samples collected during at least three monitoring events, including a winter high flow, spring high base flow and summer low baseflow.

Pescadero Lagoon Restoration and Enhancement, San Mateo County, CA
California State Coastal Conservancy, 2005-2006

Mr. Kamman was retained to support restoration and water quality enhancement planning efforts in Pescadero Lagoon. In 2005-2006, he completed a synthesis of available hydrologic and water quality information in responding to requests for development of a hydrodynamic and water quality model of the lagoon. This model was considered as a means to identify causes for repeated fish-kills in the lagoon that occurred during initial breaching of the inlet. Mr. Kamman assisted in preparing a synthesis and model development feasibility report from this effort.

Water Temperature Simulations for Trinity River Fish and Wildlife Restoration Project, Trinity County, CA
Trinity County Planning Department, 1994-2004

For over a decade, Mr. Kamman completed a number of hydrology and water quality investigations in support of alternative feasibility studies on the Trinity River Fish and Wildlife Restoration Project in direct support of the Trinity River Restoration EIR/EIS. Studies involve assessing the effects of proposed flow alternatives on water temperature within and downstream of Lewiston Reservoir. Mr. Kamman was responsible for data collection, processing, and flow/temperature modeling of Lewiston Reservoir as part of a coordinated evaluation including other Trinity River system models. Another study included evaluating how project operations could be implemented or modified to optimize Lewiston Lake release temperatures to meet downstream temperature criteria and compensate for increased warming of the river associated with side channel and feather edge restoration activities. Mr. Kamman continues to evaluate how more recent water projects (raising Shasta Dam, Sites Reservoir, and the Waterfix tunnels) consider and integrate with the Trinity Restoration Project.

Upper Eel River Unimpaired Flow and Water Temperature Assessments, Humboldt County, CA
CalTrout, 1997-1999

Mr. Kamman evaluated changes in the natural flow regime of the upper Eel River, and developed an Upper Eel River proposed release schedule to enhance downstream Chinook and Steelhead spawning and rearing habitat. This work was triggered by proposals set forth by PG&E as part of their Potter Valley Project FERC relicensing process. Work consisted of two main investigations. The first included reviewing results of a ten year PG&E study and development of multivariate regression and stream reach (SSTEMP) temperature models to assess the effects proposed flow alternatives would have on downstream temperatures. The second investigation consisted of characterizing unimpaired flow conditions and developing a daily unimpaired flow record for use in project operation models.

Subject: **Draft Environmental Impact Report for the CEMEX Rockfield Modification Project in Fresno County, California – Biological Issues Review**

Dear Ms. Borg:

I am an ecologist with more than 35 years of professional experience who specializes in the identification, ecological requirements, and regulatory protection of the flora and fauna of central California. I oversee, manage, and carry out projects involving biological resource evaluations; environmental impact assessments; special-status species surveys; aquatic resources determinations and delineations; habitat restoration planning and monitoring; species population management and monitoring; environmental permitting; environmental permit implementation; mitigation monitoring; and environmental compliance. I have contributed to the biological resource sections of hundreds of environmental impact reports, environmental impact statements, and other environmental compliance documents for projects throughout California. I earned a B.S. degree in wildlife and fisheries biology from the University of California, Davis, began working as an ecological consultant in California in 1992, and am a past president of the San Joaquin Valley Chapter and Western Section of The Wildlife Society.

Comment 58B-1

At your request, I reviewed the Draft Environmental Impact Report (Draft EIR) for the CEMEX Rockfield Modification Project (State Clearinghouse Number 2020060123) to identify any biological resource issues. My review focused on Draft EIR Section 4.4 (Biological Resources) and Appendix E (Biological Resources).

Comment 58B-2

The proposed project involves continuing, expanding, and modifying aggregate (rock, sand, and gravel) mining and processing operations on two properties between the San Joaquin River and North Friant Road in Fresno County, California. The two properties include the Plant Site, a 122-acre site approximately 1.5 miles north of the City of Fresno, and the Quarry Site, a 349-acre site approximately 2.0 miles north of the Plant Site.

The project includes two stages:

Stage 1 would involve continuing concurrent operations at both sites for up another 30 years. Operations at the Quarry Site would be modified to include (1) granite mining by drilling and blasting to a depth of 600 feet below the ground surface and (2) aggregate processing, involving washing, screening, crushing, and sorting aggregate.

Stage 2 would involve continuing granite mining and aggregate processing at the Quarry Site for approximately 70 more years.

Pursuant to California Code of Regulations (CCR) Title 14 Section 15002, the purposes of an Environmental Impact Report (EIR) and the California Environmental Quality Act (CEQA) more broadly are to:

(1) inform government decisionmakers and the public about the potential environmental effects of a project;

(2) identify the ways that environmental damage can be avoided or significantly reduced;

(3) prevent significant, avoidable environmental damage by requiring changes to the project, either by adopting alternatives or imposing mitigation measures; and

(4) disclose to the public why a project was approved if that project has significant environmental impacts that cannot be mitigated to a less than significant level.

An EIR must contain sufficient detail and analysis to serve as an adequate informational document, and it must support its conclusions with substantial evidence. That means an EIR must include enough relevant facts, reasonable assumptions based on facts, and expert opinion supported by facts that a fair argument can be made to support its conclusions. With that framework in mind, I

identified the following issues in the Draft EIR that affect the soundness of the analysis of the potential environmental effects of the proposed project on biological resources:

Comment 58B-2 Cont.

1. **The Draft EIR mischaracterizes a jurisdictional habitat.** An accurate description of the environmental setting is essential to establish the environmental baseline. The Draft EIR (Section 4.4.1.7) states the wash water conveyance ditch at the Plant Site is not a stream and therefore altering it would not require notifying the California Department of Fish and Wildlife (CDFW) pursuant to Fish and Game Code Section 1602. Fish and Game Code does not include the definition of a stream. However, CDFW generally considers a stream to be any feature with a bed, channel, and banks that conveys water and supports stream dependent life regardless of the origin and use of that feature. As the wash water conveyance ditch appears to meet those criteria, it likely qualifies as a stream, and diverting or obstructing its flow; altering its bed, channel, or bank; or depositing any material into it would be subject to provisions of Fish and Game Code Section 1600 et seq. This is important because the DRAFT EIR states the ditch is maintained through dredging and vegetation clearing (Section 4.4.1.3) and will be removed with mining (Section 4.10.3.2).

Comment 58B-3

2. **The Draft EIR relies on an outdated and incomplete analysis of potentially occurring special-status species.** The cover pages of the Habitat Assessments for the Plant Site and Quarry Site indicate those assessments were updated in December 2024. However, the record searches cited in those assessments were from 2019. As the associated databases are regularly updated, any records added since 2019 would not have been considered. Furthermore, the industry standard for record searches, especially for EIRs, is a nine-quad search radius, which includes the topographic quadrangle containing the project sites and the eight surrounding quadrangles[1]. Only four quadrangles were searched for this EIR (Section 4.4.1.8). Therefore, some special-status species that could occur on or near the project sites may not have been considered. It follows that the potential environmental effects of the proposed project on any such species would not have been disclosed and addressed. For example, searching the California Natural Diversity Database today and extending the search radius to encompass nine quads reveals several species not addressed in the Draft EIR that could occur on or near the project sites[2].

Comment 58B-4

[1] https://wildlife.ca.gov/Data/CNDDB/FAQ#563522977-what-is-a-9-quad-search

[2] California Department of Fish and Wildlife (CDFW). 2025. California Natural Diversity Database (CNDDB) RareFind 5. https://apps.wildlife.ca.gov. Accessed March 1, 2025.

Such species include California glossy snake, western mastiff bat, pallid bat, spotted bat, and Townsend's big-eared bat. Such species should be addressed before project approval.

Comment 58B-4 Cont.

3. The Draft EIR provides an inadequate analysis of environmental impacts on special-status species.

Comment 58B-5

(a) Swainson's hawk. With more than four dozen breeding season (March through August) occurrence records of this species within 2 miles of the project sites (eBird 2025[3]) and numerous potential nest trees within 0.5 mile, the project may adversely affect nesting Swainson's hawks. Although the Draft EIR states there is a moderate potential for this species to forage over the project sites and nest nearby (Table 4.4-1), it fails to address the potential indirect effects of the project on nesting Swainson's hawks. Noise and dust from blasting, excavating, scraping, or using other heavy equipment such as front-loaders and dozers that causes a Swainson's hawk nest to fail would constitute a significant impact. The unsubstantiated narrative provided in the Draft EIR (e.g., Impact 4.4-2) does not constitute substantial evidence. To sufficiently analyze those potential indirect effects, protocol surveys[4] should be conducted within a 0.5-mile radius around the project sites prior to project approval. If an active nest is identified within the 0.5-mile radius, consultation with the CDFW will be required. Depending on the risk for incidental take of Swainson's hawk, that consultation may lead to the need for the project owner to obtain an incidental take permit from the CDFW under Fish and Game Code Section 2081. Regardless, mitigating the potential for incidental take would likely require (1) conducting pre-construction surveys for Swainson's hawk during the nesting season within a 0.5-mile radius of work activities no more than 30 days before the start of those activities; (2) monitoring any Swainson's hawk nest within that area during project activities to determine if the nesting birds are exhibiting distress or abnormal behavior (e.g., swooping, stooping, giving distress calls, or failing to remain on the nest or deliver prey items) that could cause reproductive failure (i.e., though nest abandonment or loss of eggs

[3] eBird. 2025. eBird: An online database of bird distribution and abundance [web application]. eBird, Cornell Lab of Ornithology, Ithaca, New York. Available: http://www.ebird.org. (Accessed March 1, 2025).
[4] Swainson's Hawk Technical Advisory Committee (SWTAC). 2000. Recommended Timing and Methodology for Swainson's Hawk Nesting Surveys in California's Central Valley. 5 pages.

or young); and (3) ceasing project activities until the behavior of the nesting birds has normalized.

Comment 58B-5 Cont.

(b) **Tricolored blackbird**. With more than one dozen breeding season (March-June) occurrence records of this species within 2 miles of the project sites (eBird 2025[5]) and potential nesting habitat in the southeastern portion of the Plant Site (e.g., Photographs 1 and 2 of the Plant Site Habitat Assessment), the project could adversely impact nesting tricolored blackbirds. Although the Draft EIR (Table 4.4-1) states there is a low potential for this species to occur on the project sites, it fails to address the potential indirect effects of the project on nesting tricolored blackbirds. Noise and dust from blasting, excavating, scraping, or using other heavy equipment such as front-loaders and dozers that causes a tricolored blackbird nest to fail would constitute a significant impact. The unsubstantiated narrative provided in the Draft EIR (e.g., Impact 4.4-2) does not constitute substantial evidence.

Comment 58B-6

(c) **Burrowing owl.** The Draft EIR fails to address the potential indirect effects of the project on burrowing owl. For the Plant Site, for example, the Draft EIR (Table 4.4-1) states the species is presumed absent but identifies "line-of-sight opportunities favored by this species". Noise and dust from blasting, excavating, scraping, or using other heavy equipment such as front loaders or dozers that causes a burrowing owl nest to fail would constitute a significant impact. To sufficiently analyze such potential indirect effects, protocol surveys[6], involving evaluating all suitable burrows within 150 meters of the project sites, should be conducted before the project is approved.

Comment 58B-7

(d) **Western red bat.** The Draft EIR (Table 4.4-1) states this species has a moderate potential to roost on the Plant Site. Yet the potential effects of the project on this species were not addressed, and no mitigation was included. Direct impacts or indirect impacts associated with noise from processing and transporting materials that cause a western red bat roost to be abandoned could constitute a significant impact. Because bats are acoustic predators,

Comment 58B-8

[5] eBird. 2025. eBird: An online database of bird distribution and abundance [web application]. eBird, Cornell Lab of Ornithology, Ithaca, New York. Available: http://www.ebird.org. (Accessed March 1, 2025).

[6] California Department of Fish and Game. 2012. Staff Report on Burrowing Owl Mitigation, State of California Natural Resources Agency, Department of Fish and Game. 36 pages.

anthropogenic noise can also compromise their ability to effectively forage.[7] But such analysis was not included in the Draft EIR. Comment 58B-8

(e) **Sanford's arrowhead**. The Draft EIR (Appendix E-1, Table C-1) states this species is presumed absent based on the lack of habitat. However, this species occurs in aquatic habitats like that in the southeastern portion of the Plant Site. The special-status plant species surveys conducted at the Plant Site in 2017 (Appendix E-3) focused on state and federally listed species and their habitats, which are different than that of Sanford's arrowhead. Therefore, this species could be present, and the potential effects of the project on this species should be considered before project approval. Comment 58B-9

(f) **Spring-run Chinook salmon.** The Draft EIR does not discuss the potential effects of mining to 600 feet below the ground surface at the Quarry Site on river flows in the adjacent San Joaquin River. River flows are known to impact juvenile Chinook salmon survival[8]. Therefore, such effects could constitute a significant impact and should be addressed before project approval. Comment 58B-10

4. **The Draft EIR (Section 6.5.2) provides an incomplete analysis of the effects of the proposed project on biological resources compared with the no project alternative at the Quarry Site.** Specifically, the Draft EIR does not address the relative post-reclamation habitat value of comparatively shallow (approximately 20 feet deep) lakes under the no project alternative compared with that of the proposed project that would result in a comparatively deep (approximately 100 feet deep) lake. As habitat value may be inversely related to water depth[9], such analysis should be included before project approval. Comment 58B-11

The Draft EIR's failure to adequately address these issues and provide substantial evidence in support of its conclusions violates CEQA's fundamental requirements for disclosure and analysis and undermines informed decision-making. Comment 58B-12

Jeff N. Davis

Principal Scientist

Jeff is an ecologist with more than 35 years of professional experience who specializes in the identification, ecological requirements, and regulatory protection of the flora and fauna of California. As Principal Scientist, Jeff provides technical oversight of all scientists at Colibri and assures the scientific accuracy and adequacy of all work. He oversees, manages, and carries out projects involving biological resource evaluations; environmental impact assessments; special-status species surveys; aquatic resources determinations and delineations; habitat restoration planning and monitoring; species population management and monitoring; environmental permitting; environmental permit implementation; mitigation monitoring; and environmental compliance. He has contributed to the biological resource sections of hundreds environmental impact reports, environmental impact statements, and other environmental compliance documents for projects throughout California. His strengths in this regard include a detailed knowledge of California flora and fauna, the California Environmental Quality Act (CEQA), the National Environmental Policy Act (NEPA), federal and state Endangered Species Act regulations, the California Fish and Game Code, and a proven expertise in coordination, communication, and team leading.

Jeff has provided biological support services for thousands of projects in California. Such services have included: (1) evaluating biological constraints; (2) analyzing impacts; (3) preparing permit applications; (4) conducting reconnaissance, focused, and protocol surveys for special-status species; (5) conducting aquatic resource determinations and delineations; (6) conducting noxious weed assessments, mapping, and monitoring; (7) conducting nesting bird surveys; (8) coordinating and overseeing contractor activities; (9) presenting jobsite environmental education programs; and (10) providing onsite biological compliance monitoring. He routinely evaluates biological constraints and impacts to determine the need and schedule for (1) permits and agreements from the California Department of Fish and Wildlife, U.S. Fish and Wildlife Service, U.S. Army Corps of Engineers, and Regional Water Quality Control Board; (2) biological resource surveys; (3) and limited operating periods.

Jeff is a past president of the Western Section and San Joaquin Valley Chapter of The Wildlife Society.

EXHIBIT B

What is a 9-quad search?

A 9-quad search is a way to quickly create a list of CNDDB-tracked elements documented as occurring in a particular quad as well as the 8 surrounding quads. 9-quad searches are often used to generate a list of potential CNDDB-tracked elements one might encounter when performing surveys in a given area. 9-quad searches should never be used as a substitute for on-the-ground surveys. A 9-quad search can be done using the CNDDB QuickView Tool.

RECOMMENDED TIMING AND METHODOLOGY FOR SWAINSON'S HAWK NESTING SURVEYS IN CALIFORNIA'S CENTRAL VALLEY

Swainson's Hawk Technical Advisory Committee

May 31, 2000

This set of survey recommendations was developed by the Swainson's Hawk Technical Advisory Committee (TAC) to maximize the potential for locating nesting Swainson's hawks, and thus reducing the potential for nest failures as a result of project activities/disturbances. The combination of appropriate surveys, risk analysis, and monitoring has been determined to be very effective in reducing the potential for project-induced nest failures. As with most species, when the surveyor is in the right place at the right time, Swainson's hawks may be easy to observe; but some nest sites may be very difficult to locate, and even the most experienced surveyors have missed nests, nesting pairs, mis-identified a hawk in a nest, or believed incorrectly that a nest had failed. There is no substitute for specific Swainson's hawk survey experience and acquiring the correct search image.

METHODOLOGY

Surveys should be conducted in a manner that maximizes the potential to observe the adult Swainson's hawks, as well as the nest/chicks second. To meet the California Department of Fish and Game's (CDFG) recommendations for mitigation and protection of Swainson's hawks, surveys should be conducted for a ½ mile radius around all project activities, and if active nesting is identified within the ½ mile radius, consultation is required. In general, the TAC recommends this approach as well.

Minimum Equipment

Minimum survey equipment includes a high-quality pair of binoculars and a high quality spotting scope. Surveying even the smallest project area will take hours, and poor optics often result in eye-strain and difficulty distinguishing details in vegetation and subject birds. Other equipment includes good maps, GPS units, flagging, and notebooks.

Walking vs Driving

Driving (car or boat) or "windshield surveys" are usually preferred to walking if an adequate roadway is available through or around the project site. While driving, the observer can typically approach much closer to a hawk without causing it to fly. Although it might appear that a flying bird is more visible, they often fly away from the observer using trees as screens; and it is difficult to determine from where a flying bird came. Walking surveys are useful in locating a nest after a nest territory is identified, or when driving is not an option.

Angle and Distance to the Tree

Surveying subject trees from multiple angles will greatly increase the observer's chance of detecting a nest or hawk, especially after trees are fully leafed and when surveying multiple trees

in close proximity. When surveying from an access road, survey in both directions. Maintaining a distance of 50 meters to 200 meters from subject trees is optimal for observing perched and flying hawks without greatly reducing the chance of detecting a nest/young: Once a nesting territory is identified, a closer inspection may be required to locate the nest.

Speed
Travel at a speed that allows for a thorough inspection of a potential nest site. Survey speeds should not exceed 5 miles per hour to the greatest extent possible. If the surveyor must travel faster than 5 miles per hour, stop frequently to scan subject trees.

Visual and Aural Ques
Surveys will be focused on both observations and vocalizations. Observations of nests, perched adults, displaying adults, and chicks during the nesting season are all indicators of nesting Swainson's hawks. In addition, vocalizations are extremely helpful in locating nesting territories. Vocal communication between. hawks is frequent during territorial displays; during courtship and mating; through the nesting period as mates notify each other that food is available or that a threat exists; and as older chicks and fledglings beg for food.

Distractions
Minimize distractions while surveying. Although two pairs of eyes may be better than one pair at times, conversation may limit focus. Radios should be off, not only are they distracting, they may cover a hawk's call.

Notes and Species Observed
Take thorough field notes. Detailed notes and maps of the location of observed Swainson's hawk nests are essential for filling gaps in the Natural Diversity Data Base; please report all observed nest sites. Also document the occurrence of nesting great homed owls, red-tailed hawks, red-shouldered hawks and other potentially competitive species. These species will infrequently nest within 100 yards of each other, so the presence of one species will not necessarily exclude another.

TIMING

To meet **the minimum level** of protection for the species, surveys should be completed for **at least** the two survey periods immediately prior to a project's initiation. For example, if a project is scheduled to begin on June 20, you should complete 3 surveys in Period III and 3 surveys in Period V. However, it is always recommended that surveys be completed in Periods II, III and V. **Surveys should not be conducted in Period IV.**

The survey periods are defined by the timing of migration, courtship, and nesting in a "typical" year for the majority of Swainson's hawks from San Joaquin County to Northern Yolo County. Dates should be adjusted in consideration of early and late nesting seasons, and geographic differences (northern nesters tend to nest slightly later, etc). If you are not sure, contact a TAC member or CDFG biologist.

Survey dates **Justification and search image**	**Survey time**	**Number of Surveys**
I. *January-March 20 (recommended optional)*	*All day*	*1*

Prior to Swainson's hawks returning, it may be helpful to survey the project site to determine potential nest locations. Most nests are easily observed from relatively long distances, giving the surveyor the opportunity to identify potential nest sites, as well as becoming familiar with the project area. It also gives the surveyor the opportunity to locate and map competing species nest sites such as great homed owls from February on, and red-tailed hawks from March on. After March 1, surveyors are likely to observe Swainson's hawks staging in traditional nest territories.

II. *March 20 to April 5*	*Sunrise to 1000* *1600 to sunset*	*3*

Most Central Valley Swainson's hawks return by April 1, and immediately begin occupying their traditional nest territories. For those few that do not return by April 1, there are often hawks ("floaters") that act as place-holders in traditional nest sites; they are birds that do not have mates, but temporarily attach themselves to traditional territories and/or one of the site's "owners." Floaters are usually displaced by the territories' owner(s) if the owner returns.

Most trees are leafless and are relatively transparent; it is easy to observe old nests, staging birds, and competing species. The hawks are usually in their territories during the survey hours, but typically soaring and foraging in the mid-day hours. Swainson's hawks may often be observed involved in territorial and courtship displays, and circling the nest territory. Potential nest sites identified by the observation of staging Swainson's hawks will usually be active territories during that season, although the pair may not successfully nest/reproduce that year.

III. *April 5 to April 20*	*Sunrise to 1200* *1630 to Sunset*	***3***

Although trees are much less transparent at this time, 'activity at the nest site increases significantly. Both males and females are actively nest building, visiting their selected site frequently. Territorial and courtship displays are increased, as is copulation. The birds tend to vocalize often, and nest locations are most easily identified. This period may require a great deal of "sit and watch" surveying.

IV. *April 21 to June 10*	*Monitoring known nest sites only* ***Initiating Surveys is not recommended***	

Nests are extremely difficult to locate this time of year, and even the most experienced surveyor will miss them, especially if the previous surveys have not been done. During this phase of nesting, the female Swainson's hawk is in brood position, very low in the nest, laying eggs, incubating, or protecting the newly hatched and vulnerable chicks; her head may or may not be visible. Nests are often well-hidden, built into heavily vegetated sections of trees or in clumps of mistletoe, making them all but invisible. Trees are usually not viewable from all angles, which may make nest observation impossible.

Following the male to the nest may be the only method to locate it, and the male will spend hours away from the nest foraging, soaring, and will generally avoid drawing attention to the nest site. Even if the observer is fortunate enough to see a male returning with food for the female, if the female determines it is not safe she will not call the male in, and he will not approach the nest; this may happen if the observer, or others, are too close to the nest or if other threats, such as rival hawks, are apparent to the female or male.

V. ***June 10 to JuIy 30 (post-fledging)*** ***Sunrise to 1200*** ***3***
1600 to sunset

Young are active and visible, and relatively safe without parental protection. Both adults make numerous trips to the nest and are often soaring above, or perched near or on the nest tree. The location and construction of the nest may still limit visibility of the nest, young, ‘and adults.

DETERMINING A PROJECT'S POTENTIAL
FOR IMPACTING SWAINSON'S HAWKS

LEVEL OF RISK	REPRODUCTIVE SUCCESS (Individuals)	LONGTERM SURVIVABILITY (Population)	NORMAL SITE CHARACTERISTICS (Daily Average)	NEST MONI-TORING
HIGH	Direct physical contact with the nest tree while the birds are on eggs or protecting young. (Helicopters in close proximity)	Loss of available foraging area.	Little human-created noise, little human use: nest is well away from dwellings, equipment yards, human access areas, etc. *Do not include general cultivation practices in evaluation.*	MORE
		Loss of nest trees.		
	Loss of nest tree after nest building is begun prior to laying eggs.	Loss of potential nest trees.		
	Personnel within 50 yards of nest tree (out of vehicles) for extended periods while birds are on eggs or protecting young that are < 10 days old.	Cumulative: Multi-year, multi-site projects with substantial noise/personnel disturbance.		
	Initiating construction activities (machinery and personnel) within 200 yards of the nest after eggs are laid and before young are > 10 days old.	Cumulative: Single-season projects with substantial noise/personnel disturbance that is greater than or significantly different from the daily norm.		
	Heavy machinery only working within 50 yards of nest.		Substantial human-created noise and occurrence: nest is near roadways, well-used waterways, active airstrips, areas that have high human use. *Do not include general cultivation practices in evaluation.*	
	Initiating construction activities within 200 yards of nest before nest building begins or after young > 10 days old.	Cumulative: Single-season projects with activities that "blend" well with site's "normal' activities.		
LOW	All project activities (personnel and machinery) greater than 200 yards from nest.			LESS

INTRODUCTION AND PURPOSE

Maintaining California's rich biological diversity is dependent on the conservation of species and their habitats. The California Department of Fish and Game (Department) has designated certain species as "species of special concern" when their population viability and survival is adversely affected by risk factors such as precipitous declines or other vulnerability factors (Shuford and Gardali 2008). Preliminary analyses of regional patterns for breeding populations of burrowing owls (*Athene cunicularia*) have detected declines both locally in their central and southern coastal breeding areas, and statewide where the species has experienced modest breeding range retraction (Gervais et al. 2008). In California, threat factors affecting burrowing owl populations include habitat loss, degradation and modification, and eradication of ground squirrels resulting in a loss of suitable burrows required by burrowing owls for nesting, protection from predators, and shelter (See Appendix A).

The Department recognized the need for a comprehensive conservation and mitigation strategy for burrowing owls, and in 1995 directed staff to prepare a report describing mitigation and survey recommendations. This report, "1995 Staff Report on Burrowing Owl Mitigation," (Staff Report) (CDFG 1995), contained Department-recommended burrowing owl and burrow survey techniques and mitigation measures intended to offset the loss of habitat and slow or reverse further decline of this species. Notwithstanding these measures, over the past 15+ years, burrowing owls have continued to decline in portions of their range (DeSante et al. 2007, Wilkerson and Siegel, 2010). The Department has determined that reversing declining population and range trends for burrowing owls will require implementation of more effective conservation actions, and evaluating the efficacy of the Department's existing recommended avoidance, minimization and mitigation approaches for burrowing owls.

The Department has identified three main actions that together will facilitate a more viable, coordinated, and concerted approach to conservation and mitigation for burrowing owls in California. These include:

1. Incorporating burrowing owl comprehensive conservation strategies into landscape-based planning efforts such as Natural Community Conservation Plans (NCCPs) and multi-species Habitat Conservation Plans (HCPs) that specifically address burrowing owls.
2. Developing and implementing a statewide conservation strategy (Burkett and Johnson, 2007) and local or regional conservation strategies for burrowing owls, including the development and implementation of a statewide burrowing owl survey and monitoring plan.
3. Developing more rigorous burrowing owl survey methods, working to improve the adequacy of impacts assessments; developing clear and effective avoidance and minimization measures; and developing mitigation measures to ensure impacts to the species are effectively addressed at the project, local, and/or regional level (the focus of this document).

This Report sets forth the Department's recommendations for implementing the third approach identified above by revising the 1995 Staff Report, drawing from the most relevant and current knowledge and expertise, and incorporating the best scientific information

available pertaining to the species. It is designed to provide a compilation of the best available science for Department staff, biologists, planners, land managers, California Environmental Quality Act (CEQA) lead agencies, and the public to consider when assessing impacts of projects or other activities on burrowing owls.

This revised Staff Report takes into account the California Burrowing Owl Consortium's Survey Protocol and Mitigation Guidelines (CBOC 1993, 1997) and supersedes the survey, avoidance, minimization and mitigation recommendations in the 1995 Staff Report. Based on experiences gained from implementing the 1995 Staff Report, the Department believes revising that report is warranted. This document also includes general conservation goals and principles for developing mitigation measures for burrowing owls.

DEPARTMENT ROLE AND LEGAL AUTHORITIES

The mission of the Department is to manage California's diverse fish, wildlife and plant resources, and the habitats upon which they depend, for their ecological values and for their use and enjoyment by the public. The Department has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitats necessary to maintain biologically sustainable populations of those species (Fish and Game Code (FGC) §1802). The Department, as trustee agency pursuant to CEQA (See CEQA Guidelines, §15386), has jurisdiction by law over natural resources, including fish and wildlife, affected by a project, as that term is defined in Section 21065 of the Public Resources Code. The Department exercises this authority by reviewing and commenting on environmental documents and making recommendations to avoid, minimize, and mitigate potential negative impacts to those resources held in trust for the people of California.

Field surveys designed to detect the presence of a particular species, habitat element, or natural community are one of the tools that can assist biologists in determining whether a species or habitat may be significantly impacted by land use changes or disturbance. The Department reviews field survey data as well as site-specific and regional information to evaluate whether a project's impacts may be significant. This document compiles the best available science for conducting habitat assessments and surveys, and includes considerations for developing measures to avoid impacts or mitigate unavoidable impacts.

CEQA

CEQA requires public agencies in California to analyze and disclose potential environmental impacts associated with a project that the agency will carry out, fund, or approve. Any potentially significant impact must be mitigated to the extent feasible. Project-specific CEQA mitigation is important for burrowing owls because most populations exist on privately owned parcels that, when proposed for development or other types of modification, may be subject to the environmental review requirements of CEQA.

Take

Take of individual burrowing owls and their nests is defined by FGC section 86, and prohibited by sections 3503, 3503.5 and 3513. Take is defined in FGC Section 86 as "hunt, pursue, catch, capture or kill, or attempt to hunt, pursue, catch, capture or kill."

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) implements various treaties and conventions between the United States and Canada, Japan, Mexico, and Russia for the protection of migratory birds, including the burrowing owl (50 C.F.R. § 10). The MBTA protects migratory bird nests from possession, sale, purchase, barter, transport, import and export, and collection. The other prohibitions of the MBTA - capture, pursue, hunt, and kill - are inapplicable to nests. The regulatory definition of take, as defined in Title 50 C.F.R. part 10.12, means to pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to hunt, shoot, wound, kill, trap, capture, or collect. Only the verb "collect" applies to nests. It is illegal to collect, possess, and by any means transfer possession of any migratory bird nest. The MBTA prohibits the destruction of a nest when it contains birds or eggs, and no possession shall occur during the destruction (see Fish and Wildlife Service, Migratory Bird Permit Memorandum, April 15, 2003). Certain exceptions to this prohibition are included in 50 C.F.R. section 21. Pursuant to Fish & Game Code section 3513, the Department enforces the Migratory Bird Treaty Act consistent with rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Treaty Act.

Regional Conservation Plans

Regional multiple species conservation plans offer long-term assurances for conservation of covered species at a landscape scale, in exchange for biologically appropriate levels of incidental take and/or habitat loss as defined in the approved plan. California's NCCP Act (FGC §2800 et seq.) governs such plans at the state level, and was designed to conserve species, natural communities, ecosystems, and ecological processes across a jurisdiction or a collection of jurisdictions. Complementary federal HCPs are governed by the Endangered Species Act (7 U.S.C. § 136, 16 U.S.C.§ 1531 et seq.) (ESA). Regional conservation plans (and certain other landscape-level conservation and management plans), may provide conservation for unlisted as well as listed species. Because the geographic scope of NCCPs and HCPs may span many hundreds of thousands of acres, these planning tools have the potential to play a significant role in conservation of burrowing owls, and grasslands and other habitats.

Fish and Game Commission Policies

There are a number of Fish and Game Commission policies (see FGC §2008) that can be applied to burrowing owl conservation. These include policies on: Raptors, Cooperation, Endangered and Threatened Species, Land Use Planning, Management and Utilization of Fish and Wildlife on Federal Lands, Management and Utilization of Fish and Wildlife on Private Lands, and Research.

GUIDING PRINCIPLES FOR CONSERVATION

Unless otherwise provided in a statewide, local, or regional conservation strategy, surveying and evaluating impacts to burrowing owls, as well as developing and implementing avoidance, minimization, and mitigation and conservation measures incorporate the following principles. These principles are a summary of Department staff expert opinion and were used to guide the preparation of this document.

1. Use the Precautionary Principle (Noss et al.1997), by which the alternative of increased conservation is deliberately chosen in order to buffer against incomplete knowledge of burrowing owl ecology and uncertainty about the consequences to burrowing owls of potential impacts, including those that are cumulative.
2. Employ basic conservation biology tenets and population-level approaches when determining what constitutes appropriate avoidance, minimization, and mitigation for impacts. Include mitigation effectiveness monitoring and reporting, and use an adaptive management loop to modify measures based on results.
3. Protect and conserve owls in wild, semi-natural, and agricultural habitats (conserve is defined at FGC §1802).
4. Protect and conserve natural nest burrows (or burrow surrogates) previously used by burrowing owls and sufficient foraging habitat and protect auxiliary "satellite" burrows that contribute to burrowing owl survivorship and natural behavior of owls.

CONSERVATION GOALS FOR THE BURROWING OWL IN CALIFORNIA

It is Department staff expert opinion that the following goals guide and contribute to the short and long-term conservation of burrowing owls in California:

1. Maintain size and distribution of extant burrowing owl populations (allowing for natural population fluctuations).
2. Increase geographic distribution of burrowing owls into formerly occupied historical range where burrowing owl habitat still exists, or where it can be created or enhanced, and where the reason for its local disappearance is no longer of concern.
3. Increase size of existing populations where possible and appropriate (for example, considering basic ecological principles such as carrying capacity, predator-prey relationships, and inter-specific relationships with other species at risk).
4. Protect and restore self-sustaining ecosystems or natural communities which can support burrowing owls at a landscape scale, and which will require minimal long-term management.
5. Minimize or prevent unnatural causes of burrowing owl population declines (e.g., nest burrow destruction, chemical control of rodent hosts and prey).
6. Augment/restore natural dynamics of burrowing owl populations including movement and genetic exchange among populations, such that the species does not require future listing and protection under the California Endangered Species Act (CESA) and/or the federal Endangered Species Act (ESA).
7. Engage stakeholders, including ranchers; farmers; military; tribes; local, state, and federal agencies; non-governmental organizations; and scientific research and education communities involved in burrowing owl protection and habitat management.

ACTIVITIES WITH THE POTENTIAL TO TAKE OR IMPACT BURROWING OWLS

The following activities are examples of activities that have the potential to take burrowing owls, their nests or eggs, or destroy or degrade burrowing owl habitat: grading, disking, cultivation, earthmoving, burrow blockage, heavy equipment compacting and crushing burrow tunnels, levee maintenance, flooding, burning and mowing (if burrows are impacted), and operating wind turbine collisions (collectively hereafter referred to as "projects" or "activities"

whether carried out pursuant to CEQA or not). In addition, the following activities may have impacts to burrowing owl populations: eradication of host burrowers; changes in vegetation management (i.e. grazing); use of pesticides and rodenticides; destruction, conversion or degradation of nesting, foraging, over-wintering or other habitats; destruction of natural burrows and burrow surrogates; and disturbance which may result in harassment of owls at occupied burrows.

PROJECT IMPACT EVALUATIONS

The following three progressive steps are effective in evaluating whether projects will result in impacts to burrowing owls. The information gained from these steps will inform any subsequent avoidance, minimization and mitigation measures. The steps for project impact evaluations are: 1) habitat assessment, 2) surveys, and 3) impact assessment. Habitat assessments are conducted to evaluate the likelihood that a site supports burrowing owl. Burrowing owl surveys provide information needed to determine the potential effects of proposed projects and activities on burrowing owls, and to avoid take in accordance with FGC sections 86, 3503, and 3503.5. Impact assessments evaluate the extent to which burrowing owls and their habitat may be impacted, directly or indirectly, on and within a reasonable distance of a proposed CEQA project activity or non-CEQA project. These three site evaluation steps are discussed in detail below.

Biologist Qualifications

The current scientific literature indicates that only individuals meeting the following minimum qualifications should perform burrowing owl habitat assessments, surveys, and impact assessments:

1. Familiarity with the species and its local ecology;
2. Experience conducting habitat assessments and non-breeding and breeding season surveys, or experience with these surveys conducted under the direction of an experienced surveyor;
3. Familiarity with the appropriate state and federal statutes related to burrowing owls, scientific research, and conservation;
4. Experience with analyzing impacts of development on burrowing owls and their habitat.

Habitat Assessment Data Collection and Reporting

A habitat assessment is the first step in the evaluation process and will assist investigators in determining whether or not occupancy surveys are needed. Refer to Appendix B for a definition of burrowing owl habitat. Compile the detailed information described in Appendix C when conducting project scoping, conducting a habitat assessment site visit and preparing a habitat assessment report.

Surveys

Burrowing owl surveys are the second step of the evaluation process and the best available scientific literature recommends that they be conducted whenever burrowing owl habitat or sign (see Appendix B) is encountered on or adjacent to (within 150 meters) a project site

(Thomsen 1971, Martin 1973). Occupancy of burrowing owl habitat is confirmed at a site when at least one burrowing owl, or its sign at or near a burrow entrance, is observed within the last three years (Rich 1984). Burrowing owls are more detectable during the breeding season with detection probabilities being highest during the nestling stage (Conway et al. 2008). In California, the burrowing owl breeding season extends from 1 February to 31 August (Haug et al. 1993, Thompsen 1971) with some variances by geographic location and climatic conditions. Several researchers suggest three or more survey visits during daylight hours (Haug and Diduik 1993, CBOC 1997, Conway and Simon 2003) and recommend each visit occur at least three weeks apart during the peak of the breeding season, commonly accepted in California as between 15 April and 15 July (CBOC 1997). Conway and Simon (2003) and Conway et al. (2008) recommended conducting surveys during the day when most burrowing owls in a local area are in the laying and incubation period (so as not to miss early breeding attempts), during the nesting period, and in the late nestling period when most owls are spending time above ground.

Non-breeding season (1 September to 31 January) surveys may provide information on burrowing owl occupancy, but do not substitute for breeding season surveys because results are typically inconclusive. Burrowing owls are more difficult to detect during the non-breeding season and their seasonal residency status is difficult to ascertain. Burrowing owls detected during non-breeding season surveys may be year-round residents, young from the previous breeding season, pre-breeding territorial adults, winter residents, dispersing juveniles, migrants, transients or new colonizers. In addition, the numbers of owls and their pattern of distribution may differ during winter and breeding seasons. However, on rare occasions, non-breeding season surveys may be warranted (i.e., if the site is believed to be a wintering site only based on negative breeding season results). Refer to Appendix D for information on breeding season and non-breeding season survey methodologies.

Survey Reports

Adequate information about burrowing owls present in and adjacent to an area that will be disturbed by a project or activity will enable the Department, reviewing agencies and the public to effectively assess potential impacts and will guide the development of avoidance, minimization, and mitigation measures. The survey report includes but is not limited to a description of the proposed project or proposed activity, including the proposed project start and end dates, as well as a description of disturbances or other activities occurring on-site or nearby. Refer to Appendix D for details included in a survey report.

Impact Assessment

The third step in the evaluation process is the impact assessment. When surveys confirm occupied burrowing owl habitat in or adjoining the project area, there are a number of ways to assess a project's potential significant impacts to burrowing owls and their habitat. Richardson and Miller (1997) recommended monitoring raptor behavior prior to developing management recommendations and buffers to determine the extent to which individuals have been sensitized to human disturbance. Monitoring results will also provide detail necessary for developing site-specific measures. Postovit and Postovit (1987) recommended an analytical approach to mitigation planning: define the problem (impact), set goals (to guide mitigation development), evaluate and select mitigation methods, and monitor the results.

Define the problem. The impact assessment evaluates all factors that could affect burrowing owls. Postovit and Postovit (1987) recommend evaluating the following in assessing impacts to raptors and planning mitigation: type and extent of disturbance, duration and timing of disturbance, visibility of disturbance, sensitivity and ability to habituate, and influence of environmental factors. They suggest identifying and addressing all potential direct and indirect impacts to burrowing owls, regardless of whether or not the impacts will occur during the breeding season. Several examples are given for each impact category below; however, examples are not intended to be used exclusively.

Type and extent of the disturbance. The impact assessment describes the nature (source) and extent (scale) of potential project impacts on occupied, satellite and unoccupied burrows including acreage to be lost (temporary or permanent), fragmentation/edge being created, increased distance to other nesting and foraging habitat, and habitat degradation. Discuss any project activities that impact either breeding and/or non-breeding habitat which could affect owl home range size and spatial configuration, negatively affect onsite and offsite burrowing owl presence, increase energetic costs, lower reproductive success, increase vulnerability to predation, and/or decrease the chance of procuring a mate.

Duration and timing of the impact. The impact assessment describes the amount of time the burrowing owl habitat will be unavailable to burrowing owls (temporary or permanent) on the site and the effect of that loss on essential behaviors or life history requirements of burrowing owls, the overlap of project activities with breeding and/or non-breeding seasons (timing of nesting and/or non-breeding activities may vary with latitude and climatic conditions, which should be considered with the timeline of the project or activity), and any variance of the project activities in intensity, scale and proximity relative to burrowing owl occurrences.

Visibility and sensitivity. Some individual burrowing owls or pairs are more sensitive than others to specific stimuli and may habituate to ongoing visual or audible disturbance. Site-specific monitoring may provide clues to the burrowing owl's sensitivities. This type of assessment addresses the sensitivity of burrowing owls within their nesting area to humans on foot, and vehicular traffic. Other variables are whether the site is primarily in a rural versus urban setting, and whether any prior disturbance (e.g., human development or recreation) is known at the site.

Environmental factors. The impact assessment discusses any environmental factors that could be influenced or changed by the proposed activities including nest site availability, predators, prey availability, burrowing mammal presence and abundance, and threats from other extrinsic factors such as human disturbance, urban interface, feral animals, invasive species, disease or pesticides.

Significance of impacts. The impact assessment evaluates the potential loss of nesting burrows, satellite burrows, foraging habitat, dispersal and migration habitat, wintering habitat, and habitat linkages, including habitat supporting prey and host burrowers and other essential habitat attributes. This assessment determines if impacts to the species will result in significant impacts to the species locally, regionally and range-wide per CEQA Guidelines §15382 and Appendix G. The significance of the impact to habitat depends on the extent of habitat disturbed and length of time the habitat is unavailable (for example: minor – several days, medium – several weeks to months, high - breeding season affecting juvenile survival,

or over winter affecting adult survival).

Cumulative effects. The cumulative effects assessment evaluates two consequences: 1) the project's proportional share of reasonably foreseeable impacts on burrowing owls and habitat caused by the project or in combination with other projects and local influences having impacts on burrowing owls and habitat, and 2) the effects on the regional owl population resulting from the project's impacts to burrowing owls and habitat.

Mitigation goals. Establishing goals will assist in planning mitigation and selecting measures that function at a desired level. Goals also provide a standard by which to measure mitigation success. Unless specifically provided for through other FGC Sections or through specific regulations, take, possession or destruction of individual burrowing owls, their nests and eggs is prohibited under FGC sections 3503, 3503.5 and 3513. Therefore, a required goal for all project activities is to avoid take of burrowing owls. Under CEQA, goals would consist of measures that would avoid, minimize and mitigate impacts to a less than significant level. For individual projects, mitigation must be roughly proportional to the level of impacts, including cumulative impacts, in accordance with the provisions of CEQA (CEQA Guidelines, §§ 15126.4(a)(4)(B), 15064, 15065, and 16355). In order for mitigation measures to be effective, they must be specific, enforceable, and feasible actions that will improve environmental conditions. As set forth in more detail in Appendix A, the current scientific literature supports the conclusion that mitigation for permanent habitat loss necessitates replacement with an equivalent or greater habitat area for breeding, foraging, wintering, dispersal, presence of burrows, burrow surrogates, presence of fossorial mammal dens, well drained soils, and abundant and available prey within close proximity to the burrow.

MITIGATION METHODS

The current scientific literature indicates that any site-specific avoidance or mitigation measures developed should incorporate the best practices presented below or other practices confirmed by experts and the Department. The Department is available to assist in the development of site-specific avoidance and mitigation measures.

Avoiding. A primary goal is to design and implement projects to seasonally and spatially avoid negative impacts and disturbances that could result in take of burrowing owls, nests, or eggs. Other avoidance measures may include but not be limited to:

- Avoid disturbing occupied burrows during the nesting period, from 1 February through 31 August.
- Avoid impacting burrows occupied during the non-breeding season by migratory or non-migratory resident burrowing owls.
- Avoid direct destruction of burrows through chaining (dragging a heavy chain over an area to remove shrubs), disking, cultivation, and urban, industrial, or agricultural development.
- Develop and implement a worker awareness program to increase the on-site worker's recognition of and commitment to burrowing owl protection.
- Place visible markers near burrows to ensure that farm equipment and other machinery does not collapse burrows.
- Do not fumigate, use treated bait or other means of poisoning nuisance animals in areas where burrowing owls are known or suspected to occur (e.g., sites observed with nesting

owls, designated use areas).
- Restrict the use of treated grain to poison mammals to the months of January and February.

Take avoidance (pre-construction) surveys. Take avoidance surveys are intended to detect the presence of burrowing owls on a project site at a fixed period in time and inform necessary take avoidance actions. Take avoidance surveys may detect changes in owl presence such as colonizing owls that have recently moved onto the site, migrating owls, resident burrowing owls changing burrow use, or young of the year that are still present and have not dispersed. Refer to Appendix D for take avoidance survey methodology.

Site surveillance. Burrowing owls may attempt to colonize or re-colonize an area that will be impacted; thus, the current scientific literature indicates a need for ongoing surveillance at the project site during project activities is recommended. The surveillance frequency/effort should be sufficient to detect burrowing owls if they return. Subsequent to their new occupancy or return to the site, take avoidance measures should assure with a high degree of certainty that take of owls will not occur.

Minimizing. If burrowing owls and their habitat can be protected in place on or adjacent to a project site, the use of buffer zones, visual screens or other measures while project activities are occurring can minimize disturbance impacts. Conduct site-specific monitoring to inform development of buffers (see Visibility and sensitivity above). The following general guidelines for implementing buffers should be adjusted to address site-specific conditions using the impact assessment approach described above. The CEQA lead agency and/or project proponent is encouraged to consult with the Department and other burrowing owl experts for assistance in developing site-specific buffer zones and visual screens.

Buffers. Holroyd et al. (2001) identified a need to standardize management and disturbance mitigation guidelines. For instance, guidelines for mitigating impacts by petroleum industries on burrowing owls and other prairie species (Scobie and Faminow, 2000) may be used as a template for future mitigation guidelines (Holroyd et al. 2001). Scobie and Faminow (2000) developed guidelines for activities around occupied burrowing owl nests recommending buffers around low, medium, and high disturbance activities, respectively (see below).

Recommended restricted activity dates and setback distances by level of disturbance for burrowing owls (Scobie and Faminow 2000).

Location	Time of Year	Level of Disturbance		
		Low	Med	High
Nesting sites	April 1-Aug 15	200 m*	500 m	500 m
Nesting sites	Aug 16-Oct 15	200 m	200 m	500 m
Nesting sites	Oct 16-Mar 31	50 m	100 m	500 m

* meters (m)

Based on existing vegetation, human development, and land uses in an area, resource managers may decide to allow human development or resource extraction closer to these area/sites than recommended above. However, if it is decided to allow activities closer than

the setback distances recommended, a broad-scale, long-term, scientifically-rigorous monitoring program ensures that burrowing owls are not detrimentally affected by alternative approaches.

Other minimization measures include eliminating actions that reduce burrowing owl forage and burrowing surrogates (e.g. ground squirrel), or introduce/facilitate burrowing owl predators. Actions that could influence these factors include reducing livestock grazing rates and/or changing the timing or duration of grazing or vegetation management that could result in less suitable habitat.

Burrow exclusion and closure. Burrow exclusion is a technique of installing one-way doors in burrow openings during the non-breeding season to temporarily exclude burrowing owls, or permanently exclude burrowing owls and close burrows after verifying burrows are empty by site monitoring and scoping. Exclusion in and of itself is not a take avoidance, minimization or mitigation method. Eviction of burrowing owls is a potentially significant impact under CEQA.

The long-term demographic consequences of these techniques have not been thoroughly evaluated, and the fate of evicted or excluded burrowing owls has not been systematically studied. Because burrowing owls are dependent on burrows at all times of the year for survival and/or reproduction, evicting them from nesting, roosting, and satellite burrows may lead to indirect impacts or take. Temporary or permanent closure of burrows may result in significant loss of burrows and habitat for reproduction and other life history requirements. Depending on the proximity and availability of alternate habitat, loss of access to burrows will likely result in varying levels of increased stress on burrowing owls and could depress reproduction, increase predation, increase energetic costs, and introduce risks posed by having to find and compete for available burrows. Therefore, exclusion and burrow closure are not recommended where they can be avoided. The current scientific literature indicates consideration of all possible avoidance and minimization measures before temporary or permanent exclusion and closure of burrows is implemented, in order to avoid take.

The results of a study by Trulio (1995) in California showed that burrowing owls passively displaced from their burrows were quickly attracted to adjacent artificial burrows at five of six passive relocation sites. The successful sites were all within 75 meters (m) of the destroyed burrow, a distance generally within a pair's territory. This researcher discouraged using passive relocation to artificial burrows as a mitigation measure for lost burrows without protection of adjacent foraging habitat. The study results indicated artificial burrows were used by evicted burrowing owls when they were approximately 50-100 m from the natural burrow (Thomsen 1971, Haug and Oliphant 1990). Locating artificial or natural burrows more than 100 m from the eviction burrow may greatly reduce the chances that new burrows will be used. Ideally, exclusion and burrow closure is employed only where there are adjacent natural burrows and non-impacted, sufficient habitat for burrowing owls to occupy with permanent protection mechanisms in place. Any new burrowing owl colonizing the project site after the CEQA document has been adopted may constitute changed circumstances that should be addressed in a re-circulated CEQA document.

The current scientific literature indicates that burrow exclusion should only be conducted by qualified biologists (meeting the Biologist’s Qualifications above) during the non-breeding

season, before breeding behavior is exhibited and after the burrow is confirmed empty by site surveillance and/or scoping. The literature also indicates that when temporary or permanent burrow exclusion and/or burrow closure is implemented, burrowing owls should not be excluded from burrows unless or until:

- A Burrowing Owl Exclusion Plan (see Appendix E) is developed and approved by the applicable local DFG office;
- Permanent loss of occupied burrow(s) and habitat is mitigated in accordance with the Mitigating Impacts sections below. Temporary exclusion is mitigated in accordance with the item #1 under Mitigating Impacts below.
- Site monitoring is conducted prior to, during, and after exclusion of burrowing owls from their burrows sufficient to ensure take is avoided. Conduct daily monitoring for one week to confirm young of the year have fledged if the exclusion will occur immediately after the end of the breeding season.
- Excluded burrowing owls are documented using artificial or natural burrows on an adjoining mitigation site (if able to confirm by band re-sight).

Translocation (Active relocation offsite >100 meters). At this time, there is little published information regarding the efficacy of translocating burrowing owls, and additional research is needed to determine subsequent survival and breeding success (Klute et al. 2003, Holroyd et al. 2001). Study results for translocation in Florida implied that hatching success may be decreased for populations of burrowing owls that undergo translocation (Nixon 2006). At this time, the Department is unable to authorize the capture and relocation of burrowing owls except within the context of scientific research (FGC §1002) or a NCCP conservation strategy.

Mitigating impacts. Habitat loss and degradation from rapid urbanization of farmland in the core areas of the Central and Imperial valleys is the greatest of many threats to burrowing owls in California (Shuford and Gardali, 2008). At a minimum, if burrowing owls have been documented to occupy burrows (see Definitions, Appendix B) at the project site in recent years, the current scientific literature supports the conclusion that the site should be considered occupied and mitigation should be required by the CEQA lead agency to address project-specific significant and cumulative impacts. Other site-specific and regionally significant and cumulative impacts may warrant mitigation. The current scientific literature indicates the following to be best practices. If these best practices cannot be implemented, the lead agency or lead investigator may consult with the Department to develop effective mitigation alternatives. The Department is also available to assist in the identification of suitable mitigation lands.

1. Where habitat will be temporarily disturbed, restore the disturbed area to pre-project condition including decompacting soil and revegetating. Permanent habitat protection may be warranted if there is the potential that the temporary impacts may render a nesting site (nesting burrow and satellite burrows) unsustainable or unavailable depending on the time frame, resulting in reduced survival or abandonment. For the latter potential impact, see the permanent impact measures below.
2. Mitigate for permanent impacts to nesting, occupied and satellite burrows and/or burrowing owl habitat such that the habitat acreage, number of burrows and burrowing owls impacted are replaced based on the information provided in Appendix A. Note: A

minimum habitat replacement recommendation is not provided here as it has been shown to serve as a default, replacing any site-specific analysis and discounting the wide variation in natal area, home range, foraging area, and other factors influencing burrowing owls and burrowing owl population persistence in a particular area.

3. Mitigate for permanent impacts to nesting, occupied and satellite burrows and burrowing owl habitat with (a) permanent conservation of similar vegetation communities (grassland, scrublands, desert, urban, and agriculture) to provide for burrowing owl nesting, foraging, wintering, and dispersal (i.e., during breeding and non-breeding seasons) comparable to or better than that of the impact area, and (b) sufficiently large acreage, and presence of fossorial mammals. The mitigation lands may require habitat enhancements including enhancement or expansion of burrows for breeding, shelter and dispersal opportunity, and removal or control of population stressors. If the mitigation lands are located adjacent to the impacted burrow site, ensure the nearest neighbor artificial or natural burrow clusters are at least within 210 meters (Fisher et al. 2007).
4. Permanently protect mitigation land through a conservation easement deeded to a non-profit conservation organization or public agency with a conservation mission, for the purpose of conserving burrowing owl habitat and prohibiting activities incompatible with burrowing owl use. If the project is located within the service area of a Department-approved burrowing owl conservation bank, the project proponent may purchase available burrowing owl conservation bank credits.
5. Develop and implement a mitigation land management plan to address long-term ecological sustainability and maintenance of the site for burrowing owls (see Management Plan and Artificial Burrow sections below, if applicable).
6. Fund the maintenance and management of mitigation land through the establishment of a long-term funding mechanism such as an endowment.
7. Habitat should not be altered or destroyed, and burrowing owls should not be excluded from burrows, until mitigation lands have been legally secured, are managed for the benefit of burrowing owls according to Department-approved management, monitoring and reporting plans, and the endowment or other long-term funding mechanism is in place or security is provided until these measures are completed.
8. Mitigation lands should be on, adjacent or proximate to the impact site where possible and where habitat is sufficient to support burrowing owls present.
9. Where there is insufficient habitat on, adjacent to, or near project sites where burrowing owls will be excluded, acquire mitigation lands with burrowing owl habitat away from the project site. The selection of mitigation lands should then focus on consolidating and enlarging conservation areas located outside of urban and planned growth areas, within foraging distance of other conserved lands. If mitigation lands are not available adjacent to other conserved lands, increase the mitigation land acreage requirement to ensure a selected site is of sufficient size. Offsite mitigation may not adequately offset the biological and habitat values impacted on a one to one basis. Consult with the Department when determining offsite mitigation acreages.
10. Evaluate and select suitable mitigation lands based on a comparison of the habitat attributes of the impacted and conserved lands, including but not limited to: type and structure of habitat being impacted or conserved; density of burrowing owls in impacted and conserved habitat; and significance of impacted or conserved habitat to the species range-wide. Mitigate for the highest quality burrowing owl habitat impacted first and foremost when identifying mitigation lands, even if a mitigation site is located outside of

a lead agency's jurisdictional boundary, particularly if the lead agency is a city or special district.

11. Select mitigation lands taking into account the potential human and wildlife conflicts or incompatibility, including but not limited to, human foot and vehicle traffic, and predation by cats, loose dogs and urban-adapted wildlife, and incompatible species management (i.e., snowy plover).
12. Where a burrowing owl population appears to be highly adapted to heavily altered habitats such as golf courses, airports, athletic fields, and business complexes, permanently protecting the land, augmenting the site with artificial burrows, and enhancing and maintaining those areas may enhance sustainability of the burrowing owl population onsite. Maintenance includes keeping lands grazed or mowed with weed-eaters or push mowers, free from trees and shrubs, and preventing excessive human and human-related disturbance (e.g., walking, jogging, off-road activity, dog-walking) and loose and feral pets (chasing and, presumably, preying upon owls) that make the environment uninhabitable for burrowing owls (Wesemann and Rowe 1985, Millsap and Bear 2000, Lincer and Bloom 2007). Items 4, 5 and 6 also still apply to this mitigation approach.
13. If there are no other feasible mitigation options available and a lead agency is willing to establish and oversee a Burrowing Owl Mitigation and Conservation Fund that funds on a competitive basis acquisition and permanent habitat conservation, the project proponent may participate in the lead agency's program.

Artificial burrows. Artificial burrows have been used to replace natural burrows either temporarily or long-term and their long-term success is unclear. Artificial burrows may be an effective addition to in-perpetuity habitat mitigation if they are augmenting natural burrows, the burrows are regularly maintained (i.e., no less than annual, with biennial maintenance recommended), and surrounding habitat patches are carefully maintained. There may be some circumstances, for example at airports, where squirrels will not be allowed to persist and create a dynamic burrow system, where artificial burrows may provide some support to an owl population.

Many variables may contribute to the successful use of artificial burrows by burrowing owls, including pre-existence of burrowing owls in the area, availability of food, predators, surrounding vegetation and proximity, number of natural burrows in proximity, type of materials used to build the burrow, size of the burrow and entrance, direction in which the burrow entrance is facing, slope of the entrance, number of burrow entrances per burrow, depth of the burrow, type and height of perches, and annual maintenance needs (Belthoff and King 2002, Smith et al. 2005, Barclay et al. 2011). Refer to Barclay (2008) and (2011) and to Johnson et al. 2010 (unpublished report) for guidance on installing artificial burrows including recommendations for placement, installation and maintenance.

Any long-term reliance on artificial burrows as natural burrow replacements must include semi-annual to annual cleaning and maintenance and/or replacement (Barclay et al. 2011, Smith and Conway 2005, Alexander et al. 2005) as an ongoing management practice. Alexander et al. (2005), in a study of the use of artificial burrows found that all of 20 artificial burrows needed some annual cleaning and maintenance. Burrows were either excavated by predators, blocked by soil or vegetation, or experienced substrate erosion forming a space beneath the tubing that prevented nestlings from re-entering the burrow.

Mitigation lands management plan. Develop a Mitigation Lands Management Plan for projects that require off-site or on-site mitigation habitat protection to ensure compliance with and effectiveness of identified management actions for the mitigation lands. A suggested outline and related vegetation management goals and monitoring success criteria can be found in Appendix E.

Mitigation Monitoring and Reporting

Verify the compliance with required mitigation measures, the accuracy of predictions, and ensure the effectiveness of all mitigation measures for burrowing owls by conducting follow-up monitoring, and implementing midcourse corrections, if necessary, to protect burrowing owls. Refer to CEQA Guidelines Section 15097 and the CEQA Guidelines for additional guidance on mitigation, monitoring and reporting. Monitoring is qualitatively different from site surveillance; monitoring normally has a specific purpose and its outputs and outcomes will usually allow a comparison with some baseline condition of the site before the mitigation (including avoidance and minimization) was undertaken. Ideally, monitoring should be based on the Before-After Control-Impact (BACI) principle (McDonald et al. 2000) that requires knowledge of the pre-mitigation state to provide a reference point for the state and change in state after the project and mitigation have been implemented.

ACKNOWLEDGEMENTS

We thank Jack Barclay, Jeff Lincer, David Plumpton, Jeff Kidd, Carol Roberts and other reviewers for their valuable comments on this report. We also want to acknowledge all the hard work of the Department team, especially T. Bartlett, K. Riesz, S. Wilson, D. Gifford, D. Mayer, J. Gan, L. Connolly, D. Mayer, A. Donlan, L. Bauer, L. Comrack, D. Lancaster, E. Burkett, B. Johnson, D. Johnston, A. Gonzales, S. Morey and K. Hunting.

Appendix A. Burrowing Owl Natural History and Threats

Diet

Burrowing owl diet includes arthropods, small rodents, birds, amphibians, reptiles, and carrion (Haug et al. 1993).

Breeding

In California, the breeding season for the burrowing owl typically occurs between 1 February and 31 August although breeding in December has been documented (Thompson 1971, Gervais et al. 2008); breeding behavior includes nest site selection by the male, pair formation, copulation, egg laying, hatching, fledging, and post-fledging care of young by the parents. The peak of the breeding season occurs between 15 April and 15 July and is the period when most burrowing owls have active nests (eggs or young). The incubation period lasts 29 days (Coulombe 1971) and young fledge after 44 days (Haug et al. 1993). Note that the timing of nesting activities may vary with latitude and climatic conditions. Burrowing owls may change burrows several times during the breeding season, starting when nestlings are about three weeks old (Haug et al. 1993).

Dispersal

The following discussion is an excerpt from Gervais et al (2008):

> "The burrowing owl is often considered a sedentary species (e.g., Thomsen 1971). A large proportion of adults show strong fidelity to their nest site from year to year, especially where resident, as in Florida (74% for females, 83% for males; Millsap and Bear 1997). In California, nest-site fidelity rates were 32%–50% in a large grassland and 57% in an agricultural environment (Ronan 2002, Catlin 2004, Catlin et al. 2005). Differences in these rates among sites may reflect differences in nest predation rates (Catlin 2004, Catlin et al. 2005). Despite the high nest fidelity rates, dispersal distances may be considerable for both juveniles (natal dispersal) and adults (postbreeding dispersal), but this also varied with location (Catlin 2004, Rosier et al. 2006). Distances of 53 km to roughly 150 km have been observed in California for adult and natal dispersal, respectively (D. K. Rosenberg and J. A. Gervais, unpublished data), despite the difficulty in detecting movements beyond the immediate study area (Koenig et al. 1996)."

Habitat

The burrowing owl is a small, long-legged, ground-dwelling bird species, well-adapted to open, relatively flat expanses. In California, preferred habitat is generally typified by short, sparse vegetation with few shrubs, level to gentle topography and well-drained soils (Haug et al. 1993). Grassland, shrub steppe, and desert are naturally occurring habitat types used by the species. In addition, burrowing owls may occur in some agricultural areas, ruderal grassy fields, vacant lots and pastures if the vegetation structure is suitable and there are useable burrows and foraging habitat in proximity (Gervais et al 2008). Unique amongst North

American raptors, the burrowing owl requires underground burrows or other cavities for nesting during the breeding season and for roosting and cover, year round. Burrows used by the owls are usually dug by other species termed host burrowers. In California, California ground squirrel (*Spermophilus beecheyi*) and round-tailed ground squirrel (*Citellus tereticaudus*) burrows are frequently used by burrowing owls but they may use dens or holes dug by other fossorial species including badger (*Taxidea taxus*), coyote (*Canis latrans*), and fox (e.g., San Joaquin kit fox, *Vulpes macrotis mutica*; Ronan 2002). In some instances, owls have been known to excavate their own burrows (Thompson 1971, Barclay 2007). Natural rock cavities, debris piles, culverts, and pipes also are used for nesting and roosting (Rosenberg et al. 1998). Burrowing owls have been documented using artificial burrows for nesting and cover (Smith and Belthoff, 2003).

Foraging habitat. Foraging habitat is essential to burrowing owls. The following discussion is an excerpt from Gervais et al. (2008):

> "Useful as a rough guide to evaluating project impacts and appropriate mitigation for burrowing owls, adult male burrowing owls home ranges have been documented (calculated by minimum convex polygon) to comprise anywhere from 280 acres in intensively irrigated agroecosystems in Imperial Valley (Rosenberg and Haley 2004) to 450 acres in mixed agricultural lands at Lemoore Naval Air Station, CA (Gervais et al. 2003), to 600 acres in pasture in Saskatchewan, Canada (Haug and Oliphant 1990). But owl home ranges may be much larger, perhaps by an order of magnitude, in non-irrigated grasslands such as at Carrizo Plain, California (Gervais et al. 2008), based on telemetry studies and distribution of nests. Foraging occurs primarily within 600 m of their nests (within approximately 300 acres, based on a circle with a 600 m radius) during the breeding season."

Importance of burrows and adjacent habitat. Burrows and the associated surrounding habitat are essential ecological requisites for burrowing owls throughout the year and especially during the breeding season. During the non-breeding season, burrowing owls remain closely associated with burrows, as they continue to use them as refuge from predators, shelter from weather and roost sites. Resident populations will remain near the previous season's nest burrow at least some of the time (Coulombe 1971, Thomsen 1971, Botelho 1996, LaFever et al. 2008).

In a study by Lutz and Plumpton (1999) adult males and females nested in formerly used sites at similar rates (75% and 63%, respectively) (Lutz and Plumpton 1999). Burrow fidelity has been reported in some areas; however, more frequently, burrowing owls reuse traditional nesting areas without necessarily using the same burrow (Haug et al. 1993, Dechant et al. 1999). Burrow and nest sites are re-used at a higher rate if the burrowing owl has reproduced successfully during the previous year (Haug et al. 1993) and if the number of burrows isn't limiting nesting opportunity.

Burrowing owls may use "satellite" or non-nesting burrows, moving young at 10-14 days, presumably to reduce risk of predation (Desmond and Savidge 1998) and possibly to avoid nest parasites (Dechant et al. 1999). Successful nests in Nebraska had more active satellite burrows within 75 m of the nest burrow than unsuccessful nests (Desmond and Savidge

1999). Several studies have documented the number of satellite burrows used by young and adult burrowing owls during the breeding season as between one and 11 burrows with an average use of approximately five burrows (Thompsen 1984, Haug 1985, Haug and Oliphant 1990). Supporting the notion of selecting for nest sites near potential satellite burrows, Ronan (2002) found burrowing owl families would move away from a nest site if their satellite burrows were experimentally removed through blocking their entrance.

Habitat adjacent to burrows has been documented to be important to burrowing owls. Gervais et al. (2003) found that home range sizes of male burrowing owls during the nesting season were highly variable within but not between years. Their results also suggested that owls concentrate foraging efforts within 600 meters of the nest burrow, as was observed in Canada (Haug and Oliphant 1990) and southern California (Rosenberg and Haley 2004). James et al. (1997), reported habitat modification factors causing local burrowing owl declines included habitat fragmentation and loss of connectivity.

In conclusion, the best available science indicates that essential habitat for the burrowing owl in California must include suitable year-round habitat, primarily for breeding, foraging, wintering and dispersal habitat consisting of short or sparse vegetation (at least at some time of year), presence of burrows, burrow surrogates or presence of fossorial mammal dens, well-drained soils, and abundant and available prey within close proximity to the burrow.

Threats to Burrowing Owls in California

Habitat loss. Habitat loss, degradation, and fragmentation are the greatest threats to burrowing owls in California. According to DeSante et al. (2007), “the vast majority of burrowing owls [now] occur in the wide, flat lowland valleys and basins of the Imperial Valley and Great Central Valley [where] for the most part,...the highest rates of residential and commercial development in California are occurring.” Habitat loss from the State’s long history of urbanization in coastal counties has already resulted in either extirpation or drastic reduction of burrowing owl populations there (Gervais et al. 2008). Further, loss of agricultural and other open lands (such as grazed landscapes) also negatively affect owl populations. Because of their need for open habitat with low vegetation, burrowing owls are unlikely to persist in agricultural lands dominated by vineyards and orchards (Gervais et al. 2008).

Control of burrowing rodents. According to Klute et al. (2003), the elimination of burrowing rodents through control programs is a primary factor in the recent and historical decline of burrowing owl populations nationwide. In California, ground squirrel burrows are most often used by burrowing owls for nesting and cover; thus, ground squirrel control programs may affect owl numbers in local areas by eliminating a necessary resource.

Direct mortality. Burrowing owls suffer direct losses from a number of sources. Vehicle collisions are a significant source of mortality especially in the urban interface and where owls nest alongside roads (Haug et al. 1993, Gervais et al. 2008). Road and ditch maintenance, modification of water conveyance structures (Imperial Valley) and discing to control weeds in fallow fields may destroy burrows (Rosenberg and Haley 2004, Catlin and Rosenberg 2006) which may trap or crush owls. Wind turbines at Altamont Pass Wind Resource Area are known to cause direct burrowing owl mortality (Thelander et al. 2003). Exposure to

pesticides may pose a threat to the species but is poorly understood (Klute et al. 2003, Gervais et al. 2008).

Appendix B. Definitions

Some key terms that appear in this document are defined below.

Adjacent habitat means burrowing owl habitat that abuts the area where habitat and burrows will be impacted and rendered non-suitable for occupancy.

Breeding (nesting) season begins as early as 1 February and continues through 31 August (Thomsen 1971, Zarn 1974). The timing of breeding activities may vary with latitude and climatic conditions. The breeding season includes pairing, egg-laying and incubation, and nestling and fledging stages.

Burrow exclusion is a technique of installing one-way doors in burrow openings during the non-breeding season to temporarily exclude burrowing owls or permanently exclude burrowing owls and excavate and close burrows after confirming burrows are empty.

Burrowing owl habitat generally includes, but is not limited to, short or sparse vegetation (at least at some time of year), presence of burrows, burrow surrogates or presence of fossorial mammal dens, well-drained soils, and abundant and available prey.

Burrow surrogates include culverts, piles of concrete rubble, piles of soil, burrows created along soft banks of ditches and canals, pipes, and similar structures.

Civil twilight - Morning civil twilight begins when the geometric center of the sun is 6 degrees below the horizon (civil dawn) and ends at sunrise. Evening civil twilight begins at sunset and ends when the geometric center of the sun reaches 6 degrees below the horizon (civil dusk). During this period there is enough light from the sun that artificial sources of light may not be needed to carry on outdoor activities. This concept is sometimes enshrined in laws, for example, when drivers of automobiles must turn on their headlights (called lighting-up time in the UK); when pilots may exercise the rights to fly aircraft. Civil twilight can also be described as the limit at which twilight illumination is sufficient, under clear weather conditions, for terrestrial objects to be clearly distinguished; at the beginning of morning civil twilight, or end of evening civil twilight, the horizon is clearly defined and the brightest stars are visible under clear atmospheric conditions.

Conservation for burrowing owls may include but may not be limited to protecting remaining breeding pairs or providing for population expansion, protecting and enhancing breeding and essential habitat, and amending or augmenting land use plans to stabilize populations and other specific actions to avoid the need to list the species pursuant to California or federal Endangered Species Acts.

Contiguous means connected together so as to form an uninterrupted expanse in space.

Essential habitat includes nesting, foraging, wintering, and dispersal habitat.

Foraging habitat is habitat within the estimated home range of an occupied burrow, supports suitable prey base, and allows for effective hunting.

Host burrowers include ground squirrels, badgers, foxes, coyotes, gophers etc.

Locally significant species is a species that is not rare from a statewide perspective but is rare or uncommon in a local context such as within a county or region (CEQA §15125 (c)) or is so designated in local or regional plans, policies, or ordinances (CEQA Guidelines, Appendix G). Examples include a species at the outer limits of its known range or occurring in a unique habitat type.

Non-breeding season is the period of time when nesting activity is not occurring, generally September 1 through January 31, but may vary with latitude and climatic conditions.

Occupied site or occupancy means a site that is assumed occupied if at least one burrowing owl has been observed occupying a burrow within the last three years (Rich 1984). Occupancy of suitable burrowing owl habitat may also be indicated by owl sign including its molted feathers, cast pellets, prey remains, eggshell fragments, or excrement at or near a burrow entrance or perch site.

Other impacting activities may include but may not be limited to agricultural practices, vegetation management and fire control, pest management, conversion of habitat from rangeland or natural lands to more intensive agricultural uses that could result in “take”. These impacting activities may not meet the definition of a project under CEQA.

Passive relocation is a technique of installing one-way doors in burrow openings to temporarily or permanently evict burrowing owls and prevent burrow re-occupation.

Peak of the breeding season is between 15 April and 15 July.

Sign includes its tracks, molted feathers, cast pellets (defined as 1-2” long brown to black regurgitated pellets consisting of non-digestible portions of the owls’ diet, such as fur, bones, claws, beetle elytra, or feathers), prey remains, egg shell fragments, owl white wash, nest burrow decoration materials (e.g., paper, foil, plastic items, livestock or other animal manure, etc.), possible owl perches, or other items.

Appendix C. Habitat Assessment and Reporting Details

Habitat Assessment Data Collection and Reporting

Current scientific literature indicates that it would be most effective to gather the data in the manner described below when conducting project scoping, conducting a habitat assessment site visit and preparing a habitat assessment report:

1. Conduct at least one visit covering the entire potential project/activity area including areas that will be directly or indirectly impacted by the project. Survey adjoining areas within 150 m (Thomsen 1971, Martin 1973), or more where direct or indirect effects could potentially extend offsite. If lawful access cannot be achieved to adjacent areas, surveys can be performed with a spotting scope or other methods.
2. Prior to the site visit, compile relevant biological information for the site and surrounding area to provide a local and regional context.
3. Check all available sources for burrowing owl occurrence information regionally prior to a field inspection. The CNDDB and BIOS (see References cited) may be consulted for known occurrences of burrowing owls. Other sources of information include, but are not limited to, the Proceedings of the California Burrowing Owl Symposium (Barclay et al. 2007), county bird atlas projects, Breeding Bird Survey records, eBIRD (http://ebird.org), Gervais et al. (2008), local reports or experts, museum records, and other site-specific relevant information.
4. Identify vegetation and habitat types potentially supporting burrowing owls in the project area and vicinity.
5. Record and report on the following information:
    a. A full description of the proposed project, including but not limited to, expected work periods, daily work schedules, equipment used, activities performed (such as drilling, construction, excavation, etc.) and whether the expected activities will vary in location or intensity over the project's timeline;
    b. A regional setting map, showing the general project location relative to major roads and other recognizable features;
    c. A detailed map (preferably a USGS topo 7.5' quad base map) of the site and proposed project, including the footprint of proposed land and/or vegetation-altering activities, base map source, identifying topography, landscape features, a north arrow, bar scale, and legend;
    d. A written description of the biological setting, including location (Section, Township, Range, baseline and meridian), acreage, topography, soils, geographic and hydrologic characteristics, land use and management history on and adjoining the site (i.e., whether it is urban, semi-urban or rural; whether there is any evidence of past or current livestock grazing, mowing, disking, or other vegetation management activities);
    e. An analysis of any relevant, historical information concerning burrowing owl use or occupancy (breeding, foraging, over-wintering) on site or in the assessment area;
    f. Vegetation type and structure (using Sawyer et al. 2009), vegetation height, habitat types and features in the surrounding area plus a reasonably sized (as supported with logical justification) assessment area; (Note: use caution in discounting habitat based on grass height as it can be a temporary condition variable by season and conditions (such as current grazing regime) or may be distributed as a mosaic).

g. The presence of burrowing owl individuals or pairs or sign (see Appendix B);
h. The presence of suitable burrows and/or burrow surrogates (>11 cm in diameter (height and width) and >150 cm in depth) (Johnson et al. 2010), regardless of a lack of any burrowing owl sign and/or burrow surrogates; and burrowing owls and/or their sign that have recently or historically (within the last 3 years) been identified on or adjacent to the site.

Appendix D. Breeding and Non-breeding Season Surveys and Reports

Current scientific literature indicates that it is most effective to conduct breeding and non-breeding season surveys and report in the manner that follows:

Breeding Season Surveys

Number of visits and timing. Conduct 4 survey visits: 1) at least one site visit between 15 February and 15 April, and 2) a minimum of three survey visits, at least three weeks apart, between 15 April and 15 July, with at least one visit after 15 June. Note: many burrowing owl migrants are still present in southwestern California during mid-March, therefore, exercise caution in assuming breeding occupancy early in the breeding season.

Survey method. Rosenberg et al. (2007) confirmed walking line transects were most effective in smaller habitat patches. Conduct surveys in all portions of the project site that were identified in the Habitat Assessment and fit the description of habitat in Appendix A. Conduct surveys by walking straight-line transects spaced 7 m to 20 m apart, adjusting for vegetation height and density (Rosenberg et al. 2007). At the start of each transect and, at least, every 100 m, scan the entire visible project area for burrowing owls using binoculars. During walking surveys, record all potential burrows used by burrowing owls as determined by the presence of one or more burrowing owls, pellets, prey remains, whitewash, or decoration. Some burrowing owls may be detected by their calls, so observers should also listen for burrowing owls while conducting the survey.

Care should be taken to minimize disturbance near occupied burrows during all seasons and not to "flush" burrowing owls especially if predators are present to reduce any potential for needless energy expenditure or burrowing owl mortality. Burrowing owls may flush if approached by pedestrians within 50 m (Conway et al. 2003). If raptors or other predators are present that may suppress burrowing owl activity, return at another time or later date for a follow-up survey.

Check all burrowing owls detected for bands and/or color bands and report band combinations to the Bird Banding Laboratory (BBL). Some site-specific variations to survey methods discussed below may be developed in coordination with species experts and Department staff.

Weather conditions. Poor weather may affect the surveyor's ability to detect burrowing owls, therefore, avoid conducting surveys when wind speed is >20 km/hr, and there is precipitation or dense fog. Surveys have greater detection probability if conducted when ambient temperatures are >20º C, <12 km/hr winds, and cloud cover is <75% (Conway et al. 2008).

Time of day. Daily timing of surveys varies according to the literature, latitude, and survey method. However, surveys between morning civil twilight and 10:00 AM and two hours before sunset until evening civil twilight provide the highest detection probabilities (Barclay pers. comm. 2012, Conway et al. 2008).

Alternate methods. If the project site is large enough to warrant an alternate method, consult current literature for generally accepted survey methods and consult with the Department on the proposed survey approach.

Additional breeding season site visits. Additional breeding season site visits may be necessary, especially if non-breeding season exclusion methods are contemplated. Detailed information, such as approximate home ranges of each individual or of family units, as well as foraging areas as related to the proposed project, will be important to document for evaluating impacts, planning avoidance measure implementation and for mitigation measure performance monitoring.

Adverse conditions may prevent investigators from determining presence or occupancy. Disease, predation, drought, high rainfall or site disturbance may preclude presence of burrowing owls in any given year. Any such conditions should be identified and discussed in the survey report. Visits to the site in more than one year may increase the likelihood of detection. Also, visits to adjacent known occupied habitat may help determine appropriate survey timing.

Given the high site fidelity shown by burrowing owls (see Appendix A, Importance of burrows), conducting surveys over several years may be necessary when project activities are ongoing, occur annually, or start and stop seasonally. (See Negative surveys).

Non-breeding Season Surveys

If conducting non-breeding season surveys, follow the methods described above for breeding season surveys, but conduct at least four (4) visits, spread evenly, throughout the non-breeding season. Burrowing owl experts and local Department staff are available to assist with interpreting results.

Negative Surveys

Adverse conditions may prevent investigators from documenting presence or occupancy. Disease, predation, drought, high rainfall or site disturbance may preclude presence of burrowing owl in any given year. Discuss such conditions in the Survey Report. Visits to the site in more than one year increase the likelihood of detection and failure to locate burrowing owls during one field season does not constitute evidence that the site is no longer occupied, particularly if adverse conditions influenced the survey results. Visits to other nearby known occupied sites can affirm whether the survey timing is appropriate.

Take Avoidance Surveys

Field experience from 1995 to present supports the conclusion that it would be effective to complete an initial take avoidance survey no less than 14 days prior to initiating ground disturbance activities using the recommended methods described in the Detection Surveys section above. Implementation of avoidance and minimization measures would be triggered by positive owl presence on the site where project activities will occur. The development of avoidance and minimization approaches would be informed by monitoring the burrowing owls.

Burrowing owls may re-colonize a site after only a few days. Time lapses between project activities trigger subsequent take avoidance surveys including but not limited to a final survey conducted within 24 hours prior to ground disturbance.

Survey Reports

Report on the survey methods used and results including the information described in the Summary Report and include the reports within the CEQA documentation:

1. Date, start and end time of surveys including weather conditions (ambient temperature, wind speed, percent cloud cover, precipitation and visibility);
2. Name(s) of surveyor(s) and qualifications;
3. A discussion of how the timing of the survey affected the comprehensiveness and detection probability;
4. A description of survey methods used including transect spacing, point count dispersal and duration, and any calls used;
5. A description and justification of the area surveyed relative to the project area;
6. A description that includes: number of owls or nesting pairs at each location (by nestlings, juveniles, adults, and those of an unknown age), number of burrows being used by owls, and burrowing owl sign at burrows. Include a description of individual markers, such as bands (numbers and colors), transmitters, or unique natural identifying features. If any owls are banded, request documentation from the BBL and bander to report on the details regarding the known history of the banded burrowing owl(s) (age, sex, origins, whether it was previously relocated) and provide with the report if available;
7. A description of the behavior of burrowing owls during the surveys, including feeding, resting, courtship, alarm, territorial defense, and those indicative of parents or juveniles;
8. A list of possible burrowing owl predators present and documentation of any evidence of predation of owls;
9. A detailed map (1:24,000 or closer to show details) showing locations of all burrowing owls, potential burrows, occupied burrows, areas of concentrated burrows, and burrowing owl sign. Locations documented by use of global positioning system (GPS) coordinates must include the datum in which they were collected. The map should include a title, north arrow, bar scale and legend;
10. Signed field forms, photos, etc., as appendices to the field survey report;
11. Recent color photographs of the proposed project or activity site; and
12. Original CNDDB Field Survey Forms should be sent directly to the Department's CNDDB office, and copies should be included in the environmental document as an appendix. (http://www.dfg.ca.gov/bdb/html/cnddb.html).

Appendix E. Example Components for Burrowing Owl Artificial Burrow and Exclusion Plans

Whereas the Department does not recommend exclusion and burrow closure, current scientific literature and experience from 1995 to present, indicate that the following example components for burrowing owl artificial burrow and exclusion plans, combined with consultation with the Department to further develop these plans, would be effective.

Artificial Burrow Location

If a burrow is confirmed occupied on-site, artificial burrow locations should be appropriately located and their use should be documented taking into consideration:

1. A brief description of the project and project site pre-construction;
2. The mitigation measures that will be implemented;
3. Potential conflicting site uses or encumbrances;
4. A comparison of the occupied burrow site(s) and the artificial burrow site(s) (e.g., vegetation, habitat types, fossorial species use in the area, and other features);
5. Artificial burrow(s) proximity to the project activities, roads and drainages;
6. Artificial burrow(s) proximity to other burrows and entrance exposure;
7. Photographs of the site of the occupied burrow(s) and the artificial burrows;
8. Map of the project area that identifies the burrow(s) to be excluded as well as the proposed sites for the artificial burrows;
9. A brief description of the artificial burrow design;
10. Description of the monitoring that will take place during and after project implementation including information that will be provided in a monitoring report.
11. A description of the frequency and type of burrow maintenance.

Exclusion Plan

An Exclusion Plan addresses the following including but not limited to:

1. Confirm by site surveillance that the burrow(s) is empty of burrowing owls and other species preceding burrow scoping;
2. Type of scope and appropriate timing of scoping to avoid impacts;
3. Occupancy factors to look for and what will guide determination of vacancy and excavation timing (one-way doors should be left in place 48 hours to ensure burrowing owls have left the burrow before excavation, visited twice daily and monitored for evidence that owls are inside and can't escape i.e., look for sign immediately inside the door).
4. How the burrow(s) will be excavated. Excavation using hand tools with refilling to prevent reoccupation is preferable whenever possible (may include using piping to stabilize the burrow to prevent collapsing until the entire burrow has been excavated and it can be determined that no owls reside inside the burrow);
5. Removal of other potential owl burrow surrogates or refugia on site;
6. Photographing the excavation and closure of the burrow to demonstrate success and sufficiency;

7. Monitoring of the site to evaluate success and, if needed, to implement remedial measures to prevent subsequent owl use to avoid take;
8. How the impacted site will continually be made inhospitable to burrowing owls and fossorial mammals (e.g., by allowing vegetation to grow tall, heavy disking, or immediate and continuous grading) until development is complete.

Appendix F. Mitigation Management Plan and Vegetation Management Goals

Mitigation Management Plan

A mitigation site management plan will help ensure the appropriate implementation and maintenance for the mitigation site and persistence of the burrowing owls on the site. For an example to review, refer to Rosenberg et al. (2009). The current scientific literature and field experience from 1995 to present indicate that an effective management plan includes the following:

1. Mitigation objectives;
2. Site selection factors (including a comparison of the attributes of the impacted and conserved lands) and baseline assessment;
3. Enhancement of the conserved lands (enhancement of reproductive capacity, enhancement of breeding areas and dispersal opportunities, and removal or control of population stressors);
4. Site protection method and prohibited uses;
5. Site manager roles and responsibilities;
6. Habitat management goals and objectives:
    a. Vegetation management goals,
        i. Vegetation management tools:
            1. Grazing
            2. Mowing
            3. Burning
            4. Other
    b. Management of ground squirrels and other fossorial mammals,
    c. Semi-annual and annual artificial burrow cleaning and maintenance,
    d. Non-natives control – weeds and wildlife,
    e. Trash removal;

Vegetation Management Goals

- Manage vegetation height and density (especially in immediate proximity to burrows). Suitable vegetation structure varies across sites and vegetation types, but should generally be at the average effective vegetation height of 4.7 cm (Green and Anthony 1989) and <13 cm average effective vegetation height (MacCracken et al. 1985*a)*.
- Employ experimental prescribed fires (controlled, at a small scale) to manage vegetation structure;

- Vegetation reduction or ground disturbance timing, extent, and configuration should avoid take. While local ordinances may require fire prevention through vegetation management, activities like disking, mowing, and grading during the breeding season can result in take of burrowing owls and collapse of burrows, causing nest destruction. Consult the take avoidance surveys section above for pre-management avoidance survey recommendations;
- Promote natural prey distribution and abundance, especially in proximity to occupied burrows; and
- Promote self-sustaining populations of host burrowers by limiting or prohibiting lethal rodent control measures and by ensuring food availability for host burrowers through vegetation management.

Refer to Rosenberg et al. (2009) for a good discussion of managing grasslands for burrowing owls.

Mitigation Site Success Criteria

In order to evaluate the success of mitigation and management strategies for burrowing owls, monitoring is required that is specific to the burrowing owl management plan. Given limited resources, Barclay et al. (2011) suggests managers focus on accurately estimating annual adult owl populations rather than devoting time to estimating reproduction, which shows high annual variation and is difficult to accurately estimate. Therefore, the key objective will be to determine accurately the number of adult burrowing owls and pairs, and if the numbers are maintained. A frequency of 5-10 years for surveys to estimate population size may suffice if there are no changes in the management of the nesting and foraging habitat of the owls.

Effective monitoring and evaluation of off-site and on-site mitigation management success for burrowing owls includes (Barclay, pers. comm.):

- Site tenacity;
- Number of adult owls present and reproducing;
- Colonization by burrowing owls from elsewhere (by band re-sight);
- Evidence and causes of mortality;
- Changes in distribution; and
- Trends in stressors.

Mines and bats: the impact of open-pit mining on bat activity

EMMA THEOBALD[1], DAVID J. HOSKEN[1], PATRICK FOSTER[2], and KELLY MOYES[1, 3]

Areas used in open-pit mining often undergo sudden and extensive landscape changes, including habitat fragmentation. With mining activity predicted to expand, understanding the impacts of this habitat loss on wildlife is key to developing effective mitigation at new mine developments. Despite this, research into the impacts of open-pit mines in general, and on bat populations in particular, is largely lacking. Here, we investigated potential impacts of a recently re-established open-pit mine in southwest Britain on bat activity in the surrounding landscape, using remote monitoring techniques. Distance from the mine site boundary was found to be an important predictor of bat species richness and activity levels, with the effect on richness extending to approximately 900 m from the site and the effect on activity potentially extending beyond the sampling range (1,200 m). The effect of distance from the site boundary on species richness also varied with the proportion of woodland cover. It appears that habitat loss within the mine site boundary may have reduced bat movement because of barrier effects. The study highlights the need for further research into the impacts of mines on bats.

Key words: activity, Chiroptera, disturbance, habitat, industry, mining, richness

INTRODUCTION

The dramatic alteration of ecosystems by human populations, particularly since the industrial revolution, has significantly impacted global biodiversity (Steffen *et al*., 2011). The mining industry was crucial in industrialisation and remains so in today's digital age, with the increased emphasis on technology and battery metals such as cobalt and lithium, but the discovery, extraction and processing of minerals is environmentally disruptive, with impacts potentially persisting long after the closure of a mine (Bebbington *et al*., 2008; Spitz and Trudinger, 2008). Mining currently occurs on every continent other than Antarctica and exploration emphasis is now shifting toward areas that have been little explored or previously had restricted accessibility due to politics, legislation or infrastructure (Protocol on Environmental Protection to the Antarctic Treaty, 1991, Art. 8, Doc. No. 102-22, opened for signature 4 Oct 1991; Filho, 2003).

As a result of this past and recent expansion, mining can be a major anthropogenic source of environmental degradation and habitat loss worldwide (Kutz, 2007). Surface mining (largely comprised of strip mining and open-pit mining) accounts for over 80% of ore mined each year, and can lead to sudden and extensive land use change as it requires the removal of vegetation and overburden in order to access an ore deposit (Ramani, 2012; Sonter *et al*., 2014). Given that the extraction stage of mining typically lasts from 10–30 years, biodiversity within the development footprint of open pit mines often experiences ongoing habitat fragmentation and loss impacts (Newmont Mining Corporation, 2018). Even for highly mobile animals like bats, habitat loss can decrease roost availability, reduce foraging opportunities and destroy strategic flyways (Campbell *et al*., 1996; Bambini *et al*., 2011).

Although bats make up one fifth of extant mammal species, many populations are now in decline with over 21% of species classified as Threatened or Near Threatened (IUCN, 2019). Due to their long lifespans and low reproductive output, any mining activity which reduces habitat availability to bats could result in population declines and populations will be slow to recover (Voigt and Kingston, 2016). However, there has been little investigation of potential impacts of mining on bat populations (Barclay, 2014). In addition to habitat loss, the

blasting, transportation and processing of materials during open-pit mining could result in acoustic disturbance effects (Manwar *et al*., 2016). For acoustic predators like bats, noise pollution could compromise foraging efficiency, and therefore reduce activity in the noisy areas (Senzaki *et al*., 2016). However, relatively little is known about the effects of anthropogenic noise on bats, although studies suggest that species using passive listening to locate prey or those echolocating at low frequencies (< 35 kHz) are likely to experience greater disruption from anthropogenic noise (Schaub *et al*., 2008; Bunkley *et al*., 2015).

To ameliorate impacts of disturbance and habitat loss within mining landscapes, habitat restoration is increasingly being used as a tool to slow or prevent biodiversity loss (Burgar *et al*., 2015). In addition to carrying out habitat restoration following mine closure, environmental enhancement is now frequently implemented while mining is still underway (Tischew and Kirmer, 2007). For local bat populations this ecological compensation includes habitat creation or enhancement to provide strategic flyways and additional foraging resources and the provision of bat boxes to offer roosting opportunities (although this only applies to species which roost within tree cavities or buildings or exhibit roost plasticity — Mering and Chambers, 2014; Nielsen and Kelly, 2016). However, despite the emphasis on promoting best practice methodologies through Environmental Impact Assessments (but see Richardson *et al*., 2019), research investigating the impacts of open pit mines on bat populations is lacking (Voigt and Kingston, 2016; Carvalho, 2017). Understanding the extent of potential landscape level effects on species richness and bat activity will enable better management recommendations and ultimately more effective conservation of bat populations (Gorresen and Willig, 2004).

Here, we exploited the opportunity to investigate the impacts of a recently re-established open pit mine on bat populations in the UK. Although tungsten was discovered at the Drakelands site in Southwest England in 1867, historic mineral working only occurred from 1919–1920 and 1934–1944. Mineral working was later re-established in 2014, and Drakelands is now one of only two mines with an annual tungsten concentrate production capacity of more than 3,000 tonnes outside of China (Wolf Minerals Ltd, 2018). Chemical pollution at the site is strictly controlled, with local water sources regularly checked for leached contaminants. Further, light pollution is regulated across the site, with many areas remaining unlit, and light levels along boundary vegetation kept below 4 lux (Gillingham, 2014). The mine processing plant emits noise 24 hours per day, the high frequency portion of this ranging from 12–40 kHz (measured using an Anabat ultrasonic detector (SD2 model — Titley Scientific, Lancashire, UK)) which falls within the auditory range of European bat species (Luo *et al*., 2014). High frequency noise attenuates relatively rapidly in an outdoor environment, therefore the range of ultrasonic noise emitted from the processing plant is likely to be fairly limited (Makarewicz, 1998). Other than blasting, which occurs during the daylight hours but may still have some impact on bats roosting in proximity to the extraction pit, the mine processing plant represents the most significant source of noise locally, with background noise levels in the surrounding area remaining low (West Virginia Department of Environmental Protection, 2006). Therefore, Drakelands represents an ideal study site to investigate the extent of potential impacts of habitat loss and noise on local bat populations at an open pit mine. In order to assess possible impacts, we used remote acoustic monitoring techniques to measure bat activity and species richness in relation to distance from the planning boundary of the mine site.

Materials and Methods

Study Area

The study sampled the landscape surrounding Drakelands mine, in the county of Devon in Southwest Britain (8 km^2; 50°24’47”N, 4°00’58”W — Fig. 1). The Drakelands area is largely composed of agricultural land, interspersed with patches of broadleaf woodland (20%) and a small proportion of conifer plantation (4%). The region has a maritime climate, with mean annual temperatures of 10.5°C and an annual rainfall of approximately 1,000 mm (ClimaTemps, 2017). Bordering Dartmoor National Park, Drakelands mine is situated adjacent to operating China clay mines and is located 2 km from the nearest urban area. The extraction pit measures 850 m × 450 m, with the site footprint covering an area of approximately 4 km^2 (Wolf Minerals Ltd, 2018). Development of the site required the removal of vegetation and destruction of three roosts (one tree roost, two building roosts) used by low numbers of common pipistelle *Pipistrellus pipistrellus* (n = 5), soprano pipistelle *Pipistrellus pygmaeus* (n = 5), greater horseshoe bat *Rhinolophus ferrumequinum* (n = 7) and brown long-eared bat *Plecotus auritus* (n = 3), carried out under European Protected Species Licences. In order to compensate for the loss of bat habitats, extensive mitigation measures have been implemented across the site including habitat creation, the strengthening of commuting routes by thickening hedges, installation of bat boxes and buildings, and a sensitive lighting regime (SLR Consulting, 2013). The majority of these measures are contained within the area of the planning boundary.

FIG. 1. Map detailing the location of Drakelands mine in Southwest England, UK

Field Procedure

A series of 17 line transects was designed in order to evenly sample the landscape surrounding the Drakelands site (Fig. 2). Each transect consisted of five sampling locations, positioned at approximately 20, 300, 600, 900 and 1,200 metres from the planning permission boundary of the mine. A maximum distance of 1,200 metres was selected in order to minimise the potential confounding impacts of the nearby town on bat activity. The landscape to the north of the Drakelands site was not sampled, in order to avoid confounding impacts of near-by China clay pits. Acoustic monitoring was conducted at each transect point for a duration of five consecutive nights, using one of five static Anabat ultrasonic detectors (SD1 and SD2 model — Titley Scientific, Lancashire, UK). Detectors were placed in weatherproof boxes and elevated to 1m above ground level on a tripod, tilted upwards at an angle of approximately 45°, and set to record from 30 minutes before sunset until sunrise. In order to account for potential differences in sensitivity between the detectors a randomised schedule was determined, so that each of the transect sampling points were measured equally by each of the five detectors. All five sampling points within each transect were monitored simultaneously, to avoid bias due to differing environmental conditions between locations. Transects were completed in a random order, with four transects sampled from September−October 2016 and the remaining transects sampled from March−May 2017; the selection of the sampling period was limited by funding constraints. The placement of each acoustic detector was recorded with a Garmin eTrex 10 GPS (Garmin Ltd, Southampton, UK), to determine the actual distance to the mine site. In order to investigate potential species differences in responses to the impacts of the mine resulting from different foraging ecologies, the proportion of woodland cover in the 100 m buffer surrounding each monitoring point was calculated using the Centre for Ecology and Hydrology Land Cover Map 2015 (Rowland *et al*., 2017) and ArcGIS 10.2.2 (ESRI, 2011). Environmental conditions were recorded for each night of sampling using the Global Forecast System (total precipitation, average temperature and average wind speed), as these factors influence levels of bat activity (Fischer *et al*., 2009).

Data were visualised in AnalookW (Titley Scientific, Lancashire, UK), and echolocation calls were visually inspected

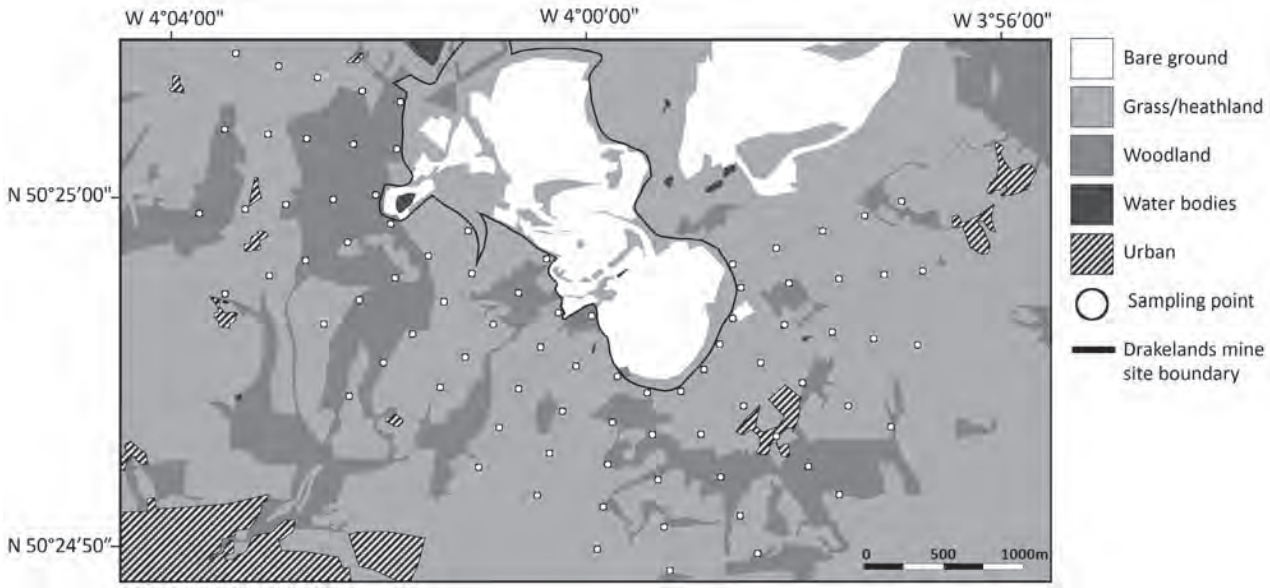

FIG. 2. Map detailing the 17 line transects, positioned at 20, 300, 600, 900, and 1,200 metres from the Drakelands mine site boundary

and assigned to species or genus based on comparison to a reference library of known species and the echolocation parameters provided in the literature by Russ (2012). Echolocation calls assigned to *Myotis* and *Plecotus* were only identified to a genus level, as many of these calls are too similar for accurate species-level assignment (Kunz and Parsons, 2009). Echolocation calls for which confident identification was not possible were labelled 'unknown', this was largely due to calls being too faint, and occasionally because the parameters of a call fell between those of two species. All echolocation calls of the same species identified within a one-minute period were classed as one 'pass'. Species richness was calculated for each night of monitoring, consisting of the sum of the number of species detected (or genus for *Myotis* and *Plecotus*) and excluding those labelled 'unknown'. Total activity was calculated for each night of monitoring as the sum of the number of passes of all species, including those labelled 'unknown', and while bat activity cannot confer abundance, the number of bat passes detected within a unit of time can be a useful measure for comparing the relative functional importance of locations within a study site (Ober and Hayes, 2008).

Data Analysis

Statistical analyses were conducted in R Studio using R version 3.3.1 (R Core Team, 2018) and the ggplot2 package (Wickham, 2016) for graphics. All response variables were assessed for normality, homogeneity of variance and over dispersion using standard diagnostic procedures. Assumptions were checked and appropriate transformations were made to reduce residual variance where necessary (Grueber *et al*., 2011). Generalised Linear Mixed Models (GLMM) were constructed using the package 'lme4' (Bates *et al*., 2015) to investigate whether distance from the mine site had an effect on species richness and total activity. Species richness models were fit using GLMMs by Laplace Approximation with a Poisson error distribution, BOBYQA optimization and a 'log' link function using the package 'lme4' (Bates *et al*., 2015). Activity models were fit using GLMMs by maximum likelihood, with a zero-inflated negative binomial distribution and a 'log' link function using the package 'glmmTMB' (Brooks *et al*., 2017).

The global models contained the fixed effects of distance from the mine site (km), proportion of woodland cover, average wind speed (mph), total precipitation (mm), average temperature (°C) and an interaction between distance and woodland cover. All models contained the random effects of date (to account for temporal autocorrelation) and location (to account for pseudo-replication as multiple nights of monitoring were conducted at each location). Potential spatial autocorrelation was assessed for the variables of species richness and total activity using Moran's I (Paradis *et al*., 2004). Spatial autocorrelation was only found to be significant in species richness (Moran's I: 0.064; $P < 0.001$), therefore the variable of 'Transect ID' was included as a random effect in all species richness models to account for this. Detector I.D. was not included in models, as preliminary analysis revealed that there was no significant differences in performance between detectors in the range of species detected or the total number of calls detected. Lunar phobia (changing foraging habitats or activity schedules as a result of moonlight) does not appear to affect behaviour in the six UK-resident bat species in which this phenomenon has been studied (Karlsson *et al*., 2002; Roeleke *et al*., 2018). As a result, we did not anticipate that moonlight intensity would significantly effect on bat activity in our study and this parameter was not included in our analyses. Models were built using all possible combinations of predictors using the package 'MuMIn' (Barton, 2017) and then ranked using Akaike's Information Criterion corrected for small sample size (AICc), which penalizes models with many explanatory variables (Burnham and Anderson, 2010). Each model was then given an Akaike weight (ΔAICc), and based on the difference in these values, the best fitting models were arrived at. Models for which $\Delta AICc \leq 2$ were considered to have equivalent support and were validated by visual examination of residuals and q-q plots (Bolker *et al*., 2009). According to some model selection methods, the model containing the fewest parameters of those with equivalent support, would be the optimal model (Vandekerckhove *et al*., 2015). However, given that this is an ecological study with substantial noise, where more than one model received equivalent support the top-ranked models ($\Delta AICc \leq 2$) were averaged to create a final model (Whittingham *et al*., 2006). Model averaging was performed by combining parameter estimates from different models in a weighted average to generate a predictive model, using the natural average method (Grueber *et al*., 2011). Confidence intervals were calculated for all parameters included in the final averaged model. Parameters for which the confidence intervals did not include zero were considered useful predictors of species richness and total activity. In order to investigate potential non-linear trends between the species richness and distance from the mine site, we ran simple generalised additive models within each tercile of woodland cover separately, using the package 'mgcv' with a gaussian error distribution and identity link function (Wood, 2011).

Ethical Standards

Permission for field work was granted by respective landowners. Bat activity was surveyed using passive acoustic monitoring and therefore bats were not affected in any way.

Results

A total of 13,610 bat passes were recorded during the study, and this represented at least 11 species (see Supplementary Table S1 for the detection frequency of each species/ genus). Data were not obtained for 14% of sampling locations, due to equipment failure and livestock interference.

In investigating the factors that influence species richness, two of the models generated were considered to have equivalent support ($\Delta AICc \leq 2$ — Table 1). Following model averaging, confidence intervals indicated that distance to the mine site was an important predictor of species richness, with differing trends depending on the proportion of woodland cover (Supplementary Table S2). Within the lower and middle terciles of woodland cover species richness rose gradually with increasing distance from the mine site. However, within the upper tercile of woodland cover species richness increased more steeply with increasing distance (Fig. 3). Visual

TABLE 1. The two top-ranking species richness models for which ΔAICc ≤ 2, which were included in model averaging. Also shown is the null model, which does not contain distance or woodland cover. Shown is the deviance (Dev), the number of model parameters (*K*), the Akaike's Information Criterion (AICc), the difference in Akaike's Information Criterion between each model and the top-ranked model (ΔAICc) and the Akaike's weight (w_i)

Model name	Model rank	Structure of fixed effects (Response = species richness; random effects = date and location)	Dev	*K*	AICc	ΔAICc	w_i
Model 1	1	Distance + woodland cover + wind + precipitation + temperature	1052.9	9	1071.4	0.0	0.51
Model 2	2	Distance* woodland cover + wind + precipitation + temperature	1052.6	10	1073.2	1.8	0.21
Null	6	Temperature + precipitation + wind	1064.6	7	1078.9	7.5	0.01

inspection of the generalised additive models reveals a non-linear trend within the upper tercile of woodland cover, with species richness rising sharply with increasing distance from the mine site, and plateauing at approximately 900 m (Fig. 4). Other important predictors of species richness were precipitation, temperature and wind, with high levels of precipitation and wind correlating with lower richness, and high temperatures correlating with greater richness.

In investigating the factors that influence total bat activity, four of the models generated were considered to have equivalent support (ΔAICc ≤ 2 — Table 2). Following model averaging, confidence intervals indicated that distance to the mine site was an important predictor of total activity, with the level of activity increasing with distance (Supplementary Table S3 and Fig. 5). Other important predictors of activity were precipitation, temperature and wind, with high levels of precipitation and wind correlating with lower activity, and high temperatures correlating with greater activity.

DISCUSSION

An improved understanding of the impacts of open pit mines on bats is crucial for informed management strategies and to help maintain the social contract that exists between mining companies and society at large. There is currently very little information available on these impacts, and we partly address that paucity here. Using model averaging techniques we found that bat species richness and activity levels increased with distance from the Drakelands mine. The effect of distance from the mine site boundary on species richness depended on

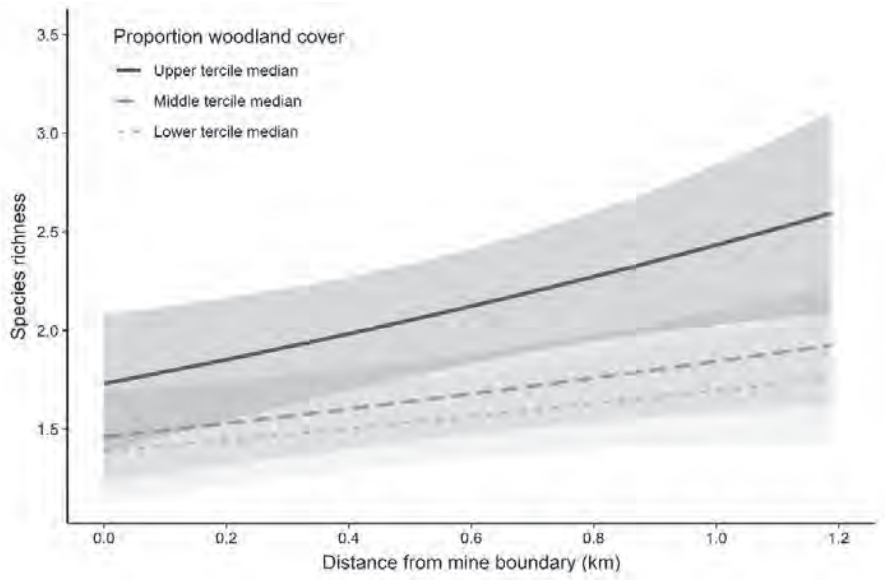

FIG. 3. The relationship between species richness and distance from the mine site, according to the proportion of woodland cover (predicted by Model 2, using averaged values of other fixed effects). Medians of each tercile of woodland cover are 0, 0.133, and 0.576. As can be seen, more species were detected as sampling moved away from the mine site boundary

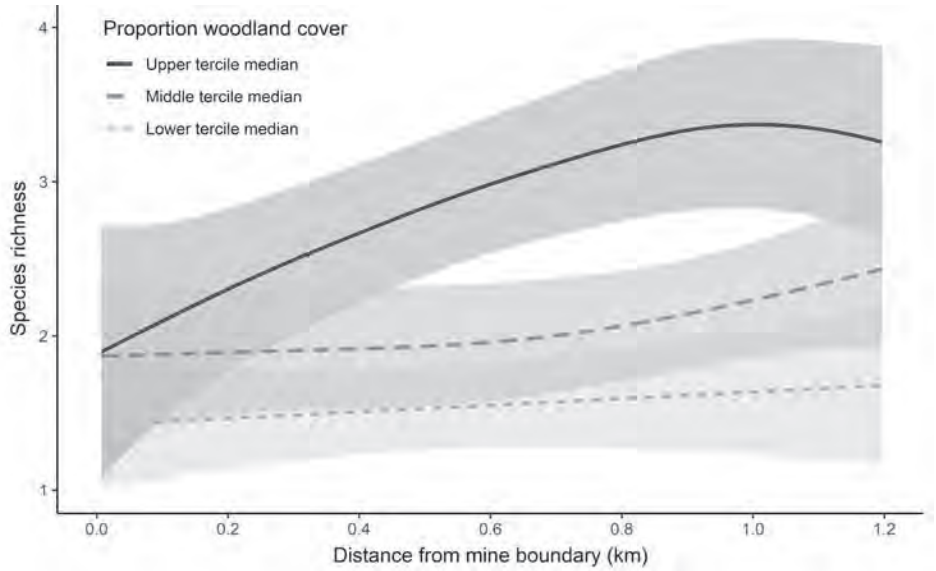

FIG. 4. Bat species richness as a function of distance from the mine site boundary. Simple generalised additive models were used to investigate potential non-linear trends between species richness and distance from the mine site, run separately within each tercile of woodland cover. Here, predictions for the three separate models are displayed on one graph to allow easy comparison. Medians of each tercile of woodland cover are 0, 0.133, and 0.576. In all models there was an increase in species richness to at least 1 km from the mine site boundary

the woodland cover around the mine. Within areas of low and medium woodland cover species richness rose gradually with increasing distance from the mine site. However, within areas of relatively high woodland cover (mean value of 62%) species richness rose more steeply, from 1.9 at the mine site boundary to 3.4 at a distance of 900 m. Given that the majority of the mitigation measures that have been implemented are contained within the site boundary, the impacts of the mining development on bat activity and species richness in the surrounding landscape may be somewhat softened.

It is important to note that the interaction between species richness and woodland cover was not likely to be driven by differences in habitat quality among monitoring locations. The vast majority of monitoring points that were situated in low cover habitats were within grasslands that were used for the grazing of livestock, and not arable farming which is often associated with reduced bat activity and species richness (Vaughan *et al*., 1997). All wooded areas were mature and predominantly broadleaf and furthermore, the wooded areas close to the mine site generally contained more water bodies, which should increase their quality for bat foraging (Vaughan, 1997). The largest woodland patch was also located close to the mine site boundary, although size of woodland patch is not necessarily correlated with the level of bat richness it supports (Law *et al*., 1999; Estrada and Coates-Estrada,

TABLE 2. The four top-ranking total activity models for which ΔAICc ≤ 2, which were included in model averaging. Also shown is the null model, which does not contain distance or woodland cover. Shown is the deviance (Dev), the number of model parameters (*K*), the Akaike's Information Criterion (AICc), the difference in Akaike's Information Criterion between each model and the top-ranked model (ΔAICc) and the Akaike's weight (w_i)

Model name	Model rank	Response = Total activity; random effects = date and location	Dev	*K*	AICc	ΔAICc	w_i
Model 3	1	Distance + precipitation + temperature + wind	2589.4	9	2608.0	0.0	0.25
Model 4	2	Distance + woodland cover + precipitation + temperature + wind	2587.5	10	2608.2	0.2	0.22
Model 5	3	Distance * woodland cover + precipitation + temperature + wind	2586.8	11	2609.7	1.7	0.10
Model 6	4	Distance + precipitation + temperature	2593.3	8	2609.7	1.7	0.10
Null	6	Temperature + precipitation + wind	2594.1	8	2610.6	3.2	0.07

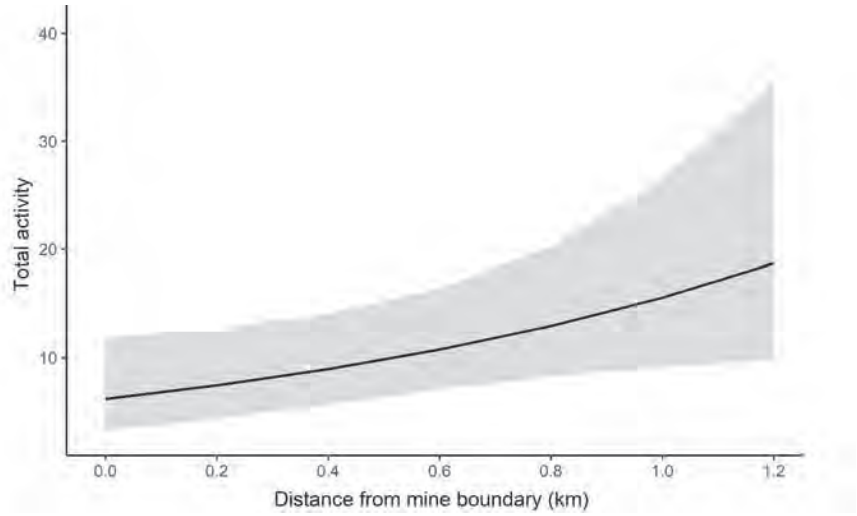

FIG. 5. The relationship between total activity and distance from the mine site (predicted by Model 3, using averaged values of other fixed effects). As the distance from the mine site boundary increased, there was an increase in total bat activity (the total number of passes recorded)

2002). Thus, it seems distance from the mine and woodland cover are both important in determining species richness.

The noise emitted from the mine processing plant may contribute towards the relatively low species richness observed in woodland habitats, close to the site boundary. Studies suggest that by masking insect generated sounds, noise pollution may reduce the foraging efficiency of both *Plecotus auritus* and Bechstein's bat *Myotis bechsteinii*, which are thought to use passive listening to locate prey and are specialised to forage within woodland habitat (Anderson and Racey, 1993; Siemers and Swift, 2006; Schaub *et al*., 2008). Avoiding areas that are degraded by noise and shifting foraging activity further from the site boundary would contribute to the increased species richness further from the site boundary within areas with high woodland cover. A field trial of the impacts of broadband noise at gas compressor stations found some bat activity was reduced to a radius of at least 80 m from the plant suggesting noise is important for some bats (Bunkley *et al*., 2015). However, sound attenuates with distance and we still saw effects up to 900 m from the mine.

A more likely explanation for the patterns detected is that the decreased species richness close to the mine could be linked to the loss of foraging areas, roosting habitat and commuting routes within the site boundary, which would reduce movement of bats in the direction of the mine, generating a barrier effect (Fensome and Mathews, 2016). The susceptibility of bat species to barrier effects varies in accordance with foraging ecology and wing morphology. Long-thin-winged species adapted to fly within low clutter habitats are thought to be less impacted by habitat loss barriers, compared with manoeuvrable species with broad, short wings which forage close to environmental clutter (Norberg and Rayner, 1987; Jones *et al*., 2003; Meyer *et al*., 2008). Furthermore, studies investigating the barrier effects of roads indicate species that forage in open spaces are willing to cross busy highways, whereas clutter specialists rarely do (Kerth and Melber, 2009; Berthinussen and Altringham, 2012*a*, 2012*b*). While we cannot conclusively state that activity decreases were driven by elevated impacts of the mine on clutter specialists, our findings are consistent with the loss of foraging habitats creating barrier effects, especially given the patterns identified (i.e., the interaction between woodland cover and distance). If our interpretation of the patterns detected is correct, effects could be further compounded by impacts on home range size. The short, broad wings of high-clutter specialists impose increased costs on comuting, and therefore the home range of these species tend to be smaller (Norberg and Rayner, 1987; Safi and Kerth, 2004). The relatively small area of habitat loss within the study site is therefore likely to have a greater impact at the local level on high clutter specialists, and a lesser impact on low clutter specialists with greater mobility which may be more affected by landscape level factors at large spatial scales (Fuentes-Montemayor *et al*., 2013).

Distance from the mine site boundary was also found to positively correlate with total nightly bat

activity. As noted above, variation in habitat quality and noise pollution are unlikely to explain this pattern over the distances covered by our surveys. We suggest instead that habitat loss and commuting route disruption because of the mine site probably drives this effect. Consistent with this interpretation, large roads can act as barriers to bats with activity increasing by 23% 1,200 meters from the road (Berthinussen and Altringham, 2012*b*). Here we focussed on total bat activity rather than species-level activity, but total activity was dominated by *P. pipistrellus* (78.1% of calls). Given that *P. pipistrellus* is a generalist and may less disrupted by human activity and habitat loss, the activity decrease toward the mine site boundary may well be greater for some individual species, but testing this requires additional data (Davidson-Watts *et al*., 2006; Richardson *et al*., 2019).

Finally, and consistent with many other studies, we found that that high wind speeds and rainfall resulted in reduced activity generally, while high temperatures correlated with higher species richness and activity (Taylor, 1963; Reichard *et al*., 2010; Voigt *et al*., 2011; Barros *et al*., 2014). These patterns are thought to be due to temperature related shifts in insect activity, variation in the energetic costs of thermoregulation, and sensory constraints on echolocation as a result of rainfall. Our study did not take place during the peak months of bat activity (June–August) (Russ *et al.,* 2006), but despite this, shifts in activity and species richness were still evident. The maternity season occurs during seasonal peak-activity and this may have generated other patterns too. For example, during lactation, female bats often adopt a bimodal (or in some cases trimodal) activity pattern, returning to the maternity roost to suckle offspring during the night (Maier, 1992; Swift, 1980). This could result in elevated activity in the vicinity of maternity roosts, and, depending on the locations of the maternity roosts, potentially alter measured impacts of the mine on bat activity in the surrounding landscape.

To conclude, our findings suggest that open pit mining reduces the activity of some bat species nearby, with negative impacts on species richness potentially extending up to 900 m from the mining activity. We also identified a threefold reduction in total bat activity close to the mine. These trends were observed despite the extensive mitigation measures that have been implemented across the site. To our knowledge, this is the first attempt to quantify impacts of open pit mines on bat populations in the wider landscape. At new open-pit mining developments bat mitigation should seek to develop substantial commuting routes to connect isolated woodland habitat patches with the wider landscape and consider enhancing existing woodland habitats that are located within 1 km of the mine site boundary. Additionally, during link-road construction underpasses created on existing commuting routes may reduce barrier effects for clutter-specialists that fly close to ground-level. Clearly, further research into the species-specific responses of bats to barrier effects is needed to better predict impacts in the wider landscape of new developments.

Abstract. Water is a fundamental resource in freshwater ecosystems, and streamflow plays a pivotal role in driving riverine ecology and biodiversity. Ecologically functional flows, managed hydrographs that are meant to reproduce the primary components of the natural hydrograph, are touted as a potential way forward to restore ecological functions of highly modified rivers, while also balancing human water needs. A major challenge in implementing functional flows will be establishing the shape of the managed hydrograph so as to optimize improvements to the ecosystem given the limited resources. Identifying the shape of the flow–biology relationship is thus critical for determining the environmental consequences of flow regulation. In California's Central Valley, studies have found that increased streamflow can improve survival of imperiled juvenile salmon populations during their oceanward migration. These studies have not explored the potential nonlinearities between flow and survival, giving resource managers the difficult task of designing flows intended to help salmon without clear guidance on flow targets. We used an information theoretic approach to analyze migration survival data from 2436 acoustic-tagged juvenile Chinook salmon from studies spanning differing water years (2013–2019) to extract actionable information on the flow–survival relationship. This relationship was best described by a step function, with three flow thresholds that we defined as minimum (4259 cfs), historic mean (10,712 cfs), and high (22,872 cfs). Survival varied by flow threshold: 3.0% below minimum, 18.9% between minimum and historic mean, 50.8% between historic mean and high, and 35.3% above high. We used these thresholds to design alternative hydrographs over the same years that included an important component of functional flows: spring pulse flows. We compared predicted cohort migration survival between actual and alternative hydrographs. Managed hydrographs with pulse flows that targeted high survival thresholds were predicted to increase annual cohort migration survival by 55–132% without any additions to the water budget and by 79–330% with a modest addition to the water budget. These quantitative estimates of the biological consequences of different flow thresholds provide resource managers with critical information for designing functional flow regimes that benefit salmon in California's highly constrained water management arena.

Key words: California; flow regulation; functional flows; migration; resource management; salmon; survival; telemetry.

Introduction

In rivers, natural flow regimes are directly linked with ecological processes that govern the life history of aquatic organisms, and are a major determinant of biodiversity (Bunn and Arthington 2002). Identifying the shapes of flow–ecology relationships is therefore critical for determining the biological consequences of water withdrawal or flow regulation on the ecosystem and to establish well-informed water management rules and recommendations (Rosenfeld 2017). Water resource use and development in watersheds has altered natural flow regimes, which in turn has altered riverine ecosystems, and is generally acknowledged to have considerable negative impacts on native biota (Pringle et al. 2000). As water resources become increasingly overtaxed due to population growth and climate change (Tanaka et al. 2006, Palmer et al. 2008), the task of balancing human and ecosystem needs will become more urgent and politically charged (Arthington et al. 2018). More than ever, objective, science-based approaches are needed for informing the development of water resource allocation targets (Petts 2009).

Few freshwater systems illustrate the management challenges of balancing environmental resources with the restoration of a collapsing ecosystem better than California's Central Valley (CCV) watershed. Here, water is heavily regulated as it supports a multi-billion dollar agricultural economy as well as tens of millions of urban and suburban water users (Speir et al. 2015). The ecosystem is vastly different than it was historically, with many native fish populations diminishing, and increasingly extreme climatic events impacting water availability (Hanak and Lund 2012). Researchers at the nonpartisan Public Policy Institute of California have suggested that restoration of native fish populations and general ecosystem health in the CCV is unattainable under the current regulatory status quo (Mount et al. 2019). These same authors propose that ecosystem-based management of the CCV is a potential way forward. Two key changes would be the adoption of ecologically functional flows (Yarnell et al. 2015, 2020) and an ecosystem water budget. Functional flows are managed hydrographs that are meant to reproduce the primary components of the natural, unimpaired hydrograph so as to restore related geomorphic, biogeochemical, or ecological functions, while also balancing human water needs. An ecosystem water budget is essentially a water right for the environment: a set amount of water than may be allocated as resource managers see fit to improve the condition of the ecosystem. If these two key changes were implemented throughout the CCV, one of the major challenges will be establishing the shape and magnitude of the managed hydrograph so as to optimize improvements to the ecosystem, given a fixed water budget. A key part of this challenge is predicting the biotic responses to different flow targets.

In the CCV, hydrologic infrastructure and water management have strongly modified the hydrograph of most river systems, including the Sacramento River, resulting in reduced winter and spring discharges (Brown and Bauer 2009). The spring rainfall and snowmelt recession is a critical facet of the CCV Mediterranean-type flow regime, and alterations to this hydrograph strongly affect riverine species which have evolved to use high spring flows resulting from winter and spring rain-fed and snowmelt runoff (Yarnell et al. 2010). Among them, CCV Chinook salmon (*Oncorhynchus tshawytscha*) populations have been particularly impacted by water management in frastructure and altered flow regimes (Yoshiyama et al. 1998, Kimmerer 2008). Of the five historic Chinook salmon populations in the CCV, one has been extirpated, one is listed as endangered, one is listed as threatened, and the other two are listed as Species of Concern under the Endangered Species Act (ESA).

One of the primary impacts of the water management infrastructure and altered flow regimes in the CCV on salmon is the reduction in spring outmigration (i.e., seaward) survival of juvenile salmon (Kjelson et al. 1981, Notch et al. 2020). Importantly, the survival bottleneck at this life stage has significant repercussions throughout the Chinook salmon lifecycle (Michel 2019). Therefore, one vital aspect for implementation of functional flows in the CCV is to assess how they will impact juvenile Chinook salmon during their spring outmigration to the Pacific Ocean. One promising component of proposed functional flows in the CCV is the implementation of spring pulse flows (Yarnell et al. 2015), as these may recreate the ideal outmigration conditions salmon historically benefitted from.

To date, studies have found strong, positive linear relationships between survival and flow in CCV rivers (Kjelson et al. 1981, Zeug et al. 2014, Henderson et al. 2019, Notch et al. 2020). However, when environmental resources are also commercially important for competing needs, this creates a problem: How to allocate limited resources if the only guidance managers have is that more is better for the population or ecosystem process in question? This difficulty often results from the statistical techniques traditionally used by ecologists, which by design only reveal linear relationships between populations or ecosystem processes and the environment. Yet, these relationships are rarely linear (Hunsicker et al. 2016, Rosenfeld 2017), and these nonlinearities can play a critical role in the population or ecosystem dynamics. Several studies have shown that nonlinear responses of ecosystems to environmental resource changes could initiate catastrophic regime shifts and local population extinction events (Scheffer et al. 2001). Therefore, it is important to explore possible nonlinearities between environmental resources and ecosystem processes, with the particular objective of finding information that is more actionable to resource managers. This is especially pertinent to Pacific salmon stocks that are often found in the middle of constrained resource management arenas (Munsch et al. 2020).

We investigated the link between flow variations in the Sacramento River, the primary Chinook salmon river in the CCV watershed, and outmigration survival of juvenile Chinook salmon. We also evaluated hypothetical outmigration survival rates in the context of alternative flow regimes. We addressed the following questions: (1) Is there evidence of nonlinearity in the flow–survival relationship in the Sacramento River? (2) If so, how can knowledge of the nonlinear relationship be used to enact ecologically functional flows that benefit juvenile Chinook salmon? Finally, we weigh the efficacy of two different alternative flow regimes on increasing population-level Chinook salmon outmigration survival rates.

Methods

Study area

The Sacramento River is the largest river in California and supports the second largest population complex of Chinook salmon on the U.S. West Coast. However, the Sacramento River has been severely altered from its historic state, with major dams constructed throughout its watershed, extensive water diversions in place for municipal, industrial, and agricultural uses, and diking for flood control and land reclamation. Shasta Reservoir and its downstream forebay Keswick Reservoir are key components in the interface between human alterations and the ecosystem in the Sacramento River. These reservoirs block passage to historic salmonid spawning and rearing habitat upstream and also regulate downstream flow. During all months, the large majority of streamflow in the Sacramento River is regulated by reservoir operations, which alters the seasonal patterns of the natural hydrograph, including the homogenization and reduction of flows during some critical salmon rearing and migration periods (Brown and Bauer 2009), as well as altering other environmental conditions, such as water temperature and turbidity.

All of the juvenile winter-run Chinook salmon (ESA endangered status), significant portions of the juvenile spring-run Chinook salmon (ESA threatened status), and juvenile fall/late-fall-run Chinook salmon (ESA species of concern) must navigate a portion of the Sacramento River with several large-scale, and hundreds of small-scale, water diversions. In the late spring, when a large portion of these juveniles outmigrate, natural seasonal reductions in tributary inputs coincide with increases in water diversions; the cumulative impacts of which result in incrementally lower flows in the more downstream reaches, until the confluence with the Feather River, the largest tributary of the Sacramento River (Fig. 1). This pattern is primarily expressed in a region (hereafter "region of interest") extending from the last major tributary before the Feather River on the upper end, the confluence with Deer Creek (Tehama County, river kilometer [rkm–distance from the Pacific Ocean by way of river] 425), to the Feather River confluence on the lower end (Sutter County, rkm 204; Fig. 2). We presume that detrimental impacts of low flows are primarily expressed in this region, where flows in the late spring are often the lowest of the year. In addition, flows in this region are considerably lower relative to the portions of the Sacramento

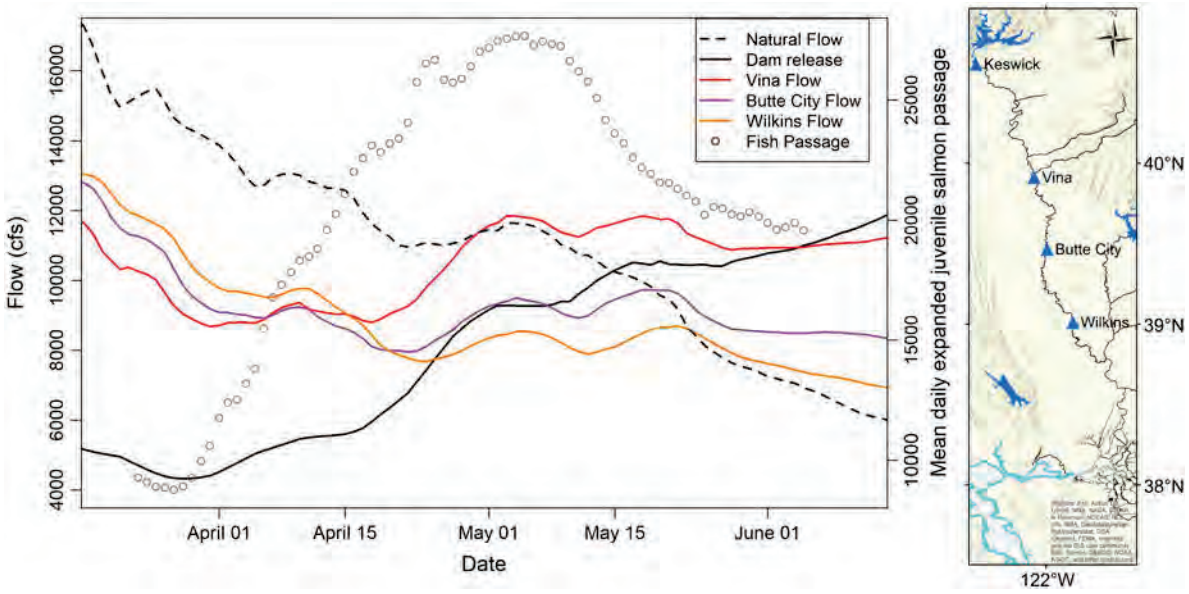

Fig. 1. Mean daily Sacramento River hydrographs for the spring period from 2000 to 2019, (excluding those classified as wet: 2006, 2011, 2017, 2019), mean daily natural hydrograph (dashed line), and mean daily expanded juvenile salmon passage (gray points, data from USFWS Red Bluff rotary screw traps, 38 rkm upstream of the region of interest). Flow levels (in cfs) are plotted through time at several gauges along the river, starting from Keswick gauge (dam release: USGS station number 11370500) on the upstream end to Wilkins Slough gauge (USGS station number 11390500) on the downstream end (color legend inset has gauges listed in order from upstream to downstream). The mean daily natural flow regime is the sum of the full natural flow statistic on the California Data Exchange Center (http://cdec.water.ca.gov) for the Bend Bridge (BND) gauging station, along with the daily flow from Mill Creek (USGS 11381500) and Deer Creek (USGS 11383500) gauges. It is therefore representative of the estimated full natural flow entering the region of interest. A 10-d moving average smoothing has been applied to all hydrographs and fish passage data. All stream gauges are operated by either USGS, US Bureau of Reclamation, or California Department of Water Resources.

River upstream and downstream, both of which are not characteristic of historic conditions. The survival rate of acoustic-tagged juvenile Chinook salmon in certain sections of this region is the lowest on the Sacramento River (Michel et al. 2015, Notch et al. 2020).

Study fish and season

The large majority of juvenile Chinook salmon in the Sacramento River rear and outmigrate during the winter or spring months (Fisher 1994). Historically, these seasons typically provided adequate flows and cool water temperatures to allow for juveniles to rear in, and transit through, downstream regions. At present, flows are only occasionally adequate for outmigration or off-channel rearing in most years. This is primarily due to reduced reservoir releases in order to store water for use in the summer months, after the outmigration window (Sturrock et al. 2020). In the winter and early spring, flows increase in the downstream direction from Keswick to Wilkins Slough until mid-April (Fig. 1), driven by tributary inflows that greatly exceed diversions. After mid-April, there is an inversion in this pattern, and flows are substantially lower at Wilkins Slough compared to Keswick (Fig. 1), resulting from cumulative diversions greatly exceeding tributary inflows during the agricultural irrigation season. It is during this same mid- to late spring period, after the inversion, that a significant portion of natural-origin juvenile salmon outmigrate through this region (Fig. 1). In addition, most CCV juvenile Chinook salmon

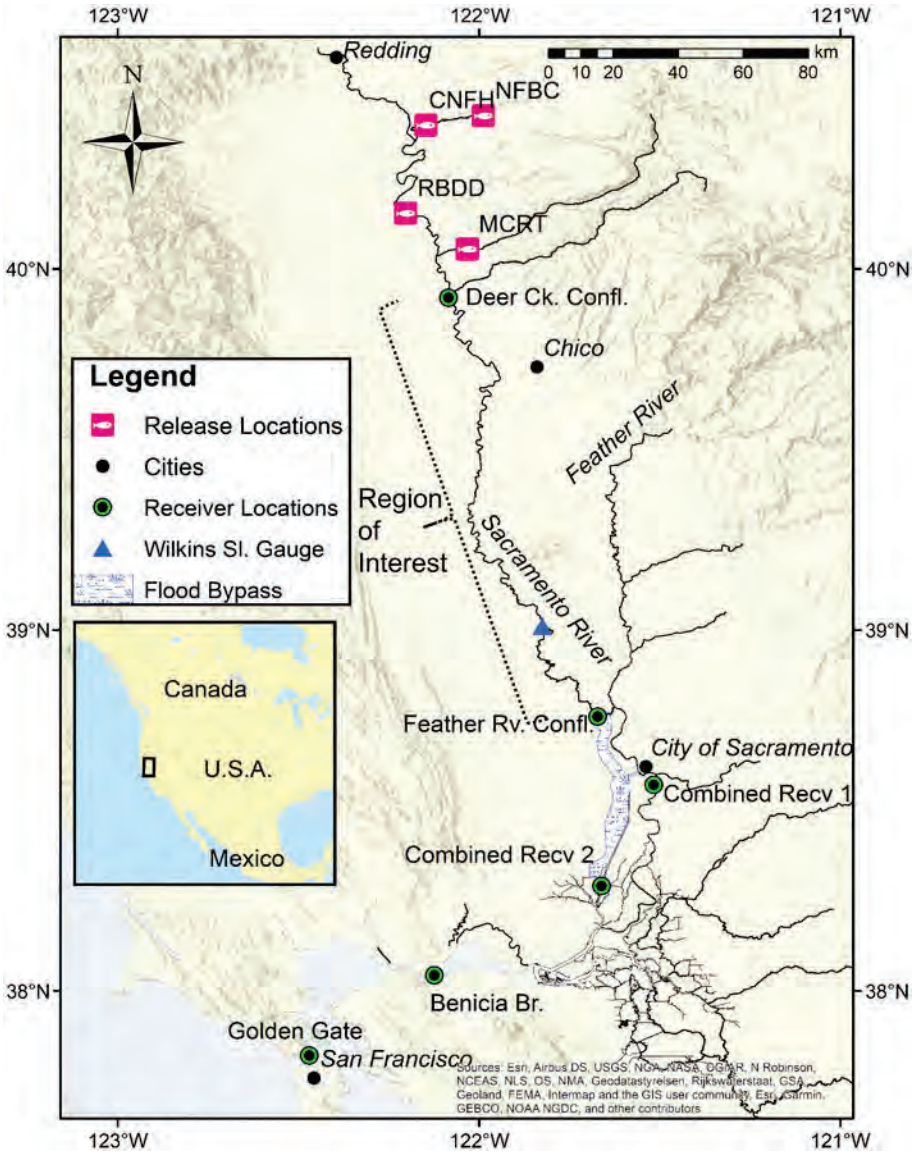

Fig. 2. Study area, release locations, and receiver locations. Region of interest spans from the confluence with Deer Creek to the confluence with Feather River. Release location abbreviations are CNFH, Coleman National Fish Hatchery; NFBC, North Fork Battle Creek; RBDD, Red Bluff Diversion Dam; and MCRT, Mill Creek rotary screw trap.

hatchery releases also peak in spring (Huber and Carlson 2015), during which their outmigration survival rates also appear to be sensitive to flow rates (Zeug et al. 2020).

Acoustic telemetry studies investigating the survival and movement of juvenile salmon in the Sacramento River have proliferated in recent years (Michel et al. 2015, Cordoleani et al. 2018, Notch et al. 2020). We compiled all the available spring period (15th March–15th June) acoustic tagging data for the Sacramento River and selected fish that were released upstream of the region of interest (above rkm 425): 3402 in total. Of those fish, only fish that were known to have entered the region of interest played a large role in parameterization

of the flow–survival relationship explored in this analysis. Fish that did not appear to survive to the region of interest may have simply not been detected entering the region and therefore play a small role in the parameterization of the flow–survival relationship. The number of fish that were known to enter the region of interest amounted to 2436 acoustic-tagged fish from six different years, including wild and hatchery fish, and fish from three of the four Sacramento River Chinook salmon populations (Table 1).

Acoustic telemetry

Wild fish were collected using rotary screw traps deployed in the Sacramento River and Mill Creek, while hatchery fish were collected from hatchery raceways. Fish were tagged using similar methods across years and populations as described by Deters et al. (2010). Acoustic tags were surgically implanted into the coelomic cavity of the anesthetized fish and closed using one or two interrupted sutures, depending on tag model. Wild fish were allowed to recover in a net pen for approximately 12 h post-surgery and released on-site after sunset. Hatchery fish were allowed to recover for up to 24 h post-surgery and released on-site, or trucked to a release location using an aerated hatchery transport tanker. All release sites were located at least 25 rkm upstream of the region of interest (Fig. 2), such that by the time fish arrived to the region of interest any potential influences of handling, trucking, or release site on survival should have largely been expressed and should have little to no effect on survival estimates in the region of interest.

All fish were tagged and tracked using the Juvenile Salmon Acoustic Telemetry System (McMichael et al. 2010). Tags were programmed to transmit at three-, five-, or ten-second intervals depending on tag type, enabling them to function for a minimum of 27, 32, and 52 d, respectively. Tag size depended on the study population and ranged in size from 10.5 mm long × 5.2 mm high × 3.0 mm wide to 10.7 mm long × 5.0 mm high × 2.8 mm wide. The transmissions from the tags were detected and the unique tag number recorded by autonomous receivers from different manufacturers (ATS [Isanti, Minnesota, USA], Teknologic [Edmonds, Washington, USA] or Lotek Wireless [Newmarket, Ontario, Canada]). All receiver locations had two or more receivers to maximize detection probability. In an effort to reduce the tag burden in study fish, a maximum 5% tag-to-fish weight ratio was observed. This allowed for fish as small as 75 mm to be tagged and released. Fish tagged ranged from 75 to 120 mm fork length (mean 86.8, standard deviation [SD] 5.8).

Table 1. Wild and hatchery tagged fish groups included in our analysis from 2013 to 2019.

Population	Origin	Year	Release dates	Release location	*N*	Genetic population origin
Mill Creek	Wild	2013	Mid-April to mid-May	MCRT	48	74% CCV fall-run 26% CCV spring-run
Coleman	Hatchery	2013	Mid-April	CNFH	285	100% CCV fall-run
Mill Creek	Wild	2015	Mid-April to mid-May	MCRT	110	44% CCV fall-run 56% CCV spring-run
Coleman	Hatchery	2016	Early-April to late-April	CNFH	540	100% CCV fall-run
Mill Creek	Wild	2017	Mid-April to late-April	MCRT	24	100% CCV fall-run
Coleman	Hatchery	2017	Early-April to late-April	CNFH	370	100% CCV fall-run
Sacramento River	Wild†	2017	June 6	RBDD	33	100% CCV fall-run
Sacramento River	Wild†	2018	Early-May to early-June	RBDD	207	100% CCV fall-run
Livingston Stone	Hatchery	2019	March 26	NFBC	199	100% Sacramento winter-run
Coleman	Hatchery	2019	April 11	CNFH	140	100% CCV fall-run
Coleman	Hatchery	2019	Late-May	RBDD	480	100% CCV fall-run
Total		2013–2019	Late-March to early-June		2436	

Notes: CCV, California's Central Valley. Release locations are further described in Fig. 2. Genetic population assignments made using protocols outlined in Clemento et al. (2011).

† Fish captured in rotary screw traps in the Sacramento River and tagged were assumed to be wild, although some hatchery fish may have been misidentified and incidentally tagged.

Cormack-Jolly-Seber model

We used the Cormack-Jolly-Seber (CJS) model for live recaptures within Program MARK (White and Burnham 1999) using the RMark package (Laake 2013) in R statistical software (vers. 3.6.1; R Core Team 2019) to estimate survival as well as to assess the fit of different flow relationships with survival. For species that express an obligate migratory behavior such as Chinook salmon, a spatial form of the CJS model can be used, in which recaptures (i.e., tagged fish detected downstream from release) occur along a migratory corridor. The model determines if a fish not detected at a given receiver location was ever detected at any receiver downstream of that specific receiver, thus enabling calculation of maximum-likelihood estimates for detection probability of all receiver locations (p), survival (Φ), and 95% confidence intervals for both (Lebreton et al. 1992).

If a predator consumes an acoustic-tagged salmon and swims downstream past the next receiver location, the CJS model would incorrectly assign that fish as having survived the reach in which it was consumed. In the river above tidal influence, Chinook salmon express obligate anadromy and do not typically travel upstream (i.e., against current) once migration has begun; any movements in the upstream direction are likely predator movements. We therefore used the entirety of detection data available in the Sacramento River for each year (>12 receiver locations per year) to truncate the detection history of each fish to only include detections leading up to the first upstream movement, if one occurred.

We then subset the remaining detection data to only include receiver locations that bookend the region of interest. After release, the first receiver location was at the Deer Creek confluence (rkm 425), at the upstream end of the region of interest. The second receiver location was located just below or above the Feather River confluence depending on the year (rkm 204 or 211, respectively), and therefore, the reach between these receiver locations encompassed the entire region of interest (Fig. 2). We also included additional receiver locations further downstream in the detection history to allow for an estimation of detection probability at the Feather River confluence location. However, during high flow events, such as in 2017 and 2019, a portion of the Sacramento River spilled into a flood bypass located just upstream of the Feather River confluence (Fig. 2). Since this introduced a secondary migration route, we used a combination of receivers at the end of the bypass (located at Liberty Island, Solano County) and receivers in the mainstem Sacramento River (located at City of Sacramento, Sacramento County) to create a synthetic recapture event in the detection history, ensuring both potential routes were covered. These data were only included in the analysis to better estimate detection probability at the end of the region of interest. Finally, we also used two downstream receiver locations to further improve detection probability estimation, one at Benicia Bridge (Contra Costa County, rkm 52) and at the Golden Gate, the entrance to the Pacific Ocean (rkm 1).

Flow–survival relationship

Each fish was assigned a value equal to the mean flow over the entire travel time from passing the Deer Creek confluence to first detection at the Feather River confluence. For fish not detected at the Feather River confluence (either due to mortality upstream, or imperfect detection probability; representing 75.3% of all fish), we imputed travel time by creating probability density functions (p.d.f.s) from all known travel times for each tagging group (i.e., rows in Table 1) using kernel density estimation ("density" function in R statistical software). We then imputed travel time by randomly selecting a point along the p.d.f. for that fish's tagging group. We used flow values from the United States Geological Survey's (USGS) Sacramento River at Wilkins Slough gauging station (USGS station number 11390500). This location was nearest to the downstream end of the region of interest and represented the minimum flows that fish would experience during the late spring period (15th April and later; Fig. 1).

We created an initial CJS model by grouping fish based on 5% quantile bins of the flows they experienced. These survival groups, parameterized in the model by dummy variables, were allowed to only impact survival estimates of the region of interest (i.e., reach 2: Deer Creek confluence to Feather River confluence, Φ_{reach2}).

To explore nonlinearity in the flow–survival relationship, we employed model selection using

the Bayesian Information Criterion (BIC) to assess the parsimony of different flow–survival modeling structures. We created multiple CJS models that allowed the relationship between flow and survival in the region of interest (reach 2: Deer Creek confluence to Feather River confluence) to take linear, log-linear, polynomial, cubic spline curve, and threshold (i.e., step function) forms. We used flow values for individual fish as individual covariates in the first four model types and as a grouping variable (dummy variable) for the threshold model. We also explored the potential for multiple thresholds in the flow–survival relationship. For all models, detection probability was allowed to vary by receiver location and tagging group. More details on the flow–survival modeling effort can be found in Appendix S1.

Spring pulse flow scenarios and theoretical survival improvements

Where we found strong evidence of a nonlinear flow–survival relationship, we assessed different management strategies that could use this information to improve cohort outmigration survival of salmon in the Sacramento River. We generated two hypothetical implementations of pulse flows during the spring period for the study years (2013–2019). The first implementation scenario allowed for sustained flows that would result in the highest survival rates based on the nonlinear flow–survival relationship. Sustained flows were centered around the average date of peak spring juvenile salmon outmigration (April 19th, based on 2005–2019 expanded juvenile salmon capture data from USFWS's Red Bluff rotary screw traps, https://www.fws.gov/redbluff/rbdd_biweekly_final.html) and scheduled to last as long as possible given the water budget. The second scenario represented an adaptive management implementation of spring pulse flows: Following a substantial increase in daily catch rates at the Red Bluff rotary screw traps, flows were temporarily increased (for four days) to the levels that would result in the highest survival rates based on the nonlinear flow–survival relationship. The maximum number of four-day pulse flow events was enacted given the available water budget. Days with substantial increases in catch rates at the rotary screw traps are proximate estimates of periods of peak outmigration of juvenile salmon, and we estimated these days to be when both (1) total expanded catch exceeded 10,000 juvenile salmon and (2) the increase was more than one standard deviation over the mean from the previous 10 d. Finally, we used two water budgets for these scenarios: a realized water budget (which consisted of the totality of water released from Keswick Dam during the spring of each year) and an ecosystem water budget, which added 150 thousand acre-feet (TAF) to the realized water budget each year.

We used the expanded combined daily catch of all runs of Chinook salmon for determining peak outmigration triggers. Expansion factors were based on capture efficiency trials operated by USFWS Red Bluff Office, and the resulting expanded total catch numbers represent the total number of fish passing the screw trap at Red Bluff. The rotary screw traps are 38 river kilometers upstream of the region of interest and therefore approximately represent the daily number of fish entering the region of interest during their outmigration. The screw traps are operated continuously, except during the passage of significant numbers of hatchery fish or during storm conditions (B. Poytress, *personal communication*). As a result, some spring sampling days are missing from our study period. Furthermore, some days of significant hatchery fish catches were also removed from the dataset; these days were identified as days when expanded daily catch total surpassed 80,000 fish.

To estimate the realized water budget, we multiplied the sum of the mean daily flow estimates (cfs) from 15th March to 15th June from the Keswick Dam gauge (USGS station number 11370500) by 1.983×10^{-3} to convert to volume (TAF). To benefit outmigrating salmon, the nonlinear flow–survival targets from the most parsimonious CJS model would need to be realized at the Wilkins Slough gauge, so we estimated a daily net change between Keswick Dam and Wilkins Slough. This approximates the net difference between water inputs (tributaries) and water exports (water diversions) between the Keswick Dam and Wilkins Slough at a daily time step. Finally, all alternative flow regimes had three important regulatory constraints: (1) minimum Keswick flows of 3250 cfs (National Marine Fisheries Service 2009 Biological Opinion and

Conference Opinion on the Long-Term Operations of the Central Valley Project and State Water Project: NMFS 2009 BiOp), (2) maximum Keswick flow reduction rate of 15% per day (U.S. Bureau of Reclamation 2008 Central Valley Project Biological Assessment), and (3) no alteration to any daily Keswick releases that were deemed to be for flood control (>20,000 cfs).

We then modeled the impact of the different flow implementation scenarios on cohort outmigration survival of spring-outmigrating juvenile Chinook salmon. We used parametric bootstrapping, where the pertinent logit-transformed survival distribution from the CJS model (given flow levels at Wilkins Slough for that day) was resampled corresponding to the expanded daily total catch at the Red Bluff screw traps. We estimated the mean logit-scale survival from the totality of samples across all days of the spring period, and then re-scaled (inverse-logit transform). For missing daily catch values, we imputed catch using a linear interpolation of the time series. Finally, to provide a baseline for assessing the potential survival gains of each scenario, we estimated the cohort outmigration survival for the status quo (using the observed spring hydrograph in the years 2013–2019).

Results

We found strong evidence of nonlinearity in the flow–survival relationship (CJS model with grouping based on 5% quantile flow bins, Fig. 3). Survival was positively related to flow for values up to 10,000 cfs, followed by a sharp increase in survival near 10,000 cfs, at which point survival asymptotes at approximately 50%.

Out of 724,567 models we tested, the triple threshold models were the most parsimonious, with 12 that were within two BIC points of the top model. We estimated survival parameters and threshold values (4259, 10,712, and 22,872 cfs) from these 12 models using model averaging. The threshold models were substantially better supported than any of the other model types tested (ΔBIC > 29). Furthermore, these threshold models, as well as all polynomial and spline models, were better supported than the linear, log-linear, and full models (ΔBIC > 146), indicating strong support of a nonlinear flow–survival relationship.

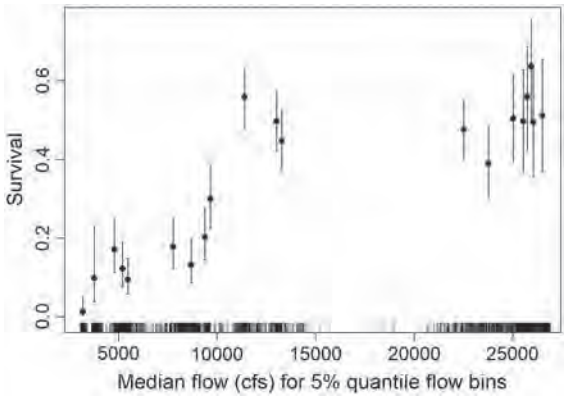

Fig. 3. Survival as a function of flow. Survival estimates (points) with 95% confidence intervals (bars) for groups at 5% quantile bins of experienced flow, plotted at the median value of bins (in cfs) on the *x*-axis. Flow experienced per fish is indicated by vertical tick marks along the *x*-axis.

In order to better understand model fit across the range of potential flow thresholds, for each flow value tested in the threshold models, we estimated the mean BIC of all models that included that flow value as one of its thresholds (Fig. 4). With similar results to the model selection exercise, models with flow thresholds around 4259, 10,712, and 22,872 cfs had strong support (i.e., lower mean BIC). We labeled these minimum (4259 cfs), historic mean (10,712 cfs), and high (22,872 cfs). The historic mean threshold had highest support of the three thresholds

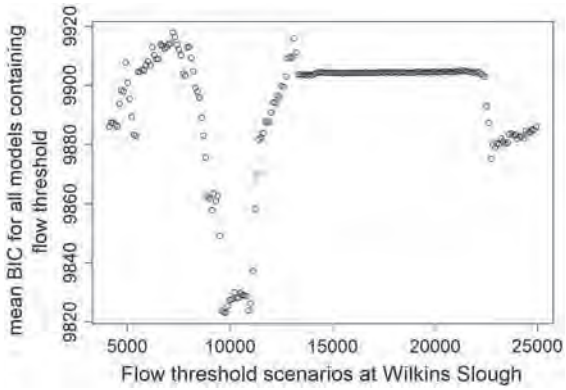

Fig. 4. Mean BIC scores per threshold value as a function of flow. A lower BIC value indicates a stronger supported model.

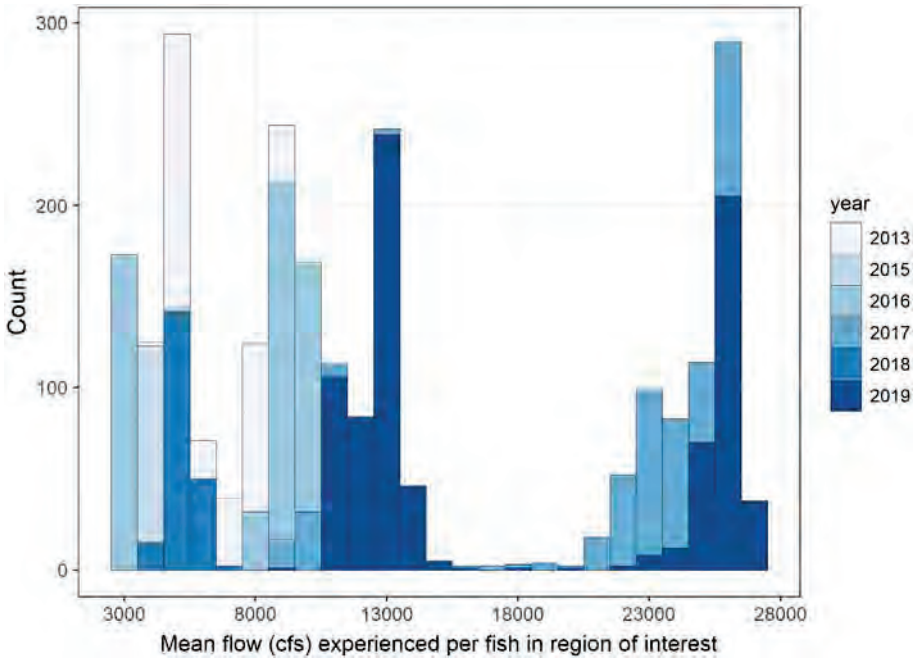

Fig. 5. Frequency of flow values used in analysis by year. Values are mean flow (cfs, as measured at Wilkins Slough gauge), both empirical and imputed, for all fish. Flow bin sizes are 1000 cfs, and bar colors indicate the relative number of fish by year for each flow bin.

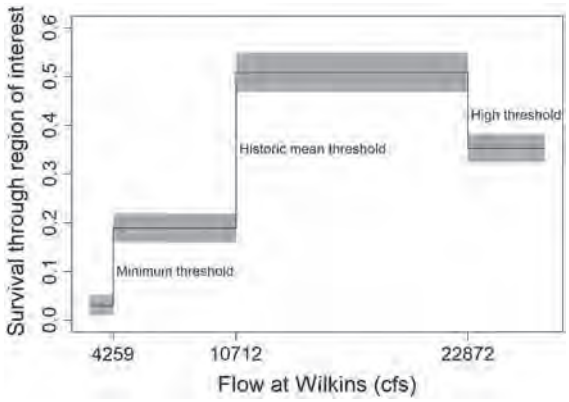

Fig. 6. Thresholds of predicted survival as a function of flow at Wilkins Slough. Predictions are based on the model averaged parameters from the most parsimonious triple threshold models, with mean thresholds at 4259, 10,712, and 22,872 cfs, with 95% confidence intervals (gray fill).

(Fig. 4). Few fish experienced flow values between approximately 14,000 and 21,000 cfs (Fig. 5), and therefore, model fit did not vary significantly with thresholds found in this range.

We used model averaged parameter estimates to predict survival for the range of flow values (Fig. 6). There was a 6.3-fold increase in survival from flows below 4259 cfs (0.03) to flows between 4259 and 10,712 cfs (0.189). There was a 2.7-fold increase in survival from flows between 4259 and 10,712 cfs to flows above 10,712 cfs (0.508). Overall, there was a 16.9-fold increase in survival from flow below 4259 to flows above 10,712 cfs. Finally, survival decreased above the 22,872 cfs threshold to 0.353. Survival was significantly different between groups, with non-overlapping 95% confidence intervals. The 22,872 cfs threshold may be an artifact of lower detection efficiencies associated with fish utilizing additional high flow migration routes with less receiver coverage.

We compared modeled cohort outmigration survival rates among five different water release scenarios for five water years with the modeled survival rates for actual flows (Fig. 7). Water years 2013 (dry), 2014 and 2015 (critical), and 2016 and 2018 (below normal) represent three classes of water supply scarcity in the Sacramento River Basin (http://cdec.water.ca.gov/re

portapp/javareports?name=WSIHIST). For dry year 2013 and below normal years 2016 and 2018, the three alternative scenarios using the available water budget resulted in survival rate increases ranging from 55% to 98%, while the scenarios with an additional 150 TAF resulted in survival rates increases ranging from 79% to 119%.

For critical years 2014 and 2015, the realized water budgets were not sufficient to allow for the alternative release scenarios, beyond just maintaining flows above the low flow threshold for as long as possible (resulting in survival rate increases of 83% and 132%, respectively). Scenarios using an additional 150 TAF resulted in survival rate increases ranging from 130% to 330%.

Discussion

Streamflow is a master variable in stream ecology, influencing biological and physical habitat characteristics, and if not managed properly, flow alteration can be a serious threat to freshwater ecosystems. Yet, water management decisions continue to be poorly informed by environmental research (Davies et al. 2013, Horne et al. 2016). In the Sacramento River Basin, surface water demands exceed supplies in all but the wettest years (Grantham and Viers 2014), and there is a pressing need to optimally allocate those limited resources to meet management objectives, including ecosystem benefits. We identified threshold responses in salmon outmigration survival across a range of observed instream flow rates. These relationships are valuable tools for updating water management practices aimed at balancing competing demands. Applying our minimum threshold (4259 cfs) as a lower critical flow boundary for spring flows could result in a 6.3-fold increase in outmigration survival. Flows above the historic mean threshold (10,712 cfs) could provide an additional 2.7-fold increase in survival. Flows above this threshold could be enacted when the resources are available, especially if coordinated with hatchery releases or peak wild salmon migration periods. All else being equal, these survival gains could result in concomitant increases in adult escapement. These modeled survival benefits justify the need to identify ways to exceed these flow thresholds more consistently and for longer periods during the spring months.

High flows promote favorable outmigration conditions for Chinook salmon juveniles, resulting in increased survival to the ocean (Connor et al. 2003, Smith et al. 2003). We identified an optimal threshold of 10,712 cfs, which we labeled historic mean, as it is similar to the long-term average of natural spring flow conditions under which Chinook salmon have evolved in this system (Fig. 1). One potential mechanism for this threshold is high flows typically increase water turbidity, which may aid juveniles in evading predators (Gregory and Levings 1998). Alternatively, it is known that outmigrating juveniles move at higher speeds with higher flow (Berggren and Filardo 1993), limiting their exposure time to predators and other hazards. Movement speeds and survival rates of wild Chinook salmon juveniles in this section of the river are strongly correlated (Notch et al. 2020). Therefore, to determine whether movement speeds may be one of the mechanisms driving the 10,712 cfs threshold, we conducted a post hoc analysis of fish travel times through the region of interest as grouped by the flow threshold boundaries. A Kruskal–Wallis test indicated significant differences in travel time distributions between the groups ($P < 0.001$), and a Dunn's multiple comparison test indicated that travel times for fish experiencing flows between 10,712 and 22,872 cfs were significantly shorter than for fish experiencing all other flow levels (Fig. 8).

Flow levels above the historic mean threshold represent normal spring time flows under natural runoff and streamflow conditions up until approximately 15th May (Fig. 1). Yet, from 1993 to 2019 such flows were only achieved in 37% of days during the 15 April–15 May peak outmigration period, and only 10% of days in below average water years (Fig. 9), and were even less likely to occur later in the spring (Fig. 10). In late spring (after approximately 15 April), tributary flows subside and demand for agricultural water deliveries increase dramatically, a combination that creates progressively diminished instream flow in downstream reaches (Fig. 1). Sturrock et al. (2020) found that under current water management regimes, the low flows and high water temperatures that occur in the late spring are selective forces against the later-migrating smolt

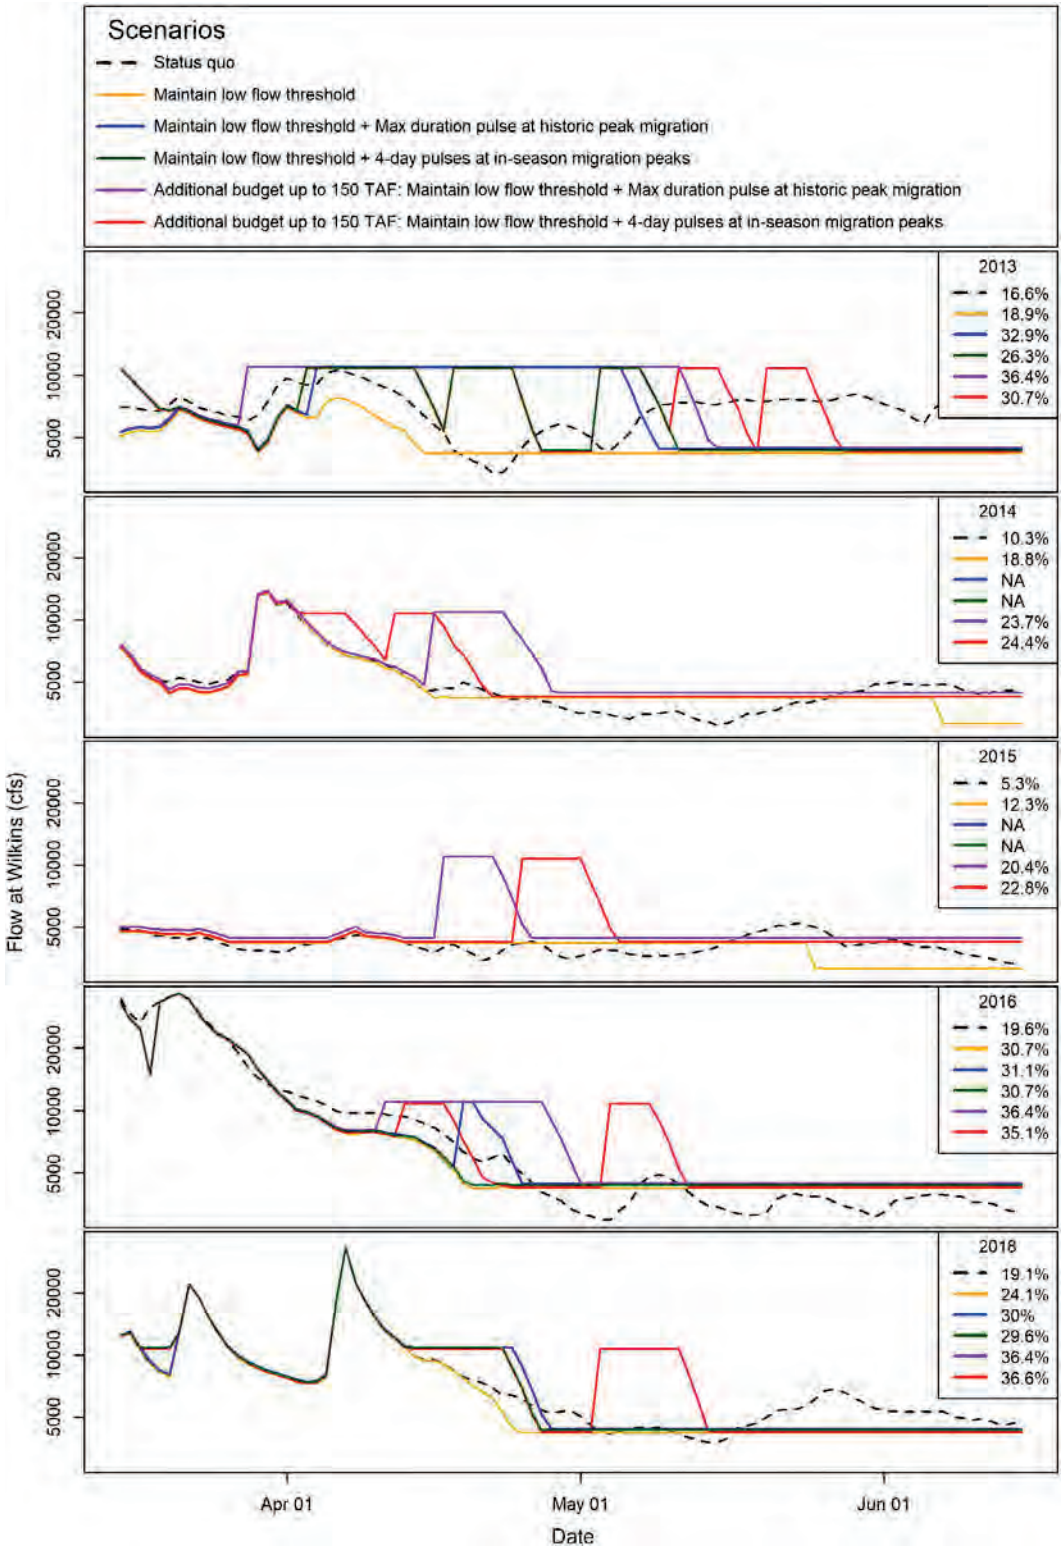

Fig. 7. Alternative flow scenario hydrographs using the flow–survival nonlinearities found in this study. Predicted cohort spring outmigration survival based on flow scenarios and daily fish passage at Red Bluff rotary

Fig. 7. Continued
screw traps are depicted in figure legends. Scenarios for 2017 and 2019 water years are not depicted, as wet conditions in those years precluded the need for pulse flows. In the historic drought years of 2014 and 2015, pulse flows were not possible based on realized water budget (NA for respective survival estimates in legend).

juvenile life-history type (>75 mm fork length [FL]). The implementation of spring pulse flows above the 10,712 cfs threshold could be a powerful tool to restore functional parts of the natural flow regime during critical periods of the salmon life history, and ultimately, the increased heterogeneity of flows may promote increased population diversity.

The mechanism driving the lower flow threshold (4259 cfs) is unclear. Anecdotal observations indicate that under certain low flow conditions, sections of the Sacramento River may have increased habitat heterogeneity, in particular with regard to pools and riffles where predator ambush habitat is likely created (C. J. Michel, *personal observation*). Flow influences other important environmental variables, such as water temperature, that might also have nonlinear relationships with survival. Because temperature and flow are highly correlated (flow and temperature experienced for these fish as measured at Wilkins Slough had a Pearson's correlation coefficient of 0.93) and flow is the most persistent driver of survival in the CCV (Henderson et al. 2019, Notch et al. 2020), we did not include temperature in this analysis. At very low flows during the latter end of the spring period, water temperature in the lower Sacramento River can approach the thermal tolerance of juvenile Chinook salmon. For fish outmigrating during flows lower than the low flow threshold, mean water temperature experienced was 19.9°C (0.5 SD) as measured at the Wilkins Slough gauge. At this temperature, salmon health and vulnerability to predation can be affected and ultimately lead to lowered survival (Marine and Cech 2004, Miller et al. 2014, Lehman et al. 2017, Michel et al. 2020). During most years, spring outmigration flows are above the lower threshold, and these unfavorable conditions are usually only observed during years of drought (e.g., 1994, 2013–2015; Fig. 10). However, in recent years, spring flows below this lower threshold have occurred in years of near average precipitation (i.e., 2016, 2018; Fig. 10), likely resulting from a complex suite of factors, including reservoir management strategies for conserving cold water for endangered winter-run Chinook salmon, and increasing water deliveries for out-of-stream uses during the summer months.

Fig. 8. Distribution of fish travel times (log-scale) through the area of interest as a function of flows experienced with respects to the flow thresholds. Travel time is calculated for fish detected both at Deer Creek confluence and at Tisdale (rkm 269), representing the upper 74% of the region of interest. Travel times to the end of the region of interest (Feather River confluence) were not used as too few fish remained in the <4259 cfs group to accurately represent travel times for that group. Letters within the plot frame indicate significant differences between travel time distributions from a Dunn's multiple comparison test, at the 0.05 level.

Of the models we tested, the threshold models had strongest support, possibly because they allow for a sharp transition between survival levels as a result of small changes in flow across some ecologically important value. For example, exceeding a given threshold can lead to river bank overflow, which activates seasonal floodplains, providing juvenile salmon an alternative downstream migration route. This is the hypothesized mechanism for the high threshold (22,872 cfs): Tisdale Weir, within the region of interest, overtops at approximately this flow value, allowing fish to enter the Sutter Bypass. Survival decreased at flows above this

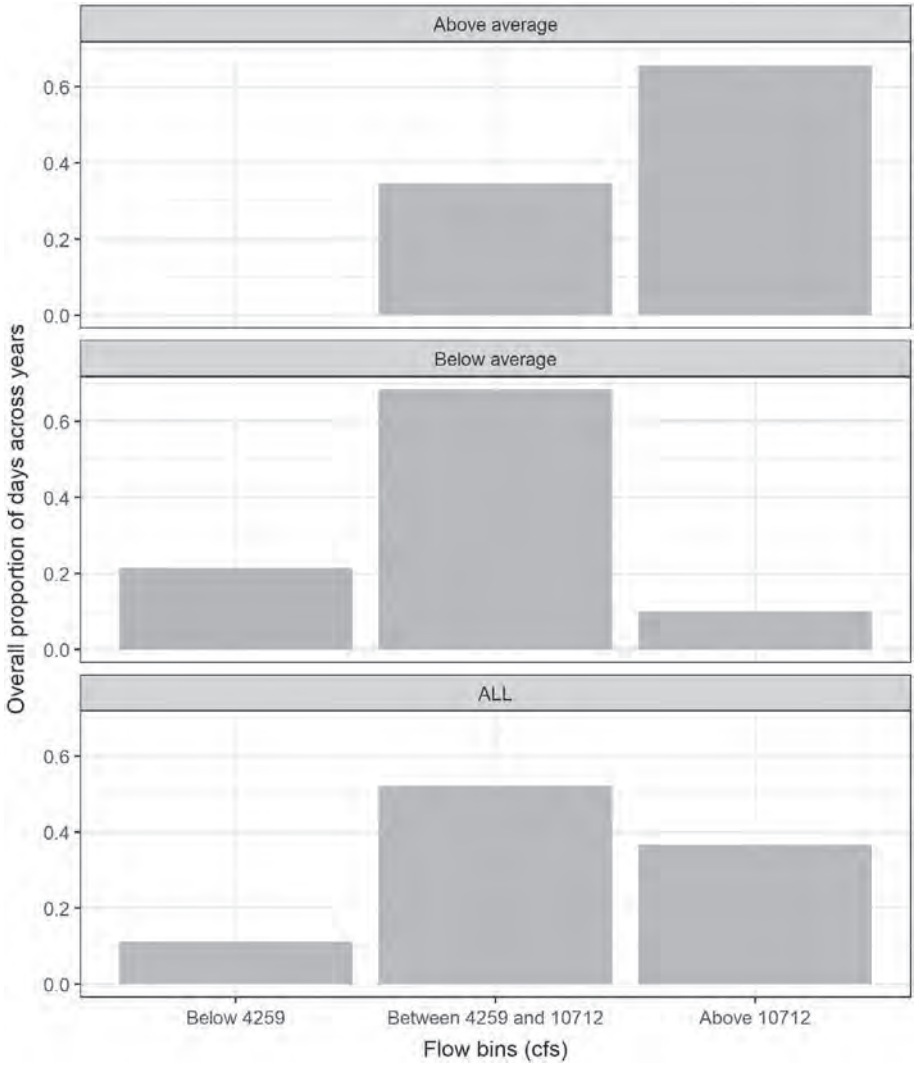

Fig. 9. Proportion of daily flows at Wilkins Slough that fall below, between, or above the two lower flow thresholds from 15th April to 15th May period from 1993 to 2019, split out by above average (i.e., wet and above normal) and below average (i.e., below normal, dry, and critically dry) water years, according to the Water Year Hydrologic Classification Index for the Sacramento Valley (http://cdec.water.ca.gov/reportapp/javareports?name=WSIHIST).

threshold, which could be evidence that fish utilizing this alternate route experienced decreased survival compared to fish remaining in the Sacramento River. While flood bypasses are generally considered to be high-quality rearing habitat for juvenile salmon (Sommer et al. 2001), there is little known about the relative survival of fish utilizing these habitats. Travel times for fish above the high threshold were significantly higher and are more widely distributed than for fish just below this threshold (Fig. 8), with fish taking up to 27 d to transit the region of interest. These slower moving fish may have been delayed as a result of spending time on floodplains, and their increased exposure time to potential stressors may explain their decreased survival in comparison to fish just below the high threshold that could not access the floodplains. This is consistent with the results of a similar study

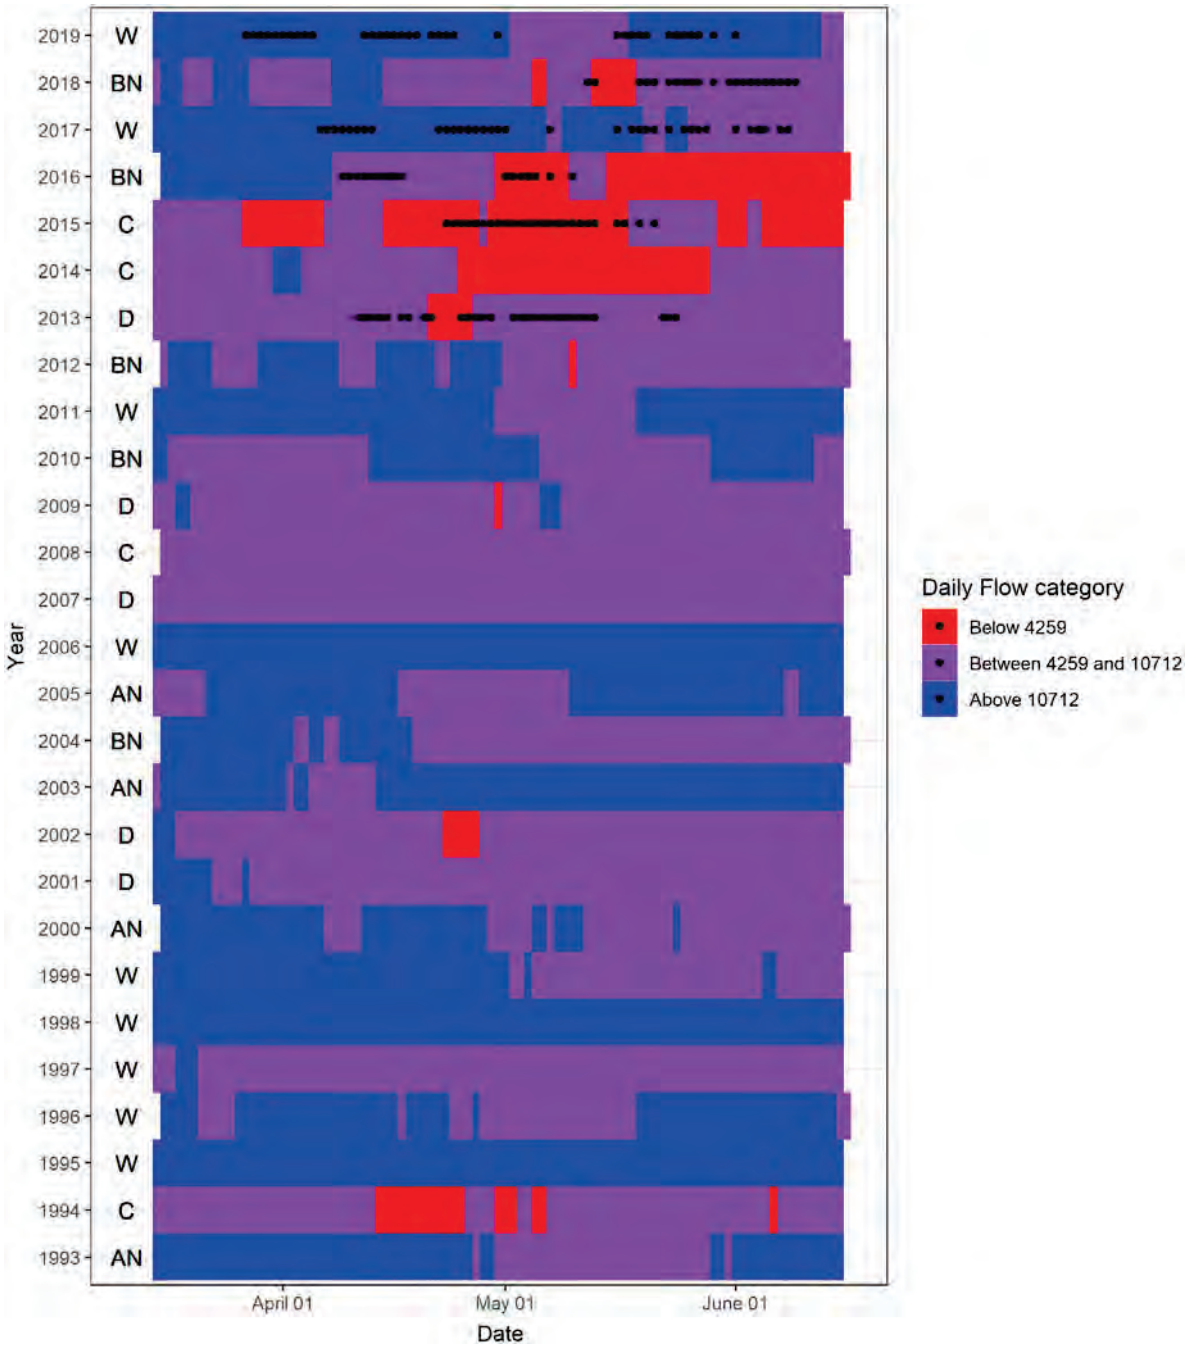

Fig. 10. Classification of flow values into the below 4259 cfs, between 4259 and 10,712 cfs, and above 10,712 cfs categories for each day of the spring outmigration period (15th March–15th June) for the years 1993–2019. Flow values are as measured at USGS Wilkins Slough gauging station on the Sacramento River. Black points represent days when acoustic-tagged fish were entering the region of interest. Text within box indicates the Water Year Hydrologic Classification Index for the Sacramento Valley (http://cdec.water.ca.gov/reportapp/javareports?name=WSIHIST); year type codes are W, wet; AN, above normal; BN, below normal; D, dry; and C, critically dry.

where survival per day was similar between release groups that traveled through a floodplain compared to those that traveled through the mainstem river, and yet due to longer travel times through the floodplain, the floodplain groups experienced overall lower survival rates (Pope et al. 2018). It should again be noted that the detection probability of fish utilizing the bypass route is likely lower, which could be a confounding driver of the high threshold.

The alternative flow regimes indicated that substantial survival gains over the status quo were possible by leveraging the thresholds we identified. These flow scenarios lead to increases in annual outmigration survival ranging between 57% and 130% without additions to the water budget and increases ranging from 79% to 330% with a modest 150 TAF addition to the water budget (Fig. 7). There were no clear and consistent differences in survival between the historic peak migration pulse flow scenario and the four-day adaptive pulse flow scenario, whether with the realized water budget or with the additional environmental water budget. We included an additional scenario where flows mimicked the status quo hydrograph, but flows were not allowed to dip below the minimum threshold, which alone led to substantial gains in survival in the Critical Dry water years 2014 and 2015 (Fig. 7). Adaptive pulse flow scenarios may be preferable to a single-pulse, fixed calendar date scenario in ways not measured in this study. For example, the adaptive implementation will be more responsive to hydrologic or biotic nuances of a given year and promote more diversity in outmigration timing.

Our analysis is consistent with many studies concluding that flow is a strong driver for Chinook salmon smolt spring outmigration survival. This period of time coincides with peak hatchery releases and peak natural-origin outmigration of fall-run Chinook salmon, the stock that supports an important commercial and recreational fishery, as well as peak outmigration of ESA threatened wild spring-run Chinook salmon smolts from Sacramento River tributaries. Spring-run Chinook salmon populations historically spawn at high elevations and therefore experience slower growth rates and delayed outmigration timing compared to other Chinook salmon populations (Yoshiyama et al. 1998). This delayed outmigration timing makes them particularly vulnerable to low flows in the late spring. Further, these late outmigrants are subject to asynchronous flow conditions between natal streams (when their initial downstream migration is triggered by snow melt or spring freshets in the tributary) and the mainstem Sacramento River, where they experience periods of low managed flows. Restoring the functionality of the spring flow regime during wild smolt outmigration is a critical step toward promoting sustainable fisheries (Jager and Rose 2003), as well as restoring a threatened population of salmon.

Other CCV native fish species may require different flow conditions during the spring, potentially creating water management conflicts. For example, high flows and cold water from dam releases may have detrimental impacts on threatened green sturgeon (*Acipenser medirostris*) in the Sacramento River (Zarri et al. 2019). Similarly, endangered winter-run Chinook salmon rely on cold water released from Shasta Reservoir during egg development in the summer, which is contingent on water operations that allow sufficient cold water availability in Shasta Reservoir for the summer months (Martin et al. 2017). Increasing spring flows for the benefit of fall-run and threatened spring-run Chinook salmon requires carefully balancing the needs of other protected species in the Sacramento River.

Our study focused on the flow–survival relationship for the smolt outmigration life history, as it was based on acoustically tagged fish, and tag size constraints precluding the tagging of smaller juveniles. However, other juvenile life-history types, namely fry and parr (approximately <55 mm and 55–75 mm FL, respectively), are important contributors to CCV Chinook salmon populations (Sturrock et al. 2020). While higher winter and spring flows also benefit fry and parr life histories (Sturrock et al. 2015, 2020), the flow thresholds defined in this study are for smolt outmigration and are likely not directly compatible with fry and parr life histories, which need flows appropriate for rearing. In addition, wild smolts were underrepresented in this analysis due to the difficultly in capturing adequately sized individuals for tagging, and the results we present are likely driven largely by survival dynamics of hatchery fish. Nonetheless, targeting ecologically functional flows that mimic the

shape of the historic flow regime under which these fish evolved should also benefit these other populations and promote life-history diversity.

Our study identifies key thresholds in the flow–survival relationships that can help water and fisheries managers evaluate trade-offs associated with different water management options that are, by law, supposed to balance instream and out-of-stream management objectives. We recommend that future studies attempt flow experiments to verify that migrating salmon would benefit as predicted from managed flow augmentation (such as pulse flows). It is likely that such pulse flows will engendered larger cohort-wide survival gains than predicted here: Flow pulses are known to promote juvenile Chinook salmon to initiate their downstream migration (Sykes et al. 2009), allowing a larger portion of the population to take advantage of the associated improvements in survival. Courter et al. (2016) used managed flow releases in the Yakima River, Washington, to show the positive impact of increased flow on Chinook salmon smolt survival, which was then used to implement a minimum flow target. Experimental pulse flows may also help decouple the mechanisms driving increased survival, because increased flows through reservoir releases may not affect temperature and turbidity the same as storm-related flow increases. Ultimately, functional flows in CCV should include a spring pulse flow component that mimics the characteristics of spring freshets and snowmelt events of a natural flow regime. These will benefit outmigrating smolts and also engender many other benefits to the ecosystem (Poff et al. 1997, Kiernan et al. 2012).

This is timely research as the frequency of drought events is predicted to increase in the CCV, creating additional stress to already vulnerable salmon populations (Yates et al. 2008). Munsch et al. (2019) showed a truncation of fish size and outmigration timing of juvenile Chinook salmon from the Sacramento River during warmer springs, which could lead to lower ocean survival. This highlights the influence of climate change on salmon species phenology and dynamics and the need for new flow management policies that include the potential impacts of future climate warming. In the Sacramento River, finding functional flows that could simulate ecologically critical aspects of the natural spring flow regime, especially in increasingly common dry water years, is a critical step in ensuring the resiliency of juvenile Chinook salmon and other native fish species into the 21st century.

Acknowledgments

We thank Cramer Fish Sciences, NOAA Fisheries, and U.S. Fish and Wildlife Service (USFWS) for providing portions of the tagging data used here. Funding and resources were provided by the U.S. Bureau of Reclamation, U.S. Fish and Wildlife Service's Anadromous Fish Restoration Program, and the Central Valley Project Improvement Act. Wild and hatchery fish collection was made possible by staff and support from USFWS–Red Bluff Fish and Wildlife Office and the California Department of Fish and Wildlife Red Bluff Office. Material, administrative, and logistical support was provided by the National Marine Fisheries Service–Southwest Fisheries Science Center. We thank Carlos Garza and the Molecular Ecology Team for genetic assignment of tagged wild fish. Finally, we thank Nate Mantua, Steve Zeug, Michael Beakes, and the anonymous reviewers for insightful reviews of the manuscript. All fish were handled humanely according to the methods described in University of California, Santa Cruz IACUC permit #DANNE1905. The Institute of Marine Sciences at the University of California, Santa Cruz, is affiliated with the Southwest Fisheries Science Center, Fisheries Ecology Division, National Marine Fisheries Service, and National Oceanic and Atmospheric Administration.

Abstract

A presumed value of shallow-habitat enhanced pelagic productivity derives from the principle that in nutrient-rich aquatic systems phytoplankton growth rate is controlled by light availability, which varies inversely with habitat depth. We measured a set of biological indicators across the gradient of habitat depth within the Sacramento–San Joaquin River Delta (California) to test the hypothesis that plankton biomass, production, and pelagic energy flow also vary systematically with habitat depth. Results showed that phytoplankton biomass and production were only weakly related to phytoplankton growth rates whereas other processes (transport, consumption) were important controls. Distribution of the invasive clam *Corbicula fluminea* was patchy, and heavily colonized habitats all supported low phytoplankton biomass and production and functioned as food sinks. Surplus primary production in shallow, uncolonized habitats provided potential subsidies to neighboring recipient habitats. Zooplankton in deeper habitats, where grazing exceeded phytoplankton production, were likely supported by significant fluxes of phytoplankton biomass from connected donor habitats. Our results provide three important lessons for ecosystem science: (a) in the absence of process measurements, derived indices provide valuable information to improve our mechanistic understanding of ecosystem function and to benefit adaptive management strategies; (b) the benefits of some ecosystem functions are displaced by water movements, so the value of individual habitat types can only be revealed through a regional perspective that includes connectedness among habitats; and (c) invasive species can act as overriding controls of habitat function, adding to the uncertainty of management outcomes.

Key words: restoration; shallow-water habitat; pelagic production; food web; freshwater ecosystems.

Introduction

Motivated by the recognition that human activities operate across landscapes to disrupt biological communities and their supporting functions, we have begun a new era of environmental management at the scale of large ecosystems (Vitousek and others 1997). Symptoms of ecosystem disturbance include the loss of biodiversity and the displacement of indigenous species by aliens. Because these symptoms are often responses to multiple stressors, strategies for ecosystem rehabilitation require multiple actions. One approach is based on the premise that habitat diversity is essential for biological diversity because a mosaic of connected habitats provides the full set of ecological and bio-

geochemical functions required to sustain complex biological communities (Noss 1983). The costs of rebuilding lost habitat in disturbed ecosystems can be large, and the benefits are highly uncertain because our experience in the practice of ecosystem management through habitat restoration is still limited (Roe and Eeten 2002; Holl and others 2003). Performing studies prior to habitat restoration can reduce this uncertainty by identifying and measuring the ecological functions provided by specific habitat types (Engelhardt and Ritchie 2001; Lucas and others 2002). Here we present the results of such a study, which was designed to measure pelagic functions and assess their ecological value across a range of aquatic habitats in the highly disturbed Sacramento–San Joaquin River Delta.

California's Delta, which is situated at the confluence of two large rivers (Figure 1a) and was once a 1,400-km^2 wetland (Atwater and others 1979), receives about 30-km^3 of annual runoff from a 140,000-km^2 watershed (Knowles 2002). Between 1860 and 1940, most of the tidal wetlands were drained and transformed into a landscape of diked farm tracts within a network of channels that is now the hub of California's highly managed water supply. This transformation was followed by changes in biological communities at multiple trophic levels, some of which have been documented through monitoring programs sustained over the past four decades (Jassby and others 2002; Kimmerer 2002).

In this study, we measured biomass and calculated productivity of phytoplankton and mesozooplankton across a range of Delta habitats. We were motivated by multiple lines of evidence suggesting that primary and secondary production are low and limit production by native species of fish, including permanent residents (Delta smelt *Hypomesus transpacificus*, splittail *Pogonichthys macrolepidotus*) and migratory species (Chinook salmon *Oncorhynchus tshawytscha*) listed as threatened or endangered (Brown 2003). Previous studies have established that (a) phytoplankton primary production is the most important source of energy fueling production within metazoan food webs, even though the Delta receives large inputs of detritus from river inflow (Sobczak and others 2002); (b) primary production within the Delta is inherently low because of high turbidity and has declined more than 40% since 1975 (Jassby and others 2002); (c) the growth and reproduction of crustacean zooplankton are limited by low phytoplankton biomass (Müller-Solger and others 2002); and (d) stocks of zooplankton, including copepods, cladocerans, and rotifers, have declined significantly since the 1970s (Orsi and Mecum 1996). The declining productivity of pelagic food webs has been hypothesized to be a contributing factor to population declines of native fishes (Bennett and Moyle 1996), including species that are the target of a large-scale restoration program (Jacobs and others 2003).

A strategic goal of the CALFED Bay-Delta Ecosystem Restoration Program is to restore natural processes, and one of its objectives to increase productivity to support the recovery of native species (California Bay-Delta Authority 2004). It is presumed that the historic loss of shallow habitat has contributed to the decline in Delta pelagic primary and secondary productivity (CALFED 2000) and that the restoration of shallow habitat may reverse that trend by increasing productivity and rehabilitating food web processes that support higher trophic levels (CALFED 2001). The presumed link between production at the food web base and higher trophic levels is consistent with a cascading set of responses that followed the 1986 introduction of the alien clam *Potamocorbula amurensis* into the downstream estuary of San Francisco Bay (Nichols and others 1990). Within a year of its introduction, *P. amurensis* dominated macrobenthos biomass in the upper estuary, reaching densities sufficient to remove phytoplankton by filter-feeding faster than the phytoplankton growth rate. Primary production declined fivefold (Alpine and Cloern 1992), and over the following decades, populations of the copepod *Eurytemora affinis* and mysid shrimp *Neomysis mercedis* collapsed (Kimmerer and Orsi 1996) and abundances of native fishes declined significantly (Feyrer and others 2003). This carefully documented suite of responses is strong evidence that the disruption of forage production within pelagic/epibenthic food webs can contribute to stock declines of native fishes through forced diet shifts and food limitation. Independent evidence comes from observations that phytoplankton biomass (Schemel and others 2003) and juvenile Chinook salmon growth rates and survival (Sommer and others 2001) are significantly higher in shallow inundated floodplains than in the adjacent deep channel of the Sacramento River.

The presumption that shallow habitats support high pelagic productivity derives from the principle that phytoplankton growth rate varies inversely with habitat depth in nutrient-rich aquatic systems (Petersen and others 2003) and assumes that bottom–up control regulates productivity. High nutrient concentrations are characteristic of the Delta (Jassby and others 2002) and San Francisco Bay, where the phytoplankton growth rate ($P\mu$) fits an empirically derived function of irradiance (Cloern

and others 1985): $P\mu = -0.09 + 0.096E/(kH)$, where E is surface irradiance, k is the light attenuation coefficient, and H is water column depth. For the characteristic summer values of E (approximately 40 Einsteins m^{-2} d^{-1}) and k (2.0 m^{-1}) measured in our study, we can apply this function to specify a depth-scaling hypothesis for the Delta as $P\mu = -0.09 + 1.91/H$, implying that the water-column phytoplankton growth rate decreases as habitat depth increases and becomes zero at the critical depth of approximately 21.2 m.

Our study was designed around the hypothesis that plankton biomass and production also vary inversely with habitat depth, assuming that bottom–up processes regulate biomass and production at the food web base in this food-limited system. To test this hypothesis, we measured plankton biomass and computed a set of productivity indices across a range of habitat depths within the Delta ecosystem. Observations supporting this hypothesis would provide an objective empirical basis for the expectation that the creation of new shallow habitats will amplify food supply functions in pelagic food webs and promote the recovery of target species. Contradictory observations would demand an understanding of other controlling processes and a reconsideration of the ecosystem benefits to be derived from this restoration strategy.

Site Description and Methods

Study Site

The Delta is a complex physical system that transitions from a strictly riverine regime at its landward margin to a tidally oscillating interconnected network of channels and open-water areas at its seaward boundary. Situated at the head of San Francisco Bay, this freshwater ecosystem is subject to numerous physical influences, including primarily semidiurnal tides, river and stream inflow, wind stress, solar radiation, and anthropogenic manipulation of pumps, gates, and barriers. All of these factors influence the physical transport of water, solutes, particles, and suspended biota such as plankton.

Study Design

We focused our study in and around Franks Tract (FT) and Mildred Island (MI), subsided farm tracts that flooded when their bounding levees were destroyed by large floods in 1938 and 1983, respectively. We sampled 2 sites in FT (surface area, 12.9 km^2; mean depth, approximately 2.5 m), 2 sites in MI (surface area, 4.1 km^2; mean depth, approximately 5 m), and 12 sites in peripheral channels (Figure 1b). The distribution of sampled habitat depths follows the systemwide hypsograph (Figure 1a inset), spanning the range of depths in the central Delta. Our study focused on shallow aquatic habitats and their adjacent deep channels because CALFED strategic plans emphasize ecosystem restoration through the rehabilitation and creation of a broad range of interconnected habitats (CALFED 2000, Jacobs and others 2003; California Bay-Delta Authority 2004). This study was designed to contrast pelagic functions across a range of habitat depths and provide an empirical basis for anticipating the outcomes of habitat creation through planned restoration actions or the unintended flooding of farm tracts after levee failures caused by future seismic or hydrologic events.

The study was designed to capture diel/tidal variability (sampling in/around MI every 6 h over a 30 h period on 5–6 September 2001); weekly variability (in/around MI from 23 August to 13 September 2001); and the spring–summer transition (sampling in/around FT every 3 weeks from 10 April to 9 July 2002). Sampling was intensive in spring and summer because these are the seasons when zooplankton are most food limited (Müller-Navarra and others 2004) and the larval stages of fishes are most dependent upon zooplankton forage (Grimaldo and others 2004). Our study assessed plankton production and trophic transfers. Other functions associated with shallow-water habitat, such as the structural functions provided by submerged and emergent vascular plants, have been assessed by other researchers (for example, Grimaldo and others 2004). We sampled only the mesozooplankton because energy supplies from the microbial loop to metazoan food webs are small relative to phytoplankton primary production (Sobczak and others 2002).

Sample Collection and Analyses

Water samples were collected from 1–1.5 m below the surface using a Van Dorn sampler or peristaltic pump and stored on ice in the dark until processing. Duplicate aliquots were filtered onto GF/F filters, placed on dry ice, and stored at −80°C until analyzed for chlorophyll *a* concentration (Chl *a*) using a Turner TD700 fluorometer (Parsons and others 1984). Separate aliquots were filtered onto 0.4-μm polycarbonate filters and dried for gravimetric determination of suspended particulate matter (SPM) concentration (Hager 1994). We pooled our results with Chl *a* and SPM measure-

ments made by Sobczak and others (2002) at eight locations (Figure 1a) during autumn 1998; spring, summer, and autumn 1999; and spring and summer 2000. Phytoplankton samples were collected in/around FT and during the 30-h MI sampling. These samples were preserved in acid-Lugol's solution and examined with a phase-contrast inverted microscope to identify the most common taxa and estimate their biomass (biovolume) from measured cell dimensions (see Cloern and Dufford 2005).

Nutrient samples, collected in/around MI during 2001, were filtered through 0.4-μm polycarbonate filters and analyzed for dissolved reactive phosphorus (DRP), dissolved silicate (DSi), nitrate, and nitrite using colorimetric techniques (Parsons and others 1984) with modifications for an Alpkem autoanalyzer. We report these results pooled with

the results from our previous studies in the central Delta during 1997 (May–November) and 1998–1999 (seasonally, sites in Figure 1b), when samples were analyzed for dissolved inorganic nitrogen (DIN = ammonium + nitrate + nitrite), DRP, and DSi using a Technicon AutoAnalyzer II and methods described by Hager (1994).

Zooplankton samples were collected with a 50-μm mesh, 0.5-m diameter net towed vertically or obliquely from the bottom to the surface. Within MI, tows were taken at two or three locations adjacent to the Chl *a* sampling sites and combined for a composite sample. Zooplankton were preserved in 5% buffered formalin with Rose Bengal dye. Subsamples were examined in a Sedgewick-Rafter cell, and all rotifers, copepods, and cladocerans were counted and identified to species or genus; lengths of 20 individuals in each category were measured. Copepod nauplii less than 0.20 mm were considered nonfeeding (N1-2) and not included in grazing-rate computations.

The nonindigenous freshwater clam *Corbicula fluminea* is a major consumer of phytoplankton biomass in the Delta (Lucas and others 2002), and we collected benthic samples to estimate *C. fluminea* biomass (CB, g ash-free dry weight m^{-2}) using a 0.05-m^2 van Veen grab. Clams retained on a 0.5-mm sieve were preserved in 10% formalin, followed by 70% ethyl alcohol. Dry weight of each individual was either measured directly (Crisp 1971) or estimated using length:weight relationships developed for each location and sampling period.

Water temperature was measured with a Sea-Bird CTD or Hydrolab DS4. The light attenuation coefficient (k) was either measured directly (using a LI-COR LI-192S quantum sensor) or estimated from Chl *a* and SPM with the following regression model: k = 0.76 + 0.076 SPM + 0.016 Chl *a* (R^2 = 0.81, n = 45). Daily surface irradiance (E) was measured by the California Irrigation Management Information System (http://www.cimis.water.ca.gov/cimis/data.jsp). The mean tidal amplitude across the Delta is approximately 1 m, and we assigned tidally averaged depths H to each sampling site from a 50-m bathymetric grid constructed for a hydrodynamic model and based on the California Department of Water Resources–compiled database of bathymetric surveys by various agencies (Monsen 2001).

Indices of Biomass, Production, and Ecological Efficiency

We used the results from this sampling program to compute indices of pelagic function as plankton biomass, productivity/trophic transfer, and ecological efficiencies (Table 1). To enable intercomparisons, all indices were based on carbon (C) as the currency of biomass and energy flow. Phytoplankton biomass, PB (mg C m^{-3}), was computed as Chl *a* multiplied by the mean C:Chl *a* ratio (32 mg C mg^{-1} Chl *a*), as determined from an empirical model (Cloern and others 1995) using 220 measurements of water temperature and irradiance across a gradient of Delta habitats from 1998 to 2000 (Sobczak and others 2002). Nutrient regulation of C:Chl *a* was not considered because dissolved inorganic nitrogen (N), phosphorus (P) and silicon (Si) concentrations are very high and rarely approach levels that limit phytoplankton growth in the Delta (Jassby and others 2002). Zooplankton biomass, ZB (mg C m^{-3}), was the cumulative biomass of 45 individual taxa/life stages, computed as the product of abundance a_i and carbon biomass m_i for each taxon (Table 1). Individual dry weights were estimated from either length measurements and published length–dry weight relationships (for example *Sinocalanus doerrii*, Dumont and others 1975; Uye 1982), or from published dry weight measurements for specific taxa (for example *Hexartha* sp, Dumont and others 1975; Bottrell and others 1976). Dry weight was converted to carbon biomass using carbon: dry weight ratios of 0.43 for *Eurytemora affinis*, 0.38 for *Pseudodiaptomus forbesi* (C. Hall unpublished), and 0.48 for other taxa (Andersen and Hessen 1991).

Areal gross primary productivity, Pg (mg C m^{-2} d^{-1}), was calculated from Chl *a* and irradiance using a model [Pg = 3.36 Chl *a* (E/k)] developed from ^{14}C assimilation assays of samples collected seasonally across the Delta (Jassby and others 2002). Net primary productivity was computed as Pg minus phytoplankton respiration rate, as estimated from a model that scales respiration with growth rate (Cloern and others 1995). Net volumetric primary productivity, PP (mg C m^{-3} d^{-1}), is areal primary productivity divided by habitat depth, H. We calculated depth-averaged phytoplankton specific growth rate, P_μ (d^{-1}), as $\ln[(PP\Delta t + PB)/PB]$, where Δt = 1 day. This procedure is valid for well-mixed water columns with vertically-homogeneous phytoplankton biomass. Profiles of temperature, conductivity, and fluorescence revealed vertical homogeneity or ephemeral stratification that typically disappeared in less than half a day.

We estimated zooplankton community grazing rate, ZG (mg C m^{-3} d^{-1}), from an Ivlev function describing ingestion rate as a hyperbolic function of phytoplankton biomass, where ingestion rate approaches a maximum at PB approximately equal to 300 mg C m^{-3}. The ingestion rate, I_i (mg C d^{-1}), of

Chl a, chlorophyll a (mg m^{-3}); a_i, abundance of zooplankton taxon i (number m^{-3}); m_i, carbon biomass (µg) of zooplankton taxon i; f_z, 0.48 (0.43 for Eurytemora, 0.38 for Pseudodiaptomus); DW_i, dry weight (µg) of zooplankton taxon i; Pg, areal gross primary productivity; H, mean water depth (m); E, daily surface irradiance (Einsteins m^{-2} d^{-1}, PAR); k, attenuation coefficient (m^{-1}); I_i, ingestion (µg C d^{-1}) of zooplankton taxon i; α, 0.069 (0.05 for rotifers); T, water temperature (°C); T', 10°C (or 16°C for rotifers); FR, filtration rate of Corbicula fluminea.

each taxon was computed as a function of phytoplankton biomass (PB), temperature (T), and body size (m_i) to account for size dependency of daily ration (Cloern 1982): $I_i = 0.95 m_i^{0.8}\ e^{\alpha(T-T')}(1-e^{-0.01PB})$, where α = 0.069 and T′ = 10°C for all taxa except rotifers (α = 0.05 and T′=16°C) (Bogdan and Gilbert 1982). This ingestion model is based on laboratory determinations of calanoid copepod feeding on phytoplankton in culture (for example, see Harris and Paffenhöfer 1976; Mullin and Brooks 1967) and may not accurately represent feeding by other taxa. However, calanoid copepods were found to contribute 63% of the cumulative biomass in all zooplankton samples (see below). Estimated grazing by rotifers, which contributed 31% of the cumulative biomass, was comparable to the lower end of direct measurements (for example, see Starkweather 1980).

We estimated *Corbicula fluminea* pumping rate, PR [ml (mg dry tissue wt)$^{-1}$ h^{-1}], using data published by Foe and Knight (1986) of siphon pumping rate PR and clam size as ash-free dry weight. Adjustments were made for water temperature, using a factor ($0.43e^{0.11T}$) based on laboratory experiments of Foe and Knight (1986). Clam filtration (and phytoplankton ingestion) rates are smaller than pumping rates because of inefficiencies caused by algal depletion in near-bed concentration boundary layers; we computed filtration rates, FR [m^3 m^{-2} d^{-1}], with the relationship derived by O'Riordan and others (1995), assuming maximum rates of water refiltration (that is, the approach estimates lower bounds on FR). From filtration rates, we calculated water column turnover rate (= FR/H, d^{-1}) and *Corbicula* grazing rates (CG = (FR·PB)/H, mg C m^{-3} d^{-1}, Table1). We classified habitats sampled during our study as ''colonized'' by *Corbicula* where CB exceeded 10 g dw m^{-2}. We determined occurrences (presence/absence) of *Corbicula* at other sampling locations from benthos surveys during 1998–2000 by the California Department of Water Resources (http://www.iep.ca.gov/data.html) and 2003 (F. Parchaso, personal communication).

High-resolution Spatial Mapping

During the September 2001 tidal cycle study of MI, we sampled continuously along horizontal transects to measure small-scale variability of phytoplankton biomass and SPM. Separate boats mapped water depth, Chl *a* fluorescence, and turbidity along transects inside MI and in surrounding channels during five consecutive slack tides. Water was pumped from 1.5 m to a Turner Designs 10-AU

fluorometer calibrated with Chl *a* samples and a Turner Designs 10-AU nephelometer calibrated with SPM samples. Fathometer depth, fluorescence, and turbidity were measured and stored on a data logger every 5 s, yielding over 24,000 data points, which were then binned into 1-min intervals. We computed primary productivity from Chl *a* and SPM at each transect location using the method described above and then estimated total daily primary production inside MI as the mean of all derived PP measurements along the interior transect.

Tidal Transport of Phytoplankton Biomass

Tidally driven advective and dispersive transport of phytoplankton biomass was measured using an RDI Instruments Acoustic Doppler Current Profiler (ADCP) and near-surface and near-bottom fluorometers (Turner Designs SCUFAs) moored in the opening between Mildred Island and its bounding channel (site M1, Figure 1b). The ADCP measured velocity profiles (binned into 0.5-m depth intervals), and the fluorometers measured fluorescence (calibrated with weekly Chl *a* samples) every 10 min for 40 days during August–September 2001. Velocity was converted to total discharge (water mass flux, Q, $m^3\ s^{-1}$) through the flow cross section using the rating process of Ruhl and Simpson (2005). Time series of discharge and Chl *a* (mean of near-surface and near-bottom measurements) were used to compute phytoplankton biomass transport as Chl *a* flux through the opening. Following Fischer and others (1979), we decomposed the total tidally averaged Chl *a* flux into two components: an essentially unidirectional background ''advective'' flux and a ''dispersive'' component resulting from ebb/flood differences in Chl *a* concentrations:

$$\langle \dot{C}(t) \rangle = \underbrace{\langle Q(t) \rangle \langle C(t) \rangle}_{\text{advective}} + \underbrace{\langle Q'(t) C'(t) \rangle}_{\text{dispersive}} \qquad (1)$$

where $\langle\ \rangle$ represents the tidal average (computed using a digital filter) (Walters and Heston 1982), $\dot{C}$ represents Chl *a* flux (mg s^{-1}), *t* is time, and ′ represents the time-varying fluctuation about the tidal mean.

Results

Nutrients

Dissolved inorganic nutrients did not approach concentrations that limit phytoplankton growth in any of the more than 200 samples we collected during 1997–1999 and 2001. Dissolved reactive phosphorus concentrations averaged 2.3 μM and were never lower than 0.5 μM (Figure 2a). Dissolved inorganic nitrogen averaged 34 μM and never fell below 3 μM (Figure 2b). Dissolved silica concentrations were never below 130 μM (data not shown). These results are consistent with monitoring data collected across the Delta from 1968 to 1998 (Jassby and others 2002) showing that potential nutrient limitation was extremely rare (DIN, DRP) or nonexistent (DSi) and with our assumptions that phytoplankton growth rate in the Delta is limited by light availability and not nutrient resources.

Phytoplankton

Phytoplankton growth rates ranged from 0.15 to 0.21 d^{-1} (= 0.2 to 0.3 doublings d^{-1}) at the deepest site and 0.55 to 0.93 d^{-1} (= 0.8 to 1.4 doublings d^{-1}) at the shallowest sites. This variability was highly correlated with habitat depth: $P\mu = 0.86 - 0.27 \ln[H]$, ($R^2 = 0.72$), (Figure 3a). If, as hypothesized, phytoplankton biomass is regulated primarily by growth rate, then PB should vary similarly with H. Over 2,000 measurements of Chl *a* within and around MI showed a complex, nonmonotonic relationship between phytoplankton biomass and habitat depth, with highest biomass occurring where H was approximately 3.5–5.5 m. However, Chl *a* was extremely variable among subhabitats within that narrow depth range (Figure 3b). Discrete sampling throughout the Delta over several years also showed that variability of PB (from 40 to 3,500 mg C m^{-3}) was irregular along the habitat depth gradient (Figure 4a) and unrelated to growth rate Pμ ($R^2 < 0.01$). High phytoplankton biomass was common at only three of 24 sampling locations, MM in the lower San Joaquin River and MIs and M2 in Mildred Island (Figure 1). Net primary production ranged from 4 to 1,200 mg C $m^{-3}\ d^{-1}$, but this variability was also weakly related to depth of the water column ($R^2 = 0.12$) or Pμ ($R^2 = 0.04$) (Figure 4b). This robust data set leads to rejection of our hypothesis that phytoplankton biomass varies systematically across gradients of habitat depth.

The phytoplankton community was dominated by a few taxa, including centric diatoms (*Cyclotella* spp., *Actinocyclus normanii*, *Skeletonema potamos*), cryptophytes (*Plagioselmis* sp., *Teleaulax amphioxeia*), *Cyanobium* sp., *Nannochloropsis* sp., and smaller components from other divisions (Table 2). Diatoms and cryptophytes have higher nutritional value than other algal taxa, partly be-

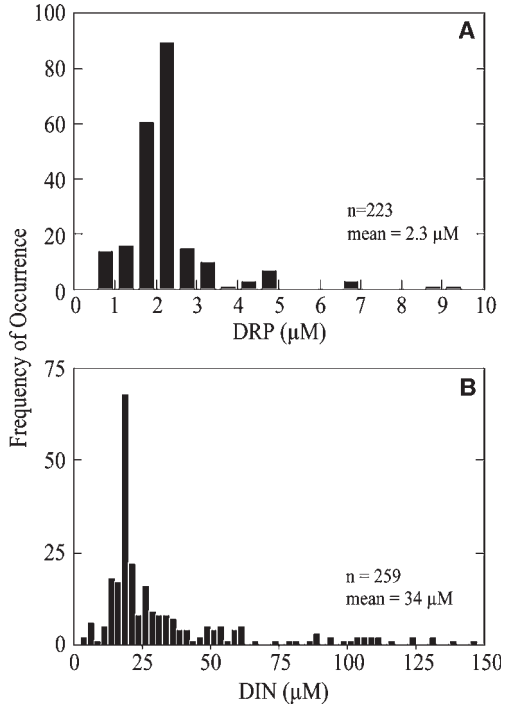

Figure 2. Frequency distributions of **A** dissolved reactive phosphorus (DRP) and **B** dissolved inorganic nitrogen (DIN) concentrations (µM) in the Delta during 1997–99 and 2001. Samples from 1997–99 were collected throughout the Delta (including our study area). Samples from 2001 were collected in/around MI during August and September. The number of samples and mean concentrations for the entire sampling period for each constituent are also shown.

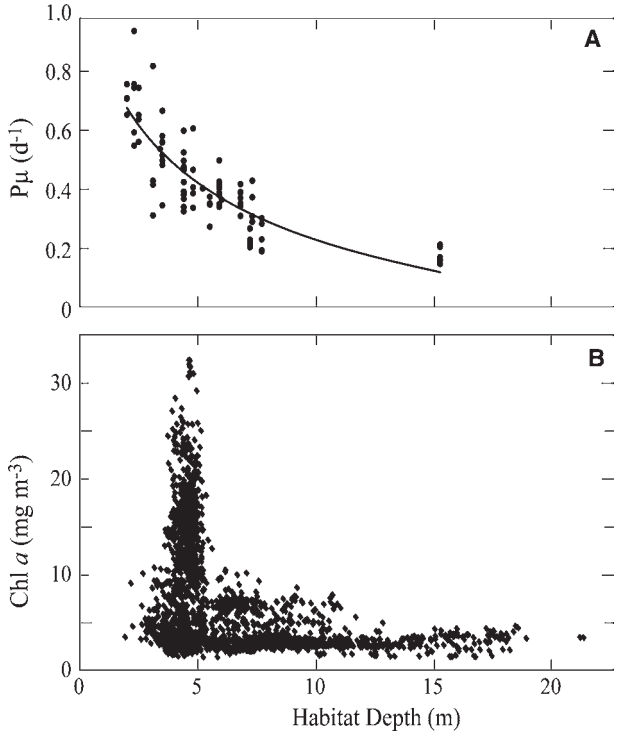

Figure 3. A Phytoplankton growth rate (Pµ) versus mean habitat depth. Growth rate was calculated from measured temperature, irradiance, and light attenuation in MI during 2001 and in Franks Tract (FT) during 2002. The logarithmic function was fit by least-squares regression: Pµ= 0.86 − 0.27 ln[H] (R^2 = 0.72). **B** Chlorophyll *a* (Chl *a*) concentrations measured during synoptic mapping plotted against habitat depth. Mapping was performed on five consecutive slack tides within and around MI on 5–6 September 2001.

cause of their enrichment in essential fatty acids (see, for example, Brett and others 2000). Their large contributions (diatoms 53% and cryptophytes 25%) to cumulative biomass in all samples and the small contributions from cyanobacteria indicate that phytoplankton biomass is an accessible, high-quality food resource for consumers in the Delta.

Zooplankton

Zooplankton biomass was also dominated by a few taxa, primarily the calanoid copepods *Pseudodiaptomus forbesi* and *Sinocalanous doerri* (Table 3). The cumulative biomass of all copepod life stages contributed 49% of zooplankton biomass in/around MI and 80% of biomass in/around FT. Rotifers (for example, *Hexarthra* sp., *Brachionus* sp., *Filinia* sp.) contributed 49% of zooplankton biomass in MI but only 8% in FT. Cladocerans (*Diaphanosoma brachyurum*, *Bosmina longirostris*, *Daphnia* sp.) were minor components in MI and contributed 11% of biomass in FT.

We hypothesized that zooplankton biomass would covary with phytoplankton biomass because zooplankton are food limited in many Delta habitats. Zooplankton biomass ranged from 4 to 55 mg C m^{-3} and was uncorrelated (R^2 = 0.01) with phytoplankton biomass (Figure 5a) or habitat depth. Estimated rates of zooplankton community grazing were similarly variable, ranging from 5 to 87 mg C $m^{-3}d^{-1}$. We used two indices to explore the apparent decoupling between phytoplankton and zooplankton biomass. The ratio ZB:PB, which measures the proportion of consumer to producer biomass, was highly variable (0.03 to 0.63) where phytoplankton biomass was low, but ZB:PB was always less than 0.1 where PB exceeded approximately 200 mg C m^{-3} (Figure 5b). The ratio ZG:ZB measures the mean daily ration (ingestion rate as a proportion of biomass) of zooplankton, and this index was also stable (around 2.3) in high-PB habitats and variable (0.7–2.2) in low-PB habitats (Figure 5c). A third

ratio (ZG:PB, not shown) revealed that zooplankton consumed less than 20% of the phytoplankton standing stock daily at most stations, even where PB was less than the presumed food-saturation algal biomass of 300 mg C m^{-3}.

Corbicula fluminea Biomass and Grazing Rate

The distribution of *Corbicula fluminea* was highly patchy, and its biomass ranged from 0 to 130 g dw m^{-2}. Overall, 14 of 23 sites were colonized by *Corbiculaj*, CB exceeded 10 g dw m^{-2} at 9 sites in/around FT and MI. Water-column turnover rates by *Corbicula* filtration ranged from 0.3 to 2.2 d^{-1} (filtering the overlying water column 0.4 to 3.2 times daily), and *Corbicula* grazing rates ranged from 20 to 510 mg C m^{-3} at the colonized sites. Five of the eight sites from the 1998–2000 sampling were considered to be colonized by *Corbicula* based on occurrences recorded during benthos surveys in 2003 (F. Parchaso, personal communication) and 1998–2000 (California Department of Water Resources).

Production–Consumption Balances

We used biomass measures and rate estimates to compute two indices of the balance between primary production and consumption. First, the ratio ZG:PP measures the fraction of daily primary production grazed by mesozooplankton. Although ZG and PP did not vary systematically across habitat types, this ratio was significantly and positively correlated with habitat depth ($y = -0.23 + 0.12x$, $R^2 = 0.56$) (Figure 6a). At habitat depths less than 8 m, ZG:PP was usually less than 1; but at the deepest habitat, ZG:PP usually exceeded 1 (daily zooplankton consumption exceeded phytoplankton production).

A second index was developed from a simple daily budget of phytoplankton biomass: $PP_{Res} = PP + \Delta PB - ZG - CG$, where ΔPB is the daily increment of phytoplankton biomass in a water parcel and

PP_{Res} is a residual term representing the balance between all processes. If daily changes in biomass, ΔPB, are small, (Figure 8b), we can assume steady state and estimate the residual term as $PP_{Res} = PP - ZG - CG$. The residual PP_{Res} was positive and highly correlated with PP where *Corbicula* was absent ($R^2 = 0.99$), but it was small or negative and uncorrelated with PP where *Corbicula* was abundant (Figure 7a). The daily phytoplankton balance was uncorrelated with zooplankton grazing, regardless of *Corbicula* presence (Figure 7b). The residual PP_{Res} was generally negative and highly correlated with *Corbicula* grazing where the clam was present ($R^2 = 0.77$, Figure 7c).

Tidal Transport

A 40-day series of current measurements illustrates the strongly tidal nature of water flow between northern MI at its adjacent channel. Volumetric flow rate during August–September 2001 (Figure 8a) oscillated approximately twice daily, with maximum instantaneous flow rates of 200–400 m^3 s^{-1}. Chl *a* concentration was also periodic (Figure 8b), containing a combination of diurnal and semidiurnal frequencies of variability (L. V. Lucas and others unpublished). Superimposed on an ambient advective flux of Chl *a* through the Delta system was a dispersive flux of Chl *a* (Figure 8c) caused by tidal time-scale pumping of higher Chl *a* water from MI to the channel. On average, this dispersive flux (<Q′ Chl *a*′>) was oriented *out* of MI, meaning that phytoplankton biomass transported to the channel on northerly-flowing ebb tides did not all return on the subsequent flood tide. The mean daily dispersive flux through this opening between MI and the surrounding channel was 1.9 kg Chl *a* d^{-1} (60.8 kg C d^{-1}). The coupled transport of zooplankton is also likely to be important but we have insufficient data to assess zooplankton transport.

Discussion

What Processes Control Phytoplankton Biomass in a Nutrient-rich Ecosystem?

Our study began with the hypothesis that shallow aquatic habitats sustain high phytoplankton biomass (and therefore high secondary production) because algal growth is light limited and mean water-column irradiance scales inversely with habitat depth. Estimated growth rates did vary

systematically across gradients of habitat depth, with highest growth rates in shallow domains (Figure 3a). Shallow, nutrient-rich habitats sustain fast phytoplankton population growth, with maximal rates comparable to 1.4 doublings of biomass per day. However, shallow habitats do not necessarily sustain high algal biomass, and our initial hypothesis was rejected on the basis of high-resolution mapping (Figure 3b) and discrete sampling across the Delta over several years (Figure 4a). Rejection of the hypothesis motivates consideration of other processes that regulate phytoplankton biomass beyond growth rate, such as top-down regulation by zooplankton and *Corbicula* and tidally-driven transport processes.

Top–down Processes. Our results indicate that zooplankton grazing is not fast enough to control phytoplankton biomass in most habitats. Median ZG was only 40% of median PP, and the ratio ZG:PP shows that net production usually exceeds depth-integrated zooplankton grazing in habitats shallower than 8 m (Figure 6a). The significant linear relation in Figure 6a (which remains significant with a similar slope and intercept upon removal of the deepest station, M1) implies that the pelagic component of shallow habitats functions as a (large) net source of algal biomass. However, deep pelagic systems are net consumers of primary production because algal respiration consumes a large fraction of photosynthetic production in the deep aphotic zone, leaving a small residual insufficient to meet the zooplankton grazing demand.

Phytoplankton biomass and production were consistently low in habitats colonized by *Corbicula fluminea* (Figure 4). *Corbicula* grazing rates were, on average, eight times higher than zooplankton grazing rates in those colonized habitats. The residual production PP_{Res} provides an index for measuring the effect of *Corbicula* grazing. Whereas shallow pelagic systems routinely functioned as net sources of phytoplankton biomass (Figure 6a), this trend was not true when we accounted for losses to *Corbicula* grazing (Figure 6b). Despite higher phytoplankton growth rates in shallow habitats, consumption by *Corbicula* rendered nearly all colonized shallow habitats phytoplankton sinks ($PP_{Res} < 0$), (Figure 6b). Residual production PP_{Res} was regulated by *Corbicula* grazing at colonized sites, indicating strong top–down control (Figure 7c); however, PP_{Res} was highly correlated with primary production at uncolonized sites, indicating bottom–up control of biomass (Figure 7a). The power of *Corbicula* grazing as a control on phytoplankton biomass accumulation in Delta habitats is consistent with the proposition that turbulent, light-limited systems are susceptible to declines in primary production due to invasive bivalves (Caraco and others 1997). Our results show that *Corbicula* colonization will determine a habitat's value to the pelagic food web, supporting the idea that top–down controls can have stronger ecosystem-level effects than bottom–up controls in aquatic systems (Moulton 1999).

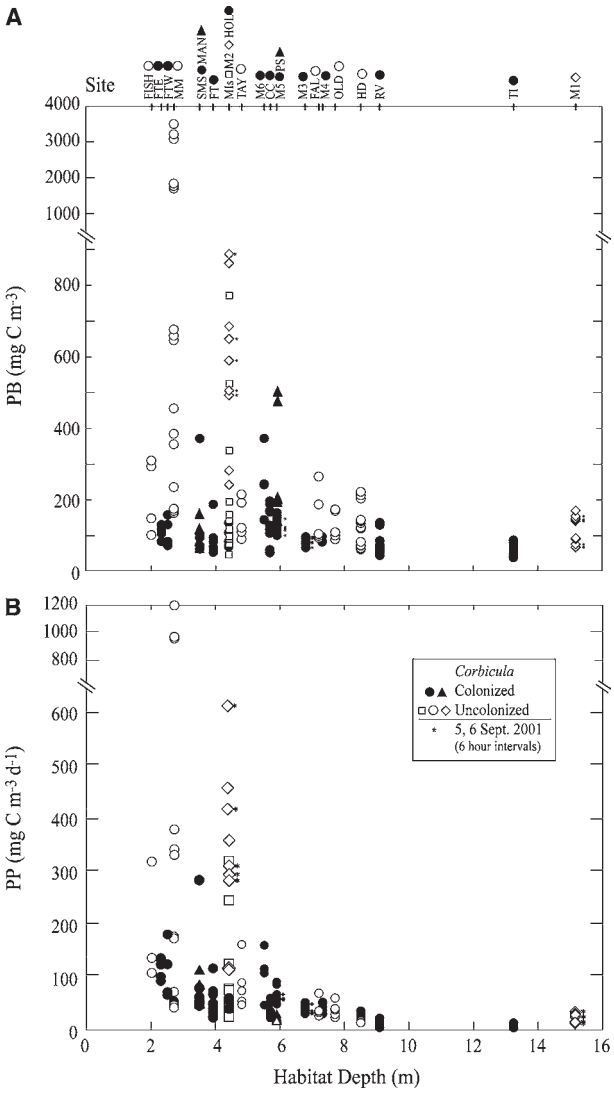

Figure 4. **A** Phytoplankton biomass (PB). **B** Net primary production (PP) versus mean habitat depth. Samples were collected during 1998–2000 (Sobczak and others 2002), 2001 (MI) and 2002 (FT). *Open symbols* indicate stations where *Corbicula* was rare or absent (''uncolonized''). *Filled symbols* indicate stations where *Corbicula* was abundant (''colonized''). *Asterisks* next to symbols indicate samples taken every 6 h over 30 h on 5–6 September 2001. Stations and corresponding symbols are detailed on the top *x*-axis at appropriate depths; stations with common depths are distinguished by different symbols.

Export from Shallow to Deep Habitats. Transport by advection and tidal dispersion must be an important process in the Delta because some habitats are net producers and others are net consumers of phytoplankton biomass (Figure 6). In the absence of transport, biomass would build in the producing habitats and become depleted in the consuming habitats. Some shallow sites uncolonized by *Corbicula* (FISH, TAY) failed to support elevated (>320 mg C m^{-3}) phytoplankton biomass (Figure 4), suggesting that biomass is transported away from productive habitats faster than it can accumulate. Lucas and others (2002) attributed low Chl *a* concentrations in northern MI to vigorous tidal exchange with the adjacent channel and consequent dispersion of low Chl *a* channel water into MI. We measured the dispersive Chl *a* flux at this location for 40 days; the results showed large tidal oscillations but net (tidally averaged) export of phytoplankton biomass from MI to the exterior channel (Figure 8c). The combination of tidally oscillating currents within a domain of spatially - variable Chl *a* drives a dispersive transport of phytoplankton from producing habitats to consuming habitats. Tidal transports could also amplify systemwide grazing losses by exposing phytoplankton to patchily distributed *Corbicula* along tidal excursions (approximately 10 km in deep narrow Delta channels).

Thus, fast transport and fast *Corbicula* grazing are the key processes leading to the decorrelation between phytoplankton growth rate and biomass distribution. Phytoplankton biomass provides no information about these governing processes, so biomass alone is a weak indicator of the ecological value of aquatic habitats.

Why Are Phytoplankton and Zooplankton Biomass Uncorrelated?

We hypothesized that zooplankton biomass would covary with phytoplankton biomass because the algal food supply is commonly suboptimal for the growth of pelagic consumers across the Delta. However, producer and consumer biomass were uncorrelated (Figure 5a). We will therefore consider three processes that dampen or cloud the trophic linkage between phytoplankton and zooplankton.

Adaptive Feeding Efficiency. From a fixed, Eulerian frame of reference, the highly variable ratio ZB:PB suggests high variability in the yield of zooplankton per unit of phytoplankton biomass and that this yield is highest at low food levels (Figure 5b). This pattern derives from the ingestion model, which is grounded in a rich history of feeding experimentation showing that particle capture is a nonlinear, asymptotic function of food density (for example, see Harris and Paffenhöfer 1976; Mullin and Brooks 1967). Although the ingestion rate of individual taxa was computed as a function of temperature, size-dependent optimal rations, and food availability, the computed ration for the zooplankton community (ZG:ZB) was strongly influenced by the asymptotic Ivlev ingestion function (Figure 5c). The index ZG:ZB shows that variability of daily ration above PB of approximately 300 mg C m^{-3} (2.1 to 2.5 d^{-1}) is much smaller than variability of the food resource PB (up to 880 mg C m^{-3}). This highly damped propagation of variability from food concentration to ingestion is a consequence of feeding mechanics and behavior that enable calanoid copepods to efficiently exploit a dilute phytoplankton suspension (minimum daily ration was 70% of biomass per day), (Figure 5c) and rapidly attain a maximum ration that does not grow with further increases in food concentration. This nonlinear feeding function describes a compensatory mechanism that buffers the effect of food variability on zooplankton ingestion and production (Pace and others 1999).

Food Subsidies and Habitat Connectivity. An Eulerian reference frame misses the tidal time-scale transports of water parcels and their contained plankton across habitat gradients, so it is difficult to assess the complexities of phytoplankton–zooplankton coupling from fixed-point sampling. Transport within and between habitats can suppress the ''local'' trophic cascade effect by facilitating habitat food subsidies. Water and suspended particles are exchanged between habitats over the course of a tidal cycle (Monsen and others 2002), and transport can act as a mechanism for *net* displacement of particles (including phytoplankton) from one habitat type to another (Lucas and others 2002). Calculations of percent production consumed by zooplankton (ZG:PP) indicate that a food deficit exists in habitats deeper than about 10 m, implying an external source of phytoplankton to sustain zooplankton nutrition in deep habitats (Figure 6a). Furthermore, the index PP_{Res} reveals production deficits in both shallow habitats (primarily due to *Corbicula* grazing) and deep ones (Figure 6b). These recipient habitats may be subsidized by the net transport of food from neighboring connected donor habitats, such as southern MI, where residual production averaged 290 mg C m^{-3} d^{-1}.

Phytoplankton biomass may be transported across other boundaries (than the northern opening) along the perimeter of MI. Time series of Chl *a* in MI suggest that phytoplankton biomass is rela-

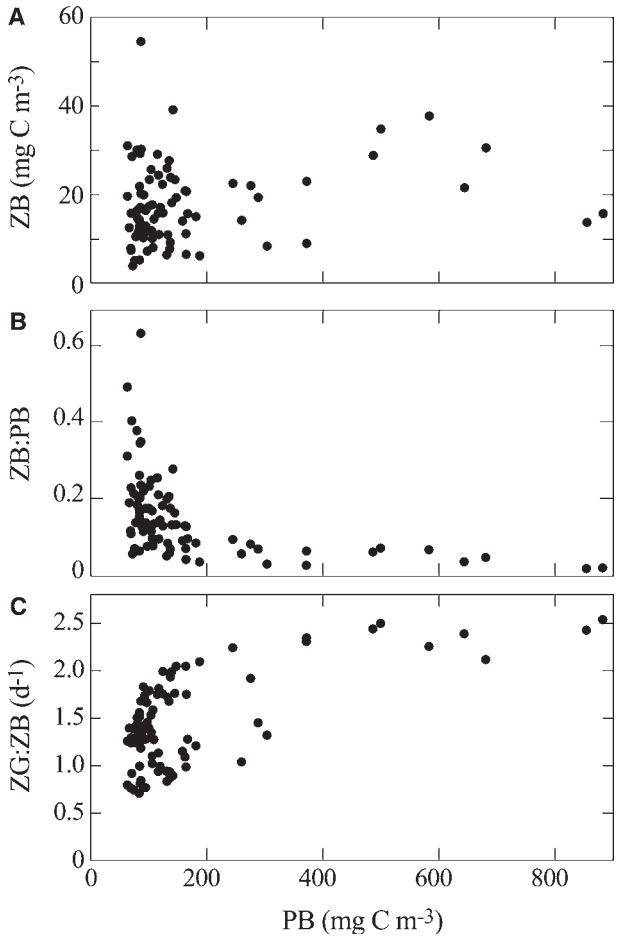

Figure 5. A Zooplankton biomass (ZB). **B** Potential grazing pressure (ZB:PB). **C** the zooplankton daily food ration (ZG:ZB) against phytoplankton biomass (PB) from samples collected in/around MI during 2001 and FT during 2002.

tively stable over periods of days (Figure 8b), indicating that a positive value for PP_{Res} represents production that may be exported from the habitat. We calculated total residual production for the interior of MI ($PP_{Res–MI}$) to estimate the potential daily flux of C from MI. We subtracted average consumption by *Corbicula* (7 mg C m^{-3} d^{-1}) and zooplankton (48 mg C m^{-3} d^{-1}) within MI from a total daily PP of 180 mg C m^{-3} d^{-1} (calculated from the high-resolution mapping data) to arrive at a potential daily C export of 2,380 kg C d^{-1} (using a volume for MI of 1.9×10^7 m^3, Monsen and others 2002). This export of shallow-habitat derived phytoplankton would subsidize 22–23 km^2 (around five times MI's surface area) of channel habitat sparsely colonized by *Corbicula* (for example, M4 or M6) or about 2 km^2 (only one-half of MI's surface area) of heavily colonized channel habitat with large deficits (for example, M3 and M5), (Figure 7c). Here, $PP_{Res–MI}$ illustrates the potential value of a donor habitat like MI to the entire system; however, the value of such donor habitats will decrease as more habitats are colonized by *Corbicula*.

Fish Predation. Zooplankton dynamics can be tightly regulated by predation (Jeppesen and others 2003), so top–down processes can also explain the weak correlation between zooplankton and phytoplankton biomass. Fish predation was not measured in our study, but low values of ZB:PB (less than 0.2) in the majority of samples (Figure 5b) are comparable to values in lakes where high predation pressure is exerted on zooplankton by planktivores (Jeppesen and others 2003). Grimaldo and others (2004) found that ichthyoplankton abundance was higher in southern MI (where mean ZB:PB = 0.05) than in the north (where mean ZB:PB = 0.23), suggesting that zooplankton production efficiency (as biomass per unit of food resource) is influenced by spatially variable predation.

Implications for Habitat Restoration Programs

This study was designed to assess pelagic functions in a disturbed ecosystem that is now the focus of large-scale restoration. One practical value of ecosystem science can come from the application of fundamental principles to guide strategic plans for meeting management targets, such as the amplification of functional diversity or the sustainability of native species. Our collective experience in applying ecological principles to meet restoration goals is limited, so lessons from site-specific studies might be useful starting points for designing assessments of habitat functional variability in other large ecosystems. The results presented here offer three lessons that may extend beyond the Sacramento–San Joaquin Delta and could provide a basis for comparing our evolving experiences in the application of ecosystem science to management of other large aquatic ecosystems.

Performance Measures of Ecosystem Management. Other large-scale programs of ecosystem rehabilitation (Clark and Zaunbrecher 1987; Walters and others 1992) are built from frameworks of adaptive management in which the outcomes of restoration actions are followed through monitoring and then lessons are applied to refine guiding conceptual models and next-phase management actions (Holling 1978; Walters 1986; Ringold and others 1996). Our results illustrate the importance of monitoring design for measuring the performance of management actions. For example,

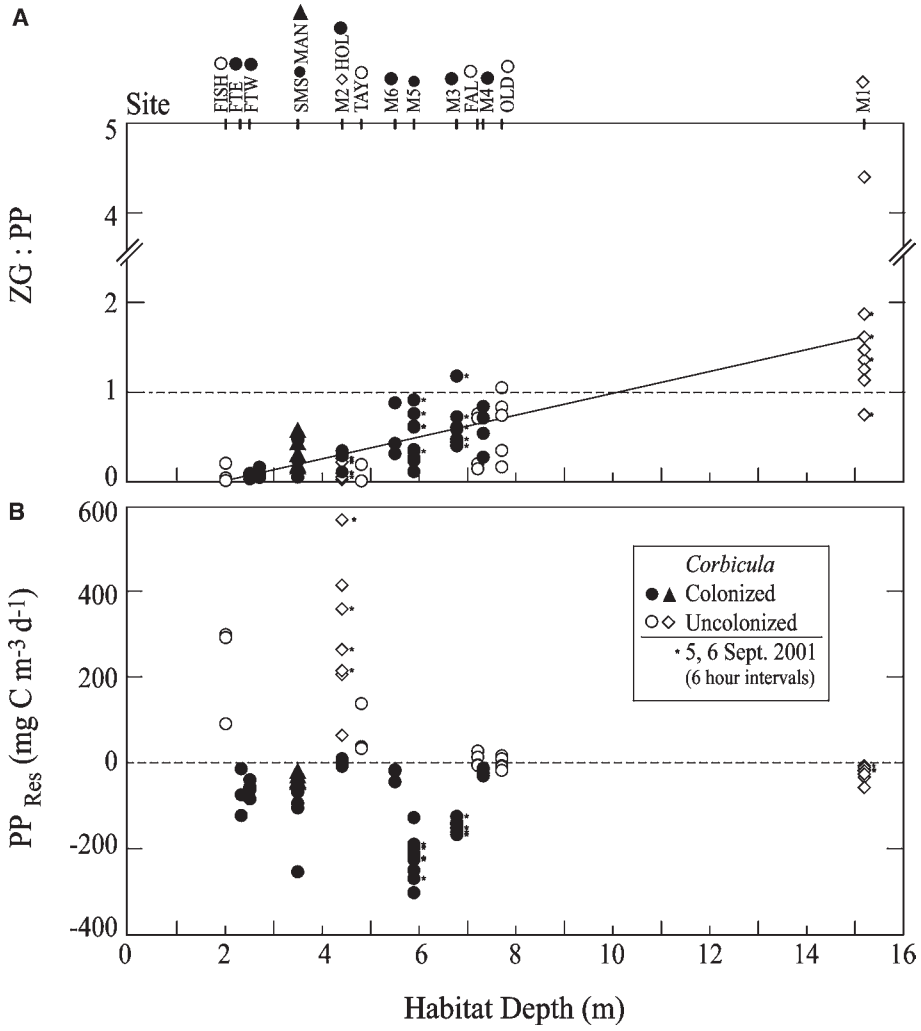

Figure 6. **A** The ratio of zooplankton grazing to primary production (ZG:PP). **B** Residual primary production (PP_{Res}) versus mean habitat depth from samples collected in/around MI in 2001 and FT in 2002. *Open symbols* indicate stations where the invasive clam, *Corbicula*, was rare or absent (''uncolonized''). *Filled symbols* indicate stations where *Corbicula* was abundant (''colonized''). *Asterisks* next to symbols indicate samples taken every 6 h over 30 h on 5–6 September 2001. Station and corresponding symbols are detailed on the top *x*-axis. **A** The *horizontal dashed line* divides surplus and deficit habitats based on zooplankton consumption alone. The *trendline* represents the linear fit of ZG:PP ($y = -0.22 + 0.13x$, $R^2 = 0.57$) with depth. **B** For PP_{Res}, the *horizontal dashed line* separates potential donor ($PP_{Res} > 0$) and recipient ($PP_{Res} < 0$) habitats when consumption by both zooplankton and *Corbicula* is taken into account.

if the goal is to amplify production in food webs that sustain endangered or threatened species, then the biomass of primary and secondary producers could be monitored to test the hypothesis that habitat creation leads to increased stocks of forage biota and their food supply. However, biomass alone is not a sufficient metric for interpreting the outcomes of habitat creation because it provides no information about the underlying processes of biomass change. We show here that phytoplankton biomass in a low-productivity ecosystem is only weakly related to phytoplankton growth rate across habitat gradients because other processes (transport, mixing, and consumption) contribute to biomass variability.

Success in the experimental application of adaptive management depends on monitoring to provide sufficient information for both *measuring* and *understanding* the outcomes of habitat creation, so that subsequent phases can incorporate improved mechanistic knowledge of the linkages between habitats and the functions they provide. In the absence of process measurements, indices can be derived to provide strong clues about the functional responses of manipulated ecosystems. For example, ZG:PP and PP_{Res} indices distinguish habitats that function as net producers or net consumers of algal biomass. Efficiency indices (ZG:ZB, ZB:PB) provide clues about why consumer and producer biomass and production are weakly correlated, even where consumers are food limited. Thoughtful design of post–ecosystem manipulation data collection and analysis might be just as important to the success of adaptive management as the design of ecosystem manipulations themselves.

Habitat Connectivity. Ecosystem restoration is guided by the principle that habitat mosaics support the diversity of functions required to sustain complex communities (Noss 1983). Our results reinforce the concept that system responses to enhanced habitat diversity are strongly set by the patterns and rates of connectivity between habitats

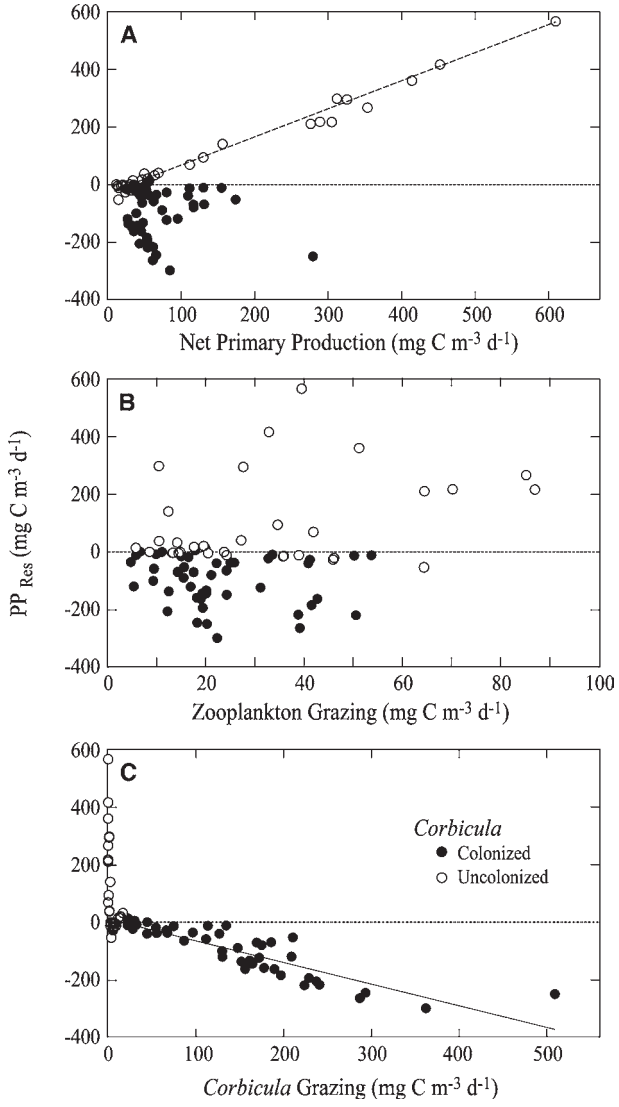

Figure 7. Residual phytoplankton production (PP_{Res}) versus **A** net primary production (PP). **B** zooplankton grazing (ZG). **C** *Corbicula* grazing (CG) from samples collected during 2001 (MI) and 2002 (FT). *Open circles* indicate sites where *Corbicula* was rare or absent (''uncolonized''). *Filled circles* indicate sites where *Corbicula* was abundant (''colonized''). *Trend lines* represent significant correlations of **A** PP_{Res} at uncolonized sites with PP ($R^2 = 0.99$, $P < 0.001$) and (**C**) PP_{Res} at colonized sites with CG (inverse correlation, $R^2 = 0.77$, $P < 0.001$).

(Polis and others 1997; Reiners and Driese 2001). Connectivity in aquatic systems is driven by water flows and mixing that transport materials, energy, and biota, leading to displacements of ecological values from one habitat to another. For example, we show that shallow habitats support high phytoplankton growth rates such that net primary production exceeds local zooplankton consumption, whereas light-limited deep habitats do not supply sufficient primary production to sustain local zooplankton consumption. Shallow autotrophic habitats can export algal biomass and fuel secondary production in adjacent deep heterotrophic habitats, but only if these donor and recipient habitats are physically connected.

Full assessment of the ecological values of different aquatic habitats requires measurement of hydraulic connectivity and its influence on regional-scale responses to habitat-scale processes. In complex, dynamic environments, high-frequency monitoring may be critical to quantify and understand connectivity between habitats. We see this in the tidal dispersive flux of phytoplankton biomass between northern MI and its neighboring channels: MI's contribution of phytoplankton biomass to adjacent channels results from the correlation of hourly-scale variations in current velocity and phytoplankton biomass. This flux component would not be discernable with temporally coarse (for example, weekly or monthly) measurements of flow and Chl *a*. Therefore, high-frequency monitoring may be necessary for the accurate quantification of the rates of material transport between adjacent habitats or sub habitats, especially in geometrically complex tidal environments. Such fundamental knowledge of hydrodynamic transport processes may be a general prerequisite for success in the design of management strategies and the interpretation of biotic and functional responses to habitat manipulations.

Invasive Species and Ecosystem Restoration. The global translocation of species is now recognized as a central mode of anthropogenic disturbance of ecosystems and their biological communities (Vitousek and others 1996; Cohen and Carlton 1998). We show here how alien species can exert a powerful constraint on the outcomes of management actions to rehabilitate ecosystems and their functions that sustain native species. Across a low-productivity ecosystem where zooplankton biomass and its algal food supply have declined significantly, phytoplankton biomass is persistently low in habitats colonized by the alien clam *Corbicula fluminea*. On a systemwide scale, *Corbicula fluminea* consumes more primary production than crustacean zooplankton, and food competition between benthic and pelagic consumers is one factor in the decline of zooplankton stocks here, as in ecosystems colonized by the zebra mussel *Dreissena polymorpha* (Caraco and others 1997; Jack and Thorp 2000) or other bivalves such as *Potamocorbula amurensis* (Nichols and others 1990; Alpine and Cloern 1992).

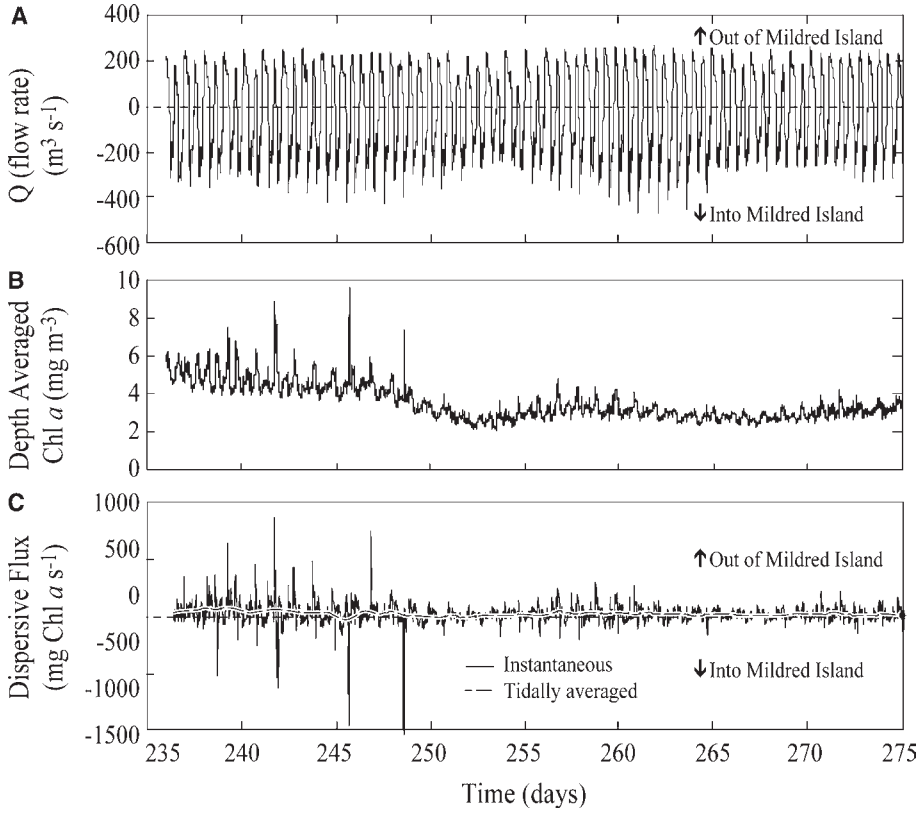

Figure 8. Time series at the northern opening of MI of **A** flow rate (Q). **B** depth-averaged Chlorophyll *a* (Chl *a*). **C** instantaneous and tidally averaged (*smoothed line*) dispersive flux of Chl *a* through the northern opening. Data were collected at 10 min intervals from 23 August to 1 October 2001. Positive values for flow rate and dispersive flux indicate flow or flux out of MI through the northern opening; negative values indicate flow or flux into MI through the northern opening. Tidally averaged dispersive flux (**C**, *smoothed line*) was generally positive (or out of MI).

The unexplained patchy distribution of *Corbicula fluminea* in the Sacramento–San Joaquin Delta implies high uncertainty in the outcomes of creating new aquatic habitats (Lucas and others 2002). New habitats colonized by *Corbicula* will function as net consumers of phytoplankton biomass and contribute little forage production in pelagic food webs. Uncolonized shallow habitats will amplify production in pelagic food webs. Although we can, to some extent, engineer habitat attributes such as bathymetry, quality of source waters, and hydrodynamic transports, we cannot control or even predict which biological communities will colonize new habitats and how those communities will evolve over time–which underscores the need for adaptive management strategies in ecosystem restoration. The alien clam *Corbicula fluminea* is a key species in this ecosystem, and its strong top–down control of phytoplankton biomass and production is a severe constraint on our capacity to amplify pelagic production through habitat creation. Alien species are equally compelling constraints on the recovery of native species in other large ecosystems (Sakai and others 2001). Perhaps the single most effective strategy for ecosystem rehabilitation is the preemptive strategy of aggressively curtailing the further translocation of aliens (Vitousek and others 1996).

Conclusions

The emerging era of landscape-scale environmental management provides opportunities to apply and test ecological principles to meet the goals of ecosystem rehabilitation programs. This study, which compared a small subset of ecological functions across habitat gradients in one ecosystem, illustrates three principles that may be general. First, adaptive management is a learning process, and success depends on the thoughtful design of the experimental component of post–ecosystem manipulation data collection and synthesis just as it depends on the thoughtful design of ecosystem manipulations; generic monitoring designs may not fully exploit the opportunities for learning. Second, a key to understanding and managing complex landscapes is knowledge of the patterns and rates of connectivity among habitats that drive fluxes of energy, resources, and biota and therefore determine the ecosystem-scale outcomes of habitat creation. Finally, invasive species can disrupt key processes and severely constrain the benefits of habitat restoration. The role of *Corbicula fluminea* as an invasive keystone species in the Sacramento–San Joaquin River Delta illustrates the need for aggressive strategies to curtail species introductions as a component of ecosystem rehabilitation.

ACKNOWLEDGEMENTS

This work was supported by the CALFED San Francisco Bay-Delta Ecosystem Restoration Program (ERP01C07). Many thanks to our boat captains Byron Richards, Francis Parchaso, Jay Cuetara, Jon Yokomizo, Lloyd Brenn, and Eric Santos; to Andy Arnsberg, Nancy Monsen, Heather Peterson, Bill Sobczak, Michelle Shouse, Francis Parchaso, Byron Richards, Scott Waller, Kitty Triboli, Mike Demsey, Mike Simpson, Cathy Ruhl, Kurt Battenfield, Linda Cloern, and Bob Herzog for their many hours in the field and on the houseboats; to Nancy Monsen for her model output of mean depths and the Delta hypsograph; to Steve Hager and Greg Cutter for the nutrient analyses; to Jim Orsi for the zooplankton community analysis; to Dick Dufford for the phytoplankton community analysis; to Bill Sobczak for his data; to Catherine Hall for her dry weight conversions and carbon values for *E. affinis* and *P. forbesi*; and to our amazing illustrator Jeanne DiLeo. Reviews by Cindy Brown, Bill Sobczak, and two anonymous reviews greatly improved this manuscript.

Subject: **CEMEX Rockfield Modification Project, Fresno County, CA**
Acoustical Comments on Draft Environmental Impact Report
Salter Project 25-0038

Dear Carmen:

Comment 58C-1

As requested, we reviewed Subchapter 4.13 Noise of the Draft Environmental Impact Report (DEIR) for the subject Project. We also reviewed information in several sections of Appendix H (Noise Assessment).

SUMMARY

In our opinion, the DEIR does not implement adequate thresholds for blasting and does not sufficiently assess or mitigate potential acoustical impacts to both nearby people and wildlife. The DEIR, therefore, fails to protect the community from future excessive noise and vibration. Our comments focus on the following issues:

1. Blasting impact analysis thresholds fail to adequately address human disturbance at nearby sensitive receptors, while focusing solely on damage criteria instead. Therefore, nearby residences and recreational areas could be exposed to excessive vibration that could be startling and disruptive, resulting in complaints, and result in a significant impact under CEQA. The related blasting analysis and mitigation measures should be updated to be stricter and to ensure that noise and vibration impacts are adequately reduced, to the greatest extent feasible. In addition, the required community engagement and communication efforts should be improved. Finally, the blast monitoring, reporting, and review efforts should also be improved.
2. Processing operations are projected to exceed noise impact thresholds at night and operating hours are to be extended. The proposed operational noise mitigation is inadequate as it fails to require specific noise reduction measures. The Project should "guarantee" a solution that mitigates the potential noise impacts in the original construction, rather than take a "wait-and-see" approach with a lengthy retrofit process that would follow complaints.

3. The DEIR also fails to fully analyze the noise and vibration impact of the Project on wildlife. Beyond the impact analysis for fish, the DEIR includes no noise or vibration thresholds, analysis, or mitigation for other wildlife in nearby areas. In particular, an analysis of blasting noise, vibration, and "airblast" should be included.

Comment 58C-1 Cont.

BACKGROUND

Comment 58C-2

The Project includes changes to the operation of the Rockfield Quarry sites in Fresno County. The existing aggregate (rock, sand, and gravel) mining and processing operations occur at the Plant Site and the Quarry Site. The proposed Project includes expanded mining operations in two stages as listed in the Project Description section of the DEIR Executive Summary. The Project would include 100 years of additional mining including new hard rock mining at the Quarry Site to a depth of 600 feet requiring the use of rock blasting that is anticipated to occur once or twice per week.

As currently proposed, blasting vibration would be clearly noticeable to nearby residents. At an unknown or unscheduled time of day, people would experience a mixed sensation of feelable vibration at the ground or in their home's structure and an impulsive air pressure wave. This is expected to be accompanied by secondary effects such as a rattle at windows, hung pictures, or other objects in their homes. Depending on the setting, people's activities, and their sensitivity, these weekly unanticipated experiences would likely be disturbing.

SECTION 1 – COMMENTS ON BLASTING

Comment 58C-3

#1.A – Thresholds for Evaluation of Blasting Vibration Ignore Human Disturbance

Impact 4.13-6 assesses the potential for the Project to generate substantial ground-borne vibration and airblast "vibration" as a result of blasting. The analysis of ground-borne blasting vibration is based solely on the potential for Project-related blasting to cause damage to nearby structures. For reference, the DEIR thresholds used to address potential blasting vibration impact vary from 0.75 inch/second to 2.0 inches/second, depending on the frequency of the resulting vibration. Thresholds for human disturbance from blasting vibration are not included. This is a notable oversight as there are several sensitive receptors as close as 250 feet from the Project area as well as recreational users of Lost Lake Park to the north. A revised analysis must employ stricter thresholds to facilitate analysis of impacts to nearby residents. We have the following supporting comments. Relevant excerpts of referenced documents are enclosed in the Appendix.

1. **Federal Transit Administration (FTA)**: It is generally accepted that ground-borne vibration thresholds to address human disturbance are more strict than standards related to building damage. For example, the DEIR presents significance thresholds from the FTA[1] for both building damage and human annoyance. These are excerpted below (Tables 4.13-10 and 4.13-11, DIER page 4.13-35). These tables clearly indicate stricter standards for the evaluation of vibration with respect to human disturbance. However, the DEIR blasting vibration impact analysis ignored the thresholds listed in Table 4.13.11.

Comment 58C-4

Table 4.13-10
FTA Thresholds for Assessing Damage to Structures

Building Category	Level RMS VdB[1]
I. Reinforced-concrete, steel or timber (no plaster)	102
II. Engineered concrete and masonry (no plaster)	98
III. Non-engineered timber and masonry buildings	94
IV. Buildings extremely susceptible to vibration damage	90

Table Source: Table 7-5 of FTA 2018.
Table Notes:
1. 1 RMS velocity in decibels (VdB) re 1 micro-inch per second.

Table 4.13-11
FTA Thresholds for Assessing Groundborne Vibration Annoyance Potential

Land Use Category	Impact Levels RMS (VdB)		
	Frequent Event[1]	*Occasional Events[b]*	*Infrequent Events[c]*
Category 1: Buildings where vibration would interfere with interior ops.	65[d]	65[d]	65[d]
Category 2: Residences and buildings where people normally sleep	72	75	80
Category 3: Institutional land uses with primarily daytime uses	75	78	83

Table Source: Table 6-3 of FTA 2018.
Table Notes:
a. "Frequent Events" is defined as more than 70 vibration events of the same source per day.
b. "Occasional Events" is defined as between 30 and 70 vibration events of the same source per day.
c. "Infrequent Events" is defined as fewer than 30 vibration events of the same source per day.
d. This criterion limit is based on levels that are acceptable for most moderately-sensitive equipment such as optical microscopes. Vibration-sensitive manufacturing or research will require detailed evaluation to define the acceptable vibration levels.

2. **U.S. Bureau of Mines Commentary**: The DEIR references a report published by the U.S. Bureau of Mines (RI 8507[2], DEIR page 4.13-35). Thresholds of significance for potential building damage from blasting vibration are drawn from this report. However, this report includes commentary related to human disturbance as follows:

Comment 58C-5

[1] FTA reference document: *Transit Noise and Vibration Impact Assessment Manual*, FTA Report No. 0123 (September 2018)

[2] U.S. Bureau of Mines Report of Investigations 8507, *Structural Response and Damage Produced by Ground Vibration from Surface Mine Blasting* (1980)

Comment 58C-5 Cont.

> *"Human reactions to blasting can be the limiting factor. Vibration levels can be felt that are considerably lower than those required to produce damage. Human reaction to vibration is dependent on event duration as well as level. Particle velocities of 0.5 in/sec from typical blasting (1-sec vibration) should be tolerable to about 95 pct of the people perceiving it as "distinctly perceptible." Relevant to whole-body vibration reaction is the degree that the vibration interferes with activity (sleep, speech, TV viewing, reading), presents a health hazard, and affects task proficiency. For people at home, the most serious blast vibration problems are house rattling, fright (fear of damage or injury), being startled, and for a few, activity interference. Complaints from these causes can be as high as 30 pct at 0.5 in/sec, and this is where good public relations attitudes and an educational program by the blaster are essential."* (RI 8507, page 68)

These statements from the U.S. Bureau of Mines report (RI 8507) indicate that people can feel vibration at considerably lower levels than those required to produce damage. And complaint rates could be as high as 30 percent for blasting vibration at 0.5 inch/second.

Comment 58C-6

3. U.S. Office of Surface Mining Reclamation and Enforcement (OSMRE): The DEIR also references the *Blasting Guidance Manual* (March 1987, DEIR Page 4.13-36) published by OSMRE in identifying significance thresholds for blasting vibration. This document also includes the following commentary:

> *"Most authorities agree that the threshold of human perception for blast vibration ground motion is around 0.03 inches per second. Depending on activity, sensitivity, and whether or not the subject knows when the event is to occur, a few humans can sense ground motion as low or lower than most instruments are able to: about 0.01 inch per second! Although complaints can occur at any level perceptible to humans, they are unusual below 0.08 inches per second or so. As peak particle velocities increase and as local and individual sensitivities increase, so will the number of complaints.* ***At, say, 0.25 inches per second****, a level that is eminently safe (*) and well within OSMRE limits, except below 2 Hz,* ***complaints can be expected****."* [emphasis added] (OSMRE Blasting Guidance Manual, page 37)
>
> [* note the author means "safe" with respect to building damage]

Comment 58C-7

4. Federal Highway Administration: The U.S. Federal Highway Administration publication No. FHWA-HI-92-001 titled *Rock Blasting and Overbreak Control* (December 1991) also includes commentary on human sensitivity to vibration. The FHWA report states that "vibration is a fact of daily life" but that "other vibration that contrasts sharply, because it is not part of the daily experience but is unusual, has been designated acultural. It surprises a person, is disturbing, and causes an acute awareness." (FHWA, page 275). This FHWA publication also summarizes previous research on the subject, characterizing human response to vibration as listed in the excerpted Table 10.10 (FHWA, page 275). The DEIR selected threshold of significance or 0.75 inch/second would be considered "severe" according to the FHWA guidance. A "severe" human response to blasting vibration should not be considered acceptable for the next 100 years of hard rock mining at the Project site.

FHWA Table 10.10 Human Response

Response	Particle Velocity
Noticeable	0.02 in/s
Troublesome	0.2 in/s
Severe	0.7 in/s

Comment 58C-7 Cont.

5. **Caltrans**: This comments above are also supported by the Caltrans *Transportation and Construction Vibration Guidance Manual* (April 2020), which states that " Ground vibration and air overpressure can be felt at levels that are well below those required to produce any damage to structures." (Caltrans Manual, page 75). Table 21 below (excerpted from the Caltrans Manual, Page 75), indicates that blasting vibration of 0.75 inch/second (threshold selected in the DEIR) would be considered between "strongly perceptible" and "mildly unpleasant." This characterization demonstrates that it is prudent to select thresholds of significance for blasting vibration that are lower or more strict that the thresholds related to building damage in order to adequately address human disturbance.

Comment 58C-8

Table 21. Human Response to Blasting Ground Vibration and Air Overpressure

Average Human Response	PPV (in/sec)	Airblast (dB)
Barely to distinctly perceptible	0.02–0.10	50–70
Distinctly to strongly perceptible	0.10–0.50	70–90
Strongly perceptible to mildly unpleasant	0.50–1.00	90–120
Mildly to distinctly unpleasant	1.00–2.00	120–140
Distinctly unpleasant to intolerable	2.00–10.00	140–170

6. **Australian Standards**: As further support, consider the Australian Standard AS 2187.2-2006 titled *Explosives – Storage and Use, Part 2: Use of Explosives*. In this standard, the recommended blasting ground vibration limits regarding damage are aligned with the Project DEIR blasting vibration damage thresholds. However, the Australian Standard further adds the following blasting "ground vibration limits for human comfort" (AS 2187.2-2006, Table J4.5(A))

Comment 58C-9

Australian Standard AS 2187.2-2006: Excerpt of Ground Vibration Limits for Human Comfort

Category	Type of Blasting Operations	Peak Component Particle Velocity
Sensitive Site*	Operations lasting more than 12 months or more than 20 blasts	5 mm/s [0.2 inch/s] for 95% blasts per year, 10mm/s [0.4 inch/s] maximum unless agreement is reached with the occupier that a higher limit may apply
Sensitive Site*	Operations lasting for less than 12 months or less than 20 blasts	10 mm/s [0.4 inch/s] maximum unless agreement is reached with the occupier that a higher limit may apply
Occupied non-sensitive sites, such as factories and commercial premises	All blasting	25 mm/s [1 inch/s] maximum unless agreement is reached with the occupier that a higher limit may apply.

** A sensitive site includes houses and low-rise residential buildings, theatres, schools, and similar buildings occupied by people*

Due to the close proximity of sensitive receptors (as close as 250 feet) and the long-term nature of the Project, ground-borne vibration from blasting should be mitigated to a more conservative threshold than the building damage thresholds used in the DEIR. The DEIR has ignored the FTA human sensitivity thresholds offered in the DEIR and ignored commentary from the U.S. Bureau of Mines, the U.S. OSMRE, and the U.S. FHWA. These U.S. publications along with the referenced Australian Standard provide evidence that a stricter standard would be feasible and appropriate to address potential for human disturbance. By failing to incorporate human disturbance thresholds into the blasting analysis, nearby residences and recreational areas could be exposed to excessive vibration that could be startling and disruptive, resulting in complaints, and should be considered a significant impact under CEQA. Therefore, the DEIR has failed to fully address the impact analysis required by CEQA and the related blasting analysis and mitigation measures should be revised.

Comment 58C-9 Cont.

#1.B – Thresholds for Evaluation of Blasting "Airblast" also Focus on Building Damage

Comment 58C-10

Impact 4.13-6 also assesses the potential for the Project to generate substantial "noise", "airborne vibration," or "airblast" as a result of blasting. "Airblast" refers to the low-frequency pressure wave transmitted through the air from an underground blast. The DEIR's analysis of airblast is based on guidance found in the U.S. Bureau of Mines publication RI 8485 *Structural Response and Damage Produced by Airblast* (1980). This document and the referenced thresholds focus on building damage. For reference, the DEIR threshold used to address potential impact from airblast is 0.01295 psi or 133 dB. This threshold is purported in the DEIR to "prevent damage and human disturbance." However, using the same threshold to address both concerns does not account for the fact that humans are more sensitive than buildings and can be disturbed by lower levels. The US Bureau of Mines Publication RI 8485 also includes this commentary on human disturbance, indicating the human annoyance occurs at lower thresholds than building damage:

> *"[Airblast] Levels exceeding 120 dB will produce some annoyance from rattling and fright, with as much as 5 to 10 pct of homes exhibiting such disturbances at the maximum level of 134 dB (0.1-Hz high-pass). Public reaction depends strongly on the blaster's public relations and the general attitudes of the neighbors to the economic and social requirement for the blasting."* (RI 8485, page 66)

Focusing on the airblast damage threshold again pays inadequate attention to the potential disturbance of sensitive residential neighbors related to the secondary effects of blasting airblast, such as the rattling of windows.

The Caltrans *Transportation and Construction Vibration Guidance Manual* (April 2020), which states that "Ground vibration and air overpressure can be felt at levels that are well below those required to produce any damage to structures." (Caltrans Manual, page 75). Table 21 below (excerpted from the Caltrans Manual, Page 75) indicates that airblast overpressure of 133 dB (thresholds selected in the DEIR) would be perceived in the range of "mildly to distinctly unpleasant." These characterizations demonstrate that it is prudent to select a threshold of significance for blasting airblast that is lower or more strict that the thresholds related to building damage in order to adequately address human disturbance.

Table 21. Human Response to Blasting Ground Vibration and Air Overpressure

Average Human Response	PPV (in/sec)	Airblast (dB)
Barely to distinctly perceptible	0.02–0.10	50–70
Distinctly to strongly perceptible	0.10–0.50	70–90
Strongly perceptible to mildly unpleasant	0.50–1.00	90–120
Mildly to distinctly unpleasant	1.00–2.00	120–140
Distinctly unpleasant to intolerable	2.00–10.00	140–170

As further support, consider the Australian Standard AS 2187.2-2006 titled *Explosives – Storage and Use, Part 2: Use of Explosives*. In this standard, the recommended blasting damage airblast limits are aligned with the Project DEIR blasting vibration damage thresholds. However the Australian Standard further adds the following "airblast limits for human comfort" (AS 2187.2-2006, Table J5.4(A))

Australian Standard AS 2187.2-2006: Excerpt of Airblast Limits for Human Comfort

Category	Type of Blasting Operations	Peak Sound Pressure Level
Sensitive Site*	Operations lasting more than 12 months or more than 20 blasts	115 dBL for 95% blasts per year, 120 dBL maximum unless agreement is reached with the occupier that a higher limit may apply
Sensitive Site*	Operations lasting for less than 12 months or less than 20 blasts	120 dBL maximum unless agreement is reached with the occupier that a higher limit may apply
Occupied non-sensitive sites, such as factories and commercial premises	All blasting	125 dBL maximum unless agreement is reached with the occupier that a higher limit may apply.

** A sensitive site includes houses and low-rise residential buildings, theatres, schools, and similar buildings occupied by people*

Comment 58C-10 Cont.

#1.C – DEIR Should Include Additional Community Engagement and Relations Efforts

Comment 58C-11

In addition to stricter thresholds or limits to be applied to blasting to address human disturbance, additional community relations efforts can and should be incorporated into the Project Blasting Protocols. As stated by the U.S. Bureau of Mines (in publication RI 8507, page 68) "*good public relations attitudes and an educational program by the blaster are essential*." Clear communication and notification of blasting events can benefit an adjacent community and reduce the impact of blasting activities. The blasting Mitigation Measure 4.13-6 and related Blasting Protocols (DEIR, Appendix H-6) includes monitoring and "complaint response procedures." However, the Project should not wait until after complaints are received to implement further community engagement. Additional effective community relations efforts should be incorporated into the standard blasting protocol procedures so they are implemented prior to and during blasting and monitoring (not only after complaints are received). The following measures should be included in the DEIR:

- Revise the mitigation measure to require blasting to be scheduled at the same time of day each day that blasting occurs (i.e., on the hour at a certain hour of the day). Based on our experience, awareness of blasting has helped people to more easily tolerate blasting vibration and airblast that is noticeable.
- Revise the mitigation measure to require notification of residents within 2,000 feet at the time of blast. This could be offered as a subscription for notifications via text message or similar means.

#1.D – The DEIR Should Require Peer Review of the Blast Monitoring Results

Comment 58C-12

The blasting Mitigation Measure 4.13-6 and related Blasting Protocols (DEIR, Appendix H-6) includes monitoring requirements and mandatory reporting to the County. However, given the technical nature of the blasting protocols, it would be appropriate for blasting reports and monitoring results to be reviewed by a third party with expertise in assessing the results. This should occur at least at the early stages of blasting and when blasting within 600 feet of a sensitive receptor.

In addition, the current Blasting Protocols include monitoring only "at the closest residential/commercial property, the closest well, and at three points to the San Joaquin River embankment." This measure does not take into account potential monitoring equipment failure or faulty results. The DEIR should have required blast monitors at the two closest residential properties, not just one. Doing so would improve confidence in the measurement results to ensure that blasting related noise and vibration is minimized.

SECTION 2 – COMMENTS ON OTHER OPERATIONAL NOISE SOURCES

Comment 58C-13

#2.A – Proposed Operational Noise Mitigation is Inadequate

Impacts 4.13-2 and 4.13-3 assess increases in ambient noise levels from Plant Site and Quarry Site operations that could exceed local standards. The analysis indicates that operational noise at night is projected to exceed the thresholds of significance and the impacts without mitigation would be potentially significant (see Tables 4.13-16 and 4.13-17, DEIR pages 4.13-57 through 4.13-60).

To address these potential impacts, the related mitigation measures (4.13-2 and 4-13.3) take the approach of requiring the operator to "implement one or more of the" measures listed to reduce noise from site operations. The mitigation measure does not identify which of these optional measures is actually required or appropriate. One of those measures is noise monitoring after operations have already commenced. Therefore, only after impacts occur, complaints are received, and excessive noise levels are found through review of monitoring data would additional noise reduction measures be identified and implemented. And that process of justifying, coordinating, and implementing the additional mitigation measures could take significant time and efforts.

The "wait and see" approach taken by this mitigation measure is insufficient to fulfill the mandate of identifying significant impacts and implementing effective mitigation measures to reduce noise BEFORE the community is exposed to excessive noise. Only AFTER the Project operation is confirmed to generate excessive noise will noise reduction measures be implemented. Meanwhile, the operation continues to expose people to excessive noise during the potentially lengthy process developing further mitigation measures, conducting pricing and feasibility studies, and submitting the measures through an approval process. This noise mitigation approach is inadequate. Instead, the operational noise impact analysis must identify the specific sources or activities that are expected to generate significant construction noise and then develop specific, effective, and feasible noise reduction measures that would reduce noise to a less than significant level.

In summary, the proposed mitigation measures are inadequate as they fail to protect the community from excessive noise BEFORE it occurs. The mitigation fails to include specific measures that would be needed to reduce all potentially significant impacts.

Comment 58C-14

#2.B DEIR Does Not Demonstrate Efficacy of Operational Noise Mitigation

As mentioned in Comment #2A above, Mitigation Measures 4.13-2 and 4-13.3 take the approach of requiring the operator to "implement one or more of" a variety of measures to reduce noise from site operation. However, the DEIR provides no supporting information to demonstrate how one or more of the listed measures will actually reduce noise to a less-than-significant level. Without such effort to define the efficacy of the operational noise mitigation measures, the DEIR cannot conclude that noise would be reduced to a less-than-significant level.

#2.C Impact of Nighttime Noise is Compounded by Extended Operational Hours

Comment 58C-15

The above comments related to nighttime noise impact findings and mitigation are compounded by the fact that the Project includes extending the hours of processing operations during nighttime hours. DEIR pages 4.1-62 and 4.1-63 note that hours of operation would be revised as follows:

"Specifically, excavation as well as aggregate processing and recycling operations would be expanded from 6 p.m. to 7 p.m., and loading/unloading and aggregate trucking could occur between the hours of 4 a.m. and 9 p.m. under the proposed project, whereas under existing conditions the earliest operations begin between 4 a.m. and 6 a.m., depending on the time of year, and end at 6:00 p.m. year-round."

Extended operations before 6 a.m. and after 7 p.m. come with increased risk and potential for sleep and speech disturbance for the nearby sensitive receivers. This further emphasizes the need to provide adequate and specific noise reduction measures in Mitigation Measures 4.13-2 and 4-13.3.

#2.D – Nighttime Noise Impact and Sleep Disturbance is Not Adequately Addressed

Comment 58C-16

The conditions of this project and the community warrant an analysis of nighttime noise and the potential for sleep disturbance since operations will occur at nighttime hours (4 a.m. to 7 a.m.). The sleep disturbance study should evaluate both average and single-event maximum noise (i.e., Leq/L50 and Lmax noise levels) from processing, truck loading, and truck pass-by noise. The nighttime industrial activities could annoy residents and cause sleep disturbance. A revised EIR should identify appropriate mitigation, including specific limitations on nighttime noise and activities.

#3 NOISE AND VIBRATION IMPACT TO WILDLIFE IS NOT SUFFICIENTLY EVALUATED

Comment 58C-17

We also reviewed the comments on noise impact on wildlife in the DEIR Chapter 4.4 Biological Resources. The DEIR indicates that:

- "Ground disturbance and noise impacts from mining could disturb nesting birds located on or near the project sites." (DEIR page 4.4-49) --- and ---
- "Mining activities on the Plant Site and Quarry Site could result in potential adverse impacts to special-status species in the riparian habitat surrounding the project sites if light, noise and vibration, and the operation of heavy equipment during mining activities result in substantial disturbance." (DEIR page 4.4-52)

However, the DEIR provides very little substantive analysis regarding noise in neighboring wildlife areas that will be subject to noise from the project operations. It appears that:

1. Existing ambient noise levels were not measured or evaluated in the neighboring wildlife areas. And based on the ambient noise data presented in Chapter 4.13, we expect that such areas, that are located away from current sources of noise (e.g., roadways), would have rather low noise levels.

2. Project operational noise levels were not predicted at neighboring wildlife areas. Without such analysis, the potential noise increase has not been evaluated adequately.

3. Impact 4.4-6 discusses impact of blasting activities on fish in the San Joaquin River. A vibration limit of 2.0-inch/second is presented as a threshold of significance, and the related mitigation of limiting blasting vibration at the river to 0.5 inch/second is incorporated into the mitigation measure. However, the evaluation of blasting ground-borne vibration and "airblast" pressure goes no further. There is no analysis of blasting impact on other wildlife and riparian habitat in the nearby areas.

Comment 58C-17 Cont.

The DEIR fails to fully analyze the noise and vibration impact of the Project on wildlife. There are no noise or vibration thresholds of significance presented for wildlife (beyond fish in the San Joaquin River). Thus, the impact to wildlife is still unknown. Furthermore, there are no noise and vibration mitigation measures that control operational noise or blasting vibration, in particular, such as halting blasting during times when birds are nesting within in the nearby area where noise, vibration, and airblast could disrupt the animals.

Report of Investigations 8507

Structure Response and Damage Produced by Ground Vibration From Surface Mine Blasting

By D. E. Siskind, M. S. Stagg, J. W. Kopp, and C. H. Dowding

UNITED STATES DEPARTMENT OF THE INTERIOR
Cecil D. Andrus, Secretary

BUREAU OF MINES
Lindsay D. Norman, Director

CONCLUSIONS

The problems of blasting vibration damage to residential structures and human tolerance to vibrations have been analyzed using data from a wide variety of studies. Statistical techniques of mean and variance analysis and probability plots have both been applied to the damage data from the 10 studies and demonstrated the following:

1. Particle velocity is still the best single ground motion descriptor.

2. Particle velocity is the most practical descriptor for regulating the damage potential for a class of structures with well-defined response characteristics (e.g., single-family residences).

3. Where the operator wants to be relieved of the responsibility of instrumenting all shots, he could design for a conservative square root scale distance of 70 ft/lb$^{1/2}$. The typical vibration levels at this scaled distance would be 0.08 to 0.15 in/sec.

4. Damage potentials for low-frequency blasts (< 40 Hz) are considerably higher than those for high-frequency blasts (> 40 Hz), with the latter often produced by close-in construction and excavation blasts.

5. Home construction is also a factor in the minimum expected damage levels. Gypsumboard (Drywall) interior walls are more damage resistant than older, plaster on wood lath construction.

6. Practical safe criteria for blasts that generate low-frequency ground vibrations are 0.75 in/sec for modern gypsumboard houses and 0.50 in/sec for plaster on lath interiors. For frequencies above 40 Hz, a safe particle velocity maximum of 2.0 in/sec is recommended for all houses.

7. All homes eventually crack because of a variety of environmental stresses, including humidity and temperature changes, settlement from consolidation and variations in ground moisture, wind, and even water absorption from tree roots. Consequently, there may be no absolute minimum vibration damage threshold when the vibration (from any cause, for instance slamming a door) could in some case precipitate a crack about to occur.

8. The chance of damage from a blast generating peak particle velocities below 0.5 in/sec is not only small (5 pct for worst cases) but decreases more rapidly than the mean prediction for the entire range of vibration levels (almost asymptotically below about 0.5 in/sec).

9. Human reactions to blasting can be the limiting factor. Vibration levels can be felt that are considerably lower than those required to produce damage. Human reaction to vibration is dependent on event duration as well as level. Particle velocities of 0.5 in/sec from typical blasting (1-sec vibration) should be tolerable to about 95 pct of the people perceiving it as "distinctly perceptible". Relevant to whole-body vibration reaction is the degree that the vibration interferes with activity (sleep, speech, TV viewing, reading), presents a health hazard, and affects task proficiency. For people at home, the most serious blast vibration problems are house rattling, fright (fear of damage or injury), being startled, and for a few, activity interference. Complaints from these causes can be as high as 30 pct at 0.5 in/sec, and this is where good public relations attitudes and an educational program by the blaster are essential.

Human Subjective Tolerance

At what level are human beings able to perceive blast vibration effects? Airblast is extremely difficult to define in this way, because of the very variable audibility of any particular event. If the predominant frequency of the event is low, it could be that, say, 115 dBL might be unnoticeable, whereas if the predominant frequencies were well into the range of human hearing, this same event might be quite annoying. It is also possible that where the airblast frequencies match the natural frequencies of structures, secondary vibrations producing rattling, etc., can occur. This effect can not only increase the subjective perception of an event, but can also extend its apparent duration. Ground motion, on the other hand, while frequency dependent to a point, depends much on the sensitivity of the human subject. Most authorities agree that the threshold of human perception for blast vibration ground motion is around 0.03 inches per second. Depending on activity, sensitivity, and whether or not the subject knows when the event is to occur, a few humans can sense ground motion as low or lower than most instruments are able to: about 0.01 inch per second!

Although complaints can occur at any level perceptible to humans, they are unusual below 0.08 inches per second or so. As peak particle velocities increase and as local and individual sensitivities increase, so will the number of complaints. At, say, 0.25 inches per second, a level that is eminently safe, and well within OSMRE limits, except below 2 Hz, complaints can be expected.

10.6 SENSITIVITY TO VIBRATION

Human beings are remarkably sensitive to vibration. If this were not so, the vibration problem would scarcely exist. The explosives technology of today insures that most operations are conducted in a safe manner. In relatively few cases is there a significant probability of damage.

Since vibration is felt in practically all cases, the reaction to this sensation is one of curiosity, concern, and even fear. Hence, it is important to understand something about human response to vibration which depends on vibration levels, frequency and duration. In addition to these physical factors, it is important to keep in mind that human response is a highly subjective phenomenon.

Human response has been investigated by many researchers. One of the early investigations was by Reiher and Meister, Berlin, 1931. Other investigations were made by Goldman, 1948, and Wiss and Parmelee, 1974. A composite of these investigators' results was presented graphically in the U. S. Bureau of Mines RI 8507, Siskind, et al, 1980. This composite is represented here in Figure 10.28.

The human response curves are all similar and highly subjective in that the response is a mixture of physiological and phychological factors individual to each person. Based on these curves, a very simple and practical set of human responses can be designated as follows:

TABLE 10.10 HUMAN RESPONSE

RESPONSE	PARTICLE VELOCITY	DISPLACEMENT AT 10 Hz	DISPLACEMENT AT 40 Hz
Noticeable	0.02 in/s	0.00032 in	0.00008 in
Troublesome	0.2 in/s	0.0032 in	0.0008 in
Severe	0.7 in/s	0.011 in	0.0028 in

Vibration is a fact of daily life which one regularly experiences but is seldom aware of. This type of vibration has been designated cultural vibration. Generally, it elicits no reaction from the person affected.

Other vibration that contrasts sharply, because it is not part of the daily experience but is unusual, has been designated acultural. It surprises a person, is disturbing, and causes an acute awareness.

J4 Ground vibration levels

J4.1 General

The maximum levels for ground vibration for human comfort that some authorities have chosen are set out in Paragraphs J4.2 to J4.5.

NOTE The maximum levels advised in this Appendix are designed to be informative and are not intended to override existing statutory requirements, particularly with respect to human comfort limits set by various authorities.

The methods of data analysis for these limits are also presented. In part, such analyses are a departure from that described in earlier and other Standards and the intention is to provide sufficient detail so that expert persons may implement these in hardware and/or software.

J4.2 Ground vibration

Vibration transmitted through the ground may cause damage to structures and architectural elements or discomfort to their occupants. The vibration levels at which people become annoyed are well below vibration levels at which damage occurs. The likelihood of such damage or discomfort may be ascertained by measuring the vibration from a blast close to the location of concern such as a building or other structure.

For all limits it is necessary to measure in three orthogonal directions, one in the vertical direction and the other two in perpendicular horizontal directions. Such measurements align with most structural members in man-made structures. From such measurements it is possible to derive the Vector Peak Particle Velocity (VPPV) and the Peak Component Particle Velocity for each direction (PCPV). The magnitude of the vector particle velocity (v_p) is the amplitude of the vector sum of three time-synchronised velocity components directly measured by an instrument. When not measured directly it may be determined by the following Equation:

$$v_p = \sqrt{v_x^2 + v_y^2 + v_z^2} \qquad \text{J4.2}$$

where v_x, v_y and v_z are the synchronized instantaneous velocity components of the x, y and z axes, respectively. The VPPV is the maximum of v_p.

J4.3 Human comfort limits

NOTE Statutory requirements for human comfort limits for ground vibration may apply in respective jurisdictions.

General guidance on human response to building vibrations is given in AS 2670.2 , ISO 2631-2 and BS 6472 .

J4.5 Recommended ground vibration limits

NOTE Statutory requirements for human comfort limits for ground vibration may apply in respective jurisdictions.

The maximum levels for ground vibration for human comfort, which some authorities have chosen, are provided in Table J4.5(A). Recommended limits for ground vibration for control of damage to structures are provided in Table J4.5(B).

Frequency-dependent limits have the capacity to precisely deal with the hazards presented by ground vibration and are seen as the basis for best practice blasting. The particular frequency-dependent criteria should be reported with the measurements. All the limits given in Tables J4.5(A) and J4.5(B) are peak component particle velocities, as used in overseas Standards and guidelines. The classification of type of structure may be difficult and when in doubt, a more conservative limit from the nearest description in Table J4.5(B) should be applied.

Table J4.5(A) — Ground vibration limits for human comfort chosen by some regulatory authorities (see Note to Table J4.5(B))

Category	Type of blasting operations	Peak component particle velocity (mm/s)
Sensitive site *	Operations lasting longer than 12 months or more than 20 blasts	5 mm/s for 95% blasts per year 10 mm/s maximum unless agreement is reached with the occupier that a higher limit may apply
Sensitive site *	Operations lasting for less than 12 months or less than 20 blasts	10 mm/s maximum unless agreement is reached with occupier that a higher limit may apply
Occupied non-sensitive sites, such as factories and commercial premises	All blasting	25 mm/s maximum unless agreement is reached with occupier that a higher limit may apply. For sites containing equipment sensitive to vibration, the vibration should be kept below manufacturer's specifications or levels that can be shown to adversely effect the equipment operation

* A sensitive site includes houses and low rise residential buildings, theatres, schools, and other similar buildings occupied by people.

NOTE The recommendations in Table J4.5(A) are intended to be informative and do not override statutory requirements with respect to human comfort limits set by various authorities. They should be read in conjunction with any such statutory requirements and with regard to their respective jurisdictions.

Table J4.5(B) — Recommended ground vibration limits for control of damage to structures (see Note)

Category	Type of blasting operations	Peak component particle velocity (mm/s)
Other structures or architectural elements that include masonry, plaster and plasterboard in their construction	All blasting	Frequency-dependent damage limit criteria Tables J4.4.2.1 and J4.4.4.1
Unoccupied structures of reinforced concrete or steel construction	All blasting	100 mm/s maximum unless agreement is reached with the owner that a higher limit may apply
Service structures, such as pipelines, powerlines and cables	All blasting	Limit to be determined by structural design methodology
NOTE Tables J4.5(A) and J4.5(B) do not cover high-rise buildings, buildings with long-span floors, specialist structures such as reservoirs, dams and hospitals, or buildings housing scientific equipment sensitive to vibration. These require special considerations, which may necessitate taking additional measurements on the structure itself, to detect any magnification of ground vibrations that might occur within the structure. Particular attention should be given to the response of suspended floors.		

J5 Airblast levels

J5.1 General

Airblast can cause discomfort to persons and, at high levels, damage to structures and architectural elements, and at very high levels, injury to persons.

The airblast levels at which people become annoyed are well below levels at which damage has been proven to occur. The evaluation of the effects of blasting should separate human response and structural/architectural damage effects of airblast. Of particular importance in this regard is the frequency content of the airblast. For example, an airblast that is inaudible to humans may still be responsible for structural/architectural damage effects. Conversely, an airblast level that causes human discomfort may have negligible structural/architectural damage effects. The limits set out in Paragraphs J5.2, J5.3 and J5.4 below offer a robust means for differentiating such effects and are based upon studies conducted by various workers in blasting.

The sound pressure level [*SPL* (*dBL*)] is defined as follows:

$$SPL = 10\log_{10}\left(\frac{P}{P_0}\right)^2 \qquad \text{J5.1}$$

where P is the pressure level (Pa) and P_0 is the reference pressure of 20 mPa. It is generally accepted that aural pain will occur in humans for *SPL* greater than 140 dBA for frequencies in the range 20 Hz to 20 kHz and for *SPL* between 160 dBL and 170 dBL for frequencies below 20 Hz.

General control limits currently used in Australia are not frequency dependent. It is probable that continuing research and development will result in the development of frequency-dependent limits and these should be adopted when available.

J5.2 Human comfort limits

NOTE Statutory requirements for human comfort limits for airblast may apply in respective jurisdictions.

Human comfort limits for airblast are linked to the annoyance produced. Several factors contribute to annoyance by impulsive sounds such as airblast. These include the loudness, duration and number of events plus the time of day and the nature of the disturbance.

J5.4 Recommended airblast limits

Airblast limits for human comfort chosen by some regulatory authorities are provided in Table J5.4(A). Recommended damage control limits are given in Table 5.4(B). All the limits are expressed as peak linear sound pressure levels. The classification of type of structure may be difficult and, when in doubt, a more conservative limit from the nearest description in Table J5.4(B) should be applied.

Table J5.4(A) — Airblast limits for human comfort chosen by some regulatory authorities (see Note to Table J5.4(B))

Category	Type of blasting operations	Peak sound pressure level (dBL)
Human comfort limits		
Sensitive site *	Operations lasting longer than 12 months or more than 20 blasts	115 dBL for 95% blasts per year. 120 dBL maximum unless agreement is reached with occupier that a higher limit may apply
Sensitive site *	Operations lasting for less than 12 months or less than 20 blasts	120 dBL mm/s for 95% blasts. 125 dBL maximum unless agreement is reached with occupier that a higher limit may apply
Occupied non-sensitive sites, such as factories and commercial premises	All blasting	125 dBL maximum unless agreement is reached with the occupier that a higher limit may apply. For sites containing equipment sensitive to vibration, the vibration should be kept below manufacturer's specifications or levels that can be shown to adversely effect the equipment operation
* A sensitive site includes houses and low rise residential buildings, hospitals, theatres, schools, etc., occupied by people.		

Table J5.4(B) — Recommended airblast limits for damage control (see Note)

Category	Type of blasting operations	Peak sound pressure level (dBL)
Damage control limits		
Structures that include masonry, plaster and plasterboard in their construction and also unoccupied structures of reinforced concrete or steel construction	All blasting	133 dBL maximum unless agreement is reached with the owner that a higher limit may apply
Service structures, such as pipelines, powerlines and cables located above the ground	All blasting	Limit to be determined by structural design methodology

NOTE Tables J5.4(A) and J5.4(B) are intended to be informative and do not override statutory requirements, particularly with respect to human comfort limits set by various authorities. They should be read in conjunction with any such statutory requirements and with regard to their respective jurisdictions.

RESUME

Jeremy Decker, PE

Vice President

Mr. Decker has been an acoustical consultant with Salter since 2005. His areas of expertise include environmental noise studies (of several types), municipal master planning and noise control policies, acoustical monitoring, architectural acoustics, machinery and mechanical system noise reduction, and vibration analyses. He has consulting experience in the development and peer review of environmental noise impact analyses for public, industrial, and other commercial projects.

California

San Joaquin River

San Joaquin River | Mike Davis

Most people think of agriculture when they think of the San Joaquin River. They don't consider king salmon swimming upstream through cool waters to spawn on the high slopes of the southern Sierra Nevada, or vast wetlands supporting millions of waterfowl and even elk herds. But they should.

The hardest working river in California originates from headwaters that include Yosemite and Kings Canyon National Parks and the Ansel Adams Wilderness. Principal tributaries like the Tuolumne and Merced provide inspiring reminders of what the 366-mile river coursing through the fertile San Joaquin Valley south of Sacramento once offered, and may yet offer again.

The river meets the other half of the state's largest watershed at the Sacramento-San Joaquin Delta where the combined rivers flow west through the Carquinez Strait into San Francisco Bay.

An abundance of wildlife depends on this river, including a significant portion of the Pacific salmon fishery that once flocked upstream by the millions. The breadth of the watershed supports a recreation industry that generates billions of dollars in economic activity and includes world-class whitewater paddling, salmon and trout fishing, and waterfowl hunting.

They also support some of the most productive and profitable agriculture in the world, irrigating more than two million acres of arid land. The rivers generate enough hydropower for more than 4 million homes, and provide drinking water to over 25 million people, including the cities of San Francisco and Los Angeles.

Did You know?

+

Before agricultural development of its valley, the San Joaquin was navigable by steamboats as far upstream as Fresno.

At 31,800 square miles, the San Joaquin watershed is the largest single river basin entirely in California, comparable in size to the Upper Peninsula of Michigan.

The Sacramento, when combined with the Pit, is one of the longest rivers in the United States entirely within one state. Only the Kuskokwim in Alaska and the Trinity in Texas are longer.

Groundwater withdrawal has led to land subsidence of more than 28 feet in the San Joaquin Valley near Mendota.

The Sacramento supports nearly 60 species of fish and 218 types of birds. Native bird populations on the river have declined steadily since the 19th century.

San Joaquin River watershed, including the Tulare Basin

The Backstory

Humans have not treated these rivers well through the years. More than a century of managing them for agriculture, hydropower, and flood control has taken its toll. The health of the San Joaquin River has suffered the impacts of hundreds of dams, levees stretching thousands of miles, and countless water diversions. More than 95 percent of floodplain and freshwater tidal marsh habitat has been converted to development or agriculture. Once-iconic salmon runs teeter on the brink of extinction.

The problems are so acute that American Rivers named the San Joaquin River one of America's Most Endangered Rivers® in 2014. In 2016, it rose to the No. 2 position on the list.

Let's stay in touch!

SUBSCRIBE

Man’s manipulation has severely hurt river habitat and opportunities for recreation and community access. More than 100 miles of the San Joaquin’s main stem have been dry for over 50 years, and water diversions along the tributaries take more than 70 percent of the natural flow. Before irrigation development, the river and its tributaries once supported the third-largest run of Pacific salmon in California, measuring more than 200,000. Today, the few remaining fish have nowhere to go.

People are at risk as well. Outdated approaches to water management have made communities vulnerable to increasingly frequent and severe droughts and floods.

The Future

There is hope on the horizon, however. California has never experienced a greater opportunity to address these threats and American Rivers is already hard at work.

There are many reasons for optimism. Voters recently passed a $7 billion “Water Bond” designed to jumpstart critical improvements to fisheries, habitat, flood safety, and water quality. The State Water Board is developing a new plan to meet water quality standards and protect the public values provided by the San Joaquin, Sacramento, and Delta watershed. More than two dozen dams must get new operating licenses that better protect rivers, native fish and water quality. The Central Valley Flood Protection Plan will be updated in 2017.

All that adds up to more water in the rivers. The Water Board must act this year to increase flows in the San Joaquin so that the watershed is healthy enough to support fish and wildlife, sustainable agriculture, and resilient communities for generations to come. In order to comply with state and federal laws, the Board must require dam owners to release more water to the river in a manner that mimics the natural flow regime.

Meanwhile, American Rivers has embarked on multi-benefit projects on the San Joaquin designed to enhance flood safety and restore salmon-rearing habitat by reconnecting the floodplain. Projects designed to improve water quality, increase water quantity, and improve quality of life by establishing the river as a more vibrant community asset are also underway.

While drought and climate change are affecting water patterns, they are also teaching Californians to adapt, improve groundwater storage and figure out ways to make a finite resource stretch farther. The San Joaquin River and the communities that depend on them are currently being acted upon by a confluence of forces that will create opportunities for historic success, or epic failure.

Planned Outreach and Coordination

Program Costs and Funding

Status of Federal Legislation

Introduction

This is the first Annual Report prepared by the San Joaquin River Restoration Program (SJRRP), describing Program activities and accomplishments during Fiscal Year (FY) 2007, and planned activities for FY 2008. The SJRRP was established upon court acceptance of a Stipulation of Settlement among three Settling Parties in October 2006 regarding restoration of the San Joaquin River, in the Central Valley of California. During FY 2007, many organization and management actions were completed to begin forming a long-term structure for the SJRRP. These include preparation of a Program Management Plan, establishment of dedicated technical work groups comprised of implementing agencies, a structured process for coordination with the Settling Parties, a comprehensive public involvement and outreach program, and a process for preparation of technical documents that will be available to the public during the preparation of the Programmatic Environmental Impact Statement/Report (PEIS/R).

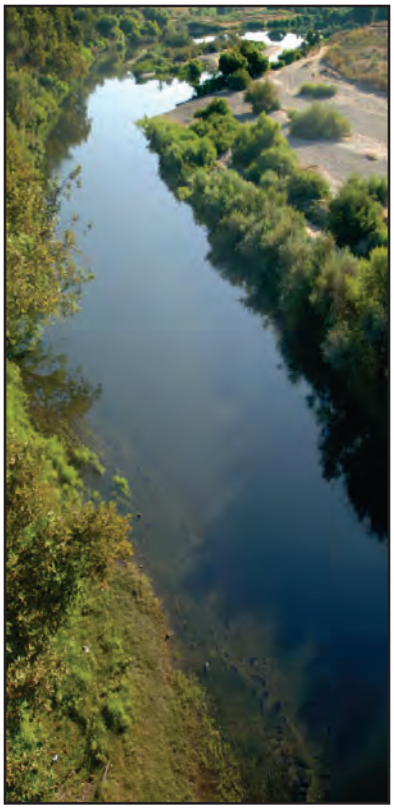
The Settlement

In 1988, a coalition of environmental groups, led by the Natural Resources Defense Council (NRDC), filed a lawsuit challenging the renewal of the long-term water service contracts between the United States and the Central Valley Project (CVP) Friant Division contractors. After more than 18 years of litigation of this lawsuit, known as *NRDC, et al., v. Kirk Rodgers, et al.,* a Stipulation of Settlement (Settlement) was reached. On September 13, 2006, the Settling Parties reached agreement on the terms and conditions of the Settlement, which was subsequently approved by the Court on October 23, 2006. The "Settling Parties" include the NRDC, Friant Water Users Authority (FWUA), and the U.S.

Former Reclamation Mid-Pacific Regional Director Kirk Rodgers speaks at a September 2006 press conference announcing an historic Settlement reached to restore flows in the San Joaquin River.

Departments of the Interior and Commerce.
The Settlement's two primary goals are:

- Restoration Goal – To restore and maintain fish populations in "good condition" in the main stem of the San Joaquin River below Friant Dam to the confluence of the Merced River, including naturally reproducing and self-sustaining populations of salmon and other fish.
- Water Management Goal – To reduce or avoid adverse water supply impacts to all of the Friant Division long-term contractors that may result from the Interim Flows and Restoration Flows provided for in the Settlement.



San Joaquin River

Settlement Implementation

The Settlement states that the Secretary of the Interior will implement the terms and conditions of the Settlement. Additionally, the Settling Parties agreed that implementation of the Settlement will also require participation of the State of California (State). Therefore, concurrent with the execution of the Settlement, the Settling Parties entered into a Memorandum of Understanding (MOU) with the State of California (by and through the California Resources Agency, the Department of Water Resources (DWR), the Department of Fish and Game (DFG), and the California Environmental Protection Agency) regarding the State's role in the implementation of the Settlement.

The program established to implement the Settlement is the San Joaquin River Restoration Program (SJRRP), and the "Implementing Agencies" responsible for the management of the Program include the Bureau of Reclamation (Reclamation), United States Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), DWR, and DFG.

Authorization and Initial Funding

The SJRRP is currently authorized under the Central Valley Project Improvement Act (CVPIA). Signed in 1992, this act included provisions for the potential restoration of the San Joaquin River and instituted a fee structure for Friant Division contractors for such activities. Interim Federal funding obligated for the SJRRP through Fiscal Year 2007 was approximately $3 million and an additional $6.5 million has been allocated for FY 2008. Additional funding and amended authorization is pending passage of Federal legislation that would approve terms and conditions of the Settlement.

San Joaquin River Restoration Area

The geographic area for the SJRRP includes California's Central Valley from the Sacramento-San Joaquin Delta (Delta) to the base of the Tehachapi Mountains south of Bakersfield. This area includes the San Joaquin River from Friant Dam to the Delta, the Friant Division of the Central Valley Project (CVP), other water service areas potentially affected by changes in water deliveries or restoration of the San Joaquin River, and tributaries to the San Joaquin River downstream of the river restoration area. The river restoration area is 153 miles long and reaches from Friant Dam to the confluence of the Merced River. This stretch of river crosses the counties of Fresno, Madera and Merced. For the purposes of the Program, the river has been divided into five primary reaches (see Figure 1). The Program will also evaluate a section of the Eastside Bypass as a potential alternative to the river for carrying restoration flows.

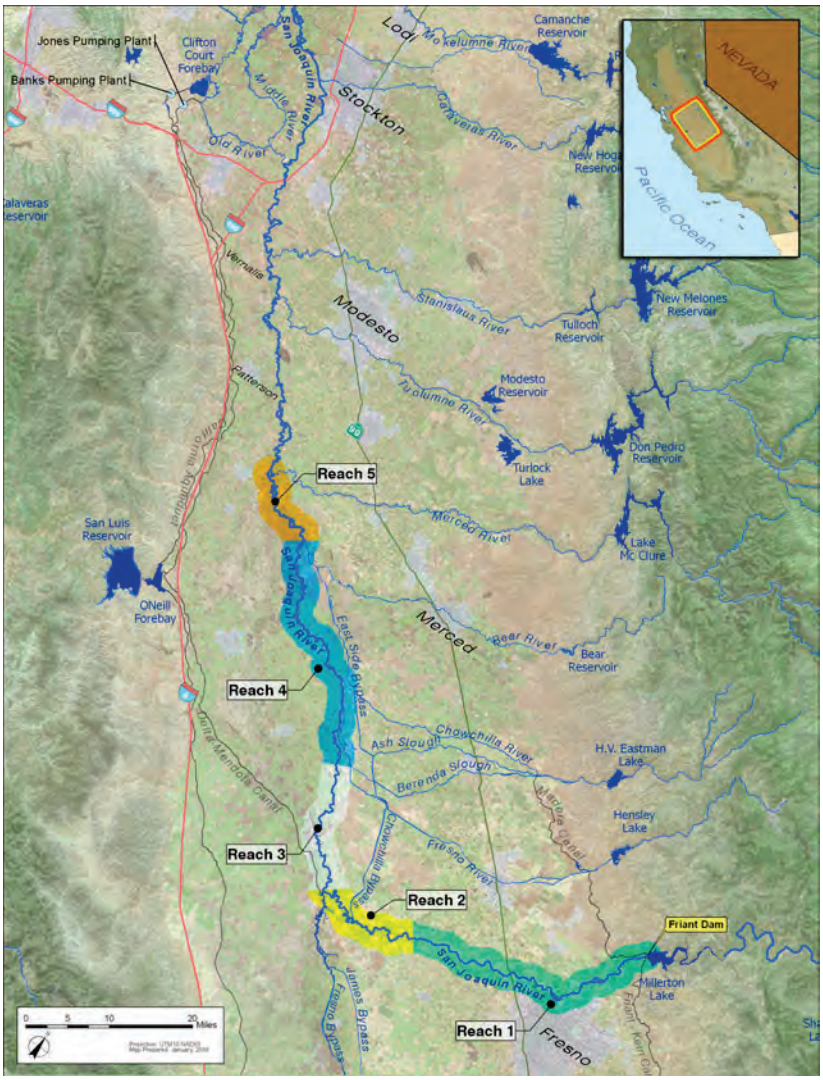


Figure 1- Map of Restoration Area

Reaches of the San Joaquin River under evaluation include:

- Reach 1 – Friant Dam to Gravelly Ford
- Reach 2 – Gravelly Ford to Mendota Dam
- Reach 3 – Mendota Dam to Sack Dam
- Reach 4 – Sack Dam to the confluence of Bear Creek and the Eastside Bypass
- Reach 5 – Eastside Bypass/Bear Creek confluence to the Merced River confluence

2006-2007: Progress and Accomplishments

During FY 2007, many organization and management actions were completed to begin forming a long-term structure for the SJRRP. These began with development of a Program Management Structure for the coordinated involvement of five implementing agencies, coordination with Settling Parties and involvement of third parties. Additional actions completed include: preparation of a Program Management Plan (PMP); establishment of dedicated technical work groups comprised of implementing agencies; a structured process for coordination with the Settling Parties; a comprehensive public involvement and outreach program; and a process for preparation of technical documents that will be available to the public during the preparation of the Programmatic Environmental Impact Statement/Report (PEIS/R).

Program Management Structure

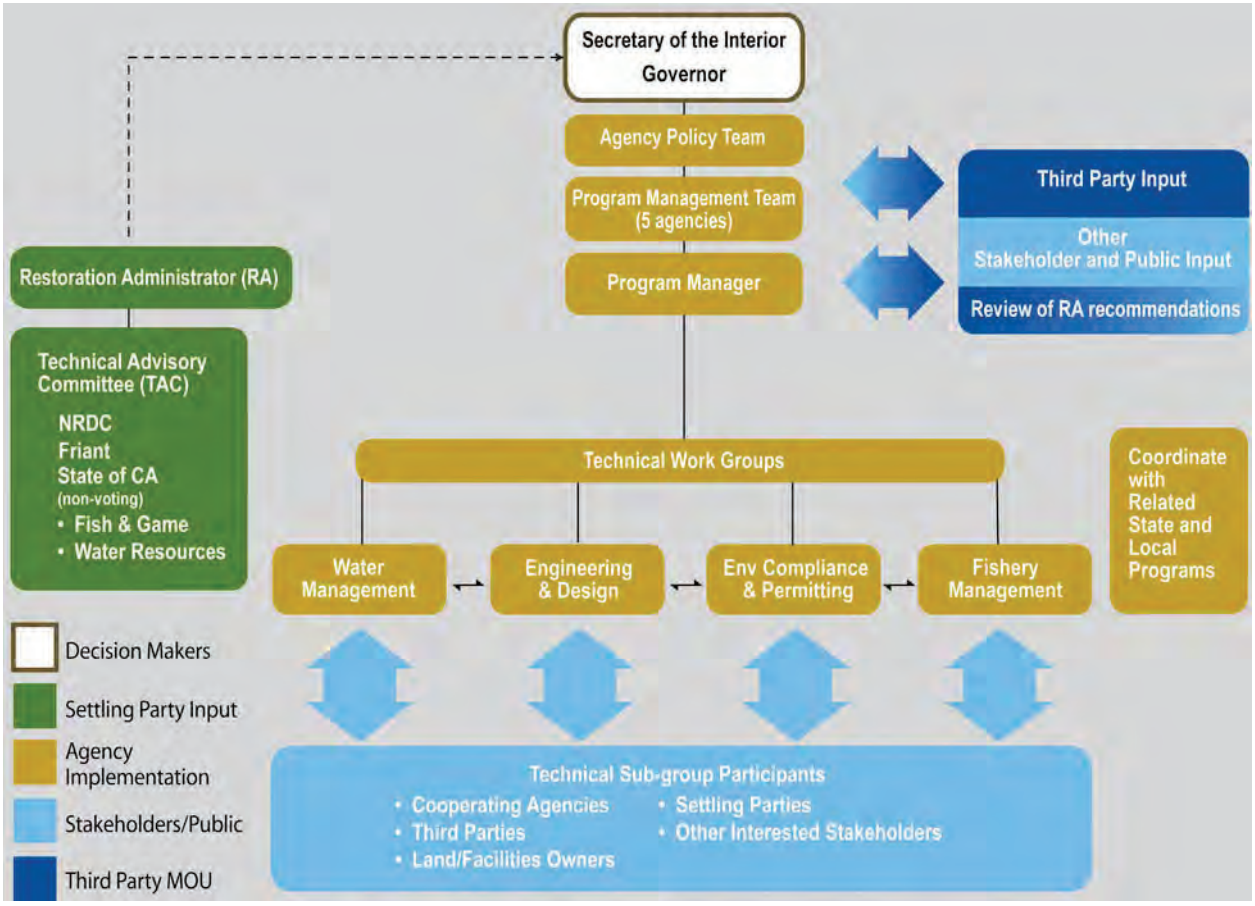

Figure 2 – Program Organizational Chart

The Settlement included clear commitments that the Settling Parties and Third Parties would be involved in the development of implementation plans by the Secretary. Court approval of the Settlement initiated a series of actions that resulted in a program approach structured to provide for effective oversight, management and transparency of the SJRRP. Key among these actions was the development of Memoranda of Understanding (MOU) with the State of California and Third Party Stakeholders.

- State of California MOU – Signed at the same time as the Settlement, this MOU recognizes that the State of California, through DFG, DWR, the Resources Agency, and CalEPA, will play a major, collaborative role in the planning, design, funding, and implementation of the actions on the San Joaquin River called for by the Settlement; and

- Third Party Stakeholders MOU – Signed in February 2007, this MOU recognizes that specific Third Parties will play a collaborative role in the planning, design, implementation, and potential adaptation of the actions on the San Joaquin River called for by the Settlement and in the draft implementing legislation.

The Program Organizational Chart (see Figure 2) reflects the provisions of the Settlement and subsequent MOUs through the following key features:

- **San Joaquin River Restoration Program Team**
  The SJRRP Team is a multi-tiered group that includes staff from the Implementing Agencies, each supplemented with technical resources available through a multi-disciplinary consultant team. Roles and responsibilities of this group include:

  - Program Management Team – Includes executives from the Implementing Agencies and is responsible for overall direction and coordination of the SJRRP;

  - Program Manager – Reclamation assigned a full-time Program Manager in November 2007 to provide direction and management of the Technical Work Groups (TWG) and to serve as chair of the Program Management Team; and

SJRRP Program Manager Jason Phillips speaks at a public meeting.

- Technical Work Groups - The SJRRP features four primary Technical Work Groups (TWGs), each supported by various subject-matter specific sub-groups, as described later in this report.

  The four TWGs are:
  - Water Management,
  - Engineering & Design,
  - Environmental Compliance & Permitting
  - Fisheries Management

- **Restoration Administrator and Technical Advisory Commitee**
  The Settlement specified the roles and responsibilities for a Restoration Administrator which is supported by a Technical Advisory Committee. The SJRRP management structure integrates these resources to obtain timely input on technical issues related to the Restoration Goal.

  - Restoration Administrator – The Restoration Administrator (RA), selected jointly by the NRDC and FWUA, provides recommendations to the Secretary of the Interior and the Governor of California regarding specific elements of the Settlement and certain issues related to the SJRRP's Restoration Goal and consults with the Technical Advisory Committee; and

  - Technical Advisory Committee – The Technical Advisory Committee (TAC) features six voting members selected by and representing FWUA and NRDC. Voting members of the TAC assist and advise the RA regarding areas outlined in the Settlement, have relevant technical or scientific background or expertise in fields related to river restoration or fishery restoration, and serve for 3 years. There are two non-voting members of the TAC representing the State (DWR and DFG) and three Federal agency liaisons(Reclamation, NMFS, USFWS) to the RA and TAC to ensure coordination and information-sharing with the Implementing Agencies.

- **Third Party Stakeholders**
  Third parties are or represent some of the entities or individuals located in the San Joaquin River Basin that are not directly involved in the Settlement, but could be affected by its implementation. These include landowners adjacent to the San Joaquin River and Eastside Bypass, water rights holders on downstream tributaries to the San Joaquin River, and other CVP water users that rely on water conveyed from the Sacramento-San Joaquin Delta.

- **Technical Work Groups**
  Technical Work Groups (TWGs) of the SJRRP and their related sub-groups guide development of the PEIS/R to address SJRRP actions. Listed below is a synopsis of each TWG area of responsibility.

- **Engineering and Design Work Group**

This TWG is responsible for preliminary engineering and design of structures and flow channels needed to meet Restoration and Water Management Goals of the Settlement. Through coordination with other TWGs, the Engineering and Design Work Group will estimate the costs of structures and flow channels for inclusion in the PEIS/R.

- **Environmental Compliance and Permitting Work Group**

This TWG plans and coordinates efforts to implement elements of the Settlement in relation to environmental studies, permits, alternative formulation, and other requirements necessary for actions needed to meet the Restoration and Water Management Goals. The Environmental Compliance and Permitting Work Group will analyze alternatives, assess their effectiveness, develop alternative descriptions, and prepare the PEIS/R.

- **Water Management Work Group**

Working in collaboration with all TWGs, the Water Management Work Group addresses water operations for accomplishing the Restoration and Water Management Goals. To support the Restoration Goal, the Water Management Work Group is developing guidelines for implementing the Restoration Flow. This includes formalization of year-type classification, development fo a continuous line hydrograph as anticipated in the Settlement, procedures and methods for incorporating hydrologic uncertainties in operation, flow and seepage monitoring, and accounting.

In support of the Water Management Goal, the Water Management Work Group is developing a plan for the recirculation, recapture, reuse, exchange or transfer of the Interim Flows and Restoration Flows to reduce or avoid impacts to Friant Division long-term contractors. In addition, the Work Group is developing recommendations for administering a Recovered Water Account to provide water pricing incentives for facilitating

* Graphical representation of Technical Work Groups designed by Chang-yi Julien Sun, 6 years old.

additional regional water management actions to further reduce the impacts to Friant Division long-term contractors. This will include features that retain, acquire, or perfect all rights to manage and control these flows, to the extent permitted by applicable law.

- **Fisheries Work Group**

The Fisheries Management Work Group is responsible for planning and coordination efforts to implement the sections in the Settlement related to meeting the Restoration Goal. Activities include: 1) developing a Fisheries Management Plan designed to provide a roadmap to adaptively manage efforts to restore and maintain naturally reproducing and self-sustaining populations of salmon and other fish in the San Joaquin River below Friant Dam to the confluence of the Merced River; 2) providing information for the permitting process and documentation specific to Paragraph 14 of the Settlement; and 3) recommending and coordinating all fisheries related planning, modeling, or research and monitoring necessary to inform efforts of the Water Management, Engineering and Design, and Environmental Compliance and Permitting Work Groups supporting implementation of the Restoration Goal and the Water Management Goal. The Fisheries Management Work Group is composed of implementing agency staff and consultant team members.

Fisheries Management Work Group Meeting

Program Management Plan

In May 2007, a Program Management Plan (PMP) was completed that provides a framework and strategy that the Implementing Agencies have committed to use in collaboratively and adaptively implementing the Program. The PMP provides an overview of the entire Program schedule, from initial planning through all construction-related activities identified in the Settlement, and the Restoration Flow period. In addition to the Program Management Structure and Technical Workgroup responsibilities described above, the PMP provides a work plan for preparation of the Program EIS/EIR, with detailed descriptions of anticipated technical tasks, intermediate milestones, and public documents. In addition, the PMP describes the relationship of Program-level planning and permitting to site- and project- specific implementation actions – many that will need to initiate planning while the PEIS/R is still being prepared.

Public Outreach and Involvement

Public involvement and outreach opportunities have been integrated into the SJRRP. Guided by a Public Involvement Plan (PIP), these activities seek to create an open and visible process through which the general public, stakeholders, affected Third Parties, and other interested parties can keep track of Program activities and progress and participate in the identification of Program issues and formulation of alternatives.

Components of the PIP that were accomplished in 2007 include:

- A Program contact list of individuals, organizations, and public agencies who want to receive notifications of Program activities;
- Public workshops, co-sponsored with local organization early in the process to present the PMP and the PIP;
- Public scoping meetings to share information and receive official public comment;
- A publicly accessible, Program-specific website that offers timely information and updates, a document repository that includes Technical Memoranda, a calendar of events, and contact information: **www.restoresjr.net;**
- Multiple avenues for interested parties with technical expertise to interface with SJRRP team members to share information;
- News releases, Fact Sheets and Program Updates.

Reclamation engineer Alan Stroppini talks with a participant about a specific area along the river at the Tulare public scoping meeting.

- **Public Scoping**

Public scoping is an early and open process for determining the scope of issues to be addressed and significant issues to be analyzed in depth in a Program Environmental Impact Statement/ Report (PEIS/R). The PEIS/R is being prepared in compliance with the National Environmental Policy Act (NEPA) and the California Environmental Quality Act (CEQA).

Firebaugh City Manager Jose Ramirez talks with SJRRP team members Paula Landis, Jason Phillips, and Bill Luce during a public scoping meeting.

Reclamation initiated the NEPA process by issuing a Notice of Intent (NOI) to prepare environmental impact documents and hold public scoping meetings on August 2, 2007. DWR initiated the CEQA process by issuing a Notice of Preparation (NOP) on August 22, 2007. Parties are provided 30 days from the date of receiving the NOP to comment on the Program. The technical review period of the NOP was from August 24 to September 24, 2007. The SJRRP scoping comment period lasted from the issuance date of the NOI until September 21, 2007. Reclamation and DWR received comments from 85 people and organizations including Federal and State agencies, local interest groups, local residents, farmers, landowners, environmental groups, public advocacy groups, Native American community groups, and individuals.

Reclamation and DWR informed groups and individuals about the scoping meetings through a variety of methods:

- Posting the NOI in the Federal Register and the NOP in the State Clearinghouse;
- Paid advertisements in the main sections of the numerous newspapers in the Program area;
- Distribution of a press release to Reclamation's media lists for the Sacramento and San Joaquin areas, which includes all major newspapers, as well as Farm Bureau publications for the counties of San Joaquin, Stanislaus, Merced, Madera, Mariposa, Fresno, Tulare, Kings and Kern, and which also included the California Farm Bureau Federation's *"Ag Alert"* weekly newspaper, the *California Farmer* and the *Capitol Press*;

- Post card notice with details for each of the scoping meetings mailed to the mailing list of approximately 3,800 agencies, organizations, and individuals that have shown interest on the SJRRP or other similar projects in the Program region; and

- Information regarding the scoping meetings on the public web site – **www.restoresjr.net**

In addition to the above outreach, letters were sent to various groups and phone calls were placed to Federal and State elected officials whose districts are within or close to the project area to invite them to the scoping meetings and encourage their members to attend and voice their thoughts and concerns about the SJRRP.

A Public Scoping document with all comments received during the Scoping process was made available to the public in December 2007.

- **Technical Memoranda**
  Numerous Technical Memoranda (TMs) are being developed prior to scheduled release of the SJRRP Draft PEIS/R in February 2009. These TMs are being made available on the Program web site **(www.restoresjr.net)** as they are completed to facilitate early coordination with the Settling Parties, Third Parties, other stakeholders, and interested members of the public regarding initial concepts and approaches under consideration at the time by the Program Team. While the Program Team does not request formal comments on the TMs, all comments received will be considered in refining the concepts and approaches in the TMs to the extent possible during the formation of the Draft PEIS/R.

- **Field Tours**
  A variety of field tours were held in 2007 for the SJRRP. These included:

  - Informational tours for staff of State and Federal legislators were held in the spring. Hosted by Reclamation, these tours were coordinated with FWUA and the San Joaquin River Resource Management Coalition (RMC);

  - Reconnaissance-level tours for Implementing Agency staff and consultant teams were held in the summer to provide an introductory overview of the various river reaches and

SJRRP team members canoed along the river to better understand invasive species challenges.

features. These tours were coordinated by Reclamation in cooperation with FWUA and the RMC; and

- Work Group tours included a one-day survey of invasive plant species and former rock quarries present along Reach 1 of the San Joaquin River. This tour was attended by members of the PMT and the TWGs.

Reclamation Real Estate Specialist Julie Bowen talks with a landowner at a public meeting in Fresno.

- **Landowner Coordination and Outreach**

The vast majority of the San Joaquin River slated for restoration is lined with private property. For example, a preliminary evaluation of private property ownership along a 2,000-foot corridor from Friant Dam to the confluence of the Merced River, and a portion of the Eastside Bypass, revealed more than 1,200 unique property owners, many of which also own the land beneath levees along the San Joaquin River.

SJRRP Landowner Coordinater Craig Moyle welcomes participants to a public landowner meeting.

To engage and gain access to private property for the SJRRP, a Landowner Coordinator has been designated for the Program. This person serves as the primary point of contact for affected landowners and manages distribution, collection, and archival of Temporary Entry Permits (TEP) signed by private property owners. The Landowner Coordinator serves as technical resource to the TWGs for all field activities, notifies landowners of pending field activities, and attends regular meetings of the Resource Management Coalition (RMC).

Developed in close coordination with the RMC, the TEP is a blanket temporary entry request for pre-construction surveys and investigations in support of the SJRRP. The TEP provides, in part, comprehensive liability protection for private property owners while SJRRP representatives are in the field. Public landowner meetings to discuss the TEP and related topics were held during December in Fresno, Firebaugh and Los Banos. Once the TEP is finalized, distribution to landowners will begin.

2008: Future Program Activities

The proposed actions in the Settlement outline how the implementing agencies will achieve the Restoration and Water Management Goals. As part of the Settlement, the Settling Parties developed a detailed timeline for developing and implementing Program improvements.

Schedule and Milestones
The following information highlights upcoming significant milestones in the three stages of the SJRRP.

Stage 1
Stage 1 focuses on program-level planning and environmental review, including formulating and evaluating reasonable alternatives for accomplishing the Restoration and Water Management Goals with a focus on system-wide aspects of implementation. Stage 1 has been initiated and includes the development of a PEIS/R and the identification of significant data needs that will be completed during Stage 2.

Stage 2
Stage 2 commences in October 2009 with the release of Interim Flows and will conclude in December 2013 with the completion of Phase 1 improvements and agreement on operational guidelines. During Stage 2, an Interim Flows program will be implemented to support relevant data collection concerning flows, temperatures, fish needs, seepage losses, recirculation, recapture, and reuse. Stage 2 also includes the reintroduction of spring-run and fall-run Chinook salmon and the implementation of all Phase 1 channel improvements.

Stage 3
The primary activities in Stage 3 include the release of full Restoration Flows from Friant Dam, continued implementation of the Fisheries Management Plan, construction of the remaining Program features that were not Phase 1 priority, and the operation and maintenance of project facilities. The full Restoration Flows shall commence no later than January 1, 2014. Stage 3 will conclude once all activities called for in the Settlement are completed; however, on-going operations and maintenance of facilities and structures will continue indefinitely.

Significant Milestones Timeline

Stage 1 — Pre-Flow Program Planning

2008

May	Initial Programs Alternatives Report
October	Program Alternatives Report
December	Fisheries Management Plan

2009

March	Draft PEIS/R
July	Final PEIS/R
September	ROD/NOD

Stage 2 — Interim Flows, Project Construction, and Salmon Introduction

2009

October	Initiate Interim Flows and Monitoring Program

2012

December	Reintroduce Chinook salmon

2013

December	Complete all Phase 1 priority construction activities

2014

June	Complete Final Interim Flow Study Report

Stage 3 — Full Restoration Flows and Continued Operations

Annual

Restoration Flow Release Schedules

Restoration Goal Progress Reports

Recovered Water Account Progress Reports

Restoration Flow Monitoring Reports

Planned Outreach and Coordination

The SJRRP Team will maintain and build upon the various outreach and coordination activities of 2007. Additional planned activities include weekly coordination meetings with the Restoration Administrator and monthly meetings with the Settling Parties.

Other features include appointment of a Technical Stakeholder Coordinator for the TWGs. This individual will provide outreach support between the TWGs and various stakeholder groups interested in documents developed for use in the eventual Draft PEIS/R. Similar to the TMs, the TWGs will not request formal approval of these documents, but will consider comments to the extent possible during refinement of the concepts and approaches under discussion.

Program Costs and Funding

- **Costs**

  During the Settlement negotiations, several estimates were prepared for implementing the actions described in Paragraph 11 of the Settlement. These estimates ranged between $250 million and $800 million. Early in Stage 1, a more comprehensive assessment of the actions necessary and the related costs will be completed by the Implementing Agencies.

  Once authorized, the Settlement establishes the San Joaquin River Restoration Fund (Fund). Approximately $17 million per year of payments from the Central Valley Project Friant Division would be deposited into the Fund to be available without further appropriations to implement the provisions of the Settlement.

  Funding by the State of California will also support the Settlement. In November 2006, State propositions 84 and 13 were passed by the California voters and should provide about $200 million of State bond funds for projects that will directly contribute to the restoration efforts.

- **Funding**
  Funding for the SJRRP during FY07 and FY08 is provided by the Federal government and the State of California, as summarized below. These funds are used to support Program management and studies for preparation of the Program EIS/R.

Annual Budget

Source	FY 2006/2007	FY 2007/2008
FEDERAL FUNDS		
Reclamation		
Central Valley Project Improvement Act	$3,000,000	$6,500,000*
San Joaquin River Restoration Fund**	0	0
National Marine Fisheries Service		
Protected Resources - salmon	$137,000	0
Federal Sub-total	**$3,137,000**	**$6,500,000**
STATE FUNDS		
Dept. of Water Resources		
Proposition 13	$1,000,000	$2,250,000
Proposition 84	0	$4,250,000
Dept. of Fish and Game		
Proposition 13	$740,000	$2,120,000
Proposition 84	0	$1,200,000
State Sub-total	**$1,740,000**	**$9,820,000**
Total	**$4,877,000**	**$16,320,000**

*Includes funding for FWS and NMFS participation.

**This fund would be authorized under the San Joaquin River Restoration Act, currently House Resolution 4074.

Status of Federal Legislation

In January 2007, Federal legislation was re-introduced by California members of Congress to authorize Federal agencies to implement the Settlement beyond the authority contained in the CVPIA. The San Joaquin River Restoration Act (House Resolution 4074) passed out of the House Committee on Natural Resources in November 2007. Congressman Jim Costa (D-Fresno) is chief House author of the San Joaquin river restoration bill first introduced by Congressman George Radanovich (R-Mariposa) and Senator Dianne Feinstein (D-California) in December 2006. Congressman Costa continues to work with all of the interested parties on implementation of the Water Management Goal and development of a financing strategy that meets Congressional requirements. Further action by the House and Senate is anticipated in 2008.

While authorization is still pending at the time of this annual report, the Department of the Interior is proceeding with environmental review based on current authorities and funding, although timely passage of Congressional legislation will be critical to implementing provisions in the Settlement and maintaining the schedule.

Overview

Chinook Salmon caught off the coast of California near Eureka, CA. *CDFW photo).*

On the west coast of North America, California streams support the southern-most Chinook Salmon runs. Chinook Salmon in California display a wide array of life history patterns that allow them to take advantage of the diverse and variable riverine and ocean environments. Chinook Salmon are “anadromous” fish, migrating upstream as adults to spawn in freshwater streams, and migrating as juveniles downstream to grow and mature in the ocean. The time spent in the ocean and freshwater varies greatly among the various runs. Chinook have been classified into six major groups, or Evolutionarily Significant Units (ESUs) by NOAA Fisheries.

The Fisheries Branch Anadromous Assessment Unit compiles annual population estimates of Chinook Salmon, *Oncorhynchus tshawytscha*. Estimates are based on counts of fish entering hatcheries and migrating past dams, carcass surveys, live fish counts, creel census data, and ground and aerial redd counts.

CDFW Video: Return of Butte Creek spring-run Chinook Salmon, 2018 (YouTube)

Southern Oregon and Northern California Coastal Chinook Salmon

The Southern Oregon and Northern California Coastal Chinook Salmon ESU includes fall-run Chinook Salmon in coastal streams from Cape Blanco in Oregon south to the Klamath River. Southern Oregon and Northern California Coastal Chinook Salmon were proposed for federal listing in 1999, but listing was determined to be "not warranted".

California Coastal Chinook

The California Coastal Chinook Salmon ESU includes all natural spawning populations of Chinook Salmon from rivers and streams south of the Klamath River to the Russian River.

Due to concern over depressed population sizes relative to historical abundance, California Coastal Chinook Salmon was federally listed as threatened in 1999.

- CDFW Plan for Assessment and Management of Coastal Chinook Salmon (PDF)

Upper Klamath - Trinity River Chinook Salmon

Within the Upper Klamath - Trinity River ESU, fall and spring Chinook Salmon spawn and rear in the Trinity River and in the Klamath River. In the Trinity River, Chinook Salmon spawn in the mainstem (with their upstream distribution limited by Lewiston Dam), the north and south forks, Hayfork Creek, New River, and Canyon Creek. In the Klamath River, Chinook Salmon once ascended into Upper Klamath Lake, Oregon, to spawn in the major tributaries to the lake

(Williamson, Sprague, and Wood Rivers), but access to this region was blocked by Copco Dam, built in 1917. Today Chinook Salmon are known to spawn in the mainstem Klamath River, Bogus Creek, Shasta River, Scott River, Indian Creek, Elk Creek, Clear Creek, Salmon River, Bluff Creek, Blue Creek, and the lower reaches of some of the other smaller tributaries to the mainstem river.

The Upper Klamath - Trinity River Chinook Salmon ESU was proposed for federal listing in 1998, but listing was determined to be "not warranted".

Central Valley Fall and late-fall-run Chinook Salmon

Four distinct runs of Chinook Salmon spawn in the Sacramento-San Joaquin River system, named for the season when the majority of the run enters freshwater as adults. Fall-run Chinook Salmon migrate upstream as adults from July through December and spawn from early October through late December. The timing of runs varies from stream to stream. Late-fall-run Chinook Salmon migrate into the rivers from mid-October through December and spawn from January through mid-April. The majority of young salmon of these races migrate to the ocean during the first few months following emergence, although some may remain in freshwater and migrate as yearlings.

Fall-run Chinook Salmon are currently the most abundant of the Central Valley races, contributing to large commercial and recreational fisheries in the ocean and popular sport fisheries in the freshwater streams. Fall-run Chinook Salmon are raised at five major Central Valley hatcheries which release more than 32 million smolts each year. Due to concerns over population size and hatchery influence, Central Valley fall and late-fall-run Chinook Salmon are a Species of Concern under the federal Endangered Species Act.

Central Valley spring-run Chinook Salmon

Four distinct runs of Chinook Salmon spawn in the Sacramento-San Joaquin River system, named for the season when the majority of the run enters freshwater as adults. Spring-run Chinook Salmon enter the Sacramento River from late March through September. Adults hold in cool water habitats through the summer, then spawn in the fall from mid-August through

early October. Spring run juveniles migrate soon after emergence as young-of-the-year, or remain in freshwater and migrate as yearlings.

Spring-run Chinook Salmon were historically the most abundant race in the Central Valley. Now only remnant runs remain in Butte, Mill, Deer, Antelope, and Beegum Creeks, tributaries to the Sacramento River. In the mainstem Sacramento River and the Feather River, early-running Chinook Salmon occur, but significant hybridization with fall run has occurred. The Status Review of Spring-Run Chinook Salmon in Sacramento River Drainage (PDF) was prepared in 1998. Due to the small number of non-hybridized populations remaining and low population sizes, Central Valley spring-run Chinook Salmon were listed as threatened under both the state and federal endangered species acts in 1999.

Annual reports to the Fish and Game Commission on Central Valley spring-run Chinook:

- 2002-2003 BIENNIAL Report (PDF)
- 2001 ANNUAL Report (PDF)
- 2000 ANNUAL Report (PDF)
- 2000 ANNUAL Report Eratta (TXT)

Sacramento River winter-run Chinook Salmon

Four distinct runs of Chinook salmon spawn in the Sacramento-San Joaquin River system, named for the season when the majority of the run enters freshwater as adults. Adult Sacramento River (SR) winter-run Chinook Salmon pass under the Golden Gate Bridge from November through May, and pass into the Sacramento River from December through early August. SR winter-run Chinook Salmon spawn in the upper mainstem Sacramento River from mid-April through August. Fry and smolts emigrate downstream from July through March through the Sacramento River, reaching the Delta from September through June.

Two biennial reports to the Fish and Game Commission on winter-run Chinook Salmon:

- 2002-2003 (PDF)
- 2000-2001 (PDF)
- Winter-run Chinook Salmon reintroduction plan for Battle Creek (PDF)

Historically, winter-run Chinook Salmon spawned in the upper reaches of Sacramento River tributaries, including the McCloud, Pit, and Little Sacramento Rivers. Shasta and Keswick dams now block access to the historic spawning areas. Winter-run Chinook, however, were able to take advantage of cool summer water releases downstream of Keswick Dam. In the 1940s and 1950s the population recovered. However, beginning in 1970, the population experienced a dramatic decline — a low of approximately 200 spawners by the 1980s. The run was classified as endangered under the state California Endangered Species Act in 1989, and as endangered under the federal Endangered Species Act in 1994.

Special Animals List xvii

Special Animals

"Special Animals" is a broad term used to refer to all the animal taxa tracked by the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB), regardless of their legal or protection status. This list is also referred to as the list of "species at risk" or "special status species." The Special Animals List includes species, subspecies, Distinct Population Segments (DPS), or Evolutionarily Significant Units (ESU) where at least one of the following conditions applies:

- Officially listed or proposed for listing under state and/or federal endangered species acts
- Taxa considered by the Department of Fish and Wildlife to be a Species of Special Concern (SSC)
- Taxa which meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the California Environmental Quality Act Guidelines
- Taxa that are biologically rare, very restricted in distribution, or declining throughout their range, but not currently threatened with extirpation
- Population(s) in California that may be peripheral to the major portion of a taxon's range but are threatened with extirpation in California
- Taxa closely associated with a habitat that is declining in California at a significant rate (e.g., wetlands, riparian, vernal pools, old growth forests, desert aquatic systems, native grasslands, valley shrubland habitats, etc.)
- Taxa designated as a special status, sensitive, or declining species by other state or federal agencies, or a non-governmental organization (NGO), and determined by the CNDDB to be rare, restricted, declining, or threatened across their range in California

The Special Animals List contains taxa that are actively inventoried, tracked, and mapped by the CNDDB, as well as taxa for which mapped data may not yet be incorporated into CNDDB user products. For the latter taxa, information at the county

and 7.5-minute USGS quadrangle level can be accessed via the CNDDB QuickView Tool.

Taxa with a "Yes" in the "End Notes?" column have additional information in the End Notes section at the back of the list.

Additional information about the California Natural Diversity Database is available on the CNDDB website.

Information on other CDFW resource management programs is available on the Department's Conservation and Management of Wildlife and Habitat website.

The CDFW Wildlife Diversity Program provides additional information on wildlife habitat, threats, and survey guidelines.

NatureServe Element Ranking

The California Natural Diversity Database program is a member of the NatureServe Network of natural heritage programs and uses the same conservation status methodology as other network programs. The ranking system was originally developed by The Nature Conservancy and is now maintained and recently revised by NatureServe. It includes a **Global rank** (G-rank), describing the status for a given taxon over its entire distribution, and a **State rank** (S-rank), describing the status for the taxon over its state distribution. For subspecies and varieties, there is also a "T" rank describing the global rank for the infraspecific taxon. The next page of this document details the criteria used to assign element ranks, from G1 to G5 for the Global rank and from S1 to S5 for the State rank. Procedurally, state programs such as the CNDDB develop the State ranks. The Global ranks are determined collaboratively among the Heritage Programs for the states/provinces containing the species. NatureServe then checks for consistency and logical errors at the national level. Because the units of conservation may include non-taxonomic biological entities such as populations or ecological communities, NatureServe refers to the targets of biological conservation as "elements" rather than taxa.

An element rank is assigned using standard criteria and rank definitions. This standardization makes the ranks comparable between organisms and across political boundaries. NatureServe has developed a "rank calculator" to help increase repeatability and transparency of the ranking process. The three main categories that are taken into consideration when assigning an element rank are rarity, threats, and trends. Within these three categories, various factors are considered, including:

- Range extent, area of occupancy, population size, total number of occurrences, and number of good occurrences (ranked A or B). Environmental specificity can also be used if other information is lacking.
- Overall threat impact as well as intrinsic vulnerability (if threats are unknown).
- Long-term and short-term trends.

Detailed information on this element ranking methodology can be found on the NatureServe Conservation Status Assessment website.

Listed below are definitions for interpreting global and state conservation status ranks. An element's ranking status may be adjusted up or down depending upon the considerations above.

Global Ranking

The global rank (G-rank) is a reflection of the overall status of an element throughout its global range.

- **GX: Presumed Extinct** – Not located despite intensive searches and virtually no likelihood of rediscovery.
- **GH: Possibly Extinct** – Known from only historical occurrences but still some hope of rediscovery. Examples of evidence include (1) that a species has not been documented in approximately 20-40 years despite some searching and/or some evidence of significant habitat loss or degradation; (2) that a species has been searched for unsuccessfully, but not thoroughly enough to presume that it is extinct throughout its range.
- **G1: Critically Imperiled** – At very high risk of extinction due to very restricted range, very few populations or occurrences, very steep declines, very severe threats, or other factors.
- **G2: Imperiled** – At high risk of extinction due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- **G3: Vulnerable** – At moderate risk of extinction due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- **G4: Apparently Secure** – At fairly low risk of extinction due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.

- **G5: Secure** – At very low risk of extinction due to a very extensive range, abundant populations or occurrences, and little to no concern from declines or threats.
- **GNR: Unranked** – Global rank not yet assessed.

State Ranking

The state rank (S-rank) is assigned in much the same way as the global rank, but state ranks refer to the imperilment status only within California's state boundaries.

- **SX: Presumed Extirpated** – Species is believed to be extirpated from the state Not located despite intensive searches of historical sites and other appropriate habitat, and virtually no likelihood that it will be rediscovered
- **SH: Possibly Extirpated** – Known from only historical records but still some hope of rediscovery. There is evidence that the species may no longer be present in the state, but not enough to state this with certainty. Examples of such evidence include (1) that a species has not been documented in approximately 20-40 years despite some searching and/or some evidence of significant habitat loss or degradation; (2) that a species has been searched for unsuccessfully, but not thoroughly enough to presume that it is no longer present in the jurisdiction.
- **S1: Critically Imperiled** – At very high risk of extirpation in the state due to very restricted range, very few populations or occurrences, very steep declines, severe threats, or other factors.
- **S2: Imperiled** – At high risk of extirpation in the state due to restricted range, few populations or occurrences, steep declines, severe threats, or other factors.
- **S3: Vulnerable** – At moderate risk of extirpation in the state due to a fairly restricted range, relatively few populations or occurrences, recent and widespread declines, threats, or other factors.
- **S4: Apparently Secure** – At a fairly low risk of extirpation in the state due to an extensive range and/or many populations or occurrences, but with possible cause for some concern as a result of local recent declines, threats, or other factors.

- **S5: Secure** – At very low or no risk of extirpation in the state due to a very extensive range, abundant populations or occurrences, and little to no concern from declines or threats.
- **SNR: Unranked** – State rank not yet assessed.

Additional Notes on NatureServe Ranks

- Rank Qualifiers
    1. Taxa which are subspecies receive a taxon rank (**T-rank**) in addition to the G-rank. Whereas the G-rank reflects the condition of the entire species, the T-rank reflects the global status of just the subspecies. For example, the Point Reyes mountain beaver, *Aplodontia rufa* ssp. *phaea*, is ranked G5T2. The G-rank refers to the whole species, i.e., *Aplodontia rufa*; the T-rank refers only to the global condition of ssp. *phaea*.
    2. **C = Captive or Cultivated Only** — taxon at present is presumed or possibly extinct or eliminated in the wild across their entire native range but is extant in cultivation, in captivity, as a naturalized population (or populations) outside their native range, or as a reintroduced population not yet established. The “C” modifier is only used at a global level and not at a state level. Possible ranks are GXC or GHC.
    3. **Q = Questionable taxonomy** that may reduce conservation priority — Distinctiveness of this entity as a taxon at the current level is questionable; resolution of this uncertainty may result in change from a species to a subspecies or hybrid, or inclusion of this taxon in another taxon, with the resulting taxon having a lower-priority (numerically higher) conservation status rank. The “Q” modifier is only used at the global level, not at the state level.
- Uncertainty about the status of an element is expressed in two major ways:
    1. By expressing the ranks as a **range** of values: e.g., S2S3 indicates the rank is somewhere between S2 and S3.
    2. By adding a “**?**” to the rank: e.g., S2?; this represents more certainty than S2S3, but less certainty than S2.

- Other considerations used when ranking a species include the pattern of distribution of the element on the landscape, fragmentation of the population, and historical extent as compared to its modern range. It is important to take an overall view when ranking sensitive elements rather than simply counting element occurrences.

Animal Element Occurrences and Mapping

What is an Element Occurrence?

An Element Occurrence (EO) is a location where a given element has been documented to occur. It is a concept developed and applied within the NatureServe natural heritage network. An EO is not a population, but may indicate that a population is present in that area; likewise, a single population may be represented by more than one EO. An EO is based upon the source documents available at the time of mapping. Both the mapped feature and the text portion of EOs are updated as new information becomes available.

Element Occurrence Definitions Vary by Taxa

The EO definition refers to the types of information mapped. For most animal taxa, the CNDDB is interested in information that indicates the presence of a resident population. However, for many migratory birds, the CNDDB only tracks detections of nest sites or behaviors indicating reproduction is occurring at the site. Details about avian detections are available in the Submitting Avian Detections document. For other taxa where CNDDB tracks only a certain part of the range or life history, the area or life stage is indicated on the list under the “Comment” column.

Mapping Conventions

Information in CNDDB is mapped to balance precision and uncertainty, based upon the source materials used to determine the location of the Element Occurrence. Data with precise location information are mapped with 80m-radius circles or specific polygons. Data with vague location information are mapped with non-specific circular features or non-specific polygons. Non-specific features indicate that the species was found somewhere within the mapped area, but the exact location was unknown. Generally, observations/collections within ¼ mile and/or within continuous habitat are combined into a single EO.

Taxonomic Standards

Taxonomic References and Sources of Additional Information

The CNDDB follows current published taxonomy for animals as recognized by the scientific organizations listed below. The CNDDB reviews publications that propose new taxonomy and nomenclature for CNDDB-tracked species and evaluates whether these proposals are recognized by the larger scientific community. The CNDDB makes every effort to use the best available science in the taxonomy used, but different experts may recognize different names for some time after a taxonomic change is proposed. In these cases, the CNDDB will generally use the preexisting nomenclature until a change is formally recognized beyond the initial publication. In addition, the CNDDB recognizes some taxa identified by experts on the California fauna where these taxa may not be recognized by national biological societies. Generally, the taxonomy used by NatureServe is followed, with additional evaluation of taxonomy from the following sources:

- Reptiles and amphibians:
    - The Center for North American Herpetology
    - The Society for the Study of Amphibians and Reptiles
- Fishes:
    - Fricke, R., Eschmeyer, W. N. & R. van der Laan (eds) 2022. Eschmeyer's catalog of fishes: genera, species, references. Electronic version.

Listing and Special Status Information

CALIFORNIA ENDANGERED SPECIES ACT (CESA) LISTING CODES: The listing status of each species is current as of the date of this list. The most current changes in listing status will be found in the "Endangered and Threatened Animals List," which the CNDDB updates and issues quarterly. Additional information can be found on the California Fish and Game Commission CESA web page.

- SE State listed as endangered
- ST State listed as threatened
- SC State candidate for listing as endangered or threatened

FEDERAL ENDANGERED SPECIES ACT (ESA) LISTING CODES: The listing status is current as of the date of this list. The most current changes in listing status will be found in the "Endangered and Threatened Animals List," which the CNDDB updates and issues quarterly. Federal listing actions are published in the Federal Register.

- FE Federally listed as endangered
- FT Federally listed as threatened
- FPE Federally proposed for listing as endangered
- FPT Federally proposed for listing as threatened
- FC Federal candidate species (former Category 1 candidates)

Section 4(c)(2)(A) of the Act requires the U.S. Fish and Wildlife Service and the National Marine Fisheries Service to conduct a review of listed species at least once every five years. Five year reviews are made available by the U.S. Fish and Wildlife Service and the National Marine Fisheries Service.

OTHER STATUS CODES: The status of species on the Special Animals List according to other conservation organizations is provided below. Taxa on these lists are reviewed for inclusion in the CNDDB Special Animals List, but are not automatically included. For example, taxa that are regionally rare within a portion of California may not be included, because they may be of lesser conservation concern across their full range in California.

- **American Fisheries Society (AFS):**
    1. Designations for freshwater and diadromous species were taken from the paper:
        - Jelks, H.L., S.J. Walsh, N.M. Burkhead, S. Contreras-Balderas, E. Díaz-Pardo, D.A. Hendrickson, J. Lyons, N.E. Mandrak, F. McCormick, J.S. Nelson, S.P. Platania, B.A. Porter, C.B. Renaud, J.J. Schmitter-Soto, E.B. Taylor, and M.L. Warren, Jr. 2008. Conservation status of imperiled North American freshwater and diadromous fishes. Fisheries 33(8):372-407.
    2. Designations for marine and estuarine species were taken from the paper:
        - Musick, J.A. et al. 2000. Marine, Estuarine, and Diadromous Fish Stocks at Risk of Extinction in North America (Exclusive of Pacific Salmonids). Fisheries 25(11):6-30.
- **Bureau of Land Management (BLM) Sensitive:** Bureau of Land Management Manual §6840 states that "BLM sensitive species are: (1) species listed or proposed for listing under the Endangered Species Act (ESA), and (2) species requiring special management consideration to promote their conservation and reduce the likelihood and need for future listing under the ESA, which are designated as Bureau sensitive by the State Director(s). All Federal candidate species, proposed species, and delisted species in the 5 years following delisting will be conserved as Bureau sensitive species." Downloadable copies of the California-BLM Special Status Animals and Sensitive Species Lists are available.
- **California Department of Forestry and Fire Protection (CDF) Sensitive:** California Department of Forestry and Fire Protection classifies "sensitive species" as those species that warrant special protection during timber operations. The list of "sensitive species" is given in §895.1 (Definitions) of the California Forest Practice Rules.
- **CDFW Fully Protected:** The classification of Fully Protected was the State's initial effort to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, amphibians and reptiles, birds, and mammals. Most of the species on these lists have

subsequently been listed under the California and/or federal endangered species acts; the exceptions are white-tailed kite, golden eagle, trumpeter swan, northern elephant seal, and ringtail cat. The white-tailed kite, golden eagle, and ringtail cat are tracked in the CNDDB. The trumpeter swan and northern elephant seal are not tracked by the CNDDB. The Fish and Game Code sections dealing with Fully Protected species state that these species "...may not be taken or possessed at any time and no provision of this code or any other law shall be construed to authorize the issuance of permits or licenses to take any fully protected" species, although take may be authorized for necessary scientific research. This language arguably makes the "Fully Protected" designation the strongest and most restrictive regarding the "take" of these species. In 2003, code sections dealing with Fully Protected species were amended to allow the Department to authorize take resulting from recovery activities for state-listed species. More information on Fully Protected species and the take provisions can be found in the Fish and Game Code: birds at §3511, mammals at §4700, reptiles and amphibians at §5050, and fish at §5515). Additional information on Fully Protected fish can be found in the California Code of Regulations, Title 14, Division 1, Subdivision 1, Chapter 2, Article 4, §5.93. The category of Protected Amphibians and Reptiles in Title 14 has been repealed. Senate Bill no. 147 (July 2023) removed American peregrine falcon, brown pelican, and thicktail chub as fully protected species under the Fish & Game Code because they have been delisted-recovered under CESA or are considered extinct.

- **CDFW Species of Special Concern (SSC):** It is the goal and responsibility of the Department of Fish and Wildlife to maintain viable populations of all native species. To this end, the Department has designated certain vertebrate species as “Species of Special Concern” because declining population levels, limited ranges, and/or continuing threats have made them vulnerable to extinction. The goal of designating SSCs is to halt or reverse their decline by calling attention to their plight and addressing the issues of concern early enough to secure their long-term viability. Not all SSCs have declined equally; some species may be just starting to decline, while others may have already reached the point where they

meet the criteria for listing as a threatened or endangered under state and/or federal endangered species acts.

- **CDFW Watch List Species:** Watch list species are taxa that were previously SSCs but do not currently meet SSC criteria, and for which there is concern and a need for additional information to clarify status.
- **International Union for Conservation of Nature (IUCN) Red List of Threatened Species:** The IUCN assesses, on a global scale, the conservation status of species, subspecies, varieties, and even selected subpopulations in order to highlight taxa threatened with extinction, and therefore promote their conservation. Detailed information is available from the IUCN Red List Online. When the CNDDB tracks a subunit (such as subspecies, DPS, or ESU) that does not have an IUCN status, the CNDDB either:
    1. Applies the IUCN status of the parent entity to the CNDDB element if the IUCN status is Critical (CR), Endangered, (EN), or Vulnerable (VU)
    2. Does not apply the IUCN status of the parent entity to the CNDDB element if the IUCN status is Near Threatened (NT), Least Concern (LC), or Data Deficient (DD).
- **Marine Mammal Commission (MMC) Marine Mammal Species of Special Concern:** Section 202 of the Marine Mammal Protection Act (MMPA) directs the MMC, in consultation with its Committee of Scientific Advisors, to make recommendations to the Department of Commerce, the Department of the Interior, and other federal agencies on research and management actions needed to conserve species of marine mammals. To meet this charge, the Commission devotes special attention to particular species and populations that are vulnerable to various types of human-related activities, impacts, and contaminants. Such species may include marine mammals listed as endangered or threatened under the federal ESA or as depleted under the MMPA. In addition, the Commission often directs special attention to other species or populations of marine mammals not so listed whenever special conservation challenges arise that may affect them. More information on the MMPA and the list of species is

available from the MMC Marine Mammal Species and Populations of Concern website.

- **United States Forest Service (USFS) Sensitive:** The USDA Forest Service defines sensitive species as plant and animal species identified by a regional forester that are not listed or proposed for listing under the federal Endangered Species Act for which population viability is a concern, as evidenced by significant current or predicted downward trends in population numbers or density, or significant current or predicted downward trends in habitat capability that would reduce a species' existing distribution. Regional Foresters shall identify sensitive species occurring within the region. More information on California species can be found on the Pacific Southwest Region (Region 5) Plants and Animals site, including links to download the Regional Forester's Sensitive Animal Species List.
- **U.S. Fish and Wildlife Service (USFWS) Birds of Conservation Concern:** The goal of the Birds of Conservation Concern 2021 report is to accurately identify the migratory and non-migratory bird species (beyond those already designated as federally threatened or endangered) that represent highest conservation priorities and draw attention to species in need of conservation action.

Table of Special Status Code Abbreviations

Organization	Abbreviation
American Fisheries Society - Endangered	AFS_EN
American Fisheries Society - Threatened	AFS_TH

Special Animals List

(929 taxa)

Last updated January 3, 2025

The remainder of this document contains the CNDDB's Special Animals List, current as of the date on the title page of this document.

Invertebrates

PELECYPODA (clams and mussels)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Anodonta californiensis	California floater		G3	S2?	None	None	USFS:S	Yes	
Anodonta oregonensis	Oregon floater		G5	S2?	None	None	IUCN:LC	Yes	
Gonidea angulata	western ridged mussel		G3	S2	None	None	IUCN:VU	Yes	
Margaritifera falcata	western pearlshell		G3G4	S1S2	None	None	IUCN:NT	Yes	
Pisidium ultramontanum	montane peaclam		G1	S1	None	None	IUCN:VU USFS:S	Yes	

GASTROPODA (snails, slugs, and abalones)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Ammonitella yatesii	tight coin (=Yates' snail)		G1	S1	None	None	IUCN:VU	Yes	
Ancotrema voyanum	hooded lancetooth		G1G2	S1S2	None	None		Yes	
Assiminea infima	Badwater snail		G1	S1	None	None	IUCN:VU	Yes	
Binneya notabilis	Santa Barbara shelled slug		G1	S1	None	None	IUCN:DD	Yes	
Colligyrus convexus	canary duskysnail		G2	S2	None	None		Yes	
Eremarionta immaculata	white desertsnail		G1	S1	None	None	IUCN:VU	Yes

Fratercula cirrhata	tufted puffin	Nesting colony	G5	S1S2	None	None	CDFW:SSC IUCN:LC USFWS:BCC	Yes	
Ptychoramphus aleuticus	Cassin's auklet	Nesting colony	G4	S3	None	None	CDFW:SSC IUCN:NT USFWS:BCC	No	
Synthliboramphus scrippsi	Scripps's murrelet	Nesting colony	G2	S2	None	Threatened	BLM:S IUCN:VU USFWS:BCC	Yes	Yes

CUCULIDAE (cuckoos and relatives)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Coccyzus americanus occidentalis	western yellow-billed cuckoo	Nesting	G5T2T3	S1	Threatened	Endangered	BLM:S USFS:S	Yes	

STRIGIDAE (owls)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Asio flammeus	short-eared owl	Nesting	G5	S2	None	None	CDFW:SSC IUCN:LC USFWS:BCC	Yes	
Asio otus	long-eared owl	Nesting	G5	S3?	None	None	CDFW:SSC IUCN:LC USFWS:BCC	Yes	
Athene cunicularia	burrowing owl	Burrow sites & some wintering sites	G4	S2	None	Candidate Endangered	BLM:S CDFW:SSC IUCN:LC USFWS:BCC	Yes	Yes
Micrathene whitneyi	elf owl	Nesting	G5	S1	None	Endangered	BLM:S IUCN:LC	Yes	
Psiloscops flammeolus	flammulated owl	Nesting	G4	S2S4	None	None	IUCN:LC USFWS:BCC	Yes	
Strix nebulosa	great gray owl	Nesting	G5	S1	None	Endangered	CDF:S IUCN:LC USFS:S	Yes	
Strix occidentalis caurina	northern spotted owl		G3G4T3	S2	Threatened	Threatened	CDF:S	No	Yes

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Strix occidentalis occidentalis	California spotted owl		G3G4T2T3	S2	None	None	BLM:S CDFW:SSC USFS:S USFWS:BCC	No	Yes

APODIDAE (swifts)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Chaetura vauxi	Vaux's swift	Nesting	G5	S3	None	None	CDFW:SSC IUCN:LC USFWS:BCC	No	
Cypseloides niger	black swift	Nesting	G4	S3	None	None	CDFW:SSC IUCN:VU USFWS:BCC	Yes	

TROCHILIDAE (hummingbirds)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Calypte costae	Costa's hummingbird	Nesting	G5	S4	None	None	IUCN:LC USFWS:BCC	No	
Selasphorus rufus	rufous hummingbird	Nesting	G4	S1S2	None	None	IUCN:NT USFWS:BCC	No	

PICIDAE (woodpeckers)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Colaptes chrysoides	gilded flicker		G4	S2	None	Endangered	BLM:S IUCN:LC USFWS:BCC	Yes	
Melanerpes lewis	Lewis' woodpecker	Nesting	G4	S4	None	None	IUCN:LC USFWS:BCC	Yes	
Melanerpes uropygialis	Gila woodpecker		G5	S2	None	Endangered	BLM:S IUCN:LC USFWS:BCC	Yes	
Picoides arcticus	black-backed woodpecker		G5	S2	None	None	IUCN:LC	Yes	

TYRANNIDAE (tyrant flycatchers)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Contopus cooperi	olive-sided flycatcher	Nesting	G4	S3	None	None	CDFW:SSC IUCN:NT USFWS:BCC	Yes	
Empidonax traillii	willow flycatcher	Nesting	G5	S3	None	Endangered	IUCN:LC USFS:S	Yes	Yes
Empidonax traillii brewsteri	little willow flycatcher	Nesting	G5T3T4	S3	None	Endangered		Yes	Yes
Empidonax traillii extimus	southwestern willow flycatcher	Nesting	G5T2	S3	Endangered	Endangered		Yes	Yes
Myiarchus tyrannulus	brown-crested flycatcher	Nesting	G5	S3	None	None	CDFW:WL IUCN:LC	Yes	
Pyrocephalus rubinus	vermilion flycatcher	Nesting	G5	S2S3	None	None	CDFW:SSC IUCN:LC	Yes	

LANIIDAE (shrikes)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Lanius ludovicianus	loggerhead shrike	Nesting	G4	S4	None	None	CDFW:SSC IUCN:NT	Yes	
Lanius ludovicianus anthonyi	Island loggerhead shrike		G4T1	S1	None	None	CDFW:SSC	No	
Lanius ludovicianus mearnsi	San Clemente loggerhead shrike		G4T1Q	S2	Endangered	None	CDFW:SSC	Yes	Yes

VIREONIDAE (vireos)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Vireo bellii arizonae	Arizona Bell's vireo	Nesting	G5T4	S3	None	Endangered	BLM:S	Yes	Yes
Vireo bellii pusillus	least Bell's vireo	Nesting	G5T2	S3	Endangered	Endangered		Yes	Yes
Vireo huttoni unitti	Catalina Hutton's vireo		G5T2?	S2	None	None	CDFW:SSC	No	
Vireo vicinior	gray vireo	Nesting	G5	S2	None	None	BLM:S CDFW:SSC IUCN:LC USFS:S	Yes	

CORVIDAE (jays, crows, and magpies)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Aphelocoma californica cana	Eagle Mountain scrub-jay		G5T3	S3	None	None	CDFW:WL	No	

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Aphelocoma insularis	Island scrub-jay		G1	S1	None	None	IUCN:NT USFWS:BCC	No	
Pica nuttalli	yellow-billed magpie	Nesting & communal roosts	G3G4	S3S4	None	None	IUCN:VU USFWS:BCC	No	

ALAUDIDAE (larks)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Eremophila alpestris actia	California horned lark		G5T4Q	S4	None	None	CDFW:WL IUCN:LC	Yes	

HIRUNDINIDAE (swallows)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Progne subis	purple martin	Nesting	G5	S3	None	None	CDFW:SSC IUCN:LC	Yes	
Riparia riparia	bank swallow	Nesting	G5	S3	None	Threatened	BLM:S IUCN:LC	Yes	

PARIDAE (titmice and relatives)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Poecile atricapillus	black-capped chickadee		G5	S3	None	None	CDFW:WL IUCN:LC	No	

TROGLODYTIDAE (wrens)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Campylorhynchus brunneicapillus sandiegensis	coastal cactus wren	San Diego & Orange Counties only	G5T3Q	S2	None	None	CDFW:SSC USFS:S USFWS:BCC	Yes	Yes
Cistothorus palustris clarkae	Clark's marsh wren		G5T2	S2	None	None	CDFW:SSC	No	
Thryomanes bewickii leucophrys	San Clemente Bewick's wren		G5TX	SX	None	None	CDFW:SSC	No	

POLIOPTILIDAE (gnatcatchers)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Polioptila californica californica	coastal California gnatcatcher		G4G5T3Q	S2	Threatened	None	CDFW:SSC	Yes	Yes
Polioptila melanura	black-tailed gnatcatcher		G5	S3S4	None	None	CDFW:WL IUCN:LC	Yes	

MIMIDAE (mockingbirds and thrashers)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Toxostoma bendirei	Bendire's thrasher		G4	S2	None	None	BLM:S CDFW:SSC IUCN:VU USFWS:BCC	Yes	
Toxostoma crissale	Crissal thrasher		G5	S2	None	None	BLM:S CDFW:SSC IUCN:LC	Yes	

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Toxostoma lecontei	Le Conte's thrasher		G4	S3	None	None	BLM:S CDFW:SSC IUCN:LC USFWS:BCC	Yes	Yes

PASSERELLIDAE (sparrows)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Aimophila ruficeps canescens	southern California rufous-crowned sparrow		G5T3	S4	None	None	CDFW:WL	Yes	
Aimophila ruficeps obscura	Santa Cruz Island rufous-crowned sparrow		G5T2	S2	None	None	CDFW:SSC	No	
Ammodramus savannarum	grasshopper sparrow	Nesting	G5	S3	None	None	CDFW:SSC IUCN:LC	Yes	
Artemisiospiza belli belli	Bell's sparrow		G5T2T3	S3	None	None	CDFW:WL	Yes	
Artemisiospiza belli clementeae	San Clemente Bell's sparrow		G5T2Q	S2	Delisted	None	CDFW:SSC	Yes	Yes
Junco hyemalis caniceps	gray-headed junco	Nesting	G5T5	S1	None	None	CDFW:WL	Yes	
Melospiza melodia graminea	Channel Island song sparrow		G5T1	S1	None	None	CDFW:SSC USFWS:BCC	Yes	Yes

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Melospiza melodia maxillaris	Suisun song sparrow		G5T3	S2	None	None	CDFW:SSC	Yes	
Melospiza melodia pop. 1	song sparrow ("Modesto" population)		G5T3?Q	S3?	None	None	CDFW:SSC	Yes	
Melospiza melodia pusillula	Alameda song sparrow		G5T2T3	S2	None	None	CDFW:SSC USFWS:BCC	Yes	
Melospiza melodia samuelis	San Pablo song sparrow		G5T2	S2	None	None	CDFW:SSC USFWS:BCC	Yes	
Melozone aberti	Abert's towhee		G4	S4	None	None	IUCN:LC	No	
Melozone crissalis eremophilus	Inyo California towhee		G4G5T2	S2	Threatened	Endangered		Yes	Yes
Passerculus sandwichensis alaudinus	Bryant's savannah sparrow		G5T3	S3	None	None	CDFW:SSC	No	
Passerculus sandwichensis beldingi	Belding's savannah sparrow		G5T3	S3	None	Endangered	USFWS:BCC	Yes	
Passerculus sandwichensis rostratus	large-billed savannah sparrow	Wintering	G5T2T3Q	S2	None	None	CDFW:SSC	No	
Pipilo maculatus clementae	San Clemente spotted towhee		G5T1T2	S3	None	None	CDFW:SSC	No	
Pooecetes gramineus affinis	Oregon vesper sparrow	Wintering	G5T2	S2	None	None	CDFW:SSC USFWS:BCC	No	

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Spizella breweri	Brewer's sparrow	Nesting	G5	S4	None	None	IUCN:LC	Yes	

ICTERIIDAE (yellow-breasted chats)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Icteria virens	yellow-breasted chat	Nesting	G5	S4	None	None	CDFW:SSC IUCN:LC	Yes	

ICTERIDAE (blackbirds)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Agelaius phoeniceus aciculatus	Kern red-winged blackbird		G5T1	S1	None	None	CDFW:SSC	No	
Agelaius tricolor	tricolored blackbird	Nesting colony	G1G2	S2	None	Threatened	BLM:S CDFW:SSC IUCN:EN USFWS:BCC	Yes	
Xanthocephalus xanthocephalus	yellow-headed blackbird	Nesting	G5	S3	None	None	CDFW:SSC IUCN:LC	Yes	

PARULIDAE (wood-warblers)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Geothlypis trichas sinuosa	saltmarsh common yellowthroat		G5T3	S3	None	None	CDFW:SSC USFWS:BCC	Yes	Yes

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Leiothlypis luciae	Lucy's warbler	Nesting	G5	S3	None	None	BLM:S CDFW:SSC IUCN:LC	Yes	
Leiothlypis virginiae	Virginia's warbler	Nesting	G5	S2	None	None	CDFW:WL IUCN:LC USFWS:BCC	Yes	
Setophaga petechia	yellow warbler	Nesting	G5	S3	None	None	CDFW:SSC IUCN:LC	Yes	Yes
Setophaga petechia sonorana	Sonoran yellow warbler	Nesting	G5T2T3	S2	None	None	CDFW:SSC	Yes	Yes

CARDINALIDAE (cardinals)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Cardinalis cardinalis	northern cardinal		G5	S1	None	None	CDFW:WL IUCN:LC	Yes	
Piranga flava	hepatic tanager	Nesting	G5	S1	None	None	CDFW:WL IUCN:LC	Yes	
Piranga rubra	summer tanager	Nesting	G5	S1	None	None	CDFW:SSC IUCN:LC	Yes	

FRINGILLIDAE (finches and relatives)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Spinus lawrencei	Lawrence's goldfinch	Nesting	G3G4	S4	None	None	IUCN:LC USFWS:BCC	Yes	

Mammals

SORICIDAE (shrews)

Scientific Name	Common Name	Comments	Global Rank	State Rank	ESA	CESA	Other Status	Records in CNDDB?	End Notes?
Sorex lyelli	Mount Lyell shrew		G3G4	S3S4	None	None	CDFW:SSC IUCN:LC	Yes	
Sorex ornatus relictus	Buena Vista Lake ornate shrew		G5T1	S1	Endangered	None	CDFW:SSC	Yes	
Sorex ornatus salarius	Monterey shrew		G5T1T2	S1S2	None	None	CDFW:SSC	Yes	
Sorex ornatus salicornicus	southern California saltmarsh shrew		G5T1?	S1	None	None	CDFW:SSC	Yes	
Sorex ornatus sinuosus	Suisun shrew		G5T1T2Q	S1S2	None	None	CDFW:SSC	Yes	
Sorex ornatus willetti	Santa Catalina shrew		G5T1	S1	None	None	CDFW:SSC	Yes	
Sorex vagrans halicoetes	salt-marsh wandering shrew		G5T1	S1	None	None	CDFW:SSC	Yes	
Sorex vagrans paludivagus	Monterey vagrant shrew		G5T1	S2	None	None		Yes	

TALPIDAE (moles)

End Notes

Invertebrates

GASTROPODA (snails, slugs, and abalones)

Prophysaon sp. 1

Klamath taildropper

1) This entity is known to be unique morphologically and genetically (Frest & Johannes 2000, Wilke & Duncan 2004, Roth & Sadeghian 2006), but has not been formally described and some may reference it as part of the *Prophysaon coeruleum* species complex.

ARACHNIDA (spiders and relatives)

Hubbardia shoshonensis

Shoshone Cave whip-scorpion

1) BLM Sensitive list uses the scientific name *Trithyreus shoshonensis*.

CRUSTACEA, Order Amphipoda (amphipods)

Hyalella muerta

Texas Spring amphipod

1) First North American hypogean hyalellid.

Hyalella sandra

Death Valley amphipod

1) Population in Texas Springs is an accidental introduction. Population in Nevares Springs may be a new species.

INSECTA, Order Coleoptera (beetles)

Trigonoscuta sp.

Doyen's trigonoscuta dune weevil

1) Sometimes referred to as *Trigonoscuta doyeni*, which is an unpublished manuscript name.

INSECTA, Order Lepidoptera (butterflies and moths)

Callophrys thornei

Thorne's hairstreak

1) Formerly *Mitoura thornei*.

Euproserpinus euterpe

Kern primrose sphinx moth

1) Until its rediscovery in Kern County in 1974, this moth had been thought to be extinct. A second population was later found in San Luis Obispo County (Xerces Society 2005).

Speyeria zerene myrtleae

Myrtle's silverspot butterfly

1) The USFWS and others have not yet determined if the taxonomic expansion by Emmel and Emmel (1998) into *S. z. myrtleae* and *S. z. puntareyes* is warranted. The *Speyereia zerene* along the coast of Marin and Sonoma Counties are federally endangered under the subspecies concept in the 1992 listing.

INSECTA, Order Hymenoptera (ants, bees, and wasps)

Bombus crotchii

Crotch's bumble bee

1) Originally advanced to candidacy by the Fish and Game Commission in June 2019. The candidacy determination was challenged in court. Candidacy was temporarily stayed beginning February 2021 following an adverse trial court judgment. The Third District Court of Appeal reversed the trial court judgment. Candidacy was reinstated on September 30, 2022.

Bombus franklini

Franklin's bumble bee

1) Originally advanced to candidacy by the Fish and Game Commission in June 2019. The candidacy determination was challenged in court. Candidacy was temporarily stayed beginning February 2021 following an adverse trial court judgment. The Third District Court of Appeal reversed the trial court judgment. Candidacy was reinstated on September 30, 2022.

Bombus occidentalis

western bumble bee

1) Originally advanced to candidacy by the Fish and Game Commission in June 2019. The candidacy determination was challenged in court. Candidacy was temporarily stayed beginning February 2021 following an adverse trial court judgment. The Third District Court of Appeal reversed the trial court judgment. Candidacy was reinstated on September 30, 2022.

Bombus suckleyi

Suckley's cuckoo bumble bee

1) Originally advanced to candidacy by the Fish and Game Commission in June 2019. The candidacy determination was challenged in court. Candidacy was temporarily stayed beginning February 2021 following an adverse trial court judgment. The Third District Court of Appeal reversed the trial court judgment. Candidacy was reinstated on September 30, 2022.

Fishes

SALMONIDAE (trout and salmon)

Oncorhynchus kisutch pop. 2

coho salmon - southern Oregon / northern California ESU

1) Federal listing refers to populations between Cape Blanco, Oregon and Punta Gorda, Humboldt County, California.
2) State listing refers to populations between the Oregon border and Punta Gorda, Humboldt County, California.

Oncorhynchus kisutch pop. 4

coho salmon - central California coast ESU

1) Federal listing is limited to naturally spawning populations in streams between Punta Gorda, Humboldt County and the San Lorenzo River, Santa Cruz County.
2) State listing is limited to populations south of Punta Gorda, Humboldt County.

Oncorhynchus mykiss irideus pop. 1

steelhead - Klamath Mountains Province DPS

1) This ESU includes all naturally spawned populations residing in streams between the Elk River in Oregon and the Klamath River in California, inclusive.
2) CDFW SSC designation refers only to the California portion of the ESU and refers only to the summer-run.

Oncorhynchus mykiss irideus pop. 10

steelhead - southern California DPS

1) The federal designation refers to fish in the coastal basins from the Santa Maria River (inclusive), south to the U.S. - Mexico Border.

Oncorhynchus mykiss irideus pop. 11

steelhead - Central Valley DPS

1) Federal listing includes all runs in the Sacramento and San Joaquin rivers and their tributaries.

Oncorhynchus mykiss irideus pop. 8

steelhead - central California coast DPS

1) Federal listing includes all runs in coastal basins from the Russian River in Sonoma County, south to Soquel Creek in Santa Cruz County, inclusive. It includes the San Francisco and San Pablo Bay basins, but excludes the Sacramento-San Joaquin River basins.

Oncorhynchus mykiss irideus pop. 9

steelhead - south-central California coast DPS

1) Federal listing includes all runs in coastal basins from the Pajaro River south to, but not including, the Santa Maria River.
2) CDFW SSC designation refers to southern steelhead trout.

Oncorhynchus tshawytscha pop. 11

chinook salmon - Central Valley spring-run ESU

1) Federal listing refers to the Central Valley spring-run ESU. It includes populations spawning in the Sacramento River and its tributaries.

Oncorhynchus tshawytscha pop. 13

chinook salmon - Central Valley fall / late fall-run ESU

1) The Central Valley fall/late fall-run ESU refers to populations spawning in the Sacramento and San Joaquin rivers and their tributaries.
2) CDFW SSC designation refers only to the fall-run.

Oncorhynchus tshawytscha pop. 17

chinook salmon - California coastal ESU

1) Originally proposed as part of a larger Southern Oregon and California Coastal ESU. This new ESU was revised to include only naturally spawned coastal spring- and fall-run chinook salmon between Redwood Creek in Humboldt County and the Russian River in Sonoma County.

OSMERIDAE (smelt)

Thaleichthys pacificus

eulachon

1) The Federal Threatened status pertains to the "southern DPS" of eulachon that range from central British Columbia, Washington, Oregon, and northern California.

CYPRINIDAE (minnows and carp)

Rhinichthys nevadensis nevadensis

Amargosa speckled dace

1) Moyle et al. 2023 formally named/described the *Rhinichthys* complex in California and Nevada, and former Amargosa Canyon speckled dace (*R. osculus* ssp. 1) and Owens speckled dace (*R. osculus* ssp. 2) are combined as newly described Amargosa speckled dace ().

Siphateles bicolor ssp. 11 R. nevadensis nevadensis

High Rock Springs tui chub

1) Formerly *Siphateles bicolor* ssp. 2, which did not account for other undescribed subspecies outside of CA.

Siphateles bicolor ssp. 12

Eagle Lake tui chub

1) Formerly *Siphateles bicolor* ssp. 1, which did not account for other undescribed subspecies outside of CA.

Siphateles bicolor ssp. 14

Pit River tui chub

1) Formerly *Siphateles bicolor* ssp. 3, which did not account for other undescribed subspecies outside of CA.

Amphibians

PLETHODONTIDAE (lungless salamanders)

Aneides niger

Santa Cruz black salamander

1) CDFW SSC status uses former subspecies concept of *Aneides flavipunctatus niger*.

Batrachoseps relictus

relictual slender salamander

1) Taxonomy follows Jockusch et al. 2012. Morphological and molecular diversification of slender salamanders (Caudata: Plethodontidae: *Batrachoseps*) in the southern Sierra Nevada of California with descriptions of two new species. Zootaxa 3190:1-30, which synonymized *Batrachoseps* sp. 1, Breckenridge Mountain slender salamander, with *B. relictus*.

Hydromantes shastae

Shasta salamander

1) *Hydromantes shastae* has been proposed to consist of cryptic genetic structuring that may warrant recognition of additional species named as *Hydromantes samweli* and *Hydromantes wintu* (Bingham et al. 2018, Bull. Mus. Comp. Zool. 161(10):403-427). Until formally reviewed by the Fish and Game Commission, all populations in the Shasta salamander complex are legally state threatened.

Plethodon asupak

Scott Bar salamander

1) Since this newly described species was formerly considered to be a subpopulation of *Plethodon stormi* (Mead et al. 2005), and since *Plethodon stormi* is listed as threatened under CESA, *Plethodon asupak* retains the designation as a threatened species under CESA (Calif. Regulatory Notice Register, No. 21-Z, p.916, 25 May 2007).

BUFONIDAE (true toads)

Anaxyrus californicus

arroyo toad

1) At the time of listing, arroyo toad was known as *Bufo microscaphus californicus*, a subspecies of southwestern toad. In 2001, it was determined to be its own species, *Bufo californicus*. Since then, many species in the genus *Bufo* were changed to the genus *Anaxyrus*, and now arroyo toad is known as *Anaxyrus californicus* (Frost et al. 2006).

Anaxyrus canorus

Yosemite toad

1) Formerly *Bufo canorus*; Frost et al. (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Anaxyrus* (Tschudi 1845).

Anaxyrus exsul

black toad

1) Formerly *Bufo canorus*; Frost et al. (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Anaxyrus* (Tschudi 1845).

Incilius alvarius

Sonoran Desert toad

1) Formerly *Bufo alvarius*. Between 2006-2009, the scientific name has been changed to *Cranopsis alvaria*, *Ollotis alvaria*, *Incilius alvarius*, back to *Ollotis alvarius*, and then back to *Incilius alvarius*. The common name has changed from Colorado River toad to Sonoran Desert toad.

RANIDAE (true frogs)

Lithobates pipiens

northern leopard frog

1) Formerly *Rana pipiens*; Frost et al. (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Lithobates* (Fitzinger 1843).

Lithobates yavapaiensis

lowland leopard frog

1) Formerly *Rana yavapaiensis*; Frost et al. (2006. The Amphibian Tree of Life. Bulletin of the American Museum of Natural History 297: 1-370) placed this species in the genus *Lithobates* (Fitzinger 1843).

Rana aurora

northern red-legged frog

1) An mtDNA study (Shaffer et al. 2004) concluded that *Rana aurora aurora* and *Rana aurora draytonii* should be recognized as separate species with a narrow zone of overlap

Rana draytonii

California red-legged frog

1) An mtDNA study (Shaffer et al. 2004) concluded that *Rana aurora aurora* and *Rana aurora draytonii* should be recognized as separate species with a narrow zone of overlap, and that the range of *draytonii* extends about 100 km further north in coastal California than previously thought.

Rana muscosa

southern mountain yellow-legged frog

1) Both federally recognized Distinct Population Segments (DPS) of the mountain yellow-legged frog (*Rana muscosa*) are currently Endangered (2021). The mountain yellow-legged frog – northern DPS is known from the southern Sierra Nevada; the mountain yellow-legged frog – southern DPS is known from the Transverse Ranges.

Rana sierrae

Sierra Nevada yellow-legged frog

1) Formerly *Rana muscosa*. *Rana muscosa* was split into *Rana sierrae*, the Sierra Nevada yellow-legged frog, found in the northern and central Sierra Nevada, and *Rana muscosa*, the southern mountain yellow-legged frog, found in the southern Sierra Nevada and southern California.

Reptiles

XANTUSIIDAE (night lizards)

Xantusia vigilis sierrae

Sierra night lizard

1) Formerly *Xantusia sierrae*; scientific name changed to reflect currently accepted subspecies concept.

ANNIELLIDAE (legless lizards)

Anniella alexanderae

Temblor legless lizard

1) Legless lizards (*Anniella* spp.) in California were traditionally considered one species, but are now considered five species (Pappenfuss and Parham, 2013). The prior (Jennings and Hayes, 1994) and current (Thompson et al. 2016) Species of Special Concern (SSC) projects evaluated the traditional single species taxon and determined all legless lizards in California to be an SSC. Therefore, the SSC status is carried over to the new taxon concepts until further SSC evaluation.

Anniella campi

Southern Sierra legless lizard

1) Legless lizards (*Anniella* spp.) in California were traditionally considered one species, but are now considered five species (Pappenfuss and Parham, 2013). The prior (Jennings and Hayes, 1994) and current (Thompson et al. 2016) Species of Special Concern (SSC) projects evaluated the traditional single species taxon and determined all legless lizards in California to be an SSC. Therefore, the SSC status is carried over to the new taxon concepts until further SSC evaluation.

Anniella grinnelli

Bakersfield legless lizard

1) Legless lizards (*Anniella* spp.) in California were traditionally considered one species, but are now considered five species (Pappenfuss and Parham, 2013). The prior (Jennings and Hayes, 1994) and current (Thompson et al. 2016) Species of Special Concern (SSC) projects evaluated the traditional single species taxon and determined all legless lizards in California to be an SSC. Therefore, the SSC status is carried over to the new taxon concepts until further SSC evaluation.

Anniella pulchra

Northern California legless lizard

1) Legless lizards (*Anniella* spp.) in California were traditionally considered one species, but are now considered five species (Pappenfuss and Parham, 2013). The prior (Jennings and Hayes, 1994) and current (Thompson et al. 2016) Species of Special Concern (SSC) projects evaluated the traditional single species taxon and determined all legless lizards in California to be an SSC. Therefore, the SSC status is carried over to the new taxon concepts until further SSC evaluation.

Anniella spp.

California legless lizard

1) This element represents California records of *Anniella* not yet assigned to new species within the *Anniella pulchra* complex. Legless lizards (*Anniella* spp.) in California were traditionally considered one species, but are now considered five species (Pappenfuss and Parham, 2013). CNDDB has assigned new species concepts to most, but not all, previously known and extant legless lizard occurrences. Where an occurrence of a legless lizard is not known to the species level, the general concept California legless lizard (*Anniella* spp.) will be applied until further evidence is available. All legless lizards in California are a Species of Special Concern (Thomson et al., 2016).

Anniella stebbinsi

Southern California legless lizard

1) Legless lizards (*Anniella* spp.) in California were traditionally considered one species, but are now considered five species (Pappenfuss and Parham, 2013). The prior (Jennings and Hayes, 1994) and current (Thompson et al. 2016) Species of Special Concern (SSC) projects evaluated the traditional single species taxon and determined all legless lizards in California to be an SSC. Therefore, the SSC status is carried over to the new taxon concepts until further SSC evaluation.

HELODERMATIDAE (venomous lizards)

Heloderma suspectum cinctum

banded Gila monster

1) BLM Sensitive designation refers to the full species.

NATRICIDAE (live-bearing snakes)

Thamnophis sirtalis pop. 1

south coast gartersnake

1) CDFW Species of Special Concern treats this population as a distinct taxon, though it is more commonly treated as a subpopulation of *Thamnophis sirtalis infernalis*, the California red-sided gartersnake.

Birds

PHASIANIDAE (grouse and ptarmigan)

Centrocercus urophasianus

greater sage-grouse

1) The federal proposal applies to the Bi-State DPS (Mono Basin of CA and NV; Mono, Alpine, and Inyo counties in California).

Dendragapus fuliginosus howardi

Mount Pinos sooty grouse

1) Formerly merged with *D. obscurus* as blue grouse, but separated on the basis of genetic evidence and differences in voice, behavior, and plumage.

PELECANIIDAE (pelicans)

Pelecanus occidentalis californicus

California brown pelican

1) Removed from Fully Protected list (Fish & Game Code §3511) in July 2023 by Senate Bill no. 147

ACCIPITRIDAE (hawks, kites, harriers, and eagles)

Circus hudsonius

northern harrier

1) Formerly considered conspecific with *Circus cyaneus*, but treated as separate on the basis of differences in morphology ,plumage, and breeding habitat.

FALCONIDAE (falcons)

Falco peregrinus anatum

American peregrine falcon

1) Removed from Fully Protected list (Fish & Game Code §3511) in July 2023 by Senate Bill no. 147

RALLIDAE (rails, coots, and gallinules)

Laterallus jamaicensis coturniculus

California black rail

1) The IUCN designation of Near Threatened refers to the full species.

CHARADRIIDAE (plovers and relatives)

Charadrius montanus

mountain plover

1) Proposed rule to federally list the mountain plover as threatened was withdrawn 20110512.

Charadrius nivosus nivosus

western snowy plover

1) Federal listing applies only to the Pacific coastal population.
2) CDFW SSC designation refers to both the coastal and interior populations.

LARIDAE (gulls and terns)

Gelochelidon nilotica

gull-billed tern

1) Taxonomy recently changed from *Sterna nilotica*.

Hydroprogne caspia

Caspian tern

1) Taxonomy recently changed from *Sterna caspia*.

Sternula antillarum browni

California least tern

1) Taxonomy recently changed from *Sterna antillarum browni*.

Thalasseus elegans

elegant tern

1) Taxonomy recently changed from *Sterna elegans*.

ALCIDAE (auklets, puffins, and relatives)

Synthliboramphus scrippsi

Scripps's murrelet

1) Formerly included in Xantus's murrelet as *Synthliboramphus hypoleucus scrippsi*. Now considered a full species.

STRIGIDAE (owls)

Athene cunicularia

burrowing owl

1) A burrow site = an observation of one or more owls at a burrow or evidence of recent occupation such as whitewash and feathers. Winter observations at a burrow are mapped. Winter observations with or without a burrow in San Francisco, Ventura, Sonoma, Marin, Napa, and Santa Cruz Counties are mapped.

Strix occidentalis caurina

northern spotted owl

1) There are no spotted owl EOs in the CNDDB. All spotted owl location information is maintained in a separate database (https://wildlife.ca.gov/Data/CNDDB/Spotted-Owl-Info). CNDDB subscribers can access these datasets from the same bookmark as the CNDDB layer in BIOS (https://www.wildlife.ca.gov/Data/BIOS).

Strix occidentalis occidentalis

California spotted owl

1) There are no spotted owl EOs in the CNDDB. All spotted owl location information is maintained in a separate database (https://wildlife.ca.gov/Data/CNDDB/Spotted-Owl-Info). CNDDB subscribers can access these datasets from the same bookmark as the CNDDB layer in BIOS (https://www.wildlife.ca.gov/Data/BIOS).
2) On 20230223, coastal-southern California DPS was federally proposed Endangered, and Sierra Nevada DPS was federally proposed Threatened.

TYRANNIDAE (tyrant flycatchers)

Empidonax traillii

willow flycatcher

1) State listing of the full species includes all subspecies.

Empidonax traillii brewsteri

little willow flycatcher

1) State listing of the full species includes all subspecies.

Empidonax traillii extimus

southwestern willow flycatcher

1) State listing of the full species includes all subspecies.

LANIIDAE (shrikes)

Lanius ludovicianus mearnsi

San Clemente loggerhead shrike

1) Subspecific identity of shrikes currently on San Clemente is uncertain. Mundy et al. (1997a, b) provided evidence *L. l.* mearnsi is genetically distinct from *L. l. gambeli* and *L. l. anthonyi*, whereas Patten and Campbell (2000) concluded, based on morphology, that the birds now on San Clemente are intergrades between *L. l. mearnsi* and *L. l. anthonyi*.

VIREONIDAE (vireos)

Vireo bellii arizonae

Arizona Bell's vireo

1) The IUCN designation of Near Threatened refers to the full species.

Vireo bellii pusillus

least Bell's vireo

1) The IUCN designation of Near Threatened refers to the full species.

TROGLODYTIDAE (wrens)

Campylorhynchus brunneicapillus sandiegensis

coastal cactus wren

1) CDFW Bird Species of Special Concern report uses the common name San Diego cactus wren.

POLIOPTILIDAE (gnatcatchers)

Polioptila californica californica

coastal California gnatcatcher

1) CDFW Bird Species of Special Concern report uses the common name Alta California gnatcatcher.

MIMIDAE (mockingbirds and thrashers)

Toxostoma lecontei

Le Conte's thrasher

1) CDFW SSC designation refers only to the San Joaquin population.

2) The BLM Sensitive designation refers to the San Joaquin Le Conte's thrasher, *Toxostoma lecontei macmillanorum*, although the subspecies concept is not universally recognized.

PASSERELLIDAE (sparrows)

Artemisiospiza belli clementeae

San Clemente Bell's sparrow

1) Subspecific validity uncertain. Recognized by AOU (1957), but not by Patten and Unitt (2002).

Melospiza melodia graminea

Channel Island song sparrow

1) Subspecific validity is uncertain. This subspecies when referred to as Santa Barbara song sparrow is extinct. However, the subspecies was merged by Patten (2001) with the San Miguel (*M. m. micronyx*), and San Clemente (*M. m. clementae*) song sparrows as the Channel Island song sparrow with the subspecific name *M. m. graminea*.

Melozone crissalis eremophilus

Inyo California towhee

1) Previously in the genus *Pipilo*.

PARULIDAE (wood-warblers)

Geothlypis trichas sinuosa

saltmarsh common yellowthroat

1) CDFW Bird Species of Special Concern report uses the common name San Francisco common yellowthroat

Setophaga petechia

yellow warbler

1) This element includes the subspecies *S. p. morcormi* and *S. p. brewsteri*, which are tracked under the full species, *S. petechia*, due to difficulty distinguishing them. *S. p. sonorana*, which nests in California only along the Colorado River, is tracked separately.

Setophaga petechia sonorana

Sonoran yellow warbler

1) Nests in California only along the Colorado River. Observations of yellow warblers from other regions are tracked as the full species, *S. petechia*.

Mammals

PHYLLOSTOMIDAE (leaf-nosed bats)

Leptonycteris yerbabuenae

lesser long-nosed bat

1) Federal listing uses the scientific name *Leptonycteris curasoae yerbabuenae*.

VESPERTILIONIDAE (evening bats)

Lasiurus frantzii

western red bat

1) Nomenclature changed from *Lasiurus blossevillii* to *Lasiurus frantzii* based on Baird et al. 2015, J. of Mammalogy 96(6):1255-1274.

APLODONTIIDAE (mountain beavers)

Aplodontia rufa californica

Sierra Nevada mountain beaver

1) The IUCN Least Concern designation refers to the full species.

Aplodontia rufa nigra

Point Arena mountain beaver

1) The IUCN Least Concern designation refers to the full species.

Aplodontia rufa phaea

Point Reyes mountain beaver

1) The IUCN Least Concern designation refers to the full species.

HETEROMYIDAE (kangaroo rats, pocket mice, and kangaroo mice)

Perognathus alticola alticola

white-eared pocket mouse

1) CDFW SSC, BLM Sensitive, and IUCN Endangered designations refer to the full species.

Perognathus alticola inexpectatus

Tehachapi pocket mouse

1) CDFW SSC and IUCN Endangered designations refer to the full species.

Perognathus inornatus

San Joaquin pocket mouse

1) This element includes the subspecies *P. i. inornatus* and *P. i. neglectus*, which are tracked under the full species, *P. inornatus*, due to difficulty distinguishing them. *P. i. inornatus* generally occurs on the eastern side of the San Joaquin Valley, while *P. i. neglectus* generally occurs on the western side. *P. i. psammophilus*, which occurs only in the Salinas Valley, is tracked separately.

CRICETIDAE (mice, rats, and voles)

Neotoma fuscipes riparia

riparian (=San Joaquin Valley) woodrat

1) This species is currently undergoing taxonomic revision

Reithrodontomys megalotis santacruzae

Santa Cruz harvest mouse

1) Synonymous with *Reithrodontomys megalotus longicaudus*, Santa Cruz Island population.

CANIDAE (foxes, wolves, and coyotes)

Urocyon littoralis catalinae

Santa Catalina Island fox

1) The IUCN Near Threatened status refers to the full species.

Urocyon littoralis clementae

San Clemente Island fox

1) The IUCN Near Threatened status refers to the full species.

Urocyon littoralis dickeyi

San Nicolas Island fox

1) The IUCN Near Threatened status refers to the full species.

Urocyon littoralis littoralis

San Miguel Island fox

1) The IUCN Near Threatened status refers to the full species.

Urocyon littoralis santacruzae

Santa Cruz Island fox

1) The IUCN Near Threatened status refers to the full species.

Urocyon littoralis santarosae

Santa Rosa Island fox

1) The IUCN Near Threatened status refers to the full species.

MUSTELIDAE (weasels and relatives)

Enhydra lutris nereis

southern sea otter

1) The IUCN Endangered designation refers to the full species.

Lontra canadensis sonora

southwestern river otter

1) CDFW SSC status refers only to the subspecies *L. canadensis sonora*, which is known in California only from the Colorado River.

Martes caurina humboldtensis

Humboldt marten

1) Federal status refers to the coastal DPS of Pacific marten (*Martes caurina*)

Pekania pennanti

Fisher

1) In 2004, the West Coast DPS of fisher became a candidate for federal listing, and underwent numerous evaluations, proposed rules, and revisions in subsequent years. In 2020, the West Coast DPS was further divided into the Southern Sierra Nevada DPS and the Northern California/Southern Oregon DPS (which also includes Northern Sierra Nevada and Southern Oregon Cascades subpopulations which arose from reintroductions). State threatened and federal endangered statuses apply only to the Southern Sierra Nevada ESU/DPS. State listing defines the northern limit of the SSN ESU as the Merced River, while federal listing uses the Tuolumne River.

BOVIDAE (sheep and relatives)

Ovis canadensis nelsoni

desert bighorn sheep

1) Desert bighorn sheep (*O. c. nelsoni*) in the Peninsular Ranges are tracked as a metapopulation of the subspecies, Peninsular bighorn sheep DPS (*O. c. nelsoni* pop. 2)
2) Fully Protected with the exception of legal hunting conducted in compliance with California Code of Regulations 14 CCR 362.

Ovis canadensis nelsoni pop. 2

Peninsular bighorn sheep DPS

1) The subspecies peninsular bighorn sheep (*O. c. cremnobates*) has been synonymized with *O. c. nelsoni* (Wehausen & Ramey 1993). Peninsular bighorn sheep are now considered to be a metapopulation and are recognized as a federal Distinct Population Segment (DPS).

EXHIBIT H

Understanding Blast Vibration and Airblast, their Causes, and their Damage Potential

1. Introduction to Blast Vibration and Airblast

When a blast is detonated, only a portion of the total energy is consumed in fracturing and shifting the rock. The remaining energy is dissipated in two forms:

(a) as vibration, in the form of seismic waves traveling very rapidly within the ground and along the ground surface and,

(b) as airblast, in the form of compression waves traveling through the air.

Blast Vibration.

Immediately surrounding the detonating hole is a crater zone (or inelastic zone), within which the rock has been fractured and displaced by the shockwave and by the pressure of the hot gasses generated in the explosion process. Outside this crater zone, the shockwave continues to travel, spawning a family of seismic waves. These waves radiating outward are categorized as body waves traveling through the ground and surface waves traveling on the surface of the ground.

The body waves consist of P (or primary) waves and S (or secondary) waves. P waves are compression waves that radiate outward from the source at velocities ranging from several thousand to twenty thousand feet per second, depending upon the sonic velocity of the material through which they pass. Over long distances, P waves average 5 kilometers (approximately 16,000 ft) per second. In addition to traveling faster, the P waves are of a higher frequency and dissipate more rapidly than the other wave types. S waves are shear waves (motion perpendicular to P waves). Their frequency is lower than P waves, they do not dissipate as rapidly, and they travel at approximately 60 percent of the velocity of the P waves.

Higher frequencies dissipate more rapidly than lower frequencies because energy is lost with each cycle (or reversal of direction). Higher frequencies cycle more often and consequently lose energy more rapidly.

Surface waves are formed as the body waves reach the surface. Of the various surface waves, the dominant one is the Rayleigh wave, characterized by motion that is in the form of a retrograde ellipse. (A vertical rolling loop moving away from the source, with the direction of motion at the top of the loop being back toward the source.) Surface waves travel at approximately 90 percent of the velocity of S waves and are of a lower frequency. Surface waves do not diminish as rapidly as the body waves. In all instances, however, the intensities of body waves and surface waves dissipate with distance.

It is this difference in the velocity of the various wave types that enables a seismologist to determine the distance from a recording station to the epicenter of an earthquake by comparing the arrival time of the different wave types. For vibration that is recorded on blasting seismographs in fairly close proximity to a blast however, the waves have not had time to sufficiently separate, and individual wave types are not easily identified.

As seismic waves travel outward from the blast, they excite the particles of rock and soil through which they pass and cause them to oscillate. Spherical spreading, energy loss and imperfect coupling of the particles, among other factors, cause these seismic waves to dissipate with distance. When we record blast vibration, it is the motion of these particles at a given point that is measured.

Blast vibration is described using the following terms:

Displacement - the distance the particles move, usually only a few ten-thousandths to a few thousandths of an inch.

Particle Velocity - how fast the particles move. Since the velocity is continually changing, the maximum, or **Peak Particle Velocity (PPV)**, is the important value. This rate is expressed in inches per second or millimeters per second.

Acceleration - the rate at which the particle velocity is changing, measured in feet/second/second, millimeters/second/second or in G's.

Frequency - The number of oscillations per second that a particle makes when under the influence of seismic waves, measured in Hertz (cycles per second).

(The mathematical relationships of the above four terms as they apply to sinusoidal waveforms are contained in Appendix C of this document.)

Propagation Velocity - The speed at which a seismic wave travels away from the blast, measured in feet/second or meters/second. (As indicated in the previous discussion and above, note that propagation velocity is several orders of magnitude greater than particle velocity.)

It is possible to record blast vibration as particle velocity, displacement or acceleration, depending upon the type of sensor being used. It has become standard practice for blasting, however, to use particle velocity as the best descriptor of vibration as it pertains to damage potential to residential structures. Most modern blasting seismographs use velocity sensors.

When blast vibration is recorded with a seismograph, the actual velocity of the particle motion, regardless of its direction, is recorded using a geophone block containing three mutually perpendicular velocity sensors. When properly oriented to the blast, these record in longitudinal (to and from the blast), in transverse (side to side) and in vertical axes. Each of these axes is recorded by a channel on the seismograph. Since the velocities are recorded against an accurate time base, additional information such as frequency, displacement, acceleration and true vector sum can also be derived. This is accomplished internally by modern blasting seismographs.

In close proximity to the blast, body waves dominate. As the distance from the blast increases, the body waves dissipate faster than the surface waves. As the surface waves become the dominant motion, the dominant vibration frequencies will be lower.

Some published blast vibration standards allow higher particle velocities at higher frequencies (which normally occur closer to the blast). This factor alone may allow the blaster to stay within the specified frequency-dependent limits as his blasts approach a protected structure. In other words, with no change in blast parameters or site geology, both the intensity and the frequency of the vibration would be expected to increase as the distance to the blast becomes smaller.

When the distance between the recording point and the blast becomes large enough, there is little the blaster can do to alter the frequency of the vibration. The greater the distance from the blast, waves that have traveled different paths arrive at different times and overlap. At much greater distances, the entire blast begins to take on the characteristics of a single point charge of relatively long duration. Individually detonating charges cannot easily be identified on a seismograph record unless the recording is accomplished quite close to the blast.

Airblast or Air Overpressures from Blasting.

As in the case of ground vibration waves, air overpressure waves radiate outward from a blast, diminishing with distance. Air, acting as a fluid, can only transmit compression waves.

There are various sources of airblast, some of which the Bureau of Mines identified in their report, RI 8485, *Structure Response and Damage Produced by Airblast from Surface Mining*, in 1980 and by Wiss and Linehan earlier. While these reports may seem a bit outdated, the air overpressure sources contained therein are still valid. Among them are:

Air Pressure Pulse (APP) - direct rock displacement at the face or mounding at the collar (the result is a low frequency air overpressure wave)

Rock Pressure Pulse (RPP) - vibrating ground at the measuring point (the result is low frequency air overpressure and is usually inconsequential)

Gas Release Pulse (GRP) - gas escaping through fractured rock (the result is medium to high frequency airblast)

Stemming Release Pulse (SRP) - gas escaping through blown-out stemming (the result is medium to high frequency airblast)

Unconfined surface charges, including detonating cord on the surface (the result is high frequency airblast)

Those waves from sources resulting in higher frequencies could be properly termed “airblast”. The term “air overpressure” is probably more suitable for the lower frequency waves, however it has become conventional to refer to all airborne blast pressures as airblast.

Airblast or air overpressures from blasting are measured in either decibels or psi or, in the case of SI (metric) units, in Pascals.

When comparing airblast with conventional noise sources, one must bear in mind that airblast is an impulse of very short duration and is not repeated continuously. For this reason, airblast limits are usually established that are well above the limits set for continuous noise sources and also above those limits usually imposed on firing ranges and the like that are sources of repeated impulses. Because of its very short duration, airblast makes a negligible contribution to recorded average daily noise levels.

That part of the air overpressure wave that is in the audible range (above 16 Hz or so) can be startling in an otherwise quiet surrounding. The energy level, however, is usually very small and will not normally contribute to actual damage. The lower frequency portion of the pressure wave, rather than being heard, is felt as concussion. This concussion tends to excite structures and cause windows and doors to rattle. Damage from this concussion at elevated levels is possible, but the major adverse contribution is to human response. If a nearby blast causes windows to rattle, the average person cannot tell whether it was airblast or vibration that caused it, although he will generally assume the latter.

2. The Effect of Blast Vibration on Materials and Structures

In order to provide some idea of what various PPV intensities represent, their effect on various structures and materials is contained in the following listing. These have been documented by researchers and organizations as referenced. Because of the many variables that could be encountered in the field, this listing should not be used to establish limits or be considered as the absolute point where the effect will always occur. To do so would also require consideration of frequencies. PPV units are inches per second.

PPV	Application	Effect	Reference
600	Explosive inside concrete	Mass blowout of concrete	j
375	Explosive inside concrete	Radial cracks develop in concrete	j
200	Explosive inside concrete	Spalling of loose/weathered concrete skin	j
> 100	Rock	Complete breakup of rock masses	a
100	Explosive inside concrete	Spalling of fresh grout	j
100	Explosive near concrete	No damage	l
50 - 150	Explosive near buried pipe	No damage	n
25 - 100	Rock	Tensile and some radial cracking	a
40	Mechanical equipment	Shafts misaligned	d
25	Explosive near buried pipe	No damage	o
25	Rock	Damage can occur in some rock masses	c
10 - 25	Rock	Minor tensile slabbing	a
24	Rock	Rock fracturing	b
15	Cased drill holes	Horizontal offset	d
> 12	Rock	Rockfalls in underground tunnels	b
12	Rock	Rockfalls in unlined tunnels	g
< 10	Rock	No fracturing of intact rock	a
9.1	Residential structure	Serious cracking	b
8.0	Concrete blocks	Cracking in blocks	d
8.0	Plaster	Major cracking	h
7.6	Plaster	50% probability of major damage	g
7.0 - 8.0	Cased water wells	No adverse effect on well	m
> 7.0	Residential structure	Major damage possible	e
4.0 - 7.0	Residential structure	Minor damage possible	e
6.3	Residential structure	Plaster and masonry walls crack	b
5.44	Water wells	No change in well performance	k
5.4	Plaster	50% probability of minor damage	g
4.5	Plaster	Minor cracking	h
4.3	Residential structure	Fine cracks in plaster	b
> 4.0	Residential structure	Probable damage	f
2.0 - 4.0	Residential structure	Plaster cracking (cosmetic)	e
2.8 - 3.3	Plaster	Threshold of damage (from close-in blasts)	g
3.0	Plaster	Threshold of cosmetic cracking	h
1.2 - 3.0	Residential structure	Equals stress from daily environmental changes	i
2.8	Residential structure	No damage	b
2.0	Residential structure	Plaster can start to crack	d
2.0	Plaster	Safe level of vibration	g
< 2.0	Residential structure	No damage	e
< 2.0	Residential structure	No damage	f
0.9	Residential structure	Equivalent to nail driving	i
0.5	Mercury switch	Trips switch	d
0.5	Residential structure	Equivalent to door slam	i
0.1 - 0.5	Residential structure	Equates to normal daily family activity	i
0.3	Residential structure	Equivalent to jumping on the floor	i
0.03	Residential structure	Equivalent to walking on the floor	i

3. Probable Results of Impulsive Airblast

The relationship of decibels to pressure and the probable result of various airblast intensities are presented in the following chart. The equivalent wind gust velocities are also given for several intensities.

Airblast Intensity dB	psi	Probable Result	Average Human Response
180	2.900	Structural damage	Ear drum rupture possible
175	1.631		
170	0.917	Many windows break	Intolerable
165	0.516		
160	0.290		
155	0.163	(equal to a 96 mph wind gust)	
150	0.092	Poorly mounted windows can break	
145	0.052		
140	0.029	(equal to a 40 mph wind gust)	Distinctly unpleasant
134	0.0145	OSMRE and USBM limit	
130	0.0092	(equal to a 23 mph wind gust)	
125	0.0052		
120	0.0029		Mildly unpleasant
115	0.0016		
110	0.00092	(equal to a 7.2 mph wind gust)	
105	0.00052		
100	0.00029		
95	0.00016		
90	0.000092		Strongly perceptible
85	0.000052		
80	0.000029		
75	0.000016		
70	0.0000092		Distinctly perceptible
65	0.0000052		
60	0.0000029		Perceptible

In the foregoing chart it should be noted that Average Human Response is just that. One can find individuals who would tolerate considerably higher intensities of airblast without complaint, while others may claim to be distressed at much lower intensities.

The formula for converting pressure in psi to decibels is -

$$dB = 20 \log (psi / 2.9 \times 10^{-9})$$

or conversely,

$$psi = 2.9 \times 10^{-9} \times \text{anti-log} (dB / 20)$$

The formula for equating wind gusts to pressure is from PPG Industries' architectural design criteria for their windows and is expressed as –

$$psi = 1.78 \times 10^{-5} \times V^2$$

where V is the wind speed in miles per hour.

4. Human Response to Blast Vibration and Airblast

Human response is not something that the explosive user can readily control, although one might be able to affect it in a positive way if it can be understood and properly addressed. The main contribution of typical human response to blast effects is that it increases the perception that some damage was either possible or likely to have occurred from the blasting.

Most humans are quite sensitive to motion and sound. They can perceive levels of each that are well below (by a factor of 100 to 1000 or more) those levels that could cause damage to the average structure. As sensitive as they may be, however, humans are notoriously bad in their estimation of the intensity levels of vibration and airblast. Even trained individuals, in the absence of instrumentation, have been known to make poor estimates of intensity levels.

Among the factors that have an impact on human response are:

(a) health of the individual.

(b) orientation of the individual – i.e. in a standing position, more responsive to vertical motion; lying down, more sensitive to motion from side to side.

(c) location of the individual – indoors, more receptive to structure noises; outdoors, blast effects are not as noticeable and may be masked by ambient noise and vibration.

(d) activity of the individual – persons at rest are more sensitive than those actively engaged in some physical activity.

(e) whether the individual is pre-warned or not (the startle factor) – persons expecting a blast will usually not consider the effects to be as severe as those who are not warned.

(f) quality and type of construction (for those indoors) – structural noises and rattling of windows and doors.

(g) ambient noise or vibration levels – blast effects are not perceived to be as severe when other ambient noise and vibration are present.

Obviously, there is a wide range of human response to blasting and blast effects. On one end of the spectrum is the individual who recognizes some benefit from the blasting operation. He or she will usually be a friend or ally and can actually assist in public relations with other more "average" neighbors.

At the other end of the spectrum is the individual who, for whatever reason, did not want the blasting operation there in the first place. It is not likely that anything you do, short of going away, will satisfy him. You can't ignore him, though.

Between these two extremes will be the individuals from whom you can benefit the most with a good informational or public relations program.

Attempts have been made by many to quantify Human Response in technical terms. In most cases, researchers have found that, while you can gather data on how humans respond to sonic booms, ground vibration, earthquakes, etc., the subject tends to be an elusive target. This is because there are many factors, physiological, technical and political, that can skew the results. While this may appear to make it seem futile to address human response, this is not the case.

The easiest case is the friend of the operation. Make sure that he understands that you appreciate his feelings toward your operation and that you also appreciate any efforts he may make on your behalf. While it isn't likely that he would change his opinion, you shouldn't ignore him. Stay in touch with him.

The most difficult, the fellow who didn't want you and your blasting in his neighborhood in the first place, is going to require a completely different approach. Don't ignore him either. It will only make him try harder to get you out of his life. Treat him with respect and treat him fairly, but be firm. If you didn't cause the damage that he may be claiming, there is no reason for you to pay for fixing it. When he calls and complains, don't immediately deny his claim. While you may feel certain that you didn't damage him, you cannot reach a conclusion until a proper investigation is done. Your best defense will be to use all the tools at your disposal. Pre- and post-blast surveys should be considered. Recording of blast vibration and airblast with blasting seismographs will help you disprove any false claims of damage.

While you might be inclined, as a good will gesture, to pay for minor damage claimed, be aware that if you knuckle under and pay for something that you did not cause, you will probably find that he has additional items to fix. You also run the risk of him boasting to others how he got you to take care of his problem. This could initiate a flood of complaints. Again, your best bet is to be fair, but be firm.

Before going further, with regard to the preceding comments, some (but not all) insurance companies will have a tendency to look at the cost of settling a claim versus the cost of fighting it. They will usually conclude that it is cheaper to settle than fight. Unfortunately, in addition to a total lack of fairness in the matter (and the loss experience that you or your company will receive because of it) this can establish a precedent for others who may then also claim damage.
Get a good investigative consultant or consulting group, pay promptly for only the damage that you cause (or was likely caused by you) and, above all, let your insurance company know how you feel in the matter.

Getting back to human response, what can you do to properly address those individuals who are average in their response? First, try to find out what their concerns really are. Most people haven't been around blasting and may be more fearful of it because of the unknown or because of what they see in movies or on television. When they see earthquake damage on TV, they don't understand the differences between the ground motion that caused it and the ground motion from blasting. It is understandable that they might be concerned. You (or your blast effects consultant) should explain beforehand what they will feel, see and hear when you conduct your blasting operation. Educate them. Pre-blast surveys provide an excellent opportunity to meet and talk with these people. Take advantage of that opportunity.

While some may argue against warning neighbors when a blast is going to take place, the lack of a proper warning severely increases the startle effect. In my experience, when I have been standing with neighbors and have counted down to a properly designed blast, the usual comment has been, "Is that all there is to it?" On the other hand, when a blast is detonated with no warning, most people perceive it to be worse than it really is.

Most individuals appreciate the attention that you show them when you monitor vibration and airblast at or near their residence. Granted, there are some who will refuse to allow equipment to be set up on their property, but they are usually in the minority. In some instances, just knowing that the blast effects were recorded by instruments will preclude someone from claiming damage.

Structural response has an impact on human response when the structure amplifies or otherwise adversely affects the noise and/or motion that the human may hear or feel indoors when you blast. Low frequency concussion that may only sound like a muffled thump outdoors, will probably rattle windows and other objects indoors when it reaches the side of a structure.

In the author’s experience, many complaints blamed on blast vibration should have actually been attributed to airblast. Without instrumentation, the average homeowner has no way of telling the difference. When someone a half mile away complains that you shook their house and you calculate a peak particle velocity well below the average threshold of human perception, don't tell them they're crazy. They know what they experienced. Investigate their complaint. It’s possible that your blast generated a low frequency airblast pulse in their direction.

If the blast under consideration is going to be a one time affair, consider establishing a safe viewing location for the neighboring residents. Not only will they appreciate the attention and the chance to witness the blast, they will not be in their houses to possibly hear the windows or other objects rattle. (Make sure the viewing location is truly safe, though. Your efforts at PR will suffer greatly if they are frightened or have to duck flying objects.)

Above all, be a good neighbor. Design blasts to keep adverse effects to a minimum. Cultivate good relationships with your neighbors. Remember, some day you might need to modify your operating permit for a mining operation or, in the case of construction, need to blast in an area where permitting has been difficult in the past. A few friends and neighbors who speak highly of your blasting may come in handy. In the meantime, keep good blasting records, monitor your blasts and keep a good log of complaints as they are received and the disposition of the investigation of those complaints.

Most persons, when invited to witness a well-designed blast, are usually disappointed and tend to feel that the effects are minimal. Some have gone so far as to accuse the blasting company of purposely setting off a much smaller blast than normal, when the opposite situation has actually occurred.

For further study on the subject of human response, see Oriard (1999 and 2002) or USBM RI8485 as referenced in Appendix D.

5. Blast Scaling

To facilitate comparing or estimating the effects from blasts of varying charge weights and varying distances, some scaling method is required. The conventional scaling method in use is referred to as **Scaled Distance (D_s)**, a number (without units) that provides a means of scaling a ratio of distance and charge weight.

Square Root Scaled Distance is derived by dividing the true ground path distance between the detonating charge and the object of interest by the square root of the charge weight. This is used for scaling blasts involving linear charges (the length is more than four times the diameter) and would apply to most conventional blasts.

$$\textbf{Square Root } (D_s) = \textbf{Distance / Weight}^{1/2}$$

Cube Root Scaled Distance is similarly derived except that it uses the cube root of the charge weight. Cube Root scaling is used for those instances where the item of interest involves airblast or air overpressures, underwater blast pressures and for those infrequent instances where ground vibration is generated by a spherical charge (the length of the charge is less than four times the diameter).

$$\textbf{Cube Root } (D_s) = \textbf{Distance / Weight}^{1/3}$$

When scaling blasts, the proper charge weight for the calculations would be the total quantity of explosive that is detonated in a given instant. Instant (for this purpose) has been further defined as being that amount of explosive detonating within any 8 millisecond time period.

With proper care, $\mathbf{D_s}$ can be used to predict blast vibration. When utilized in conjunction with blast vibration monitoring, it facilitates the design of blasts to conform to vibration limits. Shorter distances and higher explosive weights result in a lower $\mathbf{D_s}$ and would yield more vibration. Conversely, greater distances and smaller explosive weights result in a higher $\mathbf{D_s}$ number and less intense vibration.

In order to accommodate a large range of Scaled Distances and PPVs, the data is usually plotted on graphs that are logarithmic in both horizontal and vertical axes.

The correct $\mathbf{D_s}$ is the lowest number calculated for various configurations within the blast and will more closely relate to the highest intensity of vibration. Technically speaking, there are as many $\mathbf{D_s}$ numbers as there are holes detonating. If all the holes are loaded nearly identically and are detonated on individual delays, the closest hole will naturally yield the lowest number.

If the blast has varying charge weights (the shot may be deeper in some areas), the lowest $\mathbf{D_s}$ may be calculated for a hole that is actually farther away, toward the center of the blast, or even on the far side of it from the object of concern.

With regards to distance measurements, bear in mind that blast-induced ground vibration (for our purposes) can travel only through the ground. It can't jump across an open space. The shortest path through the ground between the detonating hole and the object of interest should be the distance used. If the distance is a couple of hundred feet, measure it with a tape. Out to five hundred feet or so, use a wheel or pace it off (if you can do so accurately). For distances of five hundred feet or more, a GPS would prove valuable. Whatever method is used, remember to adjust for any change in terrain. Strive for maximum accuracy.

Similarly, the correct distance for air overpressure purposes would be the shortest distance through air between the detonating charge and the item of concern.

Precautions to observe when scaling blasts.

Possible problems with Scaling (square root or cube root) may be encountered in certain situations. If more than one hole is detonated simultaneously, in most instances they will not all cooperate fully in increasing vibration. An example might be a long row of charges detonating simultaneously, with the point of interest located adjacent to the row. Obviously, the nearest hole and those close to it would cooperate. Holes at a much greater distance would not. Oriard (2002) found that only the holes that were included in a length along the row equal to twice the distance from the row to the point of interest contributed appreciably to the vibration intensity. For example, say you are recording 20 feet to the side of such a row. Only the nearest hole and those located within about 20 feet to either side of that hole would contribute. Counting additional holes would yield a lower $\mathbf{D_s}$ number, but without an appreciable increase in vibration intensity.

A similar situation could occur if one were to try to record near a hole with an extremely long charge length. While these situations do not occur often in normal blasting schemes, they are brought to your attention so that you might recognize them when they are encountered.

Blasters should also be aware that just because two blasts have the same calculated $\mathbf{D_s}$, the potential effects may not be the same. A large blast at a great distance and a small blast much closer might have the same $\mathbf{D_s}$, but the characteristics of the blast-generated vibration would not be the same. The distant blast would have lower frequencies and lower acceleration levels while the closer blast characteristics would be just the opposite. It is for this reason that one of the OSMRE alternative blasting level criteria allows a $\mathbf{D_s}$ that varies with distance.

6. Predicting Blast Vibration

Various methods of predicting blast vibration have been used by researchers through the years, but the most commonly used prediction curves were developed by Lewis L. Oriard, a noted seismologist from Huntington Beach, California (now retired). His curves are based upon data gathered from a large number of blasts in various geological settings. Most other researchers have come to similar conclusions with their estimations usually falling somewhere within Oriard's parameters.

The graph that follows contains curves representing Oriard's upper and lower bounds for typical down-hole blasting and also a higher approximation for those instances where there is very high confinement, such as in pre-splitting. It is important to understand that, due to the many variables involved in blast design and site-specific geology, it is possible that data points can fall above or below the bounds for typical data shown on the graph. Oriard's basic formula for predicting blast vibration is:

$$\mathbf{PPV = H \times (D_s)^{-1.6} \times K1, K2, K3, etc.}$$

where **PPV** is the Peak Particle Velocity (in inches per second) of a particular axis,

H is a factor that varies as follows:

Lower bound for conventional blasting = 24.2

Upper bound for conventional blasting = 242

Typical bound for increased response (pre-splitting, etc.) = 605

$\mathbf{D_s}$ is the Square Root Scaled Distance (as defined earlier),

The attenuation slope of **-1.6** is typical. It can be steeper for body waves recorded close to the blast or can be flatter at extended distances where surface waves would dominate. In your estimations for a given location it is best to use an attenuation slope of **-1.6** until enough data is gathered to facilitate calculating a site-specific attenuation slope.

$\mathbf{K_1}$, $\mathbf{K_2}$, $\mathbf{K_3}$, etc. are factors as described below:

The resulting peak particle velocity will decrease with -

decreasing confinement of the explosive energy,

decreasing elastic moduli,

increasing spatial distribution of the energy source,

increasing time of energy release or timing scatter,

decreasing coupling of the energy source,

and other similar factors.

(PPV would obviously increase when the effect of these factors is reversed.)

Of the factors involved, charge weight and distance, followed closely by confinement of the explosive energy, will have the most impact on vibration. Confinement of the energy is increased as the burden and spacing increase, the depth of burial of the charge increases, strength of rock improves, quality of stemming improves, etc.

Spatial distribution of the energy source would occur when two holes detonating simultaneously are separated by some finite distance. The combined weight of explosive in such holes will not generate as much vibration as one hole containing a similar total charge weight. The effect will vary depending upon the distance between the holes. The greater the distance, the less they will cooperate.

In using the Oriard prediction curves it is important to understand that the particle velocities used are those from individual channels and not the vector sum.

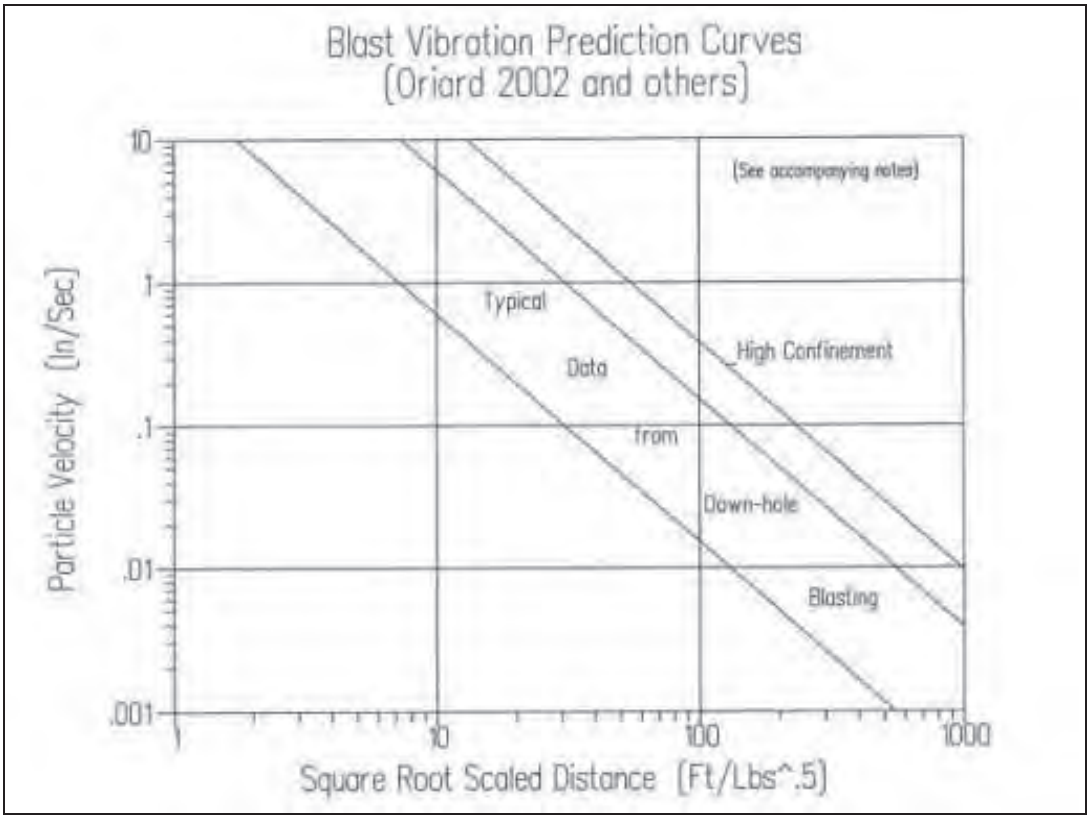
True vector sum is derived by summing the squares of the particle velocities of all three channels (at the same instant in time) and extracting the square root of that sum. Although this would indeed yield the absolute highest particle velocity for the event, current convention does not use vector sum. When our current vibration standards and prediction curves were developed, digital seismographs had not been developed and analog equipment was still in use. Vector sums could only be derived by hand digitizing the data, hence single channel data were used. Modern digital seismographs have the ability to calculate and display vector sum. The true vector sum could be as much as 73% higher than the highest individual channel although, in practice, it is usually only 15 to 20% higher. This difference should be taken into consideration if a vector sum vibration limit were to be proposed, with the limit increased accordingly.

Persons experienced in blast vibration prediction will use the range given in the curves (or formulas) as a basis and adjust them for any blast-specific variables that they can identify and quantify through experience. Data from previous blasts at the site should be plotted on log-log paper (usually obtainable from university or community college bookstores) or plotted on a computer using a good graphing program. Success in predicting blast vibration largely depends upon the experience of the predictor and the accuracy of the input data. In addition to making sure the charge weights are correct, the correct number of holes per delay should be verified and, if more than one hole or deck is detonating simultaneously, the spatial separation of those holes or decks should be noted.

In developing prediction curves for blasts, it is extremely helpful to gather data from a wide range of Scaled Distances. If all of the data is from a narrow band of D_s, it will be difficult to establish a regression factor.

When predicting blast vibration (or airblast, for that matter) it is always preferable to predict within a range rather than predicting a single number. It is also important to base your estimate on as many data points as possible.

If you are attempting to predict vibration for the first blast at a site, you will have to rely upon your experience at predicting and on as many of the blast and geological parameters as you can quantify.



7. Predicting Airblast or Air Over-Pressures

In a manner similar to vibration, air overpressures from blasting can be predicted, however Cube Root Scaling is used rather than square root.

The curves that follow are based upon data gathered from blasts in many varied locations and from research done by various individuals and organizations. Again, due to variables, many of which are difficult to quantify, data points for a given event may fall above or below the bounds shown on the graph. Results are approximate at best because wind velocity and direction can fluctuate widely in a very short span of time.

The prediction curves use a basic formula for estimating air overpressures:

$$\textbf{Peak Air Overpressure (in PSI)} = K \left(D_S \right)^{-1.2}$$

where $\mathbf{D_S}$ is the Cube Root Scaled Distance (as previously defined).

The curves representing the normal upper and lower bounds for confined charges and for the average for unconfined charges use combined **K** factors (intercepts at a D_s of 1) as follows:

Lower bound for normal blasting	0.78
Upper bound for normal blasting	2.5
Average for unconfined charges	82

The attenuation slope of **-1.2** is typical for static conditions and represents a reduction of approximately 7.2 dB for each doubling of distance. Some researchers have used attenuation slopes as flat as -1.0 or -1.1; however, the difference in pressures from using those slopes does not become a major factor until a considerable distance has been reached. If the airblast is caused by detonating high velocity explosives in mid-air, the actual slope may approach -1.3 or -1.4. This steeper slope would be the result of the higher frequencies decaying more rapidly than the lower frequencies that result from conventional blasts.

In addition to charge weight and distance (which impact the Cube Root Scaled Distance), the following factors affect the intensity of air overpressures or airblast:

Depth of burial of the charge

Terrain features, trees and foliage or other screening

Blast face orientation (facing toward the recording point increases the intensity recorded)

Velocity of blast progression (either across the face or along the surface)

Explosive composition (This can affect the elapsed time of energy release. Compared to other factors, this is minor and can normally be disregarded for most conventional in-ground explosive products)

Atmospheric conditions such as:

- Changes in Barometric Pressure - minimal effect that can normally be disregarded.

- Humidity - normal daily fluctuations may be disregarded; however, the difference between a very dry day and a rainy one can be noticeable.

Temperature gradients -

Normal (cooler with increasing altitude) - sound is refracted upwards and the blast may not be noticeable at a distance.

Inversion (warmer with increasing altitude) - sound is refracted downwards and the blast may suddenly become noticeable at a distance.

Note: A temperature inversion has little effect in the immediate area of the blast and usually only affects airblast intensities beyond a radius equal to the height of the inversion layer. Rather than focusing airblast and causing damage, a temperature inversion usually results in the blast suddenly becoming audible at a greater distance.

Wind direction and velocity - These have a major impact on air overpressure intensity. Downwind from the blast, the intensities will not dissipate as rapidly as they would upwind from the blast. Also, because wind velocities typically increase as you move upward from the ground surface, the wave front is being bent downward. This can add from several to 20 or so decibels to the intensity.

Wiss (1978) suggested that one may attempt a rough approximation of the effect of wind direction and velocity by modifying the attenuation rate of -1.2 by adding to it the result of:

Additive = 0.0265 V cos A

where **V** is the wind velocity in mph,

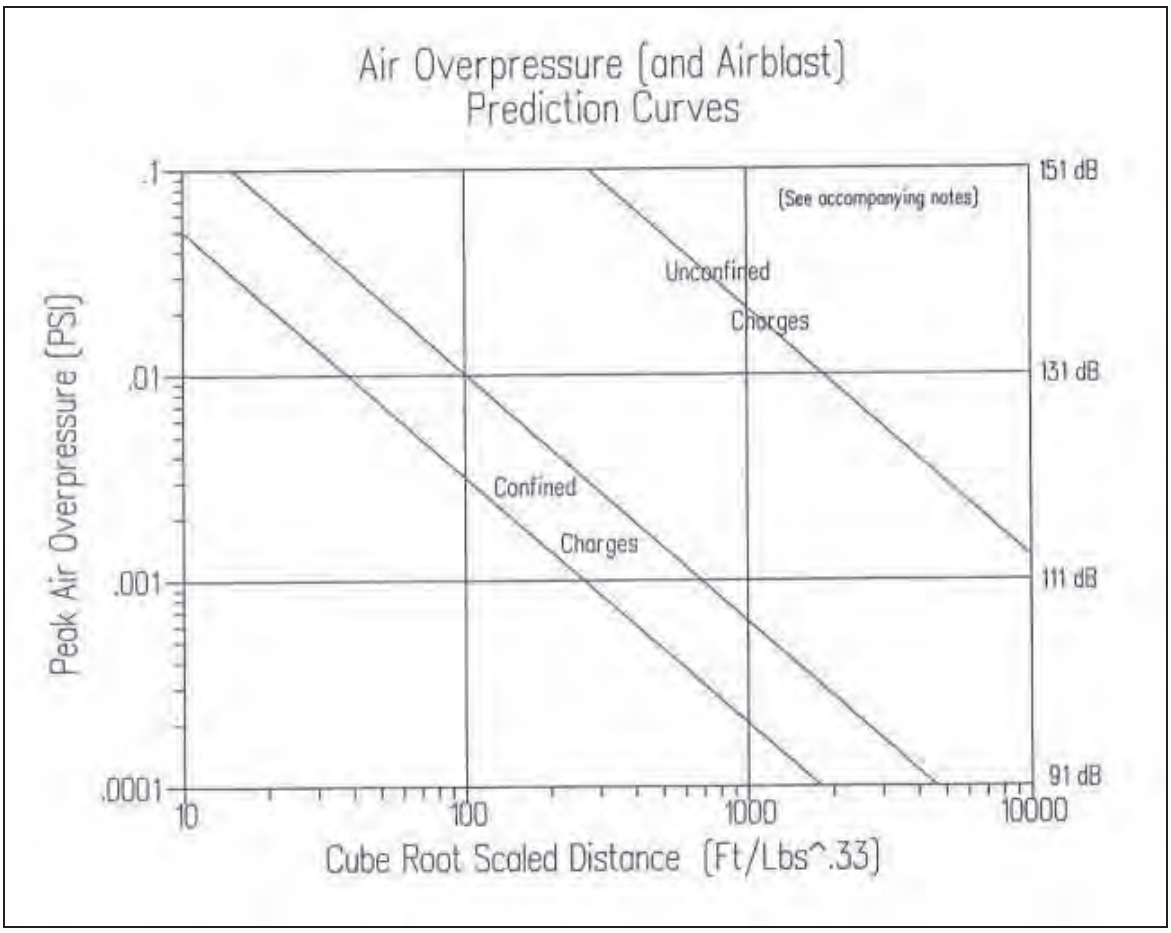
and **A** is the angle (in degrees) between the wind direction and a line from the blast to the recording point.

(Wind blowing from the blast directly toward the recording point would be 0 degrees, resulting in an attenuation rate lower than -1.2. Conversely, a wind blowing directly away from the recording point would be 180 degrees, resulting in an attenuation rate that is higher than -1.2.)

(CAUTION: The above modification of the attenuation rate was derived from data gathered from blasts during wind conditions up to a maximum of approximately 30 mph. At wind velocities in excess of this, the formula can result in a slope that is flat or inverted. Such a slope would result in predicted blast air overpressures that would remain constant or increase with distance, a situation which is not physically possible.)

In addition to the cautions concerning charge weights and delays mentioned in the previous comments on predicting vibration, it is important that the shortest distance through the air be used as the distance for predicting airblast. Depending upon the terrain, this may not always be a straight line.

The estimation of air overpressures is considerably more difficult than estimating vibration due to weather variables that can change from moment to moment. For this reason, it is usually advisable to allow for a greater margin of error when estimating air overpressures and airblast. Gathering data for specific sites and carefully noting weather conditions at blast times can assist in building accurate prediction curves for specific operations or specific sites.



8. Blast Vibration Regulatory Limits

U. S. Bureau of Mines -

In 1974, the Bureau of Mines began a study to gather and update available blast vibration data. Work was included in the area of structural and human response to vibration. This resulted in the publishing in 1980 of Bureau of Mines Report of Investigations 8507, *Structure Response and Damage Produced by Ground Vibration From Surface Mine Blasting*. Some of the conclusions contained in the report are as follows:

1. Peak Particle Velocity is the most practical descriptor of vibration as it applies to the damage potential for residential structures.

2. The potential for damage to residential structures is greater with low frequency blast vibration (below 40 Hz) than with high frequency blast vibration (40 Hz and above).

3. The type of residential construction is a factor in the vibration level required to cause damage.

4. Alternative blasting level criteria were proposed that utilized limits over a wide range of frequencies and included consideration of some limits on displacement. A graph containing the RI 8507 alternative criteria is included at the end of this discussion.

Office of Surface Mining and Reclamation Enforcement (OSMRE) -

In 1983, the OSMRE established regulations controlling vibration at all surface coal mining operations. Three optional methods of limiting vibration are allowed:

1. The first option limits Peak Particle Velocity based upon the distance to the nearest protected structure. Each blast must be monitored by a seismograph. Velocities must be kept at or below the following levels at said structures:

Distances up to 300 feet ..... 1.25 inches/second

Distances of 301 to 5000 feet ..... 1.00 inches/second

Distances beyond 5000 feet ..... .75 inches/second

2. The second option does not require monitoring, but requires the operator to design his blasts utilizing Scaled Distances (D_S). The calculated Scaled Distances must not fall below the following values:

Distances up to 300 feet 50

Distances of 301 to 5000 feet 55

Distances beyond 5000 feet 65

3. The third option requires an operator to monitor his blasts with a seismograph and allows the use of Particle Velocity limits that vary with frequency, similar to the Alternative Blasting Level Criteria proposed in RI 8507 by the Bureau of Mines. The OSMRE option differs from RI 8507 in two areas: (1) it does not differentiate between drywall and plaster-on-lath construction, allowing 0.75 inches per second for either case, and (2) it allows a Particle Velocity of 2.0 inches per second to be acceptable down to a frequency of 30 Hz rather than 40 Hz. A chart depicting this option is included on the following pages.

An analysis of the three OSMRE alternatives indicates that the second option, while not requiring recording, is quite conservative. This option could be feasible in remote locations where distances to structures were large. The third option will usually provide the operator with more flexibility, particularly for close-in blasts where frequencies would be higher.

Other blast vibration limits have been proposed for specific instances and applications. It is not unusual to find PPV limits approaching 0.5 inches per second for fragile or historic structures. These situations should be evaluated and limits applied on a case by case basis.

It is also not unusual to find instances where the limit for a residential structure is incorrectly applied to massive concrete structures, buried pipelines and other vibration resistant structures. In many of these, a far better approach would be to use a ground control specification rather than vibration limit. The damage potential more likely would come from back-break or rock-block movement than from blast-generated vibration.

9. Airblast Regulatory Limits

Bureau of Mines Report of Investigations 8485 (1980), "Structure Response and Damage Produced by Airblast From Surface Mining" generally recommends a maximum safe overpressure of 0.014 psi (134 dB) for airblast recorded at residential structures.

The OSMRE addressed airblast limits in their regulations of 1983. However, they also took into consideration the characteristics of the recording systems and established the following limits:

Recording device with a lower frequency response limit of 0.1 Hz ..... 134 dB *

Recording device with a lower frequency response limit of 2.0 Hz ..... 133 dB

Recording device with a lower frequency response limit of 6.0 Hz ..... 129 dB

Recording device C weighted, slow response …….. 105 dB *

* These can be used only with prior approval of OSMRE.

Generally, the above USBM and OSMRE limits on blast vibration and on airblast are quite conservative as they would apply to the potential for actual damage. It would appear that they were developed more for reducing human annoyance than to prevent damage to residential structures. Residential structures and humans are rather sensitive “seismographs”, although they tend to not be calibrated well. Buildings respond to minor vibration and to air overpressures by rattling windows and making other sounds. When the occupants hear these, the overall effects tend to be amplified. For this reason, it is important that blasters and blast designers strive to minimize the adverse effects of blasting as much as possible.

Important: The fact that blast vibration and airblast are kept below accepted standards does not guarantee that claims for damage will not be made (although the occurrence of actual blast-induced damage would be extremely unlikely).

10. Blast Recording

Definitions:

Seismograph - an instrument that writes a permanent continuous record of motion. A seismograph's physical constants are known accurately enough that it can be calibrated. The motion is recorded against a time base, allowing for the calculation of acceleration, displacement, velocity and frequency.

Transducer (or **sensor**) - an individual device that converts motion or pressure to voltage or capacitance.

Geophone or **Geophone block** - a housing that contains three motion transducers mounted in mutually-perpendicular axes; longitudinal, transverse and vertical.

Longitudinal axis - horizontal and oriented to record radial motion emanating from the source. The direction of the arrow on the geophone block. Motion to and from the source.

Transverse axis - horizontal, but oriented 90 degrees from the longitudinal axis. Motion from side to side.

Vertical axis - vertical, oriented 90 degrees from other two axes. Motion up and down.

Seismographs could be constructed with sensors to record in terms of particle velocity, particle displacement or particle acceleration. It is conventional in blasting, however, to record velocity. Modern units are also capable of recording the output of other types of sensors such as strain gauges, pressure transducers, etc.

We monitor the effects of blasting (1) to defend against claims of damage, (2) to comply with job specifications or regulatory or permit limits, (3) for in-house use such as slope stability or protection of owned facilities, (4) gauge the effectiveness of our blast designs, and (5) for research purposes.

A blasting seismograph is a four-channel, self-triggering recording device. It can usually process the data and print results in the field or store events for later download to a computer, or both. It is a sophisticated instrument, but it can't differentiate between a blast and other sources of motion, such as that from nearby operating equipment, heavy feet or a car door slam, etc. Most seismographs can also be accidentally triggered by a nearby source of RF (radio) energy.

Blasting seismographs are usually programmable for:

Operating mode - single shot, continuous (several shots), manual trigger, or histogram (strip chart).

Trigger source – ground vibration or airblast, or both.

Trigger level - The intensity level that will cause the seismograph to start recording.
In order to make sure the event is recorded, use the lowest trigger level consistent with avoiding false triggers. Trigger on airblast alone only if absolutely necessary. (Bear in mind that pressure waves travel much slower in air than vibration does through the ground. Depending upon the distance from the blast and the size of the pre-blast data buffer in the instrument, the ground vibration may have already passed through the recording point before the instrument would be triggered by airblast.)

Recording duration - How long the seismograph will record after it has been triggered.
Set the recording duration sufficiently long to record the entire event, including airblast. A good rule of thumb is to use the total blast initiation system time and then add one second for every 1000 feet (or portion of 1000 ft) of distance from the blast.

Geophone location.

The geophone should be located on the ground near the base of the structure to be protected. Optionally, it can be located at an interim site closer to the blast in the case of great distance and/or small charge weights. If at all possible, record on original ground rather than fill.

Do not record blast vibration:

On structures (unless that is the only possible location or is mandated).

Over hollow spaces or areas of subsidence.

Immediately adjacent to posts, poles or any other object that could oscillate and contribute to the motion in that specific location.

On grass, leaves, mulch, planter mix, loose soil or near trees and their roots.

Be specific in your documentation as to the monitoring location. Relate it to some permanent landmark. Be accurate. Don't estimate distances, measure them.

Geophone orientation should be level and with the longitudinal sensor (usually indicated by an arrow on the geophone case) pointing toward the blast.

If for some reason you are required to record on or in a structure, align the longitudinal sensor parallel with one wall, preferably pointing closest to the direction of the blast. In these instances, it is advisable to also place a second seismograph outside the structure and align its geophone so that its sensors are parallel to the ones inside. (Bear in mind that, in this instance, you are recording the structure's response to ground motion rather than the ground motion itself.)

Geophone Anchoring.

Proper coupling to the ground surface is very important. A geophone block that slips, bounces or rocks will result in readings that contain artificially high velocities and artificially low frequencies.

Possible anchoring methods (listed from best to worst):

bolting

epoxy

burying

spiking

wax

double-sided tape (carpet tape)

holding in place (not advisable unless you are an experienced operator)

merely resting on the surface

The use of sand bags or shot bags is questionable unless protection from flyrock is required. If used, make sure that the sand bag is firmly in contact with the ground surrounding the geophone block. A sand bag may raise the center of gravity of the geophone block and will not stop rocking or sliding above approximately 1/3 of a G.

The anchoring method required is determined by the amount of acceleration that is anticipated. See the attached graph for Seismograph Geophone Anchoring Recommendations.

Accelerations do not have to be very high to cause a geophone block to slip or rock. It can be shown that a combination of 1/3 G of vertical acceleration, when combined with 1/3 G of horizontal acceleration, can cause a poorly-anchored geophone to slip.

Recording airblast.

When recording blast vibration, <u>always</u> include the recording of airblast. Structures may respond to airblast that you cannot readily hear and can result in creaking, rattling or other internal noises. Many blast vibration complaints are actually the result of airblast-induced structure motion rather than ground vibration.

Orient the microphone at least 3 feet above the ground and away from walls, internal corners or other reflective surfaces. Although most microphones are omni-directional in the frequency range of most airblast, point them toward the blast. This will avoid the problem of someone thinking you are "cheating".

Record linear, peak air overpressure levels (either in dB, psi or in Pascals). Do not use A or C weighting as is common in conventional noise recording. A or C weighting will not properly record the low frequency air overpressures that are the cause of most structure response complaints.

A graph showing the attenuation curves for various sound-weighting schemes follows. The weighting curves shown are intended to duplicate the hearing capability of the human ear at various intensities. (A is for low Sound Pressure Levels, B is for medium SPLs and C is for high SPLs.) The horizontal line at 0 dB represents the linear, un-weighted sound level. If human annoyance was the concern with airblast, these weighting curves might apply. Our main concern, however, is structural response and sound weighting is not appropriate in this instance.

Care of the seismograph.

The leading problems experienced by seismograph users are usually caused by:

1. Dirt in the printer/plotter. Don't leave the instrument (and especially the printer compartment) open in the field. When stowing the geophone, microphone and microphone stand, wipe off the dirt and mud before putting them in the accessory compartment. Vacuum out the unit occasionally.

2. Failure to keep the batteries charged. A fully-charged instrument should monitor for one or two weeks or longer before the battery becomes too low to power the instrument. Follow the manufacturer's instructions on charging the battery. The better units utilize a voltage regulator that will not allow the battery to overcharge, even if it is left on the charger for extended periods of time. If the battery will not hold an adequate charge, the unit probably needs servicing.

It is important that the time and date on the instrument's clock be reasonably accurate. This ties the record to a specific event. This is especially important if you are using the instrument in a continuous monitoring mode and are leaving it set out to record a series of events.

Seismograph Calibration.

When monitoring for legal protection purposes, have the instrument calibrated annually, but absolutely no less often than 18 months. Some agencies mandate a factory calibration within the preceding 12 months or, in some instances, more often. Between calibrations, the instrument's self-check is usually sufficient to verify that the sensors are functioning properly and that the geophone is sufficiently level to provide an accurate reading.

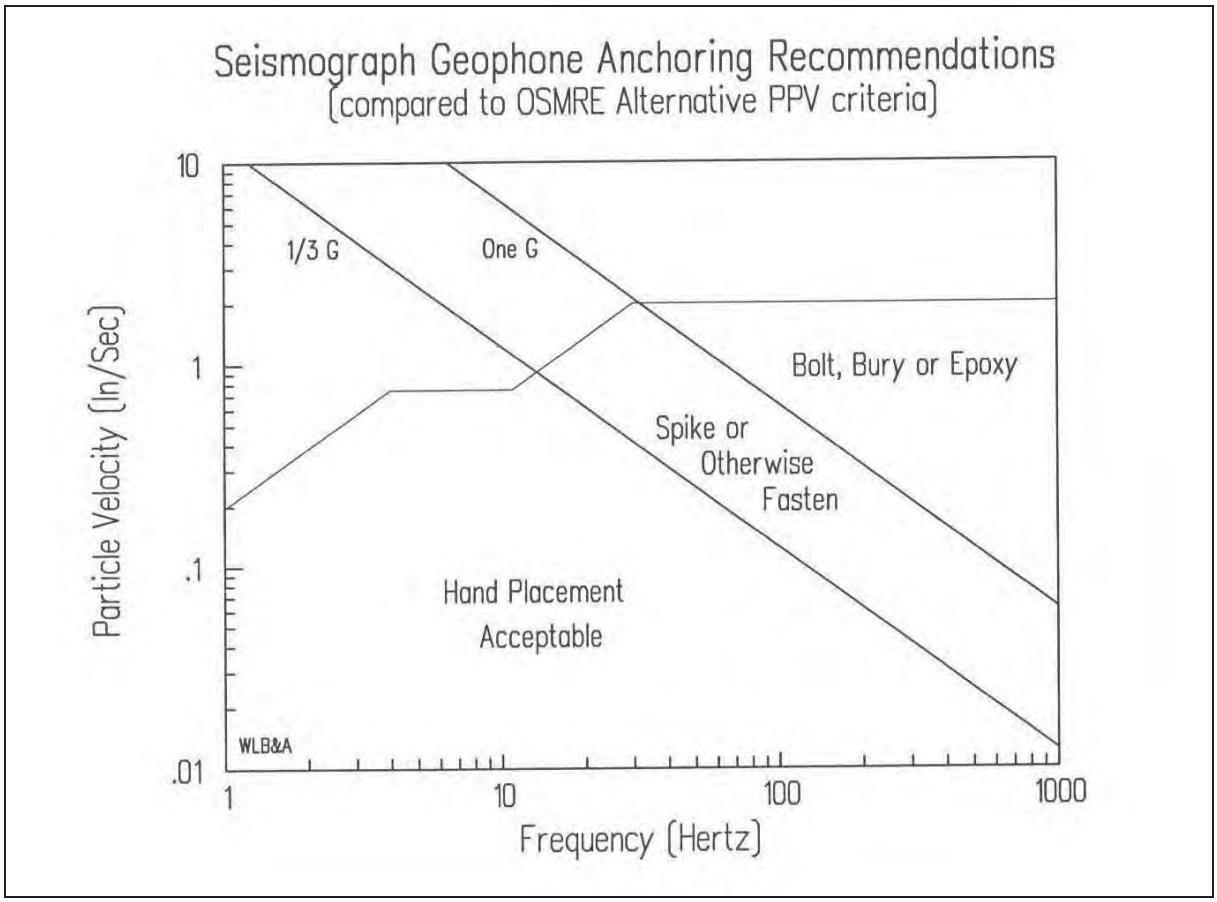
Failure to record.

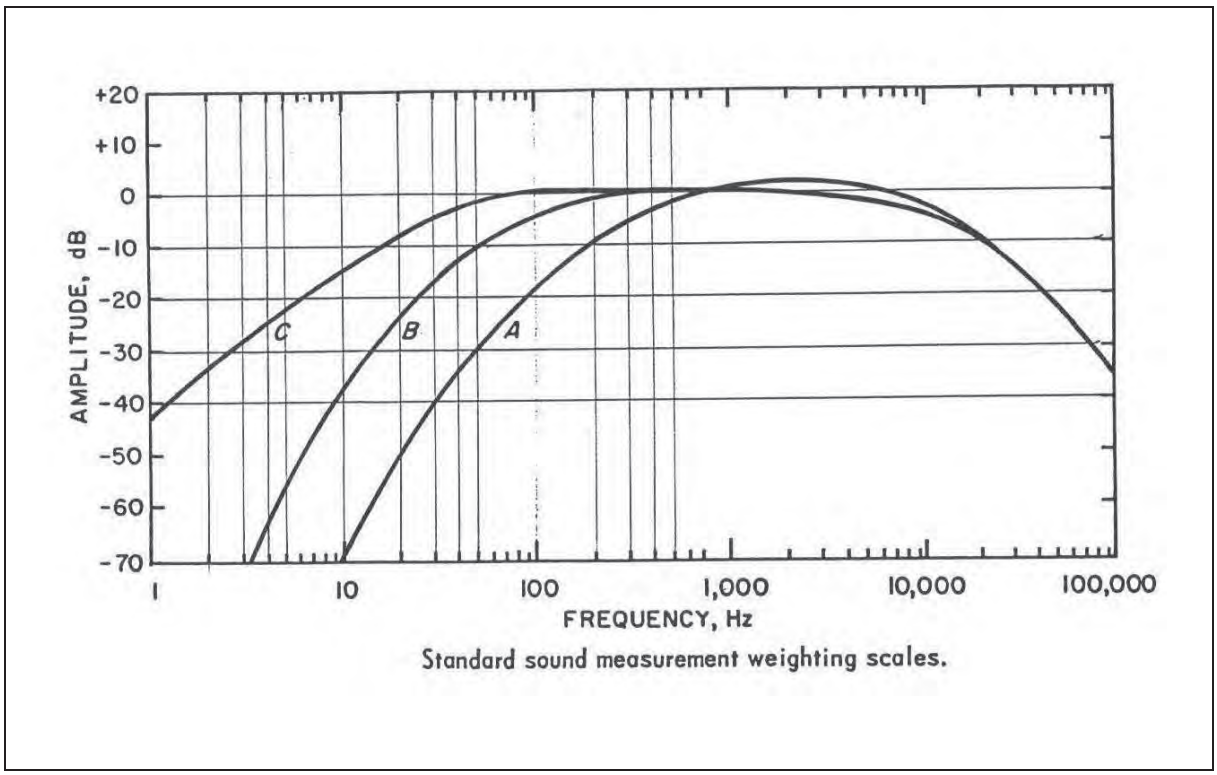
If for any reason the seismograph fails to trigger and record a blast, the seismograph operator should fill out a form (similar to the one that follows) to certify that a proper attempt was made. The document should be filed with the blast report. If at all possible, determine the reason for the failure and take corrective action. If the distance was too great and/or the vibration intensity too low to trigger the instrument, either lower the trigger level or move the instrument closer to the blast for future attempts. It is far better to extrapolate a known result than to have to estimate the blast vibration intensity.

Seismograph limitations.

Aliasing - A digital sampling phenomenon that occurs when the highest frequency of the vibration exceeds half the sampling rate of the instrument. This phenomenon will usually show up as a high frequency wave (that is usually correct) superimposed over a low frequency wave (that is incorrect). An anti-aliasing filter can prevent this from occurring in properly designed seismographs. Most modern blasting seismographs record at a minimum sampling rate of 1024 samples per second per channel. At the universally accepted four to one ratio, this provides a satisfactory frequency response for field use of up to 256 Hertz. It should be noted that, for research work, it is customary and preferable to use a ten to one (or higher) ratio.

If the instrument has an anti-aliasing filter and you are recording in very close proximity to the blast, the higher frequencies may be filtered out.





Standard sound measurement weighting scales.

11. Designing Blasts to Minimize Vibration

Before proceeding, it is very important to understand (and all successful blasters do) that most of the parameters involved in blast design are interrelated or interactive. By this we mean that making a change in one parameter will have an impact on the others and could necessitate additional changes.

With the understanding that efforts at correcting one problem could possibly lead to others, let's look at what we can do with blast design to reduce vibration. Blast vibration is affected by the following list of variables. These are in turn modified by blast design parameters as indicated.

Variables over which the blaster has no control -

1. Distance - The farther from the blast, the less vibration, however you have to blast the rock where you find it.

2. Site geology - As the distance between the blast and the recording point increases, geology plays a somewhat larger role in the vibration frequency and how quickly the vibration dissipates. While this variable may be technically interesting to some, its impact is minor due to the normal rapid dissipation of blast vibration with distance.

Variables over which the blaster does have control -

1. Quantity of explosive per delay - This is one of the major factors in controlling blast vibration. Blast design parameters that affect this would be hole diameter, number of decks, initiation scheme, etc. Generally, reducing the quantity of explosive per delay will reduce the vibration generated, but the powder factor must remain high enough to adequately fracture the material.
(See number 3 following.) Most blasters avoid decking if at all possible because it is labor intensive. Decking not only provides some reduction in blast vibration but, in certain instances, can yield better fragmentation.

2. Confinement of the explosive energy - Another major variable in blast vibration. Confinement is affected by burden and spacing, the quantity (and quality) of stemming, drilling accuracy, amount of sub-drilling and primer location, all as they relate to the quantity of explosive. Highly confined blasts (such as pre-splitting) generate higher vibration levels per unit weight of explosive. Mud-capping of boulders generates less vibration per unit weight of explosive (but much higher airblast). If a certain amount of throw or heave is acceptable, or if means are employed to prevent excessive throw, reducing burdens will lower vibration levels appreciably. However, one must be careful of increased airblast.

Bottom initiation will generally result in slightly more vibration than top initiation; however, the need to adequately break or pull the bottom usually outweighs any vibration benefit that might be gained from shooting from the top down.

3. Powder factor - Affected by almost all of the blast design parameters. The key here is to use as close to the optimum amount of explosive as possible and to distribute it through the material to be blasted in such a way as to adequately fracture and shift the mass. Too low a powder factor will not adequately fragment the material and a large portion of the available energy will be lost as seismic energy resulting in higher blast vibration. Too high a powder factor can result in flyrock along with higher airblast and vibration.

4. Explosive/borehole coupling - Although this has some minor effect on vibration, reducing coupling is seldom tried. Pre-splitting uses decoupled charges, but still results in high vibration levels because the increased confinement (the burden is far greater than normal) has a greater impact on vibration than the decoupling. Because of the difficulty in implementing it, reducing vibration by decoupling explosive charges is normally not utilized.

5. Spatial distribution of the energy source - This is a phenomenon that is a possible means of reducing vibration and can also increase the frequency of the vibration. Two examples of this are: (1) Two holes containing 100 lbs each and detonated simultaneously will generate less vibration than one hole containing 200 lbs. To take good advantage of this concept, the holes or decks detonating simultaneously should be separated by some reasonable distance, say half the width or half the length of the blast, whichever is greater. The more distance, the better. Adjacent, or nearly adjacent, holes or decks detonating simultaneously will benefit minimally from this effect. (2) A second example would be a long column of explosive generating less vibration than a spherical charge of the same weight because it is imparting vibration to a greater area. There have also been instances where a quarry or open pit mine might detonate two distinctly separate blasts simultaneously, with neither contributing appreciably to the vibration of the other.

6. Timing of energy release - Most regulatory agencies specify a minimum of 9 milliseconds (ms) between detonating charges, considering all explosives detonating within any given 8 ms time period to have detonated in the same instant. This is done solely for determining explosive weight for Scaled Distance calculations. In actual practice, delays of 5 ms to 9 ms can minimize vibration in very close-in blasting situations (say 10 to 25 feet). As distance increases, 9 ms will yield less vibration than shorter delay periods, but will not yield the minimum possible. The optimum time delay will depend on site-specific variables, but will tend to be in the range of 17 to 50 ms, with the higher delay being applicable only in larger blasts.

In the matter of selecting delay timing, some organizations have advocated a process that records the results from detonating a "signature" hole, and then using a computer program to superimpose identical waveforms over one another at differing time intervals in an attempt to find some optimum delay time that appears to offer the least amount of vibration. While this seems theoretically possible (and is easily accomplished mathematically), the method has met with only limited success. The biggest drawback is that it does not consider blast geometry, direction of initiation propagation and other blast parameters, factors which play an important part. It also assumes that the geology is consistent in all directions, a situation which may not exist.

There is a simpler method of the foregoing process that has met with some success where it is desirable to limit vibration in just one direction. The vibration resulting from a single signature hole (with burden, size and loading parameters being identical to a production hole) is recorded at several locations along a line in the direction of interest. A frequency spectrum analysis or Fast Fourier Transform (FFT) is then accomplished on the recorded data. A search is made to find one or more frequencies at which the ground in that direction does not readily transmit energy. This frequency is then converted to a delay time between detonating charges. If a realistic time can be found, a production blast is designed and detonated to test the timing. Basically what is done is to find a frequency that the ground doesn't readily transmit and then to try to pulse it at that frequency.

In considering either of the above two methods, it is very important to understand that: (1) The geology needs to be reasonably consistent between the blast and the structure or in the direction of interest, and (2) the method used to reduce blast-generated vibration in one direction may very well increase it in another.

7. Blast orientation. The maximum vibration will tend to be in a direction opposite to that in which the material is being heaved or thrown. By changing the direction of throw, you may also change the direction of maximum vibration, but usually only in a minor way. Again, be aware that, while you may be reducing the vibration in one direction, you may very well increase it in another. In most open pit mining operations, the geology will allow the rock to pull better in one direction than in others and the orientation of faces may have to be largely determined by geology, property boundaries and/or mining methods.

<u>For conventional blasting, remember that the most efficient blasts will also have the lowest vibration levels.</u>

12. Designing Blasts to Minimizing Airblast

From the causes of airblast listed earlier, we can readily see what steps need to be taken to reduce or prevent airblast. Exposed explosives charges and surface detonating cord trunk lines should never be used in urban situations.

We will assume here that you are using proper blast designs with normal burden, spacing and powder factors. If this isn't the case and you are experiencing excessive airblast, you may need to revisit your basic blast designs and compare them with well established standard criteria.

The main cause of high frequency airblast tends to be holes blowing out, either by ejecting the stemming or by venting through mud seams. Check your stemming quality and quantity. It's conventional to use drill cuttings for stemming holes because it is convenient. Cuttings, however, are not the most efficient stemming material. Pea gravel or any round stone is the worst. (Remember, shot in a shotgun load is round…..) Any fine material that turns into a slurry when loaded in a water-filled hole will also blow out quite readily. The best stemming material is angular crushed stone. Research has shown that the best size would be approximately $1/17^{th}$ of the borehole diameter. If you can readily obtain something close to this and use the correct quantity per hole, you should be able to confine the energy rather than letting it vent to atmosphere. It will take some experimenting, but the correct stemming height should be close to 80% to 100% of the burden dimension. You may find that this can be reduced if you are using the correct stemming material. The amount required is indirectly proportional to the quality. If the correct size of stemming is in short supply, at least pour a couple of feet of it directly on the explosive column and fill the remainder of the hole with drill cuttings.

To prevent holes from venting to the atmosphere in other ways, you should have your driller log the holes, watching for mud seams. When there is an obvious weak zone or cavity in a hole, it would be advisable to stem through it and resume loading (with another primer) once you are past the seam or weak zone.

Videotaping your blasts will greatly assist in troubleshooting sources of airblast from either of the above two causes.

Low frequency airblast can be caused when the velocity of initiation along a free face approaches or is above the speed of sound. This can also occur in a row of holes on the surface of the blast. The speed of sound in air at sea level is a little over 1100 feet per second. 1 millisecond of delay per foot of spacing results in blast progression of 1000 feet per second and 2 milliseconds per foot would be half of that, or 500 feet per second. It has been found that reducing the velocity of blast progression along the face to half the speed of sound or slower reduces this cause of airblast considerably. It is important to remember, however, that the delay timing should not be increased to the point of causing misfires through cut-offs in initiation systems or explosive columns. You must design for a buffer zone of several or more rows of holes between a hole that is detonating and detonators in holes where the initiation signal has not been received. If this is not done, misfires are often the result. Many successful blasters prefer to use delay timing between holes in a row of 2 ms to 5 ms per foot of burden. Many also prefer to use delay timing from row to row that is double, or nearly double, the delay timing in a row. Following these initiation design procedures will usually bring the blast progression below half the speed of sound and should prevent excessive low frequency airblast from this source.

Important: In your search for the reduction of airblast, do not compromise safety by causing misfires. In the above adjustments to blast progression, it may become necessary to increase your down-hole delay time so that a sufficient buffer zone exists.

If production requirements allow, it could also prove beneficial to schedule your blasts to take advantage of times when winds are blowing in a favorable direction or to take advantage of calmer wind conditions.

13. Blast documentation

It is extremely important to have adequate documentation of your blasts. This is more than just properly accounting for the explosives that you consume in your blasting operations. You must have a document that completely describes the blast. This can be in any format that you find convenient, but it must be accurate and it must be complete.

A good test to determine the adequacy of your blast documentation is to see if you (or better yet, another blaster) could reproduce the blast, in detail, solely from the data on the blast report. Any additional information that you have to provide from memory in order to reproduce the blast is information that should have been included on the original report.

Why is it critical to be able to reproduce a blast and to do so accurately? Assume for the moment that someone has filed a damage claim against you for a blast on a specific day. Most people (including judges and juries) who do not have first hand experience with blasting and blast effects, will tend to believe that blasting can cause all manner of structural damage and defects. Unless you, with or without your experts, can prepare a defense that proves that the damage could not have been caused by the blast in question, it is quite likely that you will be held responsible for the damage claimed.

To disprove a damage claim, one of the facts that must be established is the maximum amount and nature of blast-generated ground vibration that would have been experienced at the site of the damage claimed. Hopefully, you recorded the vibration with a blasting seismograph. If not, people knowledgeable in blast vibration can make acceptable estimates and testify as to the highest level of vibration experienced, but they need good blast records on which to base their calculations. They will be primarily interested in the specific location of the blast, the highest charge weight per delay and the time separation between delays. They should also have information on the orientation and geometry of the blast, the specific timing pattern utilized, type(s) of explosive used, burden, spacing, hole count, hole diameter and depth(s), stemming height, etc. These will help in estimating the amount of confinement of the blast.

If you monitored the blast for vibration and air over-pressure (airblast), all the better. Bear in mind that the specific location of the seismograph must also be noted. Try to relate the location of the seismograph to relatively permanent landmarks so that the location can be reconstructed a year or two later. Even when you monitor a blast, good blast documentation is important. The seismograph tape is only half the picture. You also need to know what caused the amount of vibration or air over-pressure that was recorded.

A couple of additional comments regarding blast documentation are in order:

(1) Blast records filled out in the field and in the blaster's own handwriting, signed by the blaster, are far better in court than a computer-generated printout (that might have been put together some time after the blast in question).

(2) Be accurate. Don't list a charge weight of 15 lbs and a distance of 500 feet if the real charge weight was 16.5 lbs and the distance was actually 475 feet. For the highest charge weight per delay, don't just divide the total explosives weight by the number of delays and then list the result. Put down the actual largest charge weight per delay that was loaded in the shot. Finding an inaccuracy on a blast report will probably lead an opposing attorney or the plaintiff's expert to argue that the rest of your records cannot be trusted.

Every blaster has his own favorite blast report format. A sample blast report form is included on the next page. Regardless of the format you use for the details, always include a diagram of the blast.

BLAST REPORT

BLAST IDENTIFICATION AND DATA:

14. Exploding Myths

Through the years there have been a number of strange theories, processes and phenomena that have come to the attention of blasting consultants, forensic specialists, geophysicists and others involved in addressing blast effects. Some of these were proposed by well-intentioned, but otherwise inexperienced persons, while others appear to have been dreamed up by individuals (some of whom were highly educated) in an attempt to explain some otherwise impossible situation. It might prove enlightening to look at a few of them.

Myth 1. Concrete can be readily damaged by blast vibration.

Most concrete slabs, walks, etc. will develop cracks over time for any number of reasons, but external vibration is not one of them. Explosive charges in or under concrete may cause damage to it, but this would have been the result of rock-block movement, cratering, or by heaving the concrete upward. If it was possible to crack concrete with vibration, concrete demolition work would be much easier and far less expensive. Among the normal causes of concrete damage are inadequate soil compaction, tree roots, normal curing shrinkage, heavy traffic, etc.

Myth 2. A pre-split crack can be used to control vibration.

Blasters, and even some fairly knowledgeable consultants, have fallen into this trap. While an abrupt canyon wall may attenuate surface waves, a pre-spilt crack will not make an appreciable difference in vibration attenuation except in very close proximity to the charge. A pre-split plane has a finite length and depth and vibration will go around it. The crack is not sufficiently open, having numerous contact points that will transmit vibration. As early as 1965, the Bureau of Mines (RI 6695) investigated this as a possible means of reducing ground vibration. In 1975, the Explosive Excavation Research Lab of the U. S. Army Engineer Waterways Experiment Station in Livermore California conducted its own study (Tech Report E-75-2). Both agencies determined that a pre-split fracture plane was ineffective as a buffer for vibration. In some instances, more vibration will result from a pre-split blast than from conventional production blasts with normal burdens.

Myth 3. Damage can be expected to occur automatically if blast vibration standards are exceeded.

Blast vibration standards in current use are quite conservative. As previously mentioned, it would almost appear that some of them were formulated for human response factors rather than to prevent damage. There are numerous instances where the limits spelled out in these standards have been exceeded, sometimes by double, without causing any damage.

The blaster should be cautioned however that, in refuting a claim of damage, it is not sufficient to use as his sole defense the argument that his blast vibration and airblast were within specified limits. That may form part of his defense, but it is much more important to base it upon some other type of irrefutable evidence.

Myth 4. Blast vibration can travel underground along some geologic layer or discontinuity and then suddenly come to the surface at some distant point and damage a structure.

This theory is usually proposed when an “expert” is trying to explain why he feels a complainant’s residence was damaged while other structures much nearer the blast were not adversely affected. We can mostly thank texts that describe seismic refraction theory for handing us this problem. Even though there are an infinite number of rays in waves that emanate from a detonating charge, to simplify refraction theory, the diagrams normally only show a single ray traveling from the charge down to a layer, thence along the layer, and finally coming back up to the recording device on the surface. This ray represents the ray with the earliest arrival, not the largest motion. Depending upon the distance from the blast, the largest motion would probably have been a surface wave.
No structure or portion of the ground between the detonation and the complainant’s residence escaped also being affected by passing seismic waves. If damage did indeed occur to the subject residence, there should also be evidence of damage at others closer to the blast.

Myth 5. Airblast was reflected off of a cloud layer / inversion layer (pick one) and focused on the complainant's residence causing damage.

As previously mentioned in the discussion of temperature inversions, the effect only occurs at an extended distance from the blast. The airblast from normal blasts at that distance has diminished to a point well below that capable of causing damage. If windows weren't also broken between the complainant's home and the blast, this damage from reflection theory falls short.

Myth 6. Vibration energy was trapped in a waveguide, causing it to travel much farther from the blast, eventually causing damage when it surfaced.

While one may occasionally find conditions in nature similar to a waveguide, they are fairly rare. The most common of these might occur when a layer of alluvium overlays solid rock. In this situation, vibration waves in or on the alluvium might not diminish as rapidly as they might have if the condition did not exist, but they will still be diminishing rapidly with distance. The vibration closer to the blast would have been of a higher intensity and if there was damage at the distant location, it would have also been accompanied by damage closer to the blast.

In addressing and refuting some of the foregoing myths, a useful tool as suggested by Oriard (1999 and 2002) is called the **Scale of Effects**. Scale of Effects comes out of earthquake technology where it has been used for years to identify zones of similar damage around the epicenter of an earthquake. Within a given zone, damage levels will be relatively similar and can be assigned to a specific intensity level on the Modified Mercalli scale. Higher numbers, closer to the epicenter, indicate the higher levels of damage. As the distance from the epicenter becomes greater, the decreasing levels of damage result in zones that are assigned lower numbers. In all cases, the numbers are assigned based upon ranges of actual documented damage or effects. For a further discussion of the Modified Mercalli scale or earthquakes in general, the reader is referred to a good earthquake text, to Richter's book or to one of Oriard's books listed in Appendix D.

To use the Scale of Effects for evaluating blast vibration damage, one must consider the following question: "*If the damage claimed was indeed caused by the blast, what other effects would have had to have occurred at the same time?*" Often the damage claimed would have required extremely high levels of vibration, yet other far more sensitive objects nearby were not harmed.

A classic example of this occurred in Southern California some years ago. The owner of a $7 million home claimed damage from blasting that took place approximately a half mile away. The damage claimed included cracks in the concrete garage floor, swimming pool, pool deck, chimney and plaster, a broken PVC water line, cracks in a paved tennis court, and displacement of opposing bathroom walls that showed separation of almost a half inch near the ceiling. In the owner's words (who happened to be an attorney), this was a "classic example of blast vibration damage". Where the Scale of Effects came into play was the fact that there were several statues delicately balanced on pedestals in the main hall of the residence. These statues would have surely been toppled and broken had the damage claimed been from blast vibration, but they were not. A second application of Scale of Effects was in the bathroom. If vibration from blasting had caused the walls to be permanently displaced outward at the top, why did it not also crack the mortar in the joints in the flagstone shower at one end of the bathroom?

It was fairly obvious that there had been some major shrinkage issues in the bathroom materials and the area in the garage that was cracked was located on poorly compacted fill. Although some of the damage claimed bordered on the ridiculous and was easily refuted, the Scale of Effects helped immensely in defending the contractor in this case.

Myth 7. Vibration from a blast acted as a triggering force when it was added to existing strain in a structure (i.e. the straw that broke the camel's back).

Strains that occur in structures start as soon as the structure is under construction and continue throughout its life. These are caused by many sources, among which are the shrinkage of building materials as they cure, expansive soils, changes in weather, temperature variations between day and night or different seasons, etc. Most of these far exceed the strain from blast vibration. The slight elevation of strain level during a blast would still fall well short of peak strains that the structure has experienced numerous times prior and would thus not be capable of being a trigger source.

If one were to monitor and document the various cracks in structures over an extended period, one would find that they would open and close on a continuing basis, depending upon the strain being generated by normal environmental sources. If you were to detonate a blast nearby during one of the phases when the cracks were relatively closed, the argument could be made that the blast vibration assisted in the healing of the cracks. Of course, this would be ludicrous, but that is exactly the same logic being used by persons who claim that blast vibration acted as a trigger source and caused the crack in the first place.

Lew Oriard (1999) also refutes this theory quite effectively. He states that, "*Because of the action of powerful environmental forces, all houses undergo large cyclic strains on a continuing basis. That simple fact alone dictates that a triggering force would have to be quite large. Otherwise the crack would already exist.*"

Myth 8. Damage from structural fatigue will result from repeated exposure to vibration from blasts.

The consensus of various segments of the engineering community holds that, for permanent deformation to occur from fatigue, strain must regularly exceed at least half of the yield strength of the structure or material. While strains generated from blasts could possibly exceed half the yield strength of a material or structure, it would take very large charges detonated in extremely close proximity to do so. Damage would far more likely be caused by block movement rather than vibration. Other types of damage would become apparent before fatigue could occur.

The Bureau of Mines in RI 8896 (1984) also addressed this issue. They constructed a house in the path of an advancing large open pit coal mine. Due to mine operational constraints, the blasting tests were discontinued when the high wall reached a distance of 300 feet from the house. At that point, because they had not been able to obtain structural damage from the blast vibration, they resorted to the installation of mechanical shakers in the structure in an attempt to cause cosmetic damage through accelerated fatigue tests. The shakers were set up to put vibration through the structure equivalent to approximately 0.5 inches per second of PPV. The frequency was set to fall within the resonant range of portions of the structure (5.90 to 9.35 Hertz).

The shaking of the structure finally managed to generate a tape joint crack and a crack in joint compound over a nailhead (basically cosmetic damage) after 56,000 cycles. This would have been the equivalent of 28 years of shaking, twice a day, from blast-induced vibration at a PPV ranging from 0.3 to 0.5 inches/second.

Appendix B - Metric Conversions

The following information is provided to facilitate the conversion of blast calculations between imperial (US) and SI (metric) units -

Official Definitions (according to U.S. and Canadian law):

1 inch (in.) = 25.4 millimeters (mm)

1 pound (lb.) = 453.59237 grams (g)

Useful Conversion Factors:

Distance:	feet (ft)	x	.3048	=	meters (m)
	meters	x	3.2808	=	feet
Weight:	pounds (lbs)	x	.454	=	kilograms (kg)
	kilograms	x	2.2026	=	pounds
Peak Particle Velocity:	in/sec	x	25.4	=	mm/sec
	mm/sec	x	.3937	=	in/sec
Volume:	cu. yards (yd^3)	x	1.308	=	cu. meters (m^3)
	cu. meters	x	.7645	=	cu. yards
Powder Factor:	lbs/yd^3	x	.93	=	kg/m^3
	kg/m^3	x	1.6863	=	lbs/yd^3
Square Root Scaled Distance:	$ft/lbs^{1/2}$	x	.45236	=	$m/kg^{1/2}$
	$m/kg^{1/2}$	x	2.2106	=	$ft/lbs^{1/2}$
Cube Root Scaled Distance:	$ft/lbs^{1/3}$	x	.3965	=	$m/kg^{1/3}$
	$m/kg^{1/3}$	x	2.5221	=	$ft/lbs^{1/3}$
Pressure:	psi	x	.145	=	Pascals
	Pascals	x	6.895	=	psi

Appendix C - Calculations for Sinusoidal Waveforms

The following equations express the relationships between Velocity, Displacement, Frequency and Acceleration for sinusoidal waveforms.

$$V = 2\pi f D \quad \text{or} \quad V = 386.1\ Gs / (2\pi f)$$

$$D = V / (2\pi f)$$

$$A = 2\pi f V$$

or

$$A_g = (2\pi f V) / 386.1$$

$$f = V / (2\pi D) \quad \text{or} \quad f = A / (2\pi V)$$

Where:

V is velocity in inches/second

D is peak displacement in inches

A is acceleration in inches/second^2

A_g is acceleration in Gs

f is frequency in Hertz (cycles per second)

π is 3.14159….

Note B - This publication will prove to be of great value to those persons or organizations who investigate claims of blast vibration or airblast damage.

EXHIBIT I

Lost Lake Recreation Area

County of Fresno wishes to remind residents and park patrons that swimming in the river is not recommended while water releases are occurring. The water flows are much higher and result in faster currents. Turn Around, Don't Drown!

Lost Lake Recreation Area is available for day use and camping.

On the San Joaquin River, two miles below Friant Dam and the town of Friant, Lost Lake Recreation Area is 19 miles northeast of Fresno. The primitive nature study area and 38 acre lake make Lost Lake one of the most popular County parks.

Lost Lake Recreation are provides individuals, groups, students, scouts, and families with multiple features and activities. These include reserved group picnic areas, softball field, volleyball courts, hiking trails, nature study area and trail, bird watching, hiking, kayaking, canoeing, fishing, and playgrounds. Restrooms and picnic shelters are provided in the day use area for the public.

The Campground at Lost Lake Recreation Area provides for tent, auto, and motorhome camping. Each of the 37 campsites have picnic tables and campfire rings. Water and Restrooms are provided adjacent to the campsites. Each campsite is accessible for vehicles up to 34' long. We feature two ADA compliant campsites that are reserved for people with disabilities.

If you would like to review, here is the Lost Lake Master Plan (PDF, 49MB) (/files/sharedassets/county/v/1/vision-files/files/14421-lost-lake-master-plan.pdf).

If you would like to volunteer at Lost Lake Park you can contact the Friends of Lost Lake Park (https://www.facebook.com/people/Friends-of-Lost-Lake-Park/100064267496871/).

Park Hours

Winter Hours: October 1 - March 31 from 7 AM to 7 PM
Summer Hours: April 1 - September 30 from 7 AM to 10 PM
(Note: When Campground is open, All campers must check-in prior to close of park)

Vehicle Entrance Fees

All vehicles must pay an entrance fee, even if the party has a camping reservation: Entrance fees at all developed Parks is $5 per vehicle.

Annual passes are available for $40 per year and can be purchased at Fresno County Resources Division: 2220 Tulare Street, 6th Floor, Fresno, CA 93721. Telephone (559) 600-3004

Camping Reservations and Rates

Please call Parks at (559) 600-3004 to make group campsite reservation or for more information. No reservations for single campsites. All single campsites are first come, first serve:

Rates (Effective 5/18/2015)

- $25 per night per single campsite (price includes 1st vehicle entry fee)
- $9 per night for seniors (age 62 and over, ID required, price includes 1st vehicle entry fee)
- $11 per night for Disabled Veterans (valid ID, adjudication letter, Dept. of Defense Form 214 required, price includes 1st vehicle entry fee)
- $200 per night for group campsite with a 10 vehicle minimum **(Plus $100 refundable cleaning deposit)**

(Note: All campers must check-in prior to close of park)

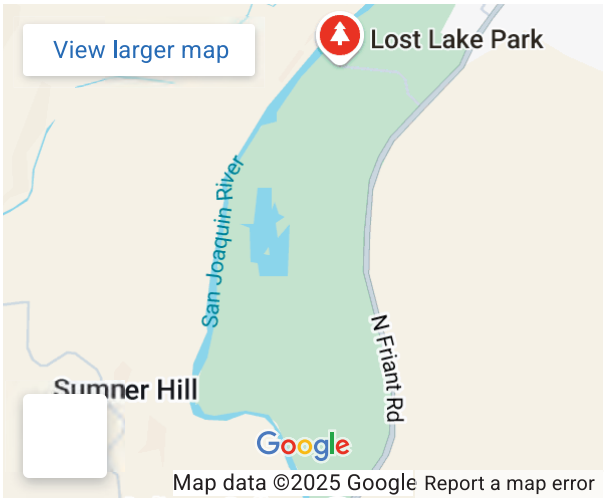
Rules, Regulations and Permits

Information on bounce houses and pets.

More information... (/departments/public-works-and-planning/divisions-of-public-works-and-planning/resources-and-parks-division/parks/county-parks-rules-and-regulations)

Campfire Permits Required (/?splash=https%3a%2f%2fwww.readyforwildfire.org%2fpermits%2fcampfire-permit%2f&____isexternal=true)

Location



Directions

Located 19 miles north of Fresno below Friant Dam. North on Highway 41 to the Friant Road exit. Proceed east on Friant Road past Woodward Park, for approximately 12 miles to Lost Lake. The entrance to the Park is on the left before the town of Friant. Once inside the Park, picnic areas are to the left and the campground is to the right.

Address

16385 N. Friant Road.
Friant, CA 93626

History

The land that today makes up the Lost Lake Recreation Area was once the ancestral home of the Wakichi Band of Yokuts. Over 300 documented grinding holes have been found throughout Lost Lake Recreation Area. Numerous Native American ceremonies are held throughout the year at Lost Lake to respect and honor local tribes.

In 1852, Charles Converse established the Converse Ferry near the north end of the present campground. Converse would go on to design and construct the first Fresno County Courthouse that is located at Millerton Lake. Converse Ferry would change names several times before being named the community of Friant.
The term "Lost Lake" is due to the creation of a gravel pit in the late 1930s as a result of quarrying materials for the construction of Friant Dam. While quarrying rock and cement for Friant Dam, about

357 pounds of gold was found in Lost Lake valued at $200,000. Today the same amount of gold would value at $7.36 million.
In 1956, the County of Fresno purchased 248 acres from the Bureau of Land Management to create Lost Lake Recreation Area. In 1959, the County of Fresno leased an additional 78 acres from the State of California State Wildlife Conservation Board (https://wcb.ca.gov/) to expand the fishing and day use area and bring the total acreage to 326 acres. On March 26,1961, Lost Lake Recreation Area was dedicated and formally open to the public. Originally a fishing and day use area, the campground planning began in 1974 however construction did not begin until 1980. In 1981, at a cost of $462,000, The Campground at Lost Lake Recreation Area opened to the public.
The Campground at Lost Lake Recreation Area was closed in September 2014 for improvements and upgrades. A $1.4 million grant was provided by the Wildlife Conservation Board utilizing Prop 40 funds via recommendations from the San Joaquin River Conservancy. The project came in under budget by approximately $150,000 and the County of Fresno contributed over $100,000 of in-kind labor and materials.

Subject:	CEMEX Proposed 100 year Extension of Gravel Quarry permit & conversion to blasting hard rock & crushing it into gravel -Letter response
Date:	Monday, March 10, 2025 6:23:15 PM
Attachments:	CEMEX-Comment-Letter response .docx

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

To: David Randall, Senior Planner, Fresno Co Public Works & Planning Dept

Dear Mr. Randall,

Myself and my husband strongly oppose the CEMEX proposed plan for changing the Quarry site from a mechanical (digging) of sand and gravel, to (blasting & manufacturing) blasting hard rock and crushing it into gravel.

Comment 59-1

The idea of blasting explosions going off so close to residential areas & public roadways is a safety hazard, not to mention creating a 600 ft below ground surface right next to the San Joaquin River, and not far from our River Parkway conservation area which is a museum devoted to teaching future generations the history of the San Joaquin River, and how our generation is protecting and preserving these wetlands for the future of our land's natural resources, is unacceptable!

CEMEX needs to find a different area to propose such a project. Attached is our response letter to the CMEX proposal.

Thanks,

Cala Carter

Subject: Public Comment on CEMEX Rockfield Quarry Modification Project EIR

Dear Mr. Randall,

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Comment 59-2

Impacts on Water Quality & the San Joaquin River

Comment 59-3

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Comment 59-4

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Comment 59-5

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow

rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Comment 59-5 Cont.

Impacts on the San Joaquin River Parkway & Recreation

Comment 59-6

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Comment 59-7

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

Comment 59-8

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.
- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR. The docu

Comment 59-9

Comment 59-10

Comment(s) 59-11 / 5-12

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Comment 59-13

Threats to Wildlife

Comment 59-14

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

Comment 59-15

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Comment 59-16

Conclusion

Comment 59-17

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Sincerely,

Cala Carter

Hello,

On behalf of the listed organizations, I am writing to provide our comments and feedback on the CEMEX Rockfield Modification Project. We appreciate the Board for releasing a Draft Environmental Impact Report for public views and the opportunity to comment on the CEMEX Rockfield Modification Project to ensure transparency, public participation, and compliance with existing policies such as the California Environmental Quality Act (CEQA).

We acknowledge the County's dedication to a comprehensive review process. The undersigned organizations respectfully submit this letter to enhance our community's well-being and ensure that critical environmental and public health standards are upheld. For your consideration, please find our comments letter attached.

Thank you,

Re: CEMEX Rockfield Quarry Modification Project EIR

David Randall, Senior Planner
Fresno County Public Works and Planning Department
Divisions of Public Works and Planning
2220 Tulare St., 6th Floor
Fresno, CA 93721

Greetings,

On behalf of the listed organizations, I am writing to provide our comments and feedback on the CEMEX Rockfield Modification Project. We appreciate the Board for releasing a Draft Environmental Impact Report for public views and the opportunity to comment on the CEMEX Rockfield Modification Project to ensure transparency, public participation, and compliance with existing policies such as the California Environmental Quality Act (CEQA). Comment 60-1

We acknowledge the County's dedication to a comprehensive review process. The undersigned organizations respectfully submit this letter to enhance our community's well-being and ensure that critical environmental and public health standards are upheld. For your consideration, please find our comments below.

Section 4.1 Aesthetics and Visual Resources

The DEIR acknowledges that the CEMEX Rockfield Modification Project will have significant and unavoidable visual impact even with mitigation measures. This draft EIR fails to analyze the equity implications of these impacts. Communities that already experience poor air quality, excessive heat, and lack of green space should not have to further endure the degradation of their visual and environmental surroundings. The San Joaquin River is a vital environmental and cultural asset that will face significant degradation if this project moves forward. This river serves as one of the few remaining natural refuges in the region, providing recreational, mental, and physical health benefits to local residents. Under Table ES-1 Mitigation Measure 4.1-1, the proposed mitigation measures, such as rock staining to reduce visual contrast, are insufficient and temporary solutions that fail to restore the ecological integrity of the affected land. Rock stain is a short-term aesthetic fix, it does not provide a real solution and does not address the

Comment 60-2

Comment 60-3

lasting environmental impact caused by this project. Over time, weather conditions will diminish any aesthetic improvements, making this measure ineffective. The stain is not guaranteed to restore the ecological integrity of the land, and over a period of time, weather conditions may impact in making disturbed areas visible again. In the long term, this is a “green washing” mitigation measure that does not address the land degradation and fails to reduce environmental impacts.

Comment 60-3 Cont.

To effectively mitigate the impact of the area's aesthetics and visual resources, Fresno County must conduct a more comprehensive environmental review that thoroughly examines the project’s disproportionate effects on impacted communities. The county should require that CEMEX engage in mandatory and enforceable land restoration efforts, that includes large scale tree planting, native vegetation restoration, and long-term air quality monitoring. Impacted residents must be engaged and considered a part of the direct decision making in the project proposal to ensure that our community needs and concerns align with restoration efforts. Furthermore, the county must impose a legal binding requirement on CEMEX to fund sustainable improvements to public parks, trails and tree cover in impacted areas, ensuring that communities' access to natural spaces is not just another place for corporate gains.

Comment 60-4

Section 4.3 Air Quality

Comment 60-5

Fresno County is already suffering from some of the worst air pollution in the nation, disproportionately harming low-income, immigrant, and BIPOC communities. The San Joaquin Valley consistently exceeds the state and federal air quality standards for PM2.5 (9.0 µg/m^3 annually, or 35 µg/m^3[1]) and ozone (8 hour standard of 0.070 ppm). CARB’s recent workshop proposing updates to the PM 2.5 standard identified the San Joaquin Valley as the state’s worst region in exceeding the 9.0 µg/m^3 annual standard, at 16.2 µg/m^3 according to recent data[2]. Additionally, the San Joaquin Valley Air Pollution Control District recognizes the air basin as being in non attainment with both of these pollutants[3]. As such, the proposed CEMEX expansion will further deteriorate the already overburdened air quality, compounding existing environmental injustices. The threshold values in the DEIR fail to account for cumulative pollution exposure, which is a critical oversight. This is a major problem because communities, especially those already burdened by pollution, do not just experience from a single pollutant but from the accumulation of pollution from various types of pollutants. Nearby communities from

Comment 60-6

[1] https://ww2.arb.ca.gov/our-work/programs/state-and-federal-area-designations/federal-area-designations/pm2-5

[2] https://ww2.arb.ca.gov/sites/default/files/2024-12/9ugm3_Annual_PM2.5_Workshop_Recommendations_and_Inventory_Updates_ADA.pdf

[3] https://ww2.valleyair.org/air-quality-information/ambient-air-quality-standards-valley-attainmnet-status/

this project site are already enduring severe health crises, including high rates of asthma, respiratory diseases, and other pollution-related illnesses. While the DEIR acknowledges potential health risks, it underestimates the severity of these health risks and fails to propose meaningful or enforceable mitigation measures. There is no clear outline strategy of how pollutants will be monitored or transparency for impacted residents.

Comment 60-6 Cont.

Comment 60-7

To ensure our communities health as a priority, we demand that Fresno County take immediate and binding actions to safeguard our communities that are directly impacted by environmental harm such as air pollution. We suggest that the county enforce a comprehensive, real-time community air monitoring program with public access to ensure health protection and also hold CEMEX accountable if their pollution level exceeds safe limits. In addition, we suggest the county require CEMEX to transition to zero emission emissions equipment to reduce and eliminate particulate pollution.

Comment 60-8

Section 4.11 Land Use and Planning

Upon review under Section 4.11 Land Use and Planning of the DEIR, we've identified several concerns regarding the project's consistency with Fresno County's General Plan goals and policies. As labeled in Goal LU-A**,** which aims to promote long-term conservation, potentially productive agricultural lands, and accommodate agricultural-support services and related activities that support the sustainable agriculture to further the County's economic development goals, the DEIR provides no specific plan to stay consistent. In addition, the DEIR stated that the proposed project provides a needed service to the surrounding area by producing cement products for construction projects. As stated by Marek Warszawski, in CEMEX's own document, Fresno County utilizes only 28% of their production. There are multiple sites where the county uses such as Vulcan Sanger Site, Academy Quarry, Fresno River Rock, AI's Concrete, Bass Avenue Materials, Carmelita Mine, Coalinga Pit #1, Coalinga Pit #2, Gale Sands, Kings River Sand and Gravel, River Rock Site, Riverbend Sand and Gravel, Sante Fe Aggregate, Sierra Pacific Materials, and Tivy Valley Granite. Following Goal LU-C, focusing on ensuring long term preservation of productive agricultural land, conserving natural wildlife habitats, and maintaining flood-carrying capacities, the project was identified as consistent. However, there was no further explanation regarding CEMEX's effort to measure how the project will be implemented to achieve this goal. The DEIR asserts that the proposed project is consistent with applicable Fresno County General Plan goals and policies, as demonstrated in Table 4.11-1. Nevertheless, the DEIR does not provide sufficient evidence or detailed analysis to support this assertion.

Comment 60-9

Comment 60-10

Comment 60-11

The DEIR lacks detailed plans and commitments necessary to demonstrate how the project will effectively contribute and be consistent with current policies and zoning regulations. More specifically, it fails to provide concrete measures or strategies that will be implemented to ensure the conservation of agricultural lands and support for agricultural activities. Best practices for agricultural sustainability, such as land conservation, habitat preservation, and mitigation of land degradation must be integrated into the project's plan to prevent long-term impact. We strongly demand a detailed plan is provided with coherent and actionable steps to demonstrate CEMEX project alignment with each policy goal. We also ask that CEMEX do a thorough examination of each relevant goal and policy, specifying clear steps to reach agricultural sustainability. This is essential to validate its claim to be consistent with local priorities.

Comment 60-11 Cont.

Comment 60-12

Section 4.13 Noise

Noise pollution is a serious yet often overlooked public health issue. Chronic exposure to excessive noise is linked to increased stress, sleep disturbances, cardiovascular disease, and cognitive impairments, particularly among vulnerable groups such as children and the elderly. The DEIR fails to assess noise pollution's cumulative impacts alongside other environmental stressors. Instead, it dismisses noise impact of nearby communities and labels it as a "less than significant" issue without proposing adequate mitigation under noise per **Figure 4.17-1.** Just because noise levels at currently identified intersections 2, 3, 14, and 15 exceed 60 decibels (dBA LdnI) within 100 ft from the road does not mean added noise will not impact communities. Dismissing the need to take further action on how this project noise impact is unacceptable. Even small noise increases can have a negative impact on residents especially combined with other pollution sources.

Comment 60-13

The DEIR clearly fails to acknowledge the project's noise impact level on residents and is dismissive of the cumulative harm to impacted communities. We demand that Fresno County impose stringent noise mitigation measures to be implemented, including stricter operational limits, noise barriers, and increased monitoring. Additionally, the County must ensure full community participation in decision-making. We demand extended public comment periods, mandatory public hearings in impacted neighborhoods, and transparency in enforcement actions. The County must require that CEMEX establish sound barriers, limit operational hours, and conduct long-term noise monitoring to minimize harm to nearby residents.

Comment 60-14

Comment 60-15

Section 4.17 Transportation

The increase in truck traffic resulting from the CEMEX expansion will not only contribute to higher emissions but also increase safety risks for pedestrians and cyclists.

Comment 60-16

Fresno County already suffers from severe air pollution, and adding more truck traffic will significantly worsen our air quality, particularly for those living near major roadways. Additionally, while there are existing bike lanes along impacted intersections, pedestrian infrastructure is severely lacking. An increase in truck traffic will make conditions even more dangerous for cyclists and pedestrians, especially with limited lighting, inadequate signage, and unprotected bike lanes. The risk of road hazards, such as falling aggregates from these trucks, further endangers residents.

Comment 60-16 Cont.

Comment 60-17

Although we appreciate CEMEX initiatives to reach a net-zero CO2 by creating a zero emission fleet and switching to having zero-emission electric ready mix trucks, the DEIR of the Rockfield Expansion Project does not detail how these sustainability goals will be integrated into the local project. The oversight of potential hazards that will impact our communities is a high concern. Also, in light of CNRA's California's Advanced Clean Car II Rule to reach zero-emission vehicles by 2035, we advise that the DEIR address how the Rockfield Expansion Project plans to incorporate zero-emission vehicle into its operation to ensure compliance with state priorities and contribute to our regional air quality improvements. We strongly urge a Specific, Measurable, Achievable, Realistic, Time bound, Inclusive, and Equitable (SMARTIE) plan on how they will transition to zero-emission transport vehicles and fund community air quality monitoring programs. Additionally, the County should also establish buffer zones between truck routes and residential areas to protect our public health. Improvements to pedestrian and cyclist safety should include enhanced protected pedestrian lanes, improved and clear signage, and improved traffic management and safety measures to prevent accidents and fatalities.

Comment 60-18

Comment(s) 60-19 60-20

Again, we thank you for the opportunity to comment on this period of the process. The undersigned are gravely concerned about the length of the time the Fresno County has allowed ongoing and unmitigated environmental issues, despite full understanding of its impact on our communities health, air quality, water quality, and infrastructure damage. Fresno County has an opportunity to demonstrate environmental leadership by upholding strong policies that protect both the environment and the well-being of its residents. I urge the county to reconsider this project proposal mitigation measures and instead adopt a community-centered approach to preserving the priorities of its community needs and health.

Comment 60-21

Comment 60-22

Thank you for your time and consideration. I look forward to your response.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

March 10, 2025

Mr. David Randall
Fresno County Public Works and Planning Department

Dear Mr. Randall,

I'm writing the following letter in regard to the CEMEX plant expansion to the Supervisor Bredefeld who represents my district.

Dear Supervisor Bredefeld,

I hope this letter finds you well. My name is Gohar Hakimipour, and I am the president and founder of the Clovis North River Alive Club. For the past four years, River Alive has spent over 1,500 hours completing service work by the San Joaquin River. Our goal from the start was to preserve the natural beauty of the river by picking up trash and restoring abandoned spots by the river to their former beauty. So, when our club heard of the plans for the CEMEX expansion, we knew it was our right to have a say. River Alive is one of the many stewarts of the river. The CEMEX expansion will hurt the river and its habitat that River Alive has worked so hard to protect. It will jeopardize the peaceful and enjoyable access to the river, but it will also risk the safety of the animals that reside near the river.

Comment 61-1

I am also part of the Clovis North cross country team. As for being a part of a huge running community that extends beyond the boundaries of my school, running across Friant to Woodward Park is stressful with the amount of anxious car traffic going on. A person has died at every intersection on Friant in the past seven years. Those lives were taken because of reckless driving due to traffic. The Cemex expansion will significantly impact the traffic on Friant, adding thousands more heavy truck traffic annually to the current heavy traffic on the Friant Road. Additional traffic as the result of Cemex expansion will compromise traffic safety on Friant and other streets in the area and will put running teams' health and wellness in danger. Not to mention, Cemex expansion will also significantly impact air quality and consequently it impacts the health of the runners and pedestrians who use Woodward Park everyday.

Comment 61-2

Comment 61-3

From as long as I could remember, the San Joaquin River has been a safe haven for me. As a child, I made a lot of memories by the San Joaquin with my family—especially my mom. We used to canoe and swim in the river on weekends. These

Comment 61-4

excursions, although tiresome, allowed me to connect to nature and connect with my mom. The CEMEX expansion will negatively impact this experience for another little girl and her mother. Therefore, I plead with you— protect the San Joaquin River. Ensure the people of Fresno can continue enjoying our beautiful river, and that we don't exacerbate the air quality problems in our city. I hope this moves you in favor of the community of Fresno. Thank you.

Comment 61-4 Cont.

Best Regards,
River Alive Club

Re: Comments on the CEQA Analysis for the Proposed CEMEX Rockfield Modification Project, EIR 7763

Background

The San Joaquin River Restoration Program (SJRRP) is the direct result of the San Joaquin River Restoration Settlement (Settlement) reached in September 2006 by the U.S. Departments of the Interior and Commerce, the Natural Resources Defense Council (NRDC), and the Friant Water Users Authority (FWUA). The Settlement, which followed an 18-year lawsuit, received Federal court approval in October 2006. The Settlement acknowledges two goals: to restore and maintain fish populations in "good condition" in the main stem of the San Joaquin River below Friant Dam to the confluence of the Merced River, (the "Restoration Goal") and to reduce or avoid adverse water supply impacts to all of the Friant Division long-term contractors that may result from the Restoration Flows provided for in the Settlement (the "Water Management Goal"). Comment 62-1

A key portion of the Settlement in support of the Restoration Goal is the release of a portion of the unimpaired runoff into Millerton Lake down the San Joaquin River to support fisheries. The Settlement also includes the role of a Restoration Administrator (RA), who is selected by the non-Federal Settling Parties (NRDC and FWUA) and appointed by the Court. The RA, in association with an assigned Technical Advisory Committee (TAC) also specified by the Settlement, is tasked with recommending how Restoration Flows will be released to meet the Restoration Goal of the Settlement and with providing input and recommendations for the implementation of various channel improvement measures to be implemented as a part of the Settlement. For the purposes of reviewing and commenting on the CEMEX Rockfield Modification Project (Project), the focus and interest of the RA will be the potential for any impact to hydrology or water quantity that may result from implementation of the Project. Comment 62-2

The CEMEX Rockfield Modification Project (Project) may affect hydrology, river flow and losses along the San Joaquin River beyond what was assumed in the Settlement. Paragraph 13(f) of the Settlement[1] states:

> *The Parties agree to work together in identifying any increased downstream surface or*

[1] NRDC, et al., v. Kirk Rodgers, et al., 381 F.Supp.2d 1212 (2005, E.D.Cal.), https://www.restoresjr.net/?wpfb_dl=9

underground diversions and the causes of any seepage losses above those assumed in Exhibit B and in identifying steps that may be taken to prevent or redress such increased downstream surface or underground diversions or seepage losses.

Comment 62-2 Cont.

As a representative of the Court tasked to consult on the implementation of the Settlement, the RA supported by the TAC has participated in the review of the Draft EIR for the Project.

Key Concerns Regarding the Project

Comment 62-3

The San Joaquin River downstream of Friant Dam to the Merced Confluence is the Restoration area, where the goal of returning riparian vegetation and anadromous fish species is being implemented. This approximately 153-mile series of reaches also experiences substantial losses of river flows – depending on year type, 30% to 85% of the water released to the river at Friant Dam does not reach the Merced confluence. The cause of the losses includes natural seepage and authorized diversions but also include unauthorized diversions and induced seepage from interconnected surface and ground water. These losses have significantly increased in the river reach between Friant Dam and Gravelly Ford, in some years more than 35% greater than what was assumed in the Settlement and the 2002 San Joaquin River Background Report.

As further background, it should be noted that in all but the wettest years, the full flow of the San Joaquin River downstream of Friant Dam is fully subscribed – various users hold existing water rights, and flows are utilized for consumptive or environmental purposes. Water rights holders and contractors along the river are engaged in working together, and with various Groundwater Sustainability Agencies (GSA's) to monitor flows, uses and losses in the river, and to identify and limit any unauthorized or illicit losses.

Comment 62-4

Restoration Flows released pursuant to the Settlement are released from water stored by the Bureau of Reclamation (Reclamation) pursuant to Reclamation's water rights. Restoration Flows released by Reclamation are protected by Section 1707 of the California Water Code, and Restoration Flows are not "abandoned water" available for other uses. But for the Restoration Flow releases, the full volume of Reclamation's stored water would be available for water supply to various Reclamation contractors. All flows stored and released by Reclamation have substantial monetary value to Reclamation or it's contractors.

As RA for the SJRRP, my focus in reviewing the Draft EIR for the Project is the potential for diversion or loss of in-river flows due to implementation of the Project, and as a result of that implementation any negative impacts for the Settlement or Restoration Program. Simply stated, no additional unauthorized diversions, or uncontrolled seepage or losses from river flows that are not fully mitigated, can be allowed because of Project Implementation.

Comments

Comment 62-5

I have coordinated with Reclamation during the review of the Draft EIR and concur and support all of Reclamation's comments on the Project as described and explained in Reclamation's comment letter of March 7, 2025. In addition to Reclamation's comments, I have several comments on the analysis of groundwater and Groundwater-Surface Water Interaction at the Quarry Site.

Comment 62-6

There are a number of generalizations used in the hydraulic analysis of the Quarry site. The analysis uses a small number of test wells (three) along the 7,000 + foot border between the Quarry Site and the San

Joaquin River, as well as a limited data set of testing, to characterize all manner of conditions groundwater and hydrologic conditions and potential impacts. Comment 62-6 Cont.

The following statement appears on pg. 4.10-113 of the Draft EIR:

> *The base flows within the San Joaquin River are typically at or below the elevation of the base of the alluvium on the Quarry Site. Thus, flows from the San Joaquin River toward the Quarry Site within the alluvium can only occur during the infrequent and relatively short-term high flow periods. Due to the recharge trenches along the west side of the Quarry Site, groundwater levels in the alluvium and the weathered rock would be maintained consistent with existing conditions. As a result, there would be no significant change in the volume of potential inflow from the river into the quarry during high flow events through the alluvium and weathered rock as a result of the project.*

Data and information elsewhere in the Draft EIR contradicts the statement that base flows are typically at or below the elevation of the base of the alluvium. For example, the HEC-RAS model results in Appendix G-1, Hydraulic Analysis, show a riverbed elevation of 286.77 at the downstream end of the Quarry Site, and 291.01 at the upstream end of the Quarry Site. Figure 3 & 4, Appendix G-4, Groundwater Conditions at the Quarry Site, shows substantially different thicknesses of alluvium and weathered rock across the site, generally much lower in elevation than the lowest point of the river. Pg 12 of Appendix G-5, states:

> *"Where present, the alluvium is up to 60 feet thick. Beneath the alluvium, the weathered rock ranges in thickness from 20 feet to 60 feet."*

Contrary to the statement above from the DEIR, it is indeed quite possible that there would be a significant change in the volume of inflow from the river, particularly when additional mining activity further lowers the hydraulic grade line across the site.

On pg. 81 of Appendix G-4, Groundwater Conditions at the Quarry Site, it is noted that "for the hardrock, the best values for transmissivity are from the pump tests on MW-1D and 2D. These values were 320 gpd per foot and 960 gpd per foot, respectively, or an average of 640 gpd per foot." These wells are closest to the river of all the monitoring wells, and thus likely represent the best available estimate of current seepage from the river. However, these estimates were averaged with transmissivity values from wells across the site, yielding a much lower estimate of overall transmissivity (350 gpd per foot) and therefore a much lower estimate of groundwater inflow to be addressed in future operation or mitigation

On Pg 4.10-56 of the DEIR, identifies the Friant-Kern Canal as "may be the predominant source of recharge" for the Quarry Site during some times of year. Setting aside the facts that the concrete-lined Friant-Kern Canal is more than a mile from the edge of the Quarry Site boundary at its nearest proximity whereas the river is only 200 feet distant, there is analysis, well data, or other evidence to corroborate this assumption. Further, Appendix N of Appendix G-4 concludes in part: Comment 62-7

> *"Stable isotope data demonstrate that all surface water and groundwater present at the site originated at the same elevation in the Sierra Nevada mountains and is present at the site due to percolation from the San Joaquin River."*

The assumption that some portion of groundwater flow into the Quarry Site originates from the Friant-Kern Canal is not supported and represents another opportunity to substantially underestimate the amount of water moving from the river into the Quarry Site.

It seems entirely possible that various favorable assumptions may have resulted in the underestimation of the volume of inflow from the river to the Quarry Site, particularly as mining progresses and lowers the Comment 62-8

hydraulic grade line for the site. If true, the losses to the river could be substantial. Even under the favorable assumptions in the DEIR, there is no end of losses from the river nor the need for continuous mitigation in the form of future pumping. From the DEIR, pg. 4.10-88:

Comment 62-8 Cont.

> *Upon completion of mining at the Quarry Site at the end of Phase 2… The consumption of groundwater at the Quarry Site would be 145 acre-feet more per year than under existing conditions (i.e., 270 acre-feet after reclamation minus 125 acre-feet existing). An approximately 108-acre, 100-foot-deep lake would be formed from groundwater and rainfall in the excavation bottom. Water would continue to be pumped from the quarry pit into the Northeast Pond and groundwater recharge trenches. Therefore, equipment related to water management, such as pumps, piping, monitoring wells, and related electrical infrastructure, would remain.*

Under more conservative estimates of inflows from the river, it is possible that losses from the river and the extent of permanent mitigation may be far greater.

It is recommended that a site-specific groundwater model be developed and run for analyzing inflows from the river and the extent of pumping required to address those inflows. In particular, different scenarios for subsurface conditions, transmissivity and future river stage can be modeled to provide a full understanding of the range of possible impacts on river flows.

Comment 62-9

The disposal of excess water from the Quarry Site is via a seepage trench located along the river. This appears to be sufficient for current activities, although there are several questions and issues with this system:

Comment 62-10

- The seepage trench is located between river and excavation area. Per the DEIR appendices (Pg 77 – 79, Appendix G-4), "it is assumed that half of the groundwater ditch recharge would flow to the San Joaquin River… the remainder would enter the excavation". If only half of the flow is returned to the river, this is a permanent impact to river flows.
- The current array of wells on the site is not reliably able to estimate inflows from the river, nor effectively measure how much water is returned to the river.
- Appropriate annual filings of water use with the State Water Resources Control Board for any water withdrawn from the San Joaquin River, and volumes of groundwater pumped and transported to the appropriate GSA, should be required.

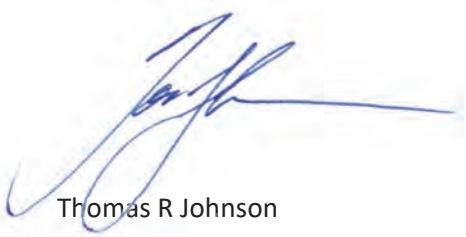
It is recommended that an alternative mitigation system for excess groundwater inflows, inflows from the river, or accumulated mining pit water be identified and included in any final permitting for the Project. The mitigation system must be able to adaptively and permanently manage the entirety of flows to the site, including rainfall, flood flows, and increased inflows to the site due to increased river stage. The mitigation system should be able to a) accurately assess the inflows from the river, b) return 100% of inflows from the river to the river, with no impact on water quality, and c) can accurately measure the returns to the river.

Comment 62-11

I appreciate the considerable effort that the applicant and the County have taken to compile the information in the DEIR and appreciate the opportunity to comment on this Project.

Please feel free to contact me with any questions or comments at tjohnson@trjllc.com or on 916-764-2268.

Regards,



Thomas R Johnson

CC: Fresno County Supervisor Garry Bredefeld

Subject: Comments on CEMEX Rockfield Expansion Project DEIR

Dear Mr. Randall,

On behalf of the Safe Access to Woodward Park coalition, we would like to share a letter we are submitting to Supervisor Bredefeld, who represents the area around Woodward Park, regarding our strong opposition to the Cemex Project.

Comment 63-1

Dear Supervisor Bredefeld,

Comment 63-2

In September 2020, shortly after Angel Hernandez was fatally hit by a car at the intersection of Friant and Fort Washington when you were the City of Fresno District 6 Councilmember, we invited you to a walk audit along Audubon and Friant Rd with Councilmember Karbassi. As you remember, during our walk we tested different crosswalks that lead to Woodward Park on Friant Road. We discussed the traffic safety situation that high volume traffic is causing on Friant Road and its incompatibility with so many pedestrians and bicyclists walking to and from Woodward Park. Unfortunately, the traffic safety on Friant Rd has gotten worse since then. More fatal accidents like Paul Moore on Friant and Audubon, and Amaya Chenot on Shepard and Friant are proof of that terrible reality. The number of memorials that are erected at every intersection on Friant Road is a testimony to the systematic and chronic traffic safety issues on the roadways near Woodward Park.

The CEMEX expansion will increase truck traffic from 250,000 to 400,000 a year. We desperately encourage you to put the health and safety of residents of your district before the wealth of another mega non-local (non-US) company and say NO to CEMEX request to extend the operation permit to 100 more years and to a scale so big that it will match the biggest mining operation in California.

Comment 63-3

Sincerely,

Anthony J. Molina, M.D.,
Safe Access to Woodward Park Coalition

Subject: Opposition to the CEMEX Rockfield Quarry EIR 7763 Proposal and the Future of the San Joaquin River

Dear David Randall,

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years. Comment 64-1

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource. Comment 64-2

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations. Comment 64-3

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts. The increased truck traffic, potential river pollution, and habitat destruction would be devastating for local wildlife. Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells. Comment(s) 64-4 64-5 64-6

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability. Moreover, the current agreement lacks measurable performance oversight, and reports indicate repeated violations of work schedules and environmental standards. The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences. Comment(s) 64-7, 64-8 64-9 64-10

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs. Comment 64-11

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century. Comment 64-12

Thank you for your time and consideration. I look forward to your response on this critical issue.

Sincerely,
Jason Palmer

Re: Rockfield Quarry Modification Project Draft Environmental Impact Report, SCH 2020060123

Dear Mr. Randall:

These comments are submitted on behalf of the Center for Biological Diversity (the "Center") regarding the Draft Environmental Impact Report ("DEIR") for the proposed Rockfield Quarry Modification Project ("Project"). The Center has reviewed the DEIR closely and has found that the DEIR's analyses and mitigation for the Project's impacts to biological resources, greenhouse gas emissions, surface and groundwater quality and availability, and its analysis of project alternatives are inadequate. The Center urges the County, at a minimum, to correct the deficiencies identified below and recirculate a revised DEIR to ensure adequate and informed public review of the Project.

Comment 65-1

The Center is a non-profit, public interest environmental organization dedicated to the protection of native species and their habitats through science, policy, and environmental law. The Center has over 1.7 million members and online activists throughout California and the United States. The Center has worked for many years to protect imperiled plants and wildlife, open space, air and water quality, and overall quality of life for people in Fresno County.

Comment 65-2

I. The DEIR Fails to Provide an Accurate Baseline Regarding the Project's Impacts to Biological Resources

Comment 65-3

Under CEQA, an environmental review document must evaluate the potential environmental impacts of the project as compared to the existing environmental conditions (the "baseline"), so that the Project's impacts can be meaningfully analyzed and compared to alternatives. (CEQA Guidelines § 15125(a); see County of Amador v. El Dorado County Water Agency (1999) 76 Cal.App.4th 931, 952; Neighbors for Smart Rail v. LA County Metropolitan

Transit Authority (2013) 57 Cal.4th 310, 315.) The evidence provided in the DEIR's analysis of impacts to biological resources does not meet this standard.

Comment 65-3 Cont.

a. The DEIR Improperly Limits the Scope of Analysis for Special-Status Species

Comment 65-4

To determine which special-status species have the potential to occur on the Project sites, the DEIR includes a literature review and search of existing databases, including a query of the CNDDB ("California Natural Diversity Database") database. However, the DEIR limits its analysis of special-status species to only four USGS 7.5-minute quadrangles (Friant, Lanes Bridge, Little Table Mountain, and Millerton Lake West) but provides no justification for this limited scope (4.4-20). Many special-status species travel long distances or disperse and migrate according to seasonal and climatic patterns. Species that experience metapopulation dynamics exhibit patchy presence and absence across a landscape but depend on suitable unoccupied habitat for long-term population stability. As such, not all species that may be impacted by the Project will be captured focusing on the four quadrangles centered on the Project site. To thoroughly analyze the potential impacts of the proposed Project, the Applicant should expand the CNDDB search to include all nine quads surrounding the Project site. The CNDDB has even created a tool to do so: the QuickView tool "Species in 9 Quads" query.[1]

b. The DEIR Improperly Withholds Data and Fails to Provide Adequate Information on Biological Surveys

Comment 65-5

The DEIR fails to perform more than cursory analysis of presence or absence of sensitive species in and around the Project area. The DEIR conducted a literature review and search of existing databases, but only performed limited surveys. While the literature sources of information used for the DEIR's analyses are extremely valuable and necessary, they are not sufficient to determine the biological resources present in the Project area, and the minimal survey for wildlife is far from adequate to detect special-status species. At each Project site, general surveys were conducted on a single day, April 30, 2019 (App E-1, p.6; App E-2, p.6). The only surveys that targeted any special status species were three surveys conducted over three days in 2017, which exclusively targeted special-status plant species within the Project boundaries (App E-3, p.1). The only surveys that assessed the habitats around the Project site, which include the San Joaquin River and Little Dry Creek among other habitats, were generalized wildlife surveys conducted on a single day, June 14, 2021 (4.4-3). This survey only extended to habitats between the two Project sites, between the Plant site and Little Dry Creek, and within 0.5 miles of the Project site along the San Joaquin River.

Notably, the information provided in the DEIR regarding the 0.5 mile surveys is inconsistent and insufficient to determine how the surveys were actually conducted, and therefore insufficient to determine whether the surveys were adequate. For example, the Plant Site Habitat Assessment (App E-1) states that this 0.5 mile buffer included in the survey only "extends from the project site to the edge of the riparian zone associated with the San Joaquin River" (App E-1, ES-1). Presumably, this is because the River lies 0.6 miles west of the project site (App E-1, ES-3), however this is not stated outright. However, later in this same appendix

[1] CNDDB QuickView. https://wildlife.ca.gov/Data/CNDDB/Maps-and-Data#43018410-cnddb-quickview-tool

(App E-1 Section 4.2.6, Riparian Habitat and Upland Vegetation, p.13), the DEIR lists several plant species that were "found" in the survey. Was the riparian area included in this survey or not? The Quarry Site Habitat Assessment (App E-2) also references the additional 0.5 mile buffer survey conducted in 2021. In both assessments, the exact same language is used: "A subsequent biological inventory was conducted on June 14, 2021, by Thomas J. McGill and Jacob Davies." However, neither assessment provides detailed information on how that subsequent survey was conducted; a description of methodology is only provided for the April 30, 2019 surveys. It is therefore unclear whether the subsequent 2021 surveys a) included riparian habitat and b) were field surveys or were based on aerial imagery or existing databases. This lack of detail obfuscates the DEIR and makes it impossible to assess the survey efforts.

Comment 65-5 Cont.

On-the-ground surveys are particularly important to determine the wildlife that surround the Project sties. The riparian zone along the San Joaquin River should receive particular attention and survey effort, as it provides suitable habitat for numerous special-status species. The DEIR itself states that "Riparian habitats found along the San Joaquin River… provide nesting habitat for raptor species" (App E1, p.15) and "The San Joaquin River corridor is considered a significant wildlife movement corridor that provides natural areas for wildlife to move through the region in search of food, shelter, or nesting habitat." (App E1, p.16).

Alarmingly, the survey information is even further deficient—the DEIR does not actually provide the data from the survey efforts at all, except in the form of maps of vegetation/habitat types. Both the Quarry and the Plant site assessments reference an Appendix B, the Observed Flora and Fauna Compendium: "Common plant species observed during the habitat assessment were identified by visual characteristics and morphology in the field and recorded in a field notebook (See Appendix B)" (App E-1, and E-2 p.7); "Wildlife species detected during the habitat assessment by sight, calls, tracks, scat, or other sign were recorded during surveys in a field notebook (See Appendix B)." (App E-1 and E-2, p.8). For both assessments, Appendix C, Potentially Occurring Special-Status Biological Resources, referenced in E-1 p.17 and E-2 p.20 is also missing. Astoundingly, this data appears to have been removed from the DEIR "for brevity" (App E-1, PDF page 61, App E-2, PDF page 125). Instead, a link is provided to the County's Project website,[2] but the website does not provide this information either. This is an egregious oversight that amounts to a clear withholding of important from the public.

For the public to properly assess the biological resources analysis and mitigation, the DEIR must provide detailed information on what areas were actually surveyed, how all surveys were performed, and what species (plants and animals) were observed. The DEIR fails to do this, instead withholding data, in clear violation of CEQA

c. The DEIR Fails to Provide Adequate Baseline Information on Numerous Special-Status Species

Comment 65-6

As noted above, the DEIR relies on existing databases, aerial imagery, and only brief general biological surveys time to determine whether special-status species are present in and around the Project area. The surveys included walking transects and recording plants and animals that were observed, including animal sign like scat (App E-1 p.7, E-2 p.8). However, general

[2] https://www.fresnocountyca.gov/Departments/Public-Works-and-Planning/divisions-of-public-works-and-planning/development-services-division/planning-and-land-use/environmental-impact-reports/cemex-rockfield-expansion

biological surveys often do not detect cryptic, fossorial, migratory, aestivating, or nocturnal wildlife species. Such species with suitable habitat in and around the Project area could be permanently or periodically present, even if not observed during a general biological survey. Targeted surveys are necessary to assess the presence of these species.

Comment 65-6 Cont.

However, targeted surveys were not performed for *any* species, either within or around the two Project sites. Instead, the DEIR relies on historical data and claims that because quarry operations have been ongoing for decades, numerous species either do not occur or are unlikely to occur in and around the Project site (4.4-23). However, numerous special-status species have been observed in very close proximity to the Project area, and have the potential to be impacted by the proposed Project. Species-specific survey data is therefore particularly important for these species, which include California tiger salamander, burrowing owl, western pond turtle, and western spadefoot, all of which can be difficult to detect without targeted surveys. For example, western spadefoot and California tiger salamander spend the majority of the year underground, and would not be detected by a one-day survey based on daytime visual observations along a transect, which is all that the DEIR includes. The DEIR therefore does not provide sufficient evidence that these species are either absent or unlikely to occur, thereby failing to provide an accurate baseline.

The DEIR claims that California tiger salamander and burrowing owl are both absent from the Project sites and that western pond turtle and western spadefoot have a low potential to occur. These claims are based on CNDDB data and a 2019 habitat assessment. However, California tiger salamanders have been observed within 1 mile and 0.5 miles of the of the Plant site and Quarry sites, respectively (4.4-29, 30), burrowing owls have been observed just over 2 miles away from each Project site (4.4-32), western pond turtles have been observed within 2.75 and 3.25 miles of the Plant and Quarry sites respectively (4.4-35), and western spadefoots have been observed within 1.8 and 1.2 miles of the Plant and Quarry sites respectively (4.4-36). All of these are small distances well within the possible movement range of these species. For example, California tiger salamanders regularly move over 600m, and sometimes up to 2.2 km, away from their breeding ponds (Orloff, 2011; Searcy et al., 2013). Burrowing owls forage over 2-3km from their nests, and young owls disperse up to 50+ km. Additionally, many burrowing owl populations are migratory, moving across very large distances (Miller, 2024). Western pond turtle nests have been found up to 1,919 feet from aquatic habitats and individuals have been documented to move regularly between aquatic habitats with long-distance movements of up to 2,018 feet (Sloan, 2012). Western spadefoots have been observe to disperse up to 600 m from breeding pools, and are likely able to disperse even further (Halstead et al., 2021; Laabs et al., 2001).

The DEIR claims that because the Project area has already been significantly disturbed and numerous movement barriers surround the Project sites, it is unlikely that any of these species will occur in the Project area. However, disturbance does not preclude the presence of these species. For example, California tiger salamanders can be found in agricultural channels and stock ponds (Alvarez et al., 2021; Wilcox et al., 2015), and numerous burrowing owl colonies exist at airports (Miller, 2024). Additionally, movement barriers around the Project area are not complete—wildlife movement across roads for example does occur, even though it may be infrequent—and individuals have the potential to enter the Project site from surrounding areas.

Comment 65-7

Additionally the DEIR fails to consider importance of adequate baseline data near the Project site but outside of the Project's footprint, as the potential impacts from the proposed

Comment 65-8

quarry—including both ongoing operations and the newly proposed blasting—may impact surrounding areas. As noted above, the DEIR references surveys of a 0.5 mile buffer around the survey area, but it these surveys also did not target any specific species – in fact, it is unclear if they included any field data at all.

Comment 65-8 Cont.

As detailed below, the rock blasting which would occur as part of the proposed Project operations has not been conducted previously, and is likely to have new detrimental impacts to wildlife outside of the Project footprint. These impacts, which include but are not limited to noise, vibrations, flyrock, dust, and geological stability, would extend beyond the Project footprint into the surrounding areas, which include the San Joaquin River and the Ball Ranch Nature Preserve, both of which support rich biodiversity and special-status species. Any special-status species that may be present in these areas, as well as on the Project sites, could be impacted by the proposed Project. Surveys and analyses must therefore include both the Project sites and the surrounding area. The DEIR entirely fails to accomplish either of these requirements.

d. The DEIR Improperly Excludes Numerous Water Features from Analysis of Baseline Conditions

Comment 65-9

The DEIR's analysis of impacts to biological resources excludes at least two water features from analysis, the river water delivery ditch at the Quarry site and the waste wash conveyance ditch at the Plant site (4.4-7). The river delivery ditch connects the quarry to the San Joaquin River, which hosts many special-status species that may also use the ditch as habitat and may therefore be impacted by the Project. The waste wash ditch conveys water from the aggregate processing plant to the onsite silt ponds. The DEIR presumably justifies exclusion of the ditches because they are not technically defined as a water of the US, a water of the state, or a lake or streambed under state and federal laws (4.4-19), although an explicit justification is not provided.

Regardless of legal definition, the ditches may serve as habitat for special-status species. The river supply ditch in particular connects a natural river that supports high biodiversity to the Project Site, and it is entirely possible that special-status species including but not limited to western pond turtle may use the ditch as habitat. For example, western pond turtles use a wide variety of aquatic and terrestrial habitats, including perennial and ephemeral waters, as well as standing water and streams (Bondi, 2009; Holland, 1994; M. R. Jennings & Hayes, 1994), and could use either of the two ditches as habitat. The DEIR also provides no detail on whether the river supply ditch is accessible by fish from the San Joaquin River, which could include Chinook salmon. If the ditch is accessible by salmon, then it is entirely possible that individuals could become trapped in the ditch or the quarry, leading to injury or mortality. In such a case, the impacts to this sensitive species could be significant. Additionally, the Project proponent would be obliged to obtain take authorization to operate the Project including the river supply ditch, which the DEIR fails to account for. By failing to assess the existing conditions in the ditches, and failing to consider special-status species that may occur in the ditches, the DEIR fails to establish an accurate baseline and potentially excludes important impacts to special-status species, in violation of CEQA.

e. The Proposed Mitigation for Numerous Special-Status Species is Insufficient and Improperly Deferred

Comment 65-10

The deficiencies in the baseline analyses noted above contribute to a lack of sufficient mitigation for impacts to special-status species. Because the DEIR inappropriately concludes that California tiger salamander is absent from the Project site, the DEIR fails to provide any mitigation measures for potential impacts to this species at all. Given the lack of adequate surveys described above, this failure to mitigate for the potential impacts to California tiger salamander is completely unjustified, and must be remedied. Comment 65-10 Cont.

The DEIR does provide mitigation measures for impacts to burrowing owl, western spadefoot and western pond turtle within the Project sites (MM 4.4-1a,b), but these mitigation measures include only pre-construction surveys and development of relocation plans (4.4-50). In the case of the burrowing owl, relocation should not be considered an appropriate mitigation measure except as a last resort. As noted by the California Department of Fish and Wildlife's ("CDFW") Staff Report, all possible avoidance and minimization measures should be considered before temporary or permanent exclusion and closure of burrows to avoid "take," and habitat compensation must be provided for any evicted owl (State of California Department of Fish and Game, 2012). The DEIR fails to consider any mitigation except relocation, in violation of these standards.

Additionally, for all three of these species, the proposed mitigation is improperly deferred, offering only vague plans to relocate any individuals encountered. The burrowing owl mitigation (MM 4.4-1) states that if burrowing owls are found, "a relocation plan shall be developed, approved by CDFW, and implemented prior to development of any Quarry Site grasslands. The western pond turtle and western spadefoot mitigation (4.4-2) states that these species would be relocated "to a nearby, suitable habitat near the Quarry Site." However, no specific relocation sites are identified for any of the three species. Relocation plans should be developed and completed for the DEIR so that the public and decision makers can judge whether such measures would adequately mitigate the Project's impacts. The DEIR therefore provides insufficient detail for the public and decision makers to ascertain whether such measures would adequately mitigate the Project's impacts to these sensitive species. Comment 65-11

This improperly deferred mitigation violates CEQA. (see *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 670 [EIR inadequate where the success or failure of mitigation efforts "may largely depend upon management plans that have not yet been formulated, and have not been subject to analysis and review within the EIR"]). In the limited circumstances in which deferred mitigation is appropriate, the agency must meet all of the following elements: (1) practical considerations prevented the formulation of mitigation measures during the planning process; (2) the agency committed itself to developing mitigation measures in the future; (3) the agency adopted specific performance criteria prior to project approval; and (4) the DEIR lists the mitigation measures to be considered, analyzed, and possibly incorporated into the mitigation plan. (See *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 736-37 [review denied].) The DEIR fails to meet these criteria.

Additionally, as noted elsewhere in this letter, impacts from the Project are likely to extend beyond the Project's footprint, so relocating individuals to areas close to the Project may not prevent significant impacts. In fact, the proposed mitigation for burrowing owl, western pond turtle, and western spadefoot entirely fails to consider impacts outside of the boundaries of the Project sites at all, despite the fact that impacts from the proposed Project's new operations (including blasting) are likely to extend well beyond the existing Project footprint. These mitigation measures are therefore insufficient.

II. The DEIR Fails to Adequately Analyze or Mitigate the Project's Blasting Impacts to Special-Status Species

Comment 65-12

The DEIR fails to provide an adequate analysis of significant impacts from the proposed Project, particularly (but not limited to) impacts from the proposed blasting. The proposed Project would include blasting up to 600 ft deep into hard rock below the alluvium in the Quarry Site, which would lead to numerous potential new impacts, including flyrock, dust, pollutants, noise, and ground vibrations. The DEIR fails to analyze any of these impacts on the wildlife that may be present in and around the Project site, including sensitive species that reside in and around the San Joaquin River (with the exception of a brief but flawed consideration of Chinook salmon), which lies a mere 200 feet from the edge of the quarry.

In place of an actual analysis of potential impacts, the DEIR provides only generalized anecdotal examples of wildlife habituating to ongoing quarry operations in the past (4.4-53, 54). Anecdotal evidence is far from sufficient to determine impacts and their significance. Not only does such evidence suffer from detection bias (i.e., only those individual animals that are able to acclimate will be observed, and those that are unable to acclimate will be unjustly ignored), but it also fails to consider the best available science on blasting. Additionally, these anecdotal examples describe habituation of wildlife to the ongoing quarry operations, which consist only of surface mining, and do not include blasting. The DEIR provides no actual study of how blasting will change the impacts of the Project and how wildlife might be affected. The so-called evidence provided in the DEIR is therefore not an appropriate to determine potential impacts of the proposed Project, particularly expansion of quarry operations through blasting.

The San Joaquin River is a precious biodiversity resource, home to numerous special-status species, including Chinook salmon, raptors, riparian birds, western pond turtle and many others. All potential impacts to the San Joaquin River and its species must be thoroughly analyzed and mitigated. The DEIR fails to accomplish this.

a. Central Valley Spring- and Fall-run Chinook Salmon

Comment 65-13

The DEIR's analysis and mitigation for impacts to Chinook salmon is insufficient. Chinook salmon have been extremely economically and culturally important for thousands of years, and remain so today. Extensive water diversions, dams, and other modifications along the San Joaquin River have rendered much of their historical habitat inaccessible, and the species has suffered great declines. The Central Valley spring-run Chinook salmon is currently listed as threatened under the state and federal Endangered Species Acts, and fall-run Chinook salmon are a species of concern. The San Joaquin River Restoration Program, a multi-agency effort to restore fish populations in the River, is currently conducting a reintroduction effort to bolster this sensitive species in the San Joaquin River. It is therefore of paramount importance that any impacts to salmon, particularly (but not limited to) those from blasting, be thoroughly analyzed and fully mitigated.

The DEIR fails to accomplish this. The DEIR provides an analysis of impacts to Chinook salmon, but the analysis is insufficient, and it minimizes the risks to this highly sensitive species. The DEIR claims that the impacts to salmon will be less than significant (4.4-63), with insufficient evidence to support this claim. The DEIR's analysis is based on a comparison of blast modeling results to the State of Alaska Department of Fish and Game blasting standards (Kolden & Aimone-Martin, 2013; "Alaska standards"). These standards are themselves based on

a summary analysis of numerous empirical studies, which investigated different species using different methods, some of which were lab-based and some of which were field-based, but none of which were standardized. In fact, only one study cited in the Alaska standards included Chinook salmon, and the study focused solely on impacts to juvenile fish, not eggs or adults. Such data are no doubt important to our understanding of blasting impacts on salmonids, but do not necessarily provide a standard that can be applied to all salmonid species in all localities. The DEIR fails to address this, providing no evidence showing that the results from the Alaska standards are applicable to the species and conditions present in the San Joaquin River. In fact, the Alaska standards themselves show that different species of fish have different sensitivity thresholds to vibrational impacts. Further, the ecology and biology of California are extremely different from many of the localities studied in the references cited in the Alaska standards, which primarily focused on Alaska and Canada. It is not safe to assume that standards developed for Alaskan biological communities and Alaskan river conditions are relevant to those in the San Joaquin River.

Comment 65-13 Cont.

Critically, the proposed Project provides no avenues for monitoring or adjustment in the case that the noise or vibrational impacts are greater than predicted by the modeling. Given the weaknesses in the analysis outlined above, it is entirely possible that the blasting would result in greater noise and vibrations reaching the river than expected, but without any kind of monitoring in place, we would never know such impacts were occurring. The DEIR is therefore entirely inadequate to detect, let alone mitigate, impacts to Chinook salmon in the San Joaquin River. To even approach adequacy, the Blasting Protocols (4.4-57) must include monitoring of the actual sound and vibrational impacts to the riverbed, and provide a contingency plan in the case that data detected in the San Joaquin River exceeds those thresholds. The County must not put the fate of this iconic socially and economically important species on limited data without proper checks in place.

Given the sensitivity of the Chinook salmon population in the San Joaquin River and the significant resources and effort that are currently being applied to support this species, relying on untested modeling, unproven assumptions and limited data to determine whether fish will be harmed is not acceptable.

b. Western Spadefoot and Western Pond Turtle

Comment 65-14

The DEIR also provides limited mitigation for western spadefoot, which only addresses impacts to individuals present on the Project site. Potential impacts of the expanded quarry operations including blasting were not addressed at all. Mining for gravel and clay has destroyed and degraded vernal pool habitat in many areas, disrupting soil formations, hydrology, and seed banks and introducing harmful invasive species (U.S. Fish and Wildlife Service, 2005). In the case of the proposed Project, such impacts would have occurred long in the past, if at all. However, if western spadefoot are still present in and around the Project site (which is impossible to determine with certainty given the lack of surveys described above), they are likely to be negatively impacted by the proposed Project. In addition to directly killing individuals and destroying spadefoot habitat when present, activities that disturb the soil and produce low frequency noise and vibration, such as mining, grading for development, and seismic exploration for natural gas may negatively impact western spadefoots (U.S. Fish and Wildlife Service, 2005). Dimmitt & Ruibal, (1980) found that western spadefoots were extremely sensitive to these types of stimuli and would emerge early from their burrows in response to these ground-moving

activities, disrupting their natural dormancy patterns. Such emergence at inappropriate times could lead to non-lethal detrimental effects that may result in reduced fitness or mortality (U.S. Fish and Wildlife Service, 2005).

Comment 65-14 Cont.

Western pond turtles are also likely to be impacted by the Project's operations if they occur in or around the Project site. While only limited data exists on the impacts of noise and vibrations on turtles, studies show that turtles can detect a range of sounds, with sea turtles likely avoiding anthropogenic noises, and noise can affect nesting in at least one sea turtle species (Maeda et al., 2024; Simmons & Narins, 2018). As discussed above, western pond turtles may occur in and around the Project site, nest in upland habitats near bodies of water, numerous of which are present in and around the Project site. Any western pond turtles near the Project sites could be harmed by the Project's blasting and operations, even outside of the project footprint.

The only mitigation provided for these two species (western spadefoot and western pond turtle) is Mitigation Measure 4.4-1b, which would require pre-construction surveys and clearance of any ponds on the two sites that are scheduled for removal. The impacts to these species from ongoing operations as well as new operations, including blasting, are not analyzed or mitigated at all. In addition to the failure to conduct adequate surveys, the DEIR provides insufficient analysis or mitigation for potential impacts to western spadefoot or western pond turtle from the proposed Project's operations.

c. Nesting Raptors

Comment 65-15

The DEIR does acknowledge potential impacts to nesting raptors, including Swainson's hawk and bald eagle. The DEIR notes that "abundant nesting habitat for raptor species can be found offsite along the San Joaquin River… and in the area along Little Dry Creek" and that "Ground disturbance and noise impacts from mining could disturb nesting birds located on or near the project sites" (4.4-49). However, the proposed mitigation for these impacts is insufficient to address these acknowledged potential impacts. MM 4.4-1c requires pre-construction surveys for nesting birds, including raptors. However, the mitigation requires only a 500' buffer zone around the disturbance area for these surveys, which is well below the standard mitigation outlined by CDFW. The CDFW guidelines for Swainson's hawk nesting surveys stipulate a 0.5 mile survey radius, significantly larger than that which is required in the DEIR (Swainson's Hawk Technical Advisory Committee, 2000). The National Bald Eagle Management Guidelines specify that new activity should not occur within 660 feet of a nest (US Fish and Wildlife Service, 2007); again, greater than the search radius described in the DEIR's mitigation. The DEIR therefore ignores guidelines based on the best available science, rendering its mitigation for impacts to Swainson's hawk and bald eagle insufficient.

d. Other Resident and Migratory Birds

Comment 65-16

Resident and migratory birds are similarly overlooked. The DEIR notes that habitats within and around the Project sites "provide suitable habitat for a variety of year-round and seasonal avian residents, as well as migrating songbirds that occur in the area." (4.4-18). Even with minimal wildlife surveys, numerous bird species were detected in the two Project sites, including red-winged blackbird, gadwall, red- tailed hawk, killdeer, American coot, common yellowthroat, pied-billed grebe, northern rough-winged swallow, tree swallow, and western kingbird (4.4-12,17). Additional nesting and resting habitat for both resident and migratory birds

lies in around the Project sites, including the San Joaquin River and the Ball Ranch Nature Preserve. As noted in the DEIR, "Nesting habitat occurs west of the project sites in riparian and oak woodland habitats associated with the San Joaquin River as well as north of the Plant Site associated with Little Dry Creek." (4.4-22). Any additional disturbance or alteration of natural habitat through the Project's proposed operations will have significant impact on the many bird species that use the habitats around the Project sites area, including not only nesting birds but migratory birds as well. The Project's impacts to migratory birds must therefore be analyzed, disclosed, and mitigated.

Comment 65-16 Cont.

The DEIR asserts that pre-construction nesting surveys for nesting birds, and buffers around any existing nests, will reduce impacts to less than significant (4.4-50-52). However, this analysis ignores the impacts of edge effects from Project operations on nesting birds, and fails to analyze impacts to birds that are not nesting, which includes birds that may use the Project and surrounding areas as a migratory stopover point or birds that forage in and around the Project sites. As described above, the proposed Project blasting operations will introduce new edge effects, including noise, which may impact resident and migratory birds within and around the Project areas. For example, field observations and controlled laboratory experiments have shown that traffic noise can significantly degrade habitat value for migrating songbirds (Ware et al., 2015). Subjects exposed to 55 and 61 dBA (simulated traffic noise) exhibited decreased feeding behavior and duration, as well as increased vigilance behavior (Ware et al., 2015). Another study found a 28% decrease in bird abundance in areas when traffic noise was present compared to when there was no traffic noise (McClure et al., 2013). And these impacts do not always improve over time: researchers have postulated that some species in areas with chronic noise pollution may become *more* sensitive to noise stressors instead of becoming habituated or less sensitive to them (Goudie & Jones, 2004). Therefore, birds (and other native wildlife) in and around the project site could be significantly adversely affected by ongoing noise from the proposed Project operations, including blasting. Nesting and foraging would both be impacted. Birds that would otherwise nest near the project site may be unable to do so, and birds that forage in and around the Project may not be able to access previously available foraging areas. However, the DEIR fails to consider these impacts, and provides no analyses or mitigation to address them, in violation of CEQA.

III. The DEIR Fails to Adequately Analyze or Mitigate the Project's Impacts to Wildlife Connectivity

Comment 65-17

Habitat connectivity is vital for wildlife movement and biodiversity conservation. Limiting movement and dispersal with barriers (e.g., development, roads, or fenced-off croplands) can affect animals' behavior, movement patterns, reproductive success, and physiological state, which can lead to significant impacts on individual wildlife, populations, communities, and landscapes (Ceia-Hasse et al., 2018; Cushman, 2006; Haddad et al., 2015; Trombulak & Frissell, 2000; Van Der Ree et al., 2011). Individuals can die off, populations can become isolated, sensitive species can become locally extinct, and important ecological processes like plant pollination and nutrient cycling can be lost. In addition, connectivity between high quality habitat areas in heterogeneous landscapes is important to allow for range shifts and species migrations as climate changes (Cushman et al., 2013; Heller & Zavaleta, 2009). Lack of wildlife connectivity results in decreased biodiversity and degraded ecosystems.

Comment 65-17 Cont.

Connectivity among and between natural waterways and upland habitat is essential for native species as well. The shade and erosion control from riparian vegetation provide cool and clear streams that are ideal for spawning and rearing (Lohse et al., 2008; Moyle et al., 2011). Encroachment and over-aggressive removal and degradation of riparian areas have been identified as major drivers of declines in California's freshwater and anadromous fish (Grantham et al., 2012; Lohse et al., 2008; Moyle et al., 2011; Opperman et al., 2005; Pess et al., 2002). Many other species, including mountain lions and bobcats, often use riparian areas and natural ridgelines as migration corridors or foraging habitat (Dickson et al., 2005; Hilty & Merenlender, 2004; M. Jennings & Lewison, 2013).

In addition to providing habitat connectivity, buffer zones around the County's aquatic habitats are essential to protect the County's high diversity of plants, fish, aquatic invertebrates, birds, amphibians, and reptiles. The streams (perennial and intermittent), wetlands (including vernal pools), and reservoirs throughout the County support numerous special-status flora and fauna, including steelhead trout, western pond turtles, and California red-legged frogs. Species that rely on these aquatic habitats also rely on the adjacent upland habitats (*e.g.*, riparian areas along streams, grassland habitat adjacent to wetlands). In fact, 60% of amphibian species, 16% of reptiles, 34% of birds and 12% of mammals in the Pacific Coast ecoregion (which includes Napa County) depend on riparian-stream systems for survival (Kelsey & West, 1998). Additionally, fish rely on healthy upland areas to influence suitable spawning habitat (Lohse et al., 2008), and agricultural encroachment on these habitats has been identified as a major driver of declines in freshwater and anadromous fish (Lohse et al., 2008; Moyle et al., 2011).

The DEIR fails to adequately analyze or mitigate impacts to wildlife connectivity from the proposed Project. The DEIR downplays the importance of the Project area to connectivity, failing to mention the area has been identified as CDFW as a "Conservation and Planning Linkage"[3] and failing to admit that the Project may impact the San Joaquin River. Instead, the DEIR erroneously claims that the "downward direction of mining activities is not expected to compromise wildlife movement opportunities or prevent the surrounding habitat from continuing to function as a wildlife corridor" (4.4-62) and that impacts to wildlife movement or corridors would therefore be less than significant (4.4-63).

This conclusion ignores the fact that the quarry is already likely disrupting connectivity, particularly along the San Joaquin River, and the proposed Project's extension of quarry and plant operations would continue to disrupt connectivity along the river for another hundred years. Even if the proposed Project did not include new hard rock mining, a continuation of the status quo alluvial mining operations that have been occurring for decades would itself have a significant impact on wildlife connectivity. If instead the operations were to be discontinued, connectivity would likely be greatly enhanced along the San Joaquin River and its riparian corridor. Further, the new proposed blasting operations and the additional mining operations that go with them will likely have additional, novel impacts to connectivity that must also be fully analyzed. The DEIR fails to do either of these necessary analyses.

The Quarry Site is already extremely close to the San Joaquin River—within 200 feet. This distance is significantly smaller than the buffers around aquatic resources that are supported by the best available science. Even buffer zones of 400 feet along streams and wetlands are often insufficient for wildlife protection (Fischer & Lindenmayer, 2000; Kilgo et al., 1998; Semlitsch & Bodie, 2003). A literature review found that recommended buffers for wildlife often far

[3] California Department of Fish & Wildlife Areas of Conservation Emphasis (https://apps.wildlife.ca.gov/ace/)

exceeded 325 feet, well beyond the largest buffers implemented in practice, and far beyond the distance between the San Joaquin River and the Quarry Site (Fischer & Lindenmayer, 2000; Robins, 2002). For example, Kilgo et al. (1998) recommend more than 1,600 feet of riparian buffer to sustain bird diversity. In addition, amphibians have been found to migrate over 1,000 feet between aquatic and terrestrial habitats through multiple life stages (Cushman, 2006; Fellers & Kleeman, 2007; Semlitsch & Bodie, 2003; Trenham & Shaffer, 2005), and western pond turtles have been found to migrate over 1,300 feet and 10,000 feet respectively from breeding ponds and streams (Semlitsch & Bodie, 2003; Trenham, 1998). Little Dry Creek, which lies 500 feet north of the Plant Site (2-23), is also within these science-based buffer zones, and its function as a potential riparian wildlife connectivity corridor would also likely be compromised by both ongoing and expanded operations.

Comment 65-17 Cont.

As described above, edge effects from the Project include but are not limited to noise, vibrations, flyrock, dust, and geological stability, all of which can impact the quality of the San Joaquin River riparian corridor and the ability of animals to move around the Project site. The proposed Project will continue the status quo of disruptive quarry operations near an essential riparian corridor and will introduce additional potential impacts from increased operations and new blasting activity that will further degrade a critical connectivity area. The DEIR fails to adequately disclose, assess, and mitigate the Project's impacts to wildlife connectivity and therefore fails to comply with CEQA.

IV. The DEIR Vastly Understates the Risk of Blasting Impacts on the San Joaquin River Ecosystem, and Improperly Defers Mitigation

Comment 65-18

The San Joaquin River is vitally important not only to California's water supply but to the many species and ecosystems that rely on its function and flows. The River has suffered over the past decades and centuries from over-exploitation, and the remaining perennial stretches with healthy riparian habitats are more important to preserve than ever.

The DEIR notes that "without appropriate vibration and airblast reduction measures, blast-induced groundborne vibration could exceed bank stability threshold" (4.4-57) and claims that the Blast Protocols would prevent significant impacts to the San Joaquin River (4.4-58). The Blasting Protocols include guidelines to monitor the impacts of blasting on the River, including vibration measurements, overpressure measurements, and visual inspection of the embankment. However, the Blast Protocols state that these visual inspections will only occur until blasts reach a depth of 100 feet (App H-6, p.5), without explaining this decision or providing any justification for cessation of riverbank monitoring. The DEIR appears to assume that blasting below 100 feet would not introduce additional risks of riverbank destabilization, but without providing a scientific explanation as to why this would be the case, it is impossible to determine whether this proposed mitigation will be sufficient to mitigate blasting impacts.

Furthermore, the DEIR provides absolutely no contingency plan for a situation in which the river embankment becomes damaged or the quarry experiences pit failure. Instead, the DEIR states "Should significance thresholds be exceeded or signs of instability of the embankment (such as clumping or cracking) be noted, the County must be notified within 48 hours. If it is determined that the instability is the direct result of blasting, and not due to natural water erosion, with or without flooding, then a corrective plan must be developed that identifies changes to the blasting program to prevent future exceedances" (4.4-58). Even the Blasting Protocols themselves state: "If the blast monitoring indicates that ground vibration or air overpressure

Comment 65-19

exceed the criteria recommended… or if flyrock exceeds the limits of the defined blast clearance zone, the operator will provide notification to Fresno County within 48 hours and identify changes to the blasting program that will be implemented to prevent future exceedances" (App H-6, p.6). This mitigation provided in the form of the Blasting Protocols (MM4.10-1) is improperly deferred. Any corrective plan or contingency plan must be fully developed before any blasting would occur, and must include an evidenced-based strategy that would be quickly implemented to prevent collapse of the riverbank and avoid potential catastrophe outlined below. The DEIR must include sufficient information about mitigation that the public and decision makers can determine whether such measures would adequately mitigate the Project's blasting impacts to the San Joaquin River. The DEIR entirely fails to accomplish this. As explained above, such improperly deferred mitigation violates CEQA.

Comment 65-19 Cont.

Further, this approach of deferring contingency plans until bank stability problems arise vastly minimizes the potential disastrous impacts of a pit failure. If the banks of the San Joaquin River were to become unstable, whether directly due to blasting operations or due to natural processes, and the river channel was to be altered such that flow was diverted into the quarry, even temporarily, the local and downstream impacts could be catastrophic. Such an event could wash out riparian habitat, harm and kill aquatic and riparian wildlife that get diverted into the pit, and introduce sediment and pollutants from the pit into the river, impacting wildlife and water quality for miles downstream.

Blasting of any kind is likely to increase this risk, even with the monitoring requirements outlined in the DEIR. One small mistake or miscalculation could lead to wide-reaching disaster from which the San Joaquin River might never fully recover. The County should not put the health of an entire river ecosystem at risk by allowing blasting so close to the San Joaquin River.

The potential for pit failure is particularly concerning given the potential for natural flooding as well. As described below in this letter (Section V-c), the DEIR's analysis conveniently finds that the San Joaquin River's 100-year floodplain no longer overlaps with the Quarry site, which FEMA's floodplain designation does (App G-1, App. A, Fig. 2). However, research indicates that flooding in California will become more extreme with climate change, not less, indicating that the 100-year floodplain may need to be updated to include the Quarry site. If blasting weakens the river embankment at all, even if those impacts are below the DEIR's established thresholds of significance, this weakening may compound with natural flooding and erosion processes to further stress the riverbanks and potentially increase the risk of pit failure, along with other synergistic flood impacts.

Even without a pit failure, deepening of the quarry is likely to have long-term impacts on the river. As stated by Norman et al. (1998), "In the long term, stream capture by gravel pits is a near certainty. Because the gravel pits have a lower base elevation, there is risk of rapid channel change into the pits during high flows, a process termed avulsion. The flooded pits "capture" the stream." If the Quarry is deepened by 600 feet as the Project proposes, any flooding in the near- or long-term could result in capture of a huge amount of streamflow. The impacts of such avulsion include river bed erosion, channel incision, bank erosion and collapse, changing aquatic habitat, increase in sediment, and damage to fish spawning habitat, among others (Norman et al., 1998).

The DEIR fails to consider the impacts of avulsion at all and fails to provide adequate analysis or mitigation for the impacts to the San Joaquin River embankment from blasting or ongoing operations. Instead, the DEIR improperly minimizes the potential impacts of the project to this sensitive ecosystem and defers important mitigation contingency planning. The DEIR's

failure to adequate analyze or mitigate impacts that could have severe consequences not only for the local area but also for the entire San Joaquin River system is an egregious oversight and a clear violation of CEQA.

Comment 65-19 Cont.

V. The DEIR Does Not Adequately Disclose, Analyze, or Mitigate Impacts to Surface Water Quality

Comment 65-20

The San Joaquin River is the second largest river in California (Laćan & Resh, 2016). It comes from headwaters in the central Sierra Nevada, including in Yosemite and Kings Canyon National Parks, and the Ansel Adams Wilderness. Snowmelt flows through the upper reaches of the River into Millerton Lake, a lake created by the Friant Dam that supplies irrigation water to the Central Valley. Past the dam, the River flows north of Fresno and then joins the Sacramento River and numerous tributaries to form the Sacramento- San Joaquin Delta (the "Delta.") The Delta is the hub of the California water system and the most valuable estuary and wetland ecosystem on the west coast.

The San Joaquin River has earned the title "hardest working river in California" by irrigating thousands of acres of cropland, providing drinking water for millions of people, and supporting fisheries and vast wetlands.

a. The DEIR Does Not Establish by Substantial Evidence that The Project Will Not Degrade Surface Water Quality.

The Plant Site and the Quarry Site are directly adjacent to the San Joaquin River. Dry Creek passes 475 feet to the north of the Plant Site on its way to the River. (DEIR at 4.10-15.) A river water delivery ditch directly connects the Plant Site to the River. (DEIR at 4.4-7.) Both the Plant Site and the Quarry Site have standing ponds of polluted industrial wastewater under current operating conditions. (DEIR at 4.10-8.) The surface water storage on the site will expand as a result of the proposed Project. At the Quarry Site, the amount of water that must be pumped out of the excavation site and stored on site will increase as the mining depth increases. (DEIR at 4.10-8.) At both the Plant Site and the Quarry Site, new ponds "may" be formed as mining progresses. The project will add groundwater recharge trenches at the boundaries of the Plant Site. All this water will be moved and stored on a site that is adjacent to the River and connected to it via surface water, but the DEIR dismisses without evidence the idea that this could lead to any surface water contamination.

The DEIR offers no estimate of the quality of the retained industrial wastewater created by the Project that will become surface water on-site. It merely reports on the current surface water quality, without considering how the intensified mining operations proposed by the Project might affect that water quality. The Project will increase the intensity of existing operations and the magnitude of blasting, and add entirely new pollutants like asphaltic oil. (DEIR at 2-44.) By completely neglecting to analyze or disclose this impact, the EIR fails to provide information regarding the project's significant environmental impacts that is sufficient to allow decision-makers and the public to understand the environmental consequences of the project, in violation of CEQA. (*Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 520; *Laurel Heights Improvement Ass'n v Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 404; See CEQA Guidelines § 15151.)

And even under current conditions, the on-site surface water is toxic. The current surface water has a conductivity level roughly ten times higher than the San Joaquin River. This conductivity level violates the drinking water standard in the basin plan. Conductivity is a general gauge of overall water quality. A higher level commonly indicates a discharge of some pollutant and a resulting harm to the overall health of the water body and the associated ecosystem (EPA, 2025). Surface water at the plant site also has significant arsenic, lead, and iron—none of which are present in significant levels in the San Joaquin River. The arsenic level at the Plant Site is 20 times the drinking water limit. The lead level is 30 times the limit. The iron level is a staggering 1,590 times above the limit. (DEIR at 4.10-24.) The DEIR claims that this toxic water—which will only get more toxic with intensified mining—will not have any impacts because the Project does not "propose" to discharge the water into the San Joaquin River. But a CEQA review is not limited to what the Project proposes; it extends to the Project's reasonably foreseeable impact. Commingling between the dirty surface water on site and the San Joaquin River is in fact reasonably foreseeable through flooding and through the confluence of the river supply channel and Little Dry Creek.

Comment 65-20 Cont.

b. The DEIR Does Not Properly Disclose Current Surface Water Quality Conditions.

Comment 65-21

The DEIR omits water quality testing necessary to understand baseline conditions and to predict likely environmental impacts. First, the surface water at the Quarry Site was not tested for lead or arsenic. (DEIR at 4.10-26.) Those two toxic metals were present in the surface water at the Plant Site at very high levels. (DEIR at 4.10-24.) Because the Project is documented to release these metals into surface water, it is inexcusable not to test for them at the Quarry Site. The County must conduct this testing.

Second, the DEIR does not test—indeed, does not analyze at all—water quality in the river supply channel. This waterway directly connects the San Joaquin River to the Plant Site, and so understanding its water quality is critical to understanding how the Project might affect water quality in the River. The DEIR asserts that water flows through the channel from the River to the Plant Site and assumes that the channel cannot introduce contamination into the River. However, without evidence, it is impossible to know if contaminates from the site are present in the channel, and, if so, if they make it to the River. The channel is an acknowledged interaction site between River water and site surface water. The failure to disclose adequate, up-to-date information about the current level of contamination means that the EIR does not establish environmental baseline, invalidating its analysis. (*Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010) 48 Cal.4th 310, 320 [holding that use of the proper baseline is critical to a meaningful assessment of a project's environmental impacts], *Save Our Peninsula Comm. v Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 119.)

c. The DEIR Dismisses the Threat of Surface Water Quality Impacts from Flooding Without Evidence.

Comment 65-22

Climate change is increasing the risk of extreme precipitation events and resulting floods in California. In particular, anthropogenic warming increases Sierra snowmelt significantly—likely by 200 to 400% during storms (Swain et al., 2018). Scientists estimate that this phenomenon may have already contributed to the failure of the Oroville Dam in 2017 when historical warming increased runoff in the Feather River Watershed by over a third. (Huang et

al., 2018; Huang & Swain, 2022). Hydrological modelling done by UCLA and the National Center for Atmospheric Research projects that the runoff-based flood risk has already doubled from historical averages and will increase further with every degree of warming. The increased flooding risk from both runoff and from sea level rise means that the amount of land in California considered to be at risk from a flood has already doubled relative to FEMA official 100-year flood projections (The Precipitation Problem: 8th Annual Risk Assessment, 2023).

Comment 65-22 Cont.

The DEIR acknowledges that the FEMA floodplain delineation based on studies from 1981 and 1998 is out of date, as it certainly is. (DEIR at 4.10-16; Figure 4.10-1.) But instead of updating the delineation with current information about the increased frequency and magnitude of flooding in California under climate change, the DEIR purports to update it based only on changed site topography. (DEIR at 4.10-16.) This results in a current site floodplain that is smaller than what FEMA delineated in 2009—a scientific implausibility that the DEIR supports with no evidence. Based on this supposed floodplain, the DEIR concludes that the San Joaquin River floodplain does not enter the Plant Site or the Quarry Site and therefore that there is no significant risk from flooding. (DEIR at 4.10-118-19.) This is contrary to the evidence and is not supported by adequate analysis. Because floodplains are expanding, not contracting, under climate change, the Project site likely is at risk of inundation from flooding in the watershed. In the event that a flood that reaches the Project site, the toxic industrial runoff stored as surface water would enter the San Joaquin River, and cause health and environmental damage everywhere the floodwaters reach.

The DEIR admits that excessive water released rapidly from the Friant Dam could result in flooding of the Quarry Site or Plant Site. However, it says that it is not necessary to consider this risk because it is "unforeseen." The DEIR does not cite any evidence to support the contention that rapid releases from the dam cannot be foreseen. In fact, the only citation in the paragraph is to the Fresno County Multi-Jurisdictional Hazard Mitigation Plan which actually estimates a "high" vulnerability to dam failure and flood in Fresno County. (The vulnerability ranking reflects the potential impact and the likelihood of future occurrences.) Just two years ago, heavy rains created record-breaking spillovers at the Friant Dam (Kassandra Gutierrez, 2023). Moreover, dam failures are increasing across the US and in California due to aging infrastructure and intensifying precipitation (Hwang & Lall, 2024; Mallakpour et al., 2019). By dismissing this threat without evidence, the DEIR violates CEQA.

d. The DEIR Relies on Improperly Deferred Mitigation for Surface Water Quality Impacts.

Comment 65-23

The DEIR repeatedly insists that stormwater runoff from the Project will be contained within the Project sites, citing no evidence besides the Surface Runoff and Drainage Plan. However, the Surface Water and Drainage Plan—meant to present "the overall conceptual approach for managing storm drainage"—is nothing more than an aspirational plan to make a plan at a later date. The Plan consists of statements like, "off-site runoff will not commingle with active project area runoff" and "stormwater runoff will be captured by the open water ponds." (DEIR at 4.10-84-85.) This is not a management plan and does not approach an effective mitigation strategy. The DEIR says that best management practices for stormwater treatment, erosion protection and stormwater monitoring will be provided in the Stormwater Pollution Prevention Plan that will be developed and implemented later, out of public view. (DEIR at 4.10-84.)

The County may not defer mitigation to a later date unless the EIR provides specific reasons why a mitigation plan cannot be developed now and provides specific performance measures to evaluate its success. (14 Cal. Code Regs. §15126.4(a)(1)(B); *San Joaquin Raptor Rescue Ctr. v County of Merced* (2007) 149 CA4th 645, 670; *Cleveland Nat'l Forest Found. v San Diego Ass'n of Gov'ts* (2017) 17 CA5th 413, 442.) An EIR is inadequate if "[t]he success or failure of mitigation efforts may largely depend upon management plans that have not yet been formulated, and have not been subject to analysis and review within the EIR." (*San Joaquin Raptor, supra*, 149 Cal.App.4th at p. 670.) As courts have pointed out "[f]undamentally, the development of mitigation measures, as envisioned by CEQA, is not meant to be a bilateral negotiation between a project proponent and the lead agency after project approval, but rather, an open process that also involves other interested agencies and the public." (*Communities for a Better Environment v. City of Richmond*, 184 Cal. App. 4th 70, 93.)

Comment 65-23 Cont.

Here, the County proposes exactly that—a stormwater mitigation plan that will be developed after Project approval, with no guarantee of success, for no clear reason. In the meantime, the DEIR asserts without evidence that stormwater will be entirely contained on the site, making the DEIR inadequate. The EIR has not established that this vague, undefined plan will effectively reduce the impact of this Project o surface water to less than significant. (*Banning Ranch Conservancy v. City of Newport (2012) 211 Cal.App.4th 1209, 1232-34*.)

e. The DEIR Ignores Possible Impacts from the River Supply Channel without Disclosure or Analysis.

Comment 65-24

Given that the river supply channel is an acknowledged direct connection between surface water on site and the San Joaquin River, the DEIR must be revised to include a full analysis not just of its water quality, but of its slope, flow characteristics, path to the River, and interactions with Dry Creek. Under Project conditions, the amount of water drawn from the River through the channel will decrease from 295 acre-feet per year to 125 acre feet per year. (DEIR at 4.19-9.) The DEIR offers no way to understand the effect of that change, or if a lower water level in the channel might allow water to move from the Project site to the River.

A "conclusory discussion" of a significant environmental impact makes an EIR "inadequate as an informational document" as a matter of law. (*Sierra Club*, *supra*, 6 Cal.5th at p. 514.) An EIR must provide information regarding the project's significant environmental impacts that is sufficient to allow decision-makers and the public to understand the environmental consequences of the project. (*Id.* at p. 520; *Laurel Heights Improvement Ass'n v Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 404; See CEQA Guidelines § 15151.) The document must include enough detail to enable the public "to understand and to consider meaningfully the issues raised by the proposed project." (*Id.* at 516 (citation omitted).) By omitting discussion of the river supply ditch almost entirely, the DEIR is inadequate.

VI. The DEIR Fails to Adequately Assess and Mitigate Impacts to Groundwater Quality and Groundwater Flow.

Comment 65-25

The DEIR's inadequate analysis of the Project's impacts on groundwater quality, groundwater flow, and groundwater supply lacks substantial evidence and overlooks several reasonably foreseeable impacts. CEQA requires adequate assessment of impacts associated with acquiring and providing water to a Project. (See *Vineyard Area Citizens for Responsible Growth,*

Inc. v. City of Rancho Cordova (2007) 40 Cal.4th 412, 434 [hereinafter "Vineyard Area Citizens"].) This assessment must include both direct and indirect environmental impacts resulting from the permanent allocation of water to a proposed project. (*Vineyard Area Citizens*, *supra*, 40 Cal.4th at 434.) Here, the DEIR overlooks not only groundwater supply, but groundwater contamination and impacts to groundwater flow from the Project's substantial groundwater pumping and blasting. It further fails to support all mitigation measures with substantial evidence and fails to assess consistency with the North Kings Groundwater Sustainability Plan.

Comment 65-25 Cont.

a. The DEIR Fails to Adequately Assess Impacts on Groundwater Quality.

The DEIR fails to adequately assess impacts on groundwater quality and support its conclusions of "less than significant impacts" for several reasons. First, the DEIR fails to mention, let alone adequately discuss, potential cross-contamination between aquifers due to the 600-foot depth of the Quarry site. The 2025 North Kings GSP provides that it is possible for the Project to tap into a separate aquifer at 600 feet below ground surface, which is the maximum depth of this project (North Kings Groundwater Sustainability Agency, 2025). This lower aquifer could have several different contaminants, or the same as those identified, at higher concentrations, impacting both surface water quality and groundwater quality as the Project pumps this water into ponds and trenches.

Relatedly, the DEIR fails to support its contention that "[b]ecause there would be no change in the management of the Northeast Pond, no change in the existing water quality in the Northeast Pond is anticipated." (DEIR at 4.10-89.) Considering the massive increase in pumping at the Quarry site, and thus (1) the increase in groundwater that will end up in the pond, and (2) the water potentially originating from a different aquifer with different contaminants in different concentrations, the EIR must provide more than simply an assumption that the water quality at the Northeast Pond will remain unchanged.

Comment 65-26

Second, the DEIR fails to support the assumption that leaving contaminated water in ponds throughout the Project site will not significantly impact groundwater quality. The DEIR identifies several groundwater quality concerns, including arsenic, nitrate, iron, manganese, and hexavalent chromium (DEIR at 4.10-42) and admits that iron, manganese, and conductivity already exceed their maximum contaminant levels in the Plant Site silt pond and three Quarry Site ponds. (DEIR at 4.10-42, 88.) It further admits that an iron and manganese rich pond that will form at the Plant Site following Phase I could impact groundwater quality. (DEIR at 4.10-95.)

Comment 65-27

However, the DEIR simply assumes the ponds will not impact groundwater quality. Appendix G provides the only explanation for this assumption: "Concentrations of total iron, total manganese, and total arsenic exceeded the respective MCLs, indicative of metals in the sediment part of the water samples. These higher concentrations aren't indicated to pose a threat to groundwater quality, because of filtration as some of the silt pond water percolates to groundwater." (Appendix G-3 at 26) Contrary to CEQA's requirement to support such contentions with "substantial evidence," nowhere does the DEIR support this conclusory statement that percolation will essentially eliminate all groundwater quality concerns. (See *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027.)

Relatedly, the DEIR further concludes, without explanation, that leaching from the Plant Site pond into groundwater will essentially stop after operations conclude, despite the Plant Site

reclaimed pond remaining full of contaminated water. The DEIR states that any leaching from the Plant site reclaimed pond will "likely" not occur. (DEIR at 4.10-95.) However, nowhere does the DEIR provide an explanation for this assumption.

Comment 65-27 Cont.

Third, the DEIR fails to provide any support for its contention that the groundwater pumped into ponds and trenches, and later reclaimed ponds, will not impact water quality in the San Joaquin River. For example, the DEIR explains that conductivity levels for four Plant Site wells exceeded the conductivity limit for the San Joaquin River below Friant Dam; however, it dismissed this impact because the Project will not discharge groundwater *directly* to the San Joaquin River. (DEIR at 4.10-43.) This, too, requires further assessment, as Appendix G states that "It is assumed that *half of the groundwater ditch recharge would flow to the San Joaquin River* or local groundwater beyond the project site," (Appendix G-3 at 35 [emphasis added]) and estimates that 145 acre feet per year will go from the trenches to the San Joaquin River or alluvium (over 47 million gallons). (Appendix G-4 at 86.) This is unsurprising, considering "[t]he recharge ditches would be located so as to have a maximum effect in two areas: 1) *near the river*, and 2) near a concentration of offsite wells to the southeast." (Appendix G-3 at 42.) Despite this assumption, nowhere does the DEIR assess impacts of high conductivity levels on groundwater and surface water, nor impacts of other contaminants on water quality in the San Joaquin River and local aquifers.

Comment 65-28

Furthermore, it remains reasonably foreseeable that flooding in the groundwater trenches and Project Site could contaminate the San Joaquin River. As described above, the DEIR admits that releases from the Friant Dam "could result in flooding of the Quarry site and/or plant site." (DEIR at 4.10 at 119.) The recharge trenches are just feet from the San Joaquin River (DEIR at 2-19), and again, Appendix G admits that "*half of the groundwater ditch recharge would flow to the San Joaquin River* or local groundwater beyond the project site." (Appendix G-3 at 35 [emphasis added].) This is a critical oversight and must be fully assessed.

Finally, despite these groundwater quality concerns, the DEIR relies on two unsupported mitigation measures to render these impacts less than significant. For the Plant Site pond specifically, the DEIR includes Mitigation Measure 4.10-5a. However, this mitigation measure requires only monitoring and only suggests a single mitigation strategy for just manganese and iron: "aeration or mechanical circulation of the water from the bottom of the pond to the surface of the pond" if iron and manganese levels persist for five years above their water quality standards (DEIR at 4.10-97-98.) Not only does this mitigation measure overlook other contaminants that could exceed standards in the pond, but it provides no support for the efficacy of aeration. This is impermissible, as substantial evidence in the record must support mitigation measures' effectiveness. (*Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027.)

Comment 65-29

And for groundwater quality at the Quarry Site, the DEIR provides "Blasting Protocols" to prevent groundwater contamination from explosives. However, not only does this ignore other potential sources of contamination (e.g. cross contamination between aquifers), but the DEIR fails to explain how the list of Best Management Practices in Appendix H-6 will prevent groundwater contamination from explosives, as CEQA requires. (DEIR at 4.10-99-100.)

Comment 65-30

b. The DEIR Fails to Adequately Support Its Conclusions Regarding Impacts to Groundwater Flow.

Comment 65-31

First, the DEIR fails to support its estimate regarding how much groundwater will be diverted from its natural flow pattern and end up in the Project site excavations. The DEIR admits that "[s]everal communities and individual residences in the foothills and Sierra Nevada rely exclusively on groundwater from bedrock wells for their supply." (Appendix G-5 at 12.) And it explains that groundwater infiltration into the bedrock *does* occur and is dependent on the degree and nature of fracturing of the weathered rock and hard rock. (DEIR at 4.10-48.)

Comment 65-31 Cont.

However, despite impacts on groundwater in this bedrock and communities that rely on it, the DEIR failed to provide sufficient information on impacts of that groundwater ending up in the Project excavations. While Appendix G estimates average hydraulic conductivity through hard rock as 1.4 gallons per day per foot (Appendix G-4 at 90), and estimates that 195 acre feet will end up in the Quarry Site annually, Appendix G acknowledges that "the thickness of the water producing fractures [in the bedrock] is unknown." (Appendix G-4 at 90.) This is critical information missing from the groundwater flow analysis. The Project could capture far more groundwater, diverted from its natural flow path, than the DEIR acknowledges.

Second, DEIR fails to take into account the potential for blasting and drilling to impact the thickness of the fractures in the hard rock. Thicker and more numerous fractures in the hard rock from blasting would result in more groundwater reaching the Project site after passing through the alluvium, drawing down aquifers potentially far beyond the Project site. Despite this potential, the EIR concludes that there will be "no significant change in the volume flowing through alluvium and weathered rock" than before the quarry deepens. (DEIR at 4.10-114.) The EIR needs to assess this impact and assess the potential for more groundwater to flow into the Project site as a result of thicker fractures after blasting.

Comment 65-32

Third, the DEIR fails to explain the flow patterns of groundwater within the bedrock. Rather, Appendix F-2 explains that "the 7 groundwater monitoring wells installed within the bedrock that have been recently installed do not provide information about the continuity of the groundwater flow … [or] distribution of aquifers and aquitards." (Appendix F-2 at 9.) In other words, the DEIR lacks critical information about flow that should affect the monitoring well placement 600 feet below ground in the bedrock. The EIR requires this critical information, as clustered monitoring wells should monitor groundwater both upstream and downstream with screening intervals at different depths to capture representative samples of contaminants. As a result, the final EIR must contain a full study modeling groundwater flow in the bedrock and place monitoring wells accordingly.

Comment 65-33

c. The DEIR Fails to Adequately Assess the Project's Impacts on Groundwater Supply.

Comment 65-34

The Project will require significant dewatering, first during excavation, then continuously as groundwater flows into the excavation pits. The DEIR estimates that half of the groundwater pumped out of the excavations will go to recharge trenches along the perimeter of the project site to "minimize drawdown" near a number of offsite wells and may also be used for dust control and wash water. (DEIR at 4.10-86, 87.) The rate of dewatering at the Plant Site will reach 1,610 acre feet per year (DEIR at 4.10-86) and at the Quarry Site 320 acre-feet per year under current conditions, 375 acre-feet per year after 30 years of mining, and 405 acre-feet per year at the end of mining. (Appendix G-5 at 45.) The projected drawdown would be approximately 90 feet at the edge of the quarry pit, 45 feet 2,000 feet from the pit, and 15 feet at 4,000 feet away. (DEIR at

4.10-107.) Dewatering will result in impacts to groundwater hydrology, altered flow regimes, and reduced groundwater levels. Comment 65-34 Cont.

Despite these critical impacts, the DEIR relies solely on recharge trenches to prevent aquifer depletion from additional acres of impervious surfaces at the Quarry Site, groundwater pumping, and the cone of depression. (DEIR at 5-23-24.) The DEIR explains "it is *most likely* that the recharge operations would be conducted throughout the mining and active dewatering period as the primary means to manage the water pumped from excavation." (DEIR at 4.10-107 [emphasis added].) In other words, the DEIR concludes that because some water pumped from the excavation area would end up in recharge trenches and ponds, "there [will] not be a substantial reduction in local groundwater volumes during mining." (DEIR at 4.10-102.)

Nowhere does the DEIR provide evidence supporting this conclusion. Instead, Appendix G estimates that there will be about 195 acre feet of outflow from the recharge ditches annually (compared to the maximum dewatering from the Plant Site of 1,610 acre feet per year and 405 acre feet from the Quarry Site per year.) (Appendix G-4 at 86.) Furthermore, the DEIR admits that only about half of the water taken from the excavation during dewatering will go to the recharge trenches (DEIR at 4.10-87), only half of which will flow to the San Joaquin River *or* local aquifers. (Appendix G-3 at 35.) Thus the DEIR's reliance on recharge trenches is not supported by substantial evidence.

Additionally, nowhere does the DEIR discuss the possibility of subsidence as a result of the massive pumping the Project will require. Instead, it dismisses this impact with one sentence, explaining that because the project will drill into hard rock there will be no subsidence. (Appendix F-1 at 14, F-2 at 8.) However, the Project Description provides that "remaining alluvial deposits on approximately 117.6 acres of the 138.5-acre Plant Site would be mined to a depth of approximately 85 feet below ground surface." (DEIR at 2-3, 2-29.) This will require substantial dewatering at the Plant site, which could result in subsidence. Subsidence, if it were to occur, could also have additional impacts, including a potential increase in flood risk. The EIR must provide more than one sentence to support its conclusion that subsidence will not be a significant impact. Comment 65-35

The only mitigation measures provided for the reasonably foreseeable drawdown of water around the Project site are Mitigation Measure 4.10-10a, "Quarry Site Groundwater Adaptive Management Program" and Mitigation Measure 4.10-10b, "Quarry Site Groundwater Adaptive Management Program Funding Mechanism." However, neither provide mitigation measures beyond the recharge trenches. Rather, they require only monitoring and vague "corrective measures" if drawdown goes beyond 15% of the baseline. (DEIR at 4.10-109.) The only specifics they provide is additional water diverted to recharge trenches, which is already part of the Project and the sole strategy identified in the DEIR for mitigating drawdown. (*Id*.) This is insufficient under CEQA, which requires that a lead agency adopt concrete, specific, and enforceable actions to mitigate significant impacts. (*California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173); (See also *Federation of Hillside & Canyon Ass'ns v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261 [mitigation measures must be "fully enforceable through permit conditions, agreements, or other measures" so "that feasible mitigation measures will actually be implemented as a condition of development."].) Comment 65-36

d. The DEIR Fails to Acknowledge the Potential of Pit Failure and Its Impacts on Groundwater Quality and Flow. Comment 65-37

Nowhere does the DEIR even mention, let alone meaningfully discuss, impacts to groundwater quality and flow from potential pit failure. Instead, the DEIR asserts that mitigation through monitoring will reduce the impact of pit failure at both sites to less than significant, despite the Quarry Site's location just 200 feet from the San Joaquin River. (DEIR at 4.7-30-37, 2-17.) However, in reaching this conclusion, the DEIR admits that it lacks critical information to support its slope stability conclusions: (1) it lacks boring data to develop reliable kinematic models; and (2) it lacks information about local groundwater conditions that could affect kinematic stability of portions of mining slopes, including artesian conditions, preferential seepage paths, and piping conditions. (DEIR at 4.7-34.) Specifically, Appendix F-2 explains that "the 7 groundwater monitoring wells installed within the bedrock that have been recently installed do not provide information about the continuity of the groundwater flow … [or] distribution of aquifers and aquitards, and consequently they do not provide sufficient information key to assessing pore pressure distribution within the slope stability model." (Appendix F-2 at 9.) Without this critical information, the DEIR fails to support its conclusions regarding slope stability with substantial evidence and overlooks grave potential impacts to groundwater quality and flow.

Comment 65-37 Cont.

The DEIR promises to mitigate the impacts of slope instability at the Quarry Site with a Quarry Site kinematic analysis and another study on groundwater conditions with the potential to impact stability. (DEIR at 4.7-36-37.) But this is insufficient under CEQA, which requires binding, enforceable mitigation *before* Project approval. (Guidelines § 15126.4, subd. (a)(2)). "[A]n agency goes too far when it simply requires a project applicant to obtain a [] report and then comply with any recommendations that may be made in the report." (*Ctr. for Biological Diversity v. Dep't of Fish & Wildlife* (2015) 234 Cal. App. 4th 214, 240); (*Endangered Habitats League, Inc. v. County of Orange* (2005) 131 Cal.App.4th 777, 793.) These reports regarding potential slope instability cannot be deferred until a later stage; they must be completed before Project approval.

e. The DEIR Fails to Adequately Assess Consistency with the North Kings Groundwater Sustainability Plan.

Comment 65-38

Finally, Appendix G of CEQA provides that a project has significant impacts if it conflicts with or obstructs a sustainable groundwater management plan. (DEIR at 4.10-83.) However, the DEIR incorrectly claims that it need not assess consistency with the North Kings Groundwater Sustainability Plan (GSP) (or any other GSP) because it is not part of the North Kings GSA area. (DEIR at 4.10-112-13.) Specifically, it claims that the top of the hard rock unit at the Quarry site is the top of the plutonic bedrock: a depth at which the North Kings GSA does not address. (DEIR at 4.10-112.) However, the boundary modification request to Department of Water Resources (DWR) that *may* draw this boundary has not yet been approved. (North Kings 2025 GSP at 3-33.) Thus, at this time the DEIR must assess consistency with the GSP, as it is admittedly "located within the jurisdiction of the North Kings GSA," in a critically over-drafted subbasin. (DEIR at 5-23.)

As a result of this incorrect assumption, the DEIR's assessment of consistency with the GSP is inadequate. The DEIR even admits elsewhere that "[t]the use of groundwater by the proposed project and cumulative projects in a critically over-drafted groundwater basin could also lead to conflict or obstruction of the North Kings GSA Groundwater Sustainability Plan, which is a potentially significant cumulative impact." (DEIR at 5-23.) However, the DEIR

assures that Impact 4.10-18 fully assessed this conflict: an impact that does not exist in the DEIR. (DEIR at 5-23, 4.10-119 [impact 4.10-17 is the final in the section].) The EIR must include this assessment and support any consistency findings with substantial evidence.

Comment 65-38 Cont.

VII. The DEIR's GHG Analysis Is Inadequate and Misleading.

Comment 65-39

The Project will emit significant GHG emissions, which the DEIR obscures with an outdated baseline and an incorrect threshold of significance that ignores feasible mitigation and misrepresents the state's climate plans. The Project proposes to lock in intensive mining on the site for one hundred years, long past the time when California needs to achieve net zero emissions. Approving a Project of this scale without adequate consideration of GHG impacts is irresponsible and a violation of CEQA.

a. The Climate Crisis Is a Catastrophic and Urgent Threat to California.

A strong, international scientific consensus has established that human-caused climate change is causing widespread harms to human society and natural systems, and that climate change threats are becoming increasingly dangerous. The Intergovernmental Panel on Climate Change (IPCC), the leading international scientific body for the assessment of climate change, concluded in its 2023 Sixth Assessment Report that: "[u]nsustainable and unequal energy and land use as well as more than a century of burning fossil fuels have unequivocally caused global warming, with global surface temperature reaching 1.1°C above 1850-1900 in 2011-2020." (IPCC, 2023). The increase in global surface temperature has resulted in sea level rise, increased frequency of extreme weather events, and has resulted in "irreversible losses" at the species and ecosystem levels. (IPCC, 2023). These findings were echoed in the United States' own 2023 Fifth National Climate Assessment, prepared by scientific experts and reviewed by the National Academy of Sciences and multiple federal agencies. The 2023 Assessment concluded that "[t]he global warming observed over the industrial era is unequivocally caused by greenhouse gas emissions from human activities–primarily burning fossil fuels" and long-term responses include "sea level rise, ice sheet losses, and associated disruptions to human health, social systems, and ecosystems." (US Global Change Research Program, 2023).

In its 2020 update, the National Academy of Sciences and the Royal Society concluded that climate change is largely a result of human activity, as "natural causes alone are inadequate to explain the recent observed changes in climate." (National Academy of Sciences & Royal Society, 2020). The additional carbon input from human activities has significantly disturbed the natural carbon cycle, resulting in an imbalance in the system that fosters global climate stability. (National Academy of Sciences & Royal Society, 2020). Based on observed and expected harms from climate change, in 2009 the U.S. Environmental Protection Agency found that greenhouse gas pollution endangers the health and welfare of current and future generations. (74 Fed. Reg. 66496 (Dec. 15, 2009) [U.S. EPA, Endangerment and Cause or Contribute Findings for Greenhouse Gases Under Section 202(a) of the Clean Air Act; Final Rule].) In 2021, EPA again recognized the critical nature of the climate crisis, stating that: "[t]he changing climate is affecting people's health and livelihoods and damaging infrastructure, ecosystems, and social systems in communities in every region of the nation." (US Environmental Protection Agency, 2021)

Comment 65-39 Cont.

These authoritative climate assessments decisively recognize the dominant role of greenhouse gases in driving climate change. In its 2023 Assessment Report, IPCC stated that "the extent to which current and future generations will experience a hotter and different world depends on choices now and in the near term." (IPCC, 2023). In order to prevent global warming from reaching an irreversible point, policies must be implemented to reach net zero CO2 emissions and achieve significant reductions in other greenhouse gases. (IPCC, 2023).

The impacts of climate change will be felt by humans and wildlife. Climate change is increasing stress on species and ecosystems—causing species-level changes in morphology, behavior, phenology, and geographic range shifts, and ecosystem-level changes such as the increasing frequency of extreme weather events, widespread changes in productivity, species interactions, and vulnerability to biological invasions (Weiskopf et al., 2020). Climate-change-related local extinctions are already widespread and have occurred in hundreds of species. (Wiens, 2016). Catastrophic levels of species extinctions are projected during this century if climate change continues unabated (Maclean & Wilson, 2011; Thomas et al., 2004; Urban, 2015). Conservation actions aimed at protecting biodiversity can slow the progression of climate change–the ecosystem services provided by biodiverse ecosystems are an integral part in the balanced functioning of our climate system (Shin et al., 2022).

Therefore, immediate and aggressive greenhouse gas emissions reductions are necessary to keep warming well below 2°C above pre-industrial levels. The IPCC Sixth Assessment Report and other expert assessments have established global carbon budgets, or the total amount of carbon that can be burned while maintaining some probability of staying below a given temperature target. According to the IPCC, "[t]he best estimates of the remaining carbon budgets from the beginning of 2020 are 500 GtCO2 for a 50% likelihood of limiting global warming to 1.5°C and 1150 GtCO2 for a 67% likelihood of limiting warming to 2°C." (IPCC, 2023). Additionally, "[i]f the annual CO2 emissions between 2020-2030 stayed, on average, at the same level as 2019, the resulting cumulative emissions would almost exhaust the remaining carbon budget for 1.5°C (50%), and deplete more than a third of the remaining carbon budget for 2°C (67%)." (IPCC, 2023). As of 2023, climate policies by the world's countries would lead to an estimated 2.7°C of warming, and possibly up to 3.4°C of warming, well above the level needed to avoid the worst dangers of climate change (Climate Action Tracker, 2023).

The United States has contributed more to climate change than any other country. The U.S. is the world's biggest cumulative emitter of greenhouse gas pollution, responsible for 24 percent of cumulative global CO2 emissions from 1850 to 2022, and the U.S. is currently the world's second highest emitter on an annual and per capita basis (Friedlingstein et al., 2023; Friedrich et al., 2023). U.S. climate policy is wholly inadequate to meet the international climate target to hold global average temperature rise to well below 2°C above pre-industrial levels to avoid the worst dangers of climate change. Current U.S. climate policy has been ranked as "insufficient" by an international team of climate policy experts and climate scientists which concluded: "[w]ithout additional, drastic emission reductions measures, the US will still be far from meeting its domestic climate target, let alone get its emissions onto a 1.5°C trajectory." (Climate Action Tracker, 2023). In its 2018 Special Report on Global Warming of 1.5°C, the IPCC—the leading international scientific body for the assessment of climate change—described the devastating harms that would occur at 2°C warming. The report highlights the necessity of limiting warming to 1.5°C to avoid catastrophic impacts to people and life on Earth (IPCC, 2018). The report also provides overwhelming evidence that climate hazards are more urgent and

more severe than previously thought, and that aggressive reductions in emissions within the next decade are essential to avoid the most devastating climate change harms.

Comment 65-39 Cont.

In California, climate change will transform our climate, resulting in such impacts as increased temperatures and wildfires, and a reduction in snowpack and precipitation levels and water availability (Turco et al., 2023). In response to inadequate action on the national level, California has taken steps through legislation and regulation to fight climate change and reduce statewide GHG emissions. Enforcement and compliance with these steps are essential to help stabilize the climate and avoid catastrophic impacts to our environment. California has a mandate under AB 1279, the California Climate Crisis Act, to achieve net zero GHG emissions by no later than 2045, and achieve and maintain net negative GHG emissions thereafter, and to ensure that by 2045, statewide GHG emissions are reduced to 85% the level in 1990. (AB 1279 2022.) In 2019, Governor Newsom issued an executive order to leverage state investments to further California's climate goals (Executive Order N-19-19 (2019).) Newsom has continued to issue climate-related executive orders, such as a 2020 order requiring that, by 2035, all passenger vehicles will be zero-emission, in addition to other motor vehicle emission goals. (Executive Order N-79-20 (2020).) Through these bills and orders, California has laid a path that may allow the state to achieve tangible climate solutions, but there is still work to be done.

Although some sources of GHG emissions may seem insignificant, climate change is a problem with cumulative impacts and effects. (*Ctr. for Biological Diversity v. Nat'l Highway Traffic Safety Admin.*, (9th Cir. 2008) 538 F.3d 1172, 1217 ("the impact of greenhouse gas emissions on climate change is precisely the kind of cumulative impacts analysis" that agencies must conduct).) One source or one small project may not appear to have a significant effect on climate change, but the combined impacts of many sources can drastically damage California's climate as a whole. Therefore, project-specific GHG emission disclosure, analysis and mitigation is vital to California meeting its climate goals and maintaining our climate.

b. The GHG Analysis Is Invalidated by the Use of an Unsupported Baseline.

Information provided in the EIR is inadequate to establish a reliable baseline of existing GHG emissions at the Project site. Under CEQA, an environmental review document must evaluate the potential environmental impacts of the project as compared to the existing environmental conditions (the "baseline"), so that the Project's impacts can be meaningfully analyzed and compared to alternatives. (CEQA Guidelines § 15125(a); see *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 952; *Neighbors for Smart Rail v. LA County Metropolitan Transit Authority* (2013) 57 Cal.4th 310, 315.)

The DEIR uses production records from the year 1998 as a baseline for this Project. (DEIR at 4.8-30.) It makes no attempt to explain why records from twenty-six years ago are an accurate report of current environmental conditions. Especially given that the last twenty-six years have seen tremendous progress on emissions reductions technologies and climate regulation, it is very likely that emissions from 1998 drastically overstate emissions from the facility today. By comparing the Project's projected emissions against an inflated baseline, the increase in emissions over baseline conditions caused by the Project will be incorrectly understated. (*Communities for a Better Env't v South Coast Air Quality Mgmt. Dist.* (2010) 48 C4th 310, 315.) The DEIR must be revised to compare the Project's GHG emissions against an accurate baseline and recirculated.

c. The EIR's Threshold of Significance Forecloses Consideration of Foreseeable GHG Impacts and Is Not Supported by Substantial Evidence.

Comment 65-40

A lead agency's selection of a threshold of significance must be supported with substantial evidence. Moreover, a determination that an environmental impact complies with a particular threshold of significance does not relieve a lead agency of its obligation to consider evidence that indicates the impact may be significant despite compliance with the threshold. (CEQA Guidelines § 15064(b)(2).) If evidence shows that an environmental impact might be significant despite the significance standard used in the EIR, the agency must address that evidence. (*Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1111.)

i. The DEIR Rejects Air District Guidance Without Evidence.

Comment 65-41

The San Joaquin Valley Air Pollution Control District ("SJVAPCD"), which has jurisdiction over the Project, provides guidance on evaluating GHG emissions under CEQA which the DEIR opts to ignore. (DEIR at 4.8-27.) It is not necessarily clear at this stage that the SJVAQMD threshold would adequately capture the significant impacts of the Project. A recirculated DEIR would have to provide substantial evidence to establish that the SJVAPCD threshold, or any threshold it opted to use, is sufficient. But dismissing a threshold that the local air district recommends, that does include performance standards directly relevant to this type of Project, with conclusory statements and no evidence falls short of the level of disclosure required under CEQA. disclose the analytic route the . . . agency traveled from evidence to action and is thus not sufficient to allow informed decision making." (*Vineyard Area Citizens for Responsible Growth*, 40 Cal.4th at p. 445 [A DEIR must "disclose the analytic route the . . . agency traveled from evidence to action."].)

The threshold recommended by SJVAPCD is that Projects must either implement Best Performance Standards or achieve a 29% reduction in emissions compared to business as usual. The DEIR claims that this policy adopted by the local air district, "does not apply to the proposed project for a number of reasons." But those reasons are unsupported by substantial evidence or reasoning. First, the DEIR notes that Fresno County is the lead agency for the Project. However, Fresno County can still use a threshold adopted by the local air district–-in fact, this is exactly how it often works. (See *Center for Biological Diversity v Department of Fish & Wildlife* (2015) 62 C4th 204, 230 [suggesting air district numerical thresholds as one possible approach].) Second, the DEIR claims that the passage of cap-and-trade in 2010 somehow makes the Air District threshold adopted in 2009 irrelevant. This is a misunderstanding of CEQA and cap-and-trade, as discussed further below. The passage of cap-and-trade did not displace local authority to regulate land use projects, and it certainly did not supersede CEQA analysis for projects that *are not subject* to cap-and-trade. The DEIR thus ignores an applicable threshold without evidence.

The DEIR likewise rejects the best performance standard required by the SJVAQMD threshold, with inadequate explanation. (DEIR at 4.8-34.) The air district published performance standards for Continuous Mix Asphalt Plant Dryers in 2010 that would reduce their GHG emissions by 13.1% to 17.2%. The DEIR says that "certain features" of the standard are "not feasible." The only elaboration here is the claim that requiring the facility to use warm mix asphalt is not feasible because the mix design is not always under the control of the operator.

This assertion stops far short of substantial evidence. It does not explain why mix design would not be controlled by the operator or who would control it. Nor does it address why other aspects of the best performance standard could not be adopted. Comment 65-41 Cont.

Instead, the DEIR rejects SJVAQMD guidance entirely in favor of a threshold adopted by the South Coast Air Quality Management District, but its application of that threshold is invalidated by the same misunderstanding of cap-and-trade that led it to incorrectly reject the SJVAQMD threshold.

ii. The Cap-and-Trade Program Does Not Alter CEQA or Relieve Lead Agencies of their CEQA Responsibilities.

Comment 65-42

The DEIR relies on cap-and-trade compliance to minimize the significance of the Project's emissions. It does this without answering the most fundamental question—whether the Project is in fact subject to cap-and-trade. Petroleum refineries, which includes facilities that produce asphalt,[4] are included if they produce over 25,000 MT CO_2e per year. (CARB, 2012). The only information the DEIR provides on current GHG emissions at the facility is the "baseline" figure from 1998. As discussed above, this is inadequate information and the DEIR must provide an actual baseline of current conditions or explain why the 1998 data is a reasonable approximation.

However, if that baseline does reflect current conditions, then the facility as currently operating is not subject to cap-and-trade. But the DEIR goes on to estimate the proposed Project's estimated emissions at 31,812 MT CO_2e, so, presumably, the facility would be subject to cap-and-trade after expansion. (DEIR at 4.8-32.) That would mean that the Project would be given an allowance that permitted a certain amount of total GHG emissions. If the Project's total emissions were less than that, it could trade the excess to other covered entities or bank them for later. If it wanted to emit more than the allowed amount, it would have to purchase credits to allow that.

But none of this is what the DEIR says. Instead, it says that *other* entities—namely, electricity and transportation fuel suppliers—are covered by cap-and-trade. (DEIR at 4.8-32.) Therefore, the DEIR ignores all the GHGs emitted by the Project's use of electricity and transportation fuel on the theory that cap-and-trade makes those emissions invisible to CEQA. These ignored emissions total 9,356 MT CO_2e, almost a third of the Project's total emissions. (DEIR at 4.8-33.) The remaining emissions, from the asphalt dryer and asphalt oil heater, the DEIR says are not covered by cap-and-trade. Because the asphalt dryer and oil heater will emit 8,508 MT CO_2e and that number is below the SCAQMD's significance threshold, the DEIR concludes the Project will not have significant GHG impacts. (DEIR at 4.8-34.

This analysis is riddled with errors and inconsistencies. As an initial matter, the DEIR must explain why the Project—a petroleum refinery that will emit over 25,000 MT CO_2e —is not itself a covered entity. Splitting the Project's emissions between some that are covered by cap-and-trade at some point upstream and others that are not covered does not make sense for a Project that should be complying with cap-and-trade in its own right, for its own total emissions.

If the Project is indeed not subject to cap-and-trade, then the cap-and-trade regulation does not cover any of its emissions, or excuse any of them from being considered under CEQA.

[4] An entity is covered if it "has one or more of the processes or operations" that define a covered entity. That means that an entity that produce asphalt, like the Project, are covered entities even if they also do other things. (CARB 2012.)

For one thing, it is not true that all electricity and transportation fuel suppliers are necessarily covered; most types of suppliers are only covered if they emit more than 25,000 MTs CO2e. The DEIR's claim that all electricity and transportation fuel used by the Project will come from a covered entity is not supported by evidence.

Comment 65-42 Cont.

Further, even electricity or fuel supplied by a covered entity is not somehow immune from consideration under CEQA at the point of use. The DEIR misunderstands the function and purpose of the cap-and-trade regulation. The cap-and-trade regulation does not eliminate or mitigate emissions and it is far from the be-all-end-all of the State's plan to achieve climate goals. The DEIR claims that the lead agency has no responsibility to address emissions from combustion of transportation fuels and electricity that *this Project* will cause; it can merely point to marginal reductions that California will achieve on a statewide level through cap-and-trade. But the cap-and-trade program is just one of many complementary programs that require different actors to work in different ways to reduce emissions. Covered facilities must participate in cap-and-trade, and local governments must mitigate impacts of their land use decisions through CEQA. One responsibility does not discharge the other.

Under CEQA, a lead agency must consider the whole of the action and the entire underlying activity being approved, including parts of the project might be regulated by another entity. (14 Cal Code Regs §15378(a), (c)–(d); *Orinda Ass'n v Board of Supervisors* (1986) 182 CA3d 1145, 1171.) This approach is necessary to prevent piecemealing, a strategy where environmental considerations are concealed through a focus on individual parts that overlooks the whole. (*Bozung v LAFCO* (1975) 13 C3d 263, 283.) Here, the DEIR considers a Project that will emit 17,864 MT CO_2e over baseline and simply subtracts 9,356 MT CO_2e of those emissions in order to fall under the 10,000 MT significance threshold. All 17,864 MT CO_2e of these emissions are part of the same Project and must be considered together. To do otherwise is a violation of CEQA.

And the SCAQMD does not bless this approach in its significance threshold either, contrary to the DEIR's assertion. The threshold asks whether the project is consistent with a qualifying local GHG reduction plan that itself has been analyzed under CEQA. If it is, then the emissions are not significant. Cap-and-trade is a statewide plan, not local, and it was never analyzed under CEQA. Moreover, the DEIR claims *it does not apply to the Project*. The SCAQMD threshold says that emissions are insignificant if the project as a whole complies with a local climate plan like a CAP; it does not contemplate separating emissions into categories based on other entities' compliance with state law and ignoring some of them. The Project cannot have it both ways: at times rely on the cap and trade program for its emissions and in other instances ignore cap and trade program.

Furthermore, in its 2022 Scoping Plan, CARB explicitly rejects exactly the approach the DEIR uses: (Scoping plan at 20-21.)

> While CARB has developed programs such as the… the Cap-and-Trade program to reduce sector-wide GHG emissions, these programs were not designed to directly mitigate individual land use development project emissions from a CEQA perspective. Therefore, claimed consistency with these programs should not be used to conclude that motor vehicle emissions from a land use development project are fully mitigated or that such projects are definitively consistent with the Scoping Plan—particularly where the project at issue is not itself directly regulated by these programs.

The DEIR bases its GHG analysis on a threshold of significance that ignores half of the Project's emissions based on a misunderstanding of cap-and-trade that has been plainly rejected by CARB. This is an inadequate threshold of significance that invalidates the DEIR. The DEIR must be revised to accurately consider the significance of the GHG impacts and recirculated so the public and decision makers receive correct, legally adequate information.

Comment 65-42 Cont.

VIII. The DEIR's Alternatives Assessment Is Inadequate.

Comment 65-43

The purpose of an EIR's discussion of alternatives is to identify ways to substantially reduce or avoid significant environmental impacts. (Laurel Heights Improvement Association v. Regents of Univ. of Cal. (1988) 47 C3d 376, 403.) Therefore, an EIR must focus on alternatives that avoid or substantially lessen the Project's significant environmental impacts. (Pub. Res. §21002; 14 Cal Code Regs §15126.6(a)–(b).) The EIR should analyze alternatives that offer substantial environmental advantages over the proposed project. (Citizens of Goleta Valley v. Board of Supervisors (1990) 52 C3d 553, 566); (see e.g. Cleveland Nat'l Forest Found. v. San Diego Ass'n of Gov'ts (2017) 17 CA5th 413, 436 [an EIR that did not consider alternatives that would reduce vehicle miles travelled was inadequate].)

CEQA requires the County to prepare an EIR that meaningfully considers the suggested alternatives in detail. (Friends of the Eel River, 108 Cal.App.4th at p. 873 [holding that because the discussion of alternatives omitted relevant, crucial information, it subverted the purposes of CEQA and was legally inadequate].) A proper alternatives discussion of alternatives should provide sufficient "information to the public to enable it to under, evaluate, and respond" to the agency's conclusion. Stated differently, the discussion should "contain facts and analysis, not just the agency's bare conclusions or opinions," and should include "meaningful detail." (Id. at 404-406.) As explained in Citizens of Goleta Valley v. Board of Supervisors (1988) 197 Cal.App.3d 1167, 1180-83, assertions that a particular alternative is economically infeasible simply because it would be more expensive or less profitable to the private applicant are not adequate. "In the absence of comparative data and analysis, no meaningful conclusions regarding the feasibility of the alternative could have been reached." (Id. at 1180-81.) The Court of Appeals added that:

> The fact that an alternative may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible. What is required is evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the project.

(*Ibid.*) Because the DEIR fails to provide substantial evidence supporting a finding of infeasibility for any suggested alternatives, additional analysis is required before the County may approve the project. (Pub. Res. Code § 21002.)

a. The General Plan or Zoning Codes Do Not Require this Proposed Project.

Comment 65-44

The DEIR refused to consider the Reduced Operational Life Alternative and an alternative 200 feet below ground surface because it claims mining aggregate for a shorter duration would conflict with the existing state MRZ-2 classification and the Fresno County General Plan and zoning designations for the project sites, which identify the project sites as

having aggregate deposits of regional and local significance (Fresno County, 2024). Specifically, it states: "[T]he County eliminated the Reduced Operational Life Alternative from further consideration as an alternative in this EIR as it would reduce utilization of a known MRZ-2 resource in conflict with Fresno County's General Plan and does not fully meet some of the project objectives." (DEIR at 6-8.) However, nowhere does the General Plan state that MRZ-2 resources must be mined for a certain duration or at a certain depth: The General Plan states only that "[t]he County shall not permit land uses incompatible with mineral resource recovery within areas designated as Mineral Resource Zone 2 (MRZ-2)." (DEIR at 6-8.) This means the County could not, for example, permit an office building on an area with MRZ-2 resources.

Comment 65-44 Cont.

The DEIR also claims drilling to any shallower depth would clash with Goal OS-C of the Fresno County General Plan Mineral Resources Section of the Open Space and Conservation Element to conserve areas identified as containing significant mineral deposits for potential future use. (DEIR at 6-39.) However, this goal specifically seeks to conserve MRZ-2 resources while also "promoting the reasonable, safe, and orderly operation of mining and extraction activities within areas designated for such use, where environmental, aesthetic, and adjacent land use compatibility impacts can be adequately mitigated." (Fresno General Plan at 2-120-21.) This goal hardly requires 100 years of mining at 600 feet bgs when environmentally superior alternatives exist.

The DEIR's other excuses for refusing a shorter-duration Project similarly lack support. For example, the DEIR claims that "interim loss of this aggregate resource could cause future shortages of construction and aggregate material in the Fresno region," and "[b]ased on this analysis, the County eliminated the Reduced Operational Life Alternative from further consideration as an alternative." (DEIR at 6-8.) Nowhere does the DEIR support this contention regarding shortages, as CEQA requires.

b. The DEIR Fails to Support Its Conclusions Regarding Other Alternatives with Substantial Evidence.

Comment 65-45

Beyond its flawed reasoning regarding the General Plan, the DEIR bases its GHG emissions assessment of all shallower alternatives (Alternatives 2-5) on unsupported assumptions. It claims that shallower mining would have the same or worse GHG emissions because "[t]he development of new or expansion of existing quarries or the reopening of Rockfield Quarry would result in even greater GHG emissions as aggregate is hauled into Fresno County from further distances, as compared to continuing the operation of the Rockfield Quarry as planned under the proposed project." (e.g. DEIR at 6-34.) In other words, not drilling to the depth of 600 feet "would require the Applicant, or other aggregate suppliers, to search for another aggregate source to supply the County's regional needs. As a result, another mine could be developed elsewhere in the County with similar or additional significant environmental impacts and increasing the overall footprint of aggregate mines in the County." (e.g. DEIR at 6-39.)

Nowhere does it support this contention, as CEQA requires. To the contrary, the Aggregate Sustainability in California report, last updated by the California Geological Survey in 2018, provides that the Fresno region will need an estimated 305 million tons of aggregate for the next 50 years' worth of construction, while it already has 556 million tons of permitted aggregate reserves, nearly double the projected demand. (Clinkenbeard & Gius, 2018; p.5) As a result, it is fairly possible that aggregate demand will go down, rather than stay the same.

c. The DEIR Fails to Support Its Conclusions Regarding Alternative 5 as the Environmentally Superior Alternative.

Comment 65-46

CEQA requires that before approving a project with significant environmental impacts, the agency must make findings identifying the specific considerations that make the environmentally superior alternative infeasible. (Pub. Res. Code § 21081; Preservation Action Council v. City of San Jose (2006) 141 Cal.App.4th 1336, 1351-52.)

The County rejected Alternative 5 (400 feet bgs, with reduced annual sales), despite this alternative (and all other shallower, shorter duration alternatives) meeting at least partially all the project objectives because it determined that Alternative 5 is not "economically feasible" without any further explanation. But under CEQA, determining that an alternative "may be more expensive or less profitable is not sufficient to show that the alternative is financially infeasible." (Preservation Action Council, 141 Cal.App.4th at 1352.) Instead, the agency must present "evidence that the additional costs or lost profitability are sufficiently severe as to render it impractical to proceed with the [alternative]." (Id.) This evidence may include, for example: total estimated costs, total projected income, total expenses, and the change in the per unit cost of a project that results from a project alternative or mitigation measure. (See Citizens of Goleta Valley v. Board of Supervisors (1988) 197 Cal.App.3d 1167, 1180.).) The findings of infeasibility must be supported by substantial evidence. (Id. at 1176-77.)

The DEIR contained no substantial analysis as to Alternative 5's economic feasibility. Nor did it even explain why it chose Alternative 5 as the "environmentally superior alternative. The DEIR states only that Alternative 5 would reduce impacts on air quality, biological resources, energy, groundwater quality and supply, mineral resources, noise, and transportation. However, this requires further support, especially considering there are no differences in the conclusions regarding those very impacts for alternative 3 (300 feet bgs.) And the only difference between Alternative 5 and Alternative 4 (300 feet bgs with additional setbacks) is that Alternative 5 would have reduced energy impacts, whereas the DEIR asserts, without any support, that energy demands under alternative 4 would remain the same because of its unsupported assertion that "demand for aggregate resources would remain." (DEIR at 6-44.)

In sum, the DEIR failed to provide any support for Alternative 5 as the environmentally superior alternative and for why Alternative 5 is economically infeasible. Both deficiencies must be address before the Project can be approved. (CEQA Guidelines, § 15091, subd. (a)(3) ["No public agency shall approve or carry out a project for which an EIR has been certified... [unless environmentally superior] project alternatives identified in the final EIR" are infeasible].) The EIR must support its conclusions regarding alternatives with substantial evidence and provide additional information for the public to comment on.

IX. Conclusion

Comment 65-47

Thank you for the opportunity to submit comments on the DEIR for the CEMEX Rockfield Quarry Modification Project. The DEIR fails to adequately analyze or mitigate the proposed Project's impacts to biological resources, greenhouse gas emissions, surface and groundwater quality and availability, and project alternatives.

Given the possibility that the Center will be required to pursue legal remedies in order to ensure that the County complies with its legal obligations including those arising under CEQA, we would like to remind the County of its statutory duty to maintain and preserve all documents

and communications that may constitute part of the "administrative record" of this proceeding. (§ 21167.6(e); *Golden Door Properties, LLC v. Superior Court* (July 30, 2020, Nos. D076605, D076924, D076993) ___Cal.App.5th___ [2020 Cal. App. LEXIS 710.) The administrative record encompasses any and all documents and communications that relate to any and all actions taken by the County with respect to the Project, and includes "pretty much everything that ever came near a proposed [project] or [] the agency's compliance with CEQA . . . ." (*County of Orange v. Superior Court* (2003) 113 Cal.App.4th 1, 8.) The administrative record further includes all correspondence, emails, and text messages sent to or received by the County's representatives or employees, that relate to the Project, including any correspondence, emails, and text messages sent between the County's representatives or employees and the Applicant's representatives or employees. Maintenance and preservation of the administrative record requires that, *inter alia*, the County (1) suspend all data destruction policies; and (2) preserve all relevant hardware unless an exact replica of each file is made.

Subject:	public comment on CEMEX Rockfield Expansion Project
Date:	Monday, March 10, 2025 9:28:11 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Fresno Planning Department,

As a partnering business and donor to the San Joaquin River Parkway, I take significant interest in the conservation and protection of this section of the San Joaquin River. This section of river provides countless ecosystem services and critical habitat for special species. Fresno County has a duty to protect these critical resources which are threatened by the rockfield expansion project. Please consider the adverse impacts of this project on the river.

Comment 66-1

Thank you for your time and consideration.

Best,
Scott

Subject: RE: Draft Environmental Impact Report for the proposed modification to the existing CEMEX Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

Dear Mr. Randall,

Friends of the River (FOR) is submitting this comment letter regarding the County of Fresno's Draft Environmental Impact Report (DEIR) 7763 for the CEMEX Rockfield Quarry: Rockfield Modification Project (proposed project). Comment 67-1

FOR's mission is to protect and restore California rivers by influencing public policy and inspiring citizen action. In addition, FOR is one of the Settling Parties of the the San Joaquin River Restoration Program (SJRRP) which is currently being implemented in accordance with the San Joaquin River Restoration Settlement and the San Joaquin River Restoration Settlement Act (Act), included in Public Law 111-11. The proposed project is located within the SJRRP Restoration Area and has the potential to impact Reclamation's successful implementation of the SJRRP.

FOR appreciates the County of Fresno's efforts on the proposed project and consideration of our comments. General comments and specific comments are provided in the attached "Comments on the Draft Environmental Impact Report: CEMEX Rockfield Quarry: Rockfield Modification Project (EIR 7763) and Unclassified Conditional Use Permit Applications No.s 3666 and 3667."

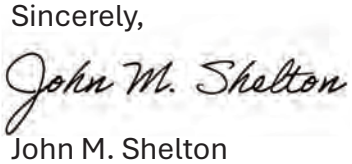
FOR does not believe there are enough overriding conditions that could be used to justify the extension of the Conditional Use Permits and that the County of Fresno should deny the application. If the County does make finding of overriding concerns for those impacts not fully mitigated, CEMEX should be required to implement more comprehensive mitigation for wildlife, recreation, visual, and traffic impacts. For several CEQA required areas of disclosure, Fresno County decision makers, FOR, and the public does not have Comment 67-2 Comment 67-3

enough information to adequately analyze the impacts of the proposed project on the resources for which we advocate. Also as an active party to the SJRRP settlement, we do not believe that the analysis is adequate to inform us in providing direction to the agencies implementing the SJRRP. We request additional information be provided in the DEIR regarding baseline conditions, impact analyses, and mitigation measures, as described in the attached document.

Comment 67-3 Cont.

FOR appreciates the opportunity to comment on this proposed project and the County's consideration of our comments. Please contact John Shelton at jshelton@friendsoftheriver.org with any questions or if there is a need for discussion of these comments in more detail.

Sincerely,



John M. Shelton
Policy Advisor
Friends of the River

Comments on the Draft Environmental Impact Report: CEMEX Rockfield Quarry: Rockfield Modification Project (EIR 7763) and Unclassified Conditional Use Permit Applications No.s 3666 and 3667

Background

Staff from Friends of the River have reviewed the documents that Fresno County has made available on their website (https://www.fresnocountyca.gov/Departments/Public-Works-and-Planning/divisions-of-public-works-and-planning/development-services-division/planning-and-land-use/environmental-impact-reports/cemex-rockfield-expansion). With the amount of information available, and the limited time for review, staff focused on issues that are important for our organization such as fisheries and wildlife, public health, and outdoor recreation. In accomplishing our review, we also discussed the project with other organizations and community members, press coverage, and social media discussions. We used these communications to note issues that should also be brought to the attention of those making the decision to move forward with this project. It is possible that some issues were covered adequately in the appendices to the Draft Environmental Impact (DEIR) or other documentation, but were not summarized adequately in the main DEIR.

Comment 67-4

General Comments

Our organization, along with other environmental organizations and community members, does not believe that a gravel quarry and gravel processing plant is an appropriate land use for the San Joaquin River corridor currently or into the future. Historically, as the area developed and gravel mining operations were sited, the gravel and sand resources of the San Joaquin River and its immediate corridor were a fast and easy source. We understand that society's values change, and believe strongly that those values now reflect a desire to let the San Joaquin River and its associated floodplains and connected upland, recover from decades of sand and gravel extraction. In the last few decades, the State (Pappas & LiveScience 2014)

Comment 67-5

Overriding Considerations and Need for Gravel Operations in the River Corridor

Statements within the DEIR and supporting documents are misleading to imply that the Plant and Quarry are needed for gravel supply for the NE Fresno and North Clovis areas. As reported in Fresnoland by Gregory Weaver (Weaver 2025) and documented by The California Geological Survey (Clinkenbeard & Gius 2018), this region is better than adequately resourced with developed

Comment 67-6

supplies for next 50 years. Although some benefits can accrue to specific segments of the County's economy, the analysis of whether those benefits are greater than the benefits of a completed San Joaquin River Parkway, that may be precluded for the next 100 years is not undertaken. In addition, the significant impacts to Visual Resources and Traffic, by themselves could show that the overall economic impact to this region is likely to be negative.

Comment 67-6 Cont.

The San Joaquin River has been noted in the past as California's most endangered river (Pappas & LiveScience 2014). Since 2014, the San Joaquin River Restoration Program, the San Joaquin River Conservancy, both the Counties of Madera and Fresno, and the City of Fresno, have been intent of making the river more ecologically resilient by investing in properties for recreation, passing land use designations for the San Joaquin Parkway, and approving projects.

For these reasons, any finding of Overriding Considerations that are related to the economy, including employment, cannot be supported without much more analysis and information disclosure.

Project Analysis Should Be Based on Both Existing and Future Impacts, Including the Length of Time Those Impacts are Occurring

Comment 67-7

- Analysis of ecological, recreational, and other impacts should be based both on existing conditions and length of impacts.
- Hydrology and wildlife (fisheries especially) should be analyzed for planned restoration from SJRRP, SJRC, Active Transportation, and other Future Land use projects

Comment 67-8

- Future impacts to water supply should quantify, based on future planned/predicted river hydrology from open water (transpiration) surfaces.

Comment 67-9

The DEIR does not adequately compare the Proposed Project to the No Project Alternative. While we agree with the assessment that the No Project Alternative is the best environmental option, the analysis and discussion should include more information on reasonably foreseeable projects and future conditions. For example, the analysis regarding transportation impacts does not fully discuss the intention of both the City and County of Fresno, and the City of Clovis, to implement numerous plans and policies that encourage Active Transportation. The impact of this project on the ability for these jurisdictions to encourage biking and walking within the affected area of this project is not analysis nor discussed other than with current conditions. The impacts of blasting, gravel truck traffic, and spread of rocks and gravel from transporting materials on Friant Avenue is likely to disrupt the implementation of Active Transportation elements significantly over time.

Comment 67-10

The hydrologic and wildlife impacts, similar to Transportation and recreation, should consider and analyze future hydrologic conditions that are being implemented by water agencies. The San Joquin River Restoration Program has well publicized intents to implement full restoration flows on the San Joaquin River. This program, that has invested $100's millions in the San Joaquin River, is based on a legally binding settlement and Federal Government law (https://www.restoresjr.net/). Analysis within the DEIR should consider the higher levels of flows within the river that is mandated by the program, the higher levels of fisheries resources that are being pursued, and other related information that is available.

Comment 67-11

Given the long timeframe of the extension of the CUPs, the DEIR should also acknowledge the US Fish and Wildlife Service's, National Marine Fisheries Service's, Department of Fish and Wildlife's, and the San Joaquin River Conservancy's plans for restoration of fish and wildlife resources. This project area is an important component of future habitat for several listed and candidate species, and species of special concern that, and programs for recovery well documented. These efforts should be reasonably foreseeable to increase the number and types of fisheries and wildlife over the 100 years of the length of this CEQA project.

Comment 67-11 Cont.

Relative to hydrologic analysis and water supply, the DEIR should also find that reclaiming both the plant site and the quarry area will increase evaporation of water that is directly linked to groundwater flow or would intercept water from Little Dry Creek that would ultimately impact the River's flow. Although reclamation to other than open water habitat would likely be cost prohibitive for the Company that ultimately is the owner when reclamation is implemented, this impact needs to be stated as a unmitigated significant impact.

Comment 67-12

Future Conditions Should be Analyzed with Climate Change Considerations

Comment 67-13

- Future conditions should be analyzed with climate change considerations
    - Hydrology – flood potential with climate modeling
    - Water Quality (algae blooms in open water pits)

Related to the above discussion of reasonably foreseeable future conditions, most of the analysis on the future conditions does not incorporate well documented future impacts due to climate change. Analysis regarding hydrological conditions for the San Joaquin River and Little Dry Creek do not include like conditions that will exist both by 2050 and 2100. As is well documented with climate models, including downscaled modeling and analysis for this region, the climate in this region will have both hotter conditions and more flashy climatological events (for examples, see Moser & Ekstrom 2010, Zhang et al. 2024, and Liu et al. 2021). The analysis of the integrity of the quarry site from inundation, including through higher levels of groundwater flow from increased height of the river, and power of the river, should be better analyzed. An especially important, mitigation that would prevent the failure of the walls of the quarry should be very robust. The analysis of the quarry site from inundation from extreme flows of Little Dry Creek is especially superficial. (see below for related issues).

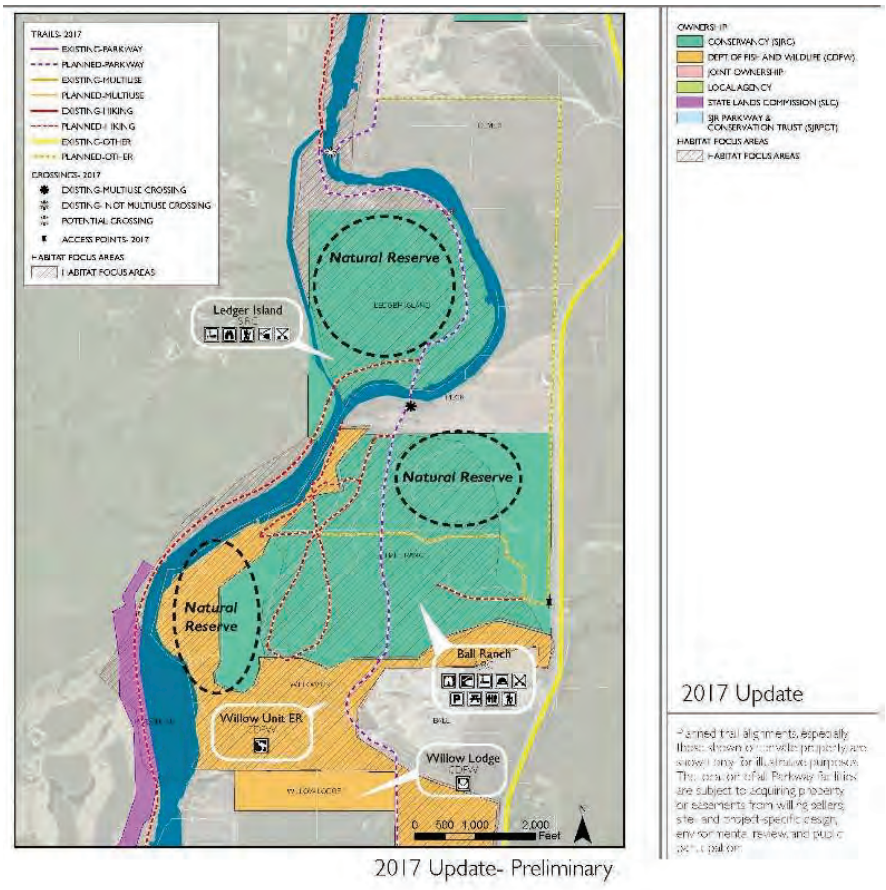
Climate Change projections are nearly unanimous in the prediction of hotter summers for this region. Reclaiming the plant and quarry sites to open water habitat does not consider what the future conditions will mean for water temperatures and the likelihood of outbreaks of *Microcystis*, a potentially dangerous micro algae (Power et al. 2024). With the potential for *Microcystis* outbreaks, the DIER should consider the potential future implications to fishers, wildlife and humans.

Better, more Comprehensive Mitigation Should be Implemented, Especially for Significant Impacts that Cannot be Fully Mitigated to Less Than Significant Impacts

Comment 67-14

An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures (§15093 of the State CEQA Guidelines). This project is one which takes a valuable resource of the County and State, and allows for the commercialization of that resource. The likelihood of a lucrative return to the local economy is documented within the DEIR. From this perspective, it is likely that CEMEX will significantly benefit from this project. For this reason, feasible mitigation measures need to be considered that in other instances could be deemed too expensive.

For Transportation impacts, especially for those that involve the safety of pedestrians and bicyclists, there are several mitigation measures that could reduce the over impacts of this proposed projects. The City and County of Fresno have identified multiple intersections along Friant Avenue within the likely travel routes for the gravel trucks. The County should consider the installation of pedestrian and bike bridges at the intersections of Fresno, Audubon, Shepard, Fort Washington, Champlain, Copper, and Willow. Potentially these overcrossings can be completed over time, with those nearest Woodward Park being the highest priority. Related to this is the impacts to the San Joaquin River Parkway multiuse trail. Although CEMEX states in their supporting documents that they could work with the San Joaquin River Conservancy to build this between the plant and Friant road, and along their quarry pit, both of these alignments will still have safety concerns with the increased truck traffic. The County should require that CEMEX build a the multiuse train and underpass at the entrance to their plant, in addition to constructing the multiuse trail on Ball Ranch, connecting by a bridge across the river to Ledger Island, and then reconnecting to the Fresno side of the river upstream of the quarry site and connecting it to Lost Lake Park. These additions would keep pedestrians and bicyclists away from the quarry and allow for safe travel by the plant site. In addition, this should also take more bicycle traffic off of Friant Road and avoid safety considerations of increased traffic.



2017 Update- Preliminary

Specific Comments

Comment 67-15

Silty discharge from Plant site ponds to Little Dry Creek active floodplain

The proposed project at the plant site (Figure 2) does not discuss past levee breakage and loss of water from the silt pond. Although the proposed project describes some protection from discharges of the silt pond, there is not much information on any increase in design characteristics to the levee than can justify more confidence that further discharges will not happen. As seen in Figures 3-7, the silt pond is located next to the active flood plain of Little Dry Creek and has likely discharged silt and silty water into that flood plain. With the existing water quality constituents of the silt pond as reported in DEIR, the proposed project should provide strong mitiation measures to assure that the levee separating the silt pond from Little Dry Creek is much stronger, better monitored, and include a spill cleanup and abatement plan.

Comment 67-16

Little Dry Creek supplies the Main Pond on Ball Ranch, that is used by the public for fishing, swimming and boating recreational activities. With the potential for future discharges of the silt pond, analysis should be done for the Main Pond on wildlife and fisheries species (see Figure 8), water quality issues, and impacts to hydrology from the proposed extension of the plant site CUP.

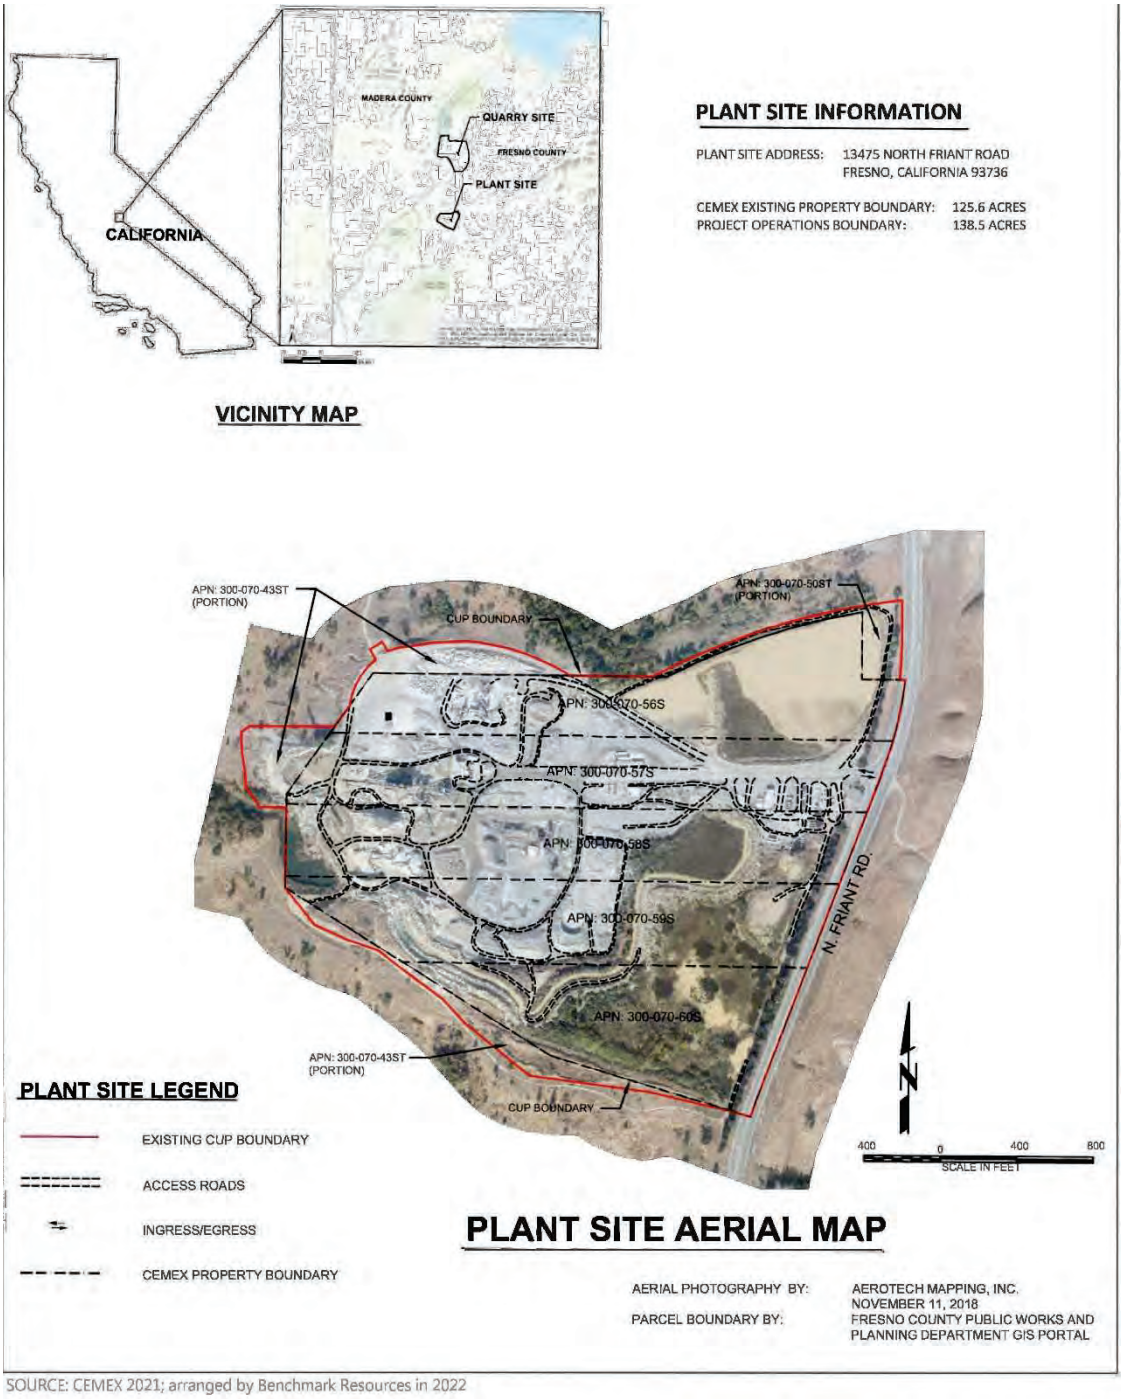

Figure 2. Figure 2-1 form DEIR showing the Plant Site's existing conditions. Note the property boundaries versus the project area disturbances and the location of the silt pond.

Comment 67-16 Cont.

Figure 8: Sacramento Pikeminnow at the entrance of the Ball Ranch Main Pond. Photo taken April 12. 2029.

Comment 67-17

Lack of any analysis of the Inlet Ditch that is connected to the San Joaquin River and Little Dry Creek

- Silt issues
- Crossing of Little dry Creek
- Low water crossing of Little Dry Creek
- Invasive species issues in Ditch
- Lack of Fish Screen
- Lack of Water Quality Analsis

Figure 2 also shows the CUP boundary, which is also described as the Project Area for the plant site. A very important area that is not included, but should be, is the inlet ditch that supplies water to the plant. Figure 3 also shows, approximately, the location of the inlet ditch as in connects to the plant site on its western boundary, travels west before turning north and connecting to the San Joaquin River. A very important note is that the ditch crosses Little Dry Creek at grade, causing the waters to commingle (Figure 9). The ditch supplies project related water supplies, and has required maintenance in the past, which is likely to continued being required for flow. For this reason, it should be included in the project area and its continued operations and maintenance described and mitigation for continued negative impacts covered.

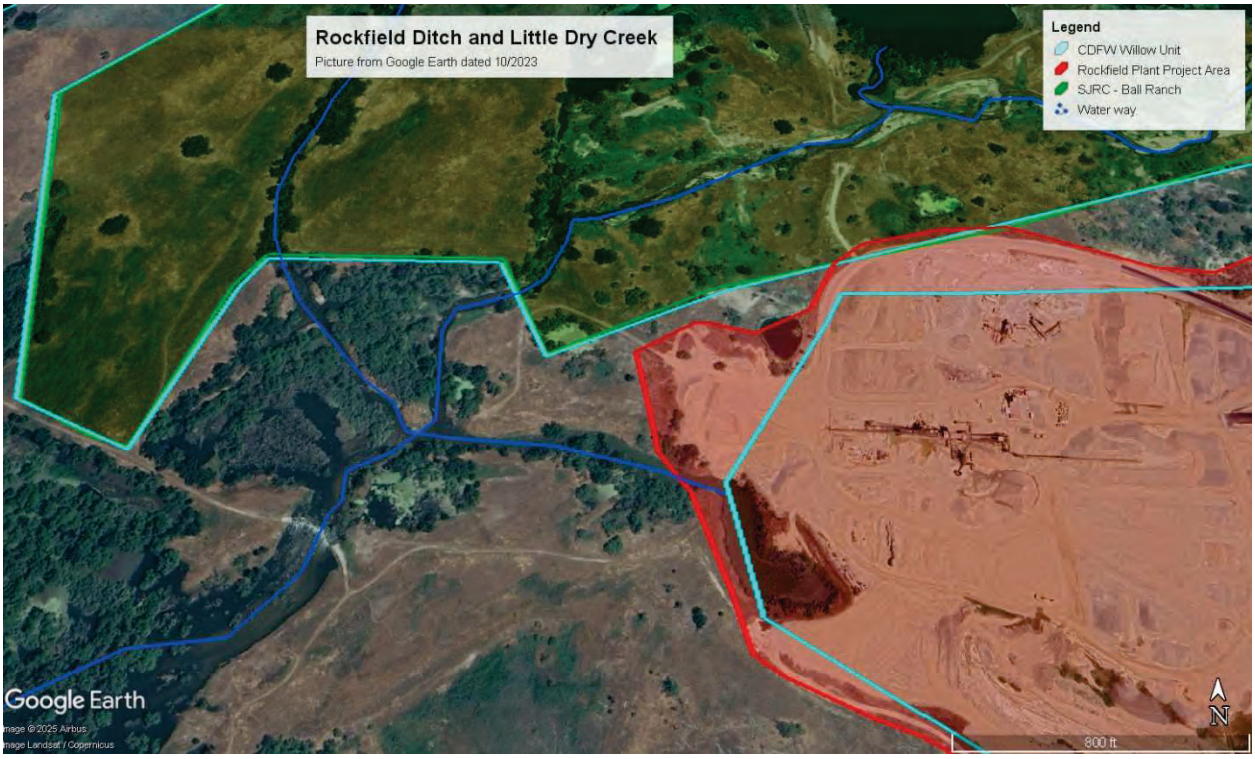

Figure 9: Rockfield water supply ditch with a focus on the crossing of Little Dry Creek from Google Earth, access in March 2025 and using the time series tool to show October 2023. Note the water within Little Dry Creek downstream of the inlet ditch crossing.

For example, Figure 10 shows how close land disturbance is to the inlet ditch pond at the plant site. This proximity of disturbance can allow silt and other contaminants to enter the water in the inlet ditch. With flows of Little Dry Creek, the likelihood of flow going back towards the River is likely. As with the water quality of the silt pond, water quality of the inlet ditch needs to be described. Mitigation and monitoring requirements need to be put into place to avoid, if possible, on going and future negative impacts. Siltation of fine sediments is especially problematic for the fisheries of the San Joaquin River and is identified as potential issues in the continue efforts as reestablishing a run of Chinook salmon.

An important mitigation measure to avoid some of the most important negative impacts from continued operations at the plant site is to separate the ditch water from Little Dry Creek. A siphon or some other such infrastructure should be required. In addition, none of the background information describes a right to use water from Little Dry Creek, and with the water comingled, CEMEX is taken water from a water body without any clam of rights for that.

Comment 67-18

Comment 67-19

Figure 10: Rockfield water supply ditch with a focus on the crossing of Little Dry Creek and the inlet pond from Google Earth, access in March 2025 and using the time series tool to show May 2023. Note that Little Dry is flowing and that the surface disturbance at the plant site goes up to the inlet pond, allowing siltation and contaminants to enter the inlet ditch waters that are connected to Little Dry Creek.

Impacts to Fisheries and Wildlife Need a More Comprehensive Analysis and a Mitigation and Monitoring Plan that Adequately Prevents Impacts

Comment 67-20

Although the supporting documentation for the DEIR discusses modeling that purports to show that the likelihood of impacts from blasting to fisheries, including Spring run Chinook salmon, are not

Comment 67-20 Cont.

expected, the monitoring, with mitigation measures if monitoring shows impacts taking place, is not sufficient to protect this very important resource. The 2013 State of Alaska Department of Fish and Game Blasting Standard (Alaska Blasting Standard) cited by the applicant identifies mitigation monitoring (hydrophones) that should be conducted in conjunction with blasting. The following is a recommended mitigation approach:

- Year 1 of blasting: Monitor blasting impacts at the river adjacent to the Quarry Site. Depending on monitoring results, implement the following actions:
    1. Below 0.6 pounds per square inch and 0.5 inches per second: no action.
    2. Between 0.6 pounds per square inch-6 pounds per square inch or 0.6 inches per second-2.0 inches per second: implement avoidance and minimization measures outlined in the Alaska Blasting Standard and continue monitoring.
    3. Above 7.3 pounds per square inch or 2.0 inches per second: implement avoidance, minimization, and mitigation measures outlined in the Alaska Blasting Standard and continue monitoring.

At the end of one year of monitoring, re-evaluate the need for monitoring using the following parameters:

- If after 1 year, river impacts stay below 0.6 pounds per square inch and 0.5 inches per second, no additional monitoring is needed so long as future blasting techniques don't create additional pressure or other river impacts.
- If after 1 year, river impacts have been between 0.6 pounds per square inch-6 pounds per square inch or 0.5 inches per second-2.0 inches per second, continue monitoring and implementing avoidance and minimization measures until 1 year of 0.6 pounds per square inch and 0.5 inches per second measurements.
- If after 1 year, river impacts exceeded above 7.3 pounds per square inch or 2.0 inches per second, continue to implement monitoring and avoidance, minimization, and mitigation measures until 1 year of lesser pounds per square inch measurements are experienced, at which point follow guidance for the range of pounds per square inch and inches per second measurements experienced.
- If at any point blasting technique changes so that blasts have the potential to be more impactful to the surrounding land than they were during a 1-year monitoring period where blasts registered below 0.6 pounds per square inch and 0.5 inches per second at the river, river monitoring should take place for the period of higher impact blasting to verify that the new blasting technique does not create additional impacts to the river. So long as impacts of the new blasting technique remain below 0.6 pounds per square inch and 0.5 inches per second at the river, no additional monitoring is necessary for that blasting technique. If the blasting technique creates impacts, either cease the technique or re-enter monitoring, avoidance, minimization, and mitigation measures described above.

Comment 67-21

The analysis of impacted wildlife species from operations, including blasting at the quarry site, does not adequately discuss probable species of wildlife expected in the area. The main example of this is any analysis of bat species. The North American Bat Monitoring Program has established monitoring sites very close to both the plant site and to the quarry site (NA Bat Monitoring Program 2023). This program has identified numerous species of bats adjacent to the project sites. In addition, Pallid Bats, recently listed as California's official state bat, have been identified in a night roosting site within 10 miles of the plant site (Figure 11). The DEIR should analyze the potential for blasting impacts of roosting of bat species, document their areas of concern, and potentially impacts for impaired water bodies such as the silt ponds on their diet.

Hi David:

As I continue to review the DEIR I just came across the following paragraph in the 4.11 table regarding land use consistency with local planning documents: Comment 68-1

See Section 4.10, "Hydrology and Water Quality." With implementation of mitigation measures, the project would have less-than-significant impacts on water quality, groundwater supplies and recharge, and drainage patterns. However, as it cannot be said with certainty at this time that access would be granted to County and private residential supply wells to allow for the full implementation of Mitigation Measure 4.10-11a, the County has determined that the proposed project's potential impact on groundwater supply wells surrounding the Quarry Site would be significant and unavoidable.

If the County of Fresno has determined Groundwater impacts to be significant and unavoidable according to this statement, why weren't those impacts highlighted in the Notice of Availability?

Dear members of the Fresno County Board of Supervisors

This letter is in protest to the approval of the Cemex USA proposition by the Fresno County to extend it's contract permit and property access for another 100 years. The damage to the (our)environment will be incalculable.

Comment 70-1

Located adjacent to the river, the project has unknown damage to the water and river. In this increasingly arid environment, the xxx to the river could be significant. Also, the continued and increased traffic of oversize vehicles is and will be a source of damage to our roads and air quality.

Comment 70-2

Comment 70-3

Why would a foreign company have such influence on our governors?

Comment 70-4

This proposition is in direct

Sincerely yours,

Evany Zirul

County of Fresno

Comment 71-1

Hello David,
I'm a 4th generation Fresnan. I just received the mailer today from the County of Fresno regarding the proposed CEMEX extension/modification of their existing agreement for mining rock, sand, & gravel adjacent to the San Joaquin River near north Fresno.

I am AGAINST any extensions or modifications to the existing agreement with CEMEX. I would like to see them cleanup, restore, & vacate that sight as spelled out in the current agreement. This property is sorely needed for the public, as Fresno continues to grow. It's been gratifying to finally see some public space (Ball & Sumner Peck ranches) set aside for public use near the San Joaquin River. The CEMEX operation has served its purpose. It's time to say "no" to any mining request extensions in that area, especially so near the river. I personally would like to see that property managed by the San Joaquin River Parkway & Trust & opened to the public, just like the former Ball Ranch & Sumner Peck properties.

Thank you for listening,
Bob Papazian

Comment(s) 72-2, 72-3 72-4

County Planners, please do not allow Cemex to extend their contract and mining in this area. We currently live in Tuscan Bluffs off Friant Road and strongly oppose the Cemex project extension and plans for a 600 foot pit. Particularly concerning is that CEMEX is a multinational company headquartered in Mexico,where they do not even allow the type of blasting/drilling CEMEX wants to do in Fresno. Please do not allow air, noise, and water pollution to affect our community. The San Joaquin River Parkway should be restored. Further, Friant Road is already very dangerous and we can't imagine what adding more truck traffic to it would cause.

Thank you for your time and consideration,

The Agellon Family

Report Suspicious

Good morning.

I vehemently oppose the Cemex Rockfield Expansion which includes the blasting of a 600 foot pit. (https://www.fresnocountyca.gov/files/sharedassets/county/v/1/vision-files/files/46439-eir-7763-informational-slideshow.pdf) There are many things not to like about this expansion, but the simplest reason is the continued damage to the environment. What has already been done is bad enough, but to allow it to continue and on a heightened level is outrageous. Not only would this continue to damage the ecosystem, but it poses more danger for Fresno's citizens as air quality worsens and elevated noise pollution commences. In addition, Fresno is already among the top 10 most polluted cities in the US as was reported in The Fresno Bee on 4/27/24, and adding to this atrocity is an affront to humanity. (https://www.fresnobee.com/news/local/article288061190.html)

Comment 73-1

In conclusion, there are many homes in the vicinity of Cemex and its homeowners would be unduly and adversely affected by this expansion. I am one of those homeowners and I forcefully oppose this expansion taking place.

Thank you.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr Randall,
I just received a letter informing me about the proposed modification of the CEMEX expansion plans. Comment 74-1
I am very opposed to this expansion. I have lived nearby for the last 35 years. We have already endured enough dust, traffic, speeding and pollution from this operation. I realize there is great pressure to provide building materials for area growth but they are basically trying to do that in the middle of a suburban area and a nature preserve. The traffic on Friant Rd has increased tremendously over the past decade. Having the large cement trucks and other construction vehicles try to share the road with all the new traffic is quite dangerous. Comment 74-2 Those trucks don't like to stop and I see them run redlights very frequently. They also speed along the highway.
The proposed change would afford even more traffic between the two plants as well as inbound customers to the concrete plant and hot-mix plant.
Those drivers are on a timeline everyday. They have to check in at arrival and departure . Every part of their day is tightly measured. They are under orders to get the job done. Quickly.
Friant road has some of the highest accident rates in the city. Many of them are fatal.
The city of Fresno has tried to mitigate the number of accidents . They lowered the speed limits. They limited right turns at red lights, highlighted signal lights and traffic signs, repainted lane lines and accommodated bicycle lanes near Woodward Park.
That's another thing- the route of access for all this truck traffic goes right next to a large regional park that has very heavy usage. A lot of the parking is on the South side of the road so there are groups of people crossing at all times. I see the disappointed looks on the faces of these big-truck drivers early in the morning when I change the light at Rice Road so I can cross to the Eaton trail.
So, are we going to unleash all this increased CEMEX traffic right into the middle of this suburban, recreation area?

Additionally, I see large holes in the pavement from the weight of the trucks. There would be two or three or four times more of them under this new plan. Comment 74-3
So who is going to pay to refurbish the road? Has that aspect been considered?

Then there are plenty of environmental concerns. Dust, debris falling off trucks, noise. All of this is a disturbance to the natural environment. Isn't that what the park was created for? The area is home to eagles, hawks, owls, coyotes , rabbits, finches, foxes etc. All of the commotion of CEMEX doesn't support that natural environment in the least. Comment 74-4
When I moved here , it was my understanding that CEMEX was supposed to be phased out . Comment 74-5

I don't even want to think about a 600 ft deep hole in the ground near Lost Lake Park!

I respectfully request that these concerns be taken into consideration and be given the most weight possible when the county makes decisions on this property.

Comment 74-5 Cont.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

I would like to voice my objection to expanding the mining operations of Cemex. Traffic in that area is dangerous and congested enough without additional mining operations going on there. The hours of operation for this project start far too early given their proximity to residential areas and has a significant impact on air quality which is something we already struggle with in our Valley. How much tax revenue will they be contributing to mitigate the effects of the air pollution, noise pollution, and traffic congestion on those of the community who will have to bear the brunt of it?

Comment 75-1

Comment(s) 75-2, 75-3

Comment 75-4

Blasting 600 feet underground so close to recreation areas and residential areas could also have unforeseen impacts on ground stability. There are no guarantees that this company will pay for any damages blasting mining will have on the surrounding areas and it could have a large impact on public funds as liability gets hashed out in the courts.

Comment 75-5

Comment 75-6

Additionally, I have serious concerns about the impact this project will have on the river and the surrounding areas such as Woodward Park and Lost Lake park. I understand reclamation is a part of their plans but that will be 70 years in the future. My children are alive now. They're the ones who will have to live through these disruptions in their environment with very little benefit to them. Just an eyesore, air pollution, noise pollution, more traffic and who knows what else.

Comment 75-7

I oppose the extension of this project. It is too close to recreation areas and residential areas. Any financial gains to our community would not outweigh the negative impacts.

Mr Randall, The term monitor for the barrier between the dig and the San Joaquin River is inadequate. Monitor means nothing without parameters and in-depth studies of the safety of the barrier. I saw no report from independent geologist as to the safety and stability of the barrier. If this fails it could have catastrophic down river and in flooding and contamination from the blast site. We must have evaluation by an independent fine geologist study this concern.

Mr Randall,

I see no report from our local native American community in the EIR as to the effect of this blast /dig may have on their river sites that have many traditional grinding holes. Has the local Table Mountain Rancheria been consulted? Have they had time to evaluate possible destruction of these Native American sites?

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Mr Randall,

I am very concerned about the term Monitor in the report. To monitor with no established preexisting levels means nothing. Water levels do vary during the year. There are no current studies presented that have completed a year of establishing the current water levels at each of the 5 domestic wells within 1/2 mile of the project. Every well must be checked as they may be in different depth levels. One of the wells serves 11 homes. Water levels do vary during the year this is why a complete evaluation of each well is mandatory to protect peoples water.

Comment 78-1

The wells levels must be protected by 24/7 evaluation by a public agency to protect the domestic wells.

Comment 78-2

Then there must be parameters to this monitoring. At what percent of water level loss is there a complete halt of the proposed blast & dig? Cemex could choose to monitor us to no water. There must be exact legal language protections in place to protect domestic wells.

I know the man on the zoom meant well when he said monitor like it was the best protection, but I do not believe he really thought through his statement.

Report Suspicious

Dear Mr. Randall,

Comment 79-1

I would like to raise an issue that affects Public Safety especially as it relates to the Quarry Site. This could be analyzed under the Hazard category as the Fresno County General Plan Implementation Program HS-E.B includes a statement that "*The County shall, as part of the development review process, ensure that new development . . . does not create manmade safety hazards . . .*".

The issue pertains to the public safety hazard that the quarry will represent after the project is complete 100 years or so from now (and maybe before). The public would expect that the site would be fenced for security purposes during the operational years. However, after the operations have ceased and the Applicant or their successors have vacated the property the quarry will remain as an attractive nuisance forever and beyond. By that time the metropolitan population will be several times larger than it is now and the river parkway will be utilized far beyond what we can now envision. Recreational travel up and down the river will lead everyone past the open quarry whether the trail is on the east or west side of the quarry.

With the stepped but vertical walls and a surface water elevation more than 400 below the trail elevation, the open quarry will not be suitable for fishing, swimming, boating, kayaking, canoeing, floating or anything else. But it will be ATTRACTIVE, especially to preteens and teenagers. There is not a fence that will keep them out.

What will happen if one or more of the public falls into the pit? They won't fall all the way down - just 50 feet. That is a sure death. And if they do fall into the water, how will they get out? With vertical walls all around, they may have to swim more than one half mile to find the sloped haul road at one point. How many people have drowned at Lost Lake because they can't swim? This might be a great EMS training center.

Who is going to maintain the fence FOREVER? The definition of an old mining feature is “abandoned mine.” That is a liability that the County will own FOREVER.

Thank you for your consideration.

DRandall@Fresno-CountyCa.Gov February 6, 2025

Subject: Cemex Mining the San Joaquin River

As residents of Fresno County, we want to strongly object to the Cemex proposal to dig a 600-foot hole in the San Joaquin Riverbed for mining purposes. This will further destroy the river and the natural habitat for birds, wildlife, and plant species. Please do not allow Cemex to continue with this project.

Comment 80-1

The negative effects of allowing this corporation to continue is overwhelming. Traffic, air quality and the destruction of our precious remaining environment is reason enough to refuse Cements efforts to go any further.

For the benefit of our valley and all who live here please deny their request.

The 600-foot-deep pit mine proposed for the San Joaquin River near Friant creates many problems to our air quality, water quality and the environment in general. Comment 81-1

Cemex, as you know, is a multinational corporation based in Mexico. Last fall, the lower house of Mexico's congress passed a bill banning the same kind of mining that Cemex proposes to do in our country, on our own San Joaquin River. Why, if Cemex's proposal is not good enough for Mexico would we allow it here in our own country? Comment 81-2

My family and I have spent many happy hours recreating and enjoying the San Joaquin River in that area. We need all the park space that we have and more. Please do not destroy our natural environment and the open spaces that we enjoy. Comment 81-3

I am asking you to vote no on Cemex's proposal to further mine the San Joaquin River.

Sincerely,

Eve Hudson

Re: Vote NO on Cemex's open pit mine application

Do NOT approve Cemex's application to extend their open pit mining operation. As a life-long resident of Fresno County, I have always enjoyed the San Joaquin River near Friant for canoeing, fishing, swimming, hiking, wildlife-viewing, and field trips for my elementary students. Some of my fondest memories are seeing deer, egrets, beavers, and lately, even eagles. Allowing this multinational company, based outside the United States, to disturb the riparian environment and muddy the water with a 600-foot mining pit for a hundred years is unconscionable. As local columnist, Marek Warszawski, points out, "last fall the lower house of [Mexico's] Congress passed a bill banning the same type of open pit mining the company wants to do in Fresno County. If blasting and drilling a 600-foot deep pit next to a major river isn't kosher in Mexico, it should be equally beyond the pale for the San Joaquin Valley." (The Fresno Bee, Jan 14, 2025)

Comment 82-1

Comment 82-2

Fifteen years ago my family and I joined others in successfully calling for the planning commission and BOS to oppose Cemex's application to mine Jesse Morrow Mountain. Let's see Fresno County do the right thing again. Vote NO on the Cemex application.

To whom it may concern:
With regard to DEIR-
Another major impact that CEMEX would have on the environment is noise. According to section 4.13-6 ,the negative effects of noise on humans can result in auditory and non auditory effects. These effects could lead to temporary or permanent hearing loss -not to mention behavioral and physiological effects.
Truck pass-by noise standard is 80 (dBA) [See page 770-771;4.13-25&26]. This level far exceeds the General Plan acceptable limits of 60 (dBA). see table 4.13-6.
This impact alone is detrimental to the health and well being of the surrounding communities. How do you plan to compensate for people with medical complications caused by high levels of noise?

To whom it may concern:
Regarding the DEIR-
There are several environmental impacts listed, but one of my main concerns is Air Quality. I see on item 4.3-10 that "long term exposure to diesel exhaust particles poses the highest cancer risk of any toxic contaminant evaluated by OEHHA. The ARB has estimated that about 70% of the cancer risk that the average Californian faces from breathing toxic air contaminants stems from diesel exhaust particles".

Comment 84-1

This alone is detrimental to communities in the surrounding area. How do you intend to mitigate this?
thank you for your attention to this matter

Dear Mr. Randall,

Comment 87-1

Flood hazards are discussed in Section 4.10.1.5 starting on Page 4.10-15 of the Executive Summary and further described in an analysis found in Appendix G-1.

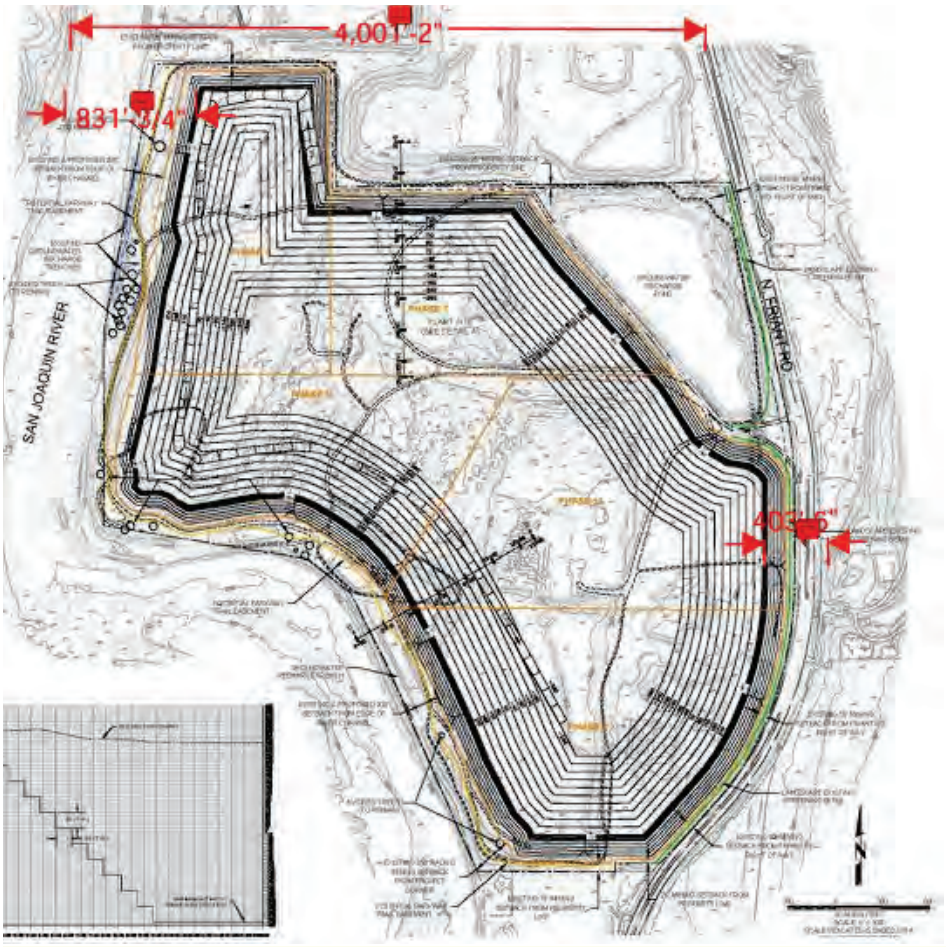
The flood hazard analysis is limited to the FEMA 100-year floodway and floodplain and states the "the floodplain does not encroach into the Quarry Site" as shown on Figure 4.10-1.

The continued development of the berm between the river channel and the Quarry Site will constrain the river and will create a choke point especially at the north end of the Quarry Site where the easterly bank of the river is more vertical. According to the 100-Year Hydraulic Results found in the Hydraulic Analysis in Appendix G-1, the flood water surface elevation between Stations 20 and 21averages out to 313.27 feet. Without a constraining bank between Stations 20 and 21on the east side of the river additional water flow will likely push to the east across the north side of the Quarry Site.

Comment 87-2

The Executive Summary includes the following caveat: *The Bureau of Reclamation owns and manages the dam, and, during unforeseen events, may be required to release water into the San Joaquin River at rates that could exceed the river channel capacity (Fresno County 2018a)*.

The establishment of an earthen berm around the Quarry Site that is higher (approximately 30 feet) than any land between the natural banks of the historic San Joaquin River will be an obstruction to unforeseen water flows in the historic channel. In fact, the creation of the Quarry Site berms will effectively obstruct about 70 percent of the historic channel width at the north end of the Quarry. This could have a devastating upstream impact as floodwaters are impeded by the Quarry Site berm.



The Fresno County General Plan HS-C.4 states: *The County shall require . . . developments within areas subject to 110- and 200- year frequency flood are designed and constructed in a manner that will not cause floodwaters to be diverted onto adjacent property or increase flood hazards to property located elsewhere."*

Comment 87-3

The Fresno County General Plan HS-C.12 states in part: *The County shall encourage the performance of appropriate investigations to determine the 200-year water surface elevations for the San Joaquin River . . . "*

Because the construction of the Quarry Site berm is intended to and will be required to remain FOREVER, it is unreasonable to assume that the analysis can be limited to the 100-year horizon. It should be a FOREVER horizon as the berm will have to withstand all conceivable and inconceivable events that it will face FOREVER.

More analysis is required to determine future impacts to this site and surrounding impacted areas due to flood hazards.

Thank you for your consideration.

Report Suspicious

Hello, I'm a resident of the City of Fresno, Fresno County and live near Woodward Park.I have lived in Fresno for over 50 years. I am writing to register my opposition to the continued dredging of the San Joaquin River and the proposal to blast the river basin.

Comment 88-1

The river bottom, air, water, and noise pollution is unacceptable,as well is the destruction of one of Fresno's greatest assets for beauty and wildlife, the San Joaquin river area. The continuance of CEMEX without an EIR since 2014 has seriously compromised the river basin and its aesthetic. We can't just be about making money we need a vision and a plan for a Fresno to be proud of, not embarrassed by. When Mr. Bredefeld (now County Supervisor representing me) his website bragged about Woodward Park and the beauty thereof. I am assuming he wants that to continue? It will be interesting to see.

Comment(s) 88-2, 88-3

Please stop this acceleration and reconsider the continued presence of CEMEX in the river bottom.

Comment 88-4

Sincerely,

Laurie Tidyman-Jones

Report Suspicious

David Randall
Senior Planner, Fresno County Department of Public Works and Planning
2220 Tulare Street
Fresno, CA 93721 Feb. 8, 2025

Dear Mr. Randall:

I write in opposition to expansion of the CEMEX Rockfield Project. Comment 89-1

The Central Valley, with its chronic air pollution problems, is not the appropriate place for a major blasting operation. Pollution exposure associated with particulate dust is a well-documented health issue; it causes respiratory inflammation and degraded lung function, which aggravate respiratory diseases such as asthma. The CEMEX operation cannot avoid the production of unsafe quantities of dust. Comment 89-2

The EIR notes (4.3 60) that "…the proposed project could potentially generate emissions that exceed the annual PM10, and the daily screening level for CO, PM10, and PM2.5. Therefore the proposed project could potentially result in a cumulatively considerable net increase of these criteria pollutants."

This conclusion requires mitigation measures, so a 'Fugitive Dust Control Plan' is projected to render the pollutant levels "less than significant". Comment 89-3

Three points regarding this mitigation plan should be noted:

1. The mitigation plan is projected to reduce daily emissions of PM2.5 a mere 1.5% (.015) below threshold, and similarly marginal amounts for other pollutants. This is reminiscent of CEMEX's mitigation projections for the rejected Jesse Morrow proposal, for which mitigations were calculated to nudge the pollutants to barely below threshold for significance.

2. Dust mitigation essentially requires the application of copious amounts of water. It is up to the County to monitor the effectiveness of the plan. The record shows that CEMEX cannot be relied upon to faithfully employ the mitigation plan. CEMEX has been cited for multiple air pollution violations (e.g., in Victorville, CA, Fairborn, OH and, more recently, Boulder, CO.) Although each violation required CEMEX to pay a few millions of dollars in fines, such penalties are apparently readily accommodated by this multi-billion dollar corporation. Comment 89-4

3. Blasting produces a major fraction of particulate pollution (presumably included in the projections for Aggregate Plant in Tables 4.3 15-17). But standard containment procedures for fugitive dust from roads and machinery operation are not effective for blast produced dust, so it is not obvious what measures are envisioned for this aspect of mitigation. As far as we can Comment 89-5

tell, the EIR does not address this factor.

Comment 89-5 Cont.

I urge the County to reject the application for the expansion of the CEMEX Rockfield Project.

Comment 89-6

Yours truly,

February 10, 2025

To: David Randall, Senior Planner

Fresno Co. Public Works & Planning Dept.

The San Joaquin River is a treasured resource. The CEMEX Rockfield expansion will change that. It will extend the contract to 100 years, and blast a 600 foot deep pit so they can continue mining. The area is popular for recreation, such as hiking, biking, fishing, and swimming. The city of Fresno does not have enough parks, so many people use this river area to recreate. Air pollution from rock dust and vehicles, water and aquifer pollution from blasting, sound from blasting, and road damage from trucks will all contribute, making this an undesirable project. Will the pit be filled in? Some say, “No one now alive will be here to see it”.

Comment 90-1

Comment(s) 90-2, 90-3

The Dragonfly Golf Course, Copper RiverCountry Club and San Joaquin River Conservancy and Trust are all close by and offer recreational activities. We must stop this greedy international company with a poor environmental and labor reputation from continuing to pollute our county.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

I am concerned with several aspects of this project. Primarily however, it seems that since 90% or more of both the quarry and plant sites are environmentally disturbed due to longtime mining operations, the County of Fresno, by issuing this DEIR, is declaring the sites unworthy of reclamation for the next 100 years. Comment 91-1

The sites are eyesores on the San Joaquin River in Fresno county, where over the past 40 years, citizens, governmental agencies, and elected officials have worked tirelessly to restore and protect this natural resource. According to the San Joaquin River Conservancy Act (1992): Comment 91-2

"…the San Joaquin River, its broad corridors, and its prominent bluffs constitute a unique and important environmental, cultural, scientific, agricultural, educational, recreational, scenic, flood water conveyance, and wildlife resource that should be preserved for the enjoyment of, and appreciation by, present and future generations."

Now, visitors have finally gained more and easier access to the river (Ball Ranch, Sumner Peck, River Center), yet this proposal condemns the river to 100 more years of unsightly destruction. Comment 91-3

Re:
The draft of the Rockfield Quarry Modification Project Environmental Impact Report No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667

Dear Mr. Randall,

We are *deeply concerned* about CEMEX's application for a permit to expand operations at the Rockfield Quarry and extend their permit for those operations for 100 years. Comment 92-1

The timeframe
100 years is a long, long time. It's four or five generations. It's far longer than most people live. Comment 92-2

It would be short-sighted and foolhardy to approve a project of this magnitude without full transparency and thorough review. Comment 92-3

Lack of transparency
Our objection is not just the length of time this EIR proposes. We are also *deeply concerned* with the manner in which this project is being proposed. It feels like a back-door, smoke-filled room, sweetheart deal that will enrich a very few and damage the many.

Typical mining practices
The consistent pattern of mining companies is to *privatize profits* and to *socialize risks.* In other words, they Comment 92-4

- plan on lack of transparency by railroading at high speed the decision-making process -- consisting of [1] thousands of pages of highly technical words and of [2] very tight deadlines to blunt potential questions, comments and opposition from the public.

- obtain excessively long permits for operations which are not in the best interest of the surrounding community.
- extract as much wealth as possible from the site while at the same time degrading and despoiling the natural landscape where the mining operations occur.
- funnel the exorbitant profits to their own corporate owners and executives, leaving little or no benefit to the community from which they are extracting wealth.
- delay or refuse to restore and reclaim the land that has been degraded and despoiled by their operations.
- declare bankruptcy so they don't have to pay for cleaning up and restoring the mining site, burdening the local taxpayers and the state with the clean-up costs to restore the land (restoration which almost never happens).

Comment 92-4 Cont.

Our demands
Specific to *this* CEMEX project, we are demanding that you and the Fresno County Supervisors:

Comment 92-5

- REFUSE to grant a 100-year permit to the expansion and extension of the CEMEX Rockfield Aggregate mining site. A 100-year permit is patently absurd. That's saddling four to five future generations with a huge problem caused by greedy corporations, short-sighted planners, and/or politicians who are foolish or in the pocket of the mining companies. A ten-or-twenty year permit, with requirements for extending another ten years at a time, would be more reasonable.
- Before even considering approval of the permit, REQUIRE the mining company (CEMEX) to commit a large deposit of money to a clean-up fund before the project starts. Also, you need to REQUIRE the mining company (CEMEX) to commit to contributing money on a monthly or quarterly basis to provide for clean-up of its own mess or to cover for lawsuits against the company for harms or violations of the law. To wait until all the environmental and health damages have already happened is patently absurd. CEMEX needs to build up a clean-up "superfund" account, managed by fiduciary professionals (an account which is impervious to being raided by politicians) if they want to do business in Fresno County.

Comment 92-6

- Before the project is even provisionally considered, INSIST that the project NOT ruin or drain our already-depleted groundwater aquifers. "Water is life," as the Indigenous People say. We are totally dependent on water for living and for the main business of the Central Valley -- farming. But California's Central Valley aquifers are extremely stressed and are extremely vulnerable given climate change/global warming. Furthermore, our Central Valley aquifers are extremely shallow (in some cases only about 100 feet deep) -- and CEMEX is proposing an open-pit mine 600 feet deep, the "height" of a 43 story building! That's 500 feet deeper than the aquifers here! A 600-foot open pit mine has the potential to drain all the groundwater in the vicinity. To give a foreign company a 100-year permit to foul or drain our groundwater supplies is folly of the first order.

Comment 92-7

Comment 92-8

Other extremely important factors not mentioned in this short letter must be considered. CEMEX should not be allowed to ram through the project approval process without adequate public transparency. We cannot allow them to destroy forever our groundwater supply, the San Joaquin watershed, and the natural beauty of this place.

Comment 92-9

Sincerely,
Bayard Taylor and June Taylor
35891 Hopewell Road, Yokuts Valley, CA 93675

February 10, 2025

David Randall
Senior Planner
Fresno County Department of Public Works and Planning
2220 Tulare Street
Fresno, CA 93721

Dear Mr. Randall:

I am writing to you to oppose the expansion and extension of the CEMEX Rockfield Project as it is specified in the published EIR. Comment 93-1

The production of unsafe levels of dust is unavoidable with such a project and even the EIR's meager mitigation efforts involve huge amounts of our area's precious water resources. This project threatens the respiratory health our residents, who already suffer from our poor air quality. It threatens our access to adequate potable water and chemically-acceptable crop-irrigating water supplies in an area extending out an unknown distance from the project site and into a reputed "breadbasket".

Further, the above does not even consider CEMEX's poor record in making good on promised mitigation efforts in the first place (e.g. Boulder, Colorado's "fugitive" dust storms: https://coloradosun.com/2024/10/22/cemex-lyons-boulder-county-permit-revocation/). Comment 93-2

CEMEX also has a poor record in making good on reclamation promises, right here in California (e.g., the un-reclaimed Davenport plant on the coast) and world-wide. And who of us will even be around at the 100 year(!) end of the Friant operation to hold them accountable? If approved the timeframe of the project should be drastically cut to the order of 10 , not 100, Comment 93-3

years and should provide some means to guarantee that there will be sufficient CEMEX funds for reclamation.

Comment 93-3 Cont.

I am also concerned about the significant costs of the project to our tax payers. For examples:
** road repairs and new traffic controlling infrastructure will be necessary, and it does not appear that CEMEX will deal with these costs.
**monitoring the air and water quality will surely involve significant financial costs and hassles! (necessary increased staff, possible need for new monitoring sites , litigations, etc)

Comment 93-4

Finally, there should be serious consideration of the project's threat to the well-being of local wildlife and the peace and beauty of the region that lies at the heart of entries to 3 National Parks, a National Monument and the magnificent wilderness areas in the adjacent Sierras. These are invaluable assets that should not be lost, degraded or diminished!

Comment 93-5

Thank you for your consideration of my concerns,
Dotty Woolum

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

To whom it may concern,

My name is Naomi Quintana, and I writing this comment as a concerned community member and environmental advocate to strongly oppose the CEMEX Rockfield Expansion along the San Joaquin River. This project poses serious and irreversible harm to our local environment, wildlife, and public resources.The San Joaquin River is home to a fragile riparian ecosystem that supports a wide variety of wildlife. The proposed expansion threatens several special-status species, including the burrowing owl, western pond turtle, western spadefoot toad, and numerous nesting birds. Habitat destruction from blasting and excavation will disrupt these species, some of which are already facing population decline. This expansion would further fragment an already vulnerable ecosystem, reducing biodiversity and weakening the resilience of our natural environment.Additionally, the project's excavation plans would create unstable slopes, increasing the risk of erosion and landslides. The long-term environmental consequences of soil destabilization cannot be ignored, especially in an area where the integrity of our land is crucial for both ecological and human health. Disturbing the geological structure of this region could lead to unforeseen hazards that we, as a community, will ultimately bear the burden of this change. Beyond the environmental consequences, this project would have lasting negative effects on the local landscape, traffic, and public infrastructure. The excavation would degrade the scenic vista of the San Joaquin River, a cherished natural landmark. It would also cause traffic congestion at key intersections, with no clear funding plan to mitigate these delays. These impacts diminish the quality of life for residents and visitors alike, with no guaranteed solutions to address them. This project is not a necessity, it is an irreversible gamble with our environment and community resources. I urge decision-

Comment 94-1

Comment 95-1

Thank you for allowing me to comment on the proposal for the CEMEX Rockfield Quarry Modification Project.
After reading the latest proposal, I have questions about the need to modify the current allowance and the need to extend it so far into the future.
As I'm sure you are aware, CEMEX is a multinational building materials company held in Mexico. It holds it's business in 50 counties. It was ranked in 2020 as the 5th largest cement company in the world.
That being said, it has options. It has other holdings in the US which produces 30% of its total operations.
As my father was involved in the concrete business, I am aware of the need for these products. I am also aware the need may increase as we work to decrease the use of wood products due to the climate changes especially in California. But that does not mean that we should anticipate the future. Are we trading the impact on wood products for the impact on the local waterways?

Comment 95-2

Why is there a need to dig dipper at the current location with the increased risk to the environment as well as the neighbors - both human and animals? This is so close to a protected area that nothing justifies to the need to extend the current timeline for 70 years!

Comment 95-3

What is the need to expand the current agreement at this time? We can do it as we come to the end of the current agreement. What is the need for a 70 year extension?

Comment 95-4

I encourage you to allow them to continue their current project without any extension. Allow the current changes in the environment and the current political changes happening now to stabilize before stepping forward.
Once an agreement is accepted, it is difficult to walk back. Do not put yourself into a contract that does NOT need to be made. Granted, it is doubtful that many of us will be alive in 70 years, but this would be something that future generations will have to deal with. Isn't that justification enough to not approve this proposal?
Thank you.

Subject: DIER PUBLIC COMMENT

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Good evening,

I am a concerned citizen of the Fresno County who has recently discovered that CEMEX plans on creating a whole about two football feilds deep in the San Joaquin River. Comment 96-1

This concerns me as the blast will disturb local wild life, such as cranes, field mice, and fish, in their natural habitat. I recently volunteered with River Park Way Trust (@riverparkwaytrust on IG) to plant native trees and shrubbery along the San Joaquin River and would hate to see our good intentions be blasted away by CEMEX. Comment 96-2

Please consider the wildlife, the nature, and the people before you continue with something like this. I ask that you do more environmental research, as well as more public votes and hearings before the plan takes place. Comment 96-3

Thank you,
a concerned citizen

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

To whom it may concern

With regard to aesthetic impact as a result of blasting and deep mining I see that section 4.2.4 identifies the Plant site and Quarry site as "Vacant or Disturbed Land" and as such would not have any impact and no mitigation required.

Comment 97-1

How can this be? Destruction of further mining will only destroy the land; especially by blasting a 600' pit by the San Joaquin River. I think this is a poor excuse to avoid making any kind of statement saying that there's nothing to address with regard to aesthetics!

The same reasoning goes with 4.2.3- just because there's no conflict with zoning for forest land,timberland, or timberland production doesn't mean there's not going to be destruction to the surrounding area. Of course there's going to be visual impairment of the land!!

Explain how you are going to mitigate the destruction you will generate over the next 100 years.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr Randall,

Comment 98-1

I am writing to express serious concerns about the impact of the proposed CEMEX quarry expansion. I urge your office to recommend not approving the project due to the significant impacts noted in your letter and others in the draft EIR [of >1000 pages!].

As a long time resident of Fresno County I have already seen the impacts of urban sprawl into eastern Fresno County. As a hiker and birder I see the effects on the river of the current operations [noise, altered habitats, heavy traffic and damages to Friant Rd]. My husband, George Sward, regularly kayaks on the SJ River and sees more directly the impacts of past and current gravel mining on the river. The impacts of a 100 year project that digs down potentially 600 ft into the riverbed are mind boggling! The planned "mitigations" for such a lengthy project cast reasonable doubt on how well and whether they will actually take place! And in the meantime, people, other animals and the physical environment are impacted for many, many decades!

I am not an engineer nor do I have the expertise to analyze such a lengthy report. But I can see what has already taken place and what continues to take place. The proposed project is too big, too damaging and too lengthy to assure true mitigation and accountability. I urge your office to state this in your report.

Thank you for your efforts,

Linda [and George] Sward, Kingsburg, CA 93631

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall:

As a concerned citizen and resident of this area I must protest the expansion of the Cemex Rockfield quarry. Converting this facility to and explosive methodology will do far more harm to the people, landscape and environment that adding 55 jobs will bring benefit. My entire career was spent leading clim operations for State Farm Insurance all over the United States and, in my professional opinion, the increased risk of blasting in the area may not be tolerated by many homeowners' carriers. Yes, of course I read the mitigation plan on the DEIR but that only addresses explosions/pyrotechnics on their site. Granted, at first blush 350 acres of rock does not seem to be much of a wildfire risk, but when someone ignites an illegal bottle rocket it's usually not the igniter's house that burns; it's someone adjacent to their property! We also need to consider the explosive vendor will be transporting their hazardous materials through Fresno County, all the way increasing the risk of an accident and subsequent wildfire.

Comment 99-1

Comment 99-2

With the Pallisades Fire fresh in everyone's memory this is not the time (and probably never will be) to add to the public danger in the highly sensitive geographical area.. One las thing to consider; having lived all over the country Fresno does not exactly have a stellar image, but it's improving. Do we really want to be known for the second deepest rock mine in California?

Report Suspicious

Since moving to Fresno in 1989 from water-feature abundant Minnesota, I have been dismayed by the neglect of the San Joaquin River. I am a River Parkway member and hope that the Friant to 99 uninterrupted ribbon can...someday...become a reality.

Comment 100-1

Expanding the Cemex operation would disastrously limit this possibility and become another example of "Why can't Fresno have nice things?" Playing devil's advocate for the project, can we identify how many "additional jobs" and/or net positive economic impact we could expect? The potential for the San Joaquin River to become an attraction and "something nice...." for Fresno area citizens and visitors seems -- as ever -- untapped.

Please forward this to our Fresno County Supervisors.

Report Suspicious

Dear Mr. Randall,

I am a resident of Fresno and would like to share my thoughts on the CEMEX blast mine proposal that will be voted on soon.

Comment 103-1

I am absolutely against this proposal for the following reasons:

1. The health of the San Joaquin River is at stake - the environmental impact will be devastating to humans, wildlife, and nature - Why is this company allowed to encroach on a wildlife preserve?

2. CEMEX states there is nothing they can do about the increased traffic impact in the intersections of Friant/Willow and Willow/Copper. These areas have a very large amount of traffic incidents currently and will just increase safety issues if CEMEX is allowed to begin their blast mine proposal.

Comment 103-2

I urge you to NOT allow this proposal to move forward.

Thank you,
Cathleen Perez

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Good morning Mr. Randall,

I'm sure if this message will reach you in regards the public comments against the Cemex Rockfield Expansion proposal. But I just heard of this project this morning. Comment 104-1

As a former Fresno County Employee, and current Madera County Resident who lives within a 5 mile radius of this mining operation, I am strongly opposed to the expansion project and the method of rock quarrying.

My husband and I hike and ride our bikes to the San Joaquin River from the Tesoro Viejo community regularly. From the hills that overlook the River, you can see, hear, and smell the quarry…at its current state of operations.

With their proposed changes, I fear that the operations would have a significant negative effect on the noise pollution experienced by humans and wildlife in the area. Comment 104-2

This location is one of the closest places that one can visit for peace and serenity that doesn't require a major trip out of town. Comment 104-3

Needless to mention the destruction of the beautiful natural habitats that surround the river and the plant would have other negative effects. I would highly suspect, that if this quarry were a completely new plant, and not a 100 year old grandfathered operation, that the issue for permit would be denied.

Please take my concern to heart. I do not want this expansion project in my backyard. It's not good for the inhabitants in the area who live and breathe here.

Thank you kindly,

Stephanie Salazar

Subject:	Public Comment: Cemex Rockfield Quarry - EIR 7763
Date:	Monday, February 17, 2025 3:07:32 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

To whom it may concern,

Comment 105-1

I am providing a public comment regarding EIR 7763. I would like to express my opposition to the proposed Rockfield Quarry modification project. This project will degrade the environment and the water quality for me, a resident who lives near the proposed project and uses water that flows near the site for drinking. The San Joaquin River is a natural resource that I use for recreation and for water access, since my drinking water comes from wells filled by the San Joaquin. The proposal of a 600-foot deep pit near the San Joaquin threatens environmental damage and degradation of water quality. The CEMEX, the industrial company, has been cited numerous times for environmental infractions, and I cannot trust that they will not continue to break environmental law and threaten the safety of my drinking water.

Comment 105-2

Comment 105-3

Furthermore, this project threatens the environment for several animal species, including the Western pond turtle and burrowing owl, both vulnerable species whose native environment will be disrupted. Considering that the aggregate reserves we have are more than sufficient, it seems that this mining project does not have a legitimate purpose. We have enough aggregate reserves; there is no reason to threaten the water and the environment near the San Joaquin river, particularly to a company that repeatedly breaks environmental regulations, and uses its massive profit margin to merely pay fines rather than ceasing from breaking law.

Comment 105-4

Comment 105-5

Therefore, I reiterate my demand that this project be rejected outright. I'm sorry that people spent so much time and money studying a project which obviously should never have been considered, but that's not my fault. Protect citizens and protect the environment we depend on, especially for our water.

Thank you

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK
Report Suspicious

Hello,

My name is Johnathan Benson, I am a science teacher and nature enthusiast in this community. I am deeply concerned about many of the impacts that this proposed mining expansion would have on our local communities, both human and ecological. Below, I have outlined some of my concerns and questions about this proposed expansion that I would like to see addressed. Comment 106-1

1. Does this open-pit mine have to be built in this, notably sensitive, location? Is there a particular reason that the underlying bedrock is different from that from other areas more far-removed from the river? Is the water from the river essential for the operation of the aggregate processing? My question is essentially, does this have to happen here? Or could it happen in a drier place less prone to the myriad problems (stream dewatering, groundwater contamination, noise pollution effects on riparian life, etc.) that are specific to this location? If it is a question of marginally increased cost, then I oppose it, but if there is some reason it has to be in this location then I would be less concerned. I have not seen a thorough rationale for why this mine has to exist here, other than the fact that it already does.
2. I enjoy swimming and paddling on the San Joaquin River, I enjoy biking alongside the San Joaquin River, and I enjoy the natural beauty of the areas surrounding the San Joaquin River. All of these benefits, available to the community at large, would be reduced by the expansion of this mining operation. A big part of the natural beauty for me is the biodiversity present in the area. I am certain that I will see less wildlife in the area as it is

Comment 106-2

disturbed significantly by more intensive mining. Rather than recharacterizing the often blighted San Joaquin River into a cultural attraction, this project would further diminish the ecological diversity of this area for a century to come. I understand that there are mitigation strategies in place for the protection of particular species, but how can you account for the opportunity cost of decreased future value of a cultural attraction. Fresno is undoubtedly growing, and will continue to do so. Has the loss of tourism potential due to impacts to the scenic vista been included in the cost benefit analysis for this project? I would like to see thorough estimation of the social and economic benefits of re-wilding the impacted areas of the riparian zone as compared to the benefits provided by the mine expansion.

Comment 106-2 Cont.

3. The consistent noise of bedrock blasting would be detrimental to my enjoyment of recreational activities near the river, particularly in the, recently reopened, Ball Ranch area. I have seen many other individuals and families enjoying a day of quiet recreation near the river, this would be negatively impacted by the constant noise of mining, processing, and additional truck traffic. Is there a set of numbers provided that would give the volume (in decibels) of allowed noise at different locations from the mining operation?

Comment 106-3

4. One of the major drivers of health issues in the Central Valley is poor air quality. This would be worsened by the expansion of mining operations in this area. The release of silicate dust is a guarantee while blasting granite and that dust would add to the already large volume of dust in the air from agricultural activities in the area. This is especially concerning with several schools within a few miles of the site. Additionally, suburban expansion continues to encroach in this area which will mean even greater human exposure as this mine operates for the next 100 years. I would like to see estimates of the added human health risk of dust exposure from mining operations over the next century, especially as connected to projected developments in the area.

Comment 106-4

Thank you for your time and consideration. I hope that you will be organizing additional public comment opportunities, especially in-person, so that county leadership can see how seriously their constituents take this issue.

Comment 106-5

Subject:	CEMEX ROCKFIELD QUARRY - “EIR 7763”
Date:	Monday, February 17, 2025 8:51:16 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Hello,

I am providing a public commenting regarding EIR 7763. I am an ecologist and previously an environmental planner. I am in shock that county officials would claim this EIR is sufficient for publishing. How could the people involved with writing this EIR claim they have any concept of impacts 100 years out? To adequately evaluate impacts on environmental resources for 100 years that would take much more extensive research than proposed in this EIR. Environmental modeling is a standard that could be used to determine impacts to air quality, biological resources, and hydrology. Those models should be employed prior to the quarry inflicting damage that cannot be reversed, not punt this effort down the road when it's too late. Also, the models should be conducted using standards agreed upon by the scientific community, not governed by the company that benefits from the results being in their favor. As a citizen of Fresno, I have concerns of why one of the areas with the worst air quality in the county is supporting projects to further degrade our air quality.

Comment 107-1

Comment 107-2

Additionally, the burrowing owl has been listed as a candidate species under the California Endangered Species Act and that is not reflected in this EIR.

Comment 107-3

The mitigation measures listed for spadefoot toad and western pond turtle I believe are not adequate to make the impact less than significant. There is EXTENSIVE research showing that pond turtles and their nests are extremely hard to detect. To actually protect the turtles, surveys should be done months in advance to place transmitters on turtles to see where they are operating around the quarry. How can this EIR claim they are not having an impact when they are not taking the necessary steps to detect such a cryptic species. And then continue to see if they come back to the work site. The way the mitigation measure (4.4-1b) is written it leaves open ended on how to prevent relocated animals from reentering the work area. As someone who has personally relocated many animals, and from learning about people doing this work such as efforts in Yosemite National Park to relocated turtles, they will come back to where they were captured.

Comment 107-4

I plan to attend any future meetings regarding this EIR to help make sure county officials don't brush off these comments by writing a few sentences saying "we disagree". The public expects to see how the county is actually addressing our concerns.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am a resident of Fresno County and am deeply concerned about the proposed blast mine near the San Joaquin River. This is an incredibly important landmark and ecological site. There is already more than enough aggregate to be obtained through permitted sites to meet Fresno's (and Madera's) expected needs for the next 50 years. I cannot understand why CEMEX, a company with a spotty history and more than 3 environmental violations per year for the last 20 years to the tune of $43 million in fines, should be allowed anywhere near a river as important to our city. It is neither needed nor wanted.

Comment(s)
108-1
108-2

I have seen the damage done by mining companies firsthand from my time growing up in Alaska. Fresno is already affected by urban sprawl and a lack of green spaces. It does not need a giant open pit near one of our most important land marks and important waterways. Please do everything in your power to prevent this plan from happening.

Report Suspicious

Sent from my iPhone

Good morning: I don't believe the idea of allowing an enormous pit next to the San Joaquin river is in the best interest of our community. The San Joaquin river is an unbelievably resource that, so far, has not been fully taken advantage of. The long term efforts to build improved public access to this resource are indeed VERY slow but happening nonetheless. The excavation of a huge pit next to the river would not only be a tremendous eyesore but a serious potential hazard as well. The potential for communication between the river and a rock pit is a real threat. The banks of rocks pits are notorious for cave-ins! The river is a rare and unbelievable opportunity for public use that could last for generations to come. It would be VERY poor planning to place our river at risk for something that,is not only unnecessary, but a bad environmental idea to begin with. Please don't allow this proposal to continue.

Subject: CEMEX EIR
Date: Tuesday, February 18, 2025 10:56:55 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Mr Randall on the EIR,

Comment 111-1

1) Cemex states that they will not mitigate the traffic congestion

That is ludicrous, This very wealthy company needs to mitigate the traffic congestion on Willow to Friant Road.

There is precedent in this county for this requirement. Table Mountain helped finance turning Friant Road into a four lane highway. Vulcan at the Austin quarry on road 145 and 41 has been required to make modifications on Road 145. They are required to finance Highway 41 to a four lane road when the county is ready to begin construction.

Comment 111-2

1) At the Friant Willow junction there should be two left lanes made for turning onto Willow from Friant. The trucks should only be allowed to use one lane.
2) A requirement that the entire Willow Road between Friant and Copper be expanded to 4 lanes.
3) A requirement that the north direction on Willow be expanded to two lanes from International to Copper.

Comment 111-3

4) There is a concern with increased heavy truck traffic effecting the traffic safety near the schools on International and Willow.

Comment 111-4

If Cemex cannot afford this they have no business mining on the river. What happens if there is a catastrophe at the mining site? Will they say we don't have money to repair?

2) Impact on water tables for domestic residential wells.

Comment 111-5

The possibility of dropping water tables on the extensive dig is a huge concern for residents.

1) Cemex should install at every residential well a constant water level monitor. This should be monitored monthly by an independent contractor paid for by Cemex.
2) Cemex must provide a bond to protect every residence of this community. If the wells fail or have greatly reduced water production and the homes are no longer realistically habitable, protection for the homeowners must be in place before operations begin. Cemex must be liable and purchase the properties at high market value. There must be a penalty in place to be paid to the resident to cover costs of moving through no fault of their own.

Diane & Jim Durando

Cemex Rockfield DEIR Concerns

David Randall County of Fresno

1-The Friant and Willow and Willow and Copper intersections are referenced as sections of road that will be used by the trucks in the project. These intersections will not effectively handle the traffic loads that the Cemex project will create. Modifications should be made to create safe intersections and road improvements as needed before the project can start.

Comment 112-1

2-Why is Willow south of Copper not included in the study area intersections while the Friant Road study area intersections go to the south of Teague. Willow south of Copper is a busy road with a high school, middle school, elementary school and junior college along that stretch of road. Trucks from Cemex use that road currently and increased traffic will lead to more wear and tear on that road surface, increases air quality degradation and a more crowded road. It seems like including those intersections along Willow to Teague would have been an option.

Comment 112-2

3-Mitigation for Traffic signals at Friant and willow needs to be completed before the traffic increases.

Comment 112-3

4-Pavement modifications between North Fork Road at Friant Road and Copper River Drive needs to be completed due to the increased wear that the project truck traffic will generate.

Comment 112-4

5-Willow avenue north of Copper has only one northbound lane with a tall cement curb. With no shoulder any stopped vehicle will block that road. There is no shoulder to move onto.

Comment 112-5

6-With the lack of adequate road surface, controlled intersections, and lane widening as needed the area leading to and away from both the plant and quarry seem inadequate to provide the safety and reduced greenhouse gas emissions that should be part of this project. Saying that it will be "fixed" when financially possible is not a solution. Saying that the impact is unavoidable is not the answer. Eliminate the impact first.

Comment 112-6

7-prehistoric bowl mortar (P-10-007115) Where is the prehistoric bowl and mortar (P-10-007115) that was found in the quarry site? Was it returned to a local tribe? Have any tribal archeologists been notified of that find?

Comment 112-7

8-As required by the current CUPs, there are appropriate traffic warning signs at access roads for both the Plant Site and Quarry Site. Existing company identification signs are located at the entrance roads to both the Plant Site and the Quarry Site in accordance with county signage regulations. There are no signs present at the quarry site at all. Who monitors/enforces the conditions of the CUPs?

Comment 112-8

9-Perceptible levels of ground vibration and air overpressure at some locations close to the quarry will be present. Is there a map showing where this impact will occur? I would like some specifics as to amount or vibration and how much air overpressure. Have actual tests for these explosions been done in situ? Are these computer models that they are basing this on?

Comment 112-9

10-Their mitigation states that structures and wells will be monitored. That is very vague. What will they be monitoring? How will they monitor the structures and wells? What type of equipment will be used to do the monitoring? There needs to be specific guidelines as to what will be looked at and how changes will be addressed. It should be a non-cemex entity doing this independent work.

Comment 112-10

11-Anywhere in the DEIR that it says that monitoring will be the mitigation needs to be reevaluated and done with specificity. Monitoring is too vague a term and means nothing. A monitoring plan with guidelines, methods, procedures, equipment and actions based on the data is needed. Just using the term monitoring as a type of mitigation is lazy and inadequate.

Comment 112-11

12-Has a blasting quarry operating on a mined-out gravel pit like this been done in California? It seems like a similar quarry would have many answers to the questions arising?

Comment 112-12

13-In the ground water and surface contamination from blasting there are a few major components missing that need to be considered. What are the explosives that are being used? What are the sizes of the various charges they are using? What are the chemical components that the blasting produces? What are the chemical compounds that will contaminate the surface and ground water? None of this is mentioned in the report. Has any blasting been done on the quarry site to determine ground vibration levels and the distance they are travelling from the point of ignition?

Comment 112-13

14-Who will monitor the ground water and surface water contamination? How will domestic wells and other ground water resources in the area be protected?

Comment 112-14

15-The impact blasting will have on salmonids is mentioned in regards to the reintroduced salmon in the San Joaquin River. Why is an old Alaska Department of Fish and Game study used? The substrate at the study site cannot be like what is at the quarry site. The river in Alaska is most like not that similar to the San Joaquin River in substrate, volume and flow. Has any actual testing with blasting been done for this DEIR in this area on the river?

Comment 112-15

16-Signage at the entrance of the quarry is nonexistent currently. There are no signs indicating an entrance to the quarry site from north or south. No signs showing trucks entering the road or quarry. The current CUP is not enforced.

Comment 112-16

17-All domestic wells in the area should be tested to provide a baseline for water quality and well production. Testing should be done quarterly during the life of the mining operation to monitor the impact on water quality and production.

Comment 112-17

18-Ambient noise should not increase. Increased truck noise, explosions and eventually plant operations will all increase noise in the area. Operating hours are not reasonable in an area surrounded by existing homes that have been present for over 40 years. Operating 16 hours a day in a suburban residential area should not be allowed.

Comment 112-18

19-Air quality will be impacted by:

Comment 112-19

Increased truck/tractor activity/dust PM10 PM2.5

Blasting PM10 PM2.5

Batch plant PM 2.5

Rock crushing /Dust PM 10 PM 2.5

Air quality will suffer with increase mining activity and trucking and equipment use in the quarry producing more greenhouse gas emissions.

Diesel exhaust is a major source of PM 2.5 a known health hazzard

Comment 112-20

20-Ambient Air Quality is monitored by the Air District. The closest station with data being used to monitor pollutants is the project site, Clovis-Villa station (Air Quality Station ID 06-019-5001. This station is located approximately 9 miles south of the project sites and measures a variety of air quality parameters. Looking at the PM 10 and PM 2.5 components the data in Table 4.3-2 Ambient Air Quality in the Project Area shows that the PM 10 values exceed state standards in the years 2013-2017. The PM 2.5 values exceed federal standards for the same years 2013-2017. There are two weaknesses to this information. The Clovis-Villa station is designed to monitor at a neighborhood scale covering an area of 0.5km to 4.0 km the station is about 9 miles away. It is confusing to have two different measuring systems used in an explanation so to convert to US standard measure for length the area covered by the monitoring station would be about 500 yards to 2.4 miles from the station. How does this measure anything from the Plant or Quarry site that is about 9 miles away? Why wasn't the air monitored at the sites of the projects. Some of the data was collected more than 10 years ago. There must be more recent data available. This information does not seem to provide an accurate value for PM10 or PM2.5 for the sites.

21-How can the Air Quality Control District monitor the sites for this DEIR without any monitoring equipment on the sites? There is no mention of monitoring or any data from monitoring other than the Clovis-Villa station and the Fresno Garland site.

Comment 112-21

22-4.3 Air Quality

Goal OS-G To improve air quality and minimize the adverse effects of air pollution in Fresno County.

Comment 112-22

Policy OS-G.11 The County shall continue, through its land use planning processes, to avoid inappropriate location of residential uses and sensitive receptors in relation to uses that include, but are not limited to, industrial and manufacturing uses and any other uses which have the potential for creating a hazardous or nuisance effect.

In this case the county has allowed residential development by the quarry site. The CUPs for the site expired and now the county wants to create an industrial site in the midst of a suburban residential area. This is in opposition to the Goal OS-G for Air Quality.

23-4.4 Biological Resources

Comment 112-23

Fish-Only Gambusia and Micropterus were observed during habitat assessment. Why didn't they seine the pond to survey what is in the water? The assessment done was a visual observation of the surface of the pond.

Amphibians-western toad and spadefoot toads exist on the adjacent properties to the north and south. Without a thorough survey they would not be found.

Comment 112-24

Reptiles- pond turtles are in the ponds on adjacent properties and travel great distances overland. They should be present in the quarry site ponds. Western fence lizards are very abundant in the area and would be found in the quarry site as well

Comment 112-25

Avian-Tricolored black birds nested in the ponds by the thousands until a few years ago when the tules disappeared. Bald and Golden eagles do still use the area but are seasonal. Observing them would

Comment 112-26

involve looking at the right time of the year. Ospreys are using the pond to forage all year long. White Pelicans are visitors to the quarry ponds throughout the year as well. The survey ignores more than 5 species of ducks that use the pond as well as no mention of Canada geese.

Comment 112-26 Cont.

Mammals-Mountain Lions have been in the area for years. They use the area of the quarry, the riparian habitat along the river corridor and all of the habitats in the area. They were not sighted in the habitat assessment as it was performed. Trail cameras which are easily available and inexpensive would have been a good tool for the assessment to have incorporated instead of "observed" or not .

Comment 113-1

Tuesday morning greetings, with a quick message to say I'm greatly concerned about any project that utilizes explosives/blasting methods, especially underground and especially in close proximity to a damsite. I'm no geological engineer, if such is the correct term, but just the same I have to wonder if there isn't a potentially "safer," for lack of a better term, method if such a project really needs to be completed at all. Sounds "suspiciously" as though it's yet another case of big business coming in and creating a big disruption of the "ecology," again, for lack of a better term, with the thoughts of big profits being the driving force.

Thank you --
George

Mr. Randall,

We live not too far from the Cemex blast proposal area. We are AGAINST it. Especially since it's not a necessary item that needs to be "mined" at this time, there is no shortage or huge demand that is not being satisfied. We do not want the noise or the disruption to the environment, plants, animals, people etc.

Comment 114-1

I think this proposal is a terrible idea. Heavy loads of mined rock on Friant Road will tear the road up and we taxpayers will be asked to pay for its repair. New housing in the area will suffer air polluted with rock dust and the road is already burdened with with too much traffic. I hope you will see that CEMEX's plan is turned down.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall, February 19, 2025

I am writing to object to CEMEXs blast mine proposal. The current permit should not be extended or modified for the following reasons: Comment 116-1

Fresno / Madera counties do not need the aggregate. Our regional demand of 305 million tons for the next 50 years will be met by the 556 million tons of reserves already permitted at on the Kings River and at Austin Quarry.

CEMEX has been fined more than $43 million for 81 environmental violation since 2000. The draft EIR does not require them to have a reserve to pay for future damage, such as a breach between the mine and the river. No amount of money could compensate for the potential environmental damage! Comment 116-2

CEMEX has no plans to rectify the unavoidable impact to traffic on Friant. Comment 116-3

The visual blight on the landscape has encroached on an adjacent state ecological preserve. Comment 116-4

The constant dynamiting is not compatible with fish and wildlife or humans living near the site! Comment 116-5

Please do not extend the current permit and reject the proposal to modify it! Comment 116-6

Sincerely,

Ann Heiniger

Selma, CA

Subject: Opposition to Proposed Modification of CEMEX Rockfield Quarry (EIR No. 7763 and CUP Nos. 3666 and 3667)

Dear Planning Commissioners

I am writing to express my strong opposition to the proposed modification of the existing CEMEX Rockfield Quarry, including Environmental Impact Report (EIR) No. 7763 and Conditional Use Permit (CUP) Application Nos. 3666 and 3667. Comment 119-1

First and foremost, the expansion would exacerbate air quality issues, particularly dust and particulate matter, which pose serious respiratory risks to nearby residents. Increased mining operations will generate higher levels of fine dust particles, which have been linked to asthma, lung disease, and other health problems, especially for vulnerable populations such as children and the elderly.

Additionally, the modification poses a substantial threat to local water resources. The expansion could lead to groundwater depletion, contamination from mining runoff, and long-term effects on nearby ecosystems. Given the ongoing concerns about water scarcity and conservation efforts in our region, approving this modification would be irresponsible and harmful to the local environment. Comment 119-2

Traffic and noise pollution are also critical concerns. Increased quarry activity will result in more heavy truck traffic, further straining local infrastructure, increasing wear and tear on roads, and elevating the risk of accidents. Comment 119-3 Furthermore, prolonged exposure to blasting and excavation noise will significantly diminish the quality of life for residents in surrounding areas. Comment 119-4

Beyond these immediate impacts, approving this modification sets a dangerous precedent for future industrial expansion at the expense of our environment and community. We must prioritize sustainable development that aligns with long-term public health and ecological conservation goals rather than allowing corporations to expand operations without fully addressing these adverse impacts. Comment 119-5

For these reasons, I urge the Planning Commission to reject the proposed modification of the CEMEX Rockfield Quarry and uphold the best interests of the community and environment. Thank you for your time and consideration.

Sincerely,

George Folsom

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Mr. Randall,

It has come to my attention that CMEX has applied for a permit to convert to a blast mine. This is such a terrible idea for the Fresno/Friant area. With homeowners insurance in California already at a super premium and many consumers in CA being denied, this would only add to the problem. CEMEX is already a problem working as a mechanized mine, in my opinion. I know countless citizens who have had rocks pop up on that road between Fresno and Friant, cracking windshields and creating yet another insurance issue: the high cost of auto insurance. Face it: everything in California is horribly expensive. We need a break. If CEMEX wants to blast they need to find another site in another city, they have been here since the 1920's I say enoug already. Please do not consider approving this new permit to blast.

Comment 121-1

With regards to the potential impact of water quality (section 2.5.6).
If the wall of earth separating the river and the open pit collapses, the impact of the water quality would be devastating. CEMEX claims they would "monitor" this; there has been no money set aside to mitigate this).
This is totally unacceptable.

RE: Cemex Rockfield Quarry Modification Project EIR

I would like to bring my concerns to the County of Fresno regarding the CEMEX Rockfield Quarry project. My concerns center around the following analyses:

1. Hydrology and Water Quality
2. Biological Resources
3. Land Use and Planning

Hydrology and Water Quality

Comment 123-1

The Draft EIR did not adequately analyze the Project's impact to the beneficial uses and water quality of the San Joaquin River. Specifically, I am concerned that the River Supply Channel's impact was not analyzed in this draft EIR. Excluding an analysis of River Supply Channel makes the draft EIR inadequate. I request that the Lead Agency conduct further analysis.

The River Supply Channel connects the Plant Site to the San Joaquin River (SJR) in two ways. According to the draft EIR, this Plant Site receives water from the San Joaquin River via a supply channel (see DEIR, Section 4.10.1.4 Current Operational Water Uses and Supplies - Plant Site Water Use and Supplies). However, this direct connection does not flow *from* the Plant Site, but rather *towards* the Plant Site. It can be presumed that the channel is sloped towards the Plant Site, though this is not explicitly stated. The second connection is the confluence/intersection of the supply channel and Little Dry Creek (about 0.3 miles west of the Plant site), where flows in Little Dry Creek (LDC) may transport water from the river supply channel to the SJR. The fact that Little Dry Creek intersects with the Supply Channel is not mentioned in the draft EIR at all. This confluence/intersection may not be a concern if the water quality of the River Supply Channel (RSC) is within acceptable levels, and if the Plant Site's discharges to the RSCl meet the requirements of the Industrial General Permit and any requirements from the California Department of Fish and Wildlife. Unfortunately, the Draft EIR and its appendices do not discuss the water quality of the River Supply Channel.

The River Supply Channel may be a pollutant source that regularly contributes to the degradation of the San Joaquin River regardless of season, but the draft EIR does not discuss this or analyze this potential impact. Taking a look at available aerial imagery shows that the RSC's pond is often discolored (see Exhibit 1). According to these aerials, the discoloration extends 0.20 miles upstream, where the confluence of LDC and the RSC is located. Both

Comment 123-1 Cont.

images in Exhibit 1 show the discolored water commingling with LDC flows, and the image taken on June 23, 2023 shows LDC flowing through a discolored section, over a weir, and out towards the SJR. It could be argued that the weir prevents overflows for a certain rain event or flow rate, or that Best Management Practices are in place to prevent contaminants from entering the supply channel. However, the EIR does not even mention the potential for commingling at this location– let alone the impacts this commingling may have on the San Joaquin River.

There are multiple sources of flows in Little Dry Creek that may cause an overtop of the weir near the Plant Site. These sources include: (a) flows from Big Dry Creek Reservoir, (b) flows from the Clovis Recycled Water Plant, (c) potential flows from Millerton New Town, and (d) rain events (see Exhibit 2). This list may not include all sources, but this list does show that flows may occur in all seasons and are not storm dependent. For example, flows from the Clovis Recycled Water Plant may occur throughout the year, and flows from the Big Dry Creek Reservoir may occur whenever the Fresno Metropolitan Flood Control District must dewater the reservoir. The exhibit I have included shows flows occurring during the Winter *and* during the Summer, where the Summer flows are visibly overtopping the weir. Furthermore, it is likely that storm-related flows overtop the weir regularly, but aerials can't capture those events because of cloud cover during storm events. However, the Lead Agency may inspect the weir during storm events to confirm how frequent overtopping happens.

This may be a pre-existing issue as the Site's Industrial Stormwater Pollution Prevention Plan (SWPPP) does not include this commingling point as part of its Project Area. I don't know the reasoning behind not including this in the Plant Site's SWPPP. If there was no risk for contaminated flows to the SJR, then I would agree that it wouldn't be necessary to include the confluence of LDC and the RSC. But, I have explained possible sources and shown photo evidence of commingling of discolored water with Little Dry Creek's flows where the commingled flows enter the San Joaquin River. It is a safe presumption that discoloration may indicate contamination/pollution. The SJR is unambiguously a Waters of the U.S., and the home of state and federally protected species.

I recommend that impacts 4.10-1 and 4.10-17 should be re-analyzed taking the River Supply Channel into consideration. Impact 4.10-1 analyzes whether the Project would violate surface water quality standards or Waste Discharge Requirements or otherwise substantially degrade surface water quality at the Plant Site or Quarry Site during Mining and Reclamation. My discussion shows that this impact was not adequately analyzed because the draft EIR excluded mention or discussion of the River Supply Channel's potential impact on the surface water quality of the San Joaquin River; which aerial photography shows there is a risk of this occuring. Impact 4.10-17 analyzes whether the Project would result in a release of pollutants in Flood Hazard, Tsunami, or Seiche. As mentioned previously, Little Dry Creek commingles with the supply channel and may regularly overtop its weir and carry any contaminants to the San Joaquin River. It can be presumed that a flood event would scale up this commingling, and the draft EIR inadequately discusses the risk of floods in regards to these commingling events.

An analysis of the supply channel's water quality and of the frequency of commingling events is

necessary because this information is unknown. I am basing my critique of this project's EIR based on aerials showing discolored water in the supply channel. Aside from this discoloration, I personally do not have knowledge of the channel's water quality. However, I request that the applicant or Responsible Agency re-analyze the aforementioned impacts considering the information provided.

Biological Resources

Comment 123-2

I will quickly mention that any potential water quality impacts may affect biological resources near the Project. I recommend that the following impacts are re-analyzed considering the newly identified confluence between the RSC and LDC:

a. Impact 4.4-2 - Adverse effect, directly or indirectly, on special status species in riparian habitat surrounding the plant Site during mining operations
    i. The Project may affect special status species in SJR by affecting Little Dry Creek's water quality. Little Dry Creek is an immediate tributary to the San Joaquin River, and the potential pollutant source, the Plant Site, is less than a mile from the San Joaquin River.
b. Impact 4.4-4 - Substantial adverse effect on any riparian habitat or other sensitive natural community
    i. See reasoning for Impact 4.4-2
c. Impact 4.4-5 - Impact on protected wetlands or water of the state.
    i. See reasoning for Impact 4.4-2
d. Impact 4.4-6 - Interfere with migratory fish
    i. See reasoning for Impact 4.4.-2. The following migratory species may be affected:
        1. Chinook Salmon
        2. Steelhead
        3. Pacific Lamprey

Land Use and Planning

Comment 123-3

Finally, I'd like to raise my concern that the draft EIR did not explicitly determine the Project's impact on the San Joaquin River Parkway Master Plan. This issue may be an oversight as the Parkway Master Plan was discussed in Section 4.11 - Land Use and Planning (see Page 4.11-44 regarding SJR Parkway Master Plan Goal, and see Page 4.11-47 regarding the SJR Parkway Policy). However, during the analysis of Impact 4.11-2, the SJR Parkway Master Plan was left out. As in, the draft EIR stated that the Project would have a less than significant impact on the Fresno County General Plan, the Madera County General Plan, the Fresno County Zoning Ordinance, and the Fresno County Surface Mining and Reclamation Ordinance. The draft EIR did not state what impact the Project would have on the San Joaquin River Parkway Master Plan. This concern could be easily addressed by having a discussion of the impacts to the SJRP Master Plan in the Final EIR.

My recommendation is that the Final EIR should explicitly determine the Project's impact on the San Joaquin River Parkway Master Plan, where the applicant and the Responsible Agency should discuss this issue with the San Joaquin River Conservancy and the San Joaquin River Parkway and Conservation Trust. Additionally, as a local resident, I encourage the Lead Agency to mediate a deal where the SJR Conservancy may provide public access along the San Joaquin River adjacent to the Plant Site and the Quarry Site in the near future (<5 years). A river-long trail could be world-class, and a valuable resource to Central Valley residents. It seems that it could be possible to connect the Pacific Crest Trail to the City of Fresno via a SJR-long trail.

Comment 123-3 Cont.

Comment 123-4

Comment 123-5

Listed Questions and/or Recommended Further Analysis and Discussion:

This section clearly lists the questions I would like answered, and the recommendations I made in my comment letter.

1. Recommendation: Clarify whether the River Supply Channel flows towards the Plant Site or towards the San Joaquin River?
2. Recommendation: Mention that Little Dry Creek intersects with the River Supply Channel.
3. Recommendation: Analyze the following:
    a. The flow rate/rain event in LDC's watershed required to overtop the aforementioned weir.
    b. An analysis of sources of flows within Little Dry Creek.
    c. Water quality analysis of Little Dry Creek upstream and downstream of the confluence point.
    d. Water quality analysis of the River Supply Channel.
4. Recommendation: Re-analyze the following impacts:
    a. Impact 4.10-1: Violate Surface Water Quality Standards or Waste Discharge…
        i. May potentially impact beneficial uses: SPWN, COLD, MIGR
    b. Impact 4.10-17: Release of Pollutants in Flood Hazard, Tsunami, or Seiche
        i. Pollutants may be carried to the San Joaquin River.
5. Recommendation: Require that the Site's Industrial SWPPP is updated to include this commingling point and to include sampling at this location. Additionally, BMPs should be implemented at this location. The RWQCB may have additional requirements.
6. Recommendation: Consult with the following agencies regarding potential contamination from the river supply channel:
    a. California Department of Fish and Wildlife (copied)
    b. Central Valley Regional Water Quality Control Board (Fresno office, copied)
7. Re-analyze the following impacts:
    a. Impact 4.4-2
    b. Impact 4.4-4
    c. Impact 4.4-5
    d. Impact 4.4-6

Comment 123-6

8. Recommendation: Explicitly state the Project's impact to the San Joaquin River Parkway

Comment 123-7

Comment
123-7 Cont.

Master Plan while analyzing Impact 4.11-2.

Thank you for your time and for accepting my comments to improve this Project's EIR.

Subject: CEMEX DEIR
Date: Friday, February 21, 2025 1:18:15 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Mr. Randall:

I have been a resident of Fresno since 1985, and live near Woodward Park. I am retired and walk along the San Joaquin River bluff and trails almost daily.
As an outdoor enthusiast, River access and restoration have been issues that I am sincerely interested in.

Comment 124-1

As such, I have completed a partial review of the Benchmark DEIR conducted relative to the CEMEX request to extend their CUP and dramatically alter the size and scale of their operations. I am deeply concerned that the scope of their request will have irreparable impacts on the well-being of the residents and wildlife in the region.

While the content of the Benchmark document may check the boxes required under CEQA, in my opinion there are numerous shortcomings in their review, and many liberties taken in their assumptions as to what impacts might be significant, and whether they might be mitigated.

With such a massive document, and short timeline for public review and comment, I've noted some concerns in several key areas, with questions below. They are not listed in any order of concern or importance. And there are other substantial issues that should be of concern, such as water, air quality, traffic, noise and more.

I've also done some comparisons with the existing Vulcan operations, as I'm certain that much of the general public is unaware of how the river bottom mining operations are being conducted. It would be unfortunate to have someone dismiss the importance of the CEMEX decision by simply thinking that Vulcan is already operating under similar constraints with their CUP.

Comment 124-2

CEMEX DEIR Review

Project need

Comment 124-3

<!--[if !supportLists]--> - <!--[endif]-->Recites need for 6 MT of aggregate for future growth.

<!--[if !supportLists]--> - <!--[endif]-->What is the regional supply of aggregate materials?

<!--[if !supportLists]--> - <!--[endif]-->Who can meet the area demand with available resources?

Comment 124-3 Cont.

<!--[if !supportLists]--> - <!--[endif]-->What other sites in the area might be able to supply future demand?

<!--[if !supportLists]--> - <!--[endif]-->What percentage of local supply is provided by CEMEX?

<!--[if !supportLists]--> - <!--[endif]-->Does CEMEX export local materials out of the area?

<!--[if !supportLists]--> - <!--[endif]-->Are the employees at CEMEX able to continue at other locations? Other employers?

<!--[if !supportLists]--> - <!--[endif]-->Would the CEMEX plant expansion have an adverse effect on other local companies?

Community / Corporate cooperation

Comment 124-4

<!--[if !supportLists]--> - <!--[endif]-->CEMEX is currently encroaching on an existing Environmental Reserve, outside of their permit.

Comment 124-5

<!--[if !supportLists]--> - <!--[endif]-->Since 2000, CEMEX has been cited 667 times and fined $52.4 million for Environmental, safety & employment related offenses.

<!--[if !supportLists]--> - <!--[endif]-->Compared to Vulcan, cited 148 times and fined $4.8 million in the same categories listed above.

<!--[if !supportLists]--> - <!--[endif]-->CEMEX quarry site is 3 miles north of the San Joaquin River and the City of Fresno. But less than that if a direct line is extended to the north Fresno communities of Copper River.

<!--[if !supportLists]--> - <!--[endif]-->Vulcan Austin quarry site is 10 miles from the River and City of Fresno, and further than that to Madera.

<!--[if !supportLists]--> - <!--[endif]-->Vulcan mining operations at the Friant site have terminated and restoration is underway.

<!--[if !supportLists]--> - <!--[endif]-->What assurance do we have that CEMEX, a foreign corporation will have the resources and commitment to meet proposed restoration efforts at the end of the project?

Geology / Hydrology / Biology

Comment 124-6

<!--[if !supportLists]--> - <!--[endif]-->Limited scope on the stability of the mining wall.

<!--[if !supportLists]--> - <!--[endif]-->Limited discussion on the potential issues of disturbing the underlying soil / rock stability with blasting and digging. Comment 124-6 Cont.

<!--[if !supportLists]--> - <!--[endif]-->Limited discussion on the impact of operations on existing groundwater levels and domestic wells. Comment 124-7

<!--[if !supportLists]--> - <!--[endif]-->Restoration of the Chinook Salmon on the SJR. Would blasting and/or mining have any adverse effect on aquatic life? Anyone who has been around a fish aquarium knows what happens when you tap on the glass. I can't imagine how fish in the river would react to blasting sound and vibration. Comment 124-8

<!--[if !supportLists]--> - <!--[endif]-->Index recites old studies completed in Alaska that are unlike the River. What impact would blast pressure and vibration waves have at this specific site? Comment 124-9

<!--[if !supportLists]--> - <!--[endif]-->Has CDFW and the USFW reviewed the proposal and shared their concerns? Comment 124-10

The size and scale of the DEIR is daunting, to say the least. And the issues required to be addressed under CEQA are well outside the areas of expertise of the general public. I'm hopeful that the Planning Department and Board of Supervisors will be able to cast serious doubt on whether this project is in the best interests of the local community. Comment 124-11

Thanks for your time and consideration.

Tom Bozzo

Subject:	CEMEX Rockfield Quarry Modification Project EIR - Deny the permit application for a century of CEMEX gravel mining on the San Joaquin River.
Date:	Friday, February 21, 2025 7:20:42 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

The EIR that the CEMEC Corporation submitted in pursuit of a permit for a century of gravel mining a few feet from from the San Joaquin River shows that their plan is a threat to our planet as it is asking for permitting for use of fossil-fueled trucks.

Comment 125-1

Table 4.8-5 of the EIR, Applicability of Scoping Plan Climate Change Policies and Measures, refers to an executive order concerning heavy-duty trucks requiring that such trucks meet the Mobile Source Strategy for Cleaner Technology and Fuels. There are detailed requirements and timelines for classes of vehicles.

Comment 125-2

The CEMEX EIR simply states that none of this applies to them since their trucks are not heavy-duty trucks but heavy-heavy duty trucks.

A continuing CEMEX gravel operation would continue to be a cause of the release of green-house gasses that are warming our planet. And we don't want that.

We should plan for more responsible industry, without exceptions, for the sake of earth's habitability for grandchildren. Rather, as CEMEX's permit to mine gravel runs out, let them wind down their San Joaquin River operation, move elsewhere if they choose, and free the mining area to become part of the River Parkway and Conservation Trust.

Comment 125-3

Re: Cemex Rockfield Quarry Modification Project Comment

Dear Sir:

I write to submit comments on the Environmental Impact Report ("EIR:) for the Cemex proposal to mine gravel to a depth of 600 feet in the area between Friant Road and the San Joaquin River, and southeast of Lost Lake Park. Comment 127-1

For many years, residents of our community have looked forward to the development of a recreational trail running continuously from the town of Friant along the San Joaquin River to Highway 99. Any such trail running south from Lost Lake Park would have to be located between the proposed quarry site and the San Joaquin River.

The EIR states that the mining activities will include blasting within the site at any time from 6:00 am to 7:00 pm. Anyone using a recreational trail adjacent to the quarry site will be exposed to these very loud, startling, unpleasant and unpredictable noises. This could be particularly problematic for anyone riding horses on a nearby trail, as the sudden noise could cause a horse to become uncontrollable and possibly "throw" a rider. Noises such as this are unacceptable in a recreational area. Mitigation of this problem could include limitations on the times blasting is permitted.

As the EIR acknowledges, corridors for the movement of wildlife are important. The banks of the San Joaquin River provide one such corridor. As relevant, that "corridor" includes the area downstream from Lost Lake Park between the proposed quarry site and the River. The EIR specifies a 200 foot wide setback between the proposed quarry site and the River, which would be the only possible location for the extension of a wildlife corridor south from Lost Lake Park. This is also the only feasible location for the extension of the contemplated recreational trail. Comment 127-2

The EIR is vague as to exactly where the western edge of this 200 foot buffer will be located. Is the distance to be measured from the low or the high water shore of the River, of perhaps from an historic high water shore? If the low water shore is used, the trail could be flooded during periods of high water, rendering it unusable for either a wildlife corridor or a trail. Comment 127-3

The EIR states that after mining activities cease, the quarry area will be left with a 100 foot deep pond having a surface 500 feet below the surrounding area. The water in the pond will be stagnant, with no inflow or outflow. This presents a number of problems, some of which are as follows: Comment 127-4

- The pit will be an eyesore for users of the nearby recreational trail.
- The pit will be a safety hazard for wildlife and trail users.
- The pit will breed mosquitoes.
- The pit will produce unpleasant odors.
- Over time, trash and debris will accumulate in the pit, and will need to be removed.

February 21, 2025

Cemex should be required to dedicate an easement or grant for a trail on the proposed setback. Cemex should also be required to plant appropriate vegetation along the eastern side of the setback to screen trail users' views of the quarry. Other possible mitigation measures for these problems could include a cement lining and pump-driven circulation system for the water in the pond, a chain link fence surrounding the pond, and mosquito fish. If the quarry is permitted, Cemex should be required to provide appropriate financial assurances, such as a bond, for any mitigation measures that are required. Comment 127-5 Comment 127-6 Comment 127-7

Thank you for considering these comments.

Respectfully submitted,

Gerald D. Vinnard

Subject:	Public Comment on Draft Environmental Impact Report (EIR) for CEMEX Rockfield Modification Project
Date:	Saturday, February 22, 2025 7:55:53 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am writing to formally submit my comments regarding the Draft Environmental Impact Report (EIR) for the proposed CEMEX Rockfield Quarry Modification Project. My children have participated in the San Joaquin River Parkway and Conservation Trust's River Camp programs, as campers and counselors. I am deeply concerned about the potential environmental and public health impacts this project may have on the **2500 children** who participate in the camp programs along the San Joaquin River each summer. The camp locations along the river are one to five miles from the planned CEMEX plant and quarry sites.

Comment 128-1

The Draft EIR acknowledges significant environmental impacts; however, I believe the proposed **mitigation measures are insufficient to protect the children, staff and volunteers in the River Camp programs**. Below, I outline key areas of concern and offer recommendations for stronger, more effective mitigation strategies.

1. Water Quality and Safety Risks

The potential contamination of the San Joaquin River from mining operations poses a direct risk to children and adults who swim, canoe, and engage in other water-based activities. The Draft EIR states that blasting and excavation could introduce contaminants such as nitrates, heavy metals, and sediment into groundwater and surface water sources.

Comment 128-2

Recommended Mitigation Measures:

- Implement **independent, third-party water quality monitoring** with real-time data transparency, focusing on **nitrates, heavy metals, turbidity, and bacterial contaminants**.
- Require **double-lined retention ponds** with **leak detection systems** to prevent groundwater contamination.
- Mandate **advanced filtration systems** (e.g., activated carbon and biofiltration) to treat runoff before it reaches the San Joaquin River.
- Increase the **minimum buffer zone from 200 feet to at least 500 feet** to better prevent contamination risks to the river.
- Establish an **emergency response plan** for immediate action in the event of contamination.

2. Noise and Vibration from Blasting

Blasting operations could create loud noises and vibrations that may disturb campers, many of whom are young children. The Draft EIR does not provide strong enough measures to minimize this impact.

Comment 128-3

Recommended Mitigation Measures:

- Prohibit blasting during **peak camp hours (8:00 AM – 4:00 PM)** to avoid disturbing activities.

- Require the use of **blast mats** to absorb shockwaves and reduce noise levels.
- Install **real-time vibration monitoring** along the riverbank to assess the impact of seismic activity on nearby camp facilities.
- Establish a **notification system** so that River Camp staff receive advance warning before any blasting occurs.

3. Air Quality and Health Risks from Dust and Emissions

Comment 128-4

Mining activities will generate significant amounts of particulate matter (PM10, PM2.5) and diesel exhaust emissions, which could negatively impact children's respiratory health. The EIR's mitigation measures do not go far enough to ensure safe air quality.

Recommended Mitigation Measures:

- Require **continuous air quality monitoring** at River Camp locations with **publicly available real-time data**.
- Implement **enhanced dust suppression** techniques, including water misting and chemical stabilizers.
- Mandate the use of **low-emission or electric-powered vehicles and equipment** to reduce diesel exhaust exposure.
- Create **vegetative buffer zones** using trees and shrubs to filter air pollutants.

4. Ecological Damage to River Habitat and Wildlife

Comment 128-5

The San Joaquin River is a critical habitat for many species, and degradation due to mining could disrupt biodiversity, impacting the hands-on environmental education provided by River Camp.

Recommended Mitigation Measures:

- Require a **comprehensive habitat restoration plan** that prioritizes native species and long-term ecological recovery.
- Expand **riparian habitat conservation areas** beyond the proposed buffer zones.
- Conduct **independent biological assessments** before and during mining operations to assess impacts on local wildlife populations.

5. Increased Truck Traffic and Safety Risks

Comment 128-6

The projected increase in heavy truck traffic poses safety risks for families traveling to and from River Camp. The Draft EIR does not adequately address traffic mitigation near recreational areas.

Recommended Mitigation Measures:

- Implement **strict truck routing plans** that avoid high-use recreational areas during peak summer months.
- Require **additional pedestrian crossings and signage** near camp entrance points.
- Install **sound barriers along major truck routes** to minimize noise pollution affecting campers.

Conclusion

Comment 128-7

While the proposed mitigation measures in the Draft EIR acknowledge potential environmental impacts, they do not go far enough to **protect the health, safety, and experience of children at River Camp**. Without **stronger protections**, this project could significantly harm the San Joaquin River ecosystem and the quality of outdoor educational opportunities available to

future generations. **Fresno County must require CEMEX to 1.) adopt more robust mitigation strategies, and 2.) describe how they (CEMEX) will fund them before approving any mining expansion near this sensitive area.**

Comment 128-7 Cont.

I appreciate your consideration of these comments and respectfully request that they be addressed in the Final Environmental Impact Report.

Sincerely,

Beth Arrindell

Subject: CEMEX Mine Blast Proposal
Date: Saturday, February 22, 2025 2:10:30 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Mr. Randall,

I am writing to object to the CEMEX blast mine proposal. Comment 129-1

The current permit should not be extended or modified for the following reasons:

- Fresno and Madera counties do not need the aggregate. Our regional demand of 305 million tons for the next 50 years will be met by the 556 million tons of reserves already permitted at the Kings River and at Austin Quarry.

- CEMEX has been fined more than $43 million for 81 environmental violations since 2000. Comment 129-2

- The draft EIR does not require CEMEX to have a reserve to pay for future damage, such as a breach between the mine and the river. Comment 129-3

- No amount of money could compensate for the potential environmental damage.

- CEMEX has no plans to rectify the unavoidable impact to traffic on Friant Road. Comment 129-4

- The visual blight on the landscape has encroached on an adjacent state ecological preserve. Comment 129-5

- The constant dynamiting is not compatible with fish and wildlife or humans living near the site! Comment 129-6

Please do not extend the current permit and reject the proposal to modify the permit! Comment 129-7

Sincerely,

Deanna Bailey
Fresno, CA

Report Suspicious

Hi David,

I wanted to send an addendum to my original letter. My concern is that the public isn't getting the full picture with this EIR and this addendum further shows the need to analyze the River Supply Channel's impact to the San Joaquin River. However, my original letter has some recommendations to improve the EIR's analyses.

Thank you,

LWK

RE: Cemex Rockfield Quarry Modification Project EIR - Addendum to Original Comment Letter

I'd like to add the included exhibit as part of my original comment. My concerns with the project's water quality impacts still stand. Specifically, that the draft EIR did not address the comingling of the River Supply Channel and Little Dry Creek. This was not discussed at all. The draft EIR is inadequate because it does not analyze the impact of the river supply channel to Little Dry Creek, a tributary to the San Joaquin River. Specifically, the Plant Site's supply pond appears discolored in multiple aerials, and full of sediment in the most recent aerial (see attached image). **The public cannot get a full picture of the CEMEX project's impacts to the environment without this analysis/discussion.** See my original letter for recommendations to improve the EIR's analysis.

Comment 130-1

Included is an aerial taken on February 9, 2025 showing the Plant Site, the River Supply Channel, and the San Joaquin River. This aerial matches the aerials included in my original comment letter (which will be included with this smaller letter). Note the heavy brown discoloration of the River Supply Channel (RSC) as it crosses Little Dry Creek (LDC). From what I gather from the EIR, the RSC flows towards the Plant Site, not towards the San Joaquin River (SJR). However, my original comment letter shows that the RSC's discoloration usually extends upstream, over LDC. The discoloration may not reach the SJR, but LDC may have flows that commingle with the RSC's discolored water, consequently allowing a mixture of RSC and LDC water to flow to the SJR, less than a mile away. The attached aerial shows brown discolored water suggesting heavy sedimentation in the water. The aerial was taken 3-4 days before a large storm that produced over an 1.0" of rain at the Fresno Airport rain gauge (see attached). It is safe to presume that the rain storm produced enough flows in LDC to carry polluted water from the RSC over the nearby weir to the SJR.

Comment 130-2

The EIR leaves questions unanswered (un-mentioned, to be frank) regarding the impact of this comingling to the SJR:

Comment 130-3

- What's the water quality of the RSC usually?
- What is the water quality of the RSC when it is discolored as shown in the aerials?
- How often does LDC commingle with RSC water?
- How often does LDC + RSC commingle water flow over the nearby weir (aerials show overflows during the summer)?
- What is the water quality impact to the SJR during the weir overflow?

- Why isn't the supply pond and channel included in the Project boundary in the EIR, or the Plant Site's SWPPP?
- Why doesn't CEMEX regularly sample the water quality in the River Supply Channel as part of their SWPPP requirements?
- What is the impact of this comingling to biological resources in the SJR?

Comment 130-3 Cont.

Please see my original comment letter for recommendations to improve the EIR's analyses and to provide the public with a full picture of the project's environmental impacts.

Comment 130-4

Thank you,

LWK

Subject: CEMEC Corporation submission re permit for gravel mining
Date: Sunday, February 23, 2025 10:22:21 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

The EIR that the CEMEC Corporation submitted in pursuit of a permit for a century of gravel mining a few feet from from the San Joaquin River shows that their plan is a threat to our planet as it is asking for permitting for use of fossil-fueled trucks. Comment 131-1

Table 4.8-5 of the EIR, Applicability of Scoping Plan Climate Change Policies and Measures, refers to an executive order concerning heavy-duty trucks requiring that such trucks meet the Mobile Source Strategy for Cleaner Technology and Fuels. There are detailed requirements and timelines for classes of vehicles. The CEMEX EIR simply states that none of this applies to them since their trucks are not heavy-duty trucks but heavy-heavy duty trucks. Continuing the CEMEX gravel operation would be a long-term source of release of green-house gasses that are warming our planet.

Additionally
4.3.1.2 Pollutants and Health Effects
4.3.1.3 Toxic Air Contaminants
Toxic air contaminants can cause long-term health effects such as cancer, birth defects, neurological damage, asthma, bronchitis or genetic damage; or short-term acute effects, such as eye watering, respiratory irritation (a cough), running nose, throat pain, and headaches. For evaluation purposes, toxic air contaminants are separated into carcinogens and non-carcinogens based on the nature of the physiological effects associated with exposure to the pollutant. Carcinogens are assumed to have no safe threshold below which health impacts would not occur, and cancer risk is expressed as excess cancer cases per one million exposed individuals, typically over a lifetime of exposure. Non-carcinogenic substances differ in they are generally assumed to feature a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant-by-pollutant basis. Acute and chronic exposure to non-carcinogens is expressed as a Hazard Index, which is the ratio of expected exposure levels to an acceptable reference exposure levels. Comment 131-2

We should plan for more responsible industry, for the sake of earth's habitability for future generations, without exceptions. Rather, as CEMEX's permit to mine gravel runs out, let them wind down their San Joaquin River operation, move elsewhere if they choose, and free the mining area to become part of the River Parkway and Conservation Trust. CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I live at Copper River Ranch and am concerned about the extension and expansion of the Cemex operation along the San Joaquin River. Comment 132-1

My concerns are as follows:

a. The environmental impact on the ecosystem and biodiversity of the river bottom. I have had firsthand experience of surface mining and drilling in Rangley, Colorado. Its effects on deer migrations and diminished wildlife populations was significant. With the continued development of open space it is more important than ever that we preserve those ecosystems that provide habitat for wildlife and also recreational space for citizens to enjoy. The San Joaquin River is a precious resource that is unique and valuable. We have already managed to destroy the river's natural migrations of salmon and steel head, let us not further damage this precious place.

b. Other than to advance the business and profit incentives of rock removal from this area, there is no lack of available rock for construction and other commercial ventures. Therefore, I can see no justification for continuing to damage and desecrate this unique ecological place. Comment 132-2

c. The Central San Joaquin Valley already has some of the worst air quality in the United States. The incident of asthma, COPD and other respiratory disease plages our city and county. How can we continue to justify rock removal and the generation of air particulates when this is purely a business venture with no need for additional product (gravel, rock, etc). Comment 132-3

d. Noise pollution, traffic congestion and danger to cyclist who use Friant, Copper and Willow for recreation and/or travel to and from school or work. Comment 132-4

e. The impact of explosives being used at the excavation site and its close proximity to homes. Comment 132-5

f. The effects on our home values and quality of life with the environmental impact of this project (noise pollution, traffic congestion, dangers of rocks harming cars and people, and air pollution secondary to excavation and truck emissions. Comment 132-6

g. How can anyone forsee the environmental consequences of granting Cemex a 100 year extension on their operations. Especially with a project that does not serve the population at large. Comment 132-7

I hope you will give serious consideration to these issues those expressed by others and reject Cemex's proposal. Comment 132-8

Comment 134-1

I'm trying very hard to control my anger with the Board of Supervisors for even allowing this project to go forward!
What price can there be on our neglected San Joaquin River? This river should be a crowning jewel for a park system itself, instead it faces a 600 foot deep mining pit! Rockfield Quarry Modification, AKA Cemex, is the culprit.

Comment 134-2

For my part, I would like to know if the Cemex's 2024 EIR correlates the increases in ozone and fine particulates that impact human health. We often seem to have the worst air quality in the nation and this is a serious concern for me.

Dear Sir,

Comment 135-1

Please deny CEMEX'S application to modify an existing use permit that allows hard-rock mining within the boundaries of the San Joaquin River Parkway.

Heavy trucking of megatons of aggregate will further ruin Friant Road and add countless traffic jams at the Friant Road and Audubon Drive intersection and at the Friant Road and Champlain intersection.

Please deny this application, also known as the Rockfield Quarry Modification Project.

Thank you for your time and consideration.

Re: Please STOP CEMEX from imposing its negative impacts on our community!

Dear Mr. Randall:

Please use your decision-making power to STOP CEMEX's proposed blasting and drilling of a 600-foot-deep pit near the San Joaquin River to supply aggregate for future area construction. Comment 137-1

Please take note that:

- The pit would be a huge eyesore on this currently beautiful landscape.
- Trucks connected with the project would cause ongoing traffic delays at two nearby intersections. Comment 137-2
- Statistics noted in *The Fresno Bee* on Feb. 16, 2025 indicate that the need for this project is in serious question. CA state geologists have reported that other sources already can supply nearly double the area's projected demand for aggregate over the next 50 years. (See "Aggregate Sustainability in California," updated in 2018 by the California Geological Survey.) What's the reasoning here? Comment 137-3
- CEMEX has 81 separate environmental violations since 2000, according to the same issue of *The Fresno Bee*. With their record, is there reason to trust that CEMEX would observe environmental rules? Comment 137-4 Please note that the draft agreement doesn't require that CEMEX put money aside to pay for potential environmental damage by this project. Comment 137-5

In my view, all of this adds up to the need to STOP CEMEX. We do not need this project. Please do not allow CEMEX to impose its negative effects on our community! Comment 137-6

Sincerely,

Suzanne Abrams

Comment 138-1

I am a resident of the Woodward Lake community.
I am opposed to the Cemex open pit mine expansion project.
We need to preserve the environment especially in these delicate times.
Not only would it harmful to the environment but would also cause unnecessary hardship to the surrounding communities which have expanded immensely in the last 2 decades.
I feel they should stop or take their business elsewhere.
Thank you
Catherine Farinelli

Subject: Public Comment on the CEMEX Rockfield Quarry Draft Environmental Impact Report (SCH No. 2020060123)

Dear Mr. Randall,

I am submitting comments on the Draft Environmental Impact Report (EIR) for the CEMEX Rockfield Quarry Proposed Expansion. As a Fresno County resident for over 40 years, a Board Member of the Fresno Audubon Society, and someone with academic and professional expertise in Biology and Engineering holding a B.S. in Mechanical Engineering and undergraduate studies in Biology from Cal Poly, San Luis Obispo, I have serious concerns regarding the report's treatment of air quality and impacts on migratory and special-status birds. Additionally, as someone who suffers from asthma, I am particularly concerned about how this project will exacerbate air quality issues in an already compromised region.

Comment 139-1

Air Quality Impacts

Comment 139-2

While the EIR proposes mitigation measures such as a Fugitive Dust Control Plan (Mitigation Measure 4.3-2), **it does not sufficiently evaluate the long-term cumulative effects of continuous quarry operations**.

Health Risks: The San Joaquin Valley has high asthma rates, and fine particulate pollution worsens respiratory conditions. The EIR does not provide a clear plan for monitoring long-term air quality impacts.

Cumulative Emissions: The report does not adequately consider the combined effect of quarry emissions alongside other industrial and agricultural pollutants in the region.

Ongoing Operations: While construction-related emissions are discussed, the impact of continuous dust and emissions over a 100-year period remains largely unaddressed.

Impacts on Birds & Migration

Comment 139-3

The EIR focuses on nesting birds but **fails to account for migratory species and special-status birds, particularly the Tricolored Blackbird (Agelaius tricolor).**

Tricolored Blackbird Concerns: This species, listed as threatened under the California Endangered Species Act since 2019, has been well documented in Fresno County. Given its colonial nesting habits in agricultural and disturbed landscapes, the expansion could disrupt critical habitat.

Dust & Noise Impact: Airborne dust settling on foraging areas and increased noise from operations may affect feeding and breeding success.

Comment 139-4

Lack of Seasonal Study: The EIR does not sufficiently analyze how quarry activities could disrupt non-nesting birds during migration or other non-nesting periods.

Comment 139-5

This project has the potential for significant environmental and public health consequences. A much more thorough review is necessary to ensure that these impacts are fully understood and effectively mitigated.

Comment 139-6

Thank you for your time and consideration.

Sincerely,

Nancy Gilmore

David Randall, Senior Planner,
Fresno County Dept. of Public Works and Planning

Fresno County Planning Commission

Comment 140-1

Re: the CEMEX Rockfield Quarry Modification Project DEIR, I would like to convey my opposition to the project, as the location is wrong for a hard rock project. The San Joaquin River corridor below Friant Dam was designated as a Mineral Resource Zone because of its' alluvial aggregate, not hard rock, resources. Those aggregates are near exhaustion, as has been recognized and planned for decades. The Counties of Fresno and Madera, the City of Fresno, the State, and the community at large have all recognized this, and planning and community expectations have shifted from resource extraction to residential development and open space uses.

Comment 140-2

The San Joaquin River Parkway and Conservation Trust, a local organization with widespread support, is an outgrowth of this long-anticipated phasing out of sand and gravel extraction on the San Joaquin River and the urgent need for local parks. This local commitment was recognized and supported by the State when it formed the San Joaquin River Conservancy to insure acquisition of these lands for ultimate public access and open space use. The Central San Joaquin Valley has the distinction of having fewer State parks than any other region, and Fresno, the 5th largest city in the State, has some of the lowest amount of open space per capita. The San Joaquin River represents a unique opportunity to correct this deficiency with a continuous and uninterrupted Parkway, a goal that many, including myself, have been working toward for decades. This project is entirely inconsistent with that goal.

Comment 140-3

Naturally-occuring aggregates are limited to current and historic river channels, which is the only reason why the MRZ designation was made on the San Joaquin River, but the hard rock of the Sierra makes up virtually the entire eastern County and underlies much of the Valley. Countless other local locations could be considered with far fewer environmental risks and impacts. Given the amount of mining already authorized within the local production-consumption region, there is no real need for this expansion, but even if there were a shortage of locally-produced sand, gravel, and other rock materials, there is no reason for a hard rock project such as this to be located directly on the San Joaquin River, with its' unique environment, and within the footprint of the long-anticipated Parkway. This is the wrong location and should not be approved.

Thank you for your consideration,

Lynn Gorman

Dear Mr. Randall,

I am writing to express my extreme disagreement with the proposed modification to the existing CEMEX Rockfield Quarry (EIR N0.7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

Comment 141-1

One of the greatest attributes to balanced, healthy life in Fresno and surrounding areas is the access to nature and natural environments. Access to and protection of the San Joaquin River and the nature corridor along its banks is of primary importance . Blasting for deep pit mining of aggregate material will be detrimental to the birds and other wildlife to say nothing of people living in the area. Excessive noise pollution is a known health risk.

Comment 141-2

The addition of heavy truck traffic hauling aggregate will add to the air pollution and be a continual traffic hazard to an already dangerous stretch of highway.

Comment 141-3

In addition there is no documented need for the increased aggregate to be blasted from the proposed 600 foot deep pit. According to the Aggregate Sustainability in California report, the Fresno region already has 556 million tons of permitted aggregate reserves more than enough to meet future needs.

Comment 141-4

Unfortunately, according to Good Jobs First, a Washington, DC based non-profit that tracks corporate and governmental accountability in economic development, CEMEX's record for environmental violations is of huge concern. The proposed project for deep pit mining is ripe with the possibility of environmental damage. How can Fresno disregard its people, its natural environment, its wildlife to a project run by a corporation with so little concern for its negative impact particularly when the product in question is not needed for future use?

Comment 141-5

PLEASE do not allow the proposed modification to the existing CEMEX Rockfield Quarry.

Sincerely,
Ellen B Hemink

Report Suspicious

David Randall,
I am making these comments in opposition to the Cemex application. I am a long term member of the Fresno Community and an original homeowner at Woodward Lake since 1987, a long time supporter of the San Joaquin Parkway, and supporter of the agricultural and recreational uses of the San Joaquin River .
It is very common for companies to remove valuable resources from our lands without creating adequate financial resources to remedy their path of destruction. Unless Cemex voluntarily establishes a fully funded safe and secure escrow which can be used by the County to restore the land and its environmental effects, their application should be denied.

THRUSDAY, FEBRUARY 27 at 5:30pm

FRIDAY, FEBRUARY 28 at 3:30pm

San Joaquin River Parkway and Conservation Trust | 11605 Old Friant Road | Fresno, CA 93730

Message from Lakefront President Kenneth Gatewood:

Hello Woodward Lake Lakefront Neighbor:

The Cemex corporation has operated two gravel quarries on Friant Road, adjoining the San Joaquin river. These quarries were supposed to have been shut down around the 2008 time period. However, the company now has a proposal before Fresno County planners, to continue these open-pit mines for the next 100 years, ultimately reaching 600 feet deep into the ground.

Cemex has submitted an Environmental Impact Report (EIR) to the County, listing dozens of extreme impacts to surrounding communities and the natural environment. Cemex will be blasting with unspecified explosives, emitting dust into the air, consuming ground water, and there will be hundreds of additional gravel truck trips on Friant Rd. and other city streets, just to name a few of the known effects.

The San Joaquin River Conservancy Trust is leading the opposition to this project. Your Lakefront Board has considered the issue and also feels this project will be severely detrimental to our quality of life. To voice your concerns, you are

invited to attend either strategy meeting as listed on the announcement attached. The meetings are duplicates for people's different schedules, so you only need to attend the one that fits your availability.

The community comment period ends March 10. The goal is to ask questions and make comments by then. County planners and Cemex must reply to all communications received before that deadline. Even if you cannot attend a strategy meeting, residents can contact the Fresno County Senior Planner as listed below. Please get involved and express your views on this issue. Together, we can be successful in preserving the quality of life in our Woodward Lake community. Thank you.

Subject: Opposition to the CEMEX Rockfield Quarry EIR 7763 Proposal and the Future of the San Joaquin River

Dear David Randall,

February 24, 2025

Comment 143-1

This memorandum documents additional concerns that I have regarding the CEMEX Rockfield EIR7763. For reference, my initial concerns were sent to you on February 2, 2025 via EMAIL.

After I submitted my initial comments stating my strong objection to this EIR, I kept on learning more while discussing this EIR with other concerned citizens and reading the 3000 plus page EIR document, reviewing its impact on the environment, the community for several generations the more I become adamant against the approval of this project.

Do we need more Aggregate?

In discussions I was recently advised that the existing mines in our area can produce 180% of the needed aggregate! So I ask, why do we need more capacity for what we have an ample supply?

Nobody wants WANT!

Comment 143-2

I've shared my concerns with many other perplexed Fresno County Citizens and concluded that the EIR contains no metrics for ongoing monitoring of environmental issues and overall performance of CEMEX. In fact the Fresno

County monitors daily Air quality and often bands home fireplace uses on bad Air quality days! Yet they might approve a foreign LLC to further degrade the Air quality.

Comment 143-2 Cont.

Most citizens are already concerned about Water, Air, Noise and Traffic levels (WANT) and are adamant that we don't WANT any more contaminants added to our already fragile environment!

Comment 143-3

In addition, the blasting will not only add unwanted noise, but it will cause vibrations that are not defined and their repeated occurrence would cause many unknown effects on humans, waterfowl, other native animal species, the fish population and specifically the reintroduction of the Salmon population in the San Joaquin River. The potential for Water and Air pollution will be compounded by the blasting with the possibility of disturbing heavy metals and other contaminants and releasing them to the Air and Water which could contaminate the nearby San Joaquin River or the water table that neighbors depend upon for their well Water!

Comment 143-4

Comment 143-5

Monitoring WANT

Comment 143-6

The EIR should list the current levels of each contaminate, as well as, the maximum acceptable level of the WANT issues.

I would suggest that a licensed Independent Environmental Firm provide the basic levels for a normal safe community and the threshold that would have a negative impact on all forms of health and life in the area.

These potential contamination parameters would require constant checking and appropriate actions if exceeded. CEMEX would be responsible for monitoring the levels with periodic reporting to the County on the exact levels and trends. The County would be allowed to verify readings with unannounced audit visits. All equipment used would be required to have routine validation and calibrations completed by an authorized firm. Additionally, sensors for Air and Noise pollution would sound alarms when exceeded and send an immediate alert to the Fresno County officials for appropriate action.

Any breach of water from the San Joaquin River would require immediate stoppage in mining activity with a repair plan requiring approval of Fresno County Offices and execution of the plan at the sole expense by CEMEX until the damage is completely mitigated.

Comment 143-7

Cost for highway upgrades

The increase in Traffic activity in the nearby area is already a major concern with broken windshields and loose aggregate falling from CEMEX trucks. The speed limit in that area is 65MPH which is the expected highway speed and the CEMEX truck require a long distance to safely merge in or exit with Traffic especially when commuter Traffic is at peak. In addition, the fully loaded trucks are difficult to stop; they are hard on the highways due to their excessive weight when loaded with product. It is strongly recommended that CEMEX finances entrance and exit lanes to their sites to safely allow their trucks to enter and exit. I would also recommend that a study be performed at the intersection of Willow and Friant Road. This is where southbound Traffic turns left onto Willow at high speeds against Traffic moving at 60MPH. A traffic light may be required and if so the cost should also be borne by CEMEX.

Comment 143-8

Comment 143-9

Comment 143-10

Termination

I suggest that the EIR contains a section for "Termination For Cause" if CEMEX ever exceeds the levels established by the Independent Environmental Firm for WANT issues or other performance failures that the county not only has the right, but the obligation to terminate the site activity!

Comment 143-11

In addition to the WANT metrics there should be other measures that are part of maintaining acceptable limits on any project of this magnitude. They should include others such as:

Not adhering to the agreed work schedule

Exceeding the number of daily truck loads

Blasting during silent periods

And many, many more…….

Having an agreement for 100 years with no performance clauses is totally absurd. I would ask that Fresno County issue a statement of compliance with the current agreement that exits with CEMEX LLC. Comments have been made by many that they continually violate standards and they keep on mining.

Comment 143-12

If there are no standards and metrics then there is no obligation to perform!

I look forward to your response and I urge the Fresno County Supervisors to

Comment 143-12 Cont.

decline this CEMEX 100 YEAR request to blast and mine 600 FEET within 200 FEET of the San Joaquin River. That is just insane!

Respectfully,

Leo Labbe

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall:

I am writing to express my opposition to the proposed CEMEX expansion of their facility off Friant Road. Comment 144-1

I am a resident of Fresno County and live very close to the CEMEX facility. From our home, about 1.5 miles away, we can hear the loud plant operations at all hours. Further, the traffic on Friant due to the trucks transporting materials causes traffic delays. More importantly is the damage the heavy trucks cause to the roads. Comment 144-2

CEMEX stating, they will not or cannot support road improvements for the expansion is disingenuous. Comment 144-3

I understand that the materials taken from the plant are necessary for construction, however I believe the area has 180% of the needed material for decades to come that is financially feasible to mine. Comment 144-4

Please record my opposition to the expansion and add my email to any list of citizens who are kept updated on the proposal.

Regards,
Bill Schmidt

Comment 145-1

I am writing to protest the expansion of mines to include blasting and a continuation of the business for 100 years as it was original supposed to terminate its operations since 2008. I live at Woodward Lake and enjoy our outdoor activities in the area. The increased pollution will be detrimental to our environment including damage to our river water ecosystem.

Thank you for considering the long range effects of this important decision to the inhabitants of all the residents located near the blast areas.

Susan Vaughn

To Whom It May Concern:

I am a lifelong resident of Fresno, and my family and I are frequent visitors to the San Joaquin River Parkway trails. Our young daughters adore their trips to the River House and Sumner Peck Ranch, so we are now greatly concerned with the proposed CEMEX Rockfield expansion.

Comment 146-1

Adding a 600 foot deep pit is something that should not just be approved overnight; further studies, particularly in regards to the environmental impact, need to occur. Our 4 year old loves trying to find animal tracks as we hike along the nearby trails – animals that may be chased out of their natural habitat with this project. Then, of course, there would be added particulates to the air, adding to our already heavily impacted poor air quality. Again, this is in an area where so many Central Valley residents seek to enjoy the outdoors – we run and bike through Woodward Park and its extended trails, pick blueberries and citrus at Sumner Peck Ranch, to name a few. We should be able to enjoy what precious levels of fresh air that we can – again, what would be the projected environmental impact here in this regard?

Comment 146-2

Comment 146-3

We would also be interested to see the impact that the CEMEX plant in general has on the nearby water supply/water table, something that heavily dissuaded us from looking at an otherwise delightful piece of property along Old Friant Road, and something that continues to dissuade us from ever refilling our water bottles while we're down at the River House.

Comment 146-4

Lastly, I'm sure others will raise concerns over the traffic impact along Friant Road as well, an already heavily traveled thoroughfare. The large trucks leaving CEMEX and headed for the 41 onramps have affected many a work-time commute. Yet, I feel this is just a small concern in comparison to the long-term ramifications and environmental impact that this rockfield expansion could cause. As our daughter said, "Please protect our beautiful river."

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

Comment 147-1

I'm sending this email to let you know I am opposed to the Rockfield Quarry Modification Project. From what I've read about it, it benefits Cemex company, but there is no benefit at all to the residents of Fresno County.

We are in need of parks, playgrounds, and other quiet green spaces where we can relax and enjoy nature, wildlife, and just being out of doors. This project threatens that.

Comment 147-2

We (and the whole valley) need clean water. Water is precious here, and this project, so close to the river, would endanger our supply.

Comment 147-3

There will be traffic delays at the affected intersections, with no plans to remedy the delays. How does that make things better for taxpayers?

Comment 147-4

All of this, just to benefit Cemex. Fresno County doesn't even need the aggregate that will be mined; the County has enough aggregate for the next 50 years.

Comment 147-5

I've lived in this area for a long time, and so often I have seen taxpayers get stuck with paying for infrastructure, cleanup, etc. while developers and big companies profit from their projects.

Please don't allow this unnecessary and potentially harmful project to go forward.

Fresno, CA 93721

Subject: Opposition to the CEMEX Rockfield Quarry EIR 7763 Proposal and the Future of the San Joaquin River

Dear David Randall,

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years.

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource.

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations.

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts. The increased truck traffic, potential river pollution, and habitat destruction would be devastating for local wildlife. Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells.

Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability. Moreover, the current agreement lacks measurable performance oversight, and reports indicate repeated violations of work schedules and environmental standards. The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences.

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs.

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century.

Thank you for your time and consideration. I look forward to your response on this critical issue.

Sincerely,
Mitchell Hall

Dear Mr Randall,

Comment 149-1

As a concerned senior citizen who has witnessed the effects of exploitation of the earth's resources for monetary profit - I urge you to use wisdom and conscience to oppose the upcoming proposal that would allow the CEMEX corporation to further mine the Banks of the San Joaquin River.

We must start reversing the damage that we have been inflicting - as future generations will be the ones paying for our greed.

God has given us all we need in a remarkable ecosystem that is designed to sustain us all - if we would start protecting the environment as wise stewards.

Please do the right thing - for the sake of, and responsibility to the future inhabitants of our land.

Sincerely,
Linda Odell
(resident of Clovis)

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

As a resident of Fresno City, I wish to express my opposition and concern regarding the extension of the CEMEX Quarry along the San Joaquin River. I feel this is so very wrong on many levels. This would be a huge threat to our natural resource of the San Joaquin River. My main reasons for opposing this project are the environmental impact on the ecosystem and biodiversity of the area, increased air pollution, increased water usage, increased heavy truck usage of Friant Road, and the impact of explosives in a sensitive area.

Please do not let this company have the permits it seeks.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am writing to express my deep concern over the proposal CEMEX is making. This will affect so much in that area. Comment 151-1

I'm sure you are aware that state geologists have written that 305 million tons of aggregate will be needed for the next 50 years worth of construction. We currently have 556 million tons of permitted aggregate reserves. Since these reserves mostly come from Minkler and Austin quarries, the only reason CEMEX wants this project on the San Joaquin river is to increase their profits. I imagine they will sell everything from the proposed plant to other locales.

Why does Fresno need this imposition of the increased noise (from blasting) and traffic, plus the possibility of shaft collapse (that BTW doesn't require CEMEX to put money in reserve to pay for potential damage)? Comment(s) 151-2, 151-3

It's possible that much lower on your list of things to consider are the potential effects on the environment- water quality, encroachment on a state ecological preserve, as well as on residents in surrounding communities. However, these ecological effects are often disregarded by those who only look at profit. Comment 151-4, 151-5 151-6

I am asking you to seriously consider not just profit but all the side effects that a project such as this will have on this community.

My vote is NO.

Sincerely,

Julie Taylor

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

Comment 152-1

As specified in Section 2.5.4 of the Executive Summary, the current count of 55 employees at the Plant Site process (and deliver as Ready-Mix drivers) the 1.4 MT annual production as allowed by the current CUPs. This equates to 25,455 tons per employee on an annual basis. According to Table Note b. of Table 4.17-1, the interplant haul is accomplished by six private party truckers who arrive and leave the site with their own trucks and are, therefore, not employees.

In Table 2-6 the employee count for Stage 1 (5 years) increases to 57 employees who will process (and deliver) 2.0 MTY, or 35,088 tons per employee annually. This amounts to a 38% increase in the production rate with two additional employees. What accounts for the significant production increase? Or will the employee count increase?

In Table 2-6 the employee count for Stage 1 (10-30 years) and Stage 2 (30-100 years) increases to 60 employees who will process (and deliver) 3.0 MTY, or 50,000 tons per employee annually. This amounts to a 42 % increase in the production rate with three additional employees. What accounts for the significant increase? At 50,000 tons per employee this is a 96% increase over the existing production rate. Will they really be able to double their efficiency? What happens if they do not significantly increase their efficiency? A ready-mix truck will only hold 9.5 cubic yards. The efficiency of those drivers can increase only if they drive substantially faster or drive a substantially shorter distance.

Table 4.17-1 Existing Annual Trip Generation at Plant and Quarry Sites provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-1 shows annual Trips for employees at the Quarry Site (entering and exiting totaling 500 annual trips) and at the Plant Site (entering and exiting totaling 26,926 annual trips) for a total employee trip count of 27,426 annual trips. Dividing by 365 days per year results in an employee count of 75.14. This is significantly more than the 55 employees that are claimed in Table 2-6. Why is there a difference?

Likewise, in Table 4.17-2 Project Annual Trip Generation – Stage 1 (2.0 MT Per Year) provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-2 shows annual Trips for employees at the Quarry

Site (entering and exiting totaling 6,000 annual trips) and at the Plant Site (entering and exiting totaling 22,602 annual trips) for a total employee trip count of 28,602 annual trips. Dividing by 365 days per year results in an employee count of 78.36. This is significantly more than the 57 employees that are claimed in Table 2-6. Why is there a difference?

Further, in Table 4.17-3 Project Annual Trip Generation – Stage 1 (3.0 MT Per Year) provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-3 shows annual Trips for employees at the Quarry Site (entering and exiting totaling 6,000 annual trips) and at the Plant Site (entering and exiting totaling 24,252 annual trips) for a total employee trip count of 28,602 annual trips. Dividing by 365 days per year results in an employee count of 82.88. This is significantly more than the 60 employees that are claimed in Table 2-6. Why is there a difference?

Finally, in Table 4.17-4 Project Annual Trip Generation – Stage 2 (3.0 MT Per Year) provides conflicting employee data that does not correlate with Table 2-6. Table 4.17-4 shows annual Trips for employees at the Quarry Site (entering and exiting totaling 30,252 annual trips) for a total employee trip count of 28,602 annual trips. Dividing by 365 days per year results in an employee count of 82.88. This is significantly more than the 60 employees that are claimed in Table 2-6. Why is there a difference?

Table 4.17-1 Existing Annual Trip Generation at Plant and Quarry Sites shows 39,906 total annual trips for Ready-Mix concrete sales whereas Table 4.17-3 Project Annual Trip Generation – Stage 1 (3.0 MT Per Year) shows 63,158 total annual trips for Ready-Mix concrete sales – a 58% increase. However, the increase in total aggregate production from 1.4 MTY to 3.0 MTY is a 114% increase. Why is the increase in Ready-Mix production substantially less (50%) than the total aggregate production increase.

Substantial review and reconciliation of the actual and projected employee counts is warranted.

Thank you for your consideration.

Hi Aida,

Thank you for reaching out to share your concerns regarding the CEMEX mining operation near the San Joaquin River. We understand and appreciate your passion for protecting our natural resources and maintaining the environmental integrity of our region.

Please know that we are carefully reviewing the matter, considering both environmental and community impacts. Public input is an essential part of this process, and your concerns will be taken into account as we evaluate the best course of action. I'll note your objections and share your sentiments with Supervisor Bredefeld.

Thank you again for reaching out, and please don't hesitate to contact our office if you have any further questions or concerns.

Best regards,

Jennifer Ortega
Community Relations & Digital Marketing Manager
Supervisor Garry Bredefeld, District 2

Report Suspicious

Dear Mr. Randall,

According to Section 2.2.2 of the Executive Summary: "*Upon approval of the project, the combined annual sales of aggregate from both sites are estimated to increase from the 1.4 MT/year allowed under the current permits to 2.0 MT/year within approximately five years of project approval and up to 3.0 MT/year within approximately 10 years of project approval.*" Comment 154-1

According to this statement, impacts to Pavement Conditions would not be triggered until the project attained the 3.0 MT per year threshold, currently estimated to be 10 years after project approval.

- The 3.0 MT per year threshold is more than twice the current 1.4 MT permitted production rate.
- What happens if the project never produces 3.0 MT/year?
- What if the production rate is held slightly less than 3.0 MT/year but more than twice the current 1.4 MT/year allowable to avoid triggering the Pavement Condition Mitigation 4.17-1b?
- What recourse does the County have to obtain compensation for the deteriorating pavement conditions caused by significant overloading?

Table 4.17-10 indicates the Existing Traffic Index to be 9.5. Comment 154-2

What Traffic Index was utilized for the current pavement section design and existing construction? Was it less than the current traffic flow TI of 9.5?

Mitigation Measure 4.17-1b should be revised to include: The County should start collecting 1/20th of the project's share during the first year of the project and continue collecting every year for one hundred years. The equitable fair share contribution shall be recalculated every 20 years. Comment 154-3

- Because the design life of pavement is typically 20 years, the project should contribute its fair share over each of the five 20-year periods over the lifetime of the project.

Thank you for your consideration.

Comment 158-1

Section 4.10-43 -Hydrology shows that in one well, gross alpha radiation activity was over the water quality standard. The NRC stated that no level of radiation exposure is safe. A USGS study by Dr. Peter McMahon (around 2019) led him to claim that manganese pulls radium out of sediment. Table 4.10-6 shows that at the Rockfield Quarry site, manganese was not within water quality standards in 3 wells.

2220 Tulare Street, Sixth Floor
Fresno, CA 93721

February 27, 2025

Dear Sir,

As a long time resident in Fresno, I am asking you to oppose the Rockfield Quarry Modification Project. My concerns are long range considerations, something that must be considered when making decisions that impact the entire San Joaquin Valley.

Environmentally, the project will increase an already serious air quality problem in the San Joaquin Valley. Comment 159-1

CEMEX had already agreed to wind down their activity. State geologists have stated there is no need for more aggregate as the reserve supply is greater than the need for the next fifty years. Comment 159-2

The rapidly growing metropolitan area around Fresno is growing so fast that traffic congestion is now a problem without having to also deal with trucks hauling rock. Comment 159-3

It will also endanger one of the best treasures in the valley, what is left of the San Joaquin River. Currently, water quality is good and recreational use becoming one of the best hidden adventures in Fresno! The dust and possible breaching of overflow from the excavation would cause permanent harm to not only the river but also the ribbon of trees and wild life along the river. Comment 159-4 Comment 159-5

Please vote NO.

Subject: STRONG OPPOSITION to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report

Dear Mr. Randall,

I am writing to formally express my strong opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas. This 100-year permit is a threat to the beauty of Fresno County.

Comment 163-1

As someone who has worked in an industrial setting for over 18 years, I appreciate clean air, open spaces, and pristine pockets of green space and wildlife in and around the San Joaquin River. Many people do! It is a respite from the hustle and bustle of the cities and towns in Fresno County. I find that the EIR fails to adequately address the following concerns:

1. Impacts on wildlife habitat
2. Water quality
3. Air pollution-from the production facility and from trucks going in and out.
4. Noise pollution

Comment(s) 163-2 163-3 163-4 163-5

5. Groundwater depletion---the citizens and farmers of Fresno County cannot spare one drop of fresh water for a project like this.
6. Industrial blight. ---don't ruin the beauty of the San Joaquin River with something like this.

Comment(s) 163-6 163-7

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

Comment 163-8

I request that the Planning Department reconsider this permit considering the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Sincerely,

Sarah Allison

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Comment 164-1

As someone with experience in outdoor recreation, I find that the EIR fails to adequately address the following concerns:

Comment 164-2

1. Impacts on wildlife habitat and water quality
2. Air pollution and noise pollution
3. Groundwater depletion and cumulative environmental impacts

Comment(s) 164-3 164-4, 164-5

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

Comment 164-6

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Sincerely,
Stephanie Castillo

Subject: Fw: Cemex Rockfield Expansion
Date: Friday, February 28, 2025 12:51:22 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Hi David!
I've been reading the EIR for the Cemex Rockfield Expansion. It is clearly written and very helpful in understanding the effects of the project might have. Comment 166-1

I have some questions I was hoping your staff can answer.

1. I have heard that there have been tainted wells of nearby landowners as a result of the current operations. If so, what was done by Cemex and the county to remedy the problem.

2. There appears to be a risk, of an excavation pit wall which borders the river, of potentially collapsing. The report states that the company will monitor regularly to prevent. Is there a required scheduled for that monitoring? If there is a collapse and any toxic waste is washed into the river... who pays for the clean up? Comment 166-2

3. A 600 foot deep mining operation that lasts 100 years is a project that is so vast in scope and repercussions that it is difficult to truly monitor and hold people accountable. What prevents an international business, like CEMEX, from walking away from a toxic, deep pit and leaving the locals to pay for the clean up. The proposed bond is unlikely to be large enough to cover any major damage. Comment 166-3 Comment 166-4

4. If Mexico doesn't allow this type of mining, why are we approving it?

Thank you for your hard work. Government employees are so under threat and under appreciated these days. I just want you to know I am thankful for people like you who are helping to create beautiful communities for all the citizenry. Comment 166-5

Sincerely,

Chris Hamilton

Subject: Fw: Cemex Expansion Project along Friant Road
Date: Friday, February 28, 2025 12:53:20 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Hi David!

Re: Cemex Expansion on Friant Road

I have some additional concerns regarding this project that I don't see covered by the DEIR. I'm looking forward to hearing your findings. Comment 167-1

1. **Increased particulate matter from diesel trucks resulting in increase health risks not addressed.**
The projected average number of daily truck trips for this project is between 650 to over 900 daily truck trips based on the charts in the study. The particulate emissions from the diesel trucks is much higher and more toxic than auto emissions especially with more EV and hybrid vehicles on the road . Higher particulate matter results in greater risks of developing cancer and asthma. There has to be an increase in health risks, such as cancer and asthma, for people along the trucks' routes but the DEIR doesn't address that. Proximity makes a difference.

2. **Incorrect baseline for statistics** Comment 167-2
In the study, Cemex has a baseline for air pollution and wear and tear on the roadways that is calculated incorrectly. It calculates effects based on what CEMEX operations are already creating rather than starting at **zero** which would reflect if the business was not operating so no damage was done to the air or the roadways. If the company completed mining the surface level deposits as first approved, they would have completed it within the 100 year time frame. Then, the baselines would reflect "no damage"- "0" to use as the basis for the deciding whether to allow expansion and blasting.

3. **Incorrect calcuations of Cemex operation damage to roadway and mitigations insufficient** Comment 167-3
According to government statistics, large semi trucks create 15 times the wear and tear on a roadway compared to a passenger vehicle. In the DEIR, Cemex calculates their share of the responsibility by number of vehicles in each category (auto vs Cemex trucks) during the day not by proportional damage. It also states that there are no funds to mitigate needed roadway improvements. Wouldn't that be another reason to not have this project. If a multibillion dollar company, doesn't value its impact on the surrounding community enough to prevent decline of safety and quality of life for residents of Fresno County, then their requests should be denied.

4. **Safety- No stats re: damage to people and vehicles due to truck spills**
I drive my car and ride my bicycle with friends on Friant road several days a week. There is no question that having trucks filled with rock and gravel pose a danger to both car and bike traffic. There is always gravel in the bike lane and often 6 inch boulders that have been dropped off passing trucks. A nearby resident was driving his car and hit a 6" boulder with their car and sustained considerable damage. The community is trying to promote bicycling for health and recreation but it doesn't take much in the roadway to have a life changing accident. Fresno has experienced tremendous growth in the last 100 years when a simple conditional use permit was given. The huge developments that are being built have changed the use of Friant Road from a rural 2 lane road to a 4 lane residential commute route. The benefits of expanding the project do not compensate for the negative impacts it causes.

Comment 167-4

5. **Fresno Already Has Sufficient Sand & Gravel Resources - Additional Mining Not Needed**
The DEIR does not acknowledge that the California State Department of Mines and Geology has found that Fresno has 180% of the sand and gravel it needs for the next 30 years. Why create a 400-600 foot deep crater in the earth that threatens the health of the San Joaquin river and its wildlife if we don't even know what our needs will be 30 years from now.

Comment 167-5

6. **How many loads (% of business) are delivered outside the Fresno Area**
Fresno has 180% of the supplies it needs for the next 30 years. The DEIR does not provide information regarding how many loads and percentage of their business is trucked out of Fresno County. Longer deliveries create greater air pollution for the valley. If the supplies aren't needed locally and are being shipped to other places, the people of Fresno are bearing the environment burden for international corporate profits. The expansion should thus be denied.

Comment 167-6

Thank you for all your hard work. I appreciate your dedication to create a healthy, happy and successful community through wise planning and development.

Subject: Opposition to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report

Dear Mr. Randall,

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Comment 168-1

As someone with experience in outdoor recreation and knowledge of this area, I find that the EIR fails to adequately address the following concerns:

Comment 168-2

1. Impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, cumulative environmental impacts, or community health.

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

Comment 168-3

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Sincerely,

Judith Looby

Subject:	Noxious gasses set for inadequate remediation close to the San Joaquin River—to be verified by Imperial County inspectors
Date:	Friday, February 28, 2025 11:02:40 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

There is a problem with the DEIR for the CEMEX rockfield expansion permit. Section Impact 4.3-4, Asphalt Plant Emission Controls, is identified as a Possibly Significant problem. The mitigation measure proposed is to heat largely the types of asphaltic concrete that release the least noxious organic compounds. Also when more volatile organic (VOCs) are heated, the VOCs are to be piped back to the burner in the plant, and before the plant is operational, Imperial County building inspectors would be brought in to verify the piping. Comment 169-1

Why would inspectors be brought from four hundred miles away to inspect a plant in Fresno County? Are Imperial County Inspectors inspectors more competent for some reason than our Fresno County inspectors? This is not explained. Transporting and housing these distant inspectors, from Imperial County, will incur extra travel and lodging expenses, which should be borne by CEMEX.

Another possibility is that this DEIR is not designed for the San Joaquin River, but is a recycled report for a project near the Mexican border. Perhaps this report is not fully an examination of Fresno County's northern border's environment.

Seeking to usually make lower-VOC asphaltic concrete is only a partial mitigation. Piping of noxious gasses cannot be expected to seal perfectly. If we consider the nearby housing developments, with more to be built in the future, the gasses will degrade more health of Fresno County residents than ever. Comment 169-2

Even if this DEIR is applied to our county, with its weak mitigation measures, it is best that this river gravel and asphalt operation be wound down now. If the corporation chooses, it would be best to set up their operations far from the river. Comment 169-3

Report Suspicious

Dear Mr. Randall,

The traffic Mitigation Measures that pertain to signalization and/or intersection improvements are very broad and lack specificity as to who, what, when and how the implementation of the Mitigation Measure will be monitored. This information is important because many of these mitigating improvements may not be triggered until sometime in the distant future well after the current cast of characters have moved on.

Comment 170-1

Some of the questions that need to be addressed are:

Comment 170-2

Mitigation measure 4.17-1a: Equitable Share Contribution – Friant Road and Willow Avenue Traffic Signal.

This Mitigation is not expected to be warranted until the project is producing 3.0 MT/year – projected to be 10 years from approval or possibly far beyond.

<!--[if !supportLists]-->o <!--[endif]-->The project should contribute its fair share over the 10 years preceding the signalization.

<!--[if !supportLists]-->▪ <!--[endif]-->What is the calculation?

<!--[if !supportLists]-->▪ <!--[endif]-->Who runs the calculation?

<!--[if !supportLists]-->▪ <!--[endif]-->When is the calculation run?

<!--[if !supportLists]-->▪ <!--[endif]-->What percentage share does the project carry?

<!--[if !supportLists]-->▪ <!--[endif]-->Who determines what is an equitable share. How is it spread?

<!--[if !supportLists]-->▪ <!--[endif]-->When are the contributions made? When do they start?

<!--[if !supportLists]-->▪ <!--[endif]-->Are the contributions in advance? In arrears?

<!--[if !supportLists]-->▪ <!--[endif]-->Are they made annually? Monthly?

<!--[if !supportLists]-->▪ <!--[endif]-->Who monitors when each of these calculations are run?

<!--[if !supportLists]-->▪ <!--[endif]-->Who monitors when each of these contributions are made?

<!--[if !supportLists]-->▪ <!--[endif]-->What transparency is there on this process until the signalization is complete?

Mitigation Measure 4.17-1c Friant Road and Willow Avenue signalization

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am confused by Impacts 4.10-11 and 4.11-12 regarding the impacts to existing groundwater elevations and supplies at the Quarry Site. Both Impacts are listed as Less than Significant although MM 4.11-12 is LTS with implementation of MM 10.10-5a and 10.10-5b.

Comment 175-1

How can that be if the residual water elevation in the Quarry at completion is at -190' BSL as shown on Figure 2-10. That 190' plus 330' equals 520' below the nominal Quarry Site elevation of 330' ASL. Either the Impacts as specified are incorrect or the residual water elevation on Figure 2-10 will ultimately be much higher.

Thank you for your consideration.

David Randall, Senior Planner
County of Fresno
Fresno, CA

Subject: Comments on CEMEX Rockfield Expansion Project DEIR

Dear Mr. Randall,

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have a particular concern since I live in the Tesoro Viejo community just a few miles from the Cemex plant, literally on the other side of the hill. Though we are not residents of Fresno County, many of the residents in Tesoro Viejo work and shop in nearby Fresno. The residents in the Tesoro Viejo community area would almost certainly be detrimentally affected by the proposed mining activities, including the proposed daily blasting, as well as all of the other environmental impacts that have been identified with this project. The DEIR barely mentions any potential impact on area residents, even though our community is literally around the corner.

Comment 176-1

Given the potential impacts on the residents near the Cemex mine, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives.

Comment 176-2

Sincerely,
Brian Agbayani
Tesoro Viejo Resident

Subject: Opposition to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report

Dear Mr. Randall,

I am writing to express my concern that the EIR for the 100-year permit for the CEMEX mining operation, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas. Comment 177-1

I'm a staff wildlife biologist with Colibri Ecological Consulting and involved in tricolored blackbird monitoring in the Central Valley, and I find that the EIR fails to adequately address the following concerns:

1. Potential habitat destruction for endangered tricolored blackbirds and other wetland species.
2. Impacts to the San Joaquin River, including water quality and groundwater depletion.
3. Whether expansion is necessary or if we as a society can learn to consume and build less.

Comment(s) 177-2 177-3 177-4

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations. Comment 177-5

I request that the Planning Department reconsider this permit and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Sincerely,
Michelle Harris

RE: The CEMEX Rockfield Project/San Joaquin River Parkway

Dear Mr. Randall.

Comment 178-1

My husband and I have been members of the San Joaquin River Parkway for many years and have enjoyed wonderful experiences along the San Joaquin River and the adjoining parkway. We live in the area and have a personal interest in maintaining the integrity of the Parkway. The SJRP is committed to "PRESERVING & RESTORING San Joaquin River lands of ecological, scenic or historic significance, to EDUCATE the public on the need for STEWARDSHIP, to RESEARCH issues affecting the river, and to promote educational, recreational and agricultural uses of the river bottom consistent with the PROTECTION OF THE RIVER'S RESOURCES."

It has come to our attention that Cemex Construction Materials is proposing an expansion of its operations near the San Joaquin River. They are requesting an extension of mining for 100 years, changing the technique from mechanical digging of sand and gravel to blasting hard rock and crushing it into gravel, and increasing the depth of the mine to 600 feet below ground surface. These requests are obviously

extreme and without evidence of the effect that will manifest in the 100-year future.

Comment 178-1 Cont.

Recently we were introduced to the CEMEX Rockfield Draft EIR (Environmental Impact Report). According to professional analysis, this report falls way short of being accurate. The consideration of wildlife, pit depth and its geologic ramifications, noise, traffic, pollution, cultural historic context, and safety issues are not addressed adequately, to mention a few. This report needs careful consideration with all parties well informed so that the best decisions are made.

Comment 178-2

The idea that you would grant 100 years of mining to this business is unconscionable. A decision affecting generations to come when no one knows what this kind of mining will do to the environment! Please explain why 100 years is even being considered.

Comment 178-3

The surrounding area around CEMEX is land devoted to stewardship and recreation. The CEMEX proposal is the exact opposite.

Comment 178-4

None of us are opposed to sand and gravel operations if they are situated in the right location. I cannot imagine a more wrong location for an operation of this nature that reflects so negatively on the San Joaquin River and the surrounding area, if approved.

Comment 178-5

Thank you for the opportunity to comment and we trust that this ill-founded proposal will be denied.

Sincerely,
Alice & Robert Knapp

Subject: Opposition to the CEMEX Rockfield Quarry EIR 7763 Proposal and the Future of the San Joaquin River

Dear David Randall,

March 1, 2025

The more that I review the EIR the more frustrated that I become that this type of project would even be considered in our backyard!

Comment 179-1

CEMEX has already destroyed the wonderful landscape from Friant Road and minimized access to the San Joaquin River for the citizens of Fresno County. Now they want to start blasting and drilling to ungodly depths of 600 feet right near the river for the next 100 years!

What could possibly go wrong? We are already cursed with air and water pollution and now they want to increase noise, dust, shock and vibration that will make us feel as though we are in a combat area. We will add to the pollution of water, air and increased traffic which will cause more chaos, as these huge trucks enter and exit Friant Road!

Comment 179-2

Comment 179-3

All of this increased pollution will have a tremendous impact on all forms of life.

Comment 179-4

A relevant anecdote; a few days ago a neighbor cut down a tree that was leaning on a fence. We noticed that the squirrels and birds were going crazy dashing around looking for their home and the next day they were gone. Some like CEMEX might call this progress! We call it destruction!

Cemex has the audacity to use terms like: Comment 179-5

LTS = Less than Significant; PS = Potentially Significant; S = Significant; SU = Significant and Unavoidable

Oh and they use the initials NI which is not defined but I can only assume to mean No Impact or Not Important.

I have to ask who made them so authoritarian!

First of all, the area would not be so unpleasant if they were never here. This probably would be a community park giving access to the public to enjoy the great outdoors. Something we are lacking in our county! Comment 179-6

Or maybe remained as farmland where the owner lived in harmony with nature.

Who set the standard for LTS? There is no measurement that defines the level of significance and the threshold for the issue to become significant! My favorite is SU which equals "Significant and Unavoidable". I would argue that it is totally avoidable if they were to leave the area and return it to its natural state. Comment 179-7

Oh but they can't as they have already stripped the land barren removing all of the topsoil and leaving us with a dust factory!

Many of the impact statements are listed as Potentially Significant with mitigation occurring during the implementation phase, so our great-grandchildren may see the results in 100 years! What a travesty! Comment 179-8

The word blasting appears 317 times in the EIR Summary. The following is an excerpt from the EIR Comment 179-9

"However, the proposed project would introduce blasting to the Quarry Site. Blasting generates groundborne noise and vibration that could impact fish in the San Joaquin River."

They go on to refer to an Alaska Department of Fish and Game comment that showed no impact to the Salmon in that study. Yet they provide no details on the conditions and use of the explosives. Were they blasting 200 feet from the river to depths of 600 feet? I would suggest that Fresno County and California Fish and Game provide their own study. Comment 179-10

The EIR does state that the noise level would exceed the limit of 85 dB with blasting level of 140 dB which is the threshold for pain! I'm sure that they will protect their workers, but what will that do to all of the wildlife in the area and the surrounding neighborhoods who are trying to enjoy a peaceful afternoon outside. Will it cause damage to nearby homes, or maybe weaken the nearby Millerton Dam.

Comment 179-11

We moved to Fresno 28 years ago because it was a great place to live; it offered great scenery, access to the mountains in a pleasant surroundings. Please don't let a Foreign LLC like CEMEX spoil it for profit!

Comment 179-12

The community needs support from our County officials.

Carol Labbe

Comment 180-1

Hello - as long time residents of Fresno (26 years in this location) - specifically near the intersection of Friant and Fort Washington, we are vehemently opposed to any further activity by CEMEX.

Between the noise, the dust, the traffic, and disturbances caused by the large trucks rumbling up and down Friant, we can't believe that our Fresno legislators would even consider any request from CEMEX to blast a giant hole in their location beyond what they have now and increase their activity. We should be considering closing them down, not providing them a reason to stay and grow.

Please vote NO to stop this travesty.

Sincerely,
William A. and Deborah Dotson

CEMEX Rockfield DEIR comments

2 March 2025

The DEIR says that "Best Practices" for the control and mitigation of fly rock from rock blasting and the mitigation of groundwater and surface water contamination from the use of explosive products are in place. What are these best practices that are mentioned? There is no explanation of the methods or manners of these “best practices”.

Comment 181-1

What are the specific blasting protocols that will be used to prevent the contamination of groundwater and surface water because of blasting? It mentions explosive products but not what they are. Each type of explosive product will produce its own type of contaminants for ground and surface water. What are the actual explosive products that will be used? What are the byproducts of the explosion that will contaminate the ground water and surface water? How will the contaminant levels be monitored and by whom? What is the plan to mitigate the contamination of the water table and surface waters? What health concerns can be caused by the contaminants left if the water?

Comment 181-2

Blasting agents need to be identified in this DEIR. “The use of blasting agents has the potential to contaminate groundwater with nitrates and other chemicals, such as petroleum hydrocarbons, if not managed properly.” This is a nonresponse as to what the blasting agents will be. The DEIR states that dynamite will not be used. What will be used to do the blasting? Virtually any blasting agent will produce nitrates and other chemicals. Nitrate and nitrite water contamination are major health issues with drinking water. How will this be minimized or avoided completely? The mention of soil type for the effects of the blasting agents will be hard rock granite. Are there any datasets of tests with this DEIR for that type of rock which is found in the quarry site.

According to the DEIR “Studies have concluded that there are no significant long-term chemical or mineralogical changes observed in groundwater that could be attributed to blasting.” Where are the results of those studies? Is this data described in one of the many tables included in the DEIR. “In one study, water samples were taken in the same hole that explosives were detonated in, and no change in water quality due to the decomposition products of the explosives could be discerned from the analysis.” Not possible for the water to be unchanged. Is there evidence of the water samples before and after the detonation? Statements need to be supported by data. Were there other impacts on the water quality due to products other than “decomposition products”? This statement in the DEIR may not be completely accurate or transparent.

Comment 181-3

This DEIR indicated that “Ground vibration at the closest residential/commercial structures, the closest wells, and at several locations along the crest of the East side of San Joaquin River embankment is (are) monitored with digital seismographs.”

Comment 181-4

What were the results for the East side of the San Joaquin River embankment? Where is the data for ground vibration and an explanation of those results? This is a critical area of concern in this DEIR for the quarry site. A breech in the embankment or subsurface flow between the San Joaquin River and the quarry pit would be catastrophic. Where are the results of this monitoring? Where were the seismographs situated? When was this done? Which residential/commercial structures were monitored? Is there a map with these locations marked. Are the results of the monitoring for each site available and explained? There should be data from their study that can be shared with the public. Over what period were these tests run? There is no mention of what type of vibration was being measured. How was the vibration generated? Was it ground vibration from blasting, using similar charges that would be detonated in the quarry? Was it monitoring ground vibration from natural ground movement? This is not clearly stated what was being measured and how it was being measured with the seismographs. This nonspecific description leaves many questions unanswered.

The DEIR states “The data is closely analyzed and logged into a spreadsheet program to track the readings and to build a dataset that can be used to further track the frequency of the vibration time histories, predict the vibration levels, and make adjustments to the blast plan as blasting progresses.” That is a horribly long run on sentence! There are no mentions of how any of the data will be utilized. How will it be analyzed? How will tracking the “readings frequencies of vibration” be used to predict vibration levels and allow for the blast plan to be adjusted? What criteria from the vibration data would be used to adjust the blasting plan? Logging data with no explanation of how it will be analyzed and used does not explain the purpose of this vibration monitoring.

Comment 181-4 Cont.

Air Pollution is a concern in the San Joaquin Valley and even more so in the area around the Plant site and Quarry site. The geography of this localized area in a trough with elevated hills on both sides that produce an elongated bowl. Fog settles in this area in the winter and dust and other particulate accumulate there as well. Potential emissions for the project include ROG, NOx, CO, SOx, PM10, and PM2.5. Individually or in combination these can create long-term health effects. It seems that monitoring of these emissions has not been done directly on either site. The data that has been shared in the DEIR may not be accurate. Are there tests that have been performed on the sites that shows these specific emissions and their levels in situ? Were tests run at various times of the year under varying conditions?

Comment 181-5

The effects of the emissions and PM10 and PM2.5 for various sources can have dramatic health on people. The DEIR lists how pollutants can affect health but neglects to indicate what levels of the contaminants will cause adverse effects. Their operations will have a negative impact on the health of the people of Fresno county. The mitigation of PM2.5 does not seem to be adequate and many of the vehicles and the operations of the quarry and plant sites will generate PM2.5. PM2.5 exposure is very dangerous with many negative outcomes. How does the mitigation plan for PM2.5 reduce the risk to people in the area?

Comment 181-6

Comment 182-1

I am writing to express my concern about the Rockfield Expansion Project. Particularly the idea of blasting the hard rock and increasing the depth of the mine. The San Joaquin River is one of the few nice areas of wildlife we have to enjoy in Fresno. Mining operations will impact wildlife, air quality, and cause irreversible damage to the watershed. I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Comment 182-2

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Sincerely,
Danielle Grassi

Comment 187-1

Since this project should have been shut down many times, I do not beleive the job issue should be a consideration. The workers on the site have known for many years that their jobs should be coming to an end. I am sure Cemex will have a nice severence package for the workers. How many years do their jobs have to be guaranteed? They have already been extended many times. This issue should not overshadow the protection of the San Joaqin river, the tranquility of the area and the greater good for the population of Fresno. I do have empathy for the loss of jobs.

Thank you,
Bob Hills

Comment(s)

Cemex needs to hire an indepent engineering firm to be on site whenever their is activity at the mine. Cemex has been fined for all kinds of violations at many sites. Both ommision and commision. When there is a infraction, the mine needs to be shut down until the issue is remidied and whatever fines necessary are paid. If there is not a remedy, then the project needs to be shut down, and the land be brought back to its natural state. This has been the plans for many years. 188-1 188-2 188-3

The proposal for the extended land use and the time duration of the project is not realistic. How does cemx propose to protect Lost lake. How does it propose to protect it from noise, air polution, and the protection of the wildlife. Wildlife does not respond well to noise, as well as humans. Cemex proposal to allow a trail to go through their property is not only ludirous but also dangerous. Many other areas have enhanced their proximity to a river for the enjoyment of their citizens. Why would Fresno not want to embrace the river, instead of abusing it.

Thank you,
Bob Hills

If this project does go through, since Cemex is a LLC, they should have to put up a huge bond. What amount do they propose to put up so the county tax payables are not stuck paying for their folly. It also needs to be tied to inflation, as time passes it will be worthless. It should be reviewed and accessed on a yearly basis. Has Cemex addressed these issues and has it agreed to an realistic bond tied to inflation. Please remember Cemex has had compliance issues in other locations. Actually, their past record alone should negate the county from even considering any agreement, particularly for a 100 years. Do laws in Mexico prohibit this type of mining?

I did not see anything to address the large numbers of bike riders on Friant road. I am somewhat disappointed in the vagueness of the EIR considering all the extentsions that they have had. They need to study the consequenses of air quality, noise and safetjy of the bike riders. Will the Cemex trucks just bully themselves into the 2nd lane to avoid the riders who often ride double file. The law says traffic has to stay 4 feet away from the riders. They do not make any exceptions when the bikers are riding double file on the line. This also makes it dangerous for the traffic in the passing lane when the trucks pull over into their lanes. I see it often.

Thanks,
Bob Hills

I do not see any remedy for the folks that have their windshieds broken by the gravel left on the road and coming off the trucks. This has been a historical issue with Cemex. With all the cameras and so forth, windshields are $500.00 a pop. Maybe the cars effected could enter Cemex's property and someone cut them a check for $500.00 to remedy the problem Cemex has caused them. Also it is dangerous for bike riders.

Good evening Mr. Randall,

Comment 195-1

I hope this finds you well. I am reach outing to you as a concerned citizen and a Native American woman. It has come to my knowledge about the CEMEX expansion that will put in danger wildlife, the river and the surrounding lands. As you may know Fresno County is Yokut land, and the Native American community has always been protectors of this land since for thousands of years the Native population have survived off the land. This land has beautiful history tied to it and therefore I do not want this expansion to happen knowing the dangers it will cost to the wildlife, the land, to the Native American Community, and the Fresno County public.

With best regards,

-Ariana Murillo

Subject:	Comments on CEMEX Rockfield Expansion Project DEIR
Date:	Sunday, March 2, 2025 5:50:31 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear David,

Thank you for taking comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. As an environmental science teacher in Fresno County and avid user of the San Joaquin River for birding and student opportunities, I wanted to share my concerns about the expansion of the CEMEX mining operation.

Comment 196-1

The river provides several ecosystem services such as aesthetics, habitat for several species, clean water, temperature regulation, stabilization of soil, and a place for people to experience natural spaces close to where they live. Most of our valley is industrialized or agriculturalized. It's hard to find unadulterated natural spaces close by.

I have seen numerous bird species that utilize the river along with river otters, muskrats, several fish species, and many more! These species are so amazing to witness and would be impacted by your proposal.

Mining operations are important for economical reasons and I understand that, however they should be done responsibly so as not to impact those who depend on the ecosystem services provided by this important river. On top of our water resources, air quality can be heavily impacted by the dust and particulates as a result of increased mining. Our air quality has historically been one of the worst but it IS improving! Why should we go backwards? We have high rates of asthma and will still be suffering from the impact of wildfires in California. Do we really want to add to that issue?

Comment 196-2

My students will be doing water quality studies along the river this year and over the next few years. I was hoping to use the San Joaquin as an example of a cleaner river than our closer Kings River so we could compare the two. If this proposal goes through I would hate to have to explain to future students why they may see declining results.

Comment 196-3

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Comment(s) 196-4 196-5

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Sincerely,

Leigh-Ann Olsen
AP Science Instructor, Kingsburg High School

2220 Tulare Street, Sixth Floor
Fresno, CA 93721

Dear Mr. Randall,

I am writing to express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas. Comment 197-1

As someone familiar with the location, I find that the EIR fails to adequately address the following concerns:

1. The Swanson's hawk has a right to not only exist, but to flourish. With this project the hawk's very existence will be in peril. Its habitat and ability to breed will be significantly impacted by the project's blasting, excavating, and trenching as well as by the use of heavy construction equipment.

2. The serious harm to the Chinook Salmon because of blasting. Comment 197-2

3. Blasting and digging could destabilize the underlying soil and rock layer. Comment 197-3

4. Very little is known of the synergy of living ecological systems. Wildlife and the microbial organisms that support them are at risk of irreparable harm if a 600-foot deep pit is blasted or dug. Comment 197-4

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not Comment 197-5

Comment
197-5 Cont.

meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations. I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.
Thank you for your time and consideration.
Sincerely,

Denise Taylor

Report Suspicious

I am writing to express my opposition to the proposal on the expansion of the Cemex open mining on the San Joaquin River. To allow hard rock blasting, or a 600 foot deep pit, or blasting for the next 100 years is absolutely destructive to the environment and will have repercussions far beyond our life term. I strongly urge a NO stance.

Comment 199-1

David Randall, Senior Planner

Subject: Aesthetic Impacts in Draft Environmental Impact Report for the CEMEX Rockfield Modification Project (EIR 7763)

Dear Mr. Randall,

I am writing to express my deep concerns and strong objection to the findings in the aesthetics section of the Draft Environmental Impact Report (EIR) for the CEMEX Rockfield Modification Project. As a long-time resident of Fresno, I frequently visit Lost Lake Park, and hike in areas surrounding the planned Quarry Site. This project, as currently proposed, will cause irreparable harm to the scenic vistas and visual character of the surrounding area.

Comment 200-1

The Draft EIR states that:

Comment 200-2

- The project will result in a **substantial adverse effect on a scenic vista (Impact 4.1-1)**.
- The project will cause **a substantial degradation of the existing visual character or quality of public views in nonurbanized areas (Impact 4.1-3)**.
- The proposed mitigation, including rock staining, **will not eliminate the discordant and disharmonious visual contrast** caused by the engineered quarry benches.

It is unacceptable that the only proposed solution for mitigating these impacts is to apply a superficial stain to the exposed rock faces. This approach does not meaningfully address the permanent alteration of the landscape and fails to provide an effective or lasting solution to the substantial visual degradation caused by the project.

Furthermore, the proposed trail easement along the San Joaquin River at the Quarry Site raises serious public safety concerns. The Draft EIR does not adequately address the risks posed by the planned trail's proximity to the quarry excavation. The following questions need to be answered before the project can proceed:

Comment 200-3

Safety and Risk Mitigation

1. Will a protective fence or barrier between the trail and the quarry be installed after the quarry is reclaimed? If not, why not?
2. What measures will be taken to prevent trail users from accidentally accessing hazardous areas?
3. Will the trail have warning signs, lighting, or emergency access points to ensure user safety?
4. How will liability be handled if an accident occurs near the quarry?

Trail Design and User Experience

6. Will the trail have any buffer zones, landscaping, or natural barriers to visually separate it from the quarry? If there are buffer zones, how wide will they be?

Comment 200-3 Cont.

7. How will noise and dust from ongoing quarry operations affect trail users? What mitigation measures planned?

Environmental Considerations

Comment 200-4

10. Will trail construction impact local wildlife, and if so, what mitigation measures will be in place?
11. How will stormwater runoff from the trail be managed to prevent erosion near the quarry?
12. Will trail lighting (if any) be designed to minimize disruption to nocturnal wildlife?

Long-Term Maintenance and Responsibility

13. Who will be responsible for maintaining the trail and ensuring it remains safe over time?
14. If the quarry site changes in the future (e.g., deeper excavation, flooding), how will that affect the trail's viability?
15. What plans are in place for the trail's upkeep after the quarry is fully reclaimed?
16. Will CEMEX commit to paying for the above safety and mitigation measures, (#1 – 15 above)? If not, why not?

I also have serious concerns about the environmental impact of the proposed rock staining process. The Draft EIR lacks details about the risks of staining materials to soil and water quality. The following questions need to be addressed:

Comment 200-5

Composition and Environmental Safety of the Stain

17. What specific materials and chemicals are used in the rock staining process?
18. Are the staining chemicals non-toxic, biodegradable, and environmentally approved? What studies, regulatory approvals, or impact assessments confirm their safety?
19. Has the stain been tested for leaching in wet conditions? If so, what specific studies demonstrate the extent of leaching?
20. Does the stain contain heavy metals, volatile organic compounds, or harmful substances? If so, what material safety data sheets, chemical analysis reports, or regulatory reviews confirm the safety of the stain?
21. What published evidence or peer-reviewed research supports the use of rock stains planned for this project?

Soil Testing and Monitoring

22. Will soil samples be tested before and after staining to detect contamination? If so, what testing methodology and standards will be used?

Comment 200-5 Cont.

23. At what distances from the staining area will soil samples be collected, and what scientific basis supports this sampling range?
24. What testing parameters will be used (e.g., pH, metal content, chemical residues), and which regulatory or industry standards will guide these tests?
25. How frequently will soil testing occur, both initially and as part of ongoing monitoring? What are the regulatory requirements or precedent studies upon which this testing frequency is based?

Water Quality Protection

26. Will groundwater wells and surface water sources be tested for staining-related contaminants? If so, what sampling methodology, frequency, and testing parameters will be used, and which environmental standards will be followed?
27. What scientific or engineering measures will be implemented to prevent stain runoff into water sources during rain events? What hydrological studies or best management practices justify these measures?
28. Will a sediment and erosion control plan be implemented? If so, what specific techniques and regulatory guidelines will govern its design and enforcement?
29. What is the response plan if contaminants, including those from staining, are detected in water sources? What enforcement mechanisms ensure compliance and remediation?

Regulatory Compliance and Best Practices

30. What federal, state or local regulations govern the use of rock stains in mining operations? Provide references to specific statutes, environmental codes or agency guidelines apply.
31. Will the project follow best management practices for applying stains in an environmentally responsible manner? What industry standards, case studies or agency-approved guidelines support CEMEX's planned use of rock stains?

Long-Term Environmental Monitoring and Accountability

32. Will there be long-term monitoring of soil and water quality after the staining process is completed? If so, what monitoring duration, testing parameters and regulatory oversight will be in place?
33. Who will be responsible for ongoing monitoring and reporting results? Will independent third-party verification be required? If not, why not?

Comment 200-6

Finally, Fresno County must require stronger mitigation measures, require additional studies, and insist on meaningful solutions rather than superficial fixes. Approving the project as it stands would set a dangerous precedent for handling significant environmental impacts. Given the project's proximity to parks, residential areas, and the San Joaquin River, I strongly encourage the County to

reconsider the project's location. At the very least, the proposal should be rejected unless these concerns are fully addressed.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

With all due respect, I urge you to do all you can to prevent the CEMEX expansion from moving forward. The San Joaquin River is home to so many species that are essential to the health of the local ecosystem, and destroying their habitat will have effects for generations to come.

Comment 202-1

My family and I visit the river area regularly, which is where I teach my children how to respect and care for their environment in a tangible way. When I am teaching my 5 year old son about the local bird populations, I am instilling in him a love and respect for the natural world that then affects how he (and we) consume and care for the resources around us. When I am explaining to my daughter the interactions between the different animals in the food web in our local ecological community, I am teaching her to treat other living creatures with kindness.

Comment 202-2

Please don't allow the mining project to be approved. We need these protected wild places more than we know.

Sincerely,

Kathleen Belden

Subject:	Opposition to the CEMEX 100-Year Permit / EIR
Date:	Monday, March 3, 2025 6:59:47 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am writing to voice my opposition to the proposed 100-year permit for the CEMEX mining operation and to formally challenge the adequacy of the Draft Environmental Impact Report (EIR). In my professional experience working with our region's unique ecosystems and native plant communities, I have witnessed firsthand how sensitive habitats can be disrupted by long-term industrial activities. Despite the significance of this project's potential impact on the San Joaquin River and surrounding areas, the EIR as drafted appears insufficient in scope and depth. Comment 209-1

Several key issues demand stronger analysis:

1. **Potential Degradation of Local Habitats**
   The EIR does not convincingly detail how continuous mining will affect flora and fauna that rely on existing ecosystems. Even slight encroachments can lead to cumulative habitat loss, yet the report provides limited evidence of a robust plan to preserve biodiversity over a century-long timeline. Comment 209-3
2. **Threats to Water Resources**
   Extended mining activities have the potential to alter groundwater tables and water quality—factors crucial to both native species and the broader community. The EIR offers minimal detail on how these resources will be monitored or protected over the long term. Comment 209-3
3. **Insufficient Cumulative Impact Assessment**
   Given that this permit spans 100 years, a comprehensive forward-looking evaluation is critical. The document needs to address how ongoing mining intersects with other regional pressures, including land-use changes, climate variability, and population growth. Comment 209-4

A project of this magnitude demands thorough scientific scrutiny, transparent mitigation strategies, and a clear plan for oversight to safeguard our local environment. Without a more rigorous assessment, it is premature to move forward with such a far-reaching permit. Comment 209-5

Thank you for considering my perspective. I respectfully request that the Planning Department reconsider this permit until the shortcomings in the EIR are adequately addressed.

Sincerely,

Subject: Comments on CEMEX Rockfield Expansion Project DEIR
Date: Monday, March 3, 2025 9:38:34 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear David,

Hi, I am a Fresno County resident and wanted to submit comments on the DEIR for the CEMEX Rockfield Expansion Project. Comment 210-1

A healthy, thriving river will be so much better economically for the region than any mine. I was at the Louis S. Eaton Trail today that runs north of Woodward Park along Friant and even though it was a cold, breezy morning, there were so many people out enjoying nature. I hiked Ball Ranch farther north last week and we saw so many dog walkers, families, and birders out enjoying the area. We need to do everything we can to protect the few green spaces we have.

Why would we allow a company to ruin our river? We have one river; we don't get a do-over. Comment 210-2

Also, a hundred years? A hundred-year contract is so long it almost boggles the mind. My elementary-aged children would have to live with the noise pollution, the air pollution, and the lack of river access for their *entire* lives. We should not move forward with a project that will negatively affect generations of Fresno county residents. Comment 210-3

We need the river - whole and healthy - more than we need a mine.

A few questions that need to be answered: Comment 210-4

1. I need to know that the river will not be affected at all. My children go to River Camp just south of the proposed area and they deserve a childhood full of nature, and a chance to enjoy the river.

2. Birds! We have so many birds along the river, I need to know that their habitat and food will be safe and that the mining will not affect them. Comment 210-5

3. Fresno already has some of the worst air pollution in the country. I need to know that there will be NO additional air pollution. Comment 210-6

4. No one is going to want to hike or camp at Lost Lake for the hundred years they're mining Comment 210-7

next door. Lost Lake is one of the few county parks that we can camp at, and to lose that would be terrible. I need to know that the mining won't affect the enjoyment of being at Lost Lake.

Comment 210-7 Cont.

5. And blast mining that close to a Friant Dam, less than three miles apart? That feels like a disaster waiting to happen. Have *independent* dam engineers agreed that explosions that close to a dam are ok?

Comment 210-8

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments.

Comment 210-9

I look forward to your response and further discussions on this important matter.

Sincerely,

Amy Gallagher

Dear Sir, my wife and I live very close to Cmex and abhor the idea that the business is expanding. There are already too many large trucks traveling up and down Friant Avenue. Comment 211-1

Also, the damage to the river and the surrounding environments can't be mitigated once done. Hard rock blasting is noise and dust pollution as well as threatening to our water to say nothing about impacting fish and wildlife. There must be a better quarry location than next to a projected 5,000 homes! We are opposed to the project. Comment(s) 211-2, 211-3 211-4

Subject: Opposition to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report

Dear Mr. Randall,

I am a resident of Fresno County and I am writing to express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR does not sufficiently or accurately assess the environmental, ecological, and community impacts this long-term operation will have on the San Joaquin River and surrounding areas.

Comment 212-1

As someone who frequently travels on roads through the area impacted by this project, and with experience in conservation and outdoor recreation, I find that the EIR fails to adequately address the following concerns:

Comment 212-2

1. The DEIR states that project emissions may exceed cancer risk thresholds. Has an analysis been done of the population-wide cancer burden? CEQA requires an analysis be done before taking into account possible mitigation measures. Fresno already has some of the worst air quality in the state!

2. What about the noise from blasting and its effects not only on residents in the area, but on people walking in the adjacent park lands? What mitigation measures are there for noise reduction at night as well as in the daytime?

Comment 212-3

3. I am very concerned about traffic congestion and the heavy trucks that will be using the

Comment 212-4

Friant/Willow corridor. I am concerned about my safety and the safety of student drivers from the Willow/International education complexes. What will CEMEX do to mitigate the traffic impacts?

Comment 212-4 Cont.

4. Some areas of local and regular recreation for residents of Fresno County include Ball Ranch, Ledger Island, Sumner Peck, and the River Center. Has the EIR analyzed the impact this project would have on the ability of county residents to recreate in these areas taking into account the noise pollution, traffic congestion and hazards, and air quality/

Comment 212-5

A project of this scale and duration - 100 years??!! - requires a far more comprehensive environmental review with thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. This DEIR does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

Comment 212-6

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Sincerely,
Karen Hammer

Report Suspicious

Dear Mr. Randall,
Do not allow Cemex to make another gravel pit on what's left of our river.

Comment 213-1

What does an international corporation like Cemex care about our quality of our environment? They do not care.

I am extremely opposed to another gravel pit. I worked at PW&P for John Thompson and I know how much the Parkway means to our community.

Do what's right for Fresno County and the San Joaquin River.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

I did not see in the ERI any mention of the recreational needs of people of color and the less fortunate. Not everyone has a cabin in Shaver, a boat or even the means to hop up to Shaver to recreate by the water. Lost lake has been an outlet for swimming, fishing and picknicking for many years. We walk there once a week for the peace and tranquility of the area. Cemex needs to address this issue.

Comment 214-1

Thanks,
Bob Hills

Comment 215-1

I think the ERI is a little wishy washy when it comes to the reaction of fish if this project is giving the go ahead. I am a fly fisherman. Every fly fisherman in the world knows that fish react in a fraction of a second to shockwaves, noise and shadows. If they don't, they won't catch any fish. This area will become a dead zone if it is foolishly given the go ahead.

Thanks,
Bob Hills

To Whom It May Concern,

Comment 216-1

The purpose of this email is to voice my objections to the proposed CEMEX expansion. I am a resident in the Woodward Lake community and feel that this expansion would negatively affect my quality of life as well as the quality of life for the entire geographic area. My biggest concerns include noise, traffic, environmental damage to the land, environmental damage to the river and waterways, and damage to wildlife habitats. Please include these concerns in the decision making process.
Sincerely,
Jon Howerton

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Hi Mr. Randall,

I have reviewed the Draft EIR for the CEMEX project, and I see a few glaring issues, especially with respect to the Biological Resources: Comment 217-1

The project claims that Western Pond Turtle is unlikely to occur on the project site as "the level of disturbance" prohibits movement of the species without a citation. This federal candidate species is known to occur at the Fresno Water Treatment plant (and others in CA, Germano 2010), so this claim that it is unlikely to occur due to disturbance seems optimistic. They noted that red-eared slider turtles were found, suggesting that suitable aquatic turtle habitat is present yet they could not detect pond turtles during their brief assessments. Red-eared sliders can exclude pond turtles from basking sites, making detection of pond turtles more difficult (Lambert et al., 2019). A real survey and plan to exclude turtles from the project site is needed, as there could be risks (vehicle collisions) associated with turtles using the site even if habitat is not disturbed.

There is no mention of surveys for the Northern legless lizard (Anniella pulchra). Although not known from this area, the species of special concern was recently discovered in the dry riverbed of the Fresno river in Madera (Hansen and Shedd 2025). This suggests that the species potentially occurs in eastern Fresno county, though no formal surveys have been performed. The species can persist in annual grassland habitats and surveys should be performed to confirm absence. Comment 217-2

Better surveys for presence of western spadefoot is also needed, as they may occupy the annual grassland on the site and use other bodies of water for reproduction. There are historic occurrences along the San Joaquin River. Comment 217-3

Suitable habitat also likely exists for other amphibian (e.g. *Batrachoseps gregarius*) and reptile species (e.g. *Thamnophis sirtalis*, *Sceloporus occidentalis*) that were absent from the report suggesting that the study was not thorough in accounting for potential impacts. Comment 217-4

Further, although breeding birds may not be present directly on the site, the changes in practices and increased traffic may cause nests to fail in the surrounding area. Nesting birds in the area should be better documented and potential impacts of blasting on nearby nests should be considered. Comment 217-5

Thanks,

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

I am totally against approving the CEMEX Expansion. It will: Comment 218-1
1. Irreparably harm the river. Comment 218-2
2. Limit land use needs in the future 100 years. Land has already been dedicated to provide natural outdoor experiences for the citizens. Comment 218-3
3. Add to the congestion on the roads in close proximity to Woodward and the Parkway, residences, and commercial establishments. Comment 218-4
4. Limit Senior citizens the pleasure open spaces available, since they are unable to travel farther. Comment 218-5
5. Increase disturbing wildlife.

The company has outlived using the land for their own use. The city has grown around them. Their existence unfortunately no longer fits into the scheme of our city. Comment 218-6

Thank you for your consideration.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

In considering approval of the Cemex expansion plans, we note all the areas listed below that benefit Cemex.

Comment 219-1

We note nothing in this rather long list that explains the benefits to the residents of Fresno County. *We therefore stand in opposition to the approval of this expansion plan.*

Cemex's expansion plan primarily benefits from increased market reach, particularly in the US, allowing them to capture a larger share of the construction materials market, leading to potential for **higher revenue, improved profitability, and stronger market position**; additionally, their focus on sustainable practices and "Urbanization Solutions" could attract environmentally conscious customers and tap into growing urban development needs, while also potentially enhancing brand reputation and opening new growth avenues.

Key benefits of Cemex's expansion plan:

Market Penetration:

By expanding their presence in the US, especially in the aggregates market, Cemex can tap into a large and growing construction sector, potentially increasing sales and market share significantly.

Profitability Boost:

Accessing a larger market with higher demand could lead to increased revenue and profitability, allowing for reinvestment in further growth initiatives.

Diversification:

Focusing on the "Urbanization Solutions" business can provide a new revenue stream beyond traditional cement products, aligning with growing urban development needs.

Sustainability Advantage:

By prioritizing lower-carbon and circular practices, Cemex can appeal to environmentally conscious customers and potentially gain a competitive edge.

Operational Efficiency:

Investment in technology and digital platforms like "Cemex Go" can optimize operations, improve customer service, and reduce costs.

Brand Reputation:

A focus on sustainability initiatives can enhance Cemex's brand image and attract a broader customer base.

Comment 220-1

This email is to share our concerns about the Cemex expansion and the type of mining they will be conducting.

We are longtime Fresno County residents who value efforts to support a beautiful river as a resource for residents and wildlife in our area.

We need natural beauty close to population, not a few hours drive away. Many cities place high value on their waterways and natural habitats because they understand the importance of these resources for human respite and wildlife refuge, not to mention property values.

We have enjoyed time spent along the river and bird walks along its shores. However, we remember well the unsightly mining that used to permeate the San Joaquin River! We appreciate leaders who turned it into something better and more useful so it can contribute to quality of life for our Valley.

The Cemex expansion threatens this valuable resource to Fresno County. Let's not go backwards.

Thank you,

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Subject: Opposition to CEMEX Rockfield Quarry Expansion Project

Dear Mr. Randall,

I am writing to express my strong opposition to the proposed expansion of the CEMEX Rockfield Quarry, as detailed in the Draft Environmental Impact Report (DEIR). This project poses significant threats to the San Joaquin River ecosystem, public safety, and local infrastructure.

Comment 222-1

Environmental Concerns:

• Depth of Excavation: The plan to excavate up to 600 feet below ground surface raises concerns about potential impacts on groundwater levels and the overall health of the river ecosystem.

• Blasting Operations: Transitioning from mechanical digging to blasting hard rock introduces risks of habitat disruption, noise pollution, and potential harm to aquatic and terrestrial wildlife.

Comment 222-2

Public Safety and Infrastructure:

Comment 222-3

• Increased Traffic: The project is expected to increase heavy truck traffic on local roads, leading to accelerated wear and tear, elevated maintenance costs, and heightened risks of accidents.

• Air Quality: Blasting and increased vehicular emissions could degrade air quality, adversely affecting public health, especially for vulnerable populations.

Comment 222-4

Economic Considerations:

Comment 222-5

• Tourism and Recreation: The San Joaquin River is a vital recreational asset. The proposed expansion could deter tourism, impacting local businesses and diminishing residents' quality of life.

Recommendations:

1. Comprehensive Environmental Review: Conduct a thorough and updated environmental impact assessment to address the potential consequences of deeper excavation and blasting.

2. Public Consultation: Engage with local communities, environmental organizations, and other stakeholders to gather input and address concerns transparently.

3. Alternative Solutions: Explore less invasive methods or alternative sites that would minimize environmental and community impacts.

In conclusion, the potential risks associated with the CEMEX Rockfield Quarry expansion outweigh the anticipated benefits. I urge the Fresno County Public Works & Planning Department to reconsider the approval of this project to safeguard our community and natural resources.

Thank you for considering my comments.

Sincerely,

Gerard Medeiros

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Good morning David:
I am writing regarding my **OPPOSITION** to the CEMEX expansion project that is being considered for approval by the County Board of Supervisors. Comment 223-1
There are several areas of concern that I have.
1. The DEIR states that the project could have emissions that may exceed cancer risk thresholds. There is no evaluation of the population-wide cancer burden. We already have an increased risk of cancer due to environmental issues (air pollution, poor water quality, etc) here in the Central Valley and this will only add to that burden.
2. The DEIR does not adequately analyze potential impacts of blasting on wildlife in this area. The examples given only related to surface mining and not the deep pit mining that is being proposed. Our wildlife in this area are already burdened by excessive heat, drought, loss of habitat and lack of clean water. This will only make conditions worse for our already threatened wildlife. Comment 223-2
3. Impacts from blasting on local residents are not adequately addressed in the DEIR. Besides the noise, there are the impacts it can have on structures, wells, destabilization of the San Joaquin River embankment. The DEIR also did not analyze the impact that blasting may have on those who use Woodward Park. Comment 223-3
4. There is also concern that this additional mining is not even really needed. I read an article in the Fresno Bee by Marik Warszawski stating that there are more than adequate reserves of the materials that this mining is going to produce. So why would we risk all these potential negative impacts when we have plenty of the product already at hand and provided by a different vendor? Comment 223-4
Please let the county know that this is a very bad idea from many standpoints. Let's protect our air quality, our wildlife and the residents who live in this area from more destruction for no purpose. Comment 223-5
Thank you for taking the time to read my comments.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK
Report Suspicious

Dear Sir,

The proposed expansion of CEMEX operations along the San Joaquin River is detrimental to the environment.. It negatively impacts the surrounding habitat and possibly impacts the San Joaquin River itself. CEMEX has been in that location and has a permit for 100 years but at this point allowing it to expand by digging a 600 foot hole so close to the river, so near a growing area is harmful to the community. Recreational areas like ball ranch, and the open area of Sumner- Peck affords people to go out and enjoy the river so allowing Cemex to dig a 600 foot hole in that area is not good. Friant Road has a lot of traffic already and it continues to have more and more traffic as homes are being built north and east of it. Allowing many heavy gravel trucks to use it daily makes the situation worse.

Many families enjoy going to the San Joaquin River and allowing Cemex to dig there harms air quality. The environmental impact report was done when? Has there been a recent EIR done?
In this area we have very few places to take families to the San Joaquin River and this is one of them and it's important to keep it to enjoy now and years to come. .
Thank you, Marcella L Osterhaus

I oppose the expansion. My main fear is for the San Joaquin river. Many millions of dollars have and will be spent to try and introduce Chinook Salmon back to the river. Blasting and possible contamination by silt and other runoff could severely damage fish and other wildlife. I and some of my Kokanee Power friends have volunteered at the Friant fish hatchery. We know how delicate the salmon fry are. They need clean water. It seems that there are two other locations for the aggregate that is needed. Kings River and 145 and 41 area. Thanks for listening. Comment 231-1

Like so many of my friends and neighbors, I am deeply opposed to allowing the expansion of CEMEX. Allowing the creation of a 600-foot-deep mining pit in this residential and environmental area would be greatly damaging in many ways. Mining rights for 100 years in this area would also be irresponsible. Please reject the CEMEX project.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall.

Figure 2-8 Quarry Site Proposed Mining Plan indicates a potential route for a Parkway Trail along the western side of the Quarry Site.

Comment 232-1

Figure 2-8 also includes notes that seem to indicate that there was, is and will be a 200' setback from the edge of the river channel and any earth stockpiling or excavation. Please note that the 200' setback is from the edge of the river (presumably at normal water release levels from Millerton Lake) to the top edge of the open pit mine where the 2:1 slope drops into the pit. The setback is not from CEMEX's property line! There are several locations near the westerly bend in the river where the setback will be less that 100 feet from the edge of the pit. This means that the "berm" that will separate the river from the pit will be far less wide than anticipated. And there is no indication that the "berm" will have any height to it nor that it will be higher than the edge of the pit.

A close examination of the topographic survey found in Appendix G-1, Appendix 1, Figure 2 shows the extent of the stockpiling and excavations that have been performed in the past. It is obvious that significant earthwork would be required to construct the "berm" to separate the river from the pit mine. It is unclear when the berm would be constructed. Without the berm there would not be any chance of constructing a Parkway Trail along the approximately 1.5 miles of river frontage.

Comment 232-2

It is also evident that a serious flood risk exists along this stretch of the river as the westerly bank is much higher than the Quarry side is. This flooding risk would increase the likelihood that the Trail would be severely damaged or rendered unusable for long periods of time and at great cost of reconstruction.

Comment 232-3

The construction of a Parkway Trail would probably require at least a 20-25' easement for the trail itself plus additional slope easements to accommodate changing terrain contours. The visual quality of the trail immediately next to the pit is less than appropriate. About as exciting as walking down the Los Angeles River.

Comment 232-4

Did I mention the safety risk of someone, or many, falling down the 2:1 slope into the pit? No fence can keep preteens, teenagers and other curious humans from exploring dangerous conditions. Who will install the fence? Who will maintain the fence FOREVER? The significant liability for the County will never cease.

Comment 232-5

The offer of the Parkway easement is given as an inducement for the County's approval of the Application, yet it is not listed as a required Mitigation Measure. Without a Parkway trail along the westerly (or easterly) boundary of the Quarry Site, the Quarry Site will physically divide an established community, the San Joaquin River Parkway with the San Joaquin Conservancy as Lead Agency, which is a CEQA Impact 4.11-1. Without the trail the Quarry will physically block all pedestrian traffic from moving up and down the river corridor. It will also substantially block westerly bicycle traffic as the use of Friant Road for west bound bicyclists has been known to be a dangerous section with significant aggregate on the bike path and stones being thrown from the aggregate trucks.

Comment 232-6

Comment 232-7

The lack of a trail also falls under CEQA Impact 4.11.2 as the Quarry Site "*conflict(s) with land use policies, plans and regulations*".

Comment 232-8

OS-A.15 **San Joaquin River Protection**. *The County shall support policies of the San Joaquin River Parkway Master Plan to protect the San Joaquin River as an aquatic habitat, recreational amenity, aesthetic resource, and water source. (See Policy OS-H.11*)

OS-C.8 **Aggregate Mine Buffers** *The County shall, where feasible along the San Joaquin River, site recreational trails, bikeways, and other recreation areas at least three hundred (300) feet from the edge of active aggregate mining operations and separate them by physical barriers. Recreational trail/bikeway crossings of active haul routes should be avoided whenever possible; if crossing of haul routes are necessary, separate where feasible*.

OS-H.10 restates **OS-A.15** noted above.

OS-I.3 Trail/Bikeway Right-of-Way *The County shall require that adequate rights-of-way or easements are provided for designated trails or bikeways as a condition of land development approvals.*

HS-C.4 Floodwater Diversion *The county shall require new flood control projects or developments within areas subject to 100- and 200- year frequency floods are designed and constructed in a manner that will not cause floodwaters to be diverted onto adjacent property or increase flood hazards to property located elsewhere*.

HS-C.12 200- Year Water Surface Elevation Investigations *The County shall encourage the performance of appropriate investigations to determine the 200-year water surface elevations for the San Joaquin River, taking into account recent storm events and existing channel conditions, to identify the potential extent and risk of flooding. New development, including public infrastructure projects, shall not be allowed along the river until the risk of flooding at the site has been determined and appropriate flood risk reduction measures identified.*

Therefore, the EIR should be revised to include a required Mitigation Measure for a future Parkway Trail easement at the Quarry Site.

Comment 232-9

The Mitigation Measure should address, at a minimum, the following issues

- The easement shall be on the westerly side of the Quarry, adjacent to the river.
- The easement shall not be within 300 feet from the breakover point into the mine that has a slope the is steeper than 4:1 (horizontal to vertical).
- The layout of the easement shall be solely on the lands of CEMEX
- The easement shall provide such width as necessary for a Multi-Use Trail with Shoulder for Equestrian Use as shown on Figure 7-2 of the Joaquin River Parkway Master Plan plus such additional width for slope easement as necessary.
- The surface elevation of the land within the easement shall be not lower than one foot above the established flood water surface elevation for a 200-year flood event.
- The surface elevation of the land within the easement shall be completed within 5 years after the approval of the Application such that the Parkway Trail can be constructed at that time if the Conservancy so desires.
- The easement shall not require the construction of bridges within the lands of CEMEX.

Thank you for your consideration.

Report Suspicious

Dear Mr. Randall,

Section 6 of the DEIR discusses the various Alternatives that have been proposed in addition to the Alternative 1: No Project.

Comment 233-1

With the exception of Alternative 4: Reduced Mining Depth (300 feet) with Additional Setbacks, none of the revised project alternatives (Alternates 2, 3 & 5) provide any reduction in the impacts to the environment other than reducing the duration of the impact from a very long term to only a long term - maybe only impacting two or three generations as opposed to impacting four generations of a typical family. And the physical impacts to the river, wildlife, birds and surrounding land would never benefit from the reduction in time of disruption from 100-years to 63-years.

These are hollow Alternatives. They provide no basis for acceptance as they only impact the Applicant by reducing the Operational Life or extraction volume.

Section 6.4.2.1 provides excuses for not considering alternative sites. The Applicant avoids acknowledging that they have previously investigated another site (Jesse Morrow) at great length. It stands to reason that the Rockfield site(s) was not their first selection but a fallback position when the Jesse Morrow site became unavailable. If there are two potential sites (Rockfield and Jesse Morrow) in Fresno County, there must be other potential sites.

Comment 233-2

The Alternative Analysis should be rewritten to provide significant alternatives that might at least include:

Comment 233-3

- no hard rock mining at the Rockfield site(s)
- expanded setbacks along the river and Friant Road
- reclamation plans that do not have hard rock facings
- potential alternative sites

Thank you for your consideration.

I live in North east Fresno and frequently go to Woodward Park. I am against the proposal to allow 100 more years of mining and to create a 600 ft pit. The impact to residents of Fresno and Madera will be huge - air quality will be worse, traffic and noise will be unacceptable to those who live nearby or use the parks or river.

Comment 236-1

This location is too close to those who live nearby or travel on the road that already is impacted by traffic. The San Joaquin river is used by the community and they project will be an eyesore. This will increase traffic and pollution on the nearby roads and community.

Comment 236-2

Please do not approve this project as it will affect our children and grandchildren.

Dear Mr Randall, Senior Planner,

I do not want 100 more years of mining our river. Please stop the mining of our beautiful river and do not contribute to the further expansion of this horrible eyesore. Also I'm very troubled by all the river rock people are using on mediums and in their landscaping. Its no different from asphalt, concrete, in that it further reduces the humidity in the air and increases the temperature of our city. Please stop this polluting project.

Good afternoon,

As a citizen of the San Joaquin Valley, I strongly oppose and urge you to move to end the expansion of CEMEX. This project will impact San Joaquin River and is extremely harmful to our environment, putting fish and wildlife in the area at risk and threatening our water quality. We, the people of San Joaquin Valley, do not want this for our environment and will hold local leadership accountable for the generational impacts and damage on our valley's endangered habitats and resources.

Subject:	Cemex 600" deep pit
Date:	Tuesday, March 4, 2025 3:54:44 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

I am very familiar with blasting in open pit mines in the coal mines in New Mexico, Arizona, Utah, and Colorado. I was in a service truck for Cummins Rocky Mountain and served the oil fields in the San Jaun Basin and multiple open pit coal mines in 4 states around the 4 Corners area. Comment 240-1

It required radio silence for 15 min the whole mine property before a blast. These mines were very remote. I would have concerns of radio frequency causing detonation near a population like ours along with issues to the city water wells on the north side of town. Water seepage from the San Joaquin River is another concern. Comment 240-2

Now the biggest concern is semi truck traffic.

Vulcan in Sanger sends out up to 1600 trucks daily from a smaller mine. Friant Rd cannot handle that kind of traffic, esp. During rush hour traffic when truck traffic would be the heaviest. Comment 240-3

How many trucks would they be able to load daily? Who will maintain Friant Road? Comment(s) 240-3 & 240-4

With blasting, is there possibly of fracturing the hardpan all the homes in N. Fresno are built on? Comment 240-5

Why do they need to mine that big of a hole that close to town? When Vulcan ran out of materials they relocated to where the hard rock is very shallow at Hwys 41/145. They are not near any homes or in a fragile river system. Comment 240-6

Cemex needs to do the same as Vulcan.

Hwy 41 is much better prepared to handle the heavy truck traffic and we can avoid future water well issues if Cemex is not next to town.

David Randall, Senior Planner
County of Fresno
Fresno, CA

Subject: Comments on CEMEX Rockfield Expansion Project DEIR

Dear David,

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. Comment 241-1

1. Impacts on the San Joaquin River Watershed. This will have a devastating effect on our precious river resource.

2. Air Quality and Dust Emissions. Air quality in the Central Valley is a vicious problem that will be exacerbated by this project. Comment 241-2

3. Biological Resource Impacts. Our fisheries can not withstand the impact of this project. Comment 241-3

4. Traffic and Noise Concerns. There is already too much congestion in the area. We don't need to make it worse. Comment 241-4

5. Cumulative Environmental Effects. CEMEX is a Mexican company. Send them back to Mexico to destroy the environment there. We don't want it here in California. Comment 241-5

Comment 241-6

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Sincerely,

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr Randall,

I am writing to voice my opposition of the above subject project.

The draft EIR does not adequately address the impact of this project because it is impossible for any planner or forecaster to project over that extraordinary long period of time. 100 years! That, in itself, should disqualify any consideration of this proposal.

Comment 243-1

Furthermore, blasting a 600 foot deep mining pit within a relatively few feet of the San Joaquin River, where the State of California has created the San Joaquin River Conservancy, is inconsistent with the mission of the Conservancy. The impact of mining vs. blasting is not adequately addressed in the EIR.

Comment 243-2

Thank you for consideration of my comments, inasmuch as I am concerned about the negative impact of this expansion project, as a resident of the City of Fresno and Fresno County.

Sincerely,

Don R. Falkenberg

Mr. Randall,

As lifetime Fresno County residents, we were are totally AGAINST the proposed expansion of the CEMEX project currently before the county administration. The expansion flies in the face of Fresno city and county residents' ongoing work to complete the San Joaquin River Parkway, not to mention its effect on water, fish, wild life, roads, and residents living near the business. The only way to mitigate the effects of blasting near the San Joaquin River would have been to NOT approve it in the first place. Who in Fresno County will hold CEMEX's feet to the fire when the environmental plan is not adhered to and necessary mitigation not followed? The many identified potential issues and problems necessitating mitigation in the plan are so numerous to be almost laughable if violations weren't so potentially disastrous. Is this draft tough enough ??

March 4, 2025

Dave Randall, Senior Planner
County of Fresno
Dept. of Public Works and Planning
Sent VIA EMAIL

Comment 249-1

I am writing to oppose the CEMEX Rockfield Modification Project (EIR 7763), and Conditional Use Permit Applications 3666 and 3667.

The California Geological Survey Map Sheet 52 provides information about the availability of and future demand for California's already permitted aggregate reserves. The 2018 update, the most recent available, indicates that the Fresno Production-Consumption Area has already permitted far more aggregate reserves for mining than this area's projected need. Here's the CGS Map Sheet 52 projection for the Fresno area:

CALIFORNIA GEOLOGICAL SURVEY MS 52

Table 1. Comparison of 50-Year Demand to Permitted Aggregate Reserves for Aggregate Study Areas as of January 1, 2017.

AGGREGATE STUDY AREA[1]	50-Year Demand (million tons)	Permitted Aggregate Reserves (million tons)	Permitted Aggregate Reserves Compared to 50-Year Demand (percent)	Projected Years Remaining
Bakersfield P-C Region	338	1,708	505	More than 50
Barstow-Victorville P-C Region	163	117	72	31 to 40
Claremont-Upland P-C Region	202	90	45	21 to 30
El Dorado County	82	15	18	11 to 20
Fresno P-C Region	305	556	182	More than 50
Glenn County	41	22	54	21 to 30
Merced County	151	61	40	21 to 30

Since our area has already permitted aggregate reserves equal to 182% of projected needs through 2066, there is no justification for the continued destruction of the Fresno side of the San Joaquin River from aggregate mining. This mining operation should be be halted immediately, and prohibited from continuing and expanding in the future.

Sincerely,

Marianne Kast

Subject: Comments on CEMEX Rockfield Expansion Project DEIR
Dear Mr. Randall,

Comment 252-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River WatershedI am very concerned about the idea of blasting rock from the delicate San Joaquin River bottom. This is an incredibly crucial part of our valley's eco-system and introducing heavy machinery and blasting away rock will ruin habitat for native animals, create sound pollution, and interfere with the aesthetics of the area.

Comment 252-2

2. Air Quality and Dust EmissionsThe amount of dust that will be created from blasting rock can not be helpful for our community. We have enough difficulties maintaining air quality as it is in the Central Valley and should avoid any additional emissions that can be controlled.

Comment 252-3

3. Cumulative Environmental EffectsThe delicate habitats of owls, native birds, and turtles will be disturbed as will the overall stability of the earth near the site. The impacts of such a major disturbance to the landscape can not be fully known and I am very concerned about the potential for ecological destruction in such a sensitive area.

Comment 252-4

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected. Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Subject:	CEMEX Expansión Is a Bad Idea
Date:	Tuesday, March 4, 2025 7:14:15 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear David,

The expansion of and changes to mining “along” the San Joaquin River will have devastating results for the river, riparian areas, effects on the groundwater table, and set the precedent for the continued exploitation of Fresno’s first and best resource- the river.

Comment 257-1

There are many times when I find myself speaking with people who don’t realize there IS a river here, running through and creating the border between Fresno and Madera. Many people don’t realize that without that river, neither city would be here. It is only because of it that the community itself exists.

The proposed extension/deepening to the existing mining site off of Friant Road will disturb the water table and natural connectivity to the river, create further obstacles to the public in accessing the river, and continue to be a nuisance to those who regularly use Friant Rd (show me a person who uses that stretch of road who HASN’T had a windshield nick or crack from gravel flying off a truck- I’ve had 3).

Comment(s) 257-2 257-3 257-4

More importantly, it is the ultimate act of giving priority to money over the general benefits to the community. It’s a case where “who knows?, it could be fine,” feels like the first line response from the people who are supposed to be acting on our behalves.

Comment 257-5

Believe in this instead: this river gave use to the land, created our cities, and has allowed us to stay. Let’s repay the respect.

Sincerely,

Molly Schnur-Salimbene

To:	Randall , David A.
Subject:	Opposition to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report
Date:	Tuesday, March 4, 2025 9:11:13 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am writing to express and record my opposition to the proposed 100-year permit for the CEMEX mining operation and challenge the adequacy of the Draft EIR prepared and submitted for this particular project. As currently drafted, the EIR does not assess the environmental, ecological, and community impacts that this 100-year timeline will have on the San Joaquin River and surrounding areas deeply enough.

Comment 258-1

As an amateur naturalist, outdoor recreation enthusiast and avid birder, I find that the EIR fails to adequately address my concerns:

<!--[if !supportLists]-->1. <!--[endif]-->safeguarding our biological resources here in Fresno County. The search area is not adequate to identify species of special status, likely mischaracterizes a habitat that would be subject to the CA Fish and Game Code, and does not have adequate analysis of the potential effect on threatened Swainson's hawk

<!--[if !supportLists]-->2. <!--[endif]-->Air Quality and environmental effects on health of human residents and recreationists. Project emissions may exceed acceptable cancer risk thresholds.

<!--[if !supportLists]-->3. <!--[endif]-->100 years is much too long a period to adequately assess future risks in our rapidly changing culture, political system and climate.

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations. Our responsibility to our community requires us to consider extractive projects with the high potential for harm carefully and with an eye on all the factors at play, not just the growth of industry.

I request that the Planning Department reconsider this permit in light of the

inadequacies of the EIR and demand a more thorough environmental review before any decisions are made. I believe that we can do better.

Thank you for your time and consideration.

Sincerely,

Amanda King

Report Suspicious

Mr. Randall:

I oppose the proposed expansion because (a) the support for a current and future need for the gravel is weak; (b) there is adequate current supply, and almost limitless untapped supply, in several local counties; (c) the San Joaquin River is a unique feature of this part of California and would be irreparably damaged if the Cemex expansion is allowed to proceed.

Comment 262-1

I live at Woodward Lakes, and I am against the following CEMEX is proposing:
- 100 more years of mining
- Creating a 600-foot-deep mining pit
- Changing the mining type to hard rock blasting. This will threaten the water quality and impact the fish and wildlife of the San Joaquin River and the surrounding areas of the river bottom.

This is NOT acceptable for our quality of life but also it will impact and harm the San Joaquin River. There is NO need for CEMEX to expand/change their current operation. I believe they make more than enough profits for their current operation, but as a company they want more profit. This is greed. DO NOT APPROVE!

Comment 263-1

I am writing to express my strong opposition to the proposed creation of a 600 foot mine in the San Joaquin River bottom with excavation rights for the next 100 years! I have two major objections. My first objection is that the proposed site sits next to and separates some of the nicest parkland in Fresno County. There is Woodward Park on one side, and Lost Lake and Millerton Lake on the other, not to mention Ball Ranch. Fresno has precious little natural habitat of any kind, let along natural habitat that is publicly accessible- we should do everything we can to optimize what we have, such as constructing walking and bicycle pathways and trails along this section of the San Joaquin River similar to what has been done in other communities such as Sacramento. This would greatly improve the ambience of Fresno and make it a much more attractive destination for visitors and for those considering relocation, as well as preserve the unique and very limited habitat along this beautiful river. The dollar value and the positive impact on the mental and physical health of our community of creating a vibrant pathway along the San Joaquin River would far outweigh the incremental savings that might be achieved with this mine. Instead of becoming a magnet for visitors and residents, the proposed 600 foot mine would be a construction zone eyesore, reinforcing negative stereotypes regarding short-sighted planning, deference to developers, and lack of consideration for quality of life.

Comment 263-2

My other concern is regarding the long-term consequences of blasting a 600 foot mine by a river. You could argue that water is the most valuable resource we have- or dont have. What would it take to mitigate the damage done by blowing up land 600 feet down- the potential to disrupt water tables, contribute to ground water pollution, and other consequences we can only imagine? What would the cost be to return the earth to its natural state before it was ripped apart by this proposed mine? Can we even calculate what that cost would be?

Lets recognize the value we have right here in Fresno and preserve and honor the San Joaquin River by turning it into a parkway, not a parking lot.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

David Randall, Senior Planner
County of Fresno
Fresno, CA

Dear David,

Comment 264-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, **I have several concerns that I urge you to address** prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed: It goes without saying that the quality of the SJ River Watershed will be further degraded with this expansion of mining. This watershed is crucial to the health of the local environment and important to the wellbeing of its citizens. One example: Lowering of the water table and the impact on residential owners in the vicinity has not been addressed. These owners should be monetarily shielded from the effects of this project before the project begins.

2. Air Quality and Dust Emissions: Dust and emissions are already a problem and will be getting worse. Currently, Fresno air quality is the worst or close to the worst in the nation and small particulate matter is extremely hazardous to human health; blasting will contribute significantly to that.

3. Biological Resource Impacts: The SJ River Watershed is home to many different species of animals and plants. These communities will undergo huge disruption and suffer severe consequences. The switch to hard rock blasting will threaten water quality and have severe consequences on fish and wildlife.

4. Traffic and Noise Concerns: There are already too many mining trucks on the road ways, increasing traffic (moving very slowly on the on ramps to the freeway and causing backup and near accidents daily especially when they are allowed to enter 41 during rush hours with meters on the ramps). This will only increase them. Additionally, it does not appear that in their analysis they have evaluated the impacts of blasting to users of the nearby park or the disturbance to nearby residents. Blasting will have major impacts on quality of life for nearby residents and their analysis barely addressed this.

5. Cumulative Environmental Effects: this new mining operation will create a massive pit in the SJV River, 600 ft deep and the size of a 43 story skyscraper. And, the most worrisome aspect of all: this project will allow 100 more years of mining. There is no reason to tie our

community and our natural environment up for 100 years…

Given these concerns, **I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives**. Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

I would ask you to not approve this project on the basis of its environmental impact and to make sure that all the environmental concerns are addressed in any updated proposal.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Sincerely,

Loren Alving

Mr. Randall,

CEMEX's proposal is an atrocity against Fresno's greatest natural resource, already scarred by a century of gravel mining the company previously agreed to wind down, and should have been rejected point blank. Undeterred, county planners and hired guns spent five years working to sidestep urgent issues and fool the public, urging modifications to the proposal put forward by CEMEX, a wealthy international corporation. Comment 265-2

Modification? They want to dynamite hundreds of feet below ground in close proximity to one of the country's most endangered rivers.

Do not allow this unnecessary project to go forward.

Some of the negative effects of this expansion are: further endangering the Salmon that bravely endure historical injury to the river. Impacts on wildlife habitat, water quality, air pollution, noise pollution, groundwater depletion, and cumulative environmental impacts, Comment 265-2

Fresno County has enough aggregate resources available without letting CEMEX have its Comment 265-3

way in our precious valley.

I object to the proposed Cemex expansion. The River is an unbelievable natural resource that should not be impinged upon any more than it already has. Right now you can kayak or canoe from Friant to Fresno without becoming aware that you are in a near urban corridor. There is no traffic noise and little sign of human development along the way EXCEPT passing the Cemex plant. In that area there is a constant rumbling of industrial activity. I fear that if the expansion is approved and blasting is used to mine the rock there will be even more noise and probable disturbance of wildlife. In particular there are two large heron rookeries, at least one bald eagle nest and a large population of ducks and geese along this stretch or river. I don't know about the salmon restoration project but the impact on this multi-million dollar project should be considered as well. Cemex should find somewhere else to establish a mine. Please do not approve this project.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear David,

I am deeply concerned about the proposed CEMEX Rockfield Expansion project. I would appreciate your consideration of the following negative impacts this project would have on our environment and community. Comment 269-1

1. The proposed 600 ft hole will create an unacceptable scar to the San Joaquin River bottom, and possibly damage the river itself. This is a risk that cannot be justified.

2. CEMEX proposes to change from the digging of sand and gravel to blasting hard rock and crushing it into gravel. This change will cause noise pollution and dust emissions. All nearby life (people and animals) will be negatively affected. Would you want to live near all of this noise and dust? I certainly would not. Comment 269-2

3. Granting a 100 year extension is, in my opinion, irresponsible and ill advised. Comment 269-3

Thank you for your consideration of my concerns in this matter.

Sincerely,

Debra Dooley

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Comment 270-1

Dear Mr Randall:
I'm writing to strongly oppose the extension for another 100 years of Cemex's rights to mine along the San Joaquin River.

With the City of Fresno expanding further north and east swallowing more and more open, green spaces, the presence of the enormous mining pit in one of very few undeveloped areas along the river is very undesirable. The whole area occupied by Cemex should be available for use by the half million population of the city, not for monetary exploitation by a multinational company.

A hundred years ago that spot was miles away from the city; now we have a huge industrial hole that will be even larger, if allowed, right where thousands of Fresnans could go for recreation. Instead, if the lease is extended, we will suffer from more air and noise pollution, face the danger of having our river contaminated and deal with the huge industrial blight where we could all have access to recreational land.

Allowing another 100-year lease will impact several future generations and deprive us all of access to undeveloped areas along the river. There's no room for that kind of industrial operation in the city any longer. Don't extend the lease!

Subject: Considerations on Fresno County Cemex Proposal
Date: Wednesday, March 5, 2025 11:08:10 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

To Mr. Randall,

I am writing as a resident of Fresno, about the Cemex expansion to mine the San Joaquin River for 100 years, going 600 feet deep. This would not be without consequences for the entire region, not to mention the state's riparian corridors enabling the water the river supplies to recharge the local aquifers. While the San Joaquin River doesn't contribute directly to the Fresno Aquifer, indirectly, it acts as a riparian woodland cloud seeder, as the trees release water transpiring from their stomata, conglomerated with beneficial to plant fungal spores, dust, and pollutants, that act as cloud seeders, nucleating water molecules to form together and create rainfall downwind, which since the Sierras are right next to us, also rebuttals that rainfall onto farmers, gardeners, and recharge basins for the aquifers here around Fresno on the Valley floor. Blast mining 600 feet deep, or the equivalent of two football fields, will destroy the groundwater supply for the native riparian woodland trees that indirectly supply our region with water, including our endemic Valley Oaks, which are losing habitat at alarming rates.

Comment 274-1

Add to this the simile for mining building materials, fracking, and earthquakes are not an impossibility, especially given California already has multiple fault zones. All we need is deep perturbations in a sensitive area, and Fresno County could become another earthquake hotspot.

Comment 274-2

Then, there is agriculture. East side farmers along the San Joaquin River, and more western SJR farmers as well, rely on clean irrigation water, directly pumped from the river by riparian rights, or indirectly from adjacent groundwater, for their crops. This project would be an existential death trap for these farmers, polluting their water supply and decimating their irrigation baseline for their incomes.

Comment 274-3

The stated reason for this mining is the region's growth occurring will need infrastructure material for building. Yet Vulcan Mining, a competitor of Cemex, already has provisioned this region with enough mining materials for the next century. Also, Cemex's previous mining on the river has only added to that. More is not even a necessity to begin with.

Comment 274-4

Also, the San Joaquin River is a water supply for human needs like clean water, fishing, and mental uplift from natural ecosystems, termed biophilia in psychology, literally, “love of life”. Truly, those of us who love life, all life, both human and non-human, love the San Joaquin River. Comment 274-5

While not a certainty, sinkholes have been known to arise in coal and gold mining operations of much less depth of extraction, so they might also arise here. It is known when mining hundreds of feet deep in area, especially watery areas, that sometimes, due to extreme subsidence, sink holes can emerge, and sometimes not even on the site of mining, but in subterranean cavities beneath adjacent urban areas that connect to riparian areas. This would spell disaster for many north Fresno residents should it commence, which 100 years and 600 feet deep; that ensures it is a possibility Comment 274-6

Lastly, air pollution from the many diesel trucks and machinery handling drilled materials and doing the drilling, day in and day out for 100 years, is going to total the health of the region’s residents. We already have some of the worst air pollution in the San Joaquin Valley. This would intensify and enhance that by multitudes. Too many residents suffer from severe air pollution industrial chemical allergies from automobile exhaust, not to mention some chemicals in farms and lawns and homes and gardens. This would forever damage the quality of life for the region, given the sheer volume of diesel fueled truck traffic transporting materials, and the mining offputs themselves. Comment 274-7

Simply put, I know this project must be terminated if the Central Valley is to survive economically and environmentally. Agriculture is a huge portion of the economy, and losing ecosystem services like available clean water, and pest predators from riparian native species, would be a loss for the regional farming community. Environmentally, the very citizens of Fresno County are endangered by the destruction that will ensue. This project must be stopped. The costs, both financial and existential, ultimately will outweigh any short-term benefits Cemex promised. Comment 274-8

Sincerely,

David M. Horwitz (Fresno resident and long-term supporter of conserving the SJ River)

I am concerned about the expansion of CEMEX operations as proposed. I reviewed the EIR and ultimately, I am left with a lot of concern in the areas of slope stability, air pollution, blasting, water quality and groundwater supply. While there are mitigations stated, there is always the risk of an "accident" or it could be that we find a breach a little too late for the damage that might have already occured. The consequences of material flowing down the river are too great and the consequences to the environment would be too grave. Also of great concern, is the depth of mining at 600 feet.

Comment 276-1

Comment 276-2

Comment 276-3

We already live in an area with poor air quality. It is time to put the brakes on adding more air pollution in future years. To commit to this endeavor for another 100 years is unimaginable.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Fresno County Senior Planner David Randall,

I am writing to express my strong opposition to the CEMEX Rockfield Expansion Project. This area, once home to Native American communities, is a natural gem that should be preserved for public use—not subjected to another century of industrial exploitation.

Comment 279-1

For over 100 years, this land has been used for concrete production, and now CEMEX wants to extend its operations for another century, further degrading the San Joaquin River and surrounding environment. The project's own environmental report acknowledges serious risks, including potential cancer-causing emissions, threats to wildlife, and dangers to water resources. Meanwhile, the public is expected to wait 100 more years before reclaiming any of this land—why should we accept that?

Comment 279-2

Fresno would benefit far more from accessible riverfront development. Imagine a vibrant riverwalk, similar to those in major cities, with restaurants, shops, and recreation areas—a space for families, businesses, and tourism. Instead, this plan offers us a hazardous mining pit.

Comment 279-3

I urge you to reject this expansion and prioritize a future that benefits the people of Fresno, not just a concrete company's profits. Let's invest in a vision that enhances our city, not poisons it.

Comment 279-4

Dear David Randall,

Comment 286-1

I am strongly opposed to the proposed CEMEX expansion along Friant Road.

Given our ongoing environmental and water challenges, moving forward with this project seems both unnecessary and detrimental. While I understand the need to responsibly utilize natural resources, this area is no longer a remote wilderness. It is now a thriving and rapidly growing community, home to many families—including mine.

Comment 286-2

Beyond its residential significance, this area stands as one of the most beautiful parts of our city. Expanding industrial operations here would compromise its natural beauty, quality of life, and long-term sustainability.

I urge you to reconsider this proposal in light of these concerns and prioritize the well-being of our community and environment.

Sincerely,
Gary Simmons 405 E Seagull Ct, Fresno, CA 93730

Subject: Opposition to the CEMEX Rockfield Expansion Project

Dear Mr. Randall,

I am writing to express my strong opposition to the proposed CEMEX Rockfield Expansion Project near the San Joaquin River in Fresno County. This proposal raises significant environmental, recreational, and procedural concerns that I believe warrant serious reconsideration.

Comment 286-1

Environmental Concerns

The project entails blasting and drilling a 600-foot-deep pit into the river's bedrock, a method unprecedented along the San Joaquin River. Such extensive mining poses substantial risks to the river's ecosystem, potentially disrupting habitats and affecting water quality. The San Joaquin River has already endured considerable environmental stress due to past developments, and introducing deep-pit mining could exacerbate these issues.

Recreational and Community Impact

The San Joaquin River Parkway has been developed to provide recreational opportunities and preserve natural habitats for the community. The proposed expansion by CEMEX conflicts with this vision, as the industrial nature of deep-pit mining is incompatible with recreational activities and wildlife conservation efforts. Approving this project could undermine years of work dedicated to enhancing the river's value as a community asset.

Comment 286-2

Procedural and Regulatory Issues

It is concerning that the current operations have been allowed to continue under outdated environmental reviews. The lack of a dedicated Environmental Impact Report (EIR) for the existing quarry operations raises questions about the adequacy of oversight and environmental protection. Granting an extension or approval for expansion without a comprehensive, up-to-

Comment 286-3

date EIR contradicts the principles of responsible environmental stewardship and public transparency.

Comment 286-3 Cont.

Conclusion

Comment 286-4

Considering these concerns, I urge the Fresno County Department of Public Works and Planning to reject the CEMEX Rockfield Expansion Project. The potential environmental degradation, conflict with community recreational goals, and procedural shortcomings present compelling reasons to halt this proposal. Protecting the integrity of the San Joaquin River and its surrounding environment should be our priority.

Thank you for considering my comments.

Sincerely,

Terri Soares

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

Comment 288-1

I am reaching out to express my grave concern about the proposed CEMEX expansion and the significant threats it poses to our environment and democratic principles.

The Draft Environmental Impact Report clearly outlines devastating consequences if this project moves forward, including 100 additional years of mining, the creation of a 600-foot deep pit, and a shift to hard rock blasting.

These actions jeopardize water quality in the San Joaquin River, endanger fish and wildlife populations, and risk irreparable harm to the ecosystem.

The San Joaquin River is a cornerstone of our community, and its preservation is vital for both the environment and future generations.

Comment 288-2

Additionally, this review process is one of the last opportunities for public input to be heard and considered. Protecting our democracy means fostering transparent, participatory decision-making, especially when it comes to projects of such magnitude.

We cannot afford to compromise the democratic process, which ensures decisions reflect the community's best interests.

Comment 288-3

I urge you to prioritize the long-term health of our environment and uphold the integrity of the review process by reconsidering this project. Decisions made today will reverberate for generations to come, and we must act as stewards of both our environment and democratic values.

Thank you for your attention to this urgent matter.

Sincerely,

Mrs. Jennifer Squire

Comment 289-1

I am writing to ask you not to approve the proposed Cemex Expansion on the San Joaquin River. This is counter productive and a threat to the river, its wildlife and plant life that the San Joaquin River Parkway Conservation and Trust is trying to preserve. They are not compatible. The Cemex plant where it currently stands should not have been allowed to continue to operate and the new expanded version will desecrate the land further for all who want to enjoy it in all it's beauty now and for generations to come.

For the record I am not a member of the trust but I firmly believe all the area along the river needs to be preserved for the future. Linda Tiboni

Report Suspicious

I am concerned about Cemex and their attempt to blast a 600 foot pit next to the San Joaquin River for the following reasons:

Comment 290-1

1. The rock and gravel aren't currently needed. There is plenty but since the sources belong to a different company Cemex would have to purchase materials.
2. Cemex has no interest in our river except greed. There is no benefit to to the river or to Fresno. A foreign company wishing to "take the money and run!"
3. There are four major issues with their plan: air quality, increased traffic, noise and destruction of the scenery.
4. As an artist I'm particularly concerned about the ruining of the scenic value. Cemex plans to "paint the rocks". Perhaps a mural could be painted of what used to be. Brings to mind a Joni Mitchell song, "Big Yellow Taxi"…."You don't know what you've got 'til it's gone."

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear David Randall,

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the urgent need to address the significant potential environmental and community impacts associated with this project, I have several concerns that you should prioritize and address prior to moving forward with approval.

Comment 291-1

1. Impacts on the San Joaquin River Watershed

The proposed mining expansion threatens the integrity of the San Joaquin River, which serves as a vital water source for local communities, agriculture, and wildlife. Excavation and dewatering processes may lower groundwater levels, disrupt the natural hydrology, and contribute to sedimentation and pollution. The river supports sensitive riparian ecosystems, including habitats for migratory birds, fish, and other aquatic species. Any disturbances to the water table could exacerbate drought conditions and harm the broader watershed. The DEIR must provide a more thorough analysis of potential long-term impacts on water flow and quality and enhance mitigation measures to prevent irreversible damage.

2. Air Quality and Dust Emissions

Comment 291-2

The expansion of mining operations will increase particulate matter (PM10 and PM2.5), which can penetrate deep into the lungs and cause or worsen respiratory diseases such as asthma and chronic bronchitis. This poses serious health risks to nearby residents and workers. The fine dust from quarrying, transportation, and processing activities can exacerbate respiratory illnesses, including asthma and other lung conditions. Given that the San Joaquin Valley already suffers from poor air quality and frequent air pollution advisories, the additional emissions from this project could contribute to non-compliance with state and federal air quality standards. The DEIR must ensure that stringent dust control measures, real-time air monitoring, and mitigation strategies are in place to protect public health.

3. Biological Resource Impacts

Comment 291-3

The project site and surrounding areas support diverse wildlife, including special-status species such as the Western pond turtle, Swainson's hawk, and various riparian-dependent species. The planned excavation and land disturbance will fragment habitats, disrupt nesting areas, and eliminate vegetation critical for ecosystem stability. The DEIR must provide a more robust conservation strategy to prevent habitat loss, mitigate species displacement, and ensure compliance with state and federal wildlife protection laws. Additionally, long-term monitoring should be required to assess ecological changes over time.

4. Traffic and Noise Concerns

Comment(s) 291-4 291-5

The project's expanded truck operations will increase congestion along Friant Road, raising safety concerns for local commuters, cyclists, and pedestrians. The addition of heavy-duty vehicles will also contribute to noise pollution, particularly during nighttime operations.

Nearby residents will experience increased exposure to engine noise, blasting vibrations, and other disturbances that could degrade their quality of life. The DEIR should analyze alternative transportation routes, implement stricter operational limits, and require noise-dampening measures to reduce these adverse effects.

Comment 291-5 Cont.

5. Cumulative Environmental Effects

Comment 291-6

This mining expansion is not occurring in isolation—it will exacerbate the cumulative environmental stressors in the region, including climate change, water scarcity, and habitat degradation. Industrial activities have heavily impacted the San Joaquin River, and further exploitation may push the ecosystem beyond a sustainable threshold. The DEIR must take a broader approach to assessing cumulative impacts, including the potential for groundwater depletion, increased carbon emissions, and long-term landscape alterations. Alternative methods, such as limiting the scale of operations or requiring additional environmental offsets, should be explored.

Comment 291-7

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Upholding public transparency and accountability in this review process is not just important but crucial to protecting the long-term health of the San Joaquin River watershed and surrounding communities.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this critical matter.

Sincerely,
Thao Xiong

As a member of the Woodward Lake community for over 34yrs I have enjoyed living in this beautiful area. My family has used the trails and waterways from Woodward park to the dam for biking, hiking, running, canoeing, fishing and exploring. We are happy now to pass these adventures down to our grandchildren. I am greatly disappointed that the county supervisors are considering an extension for drilling in this area. For years I've been concerned of the traffic on Friant. Now with the proposal of double the truck deliveries this traffic will be compounded. We have grown into a huge residential community. Thirty plus years ago this area may have been appropriate for the mining. Now it is not. What other mining project that uses explosives is in a community of homes, churches, hospitals, parks? None I'm sure. Also what assurance do we have that the mining at that depth (600ft)won't have toxins? Have they done testing down at that depth? Also what contamination is possible with the ground water in the wells at those homes near Lost Lake? Approval for 100yrs is ridiculous. There are too many unknowns. This company will have to self report and looking at their track record they seem to have lots of lawsuits paid out over the years. I believe in growing the economy of a community as much as the next person. But not with all these risks! This is a gamble I wouldn't take.

Subject: Comments on CEMEX Rockfield Expansion Project DEIR

Dear David,I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Comment 293-1
Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

1. Impacts on the San Joaquin River Watershed ~ LEAVE THE RIVER ALONE.

2. Air Quality and Dust Emissions ~ Our air quality is horrible and Asthma is at an all time high. Half of the year we are not able to enjoy the outdoors due to high AQI as it is, why make it worse. Comment 293-2

3. Biological Resource Impacts ~ it will bring so much destruction to such a beautiful place. Comment 293-3

4. Traffic and Noise Concerns ~ We have too much now, why are we adding more to the congestion we already endure. Comment 293-4

5. Cumulative Environmental ~ this is vital for our future and the lives of our children. Comment 293-5

The San Joaquin River is one of gems we have here in the valley, it is a special area and the impact of your project would disrupt all that we hold sacred for our environment. Comment 293-6
I am a regular at the river, walking and hiking and enjoying the beauty of nature in our urban life. The diversity of wildlife, the beauty of the water and a place that brings joy to so many would be threatened.

Given these concerns, I urge the agency to require CEMEX to provide additional analysis, enhance mitigation measures, and explore less harmful alternatives. Comment 293-7
Public transparency and accountability in this review process are crucial to ensuring that the long-term health of the San Joaquin River watershed and surrounding communities is protected.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Sincerely,
Joanne Bazarian

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I believe this proposed project presents such significant risks and harms to Fresno County that it should be considered for cancellation. The significant risks and harms are the following: Comment 295-1

1) Friant Avenue is a significant bicycle route with established bicycle lanes in each direction. It is one of the few locations close to Fresno and Clovis where bicycles can ride for considerable distance without interruption from traffic lights and stop signs. I enjoy riding on this road on my bicycle fairly often. The proposed large increase in truck traffic will pose significant danger to the bicyclists because the trucks will have to merge across the bicycle path. Furthermore, the truck traffic will introduce significant amounts of dirt and rocks into the bicycle path which will be a danger to me and other bicyclists. I do not feel this issue is considered sufficiently in the EIR.

2). The noise and vibrations from the blasting will significantly affect wildlife and humans in the area. Wildlife will avoid the river plain due to the noise where efforts have been made to allow greater access and protection for wildlife. The proposed EIR does not adequately address this issue. Comment 295-2

3). The continuous removal of gravel within the river bed causes increased risk of scouring downstream which can affect structures such as bridge abutments. The EIR does not consider the risk to the bridge abutments on Hwy 41 and the frontage road where it crosses the San Joaquin River downstream of the project area. Comment 295-3

4). Studies have shown that the local area already has an abundance of gravel sources that exceed the demand. Thus, I question why this project is being considered if there is already sufficiently developed gravel and granite materials. This seems to be a very high risk project with little actual demand. Comment 295-4

5). The EIR does not adequately consider the issue of pollution that can result from the hard rock mining. Hard rock mining can generate acidic water that could be contaminated with metals if certain conditions are present. The EIR does not address if this is a possibility and if it can happen, what remediation will be done. Should such remediation be needed, it will be very costly and it does not appear that Cemex will be obligated to do such remediation through bonding. Comment 295-5

Thank you for considering these issues.

Regards,

Mark Fletcher

Comments on Cemex Rockfield Quarry Modification Project EIR

I am strongly opposed to granting the Unclassified Conditional Use Permits (C.U.P. Application # 3666 & 3667) sought by Cemex Construction Materials Pacific LLC for the purpose of continuing and expanding aggregate mining, processing, and asphalt production in the floodplain of the San Joaquin River. It is time to honor the original reclamation agreement after years of considerable profit and damage. Comment 296-1

This project is not in the best interest of our community. It will cause significant and irreversible damage to the river bottom lands. It will negatively impact efforts to restore the river and its environs. It will negatively affect the fisheries, and challenge and endanger local wildlife and both local and migratory birds. It is a huge affront and callous dismissal of years of time, effort, and monies dedicated to the San Joaquin River Trust and Conservatorship allied with local, county, and state agencies and all of the good citizens who have been tireless volunteers dedicated to the restoration and rehabilitation of the river and its environs for the purpose of creating an amazing and accessible recreational asset for all to enjoy. Comment 296-2

This plant is not needed. Present and future aggregate demand in the Fresno P-C Region can easily be met by the already existing operations: Vulcan Sanger Centerville Project output: 80 mil. /tons/50 yrs. (1.6 mil. tons annually); CMI Kings River Project output: 28 mil. /tons/50 yrs. (1 mil. tons annually); Carmelita Mine output: 50 mil. /tons/50 yrs. (1 mil. tons annually); Coalinga Mine @ Lost Hills output: (tonnage not available); Madera Quarry output: 900,000 tons/yr. (900,000 tons annually); and the Austin Quarry output: 2.5 mil. /tons 100 yrs. (2.5 mil. /tons annually.) Comment 296-3

There is also no shortage of asphalt in the Central Valley. More and more pavers are using portable plants located at the worksite for both cost reduction, time-saving, and convenience. And, with the 2022 passage of AB2953 which mandated incorporation of up to 25% of reclaimed asphalt and concrete - a real plus for extending the life of our landfills, temporary portable plants reduce roundtrip truck traffic emissions to stationary plants.

Siting a hot mix asphalt (HMA) in a river bottom environment is a recipe for disaster. HMAs have many serious disadvantages including high energy consumption and high emissions of pollutants. HMA emissions produce large quantities of reactive organic gases (volatile organic compounds), nitrous oxide, carbon monoxide, sulfur dioxide, and PM10 and PM25 particulates. All of these pollutants significantly and adversely contribute to smog formation as they Comment 296-4

are ozone precursors. HMAs also emit polycyclic aromatic hydrocarbons (PAHs) and fumes from oily bitumen which are proven carcinogens. Off-gassing may also present a fire hazard. HMAs stink!

Comment(s) 296-4 Cont. & 296-5

Sadly, the Central Valley Air Basin is one of the most polluted in our nation. This plant would significantly and adversely affect our air quality daily. The plant's emissions would contribute to global warming and climate change.

Comment 296-6

These emissions cause serious and sometimes fatal health affects for those with compromised respiratory and coronary systems. PM10 and PM25 particulates are especially harmful to those suffering from asthma. The San Joaquin Valley has the highest childhood asthma rate in our country with one in six children a victim.

HMA emissions also effect our regions biota, by increasing sulfuric rain which has caused significant damage resulting in stress and high tree mortalities and it causes production loss in agricultural operations. Woefully, our air quality index (AQI) has been "normalized." Each morning our local TV news stations report air quality which ranges from good-moderate-unhealthy for sensitive groups-unhealthy-very unhealthy and even hazardous. This plant will add to ground level ozone and particulate pollution. And, while Cemex enjoys sizeable profits, our citizenry essentially pays millions for air quality violations when the San Joaquin Valley Air District is fined for exceeding both the Ca. and the National Ambient Air Quality Standards.

Comment 296-7

Roundtrip diesel truck emissions will add significant loads of the aforementioned pollutants, while compromising the safety and surface conditions of our roadways.

Comment 296-8

Both the HMA and the quarry site are extremely ill-sited. Cemex knows this: they are putting profits first. I am absolutely amazed that Cemex is seeking approval to dig and blast a 600 foot deep pit, about 345 acres wide, with extreme 45 degree slopes, approximately 1320 feet from the river. This is extremely ignorant. This pit will fill with stormwater runoff, while continually intercepting groundwater flows through the substrata. The water will be polluted by chemical stabilizers and blasting chemicals requiring storage in ponds exposing wildlife to harmful or fatal consequences. Its depth will create a huge cone of depression disrupting groundwater flows impacting both the river , downstream users, and local wells. A gaping 600 foot deep pit is also highly unstable so close to a river and the underlying aquifer. It could collapse in the event of torrential rains, river flooding, or seismic movement. It could possibly influence or change the course of the river ultimately affecting downstream residents and land owners. For Cemex to suggest this pit could ever be reclaimed for recreational use is pure folly. It will forever be an enormous gaping hole, perhaps even a death trap for humans and wildlife, filled with water at its bottom where lack of aeration will undoubtedly cause emissions of smelly noxious gases where only mosquitoes and lethal algae prosper. Cemex knows this.

Comment 296-9

Comment 296-10

This project will produce both light and noise pollution affecting humans, fisheries, wildlife, and birds. It will either destroy or compromise the quality of recreation along the river and its adjacent lands. Imagine taking your family to Lost Lake Park for a quality nature experience only to have your day negatively impacted by truck traffic, loud noise, dust, and the prevailing stench of hydrocarbon emissions. Noise reverberates in this canyon.

Comment 296-11

Reclamation takes many years to rehabilitate such immensely damaged lands. Anyone driving Friant Road is acutely aware of the detrimental impacts mining in this river bottom caused. These lands will never return to their former beauty and purpose on God's earth. Perhaps had our leaders one hundred years ago foresaw the future environmental degradation their original approval wrought, they may have instead encouraged rock plant development at a more environmentally sound site. Now we know.

Comment 296-12

Its high time Cemex concentrated on fulfilling the original agreement to reclaim these lands rather than seeking to further aggravate the existing damages, and delaying reclamation for another one hundred years. Cemex could then donate these reclaimed lands to the San Joaquin River Parkway Trust and Conservatorship and its allies for the benefit of our communities, our tourism industry, and the river and its wild denizens. Just imagine the huge tax write-off and positive public relations such a bold and gallant move this would engender!

Comment 296-12 Cont.

Again, please deny the Cemex application for C.U.P. # 3666 & 3667. NO on this proposal!!!

Sincerely,

Catherine Fowler

Report Suspicious

I am writing to again oppose the CEMEX application to extend their lease for the next 100 years. I can't believe their audacity! Within the next 50 years the City of Fresno will be built around their current plant. Their constant blasting of the rock bed will be more noise pollution in an urban area and that alone should be enough to disqualify this project, not to mention the noise pollution from their cement and gravel trucks on Friant Road within the City of Fresno. The congestion and the constant drone of trucks is already too much and driving behind these trucks often leaves windshields pitted or worse, cracked! And the pollution from their diesel exhausts is already polluting enough now. I'm sure there are other sites in the rural parts of Fresno County that can be mined that would be much more appropriate for this type of business. For all these reasons I remain firmly opposed to CEMEX's application for any extension! It should be denied.

I attended the BOS open meeting when this was requested several years ago and my former Supervisor voted for a 3 year extension even though CEMEX had not updated their EIR for 20 years. As a result, I didn't vote for him in this past election, FYI!

Fresno, CA 93721

Dear Mr. Randall and the Fresno County Board of Supervisors,

My name is Daniel Griffith, I am a District 5 resident living in Clovis at 1930 N. Dartmouth Ave Clovis CA 93619. I can be reached by phone at 559-307-6644.

Comment 298-1

I am writing this letter to express my opposition to the expansion of the CEMEX contract on Friant Road. The San Joaquin River is arguably the most important natural resource in Fresno County, and allowing a foreign company like CEMEX to dig deep into the riverbed will ruin the landscape of the river forever.

That area of the San Joaquin River is directly adjacent to the largest metro area in Fresno County, and has immense potential for conservation and recreation for Fresno County residents. Allowing CEMEX to move forward with their plan will forever rob citizens of Fresno county of that potential, and leave a permanent stain on the record of those who allowed it to happen.

Comment 298-2

There are plenty of areas that are rich with natural resources that are not directly adjacent to a major metropolitan area where mining can occur. This project should not occur on the San Joaquin as planned.

Thank you for your consideration.

Comment 299-1

Comment(s) 299-2, 299-3

Comment 299-4

NO! The CEMEX operation has existed beyond the time where it is now in the way of population expansion. Friant Road is becoming outdated and will require widening, again, within a few years. The San Joaquin River has become a recreational area from the dam all the way to the 41 highway. Trucks from CEMEX operations can be hazards. NO! It is time for CEMEX to close operations and move elsewhere. To even consider allowing CEMEX to change their mining type to hard rock blasting, allowing the creation of deep pits (up to 600 feet deep), is mind boggling! Then to add another 100 years of mining along /friant road is INSANE! NO!!
Please do not allow the renewal, extension or modification of the CEMEX contract

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

David Randall, Senior Planner

I was almost 4 years old in 1955 when my stepfather took me to Lost Lake, a work in progress then. When he showed me the salmon run, there were so many salmon shore to shore, I started to walk on them, aiming to cross the not-so-wide river. He picked me up out of the water. That was the last big salmon run, with much smaller ones for a couple of years, and then none.

Comment 300-1

1. Digging for gravel in the San Joaquin River, whose waters are already mostly diverted to Kern County or the westside of Fresno County, has continuously damaged the river bed, sides, water, plant growth, and marine life for twice my entire lifetime. Business for profit has proceeded as "private profit from public property." Taxpayers cover the additional costs to roads, fire and paramedics, police services including traffic accidents (to increase with increased heavy trucks), and various inspections and lawsuits. It is long past time to stop all work by CEMEX and all other aggregate businesses in any place on the river.

Comment 300-2

2. When these companies say they will pay to repair the damages and restore the river, it's not a credible offer because the costs will be greater than the profits. After more than 100 years already of "gravel mining," the San Joaquin River needs restoration of land, wildlife, and all plant life, and recharging the natural water flow on and below ground level.

3. A 600 foot deep mining pit is not compatible with the life of the river or the urban life now built along much of Friant Road and long time neighboring rural buildings along both sides of the river, with active farming, herding, and fishing. Rock blasting is utterly incompatible with any zoning, especially because sound carries long distances by air and ground. Professors and geologists studying the San Joaquin River say the fault lines under and around Friant Dam present only a low likelihood of danger. Allowing blasting to the area reduces my trust in their assessments.

Comment 300-3

Comment 300-4

4. For any long term lease, a period of 100 years is absurd. For any lease, 10 years is a long time, maybe negotiable, but not in this case. There are hundreds of other sources of these materials in California. Any further need for the aggregate resources that may be in the San Joaquin River cannot outweigh the public need to return the river to a more natural state, suitable for public recreation, and become a naturally healthy river.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I absolutely disagree with this proposal to allow CEMEX to destroy our local wildlife, ecosystem, and environment by allowing them to drlll 600 ft down into the San Joaquin River. They were not allowed to perform a similar project in Mexico, thence, why would we allow them to do this project reject by the Mexican government here! Comment 301-1

It makes no sense and is not in our best interest for our community in the long run. I've already sent a message to my BOS board member. Now Mr. Bredefeld is the Supervisor of our district.

There are alternatives to this project. Comment 301-2

They could go somewhere else to drill

and

Give the land to the San Joaquin River Park Way conservatory. Comment 301-3

My feelings are the same as in this Fresno Bee Opinion given on 2/15/2025. Here is the link to the article below. Comment 301-4

Dear D. Randalll,
I am against the CEMEX request for an extension on their projects along the San Joaquin River.
I believe the environmental impact is too significant to go forward with this project.
Please reject this project for the sake of our land and river.
Thank you.

Dear Fresno County Staff and Decision Makers,

Comment 304-1

I am writing to *once again strongly oppose* the Rockfield Modification Project as outlined in the Draft Environmental Impact Report (DEIR), particularly regarding Impact 4.18-1, which raises serious concerns about the potential for substantial adverse changes to tribal cultural resources. Assessment and cultural resource searches (sections 4.5.1.3 and 4.5.1.4) reveal critical gaps in the protection of potential burial sites and culturally significant areas.

According to the Burial Site Sensitivity Assessment conducted by Applied EarthWorks, the project sites are situated in areas with high to very high potential for containing *intact anthropogenic paleosols*.

I'd first like to say this section of the DEIR is intentionally vague and confusing. I understand the purpose of an impact statement and the importance of language choices used. That being said, it is unrealistic to expect even an educated, informed member of the public to review this 3,000 plus page document, let alone look into who and what anthropomorphic paleosols are. *So, let me spell it out here:* anthropomorphic paleosols are ancient soils that may (in this case they do) show evidence of human activity. Paleosols are ancient soils that have been preserved in the geologic record. They can be used to reconstruct past climates and environments.

The soils on the project sites have a documented history of containing buried cultural materials. ***The DEIR fails to recognize the risk of encountering buried cultural resources during excavation and construction activities in these high-potential areas.*** When I review the current and mitigation measures, the interpretation relies heavy on the following: 1) Cemex will accurately and diligently conform to the protection measures identified 2) Cemex has already mined extensively and therefore finding cultural resources is not a significant concern. I feel these statements directly contradict each other.

While River wash soils have a lower likelihood for harboring intact prehistoric material, the proximity of the project sites to these areas, along with the surrounding geological and hydrologic forces, increases the likelihood of disturbance to cultural deposits through construction activities*. Despite these findings, the DEIR's mitigation measures are not enforceable or proactive to protect these resources, particularly in areas where the potential for buried cultural deposits is high. Additionally, when using explosives to create a 600ft pit, how are these mitigation measures relevant?*

Comment 304-2

Questions: Mitigation Measure 4.5-:2

1. “If prehistoric or historic-era cultural resources are encountered during project activities, all ground disturbing activities within 50 feet of the find shall cease.” Does fifty (50) feet seem like an adequate buffered to protect cultural resources?
2. Can you site the research that supports a 50ft buffer for mining and major ground disturbance operations? Is it clearly laid out in CEQA Guidelines Section 15126.4(b)(3)(C)?

Comment 304-2 Cont.

“Mitigation shall consult with appropriate Native American representatives in determining appropriate treatment for unearthed cultural resources if the resources are prehistoric or Native American in nature.”

Comment 304-3

3. How many reports written by an archeologist were submitted to Fresno County and the Southern San Joaquin Valley Information Center in the past 100 years?
4. What is the Corporation’s history with consulting or working with Native representatives?
5. Which “accredited curational facility” have previous artifacts been investigated at?
6. Who is responsible for hiring the archeologist if a situation would arise?
7. How is this process enforced? How will other significant/ potentially significant impacts be enforced?
8. Does the County of Fresno have the capacity to ensure Cemex’s commitment to mitigation measures? Do our local tribal communities have the capacity to ensure there is no loss of cultural resources?

Records Searches and Cultural Resources Identification

Comment 304-4

The Plant Site records search revealed one historic-period building and a series of previous pedestrian surveys, noting 12 cultural resources and 11 studies within a half-mile of the site. Similarly, the Quarry Site search identified one cultural resource and **referenced two studies conducted more than 15 years ago**.

Personal Testimony

There are several sets of grinding stones along the San Joaquin River Parkway. GPS: 36.943340, -119.743130 in between the quarry and plant sites at the bottom of the Tesoro Viejo trail. The San Joaquin River was and is the most valuable cultural resource in the area.

I watched the San Joaquin River Conservancy Board meeting where a councilmember dismissed and disrespected Native American leaders while they advocated project completion and land stewardship. It was disgraceful. I understand that when this project moves forward it will be passed to the Fresno County Board of Supervisors. A member of both boards will be voting on this matter. *I urge the Supervisors to think about previous choices – and really listen to the public on this matter. When every resident of Fresno and Madera is dead, if this project passes, mining will continue long after we are gone. I urge the officials to examine the legacy they intend to leave behind for their community and loved ones.*

Comment 304-5

Sincerely,
Jenae McCarthy

Subject: Opposition to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report

Dear Mr. Randall,

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas. Most of the mitigation solutions in the draft EIR amount to crossing our fingers that there won't be substantial impacts to the environment and/or a naive hope that Cemex will comply with the suggested mitigations. Comment 305-1

As someone who lives in an adjacent community in Fresno County to the quarry site, and is thus very familiar with the environment in the area, I find that the draft EIR fails to adequately address the following concerns, mostly directed to proposed changes to the quarry site:

1. Aesthetics and Visual Resources
    a. The analysis prepared by Sespe Consulting is deeply flawed when it comes to photo site selection, photoshopping of potential impacts and rating of visual impacts, so much so that the integrity and credibility of Sespe's lead on this section of the DEIR should be called into question and a new analysis of the visual impact should be conducted by the County. In particular, when you look at the photoshopping of their original photos intended to show how the project will look in future phases, it's hard to imagine that Cemex could have created more optimistic forecasting of what the project would look like if they had been able to put their own in-house graphic designers on it. Comment 305-2
        i. A look at the selected photo sites alone on pages 189 through 217 of the Draft EIR PDF makes it clear that the analysis is suspect. They provide Comment 305-3

before photos from carefully selected sites that minimize what the visual impact of the planned project would be. Most of the photos show flat land that could not capture the planned deep hole Cemex wants to dig, nor the very high and ugly berms Cemex would have to build to hide said hole. The before photos do not manage to show the aesthetic beauty of the area, either from the Friant Road level that would include stunning views of Little Table Mountain, located on the Madera County side of the river, or looking down from the bluffs on both sides of the river. The view of Little Table Mountain from Friant Road, without berms to hide it, is so beautiful that it should put Friant Road in contention as a scenic byway. But there's little chance of that if this project is approved.

Comment 305-3 Cont.

1. Remedy: Hire a new consulting company to select new photo sites that would capture the actual impact that would be caused by the Cemex plan to dig a 600-foot hole in the ground (and the required berms or screening that would be necessary to hide the aesthetic impact of that hole) and do not hide the natural beauty that exists in the area. The County should select the new consulting company, with input from the public.

ii. The photoshopping of the before photos to show the visual impact of the first two phases of the 100-year Cemex plan and the reclamation stage is laughable. Where do we see in any of these doctored photos the impact of a 600-foot hole? Where do we see the giant dirt berms required to hide this hole that would block views of Little Table Mountain from Friant Road? Where do we see the enormous, stadium lighted plant equipment Cemex wants to move to the quarry site? Where do we see the giant plot of dirt surrounding the hole where all natural grasses in trees have been removed, causing a jarring and unnatural contrast with the surrounding area?

Comment 305-4

1. Remedy: Hire a new consulting company to take new photos from new photo sites and create accurate photoshopping of the undeniable visual impacts that would be caused by the Cemex plan to dig a 600-foot hole in the ground and the required berms or screening that would be necessary to hide the aesthetic impact of that hole. This should include photoshopped views from the bluffs on both sides of the river and from Friant Road, which is used by bicyclists and vehicle traffic. The County should select the new consulting company, with input from the public.

b. The visual project impact ratings in Table 4.1-3 on pages 221 and 222 need to be conducted by a new third party consultant. The new ratings should include different viewing sites and not ignore the stunning views of Little Table Mountain that will be obstructed by the berms this project would create. An honest analysis of the visual impact of this project could not possibly conclude there would be more beneficial impacts on the visual aesthetics than there are significant

Comment 305-5

impacts. No one could say that with a straight face and it should not be included in any EIR, draft or final. Comment 305-5 Cont.

i. Remedy: Conduct a new visual project impact analysis with fresh ratings by a new third party consultant selected by the County, with input from the public.

c. The harmful impact of the proposed 600-foot hole (or even a 300-foot hole should the real intent be to compromise down the road in this process) on the aesthetics of the area cannot be denied. Views from the bluffs on both sides of the river would be irreparably harmed. And it is not only from private lands. There are publicly available trails on the Madera County side of the river that would look straight into this giant hole in the earth. These trails are used by residents from many counties, not just Madera County. Even the very suspect ratings in Table 4.1-3 recognize there will be a potentially significant impact. You can't create a hole that big without ruining the visual aesthetics. Comment 305-6

   i. Remedy: The only mitigation I can think of if Cemex wants to dig any deeper in the current quarry, for visual aesthetic impacts, is for it to do so by creating a small tunnel entrance into underground tunnels that could be used for mining. There cannot be an open hole at the quarry that goes beyond its current depth, and certainly not to 600-feet deep, without causing significant impacts. A tunnel system would hide this much better (though it would probably not address other concerns caused by the proposed project to things like noise pollution caused by blasting and potential destruction of nearby aquifers used as sources of water by nearby homeowners). The potential of this mitigation should be explored in the final EIR.

d. Moving plant equipment to the quarry site at any stage of the project would cause enormous negative visual impact to the quarry site area. I did not see this seriously considered in the photoshopped images or in the visual impact ratings. This would harm visual aesthetics from both the higher bluff views and from the street view of the quarry site, especially when one considers the proposed nighttime lighting of this equipment. Comment 305-7

   i. Remedy: Conduct a new visual analysis, including new photoshopped images of what adding plant equipment to the quarry site would look like and create new visual impact ratings. The analysis should be completed by a new third-party consulting firm selected by the County, with input from the public.

   ii. Remedy: Adding plant equipment to the quarry site cannot realistically be done without greatly damaging the visual aesthetics of the area. Much of this equipment is very tall, is supposed to be lit at night, and will be extremely displeasing to the eye, both from the road, from publicly accessible trails and from nearby homes. The current analysis states that it will be out of view, but that is not how light works. Picture the lighting in high school football stadiums - you can't see inside the stadiums from the outside, but you see the lighting that comes out at the top. And the homes Comment 305-8

that look down toward the quarry would definitely see over any berms and into the intense lights. Lighting plant equipment at night would ruin the enjoyment of properties for nearby homeowners and it should not be allowed at all. It is dishonest to say that lighting plant equipment won't cause significant visual impacts in the area and that conclusion needs to be stripped from the draft EIR and changed to a significant impact. There is no mitigation for having lighted plant equipment at the quarry site and the only answer is to prevent moving plant equipment to the quarry site. The plant equipment should not be allowed to exist near the river parkway or near homes in the area. Cemex should find alternative sites for the plant equipment not close to the quarry site, and not within sight of the San Joaquin River.

Comment 305-8 Cont.

1. In the alternative, nighttime lighting other than flashlights and vehicle headlamps should be prohibited at the quarry site. Cemex operations should not be allowed at hours where daylight is not sufficient, without lighting, to do the work safely.

2. Air Quality

   a. The Draft EIR states that the level of air quality impact before mitigation is potentially significant. This includes VOC, SVOC, and/or SO2 emissions. It concludes that impacts would be less than significant with various mitigations, such as requiring less harmful types of asphaltic cement to be created on premises and periodic equipment checks and maintenance, outlined on pages 321 and 322 of the PDF. How will the County ensure that these mitigation requirements are followed?

      i. Remedy: Enforcement is key. For all air quality mitigation suggested in the EIR, require a trust or other financial mechanism be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI, to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County for any legal disputes with Cemex if Cemex does not observe any required mitigation practices and has its operations suspended or terminated by the County for failure to follow all air quality mitigation requirements.

Comment 305-9

   b. Dust control needs to have requirements enforced by the County. We're talking about Cemex, a company that never covers the dirt and debris it hauls in trucks from the quarry site, even though retractable dust covers are often present on their trucks. I'll say it again - they never cover their trucks. So why should we trust Cemex to do all the dust mitigation they claim they'll do?

      i. Remedy: Enforcement is key. For all dust mitigation suggested in the EIR, require a trust or other financial mechanism be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI, to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County for any legal disputes with Cemex if Cemex does not observe any

Comment 305-10

Comment 305-10 Cont.

required mitigation practices and has its operations suspended or terminated by the County for failure to follow all dust mitigation requirements.

c. Require new study of what the impact of dust and pollutants from the project would be on the homes on the east side of the quarry and create additional screening to prevent dust and airborne pollutants from impacting these properties.
    i. Remedy: A combination of walls, trees and any other screening determined to be helpful by consultants to minimize impact on the homes located across Friant Road from the quarry.
d. Dirt berms at the sites need to be replaced with a combination of internal walls with a facade of full-grown, healthy trees. These dirt berms add to the dust pollution problem. They are also eyesores.

3. Biological Resources

Comment 305-11

a. The blasting, project lighting and creation of a 600-foot hole in the ground will clearly impact nearby wildlife and could even destroy the ecology of the San Joaquin River area. All of the wildlife is interdependent and the loss of one type of animal will lead to losses among others. This deserves close attention and further study.
    i. Just from my own observations in the area, I've seen a mountain lion, bald eagles nesting very close to the river, roadrunners, and many of the unthreatened animals and birds that are part of the ecology in this area. What happens to this wildlife when Cemex starts blasting?

Comment 305-12

    ii. The draft EIR recognizes the presence of many cherished and some threatened animal species, but states that because the current sites maintained by Cemex are essentially wastelands, there shouldn't be any impact. This ignores the impact of blasting on the wildlife that currently lives in the surrounding area. Further study is needed on the impact of blasting on the wildlife in the river habitat.
    It is also ridiculous to reward Cemex for the damage they have done to the land to date by saying they can't make it worse for wildlife in the future.

Comment 305-13

    iii. The draft EIR states there are potentially significant impacts to certain wildlife but then states mitigation efforts can change the impact to less than significant. Again, enforcement is key. For all wildlife impact mitigation suggested in the EIR, require a trust or other financial mechanism to be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI, to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County for any legal disputes with Cemex if Cemex does not observe any required mitigation practices and has its operations suspended or terminated by the County for failure to follow all wildlife mitigation requirements.

iv. On page 382, regarding the impacts of blasting, the draft EIR states that an annual blasting plan is to be created by Cemex and provided to the County for review. Comment 305-14

1. Remedy: Rather than allowing Cemex to create an annual blasting plan, the County needs to spell out in advance of project approval whether blasting should be allowed at all and, if so, how often, at what time of day, how low the sound and vibration must be, etc. Do not allow them to make an annual plan. The County needs to set limits at the beginning and Cemex must provide funding in advance, for the full 100 years, for the County employees who will enforce these limits.

4. Geology and Soils

a. Homeowners in the area should know that the County has conducted studies ensuring that the blasting will not cause damage to the walls, foundations or land on which their homes are built. Comment 305-15

i. Remedy: If soil and geological studies have not been conducted for each home located within one mile of the quarry site, that needs to occur and be included in the final EIR to ensure that blasting at the quarry will not cause damage to structures, foundations and land that structures are built on. Homes on the bluffs on each side of the river are built on unique geological foundations and each home should be looked at individually.

ii. Remedy: Cemex should be required to place funds in a trust or other financial instrument in advance of the project expansion with enough resources to make homeowners whole if any damage to their homes or properties is caused by blasting at the Cemex facility. Cemex should also be required to pay the attorney fees of any homeowners that take legal action against Cemex for damage caused to their homes or properties.

b. To my knowledge, there is no aggregate or mineral mining project in the country so close to a major river where a government entity has approved anything close to a 600-foot hole. Because of this, neutral third-party research into the geology between the river and the proposed quarry project must be completed and included in the final EIR. We cannot rely on Cemex commissioned studies, as this draft EIR does. Comment 305-16

5. Hydrology and Water Quality

a. As seen in Figure 4.10-9 in the draft EIR, the county wells servicing homes immediately east of the quarry site go to depths of 210 and 350 feet. These wells are community wells run by Fresno County and are labeled CSA 44c. They currently collect water at 105 feet bgs. There are other wells that would be impacted, but I'll focus on these wells since they are located immediately across Friant Road from the quarry site. These wells are clearly in danger of being impacted by the quarry site plan to blast and drill down to 600 feet bgs. Blasting and drilling is a threat to the sole water supply of the community across the street from the quarry site. Comment 305-17

i. In addition to concerns about blasting and other operations causing damage to the quantity of the water supply for surrounding wells, the draft EIR itself lists the potential impacts to water quality on page 651 of the Executive Summary: "Potential effects to surface water quality within both the Plant Site and Quarry Site could occur under the proposed project. Impacts could occur due to erosion and sedimentation caused by land disturbances; the release of uncontained materials associated with processing and production facilities and equipment storage areas; improper handling of hazardous materials, including diesel, gasoline, and asphaltic oil that would be stored on-site; improper handling and detonation of blasting agents that would be brought to the site by a qualified blasting contractor for each blasting event; improper discharge of wash water generated by washing/processing of sand and gravel; and leaking oils and grease from heavy equipment. Similar leaking of oils and grease effects could occur during site reclamation, which would involve land disturbance and the use of heavy equipment as part of reconstruction and revegetation of slopes and during the demolition and removal of structures on the sites, including the removal of processing and production facilities and septic systems, and the abandonment of monitoring and groundwater supply wells." Unfortunately, the conclusion is that Cemex will follow mitigation guidance and change the impacts from potentially significant to less than significant. Reading the risks cited above from the draft EIR and knowing Cemex's record on compliance should not give any of us confidence. Comment 305-18

ii. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, to ensure that blasting and drilling activities Cemex proposes to use to create the 600-foot-deep mine will not jeopardize the water supply of CSA 44c or any other wells in the area, by collapsing or damaging any underground water aquifers or underground water sources. Comment 305-19

iii. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, to ensure that chemicals Cemex plans to use in blasting and drilling and any other chemicals involved in their operations under the proposed plan will not impact water quality to the wells in the surrounding area. One focus should be on recommending an enforcement plan for the County to adopt and how much funding it would require for proper oversight.

iv. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, looking into how the 600-foot hole Cemex wants to create will potentially cut off water seepage from the San Joaquin river to the groundwater supply used by wells in the surrounding area.

b. Maps on pages 431, 432, 435, 438 and 444 under file label "Draft EIR Volume 2 Appendices A-K File 2" on the County's Cemex Rockfield Expansion webpage Comment 305-20

show red arrows that indicate "Direction of Groundwater Flow" going from the areas that would contain wells for homeowners in the area, including County wells for CSA 44c, toward the current depression where the quarry is located. This is evidence that a depression in the earth made for a quarry will impact groundwater levels that will likely impact nearby wells. If the depression in the earth for the quarry is vastly deeper, logic dictates that there will be a greater impact on the "Direction of Groundwater Flow" and that this would likely impact groundwater levels for neighboring wells.

Comment 305-20 Cont.

   i. Remedy: More studies need to be conducted by neutral third parties, not commissioned by Cemex, looking into how the 600-foot hole Cemex wants to create will potentially cause groundwater flow into the quarry site to escalate and impact the groundwater supply used by wells in the surrounding area.

c. Mitigation Measure 4.10-6 starting on page 660 of the Executive Summary calls for Cemex to hire its own experts to monitor water quality at the quarry site in order to prevent potentially significant impacts to water quality for water used by nearby wells and relies on Cemex to honestly report its findings in a timely manner. This cannot be allowed. The County must have its own staff, funded in advance by Cemex by a trust or similar financial instrument, for the entire 100-year period, who can monitor water quality. Water quality should be measured on a weekly basis and reported on the County website, with immediate written notification to homeowners if water quality has been compromised, to prevent serious health conditions among neighboring homeowners.

Comment 305-21

d. Remedy: If there is any damage or disruption to water supply for homeowners in the surrounding area, Cemex must immediately supply water and water storage units sufficient to provide the same water quantity supplied to homeowners prior to project approval.
   i. Remedy: Because water supply storage is unsightly and undesirable for homeowners to have on their properties and will lower home values, Cemex must agree to purchase properties of any homeowners choosing that option if water supply is damaged or disrupted by their operations. Value of properties shall be determined by independent appraisers prior to any approval of Cemex project extension and indexed to average percentage increases in home values of the 93720 and 93730 zip codes over time.
e. Remedy: For all water supply protections or mitigation suggested in the EIR, require a trust or other financial mechanism be funded by Cemex in advance of full project approval, to cover all 100 years, indexed to CPI, to fund full-time County employees tasked with oversight of required mitigation. Also, require that Cemex pay full legal costs of Fresno County or nearby homeowners for any legal disputes with Cemex if Cemex causes damage or disruption to the water supply of nearby homeowners.

6. Land Use and Planning

a. Opportunity costs are important to consider here. If this project is approved, there is no going back and using the land for anything else, ever again. It will always be an unsafe area for recreation, housing or anything else if this project is approved. A better use of the plant and quarry sites will be to eventually include it in an overall plan for recreation and protected land and wildlife. Comment 305-22

7. Noise
    a. When aggregate or rock is dumped into trucks at the quarry site, the decibel levels exceed acceptable levels under County policy. Increasing the amount of truck hauling will therefore cause a significant impact to the neighborhood immediately east of the quarry site. Comment 305-23
        i. Remedy: Test noise caused by dumping of aggregate and rock into trucks and do not allow increased truck hauling from current levels at any stage of the project.
        ii. Remedy: Limit hours of truck hauling to 8:00 am to 5:00 pm to avoid loud noises in the morning and times people often return home from work. Also, no truck hauling should occur on weekends when families are most likely to be home trying to enjoy their properties.
    b. Noise from blasting will cause noise pollution and anxiety among people who live in the area, especially those with PTSD from past events in their lives such as my spouse. Comment 305-24
        i. Remedy: If blasting is allowed at all, limit it to once per day within a one-hour window of time so that it does not take people off guard. Also, it should not occur earlier than 10:00 am or after 4:00 pm and never on weekends.
8. Population and Housing
    a. See comments made in other sections of this letter concerning the impact this will have on people living in the area, especially those on both sides of the bluffs overlooking the quarry. Comment 305-25
    b. This project expansion would have a devastating effect on home values in the area and land that could eventually be used for responsible development of housing. This will have an adverse effect on current and future property tax collection for the County.
9. Recreation
    a. Potentially the greatest cost to Fresno County if this project is approved would be the loss of recreational opportunities to its residents if the Cemex project prevents the vision for a fully realized river parkway with hiking and biking trails and picnic grounds for all its residents to enjoy. Comment 305-26
    b. Another impact to recreation will come from increased truck traffic, dust and air pollution along Friant Road, which is a highly popular road for cyclists to use. Comment 305-27
        i. Remedy: Increased trucking traffic from the expanded quarry would be a danger to cyclists. One mitigation would be to require Cemex to construct a two-lane, bicycle and pedestrian only road adjacent to Friant Road from Copper Avenue in Fresno to Northfork Road (Road 206) in Friant.

10. Transportation
    a. The Cemex expansion plans include increased vehicle traffic from their trucks, including increasing traffic with large trucks on the already congested and dangerous section of Friant Avenue in Fresno, CA, particularly between Fort Washington and Freeway 41.
    b. Remedy: The stretch of Friant Avenue between Fort Washington and Freeway 41, much of it adjacent to Woodward Park, needs decreased traffic rather than the dangerous increase that this project promises. One potential mitigation would be for Cemex to pay for two additional lanes to be constructed on the northbound and southbound sides of the road on this stretch of Friant Avenue. Since this is already a bottleneck with little available land for expansion, Cemex would have to pay for properties in the path of road expansion.
        i. There is no good solution to any project that would increase traffic on this already overburdened and dangerous stretch of road. A better idea is for Cemex to find a new property in another part of the County if it wants to expand production and the amount of truck hauling it does.

Comment 305-28

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. It should also include independent, third-party study and suggested mitigation that isn't commissioned by Cemex. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

Comment 305-29

I request that the Planning Department reconsider this permit considering the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

And finally, please use common sense and treat this proposed project how it deserves to be treated. This is a monumental overreach by Cemex. The time for mining, especially deep pit blasting and drilling, along the San Joaquin River has long since passed. It is time for Fresno County to embrace the river for its recreational, wildlife and land preservation opportunities.

Thank you for your time and consideration.

Sincerely,

B McNally

Protest of Adoption of the Draft EIR and Issuance of Conditional Use Permits Nos. 3666 and 3667
Project: Rockfield Modification Project (EIR No. 2020060123)

To Whom It May Concern:

I am writing to formally protest the proposed adoption of the Draft Environmental Impact Report (EIR) and the issuance of Conditional Use Permits Nos. 3666 and 3667 for the Rockfield Modification Project. After reviewing EIR's executive summary and numerous appendices, I have significant concerns regarding the adequacy of the proposed mitigation measures in three critical areas: the long-term impacts of the 600-foot deep quarry pit, traffic, noise and vibration, and the potential degradation of water quality and availability in the San Joaquin River and regional groundwater.

Comment 306-1

1. **Risks Associated with the 600-Foot Quarry Pit**

The EIR indicates that the Quarry Site will be excavated to a depth of approximately 600 feet below ground surface. Although the document presents slope stability analyses and mitigation measures, including periodic inspections by qualified engineers, the potential for slope instability remains a serious concern that may not be adequately addressed by the proposed mitigation measures. The mitigation measures rely heavily on reactive monitoring and periodic reporting. However, given the uncertainties inherent in weathered and fractured bedrock conditions, unforeseen geological variations may lead to rapid onset of instability that these measures cannot adequately address. This raises questions about the long-term safety and environmental impacts of leaving such a deep pit after mining operations conclude.

Comment 306-2

The near-vertical slopes of the pit will severely limit the development of gradual littoral zones. Shallow areas are critical for spawning, the growth of aquatic vegetation, and for supporting a diverse range of wildlife. Without these transitional areas, the pond may be unlikely to sustain a robust ecosystem. The steep, sheer walls of the pit not only compromise habitat potential but also elevate safety risks. Such slopes can be prone to erosion or even catastrophic failure, especially during heavy rains or seismic events, which would further jeopardize both the environment and public safety. The presence of the pit also conflicts with Fresno County General Plan Policies OS-H.10. Considering the Project's proximity to the San Joaquin River, the final 600' deep pit would create a significant public safety hazard to future users of the San Joaquin River Parkway and individuals recreating on the banks of the San Joaquin and Lost Lake County Park. Additionally, the absence of detailed plans addressing long-term water circulation, sedimentation, and ecological restoration in

the final design suggests that the pit may simply become a static, inhospitable reservoir rather than a vibrant ecological asset. The proposed mitigation measures should be further evaluated by the County, as it may still represent a significant impact even after mitigation measures have been implemented.

Comment 306-2 Cont.

2. Traffic, Noise and Vibration

Comment 306-3

The Draft EIR acknowledges that blasting at the Quarry Site poses a risk of generating ground borne vibrations that could exceed the critical threshold necessary to potentially destabilize the San Joaquin River embankment. Although the proposed blasting protocols require monitoring and adjustments in blasting design, these protocols appear reactive rather than preventative and require little to no oversight from regulators. The reliance on post-blast monitoring, rather than more stringent pre-blast controls, may not fully safeguard sensitive receptors or ensure that vibration and/or levels remain within safe limits during all blasting events. This gap in precautionary measures could result in unforeseen damage to the embankment and nearby structures. Additionally, noise impacts to potential receptors from blasting activities were assessed using modeling and the mitigation measures rely on the operator self-regulating when choosing blasting designs. Both approaches introduce uncertainty and indicate that the potential impacts from noise and vibration may not be mitigated to a less than significant impact.

The EIR concludes that Impact 4.17-1 is significant and unavoidable. The EIR found that the addition of project-related trips to existing conditions, 5-year cumulative conditions, 15-year, and cumulative (year 2040) conditions would contribute to substantial decreases in level of service and substantial increase in queuing at several intersections. Mitigation of these effects relies on the County providing funding for road/signaling improvements. This is an unacceptable mitigation approach that would be avoidable if the projects proponent provided adequate funding for the necessary road improvements. I agree with the EIR's findings that this is a significant impact and implore the County to consider this impact when making a decision regarding whether or not to approve the Conditional Use Permits.

3. Potential Impacts on Water Quality

Comment 306-4

The EIR's hydrology and water quality sections contend that dewatering, pit pond formation, and potential contaminant discharges will have "less than significant" impacts on groundwater and surface water quality. However, the projected operation involves complex interactions between dewatering processes, blast-induced disturbances and effect groundwater within the fractured bedrock. The assumption that dewatering will not adversely affect the ability of nearby production wells and County Service Area 44C wells to supply adequate water to the service area, and that the existing recharge areas will remain unaffected, may be overly optimistic. The County Service Area 44C wells tap groundwater from the alluvial

Comment 306-4 Cont.

deposits, weathered zone and hard rock. Water levels in these wells are similar to those of wells at the Quary Site, suggesting that the two are hydraulically connected. According to the EIR, groundwater levels in the CSA 44C wells average approximately 45 ft below ground surface (bgs). The groundwater level in the CSA 44C well area at the time of maximum dewatering is estimated to be approximately 75 ft bgs if recharge occurs in the northeast area of the Quarry Site or approximately 105 ft bgs if recharge does not occur. Thus, the estimated decrease in the static water level at the CSA 44C wells due to the project would range from 30 feet to 60 feet depending on groundwater recharge. Significant decreases in water levels in these wells have occurred due to pumping, and there may be a significant level of uncertainty regarding the ability of these wells to produce under sustained pumping while the mine is undergoing substantial dewatering. Without clearly defined action thresholds and detailed contingency plans, there is a risk of groundwater quality/availability problems emerging, especially in a setting complicated by the deep pit and aggressive dewatering. Groundwater impacts might not be managed swiftly or effectively enough with the proposed mitigation measures to prevent broader impacts on regional groundwater or adjacent surface waters. This may result in a significant unmitigated impact that should be further evaluated.

I appreciate your attention to these critical issues and look forward to seeing your response.

Sincerely,

Ryan C. Mitchum

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

David,

Regarding the CEMEX Rockfield expansion project, me and my family as a resident of area, think that the project must stop. Comment 307-1

Many reasons came to our mind to oppose to the new project, but I will share just 2.

1. CEMEX Rockfield has been working the area many years, when they started in the Friant road, the area were just fields, but now with new house developments, the mine is in front of our eyes, the traffic of heavy trucks its added to our already crowd regular traffic.

2. The environmental impact that the new project will have in the river will be devastated. Comment 307-2

We think that new project expansion needs to be cancelled.

We hope this email from me and my family can help to consider not to the expansion of the project.

If you need have any comments or concerns, please contact me through this email.

Best regards,

Jose Palacios-Carrion

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear David,

I am writing to express my strong opposition to the proposed Rockfield Quarry modification project, particularly the 100-year mining expansion. This project raises serious concerns about its long-term environmental, community, and regulatory impacts, and I urge decision-makers to reconsider approving such an extensive timeline. Comment 309-1

My key concerns:

• 100-Year Timeline is Unmanageable

• No industry or infrastructure project should be approved for an entire century without periodic re-evaluation and accountability.

• Future environmental laws, climate conditions, and community needs are impossible to predict over 100 years.

• Environmental Impact on the San Joaquin River Corridor Comment 309-2

• Expanding mining operations 600 feet below ground risks groundwater contamination, habitat destruction, and soil instability. Comment 309-3

• The dust, air pollution, and water consumption required for hard rock mining will have lasting ecological consequences. Comment 309-4

• Community Disruptions & Land Use Conflicts Comment 309-5

• Increased blasting, noise, and traffic congestion along North Friant Road will negatively impact residents and recreation areas. Comment 309-6

• The relocation of the asphalt and concrete plants to the Quarry Site raises air quality concerns. Comment 309-7

• The project could interfere with the San Joaquin River Parkway's conservation and recreational goals which I love so much. Comment 309-8

Call to Action: Comment 309-9

I urge the County and regulatory agencies to:

1. Reject the 100-year mining approval and implement a shorter, more reasonable review period (e.g., 20-25 years).

Comment
309-10

2. Mandate stronger environmental protections for water, air, and wildlife.

3. Take care of the people of Fresno and beautify those places instead with nature

Stop mining, research for better resources,

I appreciate the opportunity to provide public input.

Best regards,

Maria Pantoja

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

Comment 310-1

I am writing to oppose the approval of CEMEX 100 year lease. The DEIR is inadequate.

Comment 310-2

1. Toxic chemicals will leach into the San Joaquin River and affect wildlife and human health. The dig pit is too close to the river

Comment 310-3

2. Explosions will be heard by cyclists, hikers, boaters, and all other visitors to the San Joaquin River. This will make for quite an unpleasant experience for those hoping to enjoy the river and its wildlife.

Comment 310-4

3. A 600 ft deep pit will not a pleasant site. I do not want to look over the San Joaquin River and see such destruction. The San Joaquin River is the jewel of Fresno. Don't destroy it!!!

Comment 310-5

4. The amount of jobs created by this mine is nothing compared to the amount of money brought by visitors to the region who recreate along the San Joaquin River.

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

Comment 312-1

It is hard to believe that the Cemex project that so dangerously impacts our environment would be considered - especially for 100 years and 600 feet of drilling.

We are faced with the existential threat of global warming that is now wreaking havoc on our world and do not need to add further destruction. With the amount of trucks that Cemex will be using to continually transport the material and the amount of pollution that will occur from this over so many years is totally unacceptable. Nowhere is the DEIR is there enough evidence that they will be able to mitigate this situation.

Comment 312-2

Additionally, blasting hard rock and crushing it into gravel going down 600 feet endangers our river and it's wildlife. Again, I see no way or no provision that would be acceptable to prevent this. We must protect this natural treasure.

Comment 312-3

I hope that the agency will require Cemex to provide further analysis and effective mitigations for these issues. We must protect the San Joaquin River watershed, surrounding areas and our environment.

Thank you for your consideration and I look forward to hearing from you and trust you will do your best to protect us.

David Randall,

This project is offensive! The permits for this company should have been canceled years ago. Comment 314-1

People in this area are already drilling new wells due to new construction. This project will take the water table right down to bedrock, there will be no water even for the deepest wells. There is nothing included in the proposal to help those who loose their water because of this project.

The traffic on Friant is already ridiculous. Many more huge gravel trucks weaving in and out of traffic, as they do, will make Friant Rd. Even more dangerous and congested. Comment 314-2

Just tell CEMEX NO, we don't want you.

Subject: Comments on CEMEX Rockfield Expansion Project DEIR

Dear David,

Comment 315-1

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval.

My husband and I have spent many hours cycling in the early mornings on Old Friant Road and Friant Road. We enjoy the quiet serenity of this special area of Fresno.

While dodging gravel trucks is a scary and jarring part of our trip, we have not yet let it stop us from enjoying this pastoral setting.

Comment 315-2

I would like to address the language in the *DEIR* regarding **Noise and Traffic** in this beautiful pastoral part of Fresno. The River Park way and Eaton Trail are sanctuaries in our town for serenity and contemplation.

The absence of a noise ordinance with specific measures to enforce a noise abatement plan for the mining project would result in reliance on CeMex, which may not provide adequate protection for our community.

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Sincerely.

Sandra Aune

Fresno County Public Works and Planning Department
Development Services and Capital Projects Division
2220 Tulare Street, 6th Floor
Fresno, CA 93721
DRandall@FresnoCountyCA.gov

Dear Mr. David Randall,

There is no need to allow a multinational company to profit off of further environmental harm to the land and watershed of our own home. With 556 million tons of permitted aggregate reserves in the Fresno region, well beyond projected demand, there is no good reason. It deeply troubles me that these open pit blights were blasted into land that was intact enough to eventually be protected as nature reserves. How I wish the San Joaquin river was respected. Bring back the salmon, restore wetlands, help California heal. It would be a joy to have healthier, longer stretches of intact native plant communities/habitat closer to home. We've found happier places below Pine Flat along the Kings. Just yesterday, we observed an immature bald eagle attempting to pilfer a fish from an osprey, whilst a mature bald eagle quietly brooded her eggs or young in a western sycamore on the other bank. Magic. But it is a much farther drive and we are now poor.

Comment 316-1

Comment 316-2

Please do not allow CEMEX to further threaten the river, ecosystem, and vulnerable wildlife (Buteo swainsoni, Ambystoma californiense, Agelaius tricolor, Elanus leucurus, Haliaeetus leucocephalus, Athene cunicularia, Actinemys marmorata, etc.). The explosions alone from the constant dynamiting of a pit near twice as deep as Millerton Lake (!) will cause distress to many species. Will we have to listen to that on our hikes? I don't have the heart for that. Responses to noise disturbance might have energetic impacts on wildlife. Habitat loss is another potential impact of noise disturbance, and one must consider all of the species in a trophic cascade. E.g. If individuals of one species habituate and better tolerate the disturbance, but the species they depend on for sustenance, in turn, do not. Problem. Some species may be more sensitive to this disturbance during nesting and cease attempts to raise young in the surrounding habitat. There is a lot of harm to consider, yet no need to allow the expansion. Ever known a dog that could not adapt to fireworks? A domesticated animal, among the most habituated to people and our loudness, often can't cope. If not confined they would flee and be lost. Imagine the impact on sensitive wildlife.

What about the human communities nearby? The stress of noise pollution is evidenced to cause disease in humans and take years off of our lifespans. Is CEMEX going to pay for our medical bills? What of the risks from more traffic? Is CEMEX going to pay for the extra wear and tear on our vehicle from damaged roads? Of course not. My family cannot afford anything

Comment 316-3

Comment 316-4

extra.

Comment 316-5

CEMEX does not legitimately care about our native wildlife, only insofar as preventing profit. They have already been fined at least more than $43 million for 81 separate environmental violations since 2000. Go away already. They are not welcome by me and mine.

I don't trust this company to prevent the worst impacts from occurring and massively polluting the river. We shouldn't have to worry. There is no need to allow them to further degrade nature and even the built environment (400,000 trucks on Friant Rd. annually! Please, no. My veteran husband recently became disabled with compounded PTSD due to a road-rager's attack, and dangerous driver's behavior in traffic is a key trigger). It is sheer corporate greed. We need the riparian ecosystem and watershed intact, unpoisoned. We do not need more aggregate. There is painfully obviously zero need. Let's celebrate our home by protecting it, restoring it, and only taking what we need when necessary, in the most respectful way possible. This, for the continuing benefit of future generations of all species. We are in the midst of the kind of accelerating biodiversity loss that amounts to a mass extinction event (the sixth). This is the first time it's being primarily driven by a single species (Homo sapiens). It is the collective behavior such as this disregard for other life we share this world with, that contributes to these declines. It's big and overwhelming, but a key is to do right in our own backyards. Please start by rejecting the CEMEX Rockfield Expansion.

Thank you for considering my words.

Sincerely,
Erin Barca

Report Suspicious

Good morning David,

Please enter the following comment regarding the CEMEX expansion Draft EIR:

I am against the CEMEX expansion project due to the negative impact on the San Joaquin river area, especially the negative impact to recreation activity, wildlife, and increased water needs.Additionally, the increase of truck traffic from tis project on this portion of Friant Road would negatively impact other motorists (such as potholes and loose rock/gravel) and cause additional wear on the road. My family and I regularly visit this and surrounding areas and this expansion would directly and negatively impact our experience in these sensitive natural areas. Many Fresno and Madera County residents visit this area to get away from the noise and pollution of the more urban areas of Fresno but this expansion, if allowed to move forward, would disrupt this precious, public sanctuary.

Comment 317-1

Comment 317-2

Comment 317-3

Please consider these impacts and do not allow this project to move forward as presented.

Subject:	Opposition to CEMEX Gravel Mine Expansion on The San Joaquin River
Date:	Friday, March 7, 2025 10:50:36 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am writing to express my strong opposition to the proposed expansion of the CEMEX gravel mine on the San Joaquin River. This project poses significant environmental, ecological, and community concerns that outweigh potential benefits. Comment 319-1

The San Joaquin River is a vital natural resource, not only for wildlife, but also for recreation for our community. Expanding mining operations in this sensitive area threatens water quality, disrupts fragile ecosystems, and increases the risk of long-term environmental degradation. I think expanding mining for the next 100 years is poor policy planning for future generations and according to recent research is unwarranted. Comment 319-2 Comment 319-3

My home sits along Friant, I enjoy daily walks on the trail and take great pride in my neighborhood. With the expansion there is an expected increase in truck traffic, this is already an issue for our household and I fear we would want to move if the early morning truck traffic increases. Not only does it disrupt homeowners along Friant, the increase in trucks will also result in significant wear and tear on Friant. One truck creates the equivalent of 5,000 cars. To burden local taxpayers with this cost is outrageous. Finally the change in technique from digging to the use of blasting hard rock will further impact residents and I fear lower property value, which will have a lasting ripple effect in our community, including local education funding. Comment 319-4 Comment 319-5

I urge the County Planning Department to prioritize sustainable land use and environmental stewardship by rejecting the expansion. Our community deserves responsible development that protects our natural resources rather than exploits them for short term gain. Comment 319-6

Re: Public Comment on Proposed CEMEX Expansion on San Joaquin River

Dear Sir,

I wish to express my strong opposition to the proposed CEMEX mining proposal that would allow hard rock blasting in the San Joaquin River bottom. Comment 320-1

My objection to this proposal is as follows:

The project would be situated in the heart of the developing San Joaquin River Parkway. Every time I visit, bike and walk on Woodward Park, the Jensen Ranch, the Eaton Trail and other riverside properties I am impressed at the popularity of these lands. Without fail I see people of all ages and all ethnicities enjoying these public properties. It is no stretch to imagine that the Parkway's expansion upriver over the next many years will be highly popular with the public. Comment 320-1

The idea that Fresno County would allow one hundred years of blasting and all that goes with such an activity is grossly anathema to the concept of a parkway which serves the public.

Most important, I spoke with a geologist to confirm what I suspected: **the entire east side of the San Joaquin Valley, up against the Sierra foothills is underlaid by granite. CEMEX should be looking elsewhere for its granite.** Without doubt, **there are thousands of acres of private rangeland in the eastern part of the valley that could be accessed for the acquisition of hard rock material.** Comment 320-3

CEMEX should be required to look elsewhere for its hard rock. It should find people live and recreate. It should conduct its operation where the environmental impacts would be far less than in the riparian San Joaquin River bottom.

Thank you for your consideration and I look forward to a formal response on this matter.

Comment 321-1

THIS SHOULD NEVER HAPPEN!!

We are once again amazed, shocked and angered by the potential devastation that will be caused by this proposed expansion. How did it even get this far?

What the hell are you thinking?!

100 MORE years of mining
600 foot DEEP mining pit
Changing approach to hard rock BLASTING

All in the beautiful San Joaquin River.

So -- here we are sending our stunned opposition to the Senior Planner, Daid Randall, Fresno County Public Works & Planning Dept., Development Services & Capital Projects Division.

My guess is that it took me more time to write this than it took Daniel and crew to consider the "plan."

There is nothing about this project that could be considered an improvement or positive from an environmental standpoint -- for fish, fowl, wildlife or people. This site is in the middle of a residential area.

Money should not be the consideration.

The answer is NO!!

Dear planning staff, I would like to voice opposition to the proposed CEMEX conditional use permit for hard rock mining
at their owned properties "Quarry & Plant sites" along the San Joaquin river basin south of Lost Lake plant.

Comment 322-1

I would also like the questions below answered.

Comment 322-2

I moved to Clovis in 1988 and have seen no end of urban growth and development in that time, North East South and West of the City of Fresno.
With the population growth of this urban area residents need areas to recreate. The San Joaquin River basin allows a perfect place for this all year round especially during the hot summers with access to the cooling waters of the San Joaquin River.

Through the efforts of the San Joaquin River Parkway Trust, individual volunteers, and the various City, County, State partners that have all worked hard and long to make this a more environmentally ecological multi use area for our residents. We should strive to make the vision of the SJRP a reality, and work carefully to preserve and restore this great treasure along the Fresno Madera County lines to the north of the City - therefore;

Comment 322-3

I oppose the conditional use plan to allow CEMEX to operate hard rock mining at either of the current properties for the following reasons;

Comment 322-4

- Noise during blasting rock crushing
- Dust during rock crushing
- Increase in transportation of product to/from quarry site
- Disturbance of resident nesting and migratory avian visitors
- Disturbance of wildlife along the river corridor
- Visual impact of quarried site
- Any potential water impacts to the current and historical flows of the San Joaquin river.

Comment(s) 322-5 322-6 322-7 322-8

Questions;

1. Does CEMEX current operations have an Environmental Impact Report on file ?
2. What arrangements have been made to find CEMEX alternative property where they could operate such a facility within Fresno/Madera counties ?
3. What requirements have been made of CEMEX to restore their said properties back to their natural state after their gravel/rock extraction ?
4. What monitoring of noise, dust, water and transportation would be in place for the proposed extension?

Comment(s) 322-9 322-10 322-11 322-12

Please consider and answer these concerns before making decisions to further any quarry operations along said San Joaquin River bottom.

Martin Cawthorne.

I am sending this e-mail to express my opinion of opposing the mining project to the San Joaquin River. This river is such a pretty river around this beautiful city and providing the city with a wonderful environmental contribution for the people of Fresno county. This mining project will be totally destroy this river and surrounding area which will be causing huge negative environmental impact to this whole San Joaquin valley.

Sincerely Yours,

Hello
Just wanted to add our thoughts to the possible expansion of CEMEX. We live in the vicinity of CEMEX. We are absolutely opposed to the expansion due to noise, pollution, and overall damage to the environment.
The San Joaquin River in this area is where we grew up fishing, camping, and enjoying what the City of Fresno offers us as far as nature. It would be a shame to continue to destroy this beautiful area for future generations.
It is our hope and desire that the City of Fresno hears our voices.
Thank you
Aurora Clark

Comment 326-1

I would like to know what specific damages to fish and other wildlife are estimated, and if CEMEX plans to replace the fish they kill with equally or better suited fish and wildlife for the area and pay for any further research it takes to find out how to do that…? If they kill any birds with their dust, are they going to replace those with equally or better suited ones for the local environment and pay for any research it takes to find out how to do that? The only kind of birds I approve CEMEX to kill are pigeons. Serious question: Can they guarantee to kill ONLY pigeons?

If any dust is found to cause diseases in the neighboring communities—including but not limited to lung problems, does CEMEX promise to pay for all necessary tests and treatments for any such diseases as determined by doctors?

If CEMEX cause any pollution in the water supply from the San Joaquin River, will they guarantee payment to the affected water facilities to test all affected water restore its purity to what it was before or better?

If any death of a human being occurs and it is determined by local authorities to be an accidental death that would not have happened if the quarry never existed, will CEMEX agree to compensate each affected immediate family member with one quarter of 1 Bitcoin (BTC) for each year of the life of the victim that was lost, up to 80 years?

I'm going to assume CEMEX will answer "no" to all of these questions, since they have already failed to do
compensatory things similar to these in areas where they have mined.

Comment 326-2

And apparently there is already an ample supply aggregate material mind in the Fresno and Madera areas.

Comment 326-3

Though I don't generally oppose free enterprise or market competition to lower prices, I oppose this plan of CEMEX. We have a great need for clean water and air, and we don't need more aggregate materials or another big hole in the ground any more than I need a hole in my head.

I oppose the approval of new or additional mining projects affecting the Madera, CA area.

Comment 328-1

I'm a resident and of Friant CA.

My name is Kathleen Fauver I live at 21267 Ruscello Lane Friant CA.

I am writing to express my opposition to the Cemex expansion. I feel that it will cause harm to our area. We are blessed with a beautiful natural resource with our San Juaquin River. The mining change will impact our area for generations to come. Blasting creating a huge mining pit will impact the surrounding environment and the wildlife. I think approval of this would be a huge mistake. The money the county would get just isn't worth the harm to the surrounding area. It will impact the water quality the fish and wildlife.

I strongly oppose the approval of the Cemex expansion.

Sincerely

Kathleen J Fauver

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

March 7, 2025

David Randall, Senior Planner
County of Fresno Department of Public Works and Planning
Development Services and Capital Projects Division
2220 Tulare Street, Sixth Floor
Fresno, CA 93721

Dear Mr. Randall,

Comment 329-1

I am writing to express my concerns regarding Draft Environmental Impact Report (DEIR) No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project threatens the San Joaquin River, local water quality, air quality, public recreation, wildlife, and public safety. Many of the proposed mitigation measures are inadequate, and some impacts lack any mitigation at all.

Impacts on Water Quality & the San Joaquin River

Comment 329-2

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet fails to provide clear solutions.

The DEIR should identify impacts to downstream water users from the dewatering of the pits and potential capture of the river during flood events.

Comment 329-3

- What is CEMEX's plan if major flooding, like the 1997 flood, breaches the levee and captures the quarry pit?
- Who will be responsible for cleanup and long-term damage if the

pit becomes part of the river system?

Comment 329-3 Cont.

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites.

Comment 329-4

Impacts on the San Joaquin River Parkway & Recreation

Comment 329-5

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

- The DEIR should identify the timeframe and exact location of the trail to be constructed.
- The DEIR should describe how the proposed trailsmeet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access
- The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

The DEIR uses out of date information when identifying recreational sites in close proximity to the quarry. The Noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Comment 329-6

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

Comment 329-7

The DEIR identifies several unavoidable negative impacts, including:

- **Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after mining phases) This constitutes an inappropriate deferral of mitigation which is not allowed under CEQA.
- **Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards? The lack of detail on *how* mitigation takes place is just one example of the inadequacy of the DEIR. The docu

Comment 329-8

- **Air Quality:** The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Comment 329-9

Threats to Wildlife

Comment 329-10

The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated. The proposed mitigation measures do not comply with existing regulations for protection.

Additionally, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River?

The biology section of the DEIR leaves more questions than it answers, and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts, and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Conclusion

Comment 329-11

Given the significant impacts to the river, wildlife, public safety, and air quality, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing the environmental impact report for the project.

Thank you for your time and consideration.

Sincerely,

Tiffany Garcia

Re: Comments on CEMEX Rockfield Expansion Project DEIR

Dear Mr. Randall,

Comment 330-1

I am writing to present my comments on the Draft Environmental Impact Report (EIR) for the CEMEX Reclamation Management Plan (RMP). Given the potential environmental impacts, I propose key mitigation measures to section 4.16 of the DEIR, focusing on the Recreational Element and improving access to the San Joaquin River for Fresno and Madera County residents.

I have concerns regarding other DEIR elements; however, I am certain they are being addressed by others.

As proposed, the project will create a century-long gap in the dream of creating an uninterrupted trail from the Friant Dam to Highway 99 as identified in the San Joaquin River Parkway Master Plan. This creates an untenable delay and essentially destroys the goal of the visioning concept proposed by the Parkway that will benefit every citizen in both Fresno and Madera counties.

Comment 330-2

First, I strongly advocate for the extension of the [Eaton] Trail from Lost Lake to Peck Ranch (Proposed Recreation Mitigation Element No. 1) extending from the high-water mark of the San Joaquin River to the width necessary to permit it to be of similar size and scope as the existing [Eaton] Trail. This extension would offer substantial benefits, including enhanced recreational opportunities for the public, improved access to natural areas, and the promotion of outdoor activities. By connecting more members of our community to these scenic areas, we can foster a greater appreciation for our environment and encourage responsible stewardship.

Second, to ensure the long-term viability and sustainability of the extended trail, it is imperative to establish an operations and maintenance fund (Proposed Recreation Mitigation Element No. 2). This dedicated fund would cover the costs associated with regular maintenance, repairs, and enhancements, ensuring that the trail remains safe and enjoyable for all users. A well-maintained trail not only serves the community but also helps protect the surrounding natural resources by preventing erosion and other environmental damage.

Third, providing access to Ledger Island (opposite the project) via the proposed [Eaton] Trail extension via a new bridge or by repairing the existing bridge (Proposed Recreation Mitigation Element No. 3). Ledger Island is a valuable natural asset that should be accessible to the

public for recreation and education. Ensuring access to this area would facilitate greater appreciation and understanding of our local ecology while providing additional recreational opportunities. Repairing the bridge is essential and would also enhance safety and connectivity, thereby making it easier for visitors to explore and enjoy the river's natural beauty. Incidentally, Ledger Island contains a stand (*quercetum*) of Valley Live Oak trees, which may arguably be the most magnificent examples of the same in the Valley.

Comment 330-2 Cont.

In light of these concerns, I urge the agency to mandate that CEMEX provide additional analysis, enhance, and craft mitigation measures to the Recreational Element where none currently exist. Public transparency and accountability in this review process are crucial to ensuring the long-term health of the San Joaquin River watershed and public benefit.

Comment 330-3

Thank you for your time and consideration of these comments. I look forward to your response and further discussions on this important matter.

Sincerely,

Michael Goldring

To: Randall , David A.
Subject: Public Comment on CEMEX Rockfield Quarry Modification Project EIR
Date: Friday, March 7, 2025 6:22:02 PM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Mr. Randall,

I am writing to express deep concerns over the Draft Environmental Impact Report No. 7763 for the proposed CEMEX Rockfield Expansion Project. This project is an existential crisis for the continued life-giving properties, both to all people in the region and state, and all the local river dependent wildlife. For instance, the pollutants released in the water would not only kill fish, but they also are known to be carcinogenic for swimmers and boating residents. The air quality would be deeply compromised, both by the mining, and the legions of diesel fueled mega trucks trucking materials every day for the next 100 years. Public safety would also be at risk, as people could not only get sick from the polluted water, they could accidentally fall into the pits inside the river, and drown to death.

Comment 333-1

Impacts on Water Quality & the San Joaquin River

Comment 333-2

The project involves deep mining next to the San Joaquin River, raising serious concerns about water loss and contamination. The DEIR acknowledges that mining could reduce river flows, yet pails to provide clear solutions. Also, the fact that it is acknowledged that river flows are reduced, means that both groundwater adjacent to the river for farmers and homeowners may be decimated, completely being lost at some point in the 100-year trajectory, endangering food sources, and habitability for residents.

Add to this is the enigma of downstream farmers and residents, and downstream wildlife habitat. They will be inevitably harmed by diversions. Yet the DEIR doesn't identify these impacts to downstream water users from the dewatering of the pits. Also, they don't identify potential capture of the river during flood events.

- <!--[if !supportLists]-->• <!--[endif]-->What is CEMEX's plan, in the event of major flooding, like the 1997 flood, when water breaches the levee and captures the quarry pit?

Comment 333-3

- <!--[if !supportLists]-->• <!--[endif]-->Who will be responsible for cleanup and long-term damage if the pit becomes part of the river system?

Additionally, the groundwater data used for the DEIR was conducted during a low river flow period. The DEIR should evaluate the groundwater data at different flow rates since the document identifies the fact that there is groundwater/surface water interaction at both sites. What is more, no geological surveys have been conducted at 600 feet depth; there is a steep potential for **toxic element exposure**. Water quality concerns include:

Comment 333-4

Comment 333-5

<!--[if !supportLists]-->▪ <!--[endif]-->Impacts on aquifers and river water.

Comment 333-5 Cont.

<!--[if !supportLists]-->▪ <!--[endif]-->Blasting vibrations may affect the **water column and salmon population**.

<!--[if !supportLists]-->▪ <!--[endif]-->Quarry expansion could introduce contaminants into groundwater.

<!--[if !supportLists]-->▪ <!--[endif]-->Use of less toxic chemicals only **"when feasible"**, lacking enforceable measures.

Impacts on the San Joaquin River Parkway & Recreation

Comment 333-6

CEMEX has referenced potential trail easements for public use, yet the DEIR lacks clear commitments or a timeline.

* The DEIR should identify the timeframe and exact location of the trail to be constructed.

* The DEIR should describe how the proposed trails meet the San Joaquin River Parkway Master Plan's requirement for a 300-foot buffer between mining operations and public access

* The DEIR should identify that CEMEX is responsible for constructing and maintaining the trail if the trail is used as a community benefit of the project.

Comment 333-7

Not only are all these concerns for recreation, but the noise and blasting impacts jeopardize recreation and blasting both, particularly for surrounding parks like Lost Lake. This is because blasting noise carries **over a mile away**. Blasting sends **rocks flying up to 100 yards**. The **explosives to be used are unknown yet**. Thus, there may be a potential for strong seismic impact. **Wells of nearby residents could be affected** by vibrations.

Comment 333-8

On this topic, the DEIR uses out of date information when identifying recreational sites near the quarry. The noise from rock crushing, blasting, and drilling will negatively impact visitors to Lost Lake Park, Ledger Island, and Sumner Peck Ranch, but these noise impacts are not evaluated. The DEIR should fully analyze these impacts and identify appropriate mitigation measures for the impacts.

Lack of Mitigation for Visual, Traffic, and Air Quality Impacts

Comment 333-9

The DEIR identifies several unavoidable negative impacts, including:

<!--[if !supportLists]-->• <!--[endif]-->**Scenic Degradation:** The project will harm scenic views, with proposed mitigation occurring only after the harm takes place (rock staining after the mining phases). This constitutes an inappropriate deferral

of mitigation which is not allowed under CEQA. An upheaval of dust and rocky detritus and heavy-duty equipment being hauled around is not an aesthetically pleasing viewing, nor is denuded top soil with its exposed rock substrate.

Comment 333-9 Cont.

<!--[if !supportLists]-->• <!--[endif]-->**Traffic Congestion:** Significant traffic impacts are expected, yet there is no guaranteed funding or timeline for necessary road improvements. How will the County ensure that CEMEX is held accountable for road damage, including truck debris and safety hazards such as toxic mining dust and particulate matter being spurned into the air by corporate owned trucks. Also, there will be significant traffic impact at key intersections, **Friant & Willow, Willow & Copper**. These are vital thorough fares for north Fresno residents, and for all Fresno and Clovis residents seeking to access the river, Woodward Park, and Millerton Lake. Therefore, the unavoidable traffic congestion creates a barrier to health and to community mobility. At the very least, CMEX should fund necessary infrastructure improvements to mitigate traffic issues.

Comment 333-10

Air Quality: The DEIR underestimates the project's impact by comparing emissions to current operations rather than a no-project scenario. Why was this approach taken instead of analyzing the full environmental cost of continued mining?

Comment 333-11

***** There will be fugitive dust which poses **health risks to nearby communities**.

*The dust may contain toxic and cancer-causing elements.

*The Air Pollution Control District **monitors equipment emissions**, but **not direct air quality impact on residents**.

Threats to Wildlife

Comment 333-12

<!--[if !supportLists]-->o <!--[endif]-->The DEIR fails to adequately analyze the impact on species like Swainson's hawk, Tricolored blackbird, Burrowing owl, and Western red bat. Drilling, blasting, and excavation could disrupt nesting and migration patterns, but those impacts are not identified or evaluated.

<!--[if !supportLists]-->▪ <!--[endif]-->The proposed mitigation measures do not comply with existing regulations for protection. Additionally, the study focuses only on species within the site, not those on adjacent lands.

Comment 333-13

<!--[if !supportLists]-->o <!--[endif]-->**The buffer zones for protected bird species are inadequate**:

Comment 333-14

- <!--[if !supportLists]-->▪ <!--[endif]-->Eagles: 500 feet proposed, **should be 660 feet**.

- <!--[if !supportLists]-->▪ <!--[endif]-->Hawks: 500 feet proposed, **should be at least 1/2 mile**.

Comment 333-14 Cont.

Also, the DEIR uses Alaska-based standards to assess fish protection instead of California-specific guidelines. Are these standards appropriate for protecting spring-run Chinook salmon in the San Joaquin River? Given the radically different climate and topography of this portion of California's San Joaquin River, I venture it safe to suggest they aren't.

Comment 333-15

The biology section of the DEIR leaves more questions than it answers and therefore does not fulfill the CEQA requirements to fully evaluate and disclose impacts and propose mitigation measures that will reduce those impacts. This section should be completely rewritten and recirculated for public comment.

Comment 333-16

Project Overview:

- <!--[if !supportLists]-->o <!--[endif]-->The CMEX quarry expansion proposes increasing mining operations, including a shift from mechanical surface removal to drilling and blasting.

- <!--[if !supportLists]-->o <!--[endif]-->Expansion permit seeks a **100-year approval**, whereas gravel companies typically receive **30-year permits**.

- <!--[if !supportLists]-->o <!--[endif]-->Plans to **dig up to 600 feet deep**, with a minimal buffer between the San Joaquin River and the quarry.

- <!--[if !supportLists]-->o <!--[endif]-->**Allowed truck loads:** 225 per day.

- <!--[if !supportLists]-->o <!--[endif]-->Expected **3 million tons of aggregate production per year**.

- <!--[if !supportLists]-->o <!--[endif]-->The project will generate approximately **800 vehicle trips per day**, yet **no traffic or bicycle safety analysis has been conducted**.

Conclusion

Comment 333-17

Given the powerful destructive nature of this operation unto the river, the wildlife it supports, human welfare, air quality, and potential flooding and seismic activity initiation, the County should require additional analysis, stronger mitigation measures, and financial guarantees from CEMEX. The additional information will need to be drafted and recirculated for public review before the finalizing of the environmental impact report for the project. If not, there will be powerful grassroots backlash from multiple organizations committed to life in the Valley. Water is life, and the San Joaquin River

provides life to farmers, residents, and wildlife. Destroying it seems inevitable given the potent evidence in testimony against the CEMEX operation. ***Money talks, but the irrevocable death of a civilization based on water, in the heartland of California, talks louder.***

Thank you for your time and consideration.

Sincerely,

David Horwitz

Report Suspicious

Dear Mr. Randall and County of Fresno Planning Board,

This letter is to register my protest to the plans by Cemex to further lengthen (again!) their lease and to further degrade the environment. Fresno City and County has finally begun to make progress in protecting the once-mighty San Joaquin and to provide access to this valuable resource to the people of the County and City. Now, Cemex wants to seriously disrupt this process while disrupting the current lives and those of future generations.

Comment 335 - 1

To make a pit significantly deeper than Millerton Lake is an absolute absurdity. One can see all along Friant Road and from the Eaton Trail the much shallower pits that are more eye sore than anything else. To say it will be made into trails and recreational space is a hollow and likely unattainable promise. And in the umpteen decades that they will degrade the land I'm sure these supposed promises will be long forgotten and what will likely be city/urbanized by then will have a grand hole in the ground to deal with. On that note, that land will be easily surrounded by housing and other development. Even now, the noise factor of such blasting will be a major disruption. Where I live, the start of dove hunting season makes for the disrupting sounds of gun blasts in my neighborhood. I can imagine what this type of blast mining will be like to the neighborhoods already not far from Cemex. Furthermore, let's not forget the dust and rocks and pebbles that will be in the roadway and the air. Already, as a former cyclist, I can attest to the debris along Friant, especially by the Cemex plant. Take a look in the roadway going up the rise just beyond the plant. Our air is already full of smog and dust and this will certainly add to it from both the mining process and the increased heavy truck traffic going to and from any such expanded project. I have danced with those trucks while on my bicycle, with some drivers being respectful, while others ride the bike lanes or fly past nearly knocking people over with the rush of air as they speed pass. Friant is a major bikeway for any rides of decent length.

Comment 335 - 2

Comment 335 - 3

Comment 335 - 4

Comment 335 - 5

Finally, there is damage to the river and its wildlife. Access has just been returned/made to the river and surrounding property at Ball Ranch and the old Sumner Peck Ranch. These will be increasingly used as word gets out that these are accessible (again). Walkers, off-road cyclists, and especially, kayakers/canoers will all lose open space access or make such spaces unpleasant or unpassable. There is nothing like being down along or on the river and seeing the deer, hearing the beavers, observing the bird rookeries, etc. And lets not forget the growing evidence of how access to green space is beneficial to mental health and in treatment of mental health disorders.

Comment 335 - 6

I ask that the County Planning Department and Public Works NOT approve this expansion. Please consider both the current and future lives that will be so negatively impacted.

Comment 335 - 7

Sincerely

Linda G. Kelsey, PhD

Subject: Comments on CEMEX Rockfield Expansion Project DEIROpposition to CEMEX Mining Project Along the San Joaquin River

Dear David,

I appreciate the opportunity to submit comments on the Draft Environmental Impact Report (DEIR) for the CEMEX Rockfield Expansion Project. Given the significant potential environmental and community impacts associated with this project, I have several concerns that I urge you to address prior to moving forward with approval. I am writing to express my strong opposition to the proposed CEMEX mining operation along the San Joaquin River near Fresno. This project poses significant threats to public safety, environmental sustainability, and the well-being of our community. Comment 336-1

Please consider the facts with regard to the following: **Impacts on the San Joaquin Viver Watershed; Air Quality and Dust Emissions; Biological Resource Impacts; Traffic and Noise Concerns; Cumulative Environmental Effects.**

First and foremost, the additional traffic generated by heavy gravel trucks and workers along Friant Road presents a severe public safety risk. Friant Road is already overburdened, with a long history of accidents and fatalities. Increasing the volume of large industrial vehicles will only exacerbate these dangers, endangering residents and commuters alike. We cannot handle it. Comment 336-2

Beyond the traffic concerns, Fresno already has one of the largest gravel surpluses in the state, as confirmed by the California Geological Survey. This raises a critical question: Why should our community bear the environmental and social costs of a mining project that is not necessary for local supply? The claim that this project is essential to Fresno's gravel supply chain is misleading and does not justify the irreversible damage it would cause. Comment 336-3

The San Joaquin River, once a thriving ecosystem, has already suffered a 97% reduction in flow, the complete loss of its salmon runs due to dam construction, and the destruction of its wetlands from decades of mining. This project would further scar an already beleaguered waterway by blasting a crater nearly twice as deep as Millerton Lake into its banks. Given the river's fragile state, allowing CEMEX to inflict further damage would be an egregious mistake. Comment 336-4

This is a critical moment to prioritize responsible environmental stewardship and community safety over corporate interests. I urge you to reject this project and protect the San Joaquin River from further degradation.
Thank you for your time and consideration. Comment 336-5

I look forward to your response on this urgent matter.

Sincerely,

Sharon R. Lucero

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

Dear Gentlemen:

I am reaching out to you regarding the new proposed CEMEX project on the San Joaquin River and why it should not be approved. According to the California Geological Survey, the Fresno metro area currently has nearly 200% more gravel then is needed for the next 50 years coming from local mines. In addition, the Kings River has roughly 2 billion tons of easily available surface gravel, which is enough for 500 years at Fresno's current 4 million-ton annual rate. Why in the world do we need to further decimate the San Joaquin River by blasting a 600 foot deep crater to extract more gravel that is not needed, unless it's to line the pockets of CEMEX? Isn't it time we start working to make the San Joaquin River better, healthier and cleaner? It's time to say enough is enough.

Comment 337-1

IN ADDITION, if this project is approved it would send an estimated 400,000 trucks down Friant Road annually - up from about 100,000 in the 1980's and 250,000 in 2023!!!! Each truck causes wear equivalent to 5,000 cars, meaning the project would add the impact of 2 billion car trips to north Fresno's streets every year in an area that's already suffering from to many cars, trucks and has become deadly. I can't tell you how many times I have stood at the crosswalk waiting for a green light at Woodward Park to Fort Washington and have seen gravel trucks run the red light.

Comment 337-2

I commend you, Mr. Bredefeld, for returning CEMEX'S political donation. But we have to do more….we have to say enough….we have to say NO!

Comment 337-3

Thank you.

Karen Micheli

David Randall, Senior Planner

Fresno County Public Works and Planning Department

Development Services and Capital Projects Division

2220 Tulare Street, Sixth Floor

Fresno, CA 93721

Dear Mr. Randall,

As a resident of Fresno living in the vicinity of the proposed project, I have concerns and objections. All too often the public is left out of the decision process and notified after the planning has been decided. Comment 339-1

First, I want to point out that the air quality in Fresno is currently very poor. We now have too many days where the air is unhealthy to breath. My concern is that this project will add to the air pollution problem. Are there modifications that can be made to any trucks that might be used to lessen the impact they will have on our air quality? Comment 339-2 What about modifications to the scale of this proposed project? Comment 339-3

Secondly, I find a one-hundred-year permit request to be unrealistic. I understand CEMEX requesting such a thing but I doubt they believe any planning group would be foolish enough to approve this. Fresno is rapidly changing and obligating future generations to live with this project is irresponsible in the extreme. Comment 339-4

Large areas of Fresno are currently changing from agriculture to residential/ urban living. One can look to San Jose to get an idea of what we will see in Fresno over the next ten to twenty years. Parks, walking trails, and natural areas such as the San Joaquin River will be extremely important to the quality of life in Fresno. These things need to be developed and enhanced now. The San Joaquin River should be a center piece for any future planning. A one-hundred-year mining project along the San Joaquin River will not improve the river or quality of life here. Comment 339-5

Please consider the concerns I have regarding the air quality, the unrealistic permit request by CEMEX and the rapid changes taking place in Fresno as we become more residential and urban. Responsible planning will be needed to guide us to a better, healthier Fresno. Comment 339-6

Thank you for your consideration.

Sincerely,

Gordon Renfro

Subject: Public Comment on Draft EIR for Rockfield Quarry Expansion – Impact 4.17-3

Mr. Randall,

I am writing to formally challenge the findings under Impact 4.17-3 of the Draft Environmental Impact Report (EIR) for the Rockfield Quarry expansion project. The report fails to account for the real and documented roadway hazards caused by debris from heavy-duty haul trucks, which pose a serious safety risk to motorists, bicyclists, and motorcyclists.

Comment 340-1

Key Concerns:

1. **Photo Evidence of Dangerous Truck Debris – Ignored in EIR**

Comment 340-2

   - I am submitting a photo of debris found on the roadway at the entrance to the Rockfield Quarry site (14765 N Friant Rd), showing tire marks from when I hit the debris with my vehicle while traveling at approximately 65 MPH.
   - This directly contradicts the EIR's claim that the project will not significantly increase roadway hazards.
   - The presence of such debris demonstrates that trucking operations at this site already create dangerous conditions

2. **Failure to Provide Mitigation Measures**

Comment 340-3

   - The report incorrectly concludes that hazards from trucking operations are "less than significant" without analyzing the specific safety risks posed by truck debris.
   - Despite clear photographic evidence of roadway hazards, the EIR does not propose any mitigation measures, such as:
     - Regular street sweeping on affected roadways.
     - Stricter enforcement of load-securing regulations.

Comment 340-3 Cont.

- A debris hazard reporting system for public complaints.

3. Contradiction in the Safety Analysis

Comment 340-4

- The EIR states that safety concerns are best handled at a programmatic level but fails to acknowledge that CEQA requires project-specific risks to be assessed.
- The report acknowledges that truck traffic will increase by up to 201 trips per day, yet it does not analyze how that will increase the frequency of debris-related hazards.

4. History of Dangerous Incidents Involving Quarry Trucks

Comment 340-5

- This is not the first time that truck debris from quarry operations on this roadway has caused safety hazards. In the mid-1990s, I was involved in an incident where rocks fell from a northbound truck and struck multiple vehicles, including the one I was in. The incidents occurred between the plant site & quarry site.
- Some drivers suffered significant damage. One I recall was a river rock going through a windshield of a van, breaking a coffee mug that was in a cup-holder on the dashboard. This creates an immediate and severe danger to motorists.
- Cemex ultimately settled with insurance companies over these claims, acknowledging liability for the damages caused by unsecured debris.
- Although I do not have official records of this incident, it is well-remembered by those involved and serves as a clear example of the dangers associated with unsecured loads from quarry operations, even trucks that are empty and traveling northbound for an additional load.
- This incident demonstrates that truck debris from quarry operations has been a known hazard for decades, and increasing truck traffic will only heighten the risk. Ignoring this history in the EIR is a major oversight.
- In addition to large debris, smaller gravel falling from trucks has caused frequent windshield damage to passing vehicles. Over the years, many drivers—including myself—have experienced cracked or shattered windshields due to loose gravel escaping from haul trucks. These incidents may not always be formally reported, but they represent a persistent and costly hazard for motorists.

5. Failure to Address Flooding Risks and Hydrologic Impacts

Comment 340-6

- The Draft EIR does not account for the potential flooding of the quarry site in the event of Friant Dam failure, removal, or extreme flood events affecting the entire watershed. Given

that this is an old quarry with potentially exposed materials, sediment, and contaminants, flooding could have significant environmental consequences that must be evaluated. Comment 340-6 Cont.

- The EIR must consider flood scenarios under different conditions, including:
  - With and without Friant Dam to assess the long-term hydrologic risks to the site.
  - Upstream dam failures or extreme releases that could lead to rapid inundation.
  - Changes in sediment transport, groundwater infiltration, and potential contamination risks from flooding a site with past and present industrial activity.
- Potential Environmental Consequences: Comment 340-7
  - Contamination Risks – Floodwaters could mobilize pollutants from the quarry site, introducing harmful chemicals or heavy metals into the San Joaquin River ecosystem.
  - Disruption of Salmon Spawning Habitats – The Salmon Conservation and Research Facility (SCRF), which supports Chinook salmon restoration efforts, relies on stable water conditions. Flooding of the quarry site could alter water quality, increase sedimentation, and impact the success of salmon spawning. Comment 340-8
  - Long-Term Groundwater and Ecosystem Damage – If floodwaters infiltrate the quarry site, they could permanently alter groundwater chemistry, harming local ecosystems that depend on the river. Comment 340-9

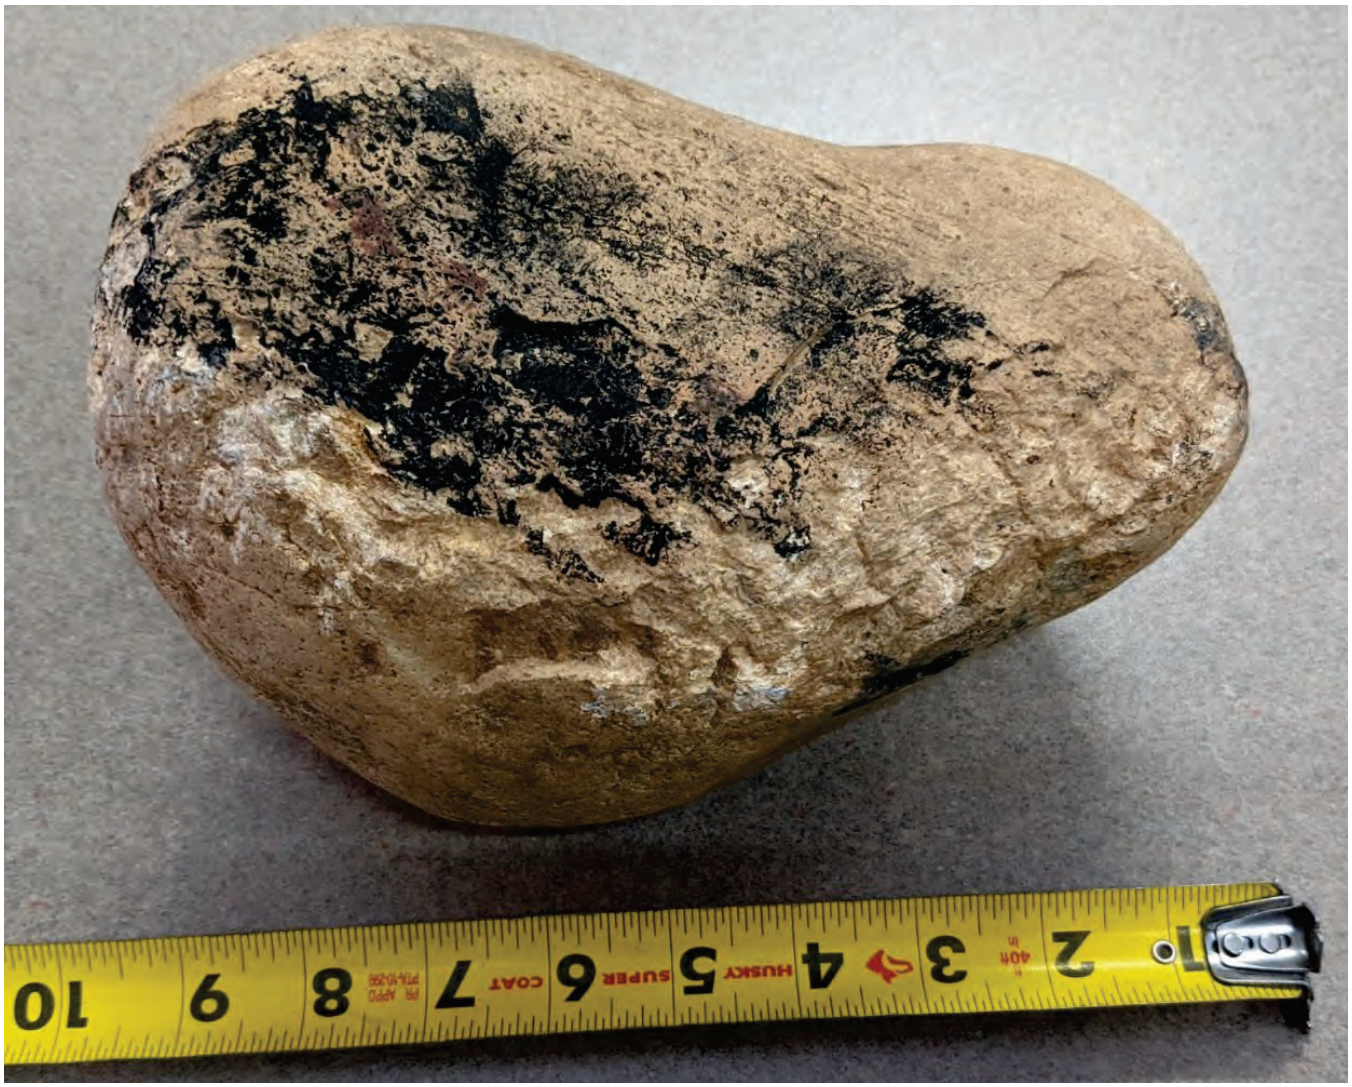
Requested Actions:

- The EIR must be revised to include a comprehensive analysis of the potential environmental risks posed by flooding at the quarry site in the event of Friant Dam failure or removal, or extreme flooding scenarios from upstream dams. This analysis should include: Comment 340-10
  - An evaluation of how floodwaters could disturb exposed quarry materials, potentially releasing pollutants, sediment, and contaminants into the San Joaquin River ecosystem.
  - A study of how flooding could alter groundwater quality, creating long-term environmental damage to surrounding ecosystems.
  - A detailed review of salmon spawning habitats near the Salmon Conservation and Research Facility and how flooding from the quarry could impact water quality and sedimentation necessary for successful Chinook salmon spawning. Comment 340-11

- The EIR must also address the risks posed by truck debris on roadways in the vicinity of the quarry, including: Comment 340-12
    - Debris removal and regular street maintenance to address hazards from both large rocks and smaller gravel that have been documented to cause damage to vehicles.
    - Enhanced load-securing regulations and enforcement to prevent material from falling off trucks and becoming a roadway hazard.
    - Development of a public reporting system for motorist and cyclist incidents related to debris on roadways near the quarry site.
- The County must require the implementation of mitigation measures to address both roadway hazards and flooding risks, including: Comment 340-13
    - Creating a flood risk management and emergency response plan specific to the quarry site.
    - Ensuring contingency plans are in place for environmental monitoring in case of flooding, particularly regarding water quality and sediment runoff.
    - Developing strategies to reduce contaminants and sediment transport from the quarry during flood events.
    - In consultation with the Salmon Conservation and Research Facility, incorporating measures to protect salmon habitats from potential flooding and sedimentation impacts.
    - Requiring routine maintenance of roadways to remove debris and ensure safe conditions for all road users.
- The EIR must fully account for the hydrological impacts of potential flooding scenarios on the quarry site and the surrounding ecosystems, including the long-term environmental consequences for water quality and fish habitats. Comment 340-14
- The County must ensure the EIR incorporates up-to-date flood risk data and potential impacts to wildlife habitats and public resources, such as the Salmon Conservation and Research Facility. Failure to do so would render the environmental review incomplete and legally deficient. Comment 340-15

Failure to properly evaluate and mitigate this issue would constitute an inadequate environmental review under CEQA. Given the clear photographic evidence, firsthand accounts, and historical incidents of debris-related dangers, the County has a responsibility to address this issue before approving the project. Comment 340-16

Sincerely,
Andy Roberts



Debris found on the roadway at 14765 N Friant Rd Quarry entrance – approximately 9.5” x 6” x 5” in size. The black marks are rubber from my tire after striking the rock at 65 MPH.

Debris found on the roadway at 14765 N Friant Rd Quarry entrance – approximately 9.5” x 6” x 5” in size. The black marks are rubber from my tire after striking the rock at 65 MPH.

Subject:	CEMEX"s proposed blast mine could expose us to unsafe amounts of nickel dust and diesel particulate matter
Date:	Friday, March 7, 2025 5:10:50 AM

CAUTION!!! - EXTERNAL EMAIL - THINK BEFORE YOU CLICK

Report Suspicious

My second comment: SJVAPCD assumed there would be 28 ppm of nickel in aggregate processing dust plus 20 ppm of nickel released from material storage plus 19 ppm of nickel in road dust. Using soil samples the empirically determined amount of nickel from aggregate processing is 20.7 ppm. In addition there is nickel in diesel exhaust from the extra truck trips. (Reference: CE01 Rockfield Air Report, December 4, 2019, page 44. Table 14: Fugitive TAC Speciation Assumptions is a listing of toxic air contaminants in aggregate processing dust. and other dust from mining.)

Comment 342-1

"The ARB has estimated that about 70% of the cancer risk that the average Californian faces from breathing toxic air contaminants stems from diesel exhaust particles." (from Rockfield Modification Project DEIR and OEHHA studies)

Comment 342-2

One person complained that dust was emitted from CEMEX's rock quarry. What if there is no water to use for controlling the dust? CEMEX company had 43 violations. The proposed natural gas powered engines would contribute to climate change and drought. I don't want them to wait until damage occurs to mitigate the damage. Mining also produces RCS (harmful silica dust) which is linked to silicosis and fibrotic scaring of the lungs (RMP DEIR, v1 CH 10 p 262) .

_____-

Dan's comment:

Nickel Contamination of the Air or Food Could Lead to Chronic Diseases in Animals and Humans: An Update of Science.

Comment 342-7

The element nickel does not appear to be needed inside of the human body and, up to recently, it was never considered by researchers to be an essential nutrient for humans. In fact, nickel is well known as a heavy metal, alongside others like lead, mercury and cadmium.

Nickel is also recognized to create serious dysfunctions inside mitochondria (the energy-producing organelles inside most human cells) and to produce massive oxidative stress throughout the body -- as these being well-studied physiological results of its toxicity(1).

Recently researchers found out that epigenetic alterations induced by nickel exposure can damage the human genome. But since healthy changes of human lifestyle are found to influence the Epigenome -- and since the Epigenome determines the health of the human Genome -- there is hope that a healthy lifestyle by itself could lead to the elimination of nickel poisoning from the body and to the reversal of the damage produced by this heavy metal inside human cells.

Sources of Nickel Pollution

Nickel mines and their surroundings are well-known locations with high nickel contamination sites, as well as the companies involved in nickel processing. Marble quarries (and other types of quarries) plus their surroundings are also sources of pollution with heavy metals, including nickel.

However, high quantities of nickel are also released from volcanoes, from the production and burning of fossil fuels of all types, and from municipal and industrial waste.

Examples of Low-Degree Environmental Exposure

Even a low-dose of nickel contamination (as we could find in women wearing nickel jewelry or hand watches daily) appears to lead to pathogenic (disease-creating) changes in the human skin. See Nickel Allergy. Cleveland Clinic website (last reviewed on 12/06/2024)(reference3).

In other studies, nickel leaching from stainless steel pots and pans (only from certain metal alloys containing this heavy metal) seems to trigger a

severe allergic reaction in up to 20% of women and 8% of men worldwide. Contact dermatitis could be reversible only by eliminating all contamination sources.

An older study published in 2013(reference4) found out that "After six hours of cooking, Ni [nickel] and Cr [chromium] concentrations in tomato sauce increased up to 26-[fold] and 7-fold respectively, depending on the grade of stainless steel".

Among this study's statements:

-- "Toxicological studies indicate that a single oral dose of Ni as low as 67 µg [micrograms] can cause recurrence of ACD [allergic contact dermatitis], flare up eczema, or lead to systemic dermatitis in individuals sensitive to nickel. Studies have shown the severity of dermatitis has a dose dependent relationship to oral doses of nickel".

-- "Stainless steel grades 304 and 316 are the most commonly used in the food and beverage industry. These SS [stainless steels] grades differ by their chemical compositions of metals including nickel and chromium.

SS grade 304 contains approximately 18–20% mass fraction chromium, and 8–12% nickel, whereas SS grade 316 contains approximately 16–18% chromium, and 10–14% nickel; other metals may also vary within the grades".

The solution for this type of nickel and chromium leaching into foods: purchasing stainless steel pots and pans which do not contain nickel or chromium in the alloy.

Examples of High-Degree Environmental Exposure

A continuous exposure to nickel has been discovered to be the main cause of a specific type of nephropathy (kidney disease) experienced by the population of a certain region of Nicaragua, according to a study published in 2020(reference2).

While nephropathy is known traditionally to exist as a complication of diabetes and high blood pressure, in this study nickel has been isolated

from a group of many contaminants as being the only possible root cause of this particular form of kidney disease.

The local medical authorities in Nicaragua consider the source of nickel pollution a mystery. However, it is well-known that near the Pacific shore there are a number of active volcanoes (including Masaya, Ometepe, and Cosigüina) -- all being part of the Ring of Fire, situated on the Pacific side of the continent. We could only speculate that these are the most probable sources of high levels of nickel gases and dust in Nicaragua.

Perhaps the classical form of nickel poisoning exists in specialized workers employed in nickel mines and corporations involved in the processing of this heavy metal.

The degree of severity in affecting the human, as well as animal body, depends on the extent of the dose, as well as the length of exposure. In cases of high-degree of environmental exposure, nickel could cause asthma, kidney failure, cardiovascular diseases, lung fibrosis and cancer of the respiratory tract.

Nickel contamination of other parts of the body contributes also to other forms of cancer, including prostate cancer(reference5).
A study published in 2022(reference6) attempts to delineate the relationship between nickel exposure and kidney function in the U.S. adults.

This study provides "evidence that Ni [nickel] exposure [is] linked with declined kidney function and might interact with Cd [cadmium] exposure".

Many stainless steel pots are made from alloys which include both nickel and cadmium -- in high percentages, up to 20% of the metal alloy -- allowing leaching of these inside foods.

According to the evidence, it is possible that even a low exposure to nickel (like in contact dermatitis) could silently initiate the lowering of human kidney function -- an insidious process which could ultimately lead, if the exposure is not discontinued, to kidney failure.

Kidney disease is an insidious one, having no initial symptoms. Fortunately, early markers like microalbuminuria have the capacity to signal the danger

many years in advance. And there are also urine tests allowing patients to be tested for kidney disease before it is showing symptoms.

Nickel as Imunotoxic and Carcinogen, Promoter of Cardiovascular and Other Chronic Diseases

Depending on the dose amount and the length of impact on the human body, nickel could become a powerful immunotoxic and carcinogen agent(references7,8).

These dangers are based on the activity of nickel against human mitochondria: "Nickel-induced mitochondrial damage can occur, due to impairment of mitochondrial membrane potential, reduction of mitochondrial ATP concentration and destruction of mitochondrial DNA".

However, according to the study "Molecular mechanisms of nickel induced neurotoxicity and chemoprevention", the solutions against powerful oxidation against the body are equally powerful antioxidants like such as L-carnitine, taurine and melatonin, (and perhaps many others) natural compounds that can counteract oxidation and prevent nickel-induced neurotoxicity and carcinogenicity"(reference9).

Most importantly, Vitamin C has been discovered since 1979 to successfully counteract nickel poisoning, when used safely in higher doses. Dr. Thomas E. Levy -- considered today to be one of the most important vitamin C scientists in the world -- mentions in his book "Primal Panacea" (MedFox Publishing, 2011) how nickel and other forms of heavy metal poisoning can be reversed with vitamin C.

This humble vitamin acts as an anti-poison natural substance in animals and humans alike, gently detoxifying the body of many toxins, including nickel. In this study, vitamin C supplementation works successfully (as opposed to other detoxifying agents endangering the kidneys) gently reversing the chromosome damage in workers occupationally exposed to nickel(reference 10).

Nickel Is Employed in the Production of Prescription Medications and Medical Devices
