Purpose: ☐Pollutant control only ☐Hydromodification control only ☒Combined pollutant control and hydromodification control ☐Pre-treatment/forebay for another structural BMP ☒Other (describe in discussion section below) The structural BMP provided are underground concrete storage vaults with an open bottom in combination with a proprietary bio-filtration device. Together these provide the retention and water quality treatment required for the site.	
Who will certify construction of this BMP? Provide name and contact information for the party responsible to sign BMP verification forms if required by the [City Engineer] (See Section 1.12 of the manual)	REC Consultants, Inc. 2442 2nd Ave. San Diego, CA 92101 (619) 232-9200
Who will be the final owner of this BMP?	Carmax 12800 Tuckahoe Creek Pkwy. Richmond, VA 23238

Who will maintain this BMP into perpetuity?	Carmax 12800 Tuckahoe Creek Pkwy. Richmond, VA 23238
What is the funding mechanism for maintenance?	Carmax 12800 Tuckahoe Creek Pkwy. Richmond, VA 23238

Form I-6 Page 4 of 4 (Copy as many needed)

Structural BMP Summary Information

(Copy this page as needed to provide information for each individual proposed structural BMP)

Discussion (as needed):

The structural BMP provided are underground concrete storage vaults (58 Old Castle Stormcapture tanks size 7x15x4) with an open bottom in combination with a proprietary bio-filtration device (Two (2) Modular Wetlands, model MWS-L-8-16). Together these provide the retention and water quality treatment required for the site.

	City of Oceanside 300 N Coast Highway Oceanside, CA 92054	**Permanent BMP Construction** **Self Certification Form**	February 2016

Date Prepared: 11/04/2019	Project No.: D19-00021; CUP19-00029
Project Applicant: Centerpoint Integrated Solutions	Phone: (303) 679-6975
Project Address: SWC Plaza Drive & Thunder Drive	
Project Engineer: REC Consultants, Inc.	Phone: (619) 232-9200

The purpose of this form is to verify that the site improvements for the project, identified above, have been constructed in conformance with the approved Storm Water Quality Management Plan (SWQMP) documents and drawings.

This form must be completed by the engineer and installing contractor and submitted prior to final inspection of the construction permit. Completion and submittal of this form is required for all new development and redevelopment projects in order to comply with the City's Storm Water ordinances and NDPES Permit Order No. R9-2013-0001. Final inspection for occupancy and/or release of grading or public improvement bonds may be delayed if this form is not submitted and approved by the City of Oceanside.

ENGINEER'S CERTIFICATION:

As the professional in responsible charge for the design of the above project, I certify that I have inspected all constructed Low Impact Development (LID) site design, source control and treatment control BMP's required per the approved SWQMP and Construction Permit No. Click here to enter text.; and that said BMP's have been constructed in compliance with the approved plans and all applicable specifications, permits, ordinances and Order No. R9-2013-0001 of the San Diego Regional Water Quality Control Board.

I understand that this BMP certification statement does not constitute an operation and maintenance verification.

ATTACHMENT 1

BACKUP FOR PDP POLLUTANT CONTROL BMPS

This is the cover sheet for Attachment 1.

Indicate which Items are Included:

Attachment Sequence	Contents	Checklist
Attachment 1a	DMA Exhibit (Required) See DMA Exhibit Checklist.	☒Included
Attachment 1b	Tabular Summary of DMAs Showing DMA ID matching DMA Exhibit, DMA Area, and DMA Type (Required)* *Provide table in this Attachment OR on DMA Exhibit in Attachment 1a	☒Included on DMA Exhibit in Attachment 1a ☐Included as Attachment 1b, separate from DMA Exhibit
Attachment 1c	Design Capture Volume Worksheet	☒Included
Attachment 1d	Form I-7, Harvest and Use Feasibility Screening Checklist (Required unless the entire project will use infiltration BMPs) Refer to Appendix B.3-1 of the BMP Design Manual to complete Form I-7.	☒Included ☐Not included because the entire project will use infiltration BMPs
Attachment 1e	Form I-8, Categorization of Infiltration Feasibility Condition (Required unless the project will use harvest and use BMPs) Refer to Appendices C and D of the BMP Design Manual to complete Form I-8.	☒Included ☐Not included because the entire project will use harvest and use BMPs
Attachment 1f	Pollutant Control BMP Design Worksheets / Calculations (Required) Refer to Appendices B and E of the BMP Design Manual for structural pollutant control BMP design guidelines	☒Included

Use this checklist to ensure the required information has been included on the DMA Exhibit:

The DMA Exhibit must identify:

☒Underlying hydrologic soil group
☒Approximate depth to groundwater
☒Existing natural hydrologic features (watercourses, seeps, springs, wetlands)
☒Critical coarse sediment yield areas to be protected
☒Existing topography and impervious areas
☒Existing and proposed site drainage network and connections to drainage offsite
☒Proposed grading
☒Proposed impervious features
☒Proposed design features and surface treatments used to minimize imperviousness
☒Drainage management area (DMA) boundaries, DMA ID numbers, and DMA areas (square footage or acreage), and DMA type (i.e., drains to BMP, self-retaining, or self-mitigating)
☒Potential pollutant source areas and corresponding required source controls (see Chapter 4, Appendix E.1, and Form I-3B)
☒Structural BMPs (identify location, type of BMP, and size/detail)

SOURCE CONTROL

BMP ID #	BMP TYPE	SYMBOL	CASQA NO.	QUANTITY	INSPECTION FREQUENCY	MAINTENANCE FREQUENCY	MAINTENANCE ACTIVITY
(1)	TRASH ENCLOSURE		SD-32	2	MONTHLY	AS NEEDED	INSPECT REGULARLY. CLEAR TRASH & DEBRIS. REPLACE LEAKING BINS. CLEAN STORAGE AREAS REGULARLY. POST SIGNS INFORMING TO NOT DISPOSE OF LIQUIDS & TO KEEP BIN LIDS CLOSED.
(2)	STENCILS	NO DUMPING	SD-13, SC-2	1 EA	MONTHLY	AS NEEDED	INSPECT AND MAINTAIN/REPLACE AS NEEDED.

BMP ID #	BMP TYPE	INSPECTION FREQUENCY	FREQUENCY MAINTENANCE	MAINTENANCE ACTIVITY
SC-1	PREVENTION OF ILLICIT DISCHARGES INTO MS4	CONTINUOUS	-	A GREASE TRAP HAS BEEN INCOPORATED INTO UTILITY PLAN AND DUMPING OF GREASE DOWN THE STROM DRAIN IS PROHIBITED OTHER GOOD HOUSEKEEPING PRACTICES WILL BE IMPLEMENTED TO DISCOURAGE DISCHARGES OF NON-STORM WATER POLLUTANTS, INCLUDING COLLECTION/RECYCLING USED COOKING OIL, CLEAN UP FOOD AND GREASE WITH ABDORBENTS/DISCARD IN TRASH AND ROUTINE MAINTANACE OF GREASE TRAP.
SC-2	STORM DRAIN STENCILING OR SIGNAGE	CONTINUOUS	REGULARLY	LABELING SHALL BE PROVIDED FOR ALL STORM WATER CONVEYANCE SYSTEM INLETS AND CATCH BASINS WITHIN THE PROJECT AREA. STORM DRAIN PLACARDS SHALL BE USED FOR SIGANGE (STENCILING IS PROHIBITED BY CITY OF OCEANSIDE). INSPECT AND MAINTAIN PLACARDS AS NEEDED.
SC-5	PROTECT TRASH STORAGE AREAS FROM RAINFALL, RUN-ON, RUNOFF, AND WIND DISPERSAL	REGULARLY	REGULARLY	ENSURE TRASH ENCLOSURE AREAS ARE FULLY CONTAINED (THREE WALLS, DOOR, ROOF). PROVIDE ATTACHED LIDS ON ALL TRASH CONTAINERS. KEEP CONTAINERS AWAY FROM STORM DRAIN VICINITY. POST SIGNS ON ALL ENCLOSURES AND/OR DUMPSTERS INFORMING USERS TO KEEP LID CLOSED AND NOT TO DISPOSE OF LIQUIDS OR HAZARDOUS MATERIALS. INSPECT TRASH STORAGE AREAS TO ENSURE INTEGRITY OF CONTAINERS AND THAT AREA IS KEPT CLEAN. REPLACE LEAKING BINS. CLEAN TRASH STORAGE AREAS REGULARLY
SC-6 A THROUGH H	ADDITIONAL BMPS BASED ON POTENTIAL SOURCES OF RUNOFF POLLUTANTS	REGULARLY OR AS DETERMINED NECESSARY	REGULARLY OR AS DETERMINED NECESSARY	SC-A ON-SITE STORM DRAIN INLETS: ON-SITE INLETS SHALL BE PROTECTED FROM ANY ILLICIT DISCHARGES AND DEBRIS. INLETS SHALL HAVE PROHIBITIVE SIGNS. MARK ALL INLETS WITH THE WORDS "NO DUMPING! DISCHARGES TO BAY" OR SIMILAR. INLET MARKINGS SHALL BE MAINTAINED AND PERIODICALLY REPAINTED. MAINTAIN ON A REGULAR BASIS TO REMOVE POLLUTANTS. ENSURE PROPER HYDRAULIC FUNCTION TO PREVENT FLOODING. CLEAN INLETS REGULARLY AND REMOVE SEDIMENTS AND DEBRIS, ESPECIALLY BEFORE START AND END OF WET SEASON. STORE WASTES COLLECTED FROM CLEANING ACTIVITIES OF DRAINAGE SYSTEM IN APPROPRIATE CONTAINERS OF TEMPORARY STORAGE SITES IN A MANNER THAT PREVENTS DISCHARGE TO THE STORM DRAIN. KEEP A RECORD OF CLEANING AND DISPOSAL ACTIVITIES. SC-C INTERIOR PARKING GARAGES: INTERIOR PARKING GARAGE WILL HAVE AN INTERIOR DRAIN THAT IS CONNECTED TO THE STORM DRAIN SYSTEM TO REMOVE NUISANCE WATER. SC-D1 NEED FOR FUTURE INDOOR & STRUCTURAL PEST CONTROL: FUTURE INDOOR & STRUCTURAL PEST CONTROL: BUILDING INCLUDES DOORS AND WINDOWS WITH SEALING THAT DISCOURAGES ENTRY OF PESTS. ANY PESTICIDES SHALL BE APPLIED MINIMALLY IN ACCORDANCE WITH MANUFACTURER'S SPECIFICATIONS AND CITY/STATE REQUIREMENTS SC-D2 LANDSCAPE/OUTDOOR PESTICIDE USE (SC-41): FINAL LANDSCAPE PLANS WILL PRESERVE EXISTING DROUGHT TOLERANT TREES, SHRUBS, AND GROUND COVER TO THE MAXIMUM EXTENT POSSIBLE, AND INCLUDE LANDSCAPING TO MINIMIZE IRRIGATION AND RUNOFF, TO PROMOTE SURFACE INFILTRATION WHERE APPROPRIATE, AND TO MINIMIZE THE USE OF FERTILIZERS AND PESTICIDES THAT CAN CONTRIBUTE TO STORM WATER POLLUTION. THE LANDSCAPED AREAS THAT WILL BE USED TO DETAIN STORMWATER, WILL HAVE PLANTS TOLERANT OF PERIODIC SATURATED SOIL CONDITIONS. FINAL LANDSCAPE PLANS HAVE BEEN DESIGNED TO ENSURE SUCCESSFUL ESTABLISHMENT, INCLUDING SELECTION OF PLANTS APPROPRIATE TO SITE SOILS, SLOPES, CLIMATE, SUN, WIND, RAIN, LAND USE, AIR MOVEMENT, ECOLOGICAL CONSISTENCY, AND PLANT INTERACTIONS. SC-N FIRE SPRINKLER TEST WATER: FIRE SPRINKLER TEST WATER SHALL BE DRAINED TO SANITARY SEWER SYSTEM. DURING A FIRE SPRINKLER TEST, THE FIRE RISER DISCHARGE SHALL BE CONNECTED BY A HOSE TO THE SEWER CLEANOUT. SC-O MISCELLANEOUS DRAIN OR WASHWATER: BOILER DRAINS SHALL BE DIRECTLY OR INDIRECTLY CONNECTED TO THE SANITARY SEWER SYSTEM AND MAY NOT DISCHARGE TO THE STORM DRAIN. ROOFTOP MOUNTED EQUIPMENT WITH POTENTIAL TO PRODUCE POLLUTANTS SHALL BE ROOFED AND/OR HAVE SECONDARY CONTAINMENT. ANY DRAINAGE SUMPS ONSITE SHALL FEATURE A SEDIMENT SUMP TO REDUCE THE QUANTITY OF SEDIMENT PUMPED WATER. COPPER BASED ROOFING, GUTTERS AND TRIM MATERIALS SHOULD BE AVOIDED. SC-P PLAZAS, SIDEWALKS, AND PARKING LOTS: SWEEP REGULARLY TO PREVENT ACCUMULATION OF LITTER AND DEBRIS, DEBRIS FROM PRESSURE WASHING MUST BE COLLECTED TO PREVENT ENTRY INTO STORM DRAIN SYSTEM. WASHWATER CONTAINING ANY CLEANING AGENT OR DEGREASER MUST BE COLLECTED AND DISCHARGED TO THE SANITARY SEWER AND NOT DISCHARGED TO A STORM DRAIN. CLEAN ALL PAVEMENT AT LEAST ONCE A YEAR.

Placeholder – **Tabular Summary of DMAs (if separate from DMA Exhibit)**

Leave placeholder intact if not applicable.

☒Not Applicable – Tabular Summary included on DMA Exhibit

DMA-3A Design Capture Volume		Worksheet B-2.1		
1	85th percentile 24-hr storm depth from Figure B.1-1	d=	0.62	inches
2	Area tributary to BMP (s)	A=	5.9	acres
3	Area weighted runoff factor (estimate using Appendix B.1.1 and B.2.1)(1)	C=	0.78	Unitless(1)
4	Street trees volume reduction	TCV=	0	cubic-feet
5	Rain barrels volume reduction	RCV=	0	cubic-feet
6	Calculate DCV = (3630 x C x d x A) – TCV - RCV	DCV=	10,357	cubic-feet

(1): Soil type D

Impervious area = 218,927 SF (5.026 acres) at C = 0.9

Pervious area = 37,896 SF (0.869 acres) at C = 0.1.

Weighted C: (5.026 x 0.9 + 0.869 x 0.1)/(5.026+0.869) = 0.78

Harvest and Use Feasibility Checklist	Form I-7

1. Is there a demand for harvested water (check all that apply) at the project site that is reliably present during the wet season?

■ Toilet and urinal flushing
■ Landscape irrigation
☐ Other:_____

2. If there is a demand; estimate the anticipated average wet season demand over a period of 36 hours. Guidance for planning level demand calculations for toilet/urinal flushing and landscape irrigation is provided in Section B.3.2.

Modified ETWU= $ET_{OWet} \times [[\Sigma(PF \times HA)/IE] + SLA] \times 0.015$

Modified ETWU= $2.8 \times [(0.3 \times 300{,}560)/0.90] \times 0.015$

Modified ETWU= 4,208

3. Calculate the DCV using worksheet B-2.1.

DCV = 10,560 (cubic feet)

3a. Is the 36 hour demand greater than or equal to the DCV?	3b. Is the 36 hour demand greater than 0.25DCV but less than the full DCV?	3c. Is the 36 hour demand less than 0.25DCV?
☐ Yes / ☒ No ⇨ ⇩	☐ Yes / ☒ No ⇨ ⇩	☒ Yes ⇩
Harvest and use appears to be feasible. Conduct more detailed evaluation and sizing calculations to confirm that DCV can be used at an adequate rate to meet drawdown criteria.	Harvest and use may be feasible. Conduct more detailed evaluation and sizing calculations to determine feasibility. Harvest and use may only be able to be used for a portion of the site, or (optionally) the storage may need to be upsized to meet long term capture targets while draining in longer than 36 hours.	Harvest and use is considered to be infeasible.

Is harvest and use feasible based on further evaluation?

☐ Yes, refer to Appendix E to select and size harvest and use BMPs.

☒ No, select alternate BMPs.

Categorization of Infiltration Feasibility Condition	Form I-8

Part 1 - Full Infiltration Feasibility Screening Criteria

Would infiltration of the full design volume be feasible from a physical perspective without any undesirable consequences that cannot be reasonably mitigated?

Criteria	Screening Question	Yes	No
1	**Is the estimated reliable infiltration rate below proposed facility locations greater than 0.5 inches per hour?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2 and Appendix D.	☐	☒

Provide basis:

Per EEI Engineering Solutions Preliminary Percolation Evaluation dated October 25, 2019 a maximum design infiltration rate of 0.265 in/hr is to be used. This design infiltration rate is calculated using the average of borings P-4 and P-5 divided by a factor of safety of 2.

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.

2	**Can infiltration greater than 0.5 inches per hour be allowed without increasing risk of geotechnical hazards (slope stability, groundwater mounding, utilities, or other factors) that cannot be mitigated to an acceptable level?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2.	☐	☒

Provide basis:

Per EEI Engineering Solutions Preliminary Percolation Evaluation dated October 25, 2019 a maximum design infiltration rate of 0.265 in/hr is to be used. This design infiltration rate is calculated using the average of borings P-4 and P-5 divided by a factor of safety of 2.

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.

Form I-8 Page 2 of 4			
Criteria	Screening Question	**Yes**	**No**
3	**Can infiltration greater than 0.5 inches per hour be allowed without increasing risk of groundwater contamination (shallow water table, storm water pollutants or other factors) that cannot be mitigated to an acceptable level?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	☐	☒
Provide basis: Per EEI Engineering Solutions Preliminary Percolation Evaluation dated October 25, 2019 a maximum design infiltration rate of 0.265 in/hr is to be used. This design infiltration rate is calculated using the average of borings P-4 and P-5 divided by a factor of safety of 2. Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
4	**Can infiltration greater than 0.5 inches per hour be allowed without causing potential water balance issues such as change of seasonality of ephemeral streams or increased discharge of contaminated groundwater to surface waters?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	☐	☒
Provide basis: Per EEI Engineering Solutions Preliminary Percolation Evaluation dated October 25, 2019 a maximum design infiltration rate of 0.265 in/hr is to be used. This design infiltration rate is calculated using the average of borings P-4 and P-5 divided by a factor of safety of 2. Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability.			
Part 1 Result *	If all answers to rows 1 - 4 are "**Yes**" a full infiltration design is potentially feasible. The feasibility screening category is **Full Infiltration** If any answer from row 1-4 is "**No**", infiltration may be possible to some extent but would not generally be feasible or desirable to achieve a "full infiltration" design. Proceed to Part 2	☐Full Infiltration ☒No	

*To be completed using gathered site information and best professional judgment considering the definition of MEP in the MS4 Permit. Additional testing and/or studies may be required by Agency/Jurisdictions to substantiate findings

Form I-8 Page 3 of 4

Part 2 – Partial Infiltration vs. No Infiltration Feasibility Screening Criteria

Would infiltration of water in any appreciable amount be physically feasible without any negative consequences that cannot be reasonably mitigated?

Criteria	Screening Question	Yes	No
5	**Do soil and geologic conditions allow for infiltration in any appreciable rate or volume?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2 and Appendix D.	☒	☐

Provide basis:

Per EEI Engineering Solutions Preliminary Percolation Evaluation dated October 25, 2019 partial infiltration is allowable.

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.

6	**Can Infiltration in any appreciable quantity be allowed without increasing risk of geotechnical hazards (slope stability, groundwater mounding, utilities, or other factors) that cannot be mitigated to an acceptable level**? The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.2.	☒	☐

Provide basis:

Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.

Form I-8 Page 4 of 4			
Criteria	Screening Question	**Yes**	**No**
7	**Can Infiltration in any appreciable quantity be allowed without posing significant risk for groundwater related concerns (shallow water table, storm water pollutants or other factors)?** The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	☒	☐
Provide basis: Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.			
8	**Can infiltration be allowed without violating downstream water rights**? The response to this Screening Question shall be based on a comprehensive evaluation of the factors presented in Appendix C.3.	☒	☐
Provide basis: Summarize findings of studies; provide reference to studies, calculations, maps, data sources, etc. Provide narrative discussion of study/data source applicability and why it was not feasible to mitigate low infiltration rates.			
Part 2 Result*	If all answers from row 1-4 are yes then partial infiltration design is potentially feasible. The feasibility screening category is **Partial Infiltration.** If any answer from row 5-8 is no, then infiltration of any volume is considered to be **infeasible** within the drainage area. The feasibility screening category is **No Infiltration.**	☒Partial Infiltration ☐No Infiltration	

*To be completed using gathered site information and best professional judgment considering the definition of MEP in the MS4 Permit. Additional testing and/or studies may be required by Agency/Jurisdictions to substantiate findings

Worksheet B.6-1: Flow-Thru Design Flows

Remove worksheet from SWQMP if not applicable.

Flow-thru Design Flows		Worksheet B.6-1		
1	DCV	DCV	10,357	cubic-feet
2	DCV retained	$DCV_{retained}$	1,450	cubic-feet
3	DCV biofiltered	$DCV_{biofiltered}$	0	cubic-feet
4	DCV requiring flow-thru (Line 1 – Line 2 – 0.67*Line 3)	$DCV_{flow-thru}$	8,907	cubic-feet
5	Adjustment factor (Line 4 / Line 1)*	AF=	0.86	unitless
6	Design rainfall intensity	i=	0.20	in/hr
7	Area tributary to BMP (s)	A=	5.89	acres
8	Area-weighted runoff factor (estimate using Appendix B.2)	C=	0.78	unitless
9	Calculate Flow Rate = AF x (C x i x A)	Q=	0.790	cfs

1) Adjustment factor shall be estimated considering only retention and biofiltration BMPs located upstream of flow-thru BMPs. That is, if the flow-thru BMP is upstream of the project's retention and biofiltration BMPs then the flow-thru BMP shall be sized using an adjustment factor of 1.
2) Volume based (e.g., dry extended detention basin) flow-thru treatment control BMPs shall be sized to the volume in Line 4 and flow based (e.g., vegetated swales) shall be sized to flow rate in Line 9. Sand filter and media filter can be designed either by volume in Line 4 or flow rate in Line 9.
3) Proprietary BMPs, if used, shall provide certified treatment capacity equal to or greater than the calculated flow rate in Line 9; certified treatment capacity per unit shall be consistent with third party certifications.
4)

NOTE:

$DVC_{PROJECT}$ = 10,357 CFS

$DCV_{RETAINED}$(IN UNDERGROUND STORAGE TANKS)=(0.14)(10,357 CFS) = 1,450 CF

$DCV_{REMAINING}$(TO BE TREATED) = 10,357 CFS – 1,450 CFS = 8,907 CFS

2 Modular Wetlands, model MWS-L-8-16 will be used to treat the flow as their total capacity according to the specifications attached to this SWQMP is larger than required (0.462 x 2 = 0.924 cfs > 0.790 cfs).

SPECIFICATIONS

FLOW-BASED DESIGNS

The Modular Wetlands® System Linear can be used in stand-alone applications to meet treatment flow requirements. Since the Modular Wetlands® is the only biofiltration system that can accept inflow pipes several feet below the surface, it can be used not only in decentralized design applications but also as a large central end-of-the-line application for maximum feasibility.

MODEL #	DIMENSIONS	WETLANDMEDIA SURFACE AREA (sq. ft.)	TREATMENT FLOW RATE (cfs)
MWS-L-4-4	4′ x 4′	23	0.052
MWS-L-4-6	4′ x 6′	32	0.073
MWS-L-4-8	4′ x 8′	50	0.115
MWS-L-4-13	4′ x 13′	63	0.144
MWS-L-4-15	4′ x 15′	76	0.175
MWS-L-4-17	4′ x 17′	90	0.206
MWS-L-4-19	4′ x 19′	103	0.237
MWS-L-4-21	4′ x 21′	117	0.268
MWS-L-6-8	7′ x 9′	64	0.147
MWS-L-8-8	8′ x 8′	100	0.230
MWS-L-8-12	8′ x 12′	151	0.346
MWS-L-8-16	8′ x 16′	201	0.462
MWS-L-8-20	9′ x 21′	252	0.577
MWS-L-8-24	9′ x 25′	302	0.693
MWS-L-10-20	10' x 20'	302	0.693

Automated Worksheet B.1: Calculation of Design Capture Volume (V2.0)

Category	#	Description	*i*	*ii*	*iii*	*iv*	Units
Standard Drainage Basin Inputs	1	Drainage Basin ID or Name	DMA 1-TW (WQ & HMP)	DMA 1--TW (WQ only, EX. A)	DMA 2-TW (WQ & HMP)	DMA 2--TW (WQ only, EX. A)	unitless
	2	85th Percentile 24-hr Storm Depth	1.97	0.62	1.97	0.62	inches
	3	Impervious Surfaces Not Directed to Dispersion Area (C=0.90)	7,262	9,667	7,817	9,460	sq-ft
	4	Semi-Pervious Surfaces Not Serving as Dispersion Area (C=0.30)					sq-ft
	5	Engineered Pervious Surfaces Not Serving as Dispersion Area (C=0.10)					sq-ft
	6	Natural Type A Soil Not Serving as Dispersion Area (C=0.10)					sq-ft
	7	Natural Type B Soil Not Serving as Dispersion Area (C=0.14)					sq-ft
	8	Natural Type C Soil Not Serving as Dispersion Area (C=0.23)					sq-ft
	9	Natural Type D Soil Not Serving as Dispersion Area (C=0.30)	1,300		1,700		sq-ft
Dispersion Area, Tree Well & Rain Barrel Inputs (Optional)	10	Does Tributary Incorporate Dispersion, Tree Wells, and/or Rain Barrels?	Yes	Yes	Yes	Yes	yes/no
	11	Impervious Surfaces **Directed to Dispersion Area** per SD-B (Ci=0.90)					sq-ft
	12	Semi-Pervious Surfaces **Serving as Dispersion Area** per SD-B (Ci=0.30)					sq-ft
	13	Engineered Pervious Surfaces **Serving as Dispersion Area** per SD-B (Ci=0.10)					sq-ft
	14	Natural Type A Soil **Serving as Dispersion Area** per SD-B (Ci=0.10)					sq-ft
	15	Natural Type B Soil **Serving as Dispersion Area** per SD-B (Ci=0.14)					sq-ft
	16	Natural Type C Soil **Serving as Dispersion Area** per SD-B (Ci=0.23)					sq-ft
	17	Natural Type D Soil **Serving as Dispersion Area** per SD-B (Ci=0.30)					sq-ft
	18	Number of Tree Wells Proposed per SD-A	3	1	3	1	#
	19	Average Mature Tree Canopy Diameter	30	30	30	30	ft
	20	Number of Rain Barrels Proposed per SD-E					#
	21	Average Rain Barrel Size					gal
Initial Runoff Factor Calculation	22	Total Tributary Area	8,562	9,667	9,517	9,460	sq-ft
	23	Initial Runoff Factor for Standard Drainage Areas	0.81	0.90	0.79	0.90	unitless
	24	Initial Runoff Factor for Dispersed & Dispersion Areas	0.00	0.00	0.00	0.00	unitless
	25	Initial Weighted Runoff Factor	0.81	0.90	0.79	0.90	unitless
	26	Initial Design Capture Volume	1,136	450	1,231	440	cubic-feet
Dispersion Area Adjustments	27	Total Impervious Area Dispersed to Pervious Surface	0	0	0	0	sq-ft
	28	Total Pervious Dispersion Area	0	0	0	0	sq-ft
	29	Ratio of Dispersed Impervious Area to Pervious Dispersion Area	n/a	n/a	n/a	n/a	ratio
	30	Adjustment Factor for Dispersed & Dispersion Areas	1.00	1.00	1.00	1.00	ratio
	31	Runoff Factor After Dispersion Techniques	0.81	0.90	0.79	0.90	unitless

ATTACHMENT 2
BACKUP FOR PDP HYDROMODIFICATION CONTROL MEASURES

This is the cover sheet for Attachment 2.

☐Mark this box if this attachment is empty because the project is exempt from PDP hydromodification management requirements.

Indicate which Items are Included:

Attachment Sequence	Contents	Checklist
Attachment 2a	1. Hydromodification Management Exhibit (Required)	☒Included See Hydromodification Management Exhibit Checklist.
Attachment 2b	Management of Critical Coarse Sediment Yield Areas (WMAA Exhibit is required, additional analyses are optional) See Section 6.2 of the BMP Design Manual.	☒Exhibit showing project drainage boundaries marked on WMAA Critical Coarse Sediment Yield Area Map (Required) Optional analyses for Critical Coarse Sediment Yield Area Determination ☐6.2.1 Verification of Geomorphic Landscape Units Onsite ☐6.2.2 Downstream Systems Sensitivity to Coarse Sediment ☐6.2.3 Optional Additional Analysis of Potential Critical Coarse Sediment Yield Areas Onsite
Attachment 2c	Geomorphic Assessment of Receiving Channels (Optional) See Section 6.3.4 of the BMP Design Manual.	☒Not performed ☐Included ☐Submitted as separate stand-alone document
Attachment 2d	Flow Control Facility Design and Structural BMP Drawdown Calculations (Required) Overflow Design Summary for each structural BMP See Chapter 6 and Appendix G of the BMP Design Manual	☐Included ☒Submitted as separate stand-alone document
Attachment 2e	Vector Control Plan (Required when structural BMPs will not drain in 96 hours)	☐Included ☒Not required because BMPs will drain in less than 96 hours

Use this checklist to ensure the required information has been included on the Hydromodification Management Exhibit:

The Hydromodification Management Exhibit must identify:

☒Underlying hydrologic soil group
☒Approximate depth to groundwater
☒Existing natural hydrologic features (watercourses, seeps, springs, wetlands)
☒Critical coarse sediment yield areas to be protected
☒Existing topography
☒Existing and proposed site drainage network and connections to drainage offsite
☒Proposed grading
☒Proposed impervious features
☒Proposed design features and surface treatments used to minimize imperviousness
☒Point(s) of Compliance (POC) for Hydromodification Management
☒Existing and proposed drainage boundary and drainage area to each POC (when necessary, create separate exhibits for pre-development and post-project conditions)
☒Structural BMPs for hydromodification management (identify location, type of BMP, and size/detail)

Please provide the Exhibit in 24”x36” format with map pocket, wet date, and stamp.

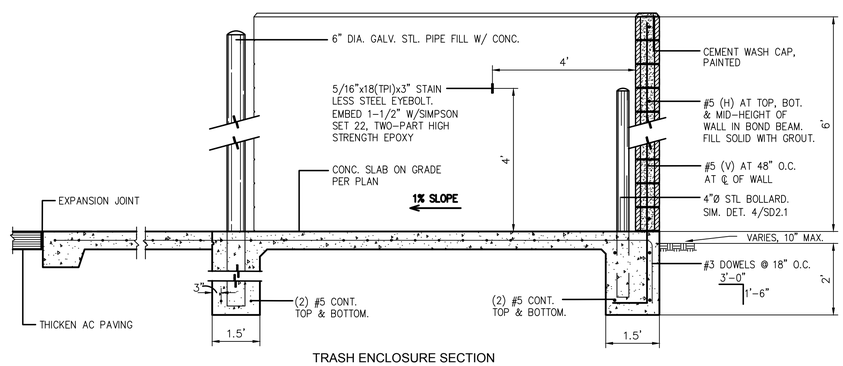
3. THE TRASH ENCLOSURE PAD SHALL BE SEALED WITH A "NON-PIGMENTED" CLEAR CONCRETE SEALER.



TRASH ENCLOSURE SECTION

SOURCE CONTROL

BMP ID #	BMP TYPE	SYMBOL	CASQA NO.	QUANTITY	INSPECTION FREQUENCY	MAINTENANCE FREQUENCY	MAINTENANCE ACTIVITY
(1)	TRASH ENCLOSURE		SD-32	2	MONTHLY	AS NEEDED	INSPECT REGULARLY. CLEAR TRASH & DEBRIS. REPLACE LEAKING BINS. CLEAN STORAGE AREAS REGULARLY. POST SIGNS INFORMING TO NOT DISPOSE OF LIQUIDS & TO KEEP BIN LIDS CLOSED.
(2)	STENCILS	NO DUMPING	SD-13, SC-2	1 EA	MONTHLY	AS NEEDED	INSPECT AND MAINTAIN/REPLACE AS NEEDED.

BMP ID #	BMP TYPE	INSPECTION FREQUENCY	FREQUENCY MAINTENANCE	MAINTENANCE ACTIVITY
SC-1	PREVENTION OF ILLICIT DISCHARGES INTO MS4	CONTINUOUS	-	A GREASE TRAP HAS BEEN INCOPORATED INTO UTILITY PLAN AND DUMPING OF GREASE DOWN THE STROM DRAIN IS PROHIBITED OTHER GOOD HOUSEKEEPING PRACTICES WILL BE IMPLEMENTED TO DISCOURAGE DISCHARGES OF NON-STORM WATER POLLUTANTS, INCLUDING COLLECTION/RECYCLING USED COOKING OIL, CLEAN UP FOOD AND GREASE WITH ABDORBENTS/DISCARD IN TRASH AND ROUTINE MAINTANACE OF GREASE TRAP.
SC-2	STORM DRAIN STENCILING OR SIGNAGE	CONTINUOUS	REGULARLY	LABELING SHALL BE PROVIDED FOR ALL STORM WATER CONVEYANCE SYSTEM INLETS AND CATCH BASINS WITHIN THE PROJECT AREA. STORM DRAIN PLACARDS SHALL BE USED FOR SIGANGE (STENCILING IS PROHIBITED BY CITY OF OCEANSIDE). INSPECT AND MAINTAIN PLACARDS AS NEEDED.
SC-5	PROTECT TRASH STORAGE AREAS FROM RAINFALL, RUN-ON, RUNOFF, AND WIND DISPERSAL	REGULARLY	REGULARLY	ENSURE TRASH ENCLOSURE AREAS ARE FULLY CONTAINED (THREE WALLS, DOOR, ROOF). PROVIDE ATTACHED LIDS ON ALL TRASH CONTAINERS. KEEP CONTAINERS AWAY FROM STORM DRAIN VICINITY. POST SIGNS ON ALL ENCLOSURES AND/OR DUMPSTERS INFORMING USERS TO KEEP LID CLOSED AND NOT TO DISPOSE OF LIQUIDS OR HAZARDOUS MATERIALS. INSPECT TRASH STORAGE AREAS TO ENSURE INTEGRITY OF CONTAINERS AND THAT AREA IS KEPT CLEAN. REPLACE LEAKING BINS. CLEAN TRASH STORAGE AREAS REGULARLY
SC-6 A THROUGH H	ADDITIONAL BMPS BASED ON POTENTIAL SOURCES OF RUNOFF POLLUTANTS	REGULARLY OR AS DETERMINED NECESSARY	REGULARLY OR AS DETERMINED NECESSARY	SC-A ON-SITE STORM DRAIN INLETS: ON-SITE INLETS SHALL BE PROTECTED FROM ANY ILLICIT DISCHARGES AND DEBRIS. INLETS SHALL HAVE PROHIBITIVE SIGNS. MARK ALL INLETS WITH THE WORDS "NO DUMPING! DISCHARGES TO BAY" OR SIMILAR. INLET MARKINGS SHALL BE MAINTAINED AND PERIODICALLY REPAINTED. MAINTAIN ON A REGULAR BASIS TO REMOVE POLLUTANTS. ENSURE PROPER HYDRAULIC FUNCTION TO PREVENT FLOODING. CLEAN INLETS REGULARLY AND REMOVE SEDIMENTS AND DEBRIS, ESPECIALLY BEFORE START AND END OF WET SEASON. STORE WASTES COLLECTED FROM CLEANING ACTIVITIES OF DRAINAGE SYSTEM IN APPROPRIATE CONTAINERS OF TEMPORARY STORAGE SITES IN A MANNER THAT PREVENTS DISCHARGE TO THE STORM DRAIN. KEEP A RECORD OF CLEANING AND DISPOSAL ACTIVITIES. SC-C INTERIOR PARKING GARAGES: INTERIOR PARKING GARAGE WILL HAVE AN INTERIOR DRAIN THAT IS CONNECTED TO THE STORM DRAIN SYSTEM TO REMOVE NUISANCE WATER. SC-D1 NEED FOR FUTURE INDOOR & STRUCTURAL PEST CONTROL: FUTURE INDOOR & STRUCTURAL PEST CONTROL: BUILDING INCLUDES DOORS AND WINDOWS WITH SEALING THAT DISCOURAGES ENTRY OF PESTS. ANY PESTICIDES SHALL BE APPLIED MINIMALLY IN ACCORDANCE WITH MANUFACTURER'S SPECIFICATIONS AND CITY/STATE REQUIREMENTS SC-D2 LANDSCAPE/OUTDOOR PESTICIDE USE (SC-41): FINAL LANDSCAPE PLANS WILL PRESERVE EXISTING DROUGHT TOLERANT TREES, SHRUBS, AND GROUND COVER TO THE MAXIMUM EXTENT POSSIBLE, AND INCLUDE LANDSCAPING TO MINIMIZE IRRIGATION AND RUNOFF, TO PROMOTE SURFACE INFILTRATION WHERE APPROPRIATE, AND TO MINIMIZE THE USE OF FERTILIZERS AND PESTICIDES THAT CAN CONTRIBUTE TO STORM WATER POLLUTION. THE LANDSCAPED AREAS THAT WILL BE USED TO DETAIN STORMWATER, WILL HAVE PLANTS TOLERANT OF PERIODIC SATURATED SOIL CONDITIONS. FINAL LANDSCAPE PLANS HAVE BEEN DESIGNED TO ENSURE SUCCESSFUL ESTABLISHMENT, INCLUDING SELECTION OF PLANTS APPROPRIATE TO SITE SOILS, SLOPES, CLIMATE, SUN, WIND, RAIN, LAND USE, AIR MOVEMENT, ECOLOGICAL CONSISTENCY, AND PLANT INTERACTIONS. SC-N FIRE SPRINKLER TEST WATER: FIRE SPRINKLER TEST WATER SHALL BE DRAINED TO SANITARY SEWER SYSTEM. DURING A FIRE SPRINKLER TEST, THE FIRE RISER DISCHARGE SHALL BE CONNECTED BY A HOSE TO THE SEWER CLEANOUT. SC-O MISCELLANEOUS DRAIN OR WASHWATER: BOILER DRAINS SHALL BE DIRECTLY OR INDIRECTLY CONNECTED TO THE SANITARY SEWER SYSTEM AND MAY NOT DISCHARGE TO THE STORM DRAIN. ROOFTOP MOUNTED EQUIPMENT WITH POTENTIAL TO PRODUCE POLLUTANTS SHALL BE ROOFED AND/OR HAVE SECONDARY CONTAINMENT. ANY DRAINAGE SUMPS ONSITE SHALL FEATURE A SEDIMENT SUMP TO REDUCE THE QUANTITY OF SEDIMENT PUMPED WATER. COPPER BASED ROOFING, GUTTERS AND TRIM MATERIALS SHOULD BE AVOIDED. SC-P PLAZAS, SIDEWALKS, AND PARKING LOTS: SWEEP REGULARLY TO PREVENT ACCUMULATION OF LITTER AND DEBRIS, DEBRIS FROM PRESSURE WASHING MUST BE COLLECTED TO PREVENT ENTRY INTO STORM DRAIN SYSTEM. WASHWATER CONTAINING ANY CLEANING AGENT OR DEGREASER MUST BE COLLECTED AND DISCHARGED TO THE SANITARY SEWER AND NOT DISCHARGED TO A STORM DRAIN. CLEAN ALL PAVEMENT AT LEAST ONCE A YEAR.

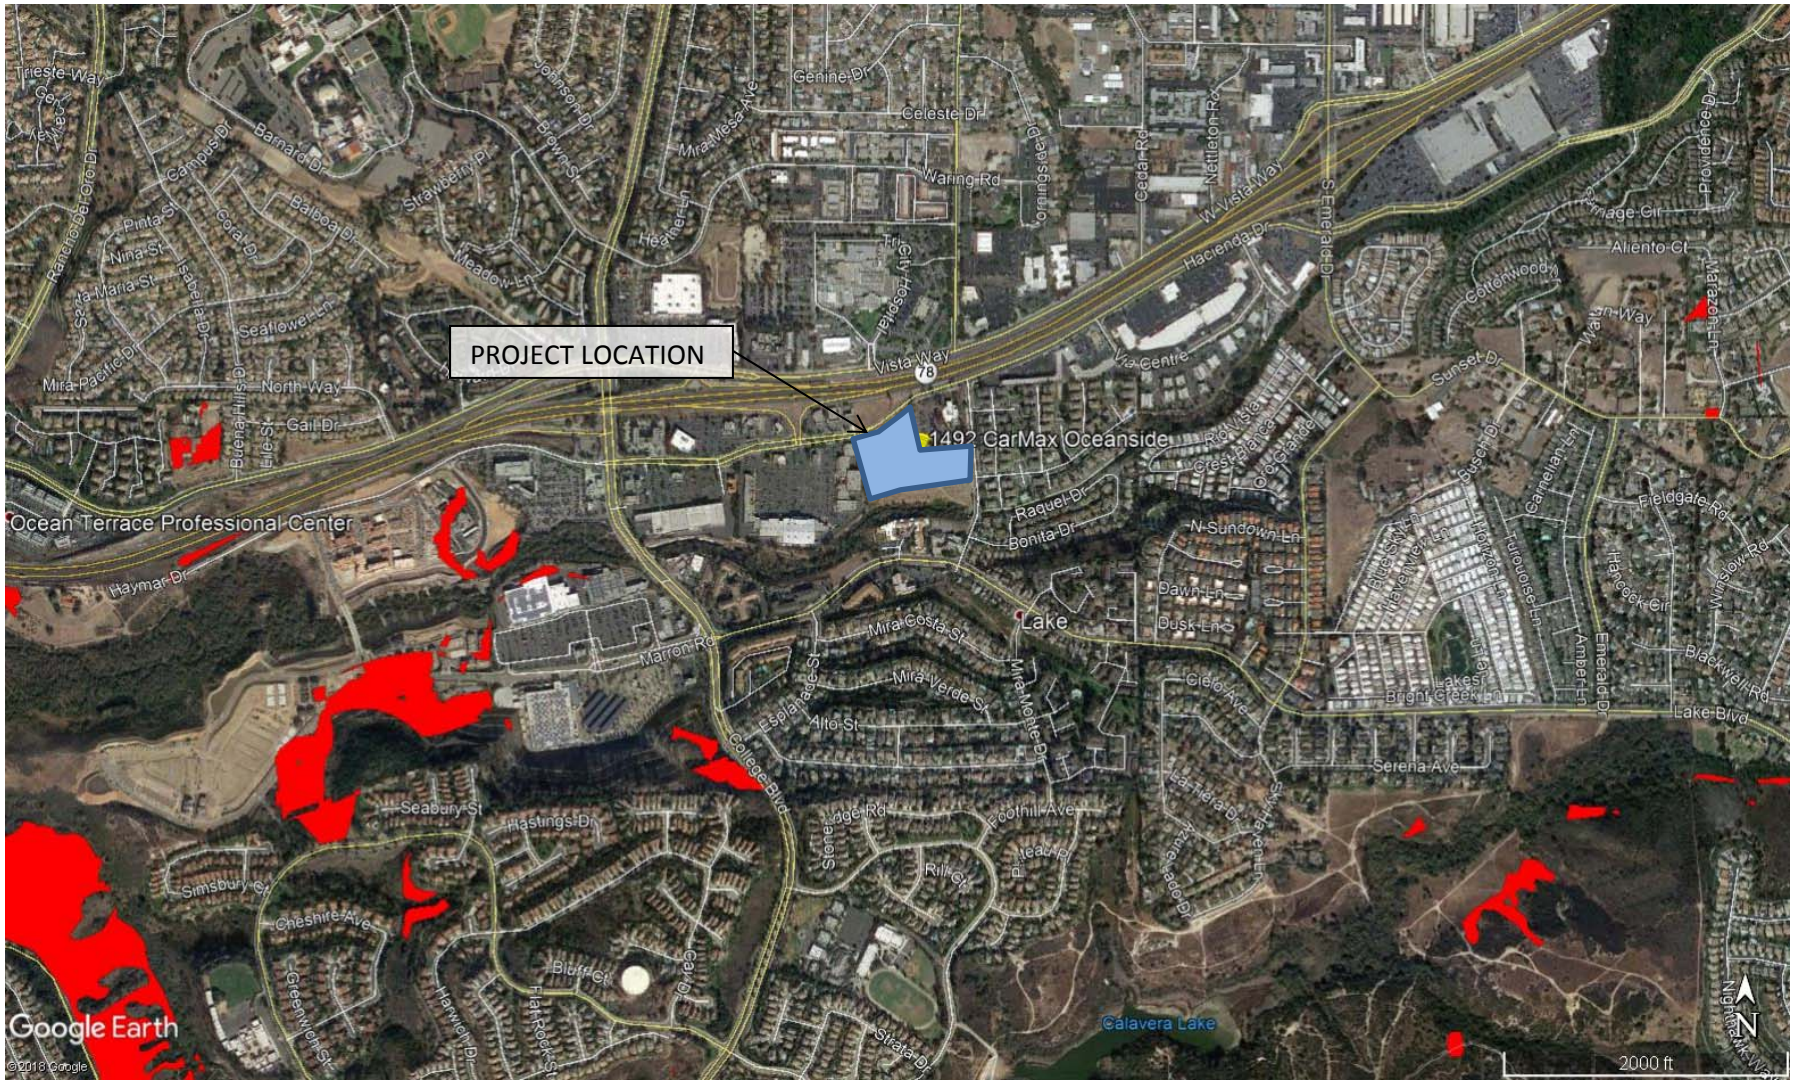
CCSYA – CARMAX OCEANSIDE



Downstream Systems Sensitivity to Course Sediment		Form I-10	
When it has been determined that potential critical coarse sediment yield areas exist within the project site, the next step is to determine whether downstream systems would be sensitive to reduction of coarse sediment yield from the project site. Use this form to document the evaluation of downstream systems requirements for preservation of coarse sediment supply.			
Project Name: Carmax Oceanside			
Project Tracking Number / Permit Application Number: D19-00021; CUP19-00029			
1	Will the project discharge runoff to a hardened MS4 system (pipe or lined channel) or an un-lined channel?	☐ Hardened MS4 system	Go to 2
		X Un-lined channel	Go to 4
2	Will the hardened MS4 system convey sediment (e.g., a concrete-lined channel with steep slope and cleansing velocity) or sink sediment (e.g., flat slopes, constrictions, treatment BMPs, or ponds with restricted outlets within the system will trap sediment and not allow conveyance of coarse sediment from the project site to an un-lined system).	☐ Convey	Go to 3
		☐ Sink	Go to 7
3	What kind of receiving water will the hardened MS4 system convey the sediment to?	☐ Un-lined channel	Go to 4
		☐ Lake ☐ Reservoir ☐ Bay	Go to 7
		☐ Lagoon ☐ Ocean	Go to 6
4	Is the un-lined channel impacted by deposition of sediment? This condition must be documented by the local agency.	☐ Yes	Go to 7
		X No	Go to 5

Form I-10 Page 2 of 2	
5	End – Preserve coarse sediment supply to protect un-lined channels from accelerated erosion due to reduction of coarse sediment yield from the project site unless further investigation determines the sediment is not critical to the receiving stream. Sediment that is critical to receiving streams is the sediment that is a significant source of bed material to the receiving stream (bed sediment supply) (see Section 6.2.3 and Appendix H.2 of the manual).
6	End – Provide management measures for preservation of coarse sediment supply (protect beach sand supply).
7	End – Downstream system does not warrant preservation of coarse sediment supply, no measures for protection of critical coarse sediment yield areas onsite are necessary. Use the space below to describe the basis for this finding for the project.

ATTACHMENT 3
STRUCTURAL BMP MAINTENANCE INFORMATION

This is the cover sheet for Attachment 3.

Indicate which Items are Included:

Attachment Sequence	Contents	Checklist
Attachment 3a	Structural BMP Maintenance Thresholds and Actions (Required)	☒Included See Structural BMP Maintenance Information Checklist.
Attachment 3b	Draft Maintenance Agreement (when applicable)	☒Included ☐Not Applicable

Use this checklist to ensure the required information has been included in the Structural BMP Maintenance Information Attachment:

Preliminary Design / Planning / CEQA level submittal:

- Attachment 3a must identify:

☒Typical maintenance indicators and actions for proposed structural BMP(s) based on Section 7.7 of the BMP Design Manual

- Attachment 3b is not required for preliminary design / planning / CEQA level submittal.

Final Design level submittal:

Attachment 3a must identify:

☒Specific maintenance indicators and actions for proposed structural BMP(s). This shall be based on Section 7.7 of the BMP Design Manual and enhanced to reflect actual proposed components of the structural BMP(s)
☒How to access the structural BMP(s) to inspect and perform maintenance
☒Features that are provided to facilitate inspection (e.g., observation ports, cleanouts, silt posts, or other features that allow the inspector to view necessary components of the structural BMP and compare to maintenance thresholds)
☒Manufacturer and part number for proprietary parts of structural BMP(s) when applicable
☒Maintenance thresholds specific to the structural BMP(s), with a location-specific frame of reference (e.g., level of accumulated materials that triggers removal of the materials, to be identified based on viewing marks on silt posts or measured with a survey rod with respect to a fixed benchmark within the BMP)
☒Recommended equipment to perform maintenance
☒When applicable, necessary special training or certification requirements for inspection and maintenance personnel such as confined space entry or hazardous waste management
Attachment 3b: For private entity operation and maintenance, Attachment 3b shall include a draft maintenance agreement in the local jurisdiction's standard format (PDP applicant to contact the City Engineer to obtain the current maintenance agreement forms).

I. COMPLIANCE WITH STORMWATER BEST MANAGEMENT PRACTICES MAINTENANCE REQUIREMENTS

All applicants are responsible for ensuring that stormwater best management practices (BMPs) or facilities installed on their property are properly maintained and that they function as designed. Tenants shall be aware of their responsibilities regarding stormwater facility maintenance and need to be familiar with the contents of this Operations and Maintenance Plan (O&M Plan). Applicants have signed and agreed to a Standard Storm Water Facilities Maintenance Agreement with Access Rights and Covenants (SWFMA). All other maintenance agreements between the applicant and their maintenance employees associated with this property shall be included in Attachment 10.

II. DESIGNATION RESPONSIBLE PARTIES

Responsible parties shall be designated and identified in Table 1.

- The Responsible BMP Party is individual, party, or parties that shall have direct responsibility for the maintenance of stormwater controls. This individual shall be the designated contact with City of Oceanside inspectors and should sign self-inspection reports and any correspondence regarding verification of inspections and required maintenance.

- The Duly Authorized Representative is the corporate officer authorized to negotiate and execute any contracts that might be necessary for future changes to operation and maintenance or to implement remedial measures if problems occur.

- The Designated Emergency Respondent is the party responsible for emergencies such as clogged drains, broken irrigation pipes, etc., that would require immediate response should they occur during off-hours.

TABLE 1
OWNERSHIP AND MAINTENANCE

	Name	Address	Phone / Email
Responsible BMP Party (if different than above)	CARMAX		
Employees reporting to Responsible BMP Party			
Duly Authorized Representative			

Designated Emergency Respondent[1]			

[1] The Designated Emergency Respondent's phone number must be a cellular phone that is reachable 24 hours a day.

Updated contact information must be provided to City of Oceanside immediately whenever a property is sold and whenever designated individuals or contractors change.

A. Maintenance Personnel

Maintenance personnel including Responsible BMP Party, Employees Reporting to Responsible BMP Party, and the Designated Emergency Respondent, must be qualified to properly maintain stormwater BMPs (including treatment and flow-control facilities), especially for restoration or rehabilitation work. Inadequately trained personnel can cause additional problems resulting in additional maintenance costs.

B. Organizational Chart

An organization chart showing the relationships of authority and responsibility between the individuals responsible for maintenance is provided in Attachment 1.

C. Training

Periodic training is conducted by the responsible BMP party for all personnel affiliated with the maintenance of stormwater BMPs. New staff and/or contractors training regarding the purpose, mode of operation, and maintenance requirements for the site's storm water facilities will be provided by the site. Necessary ongoing training for staff and/or contractors will also be provided. The site's Staff Training Program is described in Attachment 2.

TABLE 2 **BMP OPERATION AND MAINTENANCE FUNDING**	
Sources of Funding	Funding for BMP maintenance will be by tuition
Budget Category for Expenditures	Ongoing Maintenance
Process for	

establishing Annual O&M Budget	
Process for obtaining unexpected expenditures for major corrective activities	

D. BMP Maintenance Funding

The funding for BMP operation and maintenance shall be described in Table 2; including sources of funds, budget category for expenditures, process for establishing the annual operations and maintenance budget, and process for obtaining authority should unexpected expenditures for major corrective maintenance be required. Any supplemental information, including calculations and documentation shall be included in Attachment 3.

III. LOW IMPACT DEVELOPMENT AND SITE DESIGN BMPS

Low Impact Development (LID) and Site Design BMPs have been incorporated into the project to minimize stormwater impacts. LID BMPs collectively minimize directly connected impervious area and promote infiltration on the project site. Site design BMPs are permanent measures and are similar to LID BMPs.

The LID and Site Design BMPs for the project which require maintenance are identified along with their locations, including Drainage Management Areas (DMAs), in the project SWQMP. A LID Inspection form for the site is provided in Attachment 4. In the event that a project use should change or maintenance considerations may require the site to become amended, Table 22 should be referenced for original site constraints and design guidelines.

IV. SOURCE CONTROL BMPS

Source control BMPs have been selected for the project in order to minimize or prevent pollutant generation. The SWQMP and Table 4 of this O&M identifies the potential pollutant sources and corresponding permanent and operational source controls as well as their locations.

Source control BMPs should be inspected routinely in order to reduce or prevent pollution from accumulating in these areas. Routine inspections of the site's source controls are discussed in the site's maintenance schedule. Source control inspection forms are in Attachment 5.

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☒On-site storm drain inlets	• All inlets shall be marked with City of Oceanside storm drain markers	• Maintain and periodically replace inlet markers, as necessary. • Review stormwater pollution prevention information applicable to the site. • Adhere to applicable operational BMPs in Fact Sheet SC-44, "Drainage System Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com • Do not allow anyone to discharge anything to storm drains or to store or deposit materials so as to create a potential discharge to storm drains.	
☒Interior floor drains and elevator shaft sump pumps	• Interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer.	• Inspect and maintain drains to prevent blockages and overflow. • Regularly clear all associated cleanouts and hand holes.	
☐Interior parking garages	• Parking garage floor drains will be plumbed to the sanitary sewer.	• Inspect and maintain drains to prevent blockages and overflow.	

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☒Landscape/ Outdoor Pesticide Use	• Final site landscape plans shall be placed in Attachment 7 and shall be used to maintain the following: o Preserve existing native trees, shrubs, and ground cover to the maximum extent possible. o Minimize irrigation and runoff, to promote surface infiltration where appropriate, and to minimize the use of fertilizers and pesticides that can contribute to stormwater pollution. o Where landscaped areas are used to retain or detain stormwater, maintain and replace, as necessary, plants that are tolerant of saturated soil conditions. o Consider using pest-resistant plants, especially adjacent to hardscape. o To insure successful establishment, select plants appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency, and plant interactions.	• Maintain landscaping using a minimum amount of or no pesticides (consider the use of organic techniques). • Review and adhere to applicable operational BMPs in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com • Review IMP information and provide to landscape and maintenance personnel.	
☒Use efficient irrigation systems	• Employ rain shutoff devices to prevent irrigation after precipitation. • Design irrigation systems to each landscape area's specific water requirements. • Use flow reducers or shutoff valves triggered by a pressure drop to control water loss in the event of broken sprinkler heads or lines. • Employ other comparable, equally effective, methods to reduce irrigation water runoff.	• Inspect irrigation system for leaks and/or malfunctions. • Inspect that water usage is consistent with vegetation requirements. • Inspect that irrigation shut-off controls operate correctly.	

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☒Need for future indoor & structural pest control	• Note building design features that discourage entry of pests.	• Review Integrated Pest Management information and provide to other maintenance personnel.	
☐Pools, spas, ponds, decorative fountains, and other water features.	• Plumb pools to the sanitary sewer in accordance with local requirements.	• Review and adhere to applicable operational BMPs in Fact Sheet SC-72, "Fountain and Pool Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	
☐Food service	• Describe the location and features of the designated cleaning area. • Describe the items to be cleaned in this facility and how it has been sized to insure that the largest items can be accommodated.		

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☒Refuse areas	• State how site refuse will be handled and provide supporting detail to what is shown on plans. • Prohibitive signs shall be posted on or near dumpsters with the words "Do not dump hazardous materials here" or similar. • Any drains from dumpsters, compactors, and bin areas shall be connected to a grease removal device before discharge to sanitary sewer.	• Provide adequate number of receptacles. • Inspect receptacles regularly; repair or replace leaky receptacles. • Keep receptacles covered at all times. • Prohibit/prevent dumping of liquid or hazardous wastes. • Post and replace, as necessary, "no hazardous materials" signs. • Inspect and pick up litter daily and clean up spills immediately. • Keep spill control materials available on-site. Review Fact Sheet SC-34, "Waste Handling and Disposal" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	
☐Industrial processes.	• Cover or enclose areas that would be the most significant source of pollutants; or, slope the area toward a dead-end sump; or, discharge to the sanitary sewer system in compliance with the applicable municipal waste water district's requirements (include a copy of the waste acceptance letter from the agency accepting the waste in Attachment 10). • Grade or berm area to prevent run-on from surrounding areas. • Installation of storm drains in areas of equipment repair is prohibited. • Implement other features which are comparable or equally effective.	• Review and adhere to Fact Sheet SC-10, "Non- Stormwater Discharges" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☐ Outdoor storage of equipment or materials	• Comply with all requirements of local Hazardous Materials Programs for: o Hazardous Waste Generation o Hazardous Materials Release Response and Inventory o California Accidental Release (CalARP) o Aboveground Storage Tank o Uniform Fire Code Article 80 Section 103(b) & (c) 1991 • Underground Storage Tank • Storage of non-hazardous liquids shall be covered by a roof and/or drain to the sanitary sewer system, and be contained by berms, dikes, liners, or vaults. • Storage of hazardous materials and wastes must be in compliance with the local hazardous materials ordinance and a Hazardous Materials Management Plan for the site.	• Review and adhere to the Fact Sheets SC-31, "Outdoor Liquid Container Storage" and SC- 33, "Outdoor Storage of Raw Materials " in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	
	Include a detailed description of materials to be stored, storage areas, and structural features to prevent pollutants from entering storm drains.		

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☒Vehicle and Equipment Cleaning	• If a car wash area is not provided, describe measures taken to discourage on-site car washing and explain how these will be enforced. • Equip wash area with a clarifier, grease trap or other pretreatment facility, as appropriate and properly connect to the sanitary sewer. • Implement other features which are comparable or equally effective • Commercial/ industrial facilities having vehicle/ equipment cleaning needs shall either provide a covered, bermed area for washing activities or discourage vehicle/equipment washing by removing hose bibs and installing signs prohibiting such uses. • Washing areas for cars, vehicles, and equipment shall be paved, designed to prevent run-on to or runoff from the area, and plumbed to drain to the sanitary sewer. • Commercial car wash facilities shall be designed such that no runoff from the facility is discharged to the storm drain system. Wastewater from the facility shall discharge to the sanitary sewer, or a wastewater reclamation system shall be installed and permitted by proper regulatory authorities (attach permits in Attachment 10, as necessary).	• Follow operational measures to implement the following (if applicable): o Washwater from vehicle and equipment washing operations shall not be discharged to the storm drain system. o Car dealerships and similar may rinse cars with water only. o Review and adhere to Fact Sheet SC-21, “Vehicle and Equipment Cleaning,” in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	.

TABLE 3
SOURCE CONTROL BMPS

Potential Pollutant Sources	Description	Operational BMPs	Location
☒Vehicle/Equipment Repair and Maintenance	• No vehicle repair or maintenance will be done outdoors, or else describe the required features of the outdoor work area. • An industrial waste discharge permit will be obtained. For floor drains connected to the sanitary sewer; design will meet the permitting agency's requirements. • An industrial waste discharge permit will be obtained for tanks, containers or sinks to be used for parts cleaning or rinsing; design will meet the permitting agency's requirements. • Accommodate all vehicle equipment repair and maintenance indoors or designate an outdoor work area and design the area to prevent run-on and runoff of stormwater. • Show secondary containment for exterior work areas where motor oil, brake fluid, gasoline, diesel fuel, radiator fluid, acid-containing batteries or other hazardous materials or hazardous wastes are used or stored. Drains shall not be installed within the secondary containment areas.	• The following restrictions apply to use the site: o No person shall dispose of, nor permit the disposal, directly or indirectly of vehicle fluids, hazardous materials, or rinse water from parts cleaning into storm drains. o No vehicle fluid removal shall be performed outside a building, nor on asphalt or ground surfaces, whether inside or outside a building, except in such a manner as to ensure that any spilled fluid will be in an area of secondary containment. Leaking vehicle fluids shall be contained or drained from the vehicle immediately. o No person shall leave unattended drip parts or other open containers containing vehicle fluid, unless such containers are in use or in an area of secondary containment.	

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☒Fuel Dispensing Areas	• Fueling areas[1] shall have impermeable floors (i.e., portland cement concrete or equivalent smooth impervious surface) that are: o Graded at the minimum slope necessary to prevent ponding o Separated from the rest of the site by a grade break that prevents run-on of stormwater to the maximum extent practicable. • Fueling areas shall be covered by a canopy that extends a minimum of ten feet in each direction from each pump. [Alternative: The fueling area must be covered and the cover's minimum dimensions must be equal to or greater than the area within the grade break or fuel dispensing area[1]. The canopy [or cover] shall not drain onto the fueling area.	• The fueling area is to be dry swept routinely. • Review and adhere to the Business Guide Sheet, "Automotive Service—Service Stations" in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	

[1] The fueling area shall be defined as the area extending a minimum of 6.5 feet from the corner of each fuel dispenser or the length at which the hose and nozzle assembly may be operated plus a minimum of one foot, whichever is greater.

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☐Loading Docks	• Loading dock areas draining directly to the sanitary sewer shall be equipped with a spill control valve or equivalent device, which shall be kept closed during periods of operation. • Provide a roof overhang over the loading area or install door skirts cowling) at each bay that enclose the end of the trailer. • Roof downspouts shall be positioned to direct stormwater away from the loading area. Water from loading dock areas should be drained to the sanitary sewer where feasible.	• Move loaded and unloaded items indoors as soon as possible. • Review and adhere to Fact Sheet SC-30, "Outdoor Loading and Unloading," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	
☒Fire Sprinkler Test Water	• Provide a means to drain fire sprinkler test water to the sanitary sewer.	• Review the note in Fact Sheet SC-41, "Building and Grounds Maintenance," in the CASQA Stormwater Quality Handbooks at www.cabmphandbooks.com	

TABLE 3 SOURCE CONTROL BMPS			
Potential Pollutant Sources	**Description**	**Operational BMPs**	**Location**
☒Miscellaneous Drain or Wash Water • Boiler drain lines Condensate drain lines • Rooftop equipment Drainage sumps • Roofing, gutters, and trim	• Boiler drain lines shall be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system. • Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system. • Rooftop mounted equipment with potential to produce pollutants shall be roofed and/or have secondary containment. • Any drainage sumps on-site shall feature a sediment sump to reduce the quantity of sediment in pumped water. • Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.		
☒Plazas, sidewalks, and parking lots		• Plazas, sidewalks, and parking lots shall be swept regularly to prevent the accumulation of litter and debris. Debris from pressure washing shall be collected to prevent entry into the storm drain system. Washwater containing any cleaning agent or degreaser shall be collected and discharged to the sanitary sewer and not discharged to a storm drain.	

V. DRAINAGE AREAS

Table 5 summarizes the drainage management areas (DMAs) on site.

TABLE 4
DRAINAGE MANAGEMENT AREAS

DMA No.	Designation	Description
DMA-1	DMA-1	DMA-1 is the northerly portion of the site. DMA is landscape area, pervious pavement, a portion of the existing Plaza Drive, and the expansion of Plaza Drive.
DMA-2	DMA-2	DMA-2 is a portion of the existing and expansion of Plaza Drive.
DMA-3	DMA-3	DMA-3 is the majority of the site. DMA-3 is discharged to the underground detention system.
DMA-4	DMA-4	DMA-4 is a small portion of landscaped self-treated area and driveway and sidewalk de-minimus areas.

The site map in Attachment 6 shows the DMAs and their flow patterns. The map indicates, using flow patterns, how the flow from each DMA is routed to the corresponding storm water facility. Impervious and pervious areas are shown on the map.

VI. STORMWATER TREATMENT CONTROL BMPS

Treatment control BMPs treating runoff from DMAs are summarized in Table 5.

TABLE 5
STORMWATER TREATMENT CONTROL BMPS

Treatment Control BMP Type	Description	Size or Treatment Control BMP Capacity	Area Drained or Water Quality Flow
Proprietary Device	BMP-1	0.943 CFS	6.89 acres

The location and type of each of the project's stormwater facilities on site are shown on the site map in Attachment 6.
The as-built drawings[2], manufacturer's data, cut-sheets, manuals, and specific operation and maintenance requirements for each treatment control BMP shall be provided in Attachment 7.

VII. INSPECTING STORMWATER BMPS

The quality of stormwater entering the waters of the U.S. or waters of the state relies heavily on the proper operation and maintenance of permanent BMPs. LID, source control, and treatment control stormwater BMPs must be periodically inspected to ensure that they are functioning as designed. Inspections will determine the appropriate maintenance that is required for the facility.

A. Inspection Procedures

All stormwater treatment BMPs are required to be inspected a minimum of once per year. The Inspection and Maintenance Checklist(s) that is applicable to the site is provided in Attachment 8.

B. Inspection Report

The person(s) conducting the inspection activities (Responsible BMP Party. Employees reporting to Responsible BMP Party, or the Designated Emergency Respondent) shall complete the appropriate inspection checklist for the specific facility. All completed checklists are located in Attachment 8. All facilities are to be inspected on an annual basis at a minimum. A copy of each inspection form shall be kept by the applicant a minimum of 5 years.

Inspection Scoring

For each inspection item, a score is given to identify the urgency for any required maintenance. The scoring is as follows:

0 = No deficiencies identified.

1 = Monitor – Although maintenance may not be required at this time, a potential problem exists that will most likely need to be addressed in the future. This can include items like minor erosion, concrete cracks/spalling, or minor sediment accumulation. This item should be revisited at the next inspection.

[2] As-built drawings must be included after construction is complete.

2 = Routine Maintenance Required – Some inspection items can be addressed through the routine maintenance program. This can include items like vegetation management or debris/trash removal.

3 = Immediate Repair Necessary – This item needs immediate attention because failure is imminent or has already occurred. This could include items such as structural failure of a feature (outlet, weir, manhole, etc.), significant erosion, or significant sediment accumulation. This score should be given to an item that can significantly affect the function of the facility.

N/A = This is checked by an item that may not exist in a facility. Not all facilities have all of the features identified on the form (outlet, weir, manhole, etc.).

Overall Facility Rating

An overall rating is given for each facility inspected. The overall facility rating should correspond with the highest score (0, 1, 2, 3) given to any feature on the inspection form.

C. Verification of Inspection and Checklist Submittal

The Stormwater BMP Inspection and Maintenance Checklist (in Attachment 8) provides a record of inspections and the need for maintenance activities at the facility. Verification of the inspection of the stormwater facilities and the facility inspection checklist(s) shall be available to the City of Oceansideif requested.

VIII. MAINTENANCE SCHEDULE FOR STORMWATER BMPS

A maintenance schedule for the stormwater source control and treatment control BMPs on site is provided in Attachment 9. Attachment 9 includes schedules for routine inspection and maintenance, annual inspection and maintenance, and inspection and maintenance after major storm events.

A service agreement with any contractors hired to perform stormwater treatment control BMP maintenance is also provided in Attachment 10.

IX. MAINTAINING STORMWATER BMPS

Stormwater BMPs must be properly maintained to ensure that they operate correctly and provide the water quality treatment for which they were designed. Routine maintenance performed on a frequently scheduled basis, can help avoid more costly rehabilitative maintenance that results when facilities are not adequately maintained.

A. Maintenance Categories

Stormwater BMP maintenance programs are separated into three broad categories of work: routine, restoration, and rehabilitation. The categories are separated based upon the magnitude and type of the maintenance activities performed. A description of each category follows:

Routine Work

This work includes items such as the removal of debris/material that may be clogging the outlet structure well screens and trash racks. It also includes activities such as road and parking lot sweeping, weed control, mosquito treatment, and algae treatment. These activities normally will be performed numerous times during the year. These items can be completed without any prior correspondence; however, inspection and maintenance forms shall be completed.

Restoration Work

This work consists of a variety of isolated or small-scale maintenance and work needed to address operational problems. Most of this work can be completed by a small crew, with minor tools, and small equipment. These items do not require prior correspondence. However, completed maintenance forms are required.

Rehabilitation Work

This work consists of large-scale maintenance and major improvements needed to address failures within the stormwater BMP. This work requires consultation with the City of Oceanside and may require an engineering design with construction plans to be prepared for review and approval.

B. Maintenance Forms

The Stormwater BMP Inspection and Maintenance Form provides a record of maintenance activities and includes general cost information to assist in budgeting for future maintenance. Maintenance Forms for each facility type are provided in Appendix 3. Maintenance Forms shall be completed by the responsible BMP party. The form shall then be reviewed by the applicant or an authorized agent of the applicant and made available for review upon inspection by the City of Oceanside.

X. PREVENTATIVE MEASURES TO REDUCE MAINTENANCE COSTS

The most effective way to maintain a stormwater quality facility is to prevent pollutants from entering the facility. Common pollutants include sediment, trash

& debris, chemicals, pet wastes, runoff from stored materials, illicit discharges into the storm drainage system and many others. This maintenance program includes measures to address these potential contaminants at the source and save time and money in the long run. The maintenance program will consider the following:

- Educate employees and patrons to be aware of how their actions affect water quality and how they can help reduce maintenance costs.
- Keep properties, streets, gutters, and parking lots free of trash, debris, and lawn clippings.
- Ensure the proper use, storage, and disposal of hazardous wastes and chemicals. Promptly clean up spilled materials and dispose of properly.
- Plan landscape care to minimize and properly use chemicals and pesticides.
- Sweep paved surfaces and put the sweepings back on the lawn.
- Be aware of automobiles leaking fluids. Use absorbents such as cat litter to soak up drippings – dispose of properly.
- Encourage pet owners to clean up pet wastes.
- Re-vegetate disturbed and bare areas to maintain vegetative stabilization.
- Clean any private storm drainage system components, including inlets, storm drains, and outfalls.
- Do not store materials outdoors (including landscaping materials) unless properly protected from runoff.

XI. INSPECTION & MAINTENANCE – ANNUAL REPORTING

The tenant is responsible for providing verification that the stormwater treatment control BMPs have been properly inspected and maintained unless otherwise noted. Verification includes records of inspections and maintenance performed on site. Any maintenance required will be identified and described.
Records should be available at the City of Oceanside's request.

ATTACHMENT 1

ORGANIZATIONAL CHART

This section to be completed for the next submittal.

ATTACHMENT 2

TRAINING PROGRAM

EMPLOYEE TRAINING PROGRAM

Food facilities are a significant source of stormwater pollution. An important way to reduce pollution is by training employees to know the Best Management Practices for the restaurant business. Employee training should include but is not limited to the following:

Pavement and Parking Lot Cleaning

- Sweep or vacuum outside eating areas daily
- Routinely sweep parking lots and unloading areas
- Sweep up leaves on sidewalks, gutter, and streets

Litter Control

- Provide trash cans with lids
- Pick up litter daily
- Post “No littering” signs

Equipment Cleaning

- Wash floor mats, filters, and garbage cans indoors
- Dispose of washwater into sanitary sewer

Grease Handling

- Recycle and store grease in separate containers
- Regularly inspect and clean grease storage area
- Never pour oil, grease, or large quantities of oily liquids such as sauces or salad dressings or waste grease down a sink, floor drain, storm drain, or into a dumpster.
- Install screens and solid traps in sink and floor drains to catch larger solids. Clean these screens and traps frequently.
- Don’t try to “dissolve” grease by adding hot water or emulsifying chemicals – it will only move the grease further down the building‘s sewer line and make it harder to remove later.
- Use tallow bins or sealed containers with tamper-proof lids. Keep the exterior of the container clean. Check for leaks. Ask the recycler for a leak-free tallow bin and replace any leaky grease containers. If grease is stored outside, keep it under a roof, if possible.
- Inspect and clean all waste grease removal devices (grease trap or grease interceptor) often enough to keep them functioning properly and efficiently.

Waste Disposal

- Dispose of liquid waste into sanitary sewer
- Keep dumpster closed and locked
- Contact waste hauler for cleaning or repair

Landscaping and Grounds Maintenance

- Adjust sprinkler to avoid water runoff
- Minimize use of pesticides and fertilizers
- Never dispose of leftover pesticides in the gutter, street, or storm drain. Leftover pesticides must be either used up or disposed of as hazardous waste.
- Do not blow or rake leaves, grass, or garden clippings into the street, gutter, or storm drain.
- If pesticides are used, do not over apply or apply when rain is forecast.
- Do not use copper-based algaecides in pools or fountains. Control algae with chlorine or other alternatives to copper-based products.

Spill Clean-Up

- Use dry methods for spill clean ups
- Keep spill clean-up materials handy
- Report any spill that cannot be contained

Dumpster and Loading Dock Area

- Store and transfer all solid and liquid wastes, such as tallow, in watertight covered containers.
- Keep litter from accumulating around loading docks by providing trash receptacles and encouraging employees to use them.
- Bag and seal food waste before putting it in the dumpster. Do not place uncontained liquids, or leaking containers or garbage bags into a dumpster.
- Keep dumpster lids closed to keep out rainwater and to prevent trash from spilling out If the dumpster regularly overflows, get a bigger one or arrange for more frequent collection.
- If the dumpster is shared with other tenants, speak with the property/lease manager about scheduling more frequent trash pickups or a larger dumpster.
- Don’t hose out dumpsters. Apply absorbent over any fluids spilled in dumpster. Absorbent will usually be knocked out

when the dumpster is emptied.

- Have the dumpster leasing company repair or replace leaky dumpsters and compactors, and have them clean out dirty dumpsters
- Install a spill cleanup kit near the dumpster and loading dock areas.
- Post employee reminder signs such as “Keep lid closed” near tallow bins and dumpsters.
- Keep dumpsters or the dumpster enclosure locked to prevent illegal dumping

TREATMENT CONTROL BMP INSPECTION AND MAINTENANCE CHECKLIST(S)

Constructed Wetlands
INSPECTION AND MAINTENANCE CHECKLIST

Property Address: _____ Property Applicant: _____

Treatment Measure No.: _____ Date of Inspection: _____ Type of Inspection: ☐ Monthly ☐ Pre-Wet Season ☐ After heavy runoff ☐ End of Wet Season

Inspector(s): _____ Overall Facility Score*:_____ ☐ Other:_____

Defect	Conditions When Maintenance Is Needed	Maintenance Score**	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
General				
Trash & Debris	Trash and debris accumulated in basin at a minimum of once prior to October 1st, once around Feb 1st, and once May 15th. Visual evidence of dumping.			Trash and debris cleared from site and disposed of properly.
Poisonous Vegetation and noxious weeds	Poisonous or nuisance vegetation or noxious weeds, e.g., morning glory, English ivy, reed canary grass, Japanese knotweed, purple loosestrife, blackberry, Scotch broom, poison oak, stinging nettles, or devil's club.			Use Integrated Pest Management techniques to control noxious weeds or invasive species.
Contaminants and Pollution	Any evidence of oil, gasoline, contaminants or other pollutants. Note signs of hydrocarbon buildup such as floating oil on water surface.			No contaminants or pollutants present.

Defect	Conditions When Maintenance Is Needed	Maintenance Score**	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
Rodent Holes	If facility acts as a dam or berm, any evidence of rodent holes, or any evidence of water piping through dam or berm via rodent holes.			The design specifications are not compromised by holes. Any rodent control activities are in accordance with applicable laws and do not affect any protected species.
Insects	Insects such as wasps and hornets interfere with maintenance activities. Where permitted by CA DFG, or other agency regulations, stock regularly with mosquito fish (Gambusia spp.) to enhance natural mosquito and midge control. Maintain vegetation to assist Gambusia spp. movements to control mosquitoes, as well as to provide access for vector inspectors. Maintain emergent and perimeter shoreline vegetation as well as site and road access to facilitate vector surveillance and control activities.			Insects do not interfere with maintenance activities. No mosquitoes or other vectors present in unusual abundance.

Constructed Wetlands Basin - Inspection and Maintenance Checklist
Property Address: _____

Date of Inspection:_____
Treatment Measure No.:_____

Defect	Conditions When Maintenance Is Needed	Maintenance Score**	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
Vegetation	Inspect for invasive vegetation, differential settlement, cracking; erosion, leakage, or tree growth on the embankment. Correct observed problems as necessary. Mow side slopes and remove grass clippings every other month or as necessary. Supplement wetland plants if a significant portion have not established (at least 50% of the surface area) on an annual basis. Remove nuisance plant species.			Wetland vegetation should be at proper vigor and density, no nuisance or noxious weeds or invasive species should be visible, and growth should not hinder physical characteristics or requirements of wetland area.
Tree/Brush Growth and Hazard Trees	Growth does not allow maintenance access or interferes with maintenance activity. Vegetation harvesting should occur preferably between June to September (CASCA TC-21) Dead, diseased, or dying trees.			Trees do not hinder maintenance activities. Remove hazard trees as approved by the City. (Use a certified Arborist to determine health of tree or removal requirements).

Defect	Conditions When Maintenance Is Needed	Maintenance Score**	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
Drainage time	Standing water remains in basin more than five days.			Correct any circumstances that restrict the flow of water from the system. Restore drainage to design condition. If the problem cannot be corrected and problems with standing water recur, then mosquitoes should be controlled with larvicides, applied by a licensed pesticide applicator.
Outfall structure	Debris or silt build-up obstructs an outfall structure.			Remove debris and/or silt build-up and dispose of properly.
Side Slopes				
Erosion	Eroded over 2 in. deep where cause of damage is still present or where there is potential for continued erosion. Any erosion on a compacted berm embankment.			Cause of erosion is managed appropriately. Side slopes or berm are restored to design specifications, as needed.
Storage Area				

Constructed Wetlands Basin - Inspection and Maintenance Checklist
Property Address: _____

Date of Inspection:_____
Treatment Measure No.:_____

Defect	Conditions When Maintenance Is Needed	Maintenance Score**	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
Sediment	Monitor for sediment accumulation in the facility and forebay. Remove accumulated sediment in the forebay and regrade about every 5-7 years or when the accumulated sediment volume exceeds 10 percent of the basin volume. Sediment removal may not be required in the main pool area for as long as 20 years.			Sediment cleaned out to designed basin shape and depth; basin reseeded if necessary to control erosion. Sediment disposed of properly.
Liner (If Applicable)	Liner is visible and has more than three 1/4-inch holes in it.			Liner repaired or replaced. Liner is fully covered.
Emergency Overflow/Spillway and Berms				
Settlement	Berm settlement 4 inches lower than the design elevation.			Dike is built back to the design elevation.

Defect	Conditions When Maintenance Is Needed	Maintenance Score**	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
Tree Growth	Tree growth on berms or emergency spillway >4 ft in height or covering more than 10% of spillway.			Trees should be removed. If root system is small (base less than 4 inches) the root system may be left in place. Otherwise the roots should be removed and the berm restored. A civil engineer should be consulted for proper berm/spillway restoration.
Emergency Overflow/ Spillway	Rock is missing and soil is exposed at top of spillway or outside slope.			Rocks and pad depth are restored to design standards.
Debris Barriers (*e.g.*, Trash Racks)				
Trash and Debris	Trash or debris is plugging openings in the barrier.			Trash or debris is removed and disposed of properly.
Damaged/ Missing Bars	Bars are missing, loose, bent out of shape, or deteriorating due to excessive rust.			Bars are repaired or replaced to allow proper functioning of trash rack.
Inlet/Outlet Pipe	Debris barrier is missing or not attached to pipe.			Debris barrier is repaired or replaced to allow proper functioning of trash rack.
Fencing and Gates				
Missing or broken parts	Any defect in or damage to the fence or gate that permits easy entry to a facility.			Fencing and gate are restored to design specifications.

Constructed Wetlands Basin - Inspection and Maintenance Checklist
Property Address: _____

Date of Inspection:_____
Treatment Measure No.:_____

Defect	Conditions When Maintenance Is Needed	Maintenance Score**	Comments (Describe maintenance completed and if any needed maintenance was not conducted, note when it will be done.)	Results Expected When Maintenance Is Performed
Deteriorating Paint or Protective Coating	Part or parts that have a rusting or scaling condition that has affected structural adequacy.			Paint or protective coating is sufficient to protect structural adequacy of fence or gate.
Flow Duration Control Outlet (if included in design to meet Hydromodification Management Standard) [[==refer to any attachments with additional provisions==]]				
Risers, orifices and screens	Any debris or clogging			Restore unobstructed flow through discharge structure; to meet original design; dispose of debris properly.
Miscellaneous				
Miscellaneous	Any condition not covered above that needs attention to restore extended detention basin to design conditions.			Meets the design specifications.

*Overall Facility Score = Worst Score from all Defect Items Noted.
**Scores: 0 = OK, 1 = Monitor, 2 = Routine Maintenance, 3 = Immediate Repair Necessary

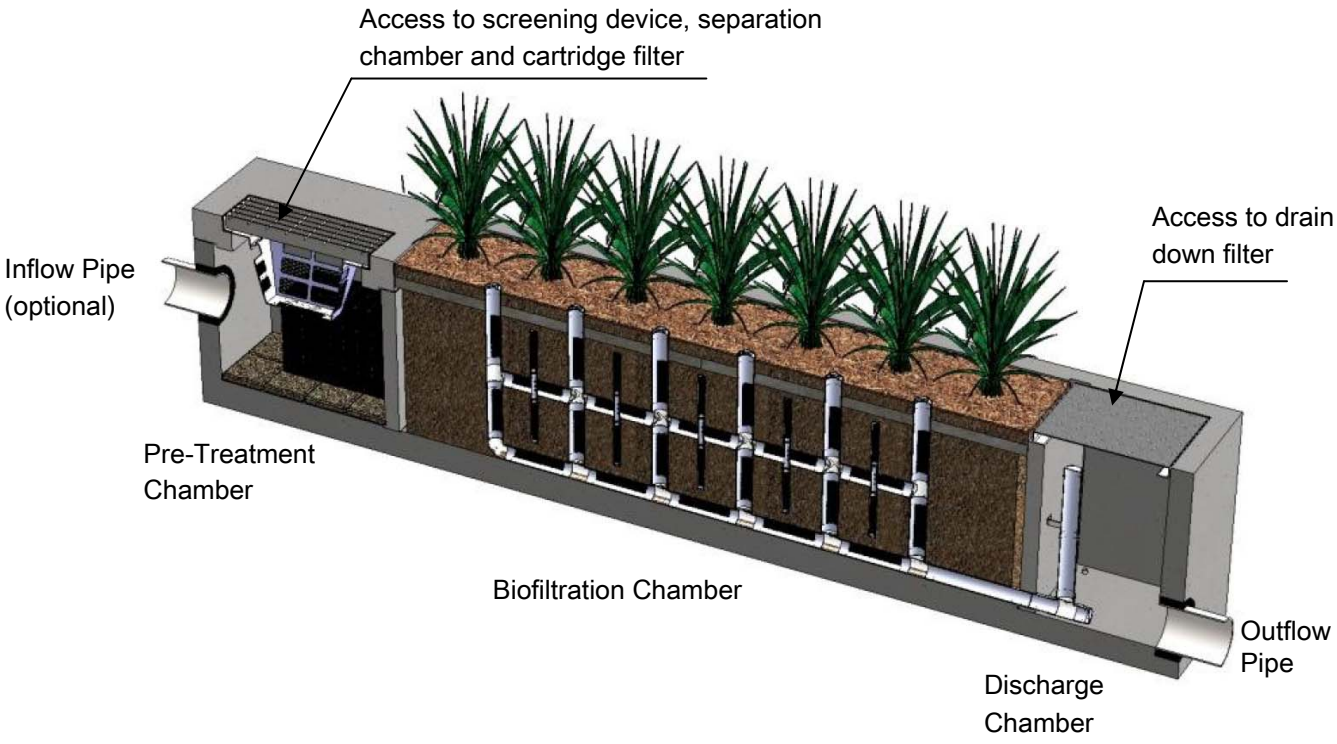
Maintenance Guidelines for Modular Wetland System - Linear

Maintenance Summary

- Remove Trash from Screening Device – average maintenance interval is 6 to 12 months.
  - (*5 minute average service time*).
- Remove Sediment from Separation Chamber – average maintenance interval is 12 to 24 months.
  - (*10 minute average service time*).
- Replace Cartridge Filter Media – average maintenance interval 12 to 24 months.
  - (*10-15 minute per cartridge average service time*).
- Replace Drain Down Filter Media – average maintenance interval is 12 to 24 months.
  - (*5 minute average service time*).
- Trim Vegetation – average maintenance interval is 6 to 12 months.
  - (*Service time varies*).

System Diagram



Maintenance Procedures

Screening Device

1. Remove grate or manhole cover to gain access to the screening device in the Pre-Treatment Chamber. Vault type units do not have screening device. Maintenance can be performed without entry.
2. Remove all pollutants collected by the screening device. Removal can be done manually or with the use of a vacuum truck. The hose of the vacuum truck will not damage the screening device.
3. Screening device can easily be removed from the Pre-Treatment Chamber to gain access to separation chamber and media filters below. Replace grate or manhole cover when completed.

Separation Chamber

1. Perform maintenance procedures of screening device listed above before maintaining the separation chamber.
2. With a pressure washer spray down pollutants accumulated on walls and cartridge filters.
3. Vacuum out Separation Chamber and remove all accumulated pollutants. Replace screening device, grate or manhole cover when completed.

Cartridge Filters

1. Perform maintenance procedures on screening device and separation chamber before maintaining cartridge filters.
2. Enter separation chamber.
3. Unscrew the two bolts holding the lid on each cartridge filter and remove lid.
4. Remove each of 4 to 8 media cages holding the media in place.
5. Spray down the cartridge filter to remove any accumulated pollutants.
6. Vacuum out old media and accumulated pollutants.
7. Reinstall media cages and fill with new media from manufacturer or outside supplier. Manufacturer will provide specification of media and sources to purchase.
8. Replace the lid and tighten down bolts. Replace screening device, grate or manhole cover when completed.

Drain Down Filter

1. Remove hatch or manhole cover over discharge chamber and enter chamber.
2. Unlock and lift drain down filter housing and remove old media block. Replace with new media block. Lower drain down filter housing and lock into place.
3. Exit chamber and replace hatch or manhole cover.

Maintenance Notes

1. Following maintenance and/or inspection, it is recommended the maintenance operator prepare a maintenance/inspection record. The record should include any maintenance activities performed, amount and description of debris collected, and condition of the system and its various filter mechanisms.

2. The owner should keep maintenance/inspection record(s) for a minimum of five years from the date of maintenance. These records should be made available to the governing municipality for inspection upon request at any time.

3. Transport all debris, trash, organics and sediments to approved facility for disposal in accordance with local and state requirements.

4. Entry into chambers may require confined space training based on state and local regulations.

5. No fertilizer shall be used in the Biofiltration Chamber.

6. Irrigation should be provided as recommended by manufacturer and/or landscape architect. Amount of irrigation required is dependent on plant species. Some plants may require irrigation.

Maintenance Procedure Illustration

Screening Device

The screening device is located directly under the manhole or grate over the Pre-Treatment Chamber. It's mounted directly underneath for easy access and cleaning. Device can be cleaned by hand or with a vacuum truck.

Separation Chamber

The separation chamber is located directly beneath the screening device. It can be quickly cleaned using a vacuum truck or by hand. A pressure washer is useful to assist in the cleaning process.

Cartridge Filters

The cartridge filters are located in the Pre-Treatment chamber connected to the wall adjacent to the biofiltration chamber. The cartridges have removable tops to access the individual media filters. Once the cartridge is open media can be easily removed and replaced by hand or a vacuum truck.

Drain Down Filter

The drain down filter is located in the Discharge Chamber. The drain filter unlocks from the wall mount and hinges up. Remove filter block and replace with new block.

Trim Vegetation

Vegetation should be maintained in the same manner as surrounding vegetation and trimmed as needed. No fertilizer shall be used on the plants. Irrigation per the recommendation of the manufacturer and or landscape architect. Different types of vegetation requires different amounts of irrigation.

Inspection Checklist

Modular Wetland System Type (Curb, Grate or UG Vault): _____ Size (22', 14' or etc.): _____

Structural Integrity:	**Yes**	**No**	**Comments**
Damage to pre-treatment access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Damage to discharge chamber access cover (manhole cover/grate) or cannot be opened using normal lifting pressure?			
Does the MWS unit show signs of structural deterioration (cracks in the wall, damage to frame)?			
Is the inlet/outlet pipe or drain down pipe damaged or otherwise not functioning properly?			
Working Condition:			
Is there evidence of illicit discharge or excessive oil, grease, or other automobile fluids entering and clogging the unit?			
Is there standing water in inappropriate areas after a dry period?			
Is the filter insert (if applicable) at capacity and/or is there an accumulation of debris/trash on the shelf system?			
Does the depth of sediment/trash/debris suggest a blockage of the inflow pipe, bypass or cartridge filter? If yes, specify which one in the comments section. Note depth of accumulation in in pre-treatment chamber.			Depth:
Does the cartridge filter media need replacement in pre-treatment chamber and/or discharge chamber?			Chamber:
Any signs of improper functioning in the discharge chamber? Note issues in comments section.			
Other Inspection Items:			
Is there an accumulation of sediment/trash/debris in the wetland media (if applicable)?			
Is it evident that the plants are alive and healthy (if applicable)? Please note Plant Information below.			
Is there a septic or foul odor coming from inside the system?			

Waste:	**Yes**	**No**

Bio Clean

A Forterra Company

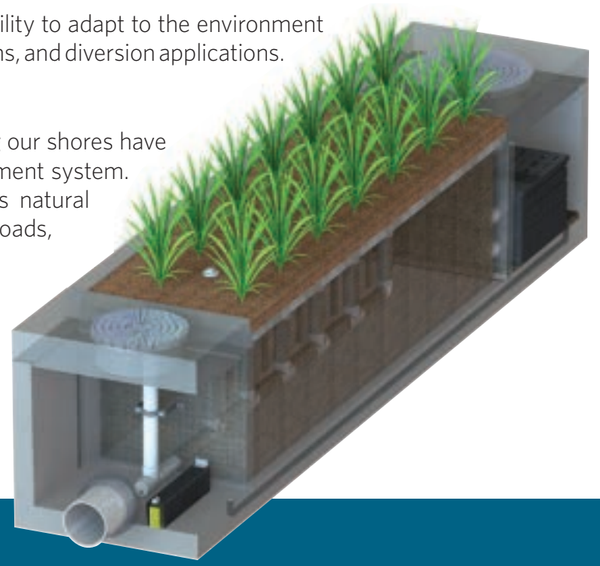
Modular Wetlands® System Linear

A Stormwater Biofiltration Solution

OVERVIEW

The Bio Clean Modular Wetlands® System Linear represents a pioneering breakthrough in stormwater technology as the only biofiltration system to utilize patented horizontal flow, allowing for a smaller footprint, higher treatment capacity, and a wide range of versatility. While most biofilters use little or no pretreatment, the Modular Wetlands® incorporates an advanced pretreatment chamber that includes separation and pre-filter cartridges. In this chamber, sediment and hydrocarbons are removed from runoff before entering the biofiltration chamber, reducing maintenance costs and improving performance.

Horizontal flow also gives the system the unique ability to adapt to the environment through a variety of configurations, bypass orientations, and diversion applications.



The Urban Impact

For hundreds of years, natural wetlands surrounding our shores have played an integral role as nature's stormwater treatment system. But as cities grow and develop, our environment's natural filtration systems are blanketed with impervious roads, rooftops, and parking lots.

Bio Clean understands this loss and has spent years re-establishing nature's presence in urban areas, and rejuvenating waterways with the Modular Wetlands® System Linear.

PERFORMANCE

The Modular Wetlands® continues to outperform other treatment methods with superior pollutant removal for TSS, heavy metals, nutrients, hydrocarbons, and bacteria. Since 2007 the Modular Wetlands® has been field tested on numerous sites across the country and is proven to effectively remove pollutants through a combination of physical, chemical, and biological filtration processes. In fact, the Modular Wetlands® harnesses some of the same biological processes found in natural wetlands in order to collect, transform, and remove even the most harmful pollutants.

66% REMOVAL OF DISSOLVED ZINC	**69%** REMOVAL OF TOTAL ZINC	**38%** REMOVAL OF DISSOLVED COPPER	**64%** REMOVAL OF TOTAL PHOSPHORUS	
45% REMOVAL OF NITROGEN	**50%** REMOVAL OF TOTAL COPPER	**95%** REMOVAL OF MOTOR OIL	**67%** REMOVAL OF ORTHO PHOSPHORUS	**85%** REMOVAL OF TSS

APPROVALS

The Modular Wetlands® System Linear has successfully met years of challenging technical reviews and testing from some of the most prestigious and demanding agencies in the nation and perhaps the world. Here is a list of some of the most high-profile approvals, certifications, and verifications from around the country.

Washington State Department of Ecology TAPE Approved
The MWS Linear is approved for General Use Level Designation (GULD) for Basic, Enhanced, and Phosphorus treatment at 1 gpm/ft² loading rate. The highest performing BMP on the market for all main pollutant categories.

California Water Resources Control Board, Full Capture Certification
The Modular Wetlands® System is the first biofiltration system to receive certification as a full capture trash treatment control device.

Virginia Department of Environmental Quality, Assignment
The Virginia Department of Environmental Quality assigned the MWS Linear the highest phosphorus removal rating for manufactured treatment devices to meet the new Virginia Stormwater Management Program (VSMP) regulation technical criteria.

Maryland Department of the Environment, Approved ESD
Granted Environmental Site Design (ESD) status for new construction, redevelopment, and retrofitting when designed in accordance with the design manual.

MASTEP Evaluation
The University of Massachusetts at Amherst – Water Resources Research Center issued a technical evaluation report noting removal rates up to 84% TSS, 70% total phosphorus, 68.5% total zinc, and more.

Rhode Island Department of Environmental Management, Approved BMP
Approved as an authorized BMP and noted to achieve the following minimum removal efficiencies: 85% TSS, 60% pathogens, 30% total phosphorus, and 30% total nitrogen.

ADVANTAGES

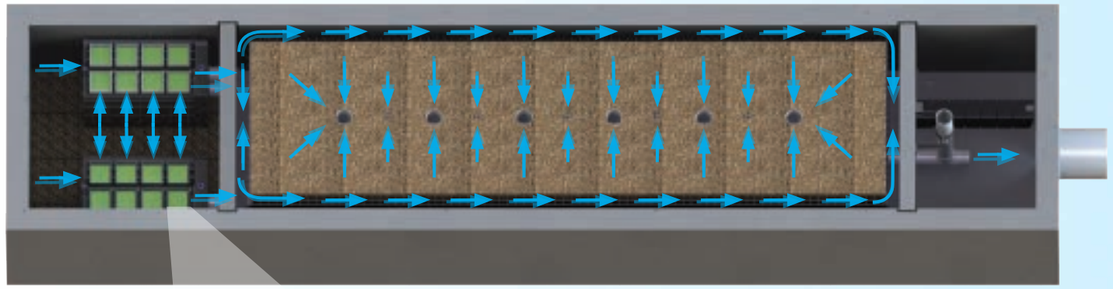
- HORIZONTAL FLOW BIOFILTRATION
- GREATER FILTER SURFACE AREA
- PRETREATMENT CHAMBER
- PATENTED PERIMETER VOID AREA
- FLOW CONTROL
- NO DEPRESSED PLANTER AREA
- AUTO DRAINDOWN MEANS NO MOSQUITO VECTOR

OPERATION

The Modular Wetlands® System Linear is the most efficient and versatile biofiltration system on the market, and it is the only system with horizontal flow which:

- Improves performance
- Reduces footprint
- Minimizes maintenance

Figure 1 & Figure 2 illustrate the invaluable benefits of horizontal flow and the multiple treatment stages.



2x to 3x more surface area than traditional downward flow bioretention systems.

Figure 2, Top View

1 PRETREATMENT

SEPARATION

- Trash, sediment, and debris are separated before entering the pre-filter cartridges
- Designed for easy maintenance access

PRE-FILTER CARTRIDGES

- Over 25 sq. ft. of surface area per cartridge
- Utilizes BioMediaGREEN™ filter material
- Removes over 80% of TSS and 90% of hydrocarbons
- Prevents pollutants that cause clogging from migrating to the biofiltration chamber

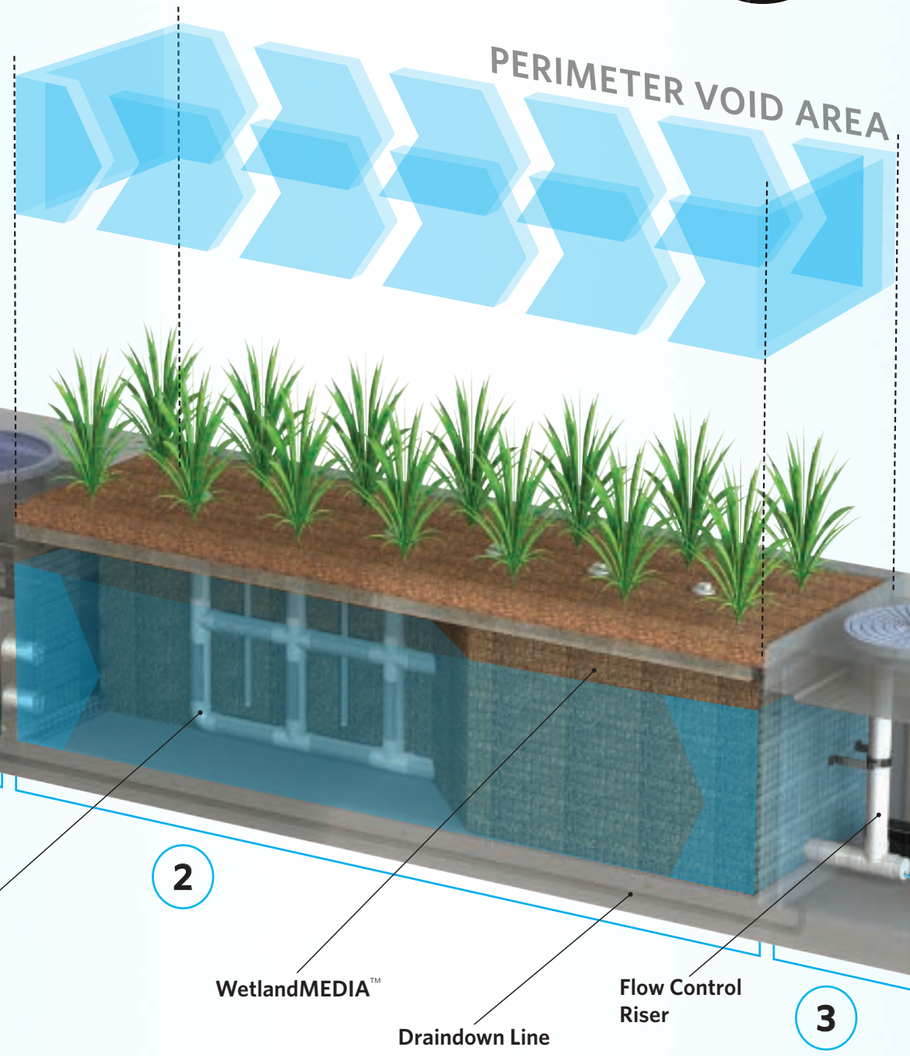


Figure 1

2 BIOFILTRATION

HORIZONTAL FLOW

- Less clogging than downward flow biofilters
- Water flow is subsurface
- Improves biological filtration

PATENTED PERIMETER VOID AREA

- Vertically extends void area between the walls and the WetlandMEDIA™ on all four sides
- Maximizes surface area of the media for higher treatment capacity

WETLANDMEDIA

- Contains no organics and removes phosphorus
- Greater surface area and 48% void space
- Maximum evapotranspiration
- High ion exchange capacity and lightweight

3 DISCHARGE

FLOW CONTROL

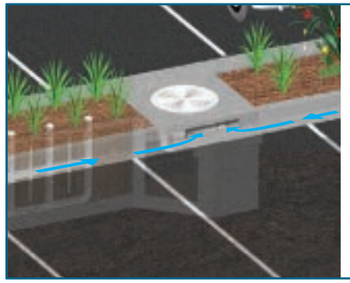
- Orifice plate controls flow of water through WetlandMEDIA™ to a level lower than the media's capacity
- Extends the life of the media and improves performance

DRAINDOWN FILTER

- The draindown is an optional feature that completely drains the pretreatment chamber
- Water that drains from the pretreatment chamber between storm events will be treated

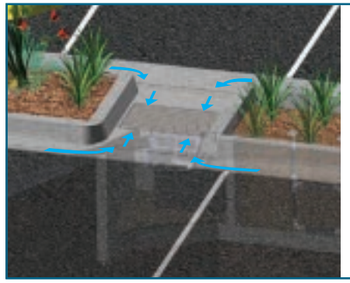
CONFIGURATIONS

The Modular Wetlands® System Linear is the preferred biofiltration system of civil engineers across the country due to its versatile design. This highly versatile system has available "pipe-in" options on most models, along with built-in curb or grated inlets for simple integration into your storm drain design.



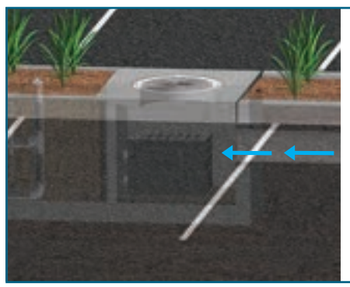
CURB TYPE

The Curb Type configuration accepts sheet flow through a curb opening and is commonly used along roadways and parking lots. It can be used in sump or flow-by conditions. Length of curb opening varies based on model and size.



GRATE TYPE

The Grate Type configuration offers the same features and benefits as the Curb Type but with a grated/drop inlet above the systems pretreatment chamber. It has the added benefit of allowing pedestrian access over the inlet. ADA-compliant grates are available to assure easy and safe access. The Grate Type can also be used in scenarios where runoff needs to be intercepted on both sides of landscape islands.



VAULT TYPE

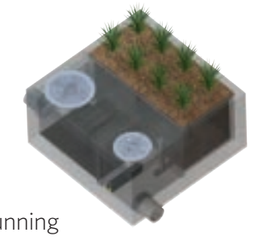
The system's patented horizontal flow biofilter is able to accept inflow pipes directly into the pretreatment chamber, meaning the Modular Wetlands® can be used in end-of-the-line installations. This greatly improves feasibility over typical decentralized designs that are required with other biofiltration/ bioretention systems. Another benefit of the "pipe-in" design is the ability to install the system downstream of underground detention systems to meet water quality volume requirements.

DOWNSPOUT TYPE

The Downspout Type is a variation of the Vault Type and is designed to accept a vertical downspout pipe from rooftop and podium areas. Some models have the option of utilizing an internal bypass, simplifying the overall design. The system can be installed as a raised planter, and the exterior can be stuccoed or covered with other finishes to match the look of adjacent buildings.

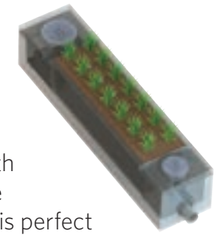
ORIENTATIONS

SIDE-BY-SIDE



The Side-By-Side orientation places the pretreatment and discharge chamber adjacent to one another with the biofiltration chamber running parallel on either side. This minimizes the system length, providing a highly compact footprint. It has been proven useful in situations such as streets with directly adjacent sidewalks, as half of the system can be placed under that sidewalk. This orientation also offers internal bypass options as discussed below.

END-TO-END



The End-To-End orientation places the pretreatment and discharge chambers on opposite ends of the biofiltration chamber, therefore minimizing the width of the system to 5 ft. (outside dimension). This orientation is perfect for linear projects and street retrofits where existing utilities and sidewalks limit the amount of space available for installation. One limitation of this orientation is that bypass must be external.

BYPASS

INTERNAL BYPASS WEIR (SIDE-BY-SIDE ONLY)

The Side-By-Side orientation places the pretreatment and discharge chambers adjacent to one another allowing for integration of internal bypass. The wall between these chambers can act as a bypass weir when flows exceed the system's treatment capacity, thus allowing bypass from the pretreatment chamber directly to the discharge chamber.

EXTERNAL DIVERSION WEIR STRUCTURE

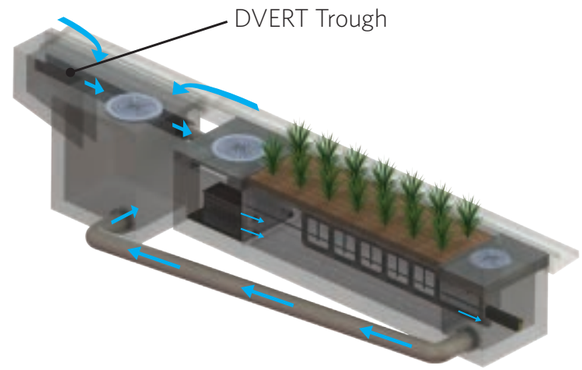
This traditional offline diversion method can be used with the Modular Wetlands® in scenarios where runoff is being piped to the system. These simple and effective structures are generally configured with two outflow pipes. The first is a smaller pipe on the upstream side of the diversion weir - to divert low flows over to the Modular Wetlands® for treatment. The second is the main pipe that receives water once the system has exceeded treatment capacity and water flows over the weir.

FLOW-BY-DESIGN

This method is one in which the system is placed just upstream of a standard curb or grate inlet to intercept the first flush. Higher flows simply pass by the Modular Wetlands® and into the standard inlet downstream.

DVERT LOW FLOW DIVERSION

This simple yet innovative diversion trough can be installed in existing or new curb and grate inlets to divert the first flush to the Modular Wetlands® via pipe. It works similar to a rain gutter and is installed just below the opening into the inlet. It captures the low flows and channels them over



to a connecting pipe exiting out the wall of the inlet and leading to the MWS Linear. The DVERT is perfect for retrofit and green street applications that allow the Modular Wetlands® to be installed anywhere space is available.

SPECIFICATIONS

FLOW-BASED DESIGNS

The Modular Wetlands® System Linear can be used in stand-alone applications to meet treatment flow requirements. Since the Modular Wetlands® is the only biofiltration system that can accept inflow pipes several feet below the surface, it can be used not only in decentralized design applications but also as a large central end-of-the-line application for maximum feasibility.

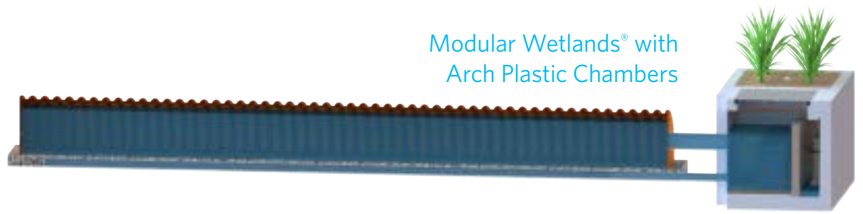
MODEL #	DIMENSIONS	WETLANDMEDIA SURFACE AREA (sq. ft.)	TREATMENT FLOW RATE (cfs)
MWS-L-4-4	4′ x 4′	23	0.052
MWS-L-4-6	4′ x 6′	32	0.073
MWS-L-4-8	4′ x 8′	50	0.115
MWS-L-4-13	4′ x 13′	63	0.144
MWS-L-4-15	4′ x 15′	76	0.175
MWS-L-4-17	4′ x 17′	90	0.206
MWS-L-4-19	4′ x 19′	103	0.237
MWS-L-4-21	4′ x 21′	117	0.268
MWS-L-6-8	7′ x 9′	64	0.147
MWS-L-8-8	8′ x 8′	100	0.230
MWS-L-8-12	8′ x 12′	151	0.346
MWS-L-8-16	8′ x 16′	201	0.462
MWS-L-8-20	9′ x 21′	252	0.577
MWS-L-8-24	9′ x 25′	302	0.693
MWS-L-10-20	10' x 20'	302	0.693

VOLUME-BASED DESIGNS

HORIZONTAL FLOW BIOFILTRATION ADVANTAGE

Modular Wetlands® with
Box Culvert Prestorage

The Modular Wetlands® System Linear offers a unique advantage in the world of biofiltration due to its exclusive horizontal flow design: Volume-Based Design. No other biofilter has the ability to be placed downstream of detention ponds, extended dry detention basins, underground storage systems and permeable paver reservoirs. The systems horizontal flow configuration and built-in orifice control allows it to be installed with just 6" of fall between inlet and outlet pipe for a simple connection to projects with shallow downstream tie-in points. In the example above, the Modular Wetlands® is installed downstream of underground box culvert storage. Designed for the water quality volume, the Modular Wetlands® will treat and discharge the required volume within local draindown time requirements.



Modular Wetlands® with
Arch Plastic Chambers

DESIGN SUPPORT

Bio Clean engineers are trained to provide you with superior support for all volume sizing configurations throughout the country. Our vast knowledge of state and local regulations allow us to quickly and efficiently size a system to maximize feasibility. Volume control and hydromodification regulations are expanding the need to decrease the cost and size of your biofiltration system. Bio Clean will help you realize these cost savings with the Modular Wetlands®, the only biofilter than can be used downstream of storage BMPs.

ADVANTAGES

- LOWER COST THAN FLOW-BASED DESIGN
- MEETS LID REQUIREMENTS
- BUILT-IN ORIFICE CONTROL STRUCTURE
- WORKS WITH DEEP INSTALLATIONS

APPLICATIONS

The Modular Wetlands® System Linear has been successfully used on numerous new construction and retrofit projects. The system's superior versatility makes it beneficial for a wide range of stormwater and waste water applications - treating rooftops, streetscapes, parking lots, and industrial sites.

INDUSTRIAL

Many states enforce strict regulations for discharges from industrial sites. The Modular Wetlands® has helped various sites meet difficult EPA-mandated effluent limits for dissolved metals and other pollutants.

RESIDENTIAL

Low to high density developments can benefit from the versatile design of the Modular Wetlands®. The system can be used in both decentralized LID design and cost-effective end-of-the-line configurations.

STREETS

Street applications can be challenging due to limited space. The Modular Wetlands® is very adaptable, and it offers the smallest footprint to work around the constraints of existing utilities on retrofit projects.

PARKING LOTS

Parking lots are designed to maximize space and the Modular Wetlands'® 4 ft. standard planter width allows for easy integration into parking lot islands and other landscape medians.

COMMERCIAL

Compared to bioretention systems, the Modular Wetlands® can treat far more area in less space, meeting treatment and volume control requirements.

MIXED USE

The Modular Wetlands® can be installed as a raised planter to treat runoff from rooftops or patios, making it perfect for sustainable "live-work" spaces.

More applications include:

• Agriculture • Reuse • Low Impact Development • Waste Water

PLANT SELECTION

Abundant plants, trees, and grasses bring value and an aesthetic benefit to any urban setting, but those in the Modular Wetlands® System Linear do even more - they increase pollutant removal. What's not seen, but very important, is that below grade, the stormwater runoff/flow is being subjected to nature's secret weapon: a dynamic physical, chemical, and biological process working to break down and remove non-point source pollutants. The flow rate is controlled in the Modular Wetlands®, giving the plants more contact time so that pollutants are more successfully decomposed, volatilized, and incorporated into the biomass of the Modular Wetlands'® micro/macro flora and fauna.

A wide range of plants are suitable for use in the Modular Wetlands®, but selections vary by location and climate. View suitable plants by visiting biocleanenvironmental.com/plants.

INSTALLATION

The Modular Wetlands® is simple, easy to install, and has a space-efficient design that offers lower excavation and installation costs compared to traditional tree-box type systems. The structure of the system resembles precast catch basin or utility vaults and is installed in a similar fashion.

The system is delivered fully assembled for quick installation. Generally, the structure can be unloaded and set in place in 15 minutes. Our experienced team of field technicians is available to supervise installations and provide technical support.

MAINTENANCE

Reduce your maintenance costs, man hours, and materials with the Modular Wetlands®. Unlike other biofiltration systems that provide no pretreatment, the Modular Wetlands® is a self-contained treatment train which incorporates simple and effective pretreatment.

Maintenance requirements for the biofilter itself are almost completely eliminated, as the pretreatment chamber removes and isolates trash, sediments, and hydrocarbons. What's left is the simple maintenance of an easily accessible pretreatment chamber that can be cleaned by hand or with a standard vac truck. Only periodic replacement of low-cost media in the pre-filter cartridges is required for long-term operation, and there is absolutely no need to replace expensive biofiltration media.

ATTACHMENT 4
Copy of Plan Sheets Showing Permanent Storm Water BMPs

This is the cover sheet for Attachment 4.

Use this checklist to ensure the required information has been included on the plans:

The plans must identify:

☒Structural BMP(s) with ID numbers matching Form I-6 Summary of PDP Structural BMPs
☒The grading and drainage design shown on the plans must be consistent with the delineation of DMAs shown on the DMA exhibit
☒Details and specifications for construction of structural BMP(s)
☒Signage indicating the location and boundary of structural BMP(s) as required by the City Engineer
☒How to access the structural BMP(s) to inspect and perform maintenance
☒Features that are provided to facilitate inspection (e.g., observation ports, cleanouts, silt posts, or other features that allow the inspector to view necessary components of the structural BMP and compare to maintenance thresholds)
☒Manufacturer and part number for proprietary parts of structural BMP(s) when applicable
☒Maintenance thresholds specific to the structural BMP(s), with a location-specific frame of reference (e.g., level of accumulated materials that triggers removal of the materials, to be identified based on viewing marks on silt posts or measured with a survey rod with respect to a fixed benchmark within the BMP)
☒Recommended equipment to perform maintenance
☒When applicable, necessary special training or certification requirements for inspection and maintenance personnel such as confined space entry or hazardous waste management
☒Include landscaping plan sheets showing vegetation requirements for vegetated structural BMP(s)
☒All BMPs must be fully dimensioned on the plans
☒When propritery BMPs are used, site specific cross section with outflow, inflow and model number shall be provided. Broucher photocopies are not allowed.

TITLE ORDER NO.: 00101379-016-NJ-DB
TITLE OFFICER:
COMMITMENT DATE: AUGUST 21, 2019

THIS SURVEY WAS BASED UPON COMMITMENT FOR TITLE INSURANCE ISSUED BY CHICAGO TITLE INSURANCE COMPANY AS NOTED ABOVE. THE EFFECTS OF AGREEMENTS, PERMITS, LIENS, ASSESSMENTS OR LEASES, ABSTRACTS OF JUDGEMENT, AND PENDING COURT ACTIONS, APPEARING IN SAID REPORT AS SCHEDULE 'B' ITEM NOS. 1, 16, 17, 18, 19, 20, 21 AND 22 ARE NOT NOTED ON THIS SURVEY.

2 THE FOLLOWING RECITALS CONTAINED IN DEED FROM VISTA IRRIGATION DISTRICT, RECORDED JULY 17, 1945 IN BOOK 1901, PAGE 429, OF OFFICIAL RECORDS. "THAT THE DISCHARGE FROM THE VISTA SANITARY DISTRICT FLOWS TO, UPON AND ACROSS SAID PREMISES AND THE RIGHT OF SUCH SANITARY DISTRICT TO CONTINUE SUCH FLOWAGE PERMANENTLY IS HEREBY ACKNOWLEDGED AND ACCEPTED BY GRANTEE AND HIS SUCCESSORS IN INTEREST."SAID EASEMENT IS NOT PLOTTABLE.

3 THE FACT THAT THE OWNERSHIP OF SAID LAND DOES NOT INCLUDE RIGHTS OF ACCESS TO OR FROM THE STREET, HIGHWAY, OR FREEWAY ABUTTING SAID LAND, SUCH RIGHTS HAVING BEEN SEVERED FROM SAID LAND BY THE DOCUMENT. RECORDED: JANUARY 2, 1953 IN BOOK 4703, PAGE 99, OF OFFICIAL RECORDS AFFECTS: HIGHWAY 78 ADJACENT

4 AN EASEMENT IN FAVOR OF THE CITY OF OCEANSIDE FOR THE PURPOSE SEWER PIPELINE PURPOSES, RECORDED: JUNE 29, 1961 AS INSTRUMENT NO. 111643.

5 AN EASEMENT IN FAVOR OF CONTRACTORS ASPHALT PRODUCTS CO., INC., A CALIFORNIA CORPORATION FOR ROAD PURPOSES, RECORDED: MARCH 24, 1964 AS INSTRUMENT NO. 53097.

6 AN EASEMENT IN FAVOR OF VISTA SANITATION DISTRICT FOR SEWER LINES AND OR MAINS, MANHOLES, SEWER LATERAL PIPE LINES, RECORDED: JUNE 5, 1970 AS INSTRUMENT NO. 97873. SAID EASEMENT IS NOT PLOTTABLE.

12 THE FACT THAT THE OWNERSHIP OF SAID LAND DOES NOT INCLUDE RIGHTS OF ACCESS TO OR FROM THE STREET, HIGHWAY, OR FREEWAY ABUTTING SAID LAND, SUCH RIGHTS HAVING BEEN SEVERED FROM SAID LAND BY THE DOCUMENT. RECORDED: JUNE 4, 1973 AS INSTRUMENT NO. 73-150978, OF OFFICIAL RECORDS AND RECORDED JUNE 4, 1973 AS INSTRUMENT NO. 73-150979, OF OFFICIAL RECORDS

13 AN EASEMENT IN FAVOR OF THE CITY OF OCEANSIDE FOR SANITARY SEWER PIPELINE, RECORDED: AUGUST 20, 1973 AS INSTRUMENT NO. 73-233038.

14 AN EASEMENT IN FAVOR OF THE CITY OF OCEANSIDE FOR GRADED SLOPES, RECORDED: JUNE 8, 1988 AS INSTRUMENT NO. 88-272917.

15 A DOCUMENT ENTITLED "LICENSE AGREEMENT", DATED, NOVEMBER 16, 1999, EXECUTED BY TERESA M. CANNON AND OUTDOOR MEDIA GROUP, INC., SUBJECT TO ALL THE TERMS, PROVISIONS AND CONDITIONS THEREIN CONTAINED, RECORDED NOVEMBER 13, 2000 AS INSTRUMENT NO. 2000-0614748, OF OFFICIAL RECORDS.

LEGEND:

SIGN	●
R7-9A	R BIKE LANE
R2-1	SPEED LIMIT 40
W3-3	
W1-8L	
R9-3a	

SIGNING NOTES:

ALL SIGNS SHALL BE MADE WITH ALUMINUM SIGN PANELS WITH TYPE IV OR BETTER (AT LEAST HIGH INTENSITY PRISMATIC) RETROREFLECTIVE SHEETING IN CONFORMANCE WITH SECTION 82, "SIGNS AND MARKINGS" OF THE MOST CURRENT CALTRANS STANDARD SPECIFICATIONS WITH THE EXCEPTION OF SECTION 82-2.02A, PART 1.

UNLESS SPECIFICALLY NOTED ON THE PLAN, ALL SIGNS SHALL BE MOUNTED SO THAT THE BOTTOM OF THE SIGN IS 7' ABOVE THE SURROUNDING GROUND SURFACE. ROADSIDE SIGNS SHALL NOT HANG OVER THE ROADWAY. SIGN PLACEMENT SHALL COMPLY WITH RS1 OF THE MOST CURRENT CALTRANS STANDARD PLANS.

SIGN POSTS SHALL BE 4"x 4" TREATED WOOD PER SECTION 82-3, "ROADSIDE SIGNS" OF THE MOST CURRENT CALTRANS STANDARD SPECIFICATIONS. SIGN POSTS SHALL BE PLACED SO THAT THEY COMPLY WITH ADA (FACILITY ACCESSIBILITY) REQUIREMENTS. SIGN POSTS SHALL BE PLACED IN COMPACTED NATIVE SOIL PER RS2 OF THE MOST CURRENT CALTRANS STANDARD PLANS. IT IS PREFERRED THAT SIGNS BE INSTALLED BEHIND SIDEWALKS, BUT IF SIGN POSTS ARE TO BE INSTALLED IN CONCRETE SIDEWALKS, THEN A 1'x 1' SQUARE, 1/2-INCH DEEP JOINT OR SAWCUT SHALL BE PLACED AROUND THE SIGN POST IN THE SIDEWALK. SIGNS SHALL BE MOUNTED ON SIGN POSTS USING SIGN PANEL FASTENING HARDWARE PER RS2 OF THE MOST CURRENT CALTRANS STANDARD PLANS, SECTION 82-3, "ROADSIDE SIGNS" OF THE MOST CURRENT CALTRANS STANDARD SPECIFICATIONS, AND AS SPECIFIED BY THE SIGN FILM MANUFACTURER.

SIGNS TO BE INSTALLED ON COUNTY OF SAN DIEGO – MAINTAINED STREET LIGHT POLES, TRAFFIC SIGNAL POLES, AND FLASHERS SHALL BE INSTALLED AS APPROVED BY THE RESIDENT ENGINEER PER THE PLAN OR WITH APPROVED STAINLESS STEEL BAND CLAMPS OR OTHER APPROVED HARDWARE THAT IS APPROPRIATE FOR THE WIND LOADING.

STREET NAME SIGNS SHALL BE INSTALLED PER THE MOST CURRENT COUNTY OF SAN DIEGO DESIGN STANDARD DRAWINGS DS-13A THROUGH DS-13G.

THE RESIDENT ENGINEER SHALL APPROVE ALL SIGN INSTALLATION LOCATIONS PRIOR TO THE CONTRACTOR INSTALLING THE SIGNS. ALL TRAFFIC SIGNS SHALL BE READILY VISIBLE TO ALL MOTORISTS DRIVING AT THE PREVAILING SPEED AS WELL AS ALL OTHER ROADWAY USERS (BICYCLISTS, EQUESTRIANS, AND PEDESTRIANS). IF THE VISIBILITY OF THE TRAFFIC SIGN IS BLOCKED, THEN THE CONTRACTOR WITH THE RESIDENT ENGINEER'S APPROVAL SHALL EITHER RELOCATE THE SIGN OR REMOVE THE OBSTRUCTIONS (SUCH AS VEGETATION, ROCKS, PRIVATE SIGNS, AND MINOR EMBANKMENTS THROUGH MINOR GRADING) THAT BLOCK THE VISIBILITY OF THE SIGN.

STRIPING NOTES:

TRAFFIC STRIPES, THERMOPLASTIC PAVEMENT MARKINGS, AND PAVEMENT MARKERS

CONTRACTOR SHALL BE RESPONSIBLE FOR THE REPLACEMENT OF ALL STRIPING, PAVEMENT MARKERS, AND LEGENDS (PAVEMENT MARKINGS) OBLITERATED BY THE CONSTRUCTION OF THIS PROJECT. CONTRACTOR SHALL BE RESPONSIBLE FOR THE INSTALLATION OF ALL NEW STRIPING, PAVEMENT MARKERS, AND LEGENDS REQUIRED FOR THIS PROJECT. CONTRACTOR SHALL BE RESPONSIBLE FOR THE REMOVAL OF ALL CONFLICTING AND REDUNDANT STRIPING, PAVEMENT MARKERS, AND LEGENDS IN THIS PROJECT.

INSTALLATION OF TRAFFIC STRIPES (TRAFFIC LINES) AND THERMOPLASTIC PAVEMENT MARKINGS SHALL CONFORM TO SECTION 84-1, "GENERAL" AND 84-2, "TRAFFIC STRIPES AND PAVEMENT MARKINGS", OF THE CALTRANS STANDARD SPECIFICATIONS AND THE FOLLOWING:

CONTROL OF THE ALIGNMENT AND LAYOUT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR AND SUBJECT TO APPROVAL BY THE ENGINEER. ALL NEW STRIPING AND REMOVAL OF REDUNDANT STRIPING SHALL BE DONE BY CONTRACTOR. STRIPING SHALL BE REMOVED BY SANDBLASTING / GRINDING AND THEN SAND SEALED PER THE ENGINEER. CONTRACTOR TO PROVIDE AND INSTALL PAVEMENT MARKERS.

SECTION 84-2.02, "MATERIALS", OF THE STANDARD SPECIFICATIONS IS AMENDED TO READ:

PAINT FOR TRAFFIC STRIPING SHALL BE LEAD FREE AND CONFORM TO THE LATEST STATE SPECIFICATIONS FOR RAPID DRY WATER BORNE, WHITE & YELLOW PAINT.

THERMOPLASTIC MATERIAL SHALL BE FREE OF LEAD AND CHROMIUM, AND SHALL CONFIRM TO THE REQUIREMENTS IN STATE SPECIFICATION PTH-02SPRAY, PTH-02HYDRO, OR PTH-02ALKYD.

FOR EACH BATCH OF THERMOPLASTIC MATERIAL FOR PAVEMENT MARKINGS, THE CONTRACTOR SHALL SUBMIT TO THE ENGINEER:

1. CERTIFICATE OF COMPLIANCE UNDER SECTION 6-1.07, "CERTIFICATES OF COMPLIANCE," OF THE STANDARD SPECIFICATIONS
2. DEPARTMENT'S MATERIALS ENGINEERING AND TESTING SERVICES NOTIFICATION LETTER STATING THAT THE MATERIAL IS APPROVED FOR USE
3. MATERIAL SAFETY DATA SHEET

PRIMER MUST COMPLY WITH THE THERMOPLASTIC MANUFACTURER'S RECOMMENDATIONS. DO NOT THIN THE PRIMER.

GLASS BEADS SHALL CONFORM TO STATE SPECIFICATIONS NO. 8010-004 (TYPE II).

COPIES OF STATE SPECIFICATIONS FOR TRAFFIC PAINT AND GLASS BEADS MAY BE OBTAINED FROM THE TRANSPORTATION LABORATORY, P.O. BOX 19128, SACRAMENTO, CALIFORNIA, 95812, TEL. (916) 227-7000.

THERMOPLASTIC PAVEMENT MARKINGS WITH ENHANCED WET-NIGHT VISIBILITY MUST CONSIST OF A SINGLE UNIFORM LAYER OF THERMOPLASTIC AND 2 LAYERS OF GLASS BEADS AS FOLLOWS:

1. THE 1ST LAYER OF GLASS BEADS MUST BE ON THE AUTHORIZED MATERIAL LIST UNDER HIGH-PERFORMANCE RETROREFLECTIVE GLASS BEADS FOR USE IN THERMOPLASTIC PAVEMENT MARKINGS. THE COLOR OF THE GLASS BEADS MUST MATCH THE COLOR OF THE STRIPE OR MARKING TO WHICH THEY ARE BEING APPLIED.
2. THE 2ND LAYER OF GLASS BEADS MUST COMPLY WITH AASHTO M 247, TYPE 2.

BOTH TYPES OF GLASS BEADS MUST BE SURFACE TREATED FOR USE WITH THERMOPLASTIC UNDER THE BEAD MANUFACTURER'S INSTRUCTIONS.

GLASS BEADS MAYBE APPLIED BY HAND ON THERMOPLASTIC PAVEMENT MARKINGS.

WITHIN 14 DAYS OF APPLYING A THERMOPLASTIC PAVEMENT MARKING WITH ENHANCED WET-NIGHT VISIBILITY, THE RETROREFLECTIVITY MUST BE A MINIMUM OF 700 MCD/SQ M/LX FOR WHITE STRIPES AND MARKINGS AND 500 MCD/SQ M/LX FOR YELLOW STRIPES AND MARKINGS. TEST THE RETROREFLECTIVITY USING A REFLECTOMETER UNDER ASTM E 1710.

WHERE STRIPING JOINS EXISTING STRIPING, AS SHOWN ON THE PLANS, THE CONTRACTOR SHALL BEGIN AND END THE TRANSITION FROM THE EXISTING STRIPING PATTERN INTO OR FROM THE NEW STRIPING PATTERN A SUFFICIENT DISTANCE TO ENSURE CONTINUITY OF THE STRIPING PATTERN.

APPLY EXTRUDED THERMOPLASTIC AT A TEMPERATURE FROM 400 TO 425 DEGREES F, UNLESS A DIFFERENT TEMPERATURE IS INSTRUCTED BY THE MANUFACTURER.

APPLY THERMOPLASTIC PAVEMENT MARKING AT A RATE OF AT LEAST 1.06 LB/SQ FT. THE APPLIED THERMOPLASTIC PAVEMENT MARKING MUST BE AT LEAST 0.125 INCH THICK.

DISTRIBUTE GLASS BEADS UNIFORMLY ON PAVEMENT MARKINGS. APPLY HIGH-PERFORMANCE GLASS BEADS AT A RATE OF AT LEAST 6 LB/100 SQ FT OF MARKING. APPLY AASHTO M 247, TYPE 2, GLASS BEADS AT A RATE OF AT LEAST 8 LB/100 SQ FT OF MARKING. THE COMBINED WEIGHT OF THE 2 TYPES OF GLASS BEADS MUST BE GREATER THAN 14 LB/100 SQ FT OF MARKING.

THERMOPLASTIC PAVEMENT MARKINGS SHALL BE FREE OF RUNS, BUBBLES, CRATERS, DRAG MARKS, STRETCH MARKS, AND DEBRIS.

THE SURFACE OF THE THERMOPLASTIC MATERIAL UPON APPLICATION SHALL PROVIDE A MINIMUM SKID RESISTANCE VALUE OF 60 BPN WHEN TESTED ACCORDING TO ASTM E 303. DOCUMENTATION DETAILING MANUFACTURE'S MINIMUM SKID RESISTANCE FOR PERFORMED THERMOPLASTIC MATERIAL SHALL BE PROVIDED TO THE ENGINEER PRIOR TO COMMENCEMENT OF PAVEMENT MARKING OPERATIONS.

PAVEMENT MARKER SHALL CONFORM TO SECTION 81-3, "PAVEMENT MARKERS," OF THE MOST CURRENT CALTRANS STANDARD SPECIFICATIONS, AND THE FOLLOWING PROVISIONS:

PAVEMENT MARKER HEIGHT SHALL BE 0.70-INCH MINIMUM. "LOW PROFILE" TYPE MARKERS WILL NOT BE ACCEPTABLE.

NOTE: CONTRACTOR TO COORDINATE GAS LINE INSTALLATION WITH UTILITY PROVIDER.

NOTE: CONTRACTOR TO PROVIDE TAMPER SWITCHES IN THE VAULT AND THE POST INDICATING SPRINKLER CONTROL VALVE

NOTE: SEE PLUMBING DRAWINGS FOR EXACT UTILITY CONNECTION LOCATIONS AT THE BUILDING. LOCATIONS SHOWN ON THIS PLAN ARE FOR GENERAL COORDINATION PURPOSES ONLY AND SHOULD BE VERIFIED PRIOR TO INSTALLATION.

NOTE: CONTRACTOR TO SEE ELECTRICAL DWGS. FOR COORDINATION WITH SITE LIGHTING, TELECOMMUNICATIONS REQUIREMENTS.

ITEMS REQUIRED LIST / NOTES TO DESIGNER

(INFORMATION REQUIRED ON SITE UTILITY PLAN)

1. LOCATION OF SITE UTILITIES SHALL BE VERIFIED BY GENERAL CONTRACTOR WITH THE PROPER UTILITY COMPANY PROVIDING SERVICE.
2. GENERAL CONTRACTOR SHALL NOTIFY THE UTILITY AUTHORITIES INSPECTORS BEFORE CONNECTING TO ANY EXISTING LINE IN ACCORDANCE WITH LOCAL REQUIREMENTS.
3. GENERAL CONTRACTOR WILL BE RESPONSIBLE FOR ALL TAP AND TIE ON FEES REQUIRED, AS WELL AS COST OF UNDERGROUND SERVICE CONNECTIONS TO THE BUILDING.
4. SANITARY SEWER PIPE SHALL BE AS OUTLINED IN SPECS.:
   8" PVC SDR 35 PER ASTM D 3034, FOR PIPES LESS THAN 12' DEEP
   8" DIP PER ASTM A 746, FOR PIPES MORE THAN 12' DEEP
5. WATER LINES SHALL BE AS OUTLINED IN SPECS.:
   D.I.P. UNDER COUNTY ROADS.
   6" AND LARGER ONSITE – PVC IS PERFERED D.I.P. ONLY IF REQUIRED.
   SMALLER THAN 6" – EITHER COPPER TUBE TYPE "K" PER ASTM B 88 OR D.I.P.
6. ELECTRICAL SERVICE TO PAD MOUNTED TRANSFORMER SHALL BE RUN UNDERGROUND, FROM ROAD RIGHT-OF-WAY TO TRANSFORMER LOCATION.
7. THRUST BLOCKS SHALL BE PROVIDED ON 4" AND LARGER WATER LINES AT ALL BENDS, TEES, AND FIRE HYDRANTS.
8. TERMINATE WATER-SERVICE PIPING AT BUILDING WALL UNTIL BUILDING WATER PIPING SYSTEMS ARE INSTALLED. TERMINATE PIPING WITH VALVE AND CAP, PLUG, OR FLANGE AS REQUIRED FOR PIPING MATERIAL. MAKE CONNECTIONS TO BUILDING WATER PIPING SYSTEMS WHEN THOSE SYSTEMS ARE INSTALLED.
9. ALL FIRE HYDRANTS SHALL BE PROVIDED WITH AN APPROVED GATE VALVE A MAXIMUM OF 5'-0" FROM HYDRANT.
10. ALL TRENCHING, PIPE LAYING, AND BACKFILLING SHALL BE IN ACCORDANCE WITH FEDERAL OSHA REGULATIONS.
11. REFER TO PLUMBING AND/OR FIRE PROTECT. SHEETS FOR FIRE LINE LEAD-IN LOCATION AND DETAIL.
12. RUN FIRE LINE AS SPECIFIED IN NOTE NO. 8 THIS SHEET.
13. REFER TO PLUMBING SHEETS FOR LOCATION OF SEWER, AND DOMESTIC UTILITY CONNECTIONS.
14. ALL PIPING SHALL BE INSTALLED WITH A MINIMUM OF 30" OF COVER, OR 12 INCHES BELOW LEVEL OF MAX FROST LINE, OR AS OUTLINED IN CONSTRUCTION SPECIFICATIONS
15. CONTRACTOR IS RESPONSIBLE FOR COMPLYING TO THE SPECIFICATIONS OF THE LOCAL AUTHORITIES WITH REGARDS TO MATERIALS AND INSTALLATION OF THE WATER AND SEWER LINES
16. THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITY COMPANIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO VERIFY EXACT LOCATION AND DEPTH OF ALL EXISTING UTILITIES AND TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THESE PLANS.
17. ALL NECESSARY INSPECTIONS, CERTIFICATIONS AND AS-BUILT SURVEYS REQUIRED BY CODES AND UTILITY COMPANIES SHALL BE PERFORMED PRIOR TO ANNOUNCED SCHEDULED SUBSTANTIAL COMPLETION AND THE FINAL C.O.
18. CONTRACTOR IS TO COORDINATE WITH ALL UTILITY COMPANIES FOR INSTALLATION REQUIREMENTS AND SPECIFICATIONS.

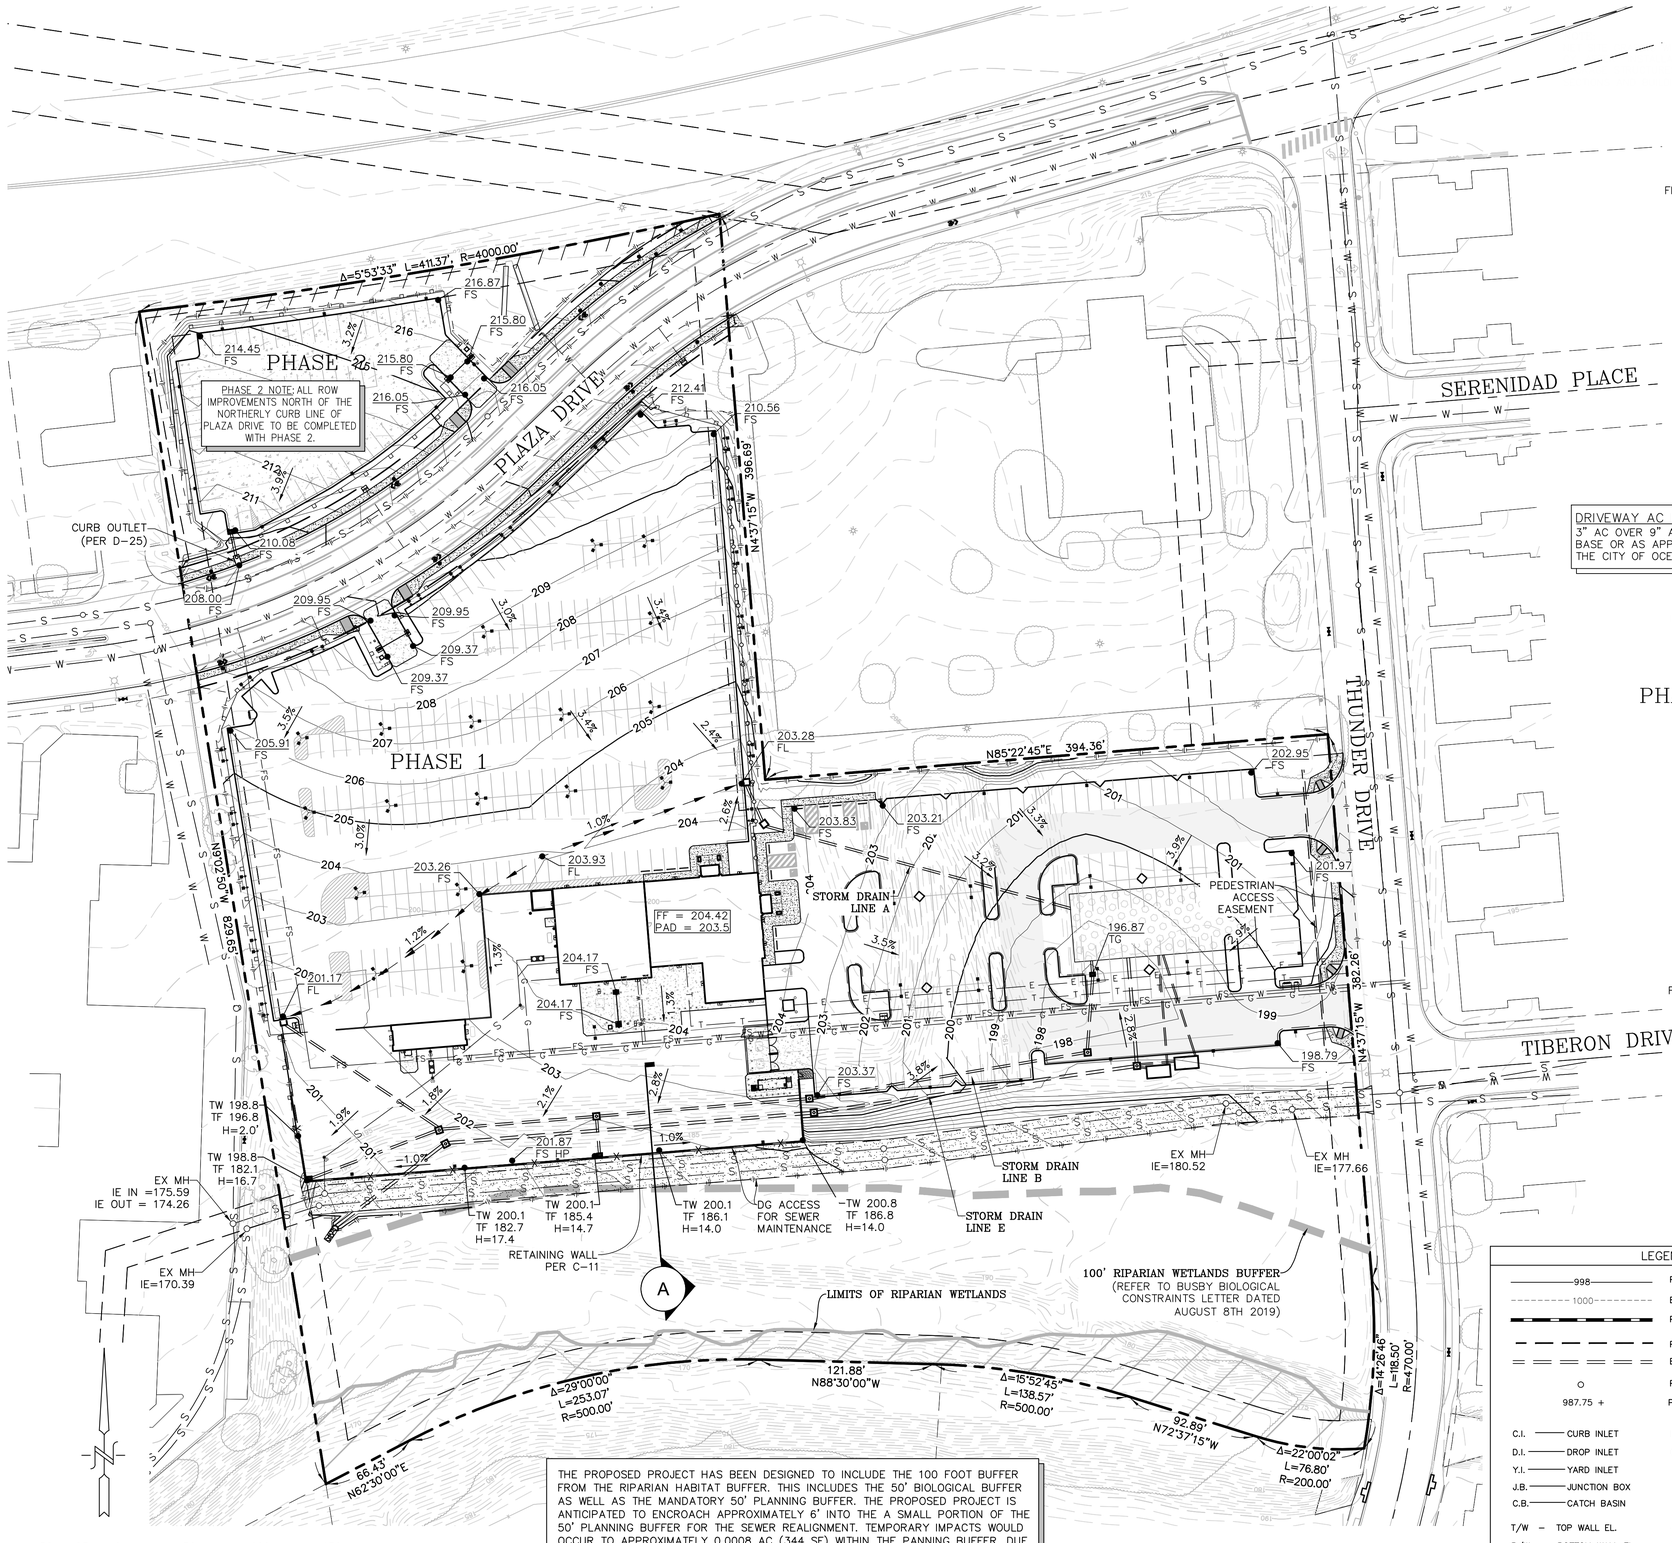
PROJECT NO

DATE March 6, 2020

SHEET TITLE UTILITY PLAN

SHEET NO C4.0

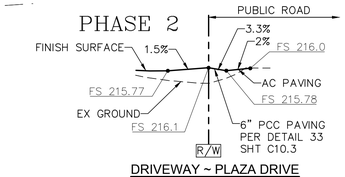


THE PROPOSED PROJECT HAS BEEN DESIGNED TO INCLUDE THE 100 FOOT BUFFER FROM THE RIPARIAN HABITAT BUFFER. THIS INCLUDES THE 50' BIOLOGICAL BUFFER AS WELL AS THE MANDATORY 50' PLANNING BUFFER. THE PROPOSED PROJECT IS ANTICIPATED TO ENCROACH APPROXIMATELY 6' INTO THE A SMALL PORTION OF THE 50' PLANNING BUFFER FOR THE SEWER REALIGNMENT. TEMPORARY IMPACTS WOULD OCCUR TO APPROXIMATELY 0.0008 AC (344 SF) WITHIN THE PANNING BUFFER. DUE TO THE SMALL SIZE OF THE IMPACTS AND THE DISTANCE (94') FROM THE RIPARIAN HABITAT , NO DIRECT IMPACTS TO RIPARIAN HABITAT IS ANTICIPATED.

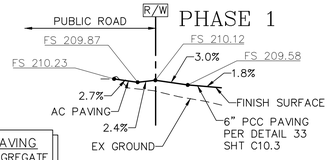
GRADING QUANTITIES

CUT	12,500 CY
FILL	12,500 CY
NET	NONE

69,250 CY REMEDIAL REMOVAL AND RECOMPACTION

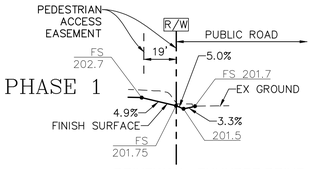


DRIVEWAY ~ PLAZA DRIVE
NORTH SIDE
SCALE: HORZ: 1" = 40'
VERT: 1" = 8'



DRIVEWAY ~ PLAZA DRIVE
SOUTH SIDE
SCALE: HORZ: 1" = 40'
VERT: 1" = 8'

DRIVEWAY AC PAVING
3" AC OVER 9" AGGREGATE BASE OR AS APPROVED BY THE CITY OF OCEANSIDE



DRIVEWAY ~ THUNDER DRIVE
NORTH ENTRANCE
SCALE: HORZ: 1" = 40'

1. SURFACES ALONG ACCESSIBLE ROUTES SHALL BE SLIP RESISTANT.
2. MAXIMUM SLOPE OF FLARED SIDE SHALL BE 1V:10H.
3. CURB RAMPS SHALL HAVE HAVE A DETECTABLE WARNING TEXTURE EXTENDING THE FULL WIDTH AND DEPTH OF THE CURB RAMP, INCLUDING FLARES. (DETECTABLE WARNINGS SHALL CONSIST OF RAISED TRUNCATED DOMES WITH A DIAMETER OF NOMINAL 0.9", A HEIGHT OF NOMINAL 0.2" AND A CENTER-TO-CENTER SPACING OF NOMINAL 2.35 INCHES AND SHALL CONTRAST VISUALLY WITH ADJOINING SURFACES, EITHER LIGHT-ON-DARK, OR DARK-ON-LIGHT. THE MATERIALS USED TO PROVIDE CONTRAST SHALL BE AN INTEGRAL PART OF THE WALKING SURFACE.)
4. BUILT-UP CURB RAMPS SHALL BE LOCATED SO THAT THEY DO NOT PROJECT INTO VEHICULAR TRAFFIC LANES.

C10.4
SHEET NO

SAMPLING

The majority of the stormwater from the developed portions of the Carmax Facility Development site will be routed to the _____ on-site detention pond(s), located just (north, south, east or west) of the proposed facility and will out-fall to the (north, south, east or west) where it will continue as sheet flow via the existing drainage paths to the receiving waters. A small amount of the developed portion of the site, storm water will by-pass the detention pond(s) via sheet flow to the (north, south, east or west). Sampling of the outfalls will be utilized for the required site storm water monitoring. The surface water drainage area of the project is approximately _____ acres of land (_____ square miles) and the proposed project area of disturbance is acres of land (see attached USGS map for activity location and receiving waters). Therefore, the required effluent NTU appropriate to the outfall is NTU, based on the guidelines provided in Appendix B of the permit.

Sampling Methods

Samples will be collected in accordance with the methodology outlined in the EPA guidance document named "NPDES Storm Water Sampling Guidance Document - EPA 833-B-92-001," an excerpt of which is included. All samples taken will be "grab samples." The samples collected are for a particular time and represent conditions at that moment.

The samples at this site are anticipated to be collected with an automatic sampler. All samples will be collected from the sampler no later than one business day after they are taken. The sample containers will be large-mouthed plastic jars with a minimum sample size of 100 milliliters. All sampling equipment will be thoroughly cleaned before any samples are taken, and care will be taken during sampling to avoid contamination by not stirring excess bottom debris in the channel or outfall, and by avoiding floating debris in the channel. Sample bottles will be labeled prior to sampling, if taken to a laboratory for testing. All samples will be taken in an area where the water is well mixed.

The samples will be well mixed prior to any transfer to a secondary container. (i.e. turbidity test vial). Samples will be analyzed within 48 hours of collection for turbidity in NTU in accordance with methodology and test procedures described in 40 CFR Part 136: EPA Method I-3860-85. A sampling narrative is required, which includes (for each sampling location) precise sampling methodology and the analytical method used to collect and analyze the samples. Operation of meters for turbidity analyses will follow manufacture's specifications. Samples taken from the Carmax Facility Development construction site are anticipated to be tested with an on site meter by qualified personnel. As necessary, samples will be submitted to an analytical laboratory for testing.

Monitoring records will be maintained for all sampling events. These records will include at a minimum:

* The facility name and address;
* Name of the analyst;
* Location of sample;
* Sample ID;
* Date and time of measurement;
* Date and time of analysis; and
* Name/model number of the analyzer instrument
* The analytical method used to collect and analyze the samples including quality control/quality assurance procedures. The narrative must include precise sampling methodology for each sampling location.

For all samples sent to a laboratory for analysis, a chain of custody will be implemented. If sampling equipment malfunctions or if vandalism, equipment loss, or other unforeseen circumstances prevent the collection of a sample, the situation will be reported in the sampling report and in the monthly report to (provide the name of the Governing Municipal Agency).

Sampling Frequency

All samples must be collected within 45 minutes of the accumulation of the specified rainfall amount. If discharge from an outfall begins after a minimum accumulation of rainfall, then a sample must be collected within 45 minutes of the first discharge from the outfall after a qualifying event. Sampling after each qualifying event will continue until the (NOT) is submitted with the final sampling data. Qualifying events are defined as:

a). For each area of the site that discharges to a receiving stream, the first rain event that reaches or exceeds 0.5 inch and allows for monitoring during normal business hours* (Monday thru Friday, 8:00 AM to 5:00 PM and Saturday, 8:00 AM to 5:00 PM when construction activity is being conducted by the Primary permittee) that occurs after all clearing and grubbing operations have been completed in the drainage area of the location selected as the representative sampling location; and

b). In addition to (a) above, for each area of the site that discharges to a receiving stream, the first rain event that reaches or exceeds 0.5 inch and allows for monitoring during normal business hours* that occurs either 90 days after the first sampling event or after all mass grading operations have been completed in the drainage area of the location selected as the representative sampling location, whichever comes first;

c). At the time of sampling performed pursuant to (a) and (b) above, if BMPs are found to be properly designed, installed and maintained, no further action is required. If BMPs in any area of the site that discharges to a receiving stream are not properly designed, installed and maintained, corrective action shall be defined and implemented within 2 business days, and turbidity samples shall be taken from discharges from that area of the site for each subsequent rain event that reaches or exceeds 0.5 inch during normal business hours* until the selected turbidity standard is attained, or until post-storm event inspections determine that BMPs are properly designed, installed and maintained; and

d). Existing construction activities, i.e., those that are occurring on or before the effective date of this permit, that have met the sampling required by (a) above shall sample in accordance with (b). Those existing construction activities that have met the sampling required by (b) above shall not be required to conduct additional sampling other than as required by (c) above.

*Note that the Permittee may choose to meet the requirements of (a) and (b) above by collecting turbidity samples from any rain event that reaches or exceeds 0.5 inch and allows for monitoring at any time of the day or week.

After construction is completed and the disturbed land has been stabilized, the final sampling event will take place within 45 minutes of the first storm of at least 0.5 inches or more within a 24-hour period.

If it is determined that BMP's are not properly designed, installed, or maintained in accordance with the permit, qualifying events will be re-defined as any storm greater than 0.5 inches in a 24 hour period. Sampling at this schedule will continue until the first rainfall event after the BMP's are deemed properly designed, installed, and maintained.

Any analysis of additional sampling taken beyond the minimum frequency defined above must be included in the sampling reports sent to (provide the name of the Governing Municipal Agency). Multiple samples taken in the same location may be averaged to comply with the standards outlined in the permit, but no analyzed data may be eliminated from the reporting.

Sampling Narrative

There are _____ proposed monitoring/sampling location shown on the Erosion, Sedimentation & Pollution Control Plan. The following is a narrative describing the proposed monitoring/sampling locations:

Sampling Point #1: Station #1 is located at the outlet pipe of the storm water management Detention Pond #1 that has been designed to attenuate the storm water runoff from the subject site. This location is designated as an out-fall sampling point for discharge from the proposed detention pond. (see the USGS Quadrant Map for activity location and receiving waters). The allowable NTU limit for this sampling station is ____ NTU's.

Sampling Point #2: Station #2 is located at the outlet pipe of the storm water management Detention Pond #2 that has been designed to attenuate the storm water runoff from the subject site. This location is designated as an out-fall sampling point for discharge from the proposed detention pond. (see the USGS Quadrant Map for activity location and receiving waters). The allowable NTU limit for this sampling station is _____ NTU's.

BMP MAINTENANCE (Note: Modify as applicable to the BMP's installed on the subject project)

Permittee Requirements

To maintain the efficiency of the BMPs, maintenance procedures will follow those specified in the (provide the name of the applicable erosion control document mandated by the State in which the project is to be constructed).

Construction Entrance/Exit (Co) - The construction entrance/exit will be inspected each day that construction activity occurs. Efforts must be made to prevent dirt, sediment, or mud flow onto any paved area. Maintenance to the entrance/exit may include top dressing of the road with 1.5 to 3.5-inch stone. Clean out and/or repair of any structures in place to trap sediment. Any material that escapes from the site onto any paved area including public rights-of-way will be immediately removed.

Disturbed Area Stabilization (Ds1, Ds2, Ds3) - Mulch or temporary grassing must be monitored to ensure that a continuous 90% cover is maintained. After seeding of permanent vegetation, the planted area must be monitored to ensure germination of the entire area.

Erosion Control Matting and Blankets (Mb) - All erosion control blankets and matting should be inspected periodically following installation, particularly after rainstorms to check for erosion and undermining. Any dislocation or failure should be repaired immediately. If washouts or breakage occurs, reinstall the material after repairing damage to the slope or ditch. Continue to monitor these areas until they become permanently stabilized.

Silt Fences and haybales (Sd1) - The barriers will be inspected weekly and after each rain event, with repairs or replacement being performed as needed. Additional barriers will be installed on site as needed to trap sediment. Sediment will be removed once it accumulates to one-half the original height of the barrier. The filter fabric will be replaced if it becomes deteriorated to a point where its effectiveness is reduced (approximately every 6 months). Sediment controls will remain until the site is permanently stabilized. Once the site is permanently stabilized, all sediment accumulated behind a barrier must be removed and properly salvaged or disposed of prior to removal of the barrier.

Inlet Sediment Traps (Sd2) - The barriers will be inspected weekly and after each rain event, with repairs or replacement being performed as needed. Additional barriers will be installed on site as needed to trap sediment. Sediment will be removed once it accumulates to one-half the original height of the barrier. The filter fabric will be replaced if it becomes deteriorated to a point where its effectiveness is reduced (approximately every 6 months). Sediment controls will remain until the site is permanently stabilized. Once the site is permanently stabilized, all sediment accumulated behind a barrier must be removed and properly salvaged or disposed of prior to removal of the barrier.

Storm Drain Outlet Protection (St) - Inspect riprap outlet structures weekly and after each rain event to determine if any erosion around or below the riprap has taken place or if stones have been dislodged. Conduct all needed repairs immediately to prevent further damage.

Filter Ring (Fr) - The filter ring must be kept clear of trash and debris. This will require continuous monitoring and maintenance, which includes sediment removal when one-half full. Structures are temporary and should be removed when the land-disturbing project has been stabilized.

Retrofit (Rt) - Repair all damages caused by soil erosion or construction equipment at or before the end of each working day. Sediment shall be removed from the pond when it reaches the specified depth on the silt gauge. Sediment shall not enter adjacent streams or drainage ways during sediment removal or disposal. The sediment shall not be deposited downstream from the embankment, adjacent to stream or floodplain.

REPORTING

All monitoring results will be submitted to the (provide the name of the appropriate Governing Municipal Agency) at the address noted below, by the fifteenth day of the month following the reporting period. Reporting periods are months during which samples are taken in accordance with the GAR 100001 permit. Upon written notification, the (provide the name of the appropriate Governing Municipal Agency) may require the permittee to submit the monitoring results on a more frequent basis. Results for the Carmax Facility Development project, which is located in (City or Town), (State), will be submitted by **return receipt certified mail** (or similar service) to the following address:

(Provide the name and address of the appropriate Governing Municipal Agency)

(phone number)

These monitoring reports will, at minimum, include:

* The date, exact place, and time of sampling;
* The name of the qualified personnel conducting the sampling;
* The date the analyses were performed;
* The time the analyses were initiated;
* The name of the individual conducting the analyses;
* References and written procedures, when available, for the analytical techniques or methods used;
* The results of the analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc. used to determine these results;
* Results which exceed 1000 NTU shall be reported as "exceeds 1000 NTU."

If no qualifying rain event occurs during a month, a monitoring report must be filed detailing such. The monitoring reports will continue to be filed with (provide the name of the Governing Municipal Agency) until the (NOT) is submitted. The (NOT) for the Carmax Facility Development project will be submitted once all construction activities have ceased, final stabilization techniques have been implemented, and the site is in compliance with the permit. The (NOT) will include the following information corresponding to the information previously submitted in the (NOI):

* The permittee's legal name, address, and phone number;
* The site/project name, site location, and GPS location of the site;
* The NPDES permit number for the storm water discharge associated with construction activity identified by the (NOT);
* A copy of the final monitoring report; and
* The name of all receiving waters.
* Certification statement signed by a corporate officer.

DOCUMENT PRESERVATION

The Erosion, Sedimentation and Pollution Control Plan and the Comprehensive Monitoring Program Plan will be retained at the corporate offices of Carmax.

The following record documents should be maintained for a period of at least 3 years after the date of final stabilization including:

* Copy of (NOI), including any backup information and all data used to complete the (NOI)
* Copy of (NOT), including any backup information
* Site plans
* Inspection summaries
* Monitoring reports including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation.

The document preservation period for these records will be extended if a written request is received from (provide the name of the Governing Municipal Agency). The Carmax Facility Development project records will be maintained at the corporate offices of Carmax, (i.e., primary permittee) once all construction activities on site have ceased.

The Erosion, Sedimentation and Pollution Control Plan and the Comprehensive Monitoring Program Plan were developed to be a dynamic document. It should represent current site conditions. Documentation may include adding an addendum page to the Plans or making written corrections for small changes. All major changes and amendments to the Erosion, Sedimentation and Pollution Control Plan and the Comprehensive Monitoring Program Plan, such as changing sampling locations, must be certified by a licensed professional.

SITE DESCRIPTION

This Comprehensive Monitoring Plan (CMP) has been prepared to meet the requirements under the General Permit No. GAR 100001 for Authorization to Discharge under the National Pollutant Discharge Elimination System (NPDES), Storm Water Discharges Associated with Construction Activities For Stand Alone Construction Projects, under the State of _____, Environmental Protection Division (EPD). The Carmax Facility Development Site Activities will disturb an area of approximately _____ acres, subsequently, a Notice of Intent (NOI), Erosion, Sedimentation and Pollution Control Plan (ES&PC), Comprehensive Monitoring Plan (CMP), and a Notice of Termination (NOT) are required for the site. The ES&PC Plan and the (CMP) will be kept at the corporate offices of Carmax and will be updated when erosion controls on site are modified to improve erosion and sediment control. The (NOT) will be submitted after Construction and final site stabilization is completed.

Carmax has identified the need to construct the _____ s.f. automobile dealership facility in (City or Town), (State). The proposed project is located on a _____ acre tract of land in (City or Town), (State). Currently, the majority of the site is (give brief description of the existing site conditions, wooded, partially developed, etc...). The surface water body that will be receiving the proposed discharge from this site (is or is not)located on the subject property. The receiving surface water body for storm water runoff from this site is (provide description of receiving waters). Please see the site USDA Quad map for reference.

The project includes construction of the _____ s.f. Sales and Service buildings with the accompanying _____ vehicle parking area, storm water management facilities, and other infrastructure to support the facility. The proposed site is located in a generally _____ area of (City or Town), (State). The site is bound on the north by _____, on the east by _____, on the west by _____ and on the south by _____. The site is comprised of _____ drainage basins, in which _____ basin drains to the (north, south, east or west) as sheet flow and the _____ basin drains to the (north, south, east or west) as sheet flow. The Carmax Facility Development Site construction activities will disturb approximately _____ acres of land. Final stabilization of the construction area is anticipated to occur 12 months after the beginning of construction. For additional information see the Site Map and Anticipated Activity Schedule included on the attached drawings.

Erosion and sedimentation control requirements for this site were explained in the accompanying ES&PC Plan dated _____. The comprehensive monitoring program details the monitoring and reporting steps required under the permit. Storm water from the Carmax Facility Development Site will ultimately be routed from the proposed storm water management conveyance systems into the existing drainage swales which exit the subject property along its (northern, southern, eastern or western) property boundary lines. Outfall sampling will be utilized for the required site storm water monitoring; this is discussed in further detail in Section 9, Sampling. The location of the outfall, streams or other bodies of water, receiving waters, and sampling locations are indicated on the Comprehensive Monitoring Program Plan (CMP1.0).

RAINFALL MONITORING

Rainfall measurements will be measured and recorded daily by automatic rain gauges. The gauges are to be mounted away from any other obstructions and inspected to ensure they are free from obstructions and debris. One gauge is to be utilized for each sampling device and inspected during the rainfall events to record the time the qualifying event occurs. One gauge must be designated as the primary measuring point for the purpose of daily rainfall measurements. If this gauge fails, another gauge may be used until a replacement is installed.

The design of the rainfall gauges requires the adjustment for the rainfall sensor to trigger the automatic sampler (if used as anticipated, please see Section 9 - Sampling). The sensor must be adjusted for the appropriate qualifying event. Sampling shall occur for the following events:

a. For each area of the site that discharges to a receiving stream, the first rain event that reaches of exceeds 0.5 inch and allows for monitoring during normal business hours* (Monday thru Friday, 8:00 AM to 5:00 PM and Saturday 8:00 AM to 5:00 PM when construction activity is being conducted by the Primary permittee) that occurs after all clearing and grubbing operations have been completed in the drainage area of the location selected as the representative sampling location;

b. In addition to (a.) above, for each area of the site that discharges to a receiving stream, the first rain event that reaches or exceeds 0.5 inch and allows for monitoring during normal business hours* that occurs either 90 days after the first sampling event or after all mass grading operations have been completed in the drainage area of the location selected as the representative sampling location, whichever comes first;

c. At the time of sampling performed pursuant to (a.) and (b.) above, if BMPs are found to be properly designed, installed and maintained, no further action is required. If BMPs in any area of the site that discharges to a receiving stream are not properly designed, installed and maintained, corrective action shall be defined and implemented within 2 business days, and turbidity samples shall be taken from discharges from that area of the site of each subsequent rain event that reaches or exceeds 0.5 inch during normal business hours* until the selected turbidity standard is attained, or until post-storm event inspections determine that BMPs are properly designed, installed and maintained; and

d. Existing construction activities, i.e., those that are occurring on or before the effective date of this permit, that have met the sampling required by (a.) above shall sample in accordance with (b.). Those existing construction activities that have met the sampling required by (b.) above shall not be required to conduct additional sampling other than as required by (c.) above.

* Note that the Permittee may choose to meet the requirements of (a.) and (b.) above by collecting turbidity samples from any rain event that reaches of exceeds 0.5 inch and allows for monitoring at any time of the day or week.

INSPECTIONS

Permittee Requirements

1). Each day when any type of construction activity has taken place, qualified personnel (i.e., a person who has successfully completed an erosion and sediment control short course approved by the (provide the name of the Governing Municipal Agency) shall:

* Inspect all areas at the site where petroleum products are stored, used, or handled for spills and leaks from vehicles and equipment.
* Inspect all locations at the site where vehicles enter or exit the site for evidence of off-site sediment tracking.
* Measure rainfall once each twenty-four hour period at the site.

These inspections must be conducted until a Notice of Termination is submitted.

2). Qualified personnel (provided by the primary permittee) shall inspect at least once every seven (7) calendar days and within 24 hours of the end of a storm that is 0.5 inches or greater:

* Disturbed areas of the site that have not undergone final stabilization.
* Areas used for storage of materials that are exposed to precipitation that have not undergone final stabilization.
* Structural control measures.

Erosion and sediment control measures identified in the Plan applicable to the site shall be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving water(s). For areas of a site that have undergone final stabilization, the permittee must comply with Part IV.D.3.a.(3) of the general permit no. GAR 100001. These inspections must be conducted until a Notice of Termination is submitted.

3). Qualified personnel (provided by the primary permittee) shall inspect at lease once per month (until a Notice of Termination is received by (provide the name of the Governing Municipal Agency)) the areas of the site that have undergone final stabilization. These areas shall be inspected for evidence of, or the potential for, pollutants entering the drainage system and the receiving water(s). Erosion and sediment control measures identified on the Erosion, Sedimentation and Pollution Control Plans (provide appropriate sheet numbers), shall be observed to ensure that they are operating correctly. Where discharge locations or points are accessible, they shall be inspected to ascertain whether erosion control measures are effective in preventing significant impacts to receiving waters.

4). Based on the results of each inspection, the site description and the pollution prevention and control measures identified in the Erosion, Sedimentation and Pollution Control Plans (provide appropriate sheet numbers), the Plans shall be revised as appropriate not later than seven (7) calendar days following each inspection. Implementation of such changes shall be made as soon as practical but in no case later than seven (7) calendar days following each inspection.

A report summarizing the scope of each inspection, will, at a minimum, include the name of the qualified personnel making the inspection, the date of the inspection, major observations during the inspection relating to the implementation of the Erosion, Sedimentation and Pollution Control Plan (provide appropriate sheet numbers), and any foreseen revisions to the plan, shall be made and retained at the site or be readily available at a designated alternate location until the entire site or that portion of a construction project that has been phased has undergone final stabilization and a Notice of Termination is submitted to EPD. The reports will also identify any incidents of non-compliance. Where the report does not identify any incidents of non-compliance, the report shall contain a certification that the facility is in compliance with the Erosion, Sedimentation and Pollution Control Plan and this permit. The report shall be signed in accordance with Part V.G. of the GAR 100001 permit. Reports of all inspections will be retained and readily available at the corporate offices of Carmax.

C10.5
SHEET NO

TURBIDITY
EPA Method 180.1 (Nephelometric)
Approved for NPDES and SDWA
Issued 1971; Editorial revisions 1974 and 1978
Store no. 00076

1. Scope and Application
1.1 This method is applicable to drinking, surface, and saline waters in the range of turbidity from 0 to 40 nephelometric turbidity units (NTU). Higher values may be obtained with dilution of the sample.
NOTE 1: NTU's are considered comparable to the previously reported Formazin Turbidity Units (FTU) and Jackson Turbidity Units (JTU).

2. Summary of Method
2.1 This method is based upon a comparison of the intensity of ligJbt scattered by the sample under defined conditions with the intensity of light scattered by a standard reference suspension. The higher, the intensity of scattered light, the higher the turbidity. Readings, in NTU's, are made in a nephelometer designed according to specifications outlined in Apparatus. A standard suspension of FormaTin, prepared under closely defined conditions, is used to calibrate the instrument
2.1.1 Formazin polymer is used as the turbidity reference suspension for water because it is more reproducible than other types of standards previously used for turbidity standards.
2.1.2 A commercially available polymer standard is also approved for use for the National Interim Primary Drinking Water Regulations. This standard is identified as AMCO-AEPA-1 available from Amoco Standard International, Inc.

3. Sample Handling and Preservation
3.1 Preservation of the sample is not practical; analysis should begin as soon as possible. Refrigeration or icing to 4°C, to minimize microbiological decomposition of solids, is recommended.

4. Interferences
4.1 The presence of floating debris and coarse sediments which settle out rapidly will give low readings. Finely divided air bubbles will affect the results in a positive manner.
4.2 The presence of true color, that is the color of water which is due to dissolved substances which absorb light, will cause turbidities to be low, although this effect is generally not significant with finished waters.

5. Apparatus
5.1 The turbidimeter shall consist of a nephelometer with light source for illuminating the sample and one or more photo-electric detectors with a readout device to indicate the intensity of light scattered at right angles to the path of the incident light The turbidimeter should be so designed that little stray light reaches the detector in the absence of turbidity and should be free from significant drift after a short warm-up period.
5.2 The sensitivity of the instrument should permit detection of a turbidity difference of 0.02 unit or less in waters having turbidities less than 1 unit The instrument should measure from 0 to 40 units turbidity. Several ranges will be necessary to obtain both adequate coverage and sufficient sensitivity for low turbidities.
5.3 The sample tubes to be used with the available instrument must be of clear, colorless glass. They should be kept scrupulously clean, both inside and out, and discarded when they become scratched or etched. They must not be handled at *all* where the Light strikes them, but should be provided with sufficient extra length, or with a protective case, so that they may be handled.
5.4 Differences in physical design of turbidimeters will cause differences in measured values for turbidity even though the same suspension is used for calibration. To minimize such differences, the following design criteria should be observed:
5.4.1 Light source: Tungsten lamp operated at a color temperature between 2200-3000° K.
5.4.2 Distance traversed by incident light and scattered light within the sample tube: Total not to exceed 10 cm.
5.4.3 Detector: Centered at 90° to the incident light path and not to exceed ±30° from 90°. The Detector and filter system, if used, shall have a spectral peak response between 400 and 600 nm.
5.5 The Hatch Turbidimeter, Model 2100 and 2100A, is in wide use and has been found to be reliable; however, other instruments meeting the above design criteria are acceptable.

6. Reagents
6.1 Turbidity-free water: Pass distilled water through a 0.45*u* pore size membrane filter if such filtered water shows a lower turbidity than the distilled water.
6.2 Stock formazin turbidity suspension:
Solution. 1: Dissolve 1.00g hydrazine sulfate, (NH2),*H2SO4, in distilled water and dilute to 100 ml in a volumetric flask.
Solution 2: Dissolve 10.00g hexamemylenetetramine in distilled water and dilute to 100 ml in a volumetric flask.
In a 100 ml volumetric flask, mix 5.0 ml Solution 1 with 5.0 ml Solution 2. Allow to stand 24 hours at 25 ±3°C, then dilute to the mark and mix.
6.3 Standard formazin turbidity suspension: Dilute 10.00ml stock turbidity suspension to 100ml with turbidity-free water. The turbidity of this suspension is defined as 40 units. Dilute portions of the standard turbidity suspension with turbidity-free water as required.
6.3.1 A new stock turbidity suspension should be prepared each month. The standard turbidity suspension and dilute turbidity standards should be prepared weekly by dilution of the stock turbidity suspension.
6.4 The AMCO-AEPA-1 standard as supplied requires no preparation or dilution prior to use.

7. Procedure
7.1 Turbidimeter calibration: The manufacturer's operating instructions should be followed. Measure standards on the turbidimeter covering the range of interest. If the instrument is already calibrated in standard turbidity units, this procedure will check the accuracy of the calibration scales. At least one standard should be run in each instrument range to be used. Some instruments permit adjustments of sensitivity so that scale values will correspond to turbidities. Reliance on a manufacturer's solid scattering standard for setting overall instrument sensitivity for all ranges is not an acceptable practice unless the turbidimeter has been shown to be free of drift on all ranges. If a pre-calibrated scale is not supplied, then calibration curves should be prepared for each range of the instrument.
7.2 Turbidities less than 40 units: Shake the sample to thoroughly disperse the solids. Wait until air bubbles disappear, then pour the sample into the turbidimeter tube. Read the turbidity directly from the instrument scale or from the appropriate calibration curve.
7.3 Turbidities exceeding 40 units: Dilute the sample with one or more volumes of turbidity-free water until the turbidity falls below 40 units. The turbidity of the original sample is then computed from the turbidity of the diluted sample and the dilution factor. For example, if 5 volumes of turbidity-free water were added to 1 volume of sample, and the diluted sample showed a turbidity of 30 units, then the turbidity of fee original sample was 180 units.
7.3.1 The Hach Turbidimeters, Models 2100 and 2100A, are equipped with 5 separate scales: 0-0.2, 0-1.0, 0-100, and 0-1000 NTU. The upper scales are to be used only as indicators of required dilution volumes to reduce readings to less than 40 NTU. **NOTE 2**: Comparative work performed in the MDQAR Laboratory indicates a progressive error on sample turbidities in excess of 40 units.

8. Calculation
8.1 Multiply sample readings by appropriate dilution to obtain final reading.
8.2 Report results as follows:

NTU	Record to Nearest:
0,0-1.0	0.05
1-10	0.1
10-40	1
40-100	5
100-400	10
400-1000	50
>1000	100

9. Precision and Accuracy
9.1 In a single laboratory (EMSL), using surface water samples at levels of 26, 41, 75 and 180 NTU, the standard deviations were ±0.60, ±0.94, ±1.2 and ±4.7 units, respectively.
9.2 Accuracy data are not available at this time.

Excerpts from NPDES Storm Water Sampling Guidance Document (Page 67-70; 119-123)
United States Environmental Protection Agency
Office of Water (EN-336)
EPA 833-B-92-001
July 1992

6. Health and Safety

Storm water sampling activities may occur when the sampling environment and/or storm water discharges create hazardous conditions. Hazardous conditions associated with sampling include:

· Hazardous weather conditions (e.g. wind, lightning, flooding, etc.)
· Sampling in confined spaces (e.g. manholes)
· Hazards associated with chemicals
· Biological hazards (e.g. rodents and snakes)
· Physical hazards (e.g. traffic, falling objects, sharp edges, slippery footing, and the potential for lifting injuries from opening or removing access panels an manhole covers, etc.)

It is essential that sampling personnel be aware of these hazards. Sampling personnel should be trained to evaluate potentially hazardous situations and develop ways for handling them. Since sampling hazards can be life threatening, safety must be the highest priority for all personnel. This chapter outlines general health and safety issues and concerns. Additional references discussed below should be consulted for more specific guidance to avoid adverse health and safety situations.

6.1 General Training Requirements

Preparation and training of all sampling personnel should be completed before beginning any sampling task. Extreme care should be taken to allow for safety precautions including proper equipment and appropriate operational techniques, sufficient time to accomplish the task, training on potential hazards, and emergency procedures. EPA's Order 1440.2 sets out the policy, responsibilities, and mandatory requirements for the safety of personnel who are involved in sampling activities. This order, which is found within the EPD NPDES Compliance Monitoring Inspector Training: Sampling manual provides further guidance to applicants' storm water sampling personnel. Basic emergency precautions include having access to both local emergency phone numbers and communication equipment (i.e. phones or radios), and ensuring that personnel are trained in first aid and carry first aid equipment.

6.2 Necessary Safety Equipment

Exhibit 6-1 contains a list of safety equipment that may be appropriate depending on the characteristics of the sampling site.
Exhibit 6-1: List of Safety Equipment
Flashlight18-inch traffic cones, Meters (for oxygen, explosivity, toxic gasses)Insect/rodent repellant, Ladder, Ventilation equipment, Safety harness50 feet of ½ inch nylon rope, Hard hat, Safety shoes, Safety goggles, Rain wear, Coveralls, Gloves (rubber)qRespiratorFirst aid kit, Reflective vestsSelf-contained breathing apparatus, Source: Adapted from NPDES Compliance Monitoring Inspector Training: Sampling, U.S. EPA, August 1990

6.3 Hazardous Weather Conditions

Common sense should dictate whether sampling be conducted during adverse weather conditions. No sampling personnel should place themselves in danger during high winds, lightening storms, or flooding conditions which might be unsafe. Under extreme conditions, a less hazardous storm event should be sampled.

6.4 Sampling in Confined Spaces

Confined spaces encountered by storm water sampling personnel typically include manholes and deep, unventilated ditches. A confined space is generally defined as a space that is somewhat enclosed with limited access and inadequate ventilation.

The National Institute of Occupational Safety and Health (NIOSH) has developed a manual entitled "Working in Confined Spaces" which should be consulted prior to confined space entry. Also, several states have developed specific procedures, which should be consulted. Unless they have been trained for confined space entry, sampling personnel should avoid entry under all circumstances.

6.4.1 Hazardous Conditions in Confined Spaces

Confined spaces pose a threat to sampling personnel because of low oxygen, explosivity, and toxic gases. When entering a confined space, a qualified person should ensure that the atmosphere is safe by sampling to test for oxygen levels, potential flammable hazards, and toxic materials known or suspected to be present. If atmospheric conditions are detected, the confined space should be ventilated or sampling personnel should use a self-contained air supply and wear a lifeline. At least one person should remain outside of the confined space in the event that problems arise. If atmospheric testing has not been properly conducted, the confined space should not be entered. Manholes can also pose a threat to safety because of the small confined area, slippery surfaces, sharp objects, unsafe ladders, etc.

6.4.2 Special Training Requirements

Personnel should not enter into a confined space unless trained in confined space entry techniques. Such training covers hazard recognition, the use of respiratory equipment and atmospheric testing devices, use of special equipment and tools, and emergency rescue procedures. In addition, at least one member of the sampling crew should be certified in basic first aid and Cardiopulmonary Resuscitation (CPR). Sampling personnel should, on an annual basis, practice confined space rescues.

6.4.3 Permit System

If entry into a confined space is necessary, an entry permit system should be developed which includes a written procedure. This permit should include, at a minimum:

· Description of work to be done
· Hazards that may be encountered
· Location and description of the confined space
· Information on atmospheric conditions at confined space
· Personnel training and emergency procedures
· Names of sampling personnel

The manual developed by NIOSH discusses this permit system in more detail. Furthermore, the Occupational Safety and Health Administration (OSHA) proposed a rule on June 5, 1989 (54 FR 24080) that would implement a permit system.

6.5 Chemical Hazards

Sampling personnel can also be at risk of exposure to hazardous chemicals - either chemical in the actual storm water discharge or the chemicals that have been placed in the sample collection containers for sample preservation. Therefore, direct contact with the preservatives and the storm water (if hazardous chemicals are suspected to be present) should be avoided. Sampling personnel should wear gloves and safety glasses to avoid skin and eye exposure to harmful chemicals. Sampling personnel should be trained to avoid exposure and instructed as to what to do if exposure occurs (e.g. flush the eyes, rinse the skin, ventilate the area, etc.).

6.6 Biological Hazards

Storm water sampling personnel may also encounter biological hazards such as rodents, snakes, and insects. The sampling crew should remain alert to these hazards. As mentioned in Section 6.2 necessary sampling equipment, for certain locations, should include repellent and a first aid kit.

6.7 Physical Hazards

The sampling crew should be aware of a number of physical hazards that could cause incidents at the sampling site. These hazards include traffic hazards, sharp edges, falling objects, slippery footing, and lifting injuries from removing manhole covers. Sampling personnel should pay close attention in order to prevent these safety hazards at all times.

If the sample point is in a manhole, a street gutter, or a ditch near the street, particular attention must be given to marking off the work area to warn oncoming traffic of the presence of the sampling crew. Traffic cones, warning signs, and barricades should be placed in appropriate places around the sampling point.

3.2.6 Measuring Rainfall

Many types of instruments have been developed to measure the amount and intensity of precipitation. All forms of precipitation are measured on the basis of depth of the water that would accumulate on a level surface if precipitation remained where it fell. There are two types of rain gauges - standard and recording gauges. A standard rain gauge collects the rainfall so that the amount of rain can be easily measured. The standard gauge for the NWS has a collector, which is 8 inches in diameter. Rain flows from the collector into a cylindrical measuring tube inside the overflow can. The measuring tube has a cross-sectional area one-tenth the size of the collector so that 0.1-inch of rainfall will fill 1 inch of the measuring tube. While this standard gauge is both accurate and easy to use, any open receptacle with vertical sides can be an effective rain gauge. Standard rain gauges are simple and inexpensive; however, with a standard gauge, there is no way to record the changes in the intensity of the rainfall without making frequent observations of the gauge during the storm.

The second type of gauge is the recording rain gauge, which provides a permanent record of the amount of rainfall which accumulates over time. These common types of recording gauges are:

· Tipping Bucket Gauge - Water caught in a collector is funneled into a two-component bucket; a know quantity of rain fills one compartment, overbalancing the bucket and emptying it into a reservoir. This moves the second bucket into place beneath the funnel. The tipping of the bucket engages an electric circuit, which records the event.
· Weighing Type Gauge - Water is weighed when it falls into a bucket placed on the platform of a spring or lever balance. The weight of the contents is recorded on a chart, showing the accumulation of precipitation.
· Float Recording Gauge - Water is measured by the rise of a float that is placed in the receiver. These gauges may be self-siphoning, or may need to be emptied periodically by hand.

Recording rain gauges provide a permanent record of rainfall, and they can be used to determine variations in rainfall intensity over time without making frequent observations during the storm. But recording gauges are more complicated mechanically than standard gauges, making them more costly, less durable, and more difficult to operate.

Although all gauges are subject to error, most errors can be minimized. To minimize errors, the gauge should be placed on a level surface that is not windswept and is away from trees or buildings that might interfere with the path of rainfall. When taking measurements, other factors contributing to error should also be considered: mistakes in reading the scale, dents in the collector rim (which change the receiving area), measuring sticks that may retain some of the water, and water lost to evaporation. In the case of tipping bucket gauges, water may not be collected while the bucket is still tipping. The most common source of inaccuracy is changes in data that are attributable to wind. It is possible to assess wind errors by comparing measurements of gauges that are protected from wind with those that are not.

3.3 Grab Sample Collection

Section 3.1.2 discussed both the parameters that must be monitored by grab samples and the conditions under which grab sampling is required. This section explains how to collect grab samples. The entire sample is collected at an uninterrupted interval (i.e. grabbed at one time). A grab sample provides information on the characterization of storm water at a given time and may be collected either manually or automatically as discussed below.

3.3.1 How to Manually Collect Grab Samples

A manual grab is collected by inserting a container under a downcurrent of a discharge with the container opening facing upstream. Generally, simplified equipment and procedures can be used. In most cases, the sample container itself may be used to collect the sample. Less accessible outfalls may require the use of poles and buckets to collect grab samples. To ensure the manual grab samples are representative of the storm water discharged, the procedure set forth in Exhibit 3-17 should be followed.

Exhibit 3-17. Recommended Operating Procedures for Taking Grab Samples

· Label sample containers before sampling event
· Take a cooler with ice to the sampling point
· Take the grab from the horizontal and vertical center of the channel
· Avoid stirring up the bottom sediments in the channel
· Hold the container so the opening faces upstream
· Avoid touching the inside of the container to prevent contamination
· Keep the sample free from uncharacteristic floating debris
· Transfer samples into proper containers (e.g. from bucket to sample container), however, fecal coliform, fecal streptococcus, phenols, and O&G should remain in original containers
· If taking numerous grabs, keep the samples separate and labeled clearly
· Use safety precautions (see Chapter 6)

Specialized equipment may be needed, particularly in situations where storm water discharges are inaccessible or where certain parameters are monitored. For example:

· When sampling for O&G and VOCs equipment that safely and securely houses O&G bottles or VOC vials should be used. This may be necessary because: (1) O&G will adhere to containers and thus should not be transferred from one container to another; and (2) excessive aeration during sampling may result in the partial escape of VOCs.
· Since facilities sometimes use sample bottles that already contain preservatives (as provided by correct laboratories), extreme care should be taken when filling them to avoid spills, splatters, or washout of preservatives.

All equipment and containers that come into contact with the sample must be clean to avoid contamination. Additionally, sample collection equipment and container materials should be totally unreactive to prevent leaching of pollutants. Cleaning procedures are discussed in detail in Section 3.5.

3.3.2 How to Collect Grab Samples by Automatic Sampler

Grab samples can also be collected using programmed automatic samplers. Automatic samplers come equipped with computers that can be programmed to collect grab samples. Programming for grabs is specific to the type of automatic sampler. Some samplers are portable and have been developed specifically to sample for storm water discharges. These samplers are frequently attached to a rain gauge and/or a flow sensor. Such samplers can be programmed to initiate sample collection by one or more of the following conditions: (1) depth of flow in a channel; (2) rainfall in inches; (3) flow rate; (4) time; (5) external signal; and (6) combinations of the first three conditions. For example, an automatic sampler could be used to collect a sample at 15-minute intervals after its sensors indicate that rainfall has begun.

When using an automatic sampler, planning is very important. First, all equipment must be properly cleaned, particularly the tubing and the sample containers. There are several different types of tubing available, including rubber and Tygon tubing. Tygon tubing is commonly used since it does not leach contaminants. Deionized water should be drawn through the sampler to remove any remaining pollutant residuals prior to taking samples. Tubing should also be drawn through the sampler to remove any remaining pollutant residuals prior to taking samples. Tubing should also be replaced periodically to avoid algae or bacterial growth.

Sampling personnel should also use adequate and appropriate containers to ensure they are properly cleaned. Section 3.5 contains information on cleaning procedures, which should be followed for all equipment. Additionally, the utilization of blanks (a control used to verify the accuracy of analytical results) is recommended to determine if cross-contamination of sampling equipment has occurred. Samplers should also be programmed, set up, and supplied with a source of power. Properly charged batteries should be readily available for portable samplers in advance of a storm event, and as a backup power supply in case of power failure. Finally, although automatic samplers may be useful in some situations, several parameters are not amenable to collection by automatic sampler. These pollutants include fecal streptococcus, fecal coliforms, oil and grease, and VOCs which should be collected manually, not automatically, as discussed in Section 3.1.2.

DESIGN GUIDELINES – HIGHWAY ACCESS/DRIVEWAY PLAN

(COORDINATE WITH LOCAL D.O.T. / HIGHWAY DEPT. REQUIREMENTS)

1. 4' SHOULDER SHALL BE REQUIRED BEHIND ALL CURB AND GUTTER SECTIONS.
2. ALL STRIPING IN THE R/W SHALL BE THERMOPLASTIC PER STATE REQUIREMENTS.
3. ANY EXISTING STRIPING IN CONFLICT WITH REQUIRED IMPROVEMENTS SHALL BE IN REMOVED ACCORDING TO STATE D.O.T. SPECIFICATIONS.
4. ALL WORK SHALL CONFORM TO STATE D.O.T. STANDARD SPECIFICATIONS.
5. LANDSCAPING SHALL CONFORM TO STATE D.O.T. STANDARD SPECIFICATION
6. STATE D.O.T. CERTIFIED FLAGGERS ARE REQUIRED WHEN USED IN TRAFFIC CONTROL OPERATIONS ON THIS PERMIT.
7. SILT AND EROSION CONTROLS SHALL BE INSTALLED AND MAINTAINED AS DEEMED NECESSARY BY THE STATE D.O.T. INSPECTOR.
8. DURING THE CONSTRUCTION OF THE DRIVEWAY AS AUTHORIZED BY THE PERMIT, THE APPLICANT SHALL MAINTAIN SUCH SIGNS AND OTHER SAFETY DEVICES AS THE FIELD INSPECTOR MAY DEEM NECESSARY TO PROPERLY PROTECT THE PUBLIC UPON THE HIGHWAY.
9. NO ADVERTISING OR PARKING PERMITTED ON STATE R/W. APPLICANT SHALL REGRASS TO STATE D.O.T. SPECIFICATIONS ALL STATE R/W AREAS WHICH ARE DAMAGED OR DISTURBED DURING WORK AUTHORIZED HEREIN. ALL REQUIRED WORK MUST BE COMPLETED BEFORE OPENING DRIVEWAY FOR PUBLIC USE.
10. CONTRACTOR SHALL CONSTRUCT ACCELERATION & DECELERATION LANE GRADE TO MATCH EXISTING ROADWAY GRADE OF ADJACENT TRAVEL LANE.
11. ALL SIGNS SHALL HAVE A MIN. 7' BOTTOM OF SIGN TO GROUND CLEARANCE AND BE INSTALLED ON A DOT STD. 4" PRESSURE TREATED WOOD POST OR 3" U CHANNEL GALV. STEEL POST.
12. ALL SAWCUTTING OF PAVEMENT REQUIRED TO SATISFY STATE D.O.T. SHALL BE AT THE EXPENSE OF THE CONTRACTOR.
13. SEE DETAIL SHEET FOR PAVEMENT SECTION AND CURB AND GUTTER DETAILS IN THE R/W.
14. NECESSARY BARRICADES, SUFFICIENT LIGHTS, SIGNS AND OTHER TRAFFIC CONTROL METHODS AS MAY BE NECESSARY FOR THE PROTECTION AND SAFETY OF THE PUBLIC SHALL BE PROVIDED AND MAINTAINED THROUGHOUT THE WIDENING OF AND CONSTRUCTION ON COUNTY ROADS.

DESIGN GUIDELINES – DEMOLITION PLAN

GENERAL NOTES:

1. DEMOLITION CONTRACTOR SHALL CONSTRUCT EROSION CONTROL MEASURES AS SHOWN ON THE EROSION CONTROL PLAN AS NECESSARY DURING DEMOLITION OPERATIONS OR AS DIRECTED BY THE ENGINEER, CITY OR COUNTY INSPECTOR TO PROTECT ADJACENT PROPERTIES AND WATER RESOURCES FROM SOIL EROSION AND SEDIMENTATION.
2. VARIATIONS TO CONDITIONS OR DISCREPANCIES IN ACTUAL FIELD CONDITIONS AS THEY APPLY TO THE DEMOLITION OR SITE DEVELOPMENT WORK MUST BE BROUGHT TO THE OWNER'S REPRESENTATIVE AND ENGINEER'S ATTENTION PRIOR TO THE COMMENCEMENT OF ANY DEMOLITION.
3. CONTRACTOR SHALL LOCATE, IDENTIFY, PROPERLY TERMINATE, AND MARK ALL EXISTING UTILITIES WITHIN THE DEMOLITION AREA THAT ARE TO REMAIN AND PROTECT THEM FROM DAMAGE.
4. THE DEMOLITION CONTRACTOR MUST NOTIFY ALL UTILITY COMPANIES, FIRE MARSHALL, AND OWNER'S REPRESENTATIVE PRIOR TO INTERUPTION OF ANY UTILITY SERVICE. NOTIFICATION MUST BE MADE PER THE PROJECT SPECIFICATIONS. THE DEMOLITION CONTRACTOR IS RESPONSIBLE FOR COORDINATION WITH AND ADHERENCE TO EACH UTILITY COMPANY'S AND FIRE MARSHAL'S REGULATIONS REGARDING SERVICE INTERUPTION.
5. THE DEMOLITION CONTRACTOR MUST PROTECT ALL LANDSCAPING AND OTHER FEATURES DESIGNATED TO REMAIN AND REPLACE SUCH ITEMS IF DISTURBED DURING DEMOLITION.
6. CONTRACTOR SHALL CONDUCT ALL DEMOLITION OPERATIONS WITH MINIMUM INTERFERENCE TO PUBLIC AND/OR PRIVATE ACCESSES AND FACILTIES. ALL AREAS OUTSIDE OF THE PAVEMENT REMOVAL LINE MUST BE MAINTAINED FOR PUBLIC ACCESS.
7. THE DEMOLITION CONTRACTOR MUST PROTECT BENCH MARKS, PROPERTY CORNERS, AND ALL OTHER SURVEY MONUMENTS FROM DAMAGE OR DISPLACEMENT. IF A MARKER MUST BE REMOVED, IT SHALL BE REPLACED BY A LICENSED LAND SURVEYOR AND REPLACED.
8. THE DEMOLITION CONTRACTOR SHALL PROVIDE TRAFFIC CONTROL MEASURES AS REQUIRED IN ACCORDANCE WITH THE U.S. DEPT. OF TRANSPORTATION "MUNUAL OF UNIFORM TRAFFIC CONTROL DEVICES" AND GOVERNING MUNICIPALITY REQUIREMENTS.
9. DEPRESSIONS AND VOID AREAS CAUSED BY DEMOLITION WORK ARE TO BE FILLED TO SUBGRADE AND PROPERLY COMPACTED TO THE EXISTING ELEVATION TO AVOID WATER PONDING.
10. THE DEMOLITION CONTRACTOR SHALL ACQUIRE ALL PERMITS AND PAY ALL ASSOCIATED FEES PERTAINING TO THE DEMOLITION AND DISPOSAL REQUIREMENTS. THE DEMOILITION CONTRACTOR IS RESPONSIBLE FOR ADHERENCE TO ALL LOCAL, STATE, AND FEDERAL REQUIREMENTS REGARDING THIS WORK. IF THERE ARE NO LOCAL, STATE OR FEDERAL REQUIREMENTS THE DEMOLITION CONTRACTOR SHALL ACQUIRE AN ENGINEERS CERTIFICATION THAT THE WORK HAS BEEN DONE IN ACCORDANCE WITH THE PLANS.
11. THE DEMOLITION CONTRACTOR SHALL COORDINATE THE DEMOLITION TO LEAVE ACCESS AND UTILITY SERVICE TO THE NEIGHBORING BUILDINGS AT ALL TIMES.
12. THE DEMOLITION CONTRACTOR SHALL FIELD LOCATE ,MARK AND PROTECT ALL EXISTING UTILITIES.

CHAPTER 1 - EXECUTIVE SUMMARY

1.1 – Introduction

The Carmax project site is located near the southwest corner of Plaza Drive and Thunder Drive in the City of Oceanside, California.

Runoff from the existing site surface flows to four points of discharge, two of them on Plaza Drive, one on Thunder Drive and the one to Buena Vista Creek.

The study analyzes existing and developed conditions for 100-year peak flowrates from the development to the existing points of discharge.

The southern portion of the property lies within Zone X of the FEMA 100-year floodplain (FEMA FIRM Panel 06073C0758G effective 5/16/19) and riparian buffer. However, development of the property will not encroach on either of these boundaries. Therefore, no Map Revision will be required.

Treatment of storm water runoff from the site has been addressed in a separate report – the “Storm Water Quality Management Plan for Carmax Oceanside”, dated November 2019 by REC. Hydromodification (HMP) analysis has been addressed in a separate report titled “Technical Memorandum: SWMM Modeling for Carmax Oceanside” dated November 2019 by REC.

Per County of San Diego drainage criteria the Modified Rational Method is used to determine peak design flowrates when the contributing drainage area is less than one square mile. Since the total watershed area discharging from the site is less than one square mile, AES computer software was used to model the pre- and post- developed condition runoff response per the Modified Rational Method.

Methodology used for the computation of design rainfall events, runoff coefficients, and rainfall intensity values are consistent with criteria set forth in the “County of San Diego Drainage Design Manual”. A more detailed explanation of methodology used for this analysis is listed in Chapter 2 of this report.

Developed condition peak flows were calculated using AES. The corresponding hydrographs were generated using the RickRat Hydro program by Rick Engineering. Hyraulic Modified-Puls detention basin routing of the AES rational method hydrology was performed using the Army Corps of Engineers HEC-HMS 4.2.1 software.

1.2 – Summary of Existing Conditions

In existing conditions, the Carmax project site is a vacant, previously graded lot. The site is divided into “North” and “South” portions separated by Plaza Drive.

Existing runoff from the north site drains via overland flow to the southwest corner of the site where it sheet flows over the existing berm and onto Plaza Drive. Runoff from the existing south site drains south towards Buena Vista Creek with a small portion draining east over the sidewalk and curb and onto Thunder Drive.

Per NOAA Precipitation Frequency Data Server, the 100-year design rainfall depth for the project site is 3.02 inches. The project runoff coefficient was calculated using the Caltrans Highway Design Manual. Figure 819.2A of the Highway Design Manual determines runoff coefficients for undeveloped areas based on watershed type. This table was used to determine the runoff coefficient of the site, calculations are summarized hereon:

Relief:	10% steep – 0.32 90% Normal – 0.17 (0.1)(0.32) + (0.9)(0.17) = 0.185
Soil Infiltration:	Soil type-D – 0.12
Vegetal Cover:	8% fair to good – 0.07 92% poor to fair – 0.12 (0.08)(0.07) + (0.92)(0.12) = 0.116
Storage:	Negligible – 0.11
Total*:*	(0.185) + (0.12) + (0.116) + (0.11) = 0.531
‘C’ Modification for Q100:	(0.531) $\times$ (1.25) = *0.66*

Thus a site coefficient of 0.66 is used for pre-development conditions.

Table 1 on the following page summarizes the existing condition design 100-year peak flow from the project site.

Table 1 – SUMMARY OF EXISTING CONDITIONS FLOWS

Discharge Location	Drainage Area (Ac)	Runoff Coefficient (C)	100-Year Peak Flow (cfs)
POC-1	1.44	0.66	5.11
POC-2	0.21	0.66	0.82
POC-3	6.89	0.66	23.74
POC-4	0.27	0.66	1.07
TOTAL	**8.81**		

1.3 – Summary of Developed Conditions

The north site is constructed solely of permeable pavement, therefore, pre- and post-development runoff remains constant. Runoff from the south site is directed to a proprietary underground detention system near the southeast corner of the site. Mitigated peak flows are then drained from the detention facility via a 24" storm drain to POC-3, at the southwest corner of the site, where runoff ultimately meets existing Buena Vista Creek.

Per NOAA Precipitation Frequency Data Server the design 100-year rainfall depth for the project site is 3.02 inches. The project runoff coefficient was calculated using the Caltrans Highway Design Manual. Figure 819.2B of the Highway Design Manual determines runoff coefficients for developed areas. This table was used to determine the runoff coefficient of the site, calculations are summarized hereon:

Type of Drainage Area: Parking lot and building – 0.75
(applicable to roofs, business with high density, multi-units, streets)

'C' Modification for Q100: $(0.75) \times (1.25) = \underline{0.94}$

Thus a site coefficient of 0.94 is used for post-development conditions. The developed site has an approximate impervious footprint of 5.798 acres.

Table 2 summarizes the unmitigated developed condition design 100-year peak flow from the project site.

Table 2 – SUMMARY OF UNMITIGATED - DEVELOPED CONDITIONS FLOWS

Discharge Location	Drainage Area (Ac)	Runoff Coefficient (C)	100-Year Peak Flow (cfs)
POC-1	1.44	0.66	5.59
POC-2	0.35	0.94	2.15
POC-3	6.89	0.94	44.38
POC-4	0.13	0.94	1.05
TOTAL	**8.81**		

Prior to discharging from the project site, first flush runoff will be treated via a underground open bottom proprietary BMP in accordance with standards set forth by the Regional Water Quality Control Board and the County of San Diego's BMP Design Manual (see "Storm Water Quality Management Plan for Carmax Oceanside").

Runoff from the developed site drains to a single onsite underground detention system. Peak flows are mitigated via this facility prior to discharging to the proprietary underground water quality system. Once through the proprietary underground water quality system, runoff will discharge to POC-3, the existing point of discharge from the site.

A summary of the detention basin is provided in Table 3.

Table 3 – SUMMARY OF UNDERGROUND BMP DIMENSIONS

1st Outlet:
Diameter: 2.3125"
Number of Orifices: 2
Invert Elev: 0.0' (invert of the tanks is assumed to be 0.0).

2nd Outlet:
Slot Dimensions: 12" wide by 2.5" tall.
Number of Slots: 3
Invert Elev: 1.25'

3rd Outlet:
Slot Dimensions: 15" wide by 8" tall.
Number of Slots: 3
Invert Elev: 2.25'

4th Outlet (Overspill):
Weir Length: 12 ft (3' x 3' opening)
Invert Elev: 3.75'

Notes:
(1): It is assumed WQ volume is to be treated after storm water leaves underground detention system. All elevations measured from the invert of the underground detention system.
(2): Depth of ponding beneath structure emergency spillway.
(3): Overflow length, the internal length of the emergency spillway.
(4): Total depth of underground BMP from soffit to invert.

The developed condition peak flows were calculated using the Modified Rational Method. The corresponding hydrographs were generated using the RickRat Hydro program by Rick Engineering (a 5 minute time step was used to generate the hydrograph as HMS only has time step allowances for 1,2,3,4,5,6 and 10 minute increments). This hydrograph was then routed through the proposed on-site detention facility in HEC-HMS. The HMS Modified-Puls results are summarized in Table 4.

Rational method hydrographs, stage-storage, stage-discharge relationships, outlet structure configurations and HEC-HMS model output is provided in Chapter 5 of this report.

Table 4 summarizes the peak inflow and discharge from the detention facility.

Table 4 – SUMMARY OF DETENTION ROUTING

Detention Basin	100-Year Peak Inflow (cfs)	100-Year Peak Outflow (cfs)	Peak Water Surface Elevation[(1)] (ft)
BMP-1	43.78	23.84	3.75

Notes: (1) Elevation above the first surface inlet invert.

1.4 – Summary of Results

Table 5 summarizes developed and existing condition drainage areas and resultant 100-year peak flow rates at the receiving discharge location from the Carmax site. Per NOAA Precipitation Frequency Data Server, the design 100-year rainfall depth for the site area is 3.02 inches.

Table 5 – SUMMARY OF PEAK FLOWS

Discharge Location	Area (ac)			100 Year Peak Flow (cfs)		
	Existing	Developed	Difference	Existing	Developed	Difference
POC-1	1.44	1.44	0.00	5.11	5.59	0.48
POC-2	0.21	0.35	0.14	0.82	2.15	1.33
POC-3	6.89	6.89	0.00	23.74	22.42	-1.32
POC-4	0.27	0.13	-0.14	1.07	1.05	-0.02

As illustrated in Table 5, the proposed Carmax project site will reduce peak flows for the large majority of the site. POC-1 and POC-2 at Plaza Drive increase slightly due to the widening and expansion of Plaza Drive. Runoff discharging at these POC's will make its way west towards the intersection of Highway 78 and Plaza Drive where said runoff enters curb inlets on the north and south sides of Plaza Drive, respectively. At final engineering the downstream curb inlets and pipes on the north and south sides of Plaza Drive will be examined to ensure existing capacity is adequate for additional runoff resulting from Plaza Drive expansion.

POC-3 is reduced by 1.32 cfs. POC-4 decreases by 0.02 cfs. POC-3 and POC-4 ultimately confluence at POC-3 in Buena Vista Creek, therefore, the total net increase of 0.49 cfs is insignificant as it discharges directly to a receiving water body. There will be no impact to downstream storm drains of flood channels.

All developed runoff will receive water quality treatment in accordance with the site specific SWQMP, whether that be treatment via proprietary BMP or green streets.

Final design details will be provided at the final engineering phase of the development.

1.5 – Hydraulic Analysis

Detailed hydraulic analysis to be provided at final engineering.

1.6 – Conclusions

This report has been prepared in accordance with the County of San Diego Hydrology Manual. This report has evaluated and addressed the potential impacts and proposed mitigation measures. A summary of the facts and findings associated with this project and the measures addressed by this report is as follows:

- The project will not alter drainage patterns on the site or increase net runoff after development.
- The ultimate discharge points will not be changed.
- Graded areas and slopes will be hydroseeded to reduce or eliminate sediment discharge.
- Hydraulic analysis to be provided at final engineering

CHAPTER 2 - METHODOLOGY

2.1 – County of San Diego Design Criteria

SECTION 3
RATIONAL METHOD AND MODIFIED RATIONAL METHOD

3.1 THE RATIONAL METHOD

The Rational Method (RM) is a mathematical formula used to determine the maximum runoff rate from a given rainfall. It has particular application in urban storm drainage, where it is used to estimate peak runoff rates from small urban and rural watersheds for the design of storm drains and small drainage structures. The RM is recommended for analyzing the runoff response from drainage areas up to approximately 1 square mile in size. It should not be used in instances where there is a junction of independent drainage systems or for drainage areas greater than approximately 1 square mile in size. In these instances, the Modified Rational Method (MRM) should be used for junctions of independent drainage systems in watersheds up to approximately 1 square mile in size (see Section 3.4); or the NRCS Hydrologic Method should be used for watersheds greater than approximately 1 square mile in size (see Section 4).

The RM can be applied using any design storm frequency (e.g., 100-year, 50-year, 10-year, etc.). The local agency determines the design storm frequency that must be used based on the type of project and specific local requirements. A discussion of design storm frequency is provided in Section 2.3 of this manual. A procedure has been developed that converts the 6-hour and 24-hour precipitation isopluvial map data to an Intensity-Duration curve that can be used for the rainfall intensity in the RM formula as shown in Figure 3-1. The RM is applicable to a 6-hour storm duration because the procedure uses Intensity-Duration Design Charts that are based on a 6-hour storm duration.

3.1.1 Rational Method Formula

The RM formula estimates the peak rate of runoff at any location in a watershed as a function of the drainage area (A), runoff coefficient (C), and rainfall intensity (I) for a duration equal to the time of concentration (T_c), which is the time required for water to

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

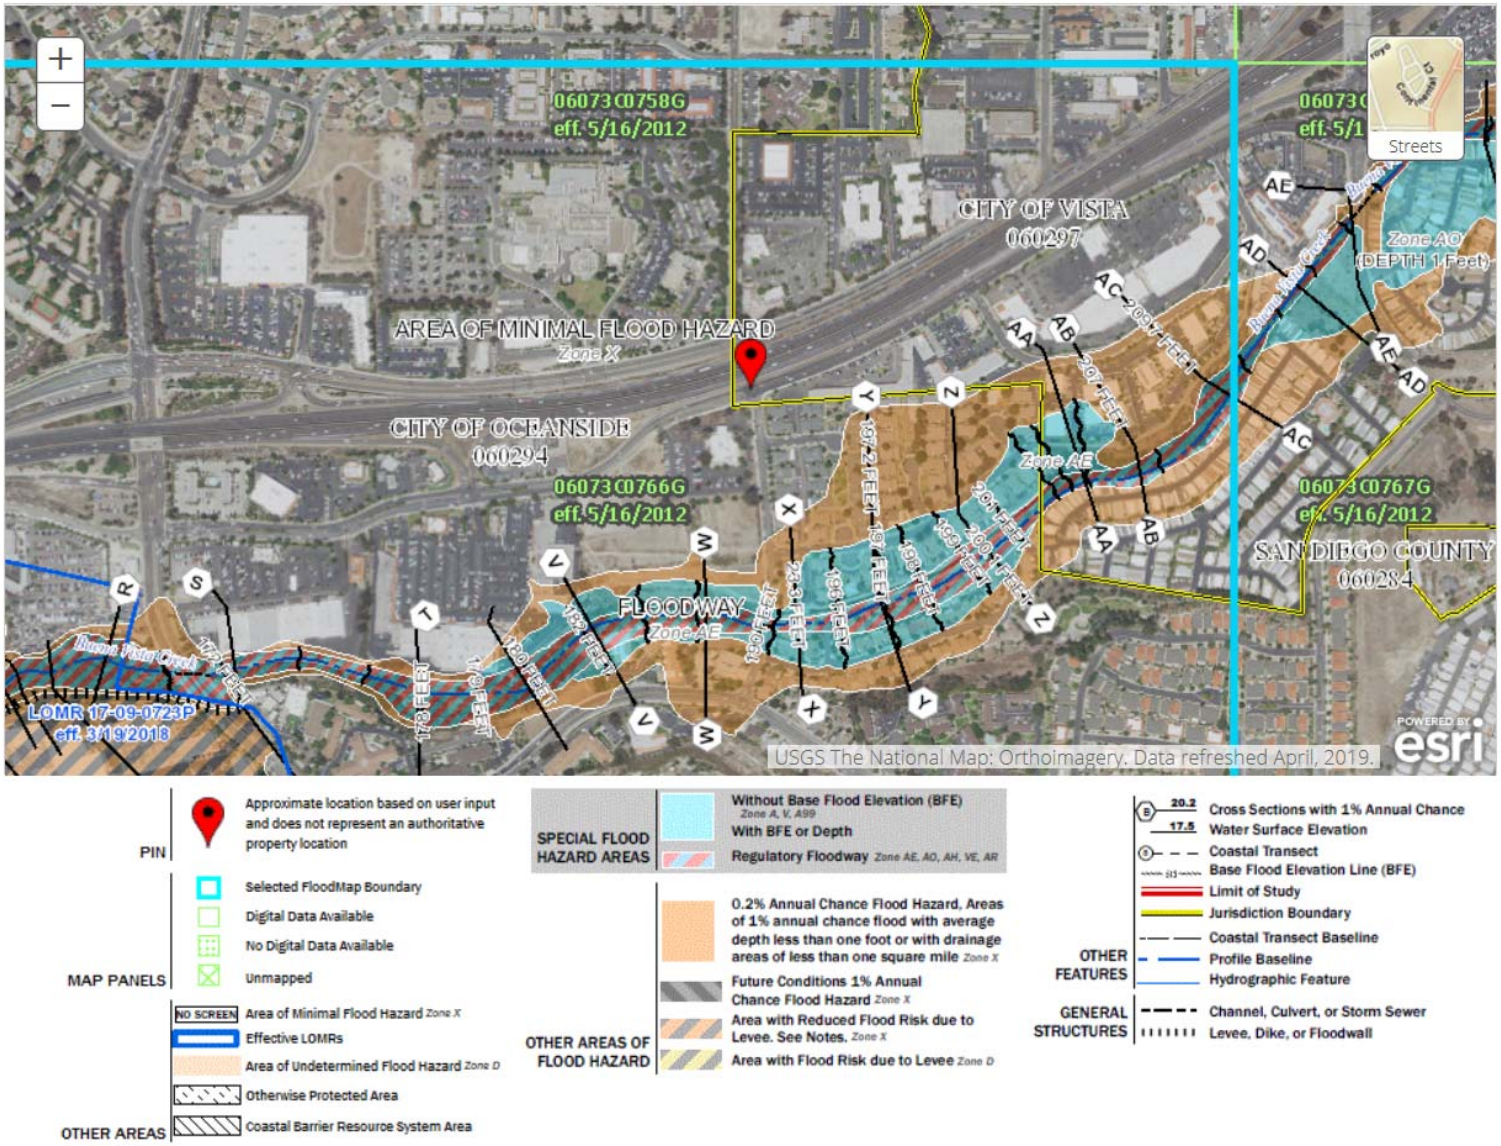
2.3 – FEMA Flood Map

FEMA FLOOD MAP – CARMAX OCEANSIDE



2.4 – Runoff Coefficient Determination

the rainfall intensity, (i) in the equation expressed in inches per hour, requires that the storm duration and the time of concentration (t_c) be equal. Therefore, the first step in estimating (i) is to estimate (t_c). Methods for determining time of concentration are discussed under Index 816.6.

- Once the time of concentration, (t_c), is estimated, the rainfall intensity, (i), corresponding to a storm of equal duration, may be obtained from available sources such as intensity-duration-frequency (IDF) curves. For IDF curve generating software, see http://hdsc.nws.noaa.gov/hdsc/pfds/.

The runoff coefficients given in Figure 819.2A and Table 819.2B are applicable for storms of up to 5 or 10 year frequencies. Less frequent, higher intensity storms usually require modification of the coefficient because infiltration, detention, and other losses have a proportionally smaller effect on the total runoff volume. The adjustment of the rational method for use with major storms can be made by multiplying the coefficient by a frequency factor, C(f). Values of C(f) are given below. Under no circumstances should the product of C(f) times C exceed 1.0.

Frequency (yrs)	C(f)
25	1.1
50	1.2
100	1.25

(2) Regional Analysis Methods. Regional analysis methods utilize records for streams or drainage areas in the vicinity of the stream under consideration which would have similar characteristics to develop peak discharge estimates. These methods provide techniques for estimating annual peak stream discharge at any site, gaged or ungaged, for probability of recurrence from 50 percent (2 years) to 1 percent (100 years). Application of these methods is convenient, but the procedure is subject to some limitations.

Regional Flood - Frequency equations developed by the U.S. Geological Survey for use in California are given in Figure 819.2C and Table 819.7A. These equations are based on regional regression analysis of data from stream gauging stations. The equations in Figure 819.2C were derived from data gathered and analyzed through 2006, while the regions covered by Table 819.7A are reflective of a 1994 study of the Southwestern U.S, which has been supplemented by a more recent 2007 Study of California Desert Region Hydrology. Information on use and development of this method may be found in "Methods for Determining Magnitude and Frequency of Floods in California Based on Data through Water Year 2006" by the U.S. Department of the Interior, Geological Survey.

The Regional Flood-Frequency equations are applicable only to sites within the flood-frequency regions for which they were derived and on streams with virtually natural flows. The equations are not directly applicable to streams in urban areas affected substantially by urban development. In urban areas the equations may be used to estimate peak discharge values under natural conditions and then by use of the techniques described in the publication or HDS No. 2, adjust the discharge values to compensate for urbanization. A method for directly estimating design discharges for some gaged and ungaged streams is also provided in HDS No. 2. The method is applicable to streams on or nearby those for which study data are available.

(3) Flood Frequency Analysis

(a) If there are two gaged sites with similar watershed characteristics but one has a short record and the other has a longer record of peak flows, a two-station comparison analysis can be conducted to extend the equivalent length of record at the shorter gaged site.

(b) Flood-frequency relations at sites near gaged sites on the same stream (or in a similar watershed) can be estimated using a ratio of drainage area for the ungaged and gaged sites.

(c) At a gaged site, weighted estimates of peak discharges based on the station flood-frequency relation and the regional

Runoff Coefficients for Undeveloped Areas

Watershed Types

	Extreme	High	Normal	Low
Relief	.28 -.35 Steep, rugged terrain with average slopes above 30%	.20 -.28 Hilly, with average slopes of 10 to 30%	.14 -.20 Rolling, with average slopes of 5 to 10%	.08 -.14 Relatively flat land, with average slopes of 0 to 5%
Soil Infiltration	.12 -.16 No effective soil cover, either rock or thin soil mantle of negligible infiltration capacity	.08 -.12 Slow to take up water, clay or shallow loam soils of low infiltration capacity, imperfectly or poorly drained	.06 -.08 Normal; well drained light or medium textured soils, sandy loams, silt and silt loams	.04 -.06 High; deep sand or other soil that takes up water readily, very light well drained soils
Vegetal Cover	.12 -.16 No effective plant cover, bare or very sparse cover	.08 -.12 Poor to fair; clean cultivation crops, or poor natural cover, less than 20% of drainage area over good cover	.06 -.08 Fair to good; about 50% of area in good grassland or woodland, not more than 50% of area in cultivated crops	.04 -.06 Good to excellent; about 90% of drainage area in good grassland, woodland or equivalent cover
Surface Storage	.10 -.12 Negligible surface depression few and shallow; drainageways steep and small, no marshes	.08 -.10 Low; well defined system of small drainageways; no ponds or marshes	.06 -.08 Normal; considerable surface depression storage; lakes and pond marshes	.04 -.06 High; surface storage, high; drainage system not sharply defined; large floodplain storage or large number of ponds or marshes
Given	An undeveloped watershed consisting of; 1) rolling terrain with average slopes of 5%, 2) clay type soils, 3) good grassland area, and 4) normal surface depressions.		Solution: Relief 0.14 Soil Infiltration 0.08 Vegetal Cover 0.04 Surface Storage 0.06 C = 0.32	
Find	The runoff coefficient, C, for the above watershed.			

Table 819.2B

Runoff Coefficients for Developed Areas (1)

Type of Drainage Area	Runoff Coefficient
Business:	
Downtown areas	0.70 - 0.95
Neighborhood areas	0.50 - 0.70
Residential:	
Single-family areas	0.30 - 0.50
Multi-units, detached	0.40 - 0.60
Multi-units, attached	0.60 - 0.75
Suburban	0.25 - 0.40
Apartment dwelling areas	0.50 - 0.70
Industrial:	
Light areas	0.50 - 0.80
Heavy areas	0.60 - 0.90
Parks, cemeteries:	0.10 - 0.25
Playgrounds:	0.20 - 0.40
Railroad yard areas:	0.20 - 0.40
Unimproved areas:	0.10 - 0.30
Lawns:	
Sandy soil, flat, 2%	0.05 - 0.10
Sandy soil, average, 2-7%	0.10 - 0.15
Sandy soil, steep, 7%	0.15 - 0.20
Heavy soil, flat, 2%	0.13 - 0.17
Heavy soil, average, 2-7%	0.18 - 0.22
Heavy soil, steep, 7%	0.25 - 0.35
Streets:	
Asphaltic	0.70 - 0.95
Concrete	0.80 - 0.95
Brick	0.70 - 0.85
Drives and walks	0.75 - 0.85
Roofs:	0.75 - 0.95

NOTES:
(1) From HDS No. 2.

regression equations are considered the best estimates of flood frequency and are used to reduce the time-sampling error that may occur in a station flood-frequency estimate.

(d) The flood-frequency flows and the maximum peak discharges at several stations in a region should be used whenever possible for comparison with the peak discharge estimated at an ungaged site using a rainfall-runoff approach or regional regression equation. The watershed characteristics at the ungaged and gaged sites should be similar.

(4) National Resources Conservation Service (NRCS) Methods. The Soil Conservation Service's SCS (former title) National Engineering Handbook, 1972, and their 1975, "Urban Hydrology for Small Watersheds", Technical Release 55 (TR-55), present a graphical method for estimating peak discharge. Most NRCS equations and curves provide results in terms of inches of runoff for unit hydrograph development and are not applicable to the estimation of a peak design discharge unless the design hydrograph is first developed in accordance with prescribed NRCS procedures. NRCS methods and procedures are applicable to drainage areas less than 3 square miles (approx. 2,000 acres) and result in a design hydrograph and design discharge that are functionally acceptable to form the basis for the design of highway drainage facilities.

819.3 Statistical Methods

Statistical methods of predicting stream discharge utilize numerical data to describe the process. Statistical methods, in general, do not require as much subjective judgment to apply as the previously described deterministic methods. They are usually well documented mathematical procedures which are applied to measured or observed data. The accuracy of statistical methods can also be measured quantitatively. However, to assure that statistical method results are valid, the method and procedures used should be verified by an experienced engineer with a thorough knowledge of engineering statistics.

2.5 – Urban Watershed Overland Time of Flow Nomograph

Note that the Initial Time of Concentration should be reflective of the general land-use at the upstream end of a drainage basin. A single lot with an area of two or less acres does not have a significant effect where the drainage basin area is 20 to 600 acres.

Table 3-2 provides limits of the length (Maximum Length (L_M)) of sheet flow to be used in hydrology studies. Initial T_i values based on average C values for the Land Use Element are also included. These values can be used in planning and design applications as described below. Exceptions may be approved by the "Regulating Agency" when submitted with a detailed study.

Table 3-2

MAXIMUM OVERLAND FLOW LENGTH (L_M)
& INITIAL TIME OF CONCENTRATION (T_i)

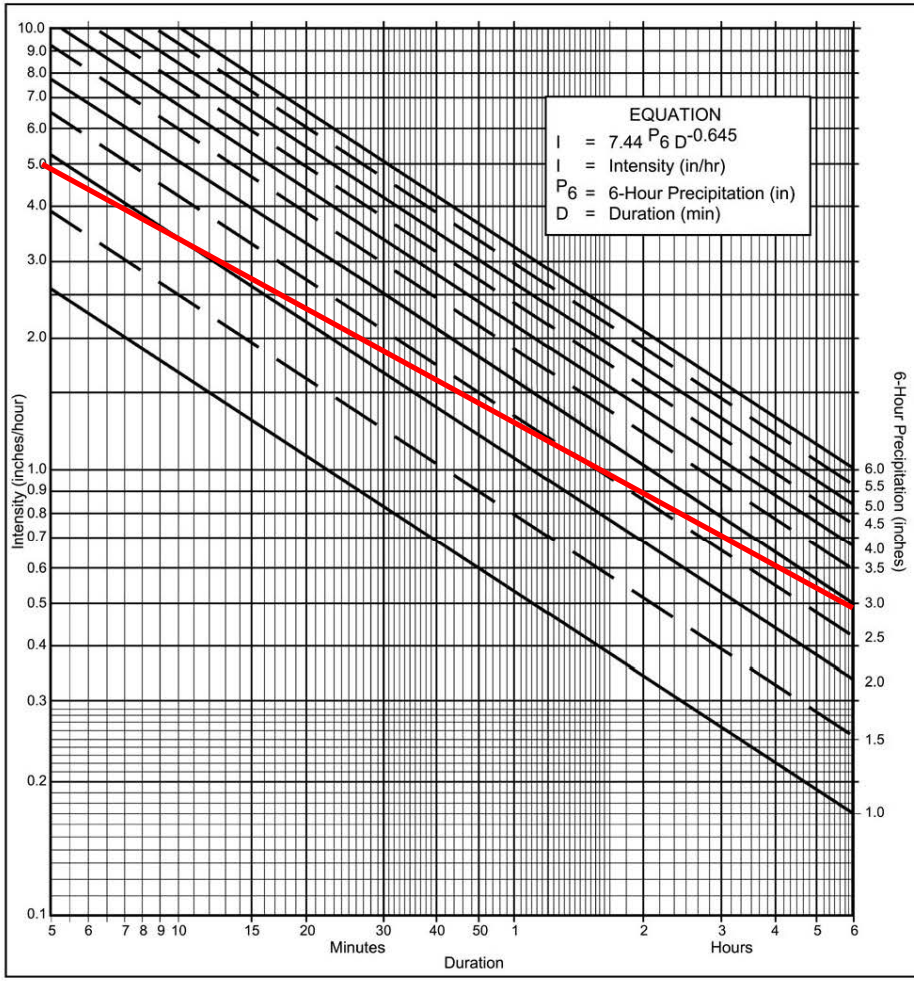
2.6 – County of San Diego Intensity- Duration Curve



Directions for Application:

(1) From precipitation maps determine 6 hr and 24 hr amounts for the selected frequency. These maps are included in the County Hydrology Manual (10, 50, and 100 yr maps included in the Design and Procedure Manual).

(2) Adjust 6 hr precipitation (if necessary) so that it is within the range of 45% to 65% of the 24 hr precipitation (not applicaple to Desert).

(3) Plot 6 hr precipitation on the right side of the chart.

(4) Draw a line through the point parallel to the plotted lines.

(5) This line is the intensity-duration curve for the location being analyzed.

Application Form:

(a) Selected frequency 100 year

(b) P_6 = 3.02 in., P_{24} = 5.05, $\frac{P_6}{P_{24}}$ = 59.8 %(2)

(c) Adjusted P_6(2) = _____ in.

(d) t_x = _____ min.

(e) I = _____ in./hr.

Note: This chart replaces the Intensity-Duration-Frequency curves used since 1965.

FIGURE 3-1

2.7 – Model Development Summary (from County of San Diego Hydrology Manual)

3.2 DEVELOPING INPUT DATA FOR THE RATIONAL METHOD

This section describes the development of the necessary data to perform RM calculations. Section 3.3 describes the RM calculation process. Input data for calculating peak flows and T_c's with the RM should be developed as follows:

1. On a topographic base map, outline the overall drainage area boundary, showing adjacent drains, existing and proposed drains, and overland flow paths.

2. Verify the accuracy of the drainage map in the field.

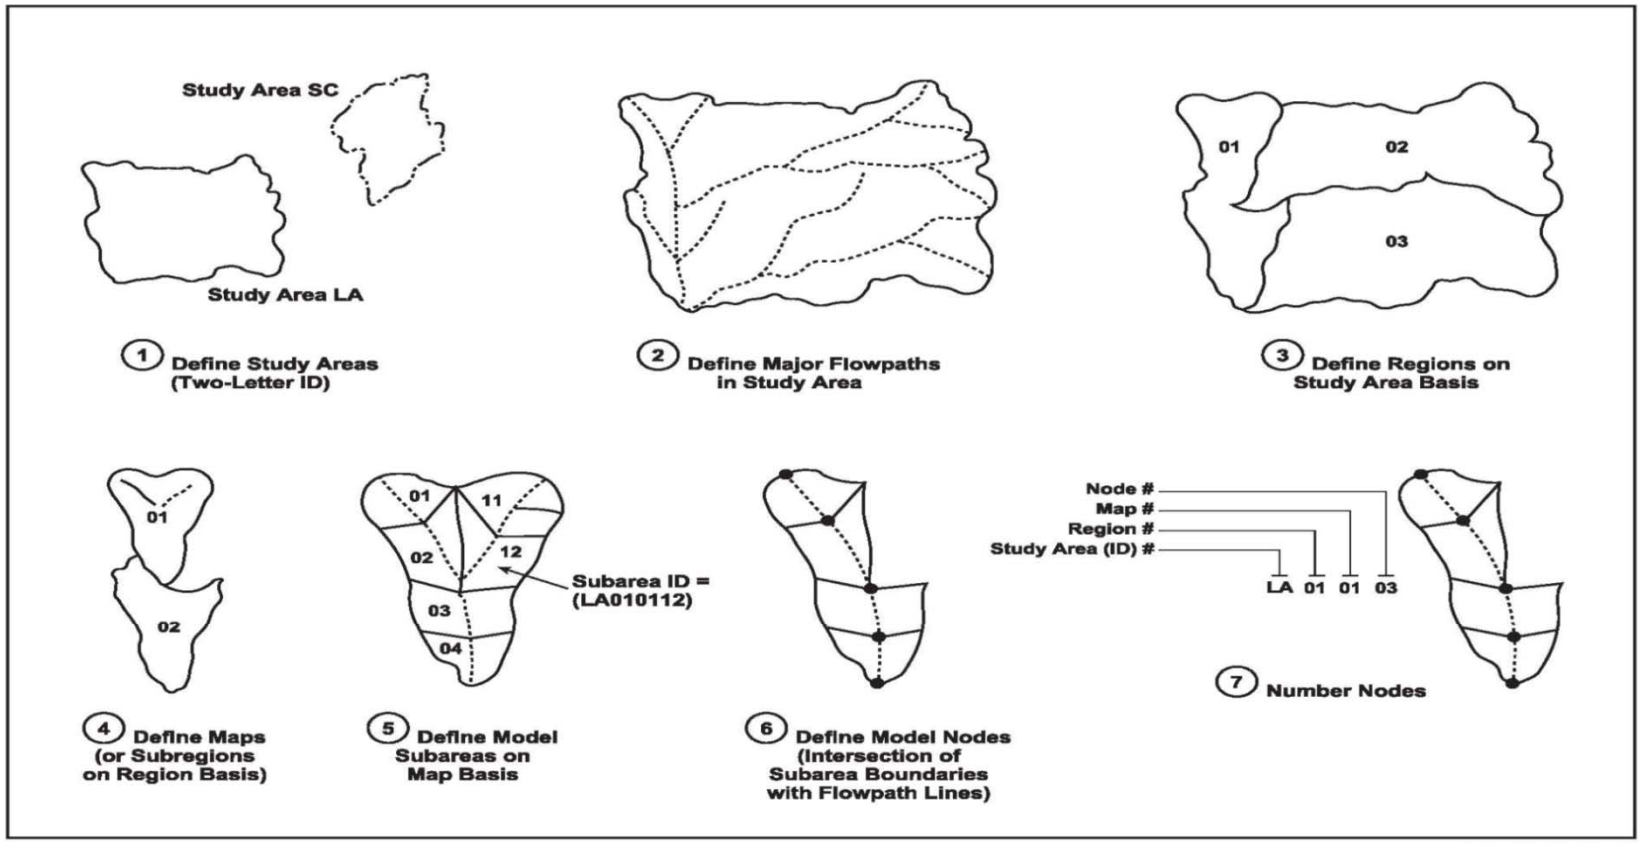
3. Divide the drainage area into subareas by locating significant points of interest. These divisions should be based on topography, soil type, and land use. Ensure that an appropriate first subarea is delineated. For natural areas, the first subarea flow path length should be less than or equal to 4,000 feet plus the overland flow length (Table 3-2). For developed areas, the initial subarea flow path length should be consistent with Table 3-2. The topography and slope within the initial subarea should be generally uniform.

4. Working from upstream to downstream, assign a number representing each subarea in the drainage system to each point of interest. Figure 3-8 provides guidelines for node numbers for geographic information system (GIS)-based studies.

5. Measure each subarea in the drainage area to determine its size in acres (A).

6. Determine the length and effective slope of the flow path in each subarea.

7. Identify the soil type for each subarea.



GIS/Hydrologic Model
Data Base Linkage Setup:
Nodes, Subareas, Links

FIGURE
3-8

8. Determine the runoff coefficient (C) for each subarea based on Table 3-1. If the subarea contains more than one type of development classification, use a proportionate average for C. In determining C for the subarea, use future land use taken from the applicable community plan, Multiple Species Conservation Plan, National Forest land use plan, etc.

9. Calculate the CA value for the subarea.

10. Calculate the Σ(CA) value(s) for the subareas upstream of the point(s) of interest.

11. Determine P_6 and P_{24} for the study using the isopluvial maps provided in Appendix B. If necessary, adjust the value for P_6 to be within 45% to 65% of the value for P_{24}.

See Section 3.3 for a description of the RM calculation process.

3.3 Performing Rational Method Calculations

This section describes the RM calculation process. Using the input data, calculation of peak flows and T_c's should be performed as follows:

1. Determine T_i for the first subarea. Use Table 3-2 or Figure 3-3 as discussed in Section 3.1.4. If the watershed is natural, the travel time to the downstream end of the first subarea can be added to T_i to obtain the T_c. Refer to paragraph 3.1.4.2 (a).

2. Determine I for the subarea using Figure 3-1. If T_i was less than 5 minutes, use the 5 minute time to determine intensity for calculating the flow.

3. Calculate the peak discharge flow rate for the subarea, where $Q_p = \Sigma(CA)\, I$.
In case that the downstream flow rate is less than the upstream flow rate, due to the long travel time that is not offset by the additional subarea runoff, use the upstream peak flow for design purposes until downstream flows increase again.

4. Estimate the T_t to the next point of interest.

5. Add the T_t to the previous T_c to obtain a new T_c.

6. Continue with step 2, above, until the final point of interest is reached.

Note: The MRM should be used to calculate the peak discharge when there is a junction from independent subareas into the drainage system.

3.4 MODIFIED RATIONAL METHOD (FOR JUNCTION ANALYSIS)

The purpose of this section is to describe the steps necessary to develop a hydrology report for a small watershed using the MRM. It is necessary to use the MRM if the watershed contains junctions of independent drainage systems. The process is based on the design manuals of the City/County of San Diego. The general process description for using this method, including an example of the application of this method, is described below.

The engineer should only use the MRM for drainage areas up to approximately 1 square mile in size. If the watershed will significantly exceed 1 square mile then the NRCS method described in Section 4 should be used. The engineer may choose to use either the RM or the MRM for calculations for up to an approximately 1-square-mile area and then transition the study to the NRCS method for additional downstream areas that exceed approximately 1 square mile. The transition process is described in Section 4.

3.4.1 Modified Rational Method General Process Description

The general process for the MRM differs from the RM only when a junction of independent drainage systems is reached. The peak Q, T_c, and I for each of the independent drainage systems at the point of the junction are calculated by the RM. The independent drainage systems are then combined using the MRM procedure described below. The peak Q, T_c, and I for each of the independent drainage systems at the point of the junction must be calculated prior to using the MRM procedure to combine the independent drainage systems, as these

values will be used for the MRM calculations. After the independent drainage systems have been combined, RM calculations are continued to the next point of interest.

3.4.2 Procedure for Combining Independent Drainage Systems at a Junction

Calculate the peak Q, T_c, and I for each of the independent drainage systems at the point of the junction. These values will be used for the MRM calculations.

At the junction of two or more independent drainage systems, the respective peak flows are combined to obtain the maximum flow out of the junction at T_c. Based on the approximation that total runoff increases directly in proportion to time, a general equation may be written to determine the maximum Q and its corresponding T_c using the peak Q, T_c, and I for each of the independent drainage systems at the point immediately before the junction. The general equation requires that contributing Q's be numbered in order of increasing T_c.

Let Q_1, T_1, and I_1 correspond to the tributary area with the shortest T_c. Likewise, let Q_2, T_2, and I_2 correspond to the tributary area with the next longer T_c; Q_3, T_3, and I_3 correspond to the tributary area with the next longer T_c; and so on. When only two independent drainage systems are combined, leave Q_3, T_3, and I_3 out of the equation. Combine the independent drainage systems using the junction equation below:

Junction Equation: $T_1 < T_2 < T_3$

$$Q_{T1} = Q_1 + \frac{T_1}{T_2} Q_2 + \frac{T_1}{T_3} Q_3$$

$$Q_{T2} = Q_2 + \frac{I_2}{I_1} Q_1 + \frac{T_2}{T_3} Q_3$$

$$Q_{T3} = Q_3 + \frac{I_3}{I_1} Q_1 + \frac{I_3}{I_2} Q_2$$

Calculate Q_{T1}, Q_{T2}, and Q_{T3}. Select the largest Q and use the T_c associated with that Q for further calculations (see the three Notes for options). If the largest calculated Q's are equal (e.g., $Q_{T1} = Q_{T2} > Q_{T3}$), use the shorter of the T_c's associated with that Q.

This equation may be expanded for a junction of more than three independent drainage systems using the same concept. The concept is that when Q from a selected subarea (e.g., Q_2) is combined with Q from another subarea with a shorter T_c (e.g., Q_1), the Q from the subarea with the shorter T_c is reduced by the ratio of the I's (I_2/I_1); and when Q from a selected subarea (e.g., Q_2) is combined with Q from another subarea with a longer T_c (e.g., Q_3), the Q from the subarea with the longer T_c is reduced by the ratio of the T_c's (T_2/T_3).

Note #1: At a junction of two independent drainage systems that have the same T_c, the tributary flows may be added to obtain the Q_p.

$$Q_p = Q_1 + Q_2 \text{; when } T_1 = T_2 \text{; and } T_c = T_1 = T_2$$

This can be verified by using the junction equation above. Let Q_3, T_3, and $I_3 = 0$. When T_1 and T_2 are the same, I_1 and I_2 are also the same, and T_1/T_2 and $I_2/I_1 = 1$. T_1/T_2 and I_2/I_1 are cancelled from the equations. At this point, $Q_{T1} = Q_{T2} = Q_1 + Q_2$.

Note #2: In the upstream part of a watershed, a conservative computation is acceptable. When the times of concentration (T_c's) are relatively close in magnitude (within 10%), use the shorter T_c for the intensity and the equation $Q = \Sigma(CA)I$.

Note #3: . An optional method of determining the T_c is to use the equation
$T_c = [(\Sigma (CA)7.44\ P_6)/Q]^{1.55}$

This equation is from $Q = \Sigma(CA)I = \Sigma(CA)(7.44\ P_6/T_c^{.645})$ and solving for T_c. The advantage in this option is that the T_c is consistent with the peak flow Q, and avoids inappropriate fluctuation in downstream flows in some cases.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 14, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Nov 3, 2014—Nov 22, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
LeC2	Las Flores loamy fine sand, 5 to 9 percent slopes, eroded	D	10.9	87.8%
VaB	Visalia sandy loam, 2 to 5 percent slopes	A	1.5	12.2%
Totals for Area of Interest			**12.4**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Aggregation is the process by which a set of component attribute values is reduced to a single value that represents the map unit as a whole.

A map unit is typically composed of one or more "components". A component is either some type of soil or some nonsoil entity, e.g., rock outcrop. For the attribute being aggregated, the first step of the aggregation process is to derive one attribute value for each of a map unit's components. From this set of component attributes, the next step of the aggregation process derives a single value that represents the map unit as a whole. Once a single value for each map unit is derived, a thematic map for soil map units can be rendered. Aggregation must be done because, on any soil map, map units are delineated but components are not.

For each of a map unit's components, a corresponding percent composition is recorded. A percent composition of 60 indicates that the corresponding component typically makes up approximately 60% of the map unit. Percent composition is a critical factor in some, but not all, aggregation methods.

The aggregation method "Dominant Condition" first groups like attribute values for the components in a map unit. For each group, percent composition is set to the sum of the percent composition of all components participating in that group. These groups now represent "conditions" rather than components. The attribute value associated with the group with the highest cumulative percent composition is returned. If more than one group shares the highest cumulative percent composition, the corresponding "tie-break" rule determines which value should be returned. The "tie-break" rule indicates whether the lower or higher group value should be returned in the case of a percent composition tie. The result returned by this aggregation method represents the dominant condition throughout the map unit only when no tie has occurred.

Component Percent Cutoff: None Specified

Components whose percent composition is below the cutoff value will not be considered. If no cutoff value is specified, all components in the database will be considered. The data for some contrasting soils of minor extent may not be in the database, and therefore are not considered.

Tie-break Rule: Higher

The tie-break rule indicates which value should be selected from a set of multiple candidate values, or which value should be selected in the event of a percent composition tie.

5.3 – HEC-HMS Modified-Puls Routing Results

Project: Detention2 Simulation Run: Run 1

Reservoir: Reservoir-1

Start of Run:	01Jan2000, 00:00	Basin Model:	Basin 1
End of Run:	01Jan2000, 07:00	Meteorologic Model:	Met 1
Compute Time:	27Feb2020, 16:20:51	Control Specifications:	Control 1

Volume Units: IN

Computed Results

Peak Inflow:	43.7800 (CFS)	Date/Time of Peak Inflow:	01Jan2000, 04:05
Peak Discharge:	21.1334 (CFS)	Date/Time of Peak Discharge	01Jan2000, 04:08
Inflow Volume:	n/a	Peak Storage:	0.5418 (AC-FT)
Discharge Volume	n/a	Peak Elevation:	3.8712 (FT)

Subject: **Preliminary Geotechnical Recommendations**
Proposed Auto Dealership
Plaza Drive & Hacienda Drive
Oceanside, San Diego County, California
EEI Project CIS-72940.7

Dear Ms. Haggerson:

In accordance with your authorization, EEI has conducted a geotechnical investigation for the proposed new Car Max facilities, in the City of Oceanside, California. The purpose of our investigation was to evaluate the subsurface conditions and develop geotechnical recommendations for the project design and construction.

Results of our investigation indicated that the proposed improvements are geotechnically feasible, provided the recommendations presented in our report are properly incorporated into project design and construction.

The purpose of this preliminary / draft report is to present our preliminary recommendations to aid client for the development of the preliminary construction cost analysis and schedules. Our final recommendations will be provided in our final report upon completion of the laboratory testing and supplemental engineering analysis.

SITE AND PROJECT DESCRIPTION

The subject site is located in the City of Oceanside, County of San Diego, California. It is an undeveloped lot that is bordered by Highway 78, Plaza Drive, and Hacienda Drive on the north; Thunder Drive and the existing Oceanside DMV on the east; commercial developments on the west; and the Buena Vista Creek

watershed on the south. The surface slopes gently towards Buena Vista Creek along the southern boundary, with elevations varying from 212 to 185 feet above mean sea level. A north-south trending channel cuts across the central part of the property. The center of the subject property is approximately situated at 33.1821° north latitude and 117.2890° west longitude (Google Earth™, 2016).

Based on conceptual information provided by the Client (CarMax, 2019), we understand that the current proposed development will consist of a new CarMax sales building (5,005 ft^2), service building (4309 ft^2), presentation building (1,197 ft^2), carwash (936 ft^2), paved parking and drive areas, associated landscaping, and other improvements. No grading plans have been provided to us at this time, but grading is expected to consist of cut-and-fill of no greater than 5 feet, exclusive of remedial grading. No foundation plans are available at this time.

Site History

Historic aerial photographs show that the subject site and surroundings were undeveloped until the mid-1960s when light grading occurred along the northern part of the property, related to the expansion of Highway 78. Further grading occurred due to development of the residential properties to the east in the 1970s and the commercial developments to the northeast and the west in the 1990s. A prior geotechnical evaluation report was prepared by NorCal Engineering for proposed developments on the subject site (NorCal Engineering, 2007). EEI obtained and reviewed this document and we present a brief summary of the report and its general finding here.

NorCal Engineering (hereafter referred to as NorCal) performed a preliminary geotechnical engineering study in 2007. Their study consisted of drilling nine borings across the property to depths of 10 to 50 feet below ground surface. In their borings, NorCal encountered 1 to 4 feet of fill consisting of silty sand and sandy clay overlying alluvium consisting of clayey sand and sandy clay. Bedrock was encountered at depths greater than 18 feet below ground surface and consisted of siltstone and sandstone. They did not encounter groundwater during their subsurface exploration. NorCal's lab testing indicated that the subsurface fill and alluvial soils were moderately expansive; negligibly corrosive to metal and concrete; corrosive to ferrous metals; and an R-Value of 33. NorCal concluded that the project was feasible from a geotechnical standpoint and provided grading and foundation recommendations.

Regional Geology

Regionally, the subject property lies within the Peninsular Ranges Geomorphic Province of southern California. This province consists of a series of ranges separated by northwest trending valleys; sub parallel to branches of the San Andreas Fault (CGS, 2002). The Peninsular Ranges geomorphic province, one of the largest geomorphic units in western North America, extends from the Transverse Ranges geomorphic province and the Los Angeles Basin, south to Baja California. It is bound on the west by the Pacific Ocean, on the south by the Gulf of California and on the east by the Colorado Desert Province. The Peninsular Ranges are essentially a series of northwest-southeast oriented fault blocks (CGS, 2002). Major fault zones and subordinate fault zones found in the Peninsular Ranges Province typically trend in a northwest-southeast direction. Regional geologic maps of the subject property and vicinity (Kennedy & Tan, 2007) indicate the property is underlain by late Pleistocene to Holocene Young Alluvial Flood Plain deposits (map symbol Qya). These deposits consist of poorly sorted sands, gravels, silts and clay that were deposited by the San Luis Rey River.

Subsurface Investigation

Our subsurface investigation was conducted on July 9, 29, 30, and 31, 2019, and consisted of advancing eleven (11) CPT soundings and excavating twenty-one (21) backhoe test trenches across the subject site.

The subsurface materials encountered in our exploratory trenches consisted of artificial fill, Quaternary-aged alluvium, and Eocene-aged Santiago Formation. A brief description of the subsurface conditions is provided below.

Artificial Fill – The surface of the subject site is covered by artificial fill. The fill consists of silty to sandy clay, clayey sand, and clayey silt that was grayish to reddish-brown mottled, damp to slightly moist, and medium stiff to stiff at the time of our subsurface exploration. Brick fragments and other detritus are common in the fill. The fill varies in depth across the property from 2 to 12 feet, being shallowest in the northern part of the property along Plaza/Hacienda Dr. and increasing in thickness towards the southern part of the property. The thickest fill deposits occur along the north-south trending channel in the central part of the property.

Quaternary Alluvial Flood Plain Deposits – Quaternary-aged older alluvium was encountered in all of the trenches except T-19 and T-20 underlying the fill. The alluvium consists of sandy clay that was light grayish brown mottled, slightly moist, and medium stiff to hard at the time of our subsurface exploration. Caliche stringers are common and the alluvium also contains trace fine-grained sand. The thickness of the alluvium varies from one to at least 11 feet, with the thickest sections of alluvium being located in the central parts of the subject property.

Eocene Santiago Formation – Eocene-aged Santiago Formation was encountered in test pits T-1, T-2, T-3, T-4, T-5, T-7, T-12, T-16, T-17, T-18, T-19, T-20, and T-21 underlying the fill and alluvium. The Santiago Formation consists of clayey sandstone that was light yellowish-brown to light grayish-brown mottled, slightly moist to moist, and soft to hard at the time of our subsurface exploration. The sandstone was massive and friable. It was encountered at depths varying from 3 to 11 feet below ground surface.

Groundwater

Groundwater was not encountered in any of our trenches or CPT soundings at the time of subsurface exploration to the maximum explored depth of 38 feet below ground surface. Additionally; the previous investigation at the site did not encounter ground water to the maximum depth of 50 below ground surface.

However; our review of nearby monitoring wells to the west indicates that groundwater can vary in depth from 12 to 20 feet below ground surface. It should be noted that fluctuations in groundwater may result from variations in the ground surface topography, subsurface stratification, precipitation, irrigation and other factors that may not be currently evident. In general, groundwater is often expected to follow the direction of surface topography. Based on topography, local groundwater flow is expected to be in a southerly to westerly direction.

PRELIMINARY RECOMMENDATIONS

California Building Code Seismic Design Parameters

EEI utilized seismic design criteria provided in Tables 3.3(1) and 3.3(2) in Section 1613A3.3 of the CBC (2016) and ASCE 7-10. Final selection of the appropriate seismic design coefficients should be made by the structural consultant based on the local laws and ordinances, expected building response, and desired level of conservatism. The site coefficients and adjusted maximum considered earthquake spectral response accelerations in accordance with the 2016 California Building Code are presented in **Table 1**.

Table 1
ASCE 7-10 Seismic Design Values

Parameter	Value
Site Coordinats	Latitude 33.1821° Longitude -117.2890°
Mapped Spectral Acceleration Value at Short Period: S_s	1.058g.
Mapped Spectral Acceleration Value at 1-Second Period: S_1	0.411g.
Site Soil Classification	D
Short Period Site Coefficient: F_a	1.077
1-Second Period Site Coefficient: F_v	1.589
Adjusted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration at Short Period: S_{MS}	1.139g.
Adjusted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration at 1-Second Period: S_{M1}	0.653g.
Design Spectral Response Acceleration at Short Periods: S_{DS}	0.759g.
Design Spectral Response Acceleration at 1-Second Period: S_{D1}	0.435g.
Peak Ground Acceleration Adjusted For Site Class Effects: PGA_M	0.441g.

Earthwork

When grading is conducted, it should be performed in accordance with good construction practice, applicable Code requirements, and the following recommendations.

Prior to the start of grading operations, utility lines within the project area, if any, should be located and marked in the field so they can be rerouted or protected during the site development. All debris and perishable material should be removed from the site.

The area of site preparation should extend at least five feet beyond any proposed improvements (e.g., building foot print, appurtenant structures, sidewalks, walkways, pavement areas, etc.). Any existing fill soil and perishable material should be excavated to contact with the firm underlying alluvial/bedrock deposits. A minimum of 12 feet of removal and recompaction should be anticipated.

To minimize the effect of differential settlement on the proposed improvements; foundation systems of the proposed improvements should be supported on a minimum five-foot thick of properly compacted fill blanket. Additionally; the differential fill thickness under each individual building should not exceed 10 feet.

When excavations deeper than five feet are made, temporary construction slopes should be no steeper than 1:1 (horizontal to vertical). Temporary construction slopes, sheeting and bracing should be provided by the contractor, as necessary, to protect workers in the excavation. Where excavations undermine existing improvements, temporary structural support should be provided to reduce risk of damage resulting from undercutting. Permanent cut and fill slopes should not be constructed steeper than 2:1.

Where fill is to be placed, the upper 6 to 8 inches of surface exposed by the excavation should be scarified, moisture-conditioned to 2 percent to 4 percent over optimum moisture content, and compacted to minimum 95 percent relative compaction[1]. The fill soil should then be placed in layers less than 8 inches in loose thickness and moisture conditioned to 2 to 4 percent over optimum moisture content, and compacted to minimum 90 percent relative compaction. If localized areas of relatively loose soil prevent proper compaction, over-excavation and re-compaction will be necessary.

The on-site soils are generally suitable for use as compacted fill and backfill. Import fill soils (if planned), should conform to the specifications presented in this report.

Import Fill and Select Backfill Material

The import fill and select backfill material should be free of perishable material and should meet the following criteria:

a.	Maximum particle size	1 inch
b.	Maximum Liquid Limit (LL)	5%
c.	Maximum Plasticity Index (PI)	0%
d.	Maximum percentage passing No. 200 sieve	20%
e.	Minimum sand equivalent	30
f.	Maximum Expansive Index (EI) (ASTM D-2849)	20

The earthwork contractor should ensure that all proposed fill materials are approved by the Geotechnical Engineer prior to use. Representative soil samples should be made available for testing at least ten working days prior to import to allow for laboratory tests.

Yielding Subgrade Conditions

The soils encountered at the subject property can exhibit “pumping” or yielding if they become saturated. This can often occur in response to periods of significant precipitation, such as during the winter rainy season. If this occurs and in order to help stabilize the yielding subgrade soils within the bottom of the removal areas, the contractor can consider the placement of stabilization fabric or geo-grid over the yielding areas, depending on the relative severity.

[1] Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM (D1557) test method. Optimum moisture content corresponding to the maximum dry density, as determined by the ASTM (D1557) test method.

Mirafi 600X (or approved equivalent) stabilization fabric may be used for areas with low to moderate yielding conditions. Geo-grid such as Tensar TX-5 may be used for areas with moderate to severe yielding conditions. Uniform sized, ¾- to 2-inch crushed rock should be placed over the stabilization fabric or geo-grid. A 12-inch thick section of crushed rock will typically be necessary to stabilize yielding ground. A filter fabric should be placed over the crushed rock to prevent migration of fines into the rock and subsequent settlement of the overlying fill. Fill soils, which should be placed and compacted in accordance with the recommendations presented herein, should then be placed over the filter fabric until design finish grades are reached. The crushed rock and stabilization fabric or geo-grid should extend at least five feet laterally beyond the limits of the yielding areas.

These operations should be performed under the observation and testing of a representative of the project Geotechnical Engineer in order to evaluate the effectiveness of these measures and to provide additional recommendations for mitigation, as necessary.

Shrinkage and Bulking

Several factors will impact earthwork balancing on the subject property, including shrinkage, bulking, subsidence, trench spoils from utilities and footing excavations, and final pavement section thickness as well as the accuracy of topography. Shrinkage, bulking and subsidence are primarily dependent upon the degree of compactive effort achieved during construction. Shrinkage, bulking and subsidence should be considered by the project civil engineer relative to final site balancing. It is recommended that the site development be planned to include an area that could be raised or lowered to accommodate final site balancing.

PRELIMINARY FOUNDATION RECOMMENDATIONS

General

The preliminary foundation recommendations provided herein are based on the proposed commercial development information provided by the Client. EEI should be provided with grading and foundation plans once they are available so that we can determine if the preliminary recommendations provided in this preliminary/draft remain applicable. Recommendations by the project's structural engineer and/or architect may exceed the following minimum preliminary recommendations. However; if analyses by the structural engineer result in less critical details than are provided herein as minimums, the minimums presented herein should be adopted.

Foundation Design

Foundation support for the proposed building could be derived by utilizing continuous interconnected foundations embedded within the newly placed compacted fill.

Allowable design parameters for foundations are as follow:

- Minimum depth for interior and exterior footing……. 3 feet
  (Measured from lowest adjacent soil grade)

- Minimum footing width…….. 1.5 feet
- No isolated pad footing is allowed
- Allowable bearing capacity (pounds per square foot), (FS ≥ 3)
    a. Sustained loads ……..2,000 psf
    b. Total loads (1/3 allowable increase for wind and seismic)……2,650 psf
- Resistance to lateral loads
    a. Passive soil resistance (pounds per cubic foot)……..200 pcf
    b. Coefficient of sliding friction……..0.35

Footings can be designed to resist lateral loads by using a combination of sliding friction and passive resistance. The coefficient of friction should be applied to dead load forces only; and Passive resistance should be reduced by one third. For foundations with no sliding friction at the base (foundations resisting uplift loads), 100% of passive resistance could be utilizes. The upper one foot of passive resistance should be neglected where the soil is not confined by the slabs or pavement.

For the properly constructed foundations in accordance with the foregoing criteria, total static post-construction settlement from the anticipated structural loads is estimated to be on the order of 1 inch. Differential settlement on the order of ½ of total settlement should be anticipated between the similarly loaded adjacent footings.

Footing Setbacks

Footings adjacent to unlined drainage swales or underground utilities (if any) should be deepened to a minimum of 6-inches below the invert of the adjacent unlined swale or utilities. This distance is measured from the footing face at the bearing elevation. Footings for structures adjacent to retaining walls should be deepened so as to extend below a 1:1 projection from the heel of the wall. Alternatively, walls may be designed to accommodate structural loads from buildings or appurtenances.

Interior Slabs-on-Grade

The subgrade beneath the slab-on-grade floors should be compacted by rolling with a smooth-wheeled rubber tired, or vibratory roller to produce a uniformly dense, non-yielding surface. The project Structural Engineer should design the interior concrete slab-on-grade floor. For the preliminary design of the slab, project structural engineer could utilize acceptable design methods by California Building Code (CBC) such as Wire Reinforcement Institute (WRI) design method. On a preliminary basis, for WRI method a minimum of site soil Plasticity Index (PI) and site soil Expansion Index (EI) of 25 percent and 85 respectively should be utilized. However; as a minimum it is recommended that a 5-inch thick slab, reinforced with No. 4 bars located at 12-inches on center, both ways, be constructed. A layer of free draining, clean ¾-inch crushed rock, at least 6-inches thick should be placed below the slab.

In addition, the soil subgrade in the upper three feet should be thoroughly pre-saturated to 30 percent above optimum moisture content.

A moisture vapor retarder/barrier should be placed beneath slabs where moisture sensitive floor coverings will be installed. Typically, plastic is used as a vapor retardant. If plastic is used, a minimum 15-mil is recommended. The plastic should comply with ASTM E1745. Plastic installation should comply with ASTM E1643.

Current construction practice typically includes placement of a 2-inch thick sand cushion between the bottom of the concrete slab and the moisture vapor retarder/barrier. This cushion can provide some protection to the vapor retarder/barrier during construction, and may assist in reducing the potential for edge curling in the slab during curing. However, the sand layer also provides a source of moisture vapor to the underside of the slab that can increase the time required to reduce moisture vapor emissions to limits acceptable for the type of floor covering placed on top of the slab. The slab can be placed directly on the vapor retarder/barrier. The floor covering manufacturer should be contacted to determine the volume of moisture vapor allowable and any treatment needed to reduce moisture vapor emissions to acceptable limits for the particular type of floor covering installed. The project team should determine the appropriate treatment for the specific application.

Exterior Slabs-on-Grade (Hardscape)

It is recommended that a minimum 5-inch thick slab reinforced with No.4 bars located at 18-inches on center, both ways, be constructed. At the exterior edges of the flatwork, a thickened edge is recommended. The thickened edges should be a minimum of 8-inches deep and 6-inches wide and reinforced with two No.4 bars at top and bottom.

Slabs should be provided with weakened plane joints. Joints should be placed in accordance with the American Concrete Institute (ACI) guidelines. Proper control joints should be provided to reduce the potential for damage resulting from shrinkage. Subgrade materials should not be allowed to desiccate between grading and the construction of the concrete slabs. The floor slab subgrade should be thoroughly and uniformly moistened prior to placing concrete.

All dedicated exterior flatwork should conform to standards provided by the governing agency including section composition, supporting material thickness and any requirements for reinforcing steel. Concrete mix proportions and construction techniques, including the addition of water and improper curing, can adversely affect the finished quality of the concrete and result in cracking and spalling of the slab. We recommend that all placement and curing be performed in accordance with procedures outlined by the American Concrete Institute and/or Portland Cement Association. Special consideration should be given to concrete placed and cured during hot or cold weather conditions.

Conventional Retaining Walls

Foundations

The recommendations provided in the foundation section of this report are also applicable to conventional retaining walls.

Lateral Earth Pressures

The active earth pressure for the design of unrestrained earth retaining structures with level backfills can be taken as equivalent to the pressure of a fluid weighing 40 pcf. The at-rest earth pressure for the design of restrained earth retaining structures (such as basement walls or re-entrant corners) with level backfills can be taken as equivalent to the pressure of a fluid weighing 60 pcf. The above values assume a granular and drained backfill condition. If expansive soils are used to backfill the proposed walls, increased active and at-rest earth pressures will need to be utilized for retaining wall design, and can be provided upon request. An additional 20 pcf should be added to these values for walls with a 2:1 H: V sloping backfill.

If required, the seismic earth pressures can be taken as equivalent to the pressure of a fluid weighing 13 pounds per cubic foot (pcf) for flexible walls and 25 pcf for restrained walls. These values are for level backfill conditions and do not include a factor of safety. Appropriate factors of safety should be incorporated into the design. This pressure is in addition to the un-factored static pressures.

An increase in earth pressure equivalent to an additional 2 feet of retained soil can be used to account for surcharge loads from light traffic. The above values do not include a factor of safety. Appropriate factors of safety should be incorporated into the design. If any other surcharge loads are anticipated, EEI should be contacted for the necessary increase in soil pressure.

Retaining Wall Drainage

Retaining walls should be designed to resist hydrostatic pressures or be provided with a backdrain to reduce the accumulation of hydrostatic pressures. Backdrains may consist of a 2-foot wide zone of ¾-inch crushed rock. The backdrain should be separated from the adjacent soils using a non-woven filter fabric, such as Mirafi 140N or equivalent. Weep holes should be provided or a perforated pipe (Schedule 40 PVC) should be installed at the base of the backdrain and sloped to discharge to a suitable storm drain facility. As an alternative, a geocomposite drainage system such as Miradrain 6000 or equivalent placed behind the wall and connected to a suitable storm drain facility can be used. The project architect should provide waterproofing specifications and details.

Backfill

All backfill soils should be compacted to at least 90 percent relative compaction. Backfill soils should consist of granular, free-draining material having an expansion index of 50 or less determined in accordance with ASTM D4829. Expansive or clayey soil should not be used for backfill material. Additionally, fill within 3 feet from the back of the wall should not contain rocks greater than 3-inches in any dimension. The wall should not be backfilled until it has reached an adequate strength.

Corrosivity

Presently, representative samples of the onsite soils are being tested for their corrosion potential. However; based on the results of the previous investigation at the site it appears that the onsite soils are none corrosive to metal and concrete and highly corrosive to ferrous metals.

On a preliminary basis it is recommended the concrete should utilize at least type II cement with maximum 0.5 water/cement ratio in accordance with California building Code (CBC) Standard 1904.3.1. Concrete mix design, materials, placement, curing, and finishing should be in conformance with the standard specifications for public works construction "Green book", and American Concrete Institute (ACI) specifications.

PRELIMINARY PAVEMENT DESIGN

Deleterious material, excessively wet or dry pockets, concentrated zones of oversized rock fragments, and any other unsuitable yielding materials encountered during grading should be removed. Once compacted fill and/or native soils are brought to the proposed pavement subgrade elevations, the subgrade should be proof-rolled in order to check for a uniform firm and unyielding surface. Representatives of the project Geotechnical Engineer should observe all grading and fill placement.

The upper 24-inches of pavement subgrade soils should be scarified; moisture conditioned to at least two percent above optimum moisture content and compacted to at least 90 percent of the laboratory standard (ASTM D1557). If loose or yielding materials are encountered during subgrade preparation, evaluation should be performed by EEI. Aggregate base materials should be properly prepared (i.e., processed and moisture conditioned) and compacted to at least 95 percent of the maximum dry density as determined by ASTM D1557. Aggregate base materials should conform to Caltrans specifications for Class 2 aggregate base.

All pavement section changes should be properly transitioned. Although not anticipated, if adverse conditions are encountered during the preparation of subgrade materials, special construction methods may need to be employed. A representative of the project Geotechnical Engineer should be present for the preparation of subgrade and aggregate base.

For the preliminary design purposes we have assumed a Traffic Index (TI) of 5.0 for the parking stalls and a Traffic Index (TI) of 6.0 for drive areas and entrance apron at the subject property. This assumed TI should be verified as necessary by the Civil Engineer or Traffic Engineer. Additionally; on a preliminary basis we have utilized an R-Value of 5 for the pavement subgrade during our calculations of pavement structural sections.

TABLE 2
Preliminary Pavement Design Recommendations

Traffic Index (TI) / Intended Use	Pavement Surface	Aggregate Base Material (1)
5	4.0-inches Asphalt Concrete	8.0-inches
6	4.0-inches Asphalt Concrete	11.0-inches
Concrete Pavement Section	6.0-inches Portland Cement Concrete	6.0-inches

(1) R-Value of 78 for Caltrans Class 2 aggregate base

Closure

As was mentioned in the previous sections of this report the recommendations presented herein are preliminary in nature. Our final conclusions and recommendations will be provided upon completion of the laboratory testing and supplemental engineering analysis.

We trust this is the information requested at this time. Please contact us should you need further information.

Sincerely,
EEI

1.0 INTRODUCTION

1.1 Purpose

The purpose of this Preliminary Percolation Evaluation is to provide preliminary percolation information to CenterPoint Integrated Solutions, LLC regarding the subject property in the City of Oceanside, San Diego County, California (**Figure 1** -Site Vicinity Map, **Figure 2**-Aerial Site Map), for onsite stormwater design purposes.

This evaluation has been conducted in general accordance with accepted geotechnical engineering principles and in general conformance with the approved proposal and cost estimate for the project by EEI, dated August 26th, 2019.

1.2 Project Description

Based on the information provided by the Client in the RFP, including a "SP-01" drawing prepared by CarMax (dated May 17, 2018), the proposed development of the subject property involves construction of a new CarMax automotive dealership. Planned buildings include a sales building (4,909 sf), a retail service area (4,309 sf), a car wash (936 sf), and a presentation area (1,197 sf). The balance of the developable portion of the site is to be developed with parking and related improvements.

1.3 Scope of Services

The scope of our services included:

- A review of readily available data pertinent to the subject property, including published and unpublished geologic reports/maps, and soils data for the area (**References**).
- Conducting a geotechnical reconnaissance of the subject property and nearby vicinity.
- Coordination with Underground Service Alert (USA) to identify the presence of underground utilities for clearance of proposed boring locations.
- Drilling and logging of five (5) 6-inch diameter borings with a truck-mounted mobile B-53 drill rig. Borings were advanced at depths of approximately 8 feet to 10 feet below the ground surface (bgs).
- Conducting percolation testing at each of the five (5) boring locations. The approximate locations of each of the borings and percolation tests are presented on **Figure 3** (Percolation Locations Map).
- Preparation of this report to presents our preliminary findings.

2.0 BACKGROUND

2.1 Subject Property Description

The subject property is located SW corner of Plaza Drive and Thunder Drive, in the City of Oceanside, San Diego County, California (Site Vicinity Map**, Figure 1;** Aerial Site Map**, Figure 2**). The subject property lies within the Peninsular Ranges Geomorphic Province and is underlain by Tertiary-aged claystone, siltstone, and sandstone deposits. The subject property is also designated as APN: 1680124300.

The property is undeveloped and encompasses approximately 10.28-acres, of which 6.33 are to be developed. The property is bound by City of Oceanside Fire Department Station 4 and Buena Vista Creek to the south, Thunder Drive to the east, commercial developments to the west and Plaza Drive to the north.

2.2 Topography

The subject property is located on the U.S. Geological Survey 7.5-minute quadrangle map for San Luis Rey, CA (2018). The center of the property has approximate coordinates of 33.182276° north latitude and -117.289277° west longitude. The property elevation varies from 174 to 200 feet above mean sea level (amsl) (Google Earth 2018). The overall subject property appears to have a generally flat surface with drainage by sheet flow, however, based solely on topography; surface drainage on the property appears to flow to the south towards Buena Vista Creek.

3.0 FIELD EXPLORATION AND PERCOLATION TESTING

3.1 Field Exploration

Field work for our Geotechnical Evaluation was conducted on September 30 and October 1st, 2019. A total of five (5) hollow-stem auger borings were advanced at the subject property in readily accessible areas (designated as borings B-1 through B-5). Boring depths ranged from approximately 8 to 10 feet below ground surface (bgs) and were logged under the supervision of a Registered Professional Engineer and Certified Engineering Geologist at EEI. The approximate locations of the borings are shown on **Figure 3**. Boring logs are presented in Appendix A of this report. A truck mounted B-53 hollow-stem auger (HSA) drill rig was used to advance borings B-1 through B-5. Blow count (N) values were determined utilizing a 140-pound hammer, falling 30-inches onto a Standard Penetration Test (SPT) split-spoon sampler and a Modified California split-tube sampler.

EEI conducted percolation testing in all five (5) exploratory borings. The presoaking and percolation testing were performed in general accordance with San Diego County BMP Design Manual for Permanent Site Design, Storm Water Treatment and Hydromodification Management (2016).

3.2 Percolation Testing

Percolation test wells were constructed by inserting 3-inch-diameter perforated PVC pipes in the borings and backfilling the annular space with 3/8-inch gravel to prevent caving during the percolation test. Following construction of the percolation test wells, they were filled with water and pre-saturated for a minimum of 24-hour period prior to the start of percolation testing. The percolation testing was then performed. Percolation testing was performed until consistent results were obtained. Upon conclusion of testing, the perforated PVC pipe was removed from the test holes and the test excavations were backfilled.

Table 1 presents the measured percolation rate and corresponding infiltration rate calculated for the test holes using the Porchet Method. Field percolation test results are presented in Appendix B.

TABLE 1
Summary of Percolation Testing

Location	Depth (ft)	Pre-Adjusted (Percolation Rate (in/hr)	Infiltration Rate (in/hr)*
B-1/P-1	10.5	0.00	0.00
B-2/P-2	9.5	9.60	0.17
B-3/P-3	11.5	4.80	0.06
B-4/P-4	8.5	12.00	2.5
B-5/P-5	10.5	7.20	0.19

*Feasibility factor of safety of 2.0 is included

3.3 Groundwater

Groundwater was not encountered in any of the exploratory borings to the maximum explored depth of 11.5 feet bgs. In our previous geotechnical investigation performed for the site (September 6, 2019) Groundwater was also not encountered in any of our trenches and the CPT soundings at the time of our subsurface exploration to the maximum explored depth of 38 feet bgs. Additionally; groundwater was not encountered in NorCal borings to the maximum depth of their exploration of 50 feet at the time of their subsurface investigation (2007).

It should be noted that fluctuations in groundwater may result from variations in the ground surface topography, subsurface stratification, precipitation, irrigation and other factors that may not be currently evident. In general, groundwater is often expected to follow the direction of surface topography. Based on topography, local groundwater flow is expected to be in a westerly direction.

3.4 Structure Setback from Retention Devices

We recommend that stormwater disposal systems be situated at least three times their depth, or a minimum of 15 feet (whichever is greater), from the outside bottom edge of structural foundations. Structural foundations include (but are not limited to) buildings, loading docks, retaining walls, and screen walls. The invert of stormwater infiltration should be outside a 1:1 (H:V) plane projected from the bottom of adjacent foundations.

Stormwater disposal systems should be checked and maintained on regular intervals. Stormwater devices including bio-swales that are located closer than 10 feet from any foundations/footings should be lined with an impermeable membrane to reduce the potential for saturation of foundation soils. Foundations may also need to be deepened.

Stormwater infiltration should not be located near utility lines where the introduction of stormwater could cause damage to utilities or settlement of trench backfill.

4.0 LIMITATIONS

This report has been conducted in accordance with generally accepted geotechnical engineering principles and practices. Findings provided herein are cursory in nature, and have been derived in accordance with current standards of practice, and no warranty is expressed or implied.

Standards of practice are subject to change with time. This report has been prepared for the sole use CenterPoint Integrated Solutions, LLC within a reasonable time from its authorization. Site conditions, land use (both onsite and offsite), or other factors may change as a result of manmade influences, and additional work may be required with the passage of time. EEI's field observations are reflective of conditions encountered in each location. As with any site, subsurface conditions are known to vary from place to place due in part to the accuracy and consistency of the equipment.

This report should not be relied upon by other parties without the express written consent of EEI and the Client; therefore, any use or reliance upon this geotechnical report by a party other than the Client shall be solely at the risk of such third party and without legal recourse against EEI, its employees, officers, or directors, regardless of whether the action in which recovery of damages is brought or based upon contract, tort, statue, or otherwise. This report is not designed as a specification document, and may not contain sufficient information for use without additional assessment. EEI assumes no responsibility or liability for work or testing performed by others.

APPENDIX A
SOIL CLASSIFICATION CHART AND BORING LOGS

UNIFIED SOIL CLASSIFICATION (ASTM D-2487-98)

MAJOR DIVISIONS			SYMBOLS GRAPH	SYMBOLS LETTER	TYPICAL DESCRIPTIONS
COARSE GRAINED SOILS	GRAVEL AND GRAVELLY SOILS	CLEAN GRAVELS (LITTLE OR NO FINES)		GW	WELL-GRADED GRAVELS, GRAVEL- SAND MIXTURES, LITTLE OR NO FINES
				GP	POORLY-GRADED GRAVELS, GRAVEL-SAND MIXTURES, LITTLE OR NO FINES
	MORE THAN 50% OF COARSE FRACTION RETAINED ON NO. 4 SIEVE	GRAVELS WITH FINES (APPRECIABLE AMOUNT OF FINES)		GM	SILTY GRAVELS, GRAVEL-SAND-SILT MIXTURES
				GC	CLAYEY GRAVELS, GRAVEL-SAND- CLAY MIXTURES
MORE THAN 50% OF MATERIAL IS LARGER THAN NO. 200 SIEVE SIZE	SAND AND SANDY SOILS	CLEAN SANDS (LITTLE OR NO FINES)		SW	WELL-GRADED SANDS,GRAVELLY SANDS, LITTLE OR NO FINES
				SP	POORLY-GRADED SANDS, GRAVELLY SAND, LITTLE OR NO FINES
	MORE THAN 50% OF COARSE FRACTION REATINED ON NO. 4 SIEVE	SANDS WITH FINES (APPRECIABLE AMOUNT OF FINES)		SM	SILTY-SANDS, SAND – SILT MIXTURES
				SC	CLAYEY SANDS, SAND – CLAY MIXTURES
FINE GRAINED SOILS	SILTS AND CLAYS	LIQUID LIMIT LESS THAN 50		ML	INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS OR CLAYEY SILTS WITH SLIGHT PLASTICITY
				CL	INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
				OL	ORGANIC SILTS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY
MORE THAN 50% OF MATERIAL IS SMALLER THAN NO. 200 SIEVE SIZE	SILTS AND CLAYS	LIQUID LIMIT GREATER THAN 50		MH	INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SAND OR SILTY SOILS
				CH	INORGANIC CLAYS OF HIGH PLASTICITY
				OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS

SAMPLER TYPES

SPT

Modified California (2.5" I.D.)

Bulk

Rock Core

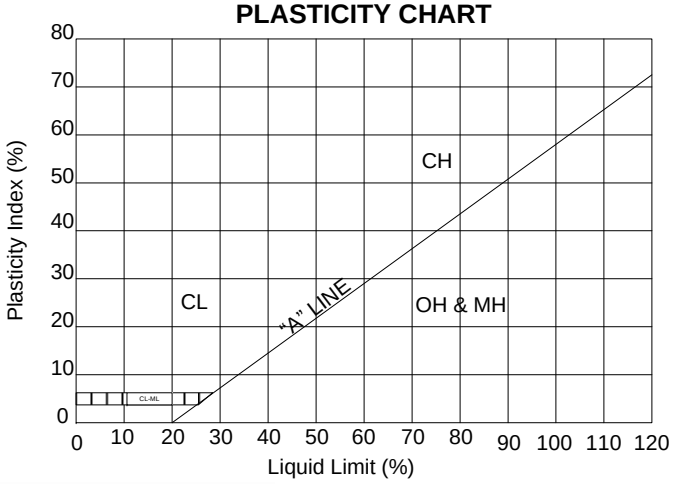
Shelby Tube

Water Level

OTHER TESTS

ATT – Atterberg Limit (Plasticity Index)
CD – Consolidated Drained Triaxial
CON – Consolidation
COR – Corrosivity)
DS – Direct Shear
EI – Expansion Index
MAX – Maximum Density
RV – R-Value
SA – Sieve Analysis
-#200 - Percent Passing #200 Sieve
TV – Torvane Shear
UU – Unconsolidated Undrained Triaxial

PLASTICITY CHART



PENETRATION RESISTANCE (Recorded As Blows/Foot)				
SAND & GRAVEL		SILT & CLAY		
Relative Density	Blows/Foot* N_{60}	Consistency	Blows/Foot* N_{60}	Strength** (KSF)
Very Loose	0-4	Very Soft	0 - 2	0 – 0.5
Loose	4-10	Soft	2 - 4	0.5 – 1.0
Medium Dense	10-30	Medium Stiff	4 - 8	1.0 – 2.0
Dense	30-50	Stiff	8 - 15	2.0 – 4.0
Very Dense	Over 50	Very Stiff	15 - 30	4.0 – 8.0
		Hard	Over 30	Over 8.0

* Number of blows of 140LB hammer falling 30 inches to drive a 2 inch O.D. (1-3/8 inch I.D.) split barrel sampler the last 12 inches of an 18-inch drive (ASTM-1586 Standard Penetration Test)

** Undrained shear strength in kips/sq. ft. As determined by laboratory testing or approximated by the standard penetration test, pocket penetrometer, torvane, or visual observation

ATTACHMENT 7
Storm Water Quality Assessment Form

This is the cover sheet for Attachment 7.

City of Oceanside – Engineering Division – Clean Water Program

STORM WATER QUALITY ASSESSMENT FOR PLANNING, ENGINEERING, AND BUILDING PERMIT APPLICATIONS

All applications for Planning, Engineering, or Building Division permits are required to complete this assessment form and include it as part of the initial permit application submittal. Staff will review the permit application content to determine the applicability of State and City storm water requirements. Please note a storm water assessment cannot be provided without a complete permit application package.

Section 1 – Project Information	
Applicant Name: Stacey Haggerson	Phone Number: (303) 679-6975
Project Name: Carmax Oceanside	Email Address (Optional): shaggerson@centerpoint-is.com
Project Site Address: SWC Plaza Drive & Thunder Drive	Street Intersection: Plaza Drive & Thunder Drive
Assessor Parcel Number(s): 168-012-42,-43	Total Parcel Area (acres or square feet): 478,210 SF
Project Description: Proposed Carmax dealership	Proposed Project Impervious Area (acres or square feet): 274,241 SF

Section 2 – Identify Project Type	
☒	New Development Project – go to Section 3
☐	Redevelopment Project go to Section 3
☐	None of the above – Skip Section 3 and go to Section 4

Section 3 – Identify Applicable Priority Development Project Categories	
☒	**New Development Project** – A project that creates 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This includes commercial, industrial, residential, mixed-use, and public development projects on public or private land.
☐	**Redevelopment Project** – A project that creates and/or replaces 5,000 square feet or more of impervious surface (collectively over the entire project site on an existing site of 10,000 square feet or more of impervious surfaces). This includes commercial, industrial, residential, mixed-use, and public development projects on public or private land.
☐	**Restaurants** – Category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption (SIC code 5812); where new or redevelopment projects that create and/or replace 5,000 square feet or more impervious surface (collectively over the entire project site).
☐	**Hillside Development** – Category includes development on any natural slope that is twenty-five percent or greater; where new or redevelopment projects that create and/or replace 5,000 square feet or more impervious surface (collectively over the entire project site).
☐	**Parking Lots** – Category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce; where new or redevelopment projects that create and/or replace 5,000 square feet or more impervious surface (collectively over the entire project site).
☐	**Streets, Roads, Highways, Freeways, and Driveways** – Category is defined as any paved impervious surface used for the transportation of automobiles, trucks, motorcycles, and other vehicles; where new or redevelopment projects that create and/or replace 5,000 square feet or more impervious surface (collectively over the entire project site).
☐	**Water Quality Environmentally Sensitive Area** – New or redevelopment projects that create and/or replace 2,500 square feet or more of impervious surface (collectively over the entire project site), and discharging directly to a Water Quality Environmentally Sensitive Area (WQESA). "Discharging directly to" includes flow that is conveyed overland a distance of 200 feet or less from the project to the WQESA, or conveyed in a pipe or open channel any distance as an isolated flow from the project to the ESA (i.e. not commingled with flows from adjacent lands).
☐	**Automotive Repair Shop** – Category is defined as a facility that is categorized in any one of the following Standard Industrial Classification (SIC) codes: 5013, 5014, 5541, 7532-7534, or 7536-7539, where new or redevelopment projects that create and/or replace 5,000 square feet or more impervious surface (collectively over the entire project site).
☐	**Retail Gasoline Outlet (RGOs)** – Category includes RGOs that meet the following criteria (a) 5,000 square feet or more or (b) a projected Average Daily Traffic (ADT) of 100 or more vehicles per day; where new or redevelopment projects that create and/or replace 5,000 square feet or more impervious surface (collectively over the entire project site).
☒	**Development Projects greater than one acre** – New or redevelopment projects that result in the disturbance of one or more acres of land and are expected to generate pollutants post construction.
☐	**None of the Above**

STORM WATER QUALITY ASSESSMENT FOR PLANNING, ENGINEERING, AND BUILDING PERMIT APPLICATIONS

Section 4 – Identify Permit Application Type	
☒	**Discretionary Permit Application**: Specific Plan (S), General Plan Amendment (GPA), Zone Amendment (ZA), Tentative Map (T), Tentative Parcel Map (P), Development Plan (D), Conditional Use Permit (CUP), Variance (V), Regular Coastal Permit (RC), Historic Permit (H), Reclamation Plan, Planned Development Permit, Planned Unit Development Permit, Planning Commission Approval of Plans, Site Plan Review, Tentative Map Amendments to Conditions of Approval or Time Extension, Variance.
☐	**Administrative Permit Application**: Administrative Clearing Permit, Lot Line Adjustment, Final Map Modification, Grading Plan (including modification or renewal), Improvement Plan (including modification), Landscape Plan, Building Permit, Construction Right-of-Way Permit, Encroachment Permit, Excavation Permit, On-site Wastewater System Permit, Underground Tank Permit, Well Permit, or etc.

Section 5 – Applicant Certification	
Name of Responsible Party: Stacey Haggerson	Phone Number: (303) 679-6975
Email Address (optional) shaggerson@centerpoint-is.com	FAX Number (optional):
I understand and acknowledge the City of Oceanside has adopted minimum requirements, as mandated by the San Diego Regional Water Quality Control Board – Order No. R9-2013-0001, as amended by Order Nos. R9-2015-0001 and R9-2015-0100 (NPDES NO. CAS0109266) for mitigating impacts associated with urban runoff, including storm water from construction and land development activities. I certify this assessment has been accurately completed to the best of my knowledge and is consistent with the proposed project. I acknowledge that non-compliance with the City Best Management Practice (BMP) Design Manual, Grading Ordinance, and Erosion Control Ordinance may result in enforcement action by the City, the California State Water Resources Control Board, and/or the San Diego Regional Water Quality Control Board. Enforcement action may include stop work orders, notice of violation, fines, or other actions.	
Applicant Signature:	Date:

Completion Guidance

Please note – the Applicant is requested to complete this form and submit as part of the project application. For assistance, please contact Development Services at (760) 435-4373.

Section 1 – Project Information

1. Applicant Name – provide name of Individual completing form, i.e. Owner or Owner Representative
2. Phone Number – provide phone number of Individual completing form, i.e. Owner or Owner Representative
3. Project Name – provide project name (consistent with project application) i.e. Jones Residence, Example Commercial Development, and etc
4. Email Address (Optional) – provide email address if you want to receive a digital copy of the project Storm Water Determination
5. Project Site Address – provide a physical address for the proposed project
6. Street Intersection – provide nearest intersecting streets
7. Assessor Parcel Number(s) – provide Assessor Parcel Number(s); refer to title documents or contact City Staff for assistance
8. Total Parcel Area (acres or square feet) – provide the parcel area; refer to title documents
9. Project Description – provide a brief project description (e.g. single-family dwelling, retail business, repair shop, and etc)
10. Approximate Proposed Project Impervious Area (acres or square feet) – provide the approximate total area of all impervious surfaces (includes roofs, sidewalk, patios, driveways, and etc)

Section 2 – Identify Project Type

1. New Development – check box if proposed project is a new development (i.e. the parcel is undeveloped and there are no existing paved surfaces or structures on the site) – if project is a new development go to Section 3.
2. Redevelopment – check box if proposed project includes the redevelopment of an existing site (i.e. replacement, rehabilitation, or reconfiguring of existing structures or paved surfaces) – if project is a "redevelopment" go to Section 3
3. None of the above – check box if proposed project is not a new development or a redevelopment; skip Section 3 and go to Section 4

Section 3 – Identify Applicable Priority Development Project Categories

1. Review each category and check the appropriate boxes that apply to your project.
2. General identification of Automotive Repair Shop SIC (Standard Industrial Classifications) as follows:
   - 5013 – Motor vehicle supplies and new parts
   - 5014 – Tires and tubes
   - 5541 – Gasoline service stations
   - 7532 – Top and body repair, and paint shops
   - 7533 – Auto exhaust system repair shops
   - 7534 – Tire retreading and repair shops
   - 7536 – Automotive glass replacement shops
   - 7537 – Automotive transmission repair shops
   - 7538 – General automotive repair shops
   - 7539 – Automotive repair shops-not elsewhere classified
3. Contact Storm Water Development Review Staff at (760) 435-5164 for assistance in determining applicability of Water Quality Environmentally Sensitive Area (WQESA) category
4. If no categories apply, check "None of the above"

Section 4 – Identify Permit Application Type

1. Identify the applicable permit application type. In general, Discretionary permits applications require a public hearing, whereas Administrative permits may be approved by Staff. Suggest obtaining assistance at the City Development Services Counter Staff and from City Planning Staff. Guidance may be obtained by telephone at (760) 435-4373.

Section 5 – Applicant Certification

1. Name of Responsible Party – provide name of Owner
2 Phone Number – provide phone number of Owner
3. Email Address (Optional) – provide email address if you want to receive a digital copy of the project Storm Water Determination
4. FAX Number (Optional) – provide FAX number if you want to receive a digital copy of the project Storm Water Determination
5. Applicant Signature – provide signature of Individual completing form, i.e. Owner or Owner Representative
6. Date – provide date current date

TECHNICAL MEMORANDUM

TO: REC Consultants, Inc.

FROM: Luis Parra, PhD, PE, CPSWQ, ToR, D.WRE, CFM.
David Edwards, MS, PE, CFM.

DATE: December 17, 2019 (revised February 26, 2020)

RE: Summary of SWMM Modeling for Hydromodification Compliance for Oceanside Carmax, City of Oceanside, CA.

INTRODUCTION

This memorandum summarizes the approach used to model the proposed commercial site in the City of Oceanside using the Environmental Protection Agency (EPA) Storm Water Management Model 5.0 (SWMM). SWMM models were prepared for the pre and post-developed conditions at the site in order to determine if the proposed HMP detention facilities have sufficient volume to meet Order R9-2013-001 requirements of the California Regional Water Quality Control Board San Diego Region (SDRWQCB), as explained in the Final Hydromodification Management Plan (HMP), dated March 2011, prepared for the County of San Diego by Brown and Caldwell.

SWMM MODEL DEVELOPMENT

The Oceanside Carmax project proposes a commercial auto sales lot on the currently vacant site. Two (2) SWMM models were prepared for this study: the first for the predevelopment and the second for the post-developed conditions. The project site drains to four (4) Points of Compliance; POC-1 and POC-2 are located to the northwest of the site at Plaza Drive, POC-3 located to the south at Buena Vista Creek and POC-4 to the east of the site at Thunder Drive.

Per Section G1.2 in Appendix G of the 2016 City of Oceanside BMP Design Manual, the EPA SWMM model was used to perform the continuous hydrologic simulation. For both SWMM models, flow duration curves were prepared to determine if the proposed HMP facilities are sufficient to meet the current HMP requirements.

The inputs required to develop SWMM models include rainfall, watershed characteristics, and BMP configurations. The Oceanside Gage from the Project Clean Water website was used for this study since it is the most representative of the project site precipitation due to elevation and proximity to the project site.

Per the California Irrigation Management Information System “Reference Evaporation Zones” (CIMIS ETo Zone Map), the project site is located within the Zone 4 Evapotranspiration Area. Thus evapotranspiration vales for the site were modeled using Zone 4 average monthly values from Table G.1-1 from the 2019 BMP Design Manual. Per the NRCS web soil survey and site specific geotechnical investigation, the project site is situated upon D soils. Soils have been assumed to be compacted in the existing condition to represent the current mass graded condition of the site, while fully compacted in

the post developed conditions. Other SWMM inputs for the subareas are discussed in the appendices to this document, where the selection of parameters is explained in detail.

HMP MODELING

It should be noted that for POC-1 the pre-developed and post-developed areas tributary to the POC will be equal as there is no diversion of flow in the post developed condition, in addition, the pervious percentage (i.e. 0% impervious due to the pervious surfaces proposed within DMA-1) assures that there will no change in the FDC at POC-1. Additionally, areas tributary to POC-2 (DMA-2) are part of the green street improvements proposed to Plaza Drive. As such, no HMP analysis is proposed for POC's 1 and 2.

PRE DEVELOPED CONDITIONS

The current site is a single developed lot that is bifurcated by Plaza Drive to the north-west of the project site. Runoff drains via overland flow to the west of the project site to the existing Plaza Drive, to the south to the adjacent Buena Vista Creek and to the Thunder Drive to the east of the project site. Table 1 below illustrates the pre-developed areas and impervious percentage accordingly. It should be noted that POC's 1 and 2 includes the portion of the existing Plaza Drive that is to be improved as part of this project site.

TABLE 1 – SUMMARY OF PRE-DEVELOPED CONDITIONS

POC	DMA	Tributary Area, A (Ac)	Impervious Percentage, Ip[(1)]
POC-1	DMA-1	1.433	0%
POC-2	DMA-2	0.216	0%
POC-3	DMA-3A	2.085	0%
	DMA-3B	3.520	0%
	DMA-3C	1.279	0%
POC-4	DMA-4	0.278	0%
TOTAL	**--**	**8.812**	0%

Notes: (1) – Per the 2013 RWQCB permit, existing condition impervious surfaces are not to be accounted for in existing conditions analysis.

DEVELOPED CONDITIONS

In developed conditions, runoff from the central project site is drained to one (1) onsite receiving HMP underground detention facility. Once flows are routed via the proposed detention basin, onsite flows are then discharged to the adjacent Buena Vista Creek at POC-3. A small portion of the project site drains to the receiving curb and gutter within the adjacent Thunder Drive to the east of the project site at POC-4.

Runoff tributary to POC's 1 and 2 are not analyzed for HMP compliance given that areas and the imperviousness remains constant in both pre and post developed conditions. Plaza Drive will incorporate green street LID principles that will address water quality and HMP requirements accordingly.

Table 2 summarizes the post-developed area and impervious percentage accordingly.

TABLE 2 – SUMMARY OF POST-DEVELOPED CONDITIONS

POC	DMA	STRUCTURAL BMP	Tributary Area, A (Ac)	Impervious Percentage, Ip
POC-1	DMA-1A	SELF-TREATING	1.082	0.0%
	DMA-1B	GREEN STREET	0.129	100%
	DMA-1C		0.229	100%
POC-2	DMA-2A	GREEN STREET	0.135	100%
	DMA-2B		0.216	100%
POC-3	DMA-3A	DETENTION	5.893	85.28%
	DMA-3B	SELF-TREATING	0.993	0.00%
POC-4	DMA-4	SELF-TREATING	0.146	50.4%
TOTAL	**--**	**--**	**8.823**	--

Notes: (1) – The DMA includes Drainage Area D as flows mix and discharge directly at the BMP.

One underground detention system is located within the project site and is responsible for handling hydromodification requirements for the project. In developed conditions, the underground detention basin will comprise of footprint of 6,090 square feet and a depth of 4 feet. The vault will feature an open bottom and an underlying 6-inch layer of gravel to provide additional storage for retention volume.

A riser spillway structure with an outlet slot (see dimensions in Table 4) will be located at the downstream end of the system to control the flows. Flows will discharge from the underground basin via a riser outlet structure within the detention system and then discharge directly to the adjacent Buena Vista Creek. A small self-treating area (DMA-3B) confluences directly at this point with the detained flows at POC-3. The riser structure will act as a spillway such that peak flows can be safely discharged to the receiving POC.

Water Quality BMP Sizing

It is assumed all storm water quality requirements for the project will be met by the BMPs detailed in the SWQMP and other BMPs included within the site design. However, detailed water quality requirements are not discussed within this technical memo. For further information in regards to storm water quality requirements for the project (including sizing and drawdown) please refer to the site specific Storm Water Quality Management Plan (SWQMP).

BMP MODELING FOR HMP PURPOSES

Modeling of dual purpose Water Quality/HMP BMPs

One underground detention system will be used for hydromodification conformance for the project site. Tables 3 & 4 illustrate the dimensions required for HMP compliance according to the SWMM model that was undertaken for the project.

TABLE 4 – SUMMARY OF DEVELOPED DUAL PURPOSE BMPs

BMP	Tributary Area (Ac)	DIMENSIONS		
		BMP Area (ft^2)	Basin Depth (ft)[(1)]	Total Volume. (ft^3)
Basin 1	5.893	6090	4.2	24,360

Notes: (1) The depth includes the 6-inches (0.5') of gravel beneath the vault surface which has been reduced to represent the volume of voids available (0.4 X 0.5' = 0.2')

TABLE 5 – SUMMARY OF RISER DETAILS:

BASIN	Lower Orifice		Lower Slot		Middle Slot		Upper Weir	
	Diam. (in)	Elev. (ft)	B x h (in)	Elev.[(1)] (ft)	B x h (in)	Elev.[(1)] (ft)	Length[(2)] (ft)	Elev.[(1)] (ft)
Basin 1	2 x 2.3125	0.0	36 x 2.5	1.25	45 x 8	2.25	12.0	3.75

Notes: (2) Invert of the underground system elevation assumed to be 0.00 ft elevation.
(3) Overflow length.

FLOW DURATION CURVE COMPARISON

The Flow Duration Curve (FDC) for the site was compared at the POCs by exporting the hourly runoff time series results from SWMM to a spreadsheet.

Q_2 and Q_{10} were determined with a partial duration statistical analysis of the runoff time series in an Excel spreadsheet using the Cunnane plotting position method (which is the preferred plotting methodology in the HMP Permit). As the SWMM Model includes a statistical analysis based on the Weibull Plotting Position Method, the Weibull Method was also used within the spreadsheet to ensure that the results were similar to those obtained by the SWMM Model.

The range between 10% of Q_2 and Q_{10} was divided into 100 equal time intervals; the number of hours that each flow rate was exceeded was counted from the hourly series. Additionally, the intermediate peaks with a return period "i" were obtained (Q_i with i=3 to 9). For the purpose of the plot, the values were presented as percentage of time exceeded for each flow rate. FDC comparison at each POC is illustrated in Figures 1 and 2 in both normal and logarithmic scale. Attachment 5 provides a detailed drainage exhibit for the post-developed condition.

As can be seen in Figure 1, the FDC for the proposed condition with the HMP BMPs is within 110% of the curve for the existing condition in both peak flows and durations. The additional runoff volume generated from developing the site will be released to the existing point of discharge at a flow rate below the 10% Q_2 lower threshold for the POC's. Additionally, the project will also not increase peak flow rates between the Q_2 and the Q_{10}, as shown in the peak flow tables in Attachment 1.

Discussion of the Manning's coefficient (Pervious Areas) for Pre and Post-Development Conditions

Typically the Manning's coefficient is selected as n = 0.10 for pervious areas and n = 0.012 for impervious areas. Due to the complexity of the model carried out in pre and post-development

conditions, a more accurate value of the Manning's coefficient for pervious areas has been chosen. Taken into consideration the "Handouts on Supplemental Guidance – Handout #2: Manning's "n" Values for Overland Flow Using EPA SWMM V.5" by the County of San Diego (Reference [6]) a more accurate value of n = 0.05 has been selected (see Table 1 of Reference [6] included in Attachment 7). An average n value between pasture and shrubs and bushes (which is also the value of dense grass) has been selected per the reference cited, for light rain (<0.8 in/hr) as more than 99% of the rainfall has been measured with this intensity.

DRAWDOWN TIME

To ensure compliance with the 96 hour drawdown requirements per Section 6.4.6 of the Final HMP dated March 2011, drawdown calculations are provided in Attachment 4 of this report. Per the drawdown calculations, the drying time of BMP-A is approximately 24 hours, satisfying drawdown time requirements.

SUMMARY

This study has demonstrated that the proposed HMP BMPs provided for Oceanside Carmax project site is sufficient to meet the current HMP criteria if the cross-section areas and volumes recommended within this technical memorandum, and the respective orifice and outlet structure are incorporated as specified within the proposed project site.

KEY ASSUMPTIONS

1. Type D Soils is representative of the existing condition site.

ATTACHMENTS

1. Q_2 to Q_{10} Comparison Tables
2. FDC Plots (log and natural "x" scale) and Flow Duration Table.
3. List of the "n" largest Peaks: Pre-Development and Post-Development Conditions
4. Elevations vs. Discharge Curves to be used in SWMM
5. Pre & Post Development Maps, Project plan and section sketches
6. SWMM Input Data in Input Format (Existing and Proposed Models)
7. SWMM Screens and Explanation of Significant Variables
8. Geotechnical Documentation
9. Summary files from the SWMM Model

ATTACHMENT 2

FLOW DURATION CURVE ANALYSIS

1) Flow duration curve shall not exceed the existing conditions by more than 10%, neither in peak flow nor duration.

The figures on the following pages illustrate that the flow duration curve in post-development conditions after the proposed BMP is below the existing flow duration curve. The flow duration curve table following the curve shows that if the interval $0.10Q_2 - Q_{10}$ is divided in 100 sub-intervals, then a) the post development divided by pre-development durations are never larger than 110% (the permit allows up to 110%); and b) there are no more than 10 intervals in the range 101%-110% which would imply an excess over 10% of the length of the curve (the permit allows less than 10% of excesses measured as 101-110%).

Consequently, the design passes the hydromodification test.

It is important to note that the flow duration curve can be expressed in the "x" axis as percentage of time, hours per year, total number of hours, or any other similar time variable. As those variables only differ by a multiplying constant, their plot in logarithmic scale is going to look exactly the same, and compliance can be observed regardless of the variable selected. However, in order to satisfy the City of Oceanside HMP example, % of time exceeded is the variable of choice in the flow duration curve. The selection of a logarithmic scale in lieu of the normal scale is preferred, as differences between the pre-development and post-development curves can be seen more clearly in the entire range of analysis. Both graphics are presented just to prove the difference.

In terms of the "y" axis, the peak flow value is the variable of choice. As an additional analysis performed by REC, not only the range of analysis is clearly depicted (10% of Q_2 to Q_{10}) but also all intermediate flows are shown (Q_2, Q_3, Q_4, Q_5, Q_6, Q_7, Q_8 and Q_9) in order to demonstrate compliance at any range $Q_x - Q_{x+1}$. It must be pointed out that one of the limitations of both the SWMM and SDHM models is that the intermediate analysis is not performed (to obtain Q_i from i = 2 to 10). REC performed the analysis using the Cunnane Plotting position Method (the preferred method in the HMP permit) from the "n" largest independent peak flows obtained from the continuous time series.

The largest "n" peak flows are attached in this appendix, as well as the values of Q_i with a return period "i", from i=2 to 10. The Q_i values are also added into the flow-duration plot.

ATTACHMENT 3

List of the "n" Largest Peaks: Pre & Post-Developed Conditions

Basic Probabilistic Equation:

R = 1/P R: Return period (years).

P: Probability of a flow to be equaled or exceeded any given year (dimensionless).

Cunnane Equation:

$$P = \frac{i-0.4}{n+0.2}$$

Weibull Equation:

$$P = \frac{i}{n+1}$$

i: Position of the peak whose probability is desired (sorted from large to small)

n: number of years analyzed.

Explanation of Variables for the Tables in this Attachment

Peak: Refers to the peak flow at the date given, taken from the continuous simulation hourly results of the n year analyzed.

Posit: If all peaks are sorted from large to small, the position of the peak in a sorting analysis is included under the variable Posit.

Date: Date of the occurrence of the peak at the outlet from the continuous simulation

Note: all peaks are not annual maxima; instead they are defined as event maxima, with a threshold to separate peaks of at least 12 hours. In other words, any peak P in a time series is defined as a value where dP/dt = 0, and the peak is the largest value in 25 hours (12 hours before, the hour of occurrence and 12 hours after the occurrence, so it is in essence a daily peak).

Note:
Cunnane is the preferred method by the HMP permit.

ATTACHMENT 4

AREA VS ELEVATION

The storage provided within the detention basin is located within the basin module in SWMM. Given that the basin is a vault with a constant area footprint (i.e. the area remains constant as the depth increases), no stage-storage calculation is required.

DISCHARGE VS ELEVATION

The orifices have been selected to maximize their size while still restricting flows to conform with the required 10% of the Q2 event flow as mandated in the Final Hydromodification Management Plan by Brown & Caldwell, dated March 2011. While REC acknowledges that these orifices are small, to increase the size of these outlets would impact the basin's ability to restrict flows beneath the HMP thresholds, thus preventing the BMP from conformance with HMP requirements.

In order to further reduce the risk of blockage of the orifices, regular maintenance of the riser and orifices must be performed to ensure potential blockages are minimized. A detail of the orifice and riser structure is provided in Attachment 5 of this memorandum.

The LID low flow orifice discharge relationship is addressed within the LID Module within SWMM – please refer to Attachment 7 for further information.

DRAWDOWN CALCULATIONS

Surface drawdown calculations are provided on the following pages for reference and proof of draining within 24 hours. It is assumed the basin is full to the invert of the first surface outlet structure such that the only discharge mechanism available is the LID orifice. The HMS analysis provided on the following pages indicates the basin is dry within approximately 24 hours.

DISCHARGE EQUATIONS

1) Weir:

$$Q_W = C_W \cdot L \cdot H^{3/2} \quad (1)$$

2) Slot:

As an orifice: $$Q_s = B_s \cdot h_s \cdot c_g \cdot \sqrt{2g\left(H - \frac{h_s}{2}\right)} \quad (2.a)$$

As a weir: $$Q_s = C_W \cdot B_s \cdot H^{3/2} \quad (2.b)$$

For H > h_s slot works as weir until orifice equation provides a smaller discharge. The elevation such that equation (2.a) = equation (2.b) is the elevation at which the behavior changes from weir to orifice.

3) Vertical Orifices

As an orifice: $$Q_o = 0.25 \cdot \pi D^2 \cdot c_g \cdot \sqrt{2g\left(H - \frac{D}{2}\right)} \quad (3.a)$$

As a weir: Critical depth and geometric family of circular sector must be solved to determined Q as a function of H:

$$\frac{Q_O^2}{g} = \frac{A_{cr}^3}{T_{cr}}; \quad H = y_{cr} + \frac{A_{cr}}{2 \cdot T_{cr}}; \; T_{cr} = 2\sqrt{y_{cr}(D - y_{cr})}\,; \quad A_{cr} = \frac{D^2}{8}[\alpha_{cr} - sin(\alpha_{cr})]\,;$$

$$y_{cr} = \frac{D}{2}[1 - sin(0.5 \cdot \alpha_{cr})] \quad \text{(3.b.1, 3.b.2, 3.b.3, 3.b.4 and 3.b.5)}$$

There is a value of H (approximately H = 110% D) from which orifices no longer work as weirs as critical depth is not possible at the entrance of the orifice. This value of H is obtained equaling the discharge using critical equations and equations (3.b).

A mathematical model is prepared with the previous equations depending on the type o discharge.

The following are the variables used above:

Q_W, Q_s, Q_O = Discharge of weir, slot or orifice (cfs)

C_W, c_g : Coefficients of discharge of weir (typically 3.1) and orifice (0.61 to 0.62)

L, B_s, D, h_s : Length of weir, width of slot, diameter of orifice and height of slot, respectively; (ft)

H: Level of water in the pond over the invert of slot, weir or orifice (ft)

A_{cr}, T_{cr}, y_{cr}, α_{cr}: Critical variables for circular sector: area (sq-ft), top width (ft), critical depth (ft), and angle to the center, respectively.

Outlet structure for Discharge of Detention Basin 1

(note: 0' elevation is assumed as surface invert of 6-inch gravel layer)

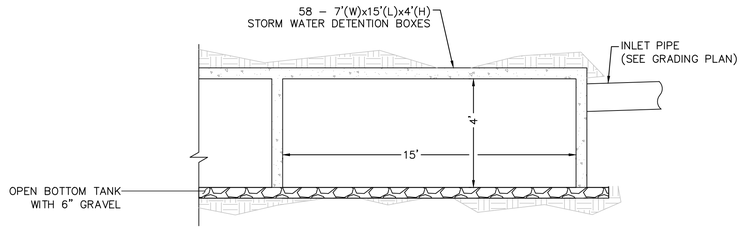
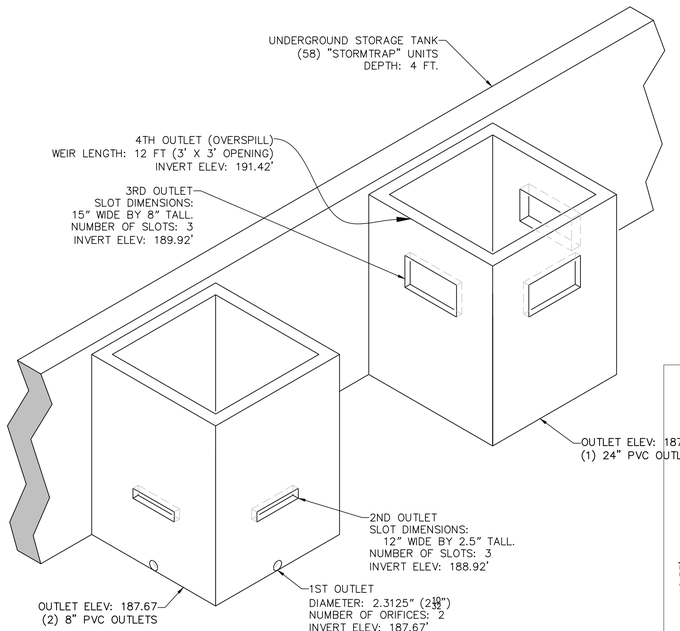
UNDERGROUND DETENTION BASIN (UDB)

NTS



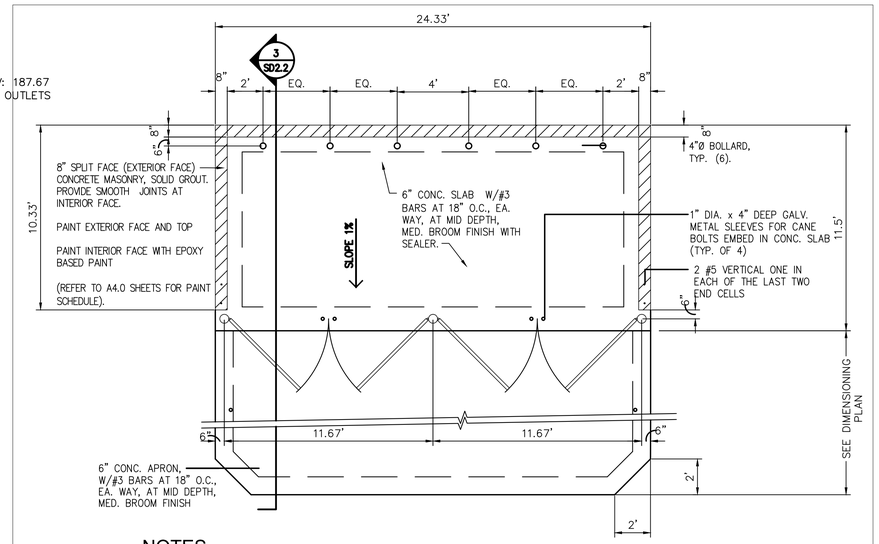
SECTION A-A: UNDERGROUND DETENTION BASIN

NTS



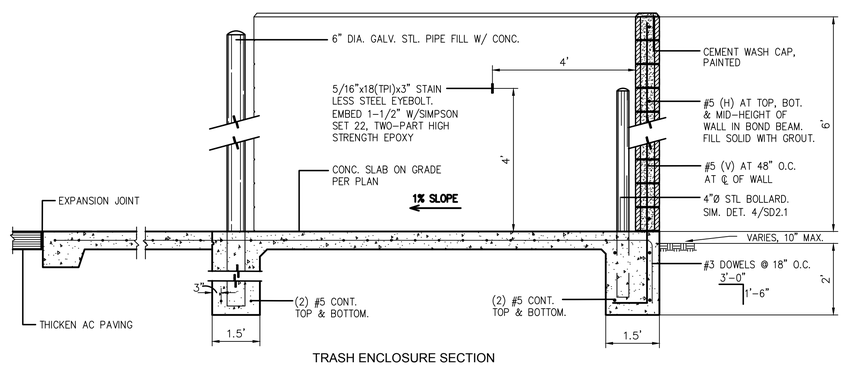
TANK OUTLET STRUCTURES

NOT TO SCALE



NOTES

1. ALL CONC. BLOCK MORTAR JOINTS SHALL BE FLUSH & SMOOTH AT INSIDE FACE.
2. SEE SITE PLAN FOR LOCATION OF TRASH ENCLOSURE.
3. THE TRASH ENCLOSURE PAD SHALL BE SEALED WITH A "NON-PIGMENTED" CLEAR CONCRETE SEALER.



TRASH ENCLOSURE SECTION

SOURCE CONTROL

BMP ID #	BMP TYPE	SYMBOL	CASQA NO.	QUANTITY	INSPECTION FREQUENCY	MAINTENANCE FREQUENCY	MAINTENANCE ACTIVITY
(1)	TRASH ENCLOSURE		SD-32	2	MONTHLY	AS NEEDED	INSPECT REGULARLY. CLEAR TRASH & DEBRIS. REPLACE LEAKING BINS. CLEAN STORAGE AREAS REGULARLY. POST SIGNS INFORMING TO NOT DISPOSE OF LIQUIDS & TO KEEP BIN LIDS CLOSED.
(2)	STENCILS	NO DUMPING	SD-13, SC-2	1 EA	MONTHLY	AS NEEDED	INSPECT AND MAINTAIN/REPLACE AS NEEDED.

BMP ID #	BMP TYPE	INSPECTION FREQUENCY	FREQUENCY MAINTENANCE	MAINTENANCE ACTIVITY
SC-1	PREVENTION OF ILLICIT DISCHARGES INTO MS4	CONTINUOUS	-	A GREASE TRAP HAS BEEN INCOPORATED INTO UTILITY PLAN AND DUMPING OF GREASE DOWN THE STROM DRAIN IS PROHIBITED OTHER GOOD HOUSEKEEPING PRACTICES WILL BE IMPLEMENTED TO DISCOURAGE DISCHARGES OF NON-STORM WATER POLLUTANTS, INCLUDING COLLECTION/RECYCLING USED COOKING OIL, CLEAN UP FOOD AND GREASE WITH ABDORBENTS/DISCARD IN TRASH AND ROUTINE MAINTANACE OF GREASE TRAP.
SC-2	STORM DRAIN STENCILING OR SIGNAGE	CONTINUOUS	REGULARLY	LABELING SHALL BE PROVIDED FOR ALL STORM WATER CONVEYANCE SYSTEM INLETS AND CATCH BASINS WITHIN THE PROJECT AREA. STORM DRAIN PLACARDS SHALL BE USED FOR SIGANGE (STENCILING IS PROHIBITED BY CITY OF OCEANSIDE). INSPECT AND MAINTAIN PLACARDS AS NEEDED.
SC-5	PROTECT TRASH STORAGE AREAS FROM RAINFALL, RUN-ON, RUNOFF, AND WIND DISPERSAL	REGULARLY	REGULARLY	ENSURE TRASH ENCLOSURE AREAS ARE FULLY CONTAINED (THREE WALLS, DOOR, ROOF). PROVIDE ATTACHED LIDS ON ALL TRASH CONTAINERS. KEEP CONTAINERS AWAY FROM STORM DRAIN VICINITY. POST SIGNS ON ALL ENCLOSURES AND/OR DUMPSTERS INFORMING USERS TO KEEP LID CLOSED AND NOT TO DISPOSE OF LIQUIDS OR HAZARDOUS MATERIALS. INSPECT TRASH STORAGE AREAS TO ENSURE INTEGRITY OF CONTAINERS AND THAT AREA IS KEPT CLEAN. REPLACE LEAKING BINS. CLEAN TRASH STORAGE AREAS REGULARLY
SC-6 A THROUGH H	ADDITIONAL BMPS BASED ON POTENTIAL SOURCES OF RUNOFF POLLUTANTS	REGULARLY OR AS DETERMINED NECESSARY	REGULARLY OR AS DETERMINED NECESSARY	SC-A ON-SITE STORM DRAIN INLETS: ON-SITE INLETS SHALL BE PROTECTED FROM ANY ILLICIT DISCHARGES AND DEBRIS. INLETS SHALL HAVE PROHIBITIVE SIGNS. MARK ALL INLETS WITH THE WORDS "NO DUMPING! DISCHARGES TO BAY" OR SIMILAR. INLET MARKINGS SHALL BE MAINTAINED AND PERIODICALLY REPAINTED. MAINTAIN ON A REGULAR BASIS TO REMOVE POLLUTANTS. ENSURE PROPER HYDRAULIC FUNCTION TO PREVENT FLOODING. CLEAN INLETS REGULARLY AND REMOVE SEDIMENTS AND DEBRIS, ESPECIALLY BEFORE START AND END OF WET SEASON. STORE WASTES COLLECTED FROM CLEANING ACTIVITIES OF DRAINAGE SYSTEM IN APPROPRIATE CONTAINERS OF TEMPORARY STORAGE SITES IN A MANNER THAT PREVENTS DISCHARGE TO THE STORM DRAIN. KEEP A RECORD OF CLEANING AND DISPOSAL ACTIVITIES. SC-C INTERIOR PARKING GARAGES: INTERIOR PARKING GARAGE WILL HAVE AN INTERIOR DRAIN THAT IS CONNECTED TO THE STORM DRAIN SYSTEM TO REMOVE NUISANCE WATER. SC-D1 NEED FOR FUTURE INDOOR & STRUCTURAL PEST CONTROL: FUTURE INDOOR & STRUCTURAL PEST CONTROL: BUILDING INCLUDES DOORS AND WINDOWS WITH SEALING THAT DISCOURAGES ENTRY OF PESTS. ANY PESTICIDES SHALL BE APPLIED MINIMALLY IN ACCORDANCE WITH MANUFACTURER'S SPECIFICATIONS AND CITY/STATE REQUIREMENTS SC-D2 LANDSCAPE/OUTDOOR PESTICIDE USE (SC-41): FINAL LANDSCAPE PLANS WILL PRESERVE EXISTING DROUGHT TOLERANT TREES, SHRUBS, AND GROUND COVER TO THE MAXIMUM EXTENT POSSIBLE, AND INCLUDE LANDSCAPING TO MINIMIZE IRRIGATION AND RUNOFF, TO PROMOTE SURFACE INFILTRATION WHERE APPROPRIATE, AND TO MINIMIZE THE USE OF FERTILIZERS AND PESTICIDES THAT CAN CONTRIBUTE TO STORM WATER POLLUTION. THE LANDSCAPED AREAS THAT WILL BE USED TO DETAIN STORMWATER, WILL HAVE PLANTS TOLERANT OF PERIODIC SATURATED SOIL CONDITIONS. FINAL LANDSCAPE PLANS HAVE BEEN DESIGNED TO ENSURE SUCCESSFUL ESTABLISHMENT, INCLUDING SELECTION OF PLANTS APPROPRIATE TO SITE SOILS, SLOPES, CLIMATE, SUN, WIND, RAIN, LAND USE, AIR MOVEMENT, ECOLOGICAL CONSISTENCY, AND PLANT INTERACTIONS. SC-N FIRE SPRINKLER TEST WATER: FIRE SPRINKLER TEST WATER SHALL BE DRAINED TO SANITARY SEWER SYSTEM. DURING A FIRE SPRINKLER TEST, THE FIRE RISER DISCHARGE SHALL BE CONNECTED BY A HOSE TO THE SEWER CLEANOUT. SC-O MISCELLANEOUS DRAIN OR WASHWATER: BOILER DRAINS SHALL BE DIRECTLY OR INDIRECTLY CONNECTED TO THE SANITARY SEWER SYSTEM AND MAY NOT DISCHARGE TO THE STORM DRAIN. ROOFTOP MOUNTED EQUIPMENT WITH POTENTIAL TO PRODUCE POLLUTANTS SHALL BE ROOFED AND/OR HAVE SECONDARY CONTAINMENT. ANY DRAINAGE SUMPS ONSITE SHALL FEATURE A SEDIMENT SUMP TO REDUCE THE QUANTITY OF SEDIMENT PUMPED WATER. COPPER BASED ROOFING, GUTTERS AND TRIM MATERIALS SHOULD BE AVOIDED. SC-P PLAZAS, SIDEWALKS, AND PARKING LOTS: SWEEP REGULARLY TO PREVENT ACCUMULATION OF LITTER AND DEBRIS, DEBRIS FROM PRESSURE WASHING MUST BE COLLECTED TO PREVENT ENTRY INTO STORM DRAIN SYSTEM. WASHWATER CONTAINING ANY CLEANING AGENT OR DEGREASER MUST BE COLLECTED AND DISCHARGED TO THE SANITARY SEWER AND NOT DISCHARGED TO A STORM DRAIN. CLEAN ALL PAVEMENT AT LEAST ONCE A YEAR.

ATTACHMENT 7

EPA SWMM FIGURES AND EXPLANATIONS

Per the attached, the reader can see the screens associated with the EPA-SWMM Model in both pre-development and post-development conditions. Each portion, i.e., sub-catchments, outfalls, storage units, weir as a discharge, and outfalls (point of compliance), are also shown.

Variables for modeling are associated with typical recommended values by the EPA-SWMM model, typical values found in technical literature (such as Maidment's Handbook of Hydrology). Recommended values for the SWMM model have been attained from Appendix G of the 2016 City of Oceanside BMP Design Manual.

Soil characteristics of the existing soils were determined from the NRCS Web Soil Survey and site specific geotechnical report (located in Attachment 8 of this report).

A Technical document prepared by Tory R Walker Engineering for the Cities of San Marcos, Oceanside and Vista (Reference [1]) can also be consulted for additional information regarding typical values for SWMM parameters.

Manning's roughness coefficients have been based upon the findings of the "*Improving Accuracy in Continuous Hydrologic Modeling: Guidance for Selecting Pervious Overland Flow Manning's n Values in the San Diego Region*" date 2016 by TRW Engineering (Reference [6]).

EXPLANATION OF SELECTED VARIABLES

Sub Catchment Areas:

Please refer to the attached diagrams that indicate the DMA and detention BMPs (BMP) sub areas modeled within the project site at both the pre and post developed conditions draining to the POC.

Parameters for the pre- and post-developed models include soil type D as determined from the NRCS websoil survey review (attached at the end of this appendix). Suction head, conductivity and initial deficit corresponds to average values expected for these soils types, according to Appendix G of the 2016 City of Oceanside BMP Design Manual.

For surface runoff infiltration values, REC selected infiltration values per Appendix G of the 2016 City of Oceanside BMP Design Manual corresponding to hydrologic soil type.

Selection of a Kinematic Approach: As the continuous model is based on hourly rainfall, and the time of concentration for the pre-development and post-development conditions is significantly smaller than 60 minutes, precise routing of the flows through the impervious surfaces, the underdrain pipe system, and the discharge pipe was considered unnecessary. The truncation error of the precipitation into hourly steps is much more significant than the precise routing in a system where the time of concentration is much smaller than 1 hour.

Infiltration:

Per the SWQMP, a factored design infiltration rate of 0.265 in/hr has been applied to the base of the detention vault.

Overland Flow Manning's Coefficient per TRWE (Reference [6])

appeal of a de facto value, we anticipate that jurisdictions will not be inclined to approve land surfaces other than short prairie grass. Therefore, in order to provide SWMM users with a wider range of land surfaces suitable for local application and to provide Copermittees with confidence in the design parameters, we recommend using the values published by Yen and Chow in Table 3-5 of the EPA SWMM Reference Manual Volume I – Hydrology.

SWMM-Endorsed Values Will Improve Model Quality

In January 2016, the EPA released the SWMM Reference Manual Volume I – Hydrology (SWMM Hydrology Reference Manual). The SWMM Hydrology Reference Manual complements the SWMM 5 User's Manual and SWMM 5 Applications Manual by providing an in-depth description of the program's hydrologic components (EPA 2016). Table 3-5 of the SWMM Hydrology Reference Manual expounds upon SWMM 5 User's Manual Table A.6 by providing Manning's *n* values for additional overland flow surfaces[3]. The values are provided in Table 1:

Table 1: Manning's *n* Values for Overland Flow (EPA, 2016; Yen 2001; Yen and Chow, 1983).

Overland Surface	Light Rain (< 0.8 in/hr)	Moderate Rain (0.8-1.2 in/hr)	Heavy Rain (> 1.2 in/hr)
Smooth asphalt pavement	0.010	0.012	0.015
Smooth impervious surface	0.011	0.013	0.015
Tar and sand pavement	0.012	0.014	0.016

Smooth bare packed soil	0.017	0.021	0.025
Moderate bare packed soil	0.025	0.030	0.035
Rough bare packed soil	0.032	0.038	0.045
Gravel soil	0.025	0.032	0.045
Mowed poor grass	0.030	0.038	0.045
Average grass, closely clipped sod	0.040	0.050	0.060
Pasture	0.040	0.055	0.070
Timberland	0.060	0.090	0.120
Dense grass	0.060	0.090	0.120
Shrubs and bushes	0.080	0.120	0.180
Land Use			
Business	0.014	0.022	0.035
Semibusiness	0.022	0.035	0.050
Industrial	0.020	0.035	0.050
Dense residential	0.025	0.040	0.060
Suburban residential	0.030	0.055	0.080
Parks and lawns	0.040	0.075	0.120

For purposes of local hydromodification management BMP design, these Manning's *n* values are an improvement upon the values presented by Engman (1986) in SWMM 5 User's Manual Table A.6. Values from SWMM 5 User's Manual Table A.6, while completely suitable for the intended application to certain agricultural land covers, comes with the disclaimer that the provided Manning's *n* values are valid for shallow-depth overland flow that match the conditions in the experimental plots (Engman,

[3] Further discussion is provided on page 6 under "Discussion of Differences Between Manning's *n* Values"

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 14, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Nov 3, 2014—Nov 22, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
LeC2	Las Flores loamy fine sand, 5 to 9 percent slopes, eroded	D	10.1	99.8%
VaB	Visalia sandy loam, 2 to 5 percent slopes	A	0.0	0.2%
Totals for Area of Interest			**10.1**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

GLOSSARY OF TERMS

Sound Pressure Level (SPL): a ratio of one sound pressure to a reference pressure (L_{ref}) of 20 µPa. Because of the dynamic range of the human ear, the ratio is calculated logarithmically by 20 log (L/L_{ref}).

A-weighted Sound Pressure Level (dBA): Some frequencies of noise are more noticeable than others. To compensate for this fact, different sound frequencies are weighted more.

Minimum Sound Level (L_{min}): Minimum SPL or the lowest SPL measured over the time interval using the A-weighted network and slow time weighting.

Maximum Sound Level (L_{max}): Maximum SPL or the highest SPL measured over the time interval the A-weighted network and slow time weighting.

Equivalent sound level (L_{eq}): the true equivalent sound level measured over the run time. Leq is the A-weighted steady sound level that contains the same total acoustical energy as the actual fluctuating sound level.

Day Night Sound Level (LDN): Representing the Day/Night sound level, this measurement is a 24 –hour average sound level where 10 dB is added to all the readings that occur between 10 pm and 7 am. This is primarily used in community noise regulations where there is a 10 dB "Penalty" for nighttime noise. Typically, LDN's are measured using A weighting.

Community Noise Exposure Level (CNEL): The accumulated exposure to sound measured in a 24-hour sampling interval and artificially boosted during certain hours. For CNEL, samples taken between 7 pm and 10 pm are boosted by 5 dB; samples taken between 10 pm and 7 am are boosted by 10 dB.

Octave Band: An octave band is defined as a frequency band whose upper band-edge frequency is twice the lower band frequency.

Third-Octave Band: A third-octave band is defined as a frequency band whose upper band-edge frequency is 1.26 times the lower band frequency.

Response Time (F,S,I): The response time is a standardized exponential time weighting of the input signal according to fast (F), slow (S) or impulse (I) time response relationships. Time response can be described with a time constant. The time constants for fast, slow and impulse responses are 1.0 seconds, 0.125 seconds and 0.35 milliseconds, respectively.

EXECUTIVE SUMMARY

This noise study has been completed to determine the noise impacts associated with the proposed project. The project known as "CarMax Auto Center" consists of a 10.98-Acre project site located on the southside of the 4000 block of Plaza Drive west of the Oceanside DMV in Oceanside, California. The project site is 10.98 acres.

Operational Noise Levels

Based upon the property line noise levels determined for the Project none of the proposed noise sources directly or cumulatively exceeds the property line standards at the residential property lines. Therefore, the proposed development related operational noise levels comply with the City's daytime noise standards at surrounding residences. No impacts are anticipated and no mitigation is required.

Traffic Noise Levels

The Project does not create a noise increase of more than 3 dBA CNEL on any roadway segment. Therefore, the project's contributions to off-site roadway noise increases will not cause any significant impacts to any existing or future noise sensitive land uses.

Construction Noise Levels

It was determined that none of the proposed equipment will exceed the City of Oceanside 85 dBA standard at 100 feet from the source. The project will also meet the County of San Diego's 75 dBA standard from all proposed equipment. No impacts will occur and no mitigation measures are required.

1.0 PROJECT INTRODUCTION

1.1 Purpose of this Study

The purpose of this Noise study is to determine both operational impacts (if any) generated from the proposed project to offsite uses. Should impacts be determined, the intent of this study would be to recommend suitable mitigation measures classify impacts as less then significant.

1.2 Project Location

The project is located on the south side of the 4000 block of Plaza Drive west of the Oceanside DMV in Oceanside, California. The project site is south of State Route 78 and approximately 4 miles east of Interstate 5. Locally, the project site is located south of the intersection of Plaza Drive and Thunder Drive. The project site is more specifically situated just south of the Tri-City Hospital. A general project vicinity map is shown in Figure 1-A.

1.3 Project Description

The proposed CarMax project would be situated on an overall vacant site which is 10.98 acres in total size. The project would consist of roughly 11,450 square feet (SF) of facilities and 476 parking spaces of which the majority of the locations would be for car sales. The project would also have roughly 2.34 acres of open space and landscaped areas. Construction of the project would begin early 2021 and be completed in just over one year. A site development plan is shown in Figure 1-B.

2.0 ACOUSTICAL FUNDAMENTALS

Noise is defined as unwanted or annoying sound which interferes with or disrupts normal activities. Exposure to high noise levels has been demonstrated to cause hearing loss. The individual human response to environmental noise is based on the sensitivity of that individual, the type of noise that occurs and when the noise occurs.

Sound is measured on a logarithmic scale consisting of sound pressure levels known as a decibel (dB). The sounds heard by humans typically do not consist of a single frequency but of a broadband of frequencies having different sound pressure levels. The method for evaluating all the frequencies of the sound is to apply an A-weighting to reflect how the human ear responds to the different sound levels at different frequencies. The A-weighted sound level adequately describes the instantaneous noise whereas the equivalent sound level depicted as Leq represents a steady sound level containing the same total acoustical energy as the actual fluctuating sound level over a given time interval.

The Community Noise Equivalent Level (CNEL) is the 24 hour A-weighted average for sound, with corrections for evening and nighttime hours. The corrections require an addition of 5 decibels to sound levels in the evening hours between 7 p.m. and 10 p.m. and an addition of 10 decibels to sound levels at nighttime hours between 10 p.m. and 7 a.m. These additions are made to account for the increased sensitivity during the evening and nighttime hours when sound appears louder.

A vehicles noise level is from a combination of the noise produced by the engine, exhaust and tires. The cumulative traffic noise levels along a roadway segment are based on three primary factors: the amount of traffic, the travel speed of the traffic, and the vehicle mix ratio or number of medium and heavy trucks. The intensity of traffic noise is increased by higher traffic volumes, greater speeds and increased number of trucks.

Because mobile/traffic noise levels are calculated on a logarithmic scale, a doubling of the traffic noise or acoustical energy results in a noise level increase of 3 dBA. Therefore, the doubling of the traffic volume, without changing the vehicle speeds or mix ratio, results in a noise increase of 3 dBA. Mobile noise levels radiant in an almost oblique fashion from the source and drop off at a rate of 3 dBA for each doubling of distance under hard site conditions and at a rate of 4.5 dBA for soft site conditions.

Hard site conditions consist of concrete, asphalt and hard pack dirt while soft site conditions exist in areas having slight grade changes, landscaped areas and vegetation. On the other hand, fixed/point sources radiate outward uniformly as it travels away from the source. Their sound levels attenuate or drop off at a rate of 6 dBA for each doubling of distance.

The most effective noise reduction methods consist of controlling the noise at the source, blocking the noise transmission with barriers. Any or all of these methods may be required to reduce noise levels to an acceptable level. To be effective, a noise barrier must have enough mass to prevent significant noise transmission through it and high enough and long enough to shield the receiver from the noise source. A safe minimum surface weight for a noise barrier is 3.5 pounds/square foot (equivalent to 3/4-inch plywood), and the barrier must be carefully constructed so that there are no cracks or openings.

Barriers constructed of wood or as a wooden fence must have minimum design considerations as follows: the boards must be ¾ inch thick and free of any gaps or knot holes. The design must also incorporate either overlapping the boards at least 1 inch or utilizing a tongue-and-grove design for this to be achieved.

3.0 SIGNIFICANCE THRESHOLDS AND STANDARDS

3.1 Operational Noise

Fixed sources and operational noise standards are governed by the City of Oceanside Noise Ordinance Section 38.12. Except for exempted activities and sounds as provided in this chapter or exempted properties as referenced in Section 38.15. It shall be unlawful for any person to cause or allow the creation of any noise to the extent that the one-hour average sound level, at any point on or beyond the boundaries of the property in the applicable base district zone on which the sound is produced exceeds the applicable limits set forth below in Table 3-1.

Table 3-1: Sound Level Limits

Base District Zone	7:00 a.m. to 9:59 p.m.	10:00 p.m. to 6:59 a.m.
(1) Residential Districts:		
RE (Residential Estate)	50	45
RS (Single-Family)	50	45
RM (Medium Density)	50	45
RH (High Density)	55	50
RT (Residential Tourist)	55	50
(2) C (Commercial)	65	60
(3) I (Industrial)	70	65
(4) D (Downtown)	65	55
(5) A (Agricultural)	50	45
(6) OS (Open Space)	50	45

In addition to the sound level limits established above, there are established sound level limits for PD (planned development) base district zones. For any residential land use within a PD zone, the sound level limit is that limit which would be otherwise applicable in the residential district zone (RE, RS, RM, RH or RT) corresponding to density of the residential development in that PD zone.

For any nonresidential land use within a PD zone, the sound level limit is that limit corresponding to the C (commercial) or I (industrial) zone which would be applicable to that use if not subject to the PD zone. For the purposes of this section, a land use shall be that use shown on a duly approved planned development plan or specific plan.

When property lines form the joint boundary of two (2) base district zones, the sound level limit shall be the arithmetic mean of the limit applicable to each of the two (2) zones.

3.2 Transportation Related Noise

The City of Oceanside's Noise Element requires that all exterior sensitive areas shall limit noise exposure. For noise sensitive residential land uses, the City has adopted a policy which has established a "normally acceptable" exterior noise level goal of 65 dBA CNEL for the outdoor areas and an interior noise level of less than 45 dBA CNEL.

Interior noise levels should be mitigated to a maximum of 45 dBA CNEL in all habitual rooms when the exterior of the residence are exposed to levels of 60 dBA CNEL or more. If windows and doors are required to be closed to meet the interior noise standard, then mechanical ventilation shall be provided per City requirements.

3.3 Construction Noise

The City of Oceanside Noise Element controls noise levels due to construction operations. It shall be unlawful for any person to operate construction equipment at any construction site, except as outlined in subsections (a) and (b) below:

(a) It shall be unlawful for any person to operate any construction equipment at a level in excess of 85 dBA at 100 feet from the source.
(b) It should be unlawful for any person to engage in construction activities between 6 PM and 7 AM when such activities exceed the ambient noise level by 5 dBA. A special permit may be granted by the Director of Public Works if extenuating circumstances exist.

4.0 EXISTING NOISE ENVIRONMENT

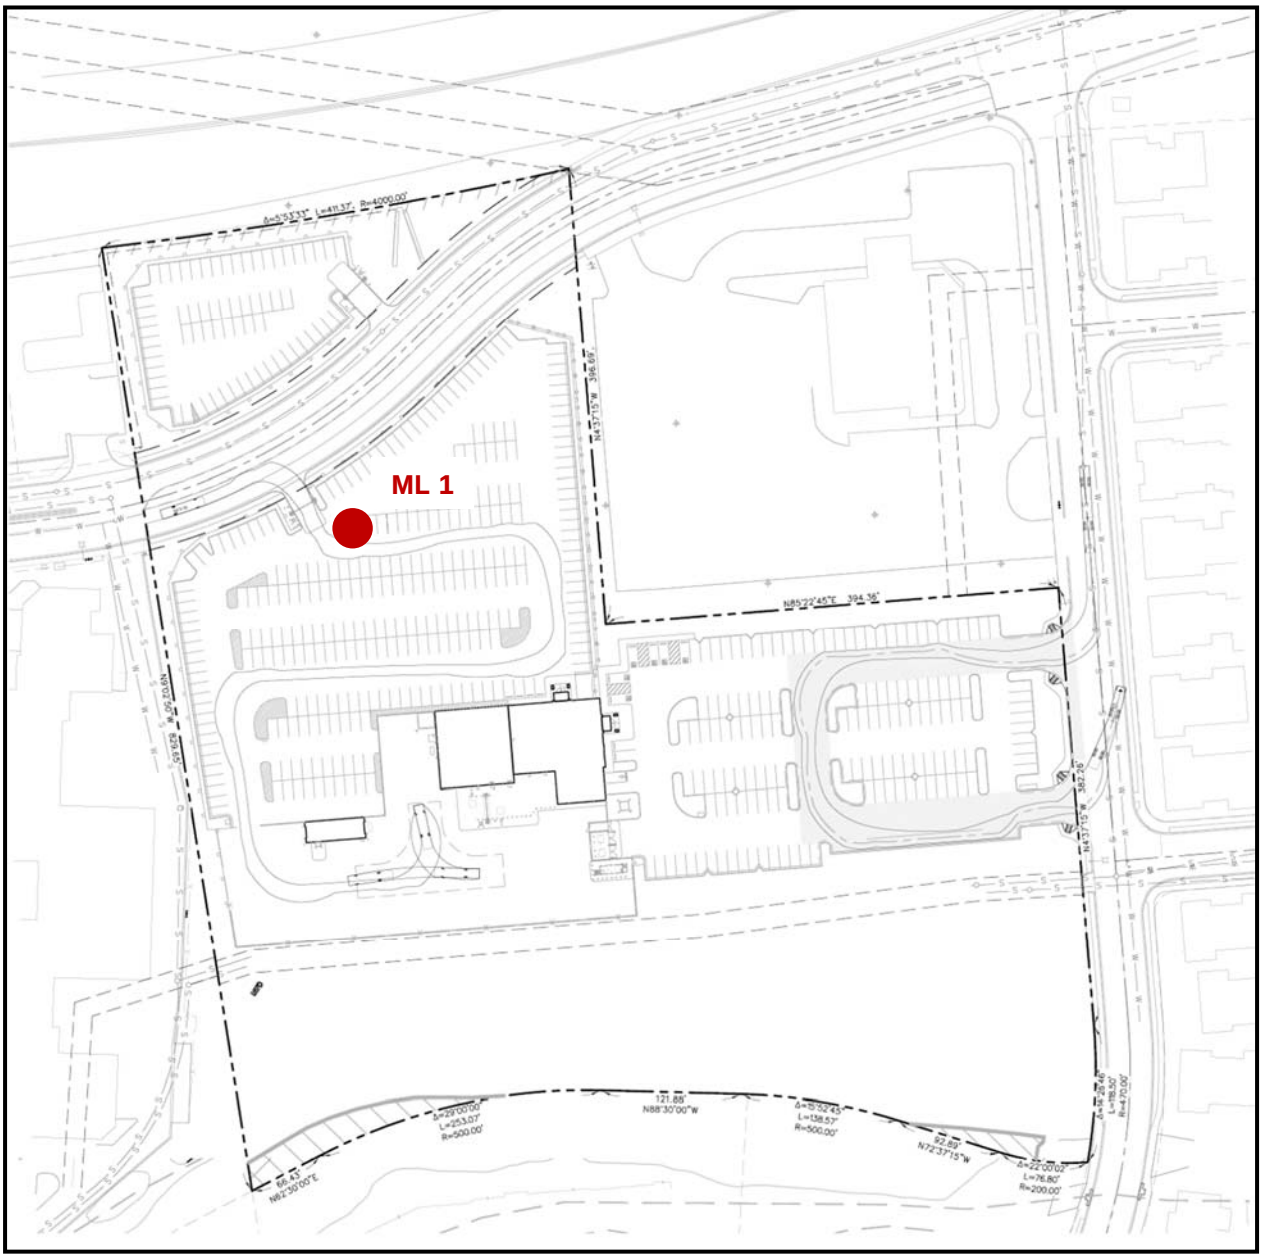
Noise measurements were taken January 13, 2020 in the afternoon hours using a Larson-Davis Model LxT Type 1 precision sound level meter, programmed, in "slow" mode, to record noise levels in "A" weighted form. The sound level meter and microphone were mounted on a tripod, five feet above the ground and equipped with a windscreen during all measurements. The sound level meter was calibrated before and after the monitoring using a Larson-Davis calibrator, Model CAL 200.

Monitoring location 1 (M1) was located along the northern portion of the site. The noise measurements were monitored for a time period of 15 minutes during normal traffic conditions. The results of the noise level measurements are presented in Table 4-1. The existing noise levels in the project area consisted primarily of traffic along the adjacent roadway during each measurement. The ambient Leq noise levels measured in the area of the project during the early afternoon were found to be between 64-71 dBA Leq along the roadways. The statistical indicators Lmax, Lmin, L10, L50 and L90, are given for the monitoring location. As can be seen from the L90 data, 90% of the time the noise level is roughly 46-50 dBA. The noise monitoring locations are provided graphically in Figure 4-1 on the following page.

Table 4-1: Measured Ambient Noise Levels

Measurement Identification	Primary Noise Source	Time	Noise Levels (dBA)					
			Leq	Lmax	Lmin	L10	L50	L90
M1	State Route 78	3:00-3:15 p.m.	61.8	73.1	57.4	63.1	60.5	59.3
Source: Ldn Consulting								

Figure 4-1: Ambient Noise Monitoring Locations



5.0 OPERATIONAL NOISE LEVELS

This section examines the potential operational noise source levels associated with the development and operation of the proposed project. Noise from a fixed or point source drops off at a rate of 6 dBA for each doubling of distance. Which means a noise level of 70 dBA at 5-feet would be 64 dBA at 10-feet and 58 dBA at 20-feet. Noise levels drop 3 decibels each time the duration of the source is reduced in half. Therefore, an hourly noise level if only operating over a 30 minute period would be reduced by 3 decibels based on the limited time of operation.

The required sound levels at a Project's property boundary depend on the time of day and the land use zone. The Project site is zoned for commercial, which allows an equivalent one-hour sound level of 65 dBA Leq-h between 7 A.M. and 9:59 P.M. and 60 dBA from 10 P.M. to 6:59 A.M at the property lines. The western and northern properties are zoned commercial. The existing residential uses located to the west and to the south allow an equivalent one-hour sound level of 50 dBA Leq-h between 7 A.M. and 9:59 P.M. and 45 dBA from 10 P.M. to 6:59 A.M at the property lines.

When two joint boundaries differ in zoning the City of Oceanside Noise Ordinance utilizes the arithmetic mean of the two standards. It should be noted: the hours of operation will only occur during the daytime hours and therefore the applicable property line standard would be 57.5 Leq-h at residential property lines.

5.1 Reference Noise Levels

This section provides a detailed description of the reference noise level measurement results. Each anticipated noise source is provided in more detail below to determine if direct noise impacts will occur. A cumulative noise level analysis with associated distances, noise reductions and calculations of the proposed sources is provided along with a table showing the individual noise sources and their associated property line noise levels.

Carwash

To examine the potential noise impacts associated with the operation of the proposed project, sound level measurements of the equipment were taken at the site. The noise measurements were taken using a Larson-Davis Model LxT Type 1 precision sound level

meter, programmed, in "slow" mode, to record noise levels in "A" weighted form. The sound level meter was mounted on a tripod, five feet above the ground and equipped with a windscreen. The results of the noise measurements are shown in Table 5-1.

Table 5-1: Reference Noise Levels

Equipment	Distance from Source (Feet)	Noise Level (dBA)	Quanity
Vacuum Equipment	3	81.8	1
Carwash Entrance	9	84.3	1
Carwash Exit (Blowers)	9	84.5	1

Air Conditioning Units

Rooftop mechanical ventilation units (HVAC) will be installed on the proposed buildings. In order to evaluate the HVAC noise impacts, the analysis utilized reference noise level measurements taken at a Von's Shopping Center in Murrieta, CA in 2010. The unshielded noise levels for the HVAC units were measured at 65.9 dBA Leq at a distance of 6 feet.

Even though the mechanical ventilation system will cycle on and off throughout the day, this approach presents the worst-case noise condition. Additionally, the noise levels associated with the roof-top mechanical ventilation system will be limited with the proposed parapet walls on each building that will vary in height but will be roughly 1-foot higher than the HVAC units to shield them both visually and acoustically. Hence, the parapet wall will block the line-of-sight from the nearest residential units. No additional reductions were taken from the parapet walls to represent a worst-case noise condition.

5.2 Property Line Noise Levels

To determine the anticipated property line noise levels from the proposed project the reference noise measurements above were utilized. Although the carwash activities and mechanical equipment are intermittent, no duty-cycle reductions were taken and the reference noise levels were considered to be continuous to establish the worst-case anticipated property line noise levels. The property line noise level projections were calculated based on the site plan showing the location of the proposed outdoor uses. The

site plan and some relative distances to the nearest property lines are provided in Figure 5-2 on the following page.

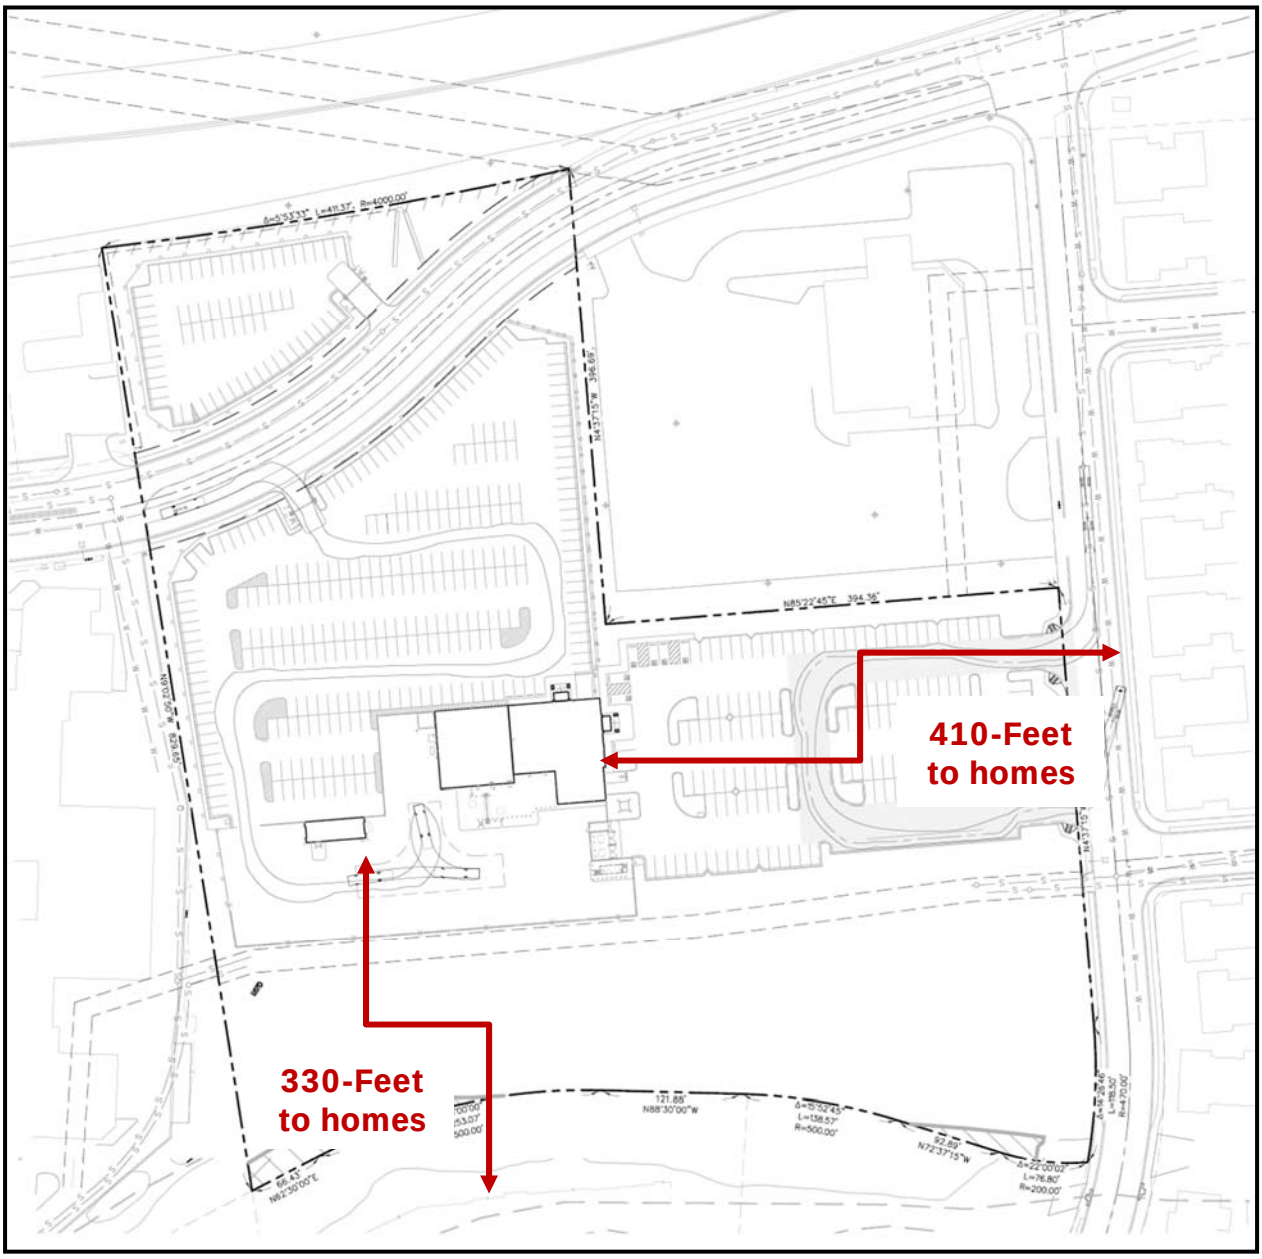
It is possible to calculate the cumulative noise levels from the proposed project to the nearest sensitive property line from the proposed noise sources. Each noise source was cumulatively added to determine the worst case outdoor activity noise levels. Although not all the noise sources are close enough to each other in distance or sound level to create a cumulative effect this method is considered conservative in determining impact potential. The results of this conservative approach are shown in Table 5-2 below for the propagated noise levels to the nearest sensitive property line located 330-410 feet from sources. It should be noted: the values given do not take into account the effect of any noise barriers, structures, or topography that may reduce the noise levels. As can be seen in Table 5-1, the noise level, without accounting for any reductions are below the most restrictive residential noise threshold as shown above in Table 3-1.

Table 5-2: Operational Noise Levels – Southern Property Line

Source	Distance from Source (Feet)	Measured Noise Level (dBA)	Distance to Nearest Property Line (Feet)	Noise Reduction due to distance (dBA)	Resultant Noise Level @ Property Line (dBA)
Vacuum Equipment	3	81.8	330	-40.8	16.5
Carwash Entrance	9	84.3		-31.3	38.1
Carwash Exit (Blowers)	9	84.5		-31.3	38.3
HVAC West Bldg	6	65.9		-34.8	12.7
HVAC East Bldg	6	65.9		-34.8	12.7
Cumulative Noise Level @ Property Line (dBA)					**41.3**

Based upon the property line noise levels determined above none of the proposed noise sources directly or cumulatively exceeds the property line standards at the surrounding property lines. Therefore, the proposed development related operational noise levels comply with the City's noise standards at surrounding residences. No impacts are anticipated and no mitigation is required.

Figure 5-1: Site Plan and Noise Sources



6.0 TRANSPORTATION NOISE LEVELS

6.1 Offsite Transportation Related Noise Levels

The off-site project-related roadway segment noise levels projected in this report were calculated using the methods in the Highway Noise Model published by the Federal Highway Administration (FHWA Highway Traffic Noise Prediction Model, FHWA-RD-77-108, December, 1978). The FHWA Model uses the traffic volume, vehicle mix, speed, and roadway geometry to compute the equivalent noise level. A spreadsheet calculation was used which computes equivalent noise levels for each of the time periods used in the calculation of CNEL. Weighting these equivalent noise levels and summing them gives the CNEL for the traffic projections. The noise contours are then established by iterating the equivalent noise level over many distances until the distance to the desired noise contour(s) are found.

Because mobile/traffic noise levels are calculated on a logarithmic scale, a doubling of the traffic noise or acoustical energy results in a noise level increase of 3 dBA. Therefore, the doubling of the traffic volume, without changing the vehicle speeds or mix ratio, results in a noise increase of 3 dBA. Mobile noise levels radiate in an almost oblique fashion from the source and drop off at a rate of 3 dBA for each doubling of distance under hard site conditions and at a rate of 4.5 dBA for soft site conditions. Hard site conditions consist of concrete, asphalt, and hard pack dirt, while soft site conditions exist in areas having slight grade changes, landscaped areas, and vegetation.

Community noise level changes greater than 3 dBA are often identified as audible and considered potential significant, while changes less than 1 dBA will not be discernible to local residents. In the range of 1 to 3 dBA, residents who are very sensitive to noise may perceive a slight change. There is no scientific evidence available to support the use of 3 dBA as the significance threshold; community noise exposures are typically over a long time period rather than the immediate comparison made in a laboratory situation. Therefore, the level at which changes in community noise levels become discernible is likely greater than 1 dBA and 3 dBA appears to be appropriate for most people. For the purposes for this analysis, a direct roadway noise impacts would be considered significant if the project increases noise levels for a noise sensitive land use by 3 dBA CNEL and if the project increases noise levels above an unacceptable noise level per the City's General Plan in the area adjacent to the roadway segment.

To determine if direct or cumulative off-site noise level increases associated with the development of the proposed project would create noise impacts. The traffic volumes for the existing conditions were compared with the traffic volume increase of existing plus the proposed project. The project's traffic assessment states that the proposed project site could generate 475 ADT including test drives (Source: CarMax Traffic Analysis – LOS Engineering, 2020). The existing ADT volumes adjacent to the project site along Thunder Drive between Plaza Drive to Tiberon Drive are 9,100 ADT and between Tiberon Drive to Lake Boulevard are 7,631 ADT. The project will result in the traffic volumes increases to 10,255 ADT and 7,796 ADT along those two segment of Thunder Drive, respectively. Typically, it requires a project to double (or add 100%) to the traffic volumes to have a direct impact of 3 dBA CNEL or be a major contributor to the cumulative traffic volumes. The project would result in only a 2-13 percent increase which would increase the noise levels less than 0.5 decibels. Cumulatively the traffic volumes along the roadway are expected to increase but the project related increase would not double the traffic volumes and therefore no impacts are anticipated.

6.2 Conclusions

The Project does not create a noise increase of more than 3 dBA CNEL on any roadway segment. Therefore, the project's contributions to off-site roadway noise increases will not cause any significant impacts to any existing or future noise sensitive land uses.

7.0 CONSTRUCTION NOISE LEVELS

Construction noise represents a short-term impact on the ambient noise levels. Noise generated by construction equipment includes haul trucks, water trucks, graders, dozers, loaders, and scrapers and can reach relatively high levels. Grading activities typically represent one of the highest potential sources for noise impacts. The most effective method of controlling construction noise is through local control of construction hours and by limiting the hours of construction to normal weekday working hours.

The City of Oceanside does not have property line standards for construction, the County of San Diego 75 dBA Leq standard is utilized in the analysis. The County's Noise Ordinance Code states that with the exception of an emergency, it should be unlawful to conduct any construction activity so as to cause, at or beyond the property lines, an average sound level greater than 75 decibels between 7:00 a.m. to 7:00 p.m.

The U.S. Environmental Protection Agency (U.S. EPA) has compiled data regarding the noise generating characteristics of specific types of construction equipment. Noise levels generated by heavy construction equipment can range from 60 dBA to in excess of 100 dBA when measured at 50 feet. However, these noise levels diminish rapidly with distance from the construction site at a rate of approximately 6 dBA per doubling of distance. For example, a noise level of 75 dBA measured at 50 feet from the noise source to the receptor would be reduced to 69 dBA at 100 feet from the source to the receptor, and reduced to 63 dBA at 200 feet from the source.

Using a point-source noise prediction model, calculations of the expected construction noise levels were completed. The essential model input data for these performance equations include the source levels of the equipment, source to receiver horizontal and vertical separations, the amount of time the equipment is operating in a given day (also referred to as the duty-cycle), and any transmission loss from topography or barriers.

7.1 Potential Noise Impact Identification

Based on the EPA noise emissions, empirical data and the amount of equipment needed, worst-case noise levels from the construction equipment operations would occur during the base operations (final site preparation). The construction schedule identifies that final site preparation activities will occur in a single phase all at the same time, with anticipated equipment including 3 tractor/backhoe/loader, 1 roller, 1 grader and 1

dozer.

Due to normal site preparation operations, most of the equipment will be spread out over the site. Based upon the proposed site plan, all the residential uses near the site are located more than 330 feet from all the site preparation activities. Therefore, the worst-case noise condition would occur when the equipment is working in close proximity to each other at distances near the property line. The noise levels utilized in this analysis are shown in Table 7-1.

As can be seen in Table 7-1, even if all the equipment was working in the same area, at a distance as close as 330 feet, the point source noise attenuation from the construction activities and the nearest property line is -16 dBA. This would result in an anticipated worst case eight-hour average combined noise level of 66 dBA at the property line.

Table 7-1: Construction Noise Levels

Equipment Type	Quantity Used	Source @ 50 Feet (dBA)	Cumulative Noise Level @ 50 Feet (dBA)
Tractor/Backhoe/Loader	3	72	77
Grader	1	73	73
Roller	1	74	74
Water Truck	1	70	70
Dozer	1	74	74
		Cumulative Level (dBA)	**82**
		Distance to Separation (Feet)	**330**
		Noise Reduction due to Distance (dBA)	**-16**
		Property Line Noise Level (dBA)	**66**

7.2 Construction Noise Conclusions

It was determined that none of the proposed equipment will exceed the City of Oceanside 85 dBA standard at 100 feet from the source. The project will also meet the County of San Diego's 75 dBA standard from all proposed equipment. No impacts will occur and no mitigation measures are required.

1.0 Introduction

The proposed CarMax auto sales dealership is to be located at the 4000 block of Plaza Drive just west of the Oceanside Department of Motor Vehicles in Oceanside, California. The general location of the project is shown in **Figure 1**. A site plan is shown in **Figure 2**.

The project will have four driveways for access. Two driveways are on Plaza Dr for sales personnel and test drivers only. Arriving customers will use Thunder Dr for on-site customer parking. The project will have two driveways along Thunder Dr for customer parking, employee parking, and delivery of vehicles with 18-wheeler car carriers. Once vehicles are unloaded from the car carriers, employees will drive the cars to the main lot using Plaza Dr.

There is no internal vehicular connection between the "sales" parking areas adjacent to Plaza Dr and the other lot adjacent to Thunder Dr used for customers, employees, and deliveries. This is to keep customers from driving their personal vehicles around the main "sales" lot areas. Customer can walk between the main "sales" lot and customer parking lot.

2.0 Vehicle Miles Traveled

A VMT analysis is required to satisfy the CEQA guidelines that utilize VMT as the measure of effectiveness for determining transportation impacts. The California Governor's Office of Planning and Research (OPR) Technical Advisory developed guidance on implementing Senate Bill 743 (SB 743) that shifts the transportation impact measure of effectiveness from Level of Service (LOS) to VMT. The OPR *Transportation Technical Advisory on Evaluating Transportation Impacts in CEQA*, December 2018 states on page 8 "As noted above, lead agencies have the discretion to set or apply their own thresholds of significance". Excerpts from the OPR Technical Advisory are included in **Appendix A**.

The City of Oceanside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020 as adopted by City Council has identified several project types that are presumed to be considered VMT reducing projects as documented on page 9 within **Appendix B**:

> "The projects listed are either locally serving or are based on substantial evidence provided by the OPR Technical Advisory Committee supporting SR 743 implementation."

The list of screened out projects is shown in **Table 1**. The City of Oceanside has developed a Project Information Form (PIF) to facilitate the screening of project requirements. A completed PIF for this project is included in **Appendix C**.

2.1 Projects Generating Less Than 1,000 ADT and Consistent with General Plan

As shown in Table 1, The City of Oceanside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020 lists several project types that screen out. One criterion is for projects that generate less than 1,000 ADT if consistent with the adopted General Plan. The project site is zoned Community Commercial.

The project traffic generation was calculated using a trip generation rate based on a survey of three open and operating CarMax dealerships. The trip generation study was prepared by Kimley-Horn and Associates in September 2002 (copy included in **Appendix D**). The data from the CarMax sites was collected by placing tube counters across all site driveways. These tubes recorded all vehicles including employees, customers, test drives, deliveries, mail carriers, trash trucks, maintenance, and any other vehicle that crossed over the tubes. The Kimley-Horn study documented a trip rate of 41.48 ADT/ksf (1,000 square feet). This is conservative when compared to the latest Institute of Transportation Engineers (ITE) 10th Edition Trip Generation that documents a trip rate of 27.06 ADT/ksf for used automobile sales. Using the CarMax based trip generation rates, the project is forecasted to generate 475 ADT (11.447 ksf of building area x 41.48 ADT/ksf). The project is consistent with the General Plan and calculated to generate 475 ADT, which is less than the 1,000 ADT threshold; therefore, the project is screened out from a transportation VMT CEQA Analysis.

TABLE 1: CITY OF OCEANSIDE VMT SCREENED OUT PROJECTS

Project Type
Projects located in a Transit Priority Areas (TPA) or Smart Growth Opportunity Area as identified in the most recent SANDAG San Diego Forward Regional Plan and is consistent with the General Plan at the time of project application. (1)(2)
Projects located in a low-VMT generating area identified on the most recent SANDAG SB 743 VMT
Locally serving K-12 schools
Day care centers
Local parks
Locally serving retail uses less than 50,000 square feet, including: gas stations, banks, restaurants, grocery stores,
Community institutions (Public libraries, fire stations, local government)
Locally serving hotels (e.g. non-destination hotels, non-regionally serving)
Student housing projects on or adjacent to college campuses
Local serving community colleges that are consistent with the assumptions noted in the most recent SANDAG
Affordable housing projects (3)
Assisted living facilities
Senior housing (as defined by HUD)
Transit projects
Bike projects
Pedestrian projects
Safety improvement projects (e.g. RRFBs and high visibility crosswalks at uncontrolled locations, pedestrian count
Safe Routes to School
Projects generating less than 500 daily vehicle trips (if inconsistent with adopted General Plan)
Projects generating less than 1,000 daily vehicle trips (if consistent with adopted General Plan)

Source: City of Oceanside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020

(1) Projects located in a TPA must be able to access the transit station within a ½ mile walking distance or 6 minute walk continuously without discontinuity of sidewalk or obstructions to the route. Qualifying transit stops means a site containing an existing rail transit station served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (OPR, 2017). A high-quality transit corridor may also be considered if a corridor with fixed route bus service has service intervals no longer than 15 minutes during peak commute hours (OPR, 2017).

(2) Smart Growth Opportunity Area Map is provided in **Appendix B**. The most recent version available shall be used.

(3) If a project is a mix of affordable housing and market rate housing or unscreened use, only the affordable housing component would qualify as screened out. Additionally, any removal of affordable housing automatically requires CEQA VMT analysis.

2.2 VMT Summary

The City of Oceanside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020 has identified several project types that are presumed to be considered VMT reducing projects if they are either locally serving or are based on substantial evidence provided by the OPR Technical Advisory Committee supporting SR 743 implementation. The project is consistent with the General Plan and calculated to generate 475 ADT, which is less than the 1,000 ADT threshold; therefore, the project is screened out from a transportation VMT CEQA Analysis.

3.0 Conclusion

The proposed CarMax auto sales dealership is located at the 4000 block of Plaza Drive just west of the Oceanside Department of Motor Vehicles in Oceanside, California. The project site is currently vacant. The project is anticipated to be completed by year 2021 or 2022.

The VMT analysis was based on guidance from the Governor's Office of Planning and Research (OPR) Technical Advisory and the City of Oceanside *Draft Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020. OPR developed guidance for implementing Senate Bill 743 (SB 743) requirements that shifts the transportation impact measure of effectiveness from Level of Service (LOS) to VMT. The City of Oceanside *Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020 has identified several project types that are presumed to be considered VMT reducing projects if they are either locally serving or are based on substantial evidence provided by the OPR Technical Advisory Committee supporting SR 743 implementation. One criterion is for projects that generate less than 1,000 ADT if consistent with the adopted General Plan.

The project is consistent with the General Plan and calculated to generate 475 ADT, which is less than the 1,000 ADT threshold; therefore, the project is screened out from a transportation VMT CEQA Analysis.

Appendix A

Excerpts from OPR Technical Advisory

TECHNICAL ADVISORY

ON EVALUATING TRANSPORTATION IMPACTS IN CEQA

December 2018

D. General Principles to Guide Consideration of VMT

SB 743 directs OPR to establish specific "criteria for determining the significance of transportation impacts of projects[.]" (Pub. Resources Code, § 21099, subd. (b)(1).) In establishing this criterion, OPR was guided by the general principles contained within CEQA, the CEQA Guidelines, and applicable case law.

To assist in the determination of significance, many lead agencies rely on "thresholds of significance." The CEQA Guidelines define a "threshold of significance" to mean "an identifiable **quantitative, qualitative[12] or performance level** of a particular environmental effect, non-compliance with which means the effect will ***normally*** be determined to be significant by the agency and compliance with which means the effect ***normally*** will be determined to be less than significant." (CEQA Guidelines, § 15064.7, subd. (a) (emphasis added).) Lead agencies have discretion to develop and adopt their own, or rely on thresholds recommended by other agencies, "provided the decision of the lead agency to adopt such thresholds is supported by substantial evidence." (*Id*. at subd. (c); *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th 1059, 1068.) Substantial evidence means "enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached." (*Id*. at § 15384 (emphasis added); *Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-1109.)

Additionally, the analysis leading to the determination of significance need not be perfect. The CEQA Guidelines describe the standard for adequacy of environmental analyses:

> An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to **make a decision which intelligently takes account of environmental consequences**. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is **reasonably feasible**. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The **courts have looked not for perfection** but for **adequacy**, **completeness**, and a **good faith effort** at full disclosure.

(CEQA Guidelines, § 15151 (emphasis added).)

These general principles guide OPR's recommendations regarding thresholds of significance for VMT set forth below.

[12] Generally, qualitative analyses should only be conducted when methods do not exist for undertaking a quantitative analysis.

E. Recommendations Regarding Significance Thresholds

As noted above, lead agencies have the discretion to set or apply their own thresholds of significance. (*Center for Biological Diversity v. California Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 218-223 [lead agency had discretion to use compliance with AB 32's emissions goals as a significance threshold]; *Save Cuyama Valley v. County of Santa Barbara* (2013) 213 Cal.App.4th at p. 1068.) However, Section 21099 of the Public Resources Code states that the criteria for determining the significance of transportation impacts must promote: (1) reduction of greenhouse gas emissions; (2) development of multimodal transportation networks; and (3) a diversity of land uses. It further directed OPR to prepare and develop criteria for determining significance. (Pub. Resources Code, § 21099, subd. (b)(1).) This section provides OPR's suggested thresholds, as well as considerations for lead agencies that choose to adopt their own

The VMT metric can support the three statutory goals: "the reduction of greenhouse gas emissions, the development of multimodal transportation networks, ***and*** a diversity of land uses." (Pub. Resources Code, § 21099, subd. (b)(1), emphasis added.) However, in order for it to promote and support all three, lead agencies should select a significance threshold that aligns with state law on all three. State law concerning the development of multimodal transportation networks and diversity of land uses requires planning for and prioritizing increases in complete streets and infill development, but does not mandate a particular depth of implementation that could translate into a particular threshold of significance. Meanwhile, the State has clear quantitative targets for GHG emissions reduction set forth in law and based on scientific consensus, and the depth of VMT reduction needed to achieve those targets has been quantified. Tying VMT thresholds to GHG reduction also supports the two other statutory goals. Therefore, to ensure adequate analysis of transportation impacts, OPR recommends using quantitative VMT thresholds linked to GHG reduction targets when methods exist to do so.

Various legislative mandates and state policies establish quantitative greenhouse gas emissions reduction targets. For example:

- Assembly Bill 32 (2006) requires statewide GHG emissions reductions to 1990 levels by 2020 and continued reductions beyond 2020.

- Senate Bill 32 (2016) requires at least a 40 percent reduction in GHG emissions from 1990 levels by 2030.

- Pursuant to Senate Bill 375 (2008), the California Air Resources Board GHG emissions reduction targets for metropolitan planning organizations (MPOs) to achieve based on land use patterns and transportation systems specified in Regional Transportation Plans and Sustainable Community Strategies (RTP/SCS). Current targets for the State's largest MPOs call for a 19 percent reduction in GHG emissions from cars and light trucks from 2005 emissions levels by 2035.

- Executive Order B-30-15 (2015) sets a GHG emissions reduction target of 40 percent below 1990 levels by 2030.

Appendix B

Excerpts from City of Oceanside VMT and LOS Guidelines

City of Oceanside

Traffic Impact Analysis Guidelines for

Vehicle Miles Traveled (VMT) and Level of Service Assessment

August 2020
Final Version

Trip Distribution / Assignment Procedure

Typically, two methods are used to determine trip distribution and assignment for transportation analysis and are considered acceptable by the City.

- The first method utilizes engineering judgement based on existing traffic data and land use patterns. This method requires the consultant to provide a map with project distribution and trip assignments to the City for review prior to conducting analysis.

- The second method utilizes the SANDAG Regional Travel Demand Model to perform a select zone or link analysis**. This approach is typically used for larger projects and shall be used for any project that generates over 2,400 ADT**.

Once trip distribution and assignment assumptions are submitted to the City, the City will review and provide feedback on assumptions. If necessary, the developer or consultant may coordinate with the City Traffic Engineer to discuss trip distribution and assignment for any clarification or considerations to travel patterns that are not readily apparent.

7.0 Screened Out Projects

SB 743 eliminates the need for some projects to be analyzed for CEQA purposes that support VMT reduction, these projects are considered screened out for VMT analysis. Screened out is defined as projects not needed to be analyzed for CEQA purposes that already support VMT reduction.

The projects listed in **Table 2** are presumed to be considered VMT-reducing projects. The projects listed are either locally serving or are based on substantial evidence provided by the OPR Technical Advisory Committee supporting SB 743 implementation. A project may be required to conduct a VMT analysis at the discretion of City Staff if it is unclear the project qualifies as screened out or based on the City Traffic Engineer's discretion.

Table 2 – Screened Out Projects

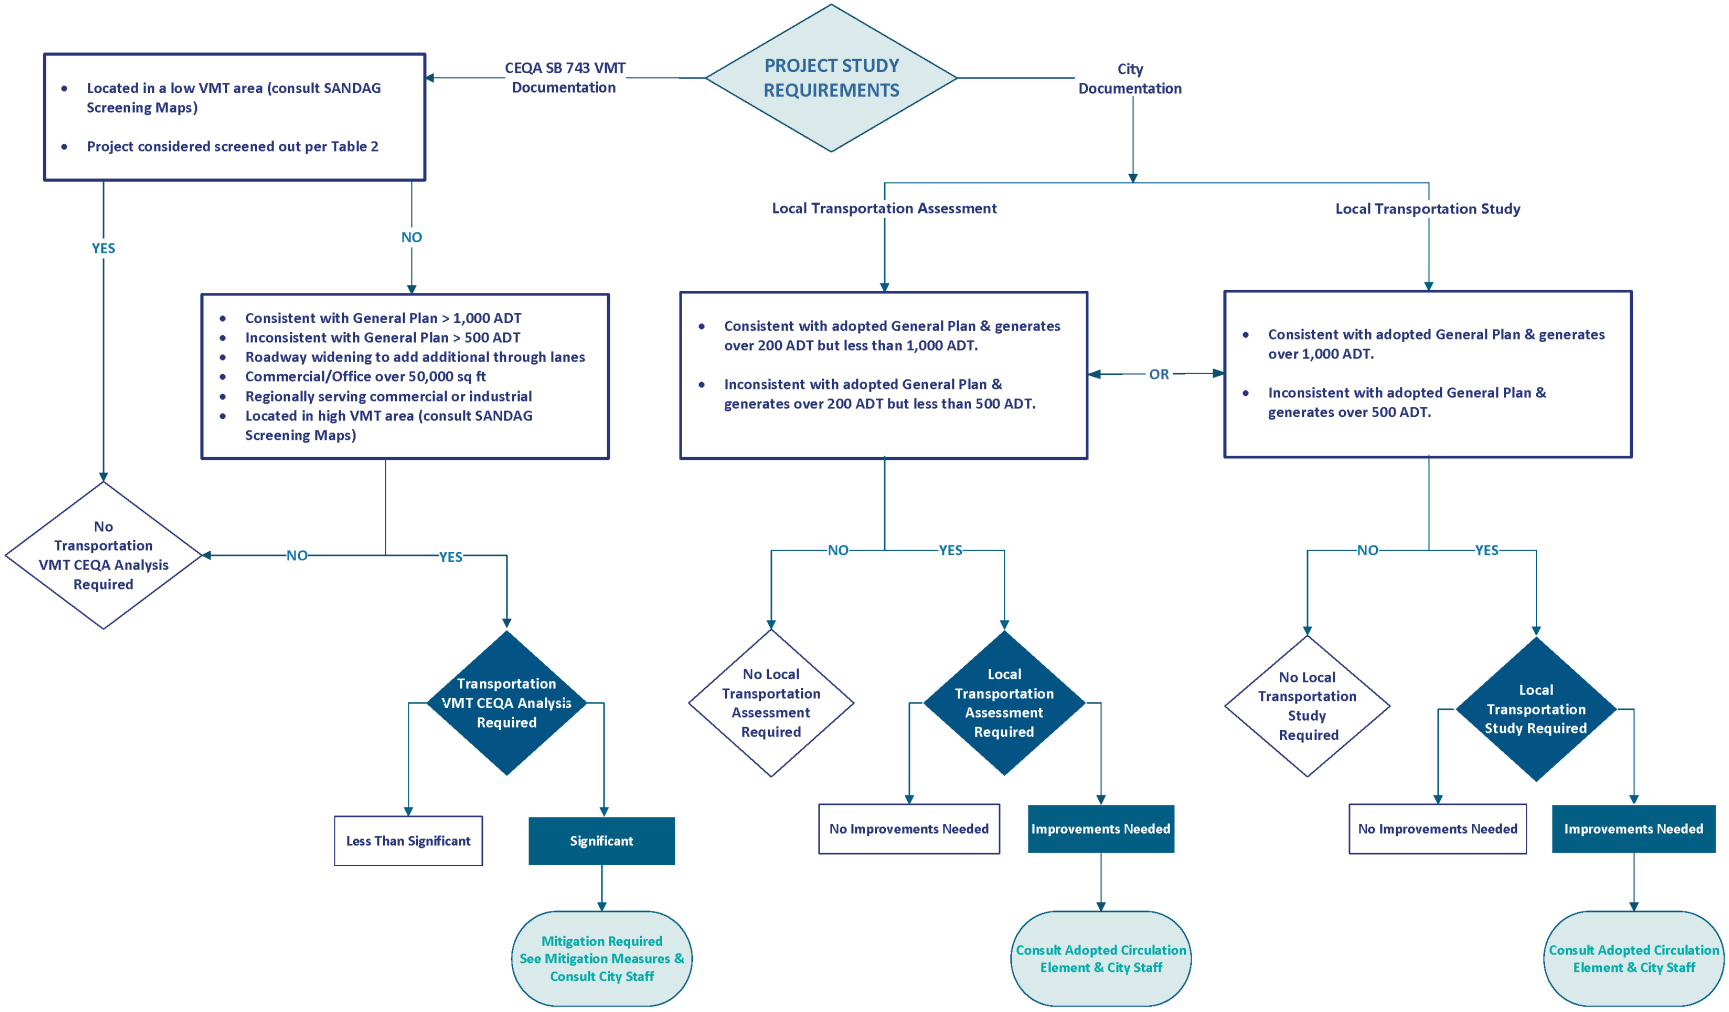
Project Type
Projects located in a Transit Priority Areas (TPA) or Smart Growth Opportunity Area as identified in the most recent SANDAG San Diego Forward Regional Plan and is consistent with the General Plan at the time of project application. (1)(2)
Projects located in a low-VMT generating area identified on the most recent SANDAG SB 743 VMT Screening map
Locally serving K-12 schools
Day care centers
Local parks
Locally serving retail uses less than 50,000 square feet, including: gas stations, banks, restaurants, grocery stores, and shopping centers
Community institutions (Public libraries, fire stations, local government)
Locally serving hotels (e.g. non-destination hotels, non-regionally serving)
Student housing projects on or adjacent to college campuses
Local serving community colleges that are consistent with the assumptions noted in the most recent SANDAG Regional Transportation Plan/Sustainable Communities Strategy
Affordable housing projects (3)
Assisted living facilities
Senior housing (as defined by HUD)
Transit projects
Bike projects
Pedestrian projects
Safety improvement projects (e.g. RRFBs and high visibility crosswalks at uncontrolled locations, pedestrian count down timers, additionally projects identified through the Highway Safety Improvement Program)
Safe Routes to School
Projects generating less than 500 daily vehicle trips (if inconsistent with adopted General Plan)
Projects generating less than 1,000 daily vehicle trips (if consistent with adopted General Plan)

(1) Projects located in a TPA must be able to access the transit station within a ½ mile walking distance or 6 minute walk continuously without discontinuity of sidewalk or obstructions to the route. Qualifying transit stops means a site containing an existing rail transit station served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (OPR, 2017). A high-quality transit corridor may also be considered if a corridor with fixed route bus service has service intervals no longer than 15 minutes during peak commute hours (OPR, 2017).
(2) Smart Growth Opportunity Area Map is provided in **Appendix B**. The most recent version available shall be used.
(3) If a project is a mix of affordable housing and market rate housing or unscreened use, only the affordable housing component would qualify as screened out. Additionally, any removal of affordable housing automatically requires CEQA VMT analysis.

8.0 Determining Project Study Requirements

Figure 8-1 helps guide development projects in determining the requirements from a local and state perspective in order to help determine study requirements. The screening flowchart indicates an overview of the circumstances where a detailed CEQA VMT analysis would or would not be required and when a project would require a Local Transportation Study or Local Transportation Assessment. The City maintains the discretion to require a project to conduct additional analysis if needed.

Figure 8-1 Project Study Requirements



* Projects are not confined to what is listed above and will need to be coordinated with City Staff to determine study requirements for developments not listed.
This flowchart is a generalization, it is up to the City's discretion to determine if additional analyses will be required and if potential mitigation or improvements are acceptable.

9.0 San Diego Regional Guidelines For VMT

The City of Oceanside utilizes the Institute of Transportation Engineers (ITE) San Diego Regional Guidelines (May 2019) to establish thresholds and methodology for VMT analysis. For analysis purposes the most recent version of these guidelines shall be utilized. The following sections summarize the VMT thresholds requirements for Oceanside in alignment with ITE. Thorough analysis explanation can be found in the most recent ITE guidance.

Minimum Threshold for VMT Analysis

Based on the recommendations of the Institute of Transportation Engineers (ITE) for the San Diego section, **Table 3** indicates when a VMT analysis for CEQA is required. This is based on keeping consistent with the thresholds previously used and *SANDAG's Not So Brief Guide Trip Generation (2002)*. These thresholds are based on the understanding that SANDAG trip generation rates differ from ITE trip generation rates which OPR's recommendations are based on.

Projects Consistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that support these goals will adhere to the following VMT analysis thresholds identified in Table 3.

Table 3 – Threshold for VMT Analysis for Projects Consistent with the Adopted General Plan

	VMT Analysis Not Needed	VMT Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 1,000 ADT	Greater than 1,000 ADT

(1) If ADT is equal to 1,000 ADT, VMT analysis is required.

Projects Inconsistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that are not in support of the General Plan have a lower VMT threshold and will require a General Plan Amendment. The following VMT analysis thresholds for projects that are inconsistent are identified in **Table 4**.

Table 4 – Threshold for VMT Analysis for Projects Inconsistent with the Adopted General Plan

	VMT Analysis Not Needed	VMT Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 500 ADT	Greater than 500 ADT

(1) If ADT is equal to 500 ADT, VMT analysis is required.

The thresholds identified in Table 3 and Table 4 stem from the professional expertise and judgement of the ITE San Diego section. These thresholds reflect what is appropriate for the San Diego region to use for VMT and have previously helped determine LOS impacts.

VMT Thresholds

This section identifies what type of VMT analysis is required based on the land use and thresholds identified in the previous section. If a project qualifies for a VMT analysis, the VMT analysis can be compared based on City-wide, Regional, or community basis. The method of comparison shall be agreed upon by the City Traffic Engineer and shall be appropriate based on the use of the site.

The following defines the metrics identified in **Table 5**. It is important the appropriate metrics are applied for each project.

VMT/Capita:

Includes all vehicle-based person trips grouped and summed to the home location of individuals who are drivers or passengers on each trip. It includes home-based and non-home-based trips. The VMT for each home is then summed for all homes in a particular census tract and divided by the population of that census tract to arrive at Resident VMT/Capita.

VMT/Employee:

Includes all vehicle-based person trips grouped and summed to the work location of individuals on the trip. This includes all trips, not just work-related trips. The VMT for each work location is then summed for all work locations in a particular census tract and divided by the number of employees of that census tract to arrive at Employee VMT/Employee.

Small Projects

Small projects, under 2,400 ADT, shall utilize the most recent version of the SANDAG SB 743 Concept Maps. SANDAG has prepared an online mapping system that calculates average VMT/capita and VMT/employee at the census tract level. This tool determines the project's VMT/employee or VMT/capita to be compared to community, city, and/or regional averages. **Appendix C** provides an example of how to use the SANDAG Concept Maps to determine the project's VMT.

Large Projects

Projects consisting of 2,400 ADT or higher will require the use of the most recent SANDAG model to determine VMT. The SANDAG transportation model provides a systematic analytical platform so that different alternatives and inputs can be evaluated in an iterative and controlled environment.

Table 5 identifies the significance thresholds for proposed land uses. Projects that exceed the significance thresholds are considered significant and will require VMT analysis and mitigation.

Table 5 – City of Oceanside Project Threshold

Project Type	Metric	Significance Threshold[1]
Residential	Resident VMT / Capita	15 % below regional average
Commercial	Employee VMT / Employee	15 % below regional average
Industrial	Employee VMT / Employee	15 % below regional average
Retail [2]	Net increase in the regional VMT	Net increase in regional VMT
Mixed-Use	Evaluate each land use separately	Based on proposed land use
Redevelopment [3]	Based on the proposed land use	Based on the proposed land use

(1) The City may request the applicant to analyze VMT using a more localized threshold if the project requires.

(2) Locally serving retail is presumed to decrease VMT however retail projects over 50,000 square feet are considered regionally serving.

(3) A redevelopment project that reduces VMT is presumed to have less than a significant impact and is screened out. The removal of affordable housing will require VMT analysis.

10.0 Mitigation Measures and Strategies for VMT Reduction

A project that exceeds the thresholds identified in the previous tables is considered to have a significant impact and will require mitigation measures and strategies. With appropriate mitigation the project may be able to apply VMT reductions to part or all of the project depending on the land use and strategy chosen. It is critical to implement strategies that are appropriate for the land use, for example, a residential project would not implement a telecommute strategy but may include providing a bike facility and amenities on-site.

SANDAG Mobility Management Guidebook

The purpose of the mitigation measures and strategies is to reduce the VMT generated by the project through a reduction of the distance driven or reducing the number of vehicle trips. It is recommended the SANDAG Mobility Management Guidebook (2019) be consulted to determine mitigation measures for the project site.

The guidebook consists of the following resources:

- Mobility Management Guidebook
- VMT Reduction Calculator Tool
- Calculator Design Document
- Recommendations for Application
- User Training Videos

Figure 10-1 identifies the potential mobility management strategies included in the guidebook that are recommended for a project exceeding the VMT thresholds. It is also recommended the SANDAG iCommute and MTS programs be utilized for projects generating employment. Several opportunities included in these programs are identified in **Table 6**. **Appendix D** contains the SANDAG Mobility Management Guidebook for reference.

The VMT Reduction Calculator Tool evaluates the VMT impact of more than 20 mobility management strategies. The calculator can be utilized to determine how a strategy, when implemented, can reduce a project's VMT. **Appendix E** contains the SANDAG VMT Reduction Calculator Tool for reference, the calculator is available on the SANDAG website. All VMT reduction strategies utilized should be discussed with the City and provided with backup documentation. Any changes or overrides to input parameters should be discussed and approved by the City.

Additional VMT Reduction Strategies for Employers
Establish and maintain participation in SANDAG's iCommute services for employers
Provide a monthly employer subsidy/pretax payroll deduction toward transit passes, carpool, or vanpool.
Encourage employees to register in SANDAG's iCommute program for rideshare matches.
Provide a monthly employer subsidy or incentives for employees or patrons who regularly commute by bicycle.
Host or sponsor regional events such as Bike to Work day, Rideshare Month
Participate in MTS promotions such as Free Ride Day and EcoPass
Implement an internal carpool program for employees
Designate an on-site point of contact for employee commute inquiries.

OPR Mitigation Measures

Table 7 identifies additional mitigation measures provided by the Office of Planning and Research (OPR).

Table 7 – OPR Recommended Mitigation Measures

Additional Mitigation Measures
Improve or increase access to transit.
Increase access to common goods and services, such as groceries, schools, and daycare.
Incorporate affordable housing into the project.
Incorporate a neighborhood electric vehicle network.
Orient the project toward transit, bicycle, and pedestrian facilities.
Improve pedestrian or bicycle networks, or transit service.
Implement or provide access to a commute reduction program.
Provide parking cash-out programs.
Unbundle parking costs.
Provide bicycle parking.
Limit or eliminate parking supply.
Provide traffic calming as a way to incentivize bicycling and/or walking.
Provide partially or fully subsidized transit passes.
Shift single occupancy vehicle trips to carpooling or vanpooling by providing ride-matching services or shuttle services.
Provide telework options.
Provide incentives or subsidies that increase the use of modes other than a single-occupancy vehicle.
Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, showers and locker rooms, and bicycle repair services.
Provide employee transportation coordinators at employment sites.
Provide a guaranteed ride home service to users of non-auto modes.
Contribute to a mobility fee program that funds multimodal transportation improvements, such as those described above.

The City may decide to implement a VMT mitigation fee bank to fund projects that would help the City reduce GHG emissions and promote VMT reduction. This would need to be developed specifically for VMT reduction projects for the City and cannot be preexisting to this document. Mitigation measures are not limited to this document and may be discussed with the City Traffic Engineer providing appropriate reduction methodologies are applied using documentation published by SANDAG, the California Air Resources Board (CARB), or the California Air Pollution Control Officers Association (CAPCOA). These resources provide quantifiable measures that may be used for project mitigation. Mitigation and reduction measures utilized should be documented and easily referenced in the document's appendix.

SIGNIFICANT AND UNAVOIDABLE IMPACTS

Projects that are unable to mitigate to a less than significant level of impact must provide a detailed statement of overriding considerations in accordance with CEQA Guidelines Sections 15091 and 15093. The following are direct quotes from the legislation to help project applicants understand CEQA law.

Section 15091 Findings:

" (a) No public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding.

The possible findings are:

(1) Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.

(2) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.

(3) Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

(b) The findings required by subdivision (a) shall be supported by substantial evidence in the record.

(c) The finding in subdivision (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives. The finding in subdivision (a)(3) shall describe the specific reasons for rejecting identified mitigation measures and project alternatives.

(d) When making the findings required in subdivision (a)(1), the agency shall also adopt a program for reporting on or monitoring the changes which it has either required in the project or made a condition of approval to avoid or substantially lessen significant environmental effects. These measures must be fully enforceable through permit conditions, agreements, or other measures.

(e) The public agency shall specify the location and custodian of the documents or other material which constitute the record of the proceedings upon which its decision is based.

(f) A statement made pursuant to Section 15093 does not substitute for the findings required by this section."

Section 15093 – Statement of Overriding Considerations:

" (a) CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposal project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable."

(b) When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.

(c) If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the notice of determination. This statement does not substitute for, and shall be in addition to, findings required pursuant to Section 15091."

11.0 LOCAL TRANSPORTATION STUDY AND LOCAL TRANSPORTATION ASSESSMENT GUIDELINES

The City of Oceanside utilizes the Institute of Transportation Engineers (ITE) San Diego Regional Guidelines (May 2019) to establish thresholds and methodology for a Local Transportation Study (LTS). A Local Transportation Study is different from VMT analysis for CEQA purposes and may be required in addition to the VMT analysis or individually. A Local Transportation Study will analyze the projects influence on the surrounding intersections and roadway network utilizing level of service (LOS) for all project scenarios. The purpose of the LTS is to help quantify the local impact of the development and expected changes in transportation conditions. The LTS should include roadway, bicycle, pedestrian, and transit evaluations. The following sections identify the project requirements for a Local Transportation Study. The Local Transportation Study helps the City ensure the goals, objectives, and policies adopted by the City are supported and implemented while monitoring the capacity for the roadway networks.

Data should be collected during typical operation hours. Data should be recent and no more than 2 years old for an LTS. **The acceptable level of service for the City of Oceanside that is consistent with the adopted Circulation Element is LOS D.**

Minimum Threshold for Local Transportation Study

Based on the recommendations of the Institute of Transportation Engineers (ITE) for the San Diego section, **Table 8** indicates when a Local Transportation Study is required for the City. This is based on keeping consistent with the thresholds previously used and *SANDAG's Not So Brief Guide (2002) Trip Generation*.

Projects Consistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that support these goals will adhere to the following LTS thresholds identified in Table 8.

Table 8 – Threshold for LTS for Projects Consistent with the Adopted General Plan

	LTS Analysis Not Needed	LTS Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 1,000 ADT	Greater than 1,000 ADT

(1) If ADT is equal to 1,000 ADT, an LTS is required.

A Local Transportation Study (LTS) will be required if a project exceeds 1,000 ADT and is consistent with the adopted General Plan.

Projects Inconsistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that are not in support of the General Plan have a lower LTS threshold and will require a General Plan Amendment. The following LTS analysis thresholds for projects that are inconsistent are identified in **Table 9**.

Table 9 – Threshold for LTS for Projects Inconsistent with the Adopted General Plan

	LTS Analysis Not Needed	LTS Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 500 ADT	Greater than 500 ADT

(1) If ADT is equal to 500 ADT, an LTS is required.

A Local Transportation Study (LTS) will be required if a project exceeds 500 ADT and is inconsistent with the adopted General Plan.

The thresholds identified in Table 7 and Table 8 stem from the professional expertise and judgement of the ITE San Diego section. These thresholds keep consistent with regional practice and will help ensure developments will not overburden the transportation network.

If a project would add peak hour trips to any existing on- or off-ramp it is recommended to consult with the City and Caltrans to determine if an LTS would be required.

Study Scenarios

The following scenarios are included in an LTS and may be modified in agreement with the City Traffic Engineer.

- Existing Conditions
- Existing Conditions Plus Project
- Existing Conditions Plus Near-Term Cumulative Projects
- Existing Conditions Plus Near-Term Cumulative Projects Plus Project
- Buildout Conditions (2030)
- Buildout Conditions Plus Project

Local Transportation Assessment (LTA)

A Local Transportation Assessment (LTA) may be required instead of a Local Transportation Study depending on the size of the project. A helps the City monitor development impacts on the transportation network and is similar to a Local Transportation Study(LTS). The main difference between the two studies is a Local Transportation Assessment (LTA) analyzes fewer scenarios than a Local Transportation Study (LTS). A Local Transportation Assessment (LTA) will be required if a project is less than 1,000 ADT but is anticipated to influence the surrounding environment.

A Local Transportation Assessment (LTA) will be required to analyze the following scenarios based on the thresholds for identified for the project's ADT.

- **A project that generates between 200-500 ADT will be required to analyze existing conditions and existing conditions plus project.**

- **A project that generates between 500-1,000 ADT will be required to analyze existing conditions, existing conditions plus project, existing conditions plus near-term cumulative projects, and existing conditions plus near-term cumulative projects plus project.**

Transportation Modes to be Included for Discussion in the LTS/LTA

Pedestrian:

- The LTS/LTA shall include pedestrian infrastructure available including any opportunities or deficiencies such as path obstructions or missing sidewalk for ½ mile walking distance from project pedestrian access points.
- All pedestrian facilities directly connected to project access points or adjacent to the project development, extending in each direction to the nearest intersection with a classified roadway or connection with a Class I path
- Facilities connecting to transit stops within two blocks of the project
- Only facilities on the side of the project or along the walking route to transit stop
- Additional geographic areas may be included in certain cases to address special cases such as schools or retail centers

Bicycle:

- The LTS/LTA shall include a discussion of bicycle infrastructure available including any opportunities or deficiencies such as bike lanes, bike buffers, or bike boxes. This section must also include discussion of what is planned based on City and regional documentation. The extents are as follows:
    - All roadways adjacent to the project, extending in each direction to the nearest intersection with a classified roadway or with a Class I path
    - Both directions of travel should be evaluated

Transit:

- The LTS/LTA shall identify any transit stops or routes existing and planned near the project site. This section shall also include a discussion and evaluation of transit stop amenities within ½ mile of each pedestrian access point.

Vehicle:

All signalized intersections and signalized project driveways shall be analyzed if:

- The project will add 50 or more peak hour (final cumulative) trips in either direction

All unsignalized intersections and unsignalized project driveways shall be analyzed if:

- The project will add 50 or more peak hour (final cumulative) trips in either direction

All freeway ramp intersections and signalized project driveways shall be analyzed if:

- The project will add 20 or more peak hour (final cumulative) trips in either direction

Intersection Level of Service analysis should be conducted using the Highway Capacity Manual (HCM) Methodology. For signalized intersections, the methodology described in the HCM for signalized intersections is used. With this methodology, the average control delay per vehicle is estimated for each lane group and aggregated for each approach and for the intersection as a whole. The relationship between control delay per vehicle and LOS for signalized intersections is summarized in **Table 10**.

Table 10 – HCM Level of Service Description for Signalized Intersections

Level of Service	Description of Traffic Conditions	Control Delay (sec/veh)
A	Insignificant delays: no approach phase is fully utilized and no vehicle waits longer than one red indication	≤ 10
B	Minimal delays: an occasional approach phase is fully utilized. Drivers begin to feel restricted.	> 10 – 20
C	Acceptable delays: major approach phase may become fully utilized. Most drivers feel somewhat restricted.	> 25 – 35
D	Tolerable delays: Drivers may wait through more than one red indication. Queues may develop but dissipate rapidly without excessive delays.	> 35 – 55
E	Significant delays: Volumes approaching capacity. Vehicles may wait through several cycles and long vehicle queues form upstream.	> 55 – 80
F	Excessive delays: Represents conditions at capacity, with extremely long delays. Queues may block upstream intersections.	> 80

Source: Highway Capacity Manual, Transportation Research Board, 2010.

For unsignalized intersections, the methodology described in the HCM for unsignalized intersections is used. With this methodology, LOS is related to the control delay for each stop-controlled movement. The relationship between control delay per vehicle and LOS for unsignalized intersections is summarized in **Table 11**.

Table 11 – HCM Level of Service Description for Unsignalized Intersections

Level of Service	Description of Traffic Conditions	Control Delay (sec/veh)
A	No delay for stop-controlled approaches.	≤ 10
B	Operations with minor delay.	> 10 – 15
C	Operations with moderate delays.	> 15 – 25
D	Operations with some delays.	> 25 – 35
E	Operations with high delays and long queues.	> 35 – 50
F	Operation with extreme congestion, with very high delays and long queues unacceptable to most drivers.	> 50

Source: Highway Capacity Manual, Transportation Research Board, 2010.

Table 12 provides guidance on the levels of ADT that can be accommodated on various types of roadways, based on level of service.

Table 12 – Circulation Element Roadway Classification LOS & Capacity

Class	Lanes	Cross Section [1]	Level of Service (LOS)				
			A	B	C	D	E
Expressway	6	102/160 122/200	30,000	42,000	60,000	70,000	80,000
Expressway	4	102/160 122/200	25,000	35,000	50,000	55,000	60,000
Prime Arterial	6	104/124	25,000	35,000	50,000	55,000	60,000
6-Lane Major Arterial	6	104/124	20,000	28,000	40,000	45,000	50,000
5-Lane Major Arterial [2]	5	102/122	17,500	24,500	35,000	40,000	45,000
4-Lane Major Arterial	4	80/100	15,000	21,000	30,000	35,000	40,000
Secondary Collector (4 lanes with 2-way left turn lane)	4	64/84	10,000	14,000	20,000	25,000	30,000
Secondary Collector (4 lanes without 2-way left-turn lane, with left turn pockets	4	54/74, 60/80	9,000	13,000	18,000	22,000	25,000
Collector (commercial fronting, 2-lanes with 2-way left turn lane) [3]	2	50/70	5,000	7,000	10,000	13,000	15,000
Collector (residential streets in the Circulation Element or industrial fronting)	2	40/60, 50/70	4,000	5,500	7,500	9,000	10,000
Local Street (residential streets NOT in the Circulation Element	1	36/56, 40/60	–	–	2,400	–	–

(1) Cross sections are listed as curd-to-curb width/total right of way width, in feet.
(2) Vandegrift Boulevard is the only Circulation Element roadway designated as a 5-lane Major Arterial. It is not intended that other roadways be build to 5-lane Major Arterial standards.
(3) This capacity will also be assumed for a two-lane one-way collector.

Table 13 indicates when a project's effect on the roadway system is considered to justify the need for roadway improvements. That is, if a project's traffic effect causes the values in this table to be exceeded, roadway improvements should be considered as follows on a case by case basis:

- Improvements should be consistent with the General Plan
- Improvements for transit, bike and pedestrian facilities should be given priority in Transit Priority Areas or Smart Growth Opportunity Areas as identified by SANDAG.
- Projects in Transit Priority Areas or Smart Growth Opportunity Areas as identified by SANDAG, that are consistent with the General Plan at the time of project application, should not be denied due to the inability to provide roadway improvements (i.e. existing right of way is constrained, etc.)

Table 13 – Determination of the Need for Roadway Improvements

Level of Service with Project*	Allowable Change Due to Project Effect**					
	Freeways		Roadway Segments		Intersections	Ramp Metering
	V/C	Speed (MPH)	V/C	Speed (MPH)	Delay (Sec.)	Delay (Min.)
E & F (or ramp meter delays above 15 min)	0.01	1	0.02	1	2	2

12.0 TRANSPORTATION DEMAND MANAGEMENT (TDM) STRATEGIES

In general, the goal of City Staff is to help Oceanside increase connectivity and level of comfort for pedestrians, bicyclists, and transit users. Project improvements may come from the City's adopted General Plan or other City policies that help improve the overall quality of life for the community. **Table 14** identifies some TDM improvement measures that may be considered for a project.

Table 14 – Potential TDM Improvement Measures

Potential TDM Measures	
Transit Facilities	Telecommuting
Bike Facilities	Rideshare Programs
Walkability	Flex-time
Carpool Incentives	Parking Cash-Out
Subsidized Transit Passes	Shuttle Service

A measure that is not listed may be considered if the mitigation is appropriately applied and reasonable. Additional improvement measures may be identified as future technologies and policies evolve or with consultation by City Staff.

13.0 RESOURCES

The following resources were used in the development of these guidelines. It is recommended the consultant develop a plan of action that aligns with the City Traffic Engineer's expectation prior to conducting any analyses.

City of San Diego. "Transportation Study Manual (TSM) Draft." September 2019.

Institute of Transportation Engineers (San Diego Section). " Guidelines for Transportation Impact Studies (TIS) in the San Diego Region." May 2019. Accessed April 1, 2020.

Appendix C

City of Oceanside Project Information Form

PROJECT INFORMATION FORM (PIF)

THE FOLLOWING IS TO BE COMPLETED BY THE PROJECT APPLICANT:

PROJECT INFORMATION FORM			
1.	**PROJECT DESCRIPTION:** CarMax Auto Dealership		
2.	**PROJECT LOCATION:** 4000 Block of Plaza Dr		
3.	**LAND USE:** Community Commercial **SIZE/DENSITY:** Approximately 10.28 Acres		
4.	**ZONING AND LAND USE CONSISTENT WITH ADOPTED GENERAL PLAN?**	☒ Yes	☐ No
5.	**PROJECT LOCATED IN TRANSIT PRIORITY AREA[1], SMART GROWTH AREA[2], OR LOW VMT AREA[3]?**	☐ Yes	☒ No
6.	**PROJECT TRIP GENERATION:** 475 ADT	☐ < 200 ADT ☒ ≥ 200 ADT ☐ ≥ 1,000 ADT ☐ ≥ 2,400 ADT	
	ATTACHMENTS		
A.	**PROJECT LOCATION MAP**	☒ Attached	
B.	**PROJECT TRIP DISTRIBUTION**	☒ Attached	
C.	**PROJECT TRIP ASSIGNMENT**	☒ Attached	

1) Projects located in a TPA must be able to access the transit station within a ½ mile walking distance or 6 minute walk continuously without discontinuity of sidewalk or obstructions to the route. Qualifying transit stops means a site containing an existing rail transit station served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (OPR, 2017). A high-quality transit corridor may also be considered if a corridor with fixed route bus service has service intervals no longer than 15 minutes during peak commute hours (OPR, 2017).
(2) See Appendix B.
(3) Based on the most recent SANDAG SB 743 Screening Map. Example shown in Appendix C.

TO BE COMPLETED BY CITY STAFF AND RETURNED TO PROJECT APPLICANT

	PROJECT STUDY REQUIREMENTS			
1)	**Does the project require a CEQA VMT analysis?** **A. If yes, does the project require a SANDAG Model Run?**	☐ Yes ☐ Yes	■ No ☐ No	☐ Incomplete[(1)]
2a)	**Does the project require a Local Transportation Study?**	■ Yes	☐ No	☐ Incomplete[(1)]
	OR			
2b)	**Does the project require a Local Transportation Assessment?**	☐ Yes	■ No	☐ Incomplete[(1)]

[(1)] Incomplete application or additional information is needed to determine study requirements.

INTRODUCTION

Kimley-Horn & Associates, Inc. was retained to conduct this trip generation study for Carmax Auto Superstores by Industrial Developments International (IDI) at three current store locations. This report summarizes the analysis and findings of the study, and offers an estimate of trip generation rates. It is anticipated that such rates may be used in the planning and design for future Carmax facilities.

Carmax Auto Superstores provide customers with a selection of pre-owned vehicles for purchase or trade-in, and the option to sell a vehicle without making a purchase. A few locations offer new car sales as well. In addition, each store has a service area that handles warranty work, general vehicle maintenance on a limited basis, and reconditioning in preparation for vehicle sales at Carmax Auto Superstores. There are currently 39 Carmax Auto Superstores in 12 states nationwide, ranging from ± 14,000 to ± 95,000 square feet. The service centers typically operate from 7:30 AM to 6:00 PM Monday through Friday, and 7:30 AM to 5:30 PM on Saturday. The sales centers are typically open from 10:00 AM to 9:00 PM Monday through Friday, 9:00 AM to 9:00 PM on Saturday, and 12:00 PM to 7:00 PM on Sunday (where allowed by local ordinances). The Institute of Transportation Engineers *Trip Generation Manual (6thEdition)* provides a land use designation (841) for new car sales. However, due to the fact that pre-owned vehicle sales account for most (if not all) of the sales at a Carmax Auto Superstore, combined with the unique nature of Carmax Auto Superstores compared with other new and used car dealers, a trip generation study was performed to more accurately determine the trip generation rates for a Carmax Auto Superstore.

STUDY METHODOLOGY

This trip generation study used the following methodology:

Trip Generation Study Variables

The purpose of this study is to develop more accurate trip generation rates for Carmax Auto Superstores. Trip generation data was averaged to ascertain the actual number of trips. Data was collected for 24 hours for a period covering weekdays and weekends, and was analyzed for daily, AM, and PM peak periods by building square footage and by the number of employees.

Study Sites

At the time of this study, there were 39 Carmax Auto Superstores in 12 states nationwide. Of these 39 sites, three of distinct size and age were used for data collection and analysis in the study. Descriptions of the three sites are found below; location maps of each site are included in Appendix A.

The sites used for data collection and analysis were:

- Davie, Florida (# 7108)
- Nashville, Tennessee (# 7150)
- Plano, Texas (# 7207)

Carmax Auto Superstore # 7108 is located in **Davie, Florida** at 7420 State Road 84. The store is located on the corner of State Road 84 and SW 71st Terrace, and access to the site is provided from each of the two roads. The main site entrance on State Road 84 allows access for employees, sales customers, and service customers, while the access on 71st Street is used primarily for vehicle delivery and distribution. Only pre-owned vehicles are sold at this location. The store is ±81,099 square feet, has 220 employees, and has been in operation since November 1997. This store differs from the other two analyzed in this study in that it is a "hub" store. A "hub" store handles service and re-conditioning for its location, as well as other "satellite" locations in the area of the "hub". This "hub" location is capable of 24-hour service, meaning that there is often a night shift used for vehicle reconditioning.

Carmax Auto Superstore # 7150 is located in **Nashville, Tennessee** at 2051 Powell Avenue. Access to the site is provided by a single driveway, shared with the adjacent Home Depot Expo, located on Powell Avenue less than one mile from Interstate 65. This location sells new and pre-owned vehicles and has a full service center for customers and reconditioning. It is designated as a "stand-alone" store, and is ±55,558 square feet, employees 187 people, and has been in operation since July 1999.

Carmax Auto Superstore # 7207 is located in **Plano, Texas** at 4448 West Plano Parkway. Access to the site is provided by two driveways, approximately 200 feet apart, along Fulgham Road, just off West Plano Parkway. The northern drive is considered the primary access to the site, and experiences a heavier amount of traffic. Transport vehicles delivering and collecting vehicles for sale primarily use the southern drive. This store is ±14,012 square feet, has 69 employees, and has been in operation since February 2002. This location is a "satellite" store and only offers pre-owned vehicles.

DATA COLLECTION

Trip Generation

Driveway volumes were collected using 24-hour automatic tube counters at all site driveways for each of the three locations used in this study. Volumes were collected for twenty-four (24) hours, for at least seven consecutive days, and were recorded in 15-minute intervals in order to determine daily and peak-hour volumes.

Manual driveway counts were performed at each site by Kimley-Horn & Associates staff to verify the count data collected by the tube counters. The dates of data collection are listed below by location.

- Davie, FL – Thursday, September 11, 2002 to Thursday, September 18, 2002
- Nashville, TN – Monday, September 9, 2002 to Thursday, September 18, 2002
- Plano, TX – Monday, September 9, 2002 to Friday, September 19, 2002

DATA ANALYSIS

Daily Trip Generation

The daily trip generation rates for each Carmax Auto Superstore location were calculated in two manners. First, by dividing the average weekday (Tuesday, Wednesday, and Thursday) total driveway volumes by the building square footage, and second, by dividing the average weekday (Tuesday, Wednesday, and Thursday) total driveway volumes by the number of employees. In addition, daily volumes from Saturday were also analyzed in the same way to determine a Saturday trip generation rate. Tables 1 and 4 summarize the daily driveway volumes observed at each study site and the resulting trip generation rates.

AM Peak Hour Trip Generation

Morning peak hour (7:00 AM to 9:00 AM) volumes were analyzed, and an AM Peak hour was determined for weekdays Tuesday, Wednesday, and Thursday. An AM Peak hour trip generation rate was then calculated using two methods. The volumes for the peak hour each day were divided first by the building square footage, and second, by the number of employees. These results were averaged to obtain a weekday AM Peak hour trip generation rate. Tables 2 and 5 summarize the AM Peak driveway volumes observed at each study site and the resulting trip generation rates.

PM Peak Hour Trip Generation

Afternoon peak hour (4:00 AM to 6:00 AM) volumes were analyzed, and a PM Peak hour was determined for weekdays Tuesday, Wednesday, and Thursday. A PM Peak hour trip generation rate was then calculated using two methods. The volumes for the peak hour each day were divided first by the building square footage, and second, by the number of employees. These results were averaged to obtain a weekday PM Peak hour trip generation rate. Tables 3 and 6 summarize the PM Peak driveway volumes observed at each study site and the resulting trip generation rates.

Table 1
Daily Trip Generation Rates (per 1,000 square feet)

Store Number	Store Location	Building Size (sq.ft.)	Total Daily Driveway Trip Ends					Daily Trip Generation Rate	
			Tues.	Wed.	Thurs	Average	Sat.	Weekday	Saturday
7108	Davie, Florida	81,099	2,786	2,380	1,955	2,374	1,704	29.27	21.01
7150	Nashville, TN	55,558	1,490	1,581	1,396	1,489	1,151	26.80	20.71
7207	Plano, Texas	14,012	963	980	932	958	1,391	68.37	99.27
Average Trip Generation Rate:								**41.48**	**47.00**

Table 2
AM Peak Hour Trip Generation Rates (per 1,000 square feet)

Store Number	Store Location	Building Size (sq. ft.)	Total Peak Hour Driveway Trip Ends				AM Peak Hour Rate		Total AM Peak
			Tues. In/out	Wed. In/out	Thurs. In/out	Average In/out	In	Out

Average Trip Generation Rate:							**0.69**	**0.44**	**1.13**

CONCLUSION

The purpose of this trip generation study was to estimate how much daily and peak hour traffic a proposed Carmax Auto Superstore may generate during a weekday and Saturday period. Since different size stores were studied, the trip generation analysis produced trip rates that can be applied to the store size or to the number of employees. The results of this trip generation study were compared against the trip rates published in the Institute of Transportation Engineers *Trip Generation Manual (6th Edition)*. The ITE Manual provides a land use code for New Car Sales (Land use 841). The comparison of ITE rates with the rates found in this study is summarized below in Table 7.

Table 7
Trip Generation Rate Comparison

Period	Based on 1,000 Square Feet		Based on Number of Employees	
	KHA Study	ITE Manual	KHA Study	ITE Manual
Weekday	41.48	37.50	10.88	21.14
Saturday	47.00	21.03	11.37	10.55
AM Peak Hour	1.56	2.21	0.44	0.67
PM Peak Hour	4.37	2.80	1.13	0.96

From Table 7, the trip rates observed based on square footage from this study are slightly lower than the ITE rates for the weekday and AM peak hour. However, the Saturday and PM peak hour rates observed were noticeably higher than the rates indicated in the ITE Manual.

The trip rates based on number of employees were observed to be considerably less than ITE rates when evaluating the weekday period, and similar to ITE rates when comparing Saturday. It should be noted that this trip generation study utilized a relatively small sample size (3 locations).

Land Use: 841
Automobile Sales (Used)

Description

A used automobile sales dealership is typically located along a major arterial street characterized by abundant commercial development. The sale or lease of used cars is the primary business at these facilities; however, automobile services and parts sales may also be available. Some dealerships also include leasing options, truck sales, and servicing. Automobile sales (new) (Land Use 840) and recreational vehicle sales (Land Use 842) are related uses.

Additional Data

Time-of-day distribution data for this land use are presented in Appendix A. For the 14 general urban/suburban sites with data, the overall highest vehicle volumes during the AM and PM on a weekday were counted between 9:45 and 10:45 a.m. and 4:30 and 5:30 p.m., respectively.

The sites were surveyed in the 2010s in Texas.

Executive Summary
CarMax Auto Dealership

The proposed CarMax auto sales dealership is to be located at the 4000 block of Plaza Drive just west of the Oceanside Department of Motor Vehicles in Oceanside, California. The project site is currently vacant. The project is anticipated to be completed by year 2021 or 2022.

This Local Transportation Study (LTS) has been prepared to determine if there are any traffic effects caused by the project traffic that would justify roadway improvements or fair share participation. This report is based on the City of Oceanside *Draft Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020 and includes the analysis of pedestrian, bicycle, transit, and traffic elements.

The **LTS Pedestrian** analysis included the assessment of pedestrian facilities. As part of the project, the applicant is widening Plaza Drive and installing sidewalks on both side of the street along the project frontage. The remaining existing pedestrian infrastructure from College Blvd to Thunder Drive did not have any deficiencies except for the north side of Plaza Dr from the project site easterly to Thunder Drive where the north side is missing a sidewalk.

The **LTS Bicycle** analysis included the assessment of bicycle facilities. As part of the project, the applicant is widening Plaza Drive and installing bike lanes on both side of the street along the project frontage. The City's Bicycle Master Plan has a recommended Class 3 bike route on Thunder Dr. If the City requires bike sharrows or bike route signs along the project frontage, then the applicant will install.

The **LTS Transit** analysis included the assessment of transit facilities. The bus stop for westbound travel on Lake Blvd is located a walking distance of approximately 710 feet from the project access on Thunder Dr and includes a bench and trash receptacle that are in good condition. The bus stop for eastbound travel on Lake Blvd is located a walking distance of approximately 940 feet from the project access on Thunder Dr and includes a trash receptacle in good condition. No transit improvements are proposed as part of this project.

The **LTS Traffic** analysis included a study area of nine (9) intersections and five (5) roadway segments. The project traffic generation was calculated using a trip generation rate from a survey of three open and operating CarMax dealerships. The data from the CarMax sites was collected by placing tube counters across all site driveways that recorded all vehicles including employees, customers, test drives, deliveries, mail carriers, trash trucks, maintenance, and any other vehicle that crossed over the tubes. Using the CarMax based trip generation rates, the project is forecasted to generate 475 ADT, 18 AM peak hour trips (11 inbound and 7 outbound), and 50 PM peak hour trips (31 inbound and 19 outbound). The project will have two driveways on Plaza Dr and two driveways on Thunder Dr. Six (6) scenarios were analyzed, which included Existing, Existing + Project, Existing + Cumulative, Existing + Cumulative + Project, Horizon Year 2030 Master Transportation Plan (MTP), and Horizon Year 2030 MTP + Project conditions. Operational findings by scenario are summarized below:

1) Under Existing conditions, the study intersections and segments are calculated to operate at LOS D or better except for:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-78 EB Ramp and Thunder Dr (LOS E), and
    c. Segment Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

2) Under Existing + Project conditions, the study intersections and segments were calculated to operate at LOS D or better except for the:
    1) Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    2) Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    3) Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

    The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's thresholds (proposed improvements are described below).

3) Under Existing + Cumulative conditions, the study intersections and segments were calculated to operate at LOS D or better except for the:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    c. Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

4) Under Existing + Cumulative + Project conditions, the study intersections and segment were calculated to operate at LOS D or better except for the:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    c. Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS F).

    The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's thresholds.

5) Under Horizon Year 2030 MTP conditions, all study intersections and segments were calculated to operate at LOS D or better, except for:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-78 EB Ramp and Thunder Dr (LOS E), and
    c. Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

6) Under Horizon Year 2030 MTP + Project conditions, all study intersections and segments were calculated to operate at LOS D or better except for the:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    c. Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS F).

    The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's thresholds.

The intersection operations are summarized in **Table ES-1** with street segment operations shown in **Table ES-2**.

TABLE ES-1: INTERSECTION LEVEL OF SERVICE

Project Improvements

1) The proposed improvement for the traffic effect on Thunder Drive is to widen the street into the site along the project frontage and restrict parking on the project side of the street between the two proposed project driveways. The City's Bicycle Master Plan has a recommended Class 3 bike route on Thunder Dr. If the City requires bike sharrows or bike route signs along the project frontage, then the applicant will install.

2) The applicant will widen Plaza Drive along the project frontage to the General Plan classification of a Secondary Collector; however, the applicant will only stripe this segment with 3 travel lanes (2 eastbound lanes and 1 westbound lane) and a center two way left turn lane in order to match the existing westbound single travel lane configuration adjacent to the DMV all to the satisfaction of the City Engineer. Additionally, the following improvements will be made to the satisfaction of the City Engineer:

   a. Sidewalks will be installed on both sides of Plaza Drive along the project frontage.

   b. Bike lanes will be striped on both sides of Plaza Drive along the project frontage.

1.0 Introduction

The proposed CarMax auto sales dealership is to be located at the 4000 block of Plaza Drive just west of the Oceanside Department of Motor Vehicles in Oceanside, California. The general location of the project is shown in **Figure 1**. A site plan is shown in **Figure 2**.

This report describes the existing roadway network in the vicinity of the project and includes a review of existing and proposed activities for weekday peak and daily traffic conditions when the project is completed. The format of this study includes the following chapters:

1.0 Introduction
2.0 Alternative Transportation Mode Assessment
3.0 Traffic Analysis
4.0 Conclusion

Figure 1: Project Location

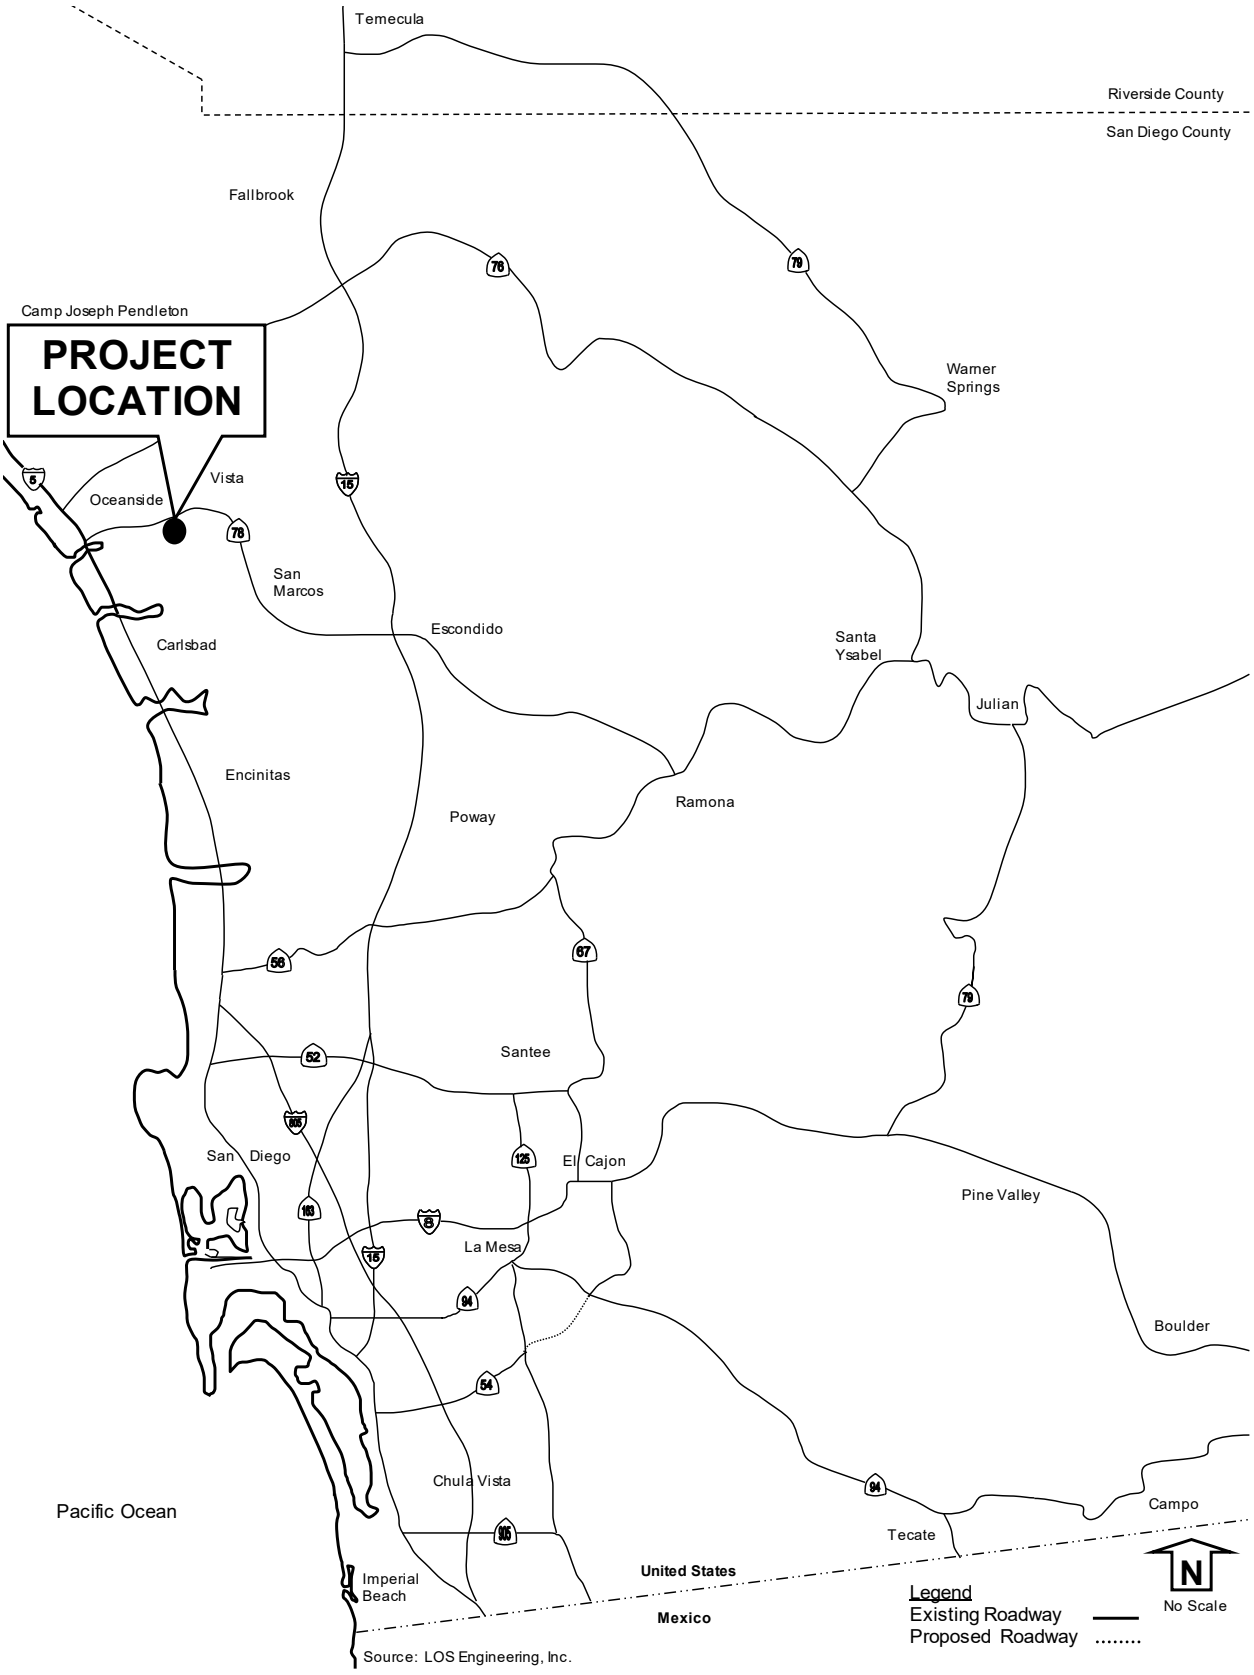

Figure 2: Site Plan

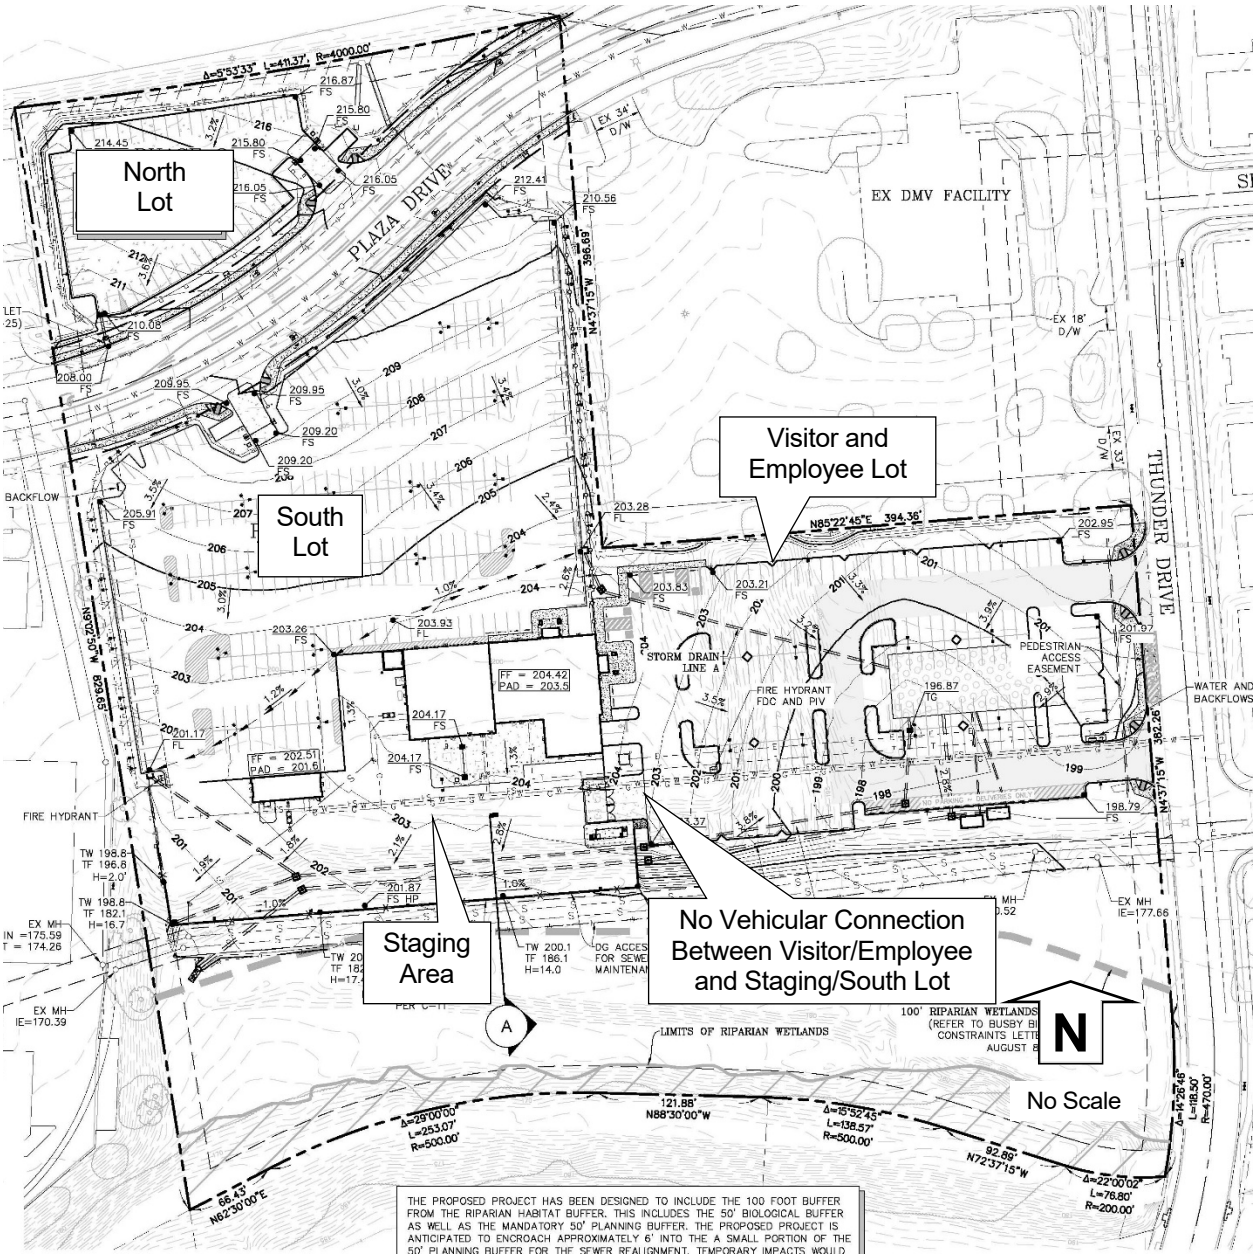


Source: REC Consultants, Inc.

2.0 Alternative Transportation Mode Assessment

The following transportation modes were analyzed based on criteria outlined in the City of Oceanside *Draft Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020:

1) Pedestrian: Documentation of pedestrian infrastructure available including any opportunities or deficiencies such as path obstructions or missing sidewalk from the project access points extending ½ mile walking distance or to the nearest intersection with a classified roadway/connection with a Class I path.

2) Bicycle: Documentation of bicycle infrastructure available including any opportunities or deficiencies such as bike lanes, bike buffers, or bike boxes from the project access points extending in each direction to the nearest intersection with a classified roadway or connection with a Class I path.

3) Transit: Identification of transit stops or routes existing within ½ mile walking distance of each pedestrian project access point.

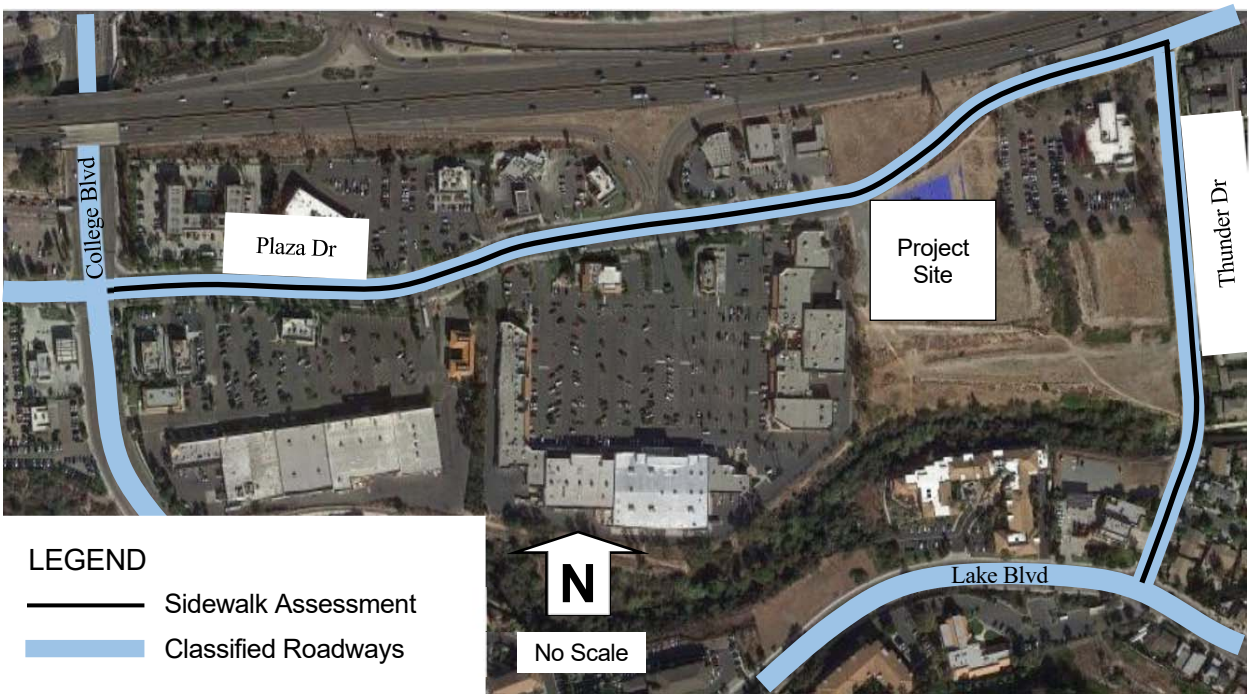
2.1 Pedestrian

The pedestrian analysis consists of documenting pedestrian infrastructure available including any opportunities or deficiencies such as path obstructions or missing sidewalk from the project access points extending to the nearest intersection with a classified roadway or to a connection with a Class I path.

> Plaza Dr from College Blvd (nearest intersection with a classified roadway) easterly to the project site there are either non-contiguous or contiguous sidewalks on both sides of the street. There are no sidewalks along the project frontage on Plaza Dr. From the project site easterly to Thunder Dr (nearest intersection with a classified roadway) there are contiguous sidewalks on the south side of the street and no sidewalk on the north side of the street. There were no major sidewalk obstructions observed along the roadway segments that had sidewalks.
>
> Thunder Dr from Plaza Dr to Lake Blvd (nearest intersection with a classified roadway) has either non-contiguous or contiguous sidewalks on both sides of the street. There were no major sidewalk obstructions observed along this segment.

As part of the project, the applicant is widening Plaza Drive and installing sidewalks on both side of the street along the project frontage. The remaining existing pedestrian infrastructure from College Blvd to Thunder Drive did not have any deficiencies except for the north side of Plaza Dr from the project site easterly to Thunder Drive where the north side is missing a sidewalk. The pedestrian study elements are shown in **Figure 3**.

Figure 3: Pedestrian Elements



Source: Google Maps

2.2 Bicycle

The bicycle analysis consists of documenting bicycle infrastructure available including any opportunities or deficiencies such as bike lanes, bike buffers, or bike boxes from the project access points extending in each direction to the nearest intersection with a classified roadway or connection with a Class I path.

> Plaza Dr from College Blvd to Thunder Dr (study limits identified by the nearest intersection with a classified roadway) has a recommended Class 3 bike route identified in the *City of Oceanside Bicycle Master Plan 2017 Update* (**Appendix A**). This segment of Plaza Dr did not have any observed bike lane nor bike route signs.
>
> Thunder Dr from Plaza Dr to Lake Blvd (study limits identified by the nearest intersection with a classified roadway) has a recommended Class 3 bike route identified in the *City of Oceanside Bicycle Master Plan 2017 Update.* This segment of Thunder Dr did not have any observed bike lane nor bike route signs.

As part of the project, the applicant is widening Plaza Drive and installing bike lanes on both sides of the street along the project frontage. If the City requires bike sharrows or bike route signs along the project frontage on Thunder Drive, then the applicant will install. The bicycle study elements are shown in **Figure 4**.

Figure 4: Bicycle Elements

Source: Google Maps

2.3 Transit

The transit analysis includes identifying the closest transit routes and stops to the project. If the stops are within ½ mile walking distance of the project access, the condition of the closest stop amenities are described. North County Transit District (NCTD) lists Bus Route 323 within ½ mile walking distance from the project access points/driveways. The closest bus stops to the project site are located on Lake Blvd just west of Thunder Dr.

The bus stop for westbound travel on Lake Blvd is located a walking distance of approximately 710 feet from the project access on Thunder Dr. The bus stop includes a bench and trash receptacle. The bus stop is in good condition.

The bus stop for eastbound travel on Lake Blvd is located a walking distance of approximately 940 feet from the project access on Thunder Dr. The bus stop includes only a trash receptacle. The bus stop is in good condition.

No transit improvements are proposed as part of this project. A summary of the service times is shown in **Table 1** for weekdays and **Table 2** for weekend days. The noted bus schedules are included in **Appendix B**.

TABLE 1: WEEKDAY BUS SERVICE OPERATIONS AND FREQUENCY

Bus Route	Weekday (Mon-Fri) Service Operations (Off-Peak Service Frequency Range)	7-9 AM Peak Hour Service Frequency	4-6 PM Peak Hour Service Frequency
Route 323	≈ 6:00 AM to ≈ 6:00 PM (≈ 60 minutes)	60 minutes	60 minutes

Notes: Above service times are summaries, thus please refer to Appendix E for exact service details.

TABLE 2: WEEKEND BUS SERVICE OPERATIONS AND FREQUENCY

Bus Route	Saturday Service Operations (Service Frequency Range)	Sunday Service Operations (Service Frequency Range)
Route 323	No scheduled service	No scheduled service

The nearby transit routes and bus stops are shown in **Figure 5**.

Figure 5: Transit Elements

Source: Google Maps

3.0 Traffic Analysis

The traffic analysis includes the study of specific scenarios, analysis of roadway operations, and determination of potential off-site improvements. Details for each of these parameters are include herein.

3.1 Study Area and Scenario Criteria

The project study area is generally determined by the limits or extent of where 50 peak hour project trips would travel in either direction to or from the site, which is based on the City of Oceanside *Draft Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment,* August 2020 (excerpts included in **Appendix D**). Additionally, the study area can also be identified by City staff, which was the basis for the following study area.

For this project, the following intersections were analyzed as part of this study:

1) Vista Way/College Blvd (Signalized)
2) Plaza Dr/College Blvd (Signalized)
3) Plaza Dr/SR-78 (Signalized)
4) Plaza Dr/Project S. Lot Driveway (future driveway, currently does not exist)
5) Plaza Dr/Thunder Dr (Signalized)
6) Thunder Dr/North Project Driveway (future driveway, currently does not exist)
7) Thunder Dr/South Project Driveway (future driveway, currently does not exist)
8) Thunder Dr/Lake Blvd (Signalized)
9) Plaza Dr/Project N. Lot Driveway (future driveway, currently does not exist)

The following street segments were analyzed as part of this study:

1) College Blvd from Vista Way to Plaza Dr
2) Plaza Dr from College Blvd to SR-78 EB Ramp
3) Plaza Dr from SR-78 EB Ramp to Thunder Dr
4) Thunder Dr from Plaza Dr to Tiberon Dr
5) Thunder Dr from Tiberon Dr to Lake Blvd

The number of scenarios to be analyzed is typically based on the size of the project, the number of cumulative projects and whether the project conforms to current zoning. For this project, the following scenarios were included based on direction from City engineering staff:

1) Existing Conditions
2) Existing + Project Conditions
3) Existing + Cumulative Conditions
4) Existing + Cumulative + Project Conditions
5) Horizon Year 2030 (Master Transportation Roadway Plan) Conditions
6) Horizon Year 2030 (Master Transportation Roadway Plan) plus project Conditions

3.2 Traffic Analysis Criteria

The traffic analyses prepared for this study were based on the *Highway Capacity Manual* (HCM) operations analysis using Level of Service (LOS) evaluation criteria. The operating conditions of the study intersections, street segments, and freeway segments were measured using the HCM LOS designations, which ranges from A through F. LOS A represents the best operating condition and LOS F denotes the worst operating condition. The LOS criteria for each roadway component are described below.

3.2.1 Intersections

The study intersections were analyzed based on the **operational analysis** outlined in the 6th Ed HCM. This process defines LOS in terms of **average control delay** per vehicle, which is measured in seconds. LOS at the intersections were calculated using the computer software program Synchro 10 (Trafficware Corporation). The 6th Ed HCM LOS for the range of delay by seconds for un-signalized and signalized intersections is described in **Table 3**.

TABLE 3: INTERSECTION LEVEL OF SERVICE DEFINITIONS (6TH EDITION HCM)

Level of Service	Un-Signalized (TWSC and AWSC) Control Delay (sec/veh where v/c ≤ 1)	Signalized Control Delay (sec/veh where v/c ≤ 1)
A	0-10	≤ 10
B	> 10-15	> 10-20
C	> 15-25	> 20-35
D	> 25-35	> 35-55
E	> 35-50	> 55-80
F	> 50	> 80

TWSC: Two Way Stop Control. AWSC: All Way Stop Control. Source: 6th Edition HCM (exhibit 20-2 for two way stop control, exhibit 21-8 for all way stop control, and exhibit 19-8 for signalized intersections).

3.2.2 Street Segments

The street segments were analyzed based on the functional classification of the roadway using the City of Oceanside *Average Daily Vehicle Trips* capacity lookup table. The roadway segment capacity and LOS standards used to analyze street segments are summarized in **Table 4**.

TABLE 4: STREET SEGMENT DAILY CAPACITY AND LOS (CITY OF OCEANSIDE)

Circulation Element Road Classification	Lanes	LOS A	LOS B	LOS C	LOS D	LOS E
Expressway	6	<30,000	<42,000	<60,000	<70,000	<80,000

3.2.3 Traffic Effect Thresholds

A project Owner/Permittee may be required to provide an off-site improvement if the project traffic exceeds the City of Oceanside *Draft Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment* (August 2020) defined thresholds as shown in **Table 5**.

TABLE 5: DETERMINATION OF THE NEED FOR ROADWAY IMPROVEMENTS

Level of Service with Project	Allowable Increase Due to Project Effect				
	Freeways	Roadway Segments		Intersections	Ramp Metering
	V/C	V/C	Speed (mph)	Delay (sec.)	Delay (min.)
E & F	0.01	0.02	1	2	2*

3.3 Existing Conditions

This section describes the study area street system, existing daily roadway, peak hour intersection traffic volumes, and existing LOS conditions.

3.3.1 Existing Street System

In the vicinity of the project site, the following roadways were analyzed as part of this study, which are described below. The roadway classification was obtained from the City of Oceanside General Plan *Circulation Element*, September 2012 (excerpts included in **Appendix F**).

College Boulevard is classified as a *Major Arterial* from Vista Way to Plaza Drive. This segment of College Boulevard is generally constructed as a 6-lane roadway with three lanes in each direction along with Class II bike lanes in each direction. The road has either a painted median (double-double yellow) or a raised median just south of Vista Way.

Plaza Drive is classified as a *Secondary Collector* from College Boulevard to Thunder Drive. Plaza Dr from College Boulevard to approximately 300 ft past SR-78 Ramps is constructed as a 4-lane roadway with two lanes in each direction. Along the project frontage, Plaza Dr is constructed as a 2-lane undivided roadway. East of the project site and along the DMV frontage, Plaza Dr is generally constructed as a 3-lane roadway (2 EB lanes and 1 WB lane) along with a center Two Way Left Turn Lane (TWLTL). The posted speed limit is 35 MPH.

Thunder Drive is classified as a *Collector Road* from Plaza Drive to Lake Blvd. This segment of Thunder Drive is constructed as a 2-lane roadway with one travel lane in each. The posted speed limit is 25 MPH.

3.3.2 Existing Traffic Volumes and LOS Analyses

Existing 7-9 AM and 4-6 PM peak period traffic volume data were collected on Tuesday, July 23, 2019 at the following intersections:

1) Vista Way/College Blvd
2) Plaza Dr/College Blvd
3) Plaza Dr/SR-78
4) Plaza Dr/Project S. Lot Driveway (Does not exist, thus peak hour through volumes used for driveway analysis were obtained from Plaza Dr segment count)
5) Plaza Dr/Thunder Dr
6) Thunder Dr/North Project Driveway (Does not exist, thus peak hour through volumes used for driveway analysis were obtained from Thunder Dr segment count)
7) Thunder Dr/South Project Driveway (Does not exist, thus peak hour through volumes used for driveway analysis were obtained from Thunder Dr segment count)
8) Thunder Dr/Lake Blvd
9) Plaza Dr/Project N. Lot Driveway (Does not exist, thus peak hour through volumes used for driveway analysis were obtained from Plaza Dr segment count)

The following street segment volumes were also collected on Tuesday, July 23, 2019:

1) College Blvd from Vista Way to Plaza Dr
2) Plaza Dr from College Blvd to SR-78 EB Ramp
3) Plaza Dr from SR-78 EB Ramp to Thunder Dr
4) Thunder Dr from Plaza Dr to North Project Driveway
5) Thunder Dr from South Project Driveway to Lake Blvd

Existing traffic, pedestrian, and bicycle counts are included in **Appendix E.** The existing roadway conditions are shown in **Figure 6** and the existing AM, PM, and daily volumes are shown on **Figure 7.**

Tiberon Dr to Lake Blvd	Collector (2U)	10,000	7,631	0.763	D

Notes: 6D=6 lane divided roadway. Daily volume is a 24 hour volume. LOS:Level of Service. V/C:Volume to Capacity Ratio

Under Existing conditions, the study intersections and segments are calculated to operate at LOS D or better except for:

1) Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
2) Segment of Plaza Dr between SR-78 EB Ramp and Thunder Dr (LOS E), and
3) Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

3.4 Project Traffic Generation

The project traffic generation was calculated using a trip generation rate based on a survey of three open and operating CarMax dealerships. The trip generation study was prepared by Kimley-Horn and Associates in September 2002 (copy included in **Appendix G**). The data from the CarMax sites was collected by placing tube counters across all site driveways. These tubes recorded all vehicles including employees, customers, test drives, deliveries, mail carriers, trash trucks, maintenance, and any other vehicle that crossed over the tubes. The Kimley-Horn study documented a trip rate of 41.48 ADT/ksf (1,000 square feet). This is conservative when compared to the latest Institute of Transportation Engineers (ITE) 10th Edition Trip Generation that documents a trip rate of 27.06 ADT/ksf for used automobile sales. Using the CarMax based trip generation rates, the project is forecasted to generate 475 ADT, 18 AM peak hour trips (11 inbound and 7 outbound), and 50 PM peak hour trips (31 inbound and 19 outbound) as shown in **Table 8**.

TABLE 8: PROJECT TRAFFIC GENERATION

Proposed						AM Peak Hour			PM Peak Hour		
Land Use	Rates & Size				Daily	IN	OUT	Total	IN	OUT	Total
CarMax	Rates:	41.48	/KSF			0.91	0.65	1.56	2.74	1.63	4.37
Used Auto Sales	Size:	11,447	SF	Trips:	**475**	11	7	**18**	31	19	**50**

Source: CarMax Trip Generation Study, Kimley-Horn and Associates (Sept 2002). KSF - 1,000 Square Feet.
Daily: 24 hour traffic.

3.5 Project Access

The project will have four driveways for access. Two driveways are on Plaza Dr for sales personnel and test drivers only. Arriving customers will use Thunder Dr for on-site customer parking. The project will have two driveways along Thunder Dr for customer parking, employee parking, and delivery of vehicles with 18-wheeler car carriers. Turning templates for the 18-wheeler car carriers using Thunder Dr are shown in **Figure 8**. Once vehicles are unloaded from the car carriers, employees will drive the cars to the main lot using Plaza Dr.

There is no internal vehicular connection between the "sales" parking areas adjacent to Plaza Dr and the other lot adjacent to Thunder Dr used for customers, employees, and deliveries. This is to keep customers from driving their personal vehicles around the main "sales" lot areas. Customer can walk between the main "sales" lot and customer parking lot.

3.6 Project Distribution and Assignment

Project trips were distributed to the adjacent roadways based on regional and local attractors; the project location between two freeway interchanges; and potential drive testing routes. The distribution accounts for 80% of the customers, employees, and deliveries using Thunder Dr while 20% for test drivers and vehicle shuttling by employees using Plaza Dr. The project distribution is shown in **Figure 9**. The project trip assignment is shown in **Figure 10**.

3.7 Existing + Project Conditions

This scenario analyzes the addition of project traffic onto the existing background traffic for AM, PM, and daily conditions. The peak hour intersection volumes and daily traffic volumes for this scenario is shown in **Figure 11**. The LOS calculated with the addition of project traffic for intersections and street segments are shown in **Tables 9 and 10,** respectively. Intersection calculations are included in **Appendix H**.

Tiberon Dr to Lake Blvd	Collector (2U)	10,000	7,631	0.763	D	47	7,678	0.768	D	0.005	No

Notes: 6D=6 lane divided roadway. Daily volume is a 24 hour volume. LOS:Level of Service. V/C:Volume to Capacity Ratio.
Project effect if increase in traffic exceeds City's threshold.

Under Existing + Project conditions, the study intersections and segments were calculated to operate at LOS D or better except for the:

1) Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
2) Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
3) Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's threshold.

3.8 Cumulative Projects

City of Oceanside staff provided traffic data on several foreseeable projects for the near-term (existing + cumulative) analysis. The cumulative project traffic volumes are shown on **Figure 12** with cumulative project details included in **Appendix I**. The following list includes a brief description of the cumulative projects:

1) Sky Haven Lane Condominiums: a 48-unit condominium project generally located on the southeast corner of Sky Haven Lane and Sunset Drive in the City of Vista. According to the Sky Haven Lane Condominium traffic study prepared by Darnell & Associates, Inc., this cumulative project is calculated to generate 384 daily trips with 31 AM and 38 PM trips.

2) Tri-City Medical Office Building: a 60,000 square foot medical office building located on the northwest corner of Vista Way and Tri City Hospital. The building is completed; however, the building was not occupied during traffic data collection. Therefore, it is included as a cumulative project. According to the Tri-City Medical Office Building traffic study prepared by Michael Baker International, this cumulative project is calculated to generate 3,000 daily trips with 180 AM and 330 PM trips.

3) Quarry Creek Master Plan: a master plan community with up to 656 homes generally located south of Haymar Drive and west of College Blvd. Based on field observations and available web data, approximately 20% to 40% of the homes and apartments were occupied during data collection. However, to be conservative only 20% was reduced from the total Quarry Creek trip generation. This resulted in the assignment of 80% of the Quarry Creek traffic in this near-term analysis. According to the Quarry Creek Master Plan traffic study prepared by Urban Systems Associates, Inc., the total project is calculated to generate 5,878 daily trips with 515 AM and 620 PM trips. The near-term assignment included 4,702 daily trips with 412 AM and 496 PM trips.

4) Children's Paradise Day Care: a day care for up to 196 students located at 5333 Marron Rd. The project is calculated to generate 980 daily trips with 166 AM and 176 PM trips.

5) To account for distant and unforeseen cumulative projects, a 0.5% growth factor per year for two years (1% total) was applied to existing counts and added to the cumulative total.

The traffic generated from the proposed cumulative projects is summarized in **Table 11**:

TABLE 11: CUMULATIVE PROJECT TRAFFIC GENERATION

Cumualtive		AM		PM	
Land Use	ADT	IN	OUT	IN	OUT
Sky Haven Lane Condominiums (48 units)	384	6	25	27	11
Tri-City Medical Office Building (60,000 sf)	3,000	144	36	99	231
Quarry Creek Master Plan	5,878	154	361	398	222
Childern's Paradise Day Care	980	83	83	88	88
Total:	**10,242**	**387**	**505**	**612**	**552**

Tiberon Dr to Lake Blvd	Collector (2U)	10,000	7,756	0.776	D	47	7,803	0.780	D	0.005	No

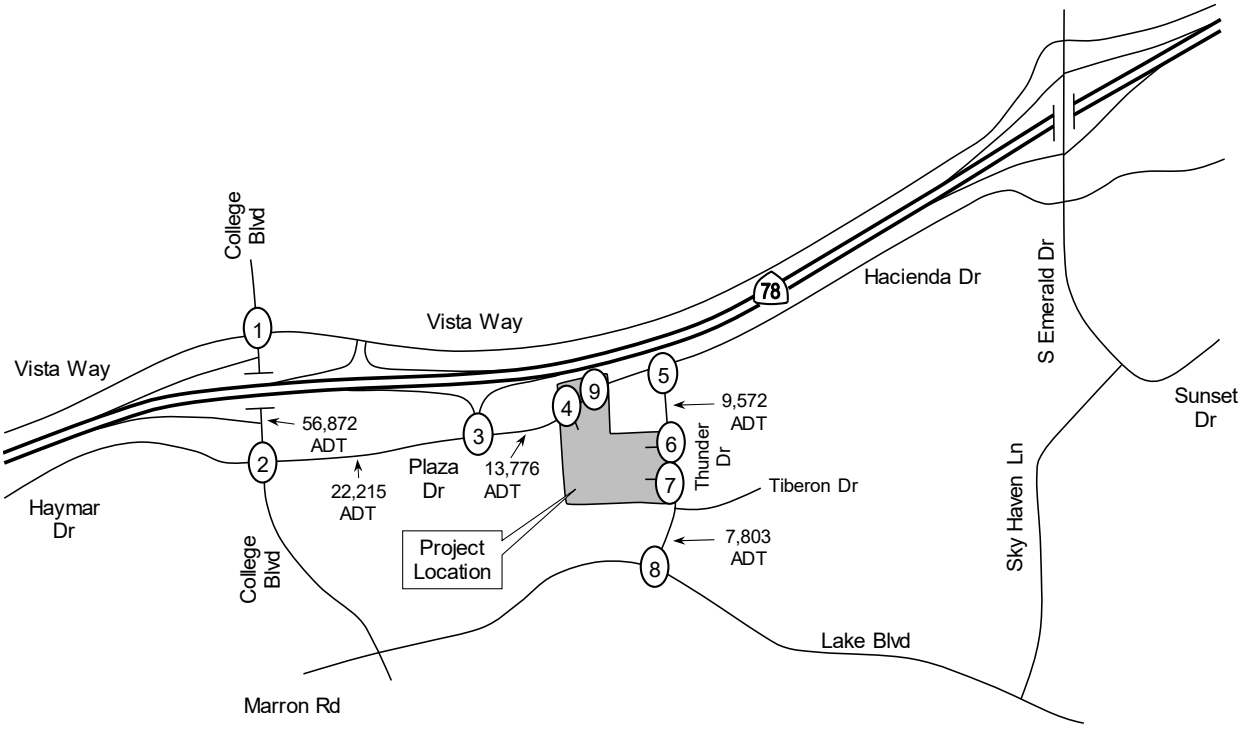
Notes: 6D=6 lane divided roadway. Daily volume is a 24 hour volume. LOS:Level of Service. V/C:Volume to Capacity Ratio.

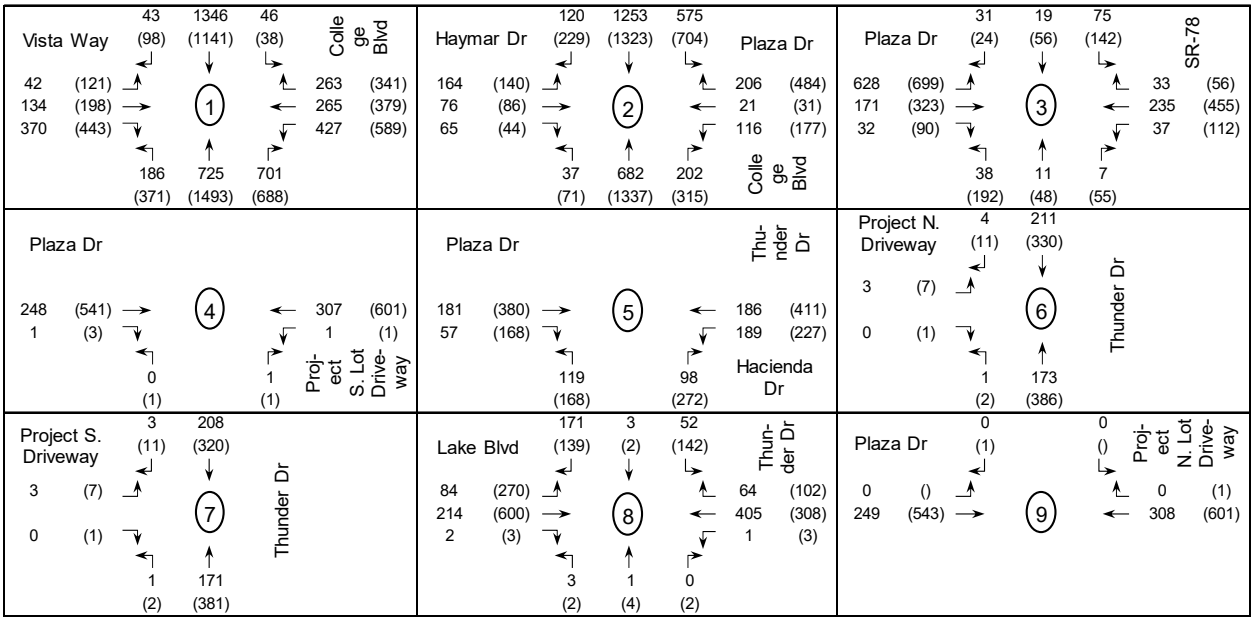
Under Existing + Cumulative + Project conditions, the study intersections and street segments are calculated to operate at LOS D or better except for the:

1) Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
2) Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
3) Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's threshold.

Figure 14: Existing + Cumulative + Project Volumes





3.11 Horizon Year 2030 (Master Transportation Plan) Conditions

This section documents the analysis of traffic volumes for AM, PM, and daily traffic conditions for a horizon year 2030 Master Transportation Plan (MTP) scenario. Copies of the Year 2030 Master Transportation Plan roadway network and volumes are included in **Appendix N**. The *Oceanside General Plan Circulation Element* included year 2030 MTP volumes for the following study intersections and segments:

1) Segment of College Blvd between Vista Way and Plaza Dr
2) Segment of Plaza Dr between College Blvd and SR-78 EB Ramp
3) Segment of Plaza Dr between SR-78 EB Ramp and Thunder Drive
4) Segment of Thunder Drive between Plaza Dr and Lake Blvd
5) Intersection of College Blvd/Vista Way
6) Intersection of College Blvd/Plaza Dr
7) Intersection of Plaza Dr/SR-78 EB Ramp

However, some of the year 2030 MTP segment volumes were lower than existing year 2019 volumes. This is most likely due to the 2030 MTP forecast having future additional roadway connections incorporated in the traffic model; thereby, adjusting or shifting traffic on the study area roadways. Additionally, some of the study segments and intersections were not analyzed in the General Plan. The study locations without 2030 MTP volumes or volumes less than existing counts included:

1) Segment of College Blvd between Vista Way and Plaza Dr (existing 52,021 ADT vs. year 2030 MTP 49,300 ADT)
2) Segment of Thunder Drive between Plaza Dr and Tiberon Dr (existing 9,100 ADT vs. year 2030 MTP 7,500 ADT)
3) Segment of Thunder Drive between Tiberon Dr and Lake Blvd (existing 7,631 ADT vs. year 2030 MTP 7,500 ADT)
4) Segment peak hour volumes along project driveways on Plaza Dr and Thunder Dr (no year 2030 MTP peak hour volumes)
5) Intersection of Plaza Dr/Thunder Dr (no year 2030 MTP volume)
6) Intersection of Thunder Dr/Lake Blvd (no year 2030 MTP volume)

To be conservative for the above segment locations, the year 2030 volumes were factored up from year 2019 volumes by applying a 0.5% per year growth factor. Over 11 years (2019 to 2030), the compounded growth factor is 1.056. For example, the application of the growth factor to the segment of College Blvd between Vista Way and Plaza Dr is calculated by taking the existing year 2019 volume of 52,021 times 1.056 to equal 54,934, which is rounded to 54,900 ADT.

The peak hour intersection volumes and daily traffic volumes are shown in **Figure 15**. The intersection LOS calculated is shown in **Table 16** with segment LOS shown in **Table 17.** Intersection LOS calculations are included in **Appendix L**.

Tiberon Dr to Lake Blvd	Collector (2U)	10,000	8,100	0.810	D	47	8,147	0.815	D	0.005	No

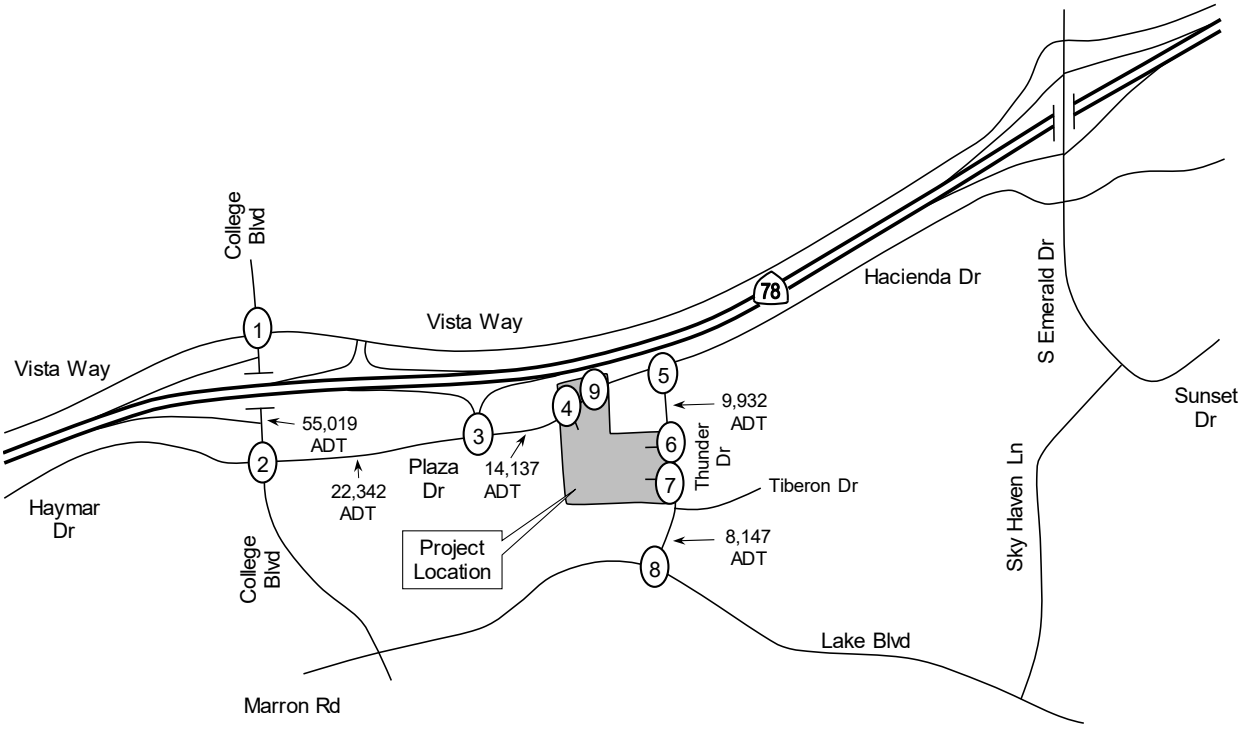
Notes: 6D=6 lane divided roadway. Daily volume is a 24 hour volume. LOS:Level of Service. V/C:Volume to Capacity Ratio.

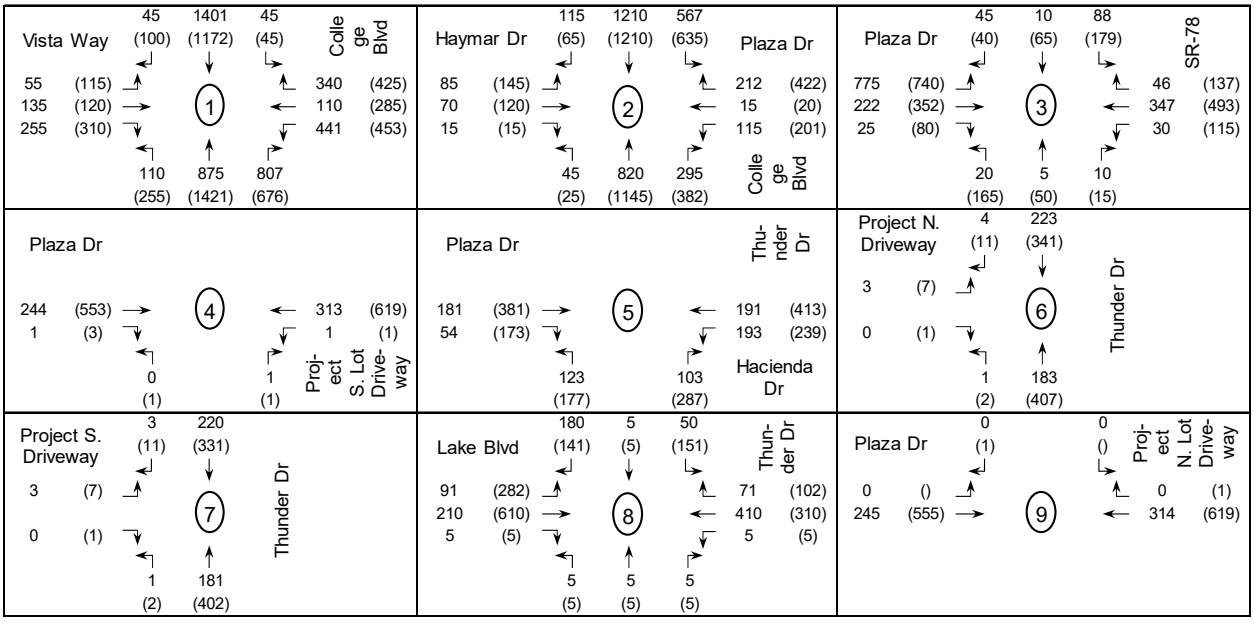
Under Horizon Year 2030 MTP + Project conditions, the study intersections and segments were calculated to operate at LOS D or better except for the:

1) Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
2) Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
3) Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS F).

The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's threshold.

Figure 16: Horizon Year 2030 + Project Volumes





3.13 Traffic Effects Summary

The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's threshold. This traffic effect occurs under existing + project, existing + cumulative + project, and horizon year + project conditions.

3.13.1 Thunder Drive Improvement

The proposed improvement for the traffic effect on Thunder Drive is to widen the street into the site along the project frontage and restrict parking on the project side of the street between the two proposed project driveways.

3.13.2 Plaza Drive Improvement

As part of the project, the applicant will widen Plaza Drive along the project frontage to the General Plan classification of a Secondary Collector; however, the applicant will only stripe this segment with 3 travel lanes (2 eastbound lanes and 1 westbound lane) and a center two way left turn lane in order to match the existing westbound single travel lane configuration adjacent to the DMV all to the satisfaction of the City Engineer. The capacity of the 3-lane roadway is taken at 75% of the capacity of a 4 lane Secondary Collector. The operations with the proposed roadway widening is shown in **Table 20.**

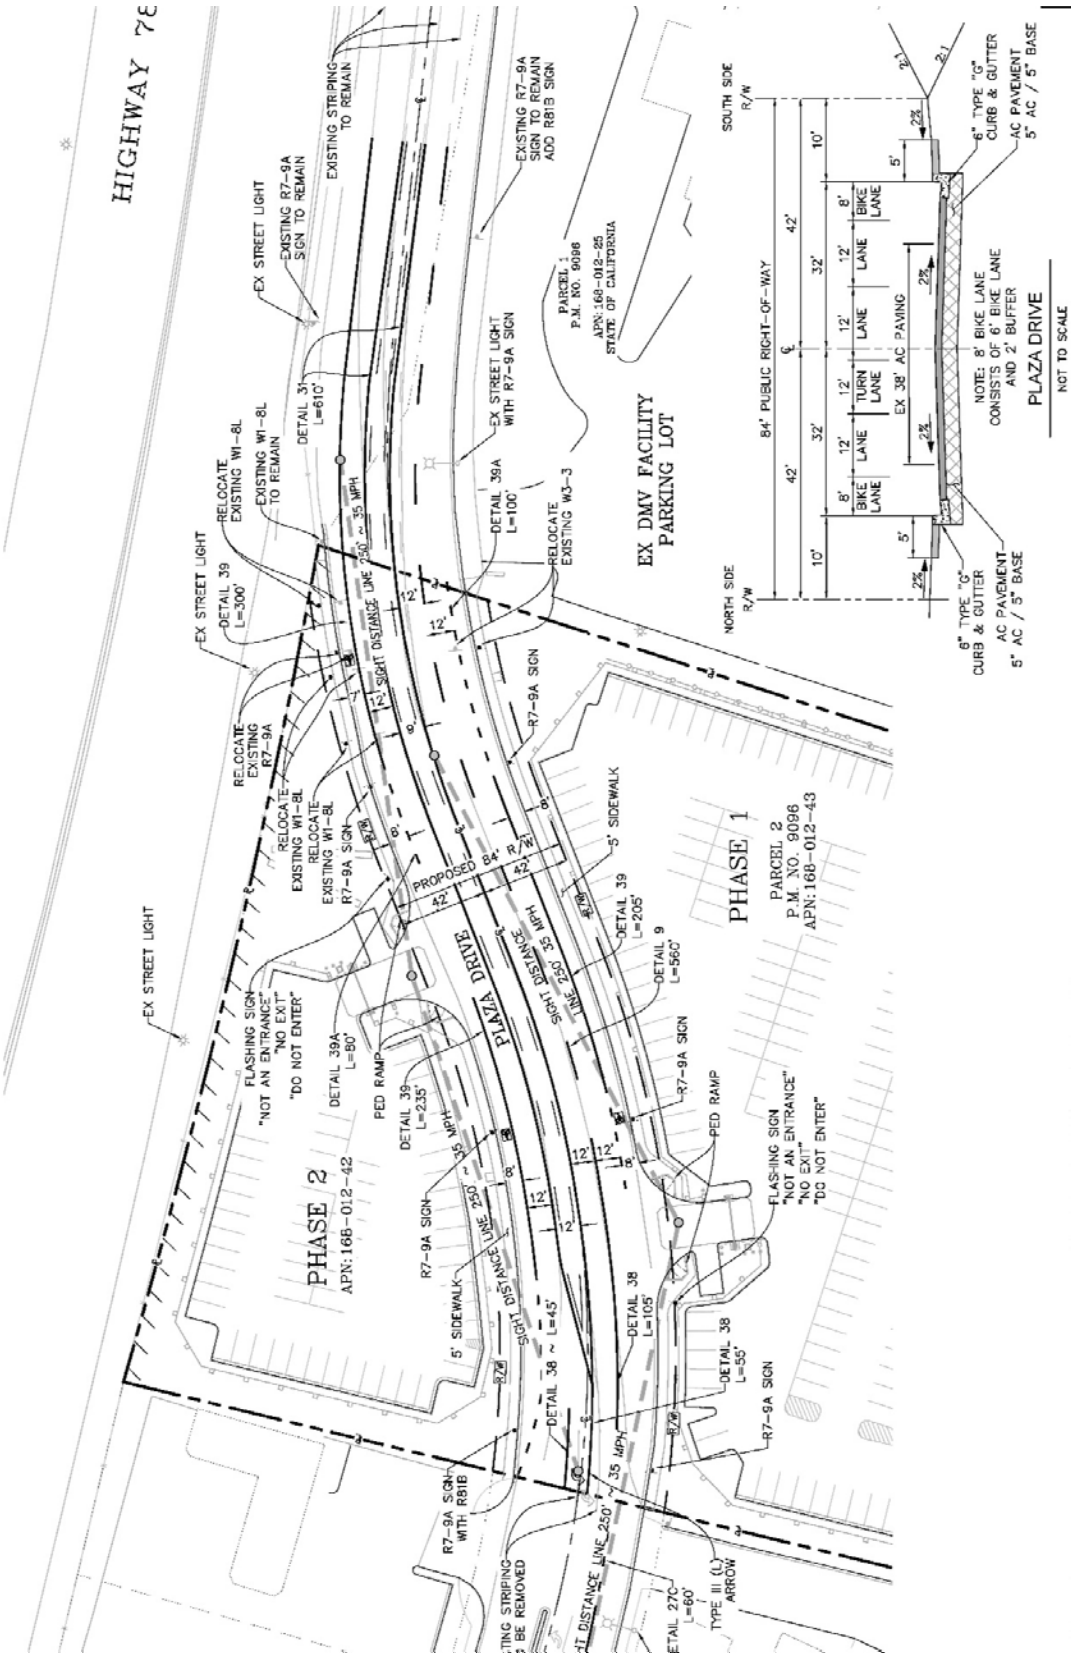
TABLE 20: PLAZA DR LEVEL OF SERVICE WITH PROJECT WIDENING

Scenario & Segment	Existing Conditions (2 lanes)					With Improvement (3 lanes + TWLTL)				
	Daily Volume	LOS E Capacity	V/C	LOS	Effect?	Daily Volume	LOS E Capacity	V/C	LOS	Effect?
Existing + Project										
Plaza Drive										
Along project frontage	13,395	15,000	0.893	**E**	No	13,395	18,750	0.71	C	No
Existing + Cumulative + Project										
Plaza Drive										
Along project frontage	13,776	15,000	0.918	**E**	No	13,776	18,750	0.73	C	No
Horizon Year + Project										
Plaza Drive										
Along project frontage	14,137	15,000	0.942	**E**	No	14,137	18,750	0.75	C	No

Notes: Daily volume is a 24 hour volume. V/C: Volume over Capacity. LOS: Level of Service. TWLTL: Two Way Left Turn Lane.

The proposed widening and striping of Plaza Drive is shown in **Figure 17**.

Figure 17: Plaza Drive Proposed Widening and Striping



Source: REC Consultants, Inc.

4.0 Conclusion

The proposed CarMax auto sales dealership is to be located at the 4000 block of Plaza Drive just west of the Oceanside Department of Motor Vehicles in Oceanside, California. The project site is currently vacant. The project is anticipated to be completed by year 2021 or 2022.

This Local Transportation Study (LTS) has been prepared to determine if there are any traffic effects caused by the project traffic that would justify roadway improvements or fair share participation. This report is based on the City of Oceanside *Draft Traffic Impact Analysis Guidelines for Vehicle Miles Traveled (VMT) and Level of Service Assessment*, August 2020 and includes the analysis of pedestrian, bicycle, transit, and traffic elements.

The **LTS Pedestrian** analysis included the assessment of pedestrian facilities. As part of the project, the applicant is widening Plaza Drive and installing sidewalks on both side of the street along the project frontage. The remaining existing pedestrian infrastructure from College Blvd to Thunder Drive did not have any deficiencies except for the north side of Plaza Dr from the project site easterly to Thunder Drive where the north side is missing a sidewalk.

The **LTS Bicycle** analysis included the assessment of bicycle facilities. As part of the project, the applicant is widening Plaza Drive and installing bike lanes on both side of the street along the project frontage. The City's Bicycle Master Plan has a recommended Class 3 bike route on Thunder Dr. If the City requires bike sharrows or bike route signs along the project frontage, then the applicant will install.

The **LTS Transit** analysis included the assessment of transit facilities. The bus stop for westbound travel on Lake Blvd is located a walking distance of approximately 710 feet from the project access on Thunder Dr and includes a bench and trash receptacle that are in good condition. The bus stop for eastbound travel on Lake Blvd is located a walking distance of approximately 940 feet from the project access on Thunder Dr and includes a trash receptacle in good condition. No transit improvements are proposed as part of this project.

The **LTS Traffic** analysis included a study area of nine (9) intersections and five (5) roadway segments. The project traffic generation was calculated using a trip generation rate from a survey of three open and operating CarMax dealerships. The data from the CarMax sites was collected by placing tube counters across all site driveways that recorded all vehicles including employees, customers, test drives, deliveries, mail carriers, trash trucks, maintenance, and any other vehicle that crossed over the tubes. Using the CarMax based trip generation rates, the project is forecasted to generate 475 ADT, 18 AM peak hour trips (11 inbound and 7 outbound), and 50 PM peak hour trips (31 inbound and 19 outbound). The project will have two driveways on Plaza Dr and two driveways on Thunder Dr. Six (6) scenarios were analyzed, which included Existing, Existing + Project, Existing + Cumulative, Existing + Cumulative + Project, Horizon Year 2030 Master Transportation Plan (MTP), and Horizon Year 2030 MTP + Project conditions. Operational findings by scenario are summarized below:

1) Under Existing conditions, the study intersections and segments are calculated to operate at LOS D or better except for:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-78 EB Ramp and Thunder Dr (LOS E), and
    c. Segment Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

2) Under Existing + Project conditions, the study intersections and segments were calculated to operate at LOS D or better except for the:
    4) Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    5) Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    6) Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

    The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's thresholds (proposed improvements are described below).

3) Under Existing + Cumulative conditions, the study intersections and segments were calculated to operate at LOS D or better except for the:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    c. Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

4) Under Existing + Cumulative + Project conditions, the study intersections and segment were calculated to operate at LOS D or better except for the:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    c. Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS F).

    The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's thresholds.

5) Under Horizon Year 2030 MTP conditions, all study intersections and segments were calculated to operate at LOS D or better, except for:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-78 EB Ramp and Thunder Dr (LOS E), and
    c. Thunder Dr between Plaza Dr and Tiberon Dr (LOS E).

6) Under Horizon Year 2030 MTP + Project conditions, all study intersections and segments were calculated to operate at LOS D or better except for the:
    a. Segment of College Blvd between Vista Way and Plaza Dr (LOS F),
    b. Segment of Plaza Dr between SR-EB Ramp to Thunder Dr (LOS E), and
    c. Segment of Thunder Dr between Plaza Dr and Tiberon Dr (LOS F).

    The project is calculated to cause a traffic effect on Thunder Drive between Plaza Drive and Tiberon Dr because the project exceeds the City's thresholds.

Project Improvements

1) The proposed improvement for the traffic effect on Thunder Drive is to widen the street into the site along the project frontage and restrict parking on the project side of the street between the two proposed project driveways. The City's Bicycle Master Plan has a recommended Class 3 bike route on Thunder Dr. If the City requires bike sharrows or bike route signs along the project frontage, then the applicant will install.

2) The applicant will widen Plaza Drive along the project frontage to the General Plan classification of a Secondary Collector; however, the applicant will only stripe this segment with 3 travel lanes (2 eastbound lanes and 1 westbound lane) and a center two way left turn lane in order to match the existing westbound single travel lane configuration adjacent to the DMV all to the satisfaction of the City Engineer. Additionally, the following improvements will be made to the satisfaction of the City Engineer:

    a. Sidewalks will be installed on both sides of Plaza Drive along the project frontage.

    b. Bike lanes will be striped on both sides of Plaza Drive along the project frontage.

Traffic Impact Analysis Guidelines for

Vehicle Miles Traveled (VMT) and Level of Service Assessment

August 2020
Final Version

Trip Distribution / Assignment Procedure

Typically, two methods are used to determine trip distribution and assignment for transportation analysis and are considered acceptable by the City.

- The first method utilizes engineering judgement based on existing traffic data and land use patterns. This method requires the consultant to provide a map with project distribution and trip assignments to the City for review prior to conducting analysis.

- The second method utilizes the SANDAG Regional Travel Demand Model to perform a select zone or link analysis**. This approach is typically used for larger projects and shall be used for any project that generates over 2,400 ADT**.

Once trip distribution and assignment assumptions are submitted to the City, the City will review and provide feedback on assumptions. If necessary, the developer or consultant may coordinate with the City Traffic Engineer to discuss trip distribution and assignment for any clarification or considerations to travel patterns that are not readily apparent.

7.0 Screened Out Projects

SB 743 eliminates the need for some projects to be analyzed for CEQA purposes that support VMT reduction, these projects are considered screened out for VMT analysis. Screened out is defined as projects not needed to be analyzed for CEQA purposes that already support VMT reduction.

The projects listed in **Table 2** are presumed to be considered VMT-reducing projects. The projects listed are either locally serving or are based on substantial evidence provided by the OPR Technical Advisory Committee supporting SB 743 implementation. A project may be required to conduct a VMT analysis at the discretion of City Staff if it is unclear the project qualifies as screened out or based on the City Traffic Engineer's discretion.

Table 2 – Screened Out Projects

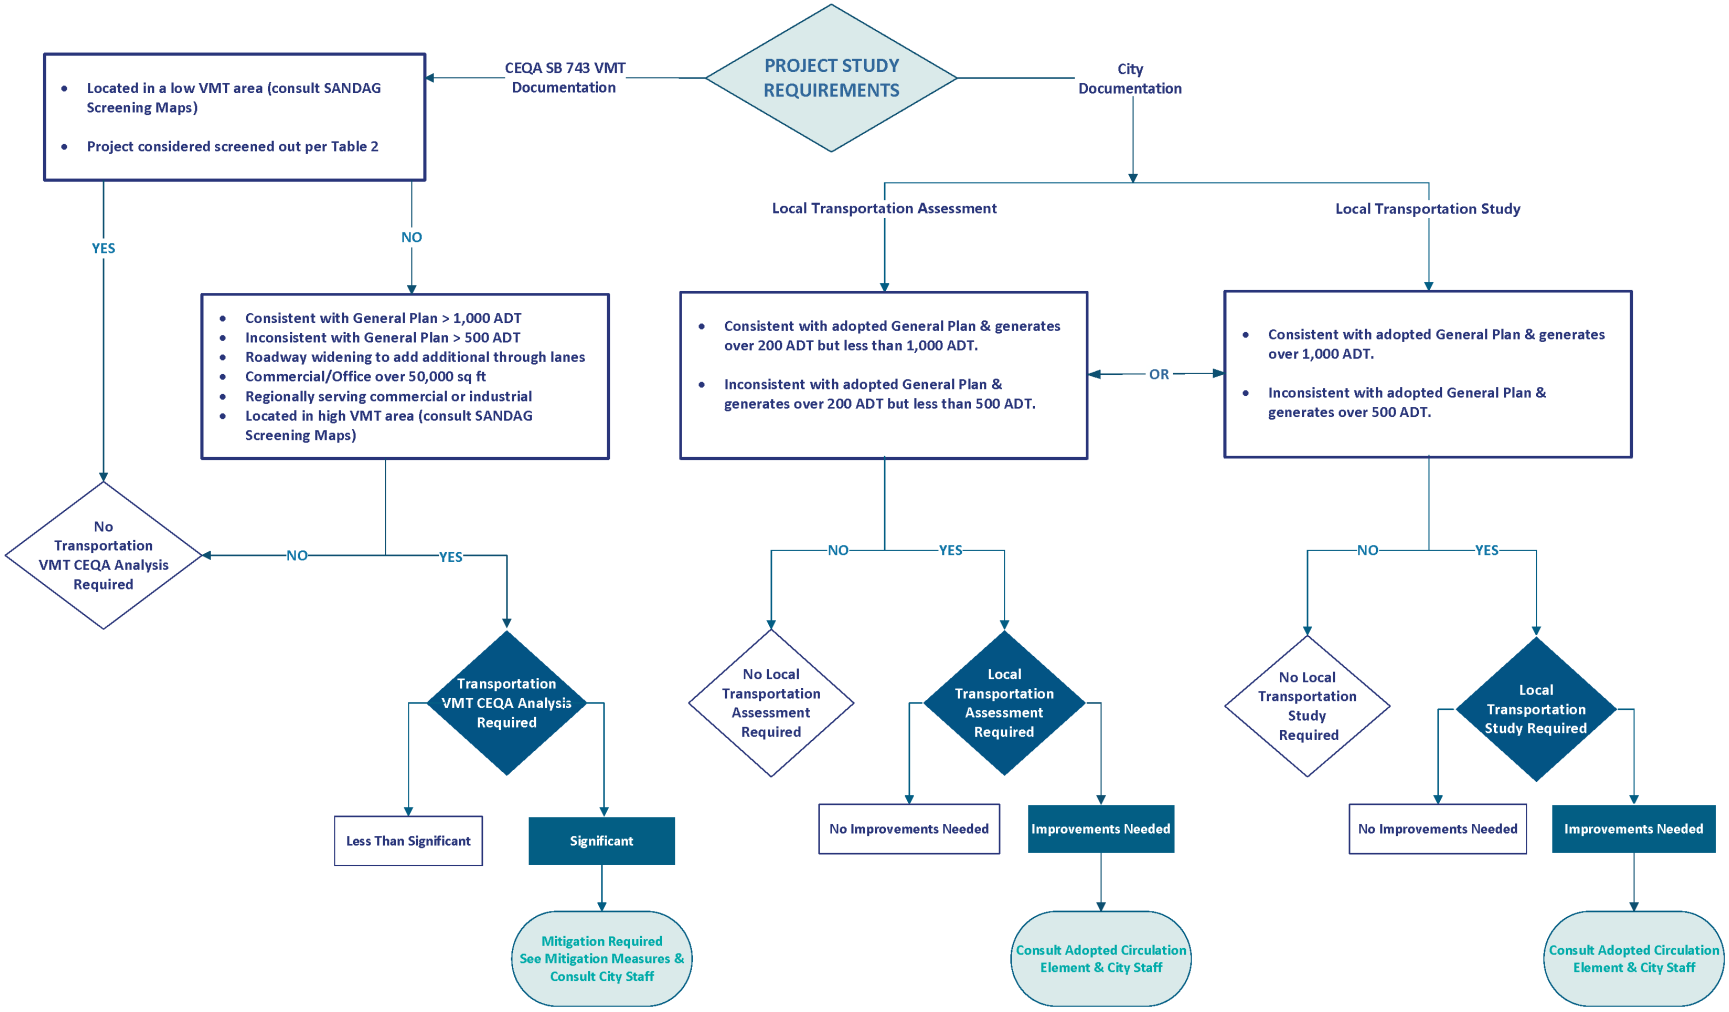
Project Type
Projects located in a Transit Priority Areas (TPA) or Smart Growth Opportunity Area as identified in the most recent SANDAG San Diego Forward Regional Plan and is consistent with the General Plan at the time of project application. (1)(2)
Projects located in a low-VMT generating area identified on the most recent SANDAG SB 743 VMT Screening map
Locally serving K-12 schools
Day care centers
Local parks
Locally serving retail uses less than 50,000 square feet, including: gas stations, banks, restaurants, grocery stores, and shopping centers
Community institutions (Public libraries, fire stations, local government)
Locally serving hotels (e.g. non-destination hotels, non-regionally serving)
Student housing projects on or adjacent to college campuses
Local serving community colleges that are consistent with the assumptions noted in the most recent SANDAG Regional Transportation Plan/Sustainable Communities Strategy
Affordable housing projects (3)
Assisted living facilities
Senior housing (as defined by HUD)
Transit projects
Bike projects
Pedestrian projects
Safety improvement projects (e.g. RRFBs and high visibility crosswalks at uncontrolled locations, pedestrian count down timers, additionally projects identified through the Highway Safety Improvement Program)
Safe Routes to School
Projects generating less than 500 daily vehicle trips (if inconsistent with adopted General Plan)
Projects generating less than 1,000 daily vehicle trips (if consistent with adopted General Plan)

(1) Projects located in a TPA must be able to access the transit station within a ½ mile walking distance or 6 minute walk continuously without discontinuity of sidewalk or obstructions to the route. Qualifying transit stops means a site containing an existing rail transit station served by either a bus or rail transit service, or the intersection of two or more major bus routes with a frequency of service interval of 15 minutes or less during the morning and afternoon peak commute periods (OPR, 2017). A high-quality transit corridor may also be considered if a corridor with fixed route bus service has service intervals no longer than 15 minutes during peak commute hours (OPR, 2017).
(2) Smart Growth Opportunity Area Map is provided in **Appendix B**. The most recent version available shall be used.
(3) If a project is a mix of affordable housing and market rate housing or unscreened use, only the affordable housing component would qualify as screened out. Additionally, any removal of affordable housing automatically requires CEQA VMT analysis.

8.0 Determining Project Study Requirements

Figure 8-1 helps guide development projects in determining the requirements from a local and state perspective in order to help determine study requirements. The screening flowchart indicates an overview of the circumstances where a detailed CEQA VMT analysis would or would not be required and when a project would require a Local Transportation Study or Local Transportation Assessment. The City maintains the discretion to require a project to conduct additional analysis if needed.

Figure 8-1 Project Study Requirements



* Projects are not confined to what is listed above and will need to be coordinated with City Staff to determine study requirements for developments not listed.
This flowchart is a generalization, it is up to the City's discretion to determine if additional analyses will be required and if potential mitigation or improvements are acceptable.

9.0 San Diego Regional Guidelines For VMT

The City of Oceanside utilizes the Institute of Transportation Engineers (ITE) San Diego Regional Guidelines (May 2019) to establish thresholds and methodology for VMT analysis. For analysis purposes the most recent version of these guidelines shall be utilized. The following sections summarize the VMT thresholds requirements for Oceanside in alignment with ITE. Thorough analysis explanation can be found in the most recent ITE guidance.

Minimum Threshold for VMT Analysis

Based on the recommendations of the Institute of Transportation Engineers (ITE) for the San Diego section, **Table 3** indicates when a VMT analysis for CEQA is required. This is based on keeping consistent with the thresholds previously used and *SANDAG's Not So Brief Guide Trip Generation (2002)*. These thresholds are based on the understanding that SANDAG trip generation rates differ from ITE trip generation rates which OPR's recommendations are based on.

Projects Consistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that support these goals will adhere to the following VMT analysis thresholds identified in Table 3.

Table 3 – Threshold for VMT Analysis for Projects Consistent with the Adopted General Plan

	VMT Analysis Not Needed	VMT Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 1,000 ADT	Greater than 1,000 ADT

(1) If ADT is equal to 1,000 ADT, VMT analysis is required.

Projects Inconsistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that are not in support of the General Plan have a lower VMT threshold and will require a General Plan Amendment. The following VMT analysis thresholds for projects that are inconsistent are identified in **Table 4**.

Table 4 – Threshold for VMT Analysis for Projects Inconsistent with the Adopted General Plan

	VMT Analysis Not Needed	VMT Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 500 ADT	Greater than 500 ADT

(1) If ADT is equal to 500 ADT, VMT analysis is required.

The thresholds identified in Table 3 and Table 4 stem from the professional expertise and judgement of the ITE San Diego section. These thresholds reflect what is appropriate for the San Diego region to use for VMT and have previously helped determine LOS impacts.

VMT Thresholds

This section identifies what type of VMT analysis is required based on the land use and thresholds identified in the previous section. If a project qualifies for a VMT analysis, the VMT analysis can be compared based on City-wide, Regional, or community basis. The method of comparison shall be agreed upon by the City Traffic Engineer and shall be appropriate based on the use of the site.

The following defines the metrics identified in **Table 5**. It is important the appropriate metrics are applied for each project.

VMT/Capita:

Includes all vehicle-based person trips grouped and summed to the home location of individuals who are drivers or passengers on each trip. It includes home-based and non-home-based trips. The VMT for each home is then summed for all homes in a particular census tract and divided by the population of that census tract to arrive at Resident VMT/Capita.

VMT/Employee:

Includes all vehicle-based person trips grouped and summed to the work location of individuals on the trip. This includes all trips, not just work-related trips. The VMT for each work location is then summed for all work locations in a particular census tract and divided by the number of employees of that census tract to arrive at Employee VMT/Employee.

Small Projects

Small projects, under 2,400 ADT, shall utilize the most recent version of the SANDAG SB 743 Concept Maps. SANDAG has prepared an online mapping system that calculates average VMT/capita and VMT/employee at the census tract level. This tool determines the project's VMT/employee or VMT/capita to be compared to community, city, and/or regional averages. **Appendix C** provides an example of how to use the SANDAG Concept Maps to determine the project's VMT.

Large Projects

Projects consisting of 2,400 ADT or higher will require the use of the most recent SANDAG model to determine VMT. The SANDAG transportation model provides a systematic analytical platform so that different alternatives and inputs can be evaluated in an iterative and controlled environment.

Table 5 identifies the significance thresholds for proposed land uses. Projects that exceed the significance thresholds are considered significant and will require VMT analysis and mitigation.

Table 5 – City of Oceanside Project Threshold

Project Type	Metric	Significance Threshold[1]
Residential	Resident VMT / Capita	15 % below regional average
Commercial	Employee VMT / Employee	15 % below regional average
Industrial	Employee VMT / Employee	15 % below regional average
Retail [2]	Net increase in the regional VMT	Net increase in regional VMT
Mixed-Use	Evaluate each land use separately	Based on proposed land use
Redevelopment [3]	Based on the proposed land use	Based on the proposed land use

(1) The City may request the applicant to analyze VMT using a more localized threshold if the project requires.

(2) Locally serving retail is presumed to decrease VMT however retail projects over 50,000 square feet are considered regionally serving.

(3) A redevelopment project that reduces VMT is presumed to have less than a significant impact and is screened out. The removal of affordable housing will require VMT analysis.

10.0 Mitigation Measures and Strategies for VMT Reduction

A project that exceeds the thresholds identified in the previous tables is considered to have a significant impact and will require mitigation measures and strategies. With appropriate mitigation the project may be able to apply VMT reductions to part or all of the project depending on the land use and strategy chosen. It is critical to implement strategies that are appropriate for the land use, for example, a residential project would not implement a telecommute strategy but may include providing a bike facility and amenities on-site.

SANDAG Mobility Management Guidebook

The purpose of the mitigation measures and strategies is to reduce the VMT generated by the project through a reduction of the distance driven or reducing the number of vehicle trips. It is recommended the SANDAG Mobility Management Guidebook (2019) be consulted to determine mitigation measures for the project site.

The guidebook consists of the following resources:

- Mobility Management Guidebook
- VMT Reduction Calculator Tool
- Calculator Design Document
- Recommendations for Application
- User Training Videos

Figure 10-1 identifies the potential mobility management strategies included in the guidebook that are recommended for a project exceeding the VMT thresholds. It is also recommended the SANDAG iCommute and MTS programs be utilized for projects generating employment. Several opportunities included in these programs are identified in **Table 6**. **Appendix D** contains the SANDAG Mobility Management Guidebook for reference.

The VMT Reduction Calculator Tool evaluates the VMT impact of more than 20 mobility management strategies. The calculator can be utilized to determine how a strategy, when implemented, can reduce a project's VMT. **Appendix E** contains the SANDAG VMT Reduction Calculator Tool for reference, the calculator is available on the SANDAG website. All VMT reduction strategies utilized should be discussed with the City and provided with backup documentation. Any changes or overrides to input parameters should be discussed and approved by the City.

Figure 10-1 Mobility Management Strategies

	Strategy Type	Strategy Name	Included in VMT Calculator?
Project/Site Level	Employer Commute Programs	Comprehensive Employer Commute Program	√
		Employer Carpool Program	√
		Employer Transit Pass Subsidy	√
		Employer Vanpool Program	√
		Employer Telework Program	√
		Employer Guaranteed Ride Home Program	
		On-Site Bike Amenities	
	Land Use Strategies	Higher-Density Development	
		Transit-Oriented Development	√

Table 6 – Additional VMT Reduction Strategies for Employers

Additional VMT Reduction Strategies for Employers
Establish and maintain participation in SANDAG's iCommute services for employers
Provide a monthly employer subsidy/pretax payroll deduction toward transit passes, carpool, or vanpool.
Encourage employees to register in SANDAG's iCommute program for rideshare matches.
Provide a monthly employer subsidy or incentives for employees or patrons who regularly commute by bicycle.
Host or sponsor regional events such as Bike to Work day, Rideshare Month
Participate in MTS promotions such as Free Ride Day and EcoPass
Implement an internal carpool program for employees
Designate an on-site point of contact for employee commute inquiries.

OPR Mitigation Measures

Table 7 identifies additional mitigation measures provided by the Office of Planning and Research (OPR).

Table 7 – OPR Recommended Mitigation Measures

Additional Mitigation Measures
Improve or increase access to transit.
Increase access to common goods and services, such as groceries, schools, and daycare.
Incorporate affordable housing into the project.
Incorporate a neighborhood electric vehicle network.
Orient the project toward transit, bicycle, and pedestrian facilities.
Improve pedestrian or bicycle networks, or transit service.
Implement or provide access to a commute reduction program.
Provide parking cash-out programs.
Unbundle parking costs.
Provide bicycle parking.
Limit or eliminate parking supply.
Provide traffic calming as a way to incentivize bicycling and/or walking.
Provide partially or fully subsidized transit passes.
Shift single occupancy vehicle trips to carpooling or vanpooling by providing ride-matching services or shuttle services.
Provide telework options.
Provide incentives or subsidies that increase the use of modes other than a single-occupancy vehicle.
Provide on-site amenities at places of work, such as priority parking for carpools and vanpools, secure bike parking, showers and locker rooms, and bicycle repair services.
Provide employee transportation coordinators at employment sites.
Provide a guaranteed ride home service to users of non-auto modes.
Contribute to a mobility fee program that funds multimodal transportation improvements, such as those described above.

The City may decide to implement a VMT mitigation fee bank to fund projects that would help the City reduce GHG emissions and promote VMT reduction. This would need to be developed specifically for VMT reduction projects for the City and cannot be preexisting to this document. Mitigation measures are not limited to this document and may be discussed with the City Traffic Engineer providing appropriate reduction methodologies are applied using documentation published by SANDAG, the California Air Resources Board (CARB), or the California Air Pollution Control Officers Association (CAPCOA). These resources provide quantifiable measures that may be used for project mitigation. Mitigation and reduction measures utilized should be documented and easily referenced in the document's appendix.

SIGNIFICANT AND UNAVOIDABLE IMPACTS

Projects that are unable to mitigate to a less than significant level of impact must provide a detailed statement of overriding considerations in accordance with CEQA Guidelines Sections 15091 and 15093. The following are direct quotes from the legislation to help project applicants understand CEQA law.

Section 15091 Findings:

" (a) No public agency shall approve or carry out a project for which an EIR has been certified which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding.

The possible findings are:

(1) Changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the final EIR.

(2) Such changes or alterations are within the responsibility and jurisdiction of another public agency and not the agency making the finding. Such changes have been adopted by such other agency or can and should be adopted by such other agency.

(3) Specific economic, legal, social, technological, or other considerations, including provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or project alternatives identified in the final EIR.

(b) The findings required by subdivision (a) shall be supported by substantial evidence in the record.

(c) The finding in subdivision (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives. The finding in subdivision (a)(3) shall describe the specific reasons for rejecting identified mitigation measures and project alternatives.

(d) When making the findings required in subdivision (a)(1), the agency shall also adopt a program for reporting on or monitoring the changes which it has either required in the project or made a condition of approval to avoid or substantially lessen significant environmental effects. These measures must be fully enforceable through permit conditions, agreements, or other measures.

(e) The public agency shall specify the location and custodian of the documents or other material which constitute the record of the proceedings upon which its decision is based.

(f) A statement made pursuant to Section 15093 does not substitute for the findings required by this section."

Section 15093 – Statement of Overriding Considerations:

" (a) CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposal project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable."

(b) When the lead agency approves a project which will result in the occurrence of significant effects which are identified in the final EIR but are not avoided or substantially lessened, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. The statement of overriding considerations shall be supported by substantial evidence in the record.

(c) If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the notice of determination. This statement does not substitute for, and shall be in addition to, findings required pursuant to Section 15091."

11.0 LOCAL TRANSPORTATION STUDY AND LOCAL TRANSPORTATION ASSESSMENT GUIDELINES

The City of Oceanside utilizes the Institute of Transportation Engineers (ITE) San Diego Regional Guidelines (May 2019) to establish thresholds and methodology for a Local Transportation Study (LTS). A Local Transportation Study is different from VMT analysis for CEQA purposes and may be required in addition to the VMT analysis or individually. A Local Transportation Study will analyze the projects influence on the surrounding intersections and roadway network utilizing level of service (LOS) for all project scenarios. The purpose of the LTS is to help quantify the local impact of the development and expected changes in transportation conditions. The LTS should include roadway, bicycle, pedestrian, and transit evaluations. The following sections identify the project requirements for a Local Transportation Study. The Local Transportation Study helps the City ensure the goals, objectives, and policies adopted by the City are supported and implemented while monitoring the capacity for the roadway networks.

Data should be collected during typical operation hours. Data should be recent and no more than 2 years old for an LTS. **The acceptable level of service for the City of Oceanside that is consistent with the adopted Circulation Element is LOS D.**

Minimum Threshold for Local Transportation Study

Based on the recommendations of the Institute of Transportation Engineers (ITE) for the San Diego section, **Table 8** indicates when a Local Transportation Study is required for the City. This is based on keeping consistent with the thresholds previously used and *SANDAG's Not So Brief Guide (2002) Trip Generation*.

Projects Consistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that support these goals will adhere to the following LTS thresholds identified in Table 8.

Table 8 – Threshold for LTS for Projects Consistent with the Adopted General Plan

	LTS Analysis Not Needed	LTS Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 1,000 ADT	Greater than 1,000 ADT

(1) If ADT is equal to 1,000 ADT, an LTS is required.

A Local Transportation Study (LTS) will be required if a project exceeds 1,000 ADT and is consistent with the adopted General Plan.

Projects Inconsistent with the Adopted General Plan

The City's adopted General Plan represents the vision and goals the City has for the community. Projects that are not in support of the General Plan have a lower LTS threshold and will require a General Plan Amendment. The following LTS analysis thresholds for projects that are inconsistent are identified in **Table 9**.

Table 9 – Threshold for LTS for Projects Inconsistent with the Adopted General Plan

	LTS Analysis Not Needed	LTS Analysis Needed (1)
Average Daily Traffic Volume (ADT)	Less than 500 ADT	Greater than 500 ADT

(1) If ADT is equal to 500 ADT, an LTS is required.

A Local Transportation Study (LTS) will be required if a project exceeds 500 ADT and is inconsistent with the adopted General Plan.

The thresholds identified in Table 7 and Table 8 stem from the professional expertise and judgement of the ITE San Diego section. These thresholds keep consistent with regional practice and will help ensure developments will not overburden the transportation network.

If a project would add peak hour trips to any existing on- or off-ramp it is recommended to consult with the City and Caltrans to determine if an LTS would be required.

Study Scenarios

The following scenarios are included in an LTS and may be modified in agreement with the City Traffic Engineer.

- Existing Conditions
- Existing Conditions Plus Project
- Existing Conditions Plus Near-Term Cumulative Projects
- Existing Conditions Plus Near-Term Cumulative Projects Plus Project
- Buildout Conditions (2030)
- Buildout Conditions Plus Project

Local Transportation Assessment (LTA)

A Local Transportation Assessment (LTA) may be required instead of a Local Transportation Study depending on the size of the project. A helps the City monitor development impacts on the transportation network and is similar to a Local Transportation Study(LTS). The main difference between the two studies is a Local Transportation Assessment (LTA) analyzes fewer scenarios than a Local Transportation Study (LTS). A Local Transportation Assessment (LTA) will be required if a project is less than 1,000 ADT but is anticipated to influence the surrounding environment.

A Local Transportation Assessment (LTA) will be required to analyze the following scenarios based on the thresholds for identified for the project's ADT.

- **A project that generates between 200-500 ADT will be required to analyze existing conditions and existing conditions plus project.**

- **A project that generates between 500-1,000 ADT will be required to analyze existing conditions, existing conditions plus project, existing conditions plus near-term cumulative projects, and existing conditions plus near-term cumulative projects plus project.**

Transportation Modes to be Included for Discussion in the LTS/LTA

Pedestrian:

- The LTS/LTA shall include pedestrian infrastructure available including any opportunities or deficiencies such as path obstructions or missing sidewalk for ½ mile walking distance from project pedestrian access points.
- All pedestrian facilities directly connected to project access points or adjacent to the project development, extending in each direction to the nearest intersection with a classified roadway or connection with a Class I path
- Facilities connecting to transit stops within two blocks of the project
- Only facilities on the side of the project or along the walking route to transit stop
- Additional geographic areas may be included in certain cases to address special cases such as schools or retail centers

Bicycle:

- The LTS/LTA shall include a discussion of bicycle infrastructure available including any opportunities or deficiencies such as bike lanes, bike buffers, or bike boxes. This section must also include discussion of what is planned based on City and regional documentation. The extents are as follows:
    - All roadways adjacent to the project, extending in each direction to the nearest intersection with a classified roadway or with a Class I path
    - Both directions of travel should be evaluated

Transit:

- The LTS/LTA shall identify any transit stops or routes existing and planned near the project site. This section shall also include a discussion and evaluation of transit stop amenities within ½ mile of each pedestrian access point.

Vehicle:

All signalized intersections and signalized project driveways shall be analyzed if:

- The project will add 50 or more peak hour (final cumulative) trips in either direction

All unsignalized intersections and unsignalized project driveways shall be analyzed if:

- The project will add 50 or more peak hour (final cumulative) trips in either direction

All freeway ramp intersections and signalized project driveways shall be analyzed if:

- The project will add 20 or more peak hour (final cumulative) trips in either direction

Intersection Level of Service analysis should be conducted using the Highway Capacity Manual (HCM) Methodology. For signalized intersections, the methodology described in the HCM for signalized intersections is used. With this methodology, the average control delay per vehicle is estimated for each lane group and aggregated for each approach and for the intersection as a whole. The relationship between control delay per vehicle and LOS for signalized intersections is summarized in **Table 10**.

Table 10 – HCM Level of Service Description for Signalized Intersections

Level of Service	Description of Traffic Conditions	Control Delay (sec/veh)
A	Insignificant delays: no approach phase is fully utilized and no vehicle waits longer than one red indication	≤ 10
B	Minimal delays: an occasional approach phase is fully utilized. Drivers begin to feel restricted.	> 10 – 20
C	Acceptable delays: major approach phase may become fully utilized. Most drivers feel somewhat restricted.	> 25 – 35
D	Tolerable delays: Drivers may wait through more than one red indication. Queues may develop but dissipate rapidly without excessive delays.	> 35 – 55
E	Significant delays: Volumes approaching capacity. Vehicles may wait through several cycles and long vehicle queues form upstream.	> 55 – 80
F	Excessive delays: Represents conditions at capacity, with extremely long delays. Queues may block upstream intersections.	> 80

Source: Highway Capacity Manual, Transportation Research Board, 2010.

For unsignalized intersections, the methodology described in the HCM for unsignalized intersections is used. With this methodology, LOS is related to the control delay for each stop-controlled movement. The relationship between control delay per vehicle and LOS for unsignalized intersections is summarized in **Table 11**.

Table 11 – HCM Level of Service Description for Unsignalized Intersections

Level of Service	Description of Traffic Conditions	Control Delay (sec/veh)
A	No delay for stop-controlled approaches.	≤ 10
B	Operations with minor delay.	> 10 – 15
C	Operations with moderate delays.	> 15 – 25
D	Operations with some delays.	> 25 – 35
E	Operations with high delays and long queues.	> 35 – 50
F	Operation with extreme congestion, with very high delays and long queues unacceptable to most drivers.	> 50

Source: Highway Capacity Manual, Transportation Research Board, 2010.

Table 12 provides guidance on the levels of ADT that can be accommodated on various types of roadways, based on level of service.

Table 12 – Circulation Element Roadway Classification LOS & Capacity

Class	Lanes	Cross Section [1]	Level of Service (LOS)				
			A	B	C	D	E
Expressway	6	102/160 122/200	30,000	42,000	60,000	70,000	80,000
Expressway	4	102/160 122/200	25,000	35,000	50,000	55,000	60,000
Prime Arterial	6	104/124	25,000	35,000	50,000	55,000	60,000
6-Lane Major Arterial	6	104/124	20,000	28,000	40,000	45,000	50,000
5-Lane Major Arterial [2]	5	102/122	17,500	24,500	35,000	40,000	45,000
4-Lane Major Arterial	4	80/100	15,000	21,000	30,000	35,000	40,000
Secondary Collector (4 lanes with 2-way left turn lane)	4	64/84	10,000	14,000	20,000	25,000	30,000
Secondary Collector (4 lanes without 2-way left-turn lane, with left turn pockets	4	54/74, 60/80	9,000	13,000	18,000	22,000	25,000
Collector (commercial fronting, 2-lanes with 2-way left turn lane) [3]	2	50/70	5,000	7,000	10,000	13,000	15,000
Collector (residential streets in the Circulation Element or industrial fronting)	2	40/60, 50/70	4,000	5,500	7,500	9,000	10,000
Local Street (residential streets NOT in the Circulation Element	1	36/56, 40/60	–	–	2,400	–	–

(1) Cross sections are listed as curd-to-curb width/total right of way width, in feet.
(2) Vandegrift Boulevard is the only Circulation Element roadway designated as a 5-lane Major Arterial. It is not intended that other roadways be build to 5-lane Major Arterial standards.
(3) This capacity will also be assumed for a two-lane one-way collector.

Table 13 indicates when a project's effect on the roadway system is considered to justify the need for roadway improvements. That is, if a project's traffic effect causes the values in this table to be exceeded, roadway improvements should be considered as follows on a case by case basis:

- Improvements should be consistent with the General Plan
- Improvements for transit, bike and pedestrian facilities should be given priority in Transit Priority Areas or Smart Growth Opportunity Areas as identified by SANDAG.
- Projects in Transit Priority Areas or Smart Growth Opportunity Areas as identified by SANDAG, that are consistent with the General Plan at the time of project application, should not be denied due to the inability to provide roadway improvements (i.e. existing right of way is constrained, etc.)

Table 13 – Determination of the Need for Roadway Improvements

Level of Service with Project*	Allowable Change Due to Project Effect**					
	Freeways		Roadway Segments		Intersections	Ramp Metering
	V/C	Speed (MPH)	V/C	Speed (MPH)	Delay (Sec.)	Delay (Min.)
E & F (or ramp meter delays above 15 min)	0.01	1	0.02	1	2	2

12.0 TRANSPORTATION DEMAND MANAGEMENT (TDM) STRATEGIES

In general, the goal of City Staff is to help Oceanside increase connectivity and level of comfort for pedestrians, bicyclists, and transit users. Project improvements may come from the City's adopted General Plan or other City policies that help improve the overall quality of life for the community. **Table 14** identifies some TDM improvement measures that may be considered for a project.

Table 14 – Potential TDM Improvement Measures

Potential TDM Measures	
Transit Facilities	Telecommuting
Bike Facilities	Rideshare Programs
Walkability	Flex-time
Carpool Incentives	Parking Cash-Out
Subsidized Transit Passes	Shuttle Service

A measure that is not listed may be considered if the mitigation is appropriately applied and reasonable. Additional improvement measures may be identified as future technologies and policies evolve or with consultation by City Staff.

13.0 RESOURCES

The following resources were used in the development of these guidelines. It is recommended the consultant develop a plan of action that aligns with the City Traffic Engineer's expectation prior to conducting any analyses.

City of San Diego. "Transportation Study Manual (TSM) Draft." September 2019.

Institute of Transportation Engineers (San Diego Section). " Guidelines for Transportation Impact Studies (TIS) in the San Diego Region." May 2019. Accessed April 1, 2020.

Governor's Office of Planning and Research (OPR). "Technical Advisory on Evaluating Transportation Impacts in CEQA." December 2018. Accessed April 1, 2020.

Governor's Office of Planning and Research (OPR). "Key Resources on SB 743: Studies, Reports, Briefs, and Tools." April 2018. Accessed April 1, 2020.

California Air Resources Board (CARB). "2017 Scoping Plan-Identified VMT Reductions and Relationship to State Climate Goals." January 2019. Accessed April 1, 2020.

California Air Pollution Control Officers Association (CAPCOA). "Quantifying Greenhouse Gas Mitigation Measures." August 2010. Accessed April 1, 2020.

San Diego Association of Governments (SANDAG). "TDM Planning Resources." 2019. Accessed April 1, 2020.

INTRODUCTION

Kimley-Horn & Associates, Inc. was retained to conduct this trip generation study for Carmax Auto Superstores by Industrial Developments International (IDI) at three current store locations. This report summarizes the analysis and findings of the study, and offers an estimate of trip generation rates. It is anticipated that such rates may be used in the planning and design for future Carmax facilities.

Carmax Auto Superstores provide customers with a selection of pre-owned vehicles for purchase or trade-in, and the option to sell a vehicle without making a purchase. A few locations offer new car sales as well. In addition, each store has a service area that handles warranty work, general vehicle maintenance on a limited basis, and reconditioning in preparation for vehicle sales at Carmax Auto Superstores. There are currently 39 Carmax Auto Superstores in 12 states nationwide, ranging from ± 14,000 to ± 95,000 square feet. The service centers typically operate from 7:30 AM to 6:00 PM Monday through Friday, and 7:30 AM to 5:30 PM on Saturday. The sales centers are typically open from 10:00 AM to 9:00 PM Monday through Friday, 9:00 AM to 9:00 PM on Saturday, and 12:00 PM to 7:00 PM on Sunday (where allowed by local ordinances). The Institute of Transportation Engineers *Trip Generation Manual (6thEdition)* provides a land use designation (841) for new car sales. However, due to the fact that pre-owned vehicle sales account for most (if not all) of the sales at a Carmax Auto Superstore, combined with the unique nature of Carmax Auto Superstores compared with other new and used car dealers, a trip generation study was performed to more accurately determine the trip generation rates for a Carmax Auto Superstore.

STUDY METHODOLOGY

This trip generation study used the following methodology:

Trip Generation Study Variables

The purpose of this study is to develop more accurate trip generation rates for Carmax Auto Superstores. Trip generation data was averaged to ascertain the actual number of trips. Data was collected for 24 hours for a period covering weekdays and weekends, and was analyzed for daily, AM, and PM peak periods by building square footage and by the number of employees.

Study Sites

At the time of this study, there were 39 Carmax Auto Superstores in 12 states nationwide. Of these 39 sites, three of distinct size and age were used for data collection and analysis in the study. Descriptions of the three sites are found below; location maps of each site are included in Appendix A.

The sites used for data collection and analysis were:

- Davie, Florida (# 7108)
- Nashville, Tennessee (# 7150)
- Plano, Texas (# 7207)

Carmax Auto Superstore # 7108 is located in **Davie, Florida** at 7420 State Road 84. The store is located on the corner of State Road 84 and SW 71st Terrace, and access to the site is provided from each of the two roads. The main site entrance on State Road 84 allows access for employees, sales customers, and service customers, while the access on 71st Street is used primarily for vehicle delivery and distribution. Only pre-owned vehicles are sold at this location. The store is ±81,099 square feet, has 220 employees, and has been in operation since November 1997. This store differs from the other two analyzed in this study in that it is a "hub" store. A "hub" store handles service and re-conditioning for its location, as well as other "satellite" locations in the area of the "hub". This "hub" location is capable of 24-hour service, meaning that there is often a night shift used for vehicle reconditioning.

Carmax Auto Superstore # 7150 is located in **Nashville, Tennessee** at 2051 Powell Avenue. Access to the site is provided by a single driveway, shared with the adjacent Home Depot Expo, located on Powell Avenue less than one mile from Interstate 65. This location sells new and pre-owned vehicles and has a full service center for customers and reconditioning. It is designated as a "stand-alone" store, and is ±55,558 square feet, employees 187 people, and has been in operation since July 1999.

Carmax Auto Superstore # 7207 is located in **Plano, Texas** at 4448 West Plano Parkway. Access to the site is provided by two driveways, approximately 200 feet apart, along Fulgham Road, just off West Plano Parkway. The northern drive is considered the primary access to the site, and experiences a heavier amount of traffic. Transport vehicles delivering and collecting vehicles for sale primarily use the southern drive. This store is ±14,012 square feet, has 69 employees, and has been in operation since February 2002. This location is a "satellite" store and only offers pre-owned vehicles.

DATA COLLECTION

Trip Generation

Driveway volumes were collected using 24-hour automatic tube counters at all site driveways for each of the three locations used in this study. Volumes were collected for twenty-four (24) hours, for at least seven consecutive days, and were recorded in 15-minute intervals in order to determine daily and peak-hour volumes.

Manual driveway counts were performed at each site by Kimley-Horn & Associates staff to verify the count data collected by the tube counters. The dates of data collection are listed below by location.

- Davie, FL – Thursday, September 11, 2002 to Thursday, September 18, 2002
- Nashville, TN – Monday, September 9, 2002 to Thursday, September 18, 2002
- Plano, TX – Monday, September 9, 2002 to Friday, September 19, 2002

DATA ANALYSIS

Daily Trip Generation

The daily trip generation rates for each Carmax Auto Superstore location were calculated in two manners. First, by dividing the average weekday (Tuesday, Wednesday, and Thursday) total driveway volumes by the building square footage, and second, by dividing the average weekday (Tuesday, Wednesday, and Thursday) total driveway volumes by the number of employees. In addition, daily volumes from Saturday were also analyzed in the same way to determine a Saturday trip generation rate. Tables 1 and 4 summarize the daily driveway volumes observed at each study site and the resulting trip generation rates.

AM Peak Hour Trip Generation

Morning peak hour (7:00 AM to 9:00 AM) volumes were analyzed, and an AM Peak hour was determined for weekdays Tuesday, Wednesday, and Thursday. An AM Peak hour trip generation rate was then calculated using two methods. The volumes for the peak hour each day were divided first by the building square footage, and second, by the number of employees. These results were averaged to obtain a weekday AM Peak hour trip generation rate. Tables 2 and 5 summarize the AM Peak driveway volumes observed at each study site and the resulting trip generation rates.

PM Peak Hour Trip Generation

Afternoon peak hour (4:00 AM to 6:00 AM) volumes were analyzed, and a PM Peak hour was determined for weekdays Tuesday, Wednesday, and Thursday. A PM Peak hour trip generation rate was then calculated using two methods. The volumes for the peak hour each day were divided first by the building square footage, and second, by the number of employees. These results were averaged to obtain a weekday PM Peak hour trip generation rate. Tables 3 and 6 summarize the PM Peak driveway volumes observed at each study site and the resulting trip generation rates.

Table 1
Daily Trip Generation Rates (per 1,000 square feet)

Store Number	Store Location	Building Size (sq.ft.)	Total Daily Driveway Trip Ends					Daily Trip Generation Rate	
			Tues.	Wed.	Thurs	Average	Sat.	Weekday	Saturday

Average Trip Generation Rate:							**0.69**	**0.44**	**1.13**

CONCLUSION

The purpose of this trip generation study was to estimate how much daily and peak hour traffic a proposed Carmax Auto Superstore may generate during a weekday and Saturday period. Since different size stores were studied, the trip generation analysis produced trip rates that can be applied to the store size or to the number of employees. The results of this trip generation study were compared against the trip rates published in the Institute of Transportation Engineers *Trip Generation Manual (6th Edition)*. The ITE Manual provides a land use code for New Car Sales (Land use 841). The comparison of ITE rates with the rates found in this study is summarized below in Table 7.

Table 7
Trip Generation Rate Comparison

Period	Based on 1,000 Square Feet		Based on Number of Employees	
	KHA Study	ITE Manual	KHA Study	ITE Manual
Weekday	41.48	37.50	10.88	21.14
Saturday	47.00	21.03	11.37	10.55
AM Peak Hour	1.56	2.21	0.44	0.67
PM Peak Hour	4.37	2.80	1.13	0.96

From Table 7, the trip rates observed based on square footage from this study are slightly lower than the ITE rates for the weekday and AM peak hour. However, the Saturday and PM peak hour rates observed were noticeably higher than the rates indicated in the ITE Manual.

The trip rates based on number of employees were observed to be considerably less than ITE rates when evaluating the weekday period, and similar to ITE rates when comparing Saturday. It should be noted that this trip generation study utilized a relatively small sample size (3 locations).

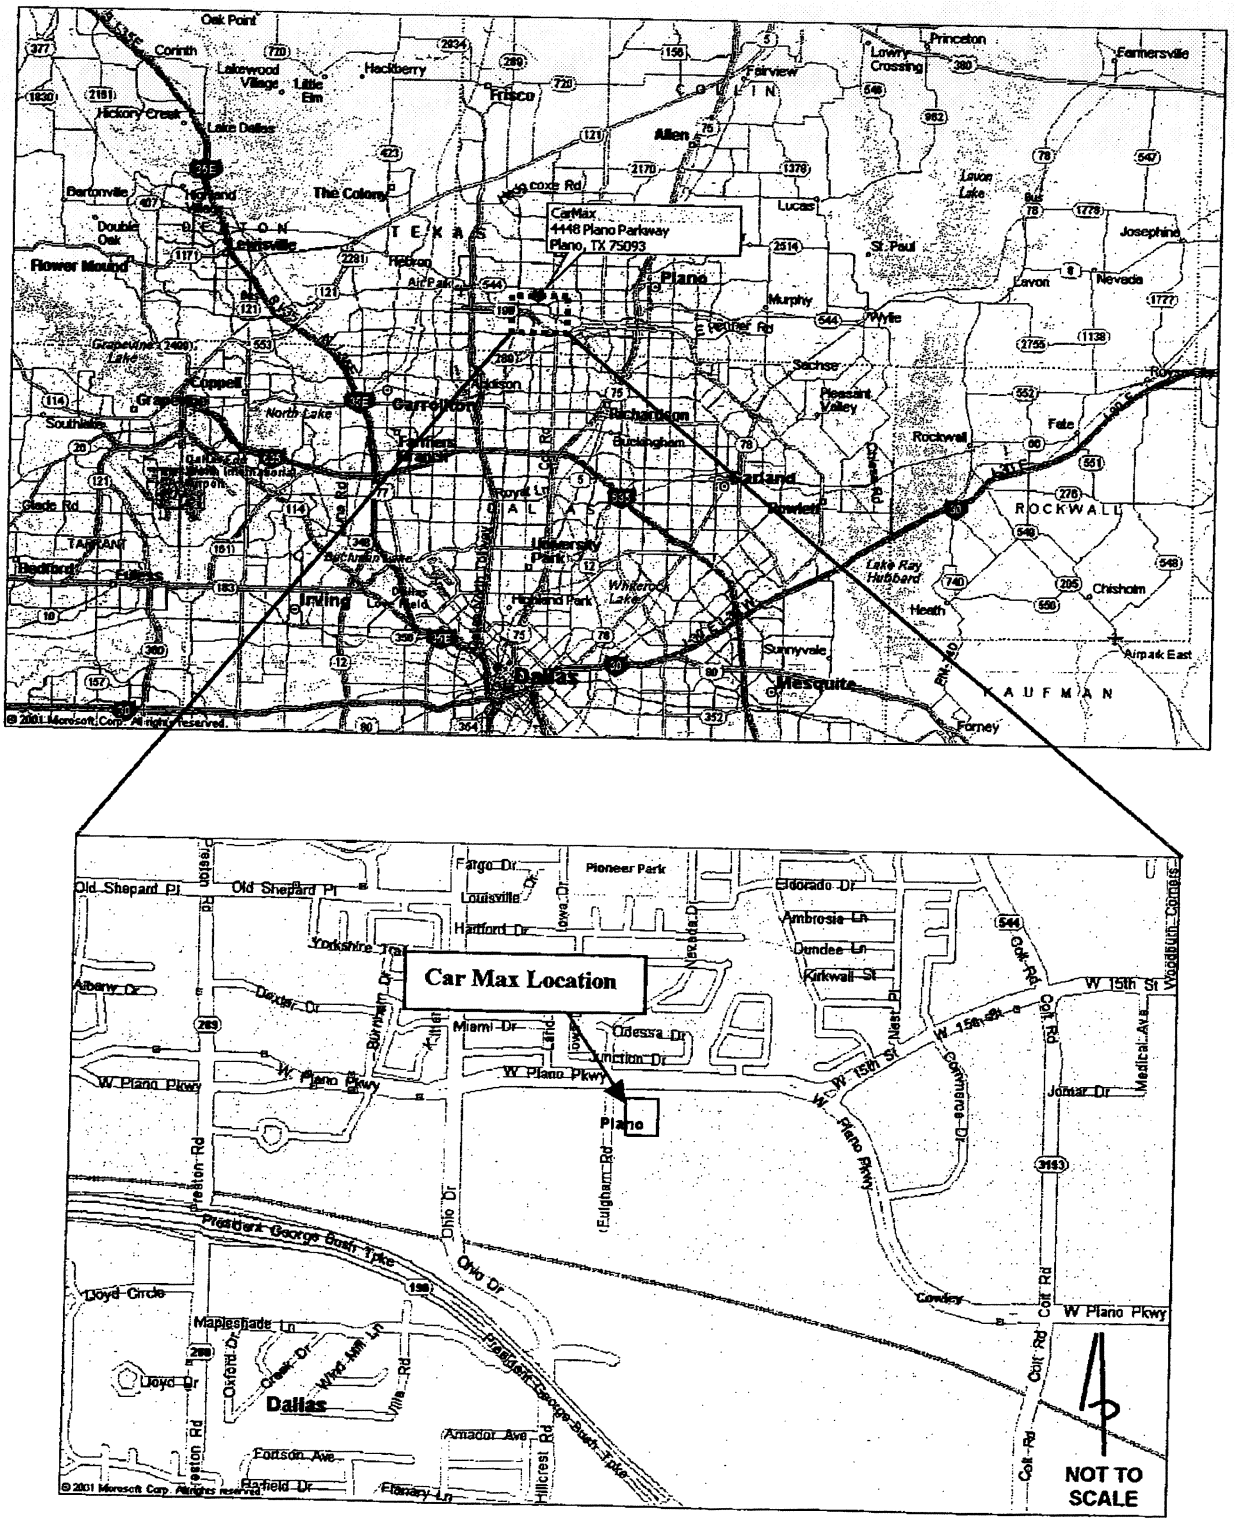
CarMax Auto Superstore #7207- Plano, Texas



Land Use: 841
Automobile Sales (Used)

Description

A used automobile sales dealership is typically located along a major arterial street characterized by abundant commercial development. The sale or lease of used cars is the primary business at these facilities; however, automobile services and parts sales may also be available. Some dealerships also include leasing options, truck sales, and servicing. Automobile sales (new) (Land Use 840) and recreational vehicle sales (Land Use 842) are related uses.

Additional Data

Time-of-day distribution data for this land use are presented in Appendix A. For the 14 general urban/suburban sites with data, the overall highest vehicle volumes during the AM and PM on a weekday were counted between 9:45 and 10:45 a.m. and 4:30 and 5:30 p.m., respectively.

The sites were surveyed in the 2010s in Texas.

Intersection Summary

Cycle Length: 90

Actuated Cycle Length: 81

Control Type: Actuated-Uncoordinated

~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

Appendix I

Cumulative Project Information

SECTION I – INTRODUCTION

PROJECT DESCRIPTION

The project is a 48 unit residential condominium development located on the southeast corner of the intersection of Sky Haven Lane and Sunset Drive in the City of Oceanside. Figure 1 provides a general vicinity map of the project location.

The site plan for the proposed project is depicted on Figure 2. Access to the site is proposed to provide one (1) lane in and one (1) lane out from Sunset Drive.

As detailed in this report, development of the proposed Emerald Ridge Development is estimated to generate 384 average daily trips, 31 AM peak hour trips and 35 PM peak hour trips.

REPORT ORGANIZATION

Following Section I - Introduction, Section II discusses Description of Analysis. Section III discusses Existing Conditions. Section IV provides analysis of Existing Plus Project Conditions, including Project Trip Generation Project Impact Analysis and Sunset Drive/Sky Haven Lane Signal Warrants Analysis. Section V provides an analysis of Impacts and Mitigation. Section VI provides a Summary of Findings and Recommendation.

FIGURE 6

PROJECT TRAFFIC

INTRODUCTION

This study analyzes the forecast traffic impact of the proposed Tri-City Medical Office Building located adjacent to the existing Tri-City Hospital north of Vista Way and west of Thunder Drive in the City of Oceanside. **Exhibit 1** shows the regional project location.

The project site is located adjacent to Tri-City Medical Center. As shown in **Exhibit 2**, the proposed site plan includes 60,000 square feet of medical office space. The proposed land use is consistent with the General Plan land use for the project site.

As required by the City of Oceanside, this traffic impact study has been prepared in accordance with the City's 1995 Circulation Element and SANDAG Congestion Management Program (CMP) traffic impact study guidelines.

SITE ACCESS AND CIRCULATION

The proposed project will take access from the existing entrance to the Tri-City Hospital on Vista Way. The existing Vista Way entrance is an unsignalized full access driveway that serves the Tri-City Hospital.

PROJECT STUDY AREA

The project study area was defined based on the distribution of project-generated trips on the roadway network. The SANDAG CMP guidelines indicate that all signalized intersections where 50 or more project-generated trips are forecast to be added should be included in the traffic impact study. A total of 14 study intersections and 11 roadway segments were identified for inclusion in this traffic study. The City of Vista does not require roadway segment analysis for traffic impact studies; however, three roadway segments located in the City of Vista were included for analysis for a comprehensive analysis. Based on the City of Oceanside thresholds and discussions with City staff, the study area consists of the following intersections and roadway segments:

Intersections

1. College Boulevard / Waring Road
2. College Boulevard / Vista Way
3. Vista Way / SR-78 Westbound Ramps
4. Vista Way / Tri-City Hospital Access
5. Vista Way / Thunder Drive
6. Vista Way / Emerald Drive
7. College Boulevard / SR-78 Eastbound Off-Ramp
8. College Boulevard / Plaza Drive
9. College Boulevard / Lake Boulevard-Marron Road
10. Plaza Drive / SR-78 Eastbound Ramps
11. Emerald Drive / SR-78 Westbound Ramps
12. Emerald Drive / SR-78 Eastbound Ramps
13. Vista Way / Buena Hills Drive
14. Vista Way / Rancho Del Oro Drive

Table 6
Proposed Project Trip Generation Rates

Land Use	Daily Rate	AM Peak Hour			PM Peak Hour		
		Total (% of Daily)	In (% AM)	Out (% AM)	Total (% of Daily)	In (% PM)	Out (% PM)
Medical Office	50/KSF	6%	80%	20%	11%	30%	70%

Source: SANDAG, "Not So Brief Guide", April 2002.
Note: KSF = 1000 square feet.

Table 7 summarizes the forecast project-generated trips based on the trip generation rates contained in Table 6. As summarized in Table 7, the proposed project is forecast to generate approximately 3,000 trips per day, which includes approximately 180 a.m. peak hour trips and approximately 330 p.m. peak hour trips.

Table 7
Proposed Project Trip Generation

Land Use	Intensity	Daily Trips	AM Peak Hour Trips			PM Peak Hour Trips		
			Total	In	Out	Total	In	Out
Medical Office	60 KSF	3,000	180	144	36	330	99	231

Note: KSF = 1000 square feet.

Project Trip Distribution

Project traffic was distributed on the roadway network based on the trip distribution that was approved for the approved Ambulatory Care Facility project, which is located on a site adjacent to the northwest corner of the Tri-City Hospital. The Ambulatory Care Facility Project would take access from Waring Road, so the distribution of trips was adjusted for the proposed Tri-City Medical Office project to reflect the access from the Tri-City Hospital Entrance on Vista Way. **Exhibit 7** illustrates the trip distribution for the proposed project.

Project Trip Assignment

Utilizing the project trip distribution shown in Exhibit 7, the forecast project-generated trips were assigned to the roadway network. **Exhibit 8** illustrates the forecast assignment of project-generated a.m. and p.m. peak hour volumes at the study intersections. Project-generated ADT volumes are illustrated in **Exhibit 9**.

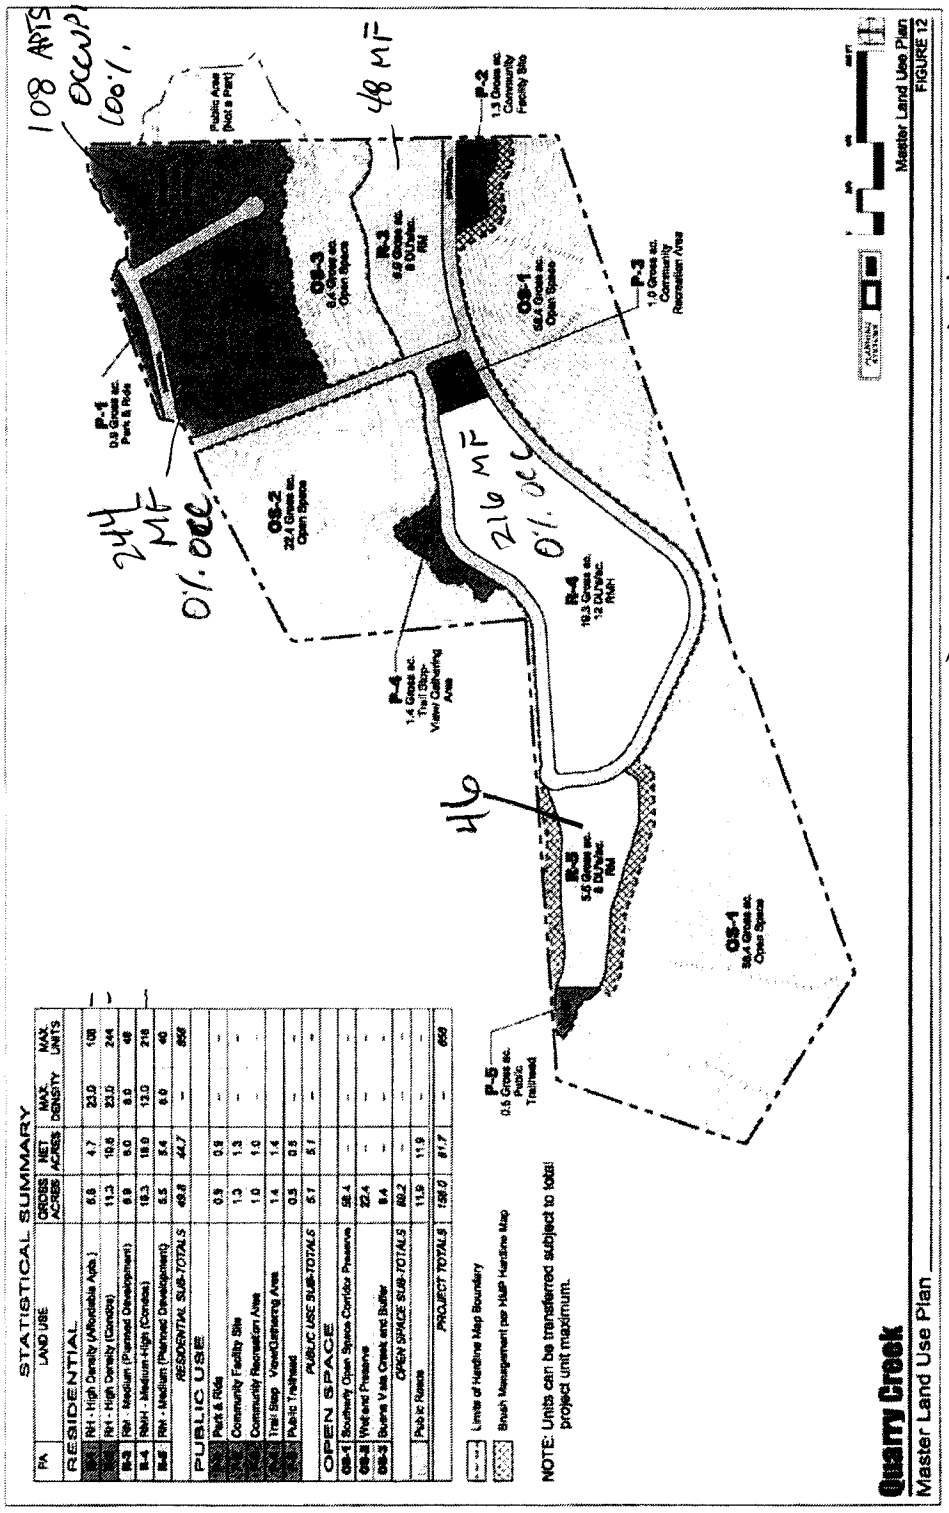
***Source: SANDAG Brief Guide Vehicular Traffic Generation Rates For the San Diego Region, April 2002.**
****Note: Trip rate adjusted to account for possible 30 child day-care facility (5 trips / child x 30 = 150ADT).**

1. The project only traffic volumes used in the analysis are slightly higher than shown above, since they were based on a previous land use plan. A slight downward adjustment to project only trip generation would not change the conclusions of this report.

2. This analysis does not reflect any Mixed-Use, Tenant, or Park-and-Ride reductions that may apply.



STATISTICAL SUMMARY

PA	LAND USE	GROSS ACRES	NET ACRES	MAX. DENSITY	MAX. UNITS
	RESIDENTIAL				
R-1	RH - High Density (Affordable Apts.)	6.8	4.7	23.0	108

Intersection Summary
Cycle Length: 90
Actuated Cycle Length: 85.8
Control Type: Actuated-Uncoordinated
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.

APPENDIX P
Summary of Berm Soil Sampling

November 6, 2019 Project No. 80.CARMAX1.19

Stacey Haggerson
CenterPoint Integrated Solutions, LLC
355 Union Boulevard, Suite 301
Lakewood, CO 80228

Subject: Summary of Berm Soil Sampling
Proposed CarMax Development
Southwest Corner of Plaza Drive and Thunder Drive
Oceanside, CA 92056

Dear Ms. Haggerson:

EnviroApplications, Inc. (*EAI*) is pleased to provide this letter summarizing the laboratory results of soil samples collected from two soil berms at the above-referenced subject site. This report is being submitted in accordance with our proposal dated September 20, 2019.

EAI understands that the berm soil sampling is being performed to assess potential contamination and evaluate possible use and/or disposal options for the soil. The scope of work performed by *EAI* included:

- Prepared a site-specific Health and Safety Plan (HASP) to address potential hazards that might be encountered during the field activities;
- Collected 30 soil samples from 10 locations at depths of approximately 1.5-, 3-, and 5-feet below the berm surface;
- Submitted the soil samples for laboratory analysis; and
- Prepared this letter report documenting the field activities, statistical analysis of laboratory results, and recommendations.

SITE DESCRIPTION

The subject site property is located in the southwest corner of Plaza Drive and Thunder Drive in Oceanside, California. The property is located north of Lake Boulevard, east of College Boulevard, south of Highway 78, and west of S. Emerald Drive. The two soil berms are located in the eastern portion of the site directly south of the Oceanside Department of Motor Vehicles (DMV) parking lot (Figure 1). The berms are comprised of soil and sparse vegetation similar to remainder of the site. Berm 1 (western berm) is approximately 71 yards long, 3 yards wide, and 2 yards high, totaling 426 cubic yards. Berm 2 (eastern berm) is approximately 80 yards long, 3 yards wide, and 2 yards high, totaling 480 cubic yards.

SOIL SAMPLING

On October 9th, based on the volume of soil, *EAI* personnel collected a total of 15 soil samples from each berm (from 10 different geographic locations) for a total of 30 soil samples. The sampling locations are shown on Figure 1. The soil samples were collected via hand auger, placed into 8-ounce glass sampling jars, and immediately sealed with Teflon-lined screw-on lids, labeled, and stored in a cooled container until transported to the laboratory.

ANALYTICAL TESTING

All 10 of the soil samples collected from the 3-foot depth interval were analyzed for Volatile Organic Compounds (VOCs) by EPA Method 8260B, Total Petroleum Hydrocarbons (TPH) Extended Range by EPA Method 8015B, California Administrative Manual (CAM) 17 Metals by EPA Method 6010B, mercury by EPA Method 7471A, and organochlorine pesticides by EPA Method 8081A. Based on laboratory results, the remaining 20 samples were not analyzed.

LABORATORY ANALYSIS RESULTS

VOCs, TPH in the gasoline fuel range (TPHg), and organochlorine pesticides were not detected in any of the soil samples collected.

TPH in the diesel fuel range (TPHd) was detected in 4 of the soil samples collected. The concentrations detected range from 4.9 to 217.4 milligrams per kilogram (mg/kg). The highest TPHd concentration was reported in SB10@3'.

Total TPH was detected in 8 of the soil samples collected. The concentrations detected range from 5.1 to 220 mg/kg. The highest total TPH concentration was reported in SB10@3'.

Concentrations of 12 of the 17 CAM metals were detected in the samples collected.

The concentrations detected are presented in the attached Table 1.

SUMMARY AND RECOMMENDATIONS

Based on the laboratory analytical results obtained, the approximate 906 cubic yards of soil is not considered a health risk for a commercial/industrial property with comparisons to Department of Toxic Substances Control (DTSC) Screening Levels (SLs) and San Francisco Bay Regional Water Quality Control Board (SFRWQCB) Tier 1 Environmental Screening Levels (ESLs). The metal concentrations detected are within the range of typical elemental metal concentrations in soils of the western United States (Shacklette, H.T., and Boerngen, J.G, 1984).

EAI concludes the bermed soil on the subject site can be re-used if desired. If not, the soil can be transported as non-hazardous waste to a landfill that accepts contaminated non-hazardous soil. If disposed of off-site, the soil will have to be properly profiled and accepted by the receiving landfill in advance of transport to the disposal facility.

If you have questions regarding this report, please contact the undersigned at (619) 291-3636.

Respectfully,
EnviroApplications, Inc.

STANDARD LIMITATIONS

This report has been prepared for the exclusive use of CenterPoint Integrated Solutions, LLC. The findings and conclusions rendered in this report are opinions based primarily on testing of soil samples collected during this project. This report does not reflect stockpile variations, which may exist between sampling points. These variations cannot be anticipated nor can they be entirely accounted for even with additional exhaustive testing. All work has been performed with the degree of skill generally exercised by practicing engineers and geologists in the environmental field. *EAI* makes no other warranty, either expressed or implied, concerning the conclusions and professional advice, which is contained within the body of this report.

No additional comments.

Receipt
The samples were received on 10/11/2019 7:30 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.1° C.

GC/MS VOA
Method 8260B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-25843 and analytical batch 570-25858 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 8260B: The matrix spike / matrix spike duplicate / sample duplicate (MS/MSD/DUP) precision for preparation batch 570-25843 and analytical batch 570-25858 was outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) precision was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

GC Semi VOA
Method 8015B: The matrix spike / matrix spike duplicate (MS/MSD) precision for preparation batch 570-25769 and 570-26082 and analytical batch 570-26041 was outside control limits. Sample matrix interference is suspected.

Method 8081A: The following analyte(s) recovered outside control limits for the LCS associated with preparation batch 570-25774 and analytical batch 570-26608: Endrin. This is not indicative of a systematic control problem because these were random marginal exceedances. Qualified results have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals
Method 6010B: The absolute response for Selenium was greater than the method reporting limit (RL) in the following samples: SB-1@3' (570-9966-2), SB-6@3' (570-9966-17) and SB-9@3' (570-9966-26).
The instrument raw data has been manually reviewed and the result can be reported as ND.

Method 6010B: The absolute response for Molybdenum and Selenium was greater than the method reporting limit (RL) in the following samples: SB-4@3' (570-9966-11), SB-7@3' (570-9966-20), SB-8@3' (570-9966-23) and SB-10@3' (570-9966-29).
The instrument raw data has been manually reviewed and the result can be reported as ND.

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-26469 and analytical batch 570-26586 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010B: Due to the high concentration of Zinc, the matrix spike / matrix spike duplicate (MS/MSD) for preparation batch 570-26469 and analytical batch 570-26586 could not be evaluated for accuracy and precision. The associated laboratory control sample / laboratory control sample duplicate (LCS/LCSD) met acceptance criteria.

Method 6010B: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 570-26397 and analytical batch 570-27480 were outside control limits. Sample matrix interference and/or non-homogeneity are suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
F1	MS and/or MSD Recovery is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits

GC Semi VOA

Qualifier	Qualifier Description
*	LCS or LCSD is outside acceptance limits.
F2	MS/MSD RPD exceeds control limits
me	LCS Recovery is within Marginal Exdeedance (ME) control limit range (± 4 SD from the mean).
p	The %RPD between the primary and confirmation column/detector is >40%. The lower value has been reported.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD Recovery is outside acceptance limits.
L	A negative instrument reading had an absolute value greater than the reporting limit

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

4. After reviewing the (MS Excel) list of “active” CDO and CAO from the Water Board, it is concluded that the property of interest is NOT included in this list.

5. After reviewing the list of hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code, identified by DTSC, it is concluded that the property of interest is NOT included in the list.

Cortese List: Section 65962.5(a)

Information Required From the Department of Toxic Substances Control (DTSC) Under Government Code Section 65962.5(a)

Section 65962.5(a)(1) requires that DTSC "shall compile and update as appropriate, but at least annually, and shall submit to the Secretary for Environmental Protection, a list of all the following: ....(1) [a]ll hazardous waste facilities subject to corrective action pursuant to Section 25187.5 of the Health and Safety Code ("HSC")."

The hazardous waste facilities identified in HSC § 25187.5 are those where DTSC has taken or contracted for corrective action because a facility owner/operator has failed to comply with a date for taking corrective action in an order issued under HSC § 25187, or because DTSC determined that immediate corrective action was necessary to abate an imminent or substantial endangerment. This is a very small and specific subgroup of facilities and they are not separately posted on the DTSC or CalEPA's website.

The facilities listed below fall under this category:

- AAD Distribution & Dry Cleaning Inc. EPA ID CAD981397417 2306 E. 38th StreetVernon, CA 90058
- The Marquardt Co. CA ID CAD044696102 16555 Saticoy Street Van Nuys, CA 91406

Section 65962.5(a)(2) requires that DTSC "shall compile and update as appropriate, but at least annually, and shall submit to the Secretary for Environmental Protection, a list of all the following: ... (2) [a]ll land designated as hazardous waste property or border zone property pursuant to Article 11 (commencing with Section 25220) of Chapter 6.5 of Division 20 of the Health and Safety Code."

No facilities or lands are listed under this provision because DTSC has not designated any hazardous waste property or border zone property pursuant to the cited provisions.

Section 65962.5(a)(3) requires that DTSC "shall compile and update as appropriate, but at least annually, and shall submit to the Secretary for Environmental Protection, a list of all the following: ....(3) [a]ll information received by the Department of Toxic Substances Control pursuant to Section 25242 of the Health and Safety Code on hazardous waste disposals on public land.

HSC § 25242(a) requires a city, county, or state agency that owns or leases land to notify DTSC if it "has probable cause to believe that a disposal of hazardous waste, which is not authorized pursuant to this chapter has occurred on, under or into the land which the city, county, or state agency owns or leases..."; DTSC then shall determine if there has been an unauthorized disposal of hazardous waste.

In practice, if a city, county or state agency contacts DTSC to provide such information, they also will have contacted or will be directed to contact DTSC's Emergency Response Duty Officer, who determines whether to authorize DTSC-funding for an emergency action to properly remove and dispose of the hazardous waste.

DTSC's Emergency Response program does not keep separate records of such reports that relate to city, county or state agency property.

In the future, DTSC will track any reports received from cities, counties, or state agencies of hazardous waste disposal on land owned or leased by a city, county or state agency, where hazardous waste was released into the environment, and provide the information to CalEPA for inclusion in this section of the Cortese list.

Section 65962.5(a)(4)requires that DTSC "shall compile and update as appropriate, but at least annually, and shall submit to the Secretary for Environmental Protection, a list of all the following: ....(4) [a]ll sites listed pursuant to Section 25356 of the Health and Safety Code."

HSC § 25356(b)(1) requires "a listing of hazardous substance release sites selected for, and subject to, a response action under this chapter." HSC § 25356(b)(2) requires DTSC to "update the list of sites at least annually to reflect new information regarding previously listed sites or the addition of new sites requiring response action." The implementing regulations provide that sites may be listed pursuant to HSC § 25356 if (a) they are not owned by the Federal Government and (b) a release or threatened release of hazardous substances has been confirmed by on-site sampling. (California Code of Regulations, Title 22, Section 67400.1). DTSC's list of sites that meet those criteria as well as the criteria in HSC § 25356(c), is found in a report in DTSC's "Envirostor" database:

- Hazardous Waste and Substances site "Cortese" list

Sites where response actions have been completed and no operation and maintenance activities are required are not included on the list.

Section 65962.5(a)(3) requires that DTSC "shall compile and update as appropriate, but at least annually, and shall submit to the Secretary for Environmental Protection, a list of all the following: ....(3) [a]ll sites included in the Abandoned Site Assessment Program."

DTSC had an abandoned site program in the 1980s. HSC § 25369, which was enacted in 1985, required an abandoned site survey in "rural unsurveyed counties." Sites identified in the abandoned site program were included in the "CalSites" database of known and potential hazardous substance release sites. After further investigation, many sites were removed from the "CalSites" database because there was no evidence that a release of hazardous substances occurred. Some time in the early 1990s, DTSC's activities under HSC § 25369, and the entire Abandoned Site Program, were concluded.

DTSC recently replaced the "CalSites" database with a new database of hazardous substance release sites, known as the "EnviroStor" database. The EnviroStor database does not indicate if a specific site was at one time included in the abandoned site program and does not have a category for sites that are considered abandoned. The CalSites database also did not include this information. Consequently, DTSC does not provide the information to CalEPA originally called for under section 65962.5(a)(3).

Background and History

APPENDIX R
Police Department Correspondence

From: Fred Armijo
To: Rayna del Rosario
Subject: RE: CarMax Oceanside - Information for Environmental Review
Date: Thursday, March 19, 2020 5:47:42 PM
Attachments: image005.png

Hello Rayna,

Please see our responses below. Please feel free to call or email me with any questions.

1. What is the address of the City of Oceanside Police Department station(s) that serves the project area?

We have a centralized police station that serves the city. It is located at 3855 Mission Avenue, Oceanside, CA 92058

2. What are the approximate response times for emergency and non-emergency calls in the project area?

5.47 minutes for Priority 1 – Emergency
8.43 minutes for Priority 2- Timing Critical/Felony Just Occurred
25.84 minutes for Priority 3- Non-Violent/Misdemeanor just occurred
38.24 minutes for Priority 4- Routine Calls for Service.

3. Are existing City of Oceanside Police Department staff levels adequate to meet current demands for police protection services in the project area?

Yes.

4. Do the proposed project components present any unique law enforcement problems for the City of Oceanside Police Department?

We do not foresee any unique law enforcement problems associated with this project.

5. Would the project require the City of Oceanside Police Department to hire more officers or staff?

We do not anticipate needing to hire more officers in order to provide services for the project.

6. Would the project impact existing response times?

We anticipate the project to have a de minimis impact on response times.

7. Do you have any recommendations that might ensure that the proposed project would not "significantly" impact City of Oceanside Police Department services?

We recommend the utilization of inventory control measures to prevent loss, to include driveway barriers after hours along with strict control of keys and access to vehicles. Onsite security and video surveillance cameras are also recommended.

Fred Armijo, Captain
Investigations Division
Oceanside Police Department
3855 Mission Avenue
Oceanside, CA 92058

Subject: CarMax Oceanside - Information for Environmental Review

Warning: External Source

Hello Fred,

We are preparing the environmental document for a proposed CarMax Facility within the City of Oceanside and would like to obtain information regarding police services within the City. Please see the letter attached and let me know if you have any questions. I look forward to hearing from you.

Thank you,

Rayna Del Rosario

APPENDIX S
Water and Sewer Will Serve Letter

CITY OF OCEANSIDE
WATER UTILITIES DEPARTMENT

October 7, 2020

Rayna Del Rosario
Environmental Analyst
REC Consultants, Inc.
2442 Second Avenue
San Diego, CA 92101

RE: CarMax Auto Superstore
APN 168-012-42 and 168-012-43
WATER AND SEWER WILL SERVE LETTER REQUEST

Dear Ms. Del Rosario,

The City has received your email request dated October 6, 2020, regarding a water and sewer will serve letter from the City of Oceanside for the proposed CarMax automobile dealership located near the intersection of Plaza Drive and Thunder Drive.

The City of Oceanside does not issue will serve letters. The project will be subject to an entitlement review process for approval by the Planning Commission or City Council. As part of this process, any off-site improvements to the City's water and sewer systems that are necessary to accommodate the proposed project must be identified and included as part of the development. Once the entitlement process is complete, the flow and capacity allowances will be set aside for the approved project.

Should you have any questions regarding this matter, please do not hesitate to contact me or Bryan Kallenbaugh at (760) 435-5860.

Sincerely,

Mabel Uyeda
