Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Worker
Scenario: NCAcute
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER
Exposure duration are only adjusted for cancer assessments

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: False
Dermal: False
Mother's milk: False
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: Moderate8HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
NOTE: Exposure duration (i.e., start age, end age, ED, & FAH) are only adjusted for cancer assessments.

****
TIER 2 SETTINGS
Tier2 not used.

****

Calculating acute risk

Acute risk breakdown by pollutant and receptor saved to: C:\Z_HARPRUN\Rockfield HRA v0.8\ROCK PRO 0 30 ACUTE\hra\0_30_PRO_NCAcuteRisk.csv
Acute risk total by receptor saved to: C:\Z_HARPRUN\Rockfield HRA v0.8\ROCK PRO 0 30 ACUTE\hra\0_30_PRO_NCAcuteRiskSumByRec.csv
HRA ran successfully

RISK SCENARIO SETTINGS

Receptor Type: Worker
Scenario: NCChronic
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER
Exposure duration are only adjusted for cancer assessments

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: False
Water: False
Fish: False
Homegrown crops: False
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: Moderate8HR

Worker Adjustment Factors
NOTE: The worker adjustment factors below are only used for cancer assessments. However, the GLC adjustment factor is also applied to 8-hr noncancer chronic assessments.
Worker adjustments factors enabled: YES
GLC adjustment factor: 2.33
Exposure frequency: 250

Fraction at time at home
NOTE: Exposure duration (i.e., start age, end age, ED, & FAH) are only adjusted for cancer assessments.

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: ED or start age changed|
Calculating chronic risk

HARP2 - HRACalc (dated 22118) 4/23/2026 9:42:35 PM - Output Log

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: NCChronic
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER
Exposure duration are only adjusted for cancer assessments

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****

INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
NOTE: Exposure duration (i.e., start age, end age, ED, & FAH) are only adjusted for cancer assessments.

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

****
HOMEGROWN CROP PATHWAY SETTINGS

Household type: HouseholdsthatGarden
Fraction leafy: 0.137
Fraction exposed: 0.137
Fraction protected: 0.137
Fraction root: 0.137

****
TIER 2 SETTINGS

Tier2 adjustments were used in this assessment. Please see the input file for details.
Tier2 - What was changed: ED or start age changed
Calculating chronic risk
Chronic risk breakdown by pollutant and receptor saved to: C:\Z_HARPRUN\Rockfield HRA v0.8\ROCKFIELD PRO 31_70 CAN\hra\31_70_PRO_NCChronicRisk.csv
Chronic risk total by receptor saved to: C:\Z_HARPRUN\Rockfield HRA v0.8\ROCKFIELD PRO 31_70 CAN\hra\31_70_PRO_NCChronicRiskSumByRec.csv

*** MODELOPTs: RegDFAULT CONC ELEV RURAL ADJ_U*

*** MODEL SETUP OPTIONS SUMMARY ***

** Model Options Selected:
* Model Uses Regulatory DEFAULT Options
* Model Is Setup For Calculation of Average CONCentration Values.
* NO GAS DEPOSITION Data Provided.
* NO PARTICLE DEPOSITION Data Provided.
* Model Uses NO DRY DEPLETION. DDPLETE = F
* Model Uses NO WET DEPLETION. WETDPLT = F
* Stack-tip Downwash.
* Model Accounts for ELEVated Terrain Effects.
* Use Calms Processing Routine.
* Use Missing Data Processing Routine.
* No Exponential Decay.
* Model Uses RURAL Dispersion Only.
* ADJ_U* - Use ADJ_U* option for SBL in AERMET
* CCVR_Sub - Meteorological data includes CCVR substitutions
* TEMP_Sub - Meteorological data includes TEMP substitutions
* Model Assumes No FLAGPOLE Receptor Heights.
* The User Specified a Pollutant Type of: HRA

**Model Calculates 1 Short Term Average(s) of: 1-HR
and Calculates PERIOD Averages

**This Run Includes: 896 Source(s); 15 Source Group(s); and 4968 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 896 VOLUME source(s)
and: 0 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 21112

**Output Options Selected:
Model Outputs Tables of PERIOD Averages by Receptor
Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE Keyword)
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)
Model Outputs Separate Summary File of High Ranked Values (SUMMFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 100.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 7.7 MB of RAM.

**Input Runstream File: aermod.inp
**Output Print File: aermod.out

**File for Saving Result Arrays: RealisticRoadSimulation.sv1
**Detailed Error/Message File: RealisticRoadSimulation.err
**File for Summary of Results: RealisticRoadSimulation.sum

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Resident
Scenario: NCChronic
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER
Exposure duration are only adjusted for cancer assessments

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: False
Fish: False
Homegrown crops: True
Beef: False
Dairy: False
Pig: False
Chicken: False
Egg: False

****
INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
Worker adjustment factors enabled: NO

Fraction at time at home
NOTE: Exposure duration (i.e., start age, end age, ED, & FAH) are only adjusted for cancer assessments.

****
SOIL & DERMAL PATHWAY SETTINGS

```
Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

APPENDIX I17 CANCER BURDEN

THIS PAGE IS INTENTIONALLY BLANK

Cancer Burden Formula

Definition:	Source:
"Cancer Burden" – The estimated increase in the occurrence of cancer cases in a population resulting from exposure to carcinogenic air contaminants. The cancer burden can be calculated by multiplying the cancer risk at a census block centroid by the number of people who live in the census block, and adding up the estimated number of potential cancer cases across the zone of impact. The result of this calculation is a single number that is intended to estimate of the number of potential cancer cases within the population that was exposed to the emissions for a lifetime (70 years). The cancer burden is calculated on the basis of lifetime (70 year) risks (whereas individual cancer risk at the MEIR is based on 30-year 1320-2 MDAQMD Rule 1320 NSR for Toxic Air Contaminants residential exposure). Cancer burden is independent of how many people move in or out of the vicinity of an individual facility. For example, if 10,000 people are exposed to a carcinogen at a concentration with a 1×10-5 cancer risk for a lifetime the cancer burden is 0.1, and if 100,000 people are exposed to a 1 × 10-5 risk the cancer burden is 1	Rule 1320: New Source Review For Toxic Air Contaminants

Formula:	$Total\ Cancer\ Burden = \sum_{i=1}^{N} (Cancer\ Risk_i * Population_i)$

*Where *i* is the specific census block and *N* is the total number of census blocks used for the analysis

For this analysis, *N* is the number of receptors in the tables and *i* is the individual receptor

Total Project Cancer Burden	**-2.63E-01**
Total Mitigated Project Cancer Burden	**-2.63E-01**

Figure Note: A figure was not developed to showcase cancer burden results do to all cancer risk values being below 0 (negative).

GLCs loaded successfully
Pollutants loaded successfully
Pathway receptors loaded successfully
****
RISK SCENARIO SETTINGS

Receptor Type: Population
Scenario: Cancer
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 70

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0
2<16 Years Bin: 14
16<30 Years Bin: 0
16 to 70 Years Bin: 54

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: True
Fish: True
Homegrown crops: True
Beef: True
Dairy: True
Pig: True
Chicken: True
Egg: True

****
INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
NOTE: The worker adjustment factors below are only used for cancer assessments. However, the GLC adjustment factor is also applied to 8-hr noncancer chronic assessments.

Worker adjustments factors enabled: YES
GLC adjustment factor: 2
Exposure frequency: 250

Fraction at time at home
3rd Trimester to 16 years: OFF
16 years to 70 years: OFF

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

RISK SCENARIO SETTINGS

Receptor Type: Population
Scenario: Cancer
Calculation Method: Derived

****
EXPOSURE DURATION PARAMETERS FOR CANCER

Start Age: -0.25
Total Exposure Duration: 70

Exposure Duration Bin Distribution
3rd Trimester Bin: 0.25
0<2 Years Bin: 2
2<9 Years Bin: 0
2<16 Years Bin: 14
16<30 Years Bin: 0
16 to 70 Years Bin: 54

****
PATHWAYS ENABLED

NOTE: Inhalation is always enabled and used for all assessments. The remaining pathways are only used for cancer and noncancer chronic assessments.

Inhalation: True
Soil: True
Dermal: True
Mother's milk: True
Water: True
Fish: True
Homegrown crops: True
Beef: True
Dairy: True
Pig: True
Chicken: True
Egg: True

****
INHALATION

Daily breathing rate: LongTerm24HR

Worker Adjustment Factors
NOTE: The worker adjustment factors below are only used for cancer assessments. However, the GLC adjustment factor is also applied to 8-hr noncancer chronic assessments.

Worker adjustments factors enabled: YES
GLC adjustment factor: 2
Exposure frequency: 250

Fraction at time at home
3rd Trimester to 16 years: OFF
16 years to 70 years: OFF

****
SOIL & DERMAL PATHWAY SETTINGS

Deposition rate (m/s): 0.02
Soil mixing depth (m): 0.01
Dermal climate: Mixed

a - Mine emissions are split into multiple mine volume sources. See report Table 16.

Road Dust Emissions From San Diego Air Pollution Control District "Haul Roads, Mineral Industry Sites, Paved and Unpaved, Default Trace Metal Composition"
https://www.sdapcd.org/content/dam/sdc/apcd/PDF/Misc/APCD_Haul_Road_Mineral_Industry_Sites_Paved_Unpaved.pdf

The emission factors for cement and flyash are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the 1998 San Diego Air Pollution Control District document, Concrete Batch Plant Operations.Speciation profiles are derived from sampling of local concrete batch plants.

Aggregates Emission Factors:
*The emission factors are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the November 1998 San Diego Air Pollution Control District document, Aggregate Crushing Operations.
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
!5% of Chromium considered Hexavalent Chromium (District Policy).
*The emission factor is derived from ratio of Silica PM4 to PM10 in the 2009 technical paper from the Journal of Air and Waste Management Association (JAWA), PM4 Crystalline Silica Emission Factors and Ambient Concentrations at Aggregate-Producing Sources in California. The average of the equipment data

Stockpile Emissions
The emission factors are from the table, "DEFAULT VALUES - Material Storage" in the December 1998 San Diego Air Pollution Control District document, *Open Material Storage Areas*.
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
! 5% assumption of 50 e-6 of Non Hexavalent Chromium, crystalline silica listed as TAC in source document but not included due too respirable amount being indeterminate

Asphalt Dust Fugitive Emissions
Emission factors are derived from a 1997 dust profile (#4082), from EPA Speciate 4.0, test data from a Mexico City Asphalt Plant.
Pollutants required for toxic reporting: TACs w/o Risk Factor. Current as of update date.
Since the amount of silica that is respirable (PM4) is indeterminate, the silica will be considered a Non-TAC (District Policy).
 **5% of Chromium considered Hexavalent Chromium (District Policy).

a - Mine emissions are split into multiple mine volume sources. See report Table 16.

Road Dust Emissions From San Diego Air Pollution Control District "Haul Roads, Mineral Industry Sites, Paved and Unpaved, Default Trace Metal Composition"
https://www.sdapcd.org/content/dam/sdc/apcd/PDF/Misc/APCD_Haul_Road_Mineral_Industry_Sites_Paved_Unpaved.pdf

* The emission factors for cement and flyash are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the 1998 San Diego Air Pollution Control District document, Concrete Batch Plant Operations.Speciation profiles are derived from sampling of local concrete batch plants.

Aggregates Emission Factors:
*The emission factors are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the November 1998 San Diego Air Pollution Control District document, Aggregate Crushing Operations.
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
!5% of Chromium considered Hexavalent Chromium (District Policy).
**The emission factor is derived from ratio of Silica PM4 to PM10 in the 2009 technical paper from the Journal of Air and Waste Management Association (JAWA), PM4 Crystalline Silica Emission Factors and Ambient Concentrations at Aggregate-Producing Sources in California. The average of the equipment data from the V

Stockpile Emissions
* The emission factors are from the table, "DEFAULT VALUES - Material Storage" in the December 1998 San Diego Air Pollution Control District document, *Open Material Storage Areas* .
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
! 5% assumption of 50 e-6 of Non Hexavalent Chromium, crystalline silica listed as TAC in source document but not included due too respirable amount being indeterminate

Asphalt Dust Fugitive Emissions
* Emission factors are derived from a 1997 dust profile (#4082), from EPA Speciate 4.0, test data from a Mexico City Asphalt Plant.
Pollutants required for toxic reporting: TACs w/o Risk Factor. Current as of update date.
Since the amount of silica that is respirable (PM4) is indeterminate, the silica will be considered a Non-TAC (District Policy).
**5% of Chromium considered Hexavalent Chromium (District Policy).

a - Mine emissions are split into multiple mine volume sources. See report Table 16.

Road Dust Emissions From San Diego Air Pollution Control District "Haul Roads, Mineral Industry Sites, Paved and Unpaved, Default Trace Metal Composition"
https://www.sdapcd.org/content/dam/sdc/apcd/PDF/Misc/APCD_Haul_Road_Mineral_Industry_Sites_Paved_Unpaved.pdf

The emission factors for cement and flyash are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the 1998 San Diego Air Pollution Control District document, Concrete Batch Plant Operations.Speciation profiles are derived from sampling of local concrete batch plants.

Aggregates Emission Factors:
*The emission factors are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the November 1998 San Diego Air Pollution Control District document, Aggregate Crushing Operations.
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
!5% of Chromium considered Hexavalent Chromium (District Policy).
*The emission factor is derived from ratio of Silica PM4 to PM10 in the 2009 technical paper from the Journal of Air and Waste Management Association (JAWA), PM4 Crystalline Silica Emission Factors and Ambient Concentrations at Aggregate-Producing Sources in California. The average of the equipment data

Stockpile Emissions
The emission factors are from the table, "DEFAULT VALUES - Material Storage" in the December 1998 San Diego Air Pollution Control District document, *Open Material Storage Areas*.
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
! 5% assumption of 50 e-6 of Non Hexavalent Chromium, crystalline silica listed as TAC in source document but not included due too respirable amount being indeterminate

Asphalt Dust Fugitive Emissions
Emission factors are derived from a 1997 dust profile (#4082), from EPA Speciate 4.0, test data from a Mexico City Asphalt Plant.
Pollutants required for toxic reporting: TACs w/o Risk Factor. Current as of update date.
Since the amount of silica that is respirable (PM4) is indeterminate, the silica will be considered a Non-TAC (District Policy).
**5% of Chromium considered Hexavalent Chromium (District Policy).

a - Mine emissions are split into multiple mine volume sources. See report Table 16.

Road Dust Emissions From San Diego Air Pollution Control District "Haul Roads, Mineral Industry Sites, Paved and Unpaved, Default Trace Metal Composition"
https://www.sdapcd.org/content/dam/sdc/apcd/PDF/Misc/APCD_Haul_Road_Mineral_Industry_Sites_Paved_Unpaved.pdf

* The emission factors for cement and flyash are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the 1998 San Diego Air Pollution Control District document, Concrete Batch Plant Operations.Speciation profiles are derived from sampling of local concrete batch plants.

Aggregates Emission Factors:
*The emission factors are from the table, "DEFAULT VALUES - TRACE METAL CONCENTRATIONS" in the November 1998 San Diego Air Pollution Control District document, Aggregate Crushing Operations.
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
!5% of Chromium considered Hexavalent Chromium (District Policy).
**The emission factor is derived from ratio of Silica PM4 to PM10 in the 2009 technical paper from the Journal of Air and Waste Management Association (JAWA), PM4 Crystalline Silica Emission Factors and Ambient Concentrations at Aggregate-Producing Sources in California. The average of the equipment data from the V

Stockpile Emissions
* The emission factors are from the table, "DEFAULT VALUES - Material Storage" in the December 1998 San Diego Air Pollution Control District document, *Open Material Storage Areas* .
Pollutants required for toxic reporting: TACs w/o Risk Factor Current as of update date
! 5% assumption of 50 e-6 of Non Hexavalent Chromium, crystalline silica listed as TAC in source document but not included due too respirable amount being indeterminate

Asphalt Dust Fugitive Emissions
* Emission factors are derived from a 1997 dust profile (#4082), from EPA Speciate 4.0, test data from a Mexico City Asphalt Plant.
Pollutants required for toxic reporting: TACs w/o Risk Factor. Current as of update date.
Since the amount of silica that is respirable (PM4) is indeterminate, the silica will be considered a Non-TAC (District Policy).
**5% of Chromium considered Hexavalent Chromium (District Policy).

Re: Regional Aggregates Demand and Project Incremental Effect on Environment

---

The Rockfield DEIR assesses off-site emissions from delivery of aggregates, ready mix concrete, and asphalt pavement by calculating potential to emit (PTE) of delivery vehicles servicing the additional production proposed by the Project. Although the off-site PTE is included in the impact analysis for the Project, Project-produced materials would substitute for some materials shipped in the baseline while providing a local source of aggregates to meet forecasted increases in demand. As discussed below, the Project's portion of the future increase in regional truck trips is much less than the PTE of those trucks. The following discussion and methodology was certified by the County of Fresno in the Riverbend Sand and Gravel Project EIR (State Clearinghouse Number 2013071097).

Potential to Emit vs CEQA

As defined in SJVAPCD Rule 2201, PTE means "the maximum capacity of an emissions unit to emit a pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the source to emit a pollutant, including pollution control equipment and restrictions in hours of operation or on the type or amount of material combusted, stored, or processed, shall be treated as part of its design only if the limitation or the effect it would have on emissions is incorporated into the applicable permit as an enforceable permit condition."

In this case, the physical or operational limitation is the size of the aggregate market. From a regional perspective most aggregate related truck trips occur in the baseline and are attributed to others. The difference between PTE and CEQA approaches to emissions calculation is primarily that PTE is source-centric in quantifying emissions and does not account for baseline activities of others. Conversely, CEQA is environment-centric requiring regional impact assessment which, in the case of aggregates, would include existing truck trips for which Project truck trips may substitute or be in addition too.

The effect of acknowledging the regional baseline and attributing only the portion of new regional trips to the Project results in the reasonably foreseeable change in regional emissions of transportation-related pollutants with respect to the regional baseline levels. This approach produces an estimate for off-site truck travel that is less than the PTE for off-site truck travel. Table 1 presents a comparison of PTE and Project increment of reasonably foreseeable emissions increases within the region.

Table 1. Non-Employee Off-Site Transportation Emissions

Pollutant	Max PTE (tpy or MT/yr)[a]	Max Reasonably Foreseeable Increase (tpy or MT/yr)[b]
ROG	0.041	0.010
CO	0.20	0.046
NOx	2.23	0.41
PM10 (total)	0.052	0.012
PM2.5	0.049	0.011
SOx	0.019	0.004
CO2e	3,614	709

Note: criteria air pollutants reported in tons and CO2e reported in metric tons (MT).
a. PTE values are the maximum from the two phases of the Project (attached).
b. Reasonably foreseeable increase (attached).

California Aggregates Demand Forecasting

The California Geological Survey publishes Map Sheet 52 – Aggregates Sustainability in California and its companion report approximately every 5 years. A copy of the most recent report published in 2018 may be found in DEIR Appendix D or downloaded from the California Department of Conservation website.[1]

Map Sheet 52 is a statewide overview of projected future aggregate needs and currently permitted reserves. The purpose of the map is to compare projected aggregate demand for the next 50 years with currently permitted aggregate reserves in various production-consumptions regions of the state. The map also shows the projected years of permitted reserves remaining and highlights regions where less than 10 years of permitted aggregate supply remain.

The Project is within the Fresno and Madera P-C Region. P-C Regions are established for areas within which the aggregates production and consumption balance (i.e., not much "leakage" across P-C Region boundaries). Historically, the long-term average amount of aggregates used within a P-C region has been shown to be proportional to the population in the region. Per capita aggregates use is a primary methodology used in Map Sheet 52 demand estimates.

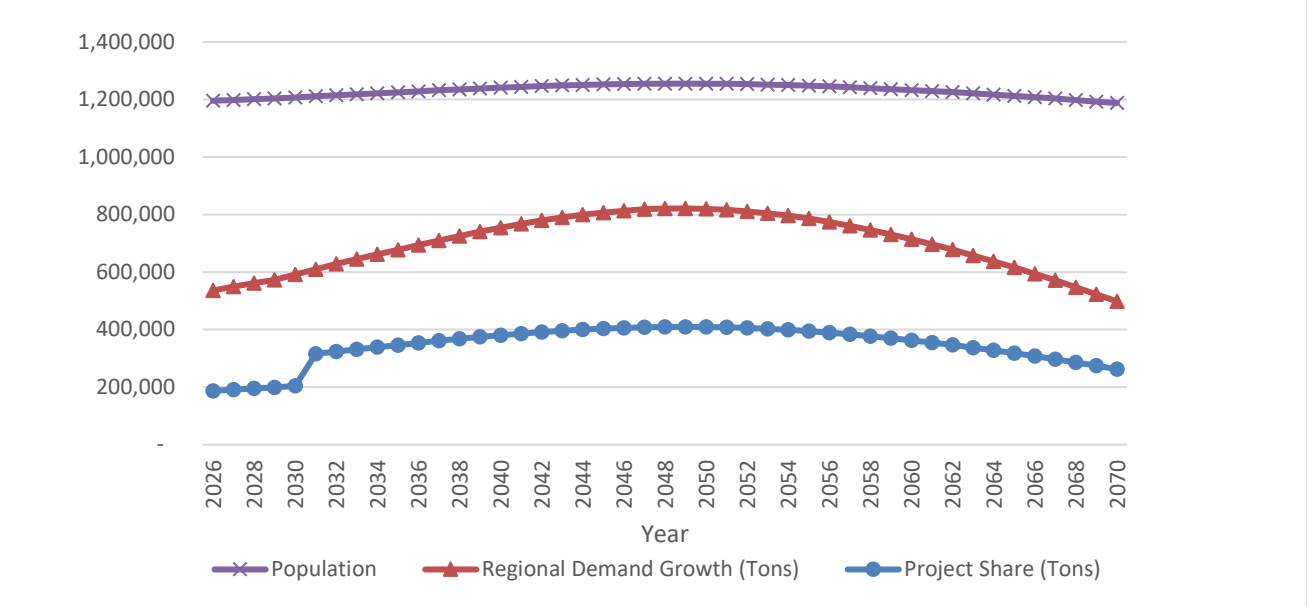
It has been demonstrated that introduction of a new source of aggregates does not increase the consumption of aggregates because the demand for aggregates is inelastic (Berck, 2005 and a copy is provided in DEIR Appendix D). Therefore, the amount of aggregates consumed is independent from the number of available aggregates resources. In the first years of a project it is foreseeable that the aggregates will primarily substitute for aggregates produced elsewhere in the baseline. Early in the Project the majority of truck trips will not be new trips.

However, the consumption of aggregates increases as time progresses if the population in the P-C Region is increasing. Table P2A population projections from the California Department of Finance[2] indicates that there will be an increase in certain years as shown in Figure 1. The California Geological Survey has determined that 4.79

[1] https://www.conservation.ca.gov/cgs/minerals/mineral-land-classification-smara
[2] https://dof.ca.gov/Forecasting/Demographics/projections/

tons per person per year are used in the Fresno-Madera P-C Region. The Region is estimated to have 1,083,705 residents in the Baseline Year of 2005. This would correspond to a demand of 5,190,947 tons per year in 2005. Between 2005 and 2026, the population of the P-C Region is forecasted to grow to 1,195,605 residents and the aggregates market size is forecasted to be 5,726,948 tons per year; an increase of 536,001 tons per year. CEQA would require assessment of the impact of the amount that exceeds baseline. In 2026 the Project would produce 2,000,000 tons per year which constitutes 34.9% of the market. Thus, the Project's incremental increase in regional aggregates use would be 34.9% of 187,186 tons. This amount corresponds to 374,371 VMT/yr for aggregates and 31,023 VMT/yr for additional truck trips (e.g., asphalt oil, cement, fuel). In 2031, the Project production would increase to 3,000,000 tons per year and remain at that level in future years. NOx emissions of 0.41 tpy in 2026 and 2031 from truck travel is the Project's incremental increase above regional baseline as compared to the NOx PTE (2.23 tpy) which is over five times greater. A similar story can be demonstrated for other pollutants.

Figure 1. Population and Change in Aggregate Demand Since Baseline – 2005



In addition to the analysis described above, the Low Carbon Fuel Standard (LCFS) has established benchmarks for the carbon intensity of fuels as described in Appendix L of this report. Figure 2 presents the increase in GHG emissions that will occur within the market and the incremental amount attributable to the Project.

By 2070, the population of the P-C Region is forecasted to be 1,187,701 residents and the aggregates market size is forecasted to be 5,689,088 tons per year which is an increase of 498,141 tons per year over the 2005 Baseline condition. Figure 1, Figure 2, and Figure 3 illustrate the relationship between market per capita demand growth, GHG and NOx emissions changes in the region and emissions changes attributable to the Project based on the portion of the market that may be served by the Project operating at peak annual rate. The emissions characteristics of the truck fleet improve over time as does the carbon intensity of the fuel.

Figure 2. Change in Transportation GHG Emissions from Baseline

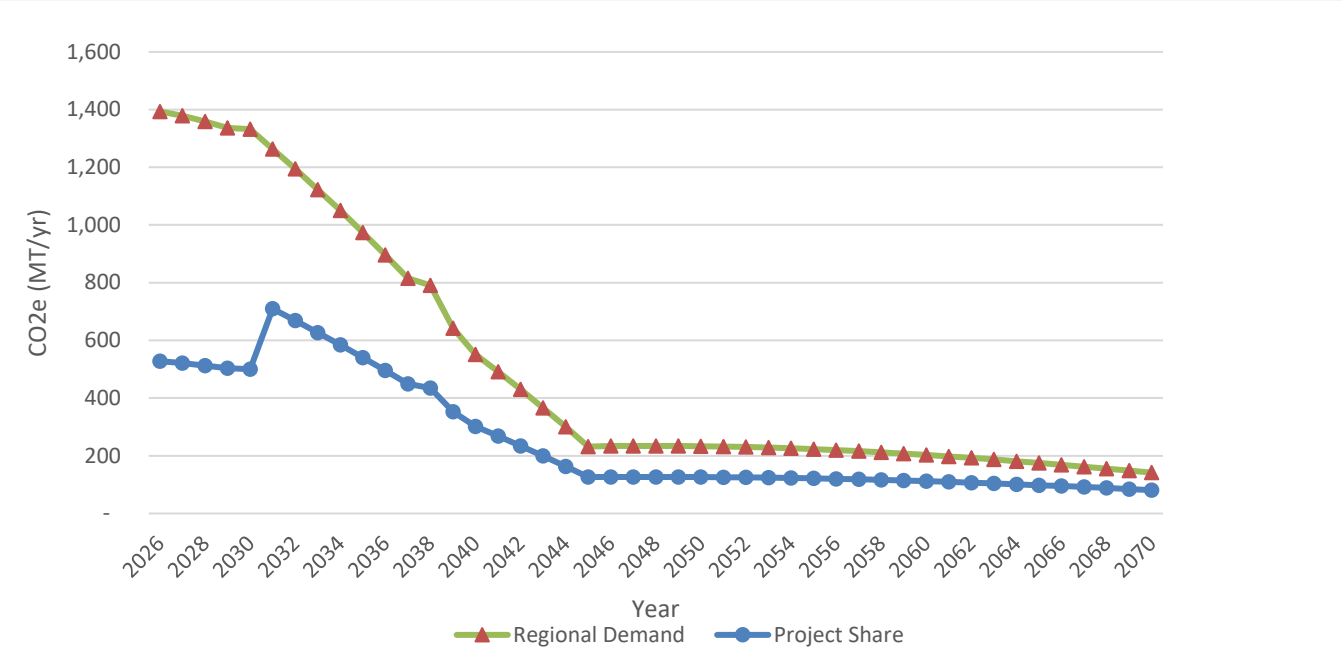


Figure 3. Change in Transportation NOx Emissions from Baseline

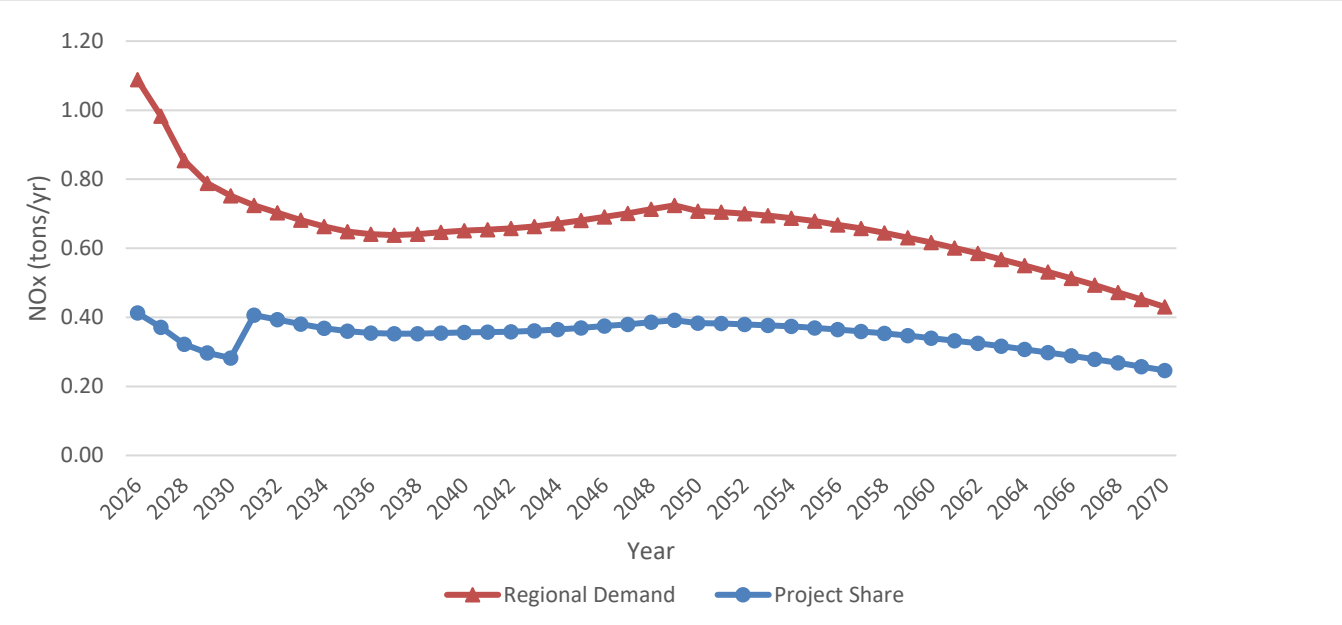

Regional Aggregate Demand

Global climate impacts are substantially driven by population growth which correlates to growth in demand for aggregate and related construction materials. Increased population, therefore, is the underlying trigger to any GHG emission associated with a proposed aggregate mining and processing facility.

"The assumption that each person will use a certain amount of aggregate every year is a simplification of actual usage patterns, but overall, an increase in the population leads to the use of more aggregate. Over long enough periods, perhaps 20 to 30 years or more, the random impacts of major public construction projects and economic recessions tend to be smoothed and consumption trends become similar to historic per capita consumption rates. Per capita consumption is a commonly used and accepted national, state, and regional measure for purposes of forecasting." (CGS, 2012, p. 5).

As discussed in Environmental Costs of Aggregate (Berck, 2005), demand for aggregate is inelastic. Inelastic demand means that an increase or decrease in the price of aggregate has little or no effect on the quantity of aggregate demanded by consumers.

"Transportation plays a major role in the cost of aggregate to the consumer. Aggregate is a low-unit value, high-bulk-weight commodity, and it must be obtained from nearby sources to minimize both the dollar cost to the aggregate consumer and other environmental and economic costs associated with transportation. If nearby sources do not exist, then transportation costs may significantly increase the cost of the aggregate by the time it reaches the consumer." (CGS, 2018, p. 17). "The importation of aggregate from neighboring regions typically results in longer haul distances, higher costs, and increased carbon dioxide emissions, air pollution, traffic congestion, and highway maintenance." (CGS, 2018, p. 10).

As local sources of aggregate are depleted and aggregate is hauled longer distances to the consumer, prices will increase. Given aggregate's inelastic demand, however, increased prices will not reduce the demand for aggregate. Conversely, a new aggregate mine that increases local aggregate supply and lowers local aggregate prices by reducing haul distances would have little effect on aggregate demand and, therefore, little effect on use or production.

Reference Data	**Value**	**Units**
Total Project Aggregate Sales (through 2026-2030)	2,000,000	tons/yr
Total Project Aggregate Sales (2031 and after)	3,000,000	tons/yr
Truck Capacity	25	tons/truck load
Trip Length	50	miles/round trip
Aggregate Demand:	4.79	tons per capita*
50-Year Aggregate Demand:	265	MMtons (CGS, 2018)
Project Data from Emissions Calculations Activity Level Sheet:		
Asphalt Plant Export	500000	tons
Asphalt Material Imports:	25000	tons
Ready Mix Plant Export	603000	tons
Ready Mix Material Imports:	70500	tons
Asphalt oil per import load	27	tons
Cement/supplement per import load	27	tons
Per AP42 Page 11.12-10, 1 yard of concrete contains:		
Coarse Aggregate	1865	lbs
Sand	1428	lbs
Cement	491	lbs
Cement Supplement	73	lbs
Water	167	lbs
Total Weight	4024	lbs
GWP - CH4	28	CO2e/CH4
GWP - N2O	265	CO2e/N2O

Additional Trips Data	**Value**	**Units**
Site Services and Fuel Delivery Trips	1,388	Round Trips
Asphalt Material Import Trips	926	Round Trips
Ready Mix Material Import Trips	2,611	Round Trips
Non-Aggregate Concrete Export Trips	4,382	Round Trips
Non-Aggregate Asphalt Export Trips	926	Round Trips

Notes

EMFAC Emissions are projected until the year 2050. After 2050, emissions factors from 2050 are used.

Total Project Aggregate sales includes aggregate sold in asphalt and ready mixed concrete. "Additional trips" calculation accounts for additional material such as asphalt binder, cement, and water, as well as facility imports. For example,"non-aggregate concrete export trips" accounts for the additional total number of trips that are accounted for by the addition of cement, water, etc. to the aggregate that is exported in the form of "Project Additional Share" is calculated as the percentage of non-aggregate additional VMT divided by the overall regional VMT growth.

*Per capita consumption is approximated assuming that the Fresno P-C region population used in Map Sheet 52 equals the Department of Finance population projections for Fresno and Madera County. Precision of the absolute number of people and resulting per capita use rate are not as important as relative population growth (DoF) and 50-year Demand (MS52) in evaluating project impacts. Per capita use was adjusted iteratively by hand until the 50-year demand summed to the amount in Map Sheet 52.

Reference Data	**Value**	**Units**
Total Project Aggregate Sales (through 2026-2030)	2,000,000	tons/yr
Total Project Aggregate Sales (2031 and after)	3,000,000	tons/yr
Truck Capacity	25	tons/truck load
Trip Length	50	miles/round trip
Aggregate Demand:	4.79	tons per capita*
50-Year Aggregate Demand:	130	MMtons (CGS, 2018)
Project Data from Emissions Calculations Activity Level Sheet:		
Asphalt Plant Export	500000	tons
Asphalt Material Imports:	25000	tons
Ready Mix Plant Export	603000	tons
Ready Mix Material Imports:	70500	tons
Asphalt oil per Import load	27	tons
Cement/supplement per import load	27	tons
Per AP42 Page 11.12-10, 1 yard of concrete contains:		
Coarse Aggregate	1865	lbs
Sand	1428	lbs
Cement	491	lbs
Cement Supplement	73	lbs
Water	167	lbs
Total Weight	4024	lbs
GWP - CH4	28	CO2e/CH4
GWP - N2O	265	CO2e/N2O

Additional Trips Data	**Value**	**Units**
Site Services and Fuel Delivery Trips	1,388	Round Trips
Asphalt Material Import Trips	926	Round Trips
Ready Mix Material Import Trips	2,611	Round Trips
Non-Aggregate Concrete Export Trips	4,382	Round Trips
Non-Aggregate Asphalt Export Trips	926	Round Trips

Notes

EMFAC Emissions are projected until the year 2050. After 2050, emissions factors from 2050 are used.

Total Project Aggregate sales includes aggregate sold in asphalt and ready mixed concrete. "Additional trips" calculation accounts for additional material such as asphalt binder, cement, and water, as well as facility imports. For example,"non-aggregate concrete export trips" accounts for the additional total number of trips that are accounted for by the addition of cement, water, etc. to the aggregate that is exported in the form of concrete

"Project Additional Share" is calculated as the percentage of non-aggregate additional VMT divided by the overall regional VMT growth.

*Per capita consumption is approximated assuming that the Fresno P-C region population used in Map Sheet 52 equals the Department of Finance population projections for Fresno and Madera County. Precision of the absolute number of people and resulting per capita use rate are not as important as relative population growth (DoF) and 50-year Demand (MS52) in evaluating project impacts. Per capita use was adjusted iteratively by hand until the 50-year demand summed to the amount in Map Sheet 52.

	Baseline	Future	
Year	2005	2026	2031
Production (tons)	1,580,413	2,000,000	3,000,000

Re: Rockfield Quarry Dust Control Plan

This Dust Control Plan for the Rockfield Quarry Project represents a preliminary document which will be submitted to the Air District for approval as part of the facility permitting process. It may be subject to change per District comment or other operational requirements.

The Control Plan outlines a series of control technique options which could be enacted to achieve the necessary level of control. Some facility operations can be controlled using multiple techniques, as indicated in the Plan. Text preceding the tables below will indicate cases where the Control Plan allows flexibility to use the most appropriate technique based on the situation or location with the facility. A series of plot plans detailing facility boundaries, roadways, stockpiles, water supplies, and other relevant information are also included in this Dust Control Plan.

Section 3-A: Sources of Fugitive Dust

1. **Pre-Activity** The following will be implemented:

Control Option	Description
#1 (Watering and Phased operations)	The site will be pre-watered, and work will be phased to reduce the amount of disturbed surface area at one time.

2. **Active Excavation Operations** (Earth – moving activities) The following will be implemented:

Control Options	Description
#1 Watering	Water will be applied to the disturbed surface area during operations, at least every 2 hours, unless the surface is visibly wet

3. Inactive Operations (Including After Work Hours, Weekend and Holidays) The following will be implemented:

Control Option	Description	Notes
#1 (Restricted Vehicle Access)	Vehicle access will be restricted.	Facility access is by steel gates which prevent unauthorized access during inactive operations.

4. Temporary stabilization of areas that remain unused for seven or more days

One of the following will be implemented, at operator discretion.

Control Options	Description	Notes
#1 (Dust Suppressant & Restricted Vehicle Access)	Vehicular access will be restricted, and dust suppressants will be applied and maintained at all un-vegetated areas. Suitable for areas of short term inactivity.	Temporary barriers or signage will be used to ensure restriction of vehicle area is maintained during inactive periods.
#2 (Vegetation)	Vegetation (cover crops) will be established on all previously disturbed areas. Ideal for areas with long term inactivity.	Consistent with reclamation requirements, areas that will be inactive long term, such as overburden piles and disturbed topsoil will be revegetated
#3 (Gravel)	Gravel will be applied and maintained at previously disturbed areas. Ideal for areas with long term inactivity.	In cases where vegetation is not an option due to ongoing activities or vehicle traffic, gravel will be applied and maintained to disturbed areas

5. Unpaved Access and Haul Roads, Traffic and Equipment Storage Area

At least one of the following will be applied for each facility roadway:

Control Options	Description
#1 (Heavy Watering)	Water all unpaved roads every 2 hours during active use.
#2 (Watering, Dust Suppressant & Speed Limit)	Apply a dust suppressant to all unpaved roads and water before application as well as whenever the crust is compromised (or as specified by the products instructions). Post speed limit signs (15mph or less) at each entrance, and again every 500 feet. Dust suppressant will be re-applied at intervals consistent with vendor specifications.
#3 (Light Watering & Speed Limit)	Water all unpaved roads every 4 hours during active use. Post speed limit signs (15mph or less) at each entrance, and again every 500 feet.

Section 3-B: Bulk Materials

6. Outdoor Handling (Truck Loading/unloading areas) The following will be implemented:

Control Options	Description	Notes
#1 Water Spray	Water will be applied at the drop point, or as moisture in feed material, to prevent visible dust.	Water spray bars or watering truck may be used for application of water during loading/unloading, unless materials are sufficiently wet from upstream watering or natural moisture to prevent fugitive emissions.

7. Outdoor Storage (Stockpiles)

Option 1 will be implemented.

Control Options	Description
#1 Watering	Use a spray system to apply water to stock piles at transfer point and/or on top of piles.

8. On-Site Transporting

Each of the following will be implemented:

Control Options	Description
#1 (Limited Speed)	Post and enforce a speed limit of 15mph or less for all vehicles on project site.
#2 (Vehicle Loading)	Load haul trucks such that there is at least 6” of space between the top of material and the top edge of the truck bed when transported across any paved public access road.
#3 (Leveling or Covering of loads)	A station will be provided to allow truck operators to level and cover loads as appropriate.

9. Off-Site Transporting

9.1. For preventing track out, control option #1 will be applied. Additionally, either Option #2 or #3 will be implemented.

Control Options	Description
#1 (Paved Surface)	Pave exit road for at least 100 feet from the site entrance/exit to the public road.
#2 (Wheel Washer)	Install and use a wheel wash system at the exit to dislodge debris from tires and vehicle undercarriage
#3 (Grizzly)	Install a grizzly (rails, pipes or grates) at the exit, covering the full width of road and at least 25 feet in length.

9.2. For preventing carryout, Option 1a or 1b will be implemented, and Option 2a or 2b will be implemented.

Control Options	Description
#1a (Empty Haul Truck - Cleaned)	Inspect interior cargo compartments before leaving the project site. Cargo compartments will be cleaned if materials that could escape on roadway are present.
#1b (Empty Haul Truck - Covered)	Cover cargo compartment with a tarp or suitable cover before leaving the project site.
#2a (Loaded Haul Truck - Water)	Load haul trucks such that there is at least 6” of space between the top of material and the top edge of the truck bed, and apply water to the top of the load before leaving the site.
#2b (Loaded Haul Truck - Covered)	Cover loaded haul trucks with a tarp or suitable cover before leaving the project site.

9.3. For cleanup of Carryout and Track out, sweeping will be implemented as applicable:

Control Options	Description
#1 (Sweeping)	If any dirt or debris is tracked onto paved roads, sweep and remove it within 30 minutes.

10. Outdoor Transport using a Chute or Conveyor

For any outdoor transport using conveyors, the conveyor or process equipment upstream of the conveyor will be equipped with water spray bars in order to sufficiently wet the materials for the prevention of visible dust.

General Information:

4-A Water Application:

Water Application Equipment

Water Application Details	**Specifications**		
Equipment Used	Water Truck ☒	Water Trailer ☐	Water Wagon ☐
Number of application equipment available	To be determined. Will be sufficient for facility operation consistent with previously outlined control methodologies.		
Application equipment capacity			
Application Rate (gallons per acre)			
Application frequency (on typical dry day)	Up to every 2 hours		
Hours of operation	TBD		
After-hours contact & phone number	TBD		

Water Supply

Water Source	**Specifications**
Fire hydrants	Will not be used for dust control
Storage tanks	Stationary tanks are not currently part of dust control plan
Wells	60 acre feet per year
River/Pond	125 acre feet of river water per year

4-B Dust Suppressant Product:

At least one dust suppressant product will be chosen, though various dust suppressants may be utilized depending on site location and operational use case. Specifics of which dust control products will be used for each process will be determined in cooperation with the SJVAPCD as part of the permitting process. Dust suppressant's utilized on site will be chosen from the SJVAPCD "List 1: Products Which Meet the 50% Efficiency Requirement" available at:

https://www.valleyair.org/compliance/dust-control/reducing-dust-emissions/#streetsweepers

Recordkeeping

Records of Daily Track out Inspection/Cleanup, Daily Facility Watering using water trucks, Dust suppressant application, and other dust control activities outlined in the Regulation VIII record keeping form shall be maintained. Example record keeping sheets are included in this plan after the Site Plot Plan Figures.

Re: **California LCFS Program and Renewable Diesel Emissions Reductions Documentation (Appendix L)**

Low Carbon Fuel Standard

The Low Carbon Fuel Standard (LCFS) is one of nine discreet early action measures to reduce California's greenhouse gas emissions (GHG) under the AB 32 Scoping Plan. The LCFS is designed to decrease the carbon intensity of California's transportation fuel pool and provide an increasing range of low-carbon and renewable fuels alternatives. The California Air Resources Board (CARB) approved the LCFS regulation in 2009; program implementation began in 2011. LCFS program amendments are periodically approved to strengthen and smooth the carbon intensity (CI) benchmarks.[1]

The LCFS program is based on the principle that each fuel has "life cycle" GHG emissions that include CO2, CH4, N2O, and other GHG contributors. This life cycle assessment examines the GHG emissions associated with the production, transportation, and use of a given fuel. The life cycle assessment includes direct emissions associated with producing, transporting, and using the fuels, as well as significant indirect effects on GHG emissions, such as changes in land use for some biofuels. The CI scores assessed for each fuel are compared to a declining CI benchmark for each year. Low carbon fuels below the benchmark generate credits, while fuels above the CI benchmark generate deficits. Credits and deficits are denominated in metric tons of GHG emissions. Providers of transportation fuels are now required to demonstrate that the mix of fuels they supply for use in California meets the LCFS carbon intensity standards, or benchmarks, for each annual compliance period.

Renewable Diesel Growth in California Fuel Pool

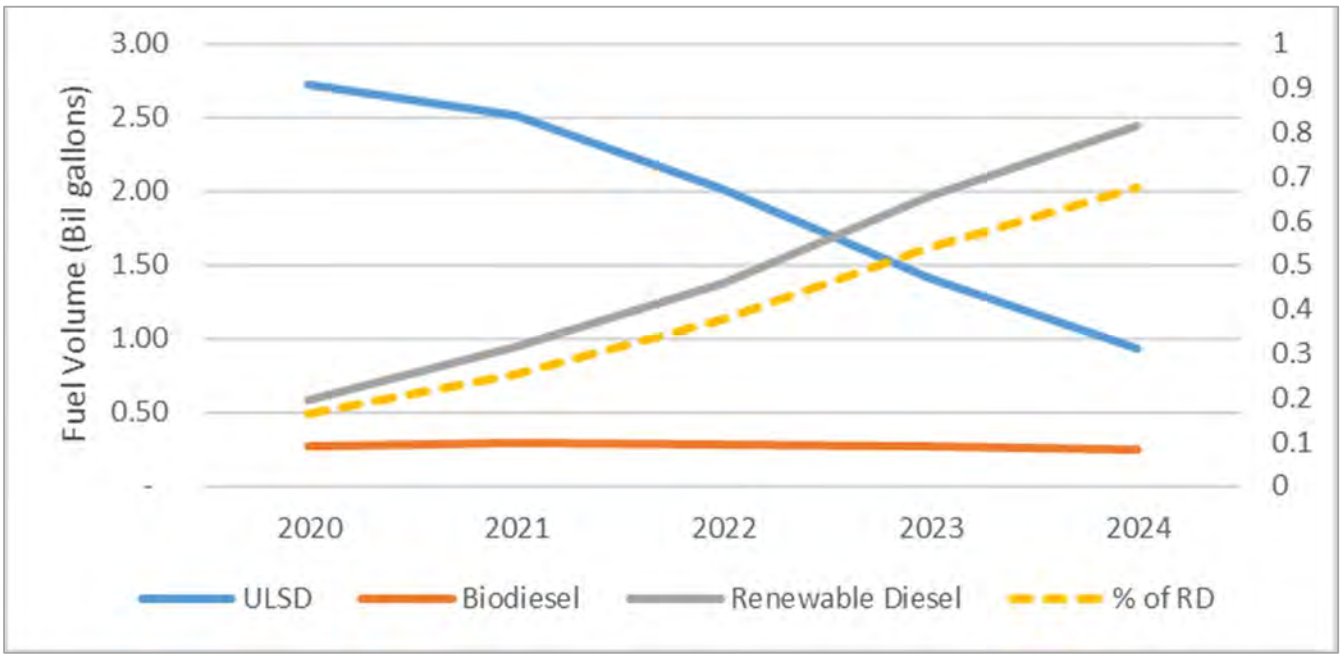
Renewable diesel (RD) currently makes up approximately 70% of the California diesel fuel pool. Over the last five years, this has trended upward from 16% in 2018 to the latest full year data of 2024 as seen in **Figure 1.**[2] As RD is

[1] CARB, 2025a, Low Carbon Fuel Stand Regulation, Table 2, Title 17, California Code of Regulations (CCR), sections 95480-95503, effective July 1, 2025. https://ww2.arb.ca.gov/sites/default/files/2025-08/2025_lcfs_fro_oal-approved_unofficial_08112025.pdf

[2] CARB 2025b, Quarterly LCSF Data Collected including total credits, deficits and volume of fuel reported under the LCFS program, https://ww2.arb.ca.gov/sites/default/files/2025-07/quarterlysummary_Q12025_2.xlsx

a drop-in fuel for fossil-derived Ultra Low Sulfur Diesel (ULSD), no additional additives are necessary, keeping its relative cost compared to biodiesel at a minimum. Therefore, the percentage of biodiesel (BD) within the diesel fuel pool is expected to remain stagnant or eventually be replaced by RD production, as both use the same feedstocks.

Figure 1. Renewable Diesel Growth in CA Fuel Pool



Source: CARB 2025b, LCFS Liquid Heavy Duty Fuel Use in CA between 2020 through 2024

The current Low Carbon Fuel Standard (LCFS) gasoline and diesel compliance targets will continue to increase the need for renewables to be blended or directly replace petroleum fuels to meet annual deadlines, suggesting that the ULSD fuel pool may eventually be dominated by RD, and other low carbon diesel fuel options.

Two other programs that have been monitoring fuel production are the California Energy Commission (CEC) or the US Energy Information Administration (EIA) and these two programs also did not capture renewable fuel production data prior to 2010. As for data captured in 2011, the LCFS recorded Renewable Diesel (RD) production to be 1.8 million gallons while in comparison the Low-Sulfur Diesel Fuel (LSDF) production was reported to be approximately 3.6 billion gallons1 (Fuels tab); this 2011 data shows that RD is less than 0.05% of the fuels used in 2011. While there is no data from 2005, a conservative estimate would be that RD (and other low CI fuel types) was less than 0.05% percent of the fuel feed stock.

LCFS 2025 CI Benchmark Data

The 2025 CI benchmarks for the ultra-low sulfur diesel (ULSD) reflects the mix of diesel fuel types projected to be produced in California between 2025 and 2045. **Figure 2** illustrates the change in ULSD CI between 2011, the first year the LCFS program collected fuels data, and 2056, the year the CEMEX project is expected to achieve

maximum production.[3] The CI benchmark for year 2045 was projected to be the same for the years 2046 through 2056.

Carbon Intensity Reductions with Renewable Diesel

The carbon intensities (CIs) of renewable diesel (RD) and low sulfur diesel fuel (LSDF) have been estimated from CARB's Quarter LCFS data collection program.[4] CI is a reliable approximation of the difference in emissions between RD and LSDF. **Figure 3** illustrates the quarterly CI variations for RD between 2011 and 2025 with a current average CI of approximately 42.7 for the years 2023 through 2025. **Figure 4** illustrates the CI variations for LSDF for the same period and has an average CI of approximately 101.5 for the years 2023 through 2025.

Project Incremental Share of Regional Off-Site On-Road Demand GHGs

As described in Regional Aggregates Demand and Effect on Air Quality memo (Appendix J, dated April 21, 2026), the Project's fair share of the future increase in regional truck trips is much less than the PTE of those trucks. **Figure 5** below illustrates the Project's incremental share of maximum GHG emissions over time when accounting for the ULSD 2025 CI benchmarks data illustrated in **Figure 2** above and the projected CI reductions from the increase of RD in the diesel fuel pool. Based on **Figure 5**, the maximum off-site on-road GHG emissions would be realized in Year 2026.

California In-Use Off-Road Diesel-Fueled Fleets Regulation

CARB additionally implemented amendments to sections 2449, 2449.1, and 2449.2 of title 13, California Code of Regulations to reduce oxides of nitrogen (NOx), diesel particulate matter (PM) and other criteria pollutant emissions from in-use off-road diesel fueled fleets in California.[5] The estimated emissions from CEMEX Rockfield operations includes extensive activities from off-road diesel fueled equipment. Of note is that beginning January 1, 2024, large and medium fleets, and on January 1, 2028, small fleets, must meet the tiered phase out requirements for this Regulation for In-Use Off-Road Diesel-Fueled Fleets. Additionally, beginning January 1, 2024, all fleets must meet the renewable diesel requirements specified in section 2449.1(f). Based on the analysis of data reported above from the LSCF Rule and averaged quarterly reporting as well as the California In-Use Off Road Diesel-Fuels Fleet Requirements, use of a 50% reduction when substituting RD for LSDF is reasonably conservative estimate of the change in CEMEX future off-road equipment Project GHG emissions. This is less than the 55% reduction in CI measured in 2025 between RD and LSDF (Tables 3 and 4) and the approximately 90% in ULSD projected for 2045 (Table 2).

APPENDIX D-4
REVISED SECTION 4.3, AIR QUALITY

4.3—AIR QUALITY

This section of the Draft EIR documents potential project impacts associated with air quality and air pollutant emissions. Impacts considered in this section include the potential for project air emissions to exceed established thresholds or to cause or contribute to exceedance of state or federal ambient air quality standards. The section also considers human health risks associated with air pollutant emissions resulting from the project and the potential for public nuisance as a result of project odors.

The information in this section is based on a peer review of Applicant-prepared studies and publicly available sources. The Applicant-prepared studies used are:

- *Air Quality, Health Risk, and Climate Change Impact Assessment*. CEMEX Rockfield Modification Project, County of Fresno, California. Prepared by Sespe Consulting, Inc. [Sespe]. December 4, 2019. (Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment")
- *Rockfield Air Quality Section Addendum No. 2, Revision 2*. CEMEX Rockfield Modification Project. Prepared by Sespe. March 7, 2022. (Appendix D-2, "Addendum to Air Quality, Health Risk, and Climate Change Impact Assessment")
- *Air Quality, Health Risk, and Climate Change Impact Assessment*. CEMEX Rockfield Modification Project. Prepared by Sespe. Revised May 13, 2026. (Appendix D-3, "Air Quality, Health Risk and Climate Change Impact Assessment")

The *Air Quality, Health Risk, and Climate Change Impact Assessment* (Air Quality Assessment) was peer reviewed by County-retained Taylor Environmental Services, Inc. (Taylor Environmental) in September 2020. The peer review comments are on file with the County. In October of 2020, Sespe prepared *Addendum No. 2 (Version 1) to the Air Quality, Health Risk, and Climate Change Impact Assessment*. Comments were provided by Taylor Environmental and Sespe updated the document in response. In December 2020, Taylor Environmental confirmed that *Addendum No. 2 (Version 1)* adequately addressed the peer review comments. In May 2021, comments on *Addendum No. 2 (Version 1)* were provided by Benchmark Resources. Per Benchmark's comments, Sespe provided an updated document (*Addendum No. 2, Revision 1*) in June 2021. Further comments were provided by Benchmark in February 2022. In response, Sespe revised the addendum again in March 2022, creating *Addendum No. 2, Revision 2*. Benchmark confirmed that the *Rockfield Air Quality Section Addendum No. 2, Revision 2* (Addendum) completed in March 2022 adequately addressed all comments and questions. Comments collected during the 2025 public comment period for the Draft EIR lead to the revised May 13, 2026, *Air*

Quality, Health Risk and Climate Change Impact Assessment (Appendix D-3). Appendix D-3 replaces Appendix D-1 and D-2 in their entirety.

4.3.1 Environmental Setting

Location and the amount of air pollutants are the primary factors that influence air quality; however, topography, climate, and meteorological conditions are also influential factors because they determine the movement and dispersal of air pollutants. California is divided into fifteen air basins, each with its own unique regional climate. The Quarry Site and Plant Site (project sites) are located in the central portion of the San Joaquin Valley Air Basin (Basin).

Although marine air generally flows into the Basin from the San Joaquin River delta, the region's topographic features restrict air movement within the Basin. The Coast Range hinders wind access into the Valley from the west, the Tehachapi Mountains prevent southerly passage of air, and the Sierra Nevada mountain range to the east is a barrier to air movement. These topographic features result in weak air flow, which becomes blocked vertically by high barometric pressure over the Basin. As a result, the Basin is susceptible to pollutant accumulation over time. Most of the surrounding mountains are above the normal height of summer inversion layers (1,500 to 3,000 feet).

During the summer season, wind usually originates at the north end of the Valley, passing through Tehachapi Pass into the Mojave Desert Air Basin. During the winter, wind occasionally originates from the south end of the Valley and flows in a north-northwesterly direction. During the winter months, the Valley experiences light, variable winds, which are usually less than 10 miles per hour (mph). Low wind speeds combined with low inversion layers during the winter creates a climate conducive to the accumulation of carbon monoxide (CO) and suspended particulate matter.

The local climatology of the project sites are best represented by ambient temperature measurements at the Western Regional Climate Center (WRCC)-operated Friant Government Camp Station in Fresno County. The highest average monthly maximum temperatures of about 100°F occur in July (WRCC 2012a). The lowest average monthly minimum temperatures of about 37°F occur in December and January (WRCC 2012a). Average annual precipitation of approximately 14 inches occurs as rainfall primarily during the months of November through March (WRCC 2012b). Summer rainfall is minimal and generally limited to scattered thundershowers over the Sierra Nevada mountain range.

4.3.1.1 Environmental Factors Affecting Air Quality

Ambient concentrations of air pollutant emissions are determined by the amount of emissions released by pollutant sources and the atmosphere's ability to transport and dilute such emissions. Natural factors affecting transport and dilution include terrain, wind, atmospheric stability, and sunlight. Existing air quality conditions in the project area are determined by such natural factors as topography, meteorology, and climate, in addition to the amount of emissions released by existing air pollutants. The environmental factors that affect ambient air pollutant concentrations are discussed separately below.

Topography, Wind Speeds, and Inversion Layers

Low wind speed conditions limit horizontal air dispersion and can result in the buildup of air pollutants. Poor air quality under low wind speed conditions can be especially pronounced in interior valleys such as the Basin, where the topography also contributes to the restriction of air movement and pollutant dispersion.

Inversion layers exist when the air temperature increases with elevation above the ground. The strength, altitude of, and duration of inversions determine the amount of vertical atmospheric mixing which occurs, which subsequently determines suspended particulate matter concentrations in the Basin. Temperature inversions occur in a stable atmosphere of warm air over cooler air hindering the upward dispersion of pollutants. Mixing ceases at the base of the inversion, which is also known as the mixing height. The Basin experiences two common types of inversions: radiation inversions and subsidence inversions.

Nocturnal cooling of an air layer near the Basin floor causes radiation inversions. It extends upward several hundred feet and occurs during the evening and early morning hours. During a radiation inversion, little vertical mixing occurs near the surface. The inversion dissipates when solar radiation warms the ground, which in turn heats the lower layers of the atmosphere. This heating causes the surface-based inversion to weaken, and finally dissipate, which allows vertical mixing through a greater depth in the atmosphere. Inversions are more persistent (stable) during the winter months, when inversions occur from 50 to 1,000 feet above the Basin floor. Studies in the southern part of the Basin indicate more frequent and persistent early morning radiation inversions than in the northern part of the valley due to the lack of marine air intrusion.

Subsidence inversions are caused by downward vertical motion in the atmosphere. As air descends, it warms due to compression, and as a result becomes warmer than the air beneath it. This is common when the semi-permanent Pacific High pressure system is

located off the west coast, which typically occurs during the summer months (San Joaquin Valley Air Pollution Control District [Air District] 2003).

Solar Radiation and its Impact on Photochemical Pollutants

The higher intensity and longer duration of solar radiation during the Valley's summer months provide ultraviolet light and warm temperatures that promote the formation of secondary photochemical pollutants (e.g., ozone). Sunlight intensity and summer temperatures are much higher in inland areas than near the coast, causing them to be especially prone to photochemical air pollution. In contrast, photochemical pollutants do not usually reach significant levels anywhere in the Valley during the winter, when temperatures are lower and daylight hours are shorter.

4.3.1.2 Pollutants and Health Effects

Air pollution contributes to a wide variety of adverse health effects. The U.S. Environmental Protection Agency (EPA) has established national ambient air quality standards (NAAQS) for six of the most common air pollutants—CO, lead, ground-level ozone (O_3), particulate matter, oxides of nitrogen (NO_x), and oxides of sulfur (SO_x)—known as "criteria" air pollutants. The California Air Resources Board (ARB) also has adopted California ambient air quality standards (CAAQS) for these same criteria air pollutants. In this Draft EIR, NAAQS and CAAQS are also referred to as the "state and federal ambient air quality standards." The presence of criteria pollutants in ambient air is generally caused by numerous, diverse, and widespread sources of emissions.

Ambient air quality standards are established to protect the public from adverse health effects of criteria pollutants and to provide protection against visibility impairment and damage to animals, crops, vegetation, or buildings.

The Office of Environmental Health Hazard Assessment (OEHHA) relies upon the following definition of "adverse respiratory health effect":

> *Medically significant physiologic or pathologic changes generally evidenced by one or more of the following:*
>
> 1. *Interference with the normal activity of the affected person or persons;*
> 2. *Episodic respiratory illness;*
> 3. *Incapacitating illness;*
> 4. *Permanent respiratory injury; and/or*
> 5. *Progressive respiratory dysfunction. (OEHHA, 6/2004).*

OEHHA considers the following "dimensions" of adverse effects when determining an adverse health effect:

1. *Biomarkers: These should be considered; however it must be kept in mind that few biomarkers have been validated sufficiently to establish their use for defining a point at which a response becomes adverse, consequently, not all changes in biomarkers should necessarily be considered adverse.*
2. *Quality of life: In recent years, decreased health-related quality of life has become widely accepted as an adverse health effect. The review committee concluded that reduction in quality of life, whether in healthy persons or persons with chronic respiratory disease, should be considered as an adverse effect.*
3. *Physiological impact: The committee recommended that small, transient reductions in pulmonary function should not necessarily be regarded as adverse, although permanent loss of lung function should be considered adverse. The committee also recommended that reversible loss of lung function in conjunction with symptoms should be considered adverse.*
4. *Symptoms: Air pollution-related symptoms associated with reduced quality of life or with a change in clinical status (i.e., requiring medical care or a change in medications) should be considered adverse at the individual level. At the population level, the committee suggested that any detectable increase in symptom frequency should be considered adverse.*
5. *Clinical outcomes: Detectable effects of air pollution on clinical measures should be considered adverse. More specifically, the ATS committee cited as examples increases in emergency department visits for asthma or hospitalizations for pneumonia, at the population level, or an increased need to use bronchodilator medication, at the individual level. The committee recommended that: "no level of effect of air pollution on population-level clinical indicators can be considered acceptable."*
6. *Mortality: Increased mortality should clearly be judged as adverse.*
7. *Population health versus individual risk: The committee concluded that a shift in risk factor distribution, and hence the risk profile of an exposed population, should be considered adverse when the relationship between the risk factor and the disease is causal, even if there is no immediate occurrence of obvious illness. (OEHHA, 6/2004).*

Based on these recommendations, many health outcomes found to be associated with criteria pollutants could be considered adverse including pulmonary function changes accompanied by symptoms, pulmonary function changes and respiratory symptoms that reduce quality of life, large changes in pulmonary function, clinical outcomes such as emergency department visits for asthma, hospitalization for respiratory and cardiovascular disease, and mortality. Research now shows that some highly susceptible

individuals may respond to common exposures at or close to natural background pollutant levels that are often unavoidable. Health effects that have been associated with each of the criteria pollutants are summarized below.

Ozone

Ground-level ozone is a secondary pollutant that forms through the reaction of NO_x and volatile organic compounds (VOCs) in the atmosphere by a photochemical process involving sun energy. Chemicals that are precursors to ozone formation can also be emitted by natural sources, particularly trees and other plants. Generally, air districts prioritize NO_x reductions over VOC reductions because NO_x reductions would have greater effect on reducing ozone concentrations and be more protective of public health.

Ground-level ozone can pose risks to human health, in contrast to the stratospheric ozone layer that protects the earth from harmful wavelengths of solar ultraviolet radiation. Short-term exposure to ground-level ozone can cause a variety of respiratory health effects, including inflammation of the lining of the lungs, reduced lung function, and respiratory symptoms such as cough, wheezing, chest pain, burning in the chest, and shortness of breath. Ozone exposure can decrease the capacity to perform exercise. Exposure to ozone can also increase susceptibility to respiratory infection. Exposure to ambient concentrations of ozone has been associated with the aggravation of respiratory illnesses such as asthma, emphysema, and bronchitis, leading to increased use of medication, absences from school, doctor and emergency department visits, and hospital admissions. Short-term exposure to ozone is associated with premature mortality. Studies have also found that long-term ozone exposure may contribute to the development of asthma, especially among children with certain genetic susceptibilities and children who frequently exercise outdoors. Long-term exposure to ozone can permanently damage lung tissue (EPA 2016a).

Other health effects of ozone include:

- difficulty to breathe deeply and vigorously,
- shortness of breath and pain when taking a deep breath,
- coughing and sore or scratchy throat,
- inflammation and damage to the airways,
- aggravation of lung diseases such as asthma, emphysema, and chronic bronchitis,
- increased frequency of asthma attacks,
- increased susceptibility of the lungs to infection, and
- continued damage to the lungs even when the symptoms have disappeared (EPA 2021a).

Nitrogen Oxides

NO_x is a generic term for the mono-nitrogen oxides which include nitric oxide (NO) and nitrogen dioxide (NO_2). NO is a colorless, odorless gas and NO_2 is a reddish brown gas. NO_x is formed from fuel combustion under high temperature or pressure. NO_x is a primary component of the photochemical reaction that results on the formation of ozone. It also contributes to other pollution problems, including a high concentration of fine particulate matter, poor visibility, and acid deposition (i.e., acid rain). NO_x decreases lung function and may reduce resistance to infection. Acute exposure to NO_2 may cause pulmonary edema, pneumonitis, and bronchitis. NO_2 is considered a relatively insoluble, reactive gas, such as phosgene and ozone. Once inhaled, NO_2 reaches the lower respiratory tract, affecting mainly the bronchioles and the adjacent alveolar spaces, where it may produce pulmonary edema within hours (EPA 2016b).

Sulfur Oxides

Fossil fuel combustion by electrical utilities and industry is the primary source of sulfur dioxide (SO_2) in the United States. SO_2 emissions that lead to high concentrations of SO_2 in the air generally also lead to the formation of other SO_x. SO_x can react with other compounds in the atmosphere to form small particles. These particles contribute to particulate matter pollution. People with asthma are especially susceptible to the effects of sulfur dioxide. Short-term exposures of asthmatic individuals to elevated levels of sulfur dioxide while exercising at a moderate level may result in breathing difficulties, accompanied by symptoms such as wheezing, chest tightness, or shortness of breath. Studies also provide consistent evidence of an association between short-term sulfur dioxide exposures and increased respiratory symptoms in children, especially those with asthma or chronic respiratory symptoms. Short-term exposures to sulfur dioxide have also been associated with respiratory-related emergency department visits and hospital admissions, particularly for children and older adults (EPA 2017).

Particulate Matter

Particulate matter is a generic term for a broad class of chemically and physically diverse substances that exist as discrete particles (liquid droplets or solids) over a wide range of sizes. Particles originate from a variety of man-made stationary and mobile sources, as well as from natural sources like forest fires. The chemical and physical properties of particulate matter vary greatly with time, region, meteorology, and the source of emissions (EPA 2020).

For regulatory purposes, EPA distinguishes between categories of particles based on size and has established standards for fine and coarse particles. PM_{10}, in general terms, is an abbreviation for particles with an aerodynamic diameter less than or equal to 10

micrometers (μm), and it represents inhalable particles small enough to penetrate deeply into the lungs (i.e., thoracic particles). PM_{10} is composed of a coarse fraction referred to as $PM_{10-2.5}$ or as thoracic coarse particles (i.e., particles with an aerodynamic diameter less than or equal to 10 μm and greater than 2.5 μm) and a fine fraction referred to as $PM_{2.5}$ or fine particles (i.e., particles with an aerodynamic diameter less than or equal to 2.5 μm). Thoracic coarse particles are emitted largely as a result of mechanical processes and uncontrolled burning. Important sources include resuspended dust (e.g., from cars, wind, etc.), industrial processes, construction and demolition operations, residential burning, and wildfires. Fine particles are formed chiefly by combustion processes (e.g., from power plants, gas and diesel engines, wood combustion, and many industrial processes) and by atmospheric reactions of gaseous pollutants (EPA 2020).

Although scientific evidence links harmful human health effects from exposures to both fine particles and thoracic coarse particles, the evidence is much stronger for fine particles than for thoracic coarse particles. Effects associated with exposures to both $PM_{2.5}$ and PM_{10} include premature mortality, aggravation of respiratory and cardiovascular disease (as indicated by increased hospital and emergency department visits), and changes in subclinical indicators of respiratory and cardiac function. Such health effects have been associated with short- and/or long-term exposure to particulate matter. Exposures to $PM_{2.5}$ are also associated with decreased lung function growth, exacerbation of allergic symptoms, and increased respiratory symptoms. Children, older adults, individuals with preexisting heart and lung disease (including asthma), and persons with lower socioeconomic status are among the groups most at risk for effects associated with particulate matter exposures. Information is accumulating and currently provides suggestive evidence for associations between long-term $PM_{2.5}$ exposure and developmental effects, such as low birth weight and infant mortality resulting from respiratory causes (EPA 2019).

Lead

Historically, the primary source of lead emissions to the air was combustion of leaded gasoline in motor vehicles (such as cars and trucks), prior to the eradication of leaded gasoline in the United States in the mid-1990s. Since then, the remaining sources of lead air emissions have been industrial sources, including lead smelting operations, battery recycling operations, and piston-engine small aircraft that use leaded aviation gasoline. Lead accumulates in bones, blood, and soft tissues of the body. Exposure to lead can affect development of the central nervous system in young children, resulting in neurodevelopmental effects such as lowered IQ and behavioral problems (EPA 2021b).

Carbon Monoxide

Gasoline-fueled vehicles and other on-road and non-road mobile sources are the primary sources of CO in the United States. Exposure to CO reduces the capacity of the blood to carry oxygen, thereby decreasing the supply of oxygen to tissues and organs. Reduction in oxygen supply to the heart, in particular, causes critical complications. People with any heart disease already have a reduced capacity for pumping oxygenated blood to the heart, which can cause them to experience myocardial ischemia (reduced oxygen to the heart), often accompanied by chest pain (angina), when exercising or under increased stress. For these people, short-term CO exposure further affects their body's already compromised ability to respond to the increased oxygen demands of exercise or exertion. Therefore, people with angina or heart disease are at the greatest risk from ambient CO. Other potentially at-risk populations include those with chronic obstructive pulmonary disease, anemia, diabetes, and those in prenatal or elderly life stages (EPA 2010).

4.3.1.3 Toxic Air Contaminants

Toxic air contaminants are a defined set of airborne pollutants that may pose a present or potential hazard to human health. A wide range of sources, from industrial plants to motor vehicles, emit toxic air contaminants. Toxic air contaminants can be emitted directly and can also be formed in the atmosphere through reactions among different pollutants. This section and the Air Quality Assessment (Appendix D-1 as updated in Appendix D-3) focus on direct toxic air contaminant emissions that would be associated with project mining, production, and reclamation activities, not those formed in the atmosphere. Diesel particulate matter, respirable crystalline silica, and naturally occurring asbestos are toxic air contaminants of concern associated with proposed project sources and are specifically discussed below.

The health effects associated with toxic air contaminants are quite diverse and generally are assessed locally, rather than regionally. Toxic air contaminants can cause long-term health effects such as cancer, birth defects, neurological damage, asthma, bronchitis or genetic damage; or short-term acute effects, such as eye watering, respiratory irritation (a cough), running nose, throat pain, and headaches. For evaluation purposes, toxic air contaminants are separated into carcinogens and non-carcinogens based on the nature of the physiological effects associated with exposure to the pollutant. Carcinogens are assumed to have no safe threshold below which health impacts would not occur, and cancer risk is expressed as excess cancer cases per one million exposed individuals, typically over a lifetime of exposure. Non-carcinogenic substances differ in that they are generally assumed to feature a safe level of exposure below which no negative health impact is believed to occur. These levels are determined on a pollutant-by-pollutant basis.

Acute and chronic exposure to non-carcinogens is expressed as a Hazard Index, which is the ratio of expected exposure levels to an acceptable reference exposure levels.

Toxic air contaminants are primarily regulated through state and local risk management programs. These programs are designed to eliminate, avoid, or minimize the risk of adverse health effects from exposures to toxic air contaminants. A chemical becomes a regulated toxic air contaminant in California based on designation by OEHHA. As part of its jurisdiction under Air Toxics Hot Spots Program (Health and Safety Code Section 44360(b)(2)), OEHHA derives cancer potencies and reference exposure levels for individual air contaminants based on the current scientific knowledge that includes consideration of possible differential effects on the health of infants, children and other sensitive subpopulations, in accordance with the mandate of the Children's Environmental Health Protection Act (Senate Bill 25, Escutia, Chapter 731, Statutes of 1999, Health and Safety Code Sections 39669.5 et seq.).

Respirable Crystalline Silica

Respirable crystalline silica refers to crystalline silicon dioxide with aerodynamic diameter less than four microns (i.e., 0.0004 centimeters). Crystalline silica or quartz is ubiquitous in nature. Most dust generated by construction and mining activities including blasting produces dust particles larger than 4 microns. These particles are too large to reach the alveoli of the lungs which are the target organ. Thus, respirable crystalline silica constitutes a tiny fraction of the dust from these sources and does not represent a significant health risk to neighbors of these types of projects. To result in toxic effects the silica needs to be crystalline, smaller than 4 microns, inhaled, and not exhaled.

Inhalation of respirable crystalline silica initially causes respiratory irritation and an inflammatory reaction in the lungs. Silicosis results from chronic exposure; it is characterized by the presence of histologically unique silicotic nodules and by fibrotic scarring of the lung. Lung diseases other than cancer associated with silica exposure include silicosis, tuberculosis/silicotuberculosis, chronic bronchitis, small airways disease, and emphysema. Ambient air exposures do not cause concern but levels to which workers (e.g., miners, sandblasters) may be exposed have been shown to cause cancer.

Diesel Particulate Matter

Diesel particulate matter is used as a surrogate for the mixture of compounds in diesel exhaust that have the potential to contribute to mutations in cells which can lead to cancer. These compounds include, but are not limited to, arsenic, benzene, formaldehyde, and nickel.

Long-term exposure to diesel exhaust particles poses the highest cancer risk of any toxic air contaminant evaluated by OEHHA. The ARB has estimated that about 70% of the cancer risk that the average Californian faces from breathing toxic air contaminants stems from diesel exhaust particles. In a comprehensive assessment of diesel exhaust, OEHHA analyzed more than 30 studies of people who worked around diesel equipment, including truck drivers, railroad workers, and equipment operators. The studies showed these workers were more likely than workers who were not exposed to diesel emissions to develop lung cancer. These studies provide strong evidence that long-term occupational exposure to diesel exhaust increases the risk of lung cancer. Other researchers and scientific organizations, including the National Institute for Occupational Safety and Health, have calculated similar cancer risks from diesel exhaust as those calculated by OEHHA.

Exposure to diesel exhaust can have immediate health effects. Diesel exhaust can irritate the eyes, nose, throat and lungs, and it can cause coughs, headaches, lightheadedness, and nausea. People with allergies, existing cardiovascular disease, the elderly, and children considered sensitive populations for diesel particulate matter exposure. Exposure to diesel exhaust also causes inflammation in the lungs, which may aggravate chronic respiratory symptoms and increase the frequency or intensity of asthma attacks.

Naturally Occurring Asbestos

In Fresno County, naturally occurring asbestos is another toxic air contaminant of concern. Asbestos is the common name for a group of naturally occurring fibrous silicate minerals that can separate into thin but strong and durable fibers, with principal forms including chrysotile, crocidolite, amosite, tremolite, actinolite, and anthophyllite (OEHHA 2000). Naturally occurring asbestos is found in some areas throughout California, most commonly where ultramafic rock or serpentinite rock is present. When construction activities occur in areas with naturally occurring asbestos in the soils or rock, the asbestos fibers can become airborne and may be inhaled, which can cause chronic local inflammation and disrupt orderly cell division, both of which can facilitate the development of asbestosis (a noncancerous lung disease involving fibrotic scarring of the lungs) and cancer (OEHHA 2000).

4.3.1.4 Regional Air Quality and Attainment Status

The determination of whether a region's air quality is healthful or unhealthful is made by comparing contaminant levels in ambient air samples to the state and federal ambient air quality standards. Table 4.3-1, "Ambient Air Quality Standards," summarizes current standards.

Both the ARB and EPA use monitoring station data to designate an area's attainment status with respect to the state and federal ambient air quality standards, respectively, for criteria air pollutants. The purpose of these designations is to identify areas with air quality problems and thereby initiate planning efforts for improvement. The three basic designation categories are "nonattainment," "attainment," and "unclassified." The "unclassified" designation is used in an area that cannot be classified on the basis of available information as meeting or not meeting the standards. In the Basin, ozone (one-hour and eight-hour), PM_{10}, and $PM_{2.5}$ are designated as "nonattainment"; the remaining criteria pollutants are designated as "attainment" or "unclassified."

Table 4.3-1
Ambient Air Quality Standards

Pollutant	Average Time	California Standards[1]	National Standards[2]	
		Concentration[3]	*Primary*[3,4]	*Secondary*[3,5]
Ozone	1 hour	0.09 ppm (180 µg/m³)	—	Same as Primary Standard
	8 hours	0.070 ppm (137 µg/m³)	0.070 ppm (**137**~~147~~ µg/m³)	
NO_2	Annual Arithmetic Mean	0.030 ppm (57 µg/m³)	0.053 ppm (100 µg/m³)	Same as Primary Standard
	1 hour	0.18 ppm (339 µg/m³)	0.100 ppm (188 µg/m³)	
CO	8 hours	9.0 ppm (10 mg/m³)	9 ppm (10 mg/m³)	None
	1 hour	20 ppm (23 mg/m³)	35 ppm (40 mg/m³)	
SO_2	24 hours	0.04 ppm (105 µg/m³)	0.14 ppm (for certain areas)	—
	Annual Arithmetic Mean	—	0.030 ppm (for certain areas)	—
	3 hours	—	—	0.5 ppm (1300 µg/m³)
	1 hour	0.25 ppm (655 µg/m³)	0.075 ppm (196 µg/m³)	—
PM_{10}	24 hours	50 µg/m³	150 µg/m³	Same as Primary Standard
	Annual Arithmetic Mean	20 µg/m³	—	
$PM_{2.5}$	24 hours	No Separate State Standard	35 µg/m³	Same as Primary Standard
	Annual Arithmetic Mean	12 µg/m³	**9.0**~~12.0~~ µg/m³	15.0 µg/m³

Pollutant	Average Time	California Standards[1]	National Standards[2]	
		Concentration[3]	*Primary[3,4]*	*Secondary[3,5]*
Lead[6]	30-day Average	1.5 µg/m³	—	—
	Calendar Quarter	—	1.5 µg/m³	Same as Primary Standard
	Rolling 3-Month Average	—	0.15 µg/m³	
Hydrogen sulfide	1 hour	0.03 ppm (42 µg/m³)	—	—
Vinyl chloride	24 hours	0.01 ppm (26 µg/m³)	—	—
Sulfates	24 hours	25 µg/m³	—	—
Visibility-reducing particles	8 hours (10:00 a.m. to 6:00 p.m. PST)	Insufficient amount to produce an extinction coefficient of 0.23 per kilometer because of particles when the relative humidity is less than 70%	—	—

Table Source: California Air Resources Board 2024~~2016~~

Table Notes:

ppm = parts per million by volume.

µg/m³ = micrograms per cubic meter.

mg/m³= milligrams per cubic meter.

1. California standards for ozone, CO, SO_2 (1-hour and 24-hour), NO_2, suspended particulate matter (PM_{10}, $PM_{2.5}$), and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. CAAQS are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, NO_2, SO_2, particulate matter, and those based on annual averages or annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration in a year, averaged over 3 years, is equal to or less than the standard. For NO_2 and SO_2, the standard is attained when the 3-year average of the 98th and 99th percentile, respectively, of the daily maximum 1-hour average at each monitor within an area does not exceed the standard (effective April 12, 2010). For PM_{10}, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 micrograms per cubic meter (µg/m³) is equal to or less than one. For $PM_{2.5}$, the 24-hour standard is attained when 98% of the daily concentrations, averaged over 3 years, are equal to or less than the standard.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based on a reference temperature of 25°C and a reference pressure of 760 torr.
   Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm (parts per million) in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety, to protect the public health.
5. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
6. The California Air Resources Board has identified lead and vinyl chloride as toxic air contaminants with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.

The Air District maintains ambient air quality monitoring stations throughout the Basin. Air pollutants monitored at each station may differ; thus, data from the closest representative station that monitors each pollutant is used as background concentrations for purposes of impact assessment. The closest ambient air quality monitoring station to the project site is the Clovis-Villa station (Air Quality Station ID 06-019-5001). This station is located approximately 9 miles south of the project sites and measures ozone, PM_{10},

$PM_{2.5}$, NO_2, CO, non-methane hydrocarbons, and speciated-VOCs. The station is constructed to monitor at a neighborhood scale covering an area between 0.5 and 4.0 kilometers in range. Data is collected for the purpose of observing the highest concentration of pollutants in the area (Air District 2020).

SO_2 is recorded at the Fresno–Garland station located approximately 12 miles south of the project sites. The station is constructed to monitor at neighborhood and urban scales covering an area between 0.5 and 50 kilometers in range (Air District 2019).

Ambient concentrations and number of days when the air quality standards were exceeded in the five-year period from 2020~~2013~~ through 2024~~2017~~ are presented in Table 4.3-2, "Ambient Air Quality in the Project Area," and Table 4.3-3, "Number of Days Exceeding Air Quality Standards." As shown in Tables 4.3-2 and 4.3-3, CO, SO_2, and NO_2 levels did not exceed state or federal standards during the five-year period. Ozone levels exceeded the state one-hour and eight-hour standards and the federal eight-hour standard each year of the five-year period. PM_{10} levels exceeded the 24-hour state standard and the annual state standard for each year of the five-year period and ~~the annual state standard for at least two years of the five-year period;~~ the 24-hour federal standard for at least one year of the five-year period ~~was not exceeded~~. $PM_{2.5}$ levels exceeded the federal 24-hour standard for at least four years ~~each year~~ of the five-year period, the annual federal standard for at least two years of the five-year period and the annual state standard for at least one year of the five-year period. ~~and met or exceeded the state and federal annual standards for at least two years of the five-year period.~~

1. Measurements of PM_{10} and $PM_{2.5}$ are usually collected every 6 days and 3 days, respectively. "Number of days exceeding the standards" are mathematical estimates.

4.3.2 Regulatory Setting

4.3.2.1 Federal

U.S. Environmental Protection Agency

The federal Clean Air Act, passed in 1970 and last amended in 1990, forms the basis for the national air pollution control effort. The U.S. EPA is responsible for implementing most aspects of the Clean Air Act, which include NAAQS for major air pollutants, performance standards for new and modified sources, hazardous air pollutant standards, approval of state attainment plans, motor vehicle emission standards, stationary source emission standards and permits, acid rain control measures, stratospheric ozone protection, and enforcement provisions. NAAQS are established for "criteria pollutants" under the Clean Air Act, which are ozone, CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and lead.

NAAQS describe acceptable air quality conditions designed to protect the health and welfare of the citizens of the nation. NAAQS (other than for ozone, NO_2, SO_2, PM_{10}, and $PM_{2.5}$, and those based on annual averages or arithmetic mean) are not to be exceeded more than once per year. Ozone, NO_2, SO_2, PM_{10}, and $PM_{2.5}$, are based on statistical calculations over 1- to 3-year periods, depending on the pollutant. The Clean Air Act requires EPA to reassess NAAQS at least every 5 years to determine whether adopted standards are adequate to protect public health based on current scientific evidence. States with areas that exceed NAAQS must prepare a state implementation plan that demonstrates how those areas will attain the standards within mandated time frames. NAAQS are presented in Table 4.3-1 above.

Standards of Performance for Asphalt Hot-Mix Facilities

Standards of Performance for Asphalt Hot-Mix Facilities (40 CFR, Part 60, Subpart I) prohibits any new hot-mix asphalt facility from discharging gases that contain particulate matter in excess of 90 milligrams per dry standard cubic meter (mg/dscm) (0.04 grain per dry standard cubic foot [gr/dscf]) and/or exhibit 20% opacity or greater. EPA Test Method

5 is used to determine particulate matter concentration and outlines sampling methodology.

Standards of Performance for Nonmetallic Mineral Processing Plants

Standards of Performance for Nonmetallic Mineral Processing Plants (40 CFR, Part 60, Subpart OOO) is applicable to new, modified, or reconstructed nonmetallic mineral processing facilities (with certain exceptions, such as fixed sand and gravel plants and crushed stone plants with capacities of 25 tons per hour or less, or portable sand and gravel plants and crushed stone plants with capacities of 150 tons per hour or less). Subpart OOO includes different requirements for facilities that commence construction, modification, or reconstruction after August 31, 1983, and after April 22, 2008; the requirements for the latter date are described. Subpart OOO includes particulate matter standards, as well as monitoring, testing, reporting, and recordkeeping requirements. Within 60 days after reaching maximum production rate, but no later than 180 days after initial startup, Subpart OOO restricts emissions from affected facilities equipped with capture systems used to capture and transport particulate matter to a control device. Emissions are prohibited in excess of 0.032 grams per dry standard cubic meter (0.014 grams per dry standard cubic foot), and from exhibiting visible emissions based on quarterly monitoring. Subpart OOO also prohibits the discharge of any fugitive emissions from affected facilities without capture systems and fugitive emissions escaping capture systems that exhibit greater than 7% opacity (12% for crushers without capture systems).

Regulations Affecting New Diesel Engines

EPA regulates emissions from new non-road (i.e., off-road, portable, and stationary) internal combustion engines by tiered standards (e.g., compression-ignition engines in 40 CFR 89.112, 40 CFR 1039.101, and 40 CFR 1039.102). Emissions from new on-road engines are regulated using standards that apply by model year, class of vehicle, and fuel type (e.g., heavy-heavy duty diesel engines in 40 CFR 86.004-11, 40 CFR 86.007-11, and 40 CFR 86.099-11). These regulations affect manufacturers but are relevant to the proposed project because diesel engines are the primary source of proposed project combustion emissions.

4.3.2.2 State

California Air Resources Board

The Clean Air Act delegates the regulation of air pollution control and the enforcement of NAAQS to the states. In California, the task of air quality management and regulation has been legislatively granted to the ARB, with subsidiary responsibilities assigned to air quality management districts and air pollution control districts at the regional and county

levels. The ARB is responsible for ensuring implementation of the California Clean Air Act and the federal Clean Air Act and regulating emissions from motor vehicles, mobile equipment, and consumer products. The ARB also sets health-based air quality standards and control measures for toxic air contaminants. The ARB has established CAAQS, which are generally more restrictive than NAAQS. CAAQS describes adverse conditions (i.e., pollution levels must be below these standards before a basin can attain the standard). CAAQS for ozone, CO, SO_2 (1 hour and 24 hours), NO_2, PM_{10}, and $PM_{2.5}$ and visibility-reducing particles are values that are not to be exceeded. All others are not to be equaled or exceeded. NAAQS and CAAQS are presented in Table 4.3-1 above.

Toxic Air Contaminant Identification and Control Act

California's comprehensive air toxics program was established in the early 1980s. The Toxic Air Contaminant Identification and Control Act (AB 1807, 1983) created California's program to reduce exposure to air toxics. The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588, 1987) requires a Statewide air toxics inventory, notification of people exposed to a significant health risk, and facility plans to reduce these risks.

Under AB 1807, the ARB is required to use certain criteria when prioritizing pollutants for control of air toxics. In selecting substances for review, the ARB must consider criteria relating to "the risk of harm to public health, amount or potential amount of emissions, manner of, and exposure to, usage of the substance in California, persistence in the atmosphere, and ambient concentrations in the community." AB 1807 also requires the ARB to use available information gathered from the AB 2588 program to include in the prioritization of compounds. The list of toxic air contaminants includes all Federal hazardous air pollutants plus the following pollutants: 1,2-dibromoethane, 1,2-dichloroethane, hexavalent chromium, cadmium, inorganic arsenic, nickel, inorganic lead, diesel particulate matter, and environmental tobacco smoke (17 CCR Section 93000 and Section 93001).

Under AB 2588, industrial facilities are required to report air toxic emissions, ascertain health risks and notify nearby residents of significant risks. In September 1992, the Hot Spots Act was amended by Senate Bill 1731, which required facilities that pose a significant health risk to reduce their risk through a risk management plan. The emissions inventory and risk assessment methodologies from the AB 2588 Program are used in the Air Quality Assessment (Appendix D-1 as updated in Appendix D-3) as discussed below in Section 4.3.3.3, "Analysis Methodology."

Idling of Commercial Heavy-Duty Trucks

In January 2005, the ARB adopted an Airborne Toxic Control Measure (ATCM) to control emissions from idling trucks. The ATCM, which became effective February 1, 2005,

prohibits idling for more than 5 minutes for all diesel-fueled commercial motor vehicles with a gross vehicular weight ratings over 10,000 pounds that are or must be licensed for operation on highways. The ATCM contains several exceptions that allow trucks to idle during the following periods: due to traffic conditions, for vehicle inspections, and when queueing. While the goal of this measure is primarily to reduce public health impacts from diesel emissions, compliance with the regulation also results in energy savings in the form of reduced fuel consumption from unnecessary idling (ARB 2020).

In-Use Off-Road Diesel-Fueled Fleets

In July 2007, the ARB adopted the Regulation for In-Use Off-Road Diesel-Fueled Fleets (Off-Road Diesel Regulation) to reduce particulate matter and NO_X emissions from existing off-road heavy-duty diesel vehicles in California. This regulation requires that specific fleet average requirements are met for NO_X emissions and for particulate matter emissions. Where average requirements cannot be met, Best Available Control Technology (BACT) requirements apply. All self-propelled off-road diesel vehicles 25 horsepower (hp) or greater used in California and most two-engine vehicles (except on-road two-engine sweepers) are subject to the Off-Road Diesel Regulation. This includes vehicles that are rented or leased (rental or leased fleets).

The Off-Road Diesel Regulation:

- requires all vehicles be reported to the ARB and labeled,
- restricts the adding of older vehicles into fleets starting on January 1, 2014,
- requires fleet owners to reduce their emissions by retiring, replacing, or repowering older engines, or installing Verified Diesel Emission Control Strategies (VDECS) i.e., exhaust retrofits,
- imposes limits on idling and requires a written idling policy, and
- requires a disclosure when selling vehicles.

All fleets must meet emission performance and reporting requirements by January 1, 2028. Annual reporting requirements, including the Responsible Official Affirmation of Reporting form, must be completed by March 1, 2028. Large fleets must report annually from 2012 to 2023, medium fleets from 2016 to 2023, and small fleets from 2018 to 2028. For each annual reporting date, a fleet must report any changes to the fleet, hour meter readings (for low-use vehicles and vehicles used a majority of the time, but not solely, for agricultural operations), and also must submit the Responsible Official Affirmation of Reporting (ROAR) form. Following January 1, 2023, small fleets may no longer add a vehicle with a Tier 2 engine to its fleet. The engine tier must be Tier 3 or higher. Medium and large fleets may not add tier 2 engines as of January 1, 2018. The goal of the In-Use

Off-Road Diesel-Fueled Fleets Regulation is to reduce particulate matter and NO_x emissions from in-use (existing) off-road heavy-duty diesel vehicles in California (ARB 2020).

In-Use On-Road Diesel-Fueled Vehicles

On December 12, 2008, the ARB adopted an ATCM to reduce NO_x and particulate matter emissions from most in-use on-road diesel trucks and buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds. This regulation affects individuals, private companies, and Federal agencies that own diesel vehicles with a Gross Vehicle Weight Rating (GVWR) greater than 14,000 lbs. that operate in California. The regulation also applies to publicly and privately owned school buses; however, their compliance requirements are different, and reporting is not required. The regulation does not apply to state and local government vehicles and public transit buses because they are already subject to other regulations. Vehicles that are exempt from other heavy duty diesel regulations, such as Cargo Handling Equipment, Drayage Truck, and Solid Waste Collection Vehicle regulations, may be subject to the Truck and Bus Regulation (regulation). Drayage and solid waste collection trucks with 2007 to 2009 model year engines must meet the requirements of the regulation by January 1, 2023.

Heavier trucks and buses with a GVWR greater than 26,000 pounds must comply with a schedule by engine model year or owners can report to show compliance with more flexible options. All heavier vehicles with 1996 or newer model year engines should have a particulate matter filter (OEM or retrofit). By January 1, 2023, all trucks and buses must have 2010 model year engines with few exceptions.

Lighter trucks and buses with a GVWR of 14,001 to 26,000 lbs. have replacement requirements starting January 1, 2015. The Engine Model Year Schedule for Lighter vehicles shown in the table to the right lists the compliance dates by engine model year for existing lighter trucks. Starting January 1, 2015, lighter vehicles with engines that are 20 years or older must be replaced with newer trucks (or engines). Starting January 1, 2020, all remaining vehicles need to be replaced so that they all have 2010 model year engines or equivalent emissions by January 1, 2023 (California Air Resources Board 2020).

4.3.2.3 Local

San Joaquin Valley Air Pollution Control District

The 1976 Lewis Presley Air Quality Management Act established the San Joaquin Valley Air Pollution Control District and other air districts throughout the state. The Federal Clean Air Act Amendments of 1977 required that each state adopt an implementation

plan outlining pollution control measures to attain the Federal standards in nonattainment areas of the state.

The ARB coordinates and oversees both state and federal air pollution control programs in California. The ARB oversees activities of local air districts and is responsible for incorporating air quality management plans developed by each air district into the State Implementation Plan (SIP) for Federal EPA approval. The ARB maintains air quality monitoring stations throughout the state in conjunction with local air districts. Data collected at these stations are used by the ARB and EPA to classify areas as "attainment" or "nonattainment" with respect to each pollutant and to monitor progress towards attaining air quality standards. ARB has divided the state into 15 air basins. Significant authority for air quality control is delegated to local air districts that regulate emissions from stationary sources and develop attainment plans. In addition, the California Clean Air Act provides the local air districts with the authority to manage transportation activities and regulate stationary source emissions. Indirect sources of pollution are those sources related to a stationary facility or development project but otherwise outside air district authority to regulate. An example of this would be the motor vehicles at an intersection, a mall, and on highways. As a state agency, the ARB regulates motor vehicles and fuels for their emissions.

The Air District and Fresno Council of Governments are responsible for formulating and implementing the air quality and transportation plans for the Fresno County area of the Basin. The Air District has adopted several attainment plans to achieve state and federal air quality standards. The Air District continuously monitors the region's progress implementing attainment plans and periodically reports to the ARB and the EPA. Finally, the Air District periodically revises attainment plans to reflect new conditions and requirements in accordance with schedules mandated by the California Clean Air Act and associated amendments.

Attainment Plans

Attainment plans relevant to the proposed project are summarized below.

Ozone Attainment Plans:

- **2004 Extreme 1-Hour Ozone Attainment Demonstration Plan**. This Plan, adopted by the Air District in 2004, sets forth measures and emission reduction strategies designed to attain the Federal 1-hour ozone standard by November 15, 2010. This Plan was approved by the EPA on March 8, 2010; however, the EPA's approval was subsequently withdrawn effective November 26, 2012, in response to a decision issued by the U.S. Court of Appeals for the Ninth Circuit (Sierra Club v. U.S. E.P.A., (9th Cir. 2012) 671

F.3d 955) remanding EPA's approval of these State Implementation Plan revisions. Concurrent with EPA's final rule, the ARB is withdrawing the Plan. On May 6, 2014, the Air District submitted a formal request to the U.S. EPA, asking that the EPA determine the Basin has attained the Federal 1-hour ozone standard which was revoked in 1997.

- **2007 8-Hour Ozone Plan**. This Plan sets forth measures and a "dual path" strategy to attain the Federal 8-hour ozone standard in the Basin by reducing emissions of ozone and particulate matter precursors. The Plan includes provisions that improve pollution control technologies for mobile and stationary sources, and Federal funding for incentive- based measures that reduce emissions. Local measures were to be adopted by the Air District before 2012. This Plan was approved by the EPA on March 1, 2012. On November 26, 2012, however, the EPA withdrew its determination that the Plan satisfied the Clean Air Act requirements due to emission growth caused by growth in vehicle-miles traveled (VMT). Other determinations in the EPA's March 1, 2012, rule approving the Plan remain unchanged and in effect.
- **2016 Ozone Plan for 2008.** 8 Hour Ozone Standard. In order to meet the December 31, 2031, deadline for attainment, this plan incorporates emissions reduction strategies for stationary sources including regulatory actions; incentive programs; technology advancement programs; policy and legislative activities; public outreach, education, and communication; and undefined strategies under "black box" provisions. The Plan demonstrates that existing regulations go above and beyond the Federal Reasonably Available Control Technology (RACT) requirement. The Plan also emphasizes that mobile source emissions, which fall under state and federal jurisdiction, make up over 85% of the Valley's NO_x emissions. For this reason, the District request that the ARB and EPA adopt and implement strategies so that sources outside District authority would be controlled enabling the standard to be met without the need for "black box" provisions. Moreover, the plan states that the ARB and EPA action will be essential to attain the state and federal air quality standards.
- **2022 Plan for the 2015 8-Hour Ozone Standard.** The 2022 Ozone Plan for the San Joaquin Valley establishes a comprehensive strategy to attain the Federal 2015 8-hour ozone standard of 70 ppb by the 2037 deadline. Developed using advanced air quality modeling and the best available science, the plan builds on decades of emission reduction efforts by the San Joaquin Valley Air Pollution Control District and ARB. It demonstrates that a 72% reduction in NOx emissions by 2037 will ensure expeditious

attainment of 2015 8-hour ozone standard. The plan integrates regulatory development, outreach, research, and incentive programs.

Particulate Matter Attainment Plans:

- **2007 PM_{10} Maintenance Plan.** On October 25, 2007, the ARB approved the 2007 PM_{10} Maintenance Plan and Request for Re-designation with modifications to the transportation conformity budgets. On September 25, 2008, the EPA approved the PM_{10} maintenance plan.
- **2008 $PM_{2.5}$ Plan**. The EPA set the first $PM_{2.5}$ standard in 1997 and in 2005 designated the Valley as nonattainment for the 1997 standard. The 1997 standard has two metrics for attainment: an annual average of 15 $\mu g/m^3$ and a 24- hour average of 65 $\mu g/m^3$. The Air District adopted the 2008 $PM_{2.5}$ Plan in April 2008 to demonstrate how the Valley would come into attainment of the 1997 $PM_{2.5}$ standard by no later than April 2015. EPA subsequently lowered the 24-hour standard to 35 $\mu g/m^3$ in 2006 and re-issued the nonattainment designation for the Valley in 2009.

  The 2008 Plan is designed to assist the Basin in attaining each $PM_{2.5}$ standard, including the ones adopted by EPA in 1997 and 2006, and the state standard. On July 13, 2011, the EPA issued a proposed rule partially approving and disapproving the 2008 $PM_{2.5}$ Plan. Subsequently, on November 9, 2011, the EPA issued a final rule approving most of the Plan with an effective date of January 9, 2012. However, the EPA disapproved the plan's contingency measures because they would not provide sufficient emission reductions.
- **2012 $PM_{2.5}$ Plan**. The 2012 $PM_{2.5}$ Plan builds on the prior $PM_{2.5}$ plans and demonstrates attainment of the newer 2006 24-hour $PM_{2.5}$ standard by the Federal attainment deadline of 2019, with the majority of the Valley actually experiencing attainment before 2019. Using the Air District Governing Board's guiding principles adopted in February 2012, this plan emphasizes public health as the number one priority in meeting NAAQS.

  The 2012 $PM_{2.5}$ Plan is a multifaceted strategy that utilizes a combination of conventional and innovative control strategies to reduce emissions of $PM_{2.5}$ and other pollutants that form $PM_{2.5}$. The Air District's successes in adopting regulations and other strategies that have improved air quality provide the foundation for the Plan. In developing the Plan, the Air District claims to have left "no stone unturned" in evaluating potential strategies to reduce emissions.

In addition to reducing direct emissions of $PM_{2.5}$, the 2012 $PM_{2.5}$ Plan focuses on reducing oxides of nitrogen (NO_x) emissions, which is a predominant pollutant not only in the formation of $PM_{2.5}$ but also ozone. This overlapping effect and emphasis on reducing NO_x emissions addresses the area's primary air quality challenges, $PM_{2.5}$ and ozone. Along with comprehensive efforts at the local level to reduce emissions, reducing mobile source emissions that are not under the direct authority of the Air District are critical to attaining the standard. The 2012 $PM_{2.5}$ Plan includes state and federal measures that will provide significant new emissions reductions in the coming years. As outlined below, the Plan's comprehensive control strategy includes regulatory actions, incentive programs, technology advancement, policy and legislative positions, public outreach, participation and communication, and additional strategies.

- **2015 Plan for the 1997 $PM_{2.5}$ Standard**. The 2015 Plan for the 1997 $PM_{2.5}$ Standard was adopted on April 16, 2015, and addresses the EPA annual $PM_{2.5}$ standard of 15 μg/m3 as well as the EPA 24-hour $PM_{2.5}$ standard of 65 μg/m3 both of which were established in 1997. The plan's strategy focuses on attaining the standard quickly, as well as prioritizing $PM_{2.5}$ emissions that pose the most health risk to residents.
- **2016 Moderate Area Plan for the 2012 $PM_{2.5}$ Standard**. The 2016 Moderate Area Plan for the 2012 $PM_{2.5}$ Standard was adopted by the District on September 15, 2016. This Plan addresses the $PM_{2.5}$ NAAQS of 12 μg/m3 with an attainment deadline of December 31, 2021, established in 2012. This Plan demonstrates the impracticability of attainment before the deadline and requests the area be reclassified from moderate to serious nonattainment.
- **2018 Plan for the 1997, 2006 and 2012 $PM_{2.5}$ Standards**. Adopted on November 15, 2018, the plan includes significant incentive based control measures as well as control measures for stationary and area industrial sources. The plan also calls on the ARB to act in order to achieve reductions of mobile sources.
- **SB 656 Particulate Matter Control Measure Implementation Schedule**. Senate Bill (SB) 656 was enacted in 2003 and codified as Health and Safety Code Section 39614. SB 656 seeks to reduce exposure to PM_{10} and $PM_{2.5}$ and make further progress toward attainment of the NAAQS and CAAQS for PM_{10} and $PM_{2.5}$. SB 656 required the California Air Resources Board, in consultation with local air districts, to develop and adopt lists of "the most readily available, feasible, and cost-effective" particulate matter control measures. Subsequently, air districts were required to adopt

implementation schedules for relevant control measures. In June 2005, The Air District adopted its SB 656 Particulate Matter Control Measure Implementation Schedule and has adopted each relevant strategy into their rules.

- **2024 Plan for the 2012 Annual PM2.5 Standard.** The 2024 Plan for the 2012 $PM_{2.5}$ Standard was adopted to address the annual $PM_{2.5}$ NAAQS of 12 $\mu g/m^3$ established in 2012. The plan outlines BACM and BACT measures, incentive programs, and requests an attainment deadline extension due to the impracticability of meeting the standard on time. It emphasizes continued collaboration with ARB and the EPA to reduce emissions from sources beyond District authority.

Rules and Regulations

The Air District establishes and administers a program of rules and regulations to attain and maintain state and national air quality standards and regulations related to toxic air contaminants. Rules and regulations that may apply to the proposed project during construction and/or operations include the following:

- **Regulation I (General Provisions)**
  - **Rule 1160 (Emission Statements)**

    Rule 1160 requires owners/operators of stationary sources that emit NO_x or ROG to submit annual emission inventories. More information can be found in the Air Resources Board's "Instructions for the Emission Data System Review and Update Report" document.
- **Regulation II (Permits)**
  - **Rule 2010 (Permits Required)**

    Rule 2010 requires newly proposed non-exempt sources of emissions to obtain an Authority to Construct prior to construction. Prior to operation of the new source, the Air District also requires that a Permit to Operate be obtained. Permits to Operate must be posted and maintained on or near the source of the air pollution.
  - **Rule 2201 (New and Modified Stationary Source Review)**

    Rule 2201, last amended April 2023, establishes Air District's program to limit emissions at new and modified sources so that there is no net increase in emissions within the Basin. Rule 2201 uses BACT and mechanisms such as emissions offsets, to ensure that AAQS are met or maintained. Criteria pollutants are regulated under this rule, including VOC, NO_x, SO_x, PM_{10}, $PM_{2.5}$, and CO. Under Rule 2201, BACT is required if the emissions of a

regulated pollutant would exceed two (2) pounds per day. In addition, emission offsets to mitigate an increase in emissions from a new or modified stationary source would be required if the facility's emissions exceed the following amounts:

- 20,000 pounds per year of NO_x or VOC;
- 200,000 pounds per year of CO;
- 54,750 pounds per year of SO_x; or
- 29,200 pounds per year of PM_{10}.

– **Rule 2280 (Portable Equipment Registration)**

Rule 2280 outlines the procedure and requirements associated with the registration of portable emissions units. Sand and gravel screening, rock crushing, and RAP crushing operations are among operations eligible for registration of portable equipment, if a portable diesel-fired engine will be used to power processing equipment. Rule 2280 would be applicable to the project if temporary construction requires equipment (such as a generator set) under Rule 2280.

– **Rule 2530 (Federally Enforceable Potential to Emit)**

The purpose of Rule 2530, last amended in June 2024, is to restrict a facility's potential to emit so that the facility may be exempt from the requirements of Rule 2520 (Federally Mandated Operating Permits). This Rule applies to the following sources:

- Major air toxics sources;
- Any stationary source that emits or has the potential to emit 100 tons per year of any air contaminant;
- Any major source;
- Any emissions unit;
- Any emissions unit, including an area source, subject to a standard or other requirement promulgated pursuant to Section 111 (NSPS) or 112 (HAPs) of the CAA published after July 21, 1992;
- Any source required to have a preconstruction review permit pursuant to the requirements of the prevention of significant deterioration (PSD) program under Title I of the Federal Clean Air act; and,
- Any source in a source category designated, pursuant to 40 CFR Part 70.3, by rule of the EPA

Rule 2530 also includes recordkeeping and reporting requirements. Rule 2530 allows facilities to be excluded from the Title V program (see Rule 2520) by taking limits or keeping records to demonstrate that their emissions are below the applicable thresholds. This process is also referred to as a "synthetic minor" or Federally Enforceable State Operating Permit (FESOP).

- **Regulation III (Fees)**

  Regulation III contains rules related to District fees. The project may be subject to fees related to permitting, air toxics, dust, ozone, as well as others.

- **Regulation IV (Prohibitions)**
  - **Rule 4001 (New Source Performance Standards)**

    Rule 4001 codifies the Air District's adoption and incorporation of Federal New Source Performance Standards (NSPS) as set forth in 40 CFR Part 60. NSPS apply to a variety of stationary sources, including asphalt plants and aggregate processing plants. The regulation imposes emissions standards for relevant pollutants and requires that specified emission performance standards, control equipment, and monitoring devices be installed at all new, modified, or reconstructed facilities to limit emissions. The regulation includes test methods, monitoring, notification, and recordkeeping requirements. The asphalt plant and aggregate plant are subject to 40 CFR Part 60, Subparts I and OOO, respectively; those regulations are discussed in previous sections.

  - **Rule 4101 (Visible Emissions)**

    Rule 4101 prohibits emissions of visible air contaminants, other than water vapor, from resulting in greater than Number 1 on Ringelmann Chart (i.e., 20% opacity) for a combined period of more than 3 minutes in any hour.

  - **Rule 4102 (Nuisance)**

    To protect public health, Rule 4102 prohibits any person from discharging such quantities of air contaminants that cause injury, detriment, nuisance, or annoyance to a considerable number of persons or to the public.

  - **Rule 4201 (Particulate Matter Concentration)**

    Rule 4201 establishes a particulate matter concentration standard governing release or discharge of dust, fumes, or total suspended particulate matter emissions into the atmosphere from any single-source operation exceeding 0.1 grains/dry standard cubic foot of gas (gr/dscf).

- **Rule 4202 (Particulate Matter Emission Rate)**

  Rule 4202 limits the weight rate of particulate matter emissions. The Rule specifies allowable emissions rates based on a process weight rate equation and calculations for various rates in an associated table within the rule.

- **Rule 4301 (Fuel Burning Equipment)**

  Rule 4301 limits the emission of air contaminants from fuel burning equipment. Included in this rule are requirements that fuel burning equipment not discharge:

  - combustion contaminants exceeding 0.1 gr/dscf at 12% carbon dioxide;
  - Discharge greater than 200 lbs. per hour of sulfur compounds;
  - Discharge greater than 140 pounds per hour of nitrogen compounds; or,
  - Discharge greater than 10 pounds per hour of combustion contaminants.

- **Rule 4307 (Boilers, Steam Generators, and Process Heaters)**

  Rule 4307 establishes NO_x and CO emissions limits for boilers, steam generators, and process heaters. This rule applies to units fired on gaseous or liquid fuel, having heat input of between 2.0 and 5.0 million British thermal units per hour (MMBtu/hr) or greater. The applicable limits for new units are 9 ppmv NO_x at 3% oxygen and 400 ppmv CO at 3% oxygen. The rule includes monitoring and recordkeeping requirements. Compliance with the emission limits must be determined by periodic source testing. This rule applies to the hot oil heater in the asphalt plant.

- **Rule 4309 (Dryers, Dehydrators, and Ovens)**

  Rule 4309 establishes NO_x and CO emissions limits for dryers, dehydrators, and ovens. This Rule applies to units fired on gaseous or liquid fuel, having a total rated heat input of 5.0 MMBtu/hr. or greater. The applicable limits for burners at asphalt plants are 4.3 ppmv NO_x at 19% oxygen and 42 ppmv CO at 19% oxygen when fired on gaseous fuel. The Rule includes monitoring and recordkeeping requirements.

  Compliance with the emission limits must be determined by periodic source testing or an approved alternate emissions monitoring system.

- **Regulation VIII (Fugitive PM_{10} Prohibitions)**

  The rules under Regulation VIII are intended to reduce ambient concentrations of particulate matter (PM_{10} or larger) and were developed pursuant to EPA guidance for Serious PM_{10} Nonattainment Areas. These rules are applicable to

specified anthropogenic sources. Applicability of each rule is discussed below, and requirements are presented for rules that apply to the project. Rule 8081 is omitted because it only applies to agricultural sources.

- **Rule 8021 (Construction, Demolition Excavation, Extraction, and Other Earthmoving Activities)**

  Rule 8021 prohibits construction, demolition, excavation, extraction, or other earthmoving activities unless the appropriate requirements are sufficiently implemented to limit visible dust emissions (VDE) to 20% opacity. Blasting emissions are exempt from this rule.

- **Rule 8031 (Bulk Materials)**

  Rule 8031 requires facilities that perform outdoor handling, storage, and transport of bulk materials to use prescribed methods to limit VDE to 20% opacity or to comply with the conditions for a stabilized surface as defined in Rule 8011 (General Requirements). Methods to limit VDE listed in Rule 8031 include:

  - Applying water or chemical/organic stabilizers/suppressants;
  - Constructing and maintaining sufficient barriers to obstruct wind;
  - Maintaining stabilized surfaces on piles; covering bulk materials with tarps, plastic, or other suitable material; limiting on-site vehicle speed;
  - Loading haul trucks to limit VDE;
  - Applying water on the top of loads to limit VDE;
  - covering haul trucks with tarps or other covers to limit VDE; and
  - Maintaining haul trucks to prevent spillage or loss of bulk materials.

- **Rule 8041 (Carryout and Trackout)**

  The purpose of Rule 8041 is to prevent or limit fugitive dust emissions from carryout and trackout on paved public roads or the paved shoulders of paved public roads. Facilities subject to Rules 8021, 8031, 8061, or 8071 must also comply with this rule. Rule 8041 requires that affected facilities prevent and/or clean up carryout and trackout at the end of each workday. Cleanup of carryout and trackout is accomplished by manually sweeping and picking up, operating a rotary brush or broom accompanied by sufficient wetting to limit VDE to 20% opacity, operating a PM_{10}-efficient street sweeper that has a pick- up efficiency of at least 80%, or flushing with water if curbs and gutters are not present and where the use of water will not result in a source of trackout material or other adverse impacts, such as a water quality violation under the National Pollutant Discharge Elimination

System program. Rule 8041 requires that owners/operators of sites with paved interior roads use a trackout control device to reduce carryout and trackout. Rule 8041 prohibits the use of blower devices, dry rotary brushes, or brooms for removal of carryout and trackout on public roads.

- **Rule 8051 (Open Areas)**

  The purpose of Rule 8051 is to limit fugitive dust emissions from open areas. The rule applies to open areas 0.5 acre or more within urban areas, and 3.0 acres or more within rural areas, that contain at least 1,000 square feet of disturbed surface area. Whenever open areas are disturbed or vehicles are used in open areas, control measures are required to comply with the conditions of a stabilized surface and to limit VDE to 20% opacity. Control measures to be used include: applying and maintaining water or other chemical dust suppressants to unvegetated areas; establishing vegetation on previously disturbed areas; or paving, applying, and maintaining gravel. Where evidence is acquired that open areas are disturbed due to trespassing, such activities should be prevented by posting "No Trespassing" signs or installing physical barriers such as fences.

- **Rule 8061 (Paved and Unpaved Roads)**

  The purpose of Rule 8061 is to limit fugitive dust emissions from paved and unpaved roads by implementing control measures and design criteria. This rule applies to any new or existing public or private paved or unpaved roads, road construction projects, and road modification projects. Rule 8061 requires that new or modified paved roads have certain specifications based on the road's existing or projected annual average daily trips (AADT). Requirements include minimum paved or stabilized shoulder widths, as well as curbing, intersection, and median specifications. The Rule prescribes requirements for maintenance of public paved roads, including specifications for PM_{10}-efficient sweepers and road cleanup. Rule 8061 requires unpaved road segments with 26 or more AADT to stabilize surfaces by application of water, chemical dust suppressant, washed gravel, or similar measures. Unpaved roads with fewer than 26 AADT are exempt from some requirements of this rule.

- **Rule 8071 (Unpaved Vehicle/Equipment Traffic Areas)**

  This rule limits fugitive dust emissions from unpaved vehicle and equipment traffic areas with 50 or more AADT by stabilizing road surfaces with water, chemical dust suppressant, washed gravel, or similar measures.

Unpaved vehicle and equipment traffic areas with less than 50 AADT are exempt from Rule 8071.

Air District CEQA Air Quality Analysis and Modeling Guidance

The Air District has developed CEQA air quality analysis and modelling guidance, but notes that this guidance is dated and may not be the best approach if one is trying to use currently accepted methods such as those employed by OEHHA (Air District 2012). For this reason, the Air Quality Assessment (Appendix D-3 ~~D-1~~) is written based on the Air Toxics Hotspots Program Guidance Manual for the Preparation of Risk Assessments (OEHHA 2015).

Voluntary Emissions Reduction Agreement (VERA) Program

The Air District creates VOC, NO_x, and PM_{10} emissions reductions by providing incentive funding primarily to owners of engines who volunteer to replace older, high polluting engines with lower emitting alternatives (e.g., new engine, electric/battery, etc.). Emissions reductions administered by the Air District satisfy requirements for banking emissions reduction credits under Rule 2301 insofar as the emissions reductions are real, surplus, permanent, quantifiable, and enforceable. Some of the funding for these projects comes from VERAs between the Air District and developers of land use projects that require additional mitigation of these pollutants in order to reduce their project emissions impacts to less than the significance thresholds in the associated CEQA document (e.g., EIR). Section 9.2 in the Guidance for Assessing and Mitigating Air Quality Impacts (GAMAQI) (Air District 2015) states:

> *"Design elements, mitigation measures, and compliance with District rules and regulations may not be sufficient to reduce project - related impacts on air quality to a less than significant level. In such situations, project proponents may enter into a Voluntary Emission Reduction Agreement (VERA) with the District to reduce the project related impact on air quality to a less than significant level. A VERA is a mitigation measure by which the project proponent provides pound - for - pound mitigation of air emissions increases through a process that funds and implements emission reduction projects. A VERA can be implemented to address impacts from both construction and operational phases of a project.*
>
> *To implement a VERA, the project proponent and the District enter into a contractual agreement in which the project proponent agrees to mitigate project specific emissions by providing funds to the District. The District's role is to administer the implementation of the VERA consisting of identifying emissions reductions projects, funding those projects and verifying that emission reductions have been successfully achieved. The VERA implementation process also provides opportunity for the project proponent to identify*

specific emission reduction projects to be administered by the District. The funds are disbursed by the District in the form of grants. Types of emission reduction projects that have been funded in the past include electrification of stationary internal combustion engines (such as agricultural irrigation pumps), replacing old heavy - duty trucks with new, cleaner, more efficient heavy - duty trucks, and replacement of old farm tractors.

The District verifies the actual emission reductions that have been achieved as a result of completed grant contracts, monitors the emission reduction projects, and ensures the enforceability of achieved reductions. The initial agreement is generally based on the projected maximum emissions increases as calculated by a District approved air quality impact assessment, and contains the corresponding fiscal obligation. However, the District has designed flexibility into the VERA such that the final mitigation can be based on actual emissions related to the project as determined by actual equipment used, hours of operation, etc. After the project is mitigated, the District certifies to the Lead Agency that the mitigation is completed, providing the Lead Agency with an enforceable mitigation measure demonstrating that project specific emissions have been mitigated to less than significant. ~~[Underline added].~~

To ensure all feasible mitigation measures are incorporated into the project to reduce project air quality impact to less than significant, the District recommends the project proponent (and/or Lead Agency) engage in discussion with the District to have the VERA adopted by the District prior to the finalization of the environmental document. This process will allow the environmental document to appropriately characterize the project emissions and demonstrate that the project impact on air quality will be mitigated to less than significant under CEQA as a result of the implementation of the adopted VERA.

The District has been developing and implementing VERA contracts with project proponents to mitigate project specific emissions since 2005. It is the District's experience that implementation of a VERA is a feasible mitigation measure, which effectively achieves the emission reductions required by a Lead Agency, including mitigation of project-related impacts on air quality by supplying real and contemporaneous emissions reductions.

Therefore, Lead Agencies should require the project proponent to negotiate a VERA with the District prior to the Lead Agency's final approval of the CEQA document. This allows the Lead Agency to disclose to the public the certainty that the VERA is assuring full mitigation of air quality impacts as specified in the environmental review document or equivalent documentation certified by the Lead Agency. The 2017 Annual Financial Report states:

Under a VERA, two mitigation approaches are available: "pollutant-by-pollutant" and "net zero". The mitigation of project emissions impacts "pollutant-by-pollutant" means that each NO_x, VOC and PM_{10} project emission will be mitigated individually to their respective significance threshold level. The mitigation of project emissions impacts to "net zero" means that the sum of NO_x, VOC and PM_{10} combined project emissions will be fully mitigated by the sum of NO_x, VOC and PM_{10} combined emission reductions achieved under the VERA. The "net zero" concept is limited to the three pollutants NO_x, VOC and PM_{10}, due to their strong interrelatedness. NO_x is the driving pollutant for both the wintertime particulate matter problem and the summertime ozone problem (in combination with VOC). The District considers "net zero" mitigation to result in a less than significant air quality impact for these three pollutants, even if VOC or PM_{10} emissions remain above their individual significance thresholds after mitigation, because this means that the mitigation has achieved excess reductions of NO_x, the critical component to the Valley's air quality issues. [Underline added].

The District strongly recommends the "net-zero" approach. This method results in a significantly larger amount of NO_x reduction, which is the primary driver to the formation of ozone and particulate matter in the Valley."

The 2017 Financial Report describes the amount of funding and emissions reductions that have occurred in the VERA Program and during the last year as follows:

"The District has entered into thirty-two VERAs since 2005. One hundred percent (100%) of all off-site mitigation fees are used by the District to fund emission reduction projects through its Incentives Programs, achieving emission reductions on behalf of the project. Additionally, developers pay an administrative fee equal to four percent (4%) of the required off-site fees. This fee is to cover the District's cost of administering the off-site emission reduction projects.

To date, in addition to avoiding approximately 12,500 tons of NO_x and PM_{10} emissions from new development through the incorporation of on-site mitigation and clean-air design measures into projects subject to Rule 9510, the District has confirmed approximately 6,900 tons of reductions in NO_x and PM_{10} emissions have been achieved through the investment of ISR and VERA funds in its emission reduction incentive programs.

This year the District achieved emission reductions totaling 501 tons NO_x and 102 tons PM_{10}, for a combined total of 603 tons at a cost effectiveness of $ 8,123 per ton of emissions reduced."

Based on language in recent Governing Board approved VERAs, an applicant can propose to pre-pay for potential excess emissions of NO_x, VOC, and/or PM_{10} (i.e., "criteria pollutants") should emissions from permit-exempt, mobile sources be found to be significant even with the implementation of all feasible mitigation measures. Similarly, permitted, stationary sources would purchase emissions credits if they exceed applicable significance thresholds except that the emissions reductions would need to have been banked by another facility and issued certificates by the Air District as emissions reduction credits under the Air ~~District~~ District's stationary source permitting program.

Applicants that enter a VERA may pay up-front for potential excess emissions predicted for the entire project; or for shorter periods called "project phases." Project phases as short as three months or long as one year have been allowed in VERAs with the choice of duration left to the Applicant's discretion. Project phases in context of a VERA are periods for which emissions are pre-paid and after which the actual excess emissions above the significance thresholds may be calculated by the Applicant and reconciled with the amount of emissions reductions achieved by the District with Applicant funds. If actual emissions during a project phase were less than the significance thresholds in the environmental document, then the emissions reductions purchased would roll-over to serve as a pre-payment for a future project phase. If actual emissions exceed one or more significance thresholds, then pre-paid emissions reductions equal to the actual excess project emissions for each pollutant would be deducted from the amount of emissions reductions achieved by the District. The remaining reductions achieved by the District after subtracting the actual excess emissions above the significance threshold would then roll-over to a future project phase. Alternatively, the Applicant may transfer emissions reductions to another project within the District that requires mitigation of emissions impacts under CEQA.

Fresno County General Plan

The *Fresno County General Plan* (Fresno County 2024) Open Space and Conservation Element includes the following policies related to air quality that apply to the proposed project:

Open Space and Conservation Element

Section G. Air Quality

Goal OS-G: To improve air quality and minimize the adverse effects of air pollution in Fresno County.

Policy OS-G.2: The County shall ensure that air quality impacts identified during the CEQA review process are fairly and consistently mitigated. The

County shall require projects to comply with the County's adopted air quality impact assessment and mitigation procedures.

Policy OS-G.11: The County shall continue, through its land use planning processes, to avoid inappropriate location of residential uses and sensitive receptors in relation to uses that include, but are not limited to, industrial and manufacturing uses and any other uses which have the potential for creating a hazardous or nuisance effect.

Policy OS-G.14: The County shall include fugitive dust control measures as a requirement for subdivision maps, site plans, and grading permits. This will assist in implementing the SJVAPCD's particulate matter of less than ten (10) microns (PM_{10}) regulation (Regulation VIII). Enforcement actions can be coordinated with the Air District's Compliance Division.

Policy OS-G.15: The County shall require all access roads, driveways, and parking areas serving new commercial and industrial development to be constructed with materials that minimize particulate emissions and are appropriate to the scale and intensity of use.

Fresno County Ordinance Code

The Fresno County Ordinance Code has the following regulations related to air quality that apply to the proposed project:

Title 15—Building and Construction

Chapter 15.04—General Provisions

15.04.120—Public Nuisance in Construction and Demolition

Any person to whom a permit has been issued as provided herein for the repair, alteration, demolition or construction of any structure shall comply with each of the following:

A. Take reasonable precaution to prevent or control the movement of wind born dust created by such activities;

B. Promptly remove all dust and mud tracked into a public street by the movement of vehicles, equipment, materials and personnel;

Zoning Ordinance of Fresno County—Land Use and Planning

The Zoning Ordinance of Fresno County – Land Use and Planning, last amended ~~June 2018~~March 2026, has policies and ordinances related to air quality. Specifically, ~~Section 858, "Regulations for Surface Mining and Reclamation in All Districts,"~~

Section 834.4.220, "Mineral Extraction Sites," contains the following countywide development standards:

~~**Section 858—Regulations for Surface Mining and Reclamation in All Districts**~~
Section 834.4.220—Mineral Extraction Sites

~~**H. Mining and Reclamation Standards**~~
I. Mining and Reclamation Standards

8. All interior roads within the site shall be maintained so as to control the creation of dust.

14. Stockpiles of overburden and minerals shall be managed to minimize water and wind erosion.

20. Good operating practices shall at all times be utilized to minimize noise, vibration, dust and unsightliness…

Surface mining operators are required to forward an annual surface mining report to the Department of Conservation (DOC) and to the County Department of Public Works and Development Services. The County is required to conduct or cause an inspection of the surface mining operation within six months of receipt of the operator's annual report to determine whether the surface mining operation is in compliance with the approved conditional use permit, approved mining and reclamation plan, approved financial assurances, and state regulations pertaining to mining. The County must submit the completed inspection form to the DOC within 30 days along with statements on compliance with SMARA, any inconsistencies with SMARA, and any pending action on the mine and reclamation plan, amendments, or financial assurances. It should be noted that the time frames specified in the County's ordinance have been superseded by statutory amendments to SMARA, effective January 2018. The County will implement that currently applicable requirements associated with state review of SMARA-related documents.

4.3.3 Significance Thresholds and Analysis Methodology

4.3.3.1 Significance Criteria

Based on Appendix G of the CEQA Guidelines, the proposed project would have a significant impact on air quality if it would:

a) conflict with or obstruct implementation of the applicable air quality plan;
b) result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non- attainment under an applicable federal or state ambient air quality standard;

c) expose sensitive receptors to substantial pollutant concentrations; or

d) result in other emissions (such as those leading to odors) adversely affecting a substantial number of people.

4.3.3.2 Significance Thresholds

The Appendix G significance criteria are qualitative criteria. The Air District has established quantitative thresholds to facilitate the evaluation of the significance criteria. These thresholds are summarized in the following tables:

- Table 4.3-4, "Air Quality Significance Thresholds—Criteria Pollutants,"
- Table 4.3-5, "Air Quality Significance Thresholds—Toxic Air Contaminants and Odor,"
- Table 4.3-6, "Ambient Air Quality Standards," and
- Table 4.3-7, "Significant Impact Level Threshold Values."

Table 4.3-4
Air Quality Significance Thresholds—Criteria Pollutants

Criteria Pollutants			
Pollutant	***Construction Phase (ton/year)***	***Operation Phase Permit-Required (Stationary) Sources (ton/year)***	***Operation Phase Permit-Exempt (Mobile) Sources (ton/year)***
CO	100	100	100
NO_X	10	10	10
ROG	10	10	10
SO_x	27	27	27
PM_{10}	15	15	15
$PM_{2.5}$	15	15	15

Table Sources: Air District 2015a.
Table Notes: As indicated in the *Guidance for Assessing and Mitigating Air Quality Impacts* (Air District 2015b), "permit-required" sources are stationary sources (e.g., processing plant, hot-mix asphalt plant, ready-mix concrete plant, recycling plant), and "permit-exempt" sources are mobile sources (e.g., haul trucks, excavators).
CO = carbon monoxide; NO_x = oxides of nitrogen; ROG = Reactive Organic Gases; SO_x = oxides of sulfate; $PM_{2.5}$ = fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less; PM_{10} = respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less.

Table 4.3-5
Air Quality Significance Thresholds—Toxic Air Contaminants and Odor

Recommended Toxic Air Contaminants and Odor Thresholds	
Toxic Air Contaminants (including carcinogens and non-carcinogens)	Maximum Incremental Cancer Risk ≥ 20 in 1 million Chronic & Acute Hazard Index ≥ 1.0 (project increment)
Odor	More than one confirmed complaint per year averaged over a three-year period, or three unconfirmed complaints per year averaged over a three-year period. (Screening distance is one mile for asphalt batch plants)

Table Sources: Air District ~~ND1~~ SJVAPCD Air Quality Thresholds of Significance-Toxic Air Contaminants and ~~ND2~~. SJVAPCD "Guidance for Assessing and Mitigating Air Quality Impacts". (SJVAPCD, 2015)

Table 4.3-6
Ambient Air Quality Standards

Ambient Air Quality Standards	
Screening Criteria	100 lb/day of any criteria pollutant after implementation of mitigation measures.
Modeling Criteria	If modeling is required because emissions exceed the screening criteria (100 lb/day), then the project would have a significant impact on an ambient air quality standard if the project concentration plus background concentration measured at the closest air monitoring station exceeds the most stringent state or federal ambient air quality standards (see Table 4.3-1, above) or Significant Impact Level (see Table 4.3-7, below) in cases where background concentration already exceeds or nearly exceeds the ambient air quality standards.

Table Sources: Air District 2015b.
Table Notes: lb/day = pounds per day

Table 4.3-7
Significant Impact Level Threshold Values

Pollutants[a]	Averaging Period	Class I (µg/m³)	Class II (µg/m³)	Class III (µg/m³)
$PM_{2.5}$	Annual	0.03 ~~0.05~~	0.13 ~~0.2~~	0.13 ~~0.2~~
	24-hour	0.27	1.2	1.2
Fugitive $PM_{2.5}$	Annual	--	0.63	--
	24-hour	--	2.5	--
PM_{10}	Annual	0.32	1	--
	24-hour	0.2	5	--
Fugitive PM_{10}	Annual	--	2.08	--
	24-hour	--	10.4	--
Carbon Monoxide (CO)	Annual	--	500	--
	24-hour	--	2000	--
Nitrogen Dioxide (NO_2)	Annual	0.1	1	--
	24-hour	--	7.5	--

Pollutants[a]	Averaging Period	Class I (µg/m³)	Class II (µg/m³)	Class III (µg/m³)
Sulfur Dioxide (SO_x)	Annual	0.08	1	--
	24-hour	0.2	5	--
	3-hour	1	25	--
	1-hour	--	7.8	--

Table Sources: Air District 2019b.
Table Notes:
a = Classes refer to the type of receptor being protected and correspond to the primary and secondary ambient air quality standards presented in Table 4.3-1. Up to date as of ~~12/4/2019~~ 5/6/2024.
µg/m³ = micrograms per cubic meter.
-- = no significant impact level exists.
CO = carbon monoxide; NO_2 = nitrogen dioxide; SO_x = oxides of sulfate; $PM_{2.5}$ = fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less; PM_{10} = respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less.

4.3.3.3 Analysis Methodology

The following sections summarizes the methods for evaluating emissions of criteria air pollutants and potential ambient air quality and health impacts associated with project emissions. Detailed methodology is provided in the Air Quality Assessment (Appendix D-1)~~, and~~ the associated Addendum (Appendix D-2), and the May 13, 2026, revision (Appendix D-3). Appendix D-3 replaces Appendix D-1 and D-2 in their entirety. The general analysis approach was to estimate the increase in emissions from proposed mining, processing, and reclamation operations relative to emissions from existing mining and processing operation at the project sites (which are the existing on the ground physical conditions referred to as the CEQA baseline) and compare the estimated increase to the significance thresholds adopted by Air District.

Project Design Features and Assumptions

Table 4.3-8, "Rockfield Modification Project Components of Air Quality and Greenhouse Gas Modelling," summarizes the project features incorporated into the Air Quality Assessment analysis.

Table 4.3-8
Rockfield Modification Project Components of Air Quality and Greenhouse Gas Modelling

Activity	Description
CONSTRUCTION[1]	
Aggregates Plant_Construction	Construction of aggregates processing plant at the Quarry Site. Expected schedule of 10 months ~~5 days~~.
Grading	Expected schedule of 20~~5~~ days.
Paving	Paving of approximately one mile of road. Expected schedule of 10 days.
Site Preparation	Clearing of Quarry Site and site preparation. Expected schedule of 10 days.

Activity	Description
RESOURCE RECOVERY AND PROCESSING	
Mining Method	Addition of hard rock mining to Quarry Site activities. Addition of primary crusher and hydraulic shovel in pit. Increased use of excavator and dozer operations, in addition to excavation by hydraulic shovel or front-end loader. Addition of drilling and blasting will be required.
Processing	Extracted resources at the Quarry Site will be processed onsite at the relocated ready-mix concrete and hot-mix asphalt plants starting at phase 2, rather than being transported to the Plant Site for processing. Adding processing plant equipment to manufacture sand.
Estimated Annual Aggregates Production	Increase from 1,374,272 tons per year to 3,000,000 tons per year.
Estimated Annual Ready Mix Production	Increase from 189,550 cubic yards per year to 300,000 cubic yards per year.
Estimated Annual Recycle Plant Production	Increase from 25,000 tons per year to 200,000 tons per year.
Estimated Annual Asphalt Plant Production	Increase from 0 tons per year to 500,000 tons per year at a new hot-mix asphalt plant, burning natural gas or propane with best available control technology (BACT).
Hours of Operation	6 days per week, Monday through Saturday (For health risk assessment, modeled conservatively as 7 days per week, 12 hours per day. For criteria pollutant emissions, modeled based on maximum hour and day, by activity levels.)

Table Source: Sespe ~~2019~~ 2026.
Table Notes:
1. The construction of the aggregate plant on the Quarry Site was conservatively assumed to occur in conjunction with the operation of the plant (i.e., the analysis assumed some plant equipment would be operating even during times when it may actually be under construction). This approach is conservative because it results in higher emissions in the model than if construction of plant equipment were estimated separately.

Impacts assessment incorporated the following general assumptions:

- The excavation and associated equipment would operate in compliance with applicable air quality regulations.
  - Diesel engines would continue to comply with applicable state regulations (e.g., ATCM) including establishment of an idling policy, and limiting idle time to less than five minutes (13 CCR Section 2449).
  - Fugitive dust emissions would continue to be controlled through implementation of controls and compliance measures within Air District Rules 8011, 8021, 8031, 8041, 8051, 8061, and 8071. A formalized dust control plan has been provided, and the emissions reduction achieved as a result of the plan are included in the emissions calculations including control methods and efficiencies (see Appendix D-3, Sub appendix K, Fugitive Dust Control Plan).

- Hazardous substances or acutely hazardous substances would not be stored on either of the project sites in quantities that would trigger chemical accident prevention provisions of the CAA or the implementing regulation (40 CFR Part 68).
- The construction of the aggregate plant on the Quarry Site was conservatively assumed to occur in conjunction with the operation of the plant (i.e., the analysis assumed the plant equipment would be operating even during times when it may actually be under construction). This approach is conservative because it results in higher emissions in the model than if construction of plant equipment were estimated separately.
- The project will accept a Condition of Approval to limit excavation to 3,000,000 tons per year.
- A waste factor of 15 percent is anticipated for processing mined alluvium and a waste factor of 5 percent is anticipated for processing of mined hard rock. In order to incorporate waste factors conservatively, the Plant Site was modeled with a waste factor of 15 percent and the Quarry Site was modeled with a waste factor of 10 percent.
- Emissions from placement of waste fines in the bottom of the quarry pit were evaluated and included processing and onsite transport of mined and waste materials.
- Off-site truck travel emissions were re-assessed based on the project's increment of future increases in regional aggregates demand for the Fresno-Production-Consumption region. The regional increment analysis used methods Fresno County previously applied in the Riverbend Sand and Gravel Mine Project. For further discussion of the regional increment analysis, see Final EIR Appendix D-5 and Sub-Appendix J of Appendix D-3.

Design features of the project include:

- Emissions characteristics of off-road vehicle engines in any particular year match those in the California Emissions Estimator Model (CalEEMod).
- Paving of roads on Quarry Site prior to year 30 of the project.

Emissions Calculations Methodologies

Emissions from combustion sources associated with the proposed project primarily consist of non-road diesel engines in off-road vehicles. Exceptions may include water and service trucks, which are on-road but assumed to have off-road engines for purposes of this analysis. This is a conservative assumption because on-road engines generally emit less pollutants as compared to off-road engines manufactured in the same calendar year

(i.e., an on road 2010 model year engine is cleaner than a 2010 off-road engine). Emissions from dust sources associated with the proposed project include windblown dust and other storage pile area emissions (e.g., loading and handling), dozer/quarrying emissions, drop emissions from material transfer, and processing plants.

Emissions from off-road engines were calculated using the CalEEMod default method and emissions factors. Blasting emissions calculations used AP-42 methodology and speciation profiles for air toxics from San Diego County Air Pollution Control District (San Diego County APCD) (EPA 1995; San Diego County APCD 2021). AP-42 and San Diego County APCD emissions factors/profiles were used because the Air District lacks guidance for blasting emissions, and links to both AP-42 and San Diego County APCD resources are provided on the Air District emissions factor webpage (Air District 2021). Dust emissions from aggregate handling and dropping, and dust emissions from travel on unpaved roads within the project sites, were predicted using AP-42 standard emissions factors (EPA 1995).

Baseline Emissions

Baseline emissions were calculated by analyzing fuel use data, engine information, and production records provided by the Applicant. Historical data for production, fuel use, and pollutant emissions were chosen to represent maximum activity levels onsite and utilized to determine the baseline emissions. Historical production data is summarized in Table 4.3-9, "Historical Production Data."

Table 4.3-9
Historical Production Data

Material Produced	Max Hour	Max Day	Annual
Aggregate (tons)	475	6,000 ~~3,166.63~~	1,580,413 ~~1,374,272~~
Recycled Material (tons)	225	1,500	25,000
Asphalt (tons)	0	0	0
Ready Mix (cubic yards)	190	1,267	189,550

Table Source: Sespe 2026~~2019~~.

Baseline emissions calculations results are demonstrated below in Table 4.3-10, "Baseline Maximum Hourly Emissions," Table 4.3-11, "Baseline Maximum Daily Emissions," and Table 4.3-12, "Baseline Maximum Annual Emissions." Permit-required (stationary) equipment and permit-exempt (mobile) equipment emissions are separated as they have separate significance thresholds.

Table 4.3-10
Baseline Maximum Hourly Emissions

Proposed Project Emissions

Construction Phase

Construction phase emissions are shown in Table 4.3-13, "Construction Phase Emissions." Construction consists of building the aggregate processing plant at the Quarry Site, and grading, paving, and site preparation (Table 4.3-8).

Table 4.3-13
Construction Phase Emissions

Units	ROG	CO	NO_x	PM_{10}	$PM_{2.5}$	SO_x
Pounds per Day	4.8	5.04 ~~34.1~~	4.87 ~~54.5~~	1.23 ~~337.3~~	0.64~~41.0~~	0.01 ~~0.064~~

Table Source: Sespe 2026 ~~2019~~.

Operation Phase

Operation phase emissions are based on the maximum proposed aggregate production and processing volumes anticipated during the entire 100-year project duration, and are summarized in Table 4.3-14, "Operation Phase Maximum Activity."

Table 4.3-14
Operation Phase Maximum Activity

Material Produced	Max Hour[1]	Max Day[2]	Annual[2]
Aggregate (tons)	1,100 ~~475 and~~	14,000 ~~10,500~~	3,000,000
Asphalt (tons)	500 ~~or 500~~	3,333 ~~6,000~~	500,000
Ready Mix (cubic yards)	190 ~~or 382~~	1,266 ~~2,284~~	300,000
Recycled Material (tons)	225 ~~or 225~~	1,500 ~~2,700~~	200,000

Table Source: Sespe ~~2019~~ 2026.

~~**Table Notes:**~~

~~1. Cells with two values are Plant Site and Quarry Site amounts, respectively. When the two values are separated by "and," both sites were assumed to operate simultaneously and when separated by "or" were assumed to operate exclusively at one site or the other; not both simultaneously.~~

2. ~~Cells with one value represent the total amount for the Plant and Quarry Sites combined.~~

Estimated emissions based on proposed project activities at the Plant Site and Quarry Site are summarized in the following tables:

- Table 4.3-15, "Operation Phase Maximum Hourly Emissions,"
- Table 4.3-16, "Operation Phase Maximum Daily Emissions," and
- Table 4.3-17, "Operation Phase Maximum Annual Emissions."

The maximum operation phase emissions are based on the emissions that would occur during maximum proposed aggregate production and processing volumes that could occur during the 100-year project duration, as identified in Table 4.13-14. This

means that the estimates in Tables 4.13-15, 4.13-16, and 4.13-17 represent the maximum emissions for that source/pollutant combination that may occur during either Stage 1 or Stage 2 operations.

Table 4.3-15

Table Notes: As indicated in the Guidance for Assessing and Mitigating Air Quality Impacts (Air District 2015b), "permit-required" sources are stationary sources (e.g., processing plant, hot-mix asphalt plant, ready-mix concrete plant, recycling plant), and "permit-exempt" sources are mobile sources (e.g., haul trucks, excavators). As noted in Appendix D-3, Project on-road emission estimates used Year 2026 emission factors from the current version of EMFAC; this recalculation was applied in response to comments on the Draft EIR and produces more up to date on-road mobile source emissions for the proposed Project operations.
- = source does not have emissions.
ton/yr = tons per year.
CO = carbon monoxide; NOx = oxides of nitrogen; ROG = Reactive Organic Gases; SOx = oxides of sulfate; PM2.5 = fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less; PM10 = respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less.

Health Risk

Exposure to equipment exhaust and fugitive dust can lead to various health impacts. Specifically, the following three types of public health impacts are commonly associated with exposure to trace metals in dust and diesel particulate matter:

1) Cancer risk (reported as a probability)
2) Acute non-cancer risk (reported as a Hazard Index)
3) Chronic non-cancer risk (reported as a Hazard Index)

The preparation of health risk assessments is a multi-step process. The first step is to identify potential contaminants that may contribute to public health risks (hazard identification. The second step is to assess the amount of contaminants that may reach the public (exposure assessment). The third step is to calculate the magnitude of the health risk as a result of exposure to harmful contaminants on the basis of the toxicology of the contaminants (dose-response assessment and risk characterization). The health risk assessment for the proposed project was performed using current best practices including methods from the OEHHA (2015) risk assessment guidelines.

Hazard Identification and Quantification

For air toxics sources, hazard identification involves the pollutant(s) of concern emitted by a facility, and the types of adverse health effects associated with exposure to the chemical(s), including whether a pollutant is a potential human carcinogen or is associated with other types of adverse health effects. Diesel particulate matter is the primary toxic air contaminant emitted by off-road engines used in mining projects.

As described in Section 4.3.1.3, "Toxic Air Contaminants," diesel particulate matter, respirable crystalline silica, and naturally occurring asbestos are toxic air contaminants of concern associated with proposed project sources. The health risk assessment considered whether health risk from asbestos should be quantified. It was determined based on review of available geologic maps and language in the Asbestos ATCM's (17CCR Sections 93105 and 93106) that asbestos is unlikely to be a concern and so was not included in the HRA. The geotechnical assessment for the proposed project (Appendix F-1) confirms that the project sites are not located in a region of California noted for rock types that contain naturally occurring asbestos and a review of on-site core samples for several borings did not indicate the presence of ultramafic rock constituents. Therefore, the proposed project would not result in health risk impacts from exposure to naturally occurring asbestos.

Diesel particulate matter has an assigned cancer potency factor (CPF) and a non-cancer reference exposure level that are used to evaluate the health risk. Fugitive dust

is generally inert but does contain trace metals and respirable crystalline silica. As documented in Appendix D-1 as updated in Appendix D-3, soil sampling of the project sites was conducted to determine potential concentrations of metals and respirable crystalline silica in the site soils. The health risk analysis conservatively assumed that toxic air contaminants are present in soil onsite at the highest concentration reported by the laboratory throughout the samples taken. Toxic air contaminants that were not detected during sampling are assumed to be present at the Minimum Detection Level.

Air District standard speciation profiles and data determined via sampling were combined with calculated PM_{10} emissions to determine the mass of each toxic air contaminant, and dispersion coefficients to quantitatively predict the ground level concentration of each toxic air contaminant, to which individuals may be exposed (see exposure assessment subsection below). The concentrations were then combined with exposure parameters to quantify the dose received by each receptor and for each exposure pathway. In the case of non-cancer risk, the exposures were then summed on a target organ by target organ basis using Hotspots Analysis and Reporting Program Air Dispersion Modeling and Risk Assessment Tool Version 2 (HARP2 risk model) to determine the maximum Hazard Index among the target organs in the body. The maximum target organ Hazard Index was then compared to the non-cancer significance criteria (i.e., 1.0 Hazard Index) as discussed in the following subsections.

Exposure Assessment

The purpose of exposure assessment is to estimate the extent of public exposure to emitted substances. In practice this means estimating exposures for those emitted substances for which potential cancer risk or non-cancer health hazards for acute, repeated 8-hour, and chronic exposures will be evaluated. This involves emission quantification, modeling of environmental transport, evaluation of environmental fate, identification of exposure routes, identification of exposed populations, and estimation of short-term (e.g., 1-hour maximum), 8-hour average, and long-term (annual) exposure levels.

HARP2 risk model software was used to model ground level concentrations at specific off-site locations. HARP2 incorporates the EPA-approved air dispersion model, American Meteorological Society/Environmental Protection Agency Regulatory Model (AERMOD). Air dispersion modeling for the proposed project was performed using AERMOD View by Lakes Environmental (Version 13.0.0 ~~9.7.0~~ running AERMOD executable Version 24142).

Modeled receptors are shown on the following figures:

- Figure 4.3-1, "Non-Residential Sensitive Receptor Locations,"
- Figure 4.3-2, "Detailed Model Receptor Locations," and
- Figure 4.3-3, "Plant Site Labeled Receptor Locations."

~~225 cartesian grid receptors,~~ 26 discrete receptors~~,~~ and 6857 ~~156~~ fence-line/grid ~~plant boundary~~ receptors were modeled. Receptors for residents and workers were modeled at ground level.

Sources of emissions were assigned positive emissions values and baseline sources were assigned negative values (i.e., to represent sink) so that the health risk assessment results represent the change in health risk from the proposed project relative to baseline conditions. In order to obtain the most conservative possible health risk assessment, the model assumes mining would place as close as possible to residential receptors. Concentration of mining emissions into a small area near receptors allows the model to demonstrate potential risk in the worst-case scenario. Chronic and cancer risks were evaluated at locations where long-term occupancy is reasonably expected (≥1 year), while maximum acute risk was assessed at the project fence line, with risk attenuation documented as distance increases.

The model was segmented into two intervals that were chosen to coincide with onsite activity changes and project consolidation at the Quarry Site after 30 years. The segments of the HRA model were chosen to coincide with onsite activity changes and represent years 1-70 for Stage 1 (years 1 through 30, with activities at both the Plant Site and Quarry Site, and parts of Stage 2 (years 31-70), with activities at only the Quarry Site) and Stage 2 (years ~~30~~31 through 100, with activities at only the Quarry Site). Each HRA phase was evaluated separately to reflect changes in onsite activities and emission locations. To capture the full 70-year duration, the first HRA segment combined the risks from each phase by summing the risks from both phases, resulting in a cumulative risk estimate that reflects continuous exposure over a 70-year operational period. Although the ~~second interval represents the final 70~~ project represents~~years of the~~ 100 years of operation, the preparation of two 70-year HRA models meets SJVAPCD guidance to use a 70-year analysis.~~project, consistent with Air District guidance, it was modeled for 30 years which represents 95th percentile of residency durations at a single location.~~

Dose-Response Assessment

Dose-response assessment is the process of characterizing the relationship between exposure to an agent and incidence of an adverse health effect in exposed populations.

In quantitative carcinogenic risk assessment, the dose-response relationship is expressed in terms of a potency slope that is used to calculate the probability or risk of cancer associated with intensity of the exposure. For noncarcinogenic effects, dose-response data developed from animal or human studies are used to develop acute, repeated 8-hour, and continuous exposure reference exposure levels. The non-cancer reference exposure levels are defined as the concentration at which no adverse non-cancer health effects are anticipated even in sensitive members of the general population, with infrequent one-hour exposures, repeated 8-hour exposures over a significant fraction of a lifetime, or continuous exposure over a significant fraction of a lifetime, respectively.

Risk Characterization

Risk characterization is the final step of the health risk assessment. In this step, information developed through the exposure assessment is combined with information from the dose-response assessment to characterize risks at each receptor. A general summary of the risk characterization components includes the following:

- The locations of the point of maximum impact (PMI), the maximum exposed individual sensitive receptor (MEIR), and the maximum exposed individual off-site worker (MEIW) are identified. The PMI, MEIW, and MEIR for cancer risk and for noncancer hazard indices may not occur at the same location; and should be identified.
- The location of any specified sensitive receptors (e.g., schools, hospitals, daycare, or eldercare facilities) are identified.
- Estimates of population-wide cancer burden are assessed if maximum incremental cancer risk greater than zero for residential receptors. The cancer burden is calculated by multiplying the cancer risk at a census block centroid by the number of people who live in the census block, and adding up the estimated number of potential cancer cases across the zone of impact. The result of this calculation is a single number that is intended to estimate the number of potential cancer cases within the population that was exposed to the emissions.

Odor

There are sensitive receptors located within one mile of the Plant Site and Quarry Site, and therefore odor concerns associated with the asphalt plant cannot be screened out based on distance (Table 4.3-5). For consideration of odors, the odor complaint history was reviewed to determine whether or not the past operation of this asphalt plant on the Plant Site (even though it stopped operating in 2009 and therefore is not a contributor to the existing environmental setting for the project) resulted in odor complaints. This review disclosed no odor complaints for the past operation of the asphalt plant. Advances in odor control technology, wind direction, and the location of the asphalt plant relative to the nearest sensitive receptors were also considered.

4.3.4 Project Impacts and Mitigation Measures

Impact 4.3-1: Conflict with or Obstruct Implementation of the Applicable Air Quality Plan

The Air District's air quality attainment plans are discussed in the "San Joaquin Valley Air Pollution Control District" subsection. Potential control measures that may be pursued to reduce emissions are described in the attainment plans. These measures would be implemented as rules and therefore would undergo the associated public rulemaking process, which allows for quarry operators to provide input on the feasibility of compliance with proposed rules. Thus, it is unlikely that such a process would result in a requirement with which the proposed project could not comply. Furthermore, aggregates production is proportional to population growth, which is a factor that is accounted for in attainment plans. Lastly, as described below in Impact 4.3-2, the proposed project would not result in any significant and unavoidable air quality impacts related to criteria air pollutant emissions. For these reasons, the proposed project would not obstruct implementation of an air quality attainment plan and this impact would be less than significant.

Level of Significance Before Mitigation: Less than significant.

Mitigation Measures: None required.

Impact 4.3-2: Result in a Cumulatively Considerable Net Increase of Any Criteria Pollutant for which the Project Region is Non-Attainment Under an Applicable Federal or State Ambient Air Quality Standard

Project operations associated with mining, processing, and reclamation activities would emit the criteria air pollutants ROG, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$ from construction equipment and from mobile equipment and motor vehicles associated with excavation

and blasting, and operation of an aggregate plant, ready-mix concrete plant, asphalt plant, and portable recycle plant on the Plant Site and Quarry Site.

The CEQA Guidelines define cumulative impacts as two or more individual effects which, when considered together, are either significant or "cumulatively considerable", meaning they add considerably to a significant environmental impact. An adequate cumulative impact analysis considers a project over time and in conjunction with other past, present, and reasonably foreseeable future projects whose impacts might compound those of the project being assessed. A Lead Agency may determine that a project's incremental contribution to a cumulative effect is not cumulatively considerable if the project would comply with the requirements in a previously approved plan or mitigation program, including but not limited to an air quality attainment or maintenance plan that provides specific requirements that would avoid or substantially lessen the cumulative problem within the geographic area in which the project is located (14 CCR Section 15064(h)(3)).

By its very nature, air pollution is largely a cumulative impact. The nonattainment status of regional pollutants is a result of past and present development. Future attainment of state and federal ambient air quality standards is a function of successful implementation of the Air District's attainment plans. Consequently, the Air District's application of thresholds of significance for criteria pollutants is relevant to the determination of whether a project's individual emissions would have a cumulatively significant impact on air quality. Thus, if the increase in emissions relative to baseline conditions exceeds thresholds for ROG, NO_x, CO, SO_x, PM_{10}, and $PM_{2.5}$, then the proposed project would result in a cumulatively considerable net increase of a criteria pollutant for which the Air District is in non-attainment under applicable state or federal ambient air quality standards. Air District attainment significance criteria for criteria pollutants are presented in Table 4.3-4 alongside non-attainment pollutants for disclosure purposes.

Based on the analysis described in Section 4.3.4.3, "Analysis Methodology," the proposed project's construction and operation phase emissions are summarized and compared to significance criteria in Table 4.3-18, "Construction Phase Criteria Pollutant Annual Emissions," and Table 4.3-19, "Operation Phase Criteria Pollutant Annual Emissions."

Table 4.3-18
Construction Phase Criteria Pollutant Annual Emissions

SO_X	0.9	27	No	1.4	27	No

Table Source: Sespe ~~2021~~ 2026.
Table Notes:
Bold values indicate that the criteria pollutant emissions exceed the significance criteria.
Negative values represent emissions reductions relative to baseline emissions due to newer technology and lower emission equipment requirements, particularly those described in the "In-Use Off-Road Diesel-Fueled Fleets" and "In-Use On-Road Diesel-Fueled Vehicles."
As noted in Appendix D-3, Project on-road emission estimates used Year 2026 emission factors from the current version of EMFAC; this recalculation was applied in response to comments on the Draft EIR and produces more up to date on-road mobile source emissions for the proposed Project operations. As indicated in the Guidance for Assessing and Mitigating Air Quality Impacts, "permit-required" sources are stationary sources (e.g., processing plant, hot-mix asphalt plant, ready-mix concrete plant, recycling plant), and "permit-exempt" sources are mobile sources (e.g., haul trucks, excavators).
ton/year = tons per year.
CO = carbon monoxide; NO_X = oxides of nitrogen; ROG = Reactive Organic Gases; SO_x = oxides of sulfate; $PM_{2.5}$ = fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less; PM_{10} = respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less.

The impact analysis for a project's potential to exceed or contribute to exceedance of an ambient air quality standard normally involves modeling emissions to predict the concentration of pollutant(s) off-site. The Air District has established a screening level of 100 pounds per day (lbs/day) that may be used to avoid modeling impacts that are unlikely to result in exceedances. If a project exceeds this screening level, then additional

modeling is required to determine whether project emissions would exceed applicable ambient air quality standard and, therefore, result in a potentially significant impact requiring mitigation.

Baseline emissions from sources located at the project sites were subtracted from future emissions at the project sites to estimate the increase in emissions on-site for comparison to the 100 lbs/day screening level as shown in Table 4.3-20, "Net Increase in Unmitigated Daily Emissions and Model Screening Level Comparison."

Table 4.3-20
Net Increase in Unmitigated Daily Emissions and Model Screening Level Comparison

Scenario	CO (lb/day)	NO_X (lb/day)	PM_{10} (lb/day)	$PM_{2.5}$ (lb/day)	SO_X (lb/day)
On-Site Baseline	228.4 ~~78.4~~	544.0 ~~199.3~~	1,023.5 ~~767.9~~	238.2 ~~228.3~~	0.5 ~~0.3~~

On-Site Increase from Project	1,095.0 ~~1,116.~~1	125.4 ~~4.0~~	34.3 ~~415.7~~	18.8 ~~143.1~~	26.1 ~~30.0~~
Screening Criteria	100	100	100	100	100
Exceeds Criteria?	Yes	Yes ~~No~~	No ~~Yes~~	No ~~Yes~~	No

Table Source: Sespe 2026~~2021~~.
Table Notes:
lb/day = pounds per day. CO = carbon monoxide; NO_X = oxides of nitrogen; ROG = Reactive Organic Gases; SO_x = oxides of sulfate; $PM_{2.5}$ = fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less; PM_{10} = respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less.

As shown in Table 4.3-18, the construction phase of the proposed project would not generate emissions that could exceed the screening level for any criteria pollutants. As shown in Table ~~4.3-19 and~~ 4.3-20, proposed project mining, processing, and production operations could generate emissions that exceed the ~~annual screening level for PM_{10}, and the~~ daily screening level for CO, and NO_x ~~PM_{10}, and $PM_{2.5}$~~. Therefore, the proposed project could potentially result in a cumulatively considerable net increase of these criteria pollutants. Note that for permit-exempt (mobile) sources, the emissions of ROG, NO_x, PM_{10}, and $PM_{2.5}$ would decrease due to technological advancement that facilitates the continued reduction in emissions from mobile diesel-powered equipment.

The potential health risks of CO, and NO_x ~~PM_{10}, and $PM_{2.5}$~~ are described above in Section 4.3.2.2, "Pollutants and Health Effects." Ambient air quality standards are established to protect the public from adverse health effects of criteria pollutants and to provide protection against visibility impairment and damage to animals, crops, vegetation, or buildings. Because the proposed project could result in emissions that exceed the Air District's thresholds of significance for criteria pollutants, the adverse health effects, visibility impairment, and damage described above in Section 4.3.2.2 could be caused or

exacerbated as a result of the proposed project emissions. Mitigation Measure 4.3-2a would require that all equipment with off-road engines ~~to~~ be retrofitted or upgraded to meet the Tier 4 Interim Particulate Emissions standard and Mitigation Measure 4.3-2b would require dust from unpaved roads and stockpiles to be controlled by the application of dust suppressants. The estimated criteria air pollutant emissions with application of Mitigation Measure 4.-2a, -2b, and -2c are presented in Table 4.3-21, "Mitigated Operation Phase Criteria Air Pollutant Annual Emissions," and Table 4.3-22, "Mitigated Net Change in Daily Emissions."

Table 4.3-21
Mitigated Operation Phase Criteria Air Pollutant Annual Emissions

	Permit-Required (Stationary) Sources (ton/yr)			Permit-Exempt (Mobile) Sources (ton/yr)

Table Source: Sespe ~~2021~~ **2026**.
Table Notes: Negative values represent emissions reductions relative to baseline emissions due to newer technology and lower emission equipment requirements, particularly those described in the "In-Use Off-Road Diesel-Fueled Fleets" and "In-Use On-Road Diesel-Fueled Vehicles", and due to implementation of Mitigation Measures 4.3-2.
lb/day = pounds per day.
CO = carbon monoxide; NO_X = oxides of nitrogen; ROG = Reactive Organic Gases; SO_x = oxides of sulfate; $PM_{2.5}$ = fine particulate matter with an aerodynamic resistance diameter of 2.5 micrometers or less; PM_{10} = respirable particulate matter with an aerodynamic resistance diameter of 10 micrometers or less.

Prior to mitigation, the project's estimated emissions of ~~NOx,~~ PM_{10}, $PM_{2.5}$ and SO_x are below the screening level threshold. As shown in Tables 4.3-21 and 4.3-22, Mitigation Measure 4.3-2a and Mitigation Measure 4.3-2b would decrease annual and daily emissions ~~of PM_{10} and daily emissions of $PM_{2.5}$ below the screening level thresholds~~. However, annual emissions of CO and NOx would remain greater than the screening level. In accordance with APR-2030, when any one of the criteria pollutants surpasses its established screening threshold, air dispersion modeling is required for all criteria pollutants. Therefore, the off-site concentration of each criterion pollutant ~~Therefore, the off-site concentrations of CO~~ were modeled for both mitigated and unmitigated levels to determine whether those concentrations exceed the applicable ambient air quality standard. The results are presented in Table 4.3-23, "Mitigated and Unmitigated Criteria Pollutant ~~CO~~ Concentrations." Air dispersion modeling was performed using the latest version of AERMOD to ensure accurate and reliable air quality predictions. Blasting was excluded from the one-hour models as blasting emissions are brief and therefore would not be appropriately modeled using steady state assumptions in AERMOD, but were instead modeled separately as discussed below.

As shown in Table 4.3-23, "Mitigated and Unmitigated Criteria Pollutant ~~CO~~ Concentrations," both project and cumulative estimated criteria pollutant ~~CO parts per million~~ concentrations would not exceed ambient air quality standards. Consequently, with implementation of Mitigation Measure 4.3-2a and Mitigation Measure 4.3-2b, criteria air pollutant emissions by the proposed project operations would be below the Air District's thresholds of significance, which are intended to be protective of human health and the environment. Therefore, this impact would be less than significant.

Table 4.3-23

Table Source: Sespe 2026.

a) Background concentration is obtained from Site No. 11.

b) HIH = 1st Highest High (highest modeled result). Where a pollutant and averaging period has a NAAQS and CAAQS standard, the most stringent standard is selected.

c) San Joaquin Valley APCD is in attainment for these pollutants (excluding PM10 and PM2.5) and averaging periods; therefore, the most stringent AAQS (CAAQS or NAAQS) is used for the significant determination.

d) San Joaquin APCD is not in attainment of these standards, therefore, San Joaquine APCD LST Significant Change Threshold is used for determining significance and does not require background concentrations (SJAPCD 2024).

e) SJVAPCD uses Class II SILs for evaluating the significance of Project PM10 and PM2.5 emissions, as reported in District Policy APR 1925, Policy for District Rule 2201 AAQA Modeling (SJVAPCD, 2024).

f) SIL is defined as "a concentration threshold used to determine whether a proposed source's emissions will have a "significant impact on air quality in an area" (APR 1925) (SJVAPCD, 2024).

~~Table 4.3-23~~ [REPLACED WITH TABLE SHOWN ABOVE]
~~Mitigated and Unmitigated Criteria Pollutant CO Concentrations~~

~~Pollutant (period)~~	~~Background (ppm)~~	~~Mitigated and Unmitigated Project Maximum[1] (ppm)~~	~~Mitigated and Unmitigated Cumulative[1] (ppm)~~	~~Ambient Air Quality Standard (ppm)~~	~~Project Exceeds?~~	~~Cumulative Exceeds?~~
~~CO (1 hr)~~	~~2.4~~	~~1.06~~	~~3.46~~	~~20~~	~~No~~	~~No~~
~~CO (8 hr)~~	~~1.8~~	~~1.06[2]~~	~~3.46[2]~~	~~9~~	~~No~~	~~No~~

~~**Table Source:** Sespe **2026**2021.~~
~~**Table Notes:**~~
~~ppm = parts per million.~~
~~CO = carbon monoxide.~~
~~1. The Addendum (Appendix D-2) indicates that CO emissions remain relatively unchanged by mitigation measures and so the mitigated and unmitigated concentrations are the same and shown in this table.~~
~~2. More conservative 1-hour results and background were assumed for 8-hour standard, as 1-hour results are still below 8-hour standard.~~

To evaluate the environmental impact of above-ground blasting at the Rockfield Quarry, a separate blasting model was conducted. Meteorological and blasting data were collected and analyzed. NO2 Dispersion modeling was conducted exclusively for the quarry site, where nine emission sources were placed around the perimeter to simulate blasting events. Appendix D-3 summarizes the dispersion modeling results for NO_2. The 98th percentile of 1-hour maximum concentrations was compared to the national standard, while the highest 1-hour concentration was compared to the state standard, reflecting the different regulatory approaches. The national criterion is based on the 98th percentile of daily maximum 1-hour values, whereas the state standard uses the single highest 1-hour concentration. Across all nine scenarios, modeled NO_2 concentrations ranged from 56 to 216 µg/m³, which are well below both National and State 1-hour limits. These findings confirm that increased operations at Rockfield Quarry comply with current air quality regulations and that emissions from the project's blasting activities would not contribute to an exceedance of an applicable Ambient Air Quality Standard (AAQS).

Level of Significance Before Mitigation: Potentially ~~S~~significant.

Mitigation Measure 4.3-2a: *Off Road Engines*

Off-road engines shall be retrofitted or upgraded in order to meet the Tier 4i Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower-hour.

Mitigation Measure 4.3-2b: *Fugitive Dust Control Plan*

A Fugitive Dust Control Plan ~~shall be~~ has been prepared for the proposed project and shall be submitted to the San Joaquin Valley Air Pollution Control District (SJVAPCD)

*for review and approval prior to project implementation. The Applicant will also coordinate with the SJVAPCD for monitoring of this Mitigation Measure 4.3-2b and the approved Fugitive Dust Control Plan. The Fugitive Dust Control Plan ~~shall~~ demonstrate**s** how the following will be implemented and enforced throughout project activities:*

- ~~*Off-road engines shall be retrofitted or upgraded in order to meet the Tier 4 Interim Particulate Emissions standard of 0.008 grams of PM_{10}/horsepower-hour.*~~
- *Unpaved roads shall be controlled at all times by application of chemical dust suppressants or other equivalent methods with a minimum of 90% effectiveness.*
- *Stockpiles shall be controlled at a level of 90% by daily application of water, by covering, or by use of another SJVAPCD approved chemical dust suppressant or other method.*

Level of Significance After Mitigation: Less than significant.

Impact 4.3-3: Expose Sensitive Receptors to Substantial Pollutant Concentrations

Determination of whether project emissions would expose sensitive receptors to substantial pollutant concentrations is a function of assessing potential health risks. Sensitive receptors are facilities that house or attract children, the elderly, people with illnesses, or others who are especially sensitive to the effects of air pollutants. Hospitals, schools, convalescent facilities, and residential areas are examples of sensitive receptors. When evaluating whether a development proposal has the potential to result in localized impacts, the nature of the air pollutant emissions, the proximity between the emitting facility and sensitive receptors, the direction of prevailing winds, and local topography must be considered. Figures 4.3-1, 4.3-2, and 4.3-3 show the locations of non-residential sensitive receptors and model receptors (including residential receptors) modeled in the health risk assessment (Appendix D-1 as updated in Appendix D-3).

As described above in Section 4.3.4.3, "Analysis Methodology," the health risk assessment did evaluate the potential health effects of toxic air contaminants including diesel particulate matter and respirable crystalline silica. The estimated health risks from operation of the proposed project are presented in Table 4.3-24, "Unmitigated Project Health Risk Impacts." The receptors for which health risks are provided represent the locations of highest exposure.

Table 4.3-24
Unmitigated Project Health Risk Impacts

Model Receptor #—Type[1]	Excess Cancer Cases per Million People Exposed (Year 1-70)	Excess Cancer Cases perMillion People Exposed (Year 31-100)	Maximum ChronicHazard Index	Maximum Acute Hazard Index
23 ~~228~~ – Residence (MEIR – Cancer, Chronic)	5.05 ~~281~~	2.17	0.01 ~~0.23~~	0.106 ~~0.51~~
25 ~~227~~—Residence (MEIR—Acute ~~Chronic~~)	0.41 ~~207~~	-0.007	0.003 ~~0.31~~	0.18 ~~0.55~~

Significance Threshold	20	20	1.0	1.0
Threshold Exceeded?	No ~~Yes~~	No	No	No ~~Yes~~

Table Source: Table 30 ~~6~~ of Sespe 2026 ~~2022~~
Table Notes: Receptor locations are shown on Figures 4.3-2 and 4.3-3
1. These receptors represent locations of highest exposure.
MEIR = Maximum Exposed Individual Sensitive Receptor; MEIW = Maximum Exposed Individual Off-Site Worker; PMI = Point of Maximum Impact.

As shown in Table 4.3-24, the proposed project will not ~~may~~ result in exceedance of ~~cancer risk and Maximum Acute Hazard Index~~ any of the health risk significance thresholds, which is a less than ~~potentially~~ significant impact on sensitive receptors. The implementation of Mitigation Measure 4.3-2a and Mitigation Measure 4.3-2b would require the implementation of measures to reduce pollutant emissions from off-road diesel equipment and to reduce dust from on-site roads and soil stockpiles. The estimated health risks from operation of the proposed project with mitigation are presented in Table 4.3-25, "Mitigated Project Health Risk Impacts."

Table 4.3-25
Mitigated Project Health Risk Impacts

Model Receptor #—Type[1]	Excess Cancer Cases per Million People Exposed (Year 1-70)	Excess Cancer Cases per Million People Exposed (Year 31-100)	Maximum Chronic Hazard Index	Maximum Acute Hazard Index

6772 ~~340~~—Fence-line Receptor (PMI-Acute)	N/A	N/A	N/A	0.84 ~~0.93~~
Significance Threshold	20	20	1.0	1.0
Threshold Exceeded?	No	No	No	No

Table Source: Sespe 2026~~2021~~.

Table Notes: Receptor locations are shown on Figures 4.3-2 and 4.3-3.

1. These receptors represent locations of highest exposure.
   MEIR: Maximum Exposed Individual Receptor; MEIW: Maximum Exposed Individual Worker; PMI: Point of Maximum Impact.

As demonstrated by Table 4.3-24, the proposed project without mitigation measures would not result in cancer, chronic, or acute health risks to residences or workers above the respective significance thresholds. Likewise, as demonstrated by Table 4.3-25, with the implementation of Mitigation Measure 4.3-2a and Mitigation Measure 4.3-2b, the proposed project would also not result in cancer, chronic, or acute health risks to residences or workers above the respective significance thresholds. ~~The analysis in Appendix B-1 and B-2 indicates that, with mitigation, each residential receptor experienced reduced cancer risk compared to the baseline. As noted in the "Risk Characterization" subsection of Section 4.3.4.3, "Analysis Methodology," estimates of population-wide cancer burden are assessed only if maximum incremental cancer risk greater than zero for residential receptors.~~ Therefore, ~~cancer burden calculations are not necessary for the proposed project, and~~ the potential of the proposed project to expose sensitive receptors to substantial pollutant concentrations would be less than significant with or without mitigation.

Level of Significance Before Mitigation: Less than ~~Potentially~~ significant.

Mitigation Measures: None required. ~~*Implement Mitigation Measure 4.3-2.*~~

~~**Level of Significance After Mitigation:** Less than significant.~~

Impact 4.3-4: Result in Other Emissions (Such as Those Leading to Odors) Adversely Affecting a Substantial Number of People

The proposed project would involve mining (consisting of excavation and blasting) on the project sites, and the operation of an aggregate plant, ready-mix concrete plant, asphalt plant, and portable recycle plant primarily on the Quarry Site. There are sensitive

receptors located within one mile of the project sites, and therefore odor concerns associated with the asphalt plant cannot be screened out based on distance (Table 4.3-5).

As shown on Figure 4.3-4, "Wind Rose," the predominant wind direction at the project sites is from the northwest. Therefore, the residences to the east and southeast of the Quarry Site would be most likely to experience odors from the proposed project operations.

Due to the subjective nature of odor impacts, the number of variables that can influence the potential for an odor impact and the variety of odor sources, there are no quantitative or formulaic methodologies to determine the presence of a significant odor impact. As summarized in Table 4.3-5, Air District significance thresholds state that a significant impact would occur if the proposed project received "More than one confirmed complaint per year averaged over a three-year period, or three unconfirmed complaints per year averaged over a three-year period."

The asphalt plant on the Quarry Site can be a potential source of odor due to the hydrocarbons that are emitted from asphaltic concrete at elevated temperatures. This primarily occurs when asphalt concrete materials are overheated during the drying process. The fumes are referred to as "blue smoke" and emissions can be limited by minimizing temperatures at which asphalt concrete materials are dried and stored and through asphalt plant design features, such as recycling exhaust back through the combustion chamber. The proposed asphalt plant would include blue smoke controls with an efficiency of 95%, based on manufacturer specifications outlined in "Blue Smoke Control Permitting Parameters" (Blue Smoke Control ND). Blue smoke control collectors are designed for controlling blue smoke that typically comes from in-plant transferring and loading hot mix asphalt. The collectors are high efficiency cartridge mist collectors. Constructed with a steel housing, the filtration is accomplished in cells with each cell having multiple stages; each more efficient than the previous. The first few stages are metal and designed to be cleaned when necessary. Other later stages may be disposable and replaced when they become plugged.

Baseline conditions at the Plant Site include the same potential sources of odor that would be located at the Plant Site during Stage 1 operations, with the exception that there is currently no hot-mix asphalt plant in operation at the Plant Site. However, a hot-mix asphalt plant did operate at the Plant Site until 2009 and, according to air district records, the operator did not receive any complaints about odors in the past (SJVAPCD 2023). The lack of past complaints indicates that existing mining and processing activities at the project sites have not been a substantial source of odor in the community.

Stage 1 operations propose the continuation of past activities at the Plant Site that did not generate complaints, and, given that the proposed Quarry Site asphalt plant would generate fewer odor producing emissions than the past asphalt plant due to its fuel source being natural gas instead of diesel, and due to the use of new technology to capture 95% of blue smoke emissions, it is not anticipated that Stage 1 operations on the Plant Site could generate odors that would adversely affect a substantial number of people.

During Stage 2 operations at the Quarry Site, blue smoke from the asphalt plant would be a new potential source of substantial odor in the area. However, as discussed above, the asphalt plant would utilize blue smoke control collector technology to control blue smoke. Furthermore, the asphalt plant would be centrally located within the Quarry Site, and the nearest residence to the proposed asphalt plant location would be 0.25 miles to the north, with other residences located at further distances. Because odor dissipates with distance, it is unlikely that substantial odors from the asphalt plant would be generated at these distances. In addition, the areas surrounding the Quarry Site are not densely populated, as shown on Figure 4.3-2, and therefore should any perceptible odor occur outside of the Quarry Site, they would not affect substantial numbers of people. Therefore, it is not anticipated that the operation of the asphalt plant on the Quarry Site could generate odors that would adversely affect a substantial number of people.

Although odor impacts from the operation of the asphalt plant on the Plant Site (i.e., prior 2009 asphalt plant) and Quarry Site are not anticipated, the County conservatively concludes that the impact is potentially significant based solely on the Air District's (2015b) *Guidance for Assessing and Mitigating Air Quality Impacts* presumption that significant odor impacts could occur at sensitive receptors within 1 mile of such plants. Therefore, Mitigation Measure 4.3-4 is recommended to further reduce any potential for odor impacts from the proposed operation of the asphalt plant.

The other proposed uses on the Quarry Site, including excavation and blasting, and operation of a diesel-powered aggregate plant, ready-mix concrete plant, and recycle plant, do not involve odor-generating sources aside from direct exhaust diesel emissions. Because exhaust from diesel-powered equipment dissipate rapidly with distance, and because the Quarry Site spans a relatively large area (~~349~~352.4 acres), with diesel-powered stationary equipment located towards the center of the site (shown on Figure 2-8, "Proposed Plant Site Mining Plan," and Figure 2-9, "Proposed Quarry Site Mining Plan," of Chapter 2, "Project Description," of this Draft EIR) and diesel-powered excavation equipment outside of setbacks from the property lines (described above in Section 2.5.2.2, "Quarry Site Mine Plans," of Chapter 2), it is unlikely that diesel odors generated on the Quarry Site would be perceptible outside of the site. It is also unlikely that diesel exhaust odors would reach the nearby sensitive receptors, the nearest of which

is located 275 feet from the Quarry Site. Therefore, the potential for the operation of the diesel-powered equipment on the Quarry Site to generate odors that would adversely affect a substantial number of people would be less than significant.

Upon the completion of mining on the Plant Site and Quarry Site, the project sites would be reclaimed to open space and open water land uses. Stagnant water can lead to odors. As described in the Plant Site Groundwater Conditions Report (Appendix G-3), groundwater would flow through the reclaimed pond on the Plant Site from the northeast to the southwest. As described in the proposed Surface Mining and Reclamation Plan (SMRP) (Appendix B), the continuous flow of groundwater would minimize the potential occurrence of odor due to stagnation. Similarly, the Quarry Site Groundwater Conditions Report (Appendix G-4) indicates that groundwater would flow through the reclaimed lake from the northeast to the southwest. Additionally, the lake would be approximately 100 feet deep. In a lake this deep, in the summer and winter, the water would become stratified into different temperature layers which do not mix. Twice a year, in the fall and spring, the waters at all layers overturns and equalizes the temperatures at all depths. As described in the proposed SMRP (Appendix B), seasonal vertical movement of water and lateral groundwater movement would preclude stagnation, and therefore, odors due to stagnation would not occur. Therefore, potential of the proposed land uses to generate odors would be less than significant.

Level of Significance Before Mitigation: Potentially significant.

Mitigation Measure 4.3-4: *Asphalt Plant Emissions Controls*

The following design features shall be incorporated into project plans to mitigate VOC, SVOC, and/or SO_2 emissions:

1) *The type of asphaltic cement produced by on-site plants affects odorous emissions. Some asphaltic cements have lower VOC/SVOC emissions than others. Therefore, asphaltic cements with lower VOC/SVOC emissions, as approved by the SJVAPCD, shall be used to the extent feasible.*
2) *In accordance with SJVAPCD Rule 4309, the Project will implement "periodic burner tune-ups" that may reduce VOC emissions from the asphalt plant. ~~To reduce VOC emissions, periodic burner tune-ups shall be implemented.~~*
3) *~~Prior to issuance of a building permit for the proposed Asphalt Plant, project plans shall show that~~ ~~m~~Mixing drum vapors will be routed back to the dryer burner. Implementation of this provision shall be verified by ~~Imperial~~ Fresno County Building Inspectors prior to authorizing operation.*

Level of Significance After Mitigation: Less than significant.

APPENDIX D-5
REVISED SECTION 4.8, GREENHOUSE GAS EMISSIONS

4.8—GREENHOUSE GAS EMISSIONS

This section of the Draft EIR documents potential impacts associated with greenhouse gas (GHG) emissions and plans for reducing GHG emissions that would occur as a result of the project.

The information in this section is based on a peer review of Applicant-prepared studies and publicly available sources. The Applicant-prepared studies used are:

- *Air Quality, Health Risk, and Climate Change Impact Assessment, CEMEX Rockfield Modification Project, County of Fresno, California*. Prepared by Sespe Consulting, Inc. [Sespe]. December 4, 2019. (Appendix D-1, "Air Quality, Health Risk, and Climate Change Impact Assessment")
- *Rockfield Air Quality Section Addendum No. 2, Revision 2*. CEMEX Rockfield Modification Project. Prepared by Sespe. March 7, 2022. (Appendix D-2, "Addendum to Air Quality, Health Risk, and Climate Change Impact Assessment")
- *Air Quality, Health Risk, and Climate Change Impact Assessment*. CEMEX Rockfield Modification Project. Prepared by Sespe. May 13, 2026. (Appendix D-3, "2026 Air Quality, Health Risk and Climate Change Impact Assessment")

The *Air Quality, Health Risk, and Climate Change Impact Assessment* (Air Quality Assessment) was peer reviewed by County-retained Taylor Environmental Services, Inc. (Taylor Environmental) in September 2020. The peer review comments are on file with the County. In October of 2020, Sespe prepared *Addendum No. 2 (Version 1) to the Air Quality, Health Risk, and Climate Change Impact Assessment*. Comments were provided by Taylor Environmental and Sespe updated the document in response. In December 2020, Taylor Environmental confirmed that *Addendum No. 2 (Version 1)* adequately addressed the peer review comments. In May 2021, comments on *Addendum No. 2 (Version 1)* were provided by Benchmark Resources. Per Benchmark's comments, Sespe provided an updated document (*Addendum No. 2, Revision 1*) in June 2021. Further comments were provided by Benchmark in February 2022. In response, Sespe revised the addendum again in March 2022, creating *Addendum No. 2, Revision 2*. Benchmark confirmed that the *Rockfield Air Quality Section Addendum No. 2, Revision 2* (Addendum) completed in March 2022 adequately addressed all comments and questions. Public comment on the Draft EIR resulted in the May 13, 2026, technical air quality report (Appendix D-3). Appendix D-3 replaces Appendix D-1 and D-2 in their entirety.

4.8.1 Environmental Setting

This section discusses GHGs and climate change issues to provide a context for the analysis of project impacts associated with GHG emissions regarding the Quarry Site and Plant Site (collectively project sites). It also provides a discussion of the actions and phenomena that contribute to climate change and puts into context global, national, and state emissions of GHGs. The term "climate change" is often used interchangeably with the term "global warming;" however, "climate change" is the preferred term because it helps convey that there are other changes in addition to rising temperatures.

4.8.1.1 The Greenhouse Effect and Greenhouse Gases

GHGs trap heat in the atmosphere. Principal GHGs include carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), ozone ($O_{3)}$, and water vapor (H_2O). Some GHGs, such as CO_2, CH_4, and N_2O, occur naturally and are emitted into the atmosphere through natural processes and human activities. Of these gases, CO_2 and CH_4 are emitted in the greatest quantities from human activities. Man-made GHGs, which have a much greater heat-absorption potential than CO_2, include fluorinated gases, such as hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), sulfur hexafluoride (SF_6), and nitrogen trifluoride (NF_3), are associated with certain industrial products and processes. The major GHGs emitted by human activities remain in the atmosphere for periods ranging from decades to centuries; therefore, it is expected that atmospheric concentrations of GHGs will continue to rise over the next few decades (U.S. Environmental Protection Agency [EPA] 2021).

Human activity has been increasing the concentration of GHGs in the atmosphere (mostly carbon dioxide from combustion of coal, oil, and gas, and a few other trace gases). Human activities are estimated to have caused approximately 1.0°C of global warming above pre-industrial levels, with a likely range of 0.8°C to 1.2°C. Global warming is likely to reach 1.5°C between 2030 and 2052 if it continues to increase at the current rate.

A warming trend from anthropogenic emissions, or human activity, from the pre-industrial period to the present is predicted to persist for centuries to millennia and continue to cause further long-term changes in the climate system, such as sea level rise, with associated impacts. Climate models project robust differences in regional climate characteristics between present-day and global warming of 1.5°C, and between 1.5°C and 2°C. These differences include increases in mean temperature in most land and ocean regions, hot extremes in most inhabited regions, heavy precipitation in several regions, and the probability of drought and precipitation deficits in some regions (Intergovernmental Panel on Climate Change [IPCC] 2018).

The effect each GHG has on climate change is measured as a combination of the volume or mass of its emissions, plus the potential of a gas or aerosol to trap heat in the atmosphere, known as its global warming potential, and is expressed as a function of how much warming would be caused by the same mass of CO_2. Thus, GHG emissions are typically measured in terms of pounds or tons of "carbon dioxide equivalent" (CO_2e).

4.8.1.2 Contributions to Greenhouse Gas Emissions

Global

Anthropogenic GHG emissions worldwide in 2014 totaled approximately 48,892 million metric tons of carbon dioxide equivalent ($MMTCO_2e$) (World Resources Institute 2017). The CO_2 equivalent for a gas is derived by multiplying the tons of the gas by the associated global warming potential, such that MMT CO_2e = (million metric tons of a GHG) x (global warming potential of the GHG). For example, the global warming potential for methane is 21. This means that emissions of 1 million metric tons of methane are equivalent to emissions of 21 million metric tons of CO_2. Six countries—China, the U.S., the Russian Federation, India, Japan, and Brazil—and the European Community accounted for approximately 53 percent of the total 2014 global emissions, approximately 25,831 MMT CO_2e (World Resources Institute 2017).

United States

In 2019, the United States produced 6,558 MMT CO_2e. The primary GHG emitted by human activities in the United States was CO_2, representing approximately 81 percent of total GHG emissions. The largest source of CO_2, and of overall GHG emissions, was fossil-fuel combustion, which accounted for approximately 92 percent of the CO_2 emissions. Since 1990, gross U.S. GHG emissions have increased by 1.8 percent. From year to year, emissions can rise and fall due to changes in the economy, the price of fuel, and other factors. In 2019, U.S. GHG emissions decreased 1.7 percent compared to 2018 levels. The decline was largely driven by the decrease in CO_2 emissions from fossil fuel combustion. The decrease in CO_2 emissions from fossil fuel combustion was a result of a 1 percent decrease in total energy use and reflects a continued shift from coal to less carbon intensive natural gas and renewables in the electric power sector (EPA 2021).

State of California

According to the GHG inventory data compiled by the California Air Resources Board (ARB) for the California Greenhouse Gas Inventory for 2000—2023~~2018~~, California emitted 360.4 ~~425~~ MMT CO_2e of GHGs in 2023, including emission resulting from out-of-state electrical generation (ARB 2025~~2020~~). The largest source of GHG emissions is transportation, which represents tailpipe emissions from on-road vehicles and direct emissions from other off-road mobile sources, followed by industry, electric power

production from both in-state and out-of-state sources, agriculture, and other sources, which include commercial and residential land uses. These primary contributors to California's GHG emissions and their relative contributions in 2023 ~~2018~~ are presented below in Table 4.8-1, "Greenhouse Gas Sources in California."

Table 4.8-1
Greenhouse Gas Sources in California

Source	Percent of Total
Transportation	37.1 ~~39.9~~%
Industrial Uses	18.6 ~~21.0~~%
Electricity Generation [a]	15.9 ~~14.8~~%
Agriculture	8.1 ~~7.7~~%
Residential Uses	7.9 ~~6.1~~%
Commercial Uses	4.1 ~~3.7~~%
Recycling and Waste	2.4 ~~2.1~~%
High global warming potential Substances	5.9 ~~4.8~~%
TOTAL[b]	**100%**

Table Source: ARB **2025** ~~2020~~.
Table Notes:
a. Includes emissions associated with imported electricity
b. Totals may not sum due to rounding.

4.8.1.3 Potential Effects of Human Activity on Climate Change

Globally, climate change has the potential to impact numerous environmental resources though uncertain impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued emissions of GHGs at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. Estimated global warming from human activity is currently increasing at 0.2°C (likely between 0.1°C and 0.3°C) per decade due to past and ongoing emissions (IPCC 2018).

The 2018 *Safeguarding California Plan: 2018 Update* report prepared by the California Natural Resources Agency (CNRA 2018) identified anticipated impacts to California due to climate change through extensive modeling efforts. The IPCC's Working Group II Report, *Climate Change 2007: Impacts, Adaptation and Vulnerability*, also describes anticipated impacts on a global scale. Collectively, the two reports indicate general climate changes in California may include the following events:

- Increasing evaporation;
- Rearrangement of ecosystems as species and ecosystems shift northward and to higher elevations;

- Increased frequency, duration, and intensity of conditions conducive to air pollution formation (particularly ozone);
- Reduced precipitation, changes to precipitation and runoff patterns, reduced snowfall (precipitation occurring as rain instead of snow), earlier snowmelt, decreased snowpack, and increased agricultural demand for water;
- Increased experiences of heat waves;
- Increased growing season and increased growth rates of weeds, insect pests and pathogens;
- Inundation by sea level rise, and exacerbated shoreline erosion; and
- Increased incidents and severity of wildfire events and expansion of the range and increased frequency of pest outbreaks (CNRA 2018 and IPCC 2007).

Changes described above are based on the results of several models prepared under different climatic scenarios; therefore, discrepancies may occur between projections and interpretations.

4.8.2 Regulatory Setting

Climate change has become widely recognized as a threat to the global climate, economy, and population. As a result, the climate change regulatory setting – at the federal, state and local levels– is complex and evolving. This section identifies key legislation, executive orders, and seminal court cases related to climate change that are relevant to the project's GHG emissions.

4.8.2.1 Federal

In 2002, President George W. Bush set a national policy goal of reducing the GHG emission intensity (tons of GHG emissions per million dollars of gross domestic product) of the U.S. economy by 18 percent by 2012. The goal did not establish any binding reduction mandates. Rather, the EPA began to administer a variety of voluntary programs and partnerships with GHG emitters in which the EPA partners with industries that produce and utilize synthetic gases to reduce emissions of particularly potent GHGs.

The Bush Administration's approach to addressing climate change was challenged in *Massachusetts et al. v. Environmental Protection Agency* (2007) 549 U.S. 497. In this decision, the U.S. Supreme Court held that the EPA was authorized by the Clean Air Act to regulate CO_2 emissions from new motor vehicles in the event that such emissions contribute to climate change. The Court did not mandate that the EPA enact regulations to reduce GHG emissions but found that the only instances in which the EPA could avoid taking action were if it found that GHGs do not contribute to climate change or if it offered a

"reasonable explanation" as to why the EPA cannot or will not exercise its discretion to determine whether GHGs contribute to climate change.

On December 7, 2009, the EPA issued an endangerment finding under the Clean Air Act, concluding that GHGs threaten the public health and welfare of current and future generations and that motor vehicles contribute to GHG pollution. These findings provide the basis for adopting new national regulations to mandate GHG emission reductions under the federal Clean Air Act.

The following four sections summarize EPA's recent regulatory activities with respect to various types of GHG sources.

Mandatory Greenhouse Gas Reporting Rule

Congress passed the Consolidated Appropriations Act of 2008 (HR 2764) in December 2007, which includes provisions requiring the establishment of mandatory GHG reporting requirements. On September 22, 2009, EPA issued a final rule to require reporting of GHG emissions from all sectors of the United States economy. Beginning on January 1, 2010, fossil fuel and industrial GHG suppliers, motor vehicle and engine manufacturers, and facilities that emit 25,000 metric tons or more of CO_2e per year are required to report GHG emissions data to EPA annually. The first annual reports for the largest emitting facilities, covering calendar year 2010, were submitted to EPA in 2011. This new program covers approximately 85 percent of the nation's GHG emissions and applies to roughly 10,000 facilities. U.S. EPA's new reporting system provides a better understanding of GHG sources and guides development of the best possible policies and programs to reduce emissions. The data also allows the reporters to track their own emissions, compare them to similar facilities, and aid in identifying cost-effective methods to reduce emissions in the future.

Prevention of Significant Deterioration and Title V Greenhouse Gas Tailoring Rule

The Clean Air Act established the Prevention of Significant Deterioration and Title V programs, which applies to stationary sources (new major sources or major modifications at existing sources for pollutants where the area the source is located is in attainment or unclassifiable with the National Ambient Air Quality Standards [NAAQS]). The Prevention of Significant Deterioration program applicability thresholds are up to 250 tons per year of an attainment pollutant, while the Title V applicability thresholds are up to 100 tons per year of a regulated air pollutant. On June 3, 2010, EPA published a final rule that tailors the applicability criteria that determine whether stationary sources and modification projects become subject to permitting requirements for GHG emissions under the Prevention of Significant Deterioration and Title V programs of the Clean Air Act (tailoring rule). Under the tailoring rule, only the largest sources of GHGs (i.e., those

responsible for 70 percent of the GHG pollution from stationary sources) would be subject to these GHG permitting requirements.

This rule establishes two initial steps of the phase-in and commits the agency to take certain actions on future steps addressing smaller sources, but it excludes certain smaller sources from Prevention of Significant Deterioration and Title V permitting for GHG emissions until at least April 30, 2016. Under Step 1, effective January 2, 2011, only sources currently subject to the Prevention of Significant Deterioration permitting program would be subject to permitting requirements for their GHG emissions. For these projects, only GHG increases of 75,000 tons per year or more of total GHGs, on a CO_2e basis, would need to determine the Best Available Control Technology for their GHG emissions. Similarly for the Title V program, only sources currently subject to the program due to their criteria air pollutant emissions would be subject to Title V requirements for GHGs. During Step 2 (July 1, 2011 to June 30, 2013), Prevention of Significant Deterioration permitting requirements will apply to new or modified facilities that emit GHG emissions of at least 100,000 tons per year CO_2e and modifications at existing facilities that increase GHG emissions by at least 75,000 tons per year CO_2e. Facilities that emit 100,000 tons per year CO_2e or more will be subject to Title V permitting requirements. Under Step 2, Prevention of Significant Deterioration and Title V permitting requirements would apply to sources generating GHG emissions at the specified levels even if they do not exceed permitting thresholds for any other pollutant.

On June 23, 2014, the U.S. Supreme Court issued its decision in *Utility Air Regulatory Group v. E.P.A.*, (2014) 573 U.S. 302. The Court held that EPA may not treat GHGs as an air pollutant for purposes of determining whether a source is a major source required to obtain a Prevention of Significant Deterioration or Title V permit. The Court also held that Prevention of Significant Deterioration permits that are otherwise required (based on emissions of other pollutants) may continue to require limitations on GHG emissions based on the application of Best Available Control Technology.

EPA and NHTSA Joint Rulemaking for Vehicle Standards

In response to the *Massachusetts v. EPA* U.S. Supreme Court ruling discussed above, the Bush Administration issued an Executive Order on May 14, 2007, directing the EPA, the Department of Transportation (DOT), and the Department of Energy (DOE) to establish regulations that reduce GHG emissions from motor vehicles, non-road vehicles, and non-road engines by 2008. On December 19, 2007, the Energy Independence and Security Act of 2007 was signed into law, which requires an increased Corporate Average Fuel Economy (CAFE) standard of 35 miles per gallon for the combined fleet of cars and light trucks by model year 2020. The Energy Independence and Security Act requires establishment of interim standards (from 2011 to 2020) that will be the "maximum

feasible average fuel economy" for each fleet. On October 10, 2008, the National Highway Traffic Safety Administration (NHTSA) released a final environmental impact statement analyzing proposed interim standards for passenger cars and light trucks in model years 2011 through 2015. The NHTSA issued a final rule for model year 2011 on March 30, 2009. On June 30, 2009, the EPA granted a waiver for California, discussed in more detail below, for its GHG emission standards for motor vehicles.

On May 7, 2010, the EPA and the NHTSA issued a final rule regulating fuel efficiency and GHG standards for cars and light-duty trucks for model years 2012–2016. This rule required vehicles to achieve the 250 g CO_2/mile (35 mpg if achieved only by fuel efficiency) standard beginning with the model 2016 fleet. This rule was consistent with the target of the Energy Independence and Security Act of 2007. On May 21, 2010, President Obama issued a memorandum to the Secretaries of Transportation and Energy, and the Administrators of the EPA and the NHTSA calling for establishment of additional standards regarding fuel efficiency and GHG reduction, clean fuels, and advanced vehicle infrastructure. In response to this directive, in 2011, the EPA and the NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks, which applies to vehicles from model year 2014 through 2018. EPA and NHTSA have adopted standards for CO_2 emissions and fuel consumption, respectively, tailored to each of three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to EPA, this program will reduce GHG emissions and fuel consumption for affected vehicles by 6 to 23 percent. Additionally, in 2012, EPA and NHTSA approved GHG and fuel economy standards of 163 g CO_2/mile (i.e., 54.8 mpg if achieved only by fuel efficiency) for light duty vehicles from model year 2017 through 2025. Fuel efficiency standards for heavy-duty pickup trucks and vans built in model years 2030-2035 were finalized by NHTSA in 2024 (NHTSA 2024).

Energy Independence and Security Act of 2007

The Energy Independence and Security Act of 2007 includes the following key measures, which would aid in the reduction of national GHG emissions:

1) Increase the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard requiring fuel producers to use at least 36 billion gallons of biofuel in 2022.
2) Set a target of 35 miles per gallon for the combined fleet of cars and light trucks by Model Year 2020; directs National Highway Traffic Safety Administration to establish a fuel economy program for medium- and heavy-duty trucks and create a separate fuel economy standard for work trucks.

3) Prescribe or revise standards affecting regional efficiency for heating and cooling products, procedures for new or amended standards, energy conservation, energy efficiency labeling for consumer electronic products, residential boiler efficiency, electric motor efficiency, and home appliances.

Additional provisions of the Energy Independence and Security Act address energy savings in government and public institutions, promoting research for alternative energy, additional research in carbon capture, international energy programs, and the creation of "green jobs."

4.8.2.2 State

Legislation, Regulations, and Executive Orders

California's legislation, regulations, and executive orders pertaining to climate change are summarized in Table 4.8-2, "California Climate Change Legislation," Table 4.8-3, "California Climate Change Regulations," and Table 4.8-4, "California Climate Change Executive Orders."

Table 4.8-2
California Climate Change Legislation

Date	Legislation	Description
October 2023	Senate Bill 253 (SB 253) and 261 (SB 261)	SB 253 and SB 261 require public and private companies doing business in California to disclose their carbon emissions and climate-related financial risks. The Climate Corporate Data Accountability Act (SB 253) requires large businesses operating in California to publicly report their greenhouse gas emissions. The Climate-Related Financial Risk Act (SB 261) mandates that companies disclose the threats they face as a result of climate change.
September 16, 2022	Assembly Bill 1279 (AB 1279) (Muratsuchi, Chapter 337, Statutes of 2022)	AB 1279 establishes the policy of the state to achieve carbon neutrality as soon as possible, but no later than 2045; to maintain net negative GHG emissions thereafter; and to ensure that by 2045 statewide anthropogenic GHG emissions are reduced at least 85 percent below 1990 levels. The bill requires ARB to ensure that Scoping Plan updates identify and recommend measures to achieve carbon neutrality, and to identify and implement policies and strategies that enable CO_2 removal solutions and carbon capture, utilization, and storage (CCUS) technologies. The 2022 Climate Change Scoping Plan was adopted by ARB in December 2022 consistent with AB 1279. The Scoping Plan is discussed later in this section.

Date	Legislation	Description
September 16, 2022	Senate Bill 905 (SB 905) (Caballero, Chapter 359, Statutes of 2022)	SB 905 requires ARB to create the Carbon Capture, Removal, Utilization, and Storage Program to evaluate, demonstrate, and regulate CCUS and carbon dioxide removal (CDR) projects and technology.
September 2, 2022	Senate Bill 846 (SB 846) (Dodd, Chapter 239, Statutes of 2022)	SB 846 extends the Diablo Canyon Power Plant's sunset date by up to five additional years for each of its two units and seeks to make the nuclear power plant eligible for federal loans. The bill requires that the California Public Utilities Commission (CPUC) not include and disallow a load-serving entity from including in their adopted resource plan, the energy, capacity, or any attribute from the Diablo Canyon power plant.
September 16, 2022	Senate Bill 1020 (SB 1020) (Laird, Chapter 361, Statutes of 2022)	SB 1020 adds interim renewable energy and zero carbon energy retail sales of electricity targets to California end-use customers set at 90 percent in 2035 and 95 percent in 2040. It accelerates the timeline required to have 100 percent renewable energy and zero carbon energy procured to serve state agencies from the original target year of 2045 to 2035. This bill requires each state agency to individually achieve the 100 percent goal by 2035 with specified requirements. This bill requires the CPUC, California Energy Commission (CEC), and ARB, on or before December 1, 2023, and annually thereafter, to issue a joint reliability progress report that reviews system and local reliability.
September 16, 2022	Senate Bill 1137 (SB 1137) (Gonzales, Chapter 365, Statutes of 2022)	SB 1137 prohibits the development of new oil and gas wells or infrastructure in health protection zones, as defined, except for purposes of public health and safety or other limited exceptions. The bill requires operators of existing oil and gas wells or infrastructure within health protection zones to undertake specified monitoring, public notice, and nuisance requirements. The bill requires ARB to consult and concur with the California Geologic Energy Management Division (CalGEM) on leak detection and repair plans for these facilities, adopt regulations as necessary to implement emission detection system standards, and collaborate with CalGEM on public access to emissions detection data.
September 16, 2022	Senate Bill 1075 (SB 1075) (Skinner, Chapter 363, Statutes of 2022)	SB 1075 requires ARB, by June 1, 2024, to prepare an evaluation that includes: policy recommendations regarding the use of hydrogen.

Date	Legislation	Description
September 16, 2022	Assembly Bill 1757 (AB 1757) (Garcia, Chapter 341, Statutes of 2022)	AB 1757 requires the California Natural Resources Agency (CNRA), in collaboration with ARB, other state agencies, and an expert advisory committee, to determine a range of targets for natural carbon sequestration, and for nature-based climate solutions, that reduce GHG emissions in 2030, 2038, and 2045 by January 1, 2024. These targets must support state goals to achieve carbon neutrality and foster climate adaptation and resilience.
September 30, 2022	Senate Bill 1206 (SB 1206) (Skinner, Chapter 884, Statutes of 2022)	SB 1206 mandates a stepped sales prohibition on newly produced high- global warming potential (GWP) HFCs to transition California's economy toward recycled and reclaimed HFCs for servicing existing HFC-based equipment. Additionally, SB 1206 also requires ARB to develop regulations to increase the adoption of very low-, i.e., GWP < 10, and no-GWP technologies in sectors that currently rely on higher-GWP HFCs.
September 23, 2021	Senate Bill 27 (SB 27) (Skinner, Chapter 237, Statutes of 2021)	SB 27 requires CNRA, in coordination with other state agencies, to establish the Natural and Working Lands Climate Smart Strategy by July 1, 2023. This bill also requires ARB to establish specified CO_2 removal targets for 2030 and beyond as part of its Scoping Plan.
September 23, 2021	Senate Bill 596 (SB 596) (Becker, Chapter 246, Statutes of 2021)	SB 596 requires ARB, by July 1, 2023, to develop a comprehensive strategy for the state's cement sector to achieve net-zero-emissions of GHGs associated with cement used within the state as soon as possible, but no later than December 31, 2045. The bill establishes an interim target of 40 percent below the 2019 average GHG intensity of cement by December 31, 2035.
2019	Senate Bill 576 (SB 576) (Umberg, Chapter 374, Statutes of 2019)	SB 576 mandates that the Ocean Protection Council develop and implement a coastal climate adaptation, infrastructure, and readiness program to improve the climate change resiliency of California's coastal communities, infrastructure, and habitat.
2019	Assembly Bill 65 (AB 65) (Petrie-Norris, Chapter 347, Statutes of 2019)	This bill requires the State Coastal Conservancy, when it allocates any funding appropriated pursuant to the California Drought, Water, Parks, Climate, Coastal Protection, and Outdoor Access For All Act of 2018, to prioritize projects that use natural infrastructure in coastal communities to help adapt to climate change.
2018	Senate Bill 100 (SB 100) (De León, Chapter 312, Statutes of 2018)	SB 100 mandates that the CPUC, CEC, and ARB plan for 60% of total retail sales of electricity in California to come from eligible renewable energy resources and zero- carbon resources by December 31, 2045. This updated RPS preempts the ARB's 33% by 2020 goal mandated by Senate Bill X1-2.

Date	Legislation	Description
2018	Assembly Bill 2127 (AB 2127) (Ting, Chapter 365, Statutes of 2018)	This bill requires the CEC, working with ARB and the CPUC, to prepare and biennially update a statewide assessment of the electric vehicle charging infrastructure needed to support the levels of electric vehicle adoption required for the state to meet its goals of putting at least 5 million zero-emission vehicles on California roads by 2030 and of reducing emissions of GHGs to 40% below 1990 levels by 2030. The bill requires the CEC to regularly seek data and input from stakeholders relating to electric vehicle charging infrastructure.
2018	Senate Bill 30 (SB 30) (Lara, Chapter 614, Statutes of 2018)	This bill requires the Insurance Commissioner to convene a working group to identify, assess, and recommend risk transfer market mechanisms that, among other things, promote investment in natural infrastructure to reduce the risks of climate change related to catastrophic events, create incentives for investment in natural infrastructure to reduce risks to communities, and provide mitigation incentives for private investment in natural lands to lessen exposure and reduce climate risks to public safety, property, utilities, and infrastructure. The bill requires the policies recommended to address specified questions.
July 26, 2017	Assembly Bill 617 (Christina Garcia, Chapter 136, Statutes of 2017)	Companion to Cap-and-Trade Program: Establishes a groundbreaking program to measure and reduce air pollution from mobile and stationary sources at the neighborhood level in the communities most impacted by air pollutants. Requires the ~~Air Resources Board (~~ARB~~)~~ to work closely with local air districts and communities to establish neighborhood air quality monitoring networks and to develop and implement plans to reduce emissions. The focus on community-based air monitoring and emission reductions will provide a national model for enhanced community protection.
July 26, 2017	Assembly Bill 398 (Eduardo Garcia, Chapter 135, Statutes of 2017)	Cap-and-Trade Program Extension: Extends and improves the Cap-and-Trade Program, which will enable the state to meet its 2030 emission reduction goals in the most cost-effective manner. Furthermore, extending the Cap-and-Trade Program will provide billions of dollars in auction proceeds to invest in communities across California.
September 19, 2016	Senate Bill 1383 (Lara, Chapter 395, Statutes of 2016)	Short-lived Climate Pollutants: Establishes statewide reduction targets for short-lived climate pollutants.
September 8, 2016	Assembly Bill 197 (Eduardo Garcia, Chapter 250, Statutes of 2016)	GHG Regulations: Prioritizes direct emission reductions from large stationary sources and mobile sources.

Date	Legislation	Description
September 8, 2016	Senate Bill 32 (Pavley, Chapter 249, Statutes of 2016)	GHG emission reduction target for 2030: Establishes a statewide GHG emission reduction target of 40% below 1990 levels by 2030.
October 8, 2015	Senate Bill 379	Local Climate Adaptation: Requires cities and counties to include climate adaptation and resiliency strategies in the safety elements of their general plans.
October 7, 2015	Senate Bill 350 (De León, Chapter 547, Statutes of 2015)	Clean Energy and Pollution Reduction Act of 2015: Establishes targets to increase retail sales of renewable electricity to 50% by 2030 and double the energy efficiency savings in electricity and natural gas end uses by 2030.
September 21, 2014	Senate Bill 605 (Lara, Chapter 523, Statutes of 2014)	Short-lived climate pollutants: Requires the State ARB to complete a comprehensive strategy to reduce emissions of short-lived climate pollutants by January 1, 2016.
September 21, 2014	Senate Bill 1275, (De León, Chapter 530, Statutes of 2014)	Charge Ahead California Initiative: Establishes a State goal of 1 million zero-emission and near-zero-emission vehicles in service by 2020. Amends the enhanced fleet modernization program to provide a mobility option. Establishes the Charge Ahead California Initiative requiring planning and reporting on vehicle incentive programs and increasing access to and benefits from zero-emission vehicles for disadvantaged, low-income, and moderate-income communities and consumers.
September 21, 2014	Senate Bill 1204 (Lara, Chapter 524, Statutes of 2014)	California Clean Truck, Bus, and Off-Road Vehicle and Equipment Technology Program: Creates the California Clean Truck, Bus, and Off-Road Vehicle and Equipment Technology Program funded by the Greenhouse Gas Reduction Fund for development, demonstration, precommercial pilot, and early commercial deployment of zero- and near-zero emission truck, bus, and off-road vehicle and equipment technologies, with priority given to projects benefiting disadvantaged communities.
September 28, 2013	Assembly Bill 8 (Perea, Chapter 401, Statutes of 2013)	Alternative fuel and vehicle technologies: funding programs: Extends until January 1, 2024, extra fees on vehicle registrations, boat registrations, and tire sales in order to fund the AB 118, Carl Moyer, and AB 923 programs that support the production, distribution, and sale of alternative fuels and vehicle technologies and air emissions reduction efforts. The bill suspends until 2024 ARB's regulation requiring gasoline refiners to provide hydrogen fueling stations and appropriates up to $220 million of AB 118 money to create a hydrogen fueling infrastructure in the State.
September 28, 2013	Assembly Bill 1092 (Levine, Chapter 410, Statutes of 2013)	Building standards: electric vehicle charging infrastructure: Requires the Building Standards Commission to adopt mandatory building standards for the installation of future electric vehicle charging infrastructure for parking spaces in multifamily dwellings and nonresidential development.

Date	Legislation	Description
September 30, 2012	Senate Bill 535 (De León, Chapter 830, Statutes of 2012)	Greenhouse Gas Reduction Fund and Disadvantaged Communities: Requires the California Environmental Protection Agency to identify disadvantaged communities; requires that 25% of all funds allocated pursuant to an investment plan for the use of moneys collected through a Cap-and-Trade ~~p~~Program be allocated to projects that benefit disadvantaged communities and 10% of those 25% be used within disadvantaged communities; and requires the Department of Finance to include a description of how these requirements are fulfilled in an annual report.
September 30, 2012	Assembly Bill 1532 (J. Perez, Chapter 807, Statutes of 2012)	Greenhouse Gas Reduction Fund in the Budget: Requires the Department of Finance to develop and submit to the Legislature an investment plan every three years for the use of the Greenhouse Gas Reduction Fund; requires revenue collected pursuant to a market-based compliance mechanism to be appropriated in the Annual Budget Act; requires the department to report annually to the Legislature on the status of projects funded; and specifies that findings issued by the Governor related to "linkage" as part of a market-base compliance mechanism are not subject to judicial review.
April 12, 2011	Senate Bill X1-2 (Simitian, Chapter 1, Statutes of 2011)	Governor Edmund G. Brown, Jr. signed Senate Bill X1-2 into law to codify the ambitious 33% by 2020 goal. SBX1-2 directs California Public Utilities Commission's Renewable Energy Resources Program to increase the amount of electricity generated from eligible renewable energy resources per year to an amount that equals at least 20% of the total electricity sold to retail customers in California per year by December 31, 2013, 25% by December 31, 2016, and 33% by December 31, 2020. The new RPS goals apply to all electricity retailers in the State including publicly owned utilities (POUs), investor-owned utilities, electricity service providers, and community choice aggregators. This new RPS preempts the ARB's 33% Renewable Electricity Standard.
September 29, 2011	Assembly Bill 1504 (Skinner, Chapter 534, Statutes of 2010)	Forest resources and carbon sequestration. Bill requires Department of Forestry and Fire Protection and ARB to assess the capacity of its forest and rangeland regulations to meet or exceed the State's GHG goals, pursuant to AB 32.
September 30, 2008	Senate Bill 375 (Steinberg, Chapter 728, Statutes of 2008)	Sustainable Communities & Climate Protection Act of 2008 requires ARB to develop regional GHG emission reduction targets for passenger vehicles. ARB is to establish targets for 2020 and 2035 for each region covered by one of the State's 18 metropolitan planning organizations.

Date	Legislation	Description
October 14, 2007	Assembly Bill 118 (Núñez, Chapter 750, Statutes of 2007)	Alternative Fuels and Vehicles Technologies: The bill would create the Alternative and Renewable Fuel and Vehicle Technology Program, to be administered by the Energy Commission, to provide funding to public projects to develop and deploy innovative technologies that transform California's fuel and vehicle types to help attain the State's climate change policies.
August 24, 2007	Senate Bill 97 (Dutton, Chapter 187, Statutes of 2007)	Directs Governor's Office of Planning and Research (OPR) to develop CEQA guidelines "for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions."
July 18, 2006	Assembly Bill 1803 (Committee on Budget, Chapter 77, Statutes of 2006)	Greenhouse gas inventory transferred to ARB from the Energy Commission.
August 21, 2006	Senate Bill 1 (Murray, Chapter 132, Statutes of 2006)	California's Million Solar Roofs plan is enhanced by PUC and CEC's adoption of the California Solar Initiative. SB1 directs PUC and CEC to expand this program to more customers and requiring the State's municipal utilities to create their own solar rebate programs. This bill would require beginning January 1, 2011, a seller of new homes to offer the option of a solar energy system to all customers negotiating to purchase a new home constructed on land meeting certain criteria and to disclose certain information.
September 26, 2006	Senate Bill 107 (Simitian, Chapter 464, Statutes of 2006)	SB 107 directs California Public Utilities Commission's Renewable Energy Resources Program to increase the amount of renewable electricity (Renewable Portfolio Standard) generated per year, from 17% to an amount that equals at least 20% of the total electricity sold to retail customers in California per year by December 31, 2010.
September 27, 2006	Assembly Bill 32 (Núñez, Chapter 488, Statutes of 2006)	California Global Warming Solutions Act of 2006. This bill would require ARB to adopt a statewide GHG emissions limit equivalent to the statewide GHG emissions levels in 1990 to be achieved by 2020. ARB shall adopt regulations to require the reporting and verification of statewide GHG emissions and to monitor and enforce compliance with this program. AB 32 directs Climate Action Team established by the Governor to coordinate the efforts set forth under Executive Order S-3-05 to continue its role in coordinating overall climate policy.
September 12, 2002	Senate Bill 1078 (Sher, Chapter 516, Statutes of 2002)	This bill establishes the California Renewables Portfolio Standard Program, which requires electric utilities and other entities under the jurisdiction of the California Public Utilities Commission to meet 20% of their renewable power by December 31, 2017, for the purposes of increasing the diversity, reliability, public health and environmental benefits of the energy mix.

Date	Legislation	Description
September 7, 2002	Senate Bill 812 (Sher, Chapter 423, Statutes of 2002)	This bill added forest management practices to the California Climate Action Registry members' reportable emissions actions and directed the Registry to adopt forestry procedures and protocols to monitor, estimate, calculate, report and certify carbon stores and carbon dioxide emissions that resulted from the conservation-based management of forests in California.
July 22, 2002	Assembly Bill 1493 (Pavley, Chapter 200, Statutes of 2002)	The "Pavley" bill requires the registry, in consultation with ARB, to adopt procedures and protocols for the reporting and certification of reductions in greenhouse gas emissions from mobile sources for use by the ARB in granting the emission reduction credits. This bill requires the ARB to develop and adopt, by January 1, 2005, regulations that achieve the maximum feasible reduction of greenhouse gases emitted by passenger vehicles and light-duty trucks.
October 11, 2001	Senate Bill 527 (Sher, Chapter 769, Statutes of 2001)	This bill revises the functions and duties of the California Climate Action Registry and requires the Registry, in coordination with CEC to adopt third-party verification metrics, developing GHG emissions protocols and qualifying third- party organizations to provide technical assistance and certification of emissions baselines and inventories. SB 527 amended SB 1771 to emphasize third-party verification.
September 30, 2000	Senate Bill 1771 (Sher, Chapter 1018, Statutes of 2000)	SB 1771 establishes the creation of the non-profit organization, the California Climate Action Registry and specifies functions and responsibilities to develop a process to identify and qualify third-party organizations approved to provide technical assistance and advice in monitoring GHG emissions and setting GHG emissions baselines in coordination with CEC. Also, the bill directs the Registry to enable participating entities to voluntarily record their annual GHG emissions inventories. Also, SB 1771 directs CEC to update the State's GHG inventory from an existing 1998 report and continuing to update it every five years.
September 28, 1988	Assembly Bill 4420 (Sher, Chapter 1506, Statutes of 1988)	The California Energy Commission (CEC) was statutorily directed to prepare and maintain the inventory of GHG emissions and to study the effects of GHGs and the climate change impacts on the State's energy supply and demand, economy, environment, agriculture, and water supplies. The study also required recommendations for avoiding, reducing, and addressing related impacts - and required the CEC to coordinate the study and any research with federal, state, academic, and industry research projects.

Table Source: ~~C~~ARB 2022

Table 4.8-3
California Climate Change Regulations

Regulations	Description
General Plan Guidelines Update	The update addresses GHG emissions in CEQA or a Climate Action Plan. The update contains a new chapter on Climate Change. The Safety Element requires adaptation.
Greenhouse Gas Reduction Fund	State program allocating proceeds from Cap-and-Trade auctions to support investments and projects that reduce greenhouse gas emissions throughout California.
Cap & Trade Amendments	The September 2016 amendments to the ~~c~~Cap-and-~~t~~Trade regulation mandated by SB 32 included: • Emission caps for the post-2020 program. • Post-2020 continuation of the allowance price containment reserve linking with Ontario's ~~c~~Cap-and-~~t~~Trade ~~p~~Program. • Compliance with the federal Clean Power Plan Modifications to allowance allocation. The July 2017 amendments to the ~~c~~Cap-and-~~t~~Trade regulation mandated by AB 398 included: • Extension of the ~~c~~Cap-and-~~t~~Trade ~~p~~Program to 2030. • Design changes to the post-2020 carbon market, including a price ceiling, price containment points, additional limits to the number and location of offset credits, and specifics on industry assistance factors. In January 2018 the ~~c~~Cap-and-~~t~~Trade ~~p~~Program was linked with Ontario. The December 2018 amendments to the ~~c~~Cap-and-~~t~~Trade regulation included: • Streamline program requirements and improve program efficiency, including the Compliance Offset Program • De-link from Ontario's ~~c~~Cap-and-~~t~~Trade ~~p~~Program • Reduce offset usage limits • Establish two price tiers and a price ceiling
Low Carbon Fuel Standard (LCFS)	The Low Carbon Fuel Standards (LCFS), approved by ARB on April 23, 2009, are designed to reduce the carbon intensity (CI) of transportation fuels used in California by at least 10% by the year 2020. The regulation entered into full effect on April 15, 2010. In September 2015, the ARB re-adopted the Low Carbon Fuel Standard (LCFS), to settle issues arising from lawsuits. The requirement is still a 10% reduction in the carbon intensity per year of transportation fuels. Amendments were approved in 2011, 2015, 2018, 2019, 2024, 2025 and 2026.
Cap & Trade Offset Protocols	The ARB has adopted six protocols for offset compliance projects. In addition to the original four protocols adopted in 2011, ARB adopted the Mine Methane Capture (MMC) Projects Compliance Offset Protocol in April 2014 and Rice Cultivation Project Compliance Offset Protocol in June 2015.
Cap & Trade Link with Quebec	California linked its ~~c~~Cap-and-~~t~~Trade ~~p~~Program with Quebec's program in January 2014. Linkage allows for the use of compliance instruments from Quebec's GHG emission trading system to meet compliance obligations pursuant to the California Cap-and-Trade Regulation, and the reciprocal approval of compliance instruments issued by California to meet compliance obligations in the external trading program.

Regulations	Description
Building Energy Efficiency Standards	The Energy Commission's 2025 Building Energy Efficiency Standards, which took effect on January 1, 2023, are estimated to reduce 10 million metric tons of GHGs over the next 30 years. The 2022 Energy Code focuses on encouraging electric heat pump technology for space and water heating; establishing electric-ready requirements for single-family homes; expanding solar photovoltaic (PV) system and battery storage standards; and strengthening ventilation standards to improve indoor air quality.
Advanced Clean Cars Standard	The Advanced Clean Cars Program represents a new approach to passenger vehicles – cars and light trucks -- by combining the control of smog- causing pollutants and GHG emissions into a single coordinated package of standards known as the Low Emission Vehicle (LEV) criteria and GHG regulations. The new approach also includes efforts under the Zero-EmissionVehicle (ZEV) Program to support and accelerate the numbers of plug-in hybrids and zero-emission vehicles in California. Advanced Clean Cars I was adopted in 2012, and Advanced Clean Cars II was adopted in 2022.
Appliance Efficiency Regulations	The Energy Commission's Appliance Efficiency Regulations (Title 20), combined with federal standards, set minimum efficiency levels for energy and water consumption in products, such as consumer electronics, household appliances, and plumbing equipment. The most recent amendments to the Appliance Efficiency Regulations were adopted December 9, 2020, and became effective March 16, 2021.
Cap & Trade Rulemaking Activities	A proposed California cap on GHG emissions and ~~a~~ market-based compliance mechanisms, including compliance offset protocols. OAL approved the rulemaking and filed it with the Secretary of State on December 13, 2011. The regulation ~~will become~~ became effective on January 1, 2012.
~~Low Carbon Fuel Standards (LCFS)~~	~~The Low Carbon Fuel Standards (LCFS), approved by ARB in April 2009, are designed to reduce the carbon intensity (CI) of transportation fuels used in California by at least 10% by the year 2020. CARB adopted amendments to the LCFS regulations in 2011, 2015, 2018, and 2019.~~
Renewable Portfolio Standard	Established in 2002, California's Renewables Portfolio Standard (RPS) requires electricity providers to ensure that renewable energy constitutes a specified minimum portion of their electric load. The current RPS requires investor-owned electric utilities to serve 60% of their electric load by 2030 with renewable energy.
Mandatory Commercial Recycling	This regulation addresses recycling requirements for businesses that generate 4 or more cubic yards of commercial solid waste per week and multifamily residential dwellings with 5 or more units, regardless of the amount of waste generated; local jurisdiction requirements for education, outreach, monitoring and reporting; and CalAsphalt and concrete recycling review. The regulations were approved on May 7, 2012, and were amended by SB 1018 on June 27, 2012.

Table 4.8-4
California Climate Change Executive Orders

Date	Executive Order	Description
May 19, 2023	N-8-23	EO-N-8-23 creates an Infrastructure Strike Team to work across state agencies to maximize federal and ~~s~~State funding opportunities for California innovation and infrastructure projects. EO-N-8-23 acknowledges that the state's electric grid must be modernized in order to meet its climate change goals.
October 7, 2020	N-82-20	Governor Newsom signed Executive Order N-82-20 in October 2020 to combat the climate and biodiversity crises by setting a statewide goal to conserve at least 30 percent of California's land and coastal waters by 2030. The Executive Order also instructed the CNRA, in consultation with other state agencies, to develop a Natural and Working Lands Climate Smart Strategy that serves as a framework to advance the state's carbon neutrality goal and build climate resilience. In addition to setting a statewide conservation goal, the Executive Order directed ~~C~~ARB to update the target for natural and working lands in support of carbon neutrality as part of this Scoping Plan, and to take into consideration the Natural and Working Lands Climate Smart Strategy.
September 23, 2020	N-79-20	EO-N-79-20 calls for elimination of new internal combustion passenger vehicles by 2035 and new internal combustion medium and heavy-duty trucks by 2045.
September 20, 2019	N-19-19	EO-N-19-19 requires various state agencies to leverage their existing investments, spending, or state-owned building to further California's climate goals.
September 10, 2018	B-55-18	Governor Brown signed Executive Order B-55-18 in September 2018 to establish a statewide goal to achieve carbon neutrality as soon as possible, and no later than 2045, and to achieve and maintain net negative emissions thereafter.
July 17, 2015	B- 32-15	EO-B-32-15 directs state agencies to develop an integrated freight action plan by July 2016. Among other things, the plan calls for targets for transportation efficiency and a transition to near-zero-emission technologies.
April 29, 2015	B-30-15	EO-B-30-15 sets a GHG emissions target for 2030 at 40% below 1990 levels.
April 25, 2012	B-18-12	EO-B-18-12 calls for significant reductions in state agencies' energy purchases and GHG emissions. The Executive Order included a Green Building Action Plan, which provided additional details and specific requirements for the implementation of the Executive Order
March 23, 2012	B-16-12	EO-B-16-12 orders state agencies to facilitate the rapid commercialization of zero- emission vehicles (ZEVs). The Executive Order sets a target for the number of 1.5 million ZEVs in California by 2025. Also, the Executive Order sets as a target for 2050 a reduction of GHG emissions from the transportation sector equaling 80% less than 1990 levels.

Date	Executive Order	Description
November 14, 2008	S-13-08	EO-S-13-08 directs state agencies to plan for sea level rise and climate impacts through coordination of the State Climate Adaptation Strategy.
January 18, 2007	S-01-07	EO-S-01-07 establishes the 2020 target and Low Carbon Fuel Standard. The EO directs the Secretary of Cal/EPA as coordinator of 2020 target activities and requires the Secretary to report back to the Governor and Legislature biannually on progress toward meeting the 2020 target.
October 18, 2006	S-20-06	EO-S-20-06 establishes responsibilities and roles of the Secretary of Cal/EPA and state agencies in climate change.
April 25, 2006	S-06-06	EO-S-06-06 directs Secretary of Cal/EPA to participate in the Bio-Energy Interagency Working Group and addresses biofuels and bioenergy from renewable resources.
June 1, 2005	S-03-05	EO-S-3-05 establishes GHG emission reduction targets, creates the Climate Action Team and directs the Secretary of Cal/EPA to coordinate efforts with meeting the targets with the heads of other state agencies. The EO requires the Secretary to report back to the Governor and Legislature biannually on progress toward meeting the GHG targets, GHG impacts to California, Mitigation and Adaptation Plans.
December 14, 2004	S-20-04	EO-S-20-04 (Green Buildings) directs state agencies to reduce energy use in state owned buildings by 20% by 2015 and increase energy efficiency.

Table Source: ~~Appendix D-1~~ Sespe 2026, Appendix D-3.

Climate Change Scoping Plan

AB 32 requires ARB to reduce statewide GHG emissions to 1990 levels by 2020. As part of this legislation, ARB was required to prepare and update every five years a "scoping plan" that demonstrates how the state will achieve this goal. The first Scoping Plan was adopted in 2011, and in it, local governments were described as "essential partners" in meeting the statewide goal, recommending a near-term GHG reduction level of 15 percent below 2005 to 2008 levels (depending on when a full emissions inventory is available) by 2020.

The first update to the Scoping Plan was released in 2013 and provided guidance to achieve a long-term target for the transportation sector of 80 percent below 1990 levels by 2050 as mandated by EO B-16-12. ARB adopted the 2017 Climate Change Scoping Plan in December 2017. The 2017 Scoping Plan provides economically viable and technologically feasible strategies for achieving the 2030 target established by EO B-30-15 and codified in SB 32 (40 percent below 1990 levels by 2030), and substantially advance toward the 2050 climate goal to reduce GHG emissions by 80 percent below 1990 levels.

To achieve the targets established by AB 1279, ARB adopted its most recent Climate Change Scoping Plan (2022 Scoping Plan) in December 2022. The 2022 Scoping Plan lays out a path to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85 percent below 1990 levels no later than 2045. The 2022 Scoping Plan also evaluates the state's progress toward meeting the near-term target of 40 percent below 1990 levels by 2030. The 2022 Scoping Plan builds on the policies and programs of the 2017 Scoping Plan and presents new strategies to accelerate achievement of the 2030 target as needed to meet the more ambitious long-term targets of AB 1279. These new strategies focus on zero-emission transportation; phasing out use of fossil gas use for heating homes and buildings; reducing chemical and refrigerants with high GWP; providing communities with sustainable options for walking, biking, and public transit; displacement of fossil-fuel fired electrical generation through use of renewable energy alternatives (e.g., solar arrays and wind turbines); and scaling up new options such as green hydrogen.

The 2022 Scoping Plan aims to rapidly move towards zero-emission transportation (i.e., electrifying cars, buses, trains, and trucks), which constitutes California's single largest source of GHGs. The regulations that impact the transportation sector are adopted and enforced by ~~C~~ARB on vehicle manufacturers and are outside the jurisdiction and control of local governments. The 2022 Scoping Plan accelerates development of new regulations as well as amendments to strengthen regulations and programs already in place.

Included in the 2022 Scoping Plan is a set of Local Actions (2022 Scoping Plan Appendix D) aimed at providing local jurisdictions with recommendations to reduce GHGs and assist the state in meeting the ambitious targets set forth in the 2022 Scoping Plan. This set of Local Actions is not regulatory, is not exhaustive, and does not include everything local governments can implement to support the State's climate goals. It focuses primarily on climate action plans (CAPs) and local authority over new residential development. It includes Section 3 on evaluating plan-level and project-level alignment with the state's Climate Goals in CEQA GHG analyses. In this section, ARB identifies several recommendations and strategies that should be considered for new development in order to determine consistency with the 2022 Scoping Plan. ARB specifically states that Section 3 of Appendix D, which discusses land use plans and development projects, does not address land uses other than residential and mixed-use residential such as industrial. However, ARB plans to explore new approaches for other land use types in the future.

Cap-and Trade Program

Central to achieving the GHG reduction targets described in the previous section is the ~~c~~Cap-and-~~t~~Trade ~~p~~Program, which was introduced by ARB in 2012. Cap-and-~~t~~Trade is a market-based emissions trading system that establishes a declining cap on emissions over

time and distributes tradeable credits under the cap. If an entity in California creates GHG emissions as part of its activities – for example, electricity generation, manufacturing, or fuel refining – it must comply with the program by either purchasing credits (or allowances) or offsets in an amount equal to that level of emissions. An allowance is a tradable credit to emit up to one MT CO_2e while an offset is a tradable compliance instrument that represents a GHG reduction or GHG removal enhancement of one MT CO_2e. Each year, the cap declines, and the number of overall credits (and therefore emissions) decreases accordingly. The use of offsets is limited to a percentage of the entity's compliance obligation, a limit that also declines over time. The ~~c~~Cap-and-~~t~~Trade ~~p~~Program applies economy-wide, setting a limit on approximately 85 percent of California GHG emissions.

The ~~c~~Cap-and-~~t~~Trade ~~p~~Program generates revenue when the allowances to emit pollution are auctioned. Some of the revenue is returned directly to electricity ratepayers, and the rest is dedicated to reducing GHG emissions by making Legislatively directed investments in California with an emphasis on programs or projects that benefit disadvantaged and low-income communities (Berkeley Law).

Table 4.8-5, "Applicability of Scoping Plan Climate Change Policies and Measures," provides a high-level summary of the climate change programs, policies and measures discussed in the 2020 Scoping Plan, including, but not limited to, those identified specifically to achieve the 2030 target, and indicates their applicability to the proposed project.

Table 4.8-5
Applicability of Scoping Plan Climate Change Policies and Measures

Recommended Action	Applies to Proposed Project?
Implement SB 350 by 2030: • Increase the Renewables Portfolio Standard to 50 percent of retail sales by 2030 and ensure grid reliability. • Establish annual targets for statewide energy efficiency savings and demand reduction that will achieve a cumulative doubling of statewide energy efficiency savings in electricity and natural gas end uses by 2030. • Reduce GHG emissions in the electricity sector through the implementation of the above measures and other actions as modeled in IRPs to meet GHG emissions reductions planning targets in the IRP process. Load-serving entities and publicly- owned utilities meet GHG emissions	No, the project will purchase grid electricity, not administrate it.

Recommended Action	Applies to Proposed Project?
reductions planning targets through a combination of measures as described in IRPs.	
Implement Mobile Source Strategy (Cleaner Technology and Fuels): • At least 1.5 million zero emission and plug-in hybrid light-duty electric vehicles by 2025. • At least 4.2 million zero emission and plug-in hybrid light-duty electric vehicles by 2030. • Further increase GHG stringency on all light-duty vehicles beyond existing Advanced Clean Cars regulations. • Medium- and heavy-duty GHG Phase 2. • Innovative Clean Transit: Transition to a suite of to-be-determined innovative clean transit options. Assumed 20 percent of new urban buses purchased beginning in 2018 will be zero emission buses with the penetration of zero-emission technology ramped up to 100 percent of new sales in 2030. Also, new natural gas buses, starting in 2018, and diesel buses, starting in 2020, meet the optional heavy-duty low-NO_x standard. • Last Mile Delivery: New regulation that would result in the use of low NO_x or cleaner engines and the deployment of increasing numbers of zero-emission trucks primarily for class 3-7 last mile delivery trucks in California. This measure assumes ZEVs comprise 2.5 percent of new Class 3–7 truck sales in local fleets starting in 2020, increasing to 10 percent in 2025 and remaining flat through 2030. • Further reduce VMT through continued implementation of SB 375 and regional Sustainable Communities Strategies; forthcoming statewide implementation of SB 743; and potential additional VMT reduction strategies not specified in the Mobile Source Strategy but included in the document "Potential VMT Reduction Strategies for Discussion."	No, project vehicles are heavy-heavy duty and were not subject to heavy- duty GHG Phase 1 regulations. Thus, they would not be subject to these measures.
Implement SB 100 which increases the Renewable Portfolio Standard (RPS) to 60 percent by 2030, with new interim targets of 44 percent by 2024 and 52 percent by 2027 as well. The bill further requires that all of the ~~s~~State's electricity come from carbon-free resources (not only PRS-eligible ones) by 2045.	No, the project would purchase grid electricity, which would comply with RPS targets.

Recommended Action	Applies to Proposed Project?
Increase stringency of SB 375 Sustainable Communities Strategy: • VMT per capita reduced 25 percent below 2019 levels by 2030, and 30 percent below 2019 levels by 2045	No, the project does not affect SB 375 targets. As discussed in DEIR Section 4.17, "Transportation," of this Draft EIR, although the proposed project appears to generate a high number of VMT, the actual effect of the project on a regional basis is to reduce VMT as compared to the condition in which the project does not exist. With no project and the same demand for aggregate, aggregate users within the region served by the project would need to travel farther on average to obtain aggregate.
Implement California Sustainable Freight Action Plan: • Improve freight system efficiency. • Deploy over 100,000 freight vehicles and equipment capable of zero emission operation and maximize both zero and near-zero emission freight vehicles and equipment powered by renewable energy by 2030.	No, the project does not affect whether Freight Action Plan can be implemented.
Adopt a Low Carbon Fuel Standard with a CI reduction of 18 percent.	No, the project does not affect ARB's ability to adopt standards.
Implement the Short-Lived Climate Pollutant (SLCP) Strategy by 2030: • 40% reduction in methane and hydrofluorocarbon emissions below 2013 levels • 50% reduction in black carbon emissions below 2013 levels • 75% reduction of organic waste disposal from 2014 levels by 2025, including recovery of at least 20% of edible food for human consumption	No, the project does not affect whether SLCP strategy can be implemented.
Implement AB 398 which extends the post-2020 Cap-and-Trade Program and doubles its stringency with an annual cap decline of 4% per year and an offset limit decline from 8% to 4%, from 2021 to 2030.	No, the project does not affect ~~C~~ARB's ability to implement Cap-and-Trade.
Implement the California 2030 Natural and Working Lands Climate Change Implementation Plan developed in response to SB 859: • Expand the use of natural and working lands for climate mitigation and adaptation by integrating climate goals into state-funded natural and working land conservation, restoration, and management programs. • Significantly increase and improve conservation, restoration, and management of California's natural and working lands, through state programs and other means, to enhance their	No, the project does not affect implementation of the Natural and Working Lands Program.

Recommended Action	Applies to Proposed Project?
resilience to worsening climate impacts, sequester carbon, and reduce GHGs.	
Implement the 2018 Forest Carbon Plan: • Significantly increase the pace and scale of forest and watershed improvements on nonfederal forest lands through incentives and other mechanisms. • Support Federal goals and actions to improve forest and watershed health and resiliency on Federal lands. • Prevent forest land conversions through easements and acquisitions, as well as land use planning. • Innovate solutions for wood products and biomass utilization to support ongoing sustainable forest management activities. • Protect and enhance the carbon sequestration potential and related benefits of urban forests. • Support key research, data management, and accountability needs.	No, the project does not affect the ability to implement the Forest Carbon Plan.
Identify and expand funding and financing mechanisms to support GHG reductions across all sectors.	No, the project does not affect whether ARB can identify and expand funding.

Table Sources: ~~C~~ARB 2022; Sespe Consulting Inc. ~~2019 (Appendix D-1)~~ 2026, Appendix D-3.

CEQA Statutes and Guidelines Amendments

Pursuant to SB 97, Office of Planning and Research (OPR) developed proposed amendments to the CEQA Guidelines (CEQA Amendments) for the feasible mitigation of GHG emissions and their effects, which it first submitted to the Secretary of the CNRA on April 13, 2009. After a public review and comment period, on December 30, 2009, the CNRA adopted the CEQA Amendments, which became effective on March 18, 2010.

The CEQA Amendments for Greenhouse Gas Emissions state in Section 15064.4(a) that lead agencies should "make a good faith effort, to the extent possible on scientific and factual data, to describe, calculate or estimate" GHG emissions resulting from a project. The CEQA Amendments note that an agency may identify emissions by either selecting a "model or methodology" to quantify the emissions or by relying on "qualitative analysis or other performance-based standards." Section 15064.4(b) provides that the lead agency should consider the following when assessing the significance of impacts from GHG emissions on the environment:

- The extent a project may increase or reduce GHG emissions as compared to the environmental setting.

- Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.
- The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of GHG emissions.

In addition, Section 15064.7(c) of the CEQA Amendments specifies that "[w]hen adopting thresholds of significance, a lead agency may consider thresholds of significance previously adopted or recommended by other public agencies, or recommended by experts, provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence." Similarly, the revision to CEQA Appendix G, "Environmental Checklist Form," which is often used as a basis for lead agencies' selection of significance thresholds, does not prescribe specific thresholds. Rather, Appendix G asks whether the project would conflict with a plan, policy or regulation adopted to reduce GHG emissions; or generate GHG emissions that would significantly affect the environment, indicating that the determination of what is a significant effect on the environment should be left to the lead agency.

Accordingly, the CEQA Amendments do not prescribe specific methodologies for performing an assessment, do not establish specific thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Amendments emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA.

The CEQA Amendments indicate that lead agencies should consider all feasible means, supported by substantial evidence and subject to monitoring and reporting, of mitigating the significant effects of GHG emissions. As pertinent to the project, these potential mitigation measures, set forth in Section 15126.4(c), may include (1) measures in an existing plan or mitigation program for the reduction of GHG emissions that are required as part of the lead agency's decision; (2) reductions in GHG emissions resulting from a project through implementation of project design features; (3) off-site measures, including offsets, to mitigate a project's emissions; and (4) carbon sequestration measures.

Among other things, the CNRA noted in its Public Notice for these changes that impacts of GHG emissions should focus on the cumulative impact on climate change. The Public Notice states:

> *While the Proposed Amendments do not foreclose the possibility that a single project may result in greenhouse gas emissions with a direct impact on the environment, the evidence before [CNRA] indicates that in most cases, the impact will be cumulative. Therefore, the Proposed Amendments emphasize that the analysis of greenhouse gas emissions should center on whether a project's incremental contribution of greenhouse gas emissions is cumulatively considerable.*

Thus, the CEQA Amendments continue to make clear that the significance of GHG emissions is most appropriately considered on a cumulative level.

4.8.2.3 Local

San Joaquin Valley Air Pollution Control District

San Joaquin Valley Air Pollution Control District (Air District) GHG policy is established in the *District Policy Addressing GHG Emission Impacts for Stationary Source Projects Under CEQA When Serving as the Lead Agency* (Air District 2009). The document outlines a methodology to determine if a project meets the Best Performance Standards for GHG emissions. The document states, "[p]rojects implementing [Best Performance Standards] would be determined to have a less than significant individual and cumulative impact on global climate change and would not require project specific quantification of GHG emissions". When serving as the lead agency, the Air District requires stationary sources that do not comply with Best Performance Standards to demonstrate GHG reductions of 29 percent as compared to Business-as-Usual. Business-as-Usual is defined by the Air District as "The emissions for a type of equipment or operation within an identified class and category projected for the year 2020, assuming no change in GHG emissions per unit of activity as established for the baseline period".

This policy, however, does not apply to the proposed project for a number of reasons. In addition to the fact that Fresno County is the lead agency for this project, ARB regulations adopted in 2010 established a ~~c~~Cap-and-~~t~~Trade ~~p~~Program for the largest sources of GHG emissions in the state. Included in the ~~c~~Cap-and-~~t~~Trade Program are electrical power and fuels that are utilized by the proposed project.

In practice, projects in the SJVAPCD sometimes use the South Coast Air Quality Management District (SCAQMD) 10,000 $MTCO_2e$/yr threshold. For example, the recent environmental impact report for the McKay Point Reservoir Project in Tulare County (Tulare Irrigation District, 2024) compares project emissions to the threshold of 10,000 $MTCO_2e$/yr, consistent with SCAQMD policy. Under CEQA, Fresno County as the lead agency has similarly decided to use the SCAQMD 10,000 $MTCO_2e$/yr as the threshold of significance for GHG for the project. Such lead agency threshold choice is permissible under CEQA, *Cuyama Valley v. County of Santa Barbara 213 Cal. App 4th 1059 (2013).*

Fresno County General Plan

In February 2024, Fresno County updated its General Plan, where the Fresno County Climate Change Vulnerability Assessment identified and mapped communities most at risk to climate change hazards in unincorporated Fresno County (see Figure 19 Social Sensitivity in Fresno County in Appendix C [to the General Plan]).

The *Fresno County General Plan* (Fresno County 2024) Health and Safety Element includes the following policies related to GHG emissions and climate change that apply to the proposed project:

Goal HS-C: To minimize the risk of loss of life, injury, and damage resulting from flood hazards.

Policy HS-C.6: The County shall encourage, as applicable, expansion of stormwater and flood protection infrastructure capacity in order to accommodate changes in precipitation and extreme weather events including establishment or expansion of recharge basins.

Goal HS-G: To improve the sustainability and resiliency of the County through continued efforts to reduce the causes of and ad~~o~~apt to climate change.

Policy HS-G.1: The County shall support plans, standards, regulation, incentives, and investments based on sound science to reduce the impacts of climate change.

Policy HS-G.3: The County shall continue to collaborate with Federal, State, regional, and local agencies, business and property owners, and residents to reduce generation of GHG and other emissions that contribute to climate change and effectively implement climate change adaption policies and programs.

Policy HS-G.9: The County shall identify and protect locations where native species may shift or lose habitat due to climate change impacts (e.g., extreme heat, wildfire and landslides) and consider ecosystem shift when updating conservation and land use plans.

Policy HS-G.13: The County shall undertake a countywide Climate Action Plan (CAP) within two years of the adoption of General Plan Amendment No. 529 (General Plan Review) with the objective of meeting a GHG emissions reduction trajectory consistent with State law (currently codified in Health and Safety Code Section 38566 et seq. [Senate Bill 32] and Executive Order B-55-18).

Fresno Council of Governments Regional Transportation Plan/Sustainable Communities Strategy

The Regional Transportation Plan/Sustainable Communities Strategy (Fresno Council of Governments 2021) develops a regional transportation network that is environmentally sensitive and reduces GHG emissions. New transportation facilities must avoid or fully mitigate all significant impacts on environmentally sensitive areas and natural resources such as minimizing loss of farmland. Increased transportation and facility design is encouraged, along with infill development near existing public transportation, which is intended to reduce vehicle miles traveled (VMT) and the associated GHGs from those mobile emissions. This plan is not applicable to the proposed project because the proposed project does involve changes to existing transportation facilities or development of new transportation facilities.

Fresno Council of Governments Priority Climate Action Plan

The Fresno Council of Governments approved the final Priority Climate Action Plan (PCAP) on February 29, 2024, which includes a regional GHG inventory, a public outreach process, identification and quantification of priority GHG emissions reduction measures, a benefit analysis for low-income and disadvantaged communities, and identification of implementation authorities (Fresno Council of Governments, 2024). The PCAP contains a 2019 GHG emissions inventory that quantifies emissions from the following sources:

- Transportation (including on-road, offroad, and aircraft sources);
- Industrial emissions;
- Energy use (residential and commercial);
- Waste and wastewater;
- Agriculture; and
- Fugitive emissions.

The PCAP scope includes both public and private sources within the County. Thus, emissions from project sources are present in the PCAP inventory. The inventory finds that in Fresno County approximately 13.2 million metric tons (MT) of CO_2e was emitted in 2019, with most emissions coming from the transportation, agriculture, and energy use sectors at 44%, 19%, and 17%, respectively. Of the transportation sector, approximately 40% of the emissions inventory results from on-road sources such as passenger cars and trucks, buses, and delivery vans.

4.8.3 Significance Thresholds and Analysis Methodology

4.8.3.1 Significance Criteria

Based on Appendix G of the CEQA Guidelines, the proposed project would have a significant impact related to GHG emissions if it would:

a) Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment; or~~?~~
b) Conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.~~?~~

4.8.3.2 Significance Thresholds

South Coast Air Quality Management District (SCAQMD) methodology was used to evaluate whether a project would generate GHG emissions that may have a significant impact on the environment (SCAQMD 2008). ~~SCAQMD methodology was used because~~ It was determined that the San Joaquin Valley Air Pollution Control District methodology is out of date ~~and does not appropriately address emissions covered by the Cap-and-Trade Program~~. The GHG analysis in the Final EIR was revised, as envisioned by CEQA, to address comments on the Draft EIR by several commenters, including the Center for Biological Diversity. In addition, the Draft EIR was released on December 20, 2024 and the comment period closed on March 10, 2025. In the Draft EIR, the GHG analysis relied in part on an analysis used in an EIR certified by Kern County in approving the modification to an oil refinery. That EIR acknowledged that certain GHG emissions related to the consumption of fuel and the use of electricity were offset upstream of those uses pursuant to California's Cap-and-Trade Program. This approach was upheld in a decision by the Fifth District Court of Appeal, which appellate court has jurisdiction over Fresno County, in *Association of Irritated Residents v. Kern County Board of Supervisors*, 17 Cal.App.5th 798 (2017) ("AIR"). However, on June 26, 2025, a new California appellate decision out of Los Angeles County reviewing the use of offsets under the Cap-And-Trade Program as part of an EIR used to evaluate a housing development program was filed by the 2nd District Court of Appeal, *Center for Biological Diversity v. County of Los Angeles*, 112 Cal.App.5th 317 (2025) ("LA County Decision"). The LA County Decision distinguished the AIR Decision and held that Los Angeles County could not rely on the fact that transportation fuels and electricity that would be used as part of the project were subject to the Cap-and-Trade Program. In an abundance of caution, Fresno County decided to revise the GHG analysis in the Draft EIR to conform to the more recent LA County Decision. Accordingly, all emissions, including those involving the consumption of fuel and the use of electricity, are included in determining whether total emissions will exceed the GHG significance threshold of 10,000 $MTCO_2e/yr$.

Based on SCAQMD methodology (SCAQMD 2014, cited in Sespe 2026 ~~2019~~), ~~emissions from sectors that are required to participate in the Cap-and-Trade Program administered by CARB are excluded from the GHG analysis. These sectors include electricity and transportation fuel, which are the energy sources that would be used by all of the proposed project mining, processing, and production operations, with the exception of the proposed asphalt plant, which would be powered by natural gas. For energy sources that are not subject to the Cap-and-Trade Program (i.e., the natural gas-fueled asphalt plant), the screening threshold established by SCAQMD methodology is 10,000 metric tons of CO_{2e} (MT CO_{2e}) per year. In this analysis,~~ GHG emissions from project sources (and here, as noted above, the County includes all GHG emission) ~~not subject to the Cap-and-Trade Program~~ are considered less than significant when:

1) Incremental project emissions ~~sources~~ are less than 10,000 MT CO_{2e} per year; and
2) ~~each~~ Project emissions do not conflict with applicable GHG plans, policies or regulations adopted for the purpose of reducing GHG emissions. ~~source complies with all applicable and feasible best performance standards developed by the Air District (Air District 2012)~~.

4.8.3.3 Analysis Methodology

GHG emissions and global climate change represent cumulative impacts. Maximum annual GHG emissions from proposed construction activities and mining operations were estimated for informational purposes. The general analysis approach was to estimate the total increase in GHG emissions from proposed construction and mining operations activities relative to emissions from existing construction and mining operations activities. Under existing conditions, there are no construction activities on the project site, therefore there are no existing GHG emissions from construction.

~~The analysis also estimates the increase in GHG emissions from fuels used on the project sites that would not be subject to the Cap-and-Trade Program.~~

Because no single project could generate enough GHG emissions to noticeably change the global average temperature, the analysis of the proposed project's potential climate change impacts focuses on the project's contribution to GHG emissions in a cumulative context.

Project Design Features and Assumptions

Table 4.8-6, "Rockfield Modification Project Components of Air Quality and Greenhouse Gas Modelling," summarizes the project features incorporated into the Air Quality Assessment analysis, which are the same as those described in Section 4.3, "Air Quality."

Table 4.8-6
Rockfield Modification Project Components of Air Quality and Greenhouse Gas Modelling

Activity	Description
CONSTRUCTION	
Aggregates Processing Construction	Construction of aggregates processing plant at the Quarry Site. Expectedschedule of 10 months ~~5 days~~.
Grading	Expected schedule of 20 ~~5~~ days.
Paving	Paving of approximately one mile of road. Expected schedule of 10 days.
Site Preparation	Clearing of Quarry Site and site preparation. Expected schedule of 10 days.
RESOURCE RECOVERY AND PROCESSING	
Mining Method	Addition of hard rock mining to Quarry Site activities. Addition of primary crusher and hydraulic shovel in pit. Increased use of excavator and dozer operations, in addition to excavation by hydraulic shovel or front-end loader. Addition of drilling and blasting will be required.
Processing	Extracted resources at the Quarry Site will be processed onsite at the relocated ready-mix concrete and hot-mix asphalt plants starting at phase 2, rather than beingtransported to the Plant Site for processing. Adding processing plant equipment to manufacture sand.
Estimated Annual Aggregates Production	Increase from 1,374,272 tons per year to 3,000,000 tons per year.
Estimated Annual ReadyMix Production	Increase from 189,550 cubic yards per year to 300,000 cubic yards per year.
Estimated Annual Recycle Plant Production	Increase from 25,000 tons per year to 200,000 tons per year.
Estimated Annual Asphalt Plant Production	Increase from 0 tons per year to 500,000 tons per year.
Hours of Operation	6 days per week, Monday through Saturday (For health risk assessment, modeledconservatively as 7 days per week, 12 hours per day. For criteria pollutant emissions, modeled based on maximum hour and day, by activity levels.)

Table Source: Sespe 2026, Appendix D-3 ~~1~~.

The GHG emissions estimates were completed using the same methodology summarized in subsection 4.3.4.3, "Analysis Methodology," of Section 4.3, "Air Quality," of this Draft EIR. However, GHG emissions estimates also included estimates of GHG emissions from project use of electricity. Detailed methodology is provided in the new Air Quality Report (Appendix D-3), which replaces the previous Air Quality Assessment (Appendix D-1) and the associated Addendum (Appendix D-2).

Regional Increment Analysis

In order to accurately address the GHG impact, a regional increment analysis was conducted which characterizes the project's contribution to cumulative regional GHG emissions (see Appendix D-3, Sub-Appendix J). This methodology responds to current regulatory guidance and reflects how aggregate demand and associated emissions are projected and managed at the regional level. The regional increment analysis is based on project activity levels, as well as regional aggregate demand as forecast in the California Department of Conservation Map Sheet 52, as revised to account for current conditions.

As outlined in Map Sheet 52, state and regional planning forecasts indicate that aggregate demand is driven by population growth and overall regional development, rather than by the maximum production capacity of any single facility (Appendix D-3, Sub-Appendix J). Accordingly, while the Project is capable of supplying aggregate to meet regional needs, its operation would not create a net increase in regional aggregate demand beyond that already forecast. Any increase in annual production from the project would be offset by corresponding reductions in production from other facilities serving the same regional market, resulting in no substantial change in total regional output.

Consistent with this framework, the GHG analysis evaluates emissions based on the project's proportional share of regional demand growth, rather than calculating emissions based on continuous operation at maximum throughput. This approach ensures that the project's GHG emissions are attributed in a manner that reflects realistic market conditions and real-world impact.

The regional increment analysis also clarifies the project's role in meeting its share of regional GHG reduction obligations. The project would comply with existing and future regulations governing greenhouse gas emissions, including Air District requirements, statewide climate policies, and new standards adopted during the life of the project. Compliance with these regulatory programs would contribute to reducing cumulative GHG impacts at the regional and statewide level.

Moreover, as analyzed by Peter Berck in his January 2005 Working Paper 994, "A Note on the Environmental Costs of Aggregate" (Appendix D-3, Sub-Appendix B) when regional demand is a constant, the inclusion of additional aggregate quarry locations within the region can reduce total GHG emissions by reducing the average distance aggregates need to be hauled.

By incorporating the regional increment analysis, the GHG impact analysis provides a more accurate, and policy-consistent assessment of the project's greenhouse gas impacts, while aligning the analysis with current forecasting methodologies and regulatory

expectations. Appendix D-3, Sub-Appendix J includes Sespe's regional increment analysis calculations and memo (April 2026). Table 4.8-7 and Table 4.8-8 present the emissions quantified in the regional increment analysis, including the project's increment of anticipated GHG emissions increases in the region for Baseline and project operations.

Use of Renewable Diesel

Project operations emissions from non-employee off-site, on-road vehicles associated with the project were calculated and adjusted (as described below) to reflect the increased share of renewable diesel (RD) in California's diesel fuel pool. As described in Appendix D-3, Sub-Appendix L, RD went from negligible in 2005 to 70% in 2024 and is expected to achieve close to 90% in the future. Based on 2025 reporting, RD has approximately 40% of the carbon intensity of low sulfur diesel fuels and is contributing to reducing the CI of the available ultra-low sulfur diesel available on the market in accordance with the Low Carbon Fuel Standard (LCFS) benchmarks (See Appendix D-3, Sub-Appendix L). Accordingly, project-related non-employee off-site on-road fleet emissions were reduced by the CI reductions established in the LCFS benchmarks between 2016 and 2018 of 2% and from 2016 to 2026 of 18.6% (See Appendix D-3, Sub-Appendix L, Figure 2).

Further, California's in-use off-road diesel fueled fleets regulations require the use of RD. To be reasonably conservative and based on the LCFS benchmark data, an adjustment of 50% was applied to estimated project-related off-road diesel emissions operating onsite (see Appendix L of Appendix D-3).

Baseline GHG Emissions

Baseline emissions were determined based on historical production records for the year 2005 ~~1998~~ and are presented in Table 4.8-7, "Baseline GHG Emissions."

Table 4.8-7
Baseline GHG Emissions

Source	CO_{2e} Emissions (Metric Tons per Year)
Stationary Sources ~~Aggregates Plant~~	0 ~~2,581~~
~~Ready Mix Plant~~	~~261~~
~~Asphalt Plant~~	~~0~~
~~Recycle Plant~~	~~35~~
~~Stockpiles~~	~~0~~
Off-road Engines (onsite)	5,212 ~~4,748~~
On-road Vehicles (onsite)	954 ~~289~~
Non-employee On-road Vehicles (offsite) (regional increment, see App J of App D-3)	5,359 ~~5,743~~
Quarrying	0

Source	CO_{2e} Emissions (Metric Tons per Year)
Blasting	0
Material Handling	0
Employee Trips	293 ~~291~~
Electricity	1,919
Total	**13,737 ~~13,948~~**

Table Source: Sespe 2026 Appendix D-3 ~~D-1~~. As noted in Appendix D-3, baseline on-road and off-road emission estimates used 2005 production data; however, Year 2018 emission factors from EMFAC were applied for on-road sources, and Year 2012 emission factors from EMFAC were applied for off-road sources; this produces lower baseline values than if Year 2005 emissions from EMFAC were applied.
Table Notes: CO_{2e} = carbon dioxide equivalent

Proposed Project GHG Emissions

Construction Phase

CalEEMod was used to estimate construction phase emissions. Project construction is expected to take place for 10 months ~~days~~ and would emit approximately 197 ~~49~~ MT CO_2e. Annualized over 30-years, this would generate approximately 6.6 metric tons of CO2e per year.

Operation Phase

Table 4.8-8, "Maximum Annual Operation Phase GHG Emissions," summarizes the maximum annual estimated GHG emissions that would be emitted from the operation of the proposed project.

Table 4.8-8
Maximum Annual Operation Phase GHG Emissions

Source	CO_2e Emissions (Metric Tons per Year)
Stationary Sources ~~Aggregates Plant~~	8,394 ~~5,489~~
~~Ready Mix Plant~~	~~413~~
~~Asphalt Plant~~	~~7,549~~
~~Recycle Plant~~	~~281~~
Stockpiles	0
Off-road Engines (onsite)	4,236 ~~8,471~~
On-road Vehicles (onsite)	927 ~~228~~
On-road Vehicles (offsite) (regional increment, see App D-3, Sub-App J)	6,068 ~~9,207~~
Quarrying	0
Blasting	0
Material Handling	0

Source	CO_2e Emissions (Metric Tons per Year)
Employee Trips	302 ~~174~~
Electricity	1,373
Total:	21,301 ~~31,812~~

Table Source: Sespe 2026, Appendix D-3 ~~D-1~~.
Table Notes: CO_2e = carbon dioxide equivalent;
Totals may not sum due to rounding.

4.8.4 Project Impacts and Mitigation Measures

Impact 4.8-1: Generate GHG Emissions, Either Directly or Indirectly, That May Have a Significant Impact on the Environment

The maximum annual estimated increase in emissions relative to baseline conditions from the construction and operation of the proposed project are presented for informational purposes in Table 4.8-9, "Proposed Project GHG Emissions Including Cap-and-Trade Program Sources." Phase 1 and Phase 2 operations under the proposed project would emit GHGs from electricity use, fuel burned in vehicle and construction and mining equipment engines, and electricity and fuel burned in stationary facilities (i.e., natural gas used by hot-mix asphalt plant and diesel fuel used by aggregate processing plant, ready-mix cement plant, and recycling plant). During the reclamation phase of the proposed project, the project sites would be converted to open space land use which would require minimal use of fuels and would not be a substantial source of GHG emissions.

As shown in Table 4.8-9, the maximum annual increase GHG emissions generated by the proposed project does not exceed~~s~~ the 10,000 MT CO_{2e} per year ~~screening~~ significance threshold. Additionally, ~~However,~~ while electricity and transportation fuel suppliers and importers are required to report emissions under the Cap-and-Trade Program administered by ~~C~~ARB, ~~which is designed to reduce GHG emissions as needed to achieve emissions reductions described in related planning documents which primarily consists of the Scoping Plan,~~ these sources were included in the analysis to determine if the 10,000 MT CO_{2e} per year GHG threshold is exceeded. ~~Thus, the emissions reductions from electricity and transportation fuel usage would occur at a level in the energy supply chain above that as compared to the proposed project, which would have no choice but to use fuel and electricity having GHG intensities that are consistent with the Scoping Plan.~~ With emissions from electricity and transportation fuels sources, the Project increment would still be less than the 10,000 MT CO_{2e} per year significance threshold.

Table 4.8-9
Proposed Project GHG Emissions Including Cap-and-Trade Program Sources

Activity	CO_2e (MT/yr)
Baseline Condition	13,737 ~~13,948~~
Construction Phase (Maximum Year)	6.6 ~~49~~
Operation Phase	21,301 ~~31,812~~
Project Emissions ~~Including Cap-and-Trade Program Sources~~ (Operation Phase minus Baseline Condition)[1]	7,564 ~~17,864~~

Table Source: Sespe 2026, Appendix D-3 ~~D-2~~
Table Notes:
1. Sources of emissions subject to the Cap-and-Trade Program consist of electricity and transportation fuel usage that would occur at a level in the energy supply chain above the proposed project, and which therefore would have no choice but to use fuel and electricity having GHG intensities that are consistent with the Scoping Plan.

CO_2e = carbon dioxide equivalent.
MT/year = metric tons per year.

~~As described in Chapter 2, "Project Description," of this Draft EIR, the proposed project would involve the development of a new hot-mix asphalt plant that would be fueled by natural gas. Specifically, natural gas would be used to fuel the asphalt plant dryer and oil heater. The emissions from this natural-gas fueled facility are not covered by the Cap-and-Trade Program. Table 4.8-10, "GHG Emissions from Project Sources Not Included in Cap-and-Trade Program," provides the estimated maximum annual emissions resulting from operation of the proposed asphalt plant.~~

~~**Table 4.8-10**~~
~~**GHG Emissions from Project Sources Not Included in Cap-and-Trade Program**~~

~~Activity~~	~~CO_2e (MT/yr)~~
~~Operation Phase (Stationary Combustion in Asphalt Dryer)~~	~~7,598~~
~~Operation Phase (Stationary Combustion in Asphalt Oil Heater)~~	~~910~~
~~Baseline Condition~~	~~0~~
~~Project Impact (Operation Phase Minus Baseline Condition)~~	~~8,508~~
~~Screening Threshold~~	~~10,000~~
~~Project Impact Exceeds Screening Criteria?~~	~~No~~

~~**Table Source:** Appendix D-2; SCAQMD 2014.~~
~~**Table Notes:** CO_2e = carbon dioxide equivalent.~~
~~MT/year = metric tons per year.~~

~~As shown in Table 4.8-9 above, GHG emissions from the asphalt plant would be less than the screening threshold. The significance thresholds also require that sources not subject to the Cap-and-Trade Program implement feasible best performance standards. There is one draft Air District best performance standard relevant to the proposed asphalt plant that has not been adopted and is provided for disclosure purposes. The Air District~~

~~developed this draft best performance standard for new continuous mix asphalt dryers that would result in GHG emissions reductions of between 13.1 and 17.2 percent less than asphalt plants that do not implement this best performance standard. The best performance standard is:~~

- ~~Non-Caltrans projects: Warm mix asphalt with premium efficiency electric motors and exhaust fan operated with a variable frequency speed control (24.1 lb CO_{2e} or equivalent).~~
- ~~Caltrans project: Separate dryer drum and mixing chamber and the use of heat from the dryer drum to mix aggregate and binder (3 percent decrease in fuel consumption, 9 percent increase in production) with premium efficiency electric motors and exhaust fan operated with a variable frequency speed control (25.3 lb CO_{2e} or equivalent) (Air District 2010).~~

~~Certain features in the draft best performance standard are not feasible and this is the reason why the document has remained draft since it was published 13 years ago. For instance, the mix design is not always under control of the operator. Thus, the warm-mix only feature is infeasible. Feasible items from the best performance standard are recommended in Mitigation Measure 4.8-1.~~

~~In summary, each of the facilities and operations under the proposed project, with the exception of the asphalt plant, would rely on an energy source subject to the Cap-and-Trade Program. GHG emissions from the asphalt plant would be less than the SCAQMD GHG screening criteria. In addition, the significance thresholds also require that sources not subject to the Cap-and-Trade Program implement feasible best performance standards. Mitigation Measure 4.8-1 would require implementation of all feasible features in the Air District best performance standards. For these reasons, the potential of the proposed project to result in a cumulatively considerable contribution to global climate change would be less than significant with mitigation.~~

Level of Significance Before Mitigation: Less than ~~Potentially~~ significant.

Mitigation Measure: None required.

~~Mitigation Measure 4.8-1:~~ *~~Asphalt Plant Performance Standards~~*

~~The asphalt plant dryer drum and mixing chamber shall be separated so that dryer exhaust gases do not contact liquid asphalt and premium efficiency electric motors with exhaust fan motors shall be equipped with variable frequency speed control. These specifications shall be shown on project plans and submitted to the San Joaquin Air Pollution Control District as part of the application for Authority to Construction the proposed asphalt plant. Air district staff will verify implementation of this measure as~~

~~*part of the permit review process.*~~

~~**Level of Significance After Mitigation:** Less than significant.~~

Impact 4.8-2: Consistency With Applicable GHG Plans, Policies, or Regulations.

Legislation (Table 4.8-2) and regulations (Table 4.8-3) are summarized in Section 4.8.2, above. One of the functions of the AB 32 Scoping Plan, which does contain policies, is to inventory and summarize the various regulations/laws that apply to emitters of GHGs. The Scoping Plan is also informed by Executive Orders (Table 4.8-4) that have been regularly incorporated with each iteration of the Scoping Plan. Thus, consistency with the Scoping Plan is consistent with the laws, regulations, and executive orders listed in Tables 4.8-2, 4.8-3, and 4.8-4, above and further documented in the updated air quality technical report, Appendix D-3 (Sespe 2026).

The proposed project's consistency with the three types of policies (local, Scoping Plan, and Executive Order B-30-15, which is the next Scoping Plan GHG target [40 percent less than 1990 levels in 2030]) is summarized as follows:

- **A Local Jurisdiction's Qualified Climate Action Plan or GHG Reduction Plan:** As detailed in Section 4.8.2.3, above, no local climate action or GHG reduction plans apply to the proposed project.
- **AB 32 Scoping Plan:** As described in Section 4.8.2.2, above, AB 32 requires that the ARB adopt regulations to require the reporting and verification of statewide GHG emissions and monitor and enforce compliance with the program. The Scoping Plan is the most recent GHG policy document issued by ARB in accordance with AB 32. In the preparation of this Report, the emissions from fuel and electricity subject to AB 32 and SB 32 were no longer used to reduce GHG emissions for purposes of determining the level of significance given recent CEQA case law.
- Fresno County utilizes the SCAQMD significance threshold as noted in Section 4.8.2.3, above. This threshold of 10,000 $MTCO_2e$/yr has been previously utilized to determine significance in an approved EIR within the SJVAPCD. ~~Although the Air District has not formally approved GHG performance measures, staff has considered measures such as a Percent Emissions Reduction Target which could be set at the overall level of reduction required by the Scoping Plan, or the level of reduction required from the industrial sector/source category by the AB 32 Scoping Plan.~~ Currently, in accordance with AB 32, the SCAQMD has set an interim GHG screening threshold of 10,000 $MTCO_{2e}$ per year for industrial projects. As shown in Table 4.8-9, GHG emissions for industrial uses proposed by the project, including those subject to the Cap-and-Trade Program, ~~that would use~~

~~an energy source not subject to the Cap-and-Trade Program (i.e., the asphalt plant)~~ would be approximately 7,564 ~~8,508~~ MT CO_{2e} per year, which is below the ~~screening~~ significance threshold. As such, the proposed project is consistent with the emissions reductions targets outlined in the Scoping Plan. In addition, as summarized in Table 4.8-5, the project would not conflict with the climate change policies and measures discussed in the Scoping Plan.

- **Executive Order B-30-15 Goals:** The proposed project is consistent with the Executive Order B-30-15 goals which apply to the fuel and electricity sectors as a whole. The fuels and electricity used by the proposed project facilities, equipment, and vehicles would be subject to the Cap-and-Trade Program as well as the Scoping Plan and related control measures (e.g., renewable energy portfolio, low carbon fuel standard) that are applied higher up in the energy supply chain. There is no plan, policy, or regulation adopted for the purpose of reducing emissions of GHGs specifically from mining projects. Thus, the sources that are affected by such plans and policies would be consistent with those plans, policies, and/or regulations by virtue of using fuels and electricity that has been produced for consumption within California.

As described above~~under Impact 4.8-1~~, the project would not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, ~~during the reclamation phase of the proposed project, the project sites would be converted to open space land use, which would require minimal use of fuels and would not be a substantial source of GHG emissions, and therefore would not conflict with any GHG plans, policies, or regulations.~~ Refer to Sespe 2026, Appendix D-3, Sub-Appendix E for additional plans, policies, and regulations that have been reviewed to ensure the Project would not result in a conflict.

In summary, the proposed project would comply with all applicable GHG impact plans, policies, and regulations. This impact would be less than significant.

Level of Significance: Less than significant.

Mitigation Measures: None required.

Environmental
Consultants

MEMORANDUM

TO:	Bruce Steubing (Benchmark)	**FROM:**	Nick Brinton-McBean (WRA)
CC:		Hope Kingma (WRA)	
DATE:	July 29, 2026		
SUBJECT:	WRA Task Summary, CEMEX Rockfield Quarry Draft Environmental Impact Report		

WRA was asked by Benchmark Resources to assist with responding to public comments received regarding the Draft Environmental Impact Report (DEIR) for the Cemex Rockfield Quarry Modification Project (EIR 7763). Specifically, WRA was asked to assist with responding to comments related to environmental or biological concerns which had been submitted by commentors during the public circulation period.

WRA received bracketed comment letters and reviewed approximately 25 letters while providing draft responses for comments on a variety of environmental topics. Topics that WRA was asked to address included: nesting and non-nesting birds, fish, potential effects to offsite aquatic habitats within the San Joaquin River, bats and general wildlife species. WRA reviewed the comment letters and formatted corresponding individual responses. In addition to the individual responses, WRA was asked to prepare draft "collective responses" to address more generalized topics including potential effects to the San Joaquin River (Response 12), offsite wildlife (Response 13), Swainson's Hawk (Response 14), non-nesting birds (Response 15), and salmonids (Response 16). These collective responses were drafted to address the broader concerns of multiple commentors who had raised similar concerns regarding these topics rather than to each individual commentor.

WRA also provided the following recommendations or general updates to the DEIR:

1. Updated Table 4.4-1 and expanded the CNDDB database search to include any species that appeared in the expanded database search and to evaluate their potential presence within the Project Area.
2. Revised Mitigation Measures 4.4-1a, 4.4-1b, and 4.4-1c to provide more expansive methodologies to survey for special-status species. Revisions to these measures included additional surveys or more expansive surveys and avoidance to ensure species are absent or more robustly avoided during certain timeframes.
3. Provided an evaluation and impact analysis for bats in Section 4.4 of the DEIR for the bat species identified in Table 4.4-1 with a moderate potential to occur. Included a new Mitigation Measure 4.4-1d to reduce potential effects to bats to less than significant levels. No significant impact would result from the implementation of the new mitigation measure.
4. Recommended adding a discussion of the San Joaquin River Restoration Program to the setting section of biological resources.

Discussion

During assistance with drafting responses to comments described above, WRA biologists expanded the California Natural Diversity Database (CNDDB) search from the 4-quadrangle search presented in the DEIR to a 9-quadrangle search based on the collective approach by WRA's team in collaboration with Benchmark. Public comments were received concerning the age as well as the distance of the CNDDB search. While the previous search covered an approximately 5-mile radius which is justifiable and adequate for standard CEQA reviews, when the CNDDB search was updated in November 2025, it was expanded to a 9-quad search. Given the additional size of the search area, additional species were listed on the CNDDB results for the larger search area that were not identified in the search area used for the DEIR. Any new species which both (1) met the criteria of a special-status species and (2) appeared in the 9-quad search, were included in the updated Table 4.4-1 and were subsequently evaluated by WRA for their potential to occur within the Project Area and documented in the updated Table 4.4-1 that WRA understands will be included as errata in the Final EIR. Evaluation of the species' potential to occur was provided by WRA biologists with at least 10 years of experience with the taxa they were asked to evaluate.

Formally listed species can require specific protocol level surveys or may require take authorization from the governing agency. However, all of the additional species added to table 4.4-1 were either unlikely to occur, or if they did have potential to occur, carried a similar listing status to those species already evaluated. Any potential project impacts to such species would be similarly reduced to a less than significant level without additional mitigation measures or take authorization requirements. Considering that the additional species evaluated for this Project area are all of similar status and the same mitigation measures would reduce the impact to those species to less than significant levels, the addition of such species does not constitute a new significant impact nor increase the severity of identified impacts that were previously evaluated.

As an example, the original DEIR found that great egret and great blue heron were both present and the DEIR prescribed a measure to reduce impacts to less than significant levels. When the updated 9-quad search was completed, snowy egret was identified and included in the list of evaluated species. Snowy egret uses similar habitats, nests colonially (similarly to great blue heron and great egret), and can co-occur in the same nesting colonies with great egret and great blue heron. Therefore, in the revised Table 4.4-1, snowy egret was ascribed a moderate potential to occur. The same mitigation measure prescribed for great blue heron and great egret would also be applicable to reduce impacts to snowy egret to less than significant levels. Therefore, inclusion of species such as this example as well as all of the other species added to the revised Table 4.4-1 does not constitute a new significant impact that was not previously evaluated or increase the severity of identified impacts previously evaluated, and does not represent significant new information as defined in CEQA Guidelines section 15088.5.

Regarding WRA's evaluation of bats, several bat species were previously identified in the DEIR as having potential to occur onsite. The additional species added to Table 4.4-1 included several bat species, including one bat species with potential to occur in the Project Area. To address potential impacts to bats, WRA recommended adding a mitigation measure to the EIR through errata to reduce potential impacts to bats that were previously identified, as well as those identified by WRA during preparation of the Final EIR. A WRA bat biologist reviewed the species identified in the DEIR and in this Final EIR, then drafted a measure requiring a bat specific survey prior to construction. Conducting this survey would identify if bats were roosting onsite where they may potentially be affected by project activities. The measure recommends avoidance during times of

year when maternity roosting may occur, and prescribes steps to minimize effects to bats outside of the maternity roosting season, thereby reducing potential impacts to all bats and roosts to a less than significant level.

200-Year HEC-RAS Analysis

MAP POCKET

HEC-RAS Work Map

INTRODUCTION

Cemex's Rockfield Modification Project (Project) is located along the east side of the San Joaquin River and west side of North Friant Road in the Friant community of Fresno County. The Project consists of an existing Plant Site at 13475 North Friant Road and an existing Quarry Site approximately 2.0 miles to the north (see Figure 1, Location Map after this report text). Chang Consultants prepared the October 15, 2020 report, *Hydraulic Analyses for Cemex Rockfield Modification Project*. The report determined that the Project complies with the applicable local and federal floodway and floodplain regulations. In addition, the report's hydraulic analysis showed that the San Joaquin River's easterly channel bank contains the 100-year flow, which prevents flow from entering the adjacent Quarry Site, i.e., the easterly channel bank along the Quarry Site is not subject to overtopping during a 100-year event.

The 100-year event is the typical standard used for engineering design and analyses as well as the basis for FEMA's floodplain mapping. This report contains a 200-year hydraulic analysis of the San Joaquin River adjacent to the Quarry Site to assess an even more extreme and rare probability flow event. A 200-year event is a flood that statistically has a 0.5-percent chance of occurring in any given year.

HYDRAULIC ANALYSIS

The US Army Corps of Engineers' HEC-RAS model was used for the 200-year hydraulic analysis. The model is similar to the one from the October 2020 report, but based on the higher flow rate. The input parameters are as follows. The existing condition cross-sections were created from 2-foot contour interval topographic mapping (NAVD 88 vertical datum) flown for the project on November 6, 2018 (see the HEC-RAS Work Map in the map pocket). A site investigation was performed that confirmed the topographic mapping is representative of existing conditions. Cemex recently raised the northerly portion of the berm separating the San Joaquin River and Quarry Site up to approximately 4 feet with compacted fill. The compacted fill was placed over an existing perimeter road from HEC-RAS cross-section 14 to 20 and prevents the 200-year flood from entering the quarry pit. The fill area is delineated on the HEC-RAS Work Map and on relevant HEC-RAS cross-section plots in Appendix A. Topographic mapping from 2026 was prepared to reflect the berm fill in the model. Encroachments were included along some cross-sections to define ineffective flow areas, i.e., to separate active versus inactive flow areas for modeling purposes. The starting downstream water surface elevation was based on normal depth. The normal depth slope was determined by calibrating the 100-year analysis. The normal depth slope was adjusted in the 100-year analysis until the base flood elevation was matched. This slope was used in the 200-year analysis.

The roughness coefficients were assigned based on a site investigation and review of aerial photographs. The roughness coefficients vary from 0.030 to 0.075. A value of 0.030 was used in areas with minimal vegetation and subject to base flow. Higher values were used to represent areas containing low to dense vegetation and trees.

FEMA's January 20, 2016, *Flood Insurance Study, Fresno County, California,* provides the 10-year (10-percent), 50-year (2-percent), 100-year (1-percent), and 500-year (0.2-percent) flow rates

for the San Joaquin River below Friant Dam (attached). The 200-year (0.5-percent) flow rate is not provided, so was estimated from a log-probability plot of the four known flow rates. The log-probability plot is attached after this report text and determined a 200-year flow rate of 95,000 cubic feet per second (cfs).

The existing condition 200-year San Joaquin River HEC-RAS results are included in Appendix A. The 100-year water surface elevations from the October 2020 report and current 200-year water surface elevations are summarized in Table 1. The Quarry Site is from cross-section 2 to 20. The table shows that the 200-year water surface elevations along the Quarry Site are 1.80 to 2.82 feet higher than the 100-year water surface elevations. Appendix A contains graphical plots of each cross-section. The cross-sections are looking downstream, so the Quarry Site is on the left side of the cross-sections. The plots show that the 200-year flow is contained within the easterly channel bank along the entire Quarry Site.

Cross-Section	100-Year WSE, ft	200-Year WSE, ft	200- minus 100-Year WSE, ft

Table 1. 100- and 200-Year Water Surface Elevations

CONCLUSION

The October 15, 2020 report, *Hydraulic Analyses for Cemex Rockfield Modification Project,* provided a 100-year San Joaquin River hydraulic analysis for the Quarry Site. The 100-year event

is the typical standard for engineering design, analyses, and FEMA floodplain mapping. The report showed that the 100-year flow will not enter the Quarry Site. This report contains a 200-year HEC-RAS hydraulic analysis in order to assess a more extreme and rare probability flow event. The results show that the 200-year flow is also contained within river's east bank and will not enter the Quarry Site.

200-Year HEC-RAS Analysis

MAP POCKET

HEC-RAS Work Map

INTRODUCTION

Cemex's Rockfield Modification Project (Project) is located along the east side of the San Joaquin River and west side of North Friant Road in the Friant community of Fresno County. The Project consists of an existing Plant Site at 13475 North Friant Road and an existing Quarry Site approximately 2.0 miles to the north (see Figure 1, Location Map after this report text). Chang Consultants prepared the October 15, 2020 report, *Hydraulic Analyses for Cemex Rockfield Modification Project*. The report determined that the Project complies with the applicable local and federal floodway and floodplain regulations. Chang Consultants also prepared the April 21, 2026, *200-Year Hydraulic Analysis for Cemex Rockfield Modification Project Quarry Site,* which concluded the 200-year storm event will not enter the Quarry Site.

The 100-year event is the typical standard used for engineering design and analyses as well as the basis for FEMA's floodplain mapping. This report contains a 200-year hydraulic analysis of the San Joaquin River adjacent to the Plant Site to assess an even more extreme and rare probability flow event. A 200-year event is a flood that statistically has a 0.5-percent chance of occurring in any given year.

The 2020 report discussed the Little Dry Creek FEMA Zone A 100-year floodplain along the Plant Site. This report includes discussion of the Little Dry Creek 200-year floodplain along the Plant Site.

HYDRAULIC ANALYSIS

San Joaquin River

The US Army Corps of Engineers' HEC-RAS model was used for the 200-year hydraulic analysis. The input parameters are as follows.

The existing condition cross-sections were created from 2021 USGS San Joaquin Central Valley DWR CA Lidar 2-foot contour interval topographic mapping on NAVD 88 vertical datum (see the HEC-RAS Work Map in the map pocket). A review of aerial photographs confirmed the topographic mapping is representative of existing conditions.

The starting downstream water surface elevation was based on normal depth. The normal depth slope was determined by calibrating the 100-year analysis. The normal depth slope was adjusted in the 100-year analysis until the base flood elevation matched FEMA's Flood Insurance Rate Map elevation (see attached FIRM Exhibit). This slope was then used in the 200-year analysis.

The roughness coefficients were assigned based on a review of aerial photographs. The roughness coefficients vary from 0.030 to 0.060. A value of 0.030 was used in areas with minimal vegetation and/or containing base flow. Higher values were used to represent areas containing low to dense vegetation and trees.

The 200-year flow rate was determined from FEMA's January 20, 2016, *Flood Insurance Study, Fresno County, California* (FIS). The FIS provides the 10-year (10-percent), 50-year (2-percent), 100-year (1-percent), and 500-year (0.2-percent) flow rates for the San Joaquin River "Below

Friant Dam" and "Below Little Dry Creek" (attached). The FIS Floodway Data Table indicates that the Friant Dam flow rates apply at and above FEMA effective cross-section DS while the Little Dry Creek flow rates apply at and below cross-section DR. Cross-sections 1 through 5 are below FIRM cross-section DR, so the flow rates Below Little Dry Creek apply. Cross-sections 6 through 9 are at and above cross-section DS, so the flow rates Below Friant Dam apply. The 200-year (0.5-percent) flow rate is not provided in the FIS, so was estimated at both locations from a log-probability plot of the four known flow rates. The log-probability plots are attached after this report text and determined a 200-year flow rate of 95,000 cubic feet per second for cross-sections 6 to 9 and 97,000 cubic feet per second for cross-sections 1 to 5.

The existing condition 200-year San Joaquin River HEC-RAS results are included in Appendix A and summarized in Table 1. The Plant Site is along HEC-RAS cross-sections 2 to 8. Appendix A contains graphical plots of each cross-section. The cross-sections are looking downstream, so the Plant Site is on the left (east) side of the cross-sections. The plots show that the 200-year flow is contained within the easterly channel bank along the entire Plant Site. The 200-year floodplain was plotted along the Plant Site on the HEC-RAS Work Map. The plotting confirms that the 200-year floodplain does not extend within the Plant Site.

Cross-Section	200-Year WSE, ft
9	300.57
8	299.74
7	298.54
6	299.09
5	298.64
4	298.55
3	298.37
2	298.32
1	298.29

Table 1. 200-Year Water Surface Elevations, NAVD 88

Little Dry Creek

FEMA's Little Dry Creek Zone A floodplain encroaches into a pond within the northeast portion of the Plant Site. A Zone A floodplain is based on approximate methods, so can be inaccurate. The Little Dry Creek 200-year floodplain in relation to the Plant Site pond has been assessed in more detail based on the San Joaquin River 200-year backwater and 2021 topographic mapping from the prior subsection. The San Joaquin River 200-year backwater elevation at the confluence is approximately 300.6 feet from the Table 1 results at cross-section 9. The HEC-RAS Work Map shows that the San Joaquin River 200-year floodplain does not encroach into the northeast pond. The Little Dry Creek 200-year water surface elevations along the Pond will be above the San Joaquin River elevations. The 2021 topographic mapping indicates that the top of berm surrounding the pond is at elevation 310 feet or higher and the adjacent Little Dry Creek flowline varies from approximately 294 to 296 feet. Based on this information, the San Joaquin River backwater will not significantly increase the Little Dry Creek 200-year water surface elevations. The berm is over 9 feet higher than the backwater elevation and over 14 feet higher than the creek flowline. Therefore, the berm will provide protection from the Little Dry Creek 200-year flow.

CONCLUSION

The April 21, 2026 Chang Consultants *200-Year Hydraulic Analysis for Cemex Rockfield Modification Project Quarry Site* report determined that the 200-year flow is contained within the San Joaquin River's east bank and will not enter the Quarry Site. This report contains a hydraulic analysis that determined that the San Joaquin River 200-year flow will not enter the Plant Site. Therefore, the two areas within Cemex Rockfield Modification project are not subject to 200-year inundation from the San Joaquin River.

BLASTING AND HUMAN RESPONSE TECHNICAL MEMORANDUM

BENCHMARK RESOURCES

VibraTechinc.com

235 E. Maple Street
Hazleton, PA 18201

Phone 570.455.5861

To: Ms. Christine M. Jones CEMEX
From: Douglas Rudenko

Subject: Technical Note on Threshold of Significance for Human Response
CEMEX Rockfield Quarry Modification Project
Fresno County, California

Date: April 29, 2026

This memo is in response to your request for a technical note to determine a threshold of significance for human response to ground vibration and air overpressure as measured at occupied residential structures not owned by Cemex.

Researchers for Caltrans developed the following human response table specifically for blast-induced ground vibrations:

Table 1. [Caltrans 2004 Table 21] Human Response to Blasting Ground Vibration

Average Human Response	PPV (in/sec)
Barely to distinctly perceptible	0.02-0.10
Distinctly to strongly perceptible	0.10-0.50
Strongly perceptible to mildly unpleasant	0.50-1.00
Mildly to distinctly unpleasant	1.00-2.00
Distinctly unpleasant and to intolerable	2.00-10.00

Jones & Stokes, 2004, *Transportation- and construction-induced vibration guidance manual*. June. (J&S 02-039.) Sacramento, CA. Prepared for California Department of Transportation, Noise, Vibration, and Hazardous Waste Management Office, Sacramento, CA.

Because this table was specifically developed to address human response to blast-induced ground vibrations, it is useful in determining a threshold of significance for the Cemex Rockfield Quarry blast-induced ground vibrations. However, in order to determine whether the 2004 Caltrans study is the most appropriate significance criteria, it is necessary to compare that table with other available studies.

The majority of the studies done on human tolerance to vibrations have been of steady-state sources, meaning that the amplitude and frequency of the vibration remain constant over the test period. This type of testing is usually performed with vibrations lasting much longer than the vibrations from a typical mine or quarry blast event. The purpose of these studies is usually to determine the vibration levels that people can perform tasks at a reasonable level of comfort,

or to set occupational exposure limits for activities such as working in an office, traveling in an airplane, driving an automobile, or operating heavy equipment. Conclusions are drawn about the effects of vibration on the human body.

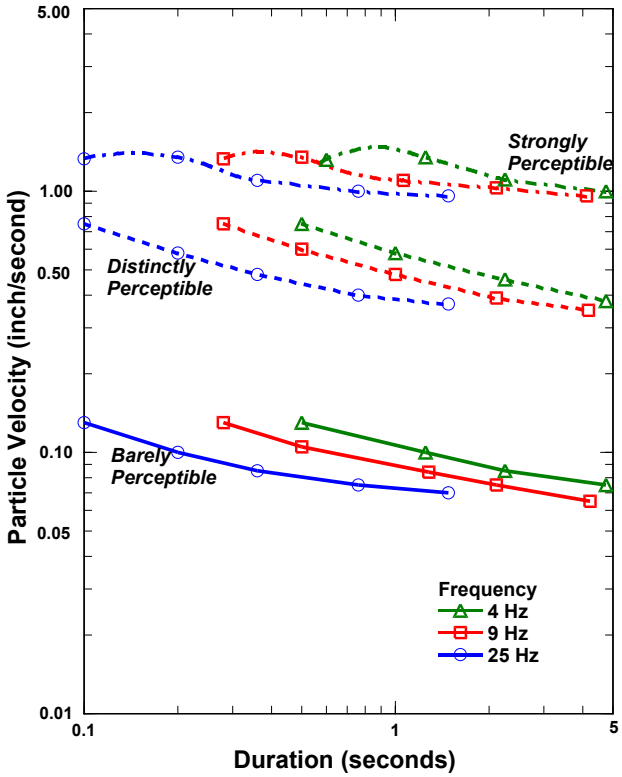

Figure 1. Human Response to Transient Vibrations of Various Frequency and Duration (from Wiss & Parmelee, 1974).

Based on available research, blast vibrations are certainly not detrimental to the human body, and the short period of time over which they occur does not produce physical fatigue. For these reasons, most studies of human response to vibration cannot be related to blast vibrations. However, three important facts become apparent from these studies. First, people can perceive vibrations over an extremely wide range of amplitudes, frequencies, and durations. Second, individual response to a given vibration level is highly subjective and varies not only with each individual but also on a daily basis. Third, it is also dependent upon many factors unrelated to the vibration event.

Blast induced ground vibration is not a steady state vibration, but rather a transient vibration. A transient vibration is a vibration that begins near its maximum level, quickly decreases in amplitude, and usually becomes imperceptible after just a few seconds. Figure 1 is derived from a study of subjective human response to transient vibrations completed by Wiss and Parmelee in 1974. The Wiss and Parmelee study involved subjecting forty people to transient vertical vibrations while standing on a test platform. Each person was exposed to vibrations of various duration and amplitude, at frequencies between 2.5 and 25 Hz, and asked to characterize their perception of the vibrations. Four levels of subjective human response

to vibration were categorized: “Barely Perceptible, Distinctly Perceptible, Strongly Perceptible, and Severe”. The mean response to the three lower categories is shown in Figure 2 for three tested frequencies. The mean response to the “Barely Perceptible” category is the level at which half of the people tested could not perceive vibrations below. The mean for each of the other categories was found similarly. Clearly human tolerance to vibration decreases as the duration of the vibration increases. The mean response curves for each frequency considered in Figure 1 are asymptotic; that is, they each approach a constant minimum level, or asymptote, as the duration increases, and each category has a common asymptote. These asymptotes provide a convenient method of assigning a subjective criterion to human response to transient vibrations that is independent of frequency or duration. Figure 2 depicts both the asymptotic mean response levels and the threshold response levels from the Wiss and Parmelee study. The threshold response levels are the levels cited by the most sensitive of the test subjects for each vibration category.

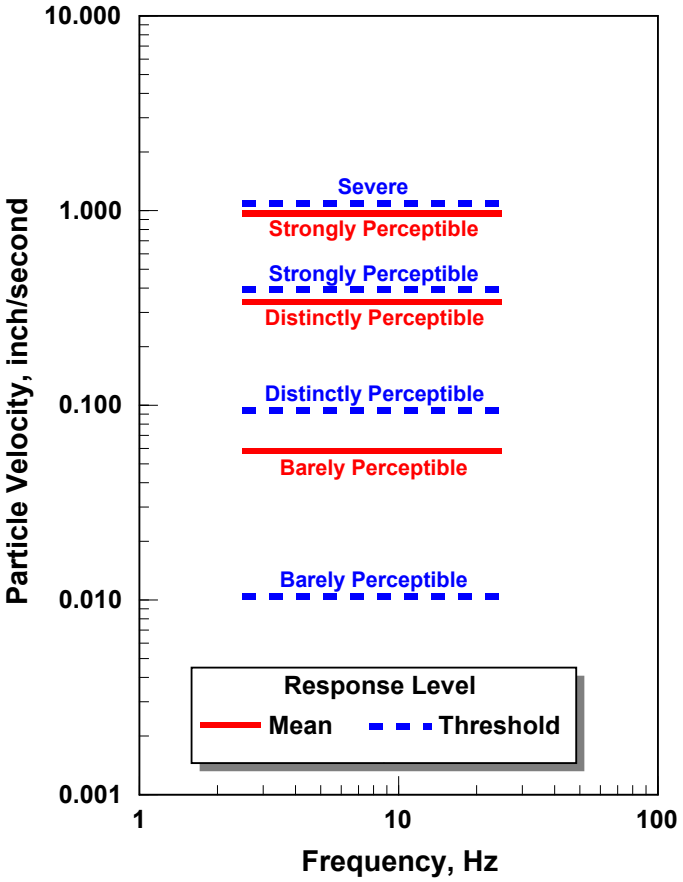

Figure 2. Generalized Human Response to Transient Vibrations (from Wiss & Parmelee, 1974).

The Wiss and Parmelee study was based on people standing and being subjected to vertical vibrations. Studies involving people in various body positions have found good correlation to the data from standing tests, suggesting that body position may not influence a persons sensitivity to vibration. The threshold levels defined by the broken lines in Figure 2 are generally accepted as quite conservative for both transient and steady state vibrations under most conditions.

Most scientific studies regarding human perceptibility to steady state and transient vibrations have been conducted in laboratories and other controlled environments. The levels at which people may perceive vibration will not change when they are in their homes, however, their classification of the vibration levels may. While no studies have been able to adequately account for all the variables affecting the response of people in their homes to blast vibrations, it is reasonable to conclude that the tolerance to vibrations would occur at levels lower than those found in laboratory environments.

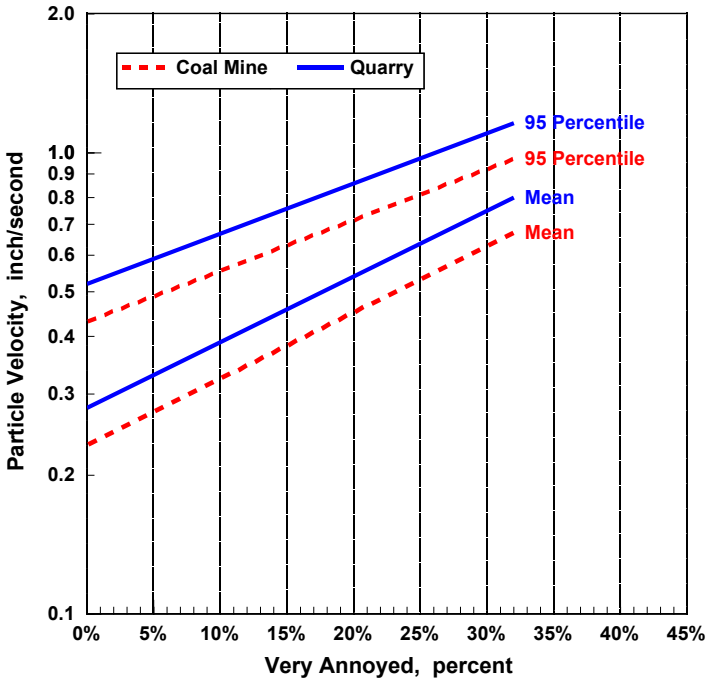

Figure 3. Reactions of Persons Subjected to Blasting Vibration in their Homes (from RI-8507).

In order to gain a better insight to the levels of vibration which evoke complaints from homeowners, the USBM calculated the ground vibrations necessary to produce structure response similar to that measured during an airblast study (USBM RI-8485). These calculated ground vibration levels were then correlated to the human annoyance curves generated through the airblast study. The result of this correlation is shown graphically in Figure 3. The 95-percentile curve represents the level at which there would be 95% confidence in the data that if ground vibration levels reached 0.60 in/sec approximately 5% of the population would consider this to be very annoying.

This data, although based on calculated ground vibration levels, may be the most valid predictor of homeowner response to blast vibrations. It is based on human response to not only perceived vibration in their homes, but also the house rattle and other associated sounds produced by vibration in a residential structure. This data also considered the fear homeowners feel concerning property damage.

By comparison, the American National Standards Institute (ANSI) has two relevant guidelines addressing vibrations for people. ANSI S3.18-1979 addresses issues of health, task proficiency and comfort for whole-body vibrations. This standard uses steady-state rather than transient blast-like vibrations. The shortest duration covered by the standard is one minute. In the frequency range of 8 to 20 Hz the recommended vibration levels for health, proficiency, and comfort are 4.4, 2.2, and 0.7 in/sec respectively.

ANSI S3.29-1983 recognizes that people perceiving vibrations in buildings have different concerns than do people performing a task. People in buildings are responding to a structure's response to the vibration, which includes secondary effects such as window rattling or movement of loose objects and pictures on walls. The peak vibration tolerated by humans in a residence or office is 0.50 or 0.71 in/sec respectively.

Comparing the research described in the preceding section with the 2004 Caltrans study and the ANSI standards, an appropriate significance threshold for human response to blast-induced ground vibrations from the proposed Rockfield Quarry is a peak particle velocity of 0.60 inches/second. This threshold falls between the two ANSI standards and is at the lower end of the "strongly perceptible to mildly unpleasant" average response in the 2004 Caltrans table, while still encompassing the 95th percentile of responses discussed in the USBM report. Maintaining this threshold would therefore sufficiently reduce potential blasting disturbances to residents living adjacent to the quarry site. The Blasting Protocols are revised to require that the blast design adhere to the 0.60 in/sec ppv threshold at occupied residential structures near the quarry site.

Human Response to Air Overpressure

Since noise levels due to blasting are generally very low frequency (approximately 2 to 25 Hz), the human ear does not detect the total energy associated with the overall linear sound energy. Based upon research on blasting, the typical fundamental frequency (the frequency where the majority of sound energy is located) for a blast is at the 20 to 25 Hz range, below the level of human hearing.

Little research has been done on the subjective human reactions to blast noise, although annoyance studies have been made for sonic booms and other impulsive source and applied to blasting. As part of the development of the air overpressure criteria by the USBM, researchers not only had to consider the structural effect of the air overpressure limit but also determine if the limit would be acceptable in terms of annoyance. In studying the limits for air overpressure annoyance, the USBM compared blasting to previous government studies of sonic booms and artillery fire.

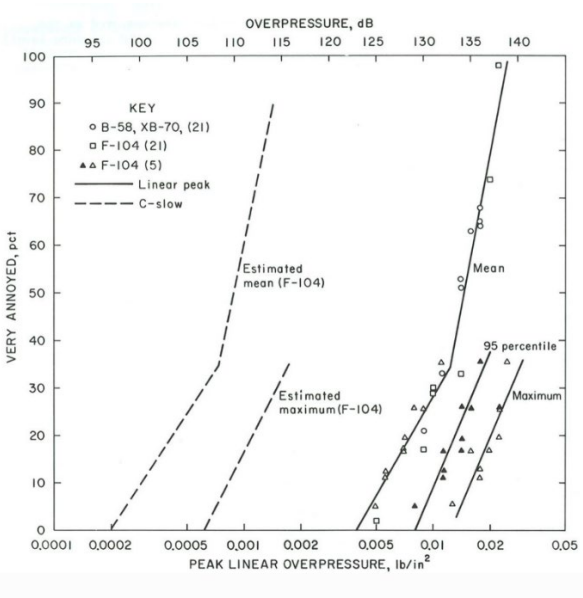

Figure 4. Population very annoyed by sonic boom-produced house rattles (after Siskind).

Figure 4 above shows the results of one study that was utilized for comparison by the USBM. The study was conducted in Oklahoma City and consisted of an average of eight booms per day for six months. Utilizing the 95-percentile line, there would be 95 % confidence in the data that at 0.01 psi blast-induced air overpressure would be acceptable to all but 5% of the population. Therefore, the appropriate threshold of significance for human response to blast-induced air overpressure is 0.01 psi. The Blasting Protocols are revised to require that blast-induced air overpressure maintain the 0.01 psi threshold at occupied residential structures near the quarry site.

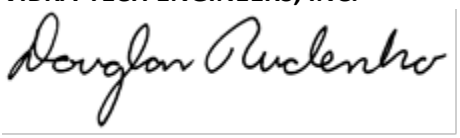
The distance to each receptor will change for each blast in the Rockfield pit as the blast location changes during the pit's development. Figure B1 and B2 in the Vibra-Tech Blast Impact Analysis Report shows 42 different blast designs and the corresponding maximum charge weight for the design that could be used. Table 2 shows the closest distance that a blast could occur to the various adjacent structures and the maximum charge weight that would be required to be below the ground vibration and air overpressure threshold of significance of 0.6 in/sec and 0.01 psi. Obviously, for many blast locations the distance to the receptor will be much greater resulting ground vibration and air overpressure levels significantly lower than 0.6 in/sec and 0.01 psi.

Table 2. Maximum charge weight for closest distance to meet threshold of significance

Receptor	Distance (ft)	Max Pounds Per Delay (lbs.)
South Residential Structure	275	*41
East Residential Structures (Mesa View Ave.)	460	116
Lost Lake Park Structures	500	138
North Ranch Structures	1,000	550
Northeast Residential (N. Friant Rd.)	1,430	1,125
Sumner Hill Residences	2,000	2,200

*To accomplish 41 lbs./delay near the closest residential structure a 53' deep hole, 3.5" diameter, 4 explosive decks, and an ANFO product with a density of 0.87 g/cc can be utilized. The maximum pounds per delay interval would be 34 lbs./delay.

Respectfully,
VIBRA-TECH ENGINEERS, INC.



Douglas Rudenko
Senior Vice President

Updated April 29, 2026

Introduction

This blasting protocol document summarizes the monitoring, control and reporting requirements for ground vibrations and air overpressures emitted from blasting at the Cemex Rockfield Quarry in Fresno County, California. In addition, it provides "Best Practices" for the control and mitigation of flyrock from rock blasting and the mitigation of groundwater and surface water contamination from the use of explosive products.

Blast Vibration Monitoring and Control Plan

A. Instrumentation Requirements

1) A direct reading velocity seismograph that adheres to the performance specifications for blasting seismographs adopted by the International Society of Explosives Engineers will be used at all times to monitor ground vibration and air overpressures resulting from blasting operations at the Rockfield Quarry.

2) All seismographs shall be considered approved only if the instrument meets the following criteria, as suggested by the International Society of Explosives Engineers:

    a) For ground vibration measurements, the instrument shall have a frequency response range from 2 – 250 hertz, within zero to -3 dB of an ideal flat response.

    b) For ground vibration measurements, the instrument shall have an accuracy of ± 5 pct. or ±0.02 in/sec, whichever is larger between 4 and 125 Hz.

    c) For air overpressure measurements, the instrument shall have a flat frequency response over the range of 2 to 250 hertz, -3dB at 2 Hz. ± 1dB.

    d) For air overpressure measurements, the instrument shall have an accuracy of ± 10 pct. Or ± 1 dB, whichever is larger between 4 and 125 Hz.

    e) The digital sampling rate shall be 1000 samples/sec or greater, per channel.

3) The instrument shall be capable of measuring and recording particle velocity in three mutual perpendicular directions.

4) The instrument shall have a seismic range from 0.02 to 4.0 inches per second for ground vibration measurements.

5) The instrument shall have a pressure range from approximately .001 to .012 pounds per square inch (psi) [approximately 106 dB to 138 dB, re: $2x10^{-9}$ psi] for air overpressure measurements.

6) The instrument shall be capable of performing a dynamic field calibration during monitoring and should be calibrated in accordance with the manufacturer's recommendations on a yearly basis.

7) Appendix A of this document gives the specifications of an instrument that meets the requirements set forth above.

B. Instrumentation Setup Procedures

1) In order to document compliance, an instrument will be located, at a minimum, at the closest residential/commercial structure, the closest well, and at three locations along the crest of the east San Joaquin River embankment. The instruments will be placed on the ground between the closest blast hole to be detonated and these locations. As the blast location moves, the embankment instruments will be moved to locations nearest the blast. Figure 1 below shows the location for the first blast and the monitoring locations.

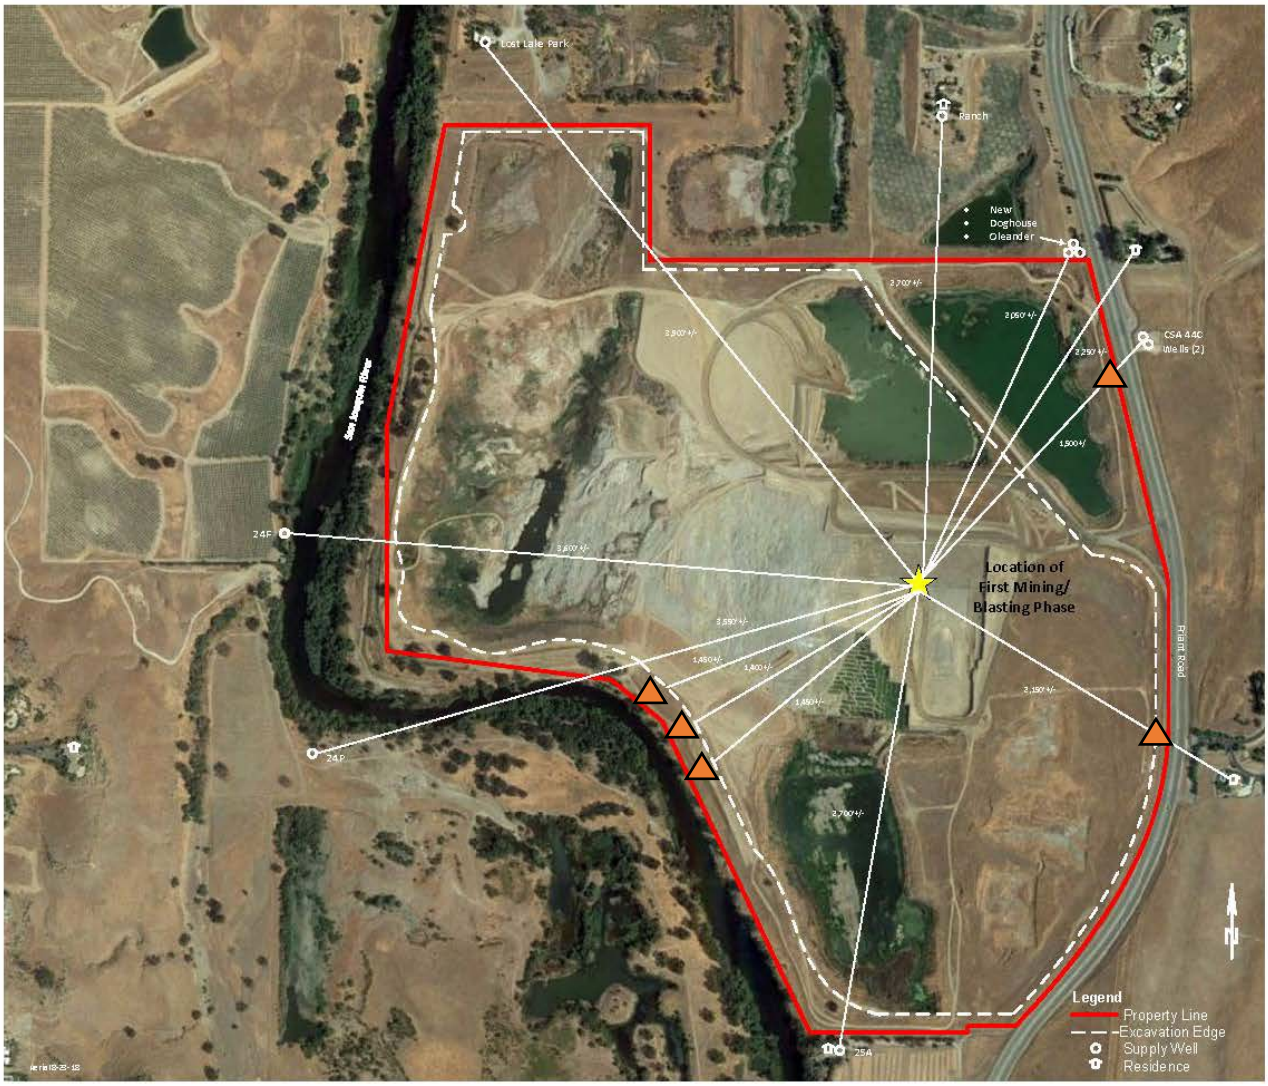

Figure 1 - Location of First Blast denoted by yellow star. Location of ground vibration and air overpressure monitors denoted by orange triangle.

If a property owner does not give permission for the monitoring to be conducted on their property then the seismograph should be placed at a location between the blast area and the property that did not provide permission (a closer distance to the blast).

Ground Vibration Measurements

a) Sensor placement - The sensor should be placed on or in the ground on the side of the structure closest to the blast, or in line with the blast

b) Location relative to the structure – Sensor placement should ensure that the data obtained adequately represents the vibration levels received at the structure being protected. The sensor should be placed within 10 feet of the structure or less than 10% of the distance from the blast, whichever is less.

    i) The sensor must be nearly level.
    ii) The longitudinal channel should be pointing directly at the blast or oriented with a reference direction (ex: North).
    iii) Where access to the structure and/or property is not available, the sensor should be placed closer to the blast in undisturbed soil.

c) Sensor coupling – Depending on the anticipated ground vibration acceleration levels spiking, burial, or sandbagging of the geophone may be appropriate depending on conditions.

    i) Burial, the preferred method, is excavating a hole that is no less than three times the height of the sensor, spiking the sensor to the bottom of the hole, and firmly compacting soil around and over the sensor.
    ii) Spiking entails removing the sod, with minimal disturbance of the soil and firmly pressing the sensor with the attached spike(s) into the ground.
    iii) Sand bagging requires removing the sod with minimal disturbance to the soil and placing the sensor on the bare spot with a sandbag over top. Sandbags should be large and loosely filled with about 10 pounds of sand. When placed over the sensor the sandbag profile should be as low and wide as possible with a maximum amount of firm contact with the ground

d) Ground Vibration Trigger Level - The trigger level should be programmed low enough to trigger the instrument from blast vibrations and high enough to minimize the occurrence of false events. The level should be slightly above the expected background vibrations of the area. A good starting level is 0.05 in/sec.

e) Record the full waveform. It is not recommended that the continuous recording option available on many seismographs be used for monitoring blast-generated vibrations. If the blast vibration is not sufficient to trigger the instrument a monitor log should be printed to show that the instrument was on and monitoring during the date and time that the blast occurred. A dynamic sensor check should also be part of the permanent record.

Air Overpressure Measurements

a) Microphone placement - The microphone should be placed along the side of the structure nearest the blast, or in line with the blast.

    i) The microphone should be mounted near the geophone with the manufacturer's windscreen attached.

ii) If practical, the microphone should not be shielded from the blast by nearby buildings, vehicles or other large barriers. If such shielding cannot be avoided, the horizontal distance between the microphone and shielding object should be greater than the height of the object above the microphone.

iii) If placed too close to a structure, the air blast may reflect from the house surface and record higher amplitudes. Structure response noise may also be recorded. Placing the microphone near a corner of the structure can minimize reflection.

2) Document the location of the seismograph. This includes the name of the structure and where the seismograph was placed on the property relative to the structure. Any person should be able to locate and identify the exact monitoring location at a future date.

3) Know and record the distance to the blast. The horizontal distance from the seismograph to the blast should be known to at least two significant digits. For example, a blast within 1000 feet would be measured to the nearest tens of feet and a blast within 10,000 feet would be measured to the nearest hundreds of feet.

C. Receptor Locations and Frequency of Monitoring

The Rockfield Quarry Blast Impact Analysis, dated September 9, 2019 lists six (6) residential/commercial locations, four (4) wells, and the San Joaquin River embankment as receptors of concern. The closest receptor locations will be based on the location of the blast. In order to ensure that the criteria set forth in the Blast Impact Analysis are met, vibration measurements need to be taken at the closest residential/commercial property, the closest well, and at three points to the San Joaquin River embankment.

D. Application of Particle Velocity and Air Overpressure Control

The ground vibration and air overpressure control limits for the receptors are detailed in the Vibra-Tech Blast Impact Analysis Report. The ground vibration and air overpressure limits are summarized below for residential/commercial structures, water wells and the east embankment of the San Joaquin River.

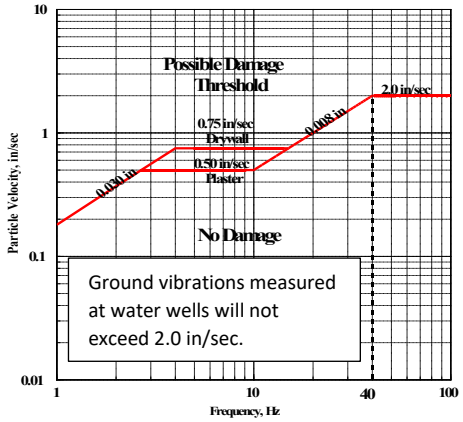

Figure 2 – Ground Vibration Criteria for Residential and Commercial Structures

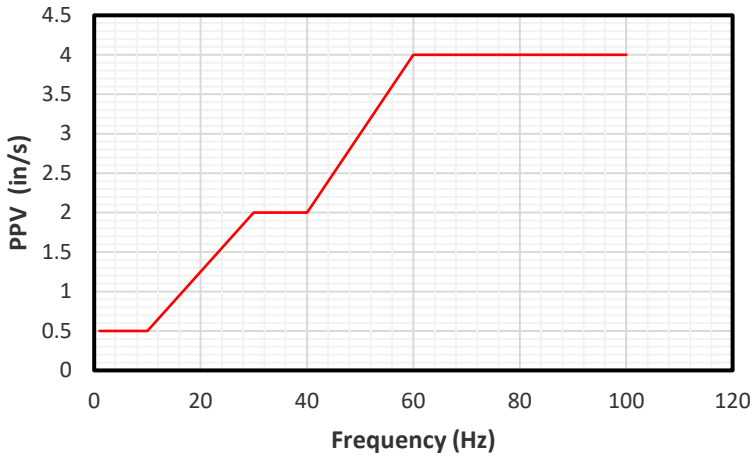

Figure 3 – Ground Vibration Criteria for East embankment of San Joaquin River

Lower Frequency Limits of Measuring System	Maximum Level in dB
0.1 Hz high-pass system	134 dB
2 Hz high-pass system	133 dB
5 or 6 Hz high-pass system	129 dB
c- slow (events not exceeding 2 sec duration)	105 dB

Table 1 – Air Overpressure limits for Residential and Commercial Structures

If the blasting operations at the Rockfield Quarry exceed the above referenced control limits for any single axis of ground vibration for any blast or the air overpressure control limit, CEMEX and their blasting contractor shall cease all blasting activities and provide notification to Fresno County. A corrective action plan will be submitted to Fresno County. The corrective action plan will give the blast design parameters and seismographic data and include any necessary proposed corrective action, which in their opinion will reduce ground vibration or air overpressure intensity.

E. Inspection of San Joaquin River Embankment

A pre-blast and post blast visual inspections of the portions of the San Joaquin Embankment that are located within 1,000 feet of each blast will be completed. These visual inspections will continue until blasts are at depths greater than 100 feet below the contact between alluvium and rock. The visual inspections will focus on signs of instability including slumping or cracking of the embankment. If any signs of instability are noted the operator will prepare a Corrective Action Plan in accordance with Section F below.

F. Corrective Action Plan

If the blast monitoring indicates that ground vibration or air overpressure exceed the criteria recommended by Vibra-Tech in Figures 2, 3, and Table 1 of this document or if flyrock exceeds the limits of the defined blast clearance zone, the operator will provide notification to Fresno County within 48 hours and identify changes to the blasting program that will be implemented to prevent future exceedances. The corrective action plan will require the immediate suspension of all blasting until the corrective action is implemented. A record of the Corrective Action Plan and the corrective actions implemented will be retained as per Section H.

G. Complaint Response Procedure

If the operation receives a blast vibration complaint, the date, time, name of complainant, complainant address, telephone number for complainant, nature of complaint, distance from blast to complainant, peak particle velocity and air overpressure level for seismograph closest to complainant, distance to seismograph from blast, and name of the person recording the complaint will be logged. The plant manager will be notified of the complaint and a return call will be made to the complainant, for complaints about which the Plant Manager has received notice. If damage is alleged by the complainant, the plant manager will arrange for a damage claim investigation from an independent third party.

H. Record Keeping

Blasting logs, drilling logs, blast videos, seismograph records and complaint logs will be retained for seven years. In addition, any Corrective Action Plans or corrective actions implemented will be recorded and retained. The blasting log will contain the full details of the drilling and blasting patterns used on site. At minimum, the Blast log will include the following:

- GPS Location for the blast
- Plan and section view of proposed drill pattern, including free face, burden, blast hole spacing, blast hole diameter, blast hole angle, lift height, and subdrill depth.
- Loading diagrams showing location, type, depth, and amount of explosives, primers, initiators, and stemming. The report will document charge weight/delay and total explosives consumed.
- Sketch of initiation sequence of blast holes, including delay times and delay system. Indicate on this sketch the location of GPS measurement.

I. Annual Reporting

An annual blast vibration monitoring report will be prepared and will summarize the results of the monitoring including comparison of the monitoring results to the applicable criteria. The report will include a graph with peak particle velocity on the X-axis and the corresponding frequency on the Y-axis. The graph will include the USBM Ground Vibration Criteria found in Section D - Figure 2 for comparison to the measured data. Data collected from the east embankment of the San Joaquin River will be plotted in a similar manner with the graph including the Ground Vibration Criteria found in Section D – Figure 3. Each blast will also be plotted on a graph showing Peak Air Overpressure vs. Blast Date from the seismograph closest to the nearest residential structure compared to USBM Air Overpressure limit found in Section D – Table 1.

The report will also include a regression analysis plot of peak particle velocity vs. scaled distance with the best fit and 95% confidence equations for the site. The report will also include a summary of blasting complaints and the results of any complaint investigations. The report will also provide a recommendation for modifying the prediction of blast-induced vibrations, if necessary, to improve the correlation of the predicted ground vibrations to the actual ground vibration measurements.

J. Annual Blasting Plan

An Annual Blasting Plan should be prepared and submitted to the County. The Annual Blasting Plan will identify the areas proposed for blasting and include proposed charge weight/delay limits for the designated areas. The proposed charge weight/delay limits will consider the results of the blast monitoring program and utilize the annual regression analysis plot of peak particle velocity vs. scaled distance with the best fit and 95% confidence equations for the site.

The charge weight/delay limits will be supported by calculations that maintain blast-induced vibrations below the following maximum values:

- Ground vibrations at residential structures, commercial structures, and groundwater wells shall be limited to those at or below the limits shown in the Vibra-Tech report, *Blast Impact Analysis, CEMEX Rockfield Quarry*, Sept 2019. Also shown in Section D Figure 2 of this document.
- Ground vibrations at the east San Joaquin River embankment shall be limited to those at or below the limits shown in the Vibra-Tech report *Blasting Induced Ground Vibration Effects on Structural Integrity of Nearby San Joaquin River Embankments*, May 2020. Also shown in Section D Figure 3 of this document.
- Air overpressures at residential or commercial structures shall be limited to those at or below the limits shown in in the Vibra-Tech report, *Blast Impact Analysis, CEMEX Rockfield Quarry*, Sept 2019. Also shown in Section D Table 1 of this document.
- In order to maintain the threshold of significance for human perception in the DEIR, ground vibration is limited to a ppv of 0.6 in/sec and air overpressure is limited to 0.01 psi as measured at occupied residential structures not owned by Cemex. These limits are documented in the Technical Note on Threshold of Significance for Human Response dated April 29, 2026.

If blasting is necessary outside of the areas indicated in the annual blast location plan a revised plan will be submitted to the County.

Flyrock Mitigation Plan

The purpose of rock blasting is to fracture and displace intact rock to facilitate its removal by mechanical equipment. This breakage and displacement occurs within a planned displacement zone called the muckpile. Rock fragments that are displaced beyond the planned displacement zone can be considered flyrock. The Mine Safety and Health Administration (MSHA) defines this area of expected blasted rock displacement as the blast area. The blaster-in-charge is responsible for defining the blast area and the clearance zone around the blast area. Inside the clearance zone the blaster-in-charge must evacuate all personnel and equipment prior to firing the blast. Outside of the clearance zone there should be no risk to personnel or equipment from flying rock fragments. Rock fragments that are displaced beyond the

clearance zone are called flyrock. The blaster-in-charge must develop and communicate a plan for every blast. This plan should

- Define the blast area
- Define an appropriate blast clearance zone based upon the proposed blast design, charging details and observed geologic conditions.
- Denote the location of warning signs outside the blast clearance zone
- Denote the location of guards outside the blast clearance zone to stop accidental entry into the clearance zone
- Define the warning whistles to be used to denote the imminent blast.

Flyrock is generated when the energy of the explosive is too close to the air/rock interface. The two primary origins for flyrock come from either the top of the blast area in the collar zone of the boreholes or from the vertical or sub-vertical free face of a bench blast. Flyrock can also originate from secondary blasting, where charges are placed in boulders to reduce oversize. Secondary breakage with explosives should be avoided at this site.

The key element of flyrock control is that explosive charges must have the appropriate degree of burial or confinement. The distance between the explosive and the air/rock interface is the charge burial distance. The appropriate charge burial distance will depend on the borehole diameter, explosive density, and the strength of the rock mass between the charge and the free surface. Flyrock can be reduced to extremely low levels with sufficient burial or confinement of explosive charges, but it can never be reduced to zero.

As stated earlier, the origin of flyrock is either from an area on the free face in front of a blast hole or the collar zone of the blast hole. The cause of flyrock from these two areas can usually be found to come from inadequate face burden or an inadequate length of stemming for a given hole diameter and explosive density. Mitigation measures for inadequate burden are:

- The blaster-in-charge must thoroughly examine the free face for signs of weak seams, voids, or cavities in the face that would serve as a zones of weakness for high pressure explosive gases to escape.
- Instrumentation and software are readily available for blasters to know the minimum burden anywhere along the length of a borehole for which a free face is available. Face profiles should be established in two dimensions for every face hole or in three dimensions for the entire face.
- In order to perform accurate face profile measurements, the free face must be clear of any muck material from previous blasts.
- The excavator should be prevented from over digging the face and toe area.
- An initial burden of 30 charge diameters should be maintained along all portions of the charge length. The burden can be changed as blasting progresses and experience is developed with the rock mass.
- Accurate drill logs must be provided to the blaster-in-charge that indicate the depth and thickness of any cavities, clay seams, or layers of unconsolidated/weaker material. If these are encountered the blaster must stem through these areas or provide other methods for preventing overloading.
- Accurate drill holes must be maintained and borehole deviation minimized. This is achieved through proper drill placement, leveling, alignment, and down pressure. If borehole deviation is suspected a borehole deviation survey should be conducted before loading.

Mitigation measures for inadequate length of stemming are:

- Measure all holes prior to loading to ensure no holes have blocked and holes are the planned drill depth.
- Measure explosive column rise during bulk loading to make sure holes are not overloaded. This is extremely important with gassing products.
- Utilize scaled depth of burial calculations to determine proper stemming heights for a given hole diameter and explosive density. A scaled depth of burial of 3.4 to 3.5 should be used for the initial stemming length calculation.
- The loading density should not be significantly higher than designed through incorrect gassing of emulsion products. Cup density[1] checks should occur frequently during the loading process.
- Angular crushed stone approximately 1/10th the blasthole diameter should be used as stemming material. When stemming the blastholes, the loader must ensure that the stemming column is continuous and the stemming material does not bridge the hole.

Other blast design errors that can cause flyrock from the top of the blast area are caused by too much confinement. If there is excessive face burden or inadequate time between rows of blastholes, the rock mass of the free face may not move out fast enough. This causes later holes in the design to be more confined with the explosive energy left with nowhere to escape except vertically.

Every blast should be recorded with a video camera from two locations. One location should be able to observe the free face of the rock mass containing the loaded blastholes and the other location should be at 90^{o} to the first location and be able to observe the top of the blast block and profile of the free face. These videos should be reviewed after each blast for any signs of ejected material beyond the clearance zone or gases coming from the free face or the collar zone of the blastholes. If these signs are observed details from the drill logs, burden profiles, blast reports, and seismograph records should be reviewed and appropriate corrective actions should be considered.

The above recommendations are made for dry ground conditions. Water saturated ground conditions can aid in the transmission of explosive pressure. This increased pressure can increase the potential for flyrock and extend the maximum displacement range of rock material. The blaster must apply additional factors of safety to his design in saturated ground conditions.

Groundwater and Surface Water Contamination Mitigation Plan

Best Management Practices for Blasting.

All activities related to blasting shall follow Best Management Practices (BMPs) to prevent contamination of groundwater and surface water including preparing, reviewing and following an approved blasting plan; proper drilling, explosive handing and loading procedures; observing the entire blasting procedures; evaluating blasting performance; and handling and storage of blasted rock.

[1] Cup Density – As a quality control measure a cup of known volume and mass is filled with the bulk explosive product after mixing the gassing agent. As the explosive product rises in the cup, the product is slashed to keep the cup volume constant. The explosive weight in the cup is measured and the density is calculated.

A. General Requirements

1. Handling of all explosive products shall be limited to qualified and licensed blasting contractors at all times.
2. Blast designs and loading controls shall be prepared by qualified blasting contractors or other experts to ensure complete detonation.
3. No explosives will be stored on site. All explosives will be delivered on site for each blast event, in D.O.T. certified commercial trucks. Any unused explosives material will be removed from the site after blasting is complete and returned to the point of origin. All local, state and federal D.O.T. regulations governing the transportation and handling of explosives will be obeyed.
4. All personnel transporting explosives to the site and onsite will carry a commercial driver's license with HAZ/MAT endorsement.
5. A current inventory of the types of explosive materials to be used on site, along with Material Safety Data Sheets, will be maintained onsite by qualified personnel.

B. Loading Practices

The following blasthole loading practices to minimize environmental effects will be followed:

1. Drilling logs shall be maintained by the driller and communicated directly to the blaster. The logs shall indicate depths and lengths of voids, cavities, and fault zones or other weak zones encountered as well as groundwater conditions.
2. Explosive products shall be managed on-site so that they are either used in the borehole, returned to the delivery vehicle, or placed in secure containers for off-site disposal.
3. Spillage of explosive materials around the borehole shall either be placed in the borehole or immediately cleaned up and properly disposed of in strict accordance with applicable state and federal regulations.
4. Loaded explosives will be detonated as soon as possible and will not be left in the blastholes overnight, unless weather or other safety concerns reasonably dictate that detonation should be postponed.
5. Loading equipment will be cleaned in an area where wastewater can be properly contained and handled in a manner that prevents release of contaminants to the environment.
6. Blasting contractors will follow industry accepted loading practices for priming, stemming, decking and column rise so that good continuity in the column load is maintained to promote complete detonation.

C. Explosive Selection

The following BMPs shall be followed to reduce the potential for groundwater contamination when explosives are used:

1. Blast holes shall be inspected prior to placement of explosive material to determine if water is present. In cases where the boreholes have standing water or are moist, explosive products shall be selected that are appropriate for site conditions and safe blast execution.
2. Explosive products will be selected that have the appropriate water resistance for the site conditions present to minimize the potential for hazardous effect of the product upon groundwater.

D. Muck Pile Management

Muck piles (the fragmented pieces of rock left after the blast) will be managed in a manner to reduce the potential for contamination by implementing the following measures:

1. Remove the muck pile from the blast area as soon as reasonably possible.
2. Manage the interaction of blasted rock piles and storm water to prevent contamination of groundwater or surface water.

APPENDIX A

Re:mote™

MONITORING

VIBRATION

Re:mote Vibration Monitoring System

Ground vibration comes from many sources in the construction, mining and energy development industries—but no matter where it comes from, it can create concerns for equipment, structures or adjacent neighbors.

The GeoSonics/Vibra-Tech Re:mote Vibration Monitoring System is a critical tool to help monitor and analyze vibration caused by construction activities. Our system will address project needs and provide experienced, third-party analysis of the collected data to help understand neighbor concerns. We use state-of-the-art instrumentation above standard blasting seismographs. This advanced technology allows two way communication between the operator and the seismograph, allowing downloads and instrument programming and diagnosis from anywhere in the world. Our capabilities far exceed others in the field, providing results of unassailable integrity.

Let us show you how the GeoSonics/Vibra-Tech Re:mote Vibration Monitoring System allows you to get data to project personnel without requiring them to spend hours in the field, saving you operational time and resources.

GeoSonics Vibra-Tech

MONITORING · ANALYSIS · REPORTING

geosonicsvibratech.com

GeoSonics Vibra-Tech

The GeoSonics/Vibra-Tech Re:mote Vibration Monitoring is a web enabled remote monitoring and data retrieval system designed for remotely accessed equipment with a managed web based interface for instrument setup and basic access to data retrieved from devices in the field. Hardware resources and overall data processing and analysis systems are managed and maintained by a centralized group system administrators, qualified support personnel and field technicians.

3000-Series Portable Vibration Monitors and IP-SR Re:mote™ Monitors have four recording modes: 1) triggered – either seismic or sound, 2) continuous with frequency (histogram), Dual mode (triggered mode plus histogram data without frequency), and 3) sustained trigger. Sustained trigger mode permits collection of consecutive waveform data up to a cumulative total of approximately 4.2 minutes. Data can be collected in either imperial (US customary) or metric units.

IP-SR Re:mote Vibration Monitor Specifications

STANDARD FEATURES:

- External geophone meets ISEE density recommendations.
- Flexible interface and extensive options available for custom configurations.

STANDARD FEATURES (Continued):

- Two (2) independent threshold alarm output ports.
- Imperial and metric operation.
- Designed & manufactured in the USA.

GENERAL:

- Weight.....7 lbs (6.7 kg)
- Dimensions..... 6 in x 8 in x 5.0 in
- Operating Temperature: 0 to 130° F (-18 to 55° C).

OPTIONAL ACCESSORIES:

- Hydrophones (instrument modifications required).
- Accelerometers to 500 g's (instrument mods. req'ed).
- Amplifiers (10x-100x).
- Optically isolated dual alarm control for dialers, pagers and remote alarm notifications.

RECORDING MODES:

Seismic Trigger:	Resolution:	0.0025 in/sec. (0.06 mm/sec.).
	Range:	Up to 5.120 in/sec. (130 mm/sec.)(Other ranges available).
	Frequency Response Range:	2 to 250 Hz (3 dB) / 2 to 1,000 Hz (Nyquist).
	Sampling Rate:	Up to 2,000 / second / channel.
	Recording Intervals:	1 to 15 seconds.
	Accuracy:	5% within one year (multi-frequency calibrated).
	Calibration:	Internal dynamic.
Sound Trigger:	Range (Linear):	82 to 148 dB (other ranges available).
	Frequency Range (3 dB):	2 to 250 Hz (3 dB) / 2 to 1,000 Hz (Nyquist).
	Accuracy:	5% within one year (multi-frequency calibrated).
	Calibration:	Internal electronic.
Continuous (Histogram):	Vibration Data:	Peak particle velocity and frequency for L, T & V.
	Recording Intervals:	Selectable: 1 to 60 seconds.
	Sound Data (Linear):	82 to 148 dB (other ranges available).
Sustained Trigger:	Multiple Event Recordings:	Consecutive waveform recordings up to 4.2 minutes.
Dual Mode:	Operating Specifications	Same as for Triggered and Histogram w/o frequency

APPENDIX I-5
PAVEMENT HAZARD IDENTIFICATION AND MITIGATION TECHNICAL MEMORANDUM

BENCHMARK RESOURCES

PETERS ENGINEERING GROUP
A CALIFORNIA CORPORATION

To: Ms. Christine M. Jones
CEMEX

From: John Rowland, PE, TE

Subject: Pavement Hazard Identification and Mitigation
CEMEX Rockfield Quarry Modification Project
Fresno County, California

Date: February 24, 2026

Peters Engineering Group prepared a traffic impact study for the CEMEX Rockfield Quarry Modification Project (hereinafter referred to as "the Project") and presented the results in a report dated November 15, 2019 (TIS) that was utilized in the Draft Environmental Impact Report dated December 2024 (DEIR). The purpose of this memorandum is to provide additional information related to identifying pavement hazards, specifically determining the severity of potholes based on size, and recommendations for mitigating the potential pavement hazard.

The U.S. Department of Transportation, Federal Highway Administration (FHWA) publication entitled *Distress Identification Manual for the Long-Term Pavement Performance Program* (Publication No. FHWA-HRT-13-092 Revised May 2014) describes potholes as bowl-shaped holes of various sizes in the pavement surface with a minimum plan dimension of 150 millimeters (mm) (approximately 6 inches). To qualify as a pothole, a 6-inch-diameter circle must fit within an irregularly-shaped pothole. FHWA describes the severity of potholes as follows:

- Low severity: less than 25 millimeters (mm) deep (approximately 1 inch)
- Moderate severity: 25 to 50 mm deep (approximately 1 to 2 inches)
- High severity: greater than 50 mm deep (approximately 2 inches)

The Transportation Research Board (TRB) *Circular Number E-C134, Influence of Roadway Surface Discontinuities on Safety, State of the Art Report* dated May 2009 states: "Holes in the pavement have to be a foot or more long and wider than a tire to be hazardous." TRB also states: "The greatest influence of holes on safety may be the hazard caused by drivers trying to avoid them."

Although it would be difficult to identify the cause of potholes, or the proportionality of responsibility for causing potholes, in the vicinity of the Project site, it is our professional opinion that the Project can mitigate its contribution to a hazardous pavement condition or a pavement safety concern by repairing highly-severe potholes.

It is recommended that, as a Project mitigation measure, until such time as other parties have entered agreements with the County of Fresno regarding sharing of these costs, at which time the Project operator's obligations would be reduced by such sharing, the Project operator shall repair potholes greater than 6.0 inches in width, length, or diameter, and greater than 2.0 inches in depth, within the travel lanes on Friant Road between North Fork Road and Willow Avenue (inclusive of the area within the intersections) as requested by the County of Fresno in response to substantiated reports from the public or as identified through County pavement condition surveys. The repair cost, including permits and fees, shall be the responsibility of the Project. Work shall be coordinated with the County of Fresno Public Works department, including closing lanes and maintaining public safety in accordance with the applicable County permits.

With the application of this mitigation measure, the pavement hazard impact would be mitigated to below a level of significance.

APPENDIX I-6
STATE ROUTE 41/FRIANT ROAD INTERCHANGE ANALYSIS TECHNICAL MEMORANDUM

BENCHMARK RESOURCES

PETERS ENGINEERING GROUP
A CALIFORNIA CORPORATION

TECHNICAL MEMORANDUM

To: Mr. J. Scott Miller
Mitchell Chadwick

From: John Rowland, PE, TE
Peters Engineering Group

Subject: Interchange Analysis – State Route 41 and Friant Road
CEMEX Rockfield Quarry Modification Project
Fresno County, California

Date: May 28, 2026

The purpose of this memorandum is to assess potential effects of the CEMEX Rockfield Quarry Modification Project (Project) contribution of vehicle trips at the interchange of State Route (SR) 41 and Friant Road. An aerial view of the interchange is presented in the attached Figure 1. This analysis focuses on observed conditions at the freeway off ramp intersections, the on ramps, and along Friant Road between approximately Nees Avenue and Fresno Street. The analyses include consideration of available traffic volume data and the relative effect of trips expected to be generated by the Project, and concludes that the trips generated by the Project will be within the normal variations and would not be expected to cause a significant change in operations or measurably affect average queue lengths, traffic signal operations, or ramp operations.

OBSERVED CONDITIONS

Site visits were conducted on Tuesday, May 19, 2026 to observe PM peak hour conditions and on Wednesday, May 20, 2026 to observe AM peak hour conditions. The observations are summarized below.

Tuesday, May 19, 2026: PM peak hour

The site visit was conducted from approximately 4:30 PM to just after 6:00 PM.

Westbound Friant Road: Traffic queues were observed in the right lane of westbound Friant Road approaching the SR 41 northbound and southbound on ramps. The queues did not appear to result from ramp metering or congestion on the ramps, but rather from very high lane utilization in the right lanes, with volume likely exceeding capacity for brief periods and long queues resulting during the red interval at the traffic signal for the northbound off ramp. The queues were observed extending to Fresno Street occasionally, but the observed queues did not block movements from the intersection of Friant Road and Fresno Street. The northbound on ramp is in advance of the signal limit line and was flowing freely, so queues were primarily

caused by traffic approaching the southbound on ramp. Queues were not excessive for through traffic on westbound Friant Road.

Eastbound Friant Road: Queues were observed in the right lane on eastbound Friant Road approaching the SR 41 southbound and northbound on ramps, and occasionally would extend to Nees Avenue and block movements from the intersection of Blackstone and Nees Avenues. The queues did not result from ramp metering or congestion on the ramps, but rather from high lane utilization in the right lane, with volume likely exceeding capacity for brief periods.

Queues were generally not excessive for through traffic on eastbound Friant Road, but the short spacing between Fresno Street, the northbound off ramp, and the southbound off ramp results in eastbound queues extending back to the next intersection. Eastbound Friant Road at times had the appearance of being completely backed up to the northbound off ramp, but queues on Friant Road generally clear during each traffic signal cycle.

Northbound SR 41 off ramp to Friant Road: Queues on the off ramp between 5:00 and 6:00 PM frequently were observed to extend approximately half a mile from Friant Road, primarily in the right lane for vehicles intending to turn right and proceed eastbound on Friant Road. It was estimated that vehicles making this movement would require two to four traffic signal cycles before passing through the intersection. There were periods when the right turn from the off ramp appeared to be completely blocked by eastbound traffic on Friant Road backed up from Fresno Street. However, the right turn from the off ramp typically flowed well once the green interval at the traffic signal at Fresno Street cleared eastbound Friant Road.

Southbound SR 41 off ramp to Friant Road: It appeared that there were brief periods during which long queues occurred, but it appeared that the queues were able to clear during each traffic signal cycle. No blockage from traffic on eastbound Friant Road extending from the signal at the northbound off ramp was observed.

Wednesday, May 20, 2026: AM peak hour

The site visit was conducted from approximately 7:30 AM to just after 8:00 AM.

Westbound Friant Road: Traffic queues were observed in the right lane of westbound Friant Road approaching the SR 41 northbound and southbound on ramps. The queues appeared to result from ramp metering on the southbound on ramp. It appears that Caltrans has implemented queue override techniques to prevent excessive spillback on Friant Road. Specifically, it was observed that the ramp meters on the southbound on ramp would occasionally stay green for extended periods of time, which would clear nearly the entire queue along Friant Road, and then switch back to typical metering with two cars per green in each lane. The queues occasionally appeared to extend to Fresno Street; however, at no time was the queue observed to block movements from the intersection of Friant Road and Fresno Street. The northbound on ramp is in advance of the signal limit line and was flowing freely, so queues were primarily caused by traffic approaching the southbound on ramp. Queues were not excessive for through traffic on westbound Friant Road. It was observed that queues for the left lane on westbound Friant Road at the northbound ramps typically cleared during each traffic signal cycle.

Eastbound Friant Road: Excessive queues were not observed on eastbound Friant Road. Traffic volumes appeared to be substantially less than the PM volumes.

Northbound SR 41 off ramp to Friant Road: Queues during the AM peak hour were much shorter than during the PM peak hour. The longest queues observed occurred for very short

periods and were likely only a few hundred feet long. Queues appeared to clear during each traffic signal cycle and no blockage was observed.

Southbound SR 41 off ramp to Friant Road: It appeared that that the queues were able to clear during each traffic signal cycle. No blockage was observed.

TRAFFIC VOLUMES

Traffic volume data available on the Caltrans web site (https://dot.ca.gov/programs/traffic-operations/census) was obtained for SR 41 freeway mainline volumes and for on ramp and off ramp volumes at Friant Road. Data were also obtained from intersection turning movement counts available in the *Vulcan Materials Austin Quarry Updated Traffic Impact Study Report* dated January 2016. The intersection turning movement counts indicate that the total volume of vehicles entering the intersection of Friant Road and the SR 41 southbound ramps in 2012 was 7,524 during the AM peak hour and 9,848 during the PM peak hour. The intersection turning movement counts indicate that the total volume of vehicles entering the intersection of Friant Road and the SR 41 northbound ramps in 2012 was 7,976 during the AM peak hour and 10,746 during the PM peak hour.

Ramp and mainline volumes available from Caltrans between 2013 and 2024 were reviewed to identify the actual historic growth rate near the interchange. The table below presents the historic volume, the most recent volume available, and growth rate data.

Table 1
Historic Volumes and Growth Rates

Location	Year	Volume	Year	Volume	Annual Growth Rate
SR 41 north of Friant Road	2013	43,000	2024	59,000	2.92%
SR 41 south of Friant Road	2013	76,000	2024	86,000	1.13%
SR 41 NB off to Friant Road	2015	24,900	2023	22,000	-1.54%
SR 41 NB on from EB Friant	2015	4,400	2023	4,600	0.56%
SR 41 NB on from WB Friant	2015	3,900	2023	5,800	5.09%
SR 41 SB off to Friant Road	2015	7,800	2023	9,800	2.89%
SR 41 SB on from EB Friant	2015	10,800	2023	11,500	0.79%
SR 41 SB on from WB Friant	2015	11,800	2023	12,700	0.92%

To estimate 2026 volumes, it is considered appropriate to apply the growth rates to the locations identified in Table 1 and to assume an annual growth rate of one percent on Friant Road. Applying these growth rates to the intersection turning movement count data, and assuming an annual growth rate of one percent on Friant Road itself, the estimated year 2026 volumes at the ramp intersections are as follows:

- intersection of Friant Road and the SR 41 southbound ramps: 8,996 during the AM peak hour and 11,873 during the PM peak hour.
- intersection of Friant Road and the SR 41 northbound ramps: 8,821 during the AM peak hour and 11,419 during the PM peak hour.

Table 2 presents the Project's net peak-hour trips at the Friant Road / SR 41 interchange and also presents the total volume estimated at the intersection with the addition of Project trips.

Table 2
Percentage of Net Project Trips at State Route 41 / Friant Road Intersections

Location	AM Peak Hour			PM Peak Hour		
	Net Project Trips	Total Volume	Project Percentage	Net Project Trips	Total Volume	Project Percentage
Friant / SR 41 SB Ramps	27	9,023	0.3%	0	11,873	0.00%
Friant / SR 41 NB Ramps	48	8,869	0.5%	0	11,419	0.00%

Note: Total volume includes net Project trips. Net Project trips are calculated using data from the Traffic Impact Study – Proposed CEMEX Rockfield Modification Project (Peters Engineering Group, November 15, 2109; Appendix I-1 of the Project Draft EIR).

DISCUSSION

It should be noted that operational analyses for conditions in which demand (volume) exceeds capacity and/or queues are extremely long (such as those observed under existing conditions as described above) produce results that are highly sensitive to assumptions actual arrival patterns, storage limitations, and queue interactions. Consequently, such analyses are not able or expected to provide precise predictions regarding the operational effect of the relatively small number of Project-generated trips. Therefore, Project-specific operational analyses to attempt to define levels of service and estimate queues have not been performed and are not expected to provide useful output given the very small percentage of net Project trips to existing traffic conditions at the subject locations.

Moreover, urban intersections typically experience daily fluctuations in traffic volumes, with a commonly-accepted standard that traffic volumes generally fluctuate up to 10 percent. The "10% rule" is described in *Evolving Standard Validation Practices for Traffic Data* dated February 8, 2022 by Fehr & Peers (and also referencing the Federal Highway Administration *Traffic Monitoring Guide* Updated October 2016) as follows: "Referring to a collection of counts for only one, or occasionally two, weekdays to represent typical weekday traffic volumes for an area. The presumption is that one to two days of counts would generally fall within +/-10% of the typical weekday volume." As such, the existing conditions peak-hour traffic volumes may fluctuate by several hundred per peak hour, perhaps up to as much 900 vehicles during the AM peak hour.

The net Project trips at the Friant Road / SR 41 interchange are a very small fraction of the total traffic volumes and are operationally negligible with respect to the total volumes at the intersections. During the AM peak hour the Project trips represent half a percent or less of the total volume, and no net Project trips are expected for typical average conditions during the PM peak hour. Project truck trips are expected to be present on any given approach to the intersections at a rate of substantially less than one truck per minute, and would contribute a negligible effect on overall traffic operations. Considering the daily fluctuations in traffic volumes typically expected in urban areas, the trips generated by the Project will be within the normal variations that would occur under existing conditions without the Project and are not expected to cause a significant change in operations or measurably affect average queue lengths, traffic signal operations, or ramp operations at the SR 41 and Friant Road interchange.

STATE ROUTE 41 / FRIANT ROAD INTERCHANGE
FRESNO, CALIFORNIA

APPENDIX L
REVISED NOTICE OF AVAILABILITY

County of Fresno

DEPARTMENT OF PUBLIC WORKS AND PLANNING
STEVEN E. WHITE, DIRECTOR

FROM:
David Randall, Senior Planner
Fresno County Public Works and Planning Department
Divisions of Public Works and Planning
2220 Tulare St., 6th Floor
Fresno, CA 93721

SUBJECT: SCH No. 2020060123 Revised Notice of Availability of a Draft Environmental Impact Report (EIR) for the Proposed CEMEX Rockfield Quarry Modification Project (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

The County of Fresno has extended the public review period for the Rockfield Quarry Expansion Project (SCH No. 2020060123) to ensure that all interested parties have adequate time to review the Draft EIR and provide comment. The public review period stated in the original Notice of Availability (NOA) was January 2, 2025, to February 17, 2025. The revised NOA, submitted with this memorandum, has a public review period of January 2, 2025, to March 10, 2025. The NOA was also revised to eliminate the reference to the public information meeting which was held on January 16, 2025. No other changes to the project or the NOA have been made.

FROM: David Randall, Senior Planner
Fresno County Public Works and Planning Department
Development Services and Capitol Projects Division
2220 Tulare St., 6th Floor,
Fresno, CA 93721

SUBJECT: Reissued Notice of Availability of a Draft Environmental Impact Report (EIR) for the proposed modification to the existing CEMEX Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

SUMMARY: The County of Fresno (County) is releasing this Notice of Availability (Notice) to announce an extension of the comment period, and to notify additional agencies that the County has prepared a Draft EIR in compliance with the California Environmental Quality Act (CEQA) for the CEMEX Rockfield Quarry Modification Project (Project) situated in an area of unincorporated Fresno County, California (see APNs and Longitude and Latitude listed below). Fresno County, as the local land use authority, may permit mining operations on unincorporated lands through the Conditional Use Permit process accompanied by approved Reclamation Plans in accordance with Section 834.4.220 of the Fresno County Zoning Ordinance. The document serves as the second Notice for this project and is being reissued to broaden the distribution list of recipients and to extend the comment period.

CEMEX Construction Materials Pacific LLC (hereinafter referred to as the "Applicant") has submitted an application to the County for two Unclassified Conditional Use Permits (CUP Application Nos. 3666 and 3667) to facilitate the continuation and modification of the Rockfield Quarry's existing operations in aggregate mining and processing, which includes rock, sand, and gravel. The project encompasses two distinct locations situated approximately two miles apart. The first location, known as the Plant Site, is positioned on the west side of North Friant Road, between North Willow Avenue and Little Dry Creek. The second location, referred to as the Quarry Site, is also on the west side of North Friant Road, situated between Bluff View Avenue and Lost Lake Road. The County has assumed the role of the lead agency for the preparation of the Environmental Impact Report (EIR No. 7763) for this project and is issuing this Notice in accordance with Section 15087 of the CEQA Guidelines.

Assessor Parcel Numbers (APNs):

Plant Site APNs: 300-070-56S, 300-070-57S, 300-070-58S, 300-070-59S, and 300-070- 60S (Latitude: 36°55’44” N / Longitude: 119°44’12” W)

Quarry Site APNs: 300-040-19, 300-040-20, 300-080-01S, 300-250-12, and 300-310-01 (portion) (Latitude: 36°57’20” N / Longitude:119°44’00” W)

PROJECT DESCRIPTION: The Applicant is requesting the continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operations. The Project includes the following two project life stages that are estimated to span 100 years:

Stage 1:

- Continue concurrent operations at both the Quarry Site and the Plant Site for up to 30 Years.
- At the Plant Site, the existing aggregate processing plant would continue to be used to wash, screen, crush and sort aggregate mined on site.
- At the Quarry Site the hard rock deposit that lies beneath the alluvial deposit currently being mined, would be mined. Excavation of the hard rock would require drilling and blasting and would occur to a depth of approximately 600-feet below ground surface (bgs).
- An aggregate processing plant would be added to the Quarry Site to wash, screen, crush, and sort the hard rock to be mined on site.
- Aggregate products produced at the Quarry Site used at the asphalt and ready-mix plants at the Plant Site would be transported approximately 2 miles south to the Plant Site via Friant Road in the same manner as the raw aggregate currently being transported from the Quarry Site to the Plant Site for the existing operations.
- Other aggregate products produced at the Quarry site not used by the asphalt and ready-mix plants at the Plant Site would be sold directly from the quarry.
- The existing asphalt plant at the Plant Site would be replaced with a modern Hot Mix Asphalt (HMA) plant.
- Periodic use of a portable crushing plant to recycle come-back concrete would continue with the addition of asphalt recycling and import of concrete debris to recycle into crushed miscellaneous base (CMB) and asphalt debris to be recycled asphalt product (RAP).
- Mine the remaining alluvial deposit at the Plant Site to a depth of approximately 85-feet below ground surface (bgs).
- Relocation of the plant operations at the Plant Site to the Quarry Site in less than 30 years to recover the deposit beneath the plants.
- Upon approval of project permits, the combined annual sales of aggregate from both sites are estimated to ramp up from the 1.4 MT allowed under the current

permits to 2.0 MT in approximately five years and up to 3.0 MT in approximately 10 years.

- When mining is completed at the Plant Site, reclamation would consist of approximately 122 acres of open space, riparian and open water wildlife habitat.

Stage 2:

- Continue hard rock mining and processing operations only at the Quarry Site for approximately 70 more years. The ready-mix concrete plant and the hot-mix asphalt plant would be relocated from the Plant Site to the Quarry Site.
- The periodic use of a portable plant to recycle concrete and asphalt debris (including imported) into CMB and RAP would be added to the Quarry Site.
- All aggregate products produced at the Quarry site would be used by the on-site asphalt and ready-mix plants or sold directly from the Quarry Site. The interplant haul would cease.
- Stage 2 operations are estimated to have annual aggregate sales of 3.0 MT.
- Reclamation of the Quarry Site would create approximately 349 acres of open space, riparian and open water wildlife habitat.

SIGNIFICANT ENVIRONMENTAL EFFECTS: The Draft EIR identified the following significant and unavoidable impacts. All remaining impacts would be significant or potentially significant prior to the implementation of mitigation measures but would be reduced to less than significant levels with mitigation applied.

- Aesthetics and Visual Resources: The project would have a substantial adverse effect on a scenic vista and would substantially degrade the existing visual character or quality of public views of the project sites from two locations. Mitigation would require the exposed rock of the quarry pit wall to be stained to reduce contrast and visibility.
- Transportation: The project would cause traffic delays at two intersections which cannot be fully mitigated due to the availability of funding for necessary improvements.

DOCUMENT AVAILABILITY: The Draft EIR and all supporting technical and reference documents are available for review at the following locations:

- Fresno County Public Works and Planning Department Current Planning Counter: 2220 Tulare St., Annex Suite B Fresno, CA 93721
- CEQAnet Web Portal (SCH #2020060123): https://ceqanet.opr.ca.gov/

- Fresno County Website (Cemex Rockfield Expansion): https://www.fresnocountyca.gov/eir7763

PUBLIC COMMENT: Due to the time limits mandated by state law, the public agencies and members of the general public should provide written comments on the Draft EIR to the County by 5:00 PM on March 10, 2025. Written comments on the Draft EIR should be sent to the following address:

David Randall, Senior Planner
Fresno County Public Works and Planning Department
Development Services and Capitol Projects Division
2220 Tulare St., 6th Floor.
Fresno, CA 93721

Or via e-mail with subject line "CEMEX Rockfield Quarry Modification Project EIR" to:
DRandall@FresnoCountyCA.gov

This Notice supersedes all previous Notices of Availability. Requests to be provided future public notices for this project may be sent to the same email or address above.

Following the public review and comment period, the County will respond to all written comments received on the environmental analysis in the Draft EIR. The responses, along with any modifications to the Draft EIR, will be compiled into a response-to-comments document. The response-to-comment document, along with the Draft EIR and its appendices, will form the Final EIR for the proposed project. In accordance with CEQA (Section 21092.5), the Final EIR, will be made available at least 10 days before certification.

Dear Mr. Randall:

Comment 1-1

Fresno County Fire Protection District (FCFDP) has received notice of this project, and has not identified any significant concerns. FCFPD has no comment for this project at this time. If future development is sought, your project/development will be subject to the requirements of the current Fire Code and Building Code when a building permit or certificate of occupancy is sought. Your project/development may be required to annex into the Community Facilities District No. 2010-01 of the Fresno County Fire Protection District.

Please feel free to contact me at (559) 319-0400 with any questions, comments and/or concerns.

Sincerely,

DUSTIN HAIL
District Fire Chief

Good morning David,

The Rockfield Quarry Modification Project EIR No. 7763 and Unclassified CUP Application Nos. 3666 and 3667 Summary document describes the proposed continuation and modification of the aggregate mining and possessing operations; however, the documents provided are from original proposed operation. The CEMEX Rockfield Modification Project Traffic Impact Study (2019), VMT Letter Addendum to Traffic Impact Study (2020), Scoping Meeting Agenda (2020) are all out of date. The documents concerning this modification should be forwarded for review.

SENT VIA EMAIL

Mr. Tawanda Mtunga, Principal Planner
Fresno County -PWP
2220 Tulare St. 6th Floor
Fresno, CA 93723
Tmtunga@fresnocountyca.gov

Dear Mr. Mtunga:

Caltrans has completed the review of the Draft Environmental Impact Report No. 7763 for Conditional Use Permit Nos. 3666 and 3667. CUP Application No. 3666 proposes to amend the approval of the Plant Site, previously approved under CUP Nos. 2235, 3034, and 3094. CUP Application No. 3667 proposes to amend the approval of the Quarry Site, previously approved CUP Nos. 367, 2032, 3063, and 3093.

The project site is located north of State Route (SR) 41/Friant Road interchange. Comment 2b-1

The mission of Caltrans is to provide a safe and reliable transportation network that serves all people and respects the environment. The Local Development Review (LDR) process reviews land use projects and plans through the lenses of our mission and state planning priorities of infill, conservation, and travel-efficient development. To ensure a safe and efficient transportation system, we encourage early consultation and coordination with local jurisdictions and project proponents on all development projects that utilize the multimodal transportation network.

Caltrans provides the following comments consistent with the State's smart mobility goals that support a vibrant economy and sustainable communities:

1. The CEMEX Rockfield Modification Project Traffic Impact Study (2019) is outdated and no longer reflective of current or future conditions. The study neglects the intersections of Friant Road with the State Route 41 interchange ramps despite their proximity to and functional relationship with the project (Comment documented in the Technical Memorandum - Response to Comments on Traffic Impact Study, dated Comment 2b-2

December 17, 2020, with a cost per trip table).

Vehicle queues are not properly addressed at or near this interchange. Queues from the local road intersections (Fresno Street and Nees Avenue) along Friant Road that extend to the ramp intersections are a concern. These conditions, along with potential off-ramp queues spillback, should be analyzed to assess operational and safety impacts.

2. The Traffic Impact Study recommends improvements to the SR 41 / SR 145 intersection. Given the extent of the modifications recommended, an Intersection Safety and Operational Assessment Process (ISOAP) would be required prior to Caltrans' consideration of intersection modifications within State right-of-way. Comment 2b-3

   The ISOAP Guide provides a data-driven, performance-based framework incorporating the Safe System Approach to screen intersection strategies and identify optimal solutions for new or improved intersections. ISOAP objectively helps select intersection control and geometric designs for the expected users within the context of an intersection's location.

If you have any other questions, please call or email: Keyomi Jones, Associate Transportation Planner at (559) 981-7284 or keyomi.jones@dot.ca.gov.

Sincerely,

Mr. Dave Padilla, Branch Chief,
Local Development Review

Subject: Comments for the Draft Environmental Impact Report, Proposed Modification to the Existing CEMEX Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667) Project, SCH# 2020060123, Fresno County

Comment 4-1

Dear David Randall,

The Central Valley Flood Protection Board (Board) appreciates the opportunity to comment on the Draft Environmental Impact Report (DEIR) for the Proposed Modification to the Existing CEMEX Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667) Project (proposed project).

The proposed project involves the continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operation in two project stages that are estimated to span 100 years. The proposed project is located along the San Joaquin River, a regulated stream and designated floodway that is within the Board's permitting authority, therefore an encroachment permit may be required. Board permit information is available on the Permitting page at the Central Valley Flood Protection Board website.

Please include the Central Valley Flood Protection Board encroachment permit regulatory setting under heading 4.10.2.2 State.

California Code of Regulations, Title 23 provides standards that govern the design and construction of projects that affect the flood control works and floodways. Board staff recommends that you review Title 23 Standards, including Sections 112 (Streams Regulated and Nonpermissible Work Periods), 116 (Borrow and Excavation Activities – Land and Channel), and 130 (Patrol Roads and Access Ramps). Any deviation or variation from these standards will require approval from the Board.

Responsibility of the Central Valley Flood Protection Board

The Board is the State's regulatory agency responsible for enforcing appropriate standards for the construction, maintenance, and operation of the flood control system that protects life, property, and habitat in California's Central Valley. The Board operates under authorities as

Docusign Envelope ID: 863DFDB3-7455-4603-B963-C2EA1A9C90E9

described in California Water Code (Water Code), which requires the Board to oversee future modifications or additions to facilities of the State Plan of Flood Control (SPFC).

Encroachment Permit

Per California Code of Regulations, Title 23, Waters, Division 1 (Title 23), Section 6, approval by the Board is required for all proposed work or uses, including the alteration of levees within any area for which there is an Adopted Plan of Flood Control within the Board's jurisdiction. In addition, Board approval is required for all proposed encroachments within a floodway, on adjacent levees, and within any Regulated Stream identified in Title 23, Table 8.1. Specifically, Board jurisdiction includes the levee section, the waterward area between project levees, a minimum 10-foot-wide strip adjacent to the landward levee toe, the area within 30 feet from the top of bank(s) of Regulated Streams, and inside Board's Designated Floodways. Activities outside of these limits which could adversely affect Federal-State flood control facilities, as determined by Board staff, are also under the Board's jurisdiction. Permits may also be required for existing unpermitted encroachments or where it is necessary to establish the conditions normally imposed by permitting, including where responsibility for the encroachment has not been clearly established or ownership or uses have been changed.

Flood Impacts Analysis

Pursuant to Section 15 of Title 23, the Board may deny an encroachment permit if the proposed project could:

- Jeopardize directly or indirectly the physical integrity of levees or other works
- Obstruct, divert, redirect, or raise the surface level of design floods or flows, or the lesser flows for which protection is provided
- Cause significant adverse changes in water velocity or flow regimen
- Impair the inspection of floodways or project works
- Interfere with the maintenance of floodways or project works
- Interfere with the ability to engage in flood fighting, patrolling, or other flood emergency activities
- Increase the damaging effects of flood flows
- Be injurious to, or interfere with, the successful execution, functioning, or operation of any adopted plan of flood control
- Adversely affect the State Plan of Flood Control, as defined in the California Water Code

The Board, as a Responsible Agency under the California Environmental Quality Act (CEQA), will review and consider the environmental effects of the proposed project identified in the DEIR, and will reach its own conclusions on whether and how to approve the project involved (14 CCR 15096, subd. (a)). This includes direct impacts to facilities under construction, as well as indirect impacts from the proposed project to surrounding facilities. Accordingly, the comments herein are intended to assist in the development of a robust CEQA document capable of supporting the Board's permitting process.

Closing

The potential risks to public safety, including increased flood risks, need to be considered when developing proposed projects that seek to modify flood control works or the hydrology of the water ways. Board staff is available to discuss any questions you have regarding the above

Docusign Envelope ID: 863DFDB3-7455-4603-B963-C2EA1A9C90E9

comments. Please contact Jordan Robbins at (916) 524-3454, or via email at Jordan.Robbins@CVFlood.ca.gov if you have any questions.

Sincerely,

Jamie Silva

DRAFT ENVIRONMENTAL IMPACT REPORT NO. 7763; RMC PACIFIC MATERIALS, LLC; ROCKFIELD QUARRY MODIFICATION PROJECT, UNCLASSIFIED CONDITIONAL USE PERMITS 3666 AND 3667; FRESNO COUNTY

Comment 5-1

Central Valley Regional Water Quality Control Board (Central Valley Water Board) staff has reviewed Draft Environmental Impact Report (DEIR) No. 7763 for the RMC Pacific Materials, LLC (CEMEX) Rockfield Quarry Modification Project. According to the DEIR's description, CEMEX plans to modify and expand its current aggregate mining and processing operations along the San Joaquin River near Friant in Fresno County (Project). The proposed Project will affect operations at two existing locations identified as the Quarry site and the Plant site.

The proposed Project will be implemented in two stages. During Stage One, CEMEX proposes to extend mining operations at the Quarry site to mine the hard rock deposit. The mining, which will include drilling and blasting, will extend to a final depth of approximately 600 feet. In addition, CEMEX will construct a new aggregate processing plant at the Quarry site to wash, screen, crush, and sort the mined hard rock. At the Plant site, mining operations will be extended to a final depth of approximately 85 feet before the area is reclaimed as open space and riparian habitat. Aggregate processing operations will continue at the Plant site during this period. In addition, CEMEX will replace the existing asphalt plant at the Plant site with a new hot-mix asphalt plant. Stage One is estimated to span 30 years and increase annual aggregate production from the current 1.4 million tons per year to eventually 3.0 million tons per year.

Stage Two is proposed to span an additional 70 years. During Stage Two, aggregate production will continue only at the Quarry site with a sustained volume of about 3.0 million tons per year. Also, during Stage Two, the ready-mix concrete plant and hot-mix asphalt plant will be relocated to the Quarry site, near the new aggregate processing plant, and all processing operations will take place at the Quarry site.

The Central Valley Water Board is responsible for protecting the quality of surface waters and ground waters of the State; therefore, our comments will address issues related to water quality matters only. The following sections discuss various programs and/or requirements applicable to the proposed Project. Comment 5-2

Waste Discharge Requirements (WDRs)

The Central Valley Water Board originally commented on the Notice of Preparation for the proposed Project in a letter dated 3 July 2020 (attached). In our letter we identified that the discharge of process wastewater from the existing aggregate processing plant at the Plant site is subject to regulation under individual waste discharge requirements (WDRs). WDRs Order 90-083 currently regulates the discharge of wastewater from the aggregate processing plant to onsite settling ponds at the Plant site. As discussed in our previous comment letter, WDRs Order 90-083 will need to be updated to reflect the changes outlined in the proposed Project.

In accordance with Water Code section 13260, CEMEX is required to submit a complete Report of Waste Discharge (RWD) to the Central Valley Water Board at least 140 days prior any material change or increase in the discharge as a result of the proposed Project. The RWD must characterize and evaluate all discharges of waste that may occur at the properties, including the discharge of aggregate wash water, ready-mix concrete wash water, and any wastewater generated at the hot-mix asphalt facility. The DEIR should clearly specify that that applicant will need to submit a RWD to the Central Valley Water Board to address changes in its operation before the proposed Project can proceed.

At a minimum the RWD should include:

1) A Form 200 signed and certified by a duly authorized person at CEMEX
2) A Technical Report that identifies all waste handling and storage areas for both solid and liquid wastes from all processing operations (i.e., aggregate processing plant, ready-mix concrete plant, and hot-mix asphalt plant) at both locations, and describes the treatment process and characterizes the discharge from the new aggregate processing plant at the Quarry site.
3) Discuss how the proposed Project's expanded operations will comply with the Salt and Nitrate Control Programs. Information on the Salt and Nitrate Control Programs can be found on the website at:

   https://waterboards.ca.gov/centralvalley/water_issues/salinity/

Note that the Nitrate Control Program is a prioritized program. The proposed Project is within Groundwater Basin 5-22.08 (San Joaquin Valley – Kings), and in a Priority 2 portion of the basin/sub-basin. Dischargers in Priority 2 basins were issued Notices to Comply in December 2023. Some sand and gravel facilities within the Central Valley have been determined to be exempt from the Nitrate Control Program because the typical washing process at aggregate processing plants does not appear to result in increased nitrogen concentrations in the discharge. However, the proposed Project will

include hard-rock blasting at the Quarry site, which may introduce materials such as ammonium nitrate fuel oil and other nitrogen containing compounds as blasting agents, which could potentially impact groundwater through the storage and handling of wastewater from aggregate processing operations. Therefore, the RWD should include a Nitrogen Source Evaluation to identify known or potential sources of nitrogen in the proposed discharge from the aggregate processing plants and dewatering water from the Quarry Site mine pits and evaluate the potential impact on underlying groundwater.

The Technical Report and Nitrogen Evaluation accompanying the RWD must be prepared and certified by a person registered to practice in California pursuant to California Business and Professions Code sections 6735, 7835, and 7835.1.

Construction and Industrial Storm Water General Permits

Comment 5-3

Dischargers whose project disturbs one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs more than one acre, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit Order No. 2022-0057-DWQ). Construction activity subject to this permit includes cleaning, grading, grubbing, and disturbances to ground such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line grade or capacity of the facility. The Construction General Permit requires development and implementation of a Storm Water Pollution Prevention Plan (SWPPP).

Storm water discharges associated with specific industrial activities, including some mining and mineral processing activities, must comply with the regulations contained in the Industrial Storm Water General Permit Order 2014-0057-DWQ.

Information on the Construction Storm Water General Permit and the Industrial Storm Water General Permit can be found on the State Water Resources Control Board website at:

https://waterboards.ca.gov/water_issues/programs/stormwater/construction.html

https://waterboards.ca.gov/water_issues/programs/stormwater/industrial.html

Dredge and Fill Permitting for Discharges to Waters of the United States and/or Waters of the State

Comment 5-4

If the Project includes the discharge of dredge and/or fill material to wetlands and/or to non-wetland waters (e.g., creek, river, pond, etc.), CEMEX must submit an application to the Central Valley Water Quality Board for such discharges. The State Water Resources Control Board and Central Valley Water Board (collectively, Water Boards) have the authority to regulate the discharge of dredged or fill material under section 401 of the Clean Water Act and the Porter-Cologne Water Quality Control Act. Dischargers that obtain a federal permit or license that authorizes impacts to waters of the United States (i.e., waters that are within federal jurisdiction), such as section 404 of the Clean Water Act and section 10 of the Safe Rivers and Harbors Act, must obtain certification from the

Water Boards to ensure that the discharge does not violate state water quality standards or any other appropriate requirements of State law. When a discharge is proposed to waters outside of federal jurisdiction, the Water Boards regulate the discharge under Porter-Cologne Water Quality Control Act through the issuance of WDRs. Comment 5-4 Cont.

The State Water Resources Control Board adopted the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State* (Procedures), which became effective on 28 May 2020. Applications for dredge/fill activity and the processing of applications must comply with the Procedures. The Procedures require, among other things, a project applicant to conduct a delineation of waters, including wetlands, in an aquatic resource delineation report. The delineation must be performed as specified in the Procedures. The Procedures also require, in some instances, an alternatives analysis to identify the Least Environmentally Damaging Practicable Alternative. Even if a project is determined to be exempt from the Procedures' alternatives analysis requirement, the applicant must, at a minimum, demonstrate a sequence of actions has been taken to first avoid, then to minimize, and lastly compensate for adverse impacts that cannot be practicably avoided or minimized to waters of the state. Comment 5-5

Information supporting the Procedures including an implementation guidance document can be found here: https://www.waterboards.ca.gov/water_issues/programs/cwa401/wrapp.html.

Other resources for applicants, including the application form and fee information can be obtained here: https://www.waterboards.ca.gov/water_issues/programs/cwa401/

Thank you for the opportunity to comment on this Project. For questions related to waste discharge requirements and submittal of the RWD, please contact Katie Carpenter at (559) 445-5551 or by email at Katie.Carpenter@waterboards.ca.gov. For questions related to storm water permits or dredge/fill permitting please contact Matt Scroggins at (559) 445-6042 or by email at Matt.Scroggins@waterboards.ca.gov.

Fresno, California 93271

CEMEX CONSTRUCTION MATERIALS PACIFIC, LLC; ROCKFIELD QUARRY MODIFICATION PROJECT ENVIRONMENTAL IMPACT REPORT NO. 7763 AND UNCLASSIFIED CONDITIONAL USE PERMIT APPLICATION NOS. 3666 AND 3667; FRESNO COUNTY

Central Valley Water Board staff has reviewed the Notice of Preparation (NOP) for the proposed Rockfield Quarry Modification Project (Project) (SCH # 2020060123). CEMEX Construction Materials Pacific, LLC (CEMEX) is proposing to expand its current aggregate (rock, sand, and gravel) mining and processing operations at the CEMEX Friant Plant (Plant). According to the NOP, the County of Fresno (County) will be the lead agency and will prepare an Environmental Impact Report (EIR) for the proposed project. A summary of our comments is provided below. The Central Valley Water Board is responsible for protecting water quality; therefore, our comments specially address water quality matters.

The NOP proposes changes to the Plant (CUP 3666) and the Quarry (CUP 3667) in two stages. During Stage One, CEMEX proposes to mine a hard rock deposit at the Quarry. The mining (via drilling and blasting) will occur at a depth of approximately 600 feet. An aggregate processing plant will also be added to the Quarry to wash, screen, crush, and sort the mined hard rock. At the Plant, the existing asphalt plant will be replaced with a hot-mix asphalt plant. Stage One is estimated to span 30 years and increase annual aggregate production from the current 1.4 million tons per year to eventually 3.0 million tons per year. Stage Two is proposed to span 70 years. During stage 2 aggregate production will continue to be 3.0 million tons per year. Also, during Stage Two, processing operations will only continue at the Quarry Site and the ready-mix concrete plant and hot-mix asphalt plant will be relocated to the Quarry Site.

The EIR for the Project should include a description of all solid and/or liquid waste that might be generated by the proposed project and how it will be handle, treated, and dispose of. Furthermore, the final EIR also needs to evaluate potential impacts to groundwater water and surface water associated with the Project. The following sections discuss various programs/requirements that may be applicable to the Project.

Waste Discharge Requirements (WDRs)

The discharge of process/wash water to land is subject to regulation under individual WDRs. WDRs Order 90-083 currently regulates the discharge of 1.5 million gallons per day of wash water generated by the washing/processing of sand and gravel at the Plant. Due to the proposed changes to the Plant and Quarry discussed in the NOP, WDRs Order 90-083 needs to be updated to reflect the proposed changes at the Plant and Quarry and ensure the discharge is consistent with Central Valley Water Board plans and policies.

In accordance with California Water Code section 13260, CEMEX is required to submit a Report of Waste Discharge (RWD) to apply for updated WDRs. The RWD must be submitted to the Central Valley Water Board at least 140 days prior to any discharge of wastewater from the project pursuant to California Water Code section 13264. The RWD needs to, at a minimum, include the following:

1) A Form 200 signed and certified by a duly authorized person at CEMEX;
2) A technical report that describes the treatment process and characterizes the wastewater discharge.

A technical report accompanying the RWD must be prepared and certified by a person registered to practice in California pursuant to California Business and Professions Code sections 6735, 7835, and 7835.1. A guidance document for applying for individual waste discharge requirements is attached to this letter.

Construction Storm Water General Permit

Dischargers whose project disturbs one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP).

For more information on the Construction General Permit, visit the State Water Resources Control Board website (https://www.waterboards.ca.gov/water_issues/programs/stormwater/construction.html).

Industrial Storm Water General Permit

Certain industries that discharge storm water to waters of the United States require coverage under a federally mandated permit. In California, the applicable permit is the Industrial Storm Water General Permit Order 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the State Water Resources Control Board website (https://www.waterboards.ca.gov/water_issues/programs/stormwater/industrial.html).

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material to waters of the United States, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACOE). If a Section 404 permit is required by the USACOE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water alterations, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACOE at (916) 557-5250.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACOE permit, or any other federal permit, is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. Water Quality Certification must be obtained prior to initiation of project activities. Water Quality Certification information can be obtained by going to the State Water Resource Control Board Water Quality Certification and Wetlands Program website.

Salt and Nitrate Control Programs

As part of the Central Valley Salinity Alternatives for Long-Term Sustainability (CV-SALTS) initiative, the Central Valley Water Board adopted Basin Plan amendments (Resolution R5-2018-0034) incorporating new programs for addressing ongoing salt and nitrate accumulation in the Central Valley at its 31 May 2018 Board Meeting. On 16 October 2019, the State Water Resources Control Board adopted Resolution 2019-0057 approving the Central Valley Water Board Basin Plan amendments and also directed the Central Valley Water Board to make targeted revisions to the Basin Plan amendments within one year from the approval of the Basin Plan amendments by the Office of Administrative Law. The Office of Administrative Law approved the Basin Plan amendments on 15 January 2020 (OAL Matter No. 2019-1203-03).

Pursuant to the Basin Plan amendments, discharges will receive a Notice to Comply with instructions and obligations for the Salt Control Program within one year of the effective date of the amendments. Upon receipt of the Notice to Comply, the Discharger will have no more than six months to submit their Notice of Intent informing the Central Valley Water Board of their choice between Option 1 (Conservative Salinity Permitting Approach) or Option 2 (Alternative Salinity Permitting Approach). For the Nitrate Control Program, the Project is within Groundwater Basin 5-22.06 (San Joaquin Valley – Madera), a Priority 2 basin/sub-basin.

More information on the Salt and Nitrate Control Program may be found on the internet (https://www.cvsalinity.org/public-info).

If you have any questions regarding this matter, please contact Denise Soria by phone at (559) 444-2488, by email at dsoria@waterboards.ca.gov.

Table 1 – ROWD Constituent Characterization List 11

[1] The Non 15 Program regulates discharges to land that are exempt from Title 27 of the California Code of Regulations. See the following link for a brief explanation of Title 27 and exemptions that may be used: http://www.waterboards.ca.gov/water_issues/programs/land_disposal/waste_discharge_requirements.shtml

I. What is a Report of Waste Discharge?

A Report of Waste Discharge (ROWD) is an application for waste discharge requirements. A ROWD consists of the following:

A completed and signed Form 200, which can be downloaded from the internet at http://www.waterboards.ca.gov/publications_forms/forms/docs/form200.pdf.

1. A technical report prepared by a California registered Civil Engineer that presents the Information listed in the table below.
2. For a new or previously unpermitted discharges, a check for the first annual fee made payableto the *State Water Resources Control Board*. Consult with staff to determine the required fee.There is no fee if you are applying for revised or updated WDRs because you are already subject to an annual permit fee. The current fee schedule can be viewed at the following link: http://www.waterboards.ca.gov/resources/fees/index.shtml#wdr

II. Compliance with the California Environmental Quality Act (CEQA)

Although not required as part of the ROWD, for new, previously unpermitted, or expanding/changing discharges, you must also submit a copy of any draft and final environmental review documents prepared to comply with the California Environmental Quality Act (CEQA).

If the local planning agency (city or county, as applicable) or another public agency has determined thatthe project (or expansion, changes, etc.) does not require any discretionary action by that agency, the Central Valley Water Board may be the lead agency for the purposes of CEQA, and you will be required to submit an Initial Study and pay all fees and other costs associated with the CEQA process unless the Board determines that the action falls within the scope of a categorical or statutory exemption. Fees associated with the filing of an Initial Study may include a California Department of Fish and Wildlife fee, County Clerk recording fees, and costs for publishing the CEQA Notice of Intent in a local newspaper. Consult with your local planning agency and Central Valley Water Board staff if you have any questions about CEQA. Additional information about CEQA is also available at the following link: https://opr.ca.gov/ceqa/.

III. What is Required for the ROWD Technical Report?

Please note the following tips to expedite the ROWD review and waste discharge requirements development:

- Providing the information in the same order as the list below will help to expedite the ROWD review. Staff will use this as a checklist.
- If any of the information is missing or incomplete, the ROWD will be deemed incomplete and the process (and your project) will be delayed until all of the required information is submitted. You will be notified in writing of the ROWD status after it has been reviewed. If the ROWD is incomplete, we will specify the additional information that is required to complete the ROWD.
- All numerical data presented in tables and calculations performed using spreadsheets should be provided in digital form (MS Excel compatible spreadsheet).
- If some of the information listed below can be found in a previous technical report prepared by a registered professional, the ROWD can incorporate the report as an appendix, but the ROWD text must specify where in the report the required information can be found. However, if appended reports contain information that conflicts with the body of the ROWD, it may cause further delays.

A. General Information
1. Is this a new/proposed or existing facility?
2. If this is an existing facility, is the discharge currently regulated under Waste Discharge Requirements (WDRs) issued by the Central Valley Water Board?
a. If so, provide the WDRs order number.
b. If not, provide the name of the local agency that issued the current permit.
3. Provide a copy of any other permits that reference or relate to the wastewater disposal system. This includes Use Permits and Surface Mining and Reclamation Act (SMARA) reclamation plans, etc.
4. Provide the following for the facility that generates the waste and the site where the waste is discharged:
a. Street address (provide street name and distance from nearest cross street if there is no street number).
b. The approximate latitude and longitude of the facility that generates the wastewater, wastewater treatment facilities, and wastewater land disposal areas.
c. Township, Range, and Section.
d. Assessor's parcel numbers.

B. Wastewater Facility and Discharge *Complete this section for both new/proposed facilities and existing facilities*.
1. A description of the sources and types of wastewater flowing into the system from:
a. Residential (population served and number of connections or equivalent dwelling units).
b. Commercial (number of connections by type).
c. Industrial (number of connections by type).
2. Design influent flow rates (average daily, dry weather daily, peak hour, peak day, and peak month), and the design treatment capacity of the system with respect to each of these. For new/proposed facilities, provide the methods used to estimate these design parameters and copies of all calculations.
3. For existing facilities, a summary table of monthly influent flow totals and monthly precipitation totals for the last five years. Explain any data gaps, outliers, and/or unusual circumstances that might affect measured flow rates. If sewer inflow and infiltration (I/I) contributes significantly to influent flow, provide an I/I analysis to project I/I as a function of total annual precipitation and/or groundwater level as appropriate.
4. A detailed description of the facilities that generate wastewater, and all wastewater conveyance, treatment, and disposal systems. Use site plans and conceptual drawings as appropriate to illustrate locations and typical construction. Include all treatment processes. The following maps, plans, and illustrations are needed:
a. A facility location map showing local topography, the facility location and/or boundaries, streets, and surface waters (including storm water drainage ditches, irrigation canals, and irrigation/tailwater ditches).
b. A process flow schematic for the entire treatment and disposal system. Include existing and proposed flow monitoring devices and sampling locations proposed to determine compliance with the WDRs.

c. A scaled treatment plant site plan.
d. A scaled map showing the limits of all proposed wastewater treatment, storage and disposal areas.
5. Characterization of the source water (the community or process water supply), influent wastewater quality (prior to treatment or discharge), and treated effluent quality. See Table 1 for a minimum list of constituents to be analyzed.
6. For POTWs and domestic wastewater facilities, a description of the sewer system, sewer materials and age, and lift station details (type, location, capacity, backup systems, and alarms features). Discuss potential inflow and infiltration (I/I) rates in light of local groundwater conditions and sewer system materials/design. For industrial facilities, a description of the industrial wastewater collection and conveyance system.
7. A description of proposed alarm systems, emergency wastewater storage facilities, and other means of preventing treatment system bypass or failure during reasonably foreseeable overload conditions (e.g., peak flows, power failure, sewer blockage). Consider both potential problems at the treatment system and within the conveyance system.
8. Preventive and contingency measures for controlling spills and accidental discharges.
9. Flood and frost protection measures (structural and operational) employed at the facility.
10. For debris, grit and screenings, sludge, and biosolids the following:
a. A description of solids generation rates, on-site treatment and handling systems, and short-term storage procedures.
b. A description of solids disposal practices.
c. For facilities that do not have continuous sludge wasting systems (i.e., where sludge accumulates in treatment and/or storage ponds), the frequency of assessing accumulated sludge volume, the date of the last sludge volume assessment, the date of the last sludge cleanout, and expected frequency of future sludge cleanout activities
11. For each wastewater treatment, storage, or disposal pond and containment structure, provide the following information:
a. Identification (name) and function of the pond.
b. Surface area, depth, and volumetric capacity at two feet of freeboard.
c. Height (relative to surrounding grade), crest width, interior slope, and exterior slope of each berm or levee.
d. Materials used to construct each berm or levee.
e. Description of engineered liner, if any. Include a copy of the Construction Quality Assurance (CQA) Report if one was prepared.
f. Estimated steady state percolation rate for each unlined pond.
g. Depth to shallow groundwater below the base and pond inverts.
h. Overfilling/overflow prevention features.
i. Operation and maintenance procedures.
12. For subsurface disposal systems, provide the design basis and documentation demonstrating that the system has been designed in accordance with applicable regulations, codes, ordinances, and guidelines. If the design deviates from these requirements, provide justification in terms of system longevity, maintainability, and groundwater protection.

13. If treated domestic effluent will be recycled for beneficial reuse or if wastewater will reused or land-applied[2], provide a complete description of the following:
a. Ownership and contact information for each landowner[3].
b. Effluent disinfection system.
c. Effluent conveyance systems.
d. Water recycling/Land application areas (LAA) areas.
e. Cropping plans.
f. Planned operations (planting and harvest, irrigation method, irrigation frequency, irrigation amounts).
g. Expected nutrient loadings (pounds per acre per year total nitrogen).
h. Expected salt loadings (pounds per acre per year total dissolved solids).
i. Tailwater management methods.
j. Storm water runoff management methods.
k. Setback distances from the edge of each recycling/land application area from the property boundary, public streets, occupied structures owned by others, and surface waters/surface water conveyances.
l. Plans that illustrate items c, d, i, j, and k above
14. If wastewater effluent will be recycled pursuant to Title 22 of the California Code of Regulations (e.g., if domestic wastewater is recycled to grow crops, irrigate landscaping, provide pasture for livestock, or for landscape or recreational impoundments, including reclamation sites owned by a POTWs, unless water is recycled solely for irrigation of landscaping at the POTW site) a Title 22 Engineering Report must be submitted to both the Central Valley Water board and the Division of Drinking Water[4].
15. Projected monthly water balances demonstrating adequate containment capacity for both the average rainfall year and the 100-year return period total annual precipitation, including consideration of at least the following:
a. For POTWs and private domestic wastewater facilities, initial baseline influent and I/I flows as well as baseline influent and I/I flows at full build out with an aging sewer system.
b. A minimum of two feet of freeboard in each pond at all times (unless a registered civil engineer determines that a lower freeboard level will not cause overtopping or berm failure).
c. Historical local evapotranspiration, pan evaporation, and lake evaporation data (monthly average values).
d. Local precipitation data with the 100-year return period annual total distributed monthly in accordance with mean monthly precipitation patterns.
e. Proposed recycling area/land application area/disposal system hydraulic loading rates distributed monthly in accordance with expected seasonal variations based on crop evapotranspiration rates.
f. Projected long-term percolation rates (including consideration of percolation from unlined ponds and the effects of solids plugging on all ponds).

[2] Uses of recycled water that are limited to landscape irrigation (including golf courses) can be regulated under General WDRs issued by the State Water Board. See this webpage for more information: https://www.waterboards.ca.gov/drinking_water/certlic/drinkingwater/requirements.html

[3] Landowners are typically named in WDRs as co-dischargers, and the WDRs may include separate requirements with which co-dischargers must comply.

[4] To the extent this information is already presented in the Title 22 Engineering Report, the ROWD may incorporate that report by reference. The Title 22 Engineering Report must also be submitted to the Division of Drinking Water for review and approval.

16. Proposed flow limits and basis for the limits. Consider dry weather flows vs. peak flows and seasonal variations. Include the technical basis for the proposed flow limit (e.g., design treatment capacity; hydraulic capacity of a main lift station, headworks, or other system element; and demonstrated effluent storage/disposal capacity).
17. A narrative description of treatment system operation and maintenance procedures to be employed, including those associated with effluent storage and disposal.
18. For POTWs, the level of operator certification and staffing; the names and grade levels of all certified operators, and the hours that the facility is manned.
19. For privately owned domestic wastewater treatment facilities, the names and grade levels of all certified operators, and the hours that the facility is manned. If the facility does not have a certified operator, provide justification for not retaining one.
C. Planned Changes in the Facility and Discharge (for existing facilities only)
1. Describe in detail any and all planned changes in the facility or discharge, addressing each of items listed in Section B above.
D. Local and Site-Specific Conditions (Illustrate with maps as appropriate)
1. Neighboring land uses.
2. Typical crops grown (if agricultural area).
3. Irrigation water source(s) and volume and quality data (if agricultural area).
4. Terrain and site drainage features.
5. Nearest surface water drainage course.
6. FEMA floodplain designation(s).
7. Average Annual precipitation (inches)
8. 100-year 365-day precipitation (inches)
9. Reference evapotranspiration (monthly and annual total)
10. Pan evaporation (monthly and annual total)
11. A description of the types and depths of soil underlying ponds and/or effluent disposal areas (include a copy of the geotechnical report and/or NRCS soil report). Include at least the following:
a. Depth of unsaturated soil when groundwater is closest to the surface.
b. Soil types based on site-specific information, sampling locations (accurately measured and recorded), description and results of percolation tests or other tests used to estimate soil long-term infiltration rates. Include depth, thickness, and soil horizons. Soils must be described at a minimum of five feet below the bottom of any disposal unit.
c. Bedrock type and condition encountered in disposal area, if any.
d. A scaled map depicting soil/rock types and test locations.
12. Provide the following information about hydrogeology and groundwater:
a. Stratigraphy, groundwater elevation and gradient, transmissivity, and influence of all recharge and pumping sources (site conceptual model).
b. Elevation and gradient of first groundwater at the facility
c. Depth to highest anticipated groundwater based upon onsite measurements taken during wet season.

d. Shallow groundwater quality for typical waste constituents, up/down gradient. (See Table 1)
e. Information on monitoring well locations, construction details, and locations of any geological features (e.g. aquitards, subterranean channels, faults) and aquifer characteristics.
f. Summary of historical groundwater monitoring results (last 5 years for existing facilities, 2 years for new/planned facilities).
E. Antidegradation Analysis
The State Water Resources Control Board Resolution No. 68-16 (the Antidegradation Policy) requires that the Central Valley Water Board maintain the high quality of waters of the state until it is demonstrated that any change in quality will be consistent with maximum benefit to the people of the state, will not unreasonably affect beneficial uses, and will not result in exceedances of one or more water quality objectives. If a discharge will degrade groundwater quality but will not cause an exceedance of one or more water quality objectives, the discharger must demonstrate that all practicable treatment or control measures have been implemented or will be implemented such that the Board can consider these measures to represent the "best practicable treatment or control" (BPTC) of the constituents of concern. Demonstrating that BPTC has been, or will be, implemented at the site can provide justification for the Board to allow the current level of degradation to continue or increase (as applicable), or for the Board to allow any degradation in the case of a new discharge. The Antidegradation Policy is incorporated into our Basin Plans, which also include implementation plans that we follow. See the following link for the Basin Plans and other important policy documents: http://www.waterboards.ca.gov/centralvalley/plans_policies/
The Antidegradation Analysis must include the following:
1. For existing facilities, whether the discharge has caused degradation. If so, for which constituents, to what degree, and whether the discharge has caused exceedance of a water quality objective.
2. The potential for the discharge to degrade groundwater quality (for new discharges) or further degrade groundwater quality (for existing discharges, whether or not the discharge is expanding).
The assessment must be made based on site-specific data and shall include the following items for each constituent listed in the effluent category on Table 1:
a. Characterization of all waste constituents to be discharged that have the potential to degrade groundwater quality;
b. Characterization of shallow groundwater quality (i.e., the uppermost layer of the uppermost aquifer) for typical waste constituents[5] upgradient and downgradient of the site and comparison to established water quality objectives [6] (include tabulated historical groundwater monitoring data and groundwater elevation contour maps for the last eight monitoring events);
c. A description of the geology and hydrogeologic conditions of the site including groundwater elevation and gradient, transmissivity, influence of all known recharge and pumping sources, and subsurface conditions at the facility, including any proposed new disposal site or storage ponds;

[5] Include analyses for the following: total coliform organisms, total dissolved solids, fixed dissolved solids,electrical conductivity, nitrate nitrogen, total nitrogen, and major anions and cations

[6] Compare to Basin Plan water quality objectives, including drinking water standards, agricultural water quality goals, etc.

d. Groundwater degradation , if any, that has resulted from existing operations, other nearby discharges, or natural occurrences;
e. The areal extent that the discharge has impacted or will impact the quality of the shallow groundwater, if any;
f. The concentration found and/or expected increase in concentration in shallow groundwater foreach constituent.
g. If degradation has occurred or is expected to occur describe the following:
i. Any facility design features and operational practices that reduce the potential for groundwater degradation (treatment or control). Such features might include salinity source control, other pollutant source control, advanced treatment, disinfection, concrete treatment structures, and pond lining systems, etc.
ii. Additional treatment or control measures that could be implemented and a preliminary capital and annual operations and maintenance cost estimate for each.
iii. How current treatment and control measures are justified as BPTC (i.e., what justifies not implementing additional measures);
iv. How no water quality objectives will be exceeded; and
v. Why allowing existing and/or anticipated degradation is in the best interest of the people of the state.
F. Industrial Storm Water Permit
The State Water Resources Control Board adopted Order 2014-0057-DWQ (NPDES General Permit CAS000001) specifying waste discharge requirements for discharges of storm water associated with industrial activities, and requiring submittal of a Notice of Intent by all affected industrial dischargers. Many industrial facilities and some domestic wastewater treatment facilities are required to obtain coverage under this permit. Provide evidence that the facility is exempt or hasapplied for coverage under the Industrial Storm Water Permit. See the following link for more information: http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/
G. General WDRs for Sanitary Sewer Systems.
The State Water Resources Control Board adopted Statewide General Waste Discharge Requirements for Sanitary Sewer Systems (Order 2006-0003-DWQ). The permit requires all public agencies that own or operate sanitary sewer systems greater than one mile in length to obtain coverage. Provide evidence that the facility is exempt or has applied for coverage under the General WDRs for Sanitary Sewer Systems. See the following link for more information: http://www.waterboards.ca.gov/water_issues/programs/sso/index.shtml

H. Department of Water Resources Well Standards

The California Department of Water Resources sets standards for the construction and destruction of groundwater wells (hereafter DWR Well Standards), as described in *California Well Standards Bulletin 74-90* (June 1991) and *Water Well Standards: State of California Bulletin 94-81* (December 1981). These standards, and any more stringent standards adopted by the State or county pursuant to Water Code section 13801, apply to all monitoring wells. Discuss whether existing monitoring wells at the facility were constructed in accordance with the Department of Water Resources Well Standards.

See the following link for more information: https://water.ca.gov/well-standards

I. Salt and Nitrate Control Programs

The Central Valley Regional Water Board adopted Basin Plan amendments incorporating new programs for addressing ongoing salt and nitrate accumulation on 31 May 2018 (Resolution No. R5-2018-0034). The resolution resulted from a Central Valley Regional Water Board initiated collaborative stakeholder initiative known as the Central Valley Salinity Alternatives for Long-term Sustainability (CV-SALTS).

Nitrate Control Program
After the effective date of the Nitrate Control Program, new dischargers located in groundwater basin/sub-basin (regardless of priority) or those with a material change to their operation that increases the level of nitrate discharged to groundwater must comply with the Nitrate Control Program and provide data and information as applicable. This provision does not apply to dischargers located in areas that are not part of a designated basin/sub-basin unless the Executive Officer of the Central Valley Water Board determines, based on the specific facts of the discharge, that it should be subject to the Nitrate Control Program and the Board's Executive Officer notifies the discharger accordingly.

This Nitrate Control Program NTC requires that discharges choose between two compliance pathways:

- **Pathway A:** New individual permitting options. The Board will set more stringent nitrate requirements in your permit to ensure that nitrate impacts will not cause a problem for drinking water users.
- **Pathway B:** Form or Join a Local Management Zone with other Permittees. A Management Zone is an association of permittees that work together to reduce nitrate loading and to provide replacement water

Salt Control Program
A new permittee, or existing permittee seeking a permit modification due to a substantial and/or material change which increases salt concentration or load from a facility, shall indicate how the permittee intends to comply with the Salt Control Program at the time of application and provide the required information to support the decision.

- *Conservative Salinity Permitting Approach* – A permittee that selects this approach must submit an assessment of how the discharge will comply with the conservative permitting requirements set forth in the Conservative Salinity Permitting Approach. The permittee shall submit this assessment to the Central Valley Water Board with the notification to the Board of its permit compliance pathway decision. If the Board does not concur with the findings of the assessment, the Board may request additional technical and/or monitoring information with a deadline for submittal. When conducting the assessment, the permittee may use historical water quality information if the information adequately represents the character of the current discharger and/or receiving water and is approved by the Board's Executive Officer.
- *Alternative Salinity Permitting Approach* – A permittee that selects this approach shall participate in the Phase I P&O Study by providing at least the minimum required level of

financial support throughout Phase I as determined by the lead entity overseeing the P&O Study. The permittee shall provide documentation of its compliance with the required level of support with the notification to the Central Valley Water Board of its permitting decision. If the permittee has an approved salinity-related Time Schedule Order, Compliance Schedule or variance that expires prior to the completion of the Phase I P&O Study, the Board, at its discretion, may extend the Time Schedule Order or Compliance Schedule or renew or grant a variance, as appropriate and allowed by other applicable policies.

See the following links for more information about the Salt and Nitrate Control Programs:
https://www.waterboards.ca.gov/centralvalley/water_issues/salinity/
https://www.cvsalinity.org/public-info

Table 1 – ROWD Constituent Characterization List

The Report of Waste Discharge must characterize the groundwater (G), source water (S), treatment system influent (I), and effluent discharge (E) for, at minimum, the constituents indicated in the list below. The characterization must be based on a statistically significant number of representative samples as determined by an appropriately registered and/or licensed professional. All media must also be characterized for all additional waste constituents that may be in the discharge based on the facility processes employed but not listed below.

Constituent [1]	Units	Minimum Recommended Characterization Data			
		POTW/ Domestic	Food Processor	Sand and Gravel	Other Industry
Biochemical Oxygen Demand	mg/L	I, E	I, E		E
Chemical Oxygen Demand	mg/L	G, E	I, E		E
Settleable Matter	ml/L	E	E		E
Total Suspended Solids	mg/L	I, E	I, E		E
Total Dissolved Solids	mg/L	G, S, I, E	G, S, E	G	G, S, E
Fixed Dissolved Solids	mg/L		E		G, S, E
Electrical Conductivity	µmhos/cm	G, S, I, E	G, S, I, E	G, S, I, E	G, S, I, E
Total Kjeldahl Nitrogen as N	mg/L	G, S, E	G, S, E		G, S, E
Ammonia Nitrogen as N	mg/L	G, S, E	G, S, E		G, S, E
Nitrate Nitrogen as N	mg/L	G, S, E	G, S, E		G, S, E
pH	pH Units	G, S, I, E	G, S, E	G, S, I, E	G, S, I, E
General Minerals[2]					
Alkalinity	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Hardness	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Bicarbonate	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Carbonate	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Calcium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Magnesium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Chloride	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Potassium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Sodium	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Sulfate	mg/L	G, S, E	G, S, E	G, S, E	G, S, E
Metals[3]					
Aluminum	ug/L	E			E
Antimony	ug/L			S, E	
Arsenic	ug/L	G, S, E	G, S, E	G, S, E	G, S, E
Barium	ug/L			S, E	
Beryllium	ug/L			S, E	
Boron	ug/L	G	G	G, S, E	G

Constituent [1]	Units	Minimum Recommended Characterization Data			
		POTW/ Domestic	Food Processor	Sand and Gravel	Other Industry
Cadmium	ug/L			S, E	
Chromium (IV)	ug/L			S, E	
Chromium (III)	ug/L			S, E	
Total Chromium	ug/L	G	G	G, S, E	G
Cobalt	ug/L			S, E	
Copper	ug/L	E	E	S, E	E
Fluoride	ug/L			S, E	
Iron	ug/L	G, S, E	G, S, E	G, S, E	G, S, E
Lead	ug/L	E		S, E	E
Mercury	ug/L	E		S, E	E
Manganese	ug/L	G, S, E	G, S, E	G, S, E	G, S, E
Molybdenum	ug/L			S, E	
Nickel	ug/L			S, E	
Selenium	ug/L			S, E	
Silver	ug/L			S, E	
Thallium	ug/L			S, E	
Vanadium	ug/L			S, E	
Zinc	ug/L	E		S, E	E
Disinfection By-Products[4]	ug/L	G, E	E		E
Formaldehyde[5]	ug/L	G, E	E		E
Phenols[5]	ug/L	G, E			E
Priority Pollutants[6]	Various	G, E			E

1 With the exception of wastewater samples, for constituents with Secondary MCLs listed in Title, 22 Table 64449-A (e.g., aluminum, copper, iron, manganese, silver, zinc, color and turbidity), samples shall be filtered with a 1.5-micron filter prior to preservation, digestion, and analysis. For all other constituents, samples shall be filtered with a 0.45-micron filter prior to preservation, digestion, and analysis. If filtering in the field is not feasible, samples shall be collected in unpreserved containers and submitted to the laboratory within 24 hours with a request (on the chain of custody form) to immediately filterthen preserve the sample.

2 General minerals analyses shall be accompanied by a cation/anion balance demonstrating complete analysis.

3 Where constituents are analyzed as part of other suites of constituents, the results may be substituted to avoid redundant analyses (i.e., arsenic results collected to fulfill the metals suite requirements may also beused to fill the Priority Pollutant suite requirements provided appropriate detection limits are used.).

4 If wastewater is disinfected using chlorination or chlorination is used in internal disinfection processes.

5 If the facility accepts holding tank waste from RVs, boats, or portable toilets.

6 The Discharger must determine which priority pollutants, if any, are likely to be present in the discharge at concentrations that might degrade groundwater quality, and must provide characterization data for those constituents.

Subject: RE: Draft Environmental Impact Report for the proposed modification to the existing CEMEX Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)

Dear Mr. Randall,

The U.S. Bureau of Reclamation (Reclamation) is submitting this comment letter regarding the County of Fresno's Draft Environmental Impact Report (DEIR) 7763 for the CEMEX Rockfield Quarry: Rockfield Modification Project (proposed project). Comment 6-1

The mission of Reclamation is to manage, develop, and protect water and related resources in an environmentally and economically sound manner in the interest of the American public. Reclamation has extensive infrastructure that is operated in the San Joaquin Basin in support of this mission, including the Friant Division of the Central Valley Project (CVP), which could be impacted by this proposed project. In addition, Reclamation is implementing the San Joaquin River Restoration Program (SJRRP) in accordance with the San Joaquin River Restoration Settlement and the San Joaquin River Restoration Settlement Act (Act), included in Public Law 111-11. The proposed project is located within the SJRRP Restoration Area and has the potential to impact Reclamation's successful implementation of the SJRRP.

With these responsibilities and interests in mind, Reclamation appreciates the County of Fresno's (County's) efforts on the proposed project and consideration of the agency's comments. General comments are provided herein, and specific comments are provided in the attached technical comment spreadsheet.

Existing Conditions

Comment 6-2

Reclamation is concerned that the environmental setting does not adequately describe the physical environmental conditions in the vicinity of the proposed project, as required by Section 15125(a) of the California Environmental Quality Act (CEQA), and requests a complete description of the following resources be included in the description of the environmental setting:

a. Terrestrial and aquatic wildlife, including species listed in accordance with the Endangered Species Act, that may be present in the vicinity of the proposed project
b. The existing impacted hydrology of the San Joaquin River (SJR) Comment 6-3
c. Actions being taken to implement the SJRRP, including: Comment 6-4

(1) Reintroduction of Central Valley (CV) spring-run Chinook salmon (*Oncorhynchus tshawytscha*)
(2) SJRRP flows that offset existing impacts to the river and CV spring-run Chinook salmon

Comment 6-4 cont.

d. The Plant Site river water delivery ditch (delivery ditch) and its connection to Little Dry Creek

Comment 6-5

Reclamation also requests that a projected future conditions baseline be included in addition to existing conditions for hydrologic impact analyses, as provided for in CEQA Section15125(a)(1). The DEIR groundwater section and adaptive management plan assume future groundwater conditions will be similar to existing conditions. However, the ongoing implementation of the SJRRP involves increased flows down the SJR, which will elevate the river stage, increase the river's connectivity with adjacent groundwater, and increase groundwater levels in some locations. Because current conditions are the only baseline used in the analysis of impacts and as a measure of future impact in the adaptive management program, the hydrologic impacts of the proposed project are likely underestimated and would be involuntarily subsidized by SJRRP flows, negatively impacting the implementation of the SJRRP and Reclamation's water rights. The analysis should include impacts based on future SJRRP flows and the adaptive management program should be designed in a way that future SJRRP flows are not impacted by operation of the proposed project.

Comment 6-6

Holding Contracts and Water Rights

Comment 6-7

Reclamation is concerned with the applicant's described use of the Holding Contract for this project. Reclamation provides the following comments solely to inform the applicant's environmental review. Reclamation reserves all rights, claims and defenses available to the U.S. under the Holding Contracts.

a. The DEIR improperly points to Holding Contract #15 as a water right; a Holding Contract does not purport to be a water right nor is it a water supply contract for CVP water. Reclamation could not locate any water right associated with any CEMEX parcel and no water use reports could be located in the State electronic Water Rights Information Management System database. The State of California has required all water right claimants to have claims on file and submittals of annual use since 2006. The applicant should provide evidence that it may lawfully divert water as described in the DEIR.
b. In addition, and assuming the applicant can demonstrate authorization to divert water as described in the DEIR, Holding Contract #15 obligates the water user to return any water used for specified industrial purposes to the river free of pollution and/or contamination. The applicant should provide evidence that they are able to return the water to the river free of pollution and/or contamination. It appears the applicant is proposing to capture river flows in the Quarry Site that contain hazardous materials as a flood reduction strategy. This approach would create unnecessary pollution risk and divert water supplies into the quarry that would otherwise be available for other water users. All flood flows should be routed away from the site. The project proponent should also confirm with the State Water Resources Control Board that this action would conform with the Governor's order regarding the use of flood flows for groundwater recharge.

Floodplain Analysis

Comment 6-8

Reclamation has serious concerns about the use of an alternative floodplain map in the hydrologic impact analysis. The current Federal Emergency Management Agency (FEMA) map shows portions of both the Quarry Site and the Plant Site to be located within the 100-year floodplain. Given the proposed project's 100-year life, that would mean the project sites have a 63% chance of flooding within the project lifetime and a 38% chance of experiencing a 200-year flood during the proposed project's 100-year life (NOAA's

National Weather Service, n.d.). The DEIR uses an alternative floodplain map, which does not show the Quarry Site to be located within the floodplain, as the basis for the analysis of impacts of the proposed project. Reclamation has several concerns with this approach:

Comment 6-8 cont.

a. The alternative map does not appear to have been peer reviewed or accepted by FEMA as an official amendment to the currently effective Flood Insurance Rate Map through a Letter of Map Revision (LOMR). Use of an alternate floodplain map that has not been approved through FEMA floodplain mapping is insufficient evidence to demonstrate that the Quarry Site would not be impacted by a 100-year flood event.
b. The 2022 public draft of the Central Valley Flood Prevention Plan Technical Analyses Summary Report (2022 CVFPPT draft technical analyses) (Department of Water Resources, 2022) includes climate change flood frequency analyses for low, medium, and high climate change impact scenarios in 2072. As a part of the analyses, it identifies the change in peak flows for the 1997 flood under the respective climate change conditions. It found that at the Gravelly Ford gage, the projected change in peak flows would increase 132% under the low scenario, 162% under the medium scenario, and 208% under the high scenario (Table 5.6). This data strongly suggests flood forecasts will increase in magnitude over the life of the proposed project.

The applicant's less conservative approach increases the risk that flood water will enter the proposed project sites without impact assessments or mitigation measures. Until FEMA has accepted the applicant's alternative floodplain map through a LOMR, the official FEMA map should be used for all hydrologic analyses in the DEIR. Should the County move forward with the applicant's HEC-RAS model approach, Reclamation recommends running larger flood events, such as those anticipated in the 2022 CVFPPT draft technical analyses, to understand the risk of large flood events affecting the proposed project by connecting the river to the Quarry Pit and potentially polluting the SJR. In either case, the current analysis based on the alternative map does not include an analysis of direct or indirect impacts from overland flooding into the Quarry Site. Since the proposed project is within the FEMA 100-yr floodplain and is highly likely to experience a large flood during the proposed project life, an analysis of effects of overland flooding to the Quarry Site should be included in the DEIR.

Comment 6-9

Comment 6-10

Impact Analyses

Reclamation is concerned the DEIR provides an incomplete impact analysis for several resource categories as further described below.

Comment 6-11

Geology and Hydrology

Reclamation is concerned that the analysis presented in the DEIR has an antiquated understanding of SJR hydrology and understates the current and future connectivity between the SJR and the Quarry Pit. The analysis presented provides limited data comparing the river stage and groundwater levels and does not evaluate the river at higher stages as are expected with continued implementation of the SJRRP. In addition, connectivity may be greater than anticipated due to local variation in rock fracturing not characterized in the exploratory borings. Supplemental analysis should be completed to better understand the connectivity between the river and the Quarry Site so that appropriate mitigation can be developed and implemented.

Comment 6-12

It does not appear that an analysis was conducted of impacts of Plant Site pumping on the SJR. The SJR is approximately 800 feet from the Plant Site. Little Dry Creek, which provides tributary flows to the SJR, is within 200 feet of the Plant Site. Please provide an analysis as to how the lowering of the groundwater

Comment 6-13

table around the Plant Site will impact flows in the surface tributaries and include this additional impact determination in the DEIR. Comment 6-13 Cont.

In the analysis it is stated that the Friant-Kern Canal (FKC) is the primary contributor of groundwater in the area and compares maximum canal flows that only take place in wet years to median river flows in support of this claim. The FKC is lined and over a mile away from this location, while the river is only 200 feet from the site. Comparing maximum canal flows that only take place in wet years to median river flows does not account for temporal, hydrologic, or geographic factors. Please provide a supplemental analysis to verify this assumption or otherwise amend it. Comment 6-14

Water Quality

As currently proposed, water pumped from the sites would either directly, or after other uses, be placed into recharge pits and trenches adjacent to the site. However, there is no water quality treatment proposed to take place prior to placement in settling and recharge vessels. If water that exceeds water quality standards for surface or groundwater is placed in the trenches, it has the potential to contaminate existing groundwater supplies and percolate into the SJR, impacting aquatic species such as CV spring-run Chinook salmon. An analysis should be conducted on the proposed project's potential to contaminate river water from recharge operations. Comment 6-15

To the extent long-term recharge operations at the Quarry Site would be generated from pumping of the pond, pond water quality should be analyzed in greater detail to disclose what constituents would be put into the recharge trenches from the pond. The Quarry Site Pond should be monitored for water quality concerns in a similar fashion to the Plant Site Pond and, if water quality standards are exceeded, mitigation measures should be implemented, including but not limited to, installation of an aeration or oxygenation system in the Quarry Site Pond.

Biological Resources

Due to incomplete descriptions of existing conditions and incomplete hydrology, water quality, and other resource impact analyses, there is not currently enough information to complete a biological resources impact assessment since impacts to many of these resources, especially aquatic species, are dependent on other resource impacts. The biological resources analysis should be revised based on inclusion of the information requested above. Comment 6-16

Blasting Impacts

The river adjacent to the Quarry Site is a rearing site for juvenile CV spring-run Chinook salmon and an over-summer holding and spawning site for adult CV spring-run Chinook salmon. Although the project proponent's analysis concludes the blasting protocols will have significantly less impacts than those that may "cause harm" such as mortality, it is not possible to verify the field accuracy of the analysis. Blasting impacts greater than those stated in the report may impact fish behavior at various life stages (i.e., juveniles displaced from cover in rearing habitat, adults displaced from holding and spawning habitat) and therefore impact the success of SJRRP. Blasting impacts should be monitored to verify the level of impact. Comment 6-17

Invasive Species

Reclamation is concerned with the potential for invasive aquatic fish species entering the river from the Plant Site Pond, especially should the existing delivery ditch remain in place. The applicant should screen the ditch and ensure the ditch is in no way connected to the Plant Site, even in the event of flooding, to prevent invasive species introduction to the SJR. Comment 6-18

Cumulative Impacts

Comment 6-19

Reclamation is concerned about the cumulative impacts analysis. The SJR has significant cumulative impacts to its hydrology due to existing diversions, as demonstrated by the need for the SJRRP. Therefore, for the purposes of analyzing cumulative impacts to the hydrology of the SJR, cumulative impacts of this proposed project should be determined based on whether the project is cumulatively considerable, not on whether the impact itself is determined to be significant or if the project substantially draws down groundwater. Please revise this analysis.

Mitigation Measures

Comment 6-20

Floodplain Management

Reclamation requests the proposed project develop additional mitigation measures such as enhanced berms, overland flooding hazardous management plans for the site, and plans to put flood waters back into the river free of pollution or other water quality constituents from the sites to avoid and minimize impacts to the SJR in the event of a flood event.

Sediment Management

Comment 6-21

In reviewing Google Earth (n.d.) aerial photography, sediment deposition from the Plant Site into the delivery ditch is visible at times. The delivery ditch is directly connected to Little Dry Creek and the SJR. Plant Site flood protections should be increased as a part of project mitigation measures to maintain the natural channel and prevent the introduction of sediment into the river from the project site.

Blasting

Comment 6-22

The 2013 State of Alaska Department of Fish and Game Blasting Standard (Alaska Blasting Standard) cited by the applicant identifies mitigation monitoring (hydrophones) that should be conducted in conjunction with blasting (Timothy, 2013). Reclamation requests that the applicant adaptively manage blasting for impacts to aquatic life. Reclamation has provided a recommended mitigation approach for consideration:

Year 1 of blasting: Monitor blasting impacts at the river adjacent to the Quarry Site. Depending on monitoring results, implement the following actions:

(1) Below 0.6 pounds per square inch and 0.5 inches per second: no action.
(2) Between 0.6 pounds per square inch-6 pounds per square inch or 0.6 inches per second-2.0 inches per second: implement avoidance and minimization measures outlined in the Alaska Blasting Standard and continue monitoring.
(3) Above 7.3 pounds per square inch or 2.0 inches per second: implement avoidance, minimization, and mitigation measures outlined in the Alaska Blasting Standard and continue monitoring.

At the end of one year of monitoring, re-evaluate the need for monitoring using the following parameters:

(4) If after 1 year, river impacts stay below 0.6 pounds per square inch and 0.5 inches per second, no additional monitoring is needed so long as future blasting techniques don't create additional pressure or other river impacts.
(5) If after 1 year, river impacts have been between 0.6 pounds per square inch-6 pounds per square inch or 0.5 inches per second-2.0 inches per second, continue monitoring and implementing avoidance and minimization measures until 1 year of 0.6 pounds per square inch and 0.5 inches per second measurements.

(6) If after 1 year, river impacts exceeded above 7.3 pounds per square inch or 2.0 inches per second, continue to implement monitoring and avoidance, minimization, and mitigation measures until 1 year of lesser pounds per square inch measurements are experienced, at which point follow guidance for the range of pounds per square inch and inches per second measurements experienced.

Comment 6-22 cont.

If at any point blasting technique changes so that blasts have the potential to be more impactful to the surrounding land than they were during a 1-year monitoring period where blasts registered below 0.6 pounds per square inch and 0.5 inches per second at the river, river monitoring should take place for the period of higher impact blasting to verify that the new blasting technique does not create additional impacts to the river. So long as impacts of the new blasting technique remain below 0.6 pounds per square inch and 0.5 inches per second at the river, no additional monitoring is necessary for that blasting technique. If the blasting technique creates impacts, either cease the technique or re-enter monitoring, avoidance, minimization, and mitigation measures described above.

As a part of this adaptive management measure, the applicant is encouraged to work with Reclamation to understand when and where various life stages may be present to efficiently apply avoidance, minimization, and mitigation measures.

Groundwater Monitoring

Comment 6-23

Reclamation requests the applicant use the MW-2 monitoring well cluster in addition to MW-1 monitoring well cluster in the adaptive management plan for the Quarry Site. This would likely provide additional benefit to the mitigation measure by providing spatial coverage representing the southern portion of the Quarry Site. Infiltration from the river into the excavated site will be highly influenced by localized fracture characteristics, as demonstrated by the airlift permeability testing in hard rock at MW-2; the well's test results were 10 times greater than at MW-1.

Reclamation also requests that baseline conditions for all groundwater monitoring programs be developed so that they can adapt to expected increased baseflow conditions in the SJR associated with the SJRRP. Reclamation requests the opportunity to review and comment on the baseline proposals and to review the annual reports and any impact evaluations produced.

As currently proposed, the adaptive management plan states that if, upon additional assessment it is confirmed "that a decrease in groundwater levels greater than 15 percent is exclusively attributable to mine dewatering, then corrective measures would be implemented" (4.10-109). The burden of proof is inappropriately placed in this circumstance. The applicant should bear the responsibility to prove that their project does *not* contribute to impacts above 15 percent and, to the extent impacts may be attributable to them, appropriate corrective measures should be implemented. Reclamation recommends amending this in the adaptive management plan.

200-foot Setback

Comment 6-24

Reclamation is concerned about using a 200-foot setback from the river for the Quarry Site. There is no justification provided for the applicability of this setback other than preceding permits. The last time the Conditional Use Permits (CUPs) were updated was in 2004 (from the early 1980s), which was prior to the Settlement and Settlement Act that resulted in the SJRRP. Therefore, the 200-foot setback did not consider the SJRRP restoration activities and reintroduction of CV spring-run Chinook salmon. To avoid adversely impacting the implementation of the SJRRP, this buffer should be revised for any subsequent CUPs, including the proposed project. Reclamation recommends that, based on the sensitive special status resources present near the site, the maximum feasible setback be considered.

In conclusion, Reclamation does not have enough information to adequately analyze the impacts of the proposed project to the resources the agency manages. Reclamation requests additional information be provided in the DEIR regarding baseline conditions, impact analyses, and mitigation measures, as described above and in the attached technical comment spreadsheet.

Comment 6-25

Reclamation appreciates the opportunity to comment on this proposed project and the County's consideration of our comments. Please contact Ms. Becky Victorine at rvictorine@usbr.gov with any questions or if there is a need for discussion of these comments in more detail.

Sincerely,

Karl Stock

#	Document	PDF pg	Section	Existing Text	Comment	
1	DEIR	29, 98			The Draft Environmental Impact Report (DEIR) does not include adequate information to determine the effects of the proposed project on all species listed under the Endangered Species Act (ESA) that have the potential to occur in the action area. The Regulatory Setting Section of Chapter 4.4 mentions the ESA but does not provide information on the applicability to this proposed project (i.e. whether consultation with the United States Fish and Wildlife Service (FWS) is required in accordance with Section 7 or Section 10 and if not, why). Recommend the project proponent request an official species list from the FWS and provide information in the analysis on the potential effects of the proposed project on all listed species potentially occurring in the action area and include project-specific information on the applicability of the ESA to the proposed project. Recommend the project proponent provide further information on what coordination is planned with FWS regarding an incidental take statement.	Comment 6-26
2	DEIR	29, 98			Please provide further analysis regarding the baseline conditions of the San Joaquin River (SJR) in the action area and the effects of the proposed project on the Central Valley (CV) spring-run Chinook salmon (Oncorhynchus tshawytscha) being reintroduced to the SJR by the San Joaquin River Restoration Program (SJRRP), as it is not adequately described in the DEIR. The United States Bureau of Reclamation (Reclamation) recommends the project proponents coordinate with all the SJRRP Implementing Agencies, including National Marine Fisheries Service (NMFS), to ensure that the analysis captures the environmental setting accurately and adequately, and that compliance with all applicable environmental laws and regulations are being documented for the proposed project.	Comment 6-27
3	DEIR	35	Impact Table	Impact 4.1-1 Rock Staining	If the walls are stained adjacent to the SJR's edge, there is a potential for the stain to seep or spill into the river. Recommend no staining of pit walls unless the project proponent can prevent impacts to the river through product selection and/or application precautions.	Comment 6-28

#	Document	PDF pg	Section	Existing Text	Comment	
4	DEIR	47	Impact Table	Impact 4.7-7 Result in slope instability.	The mitigation measures are good efforts to prevent a potential slope failure from occurring but do not address mitigation in the event a failure occurs. There is particular concern over the potential for failure adjacent to the SJR given the constant seepage and groundwater exchange occurring at the riverbanks. A mitigation plan should be included for the instance there is a slope failure in the quarry or the adjacent riverbank.	Comment 6-29
5	DEIR	118	2.4.2.1	The San Joaquin River is located approximately 0.5 miles to the west of the Plant Site. The project proponent has water rights to use river water for industrial purposes in connection with the processing of rock, sand, and gravel. Water is diverted from the river to the Plant Site via a ditch and the water is then used to wash the aggregate.	The DEIR improperly points to Holding Contract #15 as a water right; a Holding Contract does not purport to be a water right nor is it a water supply contract for Central Valley Project (CVP) water. Reclamation could not locate any water right associated with any CEMEX parcel and no water use reports could be located in the State electronic Water Rights Information Management System database. The project proponent should provide evidence that it may lawfully divert water as described in the DEIR.	Comment 6-30
6	DEIR	118	2.4.2.1	The San Joaquin River is located approximately 0.5 miles to the west of the Plant Site. The project proponent has water rights to use river water for industrial purposes in connection with the processing of rock, sand, and gravel. Water is diverted from the river to the Plant Site via a ditch and the water is then used to wash the aggregate.	Holding Contract #15 obligates the water user to return any water used for specified industrial purposes to the river free of pollution and/or contamination. The project proponent should provide evidence that they are able to return the water to the river free of pollution and/or contamination.	Comment 6-31

#	Document	PDF pg	Section	Existing Text	Comment	
7	DEIR	118	2.4.2.1	[Plant site] Approximately 35 acre-feet/year of groundwater from onsite wells is consumed by the ready-mix concrete operations with a small amount of groundwater (approximately 1 acre-feet/year) also used for domestic purposes (e.g., toilets, handwashing, etc.).	With groundwater levels from 21 to 34 ft below ground surface (bgs), "groundwater" at the Plant Site from shallow wells is more likely interconnected with surface waters, predominantly the SJR. If so, the shallow well use at the Plant Site would then be considered a use of surface waters and would require associated water rights, only deep wells would truly be "groundwater."	Comment 6-32
8	DEIR	120	Current CUP permits		The last time the Conditional Use Permits (CUPs) were updated was in 2004, which is prior to the SJR Settlement that resulted in the SJRRP. Therefore, the 200-foot setback from the river did not consider the SJRRP, the restoration goals and the reintroduction of CV spring-run Chinook salmon. To avoid adversely impacting implementation of the SJRRP and salmon, this buffer should be revisited for any subsequent CUPs, including the bedrock quarry proposal.	Comment 6-33
9	Appendix 2 of 2	131	Well Diagram and Logs	Well Log MW-2	Mitigation measures identified in the DEIR propose consistent monitoring of wells to ensure no impact to groundwater during operations, but it does not appear the monitoring wells are sufficiently deep to monitor deep aquifer impacts. Please clarify how monitoring efforts will be implemented and adapted to reflect conditions of the deep aquifer and ensure adequate mitigation.	Comment 6-34
10	DEIR	331	4.4.1.3	River Water Delivery Ditch	Please describe how the surface water diversion operates in greater detail. For example, is this waterway screened? What species exist in the diversion? How does water move from the diversion to the Plant Site, and how does it interact with the Plant Site at various flow levels? Is the ditch grade maintained by dredging?	Comment 6-35

#	Document	PDF pg	Section	Existing Text	Comment	
11	DEIR	335	4.4.1.4	Plant Site Wildlife	With the connection of the Plant Site to the SJR through a delivery ditch, are there any potential mitigation measures that could be implemented to prevent non-native species from entering the SJR? Reclamation recommends incorporating some mitigation measure to prevent fish species from using the ditch as a corridor between the Plant Site and the SJR.	Comment 6-36
12	DEIR	341	4.4.1.4	Quarry Site Wildlife	Please clarify the methods used for the Quarry Site assessment of aquatic species. Also, please provide information regarding how native species arrived in the ponded pits and whether those conditions would allow fish from the SJR to get into the pits. Reclamation recommends a more thorough investigation of the aquatic species near the proposed project site, especially in the ponded pits.	Comment 6-37
13	DEIR	385	Impact 4.4-5	...do not fall under the regulatory authority of the Army Corps, SWRCB, or CDFW	The delivery ditch identified at the Plant Site is directly connected to Little Dry Creek (LDC), which flows into the SJR. However, there is no discussion of this existing condition. In reviewing aerial imagery, there are visible sediment depositions that appear to have originated from the Plant Site and were released into the delivery ditch. This sediment disposition causes turbidity issues and impacts to water quality within LDC and the SJR. Please describe the hydrologic connectivity of the delivery ditch to the Plant Site, how sediment and water quality have been managed to date, and the potential impacts of sediment and water quality concerns to riparian areas along LDC and the SJR.	Comment 6-38
14	DEIR	385	Impact 4.4-5	result of dewatering would not adversely affect streamflow in either the San Joaquin River or Little Dry Creek because as described above dewatering of these deeper geologic units would not affect the quantity of water in the river.	This discussion in not consistent with the discussion of Impact 4.10-12, which states there is potential for significant impact; Mitigation Measure 4.10-10a is needed to protect the SJR adjacent to the Quarry Site due to this impact. Impact 4.4-5 describes reduced issues as compared to those described in 4.10-12, by stating that the SJR and LDC are usually losing streams without recognizing connectivity. Please provide a more thorough, consistent analysis and discussion of Impact 4.4-5, particularly LDC during all hydrologic conditions.	Comment 6-39

#	Document	PDF pg	Section	Existing Text	Comment	
15	DEIR	385	4.4.4	...together demonstrate that the San Joaquin River is not in direct hydraulic communication with the weathered rock and hard rock at the Quarry Site.	While the connection in weathered rock and bedrock is more limited, it is inaccurate to state that there is no hydraulic connection. Please revise this statement and any related analyses and impact determinations accordingly.	Comment 6-40
16	DEIR	386	4.4.4	Fish species that occur in the San…	This is an inadequate description of fish species in the SJR. Reclamation suggests investigating resources on the SJRRP website(restoresjr.net) and from other resource agencies to better describe the aquatic resources in the SJR and consider potential effects and mitigation relevant to the proposed project.	Comment 6-41
17	DEIR	387	4.4.4	In 2013, the Alaska Department of Fish and Game…	Please clarify if this blasting standard is the common industry standard, or only the standard for Alaska?	Comment 6-42
18	DEIR	387	4.4.4	This level of ground vibration is significantly…	The SJR adjacent to the Quarry Site is a spawning site for CV spring-run Chinook salmon. Although the project proponent's analysis concludes the blasting protocols will have significantly less impacts than those that may "cause harm" such as mortality, it is not possible to verify the field accuracy of the analysis. Blasting impacts greater than those stated in the DEIR may impact fish behavior at various life stages (i.e., juveniles displaced from cover in rearing habitat, adults displaced from spawning habitat) and therefore impact the success of the SJRRP. Reclamation requests the monitoring and avoidance, minimization, and mitigation measures outlined in the Alaska blasting standards be implemented as necessary for blasting impacts.	Comment 6-43
19	DEIR	554	4.9		Based on the language in the DEIR, it does not appear that the hazardous materials plan accounts for overland flooding of the Quarry Site. Please provide a hazardous materials plan that accounts for the possibility of overland flooding.	Comment 6-44
20	DEIR	567	Figure 4.10-1		It appears the Quarry Site is within the Federal Emergency Management Agency (FEMA) 100-year Zone AE floodplain, as is a portion of the Plant Site. How will the project proponent prevent flood water from entering the Quarry Site in a 100-year or greater event?	Comment 6-45

#	Document	PDF pg	Section	Existing Text	Comment	
21	DEIR	569		The easterly bank slope is generally flatter than 2:1 (horizontal: vertical). There are no signs of significant bank erosion. During historic flow events, including the January 1997 flood event of approximately 60,300 cubic feet per second (cfs), the easterly bank along the Quarry Site did not experience significant erosion and the bank has never breached into the Quarry Site.	Reclamation recommends conducting a bank stability model that incorporates recharge operations and flooding events to ensure the risks of bank erosion will not increase due to recharge operations.	Comment 6-46
22	DEIR	569			As currently documented and designed, the sites do not contemplate mitigation of overland flow events greater than a 100-year flood. It appears there is notable risk of capturing river flows and contaminating river water and groundwater in an event greater than a 100-year flood. Reclamation recommends that larger events should also be considered in the analysis; County Policy HS-C.14 suggests a 200-year floodplain should be considered. Consider constructing larger levees that can protect the Plant and Quarry Sites from events greater than a 100-year flood.	Comment 6-47
23	DEIR	577	4.10.1.5	San Joaquin River floodway generally does not encroach onto the Plant Site or Quarry Site, but the floodplain encroaches on the west side of both sites	The description of Figure 4.10-1 (on page 4.10-15) incorrectly characterizes encroachment as potentially occurring by the floodway or floodplain onto the Plant or Quarry Site, instead of the other way around. Please revise the text to characterize the sites' encroachment (or not) into the floodway or floodplain.	Comment 6-48
24	DEIR	578	4.10.1.5	Controlled Release from Dam	Operations of Friant Dam have changed greatly in the last decade and should be described here.	Comment 6-49
25	DEIR	579	Figure 4.10-5		It appears the Quarry Site equipment will be placed below the groundwater table and the Quarry Site may need to be continuously pumped to not flood the aggregate plant, asphalt plant, ready-mix concrete plant, and office. What happens if a pump goes down and these structures start to flood? Please include appropriate mitigation measrues to address this possibility.	Comment 6-50

#	Document	PDF pg	Section	Existing Text	Comment	
26	DEIR	585			It appears that some of the ponded water on the sites exceed water quality standards. The project proponent claims water quality exceedances are acceptable because the proposed project does not discharge directly to the SJR, however at the Quarry Site the proposed project discharges within 100 feet of the river and leaves minimal opportunity for filtration. Additional water treatment should be conducted before recharging water collected from the Quarry or plant Sites.	Comment 6-51
27	DEIR	585	Plant Site Surface Water Quality		The water quality analysis of the Plant Site's silt pond shows high exceedances for metals. Please analyze and disclose the potential for those metals to leach into the soils and surrounding groundwater.	Comment 6-52
28	DEIR	588	Table 4.10-4		It appears the water quality parameters sampled for at the Plant Site were not repeated at the Quarry Site. For instance, arsenic and lead were not sampled; these constituents should be sampled at both sites. Please provide congruent sample information as a part of any analysis.	Comment 6-53
29	DEIR	600	4.10-37		Please clarify if trenches and pumps are sized to move and recharge Quarry Site groundwater and rainwater during wet years, or if pump and/or trench capacity will be exceeded in wet years. If capacity will be exceeded, please clarify how site flooding will be mitigated.	Comment 6-54
30	DEIR	605			To complete a meaningful review of the water quality of the SJR compared to the Quarry Site, the river should be analyzed upstream of any potential groundwater seepage or other impacts from the mining operation. Please include a SJR sample site both upstream and downstream of the proposed project and revise the analysis accordingly.	Comment 6-55
31	DEIR	610	San Joaquin River Connection to the Quarry Site		Please discuss lagged depletions from the SJR to the Quarry Site through weathered rock and bedrock in the DEIR.	Comment 6-56

#	Document	PDF pg	Section	Existing Text	Comment	
32	DEIR	611		The water level data for well MW-2S, screened only in the alluvium, shows that the well does not contain water except during periods when the San Joaquin River stage is greater than 4 feet. A review of river stage data from January 2014 to February 2023 indicates that the San Joaquin River stage measurements exceeded 4 feet for approximately 13 percent of the January 2014 to February 2023 time period.	SJRRP flows will increase the river stage in the coming years. How are future conditions with the proposed project analyzed to account for SJRRP flows in the SJR? How will the project proponent ensure SJRRP flows are not taken by proposed project pumping?	Comment 6-57
33	DEIR	611		Thus, for water to flow from the river and into the alluvium any appreciable distance, the San Joaquin River stage needs to be somewhat higher than 2.5 feet to create a sufficient hydraulic gradient, or slope, away from the river and toward the well location.	This conclusion appears overly broad. It does not address connectivity between weathered rock and bedrock, and it does not address changes to the hydraulic gradient caused by factors such as pumping adjacent to the SJR (as is proposed by the proposed project) or the impacts of recharge trenches. It is unclear if water could be pulled away from the SJR through alluvial material at low stages in these circumstances. Supplemental analysis should be conducted to address these scenarios.	Comment 6-58
34	DEIR	611	4.10.1.9	Thus, when the stage of the river is high enough that the water surface is above the base of the alluvium, there is a higher potential for seepage of water from the river into the Quarry Site... As a result, the San Joaquin River flows are always in contact with the alluvium (which overlies the weathered rock) in this segment of the river.	Will recharge trenches in the NW corner of the Quarry Site provide water that will travel toward the SJR, or will the water move toward the quarry due to location and the hydraulic grade created by continued pumping? How will the hydraulic grade created by recharge trenches and pumping be impacted by varying hydrologic conditions? The analysis presented suggests there is not a strong correlation between the SJR and Quarry Site groundwater. However, as described, the analysis is insufficient to reach this conclusion. Please expand the discussion on this topic and provide a supplemental analysis.	Comment 6-59

#	Document	PDF pg	Section	Existing Text	Comment	
35	DEIR	617		Charts 1 and 2 of Figure 4.10-11 also show relatively minor fluctuations in water levels at the monitoring wells, with the difference between minimum and maximum elevations measured being approximately 10 feet or less... The data from the longer period of record for the offsite wells corroborates the conclusion that, while local rainfall and increased river flows or stages may have short-term effects on the groundwater levels in the weathered rock and hard rock at the Quarry Site and its vicinity, such effects are minor and do not persist.	Comparing recent data to data from 50 years ago is not an appropriate analysis to verify the validity of the project proponent's claim about consistent groundwater levels in the area or that local rainfall and river flow has short term, minor effects on groundwater levels in the weathered rock and hard rock at the Quarry Site. Comparison of monitoring well data to offsite wells should have overlapping periods of record and long-term trends should be evaluated based on recent conditions, not conditions from 50 years ago. Please remove this comparison and any conclusions supported by it, or otherwise provide supplemental, local data to provide relevant trend comparisons.	Comment 6-60
36	DEIR	617	4.10-55	The data from the longer period of record for the offsite wells corroborates the conclusion that, while local rainfall and increased river flows or stages may have short-term effects on the groundwater levels in the weathered rock and hard rock at the Quarry Site and its vicinity, such effects are minor and do not persist.	These conclusions should be separated to address rainfall and river stage separately, since the two appear to have different levels of correlation with groundwater levels. The charts demonstrate a close correlation between river stage and groundwater levels. This correlation demonstrates a significant risk of future river dewatering through Quarry Site dewatering. This impact should be addressed in the document and adequately avoided, minimized, or otherwise mitigated in the project plans.	Comment 6-61

#	Document	PDF pg	Section	Existing Text	Comment	
37	DEIR	617	4.10.1.9	conclusion that, while local rainfall and increased river flows or stages may have short-term effects on the groundwater levels…such effects are minor and do not persist.	The bottom of page 4.10-55 makes the conclusion that "increased river flows or stages may have short-term effects on the groundwater levels" at the Quarry Site but "such effects are minor and do not persist." This conclusion ignores the hydraulic connection between groundwater and the SJR that can be observed during periods of higher river stages (Figure 4.10-11) and contributes to stable groundwater elevations in the monitoring wells from generally stable river flows the rest of the year. This hydraulic connection in all three groundwater zones at MW-1 and MW-2 on the west side of the Quarry Site near the river is described in Appendix G-4 (page 35 and 50) but is absent from the text of the DEIR. Please incorporate this data into the DEIR analysis and revise the DEIR impact conclusions to incorporate this information.	Comment 6-62
38	DEIR	618		Based on pumping records provided by the project proponent, during the 2018-2019 water year, a total of 330 acre-feet were pumped from the existing mining excavation... This indicates that, while there is some hydraulic connectivity between the San Joaquin River and the Quarry Site, water from San Joaquin River is currently not a substantial source of the groundwater inflow into excavations within the Quarry Site.	The previous section states that connection to the SJR is not significant until the SJR reaches a stage 2.5 ft or higher. This analysis makes conclusions about connectivity to the SJR without verifying the stage was high enough to analyze connectivity when, as claimed by the project proponent, connectivity would be possible. In addition, this analysis was completed without a full year's worth of data; the spring runoff period is when the SJR is most likely to have a higher stage, as discussed in previous sections, and is not included in this analysis. Without this data, there is no way to understand how groundwater and groundwater pumping are related to river flows. The existing analysis should be supplemented with an analysis that includes seasons when the SJR stage is above the start of the alluvial material. In addition, this analysis does not consider impacts of pumping and its effects on hydraulic gradient or lagged impacts of pumping on river flows and vice versa. These influences should be considered in a supplemental analysis.	Comment 6-63

#	Document	PDF pg	Section	Existing Text	Comment	
39	DEIR	618		The *Hydrology and Water Quality Analysis Report* (Appendix G-5) notes that the median flow in the San Joaquin River is 394 cfs, while diversions to the canal are in the range of 4,200 cfs. Thus, leakage from the canal flows, which flow year-round, are likely an important source of groundwater recharge to the areas in the vicinity of the Friant-Kern Canal, including the Quarry Site. This is consistent with the *Groundwater Sustainability Plan* for the North Kings GSA, which identifies both the San Joaquin River and the Friant- Kern Canal as significant sources of groundwater recharge to the North Kings GSA (North Kings GSA 2022).	The Friant-Kern Canal (FKC) is lined and over a mile away from this location, while the river is only 200 feet from the site. Comparing maximum canal flows that only take place in wet years to median river flows does not account for temporal, hydrologic, or geographic factors that influence groundwater availability. Please provide a supplemental analysis to verify this assumption or otherwise amend this statement.	Comment 6-64
40	DEIR	621	Figure 4.10-13		This figure does not account for any lagged depletion that might exist between the SJR and groundwater due to pumping. A supplemental analysis should be completed that considers lagged impacts to the river.	Comment 6-65
41	DEIR	623	Table 4.10-7	implies not any significant or consistent flow of water from the river to the GW at the Quarry Site	Comparing SJR water levels from spring 2017 (wet year) to monitoring levels in fall 2021 (critical-high year) is not an appropriate comparison. Also note that the recharge trenches are right next to the monitoring wells, so they would influence water levels and quality. Any analysis used to support an impact conclusion should use data from a single analysis time period where there is data available at all monitoring locations. Further, this data should be taken at varying hydrologic regimes to reflect varying conditions, and artificial recharge should either not be taking place or otherwise appropriately addressed in any analysis to ensure the results are not artificially swayed by recharge operations.	Comment 6-66

42	DEIR	629			It appears that Waste Discharge Requirement Order 90-083 for the Plant Site expired in 2020. Is there a subsequent order permitting discharge? Please provide or reference any subsequent permits with the DEIR materials.	Comment 6-67
43	DEIR	633		The Surface Mining and Reclamation Act of 1975 (SMARA) (Public Resources Code [PRC], Sections 2710–2796) and its implementing regulations (California Code of Regulations [CCR], Title 14, Section 3500 et seq.).....SMARA 14 CCR Section 3706 applies to the discussion of the project's potential for hydrology and water quality impacts:.....f) When stream diversions are required, they shall be constructed in accordance with: (1) the stream and lake alteration agreement between the operator and the Department of Fish and Game; and (2) the requirements of the Federal CWA, Sections 301 (33 U.S.C. 1311) and Section 404 (33 U.S.C. 1344) and/or Section 10 of the Rivers and Harbors Act of 1899 (33 U.S.C. 403).	Does the SJR diversion conform to Surface Mining and Reclamation Act standards? This should be reassessed as a part of this permit application to ensure that the proposed project does not contaminate the SJR and impact Reclamation water interests.	Comment 6-68

#	Document	PDF pg	Section	Existing Text	Comment	
44	DEIR	646		The analysis assumes that the operator of the Rockfield Quarry (Operator) would comply with the requirements of the California Surface Mining and Reclamation Act, Fresno County Ordinance Code, and NPDES requirements.	Aerial photos indicate there have likely been previous breaches at the Quarry Site. Given the existing conditions, mitigation measures should be incorporated into the proposed project to reduce the risk of future surface water contamination events.	Comment 6-69
45	DEIR	654		**Mitigation Measure 4.10-1:** *Blasting Protocols - The operator of the Rockfield Quarry shall at all times implement the requirements of the "Blasting Protocols" developed October 27, 2020, and updated September 8, 2021, by Vibra-Tech Engineers, Inc. The Blasting Protocols shall be appended to the Mitigation Monitoring and Reporting Program and shall be incorporated into the conditions of approval for the project.*	Reclamation is concerned that until blasting impact significance can be verified through monitoring, there continues to be the potential for significant blasting impacts. Please see Reclamation's letter for a proposed monitoring and mitigation plan.	Comment 6-70
46	DEIR	655	Impact 4.10-4		The impact to the Plant Site is currently being assessed based on groundwater quality, but recharge trenches will put surface water into the groundwater. Therefore, existing groundwater *and* surface water conditions should be evaluated when determining the proposed project's impact to groundwater quality. According to Table 4.10-3, surface water on the site exceeds water quality standards for manganese, iron, lead, arsenic, and conductivity. All these parameters should be considered in the analysis.	Comment 6-71

#	Document	PDF pg	Section	Existing Text	Comment	
47	DEIR	658		The adaptive management program would be responsive to changing water quality conditions in the reclaimed pond over time... If the iron and/or manganese levels persist above their respective water quality standards, then the mitigation measure recommends feasible actions that can be taken to address reducing conditions in the pond.	Table 4.10-3 indicates that more than just manganese and iron exceed water quality standards. All parameters that exceed water quality standards should be included in any monitoring and adaptive management plan. Monitoring should be conducted monthly. Iron, manganese, lead, and arsenic monitoring should take place at least every six months or immediately upon determination that there have been two exceedances of one of the action parameters, whichever is more frequent. Once iron, manganese, lead, and arsenic monitoring has begun, it should continue monthly until exceedances have resolved for at least two measurement cycles. Monitoring results should be provided to the County of Fresno and stakeholders yearly unless there is an exceedance event, at which point parties should be notified within 30 days of testing.	Comment 6-72
48	DEIR	658	Mitigation Measure 4.10-5a		The 5-year clock on this monitoring should not start until the Plant Site Pond has completely filled and any vegetation present has an opportunity to degrade, creating a hydrologically stable pond elevation and low dissolved oxygen (DO) conditions, at least one year after the pond is filled. Monitoring should also take place as the pond fills.	Comment 6-73
49	DEIR	662	Impact 4.10-6	The Operator would be required to update the existing HMBP and SPCC Plan for both the Plant Site and Quarry Site and in accordance with hazardous material regulations.	The proposed project poses significant risk of flooding at the Quarry Site. The project proponent should clarify that the updated Hazardous Materials Business Plan and Spill Prevention, Control, and Countermeasure Plan will include a specific plan for Quarry Site flooding, or otherwise this plan should be added as a mitigation measure to prevent significant water quality impacts to the SJR and groundwater in the event of a flood.	Comment 6-74

#	Document	PDF pg	Section	Existing Text	Comment	
50	DEIR	662	Impact 4.10-6	As described in the "Groundwater Quality at the Quarry Site" subsection of Section 4.10.1.7, above, groundwater sampling of monitoring wells at the Quarry Site indicates that all constituents were generally within water quality standards, except for nitrate, manganese, and gross alpha activity, which exceeded thresholds in some of the wells sampled.	The impact to the Quarry Site is currently being assessed based on groundwater quality, but recharge trenches will put surface water into the groundwater. Therefore, existing groundwater *and* surface water conditions should be evaluated when determining the proposed project's impact to groundwater quality. According to Table 4.10-3-4, surface water on the site exceeds water quality standards for manganese, iron, lead, arsenic, and conductivity. All of these parameters should be considered.	Comment 6-75
51	DEIR	663	Impact 4.10-6	However, since the rate of inflow of 455 acre-feet per year exceeds the evaporation rate of 380 acre-feet per year, dissolved solids would not accumulate over time because they would be continually diluted by the inflow of water with an average TDS of 100 mg/L... Therefore, the potential for the quarry pit lake to accumulate concentrations of constituents that would violate water quality standards or waste discharge requirements, or otherwise degrade water quality, would be less than significant.	Dilution of existing pond water with water that also has dissolved solids will not prevent accumulation of dissolved solids and other water quality constituents such as minerals and metals; accumulation will take place over time because evaporation will not remove dissolved solids from the pond. This analysis should be revised.	Comment 6-76
52	DEIR	663	Impact 4.10-6	**Violate Groundwater Quality Standards or Otherwise Substantially Degrade Groundwater Quality at the Quarry Site Due to the Ponding of Water in the Excavation**	At this point, there is insufficient analysis to determine that this impact is not significant. Additional analysis should be conducted, and this determination should be reconsidered accordingly, including the potential incorporation of mitigation measures and adaptive management actions to address potentially significant impacts.	Comment 6-77

#	Document	PDF pg	Section	Existing Text	Comment	
53	DEIR	663	Impact 4.10-6		Reclamation requests that the Quarry Site Pond be monitored for water quality concerns in a similar fashion to the Plant Site Pond. If water quality standards are exceeded at the Quarry Site Pond, mitigation of impacts should be implemented, including but not limited to the installation of an aeration or oxygenation system.	Comment 6-78
54	DEIR	663	Impact 4.10-6		The project proponent has not provided any information on what types of metals or minerals may be naturally present in bedrock and deeper groundwater sources that may impact water quality at the Quarry Site. Without a clear understanding of what parameters may exceed water quality standards, it is not possible to know exactly what constituents should be monitored. Therefore, during mining and reclamation a wide suite of water quality constituents should be monitored to ensure an appropriate long-term monitoring and adaptive management plan is developed and implemented.	Comment 6-79
55	DEIR	663	Impact 4.10-6		At 100 feet deep, the Quarry Site Pond will likely experience low dissolved oxygen (DO) conditions near the bottom. This will make any accumulated metals soluble, increasing the chances of exceeding water quality standards and contaminating adjacent groundwater or alluvial groundwater that is receiving pumped pond water to recharge pits. Should the Quarry Site, during mining, reclamation, or after pond inundation show high levels of metals or trend toward increased metal loads that could contaminate local groundwater supply or the SJR through groundwater recharge, appropriate mitigation measures should be implemented including stopping excavation or installing and maintaining an appropriate system to increase DO in the pond.	Comment 6-80

#	Document	PDF pg	Section	Existing Text	Comment	
56	DEIR	663	Impact 4.10-6	Upon the completion of Phase 1 and Phase 2 mining operations at the Quarry Site, the entire quarry pit excavation would have a bottom depth of approximately 290 feet below msl and would fill with groundwater and rainfall to form a 100-foot-deep lake with a surface elevation of about 190 feet below msl, which is about 500 feet below the surrounding grade (shown in Figure 2-10). Once the quarry pit fills to that level, approximately 195 acre-feet of groundwater and 260 acre-feet of rainfall and local runoff would enter the Quarry on an annual basis.	Why does this analysis assume the water level in the Quarry Site Pond will stay 500 ft below ground surface (bgs) when current groundwater elevations are less than 50 feet bgs? One would assume the water level would attempt to rise to reach equilibrium with the level of the existing groundwater table. Please provide evidence to support this assumption.	Comment 6-81
57	DEIR	664	Impact 4.10-8	The use of the recharge trenches would limit the amount of drawdown of the water table in the unconfined alluvial aquifer to six to eight feet at a distance of 500 feet from the excavation (KDSA 2021). As shown in Table 4.10-8, there are no supply wells within 500 feet of the excavation. At a distance of 500 feet to 1,000 feet from the excavation, within which there are three wells, the drawdown would be approximately three to five feet (KDSA 2021).	The SJR is approximately 800 feet from the Plant Site. LDC, which provides tributary flows to the SJR, is within 200 feet of the Plant Site. Please provide a detailed analysis as to how the lowering of the groundwater table around the Plant Site will impact flows in the surface tributaries and describe the outcome of this analysis in a new impact determination within the DEIR. Any impacts to the SJR should be mitigated to avoid impacts to biological resources and other water users.	Comment 6-82

58	DEIR	670	Mitigation Measure 4.10-10a	*For the San Joaquin River, the impact must be specific to both the alluvium and weathered rock aquifer zones.*	These zones could deplete and replenish at different rates. This is not an appropriate measure of impact and should be revised.	Comment 6-83
59	DEIR	670	Mitigation Measure 4.10-10a	If mining progresses to the full approved depth without causing a potentially significant impact to nearby wells or flows in the San Joaquin River, then monitoring in the MW-1 and MW-3 well clusters will continue for at least 3 years, to include at least two below-normal rainfall years or one critically dry year, as defined by DWR.	Monitoring at the well clusters should continue for at least 10 years after mining has ceased and include at least one wet year, as defined by the California Department of Water Resources.	Comment 6-84
60	DEIR	670	Mitigation Measure 4.10-10a	If the additional assessment confirms that a decrease in water levels greater than 15% is exclusively attributable to mine dewatering, then corrective measures would be implemented.	As currently proposed, the adaptive management plan states that if, upon additional assessment it is confirmed that a decrease in groundwater levels greater than 15 percent is exclusively attributable to mine dewatering, then corrective measures would be implemented (4.10-109). The burden of proof is inappropriately placed in this circumstance. The applicant should bear the responsibility to prove that their project does not contribute to impacts above 15 percent and, to the extent impacts may be attributable to them, appropriate corrective measures should be implemented. Reclamation recommends amending this in the adaptive management plan.	Comment 6-85

#	Document	PDF pg	Section	Existing Text	Comment	
61	DEIR	670	Mitigation Measure 4.10-10a	If the monitoring data indicate that groundwater levels in any of the monitored wells drop such that the available water column decreases by more than 15%, then a significant impact to available groundwater supply will have occurred.	Any measured change should be based on the change at any given point compared to what groundwater levels would be without the proposed project, not a percentage from current conditions. Groundwater levels will continue to fluctuate in dry and wet years and with the increased SJRRP Restoration Flows down the SJR in the future. Increases in groundwater levels due to other factors such as SJRRP flows could mask impacts of the proposed project. Reclamation requests the applicant use the MW-2 monitoring well cluster in addition to the MW-1 monitoring well cluster in the adaptive management plan for the Quarry Site. This would likely provide additional benefit to the mitigation measure by providing spatial coverage representing the southern portion of the Quarry Site. Infiltration from the river into the excavated site will be highly influenced by localized fracture characteristics, as demonstrated by the airlift permeability testing in hard rock at MW-2; the well's test results were 10 times greater than at MW-1. Reclamation also requests that baseline conditions for all groundwater monitoring programs be developed so that they can adapt to expected increased baseflow conditions in the SJR associated with the SJRRP. Reclamation requests the opportunity to review and comment on the baseline proposals and to review the annual reports and any impact evaluations produced.	Comment 6-86
62	DEIR	670	Mitigation Measure 4.10-10a	If, during mining, all available water from dewatering is being pumped to the recharge trench and the water column in the MW-1 well cluster remains below 85% of baseline elevations, then mining could not progress to greater depths in the quarry.	If recharge operations cannot recover the water column in the MW-1 well to within 85% of baseline elevations, ceasing mining to greater depths prevents further impact, but it does not mitigate for the impact that has already occurred. How would the mitigation plan ensure impacts are corrected even after mining ceases?	Comment 6-87

#	Document	PDF pg	Section	Existing Text	Comment	
63	DEIR	670	Mitigation Measure 4.10-10a	The dataloggers shall be programmed to record water levels at least once every six hours such that a range of static and pumping water level effects would be captured. The data shall be downloaded every six months for review and subsequent inclusion in annual mitigation monitoring reports.	Dataloggers should receive more regular downloads to ensure proper function and to be able to provide any impact threshold data more regularly than every 6 months. Sufficient baseline data should be collected from the dataloggers prior to work starting on the Quarry Site to ensure an understanding of existing hydrologic conditions and to validate and calibrate any groundwater models that may be required. This data set should include wet, dry, and average year hydrology.	Comment 6-88
64	DEIR	670	Mitigation Measure 4.10-10a	The rate of pumping into the recharge trench would be increased until the water column in the MW-1 well cluster and any monitored private wells west of the Quarry Site recover to within 85% or more of baseline levels.	What is considered "baseline level" for these wells? These terms should be dynamic based on hydrologic conditions, including increases in SJRRP flows, and the definitions should be approved by impacted stakeholders. Reclamation requests the opportunity to review the proposed baseline levels and have its comments considered in the development of baseline levels.	Comment 6-89
65	DEIR	670	Mitigation Measure 4.10-10a		The Quarry Site Groundwater Adaptive Management Program should be designed to assess any potential effect, and avoid, minimize, or otherwise mitigate the effect, to the SJR and alluvial groundwater system surrounding it, not only the CSA 44C wells, as is listed now.	Comment 6-90
66	DEIR	670	Mitigation Measure 4.10-10a		Any discharged water must be of sufficient quality to keep CV spring-run Chinook salmon in "good" condition to be consistent with the Restoration Goal of the SJR Settlement.	Comment 6-91
67	DEIR	670	Mitigation Measure 4.10-10a		Please provide a map of the well sites referenced in Mitigation Measure 4.10-10a.	Comment 6-92

#	Document	PDF pg	Section	Existing Text	Comment	
68	DEIR	675	Impact 4.10-12	The base flows within the San Joaquin River are typically at or below the elevation of the base of the alluvium on the Quarry Site. Thus, flows from the San Joaquin River toward the Quarry Site within the alluvium can only occur during the infrequent and relatively short-term high flow periods. Due to the recharge trenches along the west side of the Quarry Site, groundwater levels in the alluvium and the weathered rock would be maintained consistent with existing conditions. As a result, there would be no significant change in the volume of potential inflow from the river into the quarry during high flow events through the alluvium and weathered rock as a result of the project.	This assumption should be verified through a robust monitoring program that is adapted to consider future baseline conditions and, should impacts to the SJR occur, appropriate mitigation should be implemented.	Comment 6-93
69	DEIR	675	Impact 4.10-12	Increases in the San Joaquin River stage of three to six feet may increase the groundwater level in the band of alluvium between the river and the existing quarry by six inches up to three feet for periods of a few weeks to a month.	How will this be impacted by changes to the hydraulic gradient due to pumping? Please complete a supplemental analysis that includes this information, incorporate mitigation measures, and revise impact determinations, as applicable.	Comment 6-94

#	Document	PDF pg	Section	Existing Text	Comment	
70	DEIR	679	Impact 4.10-14	As described in the "Erosion and Sedimentation" subsection of Section 4.10.1.5, above, results of the Hydraulic Analysis indicate that the 100-year flow velocities along the Quarry Site river bank under existing conditions are generally at or below the 6 fps "permissible velocity" below which the natural channel will resist erosion, at all cross- sections shown in Figure 4.10-1 except at cross-sections 8, 15, and 16. The proposed SMRP would maintain the existing 200-foot setback from the river edge at the Quarry Site and would not disturb the easterly channel bank along the Quarry Site (nor any other portions of the channel).	While the excavation will take place more than 200 feet from the bank, recharge trenches will be located between the bank and the Quarry Site. Recharge operations should be considered in the bank stability analysis and appropriate mitigation should be implemented. Further, this impact should be re-assessed using the FEMA flood map and considering a 100-year flood that considers the impacts of climate variability. In addition, as recommended in county code, the 200-year event should also be considered.	Comment 6-95
71	DEIR	679	Impact 4.10-16	As described in Section 4.10.1.4, above, the Hydraulic Analysis (Appendix G-1) shows that the San Joaquin River floodplain does not enter into the Quarry Site and therefore the river would not overtop its banks and flow into the quarry.	This impact should be re-assessed using the FEMA floodplain map and climate variability that is expected over the life of the proposed project. In addition, as recommended in county code, the 200-year event should also be considered in this analysis.	Comment 6-96
72	DEIR	679	Impacts 4.10-15 and 16		How would the project proponent handle flood water from the SJR or LDC in the event of a big storm and localized flooding, including potential flooding of site equipment? Water that enters either site that would normally go to the river should be removed from the site promptly and without pollution from on-site hazardous materials.	Comment 6-97

#	Document	PDF pg	Section	Existing Text	Comment
73	DEIR	680	Impact 4.10-16	The analysis also concludes that the San Joaquin River floodplain does not enter into the Plant Site, and existing topography and berms along the north edge of the Plant Site prevent the Little Dry Creek floodplain from entering the Plant Site, with the exception of a small portion of the northwest corner of the Plant Site (as shown in Figure 4.10-1). This portion of the Plant Site is currently used as a stockpile area, and this use would continue during Phase 1 mining operations. Upon completion of Phase 1 mining, the stockpiles would be removed, and the area would be graded to drain to the reclaimed pond to the east, as it does under existing conditions, which would improve conditions relative to flood flows... Although minor changes to the drainage patterns of the portion of the Plant Site in the Little Dry Creek floodplain would occur under the proposed project, ultimately, the area would drain towards the reclaimed Plant Site mining excavation, similar to existing conditions, and flood flows would not be impeded or redirected.	The text states that flood flows would be directed toward the reclaimed pond to the east and then goes on to state that flood flows would not be impeded or redirected. These two statements contradict each other - please clarify and revise so that the text is consistent. Also, during flooding of LDC, the berm walls could be breached and/or silt leave the Plant Site, travel down to the delivery ditch, and enter the SJR. Aerial photography supports that this could occur and potentially has in the past. Existing conditions that create the risk of sediment entering the river should be remediated prior to any further improvements to the site.

Comment 6-98

#	Document	PDF pg	Section	Existing Text	Comment	
74	DEIR	681	Impact 4.10-17	The enlarged mining excavation could help contain and minimize downstream flooding, which would reduce the overall potential for release of pollutants, including sediment.	It appears the project proponent is proposing to capture river flows in the Quarry Site, which contains hazardous materials, as a flood reduction strategy. This approach would create unnecessary pollution risk and divert water supplies into the Quarry Site intended for downstream water users. All flood flows should be routed away from the Quarry Site.	Comment 6-99
75	DEIR	707		**Policy OS-A.14:** The County shall require the protection of floodplain lands and, where appropriate, acquire public easements for purposes of flood protection, public safety, wildlife preservation, groundwater recharge, access, and recreation. Consistent: The project would not result in any development within a floodplain. The northwest corner of the Plant Site is within the floodplain of Little Dry Creek. However, this portion of the site is and would continue to be used for stockpile storage. When the site is reclaimed, the stockpiles would be removed, and the site graded to drain to an existing pond.	While the proposed project might not create development within the floodplain, it does not protect it, as called for in the policy. There continue to be questions regarding the boundaries of the floodplain relative to the proposed project area that should be addressed before an impact determination is made. In addition, it states here that the Plant Site will divert flood waters into a pond where removal is not possible. This is not how a protected floodplain is intended to function and is not an acceptable long-term plan to address floodwaters on the Plant Site.	Comment 6-100

#	Document	PDF pg	Section	Existing Text	Comment	
76	DEIR	707		**Policy OS-A.5:** The County shall encourage, where economically, environmentally, and technically feasible, efforts aimed at directly or indirectly recharging the county's groundwater. Consistent: Project operations include recharge of the underlying aquifer through direct pumping of water pumped from the excavations into unlined ponds and recharge trenches.	It is Reclamation's understanding that pumping of water into unlined ponds and recharge trenches is being proposed to mitigate for some of the impacts of the proposed project on the local groundwater table and the SJR and would not creatie a net gain to groundwater supply. The response to this policy statement is misleading and should be removed; the proposed project would have a negative impact on local groundwater and surface water supply and water users.	Comment 6-101
77	DEIR	707	Policy OS-A.14	Consistent: The project would not result in any development within a floodplain….	The applicant appears to be claiming the policy is related only to developing within the floodplain. However, this policy also appears to be related to not constraining floodplains (for wildlife and public safety), promoting groundwater recharge, wildlife preservation, and recreation. The use of a portion of the LDC floodplain for stockpile/storage does not appear to be consistent with this policy. Reclamation recommends that the LDC floodplain be left in or restored to a natural condition and that stockpiling be limited to areas outside of the LDC 100-year floodplain. Reclamation notes that flow contributions from LDC help maintain flows and support water diversions downstream.	Comment 6-102

#	Document	PDF pg	Section	Existing Text	Comment	
78	DEIR	709		**Policy OS-A.24**	The project proponent's water quality analysis does not address the water quality of recharge waters, which show water quality exceedances. For instance, DEIR pdf page 656 states "Basin Plan limits for conductivity, iron, and manganese were exceeded, but Basin Plan limits would only apply to groundwater pumped from the Plant Site if the water was to be discharged directly to the San Joaquin River." It appears the project proponent is not intending to mitigate potetnial water quality impacts from pumped recharge water with known Basin Plan exceedances because it is not being discharged to a live stream. However, recharge water being placed in these shallow recharge structures has a strong potential to introduce pollutants and water quality constituents into the shallow groundwater table, which would degrade groundwater and impact the adjacent water bodies. This impact should be addressed before any determination is made regarding consistency with this policy.	Comment 6-103
79	DEIR	711	Goal OS-D, OS-D.4	To conserve the function and value...related riparian areas...	The DEIR states these goals are "not applicable" and "consistent", respectively. The delivery ditch at the Plant Site is directly connected to Little Dry Creek, which flows into the SJR. In reviewing aerial imagery, there are visible sediment depositions that appear to have originated from the Plant Site and been released into the delivery ditch. There is riparian vegetation along LCD and the SJR that could be impacted by this sediment. However, there is no discussion of this existing condition or potential impacts. Impact 4.4-4 only discusses dust control and blasting and does not address the other potential impacts. As requested for Impact 4.4-5, baseline conditions should be accurately described, and potential impacts disclosed. The determination for this goal should be reconsidered with this additional information included in the analysis.	Comment 6-104
80	DEIR	728-729	Policy Habitat 7,9, 16		The DEIR lacks sufficient detail for addressing long-term ecological restoration of the proposed project sites. No definition of open water habitat and no plan to remove aquatic vegetation is provided. What are the criteria for success and what is the monitoring plan? How will the project proponent ensure the plan does not impact the SJRRP? Please expand here.	Comment 6-105

#	Document	PDF pg	Section	Existing Text	Comment	
81	DEIR	926		List Method: A list of past, present, and reasonably foreseeable future projects producing related or cumulative impacts, including those projects outside the control of the agency.	The DEIR states that a List Method or Regional Growth Projections Method will be used and will be identified at the beginning of each section but does not actually appear to state the method in each section. Please state which approach was used for each resource analyzed.	Comment 6-106
82	DEIR	937		The proposed project would not affect water from Millerton Reservoir, Friant-Kern Canal, and Tule River; therefore, there would not be potential cumulative impacts of the proposed project and the Friant Ranch Specific Plan project on riparian communities, waters of the state, wetlands, or groundwater dependent ecosystems in the vicinity of the project sites.	Any increase in Reach 1 losses, such as those that would occur from operation of the proposed project, would reduce the amount of available water supply to the Friant Division water users and therefore, negatively impact the Friant-Kern Canal. This conclusion should be revised.	Comment 6-107
83	DEIR	946		Regarding cumulative impacts to surface water quality (Impacts 4.10-1, 4.10-2, and 4.10- 3), stormwater runoff is contained within the project sites by the existing berms, and the project would not impact surface water quality outside of the project sites.	The proposed project does have the potential to impact surface water quality of the SJR if recharge water that is not of a similar quality to SJR water is placed immediately adjacent to the SJR. This statement should be revised to disclose this potential impact and any related analyses should be revisited.	Comment 6-108

#	Document	PDF pg	Section	Existing Text	Comment	
84	DEIR	947		Furthermore, as described in Impacts 4.10-10 and 4.10-11, during both mining operations and after final reclamation, the estimated increase in groundwater consumption at the Plant Site and Quarry Site are several orders of magnitude smaller than the fluctuations in the water balance of the North Kings GSA area. For these reasons, the project's contribution to the significant cumulative impacts related to the depletion of groundwater and conflict/obstruction with the North Kings GSA Groundwater Sustainability Plan would be less than cumulatively considerable.	As stated on Page 5-1, "For purposes of this Draft EIR, the proposed project would be considered to have a significant cumulative effect if... the cumulative effects of other past, present, and reasonably foreseeable future projects without the proposed project are already significant and the project contributes measurably to the effect. The standards used herein to determine measurability are that either the impact must be noticeable or must exceed an established threshold of significance." The measure of significant cumulative effect used for this analysis is a noticeable impact or an impact that exceeds an established threshold of significance. As currently analyzed, the project proponent has indicated the impact is "less than cumulatively considerable," but has not analyzed the impact against the measures outlined in the document. Please analyze this impact to the standards required and amend the section accordingly.	Comment 6-109
85	DEIR	947		The proposed project and cumulative projects could have a significant impact on the hydrology of the San Joaquin River should the projects substantially drawdown groundwater and thereby result in a decrease of flows in the river (Impact 4.10-12).	The SJR already has significant cumulative impacts to its hydrology due to existing diversions, as demonstrated by the need for the SJRRP. Therefore, for the purposes of analyzing cumulative impacts to the hydrology of the SJR, cumulative impacts of this proposed project should be determined based on whether the project is cumulatively considerable, not on whether the impact itself is determined to be significant or if the project substantially draws down groundwater. Please revise this analysis.	Comment 6-110

#	Document	PDF pg	Section	Existing Text	Comment	
86	DEIR	947			The referenced Groundwater Sustainability Plan (GSP) provided by the North Kings Groundwater Sustainability Agency (GSA) to the State of California Department of Water Resources (DWR) included corrective actions identified by DWR as necessary for GSP approval. The corrective actions include an interconnected surface water (ISW) analysis to better understand the interaction between surface water flows and groundwater. As such, the North Kings GSA entered a Memorandum of Understanding with other GSAs, the SJRRP, Friant Water Authority, and the SJRRP Restoration Administrator to initiate a Technical Committee analyzing ISW. The project proponent should engage the North Kings GSA to ensure consistent understanding of ISW and water budget impacts.	Comment 6-111
87	DEIR	948		The Quarry Site is not located in a flood plain, and only a small portion of the northwest corner of the Plant Site (as shown in Figure 4.10-1, “Current and Regulatory Floodways and Floodplains,”) is located within the Little Dry Creek floodplain.	Please revise this language to reflect the FEMA floodplain map and assess the cumulative impact recognizing that the project proponent's alternate floodplain map does not represent the complete data set regarding flood risk for this project.	Comment 6-112
88	DEIR	956		The project’s contribution to the cumulative increase in groundwater use in Fresno County would be cumulatively considerable.	Please clarify that there have been significant cumulative impacts to groundwater in the region, as evidenced by the need for the North Kings GSA and GSP. Analyzing water availability during wet hydrology does not provide a complete picture; groundwater availability in times of drought is at a deficit. Over the course of the proposed project's 100-year life, pumping will undoubtedly take place during times of drought. Please provide a proposed mitigation plan to offset this cumulative impact, especially during times of drought.	Comment 6-113

#	Document	PDF pg	Section	Existing Text	Comment	
89	DEIR	957		As discussed in the preceding sections, the proposed project would not make cumulatively considerable contributions to any significant cumulative impacts except related to transportation. Impact 4.17-1 would remain a significant and unavoidable impact even with mitigation and would contribute significantly to cumulative transportation impacts in the region. See Section 5.3.17, above, for details.	This statement does not address the proposed project's impact to groundwater in times of drought or its impact to the SJR when analyzed for cumulative impact. Please revise to reflect these areas of significant cumulative impacts.	Comment 6-114
90	DEIR	1005	Alternative 4		Please add a risk analysis of bank stabilization and flood protection with and without an additional 100-foot setback. This appears to be a significant consideration with the 100-foot setback that should be considered in the analysis.	Comment 6-115
91	Appendix 1 of 2, Appendix 2 of 2	1798-3	Hydraulic Analysis	[Use of 100-year flow velocities]	The use of 100-year flow velocities, equating to a 71,000 cfs flow, is not adequate given the lifetime of the proposed project (i.e. 100 years). There is a 63% chance of a 100-year flood or larger during a 100-year project lifespan. Since the 100-year flow velocity estimates are close to the erosion threshold, higher flows could endanger the integrity of the natural berms and levees around the proposed project sites. Breaching of the proposed project sites by high flows could cause long-term impact to fisheries, the ability for Reclamation to provide water to Holding Contracts below the proposed project site, the ability of Reclamation to meet environmental flow requirements, and potentially the ability of Reclamation to deliver water to Mendota Pool for the Exchange Contract.	Comment 6-116
92	Appendix 1 of 2	49	3.4	"The San Joaquin River is located approx. 0.6 miles to the west of the Plant Site... In addition, the silt ponds, serve as a source of recharge to the groundwater.	This section describes in detail how water is being consumed, not returned to the river, which would be inconsistent with Holding Contract #15. Furthermore, this section describes that the project proponent is claiming their Holding Contract as evidence of a water right, which Reclamation does not support. Reclamation recommends revising this language.	Comment 6-117

Subject: Technical Assistance for the Draft Environmental Impact Report for the Rockfield Quarry Modification Project

Dear Mr. Randall,

The National Marine Fisheries Service (NMFS) is the federal agency responsible for managing, conserving, and protecting marine resources for inland, coastal, and offshore waters of the United States. We derive mandates from several statues, including the Federal Endangered Species Act (ESA) and the Magnuson-Stevens Fishery Conservation and Management Act[1] (MSA). The purpose of ESA is to conserve threatened and endangered species and their ecosystems, while the MSA aims to protect habitat for species important for commercial and recreational fisheries. NMFS's technical assistance in this letter pertains to the Draft Environmental Impact Report (EIR) for the Rockfield Quarry Modification Project (Project), near Fresno, California.

Comment 7-1

The Project location is approximately 0.5 miles east of the mainstem San Joaquin River, within an alluvial floodplain deposit. The proximity of the Project location to the San Joaquin River, in addition to the proposed mining depth (i.e., over 300 feet), should take into consideration how surface water and groundwater are hydraulically linked. There is no ESA-designated critical habitat in the San Joaquin River near the Project area, however the hydraulic linkage is critically important in creating and maintaining habitat for federally threatened California Central Valley (CCV) steelhead (*Oncorhynchus mykiss*), Central Valley (CV) spring-run Chinook salmon

Comment 7-2

[1] For detailed information on the MSA refer to: https://www.fisheries.noaa.gov/topic/laws-policies/magnuson-stevens-act

(*O. tshawytscha*), and the southern Distinct Population Segment (sDPS) of North American green sturgeon (*Acipenser medirostris*) listed under the ESA. The current analysis is inadequate to understand the full breadth of potential impacts the Project will have on the ESA- listed and MSA-managed species in the San Joaquin River. A more robust analysis considering future impacts under a fully implemented San Joaquin River Restoration Program (SJRRP) and expected future hydrologic conditions should be included in your Draft EIR.

Comment 7-2 Cont.

Comment 7-3

In addition, CV fall-run Chinook salmon are an important commercial and recreational sportfish under the MSA. Where groundwater aquifer supplements streamflow, the influx of cold, clean water is important for maintaining surface water temperature and flow volume. The mainstem San Joaquin River, up to Friant Dam, is designated Essential Fish Habitat (EFH) for federally managed Chinook salmon species within the Pacific Coast Salmon Fishery Management Plan[2], pursuant to the MSA. For the purposes of the MSA, EFH means "those waters and substrate necessary to fish for spawning, breeding, feeding, or growth to maturity", and includes the associated physical, chemical, and biological properties that are used by fish (50 CFR 600.10).

Comment 7-4

The Project location is hydraulically linked to habitat in the San Joaquin River where ESA-listed CCV steelhead and sDPS green sturgeon, and MSA-managed CV fall-run Chinook salmon, have the potential to occur over the next 100 years during implementation of the Project. Additionally, CV spring-run Chinook salmon[3] currently spawn, rear, and migrate, in the San Joaquin River in the proximity of the Project location. This reintroduced population of CV spring-run Chinook salmon are part of the long-term reintroduction efforts by the San Joaquin River Restoration Program[4]. The SJRRP also includes volitional fish passage infrastructure projects that are expected to increase the presence and population of CCV steelhead, sDPS green sturgeon, and Chinook salmon (both fall-run and spring-run) in the hydraulically-linked Project area of the San Joaquin River.

---

[2] For detailed information on the Pacific Coast Salmon Fishery Management Plan refer to: https://www.pcouncil.org/fishery-management-plan-and-amendments-3/

[3] NMFS has designated the CV spring-run Chinook salmon being reintroduced to the San Joaquin River as a non-essential experimental population (NEP) in accordance with Section 10(j) of the ESA (78 FR 79622, December 31, 2013). The boundaries of this NEP area include the San Joaquin River from Friant Dam downstream to its confluence with the Merced River.

[4] For more information refer to https://www.restoresjr.net/ and https://www.fisheries.noaa.gov/west-coast/habitat-conservation/san-joaquin-river-restoration

NMFS is available to coordinate with Fresno County on this Project to help minimize, avoid, or offset potential impacts to CCV steelhead, sDPS green sturgeon, and habitat for CV fall-run and spring-run Chinook salmon. If you have any questions regarding this letter, please contact Ms. Hilary Glenn at hilary.glenn@noaa.gov or (916) 200-8211.

Sincerely,

Jonathan Ambrose

RE: CEMEX Rockfield Quarry Rockfield Modification Project (EIR 7763) and Unclassified Conditional Use Permit Applications Nos. 3666 and 3667 – Draft Environmental Impact Report

Dear Mr. Randall,

I write in response to the Draft Environmental Impact Report regarding the CEMEX company's proposal to expand its operations on the San Joaquin River, which include plans to blast and drill a 600-foot pit to extract rock for the purpose of making gravel, northeast of the City of Fresno. Comment 8-1

The CEMEX proposal is unnecessary, unjustifiable, and unwanted by many concerned area residents, community members, and environmental protection advocates. At its core, the CEMEX plan would permanently disfigure and devastate a prized natural resource in Fresno County – the San Joaquin River and the long-standing goal to restore a 22-mile segment into a scenic parkway. Comment 8-2

There are a number of alarming aspects to CEMEX's plan: the company's request to extend its mining at this location for a stunning 100 years; the pit's size would be deeper than the height of the Washington Monument; the lack of clarity regarding mitigation measures for this project that involves dynamiting; and the probability of increased traffic congestion and its repercussions. And, the list goes on. Comment(s) 8-3, 8-4, 8-5, 8-6

However, I want to focus on two specific reasons that I find greatly disturbing and warranting the rejection of the CEMEX proposal.

First, the deep pit will be created by using dynamite to blast rock and crush it into gravel. This pit will be in close proximity to the river – so the potential for contamination and harm to the water, fish, and wildlife is extremely high. This risky situation poses a critical threat to efforts to restore the river and its habitat as well as to residential wells that could go dry because of a shrinking water table. Comment(s) 8-7 and 8-8

Second, the crux of this proposal comes down to the need for it. According to state records cited by a recent report in *Fresnoland*, the "Fresno metro area currently has nearly 200% more gravel than is needed for the next 50 years coming from local mines. The Kings River has roughly 2 billion tons of easily available surface gravel – enough for 500 years at Fresno's current 4 million-ton annual rate." Comment 8-9

In short, there simply is no need for this operation. The *Fresnoland* report described the river this way: "The San Joaquin River, one of California's most beleaguered waterways, has endured over a century of exploitation." Comment 8-10

Re: CEMEX Rockfield Quarry Modification Project Environmental Impact Report

Dear Mr. Randall:

The Friant Water Authority hereby submits the following comments on the subject Environmental Impact Report (EIR).

Background

The Friant Water Authority (FWA) is a public agency formed by its members under California law to operate and maintain the Friant-Kern Canal and to represent our members in federal or state policy, political, and operational decisions that could affect the water supply of the Central Valley Project's Friant Division. FWA also operates and maintains the Friant-Kern Canal on behalf of the U.S. Bureau of Reclamation. Comment 9-1

FWA is a party to the litigation entitled *NRDC et al. v. Kirk Rodgers et al*. In 1988, a coalition of environmental groups filed a lawsuit challenging the renewal of long-term water service contracts between the United States and California's Central Valley Project Friant Division contractors. After more than 18 years of litigation, the Settling Parties reached a Stipulation of Settlement Agreement (Settlement). Besides FWA, the Settling Parties include the U.S. Bureau of Reclamation (Reclamation), which operates and maintains Friant Dam, immediately upstream of the CEMEX Rockfield Quarry Modification Project. To implement the Settlement, Reclamation established the San Joaquin River Restoration Program (SJRRP) and invited the U.S. Fish and Wildlife Service, the National Marine Fisheries Service, and the State of California's departments of Water Resources and Fish and Wildlife to join as implementing agencies. Comment 9-2

The Settlement provides for, among other things, the release of water from Friant Dam and Millerton Lake into the San Joaquin River to restore and maintain fish populations (including naturally reproducing and self-sustaining populations of

salmon and other fish) in good condition in the mainstem San Joaquin River downstream of Friant Dam to the confluence with the Merced River. The water released, called Restoration Flows, is protected from diversion pursuant to State Water Code Section 1707 and is over and above the water historically released to comply with the so-called Holding Contracts. The Holding Contracts are agreements between Reclamation and certain landowners downstream from Friant Dam under which water is released to maintain a 5 cubic feet per second (cfs) flow requirement past those landowners' property. The most downstream landowner is approximately 40 miles downstream of Friant Dam. Before the Settlement, sufficient water was released from Friant Dam to provide a flow of 5 cfs to that landowner. The San Joaquin River was dry beyond that point, except when flood control releases were required from Friant Dam.

Comment 9-2 Cont.

Comments

FWA has the following specific comments on the subject EIR:

Comment 9-3

Page 2.16: The text states: "*applicant has water rights to use river water for industrial purposes in connection with the processing of rock, sand, and gravel*." FWA is unaware of such a water right. The document should be revised to include documentation supporting the claim of water rights, including copies of reports of diversion that the Applicant has made to the State Water Resources Control Board. If the water for the applicant is diverted in accordance with Holding Contract No. 15, it is FWA's understanding that Reclamation does not consider Holding Contracts to confer a water right. Holding Contracts are merely a commitment by Reclamation to provide 5 cfs past the Applicant's property adjacent to the San Joaquin River.

Furthermore, Holding Contract No. 15 states the following:

- Article 12 ("*How the Owner May Divert Water*") states: "*The United Staes does not and will not…object to any reasonable beneficial use of the water of the River for irrigation and/or domestic purposes exclusively upon the said land…*"
- Article 28(a) states: "*…the United States agrees, notwithstanding any provision to the contrary in this contract contained, particularly Article 24 ["*Adverse Interests Conveyed or Reconveyed*"], that it will not object to the use by PACIFIC COAST AGGREGATES, INC., [sic] of the water of the San Joaquin River for industrial purposes in connection with the processing of rock, sand, and gravel, provided the water used is returned to the River free of pollution and/or contamination*."

Therefore, any water diverted under Holding Contract 15 must either be used for "for irrigation and/or domestic purposes" or returned to the San Joaquin River "free of pollution and/or contamination."

Page 2.16: The text states: "*Water is diverted from the river to the Plant Site via a ditch and the water then is used to wash the aggregate*." The document should state if the diversion is screened to prevent fish from entering the ditch.

Comment 9-4

Page 4.4-62 to -63: The text states: "*Fish species that occur in the San Joaquin River include largemouth bass, bluegill (Lepomis macrochirus), catfish, and common carp (Cyprinus carpio). Rainbow trout (Oncorhynchus mykiss) that are triploid (fish that is sterile) are planted for recreation. A Central Valley spring-run reintroduction effort for juvenile spring- and fall-run Chinook salmon (Oncorhynchus tshawytscha) is being undertaken on the San Joaquin River by the Bureau of Reclamation and others as part of the San Joaquin River Restoration Program. The river contains seasonal habitat for rearing and holding of juvenile spring- and fall-run Chinook salmon and are potential breeding habitat for spring- and fall-run Chinook salmon*." The San Joaquin River Restoration Program is undertaking a significant fishery restoration effort. While the description given is accurate, it is insufficient given the magnitude of the effort and the importance of the work. Suggest additional information be provided. The Applicant should review the information available on the San Joaquin River Restoration Program's website (https://www.restoresjr.net/), on the US Fish & Wildlife Service's website (https://www.fws.gov/project/san-joaquin-river-restoration-program), the National Marine Fisheries Service's website (https://www.fisheries.noaa.gov/west-coast/habitat-conservation/san-joaquin-river-restoration), and the California Department of Fish and Wildlife's website (https://wildlife.ca.gov/Regions/4/San-Joaquin-River). Comment 9-5

Page 4.10-7: The text states: "*During historic flow events, including the January 1997 flood event of approximately 60,300 cubic feet per second (cfs), the easterly bank along the Quarry Site did not experience significant erosion and the bank has never breached into the Quarry Site*." The Corps of Engineers estimated the January 1997 flood to have a 60-to-80-year recurrence interval in their "Sacramento and San Joaquin River Basins, California Post Flood Assessment" (https://babel.hathitrust.org/cgi/pt?id=uc1.31210025006170&seq=322 at Table 6-2, page 6-10). The Applicant should analyze the impact from up to a 200-year flood. Comment 9-6

Page 4.10-16: The text states: "*…during unforeseen events, may be required to release water into the San Joaquin River at rates that could exceed the river channel capacity (Fresno County 2018a)*." It should be noted that such releases from Friant Dam may be required during foreseen events as well as unforseen. Comment 9-7

Page 4.10-49: The text states: "*The water level data for well MW-2S, screened only in the alluvium, shows that the well does not contain water except during periods when the San Joaquin River stage is greater than 4 feet. A review of river stage data from January 2014 to February 2023 indicates that the San Joaquin River stage measurements exceeded 4 feet for approximately 13 percent of the January 2014 to February 2023 time period*." Once full implementation of the SJRRP is completed, there will be times when flows in the San Joaquin River will exceed 2,500 cfs for 2 weeks followed by 4,000 cfs for 2 weeks. The EIR should analyze San Joaquin River stages under these flows. The Restoration Flow hydrographs can be found in Exhibit B of the Settlement (https://www.restoresjr.net/?wpfb_dl=9). Comment 9-8

Page 4.10-56: The text states: "*…leakage from the canal flows, which flow year-round, are likely an important source of groundwater recharge to the areas in the vicinity of the Friant-Kern Canal, including the Quarry Site*." As noted above, FWA operates and maintains the Friant-Kern Canal. We Comment 9-9

are unaware of the occurrence of significant seepage from the Friant-Kern Canal in the vicinity of the Quarry Modification Project, and the Friant-Kern Canal is about 2 miles from the Quarry Site. The text references the North Kings GSA's 2022 Groundwater Sustainability Plan as a source of the information contained in this section. The specific page number should be provided, using the updated 2025 GSP (https://northkingsgsa.org/groundwater-sustainability-plan/). Comment 9-9 Cont.

Page 4.10-104: The text states: "*Additionally, diversion of up to 295 acre-feet per year from the San Joaquin River would cease, making that water available for groundwater recharge through the riverbed or for use in lieu of groundwater within the North Kings GSA management area*." If the diversion of San Joaquin River water is done under a Holding Contract, that water cannot be used outside of the Holding, so the water would NOT be available for use "in lieu of groundwater within the North Kings GSA management area" outside of the boundaries specified in the Holding Contract. Comment 9-10

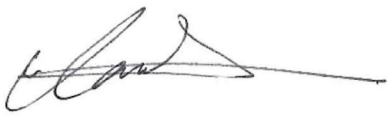
Page 4.11-36: Policy HS-C.12 discusses determination of the 200-year water surface elevations and states that "*new project development...shall not be allowed along the river until the risk of flooding at the site has been determined and appropriate flood risk reduction measures identified*." But the consistency analysis only addresses the 100-year flood. The consistency analysis should be redone. Comment 9-11

Page 4.11-37: Policy HS-C.14 states the County shall promote flood control measures that maintain natural conditions within the 200-year floodplain, but there is no mention of the 200-year floodplain in the consistency analysis. Again, the consistency analysis should be redone. Comment 9-12

Page 5-13: The text states: "*The proposed project would not affect water from Millerton Reservoir, Friant-Kern Canal, and Tule River; therefore, there would not be potential cumulative impacts of the proposed project and the Friant Ranch Specific Plan project on riparian communities, waters of the state, wetlands, or groundwater dependent ecosystems in the vicinity of the project sites*." The San Joaquin River is declared to be a "fully appropriated stream system" by the California State Water Resources Control Board. Any increase in water seepage from the San Joaquin River directly impacts the water supply of the water users of the Friant Division, which get water from the San Joaquin River, the Friant-Kern Canal, and from Millerton Reservoir. The text and impact analyses should be revised. Comment 9-13

On March 7, 2025, Reclamation also provided comments on the subject EIR, which FWA concurs with and are incorporated here by reference. Thank you for the opportunity to comment. Comment 9-14

Sincerely,



Ian Buck-Macleod

Subject: CEMEX Rockfield Quarry Modification Project EIR – Project 7786 – Public Comment Letter

Dear Mr. Randall,

On behalf of the North Kings Groundwater Sustainability Agency (North Kings GSA), the following comments are provided in response to the draft environmental impact report (DEIR) for the CEMEX Rockfield Quarry Modification Project (Project). The Project, both the Plant Site and the Quarry Site, are located within the North Kings GSA as indicated in the DEIR. As such, the scope of the comments provided is limited to potential concerns for water quality, water quantity and ability to reach groundwater sustainability, recharge and potential impacts, and interconnected surface water from the San Joaquin River (SJR) and the groundwater. Specifically, the DEIR should be modified to address the following: Comment 10-1

1. The DEIR evaluates several alternatives including one alternative (Alternative 4) that reduces the mining depth and the setbacks from the SJR from current 200-foot setback by another 100-feet creating a 300-foot setback from the SJR. One of the current efforts being undertaken by the North Kings GSA along with Madera County GSA, United States Bureau of Reclamation (USBR), Friant Water Authority (FWA) and the McMullin Area GSA is an investigation related to interconnected surface water in Reaches 1 and 2 of the SJR. This evaluation and setting of management criteria is required by the Sustainable Groundwater Management Act of 2014 (SGMA) and is in its infancy. Data is being collected to evaluate the interconnectivity and it is unknown whether 300 feet is adequate to address interconnectivity between the SJR and the groundwater at the Quarry Site. The DEIR must consider an investigation that establishes the adequate setback distance needed to address interconnectivity between the SJR and the groundwater at the Quarry Site. Comment 10-2

   Additionally, there are several monitoring wells identified at both the Quarry Site and the Plant Site that provide valuable information. CEMEX should Comment 10-3

ensure the data is shared with Fresno County and the North Kings GSA to be able to monitor potential impacts from the operations and interconnectivity between the SJR and the groundwater in the Project area. Comment 10-3 Cont.

2. The DEIR discusses the overdraft conditions in the Kings Subbasin as presented in the original groundwater sustainability plan (GSP) submitted for the North Kings GSA. The California Department of Water Resources approved the GSP with corrective actions needing to be addressed prior to the resubmittal of the revised GSP and periodic evaluation in January 2025. As such, the North Kings GSA GSP has been revised to address the corrective actions. The base period used in the past, present and future water budgets has been updated to capture more recent years including the most recent drought periods of 2012 to 2016 and 2020 to 2022. The revised GSP and periodic evaluation are available on the North Kings GSA websites at www.northkingsgsa.org and the DEIR should be updated to reflect the most current information related to reaching sustainability in the North Kings GSA. Comment 10-4
3. The joint powers authority (JPA) agreement stipulates that each agency in the North Kings GSA is responsible for mitigating for their portion of the total overdraft within the North Kings GSA boundary. As such, Fresno County is responsible for mitigating for the overdraft conditions in the Fresno County white areas (those with no surface water access). The mitigation target for Fresno County across all the white areas is estimated to be between 1000 acre-feet and 3,000 acre-feet average annual. While the Project indicated it has minimal groundwater demand, an analysis of existing and future with project conditions should be completed. These two conditions should be presented side by side to allow for a straight-forward comparison. The analysis should include all sources of water including precipitation, surface water, groundwater, recharge for the current condition and compare that to the future conditions at various phases with the Project. While the total groundwater demand for the Project appears to be minimal according to the numbers cited in Section 4.10, the County and the North Kings GSA need assurances that the project will not result in additional overdraft in the North Kings GSA. Any use or loss of water above allowable amounts will need to be mitigated and a plan presented on how that will occur. Comment 10-5
4. The DEIR indicates that the Project relies on riparian water rights for industrial uses at the Plant Site and no surface water rights at the Quarry Site. The DEIR should better document the riparian rights at the Plant Site and address other sources of water for the Quarry Site to demonstrate there is no net demand on the groundwater aquifer to support the Project activities. Comment 10-6
5. The North Kings GSA has an obligation to address water quality concerns caused by increased pumping and groundwater level declines per SGMA. The DEIR, Section 4.10) addresses existing water quality conditions at the Plant Site and Quarry Sites. There are some constituents of concern as identified on Tables 4.10.5 and 4.10.6 which are in exceedance of existing primary and secondary drinking water standards. With the number of wells located near the Plant Site and Quarry Site, the DEIR must identify how future water Comment 10-7

contamination issues at these locations will be addressed due to the potential for the water stored in the on-site ponds migrating beyond the project site causing impacts to neighboring wells. Comment 10-7 Cont.

6. Upon Project Completion, the site will be used for habitat and other water recreation activities as there will be a massive hole (up to 600 feet deep) that will be allowed to fill with water. The water budget analysis requested above in Comment No. 4 must address the losses that will occur from evaporation and mitigation measures must be implemented. Comment 10-8

7. The North Kings GSA requests that monitor well data collected on the site be made available to the North Kings GSA, and a data sharing agreement be entered into to allow that to occur. North Kings GSA will request in the data sharing agreement that any monitor wells remain in place even after decommissioning of the Plant Site or Quarry SIte to allow for continued monitoring for water levels and water quality. Comment 10-9

Please do not hesitate to contact me should you have any questions regarding the comments at 559-233-7161, x. 7109 or by email at kchauhan@fresnoirrigation.com.

Sincerely,

Kassy D. Chauhan

Dear Mr. Randall

SUBJECT: Cemex Rockfield Modification Project (Project)
Draft Environmental Impact Report (DEIR)

The San Joaquin River Conservancy (Conservancy) received a Notice of Availability of a Draft Environmental Impact Report (DEIR) from the County of Fresno Department of Public Works and Planning for the Cemex Rockfield Modification Project (Project) pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines[1].

We appreciate the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect the implementation of the Conservancy's mission and updated San Joaquin River Master Plan (Parkway Master Plan).

Comment 11-1

San Joaquin River Conservancy Background

The San Joaquin River Conservancy is an agency of the State of California created by the Legislature to create the San Joaquin River Parkway by: acquiring 5,900 acres from willing sellers for Parkway purposes; enhancing and restoring riparian, floodplain, and other habitats, and conserving natural and cultural resources on its lands; and developing and managing its lands for public recreational and educational uses compatible with resource protection. The Conservancy also assists other entities in conserving and improving their lands for the Parkway. The Conservancy works to facilitate the development of the Parkway, cultivate public support, and secure its future.

The Conservancy Governing Board adopted the Parkway Master Plan and certified its programmatic Environmental Impact Report in 1997 and updated the document in 2018. The updated Parkway Master Plan provides goals, objectives, and design standards for appropriate public recreational uses, trail corridors, habitat restoration, fishing and boating access, etc. on public Parkway lands. Goals, objectives, and policies consistent with the Parkway Master Plan have been adopted in the County of Fresno General Plan.

1 CEQA is codified in the California Public Resources Code in section 2100 et seq. The "CEQA Guidelines" are found in Title 14 of the California Code of Regulations, commencing with section 15000.

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

David Randall
County of Fresno Department of Public Works and Planning
March 10, 2025

Project Description Summary

As presented in the DEIR, the Project will continue and modify its current aggregate (rock, sand and gravel) mining and processing operations located on two properties (Plant Site and Quarry Site) between North Friant Road and the San Joaquin River, in Fresno County. The current mining and processing operations have been continuous at the two sites for 108 years.

Comment 11-2

The Project would be implemented in two stages:

Stage 1: continue current operations at both the Quarry Site and the Plant Site for up to 30 years. Upon completion of mining at the Plant Site, operations at the Plant Site would cease and the site would be reclaimed as 138.5 acres of open space, riparian, and open water wildlife habitat. At this time, operations at the Quarry Site would then be modified, upon approval of the Modification project permit, to include hard rock (granite) excavation (drilling and blasting).

Upon approval of the project, the combined annual sales of aggregate from both sites are estimated to increase from the 1.4 MT/year allowed under the current permits to 2.0 MT/year within approximately five years of project approval and up to 3.0 MT/year within approximately 10 years of project approval.

Stage 2: continue hard rock mining and processing operations only at the Quarry Site for approximately 70 more years. Upon completion of mining at the Quarry Site, operations at the Quarry Site would cease and the site would be reclaimed as 352.4 acres of open space, riparian, and open water wildlife habitat.

Stage 2 operations are estimated to have annual aggregate sales of 3.0 MT/year.

The total Project life of the combined Stages (1&2) is estimated to be up to 100 years.

Comments and Recommendations

As presented in the DEIR, the Project appears to be consistent with several of the goals and policies included within the Parkway Master Plan. For example, the Parkway Master Plan encourages recreational fishing at off-stream excavated ponds (from gravel mining) and specifically supports the development of a multi-use Parkway trail, secondary trails, and a trail system on Parkway properties for a connected recreational system and connect open spaces, provide loop routes and nature trails, provide river access, and secondary trails to link to adjacent bikeways. However, the Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an incompatible activity and conflict with existing or planned Parkway land uses near the Project.

Comment 11-3

In accordance with the goals and policies of the Parkway Master Plan, the Conservancy offers the comments and recommendations below to assist the County of Fresno in the appropriate application of Parkway policies and identification and/or mitigation of the Project's significant, or potentially significant, direct and indirect impacts within the San Joaquin River Parkway. Editorial comments or other suggestions may also be included to improve the accuracy and consistency of the DEIR.

Comment 11-4

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

General Comments

The DEIR does not identify the State Lands Commission as a State Agency with jurisdiction over sovereign lands adjacent to the San Joaquin River or describe any current or potential lease for mining operations. Comment 11-5

Project Description

During the Conservancy's review of the submitted materials, it was noticed that the project description/operational statement and the project description within the DEIR contain conflicting information. Specifically, it was noted that the project description/operational statement identifies that Stage 1 will reclaim 122 acres of open space, riparian and open water wildlife habitat and Stage 2 would create approximately 349 acres of open space, riparian and open water wildlife habitat. However, in the project description of the DEIR, Stage 1 is identified as reclaiming 138.5 acres of open space, riparian, and open water wildlife habitat with Stage 2 creating 352.4 acres of open space, riparian, and open water wildlife habitat. Comment 11-6

In Section 2.4.2.2 Quarry Site Existing Conditions, under the Screening, Parking, Lighting and Fencing sub-section, it is mentioned that there is perimeter fencing surrounding the Quarry Site and does not mention fencing at the Conservancy owned property known as Beck Ranch. Presence or absence of fencing should be identified. Comment 11-7

In Section 2.5.2.2 Quarry Site Mine Plans, under the Screening, Parking, Lighting and Fencing sub-section, it is mentioned that the remainder of the north property line would be fenced with minimum four-foot high, ranch fencing consisting of metal T-posts and at least three strands of barbed wire. The Conservancy owns Beck Ranch, which is adjacent to the north property line and is managed as a conservation area. For fencing the boundary between the north property line and Beck Ranch, 5-strand barbed wire with a wildlife friendly, smooth top and bottom wire is preferred and recommended. Comment 11-8

In Section 2.5.8 Trail Easements, it is mentioned that the applicant is in discussions with the Conservancy's Executive Officer towards providing potential easements at the Plant Site and Quarry Site. This statement is misleading. It would be more appropriate to say that discussions are being reinitiated, as there has been no recent communication on proposed easements, until March 6, 2025, after the DEIR was released. Comment 11-9

4.1 Aesthetics and Visual Resources

The DEIR provides a substantial amount of information on impacts to aesthetics and visual resources; however, the DEIR does not adequately address the effects of the Project on adjacent, Conservancy owned properties. Therefore, it appears that the Project is inconsistent with the Parkway Master Plan goals and policies by omitting analysis for Conservancy owned properties and/or negatively impacting quality scenery, aesthetics, and viewsheds. Comment 11-10

In Section 4.1.1.4 Identification of Potentially Sensitive Viewpoints, under the Public Parks/Recreation Facilities sub-section, there is no mention of the Conservancy's owned property, known as Ball Ranch, which is adjacent to the Plant Site. Ball Ranch is open to the public 7-days a week for recreation and public access.

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

Table 4.1-2, Summary of Potentially Sensitive Viewpoint Locations, does not include the Conservancy owned property, known as Beck Ranch, which is a viewpoint located adjacent to Lost Lake Regional Park, north/northwest of the Quarry Site. The table also provides inaccurate information on both Ball Ranch and Ledger Island, stating that they are not currently accessible to the public. Both Conservancy owned properties have been open to the public 7-days a week for recreation and public access. Comment 11-11

Table 4.1-3, U.S. Bureau of Land Management Visual Project Impact Ratings at Nearby Viewpoints, does not include the Conservancy owned property, known as Beck Ranch, which is a viewpoint located adjacent to Lost Lake Regional Park, north/northwest of the Quarry Site. Beck Ranch is also omitted in the following discussion and analysis. Comment 11-12

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures: Comment 11-13

- Revegetation, habitat enhancement, and amenity plantings should be implemented in such a way to screen views between the Project and surrounding land uses.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

The Conservancy supports and encourages the conservation of habitat on private lands and recommends planting native vegetation on pond berms and controlling/removing non-native/invasive plant species from the Project as a feasible mitigation measure. Comment 11-14

The Conservancy supports and encourages minimizing lighting associated with Parkway development and encourages land use policies that minimize light impacts in the floodplain. Apart from safety, preclude lighting in the vicinity of the wildlife corridor or a natural reserve, to the greatest extent possible. Comment 11-15

4.3 Air Quality and 4.8 Greenhouse Gas Emissions
The DEIR provides a substantial amount of information on impacts to air quality; however, the DEIR does not adequately address the effects of the Project on adjacent Conservancy owned properties. Comment 11-16

As stated in the DEIR, the Project can provide a potential source of odor due to the hydrocarbons that are emitted from asphaltic concrete at elevated temperatures. The Conservancy owned properties known as Ball Ranch, Ledger Island and Beck Ranch were not considered as potential model receptor locations. Significant odor impact could occur at the adjacent, Conservancy owned properties and additional analysis should be undertaken to determine the extent of the impacts and appropriate mitigation measures. It appears that the Project is inconsistent with the Parkway Master Plan goals and policies by omitting analysis for Conservancy owned properties and/or negatively impacting regional air quality and greenhouse gas emissions.

The Conservancy supports and encourages the applicant to use alternative fueled construction equipment, minimize idling time, and required that equipment is properly maintained and tuned to prevent or minimize impacts to air quality and reduce greenhouse gas emissions. Comment 11-17

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

4.4 Biological Resources

The Conservancy supports and encourages coordination with federal and State environmental regulatory and permitting agencies, including, but not limited to, the California Department of Fish and Wildlife, the California Department of Water Resources, and the Regional Water Quality Control Board to develop adequate avoidance and minimization measures to impacts on biological resources within the Projects area of impact.

Comment 11-18

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends implementation of the following buffers:

- Provide native vegetation for screening wildlife from human activity as necessary to accommodate less width for a buffer zone.
- Provide a 700-foot buffer between any Parkway improvement and sensitive habitat. (Sensitive habitat includes areas of special biological significance that provide habitat for locally unique biotic species/communities; that are adjacent to essential habitats of rare, endangered or threatened species; or any natural community vulnerable to environmental effects of projects).
- Avoid more intensive recreational or other uses within 1500 feet of rookeries where feasible.
- From the river wildlife corridor, encourage 100-foot buffers from agriculture/pasture; 150-foot buffers from rural residences (less than .05 unit per acre); 300-foot buffers from medium density rural residences (.05 units per acre to less than 1 unit per acre); 600-foot buffers from business/industry or urban density development (more than 1 unit per acre); and 700-foot buffers for any development from sensitive habitat.

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures:

- Avoid, minimize, and ensure pollution prevention and compliance in the use of herbicides.
- Incorporate construction best management practices for stormwater quality management, including erosion and sedimentation controls and spill prevention and control, into all applicable permits and as part of Project implementation.
- Properly maintain stormwater quality management post-construction controls.

Comment 11-19

The Conservancy requests that the County of Fresno requires the applicant to implement the above buffers and recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

4.5 Cultural and 4.18 Tribal Resources

The Conservancy supports and encourages the protection of cultural resources within the Project impact area and recommends additional tribal consultation or outreach prior to completion of the Final EIR based on the known and likely cultural and archaeological resources, including human remains.

Comment 11-20

The Conservancy recommends the following best management practices:

- If any cultural resources, such as structural features, unusual amounts of bone or shell, flaked or ground stone artifacts, historic-era artifacts, human remains, or architectural remains are encountered during any project construction activities, work shall be suspended immediately at

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

the location of the find and within an appropriate radius of at least 50 feet. A qualified archaeologist shall conduct a field investigation of the specific site and recommend mitigation necessary for the protection or recovery of any cultural resource concluded by the archaeologist to represent a historical resource or unique archaeological resource.

Comment 11-20 Cont.

- If human remains are accidentally discovered during the proposed Project's construction activities, the requirements of California Health and Human Safety Code section 7050.5 must be followed. Potentially damaging excavation must halt in the area of the remains, with a minimum radius of 50 feet, and the local County Coroner must be notified. The Coroner is required to examine all discoveries of human remains within 48 hours of receiving notice of a discovery on private or state lands (Health and Safety Code section 7050.50(b).) If the Coroner determines that the remains are those of a Native American, he or she must contact the Native American Heritage Commission (NAHC) by phone within 24 hours of making that determination (Health and Safety Code section 7050 (c)). Pursuant to the provisions of the PRC section 5097.98, the NAHC shall identify a Most Likely Descendant (MLD). The MLD designated by the NAHC shall have at least 48 hours to inspect the site and propose treatment and disposition of the remains and any associated grave goods.

Comment 11-21

4.9 Hazards and Hazardous Materials and 4.20 Wildfire

To minimize the risk of loss of life, injury, and damage to property and natural resources resulting from fire hazards, the Conservancy recommends the following avoidance and minimization measures:

- Perform fire prevention measures including thinning or mowing, reducing ladder fuels, and weed abatement on property boundaries, access roads, and around parking areas and/or structures.
- Provide 600-foot buffers between business/industry or urban density development (more than 1 unit per acre) and Conservancy owned properties.

Comment 11-22

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

4.10 Hydrology and Water Quality

The Conservancy supports and encourages coordination with federal and State environmental regulatory and permitting agencies, including, but not limited to, the California Department of Fish and Wildlife, Department of Water Resources, and the Regional Water Quality Control Board to develop adequate avoidance and minimization measures to impacts on hydrology and water quality resources within the Projects area of impact.

Comment 11-23

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures:

- Provide erosion control and slope stabilization measures in any area where erosion could lead to sedimentation of a waterbody.
- Perform major vehicle maintenance, repair jobs, and equipment washing at appropriate off-site locations.
- Regularly maintain equipment to prevent fluid leaks. Any leaks shall be captured in containers until the equipment is moved or repaired.
- Prepare a spill prevention and response plan prior to construction.

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

- Designate one area, well away from streams or storm drain inlets, for auto and equipment parking and routine vehicle and equipment maintenance;
- Clean-up spilled dry materials immediately and dispose appropriately.
- Use the minimum amount of water necessary for dust control.
- Clean-up liquid spills on paved or impermeable surfaces using “dry” cleanup methods (e.g. absorbent materials such as cat litter, and/or rags).
- Clean-up spills on dirt areas by removing and properly disposing of the contaminated soil.
- Store stockpiled materials, wastes, containers and dumpsters under a temporary roof or secured plastic sheeting where they cannot enter into or be washed by rainfall or runoff into waters of the U.S./State or aquatic habitat.
- Properly store containers of paints, chemicals, solvents, and other hazardous materials in garages or sheds with double containment during rainy periods.
- Avoid operating equipment in a live stream channel.
- Apply best management practices for treating, detaining, and percolating stormwater runoff, such as bioswales, bioretention areas and seasonal wetlands.

Comment 11-23 Cont.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

4.11 Land Use and Planning

As previously stated, the Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an incompatible activity and conflict with existing or planned Parkway land uses near the Project.

Comment 11-24

To minimize land use impacts to adjacent, Conservancy owned properties, the Conservancy recommends implementation of the following buffers:

- To the extent feasible, acquire, enhance, restore and maintain a continuous riparian/wildlife corridor throughout public Parkway lands with a minimum width of 200 feet upland from the ordinary low-water mark and gaps of no greater than 200 feet or the minimum necessary to allow for infrastructure (e.g. roads, bridges, boat launches, etc.).
- Build trails or provide easements for bikeways and other recreation areas at least 300 feet from the boundary of active mining operations and processing plants, separate them by physical barriers, and avoid trail/bikeway crossings of active haul routes.
- Where feasible, provide a minimum width of 100 feet for the Parkway multi-use trail corridor.
- From the river wildlife corridor, encourage 100-foot buffers from agriculture/pasture; 150-foot buffers from rural residences (less than .05 unit per acre); 300-foot buffers from medium density rural residences (.05 units per acre to less than 1 unit per acre); 600-foot buffers from business/industry or urban density development (more than 1 unit per acre); and 700-foot buffers for any development from sensitive habitat.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

Additionally, please note that the property referenced in the DEIR that is south of the Quarry Site, known as Sumner Peck Ranch, is not owned by the Conservancy – it is owned by the San Joaquin River Parkway and Conservation Trust. Please see that attached Parkway Public and Non-Profit Property Ownership map for clarification on ownership within the Parkway.

Comment 11-25

4.12 Mineral Resources

The Parkway Master Plan directs the Conservancy to work with gravel mining companies to develop reclamation plans that enhance and compliment Parkway goals, while not conflicting with sand and gravel mining operations. The Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an incompatible activity and conflict with existing or planned Parkway land uses near the Project.

Comment 11-26

4.13 Noise

Project noise generated at the Quarry Site may exceed applicable noise standards. Based on distance to closest receptors, the analysis appears to have excluded the recreating public at adjacent, Conservancy owned properties (Ball Ranch, Ledger Island, Beck Ranch).

Comment 11-27

To minimize impacts to adjacent, Conservancy owned properties the Conservancy recommends the following avoidance and minimization measures:

- Minimize excessive noise generating activities to reduce disturbance to the nearest sensitive land uses, including the adjacent, Conservancy owned properties, which provide habitat for sensitive wildlife, recreation, and public access.
- Minimize excessive vibration generating activities to reduce disturbance to the nearest sensitive land uses, including the adjacent, Conservancy owned properties, which provide habitat for sensitive wildlife, recreation, and public access.

The Conservancy requests that the County of Fresno requires the applicant to implement the above recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

4.16 Recreation and 4.17 Transportation

The Project is consistent with the Parkway Master Plan goals and policies by encouraging low-intensity use and habitat conservation and connections to other regional recreational trails, open spaces, and land uses; trail systems that enhance non-motorized commuting and transportation. However, these sections should be revised to include current information and analysis on both Ball Ranch and Ledger Island, which are currently open 7-days a week for recreation and public access.

Comment 11-28

To minimize impacts to adjacent, Conservancy owned properties, the Conservancy recommends the following avoidance and minimization measures:

Comment 11-29

- Improve safety and reduce pedestrian and bicycle traffic between Old Friant Road to Lost Lake campground by assisting the Conservancy in creating the Lewis S. Eaton Trail expansion segment and/or rehabilitation of Ledger Island Bridge.

The Conservancy requests that the County of Fresno requires the applicant to implement the above

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

recommendations, at a minimum, to minimize impacts to adjacent, Conservancy owned properties.

Comment 11-29 Cont.

The Conservancy supports and encourages continued discussions between the applicant and the Conservancy's Executive Officer, towards providing potential easements at the Plant Site and Quarry Site, which will link public Parkway lands and provide a continuous, multi-use trail. For consistency with the Parkway Master Plan, were feasible, a minimum 100ft multi-use Parkway trail corridor is preferred.

Comment 11-30

Alternatives

The Conservancy supports and encourages an evaluation of a range of reasonable Project Alternatives prior to selecting a preferred Project Alternative. The current mining and processing operations along the San Joaquin River have been limited to sand and gravel mining excavations, and have been continuous at the two sites for 108 years. The Project proposes a new activity, hard rock (granite) excavation (drilling and blasting) within the Parkway that was never previously evaluated by the Parkway Master Plan. Therefore, as sand and gravel mining operations were the only mining activity evaluated, hard rock excavation may be an incompatible activity and conflict with existing or planned Parkway recreation near the Project.

Comment 11-31

The DEIR considers several Project Alternatives, all of which include hard rock excavation except for the No Project Alternative. The Conservancy recommends that additional alternatives that provide for sand and gravel mining operations, consistent with the Parkway Master Plan, be evaluated and considered.

Section 6.3.1 lists ten project objectives. The Conservancy concurs with the project objectives within its purview, specifically:

Comment 11-32

8. Maintain consistency with the San Joaquin River Parkway Master Plan.
9. Reclaim both sites to wildlife habitat in a manner similar to the reclaimed mine sites that make up the majority of the San Joaquin River Parkway properties.
10. Provide potential Parkway trail easements.

In addition to the objectives listed in this Section, the Conservancy would also support adding "maintaining consistency with the County of Fresno General Plan" as part of the 8th objective or as a standalone project objective.

Comment 11-33

Conclusion

The Conservancy appreciates the opportunity to comment on the DEIR for the Project and recommends that the County of Fresno Department of Public Works and Planning address the Conservancy's comments and concerns in the Final EIR.

Comment 11-34

Due to the issues presented in this letter, the Conservancy concludes that the DEIR does not adequately identify or mitigate the Project's impacts on environmental resources and that the Project may not be consistent with the Parkway Master Plan. The Conservancy recommends that the Draft Environmental Document discuss additional potential safe, public access opportunities within the San Joaquin River Parkway to accommodate the reasonable and foreseeable impacts to adjacent open space areas, intended for recreation and public access. Increasing safe, public access to the Parkway will also meet policies and objectives that are set forth in the Parkway Master Plan and Open Space and Recreation Element of the City of Fresno General Plan.

Comment 11-35

Docusign Envelope ID: 2CB559FA-3141-42AB-A82F-E05A0C8D7AFD

The Conservancy also requests to be consulted during the development any reclamation and revegetation plans to ensure that the plans enhance and compliment Parkway goals.

Comment 11-36

Pursuant to Public Resources Code sections 21092 and 21092.2, the Conservancy requests written notification of proposed actions and pending decisions regarding the Project. Written notifications shall be directed to:

San Joaquin River Conservancy
Kari Kyler Daniska, Executive Officer
PO Box 28338
Fresno, CA 93729

The Conservancy requests an opportunity to review and comment on any response that the County of Fresno has to our comments and to receive notification of any forthcoming hearing date(s) for the Project.

If you have any questions regarding the comments provided in this letter or wish to schedule a meeting, please contact me at (559) 287-2650 or by email at kari.daniska@sjrc.ca.gov.

Sincerely,

Kari Kyler Daniska
Executive Officer

Re: Draft Environmental Impact Report SCH #2020060123, EIR No. 7763 (Draft EIR) For the Proposed Unclassified Conditional Use Permit Application Nos. 3666 and 3667, CEMEX Rockfield Quarry Project

Mr. Randall:

Comment 12-1

I represent the City of Fresno, and I write to submit the following comments on the Draft EIR for the CEMEX Rockfield Quarry Project (the "Draft EIR"). As set forth below, the City has identified several procedural and substantive deficiencies that preclude certification of the Draft EIR in its present form.

Chief among the substantive deficiencies is: (1) the Draft EIR's failure to consider the physical impacts of increased hauling by heavy trucks over North Friant Road by shifting truck traffic from the other aggregate mines listed on page 4.17-20 of the EIR to the CEMEX Rockfield Quarry Site and Plant Site (collectively, the "Project"), (2) failure to consider the cumulative impacts of the Project and these other aggregate mines in the cumulative impacts section, despite using these other mines to effectively erase the transportation impacts from the Project, and despite noting that, taken together, these projects will result in an increase of over 3,000,000 annual VMTs by Stage 2 of the Project (3) failure to discuss impacts to water quality, such as the potential alteration to groundwater flow as a result of continuous dewatering during mining operations below the existing groundwater level, mobilization of naturally occurring constiutents, such as arsenic, iron, lead, and manganese into the ground water (these hydrology and water quality impacts and improved mitigation measures to address them are discussed in more detail in the letter dated March 3, 2025 from the City of Fresno Department of Public Utilities to David Randall, Fresno County Public Works and Planning Department, a copy of which is attached as Exhibit 1 hereto).

Chief among the procedural deficiencies is the fact that the Project described in the Draft EIR includes portions of APNs 300-070-43ST, 48ST, and 50ST, which are not included in the applications for Conditional Use Permits 3666 and 3667, and were not listed in the Notice of Preparation ("NOP"), Notice of Completion ("NOC") or Notice of Availability ("NOA").

These and other deficiencies are discussed below in the order in which they appear.

1. Project Application

Comment 12-2

The land use application for Conditional Use Permit 3666, which applies to the Plant Site, is incomplete and does not meet the requirements of the Fresno County Zoning Code 838.5.060, because it contains no reference to the land owned by the California Department of Fish and Wildlife (the "CDFW") referred to on page 2-2 of the EIR's Project Description as portions of APNs 300-070-43ST, 48ST, and 50ST (the "CDFW Property"). If that land is to be included in the Project, it must be listed in the Conditional Use Permit application, and an Authorization of Agent to Act on Behalf of Property Owner must be filed with Fresno County (the "County"). Accordingly, the application is incomplete based on the Draft EIR's Project Description.

2. Notice of Preparation

Comment 12-3

The NOP for the EIR was dated June 3, 2020 and posted on June 5, 2020 as SCH No. 2020060123. That NOP is not valid for the EIR, because the project description included in the NOP lists the Plant Site as "Assessor Parcel Numbers (APNs) 300-070-56S, 57S, 58S, 59S, & 60S," and does not identify the CDFW Property as part of the Plant Site, unlike the Project Description in the EIR. (*Compare* NOP, Attachment A at p. 1, *with* EIR at p. 2-2.)

The Plant Site Aerial included in the NOP also omits the CDFW Property, and is inconsistent with the Aerial depicted in the EIR. (*Compare* NOP, Figure 2 *with* EIR, Figures 2-1 and 2-6.) Project Description/Operational Statement, Appendix B-2, states on page 14 that the CDFW Property is already currently being utilized as part of the Plant Site for mining operations, so this state-owned land should have been identified in the NOP.

This is a significant omission because the NOP was sent to the State Clearinghouse, pursuant to the CEQA Guidelines (California Code of Regulations, Title 14, Section 15000-15387) for mandatory notice to the following reviewing agencies:

> California Air Resources Board (ARB), California Department of Conservation (DOC), California Department of Parks and Recreation, California Department of Resources Recycling and Recovery, California Department of Transportation, District 6 (DOT), California Department of Water Resources (DWR), California Governor's Office of Emergency Services (OES), California Natural Resources Agency, California Regional Water Quality Control Board, Central Valley Fresno Region 5 (RWQCB), California San Joaquin River Conservancy (SJRC), California State Lands Commission (SLC), Central Valley Flood Protection Board, Delta Stewardship Council, Office of Historic Preservation, State Water Resources Control Board, Division of Water Quality, California Native American Heritage Commission (NAHC), California Department of Fish and Wildlife, Central Region 4 (CDFW)

When the NOP was distributed to the reviewing agencies, those agencies, and CDFW in particular, should have been provided notice that CDFW property was being considered as part of the Project in the EIR.

Comment 12-4

The project description in the NOP also fails to adequately describe the true expansive nature of the Project, which it merely describes as allowing "the Rockfield Quarry a continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operations." (NOP, Attachment A at p. 1.) The project description does not adequately identify as significant new land uses activities such as significantly increasing the mining depth to 600 feet below grade that requires hard rock blasting adjacent to the San Joaquin River, public parks, camping sites, adding a material recycling of concrete and asphalt concrete, adding on-site sales of materials to the public, resuming aggregate mining at the Plant Site and adding a large hot-mix asphalt plant. The Project results in reduced setbacks and buffers and other project features that were previously required by the Previous CUPs.

3. Notice of Completion

Comment 12-5

The Notice of Completion dated July 6, 2020, (NOC) is not valid for the proposed Draft EIR. As with the NOP, filed one month earlier, the NOC was sent to the same agencies with the same incorrect project location, incorrect project description and including Figure 1 and 2 that do not show the CDFW Property that is included in the Draft EIR.

Only two letters were received by the State Clearinghouse on the NOP, California Department of Fish and Wildlife (CDFW) and Native American Heritage Commission (NAHC). CDFW submitted a letter dated July 6, 2020, that states the CDFW is submitting comments as a Responsible Agency, a permitting agency. However, since the Draft EIR also includes the CDFW Property, it should have been given notice that it is actually an owner of part of the Project, in which case its comments could have addressed more than its interest merely as a permitting agency.

4. Notice of Availability

Comment 12-6

The "Reissued Notice of Availability of a Draft Environmental Impact Report (EIR) for the proposed modification to the existing CEMEX Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667)" (the "NOA") for the Draft EIR is posted on the County of Fresno website.

NOA's are typically posted at the Project Site, mailed to adjacent landowners, interested parties and posted at the County of Fresno administrative offices. Public involvement is one of the fundamental objectives of CEQA. Thus, adequate notification to the public of the availability of a Draft EIR is important in achieving this objective (CEQA Guideline §15201, Public Resources Code §21083 and 21087).

As with the NOP and NOC, the NOA merely describes the proposed Project as a "continuation and modification of its current aggregate (rock, sand and gravel) mining and processing operations," and fails to describe the vastly expanded operations that would be allowed under the Project. Like the NOP, the NOA omits the APN numbers for the CDFW Property.

The County of Fresno has failed to comply with the requirements of CEQA and State Law with incorrect and misleading public notices. The proposed Project needs to be correctly noticed and recirculated in order for State and Federal agencies, interested parties and the general public to determine their interest in the proposed Project.

Comment 12-6 Cont.

5. Draft Environmental Impact Report No. 7763 SCH# 2020060123

Comment 12-7

Chapter 1, Introduction and **Chapter 2**, Executive Summary need to be revised to reflect the significant revisions to Draft EIR.

a. Chapter 2: Project Description

The Draft EIR project description is insufficient and inaccurate in describing the proposed Project and does not comply with CEQA Guidelines and CEQA regulations. The Draft EIR project description is inconsistent with the Project Description/Operational Statement (Appendix B-2) that is part of the Surface Mining Reclamation Plan (Appendix B-1). The Draft EIR needs to be revised and recirculated.

i. <u>Project Location</u>

Comment 12-8

CEQA §15124, Project Description, lists the required information needed to evaluate and review the environmental impacts of the proposed Project. CEQA §15124(a) states:

> The precise location and boundaries of the proposed project shall be shown on a detailed map, preferably topographic. The location of the project shall also appear on a regional map.

The Draft EIR fails to comply with CEQA §15124(a) because the Project Location is both internally inconsistent within the Draft EIR, and inconsistent with the applicable Project CUP applications, which do not include the CDFW Property.

Within the Draft EIR, Figure 1-1 (Regional Location) and Figure 1-2 (Site Location) do not include the whole of the action which has the potential for resulting in either direct physical change in the environment or the reasonably foreseeable indirect physical change in the environment (CEQA Guidelines §15379(a); Public Resources Code §21065). Figures 1-1 and 1-2 do not appear to include the CDFW Property (APNs 300-070-43ST, 48ST and 50ST).

Draft EIR section 2.2.1, Project Location, states that the "12.9 acres owned by the [sic] California Department of Fish and Wildlife" is included in the 138.5-acre Plant Site and is currently used by the Applicant for current mining operations. The Draft EIR states:

> This Draft EIR assumes that CDFW will permit CDFW to continue to be used for mining and processing operations under the proposed project. Therefore, this 12.9-acre area is included in the 138.5-acre Plant Site.

However, the Draft EIR depicts the location of the Project, particularly the land owned by the State of California, inconsistently or not at all in the Draft EIR and therefore, does not disclose and analyze the significant environmental impacts of the whole project.

Comment 12-8 Cont.

Moreover, Conditional Use Permit 3577-A, to extend operational time limit from July 28, 2023 to July 28, 2027 does not include the land identified as "portions of APNs 300-070-43ST, 48ST and 50ST." Exhibit 2 of CUP 3755, Location Map, depicts the Plant Site as located on APNs 300-070-56S, 57S, 58S, 59S and 60S and consists of approximately 122 acres. APNs 300-070-56S, 57S, 58S, 59S and 60S total to 121.94 acres.

ii. Plant Site Aggregate Mining

Comment 12-9

The Project Description/Operational Statement (Appendix B-2) state on page 2 that "At the Plant Site, mining of the alluvial deposit will resume…." Therefore, aggregate mining that occurred in the past cannot be considered a part of the baseline conditions and needs to be treated as a new and unapproved land use pursuant to Fresno County Zoning Code Section 868.6.020, Expiration. Section 868.6.020A.1.c. states:

> If there is a cessation in the occupancy or use of land or structure(s) authorized by the permit or approval for a period in excess of two years, the permit or approval shall expire and be deemed void.

Aggregate mining is a use of land, such as the concrete plant or asphalt plant. If there is cessation of a particular approved land use in a conditional use permit for more than two years, the land use permit expires. The Draft EIR needs to be revised and recirculated to eliminate previous aggregate mining environmental impacts on the Plant Site from the baseline as existing conditions.

iii. Section 2.4.8 Current Operating Entitlements and Vested Rights.

Comment 12-10

The Project Description fails to adequately describe the current operating entitlements and vested rights, because it fails to describe the approved Site Plans and Rehabilitation Plans that were imposed as conditions on the existing CUPs. This leads to omitted and misleading information regarding the restrictions on the current site operations.

For example, in Table 2-1, Rockfield Modification Project Characteristics, the Draft EIR incorrectly states there is no maximum mining depth under the existing CUPs for the Plant and Quarry Sites. To the contrary, Condition No. 21 to CUP 2032 for the Quarry Site required the submission and approval of a Site Plan Review, which would have established the maximum depth of excavation, most likely at 45'. The parameters of the approved Site Plan Review, which are a condition of approval, should be disclosed. The Staff Report for CUP 2032 states that "The applicant estimates groundwater depth to be 20 feet and is proposing to excavate to a depth of 45 feet." (Staff Report, § C; *see also* City of Fresno Department of Public Utilities, Exhibit 1 hereto, for further commentary on hydrology and the impacts of deeper mining.) The Mining Plan attached to the Staff Report shows the "Maximum Excavation Depth" to be 45'.

Similar Site Plan Review requirements are set forth in CUP 367, though there is no indication of maximum depth in the CUP itself. (CUP 367, Area A Condition No. 24, Area B Condition No. 10.) Nevertheless, since mining stopped at 32 feet bgs (Draft EIR 2-29), it seems likely that a similar limit is present in the current Site Plan. Since these Site Plans are part of the express conditions on the existing CUPs, they should be disclosed in the Draft EIR.

Comment 12-10 Cont.

Similarly, both CUPs required the submission and approval of rehabilitation plans. (CUP 2032, Condition 13; CUP 367, Area A Condition 18, Area B Condition 11.) These plans may include requirements that are inconsistent with the depths proposed for the Project in the Draft EIR. Other requirements in the current rehabilitation plans may be inconsistent with the Project, thereby leading to other potential impacts from the Project. Accordingly, the terms of the existing rehabilitation plans should be disclosed in section 2.4.8.

Comment 12-11

In addition, section 2.4.8 states that the Operations at the Rockfield Quarry are currently governed by and vested under CUPs 367, 2032, 2209, 3063, and 3093. However, this is only partially true. As disclosed on page 2-8, there are currently no mining operations on the Plant Site. Accordingly, there is no longer any vested right to "continue" mining on the Plant Site.

Comment 12-12

Moreover, vested rights under SMARA are limited to mining of areas that were "'clearly intended'" to be excavated—as measured by objective manifestations, not subjective intent" when the vested rights were first triggered. (*Calvert v. County of Yuba* (2006) 145 Cal.App.4th 613, 625.) Accordingly, the vested rights do not cover any expansion of the area allowed to be mined. The area intended to be mined at the time of the CUPs is delineated on the Site Plans that were required to be approved before mining commenced. Accordingly, once again, the bounds of mining disclosed in the Site Plans must be disclosed in the Project Description.

iv. Stockpiling

Comment 12-13

Table 2-1, Rockfield Modification Project Characteristics, indicates that the Project will mine and process 3.3 MT of aggregate per year, but sell 3.0 MT per year. It appears the excess 0.3 MT per year of waste/fines will be stockpiled until the sites are reclaimed at the end of mining. The Draft EIR needs to identify the amount of sand/fines and mine waste that is existing on site and stockpiled in berms to understand the impact of adding additional sand/fines and mine waste.

In Appendix B-1, page 57, Paragraph 4.4.23 states the Plant Site will use the fines, tailings and other mining waste to reclaim the bottom 20 feet of the excavation. The Quarry Site will deposit the fines, tailing and mining waste in the bottom of the excavation. The Plant Site will not be reclaimed for 30 years, and the Quarry Site will not be reclaimed for 100. This will amount to 30 MT stockpiled until reclamation or 551 acres of sand and mine waste at 25 feet in height. The Draft EIR needs to detail how the waste/fines will be stockpiled, the amount, maximum height and duration of stockpiling on each site before final reclamation, identify the significant environmental impacts associated with large numerous stockpiles and provide meaningful mitigation. Stockpiling mitigation should include:

- Limiting stockpiles height to 25 feet to prevent visibility from the surrounding properties and public roads

- Covering the sand and mine waste with impermeable material to prevent blowing sand and dust

- Limiting the amount of stockpiled material to 1MT at any one time (1MT at 25 feet in height results in 18.36 acres of stockpiled material) The Project is required to export from the Project Site any material over 1 MT.

Comment 12-13 Cont.

v. Project Life

Comment 12-14

Table 2-1 indicates the proposed project life of 30 years for the Plant Site and 100 years for the Quarry Site. As stated above, surface mining by its very nature is a finite and temporary land use. State and local regulations require a reclamation plan as part of the permit. The Draft EIR uses models to predict future conditions under which the Project will operate to identify the significant environmental conditions and mitigation of the Project's environmental impacts. No analysis provided in the Draft EIR can model conditions or determine the Project's environmental impact on the area and region 30 years out, let alone 100 years in the future. The Draft EIR will become obsolete in identifying significant environmental impacts and mitigation for those impacts many years before the end of the Project Life. The Project Life should be reduced to the lowest modeling limitations presented in the Draft EIR.

vi. Figures 2-1 And 2-2 Aerials

Comment 12-15

Figure 2-1 incorrectly shows the "CUP Boundary" as including the CDFW Property. As noted above, the CUP applications do not include the CDFW Property. Figure 2-1 should be corrected to show the actual CUP boundary. Figure 2-2 is not legible to determine the "Existing CUP Boundary." Figure 2-2 needs to be corrected to clearly show the existing and proposed project boundary.

vii. Existing Setbacks

Comment 12-16

The existing setbacks stated on Page 2-15 are not consistent with the existing CUPs and approved project features and need to be corrected to provide accurate information to determine the significant environmental impacts of the Project as detailed below. The existing CUPs are described as and have the following conditions of approval concerning what conditions of approval and project design features apply:

> Fresno County Resolution No. 11848 (CUP 3093 and 3094) Condition 1 states: "All conditions of Conditional Use Permits Nos. 367,2032, 2235, 2241 3063 and 3064 shall remain in full force and effect except as modified by the condition below."

Comment 12-16 Cont.

> Fresno County Resolution 11776 (CUP 3063 and 3064) Condition 1 states: "All conditions of Conditional Use Permits Nos. 367,2032, 2235, 2241 shall remain in full force and effect except as modified by the condition below."

On Page 2-16 the Draft EIR states: "1) No stockpiled soil or materials placed closer than 25 feet from any property boundary except visual/sound berms." This is an incomplete description of the intent of the previous approved CUPs. Condition 3 of CUP 367 for the Plant Site states:

> Except for the main sand pile, the height of the material stockpiles shall not exceed 25 feet unless the Permittee is able to satisfy County that it will plant landscaping which will, within five (5) years of planting, effectively screen such stockpiles from view from Friant Road.

Comment 12-17

On page 2-18 of the Draft EIR states: the setback for the Quarry Site is a 200-foot mining setback from the river edge. However, Condition No.15 of CUP 2032 expands that and states:

> All excavation operations, including stockpiling, shall be set back a minimum of 200 feet from the existing San Joaquin River Channel. Riparian vegetation shall not be disturbed.

The setback from San Joaquin River is a project feature of CUP 2032 and is more precisely identified in the Mining Plan cross section attached to the CUP (a copy of which is attached hereto as Exhibit 3), which identifies the approved plan's setback from the San Joaquin River as:

> 200' Setback from existing stream channel or 20' setback from the reclamation board's existing designated floodway, whichever is further from the river bank.

Comment 12-18

Figure 4.10-1 depicts the current and regulatory floodways and floodplains for the Project Sites. However, the Plant Site does not include the Project's area owned by the State of California. The Draft EIR should include a map showing the setback line as required by the Previous CUPs in order to analyze the impact of the proposed Project to the existing setback requirements.

Comment 12-19

On page 2-18 the Draft EIR states: "7) no stockpile soil or material will be placed closer than 25 feet from any property boundary except visual/sound berms." This statement is not accurate and needs to be corrected. Condition No. 3 of CUP 2032 for the Quarry Site states:

> Stockpiling of materials shall not be allowed within 200 feet of the south property line, nor shall an excavation be allowed within a 260-foot radius of the front entry of the residences on the adjoining property to the south.

Also, Condition No. 12 of CUP 367 for the Quarry Site states:

> Stockpiling of material shall not be allowed within 200 feet of Friant Road or that portion of the north property line adjoining Lost Lake Park unless Permittee

screens any such closer stockpiling with approved landscaping so that it is not visible from Friant Road and the north property line of Lost Lake Park.

Comment 12-19 Cont.

viii. General Plan Land Use Designations

Comment 12-20

On page 2-28 the Draft EIR implies there has been continuous recovery of mineral resources at the "combined" project sites for more than 100 years. This is not a correct description of the recovery of mineral resources at the Plant Site. The Plant Site is subject to a separate conditional use permit (CUP 3666). The Project Description/Operational Statement (Appendix B-2) states that aggregate mining has stopped on the Plant Site and therefore has not been continuous. Pursuant to Fresno County Zoning Code Section 868.6.020, Expiration, the mining of aggregate (land use) that is subject to a conditional use permit at the Plant Site has expired. Therefore, it is considered a new land use at the Plant Site and is not included in the Draft EIR baseline to determine Project's significant environmental impacts.

The Draft EIR States the uses allowed in the agriculture designation include special agricultural uses and agriculture-related activities, including value-added processing facilities listed in Table LU-1. General Plan Table LU-1, Agriculture/Resource states:

Comment 12-21

> This designation provides for the production of crops and livestock, and for location of necessary agriculture commercial centers, agricultural processing facilities, and certain nonagricultural activities.

Although surface mining is allowed in Agricultural designated land, it is not an agricultural use. The Draft EIR implies that any process located on the Project Site is a "Value-Added Agricultural Use (Processing Facility). However, the Fresno County General Plan, Appendix A, Glossary, defines "Value-Added Agricultural Uses as:

> Uses of facilities that increase the value of agricultural produce over the cost of raw produce, such as canning, drying, freezing or packaging agricultural produce for the ultimate sale to consumers.

The use of value added agricultural to justify the inclusion adding concrete and asphalt recycling is not consistent with the Fresno County General Plan.

The proposed Project is inconsistent with the Fresno County General Plan Goal PF-F and Policy PF-F.3, Solid Waste Facility Siting. Policy PF-F.3, e. states:

Comment 12-22

> Solid waste facilities shall not be located adjacent to rivers, reservoirs, canals, lakes or other waterways.

The proposed Project is located adjacent to the San Joaquin River.

As noted above, Appendix B-1, page 57, Paragraph 4.4.23 states the Plant Site will use the fines, tailings and other mining waste to reclaim the bottom 20 feet of the excavation. The Quarry Site will deposit the fines, tailing and mining waste in the bottom of the excavation. The Plant Site will not be reclaimed for 30 years, and the Quarry Site will not be reclaimed for 100.

This will amount to 30 MT stockpiled until reclamation or 551 acres of sand and mine waste at 25 feet in height. In other words, the Project will include a significant disposal of solid waste onto the Project site. (Fresno County Municipal Code, Section 8.20.010.M ("defining solid waste"); Pub Res. Code 40191 (same), 40192 (defining "disposal" as final deposition of solid waste onto land).)

Comment 12-22 Cont.

In addition, the proposed Project includes the acceptance and recycling of used concrete and asphalt concrete. The Project Description indicates the annual tonnage of 200,000 MT. Solid waste processing facilities are considered solid waste facilities under the Public Resources Code and the Fresno County Municipal Code. (Public Resources Code §§ 40172, 40194; Fresno County Municipal Code § 8.20.010(G).)

The proposed uses of the Project as a solid waste facility are not consistent with the Fresno County General Plan. The EIR must be revised to address this land use impact.

ix. Proposed Project Elements

Comment 12-23

On page 2-40 the Draft EIR states that the Quarry Site is designed to continue avoidance of the riparian corridor along the San Joaquin River and mining setbacks required under the existing CUPs would remain the same. Figure 2-8, Proposed Quarry Site Mining Plan, needs to be revised to depict the setbacks required under the previous CUPs.

Comment 12-24

Also, on page 2-40 the Draft EIR states that the existing screening berms along North Friant Road frontage and the south property line would remain in place. The Draft EIR needs to provide the height and location of the existing berms and provide information on the north property line screening or setback. The Draft EIR should include a line-of-site analysis that depicts the maximum height of stockpiles on the Project Sites.

Comment 12-25

Table 2-6, Existing and Proposed Daily Truck Trip Generation does not include trips from the Material Recovery Facility that is planned to accept used concrete and asphalt concrete which is projected to total 200,000 tons per year. The table and its use within the Draft EIR need to be corrected to accurately depict generated truck trips and identify the significant environmental impact of the Project.

x. Trail Easements

Comment 12-26

On page 2-51, the Draft EIR states that the applicant is in discussions with the San Joaquin Conservancy's (SJRC) Executive Officer towards providing trail easements at the Plant and Quarry Site. The Draft EIR concludes that no further CEQA review is warranted because SJRC has not "currently" proposed development and construction. The trails are part of the San Joaquin River Parkway Master Plan. The Draft EIR further states that should the trails be proposed for development in the future, project-level CEQA review would be required prior to construction. This is not an accurate summary of the Project's impact on the San Joaquin River Parkway Master Plan.

The Draft EIR, states in Section 2.3, Project Purpose and Objectives, 10): Provide potential Parkway trail easement. The Project needs to make provisions for an easement to allow the San Joaquin River Parkway Master Plan to go forward and provide linkage to trails within a certain time limit, instead of 100 years from now. Project Description/Operational Statement, Appendix B-2 states that the Project will "acquire, through purchase, easements, or other mutually satisfactory transactions, land for recreation areas and the expansion of existing parks and recreation areas." Specific mitigation measures should be included in the Draft EIR requiring the Project to provide the necessary trail easements consistent with the San Joaquin River Parkway Master Plan and Lost Lakes Park Master Plan, acquire, through purchase, easements, or other mutually satisfactory transactions, land for recreation areas and the expansion of existing parks and recreation areas within five years of Project approval.

Comment 12-26 Cont.

xi. Other Agencies Whose Approval May Be Required

Comment 12-27

The proposed Project includes the acceptance and recycling of used concrete and asphalt concrete, and the final disposal of fines, overburden, and other mining waste onto the land. The Project Description indicates the annual tonnage of 200,000 MT in concrete and asphalt waste for recycling. This is considered a large Material Recovery Facility. This land use is subject to regulations as a proposed Material Recovery Facility, and possibly as a solid waste disposal facility. Recycling of concrete and asphalt concrete is subject to a Solid Waste Facility Permit (SWFP). The Draft EIR needs to provide details in the Project Description how the operation of the Material Recovery Facility and the disposal of fines, overburden, and other mining waste will take place and be consistent with all applicable regulations of CalRecycle.

b. Chapter 4: Environmental Analysis

Comment 12-28

i. Section 4.1 Aesthetics

The Draft EIR is inadequate in describing the significant impact on a designated scenic roadway. On page 4.1-61 of the Draft EIR states there are no state scenic highways. However, there are local designated scenic highways.

The Draft EIR is not consistent with the Fresno County Rural Bikeways Plan that depicts North Friant Road on Figure OS-1 of the Fresno County General Plan as a designated scenic highway. The Draft EIR is not consistent with the City of Fresno General Plan that depicts North Friant Road as a scenic highway. The Project has the potential to significantly impacting the off-site views from the roadway if not mitigated. The Draft EIR is inadequate because it did not analyze the off-site views from the designated scenic highway and did not include Project features to prevent the Project operations from being visible from the scenic roadway. Mitigation Measure 4.1-1 is inadequate to lessen the visual impact of the Project from the designated scenic roadways. The Project should include the following mitigation:

> No stockpiles or mining facilities including the cement plant, asphalt plant, material recovery or buildings shall be visible from North Friant Road or surrounding properties.

Comment 12-29

The Draft EIR is insufficient in mitigating the Project's impact on Light and Glare. The Project will introduce a new source of night time lighting in the surrounding community. The Draft EIR concludes that design features will result in a less than significant impact. However, there is no requirement that the Project implement any of the features discussed. Therefore, the following mitigation measure should be added to the Draft EIR:

- Night lighting on the property shall be arranged and controlled so as not to luminate public rights-of-way or adjacent properties.
- The Project shall only use high-pressure sodium and cut-off fixtures to minimize light pollution.
- The Applicant shall submit a lighting plan to the County Planning Department for approval prior to construction of the processing facilities that will identify the location of lights, how they will be aimed, and types of shielding that will be utilized such that light bulbs and reflectors are not visible from public viewing areas and illumination of the vicinity and the nighttime sky is minimized.
- Nighttime lighting on the Project Site shall be limited to areas required for the safety of project personnel and the public.
- The Project's fencing shall either be constructed of non-reflective material, treated, or painted to reduce visual impacts.
- Non-reflective surfaces or non-reflective paint shall be used for the processing plant equipment and structures to minimize glare from these facilities.

ii. Section 4.3 Air Quality

The air quality assumptions are inadequate to determine Project's environmental impacts and the conclusions in Section 4.3, Air Quality. The Draft EIR needs to be revised and recirculated.

(1) AQ Modelling

Comment 12-30

The air quality assessment was peer reviewed by Taylor Environmental in 2020, and was apparently completed in March of 2022. It is now March of 2025, and this analysis would appear to be woefully out of date. Were the latest versions of the air quality modelling tools used? Did they apply the latest regulations, such as the 2022 Advanced Clean Fleets Regulation and amendments to the 2004 Transport Refrigeration Unit (TRU) Airborne Toxic Control Measures?

(2) Baseline Selection

Comment 12-31

The AQ modelling is fundamentally flawed, because it arbitrarily selects as the baseline year 1998. (Appendix D-1 at p. 88 ("The Baseline was determined based on historical production records for the year 1998").) This flawed baseline was then subtracted from the

project impacts, and evaluated against the significance criteria. This is material, because emissions technology has advanced since 1998, and operations at the site have changed. An up-to-date baseline of the current conditions should be used to analyze the Project's impacts.

Comment 12-31 Cont.

(3) Aggregate Processing and Stockpiling

Appendix D-1, Air Quality, Health Risk, and Climate Change Impact Assessment, list the Project features that are used in assessing air emissions. The air emissions were incorrectly modeled on aggregate production of 3 MT per year. Table 2-1 lists 3.3 MT per year of aggregate processing. The remaining .3 tons per year are fines and mine waste that will remain on the Project Sites and stockpiled until they are deposited in the bottom of the mine at the time of reclamation, 30 to 100 years in the future. The Draft EIR air quality assessment needs to be revised to include this significant increase of 30 MT of aggregate processing and stockpiling to identify the significant environmental effect and provide mitigation.

Comment 12-32

(4) Concrete Recycling

The Draft EIR does not discuss the exposure to asbestos from recycling older concrete or provide protocols to prevent exposure to workers and the public. Mesothelioma Hope website provides information on "The Risk of Asbestos in Concrete." The Draft EIR needs to be revised to include analysis of the risk of airborne asbestos exposure from recycling used concrete.

Comment 12-33

(5) Project Components for Air Quality Analysis

Table 4.3-8, Rockfield Modification Project Components of Air Quality and Greenhouse Gas Modeling, does not include operation mobile equipment, onsite and offsite delivery trucks, or onsite and offsite workers vehicles. The air quality and greenhouse gas modeling are insufficient to analyze the significant environmental effect of the proposed Project. Table 4.3-8 needs to be revised to include all Project components.

Comment 12-34

(6) Baseline Emissions

Baseline emissions information depicted in Table 4.3-9, Historical Production Data, needs to be revised. Production of aggregate, concrete and asphalt is seasonal with an increase in production during Summer months. The baseline emission data needs to describe how the Maximum Hour and Maximum Day is determined for modeling.

Comment 12-35

(7) Emissions

Tables 4.3-10, 4.3-11 and 4.3-12 needs to be revised to include operation mobile equipment, onsite and offsite delivery trucks, or onsite and offsite workers vehicles.

Comment 12-36

Tables 4.3-16 and 4.3-17 needs to clearly depict the thresholds of significance for each source pollutant.

(8) VMT Impacts on GHGs and Air Quality

Comment 12-37

Table 34 of Appendix D-1 states the Project vehicles are heavy-heavy duty and are not subject to heavy duty GHG Phase 1 regulations. However, there are heavy duty trucks that have a direct and indirect impact that are generated by delivery of Project's products and acceptance of materials for recycling. Although the Vehicle Miles Travel (VMT) is used to determine transportation impacts and has been limited to passenger vehicles and light trucks, VMT for the operational aspects of the Project still applies to determine environmental impacts from air quality and hazards. The Project's air quality modeling needs to include the 6.2 million annual VMT generated by the Project (Appendix I-2, Estimates of Vehicle Miles Traveled). To the extent the VMT analysis indicates that the Project will result in a reduction of regional VMTs from similar aggregate mining operations, the EIR must still analyze the air quality impacts caused by the redistribution of VMTs. For instance, will heavier traffic on Friant Rd. result in higher levels of diesel particulate exposure in closer proximity to sensitive receptors?

(9) Compliance with Air Quality Plans

Comment 12-38

On page 4.3-57, the Draft EIR, concerning Impact 4.3.1, is insufficient and needs to be revised. The emission data for Project operations exceeds daily and annual San Joaquin Valley Air Pollution Control District (SJVAPCD) thresholds which results in conflict with air quality plans.

In addition, the analysis concludes the Applicant will be able to comply with future rule making by the SJVAPCD concerning implementation of applicable air quality plans. Thus, concluding that the level of significance before mitigation is less than significant. There is no requirement in the Draft EIR for the Project to comply with future air quality attainment plans during the 100-year Project duration. This assumption was used to support a determination of less than significant is not support by proposed Project components. The air quality assessment assumed minor changes in rulemaking in the future will "likely" lessen future Project impacts on air quality. A mitigation measure should be included to the Draft EIR requiring the Project to comply and implement all new technology, air quality plans, goals and regulations in the future.

(10) Natural Gas

Comment 12-39

California Energy Commission has a goal of eliminating natural gas use by 2045. The use of natural gas has a significant impact on greenhouse gases in California. The Project proposes the use of natural gas for the asphalt plant and therefore would not be in compliance with this goal. The Project, to comply should build the new asphalt plant using electricity instead of natural gas or other fossil fuels. This will result in a reduction in air pollutants. The Project should be revised to use electricity instead of natural gas or other fossil fuels for the asphalt plant and other Project components.

The Project should be required to use all-electric mining trucks. Caterpillar has successfully demonstrated the first battery electric 793 large mining truck. The Project should be required to use all-electric mining vehicles to lessen air quality impacts.

Caterpillar Electric 793 Mining Truck

Comment 12-40

(11) Greenhouse Gases Modeling

The Project used the South Coast Air Quality Management District's guidance on impact analysis for GHG, stating that SJVAPCD modeling was outdated. The advantage to the Project was the exclusion of emissions from sectors that are required to participate in the Cap-and-Trade Program, i.e. gasoline and diesel. This is an impermissible deferral of the obligation to disclose the environmental impacts of this Project. The Project should use the SJVAPCD modeling or another suitable methodology that actually analyzes the impacts from this Project.

(12) CO2 Emissions

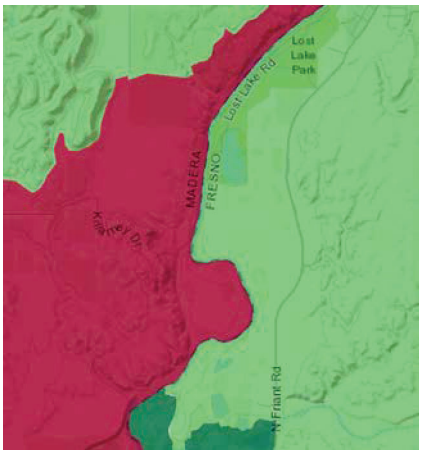
Comment 12-41

SJVAPCD uses the CalEEMOD model to determine project's air quality impacts. The air quality analysis in Appendix D-2 also states the Project uses CalEEMOD. On page 4.3-62, Table 4.3-23, Mitigated and Unmitigated CO Concentration was modeled without including the 6.2 million annual VMT generated as required in the CalEEMOD. Therefore, the conclusion the Project does not exceed CO concentration is not accurate and needs to be revised to analyze the entire Project's environmental impact on CO concentrations and other air pollutants. The Draft EIR needs to be revised to include all sources of air pollutants from the Project for air quality modeling.

(13) Fugitive Dust Control

Comment 12-42

The Draft EIR needs to include an analysis of the Project's dust particulate (PM2.5) impact on the Census Tract 6039001000 located westerly from the Project in unincorporated Madera County and surrounding area in order to determine the cumulative net increase of an criteria pollutant. CalEnviroScreen 4.0 indicates this area has a high pollution burden of 90 percentile for PM2.5 as shown in red. High PM2.5 (94 Percentile) is also the existing condition for adjacent Census Tracts easterly in Fresno County but has a lower overall pollution burden as shown in green due to other socio/environmental factors, such as the ability to deal with pollution load. The increase in aggregate production from 1.3 MT to 3.3 MT annually at both the Plant and Quarry Site will exasperate the existing conditions on this area.



Source: CalEnviroscreen 4.0

Comment 12-43

Mitigation Measure 4.3-2, Fugitive Dust Control Plan, on page 4.3-62 is not adequate and needs to be revised to include that all trucks hauling materials need to be completely covered both on-site and delivery trucks to reduce fugitive dust generated by the Project.

Table 4.3-20 identifies that CO, PM10 and PM2.5 exceeds significance criteria. Mitigation Measure 4.3-2 is not adequate to mitigate the significant environmental impacts to less than significant. The Draft EIR needs to identify additional measures that the Project can implement in order to make the finding of less than significance. Therefore, without additional analysis and mitigation the Draft EIR results in Significant and Unavoidable.

Mitigation Measure 4.3-2 Fugitive Dust Control should include the following additional mitigation:

> All truck loading/unloading facilities to be equipped with one 110/208-voltpower outlet for every two-truck loading/unloading facility. A minimum 2-foot-by-3foot sign shall be clearly visible at each loading lock and in a readable letter size that states: “Diesel engine idling limited to a maximum of 2 minutes.” The sign shall include instructions for diesel trucks idling for more than 2 minutes to connect to the 110/208-vole poser to run any auxiliary equipment.

Comment 12-44

(14) <u>Air Quality Impact on Sensitive Receptors</u>

On page 4.3-63, Table 4.3-24 indicates the Project exceeds the threshold for environmental significance for Excess Cancer per Million People Exposed and for the Maximum Acute Hazard Index. The Draft EIR reached this conclusion even without including the 6.2 million annual VMT generated by the Project or the added aggregate processing and stockpiling. There is no explanation why “Fence-line Receptors” are not included in the table. However, users and workers at the adjacent recreation parks would have exposure. The Draft EIR needs to include additional mitigation to reduce air quality impact and health risks from the Project.

Thes mitigation measures should include the following:

- All truck loading/unloading facilities to be equipped with one 110/208-voltpower outlet for every two-truck loading/unloading facility. A minimum 2-foot-by-3-foot sign shall be clearly visible at each loading dock that indicates, "Diesel engine idling limited to a maximum of 2 minutes." The sign shall include instructions for diesel trucks idling for more than 2 minutes to connect to the 110/208-volt power to run any auxiliary equipment. Comment 12-44 Cont.

- The use of electric-powered "yard trucks" or forklifts to move truck trailers around a truck yard or truck loading/unloading facility.

- The use of buildings or walls to shield commercial activity from nearby residences or other sensitive land uses.

- The use of EPA-rated Tier 4 Final engines in diesel-fueled construction equipment when construction activities are adjacent to existing sensitive receptors.

- The planting and maintenance of vegetative buffers between truck loading/unloading facilities and nearby residences, schools, daycare facilities, and any other sensitive receptors. As part of detailed site design, a landscape architect licensed by the California Landscape Architects Technical Committee shall identify all locations where trees should be located, accounting for areas where shade is desired such as along pedestrian and bicycle routes, the locations of solar photovoltaic panels, and other infrastructure.

- The use of all electrical-powered Transportation Refrigeration Units (TRUs).

- The use of all electric heavy-duty trucks.

- Designate truck routes that avoid sensitive land uses, including low-income and minority neighborhoods.

(15) Odors

The proposed Project includes a hot-mix asphalt plant that will generate 200,000 tons of asphalt per year. Hot-mix asphalt plants generate noxious odors that can impact people even 1.5 miles away. The discussion of Impact 4.3-4, starting on page 4.3-65, states that the hot-mix asphalt is a continuation of the of past activities. However, the asphalt plant stopped operations in 2009 and therefore is not considered a part of the baseline conditions and needs to be treated as a new and unapproved land use pursuant to Fresno County Zoning Code Section 868.6.020, Expiration. Comment 12-45

The Draft EIR states that no odor complaints were received when the previous asphalt plant operated, however there is no information on what type of asphalt plant was in operation. There are no records to search for odor complaints and it is based on a person's memory. Therefore, not a reliable assumption to make a finding of no previous odor complaints. This just as likely indicates there is poor record keeping and lack of concern about the asphalt plant's impact on the community. Comment 12-46

Comment 12-47

The odor impact analysis assumes facts that are not part of the Draft EIR or its Project description as justification of reduced Project air quality impacts. Section 4.3-4 states that the proposed asphalt plant would generate fewer odor producing emissions than the past due to its fuel source being natural gas instead of diesel and due to the use of new technology to capture 95% of blue smoke emissions and therefore concludes "it is not anticipated that Stage 1 operations on the Plant Site could generate odors that would adversely affect a substantial number of people." This assumption is not supported by facts.

The use of natural gas instead of diesel will not occur until a natural gas line is installed to the asphalt plant for Phase 1 at the Plant Site. There is no discussion of the fuel source for the asphalt plant when it is relocated in Phase 2 at the Quarry Site. The Draft EIR does not identify when natural gas will be used in Phase 2 at the Quarry Site. There is not discussion what happens to the fuel source as the asphalt plant is moved to accommodate surface mining in either Phase 1 or Phase 2. There is no discussion that identifies and details the "new technology" will capture 95% of blue smoke or if the asphalt plant will include this technology. The Draft EIR needs to be revised to provide specific equipment that will capture 95% of blue smoke.

Comment 12-48

The Draft EIR bases Project Impacts on air quality odors based on a "modern" asphalt plant. The Draft EIR does not provide any details on what a modern asphalt plant consists of or a list of equipment that reduces odor impacts, just that the asphalt plant will receive a permit from the SJVAPCD prior to operation. However, this is not a guarantee that the proposed asphalt plant will not generate offensive odors to the surrounding community during the life of the Project.

The County of Orange, which has a similar air inversion condition as the San Joaquin Valley, approved a hot-mix asphalt plant on a portion of a former gravel quarry in 1993 located in unincorporated Orange County north of the City of Irvine. There are a series of rolling hills and valleys that separate the asphalt plant from the nearest residences, 0.5 miles away. An EIR with a Health-Based Risk Assessment was prepare in 2005 for a residential development that concluded it was unlikely that releases from the asphalt plant would have the potential of adversely affecting the residential development since the asphalt plant received the necessary permits.

However, this was not the result and even with the expert assistance of the South Coast Air Quality Management District (SCAQMD) it was very difficult to stop adversely affecting the surrounding community, even at 1.5 miles away. The asphalt plant emitted odors that resulted in eventually the City of Irvine buying the asphalt plant to eliminate the nuisance from its residents at a cost to tax payers of between $50 and $100 Million Dollars.

In 2020, the City of Irvine filed a "Complaint for Public Nuisance Abatement Injunction, Equitable Relief and Civil Penalties (30-2020-01153015-CU-MC-CJC) (Irvine Lawsuit) against the hot-mix asphalt plant. The Lawsuit stated that since 2019, 468 complaints relating to the asphalt plant were fielded by SCAQMD with the vast majority related to issues with asphalt, oil, tar-like odors and smoke. SCAQMD stated in 2022 that they had received more than 1,400 odor complaints from the asphalt plant source.

Comment 12-48 Cont.

SCAQMD issued in 2022 eight odor nuisance NOVs to the asphalt plant. The asphalt plant was expanded in 2016 with active permits for existing equipment. Irvine's asphalt plant is considered "modern" and SCAQMD stated it is working with the operator on a "carbon adsorption unit" under a research permit. The plant in 2022 was to evaluate if there was a decrease in odor or emissions. SCAQMD also required the asphalt plant to instruct drivers to cover any loads of asphalt prior to leaving the facility and instruct drivers on approved truck routes. None of this worked to mitigate odors and the City of Irvine purchased the asphalt plant in 2023.

Draft EIR, Impact 4.3-4 states that there are residences within 0.25 miles from the proposed asphalt plant and concludes that it is "unlikely" that substantial odors from the asphalt plant would be generated at these distances based on Figure 4.3-4, Wind Rose. However, Figure 4.3-4 depicts a wide area of impact surrounding the Project under typical low wind conditions. Section 4.3.1.1, Environmental Factors Affecting Air Quality, that states: "Low wind speed conditions limit horizontal air dispersion and can result in a buildup of air pollutants." The conclusion that residences 0.25 miles away will not experience substantial odors is not supported by fact and is likely. This would result in a significant environmental impact that needs to be mitigated.

Comment 12-49

Figure 4.3-4, Wind Rose, is insufficient to adequately depict the influence of wind on the Project. Winds are seasonal and vary between winter (December – February) spring (March – May) summer (June – August) and fall (September – November). The Draft EIR should be revised to provide the seasonal analysis of wind direction and speed that is overlaid on aerial maps of the surrounding 3-mile area that includes all sensitive receptor locations.

Comment 12-50

Mitigation Measure 4.3-4: Asphalt Plant Emissions Controls, is not sufficient to mitigate the significant odors and air pollutants from the asphalt plant. Mitigation Measure 4.3-4 should be revised as follows:

> Prior to the issuance of any permit a sign shall be posted at each entrance to the Project, with letters large enough to be read from the public road, with the San Joaquin Valley Air Pollution Control District most current toll-free phone number (800-870-1037), website address and email address to make odor, vehicle smoke and dust complaints. The sign shall include the name of the facility and address. The sign shall be updated as soon as any of the information changes.
>
> The operator of the facility will annually mail to each property owner within 3 miles of the Project Site, the County of Fresno and any interested parties requesting the notice, a letter with information on how to file an air pollution complaint to the San Joaquin Valley Air Pollution Control District with the following explanation:
>
> > The District receives complaints that may constitute a public nuisance. The state's public nuisance law (CH&SC 41700) prohibits emissions which cause odors or other disturbances in the community that impact a

significant number of people, create a threat to public health or cause damage to property.

Comment 12-50 Cont.

Asphalt loads are required to be covered prior to leaving the facility and operator shall instruct drivers on approved truck routes.

Mitigation Measure 4.3-4, 1) states that asphalt cements with lower VOC/SVOC emissions, as approved by the SJVAPCD, shall be used to the "extent feasible" will not result in a measurable reduction in VOC/SVOC. The proposed mitigation does not quantify a limit on the use of processes that generate higher VOC/SVOC. The use of lower VOC/SVOC depends on how the asphalt is being uses, such as the specification requirement of the roadway being paved. The Draft EIR needs to identify the different types of asphalt processes, their use and the amount of VOC/SVOC they emit, and the anticipated percentage of Project's production of the different types of asphalt, especially the production of lower VOC/SVOC asphalt. The mitigation measure needs to quantify and limit on the amount of high VOC/SVOC asphalt that can be produced in order to mitigate the Project's environmental air quality impacts.

Comment 12-51

Mitigation Measure 4.3-4, 2) states: "To reduce VOC emissions, periodic burner tune-ups shall be implemented" is not adequate to mitigate the significant environmental impacts on air quality. The mitigation measure needs to identify the equipment being added that is used to reduce air pollution impacts. The Draft EIR in determining "less than significant impact" relies on the uses of "new technology" that will capture 95% of blue smoke. The mitigation measure should include that the Project will conform to all new laws to prevent generation of air pollutants and update its equipment and procedures to conform with any new rule making, within six months of enactment.

Comment 12-52

The use of the term "periodic" has no quantifiable meaning and will not result in adequate mitigation. The mitigation needs to include a meaningful time limit, such as daily, weekly or monthly that the burner tune-up shall take place.

Mitigation Measure 4.3-4 3) needs to be revised to apply to the features and environmental impacts of the Project instead of a project located in Imperial County.

Comment 12-53

The mitigation measure should include that the County of Fresno will monthly inspect the operations of the Project to determine that the Plant Site and Quarry Site are implementing all design features, conditions of approval and mitigation measures. The County of Fresno will keep records of all inspections, public complaints and notice of corrections during the life of the Project (100 years). This information shall be available to the public.

(16) Odor - Pond Pits

Comment 12-54

The Reclamation Plan will result in pond pits on each Project Site. The Draft EIR acknowledges stagnant water can lead to odors. The impact analysis assumes that there will be enough groundwater flow through the Plant Site pond and the Quarry Site to eliminate pond stagnation. Appendix G-4, Groundwater Conditions Quarry Site, indicates after reclamation there will be low inflow of groundwater with higher evaporation to prevent a pond deeper than

Comment 12-54 Cont.

110 feet. The Draft EIR impact analysis states that the Quarry Site pond will upwell twice a year that will result in no pond odors.

The Quarry Site pond is over 400 feet from the surrounding surface. It is unlikely the pond will experience wind upwelling given the depth of the quarry walls, narrow surface water area and the typical low wind conditions in the area. Ocean upwelling only occurs in 4 places on earth and account for only 1% of the ocean surface.

Upwelling can occur with change in surface water temperature. However, deep quarry ponds typically remain very cold all year so it is unlikely that upwelling will occur due to warm surface water and certainly not twice a year. The Draft EIR does not support the assumption that the pond pits will not become stagnant and create an odor nuisance to the surrounding sensitive receptors. The Draft EIR should include a mitigation measure to prevent stagnant water as is included in Previous CUPs. Conditional Use Permit 2032, included Condition No. 14:

> All water bodies shall be designed to avoid stagnant water or shall be improved with appropriate circulation systems. Corrective measures shall be taken to eliminate the stagnant condition of the pond adjacent to the plant site.

The Draft EIR conclusion of Less than Significant after mitigation for air quality impacts is not supported by the analysis or the proposed mitigation to lessen the identified environmental impacts. The Draft EIR should fine the Project's environmental impact on air quality is Significant and Unavoidable.

iii. Section 4.4 Biological Resources

Comment 12-55

The Draft EIR is insufficient in describing the environmental impact of the Project's Biological Resources and providing mitigation for Project's significant environmental impacts. Mitigation Measures 4.4-1a, 4.4-1b and 4.4-1c only require the biological resources clearance surveys "at the start of construction" or "initiation of a mining phase." The Project only has two phases, Phase 1 of 30 years and Phase 2 of 70 years. The mitigation measures are inadequate to prevent the significant Project impacts on Burrowing Owls, Western Pond Turtle and Western Spadefoot, and nesting birds. The mitigation measure needs to be revised to require annual surveys and when mining operations occur or are relocated within the Project Site to prevent mining operation's impacts on biological resources.

iv. Section 4.8 Greenhouse Gas Emissions

Comment 12-56

The Project used the South Coast Air Quality Management District's guidance on impact analysis for GHG, stating that SJVAPCD modeling was outdated. The advantage to the Project was the exclusion of emissions from sectors that are required to participate in the Cap-and-Trade Program, i.e. gasoline and diesel. This is an impermissible deferral of the obligation to disclose the environmental impacts of this Project. The Project should use the SJVAPCD modeling or another suitable methodology that actually analyzes the impacts from this Project.

Comment 12-57

v. Section 4.9 Hazard and Hazardous Materials

The Draft EIR is insufficient in describing the environmental impact of the Project and needs to be revised. Section 4.9 needs to include the exposure to asbestos from processing 200,000 tons annually of used concrete to make aggregate. The Draft EIR needs to include mitigation to lessen the exposure to workers and the community from asbestos in the aggregate process and stockpiling of broken and crushed concrete that may contain asbestos by requiring testing of used concrete prior to accepting material.

Comment 12-58

Impact 4.9-3 states that "upon completion of the final reclamation activities, the Plant Site and Quarry Site would be converted to open space land use." The Fresno County General Plan defines Open Space Land as:

> Any parcel or area of land or water that is essentially unimproved and devoted to an open space use for the purpose of: 1) the preservation of natural resources; 2) the managed production of resources; 3) outdoor recreation; or 4) public health and safety.

The Project is not consistent with the Fresno County General Plan definition of Open Space Land. Table 2-2, Allowable Uses and Permit Requirements for Agricultural Zones (attached as Exhibit 2 hereto) lists all the land uses allowed, however none of the land uses listed could be accommodated if the Project's Reclamation Plan is implemented.

Comment 12-59

The Fresno County Zoning Code Section 834.4.220, Material Extraction Sites, defines "Reclamation" as:

> Reclamation. The combined process of land treatment that minimizes water degradation, air pollution, damage to aquatic or wildlife habitat, flooding, erosion, and other adverse effects from surface mining operations, including adverse surface effects incidental to underground mines, so that mined lands are reclaimed to a usable condition which is readily adaptable for alternate land uses and create no danger to public health or safety. The process may extend to affected lands surrounding mined lands, and may require backfilling, grading, resoiling, revegetation, soil compaction, stabilization, or other measures.

The Draft EIR describes that reclamation of the 85-foot-deep pit at the Plant Site is to result in a 65-foot-deep quarry hole with eventually 20 feet of water that is not accessible by the public and has no recreational value or use. The Previous CUP's approved by the County require the Reclamation Plan to show the number of lakes with islands (CUP 2032, Condition of Approval No. 13). All other terms of the previously approved rehabilitation plans required in the CUPs should be disclosed for a fair comparison of the final impacts of this project following reclamation.

The Quarry Site's 600-foot-deep pit is to result in a 400-foot sheer walled quarry with eventually 200 feet of water at the bottom. There is no public accessibility or recreational value to the reclamation plan as presented in the Draft EIR. Surface mining quarries are notoriously

hazardous with drowning fatalities. Quarries have steep drop-offs, deep water, sharp rocks, flooded equipment, submerged wire and industrial waste according to an article by Hobart M. King, PhD, RPG, "Abandon Mine and Quarry Accidents Claim Several Lives per Year," (attached as Exhibit 4 hereto). Comment 12-59 Cont.

The Draft EIR needs to be revised to provide analysis of the dangers of closed surface mines on the public. The Project and Reclamation Plan needs to be revised to leave the Project Sites in a useable condition which is readily adaptable for alternative land uses and create no danger to the public health or safety.

The Draft EIR should analyze the potential for a significant human health impact from mosquito borne pathogens and other vectors that may find habitat in the multiple ponds that will be created within the proposed Project. The Vector-Borne Disease Section of the California Department of Public Health has published Best Management Practices for Mosquito Control in California (the "Vector BMPs"), available at westnile.ca.gov/pdfs/BMPMosquitoControl.pdf. The document indicates that "Standing water mosquito breeding sites may include artificial containers, treeholes, catch basins, open ditches, retention/detention ponds, natural or constructed ponds and wetlands, stormwater management devices, and the edges of streams." The multiple ponds present in the project therefore present possible breeding grounds for mosquitos, which have been found to be infected with West Nile Virus in Fresno County. (https://westnile.ca.gov/case_counts.php?year=2023&option=print.) This potential impact should be evaluated and the Universally Applicable Mosquito Control BMPs and other appropriate BMPs identified in the Vector BMPs should be included in the Draft EIR. Further analysis and development of appropriate mitigation measures should be performed in consultation with the Fresno Mosquito and Vector Control District. Comment 12-60

vi. Section 4.11 Land Use Comment 12-61

(1) Zone Change

Table 2-1, Rockfield Modification Project Characteristics, includes "Concrete and Asphalt Recycling" with the "annual sales" of 200,000 MT in both Phase 1 and 2. As noted above, the Project also includes a solid waste disposal component for the fines, overburden, and other mining wastes. Pursuant to Fresno County Zoning Code Section 808.2.- Agricultural Zones, Table 2-2, Allowable Uses and Permit Requirements for Agricultural Zones, a Recycling Facility or Solid Waste Disposal Facility is not an allowed land use in the Agricultural Zone. Therefore, the proposed Project is required to apply for a zone change in order to include concrete and asphalt recycling and processes and large scale solid waste disposal.

(2) Lost Lake Park Master Plan Comment 12-62

The Draft EIR is not consistent with the Lost Lake Park Master Plan and needs to be revised to include analysis of consistency with the approved plan. Lost Lake Park Master Plan, dated 2011, plans trail connections to and through the Project Sites. The Central Valley Vision Plan to improve livability and the regions need for recreational opportunities.

(3) Surface Mining and Reclamation Act

Comment 12-63

The Draft EIR is not consistent with the California Surface Mining and Reclamation Act (SMRA). The intent of the legislature pursuant to Cal. Pub. Res. Code § 2712:

> It is the intent of the Legislature to create and maintain an effective and comprehensive surface mining and reclamation policy with regulation of surface mining operations so as to assure that:
>
> a. Adverse environmental effects are prevented or minimized and that mined lands are reclaimed to a usable condition which is readily adoptable for alternative land uses.
>
> b. The production and conservation of minerals are encouraged, while giving consideration to values relating to recreation, watershed, wildlife, range and forage, and aesthetic enjoyment.
>
> c. Residual hazards to the public health and safety are eliminated.

The proposed Project results in significant and unavoidable environmental direct, indirect and cumulative impacts for aesthetics, air quality and transportation that cannot be mitigated. Therefore, the adverse environmental effects of the Project are not prevented or minimized. The Project is not consistent with Section 2712(a).

Comment 12-64

The Project's reclaimed condition of the Plant Site and Quarry Site has no other adoptable land use than a pit pond surrounded by steep walls. There is no visual benefit to the community because the water is located so far down from the surface. Painting the quarry walls brown is insufficient to mitigate the visual impact of the steep quarry walls that cannot be planted with vegetation and are too steep to maintain vegetation.

The Draft EIR concludes the reclamation plan will be used for open space, riparian and open water wildlife habitat. There is no evidence presented that water wildlife will have a beneficial use of the pit pond. Section 4.4 Biological Resources, states:

> Adverse effects to special-status species could occur if wildlife that encounter the quarry pit pond or quarry lake are exposed to water with elevated concentration of metals or minerals.

The Project does not include measures to prevent the accumulation of metals or minerals. In fact, the Project proposes to abandon mining equipment and other metals in the mine pit that will be broken down over time by water resulting in accumulation of metals. The Project's Reclamation Plan does not provide a recreational value to the community. There is no mitigation measure that requires land dedication for trail easements or purchase of alternative land for recreational use. Although the Project Description/Operational Statement in Appendix B-2 makes many statements of mitigation the operator will do, many are not part of the Project and have not been included as mitigation measures in the Draft EIR. The Project is not consistent with Section 2712(b).

As discussed above, abandoned quarries are fundamentally dangerous to the community, especially in a high-use recreational area as the San Joaquin River. The abandoned quarry is an attractive nuisance that people will be tempted to go into. The Project will leave behind very dangerous quarry pits. The only protection for the public is a 4-foot-high barb wire fence. The Project is not consistent with Section 2712(c). Comment 12-65

Special consideration needs to be applied to the Project in determining consistency with the SMRA and CEQA. The proposed Project is located near to urban development and the area will continue to grow in population with associated housing and commercial development that will result on an increase in people exposed to the dust, odor, noise, air pollutants and safety concerns generated from the Project. A 491 multifamily project has been constructed the northeast corner of Friant Road and Copper Avenue, less than 3 miles from the Project. The Project is located within a highly desirable recreation area of the region. The need for recreational use will continue to grow as the population in the area increases during the life of the Project. The area is already in need of additional recreational opportunities. The Project will result in exposing an increasing number of people using the San Joaquin River recreational facilities to odors, dust, noise, air pollutants and safety concerns during the life of the Project.

vii. Section 4.17 Transportation

Comment 12-66

(1) Truck Routes

The Draft EIR is insufficient in describing the Project's environmental impacts on transportation and needs to be revised. Section 4.17 needs to include a map of approved truck routes accessing the Project Sites from major transportation facilities in Fresno County and surrounding cites.

The VMT analysis in Appendix I-2 discloses that the Project will result in an increase from the existing 3,153,449 VMTs of the current operation to 6,668,850 VMTs in Phase 2. While the analysis also provides that a no-project alternative will result in 8,060,099 VMTs as a result of demand being "redistributed" to other mines in different locations, Figure 4.17-2 of the Draft EIR shows that these other sites are located away from Friant Road, which will be the most heavily travelled street by trucks from the proposed Project. In light of the sheer volume of VMTs that could be "redistributed" depending on the existence of the Project makes a clear map of truck routes even more crucial to understanding the impacts of this Project.

(2) Pedestrians

Comment 12-67

The Draft EIR is insufficient in describing the existing pedestrian facilities in the Project vicinity. Section 4.17.1.4 must be updated to include the Eaton Trail on the west side of North Friant Road that serves both pedestrians and cyclists. Intersection trail crossings exist along North Friant Road at the intersections of Copper, Lakewood, Champlain, Fort Washington, Shepherd, Audubon and Fresno. Each of these pedestrian intersections connect residents of the City of Fresno to Woodward Park, trail facilities, residential, office and retail uses.

Comment 12-68

(3) Transportation Policies

The Draft EIR is insufficient in identifying applicable land use and planning policies and ordinance. The proposed Project needs to be consistent with City of Fresno Active Transportation Plan https://www.fresno.gov/publicworks/active-transportation-plan/ seven (7) goals:

1. Safety Enhancement
2. Connectivity, Accessibility and Comfort
3. Equity and Inclusivity
4. Economic Vitality & Quality of Life
5. Education, Encouragement & Enforcement
6. Data Collection and Performance Monitoring
7. Ongoing Maintenance

The Draft EIR is not consistent with the City of Fresno Active Transportation Plan's safety goals. It is common sense that more than doubling the annual mining activity, adding aggregate mining at the Plant Site (which is a new use, since the prior use was ceased), adding an asphalt plant, increasing concrete production, adding material recovery operations and sales of materials from the plant will increase heavy trucks on the roadways accessing the Project Sites from major transportation corridors. The added truck traffic on roadways, such as North Friant Road will exasperate existing safety issues to motorist, cyclist and pedestrians. There have been multiple pedestrian and bicyclist fatalities along Friant Road. Pursuant to Jill Gromley, Assistant Director, Traffic Engineering Division, City of Fresno:

> There have been 189 collisions reported along Friant Road corridor from Blackstone to Copper River Drive from January 1, 2019 to December 31, 2024. Sixty-two (62) of these collisions resulted in injuries and 8 were fatal. Three of the fatal collisions involved pedestrians and one involved a bicyclist. Park patrons and trail users frequently park east of Friant Road and walk through the Woodward Park entrance on Fort Washington or utilize the parking lot on the southeast corner of the Friant/Copper intersection. The residential uses east of Friant Road generate high volumes of park patrons and trail users crossing Friant Road. Frequent complaints from visitors at the park and trail users is the high speed of traffic along Friant Road and large volumes of truck traffic.

The population of Fresno County will increase over the life of the Project (100 years) which will result in increased likelihood of conflicts between trucks from the Project and pedestrians and cyclist. Although the City of Fresno monitors roadway speed, intersection operations, and adjusts speed limits accidents and deaths still occur. The Project should

implement the measures of the Fresno Area Transportation Plan and include Project features to mitigate truck traffic safety impacts on the surrounding area.

Comment 12-68 Cont.

(4) Transportation Impacts other Than VMT

Comment 12-69

The Draft EIR is insufficient in assessing transportation impacts and needs to be revised. Pursuant to OPR's Technical Advisory on Evaluation Transportation Impact in CEQA, dated December 2018, Paragraph G Analyzing Other Impacts Related to Transportation, page 25 a change in the methodology of assessing transportation impacts does not relieve a public agency of the requirement to analyze a project's potential significant transportation impacts to air quality including mobile sources, noise, safety, or any other impact associated with transportation. Under Public Resources Code section 21099(b)(3), the deprecation of level of service analysis does not "preclude the application of local general plan policies, zoning codes, conditions of approval, thresholds, or any other planning requirements." Accordingly, the County's traffic index thresholds of significance (along with consideration of other non-delay related impacts) are still applicable.

Using the County's TI thresholds, Chapter 4.17 concludes that the Project results in significant unavoidable impacts after mitigation to pavement conditions on Friant Road between North Fork Road and Copper River Drive, and Willow Avenue between Friant Road and Copper Avenue. (Draft EIR at 4.17-29 through 30.) These impacts are virtually undeniable, given the 6 million VMTs from Project-related vehicles, mostly heavy trucks delivering aggregate and asphalt from the Project and the acceptance of used concrete and asphalt concrete for recycling. While the LOS impacts may be moot in light of SB 743, these pavement impacts are not.

Furthermore, in the discussion of impact 4.17-3, regarding increases to hazards, the Draft EIR concludes that no such impact would occur, in part because "the operator of the Rockfield Quarry would be required to pay an equitable share of pavement improvements to the County of Fresno to improve the pavement section and accommodate the traffic index values, thereby keeping road conditions safe." This is inconsistent with the conclusion in Impact 4.17-1 that the mitigation measure would be insufficient to avoid a significant adverse impact.

Comment 12-70

The City of Fresno is concerned about the Project's significant unmitigated environmental impact to its roadway surfaces from truck traffic carrying heavy loads. The Project truck traffic Average Daily Trips is expected to increase 57% over existing conditions in State 1 and an additional 38% in Stage 2. Figure 4.17-1, Traffic Study Intersection and Project Trip Distribution Percentages, indicates that 55% of the Project traffic will utilize North Friant Road to southwest of the Project Site. That traffic will be dispersed throughout the City of Fresno. Public Works Director, Scott Mozier, PE, TE estimates that the cost to repave Friant Road from SR-41 to the northern city limit is $12.8 million dollars. This would occur at 20-year frequencies, there would be a total of five rehabilitation projects for a 100-year repaving cost of $64 million dollars. This is a significant cost to the City of Fresno of Project related to non-LOS transportation impacts.

The Draft EIR needs to provide an up to date analysis of the transportation impact of truck traffic on surrounding roads (not just Friant Road and Willow Avenue) and provide a

Project Trip Distribution analysis that indicated the percentage of truck traffic using study area roadways and intersections. The Draft EIR needs to provide an analysis of the existing condition of roadways and the potential of the Project's truck traffic to degenerate the life of the roadway pavement and provide mitigation for the Project's transportation impacts. Comment 12-70 Cont.

In addition, the Draft EIR should consider additional mitigation measures to address this significant impact. The Project should pay for the repair of all Project-related impacts to wear and tear of roadways. The following mitigation measure should be added to the Project: Comment 12-71

> The Applicant/Owner shall enter into an agreement with the City of Fresno to pay for all cost of roadway damage caused by the Project's truck traffic. The Applicant/Owner will pay the cost to prepare a study and monitor roadway conditions every 5 years thorough the life of the Project and until the Reclamation Plan has been fully implemented.

viii. Section 4.16 Recreation Comment 12-72

The Draft EIR is insufficient in describing the recreational facilities near the Project Sites. A map should be provided to depict the location of the recreation facilities identified in Table 4.16-1.

Table 4.16-1 is not accurate in describing the uses of the recreation facilities. San Joaquin River Ecological Reserve – Willow Unit and Lost Lake Park had access from a bridge and once the bridge is rebuilt, will have public access. Currently, public access can be made via the river by boat. The Draft EIR needs to use descriptions provided by the facility such as day use, hiking trails and camping. The Draft EIR presents information in a manner to lessen the public's value of the recreation facilities around the Project.

ix. Section 4.19 Hydrology And Water Quality Comment 12-73

The Hydrology and Water Quality analysis fails to consider significant potential impacts and several mitigation measures that should be revised to address those impacts.

For example, the proposed Project stands to greatly increase the depth of mining, which would require continuous dewatering in areas beneath the existing groundwater levels. This may result in the movement of water from deeper confined areas of the aquifer, reducing the availability of water for other wells in the area. Additional analysis of that potential impact is required.

The Draft EIR notes the presence of mobilized natural constituents in recycled silt pond water, but dismisses that impact as the result of "variability in sampling procedures," and discounts the presence of manganese and iron without sufficient analysis. The variability in measurements may be the result of operational factors. The Draft EIR must consider whether mobilized constituents have entered the groundwater at high concentrations, and must fully address the potential health implication of elevated iron and manganese concentrations. Comment 12-74

In addition, the mitigation measures listed in this section require further refinement. The Blasting Protocols (Mitigation Measure 4.10-1) need more detail regarding the frequency of monitoring, and specific actions that would be triggered by any protocol violations, as well as information about verification of compliance and the use of specific monitoring actions using measurable water quality metrics. Comment 12-75

The Plant Site Pond Adaptive Management Program (Mitigation Measure 4.10-5) needs to provide additional information regarding: (1) who will oversee and enforce the plan, (2) the threshold water quality parameters for trigging corrective action, (3) timelines for implementing corrective measures, (4) the risks to human health and safety from herbicide use for vegetation management, (5) guidelines for the selection of such herbicides, and (6) measures to handle high testing variability due to seasonal cycles. Comment 12-76

The Plant Site Pond Adaptive Management Program Funding Mechanism (Mitigation Measure 4.10-5) should provide details regarding the amount of funding, and the method of determining whether stabilization has occurred for the purposes of cancelling the funding mechanism.

The Quarry Site Groundwater Adaptive Management Program (Mitigation Measure 4.10-10a) involves monitoring multiple wells across the site, and beyond, which could create logistical challenges. The measure should require the Project Applicant to demonstrate long-term access to offsite wells and further specify contingencies for situations where available data is insufficient. Also, additional data should be provided regarding how quickly a 15% reduction in the water column could realistically occur given the large-scale nature of the Project. Comment 12-77

The Quarry Site Groundwater Adaptive Management Program Funding Mechanism should have a provision for extending the duration beyond three years if the groundwater systems impacted by dewatering take longer than that to stabilize. In addition, this measure should clarify that monitoring and corrective actions will continue indefinitely if groundwater levels do not recover to the baseline levels.

These impacts and mitigation measures, as well as some additional general observations and recommendations are discussed in more detail in the letter dated March 3, 2025 from the Fresno Department of Public Utilities to David Randall, Fresno County Public Works and Planning Department, a copy of which is attached as Exhibit 1 hereto.

c. Chapter 5: Cumulative analysis

The cumulative impact analysis is deficient as it does not include all of the aggregate mining operations that were used to eliminate the VMT impact from off-site hauling trips for the Project. Specifically, it includes only Austin Quarry, and omits Sanger Sand & Gravel, Kings River Sand & Gravel, Madera Quarry, Carmelita Resources, and Riverbend Sand & Gravel. Comment 12-78

In section 4.17, the Draft EIR claims that the Project will contribute 6,683,850 VMTs by Phase 2. (Draft EIR at 4.17-20.) In the individual analysis of the Project, those VMTs are ignored based on the argument that in the absence of the Project, these other mines would

contribute between 8 and 8.6 million VMTs. (Draft EIR at 4.17-23 through 24.) If this is the case, then these projects, taken together, clearly have a significant cumulative impact, and the proposed Project "contributes measurably" to the effect. This is the very definition of a cumulative impact. Comment 12-78 Cont.

Moreover, the CEQA Guidelines state that when a list is used to evaluate cumulative impacts, consideration should be given to the type of project "when the impact is specialized, such as a particular air pollutant or mode of traffic." (CEQA Guidelines § 15130(b)(2).) Here, the VMT analysis already identified similar projects using a particular mode of traffic and creating related and interdependent impacts. Those projects should all be included in the cumulative impact analysis, particularly with regards to transportation, GHG, aesthetics, and air quality analysis.

On page 5-11, the Draft EIR states that SJVAPCD considers a project's individual emissions of criteria air pollutants to be both individually significant and cumulatively considerable it they exceed the applicable significance thresholds. The proposed Project exceeds significance thresholds because the Draft EIR did not include a significant quantity of aggregate mining (30 MT) of fines and mine waste, the stockpiling of the excess mine waste on the Project Site for 100 years, or modeling of VMT impact on threshold criteria. These impacts must be reexamined in the cumulative impact section as well, following the addition of the similar aggregate mining projects. Comment 12-79

The Draft EIR is insufficient in analyzing the cumulative impacts of the Project on air quality. The proposed Project will result in a cumulative impact on PM2.5 because the proposed mitigation for fugitive dust is not adequate to lessen the Project impact to less than significant. The Project's impact is Significant and Unavoidable. The Project has a significant impact on exposing sensitive receptors to dust and odor because not all feasible mitigation has been included in the Project. The Asphalt Plant Emission Controls are not adequate to lessen the exposure to sensitive receptors from dust and odors and results in significant and unavoidable impact. The Project has not included all feasible mitigation to less the adverse impact of the asphalt plant on a substantial number of people. Comment 12-80

d. Appendix B-2: Project Description/Operational Statement

i. Project Need and Economic Impact Comment 12-81

The information provided on Page 6, of Appendix B-2, Project Description/Operational Statement is inaccurate and misleading as to the amount of permitted aggregate mining and processing facilities within the Fresno P-C Region in stating that there is an existing 50-Year permitted capacity of 6.0 MT, but a 50-Year need for 6.1 MT. California Geological Survey, Aggregate Sustainability in California, 2018, Table 1 (attached as Exhibit 5 hereto). Comparison of 50-Year Demand to Permitted Aggregate Reserves for Aggregate Study Area as of January 1, 2017, indicates the Fresno P-C Region has a 305 MT 50-Year Demand, has 556 MT Permitted Aggregate Reserve that results in having 182% of the 50-Year demand. This results in a 6.1 MT 50-Year demand, but the permitted 50-Year aggregate reserve is 11.12 MT. These figures do not

include the Fresno County Carmelita Project's permitted aggregate production of 1.25 MT per year. Comment 12-81 Cont.

e. Chapter 6: Alternative Analysis

The Alternative Analysis prematurely rejected the Reduced Operational Life Alternative. The County found that it would reduce utilization of a known MRZ-2 resource in conflict with Fresno County's General Plan and does not fully meet some of the project objectives." This ignores the possibility (or given the site's history, the virtual certainty) that the Project Owner would seek a further extension of the CUPs upon their expiration. At that time, an environmental review could take place to more accurately analyze impacts taking place far in the future from the present day. Armed with that more accurate analysis, the County could then re-evaluate the continuing need for the mine, and weigh that need against the environmental concerns then prevailing. This would have the additional benefit of allowing the County to consider mitigation measures using technological advancements that have not yet taken place. Comment 12-82

The same deficiency appears in the discussion of alternatives 2-6. Those alternatives should recognize that a limited CUP approval now does not preclude a further expansion or extension of mining following expiration or exhaustion of current limitations. Accordingly, these alternatives could meet the project objectives, but with the benefit of further environmental review and possibly more effective mitigation to be implemented at a later date.

In addition, the analysis of the project alternatives incorrectly states that neither the proposed project nor Alternatives 1, 2, 3, 4, or 5 would result in any significant transportation impacts." (Draft EIR at 6-19, 6-30, 6-38, 6-49, 6-57.) To the contrary, Chapter 4.17 identified significant unavoidable impacts after mitigation, both in terms of signalization and pavement damage. These impacts must be recognized in the discussion of the alternatives. Comment 12-83

6. Conclusion.

For the foregoing reasons, the NOP, NOC, NOA, and Draft EIR all require significant revision, and should be revised and recirculated for public comment.

Sincerely,

TUCKER ELLIS LLP

Douglas A. Hedenkamp
Partner

SUBJECT: RESPONSE TO THE NOTICE OF AVAILABILITY OF A DRAFT ENVIRONMENTAL IMPACT REPORT (EIR) FOR THE PROPOSED MODIFICATION TO THE EXISTING CEMEX ROCKFIELD QUARRY (EIR NO. 7763 AND UNCLASSIFIED CONDITIONAL USE PERMIT APPLICATIONS NO. 3666 AND NO. 3667)

Dear Mr. Randall:

The City of Fresno, Department of Public Utilities, (DPU) is in receipt of the reissued Notice of Availability, received on January 24, 2025, for the Draft Environmental Impact Report (EIR) for the Proposed Modification to the Existing Cemex Rockfield Quarry (EIR No. 7763 and Unclassified Conditional Use Permit Application Nos. 3666 and 3667) (Project). The purpose of this response letter is to convey DPU's concerns following review of the EIR Sections 4.10 – Hydrology and Water Quality and 4.19 – Utilities and Service Systems, particularly as they relate to water supply and water quality impacts.

Comment 12-84

BACKGROUND

CEMEX Construction Materials Pacific LLC has submitted applications to Fresno County (County) for two unclassified Conditional Use Permits (CUPs). These applications seek approval to continue and modify existing aggregate mining and processing activities, including the extraction of rock, sand, and gravel, at the Rockfield Quarry. The proposed project encompasses two distinct locations, situated approximately two miles apart:

Comment 12-85

1. Plant Site (approximately 139 acres): Located on the west side of North Friant Road, between North Willow Avenue and Little Dry Creek, approximately 1.2 miles north of the City of Fresno limits. Comment 12-85 Cont.
2. Quarry Site (approximately 352 acres): Located on the west side of North Friant Road, between Bluff Avenue and Lost Lake Road, approximately 2.7 miles north of the City of Fresno limits.

Since 1924, the Plant Site has supported aggregate mining and processing, including an aggregate processing plant, a ready-mix concrete facility, and ancillary operations that also process raw aggregate brought in from the Quarry Site. Mining and processing activities disturb nearly the entire plant site, aside from mandated setbacks along Friant Road. Comment 12-86

At the Quarry Site, permitted for aggregate mining since 1960 (with initial operations dating back to 1913 to 1920 and a later resumption in the late 1980s), mining is focused on the alluvial deposit. There are no processing facilities onsite; instead, raw aggregate is transported approximately two miles south via Friant Road to the Plant Site for processing. Most of the Quarry Site has been extensively mined and disturbed, except for required setbacks along the San Joaquin River and Friant Road. Groundwater or surface water encountered during excavation is pumped either to a reclaimed pond in the northeast corner (the "Northeast Pond") or to recharge trenches along the site's western boundary. Historically, when the Northeast Pond was mined about 20 years ago, water from excavations was pumped to a nearby recharge trench, but following the completion of that excavation, water is now directed to the Northeast Pond for recharge.

The Modification Project is planned in two stages:

- In Stage 1, lasting up to 30 years, operations will continue concurrently at both sites. At the Plant Site, the existing processing plant, ready-mix concrete plant, and related facilities will remain active, with a new modern asphalt plant replacing the outdated unit. Mining will proceed to a depth of about 85 feet below ground surface, with water pumped from excavations to recharge trenches along the site's boundaries. Upon completion, the Plant Site will be reclaimed as 138.5 acres of open space, riparian, and open water wildlife habitat. At the Quarry Site, mining will be modified to extract the underlying hard rock (granite) beneath the alluvial deposit via drilling and blasting to roughly 600 feet bgs while maintaining the Northeast Pond as a groundwater recharge source. A new aggregate processing plant, located in a previously excavated pit about 30 feet bgs, will be added, and wash water will be recycled onsite. Comment 12-87
- In Stage 2, hard rock mining and processing will continue exclusively at the Quarry Site. The ready-mix concrete and hot-mix asphalt plants will be relocated from the Plant Site to the Quarry Site, and once excavation is complete, mining Comment 12-88

and processing equipment will be removed (except for water management infrastructure). The Quarry Site will then be reclaimed as 352.4 acres of open space, riparian, and open water wildlife habitat.

Comment 12-88 Cont.

The City and Project are within the same Kings Subbasin, thus making the Project subject to the objectives of the North Kings Groundwater Sustainability Agency (NKGSA) as imposed by the Sustainable Groundwater Management Act (SGMA).

WATER SUPPLY AND GROUNDWATER USAGE

Plant Site

1. The Applicant holds riparian rights to withdraw water from the San Joaquin River for use in aggregate processing at the Plant Site. River water arrives via a dedicated delivery ditch on the west side of the property. After use in washing rock, sand, and gravel, the process of water now carrying fine sediments, flows to silt ponds, where these fines settle out. The clarified water is then circulated back to the processing plant or used for dust control, with any surplus recharging the underlying aquifer. The water level in the silt ponds fluctuates seasonally based on rainfall and groundwater levels, and new ponds may be formed as mining operations shift across the site. Current usage of river water for processing totals approximately 295 acre-feet per year.

Comment 12-89

2. Current Groundwater Usage
    - The Plant Site supports aggregate mining and processing, including a ready-mix concrete facility and ancillary operations.
    - Water usage primarily involves low-volume pumping for operational needs such as equipment wash-down, dust control, and limited dewatering if shallow groundwater is encountered during excavation (although much of the site is already heavily disturbed).
    - Existing practices indicate that most onsite water demand is met with minimal groundwater pumping, supplemented by any necessary surface water management.
3. Proposed Groundwater Usage (Stage 1 and Transition to Stage 2)
    - During Stage 1, the existing processing plant and ready-mix facility remain at the Plant Site, with groundwater usage continuing at levels similar to current operations (e.g., equipment washing, dust control).
    - A new asphalt plant will replace the outdated one, but no substantial increase in groundwater extraction is anticipated, as pumping volumes are projected to remain low and used efficiently.

- By Stage 2, once mining ceases at the Plant Site, the ready-mix and asphalt plants relocate to the Quarry Site, substantially reducing or eliminating most groundwater usage at the Plant Site.
- Ultimately, the Plant Site will be reclaimed, thereby further decreasing any groundwater withdrawals. By Stage 2, once mining ceases at the Plant Site, the ready-mix and asphalt plants relocate to the Quarry Site, substantially reducing or eliminating most groundwater usage at the Plant Site.
- Ultimately, the Plant Site will be reclaimed, thereby further decreasing any groundwater withdrawals.

Comment 12-89 Cont.

Quarry Site

1. No surface water from the San Joaquin River is used at the Quarry Site. Instead, the site relies on the Northeast Pond, a permanent water body located in the northeastern portion of the property that functions as a dedicated groundwater recharge feature. By allowing water to percolate into the underlying aquifer, this pond plays an important role in maintaining local groundwater levels. Beyond the Northeast Pond, several additional ponds have formed over time due to historical and ongoing mining activities. These are typically seasonal or temporary features, receiving water primarily from rainfall runoff and shallow groundwater inflows. Their size and shape may vary seasonally and in response to quarrying operations. If standing water in these ponds impedes active mining, it can be pumped out to facilitate continued excavation. As the quarry expands into new areas, freshly excavated depressions may accumulate water, creating new temporary ponds.

Comment 12-90

2. Current Groundwater Usage
    - Historically, mining at the Quarry Site has been focused on alluvial deposits. Dewatering activities are limited to pumping water from active excavation areas to a recharge pond (the "Northeast Pond") or to recharge trenches along the site boundary.
    - These small-scale pumping efforts are designed to manage water levels within the excavation while reintroducing excess water to the local aquifer system via recharge features.
    - There are no active large-volume production wells at the Quarry Site for processing or potable use.

Comment 12-90 Cont.

3. Proposed Groundwater Usage (Stage 1 and Stage 2)

- In Stage 1, mining will expand to underlying hard rock (granite), requiring continued dewatering of excavation areas. However, this water will again be recycled or returned to recharge ponds or trenches, minimizing net groundwater consumption.
- A new aggregate processing plant will be constructed in a previously mined pit (approximately 30 feet below ground surface), using wash water that is largely recycled onsite. Any groundwater usage is expected to remain limited to operational needs such as drilling, dust control, and equipment cleaning.
- In Stage 2, full-scale hard rock mining continues, and the ready-mix and asphalt plants relocate from the Plant Site to the Quarry Site. Groundwater demand may shift onsite but overall remains modest, given the emphasis on water recycling and on pumping water primarily for dewatering and dust control.
- Ultimately, upon mine closure, the Quarry Site is to be reclaimed as open space and habitat, at which point groundwater pumping would cease, apart from possible minimal flows needed to maintain water features for reclamation purposes.

The existing and proposed water use was summarized in Table 4.19-1, which is reproduced below:

	Project Phase				Change from Existing Conditions		
Source	Existing	Stage 1	Stage 2	Reclamation	Stage 1	Stage 2	Reclamation
Plant Site							
San Joaquin River	295	125	0	0	-170	-295	-295
Groundwater Supply Wells	35	60	0	0	25	-35	-35
Reclamation Period Evaporation and Evapotranspiration	0	0	440	440	0	440	440
Plant Site Total:	**330**	**185**	**440**	**440**	**-145**	**110**	**110**
Quarry Site							
Groundwater Supply Wells	0	1	55	0	1	56	0
Water Use from Ponded Pits	440	465	495	0	24	55	-440
Reclamation Period Evaporation and Evapotranspiration	0	0	0	585	0	0	585
Quarry Site Total:	**440**	**465**	**550**	**585**	**25**	**111**	**145**
Project Total:	**770**	**650**	**990**	**1,025**	**-120**	**220**	**255**

Available of water vs. the proposed water use was summarized in Table 4.19-2, which is reproduced below:

Comment 12-90 Cont.

Site	Water Source	Existing	Stage 1	Stage 2	Reclamation
Plant Site	Rainfall, groundwater inflow, silt pond, deep seepage	420	865	600	440
Quarry Site	Rainfall, groundwater inflow from alluvial & weathered rock, seepage from recharge ditch & NE Pond	635	675	715	600
	Total Availability for Both Sites:	1,055	1,540	1,315	1,040
	Total Water Use:	770	650	990	1,025
	Total Availability vs. Total Use:	+285	+890	+325	+15

HYDROLOGY AND WATER QUALITY

Plant Site Hydrogeologic Setting

Comment 12-91

Groundwater monitoring at the plant site is currently conducted in four shallow alluvial wells. These wells were installed in 2018 and extend from approximately 96 to 116 feet below ground surface (bgs). The alluvial deposits at this location typically consist of unconsolidated materials such as sand, silt, clay, and gravel, which can provide a relatively shallow groundwater pathway. Based on the data collected to date, groundwater flow in the shallow alluvial aquifer at the plant site generally trends toward the south-southwest.

Quarry Site Hydrogeologic Setting

Groundwater at this site is found in three distinct geologic units: alluvium, weathered rock, and hard rock. Each unit has different physical and hydrogeologic characteristics, which influence both the depth of the wells and the direction of groundwater flow.

1. Alluvium (Shallow Wells)
    - The alluvial deposits consist of unconsolidated materials such as sand, silt, clay, and gravel.
    - Four wells are currently completed in the alluvium, each less than 30 feet deep.
    - These shallow wells are identified by an "S" at the end of their well number (e.g., Well 1S).
2. Weathered Rock (Intermediate Wells)
    - Beneath the alluvium lies a layer of partially decomposed or weathered bedrock.
    - Four wells are screened within the weathered rock at depths generally

between 40 and 70 feet.

Comment 12-91 Cont.

- These are labeled with an "M" after the well number (e.g., Well 2M).

3. Hard Rock (Deep Wells)
    - The deepest geologic unit comprises unweathered (competent) bedrock.
    - Seven wells—designated with a "D" (e.g., Well 3D)—are drilled into this hard rock formation, reaching depths of approximately 600 feet.

Based on current hydrogeologic data, groundwater flow in the shallow (alluvial) wells is predominantly toward the south and southeast. In the weathered rock wells, flow is also generally toward the southeast.

Groundwater sampling at the Quarry Site's groundwater monitoring wells occurred in 2018, 2019 and then a more comprehensive groundwater sampling event occurred in September and October 2021.

POTENTIAL IMPACTS NOT DISCUSSED IN EIR

Comment 12-92

1. Potential alteration to natural groundwater flow characteristics

Currently, "the depth of groundwater across the Quarry Site has been measured as varying from about 10 to 45 feet bgs" (page 4.10-37) while, for the Plant Site, "the depth to groundwater varies from about 10 to 40 feet bgs" (page 4.10-34). The Project involves extensive mining below the existing groundwater levels, hundreds of feet in the case of the Quarry Site, which requires continuous dewatering of the mines. The applicant has emphasized that groundwater usage in Phase 1 and Phase 2 will be relatively similar to existing conditions. However, the continuous dewatering of the mines and subsequent recharge of that water into onsite ponding basins may result in the movement of the water from deeper, potentially confined aquifers to the shallower, unconfined aquifer. Many of the City wells in the northern portion of the City draw water from the deeper, confined aquifers, and continuous dewatering of mines in the vicinity of those confined aquifers may reduce water availability for those wells. As such, there needs to be a greater understanding of the volume of water expected to be dewatered from the mines over both Phase 1 and Phase 2, whether the volume changes seasonally or annually, and if the water recharged onsite is able to reach those deeper aquifers.

2. Mobilization of naturally occurring constituents

Comment 12-93

The EIR seemed to de-emphasize the potential impact of mobilizing naturally occurring constituents, including arsenic, iron, lead, and manganese. Based on the water quality data shown in Table 4.10-3, continuous aggregate processing with recycled silt pond water appears to release and concentrate the naturally occurring constituents in the silt ponds. There was no discussion of whether the silt pond was lined nor of any water

treatment associated with the silt ponds, so it was assumed that all the silt pond water freely percolates into the groundwater aquifer. The newly mobilized constituents appear to have impacted multiple monitoring wells throughout the Plant site in the vicinity of the silt pond, as shown in Table 4.10-5. Elevated iron and/or manganese was detected from the monitoring wells on the following dates:

Comment 12-93 Cont.

Constituent	Units	MW-2	MW-3		MW-4	sMCL
		8/9/18	10/17/18	8/28/19	10/24/18	
Iron	µg/L	530	<30	2,600	<30	300
Manganese	µg/L	790	2,600	1,030	300	50

There did not appear to be any elevated concentrations of arsenic or lead.

The explanation provided in the EIR was unsatisfactory. It stated, "However, the iron and manganese concentrations vary substantially between sampling events. Thus, the occasional elevated levels of iron and manganese identified in some of the samples from Plant Site wells MW-2, MW-3, and MW-4 most likely represent naturally occurring concentrations in suspended solids within the samples and may be the result of variability in sampling procedures" (page 4.10-42).

Comment 12-94

The EIR did not consider the possibility that concentrated and mobilized iron and manganese from the silt ponds infiltrated into the groundwater, thus triggering the extremely high concentrations that well exceed background levels. Furthermore, the variability in the concentrations detected are likely a result of operational factors such as when the silt pond is filled or not, whether water is being actively used for aggregate processing and being discharged back to the silt pond, and the groundwater level at the time of the sampling, with higher groundwater levels likely leading to a reduced time of travel from the silt ponds to the monitoring wells.

Comment 12-95

Furthermore, the EIR appears to be dismissive of the potential health implications of elevated manganese concentrations. During the discussion of Impact 4.10-4, it stated, "Iron and manganese concentrations showed high variability and exceed their respective Basin Plan standards and secondary MCL standards in some of the samples collected. Note that Basin Plan standards for iron and manganese are the same as the secondary MCL standards (300 µg/L for iron and 50 µg/L for manganese)...The secondary MCL standards are established as a threshold above which constituents may impart undesirable tastes and odors, or can cause staining and scaling, but do not pose a health threat. Therefore, the exceedance of the secondary MCL standards for iron and manganese concentrations in some of the samples collected does not pose a risk to human health" (page 4.10-94).

Comment 12-96

It appears the analysis did not take into consideration the recent California legislation introduced to require a maximum contaminant level (MCL) for manganese. Comment 12-97

On March 29, 2022, Senate Bill 1124 (SB 1124) was revised to the "Public health goal: primary drinking water standard: manganese" bill with the following requirements:

- On or before July 1, 2023, the Office of Environmental Hazard Assessment (OEHHA) is to prepare a public health goal for manganese.
- The State Water Resources Control Board (SWRCB), after OEHHA publishes a public health goal for manganese, is to adopt a primary drinking water standard for manganese and to establish monitoring requirements for manganese.
- On or before January 31, 2024, the SWRCB is to consider establishing a notification or response level for manganese that would remain in place until the state board adopts a primary drinking water standard for manganese.

In a letter from the Director of the CalEPA Office of Environmental Health Hazard Assessment to the Deputy Director of the SWRCB Division of Drinking Water[1], it states, "In response to your request dated April 7, 2022, the Office of Environmental Health Hazard Assessment (OEHHA) has reviewed the recommendation for a revised notification level (NL) for manganese developed by the Division of Drinking Water (DDW) scientific staff. Based on the potential risk for manganese induced neurotoxicological effects in bottle fed infants, DDW staff recommended a health protective concentration (HPC) of 20 µg/L, equivalent to 20 parts per billion (ppb), to serve as the basis for future recommended revisions to the current manganese notification and response levels of 500 µg/L and 5,000 µg/L, respectively. Based on a review of the information presented, OEHHA agrees with an HPC of 20 µg/L as the basis for the NL. OEHHA also suggests some additional steps, as outlined below, for future work on developing an HPC for manganese".

As such, the EIR should now consider the consequences of how the concentration and mobilization of manganese in the water infiltrating from the silt ponds will impact downstream communities, including the City of Fresno, in light of a notification level and potential MCL for manganese being set at the HPC of 20 µg/L.

Furthermore, as the bedrock is fractured over the course of mining operation, it is possible that the infiltration from the manganese laden silt basins will find a preferential path into deeper aquifers. Therefore, the EIR must also consider the potential wider spread mobilization of the manganese with future mining activities. Comment 12-98

RECOMMENDATIONS FOR EIR MITIGATION MEASURES

Comment 12-99

With the impacts already detailed in the EIR, along with the additional impacts raised in this letter, the City of Fresno strongly recommends that the mitigation measures consider the following:

Impact 4.10-1: Violate Surface Water Quality Standards or Waste Discharge Requirements or Otherwise Substantially Degrade Surface Water Quality at the Plant Site or Quarry Site During Mining and Reclamation

Mitigation Measure 4.10-1: Blasting Protocols

- **Implementation Details:** While it is great that the protocol will be appended to the Mitigation Monitoring and Reporting Program, more detail on specific measures (e.g., frequency of monitoring or specific actions triggered by protocol violations) could help ensure clarity in enforcement.
- **Enforcement Mechanisms:** How will compliance with the protocols be verified? Including specific monitoring or reporting actions that link back to measurable water quality metrics (e.g., turbidity during blasting) might improve transparency.

Impact 4.10-5: Violate Groundwater Quality Standards or Otherwise Substantially Degrade Groundwater Quality at the Plant Site due to the Ponding of Water in the Excavation

Comment 12-100

Mitigation Measure 4.10-5a: Plant Site Pond Adaptive Management Program

- **Monitoring:** Identify who is overseeing and enforcing the adaptive management plan.
- **Threshold Clarity:** While the thresholds for various water quality parameters (e.g., pH, DO) are provided, it would be helpful to have more specific guidance on the thresholds for corrective action (beyond simply exceeding action levels) and timelines for implementing corrective measures.
- **Possible Risks from Vegetation Removal:** As described in the text of the EIR, "Elevated iron and manganese levels are common in and around reclaimed mining excavations that have filled with water because decaying vegetation on the bottom of ponds can create oxygen-deficient, or reducing, conditions. The reducing conditions mobilize naturally occurring iron and manganese from within the silts and other sediments present at the bottom of the reclaimed mining excavations" (Page 4.10-95). As such, vegetation removal is needed to reduce the mobilization of iron and manganese. However, the use of herbicides to manage vegetation could be problematic should chemicals used in the treatment of the vegetation

Comment 12-100 Cont.

pose risk to human health. As such, the mitigation measure should provide proper guidelines for the selection of chemicals used in the vegetation removal, should it be needed.

- **Seasonal Variability:** There is a commitment to testing iron and manganese levels after seasonal cycles, but further clarity on how to handle high variability due to weather or seasonal changes (e.g., during wet or dry seasons) would ensure more accurate interpretation of data.

Mitigation Measure 4.10-5b: Plant Site Pond Adaptive Management Program Funding Mechanism

Comment 12-101

- **Clarity on Funding Amounts:** The measure states that the funding must be "sufficient," but no details are provided on what constitutes a sufficient amount. Providing more specific estimates based on monitoring costs would help ensure that the funding is adequate for long-term mitigation needs.
- **Mechanism Termination Criteria:** The conditions under which the funding mechanism is canceled (after five years of stabilization) are clear. However, it might be helpful to specify how "stabilization" will be definitively determined, especially in the case of ongoing water quality issues that could be challenging to resolve quickly.

Impact 4.10-10: Substantially Decrease Groundwater Supplies During Mining Operations and After the Completion of Reclamation at the Quarry Site such that the Project Could Interfere with Existing Groundwater Supply Wells

Comment 12-102

Mitigation Measure 4.10-10a: Quarry Site Groundwater Adaptive Management Program

- **Complicated Monitoring Locations:** The program involves monitoring multiple wells across the site and beyond (including private wells), which could create logistical challenges. Ensuring access to private wells or finding reliable substitutes for unmonitored areas might be difficult. It may be helpful to demonstrate long-term access to offsite wells and to further specify contingencies for situations when monitoring data is insufficient.
- **Threshold for "Significant Impact":** While the 15% reduction in water column is conservative, additional data might be needed on how quickly such impacts could realistically occur under various environmental conditions, especially given the large-scale nature of the Project.

Mitigation Measure 4.10-10b: Quarry Site Groundwater Adaptive Management Program Funding Mechanism

Comment 12-103

- **Post-Mining Monitoring Duration:** While three years is a reasonable duration, the groundwater systems impacted by dewatering could take longer than three years to fully stabilize. Extending the duration of monitoring or specifying the criteria for extending monitoring if needed would strengthen this mitigation. Comment 12-103 Cont.
- **Monitoring after Mining:** It would be helpful to clarify if monitoring and corrective actions would continue indefinitely if groundwater levels do not recover to baseline levels. The mechanism should account for this possibility without having to revise it at every stage of the process.

General Recommendations:

- **Observance of North Kings Groundwater Sustainability Plan**: As a Project within the NKGSA, the applicant is required to observe all North Kings Groundwater Sustainability Plan guidelines. Should there be a negative impact on neighboring domestics wells, the financial costs for the mitigation shall be entirely borne by the applicant. Comment 12-104
- **Need for Current Groundwater Quality Data:** The most recent groundwater quality data was collected in 2021, which may not accurately reflect current conditions, particularly following recent wet and drought periods that can alter aquifer chemistry and water levels. Collecting and analyzing new data before the planned expansion begins will provide a more reliable baseline for understanding current conditions and monitoring any future changes linked to mining activities. Additionally, it may be beneficial to collect water quality samples during active operation as well as when there is a prolonged pause in operation to better establish a no operation baseline and current impacts from active operation. Comment 12-105
- **Groundwater Well Sampling Program:** While discussed, it is recommended to develop and implement a structured, recurring groundwater sampling program focused on monitoring water quality at strategically selected wells located both upgradient and downgradient of the Quarry and Plant Sites. This program should include: Comment 12-106
    1. **Key Parameters:** Electrical conductivity, dissolved oxygen, oxidation-reduction potential, and manganese levels
    2. **Flexibility for Additional Parameters:** The program should be designed to incorporate other water quality indicators as necessary. These additional parameters might be recommended by regulatory agencies, the City or County, or other stakeholders to address emerging concerns or site-specific conditions.
- **Consistent Sampling Schedule:** To detect trends or anomalies in a timely manner, sampling events should be conducted at regular intervals, such as Comment 12-107

monthly. Adhering to a predictable schedule will enhance the reliability of trend analyses, enable early identification of potential issues, and support proactive decision-making regarding any necessary mitigation or operational adjustments. Comment 12-107 Cont.

- **Adaptive Management:** If data indicates any significant changes in groundwater quality, implement appropriate mitigation measures (e.g., adjustments to surface water management practices, enhanced water treatment) in consultation with regulatory agencies and other stakeholders. Additionally, as the site conditions evolve, continue to refine the groundwater well sampling program to ensure ongoing protection of downgradient groundwater users. Comment 12-108
- **Enhanced Reporting Transparency:** Across the mitigation measures, ensuring clear and accessible reporting (e.g., publicly available monitoring reports) would help build trust with stakeholders. Comment 12-109
- **Third-Party Reviews:** While third-party oversight for funding is mentioned, adding independent review of the environmental data and mitigation effectiveness would further strengthen the integrity of these programs. Comment 12-110
- **Contingency Planning:** Developing more explicit contingency plans for situations where the monitoring and mitigation measures fail to resolve issues within the prescribed timeframes would help prevent prolonged environmental impacts. Comment 12-111

Abandoned Mine and Quarry Accidents Claim Several Lives per Year

Most of the victims are young and went to the quarry to swim or ride an ATV.

Article by: Hobart M. King, PhD, RPG

Dangerous Places!

Abandoned mines and quarries are dangerous places! In a typical year, several people die in accidents that occur in abandoned mines across the United States. Some of these deaths can be prevented if citizens know the danger of these properties; if landowners make better efforts to warn and limit access; and, if governments have improved programs for reclaiming or regulating them.

Don't swim in quarries!
Drowning is the leading cause of death in abandoned mines and quarries.

If you are a mineral collector, hiker, recreational vehicle rider, swimmer, or curious person, you have no business entering an abandoned or inactive mine or quarry. In almost every instance, you will be trespassing because abandoned mines and quarries are almost always on private property.

Abandoned mine structure: Structures at abandoned mine sites are often dangerous and unstable. They can also house dangerous chemicals or explosives. Stay out of these structures. Bureau of Land Management image.

ADVERTISEMENT

Where Do Fatalities Occur?

Deaths in abandoned and inactive mines occur across the United States. Many of them occur in the eastern coal fields, the sand and gravel quarries of the upper Mississippi Valley, limestone quarries in the southeast, or the metal

mines in the southwest. Deadly accidents can happen in any type of abandoned mine or quarry. Stay out!

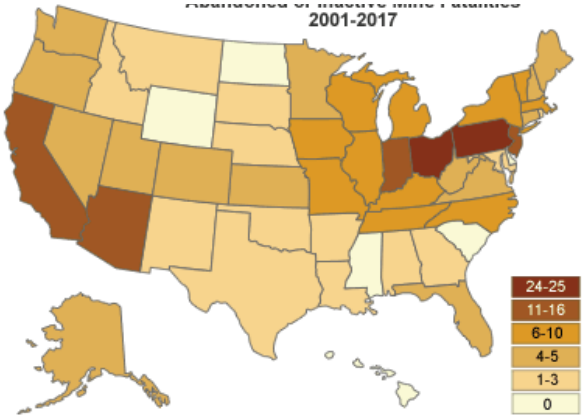
Drowning is the Leading Cause of Death

Drowning is the number one cause of death in abandoned mines. Most people involved in this type of accident went to a quarry for swimming. Quarries are extremely dangerous places to swim. Steep drop-offs, deep water, sharp rocks, flooded equipment, submerged wire, and industrial waste make swimming risky.

Another risk factor is the very cold water. Many quarry operations excavate to depths below the water table and use pumps to keep the mine dry while it is in operation. When mining stops, the pumps are turned off and the quarry floods by the inflow of cold groundwater. This groundwater inflow can keep the quarry water very cold even in late summer.

Jumping or falling into cold water can be fatal - even for a young healthy person. Here is a quote from the **National Institute of Health** on how a body responds to sudden immersion in cold water...

> *A fall in skin temperature elicits a powerful cardiorespiratory response, termed "cold shock," comprising an initial gasp, hypertension, and hyperventilation despite a profound hypocapnia. [...] The respiratory responses to skin cooling override both conscious and other autonomic respiratory controls and may act as a precursor to drowning.*



Abandoned mine fatalities map: Deaths in abandoned and inactive mines occur across the United States. Many of them occur in the eastern coal fields, the sand and gravel quarries of the upper Mississippi Valley, and metal mines in the southwest. ADVERTISEMENT

Don't Go Swimming in a Quarry

Most deaths that occur in abandoned mines and quarries are drownings. Most of the people who drown didn't fall in by accident. They went there to swim. Don't swim in a quarry. The water can be dangerously cold, there are no lifeguards, no rescue equipment, and it is simply not safe.

2010	20
2009	13

ATV Accidents

ATV accidents are the second leading cause of death. Quarries and surface mines are dangerous places to ride an ATV. Riders unfamiliar with the quarry can speed over a quarry's high wall or embankment. Death can result when an ATV is driven too close to a high wall and the rock, previously fractured from blasting, collapses from vibrations or weight. ATV riders have been killed by driving into wire fences at high speeds and losing control on gravel or sand-covered surfaces.

ATV accidents are the second leading cause of death in abandoned mines and quarries.

Falls and Asphyxiation

Falls are also deadly. Rock climbing in a mine or quarry is especially dangerous. The rock of a high wall or a mine has been fractured by blasting and can be highly unstable. The rocks that the climber depends upon for support can break free, or the climber's weight can destabilize an entire face of rock. Falls also occur in underground mines when the victim walks across rotted timbers covering a vertical shaft or steps over a ledge while negotiating a dark area.

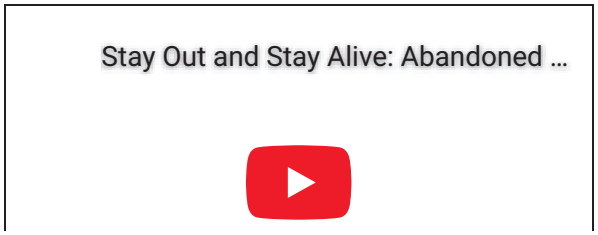
Where Did This Data Come From? The data used to create the tables and map on this page was obtained from newspaper articles that we encountered in our daily readings and website reports complied by the Mine Safety and Health Administration. The actual number of fatalities is, without any doubt, higher than the numbers shown in the tables and on the map.



Asphyxiation typically happens in underground mines. These mines can contain dangerous gases or have low levels of oxygen. Some victims have not realized that they were inhaling dangerous air until it was too late. Other causes of death include electrocution, passage collapse, and rockfalls.

Stay Out and Stay Alive: Abandoned Mine Safety. Video produced by the Office of Surface Mining Reclamation and Enforcement.

Why No Reclamation?

Today all mining operations must be reclaimed when work is completed. Miners are expected to return the land to a condition similar to before the mining was done - or in an alternative condition specified in their approved mining permit.

To assure that reclamation is done, the mining company must post a performance bond. The bond money is used to reclaim the land if the mining company goes bankrupt or fails to reclaim the land as required. Sometimes there is not enough bond money to complete the reclamation work, and that work goes undone.

Many abandoned mines were closed long before permitting and bonds were required. The responsibility to reclaim these mines can fall to the current property owner or to the government. Reclamation is expensive, so many of these jobs have not been completed.

Equipment, Structures, and Mine Openings

The buildings, structures, and equipment left at abandoned mines are also dangerous. The buildings and structures can be old and unstable. Floors can collapse when they are walked on. Supports can be rusted away. Chemicals, explosives, or electrical equipment and other dangers are sometimes left inside. Don't explore equipment and structures at abandoned mines.

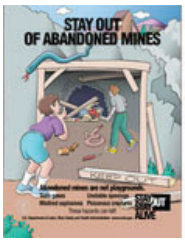
Abandoned iron processing facility in England: The abandoned mines problem is not confined to the United States. Open pits, underground mine entries, mineral processing facilities, and other abandoned works can be found in all parts of the world. The photo above is of an abandoned iron processing facility in North Yorkshire, England. Photograph copyright iStockphoto / PaulaConnelly.

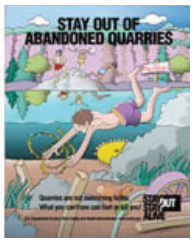
Underground mines are especially dangerous. They are dark inside, have loose rocks on the walls and roof, and there can be deep shafts and tunnels concealed by rotten wood covers. Underground mines are often used as homes by bats, bears, snakes, and other dangerous animals.

ADVERTISEMENT

People of All Ages Are Killed

Abandoned mine accidents claim the lives of people of all ages. Children sometimes enter mines without supervision, and adults sometimes take children with them when entering an abandoned mine site. A table on this page shows the age distribution of abandoned and inactive mine deaths. Most victims are young and die by drowning. Older victims die from a variety of causes.





MSHA educational books: The "Fatalities by Age" chart on this page shows that young people account for most of the fatal accidents. The **Mine Safety and Health Administration** has produced educational materials appropriate for school-age children.

If You Know of An Abandoned Mine...

Dangerous mining sites should be reported - especially if you know that there are dangerous activities going on there. You can start by reporting to your local police. Another good place to report is the **Office of Surface Mining's contact list**.

Spread the Word!

Help educate people in your area about the dangers of abandoned mines. One life saved is worth a lot of effort.

Where Did This Data Come From?

The data used to create the tables and map on this page was obtained from newspaper articles that we encountered in our daily readings and website reports complied by the Mine Safety

The victims range in age from preschool children to an 85-year-old mining veteran.

Report Suspicious

Good afternoon David,

The San Joaquin Valley Air Pollution Control District (District) has the following comments on the Draft Environmental Impact Report for the CEMEX Rockfield Quarry Modification Project.

Please let me know if you have any questions.

Thank you,

Michael Corder

Project: Draft Environmental Impact Report for the CEMEX Rockfield Quarry Modification Project

District CEQA Reference No: 20250088

Dear Mr. Randall:

Comment 13-1

The San Joaquin Valley Air Pollution Control District (District) has reviewed the Draft Environmental Impact Report (DEIR) from the County of Fresno (County) for the CEMEX Rockfield Quarry Modification Project. Per the DEIR, the project is for the continuation and modification of its current aggregate (rock, sand, and gravel) mining and processing operation to allow for an increase in their aggregate sales from 1.4 MT/yr to 2.0 MT/yr within 5 years and up to 3.0 MT/yr within 10 years. The Project is located at two sites: 13475 N. Friant Road (Plant Site) and 14765 N. Friant Road (Quarry Site) in Fresno, CA.

The District offers the following comments at this time regarding the Project:

1) Project Operational Emissions

Comment 13-2

Per the DEIR, the Project will result in increased On-Road Diesel-Fueled Vehicle trips, for example, heavy-heavy duty (HHD) trucks. More specifically, Table 4.3-21 (Mitigated Operational Phase Criteria Air Pollution Annual Emissions), presents the Project mobile source criteria pollutant emissions which are demonstrated to be below the District significance thresholds. Additionally, the DEIR states the emission reductions from mobile sources are attributed to technological advancements and stricter emissions requirements, such as compliance with the "In-Use Off-Road Diesel-Fueled Fleets" and "In-Use On-Road Diesel-Fueled Vehicles" regulations. To ensure air quality emission impacts from Project operations are lessened, the District recommends including an enforceable mitigation measure, that requires the use of cleaner HHD trucks.

Printed on recycled paper.

The San Joaquin Valley will not be able to attain stringent health-based federal air quality standards without significant reductions in emissions from HHD trucks, the single largest source of NOx emissions in the San Joaquin Valley. Accordingly, to meet federal air quality attainment standards, the District's ozone and particulate matter attainment plans rely on a significant and rapid transition of HHD fleets to zero or near-zero emissions technologies.

Comment 13-2 Cont.

The Project is an aggregate (rock, sand, and gravel) mining and processing operation and will result in HHD truck trips. Therefore, District also recommends that the following measures be considered by the County to reduce Project-related operational emissions:

- *Recommended Measure*: Fleets associated with operational activities utilize the cleanest available HHD trucks, including zero and near-zero technologies.

- *Recommended Measure*: All on-site service equipment (cargo handling, yard hostlers, forklifts, pallet jacks, etc.) utilize zero-emissions technologies.

2) Truck Routing

Truck routing involves the assessment of which roads HHD trucks take to and from their destination, and the emissions impact that the HHD trucks may have on residential communities and sensitive receptors. The Project is an aggregate (rock, sand, and gravel) mining and processing operation and will result in HHD truck trips.

Comment 13-3

The District recommends the County evaluate HHD truck routing patterns for the Project, with the aim of limiting exposure of residential communities and sensitive receptors to emissions. This evaluation would consider the current truck routes, the quantity and type of each truck (e.g., Medium Heavy-Duty, HHD, etc.), the destination and origin of each trip, traffic volume correlation with the time of day or the day of the week, overall Vehicle Miles Traveled (VMT), and associated exhaust emissions. The truck routing evaluation would also identify alternative truck routes and their impacts on VMT and air quality.

3) Reduce Idling of Heavy-Duty Trucks

Comment 13-4

The goal of this strategy is to limit the potential for localized PM2.5 and toxic air contaminant impacts associated with the idling of Heavy-Duty trucks. The diesel exhaust from idling has the potential to impose significant adverse health and environmental impacts.

Since the Project will result in HHD truck trips, the District recommends the EIR include measures to ensure compliance of the state anti-idling regulation (13 CCR § 2485 and 13 CCR § 2480) and discuss the importance of limiting the amount of idling, especially near sensitive receptors.

Comment 13-4 Cont.

4) Electric On-Site Off-Road and On-Road Equipment

Comment 13-5

Since the development Project is an aggregate (rock, sand, and gravel) mining and processing operation, the Project will result in the increased use of off-road equipment (e.g., tractors, excavators, forklifts, etc.) and on-road equipment (e.g., off-highway trucks to move materials). The District recommends that the County include requirements for project proponents to utilize electric or zero emission off-road and on-road equipment.

5) Health Risk Screening/Assessment and Ambient Air Quality Analysis

Comment 13-6

The District reviewed the Health Risk Assessment (HRA) and Ambient Air Quality Analysis (AAQA) for the Project and offers the following comments:

- For evaluating the potential health risks to impacted receptors (residences, other businesses, etc.), emissions reductions from one location cannot be used to directly reduce emissions, and therefore potential health impacts (cancer, chronic, and acute), at another location. The potential health risk to surrounding receptors shall be analyzed for all new emissions locations. Any potential decreases/increases in health impacts must be evaluated by modeling the emissions at their actual release locations and comparing the health impacts on an individual receptor by receptor basis for all receptors. Therefore, in order to ensure that the public's exposure is properly evaluated from this Project, any new potential air toxics emissions resulting from the Project should be evaluated for their potential health risk to the surrounding public.
- Per District Policy APR-2030, the District recommends an AAQA be performed for all criteria pollutant emissions for which an ambient air quality standard exists when a stationary source project would result in an increase of 100 pounds per day for any criteria pollutant. The Project indicates that CO emissions exceed the 100 lb/day threshold, however, it appears that the AAQA only evaluated CO emissions. The District recommends that the AAQA also include NOx, SOx, PM10, and PM2.5 emissions.

Comment 13-7

- Receptor gridding was used for the AAQA and HRA; however, the District recommends using a combination of fence line, cartesian grid, and discrete receptors to ensure that the maximally impacted receptors are reasonably captured. Where maximally impacted receptors are found in areas with coarse gridding, the District recommends placing additional receptors around them such that the spacing does not exceed 25 meters between receptors. For more information, please consult the District's Modeling Guidance.

Comment 13-8

- The District recommends adding receptors along the farmland fence line to the West of the Quarry Site in order properly assess acute health impacts to potential farm workers. Comment 13-9
- The emissions from the second phase of the Project are evaluated from thirty-one to sixty years. District policy is to evaluate long term residential risk over a seventy year period. Comment 13-10
- The HARP2 output files for the mitigated cancer risk to workers indicate that the risk was evaluated using a 25-year exposure. The District recommends using a 40-year exposure period for evaluating health impacts to worker receptors. Comment 13-11
- The Project uses variable emission rates in its dispersion modeling which were then imported into HARP2 for the risk assessment. In such cases, at least two modeling runs must be performed. One modeling run for long-term analyses (cancer/chronic) and one run for short term analyses (acute), with each using the appropriate scalars. In addition, the HRA must also apply an appropriate Worker Adjustment Factor (WAF) when evaluating the long-term carcinogenic impacts for workers. Comment 13-12
- The Fraction of Time at Home was enabled in HARP2 for the residential risk assessments. Due to the prevalence of home schooling and telework the District recommends that this option be disabled unless justification is provided. Comment 13-13
- The District could not determine from the documentation provided how the health impacts and ambient air quality impacts from blasting emissions were evaluated. Comment 13-14

Based on the above, the District recommends the HRA and AAQA be revised to ensure the analysis is representative and adequately reflects the Project's potential air quality health impacts. Comment 13-15

6) District Rules and Regulations

Comment 13-16

The District issues permits for many types of air pollution sources, and regulates some activities that do not require permits. A project subject to District rules and regulations would reduce its impacts on air quality through compliance with the District's regulatory framework. In general, a regulation is a collection of individual rules, each of which deals with a specific topic. As an example, Regulation II (Permits) includes District Rule 2010 (Permits Required), Rule 2201 (New and Modified Stationary Source Review), Rule 2520 (Federally Mandated Operating Permits), and several other rules pertaining to District permitting requirements and processes.

The list of rules below is neither exhaustive nor exclusive. Current District rules can be found online at: https://ww2.valleyair.org/rules-and-planning/current-district-rules-and-regulations. To identify other District rules or regulations that apply to future projects, or to obtain information about District permit requirements, the project

proponents are strongly encouraged to contact the District's Small Business Assistance (SBA) Office at (559) 230-5888.

Comment 13-16 Cont.

6a) District Rules 2010 and 2201 - Air Quality Permitting for Stationary Sources

Stationary Source emissions include any building, structure, facility, or installation which emits or may emit any affected pollutant directly or as a fugitive emission. District Rule 2010 (Permits Required) requires operators of emission sources to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) from the District. District Rule 2201 (New and Modified Stationary Source Review) requires that new and modified stationary sources of emissions mitigate their emissions using Best Available Control Technology (BACT).

This Project will be subject to District Rule 2010 (Permits Required) and Rule 2201 (New and Modified Stationary Source Review) and will require District permits. Prior to construction, the Project proponent should submit to the District an application for an ATC. For further information or assistance, the project proponent may contact the District's SBA Office at (559) 230-5888.

6b) District Regulation VIII (Fugitive PM10 Prohibitions)

Comment 13-16 Cont.

The project proponent may be required to submit a Construction Notification Form or submit and receive approval of a Dust Control Plan prior to commencing any earthmoving activities as described in Regulation VIII, specifically Rule 8021 – *Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities.*

Should the project result in at least 1-acre in size, the project proponent shall provide written notification to the District at least 48 hours prior to the project proponents intent to commence any earthmoving activities pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). Also, should the project result in the disturbance of 5-acres or more, or will include moving, depositing, or relocating more than 2,500 cubic yards per day of bulk materials, the project proponent shall submit to the District a Dust Control Plan pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). For additional information regarding the written notification or Dust Control Plan requirements, please contact District Compliance staff at (559) 230-5950.

The application for both the Construction Notification and Dust Control Plan can be found online at: https://ww2.valleyair.org/media/fm3jrbsq/dcp-form.docx

Information about District Regulation VIII can be found online at: https://ww2.valleyair.org/dustcontrol

6c) Other District Rules and Regulations

Comment 13-16 Cont.

The Project may also be subject to the following District rules: Rule 4102 (Nuisance) and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations).

7) District Comment Letter

Comment 13-17

The District recommends that a copy of the District's comments be provided to the Project proponent.

If you have any questions or require further information, please contact Michael Corder by e-mail at Michael Corder@valleyair.org or by phone at (559) 230-5818.

Sincerely,

Tom Jordan

Subject: Opposition to the CEMEX 100-Year Permit and Challenge to the Draft Environmental Impact Report

Dear Mr. Randall,

I am writing to formally express my opposition to the proposed 100-year permit for the CEMEX mining operation and to challenge the adequacy of the Draft Environmental Impact Report (EIR) prepared for this project. The EIR, as currently drafted, does not sufficiently or accurately assess the environmental, ecological, and community impacts that this long-term operation will have on the San Joaquin River and surrounding areas.

Comment 14-1

As someone with lifelong familiarity with the location, I find that the EIR fails to adequately address the following concerns:

Comment 14-2

1. Impacts on wildlife habitat
2. Water quality
3. Air pollution
4. Noise pollution
5. Groundwater depletion
6. Cumulative environmental impacts, and
7. Community health concerns
8. Cultural Resources

Comment(s) 14-3 14-4 14-5 14-6 14-7 14-8 14-9

A project of this scale and duration requires a far more comprehensive environmental review that includes thorough scientific analysis, long-term cumulative impact assessments, and meaningful mitigation strategies. The EIR, as it stands, does not meet these standards, and I urge Fresno County to require revisions that fully account for the long-term consequences of extending CEMEX's mining operations.

Comment 14-10

I request that the Planning Department reconsider this permit in light of the inadequacies of the EIR and demand a more thorough environmental review before any decisions are made.

Thank you for your time and consideration.

Sincerely,
Elsa Mejia

Subject: CEMEX Rockfield Quarry Modification Project (Project)
Draft Environmental Impact Report (DEIR)
SCH No.: 2020060123

Dear David Randall:

The California Department of Fish and Wildlife (CDFW) received a DEIR from Fresno County for the Project pursuant to the California Environmental Quality Act (CEQA) and CEQA Guidelines.

Thank you for the opportunity to provide comments and recommendations regarding those activities involved in the Project that may affect California fish and wildlife. Likewise, we appreciate the opportunity to provide comments regarding those aspects of the Project that CDFW, by law, may be required to carry out or approve through the exercise of its own regulatory authority under the Fish and Game Code.

CDFW ROLE

Comment 15-1

CDFW is California's **Trustee Agency** for fish and wildlife resources and holds those resources in trust by statue for all the people of the State (Fish & Game Code, Section 711.7, subd. (a) & 1802; Pub. Resources Code, Section 21070; CEQA Guidelines Section 15386, subd. (a)). CDFW, in its trustee capacity, has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and habitat necessary for biologically sustainable populations of those species (Id., Section 1802). Similarly, for purposes of CEQA, CDFW is charged by law to provide, as available, biological expertise during public agency environmental review efforts, focusing specifically on projects and related activities that have the potential to adversely affect fish and wildlife resources.

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

CDFW is also submitting comments as a **Responsible Agency** under CEQA (Pub. Resources Code, Section 21069; CEQA Guidelines, Section 15381). CDFW expects that it may need to exercise regulatory authority as provided by the Fish and Game Code. As proposed, for example, the Project may be subject to CDFW's lake and streambed alteration regulatory authority (Fish & Game Code, Section 1600 et seq.). Likewise, to the extent implementation of the Project as proposed may result in "take" as defined by State law of any species protected under the California Endangered Species Act (CESA) (Fish & Game Code, Section 2050 et seq.), related authorization as provided by the Fish and Game Code may be required.

Comment 15-1 Cont.

Fully Protected Species: CDFW has jurisdiction over fully protected species of birds, mammals, amphibians and reptiles, and fish, pursuant to Fish and Game Code sections 3511, 4700, 5050, and 5515. Fully protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except as follows:

Comment 15-2

- Take is for necessary scientific research,
- Efforts to recover a fully protected, endangered, or threatened species, live capture, and relocation of a bird species for the protection of livestock, or
- They are a covered species whose conservation and management is provided for in a Natural Community Conservation Plan (Fish & G. Code, §§ 3511, 4700, 5050, & 5515).

Additionally, specified types of infrastructure projects may be eligible for an Incidental Take Permit (ITP) for unavoidable impacts to fully protected species if certain conditions are met (see Fish & G. Code §2081.15). Project proponents should consult with CDFW early in the Project planning process if an ITP may be pursued for the Project.

CDFW Ecological Reserve: Fish and Game Code section 1583 states "Except in accordance with the regulations of the commission it is unlawful to enter upon any ecological reserves established under the provisions of the article, or to take therein any bird or the nest or eggs thereof, or any mammal, fish, mollusks, crustaceans, amphibia, reptiles or any other form of plant or animal life." In addition, California Code of Regulations, Title 14, Section 630 states "All ecological reserves are maintained for the primary purpose of developing a statewide program for protection of rare, threatened, or endangered native plants, wildlife, aquatic organisms, and specialized terrestrial or aquatic habitat types", and therefore, any other activity on these lands is restricted.

Nesting Birds: CDFW has jurisdiction over actions with potential to result in the disturbance or destruction of active nest sites or the unauthorized take of birds. Fish and Game Code sections that protect birds, their eggs and nests include Sections 3503

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

(regarding unlawful take, possession or needless destruction of the nest or eggs of any bird), 3503.5 (regarding the take, possession or destruction of any birds-of-prey or their nests or eggs), and 3513 (regarding unlawful take of any migratory nongame bird). Comment 15-2 Cont.

Water Rights: The capture of stream flows to is subject to appropriation and approval by the State Water Resources Control Board (SWRCB) pursuant to Water Code section 1200 et seq. CDFW, as Trustee Agency, is consulted by SWRCB during the water rights process to provide terms and conditions designed to protect fish and wildlife prior to appropriation of the State's water resources. Certain fish and wildlife are reliant upon aquatic and riparian ecosystems, which in turn are reliant upon adequate flows of water. CDFW, therefore, has a material interest in assuring that adequate water flows within streams for the protection, maintenance, and proper stewardship of those resources. CDFW provides, as available, biological expertise to review and comment on environmental documents and impacts arising from Project activities.

PROJECT DESCRIPTION SUMMARY

Comment 15-3

Proponent: CEMEX

Objective: The proposed Project is a continuation and modification of aggregate (rock, sand, and gravel) mining and processing operations located on two properties, the Plant Site and the Quarry Site. The Project would occur in two stages as described below:

Stage 1: Stage 1 of the Project would include concurrent operations at both the Quarry Site and the Plant Site for up to 30 years. At the Plant Site, the existing aggregate processing plant will continue to be used to wash, screen, crush, and sort aggregate mined from the Plant Site. The existing ready-mix concrete plant, hot-mix asphalt plant, and related supportive facilities would continue to operate. The remaining alluvial deposit would be mined to a depth of approximately 75 feet below ground surface (bgs). Surface and/or groundwater encountered within the excavation would be pumped to groundwater recharge trenches along boundaries of the Plant Site. Upon completion of alluvial deposit mining at the Plant Site, operations at the Plant Site would cease, all equipment would be removed, and the site reclaimed as 122 acres of open space, riparian, and open water wildlife habitat.

At the Quarry Site, mining would be modified to include the hard rock (granite) that lies beneath the alluvial deposit currently being mined. Surface and/or groundwater encountered within the excavation will continue to be pumped to an existing reclaimed pond in the northeast corner of the Quarry Site for recharge to the groundwater and to existing groundwater recharge trenches along the western boundaries of the Quarry Site. Excavation of the hard rock would require drilling and blasting and would occur to a depth of approximately 600 feet bgs. An aggregate processing plant would be added

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

to the Quarry Site to wash, screen, crush, and sort the aggregate. The plant would be located in a previously excavated pit approximately 30 feet bgs.

Comment 15-3 Cont.

Stage 2: Stage 2 of the Project would continue hard rock mining and processing operations at the Quarry Site. The ready-mix concrete plant and the hot-mix asphalt plant will be relocated from the Plant Site to the Quarry Site adjacent to the aggregate processing plant. Upon completion of excavation at the Quarry Site, operations at the Quarry Site would cease and all equipment would be removed. Reclamation of the Quarry Site will create approximately 349 acres of open space, riparian, and open water wildlife habitat. The total Project life of the combined Stages 1 and 2 is estimated to be 100 years.

Location: The Project is located at two sites: 13475 N. Friant Road and 14765 North Friant Road, Fresno. The Project is located between North Friant Road and the San Joaquin River, in an unincorporated portion of Fresno County.

- Plant Site (CUP 3666): CEMEX's current Plant Site is located on approximately 122 acres on the west side of North Friant Road, on Assessor's Parcel Number (APNs) 300-070-56S, 57S,58S,59S, and 60S, approximately 1.5 miles north of the City of Fresno and approximately 0.7 mile north of the intersection of North Willow Avenue and North Friant Road.
- Quarry Site (CUP 3667): CEMEX's current Quarry Site is located on approximately 349 acres on the west side of North Friant Road, on APNs 300-040-19 and 20, 300-080-01S, 300-250-12 and portion of 300-310-01, approximately 2.0 miles north of CEMEX's current Plant Site and approximately 2.0 miles south of the unincorporated community of Friant.

Timeframe: Undetermined; however, mining and processing activities are anticipated to take approximately 100 years to complete.

COMMENTS AND RECOMMENDATIONS

Comment 15-4

CDFW offers the following comments and recommendations to assist Fresno County in adequately identifying and/or mitigating the Project's significant, or potentially significant, direct and indirect impacts on fish and wildlife (biological) resources. Editorial comments or other suggestions may also be included to improve the CEQA document prepared for this Project.

The DEIR details the Project activities proposed at both the Plant Site and Quarry Site over the next century. CDFW would like to note that the length of the Project coupled with the uncertainty surrounding the extensive blasting and mining activities for the Quarry Site have CDFW concerned that the proposed Project would result in significant long-term impacts to species and habitats within and surrounding the San Joaquin River

Comment 15-5

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

and its habitats and have the potential to significantly impact restoration and conservation goals in the Project vicinity. For instance, the Willow Unit of CDFW's San Joaquin River Ecological Reserve (SJRER) surrounds the current Plant Site on three sides (the fourth side being Friant Road). The Willow Unit was acquired with State Bond Funds, for the intended purpose of perpetual protection of riparian habitat and associated wildlife. The Willow Unit supports high quality riparian habitat for both nesting and migratory bird species.

Comment 15-5 Cont.

Comment 15-6

Additionally, the San Joaquin River Restoration Program (SJRRP) is currently working to restore and maintain fish populations in "good condition" in the mainstem San Joaquin River downstream of Friant Dam to the confluence with the Merced River (i.e., Restoration Area) and restore and maintain naturally reproducing and self-sustaining populations of salmon and other fish. CDFW would like to note the SJRRP is working on two major passage improvements projects (Sack Dam and Mendota Dam) to allow volitional passage of anadromous fishes upstream to Friant Dam (upstream of the Project). Further, CDFW has invested millions of dollars to construct a state-of-the-art Salmon Conservation and Research Facility (SCARF; i.e., conservation hatchery), also upstream of this site, to help with the reintroduction of spring-run Chinook salmon (*Oncorhynchus tshawytscha pop. 11*). Once fully operational, the SCARF plans to release 1.2 million smolts annually from its volitional release channel upstream of the Project site. Further the Project is directly adjacent to the most important reach of the river for spring-run Chinook salmon to complete various life-cycle stages (egg, juvenile, and adult), with holding, spawning, incubation, and rearing occurring directly adjacent to the Project site.

Comment 15-7

Finally, the Lost Lake Recreation Area, which borders the Quarry Site to the north, is also State-owned land and is operated under an expired lease with Fresno County. Lost Lake Recreation Area provides important recreational opportunities to the public and also supports high quality riparian habitat for a variety of wildlife species, including many of the special-status species identified in the DEIR.

Comment 15-8

While CDFW acknowledges that a detailed analysis was included in the Project DEIR to evaluate impacts to the San Joaquin River and associated floodplain from the associated Project blasting and mining activities, CDFW is concerned that the duration of the Project, coupled with the complexity of the Project impacts, which includes blasting and excavation of bedrock down to approximately 600 feet, and uncertainty in climatic conditions due to climate change over the next 100 years, will result in significant unanalyzed direct and indirect impacts to biological resources beyond baseline conditions. CDFW is specifically concerned with potential Project-related impacts to riparian habitat and associated fish and wildlife which inhabit areas adjacent to the Project site, specifically impacts associated with noise (hydroacoustic and acoustic), blasting, water quality, vibration, and direct disturbance. In addition, deep

Comment 15-9

Comment 15-10

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

mining activities could severely impact the underlying hydrology on which the San Joaquin River and the river's associated riparian vegetation depends, particularly if slope failure were to occur at the Quarry Site, the natural berms and levees surrounding the Project site were to fail from high flows or unforeseen climatic conditions, or if unanticipated rock fractures provide more hydrologic connection than assumed in the DEIR. This situation would be of particular concern to the SJRRP restoration activities, as water released from the Friant Dam is fully allocated for downstream riparian water right holders and SJRRP Restoration Flows. Any unintentional diversion, from events such as slope failure or deep pit capture and/or filling, would have significant impacts on downstream water deliveries and the success of SJRRP's goal in restoring a natural self-sustaining population of spring-run Chinook salmon below Friant dam.

Comment 15-10 Cont.

In summary, CDFW is concerned Project activities, which include blasting and mining operations directly adjacent to the San Joaquin River to a depth of approximately 600 feet, and would occur over an approximate 100-year period, would result in significant direct and indirect impacts to sensitive resources within and adjacent to the Project site over the life of the Project. These impacts have the potential to disrupt San Joaquin River hydrology, impact the restoration and conservation goals within the San Joaquin River and associated SJRER, as well as the restoration goals of the SJRRP. Due to these concerns, CDFW strongly recommends that the Project be modified to a more environmentally superior alternative, and that Project activities be adjusted to limit site blasting and excavation (i.e., activities associated with the Quarry Site) further away from the San Joaquin River and the river's associated habitats, reducing the potential for impacts to CDFW-owned lands, and sensitive species and habitats.

Comment 15-11

In addition to the general recommendation provided above, CDFW has concerns about the ability of some the proposed mitigation measures to reduce impacts to less than significant and avoid unauthorized take for several special-status animal species, including the State endangered and fully protected bald eagle (*Haliaeetus leucocephalus*), the State threatened Swainson's hawk (*Buteo swainsoni*), the State and federally threatened California tiger salamander – Central California Distinct Population Segment (DPS) (*Ambystoma californiense pop.1*), the State and federally threatened Chinook salmon – Central Valley spring-run Evolutionary Significant Unit (ESU), the State fully protected white-tailed kite (*Elanus leucurus*), the State candidate western burrowing owl (*Athene hypugaea*), tricolored blackbird (*Agelaius tricolor*), and Crotch's bumble bee (*Bombus crotchii*), the State species of special concern and federally proposed threatened western pond turtle (*Actinemys marmorata*) and western spadefoot (*Spea hammondii*), and the State species of special concern Chinook salmon – Central Valley fall/late-run ESU, hardhead (*Mylopharodon conocephalus*), Kern brook lamprey (*Lampetra hubbsi*), Pacific lamprey (*Entosphenus tridentatus*), and Sacramento hitch (*Lavinia exilicauda exilicauda)*, the State species of special concern and federally

Comment 15-12

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

threatened steelhead – Central Valley DPS (*Oncorhynchus mykiss irideus pop.* 11), and the State species of special concern western river lamprey (*Lampetra ayresii*). Comment 15-12 Cont.

Terrestrial Species Comment 15-13

State Fully Protected Raptors

CDFW would like to note that, based on the information provided in the DEIR, habitat assessments and surveys for special-status species were focused mainly within the Project site, and focused surveys were not conducted for bald eagle (BAEA) and white-tailed kite (WTKI). Additionally, the DEIR does not appear to have a substantive analysis of direct and indirect impacts to biological resources adjacent to the Project site. CDFW is particularly concerned with the impacts from Project activities to BAEA and WTKI if these species were to nest within the habitats surrounding the Project site. Certain Project details and their associated potential impacts to biological resources are also lacking, such as a detailed analysis of the potential acoustic and vibratory impacts to BAEA and WTKI from the blasting and mining activities associated with the Quarry Site.

Mitigation Measure 4.4-1c is provided to mitigate for potential impacts to nesting birds, including BAEA and WTKI, and requires a preconstruction survey prior to Project activities and the implementation of inadequate no-disturbance buffers. CDFW does not concur that the surveys and no-disturbance buffers proposed in Mitigation Measure 4.4-1c are sufficient to mitigate for potential impacts to these species. CDFW is also concerned that Project activities such as blasting may result in indirect impacts to BAEA and WTKI, and these Project activities need to be more adequately analyzed in the DEIR. As such, CDFW recommends that the DEIR include a more robust analysis of potential impacts to BAEA and WTKI from ongoing Project activities, particularly for the blasting and mining proposed at the Quarry Site, and that this analysis include a sufficient area around the Project site.

In addition to the recommendation above, CDFW recommends the following:

> **Recommended Mitigation Measure 1: State Fully Protected Raptor Surveys**
>
> CDFW recommends that focused BAEA and WTKI surveys be conducted prior to the initiation of Project blasting activities. CDFW recommends that these surveys occur within the Project site and a ½-mile buffer of the Project site and that BAEA surveys follow the Bald Eagle Breeding Survey Instructions (CDFW 2010) protocol and be conducted by a qualified biologist prior to the initiation of plant construction or mining phases as outlined in the DEIR.

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

Recommended Mitigation Measure 2: State Fully Protected Raptor Avoidance Buffer

Comment 15-13 Cont.

If a BAEA or WTKI is found prior to or during surveys or Project activities, CDFW recommends implementation of a minimum ½-mile no-disturbance buffer. CDFW advises that this buffer remains in place until the breeding season has ended or until a qualified biologist has determined that nesting has ceased, the birds have fledged and are no longer reliant upon parental care for survival. In the event that a BAEA or WTKI is detected during surveys, and a ½-mile no-disturbance buffer is not feasible, consultation with CDFW is recommended.

Swainson's Hawk

Comment 15-14

CDFW would like to note that, based on the information provided in the DEIR, habitat assessments and surveys for special-status species were focused mainly within the Project site, and focused surveys were not conducted for Swainson' hawk (SWHA). Additionally, the DEIR does not appear to have a substantive analysis of direct and indirect impacts to biological resources adjacent to the Project site. CDFW is particularly concerned with the impacts from Project activities to SWHA if individuals were to nest within the habitats surrounding the Project site. Certain Project details and their associated potential impacts to biological resources are also lacking, such as a detailed analysis of the potential acoustic and vibratory impacts to SWHA from the blasting and mining activities associated with the Quarry Site.

Mitigation Measure 4.4-1c is provided to mitigate for potential impacts to nesting birds, including SWHA, and requires a preconstruction survey prior to Project activities and the implementation of inadequate no-disturbance buffers. CDFW does not concur that the surveys and no-disturbance buffers proposed in Mitigation Measure 4.4-1c are sufficient to mitigate for potential impacts to this species. CDFW is also concerned that Project activities such as blasting may result in indirect impacts to SWHA, and these Project activities need to be more adequately analyzed in the DEIR. As such, CDFW recommends that the DEIR includes a more robust analysis of potential impacts to SWHA from ongoing Project activities, particularly for the blasting and mining proposed at the Quarry Site, and that this analysis includes a sufficient area around the Project site.

In addition to the recommendation above, CDFW recommends the following: **Western Pond Turtle and Western Spadefoot**

Comment 15-15

CDFW would like to note that based on the information provided in the DEIR, habitat assessments and surveys for special-status species were focused mainly within the Project site, and focused surveys were not conducted for western pond turtle (WPT) and western spadefoot (WESP). CDFW would also like to note that DEIR did not focus

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

on an evaluation of the habitat adjacent to the Project site, particularly along the San Joaquin River, and the DEIR does not appear to have a substantive analysis of direct and indirect impacts to biological resources adjacent to the Project site. CDFW is particularly concerned with the impacts from Project activities to WPT and WESP if this species were to utilize habitats surrounding the Project site. Certain Project details and their associated potential impacts to biological resources is also lacking, such as a detailed analysis of the potential acoustic and vibratory impacts to WPT and WESP and their associated burrows from the blasting and mining activities associated with the Quarry Site. CDFW is concerned that direct and indirect impacts to WPT and WESP, such as the potential collapse of burrows, inadvertent entrapment, direct mortality of individuals, and displacement due to sound or vibration, are not adequately analyzed in the DEIR. As such, CDFW recommends that the DEIR include a more robust analysis of potential impacts to WPT and WESP from ongoing Project activities, particularly for the blasting and mining proposed at the Quarry Site, and that this analysis include a sufficient area around the Project site. This additional analysis should consider information within several published research studies on various toad species which demonstrate that vibrations outside of typical emergence cues like rainfall can result in the emergence of toads from underground refugia, including during times of hibernation. It is also important to note that thunder, or sounds like thunder, can stimulate toad emergence. The vibrations and sounds associated with blasting could result in the atypical and seasonally inappropriate emergence of spadefoot, resulting in direct mortality, reduced survival, and impacts to reproductive success.

Comment 15-15 Cont.

CDFW would also like to note that Mitigation Measure 4.4-1b of the DEIR states, “Pre-construction clearance surveys within the boundaries of the Quarry Site shall be conducted […] A combination of visual and trapping surveys by a CDFW-qualified biologist may be performed.” CDFW is concerned the use of the phrase “may be performed” introduces an element of uncertainty and could lead to inadequate or nonexistent survey efforts, potentially affecting these sensitive species. As such, CDFW recommends revising this measure to explicitly require visual and trapping surveys prior to the initiation of any construction activities.

Comment 15-16

Aquatic Species

Comment 15-17

As noted above, extensive restoration, conservation, and management efforts are occurring within the San Joaquin River and adjacent SJRER, and aquatic species, including Chinook salmon, hardhead, Kern brook lamprey, Pacific lamprey, Sacramento hitch, steelhead, western river lamprey, sacrament sucker (*Catostomus occidentalis*), Sacramento pikeminnow (*Ptycochelis grandis)*, threespine stickleback (*gasterosteus aculeatus*), as well as species of sculpin (*cottus sp.*) have the potential to utilize the habitats directly adjacent to the Project site over the life of the Project. CDFW is concerned that the proximity of Project activities to the San Joaquin River and adjacent

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

riparian habitat, particularly the blasting and mining activities associated with the Quarry Site, are likely to result in potentially significant impacts to aquatic species, particularly if slope failure were to occur at the Quarry Site or the natural berms and levees surrounding the Project site were to fail from high flows or unforeseen climatic conditions. In addition, unanticipated rock fractures could provide more hydrologic connection of the mining pit to the San Joaquin River than assumed in the DEIR, which could deep pit capture by the San Joaquin River and associated modification to San Joaquin River subsurface and subsurface flows. As such, CDFW has the following comments and recommendations:

Comment 15-17 Cont.

San Joaquin River Floodplain

Comment 15-18

While the DEIR notes that the Plant Site and Quarry Site are not located within the modeled 100-year floodplain of the San Joaquin River, the river is not in direct hydraulic communication with the weathered and hard rock at the Quarry Site, and that dewatering of the deeper geologic units associated with the Quarry Site Project activities would not be expected to affect the quantity of the water within the river, CDFW would like to highlight there is extensive amount of uncertainty with these statements, particularly due to the difficulty in attempting to evaluate and analyze potential changes to the surrounding areas over time (e.g., changes in topography, rainfall amounts, etc.), particularly from high flows and/or increasingly extreme weather events associated with climate change. CDFW would also like to note that portions of the Project site are still located within the rivers historic floodplain and is potentially still connected to the San Joaquin River via subsurface flow and at times, potentially overland flow, when large flood flow events occur. CDFW would also like to note that the 20th century levee construction does not cut off the historic plain from local watershed processes.

The San Joaquin River flow/stage is the local control for the shallow groundwater table elevation. This San Joaquin River's influence on the groundwater table extends laterally away from the river into the historic floodplain's subsurface which is predominantly composed of alluvial (sand, gravel, and cobble) deposits. These sediments are found to cap local bedrock in some areas. The extraction or pumping of groundwater within the historic or present-day floodplain adjacent to the San Joquin River, would influence river and hyporheic flow, and shallow groundwater elevations. Excavation or pumping below the groundwater table elevation within the floodplain would cause a local cone of depression that would draw down the groundwater table elevation. This would create a gradient that would pull water from the San Joaquin River and its subsurface, known as a losing stream. This would have the potential to have a significant impact to the San Joaquin River watershed and the success of the SJRRP.

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

Levee Overtopping/Levee Failure

Comment 5-19

Friant Dam flood releases can occur in winter and spring. These flows have the potential to overtop or laterally incise levees, natural or constructed. Given the proposed Project's 100-year lifespan, it is critical that more dynamic language be incorporated into the DEIR to account for potential changes to the surrounding areas over time and potential for levee overtopping or failure. CDFW is concerned that flood releases, coupled with the potential for increased extreme flow events due to climate change, could jeopardize the integrity of the natural berms and levees surrounding the Project site, and that breaching of these barriers by high flows could result in long-term impacts to San Joaquin River fisheries and nearby restoration projects. As natural systems are inherently dynamic, it is essential to consider all potential scenarios for a Project with such an extended duration. Coordination with CDFW and other relevant agencies is strongly recommended to develop adaptive language that minimizes the potential long-term impacts of the Project.

Water Temperatures/Water Quality

Comment 5-20

Suitable San Joaquin River temperatures are essential for the success in restoring the river and for the goals associated with the SJRRP. In general, San Joaquin River temperatures increase as water flows downstream from Friant Dam except for the coldest months in late fall and early winter. The reduction of flow traveling downstream, by a surface or subsurface diversion associated with mining pit capture would increase this dynamic and cause the San Joaquin River to warm sooner and at a faster rate. This can cause lethal/sub-lethal conditions for salmon and other fishes. Water found within the historic San Joaquin River floodplain, surface and subsurface, would have different water quality and temperatures than San Joaquin River surface flow. While the DEIR notes that groundwater and onsite water associated with the mining activities would remain on the Project site for percolation into the groundwater aquifer, CDFW would like to reiterate that any surface or subsurface flow of water from the Project site would have the potential to warm the San Joaquin River and cause water quality issues that can result in lethal/sub-lethal conditions for fishes and potentially hinder SJRRP's efforts.

Rock Blasting and Impacts to Chinook Salmon

Comment 5-21

The San Joaquin River, from Friant Dam to Little Dry Creek, is the primary spring-run Chinook salmon over-summer holding, spawning, and incubation reach for the SJRRP based on river temperatures, streambed substrate, and flows. The Project is immediately adjacent to this important reach that supports these critical phases of salmon life history. Rock blasting adjacent to the San Joaquin River would likely cause physical vibrations laterally within the floodplain and into the riverine environment, may have significant impacts on the behavior of salmon adults with over-summer holding

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

(April to September), habitat spawning selection (September to mid-November), and the incubation of alevin/fry (September - March). While the DEIR evaluates potential blasting impacts to salmonids and concludes that blasting activities would be below a significant harm threshold identified by the Alaska Department of Fish and Game, CDFW would like to note that in addition to direct mortality and harm, rock blasting may cause an avoidant behavior in salmon. If blasting were to cause avoidant behavior, blasting activities could act as a behavioral barrier blocking salmon from entering and occupying suitable holding and spawning habitat located near and upstream of the Project. In addition, physical vibrations rock blasting could result in premature emergence on alevin/fry from the redd incubation environment. Juveniles emerging too early result in poor survival from their inability to navigate flows, avoid entrainment, and successfully escape predators. Due to the complexity of trying to determine behavioral thresholds to fish salmon from the proposed blasting activities, CDFW reiterates the recommendation that the Project be modified to an environmentally superior alternative, and that Project activities be adjusted to site blasting and excavation (i.e., activities associated with the Quarry Site) further away from the San Joaquin River and the river's associated habitats. In addition to this general recommendation, CDFW recommends the following:

Comment 5-21 Cont.

> **Recommended Mitigation Measure 15: Chinook Salmon Consultation**
>
> It is recommended the Project proponent consult with CDFW to determine how to minimize and mitigate impacts to juvenile salmon utilization of the San Joaquin River from rock blasting.

Blasting Protocols

Comment 5-22

Mitigation measure 4.10-1 of the DEIR requires implementation of the *Blasting Protocols* which specifies that blasting must begin at the center of the Quarry site and that monitoring of ground borne vibration can occur and be used to verify that predicted maximum ground vibrations are consistent with actual ground vibration measurements and allow for adjustments in blasting design to occur based on the monitoring results. CDFW is concerned that the blasting protocols may have unforeseen impacts to aquatic species and recommends having a biological monitor visually observe blasting activities adjacent to the San Joaquin River to look for signs of impacts to species (e.g. unusual behavior, mortality).

Editorial Comments and/or Suggestions

Comment 5-23

Blasting Impacts: Within the DEIR, noise significance thresholds are discussed. However, these thresholds primarily focus on impacts related to salmon, as detailed in the DEIR section "Effects of Nearby Blasting on Salmon in the San Joaquin River," and do not address potential impacts on other animal species. CDFW strongly recommends

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

a comprehensive evaluation of the potential effects of acoustic and vibration impacts from the proposed blasting, particularly in relation to impacts to special-status species listed in previous sections of this letter. Furthermore, relevant thresholds or evaluation criteria should be established to minimize these effects and ensure the protection of wildlife in the surrounding areas.

Comment 5-23 Cont.

Reclamation Plans: The DEIR, on page 148, states that at the Plant Site, "It is estimated that an approximately 100.5-acre, 20-foot-deep pond would form above the reclaimed bottom from groundwater and rainfall." The Project proposes that, upon completion, the Plant Site would be converted into an open water habitat or lake with a relatively uniform bottom elevation and a depth of approximately 20 feet, which offers limited benefit to wildlife. CDFW recommends placing overburden and fines at the bottom of the pit to create topographic complexity, ensuring the formation of dry islands, peninsulas, and variable water depths. This more naturalistic approach would enhance the site's suitability for wildlife use. As an example, CDFW suggests that the reclamation plan reference sites such as Ball Ranch (coordinates: 36.936284°, -119.736811° and 36.857447°, -119.834031°).

Comment 5-24

Overall, CDFW does not concur with the proposed reclamation plan. CDFW recommends the development of a more comprehensive reclamation plan in collaboration with relevant agencies. Given that the Project is anticipated to be completed over a 100-year timeframe, it is essential to create a detailed reclamation plan that incorporates dynamic language, allowing for flexibility to accommodate potential changes over time.

Comment 5-25

Quarry Site Groundwater Adaptive Management Program: Mitigation Measure 4.10-10a of the DEIR states, "To assess any potential effect on the CSA 44C wells due to the proposed excavation of a hard rock quarry pit at the Quarry Site, monitoring shall be conducted in the nested set of wells between the Northeast Pond and the CSA 44C wells, and in the CSA 44C wells themselves." CDFW is concerned that monitoring at only one of the two well clusters near the San Joaquin River may not fully represent conditions along the entire boundary.

Comment 5-26

CDFW recommends the following:

1. Add pressure transducer monitoring to the MW-2 well cluster, located in the alluvium and weathered rock, to establish baseline conditions and evaluate potential impacts (MW-1 is already included and contains applicable thresholds and actions for MW-2).

2. Conduct further investigation into the elevation of the contact between the alluvium and weathered rock in relation to the adjacent channel bed and stream stage along the mine boundary shared with the San Joaquin River. This data

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

should be used to refine the adaptive management program concerning potential streamflow depletion.

Comment 5-26 Cont.

Sustainable Groundwater Management Act (SGMA), Interconnected Surface Waters, and Groundwater Dependent Ecosystems: Groundwater Sustainability Plans were prepared for the Kings Subbasin. The Kings Subbasin (Subbasin No. 5-022.08 of the San Joaquin Valley Groundwater Basin) is designated as a high priority Subbasin by the Department of Water Resources (DWR). SGMA defines sustainable groundwater management as, "management and use of groundwater in a manner that can be maintained during the planning and implementation horizon without causing undesirable results (Water Code, § 10721 (v))." CDFW recommends that the DEIR include an analysis of Project-related activities in relation to the North Kings Groundwater Sustainability Plan, including analysis of potential undesirable results and adverse impacts to groundwater dependent ecosystems including the biological resources listed above.

Comment 5-27

CDFW recommends a hydrologic study or other information that identifies and analyzes the impacts to the aquatic ecosystems and fisheries of the San Joaquin River that may result from Project implementation. CDFW recommends that it include specific triggers for evaluating changes to surface and ground water levels and monitoring wetland and riparian habitats that would be affected by these changes.

Water Rights: The Project description allows for the diversion and storage of surface water for Project activities. As stated previously, the capture of stream flows is subject to appropriation and approval by the SWRCB pursuant to Water Code section 1200 et seq. CDFW recommends that the DEIR includes a detailed description of the water rights and water entitlements that would pertain specifically to the Project and address any applications or change petitions that may be filed. CDFW, as Trustee Agency, is consulted by the SWRCB during the water rights process to provide terms and conditions designed to protect fish and wildlife prior to appropriation of the State's water resources. Given the potential for impacts to special-status species and their habitats, it is advised that required consultation with CDFW occur well in advance of the SWRCB water right application process.

Comment 5-28

Nesting birds: CDFW encourages that Project ground-disturbing and blasting activities occur during the bird non-nesting season; however, if ground or vegetation disturbing or blasting activities must occur during the nesting season (February 1st through September 15th), the Project applicant is responsible for ensuring that implementation of the Project does not result in violation of the Migratory Bird Treaty Act or relevant Fish and Game Code sections as referenced above.

Comment 5-29

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

CDFW further recommends that the DEIR include that a qualified biologist conduct a pre-construction survey for active nests no more than three days prior to the start of ground or vegetation disturbance or blasting activities to maximize the probability that nests that could potentially be impacted are detected. CDFW also recommends that surveys cover a sufficient area around the Project site to identify nests and determine their status. A sufficient area means any area potentially affected, either directly or indirectly, by the Project. In addition to direct impacts (i.e., nest destruction), noise, vibration, and movement of workers or equipment could also affect nests. CDFW recommends that a qualified biologist establish a behavioral baseline of all identified nests. Once Project activities begin, CDFW recommends having a qualified biologist continuously monitor nests to detect behavioral changes resulting from the Project. If behavioral changes occur, CDFW recommends halting the work causing that change and consulting with CDFW for additional avoidance and minimization measures.

Comment 5-30

If continuous monitoring of identified nests by a qualified biologist is not feasible, CDFW recommends a minimum no-disturbance buffer of 300 feet around active nests of non-listed bird species and a 500-foot no-disturbance buffer around active nests of non-listed raptors. These buffers are advised to remain in place until the breeding season has ended or until a qualified biologist has determined the birds have fledged and are no longer reliant upon the nest or on-site parental care for survival. Variance from these no-disturbance buffers is possible when there is a compelling biological or ecological reason to do so. CDFW recommends that a qualified wildlife biologist advise and support any variance from these buffers and notify CDFW in advance of implementing a variance.

CNDDB Positive Submission of Data: Please note that the California Natural Diversity Database (CNDDB) is populated by and records voluntary submissions of species detections. As a result, species may be present in locations not depicted in the CNDDB but where there are suitable habitats and features capable of supporting species. A lack of an occurrence record in the CNDDB does not mean a species is not present. In order to adequately assess any potential Project-related impacts to biological resources, surveys conducted by a qualified wildlife biologist/botanist during the appropriate survey period(s) and using the appropriate protocol survey methodology are warranted in order to determine whether or not any special-status species are present at or near the Project site.

Comment 5-31

Adjacent State Protected Lands: As mentioned above, the Willow Unit of CDFW's San Joaquin River Ecological Reserve (SJRER) surrounds the Project site on three sides (the fourth side being Friant Road). A portion of the Plant Site acreage has encroached upon property owned by the State of California (both CDFW and the San Joaquin River Conservancy). This encroachment outside of lands now owned by Cemex was a condition present at the time of CDFW's acquisition of the Willow Unit

Comment 5-32

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

from the Ball Family. However, the condition was to be remedied within a certain timeframe of purchase but the intended retraction and restoration of the State-owned acreage never occurred. Cemex and CDFW have had preliminary discussions about this issue, which could be resolved with a property exchange and parcel boundary adjustment, but final resolution will be needed prior to ***any*** expanded activities at the Plant Site.

Comment 5-32 Cont.

Additionally, the Quarry Site borders Lost Lake Recreation Area. CDFW would like to note that Lost Lake Park not only is State-owned land, but the lands are under an expired lease with Fresno County. Both these CDFW lands provide habitat for several State and federally listed special-status species.

Comment 5-33

In addition to consultation with CDFW regional staff, CDFW recommends consultation with CDFW's Regional Ecological Reserve Management Unit staff well in advance of Project initiation to demonstrate accurate delineation of property boundaries to prevent inadvertent encroachment on CDFW owned lands. Consultation is also recommended to discuss planned ingress and egress to the Project site for the purposes of avoiding impacts on CDFW-owned lands, which is prohibited by Title 14 California Code of Regulations § 630. Please contact John Battistoni, Regional Ecological Reserve Management Unit Supervisor, at the address on the letterhead above or via email at John.Battistoni@wildlife.ca.gov.

Comment 5-34

Lake and Streambed Alteration: Project activities that substantially change the bed, bank, and channel of any river, stream, or lake are subject to CDFW's regulatory authority pursuant Fish and Game Code section 1600 et seq. Fish and Game Code section 1602 requires an entity to notify CDFW prior to commencing any activity that may (a) substantially divert or obstruct the natural flow of any river, stream, or lake; (b) substantially change or use any material from the bed, bank, or channel of any river, stream, or lake (including the removal of riparian vegetation): (c) deposit debris, waste or other materials that could pass into any river, stream, or lake. "Any river, stream, or lake" includes those that are ephemeral or intermittent as well as those that are perennial and may include those that are highly modified such as canals and retention basins.

Comment 5-35

CDFW is required to comply with CEQA in the issuance of a Lake or Streambed Alteration Agreement (LSAA); therefore, if the CEQA document approved for the Project does not adequately describe the Project and its impacts to lakes or streams, a subsequent CEQA analysis may be necessary for LSAA issuance. For information on notification requirements, please refer to CDFW's website (https://wildlife.ca.gov/Conservation/LSA) or contact CDFW staff in the Central Region Lake and Streambed Alteration Program at (559) 243-4593.

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

Cumulative Impacts: Currently, the DEIR has a very broad analysis of cumulative impacts to biological resources and does not adequately evaluate impacts to specific resources. As such, the conclusions reached in the cumulative impacts analysis are not supported by substantial evidence and the analysis lacks sufficient rigor and transparency to adequately develop reasonable and feasible measures to reduce harm. To address this lack of evidence, CDFW recommends that a cumulative impact analysis be conducted for all biological resources that will either be significantly or potentially significantly impacted by implementation of the Project, including those whose impacts are determined to be less than significant with mitigation incorporated or for those resources that are rare or in poor or declining health and will be impacted by the Project, even if those impacts are relatively small (i.e., less than significant). CDFW recommends cumulative impacts be analyzed for the following species using an acceptable methodology to evaluate the impacts of past, present, and reasonably foreseeable future projects on resources and be focused specifically on the resource, not the Project. An appropriate resource study area should be identified and mapped for each resource being analyzed and utilized for this analysis. CDFW staff is available for consultation in support of cumulative impacts analyses as a trustee and responsible agency under CEQA.

Comment 5-36

Environmental Data

Comment 5-37

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. (Pub. Resources Code, Section 21003, subd. (e).) Accordingly, please report any special-status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNDDB field survey form can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Submitting-Data. The completed form can be mailed electronically to CNDDB at the following email address: CNDDB@wildlife.ca.gov. The types of information reported to CNDDB can be found at the following link: https://www.wildlife.ca.gov/Data/CNDDB/Plants-and-Animals.

Filing Fees

Comment 5-38

The Project, as proposed, would have an impact on fish and/or wildlife, and assessment of filing fees is necessary. Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW. Payment of the fee is required in order for the underlying Project approval to be operative, vested, and final. (Cal. Code Regs, tit. 14, Section 753.5; Fish & G. Code, Section 711.4; Pub. Resources Code, Section 21089.)

Docusign Envelope ID: 6DFE07F6-3BB8-4E82-9B6B-48276BBDAD5A

CONCLUSION

Comment 5-39

CDFW appreciates the opportunity to comment on the DEIR to assist Fresno County in identifying and mitigating Project impacts on biological resources.

More information on survey and monitoring protocols for sensitive species can be found at CDFW's website (https://www.wildlife.ca.gov/Conservation/Survey-Protocols). Please see the enclosed Mitigation Monitoring and Reporting Program (MMRP) table which corresponds with recommended mitigation measures in this comment letter. Questions regarding this letter or further coordination should be directed to Evelyn Barajas-Perez, Environmental Scientist, at (805) 503-5738 or Evelyn.Barajas-Perez@Wildlife.ca.gov.

Sincerely,

Report Suspicious

David,

My name is Leo Labbe and I currently serve as the club secretary, I am also a past President of the local Fly Fishers for Conservation here in Fresno County. We have over 200 active members that support and want to conserve our precious environment.

I was totally unaware of the meeting that occurred in January? Comment 16-1

However, I did receive the draft of the EIR in the mail and I am very concerned that this proposal even exists and would like to ask how was the meeting made public? I was involved in the original proposal. Also what are the next steps and possibly what can we do as an organization to share our thoughts and concerns?

I have attached a list of issues. Can you please respond to the EMAIL to confirm that you have received them. Comment 16-2

I also would appreciate your thoughts on how we should proceed as concerned citizens to this proposal. Comment 16-3

I appreciate your help and I am available to discuss via EMAIL or by phone.

Regards,

Leo Labbe 559 281-2713pap

CEMEX Proposal issues

This is probably one of the most spectacular parcels of land in the area and the public has virtually no access to it and overall, very limited access to the San Joaquin River. There are a few parks that provide limited access for a fee, but in general most of the land is private or used commercially for mining and pilfering of this precious limited resource. This agreement will insure this limitation is extended for the next 100 years. Comment 16-4

The process is being expedited in a period where public input and the opportunity to voice concerns are very difficult. I have to ask the obvious question which is, why rush the approval process for an agreement that will last 100 years. What is the hurry? A public meeting was held June 24th and comments accepted through July 6th. Only 8 business days for a commitment that will last for 100 years. Let's slow down and give the people of Fresno County the opportunity to learn about this project and the potential impact that it will have on our Great-Grandchildren who are yet to be born! Comment 16-5

During the last decade, the CDFW has successfully begun the process of re-introducing Salmon into the San Joaquin River. The impact on this restoration will be significant and could prove to be detrimental to its success! Comment 16-6

A 100year agreement is unthinkable and will continue to limit its use for many generations to come. Comment 16-7

As a society, we have the responsibility to end this tragic use of the land for the profit of a foreign LLC. Return the land to the public and don't add to the pollution of our precious water, air, noise and traffic! There are many other places where gravel can be mined. Why select this pristine piece of land to be permanently destroyed and potentially impact the lives and living conditions of the citizens of Fresno County and add contamination to the already unhealthy environment that already exists in Fresno. Comment 16-8

This land could be used for many other purposes that would be much more profitable for the county. Not only by generating more tax revenue, but also potentially adding legitimate business revenue for much more appropriate use on this special property, such as increasing tourist, recreational and business revenue to the County. Comment 16-9

Cemex LLC is part of a Mexican corporation and, by design, they have Limited Liability and if something does happens, then no one will be held responsible! The current agreement has provisions that state that the land will be returned to natural conditions after the 100 year period. If the current agreement ends in 2023, Cemex will move out of the area and leave us with the mess that they have already created. Comment 16-10

They have an existing agreement that is not measured for performance. Input from the ZOOM meeting was that they continually violated the current work time schedule and had many environmental violations that were not addressed. Comment 16-11

Truck Traffic increasing to over 1000 per day! A 10 hour day means 100 trucks per hour. Friant Road was not expanded to 4 lanes exclusively for CEMEX truck flow? Who will pay for additional wear and tear of the highways? Comment 16-12

What will be the impact on wildlife that habitats in the area? Please review the Fresno Bee video that shows the deplorable conditions of their current site. Comment(s) 16-13 / 16-14

Here is the link:

https://www.fresnobee.com/article243753187.html

Now, imagine tripling that area. What kind of mess are we allowing them to create? Wildlife does not and will not exists in these conditions. There is no landscaping or trees of any kind. All we have are dusty roads with lots of equipment adding to our pollution problem.

Comment(s) 16-15 / 16-16

Fracking and blasting a 600ft mine will have a tremendous impact on the San Joaquin River that will be within 200 feet from the area. Water will be used to clean the aggregate and accidental discharge could occur polluting the river. Seepage from the river and the surrounding aquifer will devastate the river and surrounding wells. If we have another emergency release of Lake Millerton like we did in 1996; the pollution and debris from this mining operation will impact all the surroundings on its way to the ocean! All hopes of re-introducing Salmon to the river will be impacted by the blasting near their spawning waters.

Comment(s) 16-17 / 16-18 16-19 / 16-20

In closing, this land offers much more potential than an ugly private mine for a foreign LLC for the next 100 years. It could become an amazing public land to be enjoyed by the people of Fresno County. However, if this project is approved, the river will become an eyesore and an environmental hazard for the area that is already plagued by those many issues.

Comment 16-21

What are the benefits to the county and community? We all have a responsibility to be good Sheppard's of the land. This project does not come close to meeting this responsibility. If this passes, historians will look back and wonder what the county officials were thinking?

I look forward to hearing from you regarding this critical timely issue.

Please feel free to contact me if you would like clarity or more information.

Thanks for listening,

Leo Labbe

RE: Support CEMEX's Modification Plan for the Rockfield Quarry

Dear Mr. Chairman and Planning Commissioners,

On behalf of Floyd Johnston Construction Co., Inc, I am writing in support of Cemex's Rockfield Quarry Modification Project. Comment 17-1

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor. Thank you for recognizing the benefits of having a quarry located in your community.

Sincerely,

Daniel Frank

Subject: Opposition to the CEMEX Rockfield Quarry EIR 7763 Proposal and the Future of the San Joaquin River

Dear David Randall,

As a member of Fresno Fly Fishers for Conservation and a concerned resident of Fresno County, I am writing to express my deep opposition to the CEMEX proposal that would extend commercial mining operations on the banks of the San Joaquin River for the next 100 years. Comment 20-1

This area is one of the most spectacular parcels of land in the region, yet public access remains extremely limited. Instead of prioritizing conservation and community use, this agreement would extend private and commercial restrictions, preventing generations of Fresno County residents from enjoying this vital natural resource. Comment 20-2

I am particularly concerned about the expedited approval process for this 100-year commitment. The brief public comment period, which ends on March 10th is far too little time for Fresno County residents to learn about the project's consequences. A project of this magnitude demands thorough consideration, not a rushed decision that will impact future generations. Comment 20-3

The environmental consequences of this project cannot be ignored. The California Department of Fish and Wildlife (CDFW) has made significant strides in reintroducing salmon to the San Joaquin River, yet this mining operation could jeopardize these efforts. The increased truck traffic, potential river pollution, and habitat destruction would be devastating for local wildlife. Fracking and blasting a 600-foot mine so close to the river could lead to accidental discharges, seepage, and contamination of the surrounding water table endangering both aquatic ecosystems and local wells. Comment(s) 20-4 20-5 20-6

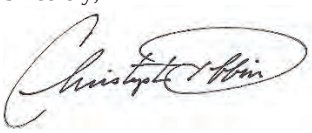
Beyond the environmental harm, this project poses economic concerns. CEMEX, a foreign-owned LLC, is granted limited liability by design, meaning if damages occur, there may be little accountability. Moreover, the current agreement lacks measurable performance oversight, and reports indicate repeated violations of work schedules and environmental standards. The increased truck traffic alone—up to 1,000 trucks per day will degrade our roads and impact local residents, with little assurance that CEMEX will be held responsible for the consequences. Comment(s) 20-7, 20-8 20-9 20-10

Fresno County deserves better. Rather than approving a destructive mining operation, this land should be preserved and made accessible to the public. A park or conservation area would not only protect the environment but could also generate long-term revenue through recreation, tourism, and sustainable business opportunities. A private mine will only benefit a foreign corporation, while our community bears the long-term costs. Comment 20-11

I urge you to reconsider this agreement and advocate for a better future for Fresno County. Our community has the right to more input and a greater say in how this land is used. Please extend the public comment period and conduct a thorough review of the environmental and economic impacts before making a decision that will affect our region for the next century. Comment 20-12

Thank you for your time and consideration. I look forward to your response on this critical issue.

Sincerely,



Fresno Fly Fishers for Conservation

RE: Support CEMEX's Modification Plan for the Rockfield Quarry

Dear Mr. Randall,

Comment 21-1

On behalf of Clean Cut Landscape Inc., I am writing in support of Cemex's Rockfield Quarry Modification Project. We have been consistently using CEMEX for years on projects in the public works sector in the Fresno area.

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Dear Mr Randall,

Please find the attached letter regarding the Cemex - Rockfield Aggregates plant modifications.

Comment 23-1

I've been fortunate enough to have worked with this facility on many projects over the last 35 years. The information provided in this letter is an honest and fair outline of what companies like Cemex bring to a community.

I would ask that the Fresno County staff delivers an approval for Cemex's plans. This company produces a valuable resource and contributes to the growth of the community as well as solid, well paying jobs for the people in your region.

Kindest Regards,

Mike Branco

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region.

Transporting aggregate from distant sources results in increased construction costs, fuel consumption, greenhouse gas emissions, and would contribute to existing traffic congestion. According to the Department of Conservation, transportation costs alone can increase 22 cents per ton for every additional mile traveled. Consequently, these higher construction costs are passed on to businesses, homeowners and county taxpayers.

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Importantly, Cemex's proposed modification plan also includes considerable resources for wildlife and habitat protection, 470 acres of open space with riparian areas, ponds, lakes, and native vegetation, and an easement for the Parkway Plan to expand the existing pedestrian and bicycle trail along the San Joaquin River that will benefit the local community.

Cemex has developed a constructive and thoughtful plan that serves the region's building, water, environmental and recreational needs, while remaining committed to being a good corporate citizen and responsible neighbor.

Thank you for recognizing the benefits of having a quarry located in your community.

Sincerely,

Mike Higgins

RE: Support Cemex's Modification Plan for the Rockfield Quarry

Dear Mr. Randall,

On behalf of General Teamsters Union Local No. 431, I am writing in support of Cemex's Rockfield Quarry Modification Project.

Cemex's Rockfield Quarry has been providing the Fresno Region with a reliable source of construction aggregate for the past 100 years. Having a local and affordable source of construction aggregate is an important consideration for businesses when they choose to expand or locate to Fresno County or when public agencies invest taxpayer dollars in public infrastructure. The demand for new construction in the Fresno region is projected to grow, requiring over 6 million tons of construction aggregate per year for the next 50 years. This demand should be supplied locally, as opposed to being trucked and shipped in from outside the region. Cemex directly supports over 90 people in the Fresno region, providing high quality, high paying jobs, many of them union jobs, as a source of economic security for their families.

Comment 26-1

Cemex has been a steadfast and reliable supplier of building materials needed to grow the region's economy and the county's investments in public infrastructure. Aggregates from their Rockfield Quarry have been used in the businesses, homes, roads and schools found in most of our neighborhoods.

Again, on behalf of our members and the communities who depend on a local source of construction aggregate to build homes, businesses and public sector infrastructure, we urge the Fresno County Planning Commission to approve the modification plan without delay.

Thank you for recognizing the benefits of having a quarry located in your community.

Sincerely,

Steve Sharp, President
