CERS HAZ WASTE:
Site ID: 78954
CERS ID: 10373539
CERS Description: Hazardous Waste Generator

Violations:
Site ID: 78954
Site Name: UNITED #044
Violation Date: 06-01-2016
Citation: 23 CCR 16 2665 - California Code of Regulations, Title 23, Chapter 16, Section(s) 2665
Violation Description: Failure of the overfill prevention system to meet one of the following requirements: Alert the transfer operator when the tank is 90 percent full by restricting the flow into the tank or triggering an audible and visual alarm; or Restrict delivery of flow to the tank at least 30 minutes before the tank overfills, provided the restriction occurs

UNITED #044 (Continued) **S105034159**

	when the tank is filled to no more than 95 percent of capacity; and activate an audible alarm at least five minutes before the tank overfills; or Provide positive shut-off of flow to the tank when the tank is filled to no more than 95 percent of capacity; or Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling.
Violation Notes:	Returned to compliance on 06/01/2016. Inspection Sequence ID:5434866;Tank ID:21541,21540,21539,21538;Violation Description:(RP) Failure of the overfill prevention system to meet one of the following requirements: 1. Alert the transfer operator when the tank is 90% full by restricting the flow into the tank or triggering an audible and visual alarm; or 2. Restrict delivery of flow to the tank at least 30m before the tank overfills, provided the restriction occurs when the tank is filled to no more than 95% of capacity; and activate an audible alarm at least 5m before the tank overfills; or 3. Provide positive shut-off of flow to the tank when the tank is filled to no more than 95% of capacity; or 4. Provide positive shut-off of flow to the tank so that none of the fittings located on the top of the tank are exposed to product due to overfilling. 23 CCR 2635(b)(2), 2665

Case Worker:	CH
RB Case Number:	Not reported
Local Agency:	SAN DIEGO COUNTY LOP
File Location:	Local Agency
Local Case Number:	H12485-008
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Benzene, Diesel, MTBE / TBA / Other Fuel Oxygenates, Gasoline
Site History:	On May 11, 2006 soil sampling was completed in conjunction with installation of two new dispensers, new secondary containment under the existing four dispensers, and new piping. Petroleum impacted-soil was identified five feet beneath dispenser four, with total petroleum hydrocarbons (TPH) from gasoline and diesel detected at 1,700 and 540 milligrams per kilogram (mg/kg), respectively. Based upon these results, Unauthorized Release H12485-008 was opened. In February 2007, four soil borings were drilled to the north, west, and south of the dispenser island and completed as groundwater monitoring wells. A total of 11 soil samples were collected and analyzed, and two petroleum constituents were detected in the samples. TPH from diesel (TPHd) was detected in samples from all four borings at a maximum of 180 mg/kg, and tert-butyl alcohol (TBA) was detected in soil samples from three of the borings at a maximum of 0.026 mg/kg. Groundwater monitoring continued on a quarterly basis through 2007, and on a semi-annual basis in 2008. Petroleum constituents were not detected

COLLEGE BLVD EXXON (Continued) **S104575941**

in monitoring well MW-4A during any monitoring event. Benzene was only detected in monitoring well MW-3A and MTBE was detected in monitoring wells MW-1A, MW-2A, and MW-3A, and concentrations of these constituents did not exceed maximum contaminant levels (MCLs) during any sampling event. TBA was detected in groundwater samples from monitoring wells MW-1A and MW-3A at concentrations that exceeded the California Drinking Water Action Level (AL) during every sampling event. In July 2007, the responsible parties were directed to complete additional site assessment to determine the lateral and vertical extent of petroleum-impacted soil and the lateral extent of the groundwater plume. A workplan to install three additional groundwater monitoring wells and two soil borings was approved in November 2007. These activities were never completed. In response to enforcement action by DEH, groundwater monitoring resumed in April, 2011 and continued on a semi-annual basis until June, 2012. During the last monitoring event, petroleum constituents were detected in groundwater samples from monitoring wells MW-2A and MW-3A. Specifically, MTBE was detected in monitoring well MW-2A at a concentration below the MCL and TBA was detected in monitoring well MW-3A at a concentration below the AL. The consultant recommended preparing a request for case closure based on the low to non-detect concentrations of the constituents of concern in the groundwater samples. DEH required that the consultant submit a Corrective Action Plan for the case based upon remediation by natural attenuation. The Corrective Action Plan (CAP), dated September 13, 2011, and Revised Corrective Action Plan Addendum (CAP Addendum), dated August 22, 2013, prepared for the site recommend remediation of the site by natural attenuation. The CAP states that the contaminants of concern at the site have naturally attenuated, will continue to degrade, and do not pose a risk to sensitive receptors. The CAP Addendum states that soil and groundwater clean-up goals for the site have been met and there is no risk to the environment or human health from petroleum hydrocarbons remaining at the site. Both reports recommend that the case be closed. The public review period for the CAP and CAP Addendum was completed on January 31, 2014. The City of Oceanside Water Utilities Department was notified of the closure on March 7, 2014, and given 60 days to comment. Neither DEH nor the consultant received any comments. DEH concurs with the conclusions presented in the CAP and CAP Addendum and the recommendation to close the case.

Local Agency:	SAN DIEGO COUNTY LOP
File Location:	Not reported
Local Case Number:	121464-001
Potential Media Affect:	Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern:	Gasoline
Site History:	The Site is located in the City of Oceanside, California on the southeast corner of College Boulevard and Waring Road. Site improvements include a Circle K mini]mart, three 10,000]gallon underground storage tanks (USTs) containing regular unleaded, mid]grade unleaded, and premium unleaded fuel, and one fuel dispensing island with two dispensers. Properties surrounding the Site are commercial and residential. In December 2007, four soil borings (B]1 through B]4) were advanced near the USTs and dispensers at the Site as part of an environmental due diligence (baseline) assessment conducted for a property transfer. The borings were advanced by hollow]stem augers to depths of approximately 30 to 35 feet below ground surface (bgs). Based on the results of the baseline assessment, Unauthorized Release Case 121464-001 was opened. On May 3, 2012, a CAP was submitted to DEH proposing to perform a soil vapor survey and collect additional site specific soil parameters to further evaluate the potential vapor inhalation risk to the occupants of the station building. On October 11 and 21, 2012, five dual]nested vapor monitoring probes (SVP]1 through SVP]5) were installed surrounding the Circle K building. In general, the probes were constructed with a shallow probe set between approximately 4.5 to 5 feet bgs and a deeper probe set from approximately 9.5 to 10 feet bgs. Vapor probe sampling was conducted on November 12, 2012 and December 3, 2012. The cancer risk for any carcinogenic Target Compound was less than one in a million; therefore the Site does not pose a human health risk to the occupants of the Circle K building. Three off]site (HP]4 through HP]6) temporary wells were installed

CONOCOPHILLIPS (Continued) **S109277045**

downgradient of the Site. Groundwater samples were collected in the temporary wells to delineate the down]gradient hydrocarbon impact to the groundwater. MTBE, TAME and TBA were detected in the groundwater sample collected at HP]5, at concentrations of 98 i%g/l, 2.5 i%g/l, and 20 i%g/l, respectively. BTEX, diisopropyl ether (DIPE), ethyl]tert]butyl ether (ETBE), and ethanol were not detected above the laboratory reporting limits in groundwater samples collected. Residual impacted soil with concentrations greater than 100 milligram per kilogram of total petroleum hydrocarbons as gasoline does not exist at the Site. Seven groundwater monitoring wells have been installed at the Site. Groundwater was monitored between March 2009 and September 2014. Free product has never been detected at the Site. Hydrocarbon-impacted groundwater at the Site appears to be consistent with a release from the former UST system. Following DPE activities, dissolved-phase hydrocarbons remain in low concentrations beneath the Site and immediately downgradient beneath College Boulevard. The case for closure was evaluated under the Statefs Low-Threat Underground Storage Tank Case Closure Policy (the Policy). It was concluded that the case qualifies for a low-risk closure designation and it was recommended that DEH grant low-risk closure for Unauthorized Release Case 121464-001. DEH concurred that the case qualifies for a low-risk closure designation. Public notification was conducted per the Policy. No comments were received.

Status Date:	08/28/2012
Case Worker:	CF
RB Case Number:	9UT3452
Local Agency:	SAN DIEGO COUNTY LOP
File Location:	Local Agency
Local Case Number:	H02509-001
Potential Media Affect:	Aquifer used for drinking water supply
Potential Contaminants of Concern:	Diesel, Gasoline, Waste Oil / Motor / Hydraulic / Lubricating
Site History:	An unauthorized release of gasoline and diesel occurred at a 155-acre property owned by Hanson Aggregates, LLC (Hanson) in Carlsbad, California. The subject property is bounded on the north by State Highway 78 and Haymar Drive, on the east by College Boulevard, and on the south by residential properties. The site is bisected by Buena Vista Creek. Approximately 103 acres of the property, as well as the land and west of the property, are undeveloped. The remaining 52 acres of the property were the site of an aggregate quarry and concrete production facility. In recent years, concrete was brought in from outside sources and crushed to produce recycled aggregate. Quarry and concrete production operations ceased in 2010 when the quarry was closed and the facility was dismantled. The former office and storage buildings, two asphalt plants, a concrete batch plant, a recycled-material area for asphalt/concrete, a rock crushing plant, a maintenance shop, bulk materials storage areas, fueling facilities, several storage trailers and fenced areas, two empty explosives magazines/containers, a scale-room building, a sales office, four above-ground storage tanks (ASTs), and 21 underground storage tanks (USTs) were removed. The USTs had been used to store gasoline, diesel, and asphalt emulsion fluid. Four diesel USTs were removed at the facility on December 17, 1986. Two of the USTs had 4,000-gallon capacities, one had a 15,000-gallon-capacity, and one had a 20,000-gallon capacity. On February 26, 1987, one 1000-gallon-capacity gasoline tank was abandoned in place with cement slurry. No unauthorized releases were observed when the tanks were decommissioned. On April 7, 1997, a 550-gallon capacity waste oil tank was removed. Analytical results for a soil sample collected during the removal inspection included detection of total petroleum hydrocarbons (TPH) at a concentration of 1,400 milligrams per kilogram (mg/kg). An unauthorized release case was opened on April 21, 1997. A limited environmental assessment of site soils was performed at the site in 1998. However, the investigation addressed the area of the UST fuel system at the facility and did not address the waste oil release. Gasoline and diesel impacts were reported that were attributed to the eight operating USTs in the area. The maximum TPH concentrations reported for impacted soil samples were 3,500 mg/kg as gasoline and 30,000 mg/kg as diesel. Eight USTs were removed in August 1998. The tanks included three 10,000-gallon-capacity USTs and one 12,000-gallon-capacity UST that had stored gasoline. Three diesel USTs, each with a 10,000-gallon-capacity, and one diesel UST with a 12,000-gallon-capacity were also removed. The distribution lines and dispensers associated with the UST system were subsequently removed in March 2000. An estimated 900 cubic yards (yd3) of TPH-impacted soil were excavated and disposed of off-site. Confirmation samples were collected from the walls of the UST excavation to determine the effectiveness of over-excavation and soil removal. Based on the confirmation sample results, soil impacted with diesel-range hydrocarbons still remained beyond the excavated area. Seventy-four borings were drilled and sampled at the site from August

HANSON AGGREGATES PAC SO REGIO (Continued) **1001020730**

1998 to November 1999. Analytical results for soil samples collected from the borings indicated that an estimated 1,900 yd3 of TPH-impacted soil remained in place in the vicinity of the eight former USTs. Temporary groundwater monitoring wells were installed in 26 of the 74 borings. Three of the borings were converted into monitoring wells KMW-l through KMW-3. In March 2001, monitoring wells MW-1 through MW-13 were installed at the site. Additional investigation in January 2003 included the drilling of 11 borings north of Buena Vista Creek. Data obtained from the borings served as a basis to install four additional wells (MW-14 through MW-17) in February 2003. Water level measurements for the wells indicated the groundwater flow direction to be to the south-southwest towards Buena Vista Creek. Liquid-phase hydrocarbons (LPH) were first detected in MW-3 and MW-7 in May 2001. Although LPH was not subsequently detected in MW-7, it was measured in MW-3 until March 2005. From 2001 through March 2004, approximately 148 gallons of groundwater and LPH were removed. Four additional monitoring wells (MW-18 to MW-21) were installed in 2006 and MW-22 was installed in 2007. Analytical results for groundwater samples collected during quarterly sampling events through 2009 indicated impacts by TPH as gasoline and diesel, the aromatic hydrocarbons benzene, toluene, ethyl-benzene, and xylenes (BTEX), and the fuel oxygenates methyl-tert-butyl ether (MTBE) and tert-butyl alcohol (TBA). An interim remedial action (IRA) was implemented in December 2003 involving the excavation of six barrier trenches to depths approximately five feet below the water table. An Oxygen Reducing Compound (ORC) slurry was injected into the barrier trenches. The intent of the IRA was to inhibit the migration of dissolved-phase contaminants into Buena Vista Creek. By January 1995, it was concluded that the method was ineffective insofar as significant decreases in contaminant concentrations were not observed. Analytical data for groundwater samples provided the basis to delineate the lateral extents of dissolved benzene and MTBE by mid-2005. A new interim remedial strategy was implemented from July 2005 through April 2006 that included further excavation of the source area and the subsequent use of ozone-sparging to reduce dissolved-phase contaminants. Of the total of 43,500 yd3 of soil excavated, approximately 15,000 yd3 was not impacted by gasoline, diesel, BTEX, or fuel oxygenates and was used to backfill the excavation. In mid-2006, approximately 17,000 yd3 of TPH-impacted soil were placed into passive, on-site, bioremediation treatment cells. The remaining excavated soil had low TPH impacts and was stockpiled onsite. Verification sampling of soil treated in the bioremediation cells and the stockpiled soil was completed in the second quarter of 2009. Analytical results indicated that TPH as gasoline and BTEX concentrations were near or at detection levels and that remaining diesel concentrations averaged 80 mg/kg. [Note: Hanson plans to reuse the soil beneath roads on the property]. Sixteen ozone-sparging wells were installed in 2006 to address residual impacts to groundwater beneath the site. A pilot study of the ozone-sparging system was performed from August 2006 through January 2007 that demonstrated a significant reduction in the mass of dissolved benzene and MTBE. The system delivered over 15,000 pounds of oxygen/ozone to the saturated zone and operated through January 2010. A Corrective Action Plan (CAP) for the site was submitted to DEH in October 2012. Trend analyses for groundwater contaminants were added to the CAP in May 2012. The CAP was approved in June 2011. The site conceptual model indicates that the dissolved contaminant plume

HANSON AGGREGATES PAC SO REGIO (Continued) **1001020730**

has stabilized approximately 475 feet down-gradient of the source area (i.e., up-gradient of Buena Vista Creek), benzene, MTBE, and TBA have not been detected in surface water samples collected from the creek, and that a private water well located 1,900 feet northwest of the source area has not been impacted by the petroleum hydrocarbon release. The CAP reports that total dissolved solids levels in groundwater beneath the site area exceed State standards for drinking water and that the Oceanside and Carlsbad municipal water districts have no plans to develop groundwater in the area. Based on these findings, the consultant (Brown and Caldwell) has recommended remediation of site soil and groundwater by natural attenuation and no further action. DEH concurs with these recommendations.

Site History: The Hanson America (formerly Hanson Aggregates Pacific Southwest, Inc.) property consists of approximately 155 acres along the Buena Vista Creek drainage in Carlsbad, California. The subject property is bounded on the north by State Highway 78 and Haymar Drive, on the east by College Boulevard, on the south by residential developments, and by undeveloped land to the west. Approximately 103 acres of the property is undeveloped. Although aggregate was formerly quarried on the property, current operations at the facility are limited to the production of concrete from existing and imported aggregate reserves. Past quarry operations and current production activities have been confined to approximately 52 acres of the property. The surface mine (quarry) has been decommissioned, as well as former office and storage buildings, two asphalt plants, a concrete batch plant, a recycled-material area for asphalt/concrete, a rock crushing plant, a maintenance shop, bulk materials storage areas, fueling facilities, several storage trailers and fenced areas, two empty explosives magazines/ containers, a scale-room building, a sales office, four above-ground storage tanks (ASTs) and numerous underground storage tanks (USTs). One AST remains in operation at the facility. Four diesel USTs were removed at the facility on December 17, 1986. Two of the USTs had 4,000-gallon capacities, one had a 15,000-gallon-capacity, and one had a 20,000-gallon capacity. On February 26, 1987, one 1000-gallon gasoline tank was abandoned in place by slurry-filling. No unauthorized releases were observed at the time these tanks were decommissioned. However, on April 17, 1997, a 550-gallon capacity waste oil tank was removed. Analytical results for a soil sample collected during the removal inspection had a total petroleum hydrocarbon (TPH) concentration of 1,400 milligrams per kilogram (mg/kg) and an unauthorized release case was opened. A

HANSON AGGREGATES PAC SO REGIO (Continued) **1001020730**

limited site assessment was performed in 1998, as documented in a report dated August 3, 1998. However, the site assessment did not address the waste oil release; it was performed in the area of the UST fuel system at the facility. Gasoline and diesel impacts related to the eight operating USTs in the area were reported. The maximum TPH concentrations reported for impacted soil samples were 3,500 mg/kg as gasoline and 30,000 mg/kg as diesel. The eight USTs were removed in August 1998. The tanks included two 10,000-gallon capacity gasoline USTs, three 10,000-gallon capacity diesel USTs, and three 12,000-gallon capacity diesel USTs. The distribution lines and dispensers associated with the UST system were also removed in March 2000. An estimated 900 cubic yards of impacted soil were removed and disposed of off-site. Confirmation samples were then collected from the walls of the UST excavation to determine the effectiveness of over-excavation and soil removal. Based on the confirmation sample results, soil impacted with diesel-range hydrocarbons still remained beyond the excavated area. Subsequent assessment data indicated that an estimated 400 cubic yards of fuel-impacted soil in the vicinity of the six former diesel tanks remained in place. An estimated 1,500 cubic yards of residual TPH-impacted soil remained in the vicinity of the former gasoline USTs. Seventy-four borings were drilled and sampled at the site from August 1998 to November 1999. Temporary groundwater monitoring wells were installed in 26 of the borings. Three of the borings were converted into permanent monitoring wells (KMW-l through KMW-3). In March 2001, an additional 13 permanent groundwater monitoring wells (MW -1 through MW -13) were installed at the site. Additional investigation in January 2003 included the drilling of 11 borings north of Buena Vista Creek. Data obtained from the borings were used to select the locations for four additional wells near the creek. These wells (MW-14 through MW-17) were installed in February 2003. Water level measurements for the wells indicated the groundwater flow direction to be to the south/southwest. Liquid-phase hydrocarbons (LPH) were first detected in two of the groundwater monitoring wells (MW-3 and MW-7) in May 2001. Although LPH was not detected in MW-7 after May 2001, it was measured in MW-3 until March 2005. Beginning in 2001, LPH was purged from MW-3 on a quarterly basis. Approximately 148 gallons of groundwater and LPH were removed from MW-3 through March 2004. Prior to implementation of site remediation in July 2005, the maximum detected concentration of TPH as gasoline was 53,000 micrograms per liter (ug/l). The maximum detected TPH as diesel concentration was 66,000 ug/l. The maximum detected concentrations of aromatic hydrocarbons were as follows: benzene -19,000 ug/l, toluene - 12,000 ug/l, ethyl-benzene - 1,600 ug/l, and total xylenes - 10,400 ug/l. The maximum detected concentrations of the fuel oxygenates methyl-tert-butyl ether (MTBE) and tert butyl alcohol (TBA) were 2,200 and 22 ug/l, respectively. (Note: several samples had elevated detection limits for TBA of up to 500 ug/l). In December 2003, six ORC barriers trenches were installed at the site to inhibit the migration of dissolved-phase gasoline, diesel, aromatic hydrocarbons, and fuel oxygenates. The trenches extended approximately five feet below the water table and were backfilled with the ORC slurry. By January 1995, it was concluded that this interim remedial action (IRA) was not effective. Analytical data for groundwater samples provided the basis to delineate the lateral extents of dissolved benzene and methyl-tert-butyl ether (MTBE) by mid-2005. The dissolved benzene plume has stabilized approximately 200 feet down-gradient

HANSON AGGREGATES PAC SO REGIO (Continued) **1001020730**

from the former fuel UST area. The dissolved MTBE plume has migrated approximately 700 feet down-gradient. Petroleum hydrocarbons (e.g., gasoline and diesel), volatile organic compounds (including benzene), and fuel oxygenates (e.g., MTBE) have not been detected in surface water samples collected from Buena Vista Creek. Removal of TPH-impacted soil from the source area (i.e., former UST area) was performed from July 2005 through March 2006 as an IRA. The excavated soil was placed into on-site passive bioremediation treatment cells in mid-2006 with the intention of re-using the remediated soil onsite. Based on 1998 site assessment data, it was estimated that approximately 7,700 cubic yards of soil required excavation (1,900 cubic yards of TPH-impacted soil and 5,800 cubic yards of clean soil). During IRA implementation, the volume of TPH-impacted was found to be significantly greater than anticipated. A total of 43,500 cubic yards of soil were excavated. This excavated soil was estimated to consist of 14,000 cubic yards of clean soil, 10,500 cubic yards of low-level, TPH- impacted soils that could be reused onsite (with restrictions), and 19,000 cubic yards of TPH-impacted soil. Following removal of the soil, the excavated areas were backfilled.
Verification sampling of soil treated in the bioremediation cells was completed in the second quarter of 2009. Currently Hanson America is developing a plan for the on-site reuse of the treated soil.
Following the excavation of TPH-impacted soils in 2006, four monitoring wells were installed to replace wells that were destroyed prior to implementation of the IRA. Sixteen ozone-sparging wells and three vapor probes were also installed in association with a pilot test to address residual impacts to groundwater beneath the site. The pilot test began on August 28, 2006, and concluded on March 15, 2007, when the operation was approved by DEH for continued use as part of the IRA. The ozone-sparging system operated through February 2010. Data generated during system operation is currently being evaluated as to its effectiveness. A Corrective Action Plan (CAP) for the site is currently in preparation.

Site History:	An aggregate quarry and concrete production facility operated by Hanson Aggregates, LLC (currently Lehigh Hanson) was decommissioned in early 2011. The facility occupied approximately 52 acres of a 155-acre property located south of Highway 78 and north of Buena Vista Creek in Carlsbad, California. An unauthorized release of petroleum hydrocarbons was discovered at the facility in 1998 that originated from an underground storage tank (UST) system consisting of eight tanks and associated pipelines. The USTs were removed in 1998 and the pipelines were removed in 2000 under DEH Case #H02509-001. Impacted soil was excavated and stored onsite, of which approximately 17,000 cubic yards (yd3) were remediated in bio-treatment cells. Groundwater impacted by the petroleum hydrocarbon release was remediated by ozone sparging under #H02509-001. Three additional areas of petroleum hydrocarbon-impacted soil at the facility were identified during a Phase II environmental site assessment (ESA) in 1999 (Kleinfelder, 2000). Although the sources of the impacts may have included the former UST system, soil remediation was not addressed in these areas until after the facility was demolished. The three areas included the former maintenance shop, aggregate conveyor tunnel, and asphalt plant. Of these areas, the former maintenance shop and the former conveyor tunnel were located down-gradient of the former UST system. The asphalt plant was located in the southeastern portion of the facility, immediately north of Buena Vista Creek. In anticipation of major cutting and filling operations during reclamation grading activities, plant structures, utilities, and vegetation in the three areas were removed in early 2011. A work plan for addressing remaining petroleum hydrocarbon-impacted soil during reclamation grading activities was submitted under Voluntary Assistance Program (VAP) case #H02509-003. Cleanup goals proposed in the work plan for remedial excavation activities were 100 milligrams per kilogram (mg/kg) for Total Petroleum Hydrocarbons (TPH) as gasoline and 500 mg/kg as diesel. DEH approved the work plan on April 8, 2011, and a work plan addendum on August 17, 2011. During the 1998 Phase II ESA, borings were advanced south and west of the maintenance building to collect soil samples, ostensibly to assess impacts from the UST system that had been

HANSON AGGREGATES PAC SO REGIO (Continued) **1001020730**

removed earlier that year. The maximum diesel concentration detected in the soil samples was 15,800 milligrams per kilogram (mg/kg), while gasoline was detected at a maximum concentration of 7.3 mg/kg. Additional soil samples were collected southwest of the maintenance shop during remediation of pipe trenches in 2006. Analysis of the samples also indicated primarily diesel impacts. Because the maintenance shop was in use at the time of the Phase II ESA, the soil beneath its foundation and adjoining areas were not assessed until the 2011 work plan was implemented. Eighteen potholes were excavated to depths of 6 to 7 feet below ground surface (bgs), a depth coincident with the water table. Twenty-one total soil samples were collected and analyzed for Total Petroleum Hydrocarbons (TPH) as diesel and gasoline. The sample locations that yielded the highest maximum detected TPH concentrations were used as starting points for remedial excavation, which was further guided by visual observations, photo-ionization detector readings, and laboratory results for confirmation soil samples. Impacted soil was removed by stepping out horizontally until cleanup goals were met and vertically until the water table was reached. Approximately 2,684 tons of impacted soil was removed from the maintenance shop excavation. Petroleum hydrocarbon impacts to soil surrounding the former Aggregate Conveyor Tunnel No. 1 were confirmed during removal of the conveyor system in July 2011. The system had transported aggregate through the tunnel from the former stockpile area to the processing area when the facility was in operation. The Phase II ESA report indicated that diesel and gasoline were detected at a maximum concentration of 5,300 and 110 mg/kg, respectively, in a soil sample collected from a boring advanced adjacent to the tunnel. TPH as diesel and gasoline were also detected in a discrete-depth groundwater sample collected from the boring. During reclamation grading, stockpiled soil removed during over-excavation of the tunnel was noted as emitting odors. Analysis of soil samples collected from the stockpile indicated diesel and gasoline concentrations in excess of work plan cleanup levels. Approximately 800 tons of petroleum hydrocarbon-impacted soil was removed from the conveyor tunnel excavation. During the Phase II ESA in 1999, diesel-impacted soil had been detected in soil samples collected from borings advanced southeast of Asphalt Plant No.1. The borings were located around seven tanks that serviced the plant and had contained asphalt, diesel, and kerosene. According to the Phase II ESA report, diesel was detected at a maximum concentration of 16,000 mg/kg in a soil sample collected southeast of the tanks and adjacent to a product pipeline. The tanks and the asphalt plant were removed in approximately 2001. According to the Phase II ESA report, Product Line No. 2, located south of the former Asphalt Plant No. 1 and northeast of the former tanks, was removed under DEH permit in March 2000. A hole in the pipeline was noted by the DEH inspector and soil samples indicated that a diesel release from the pipeline had occurred. During reclamation grading in 2011, a pipe containing residual diesel was encountered that indicated a fuel release in the former asphalt plant area. The spill was reported to DEH and contained. Although the fuel and impacted soil were removed, analytical results for soil confirmation samples indicated that further excavation was needed to remove remaining soil where product concentrations exceeded the cleanup level for diesel. During potholing activity to the water table, an additional pipe release was discovered where residual fuel had collected on groundwater. A vacuum truck was used to extract approximately 1600 gallons of mixed fuel

HANSON AGGREGATES PAC SO REGIO (Continued) **1001020730**

and water. Once the potholes were dewatered, non-impacted soil was placed as backfill in the excavations. The remainder of the pipe and approximately 4,651 tons of impacted soil were removed from the final excavation of the asphalt plant tank area. A former monitoring well had been located approximately 50 feet down-gradient of the product release area. Analytical results for groundwater samples collected from the well from September 2006 to the final sampling event in April 2010 indicated no detection of petroleum hydrocarbon fuel constituents. Remedial activities performed during reclamation grading at the site resulted in the excavation and off-site disposal of a total of 8,135 tons of TPH-impacted soil. Residual product and impacted groundwater encountered in the former asphalt plant area were removed and also disposed off site. Historical groundwater sampling results suggest that the product release did not impact Buena Vista Creek. Based on these results, the consultant (Brown and Caldwell) has recommended no further action at the site and case closure. DEH concurs with these recommendations.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 04/03/2019

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

PROPOSED CARMAX - OCEANSIDE
CAMINO CREST DR
OCEANSIDE, CA 92056

TARGET PROPERTY COORDINATES

Latitude (North):	33.181949 - 33° 10' 55.02''
Longitude (West):	117.289225 - 117° 17' 21.21''
Universal Tranverse Mercator:	Zone 11
UTM X (Meters):	473036.8
UTM Y (Meters):	3671303.5
Elevation:	194 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5641318 SAN LUIS REY, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

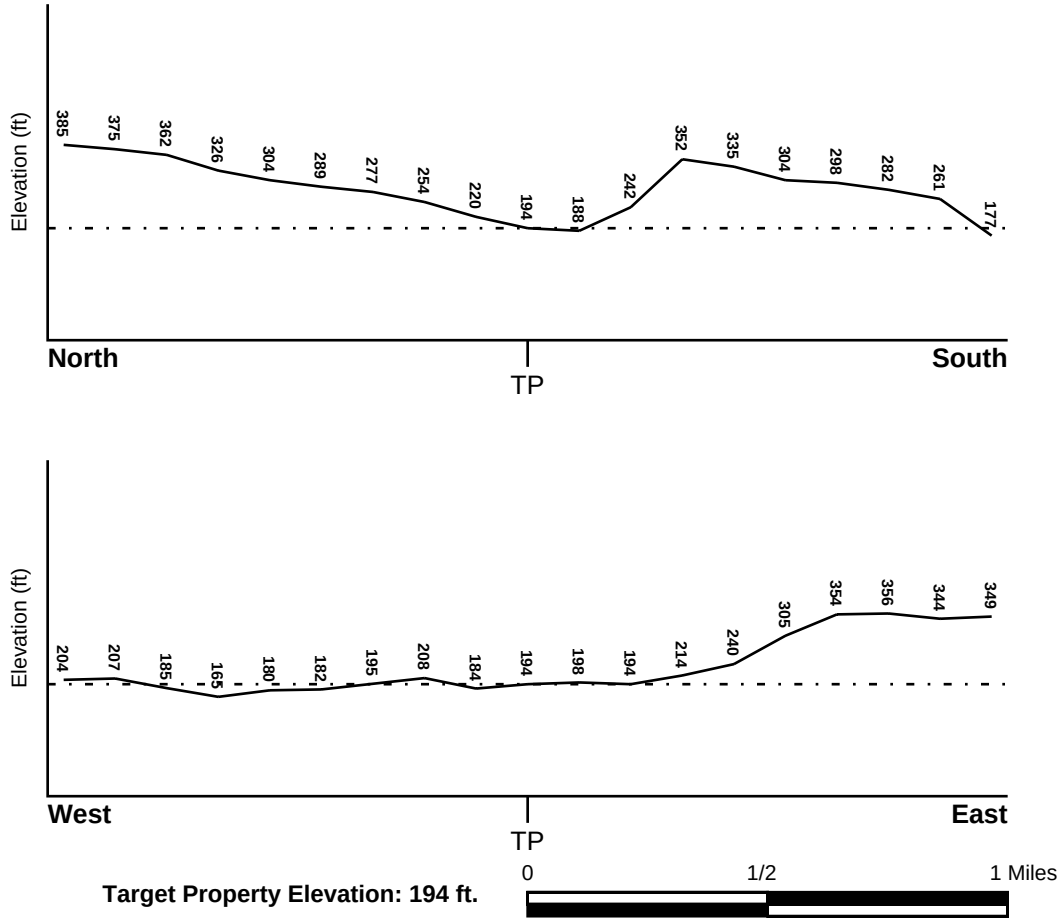
TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES



Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06073C0766G	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06073C0758G	FEMA FIRM Flood data

06073C0767G	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
SAN LUIS REY	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: LAS FLORES

Soil Surface Texture: loamy fine sand

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Moderately well drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	loamy fine sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	Not reported	Max: Min:	Max: Min:
2	14 inches	22 inches	sandy clay	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	Not reported	Max: Min:	Max: Min:

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

DATABASE ASSESSMENT CRITIERA

PHASE I ENVIRONMENTAL SITE ASSESSMENT REPORT

Proposed Oceanside CarMax Facility
Vacant Commercial Property
3843-4003 Plaza Drive, Oceanside
(North) San Diego County, CA 92056

September 10, 2019

EAI Project No.: 80.CARMAX1.19
APNs: 168-012-42 & -43-00

DATABASE ASSESSMENT CRITERIA

EnviroApplications, Inc. (*EAI*) used a commercial government database search service in the preparation of this report. Specifically, research into environmental regulatory agency database listings was performed by a third-party database search firm. The purpose of the review was to identify reported environmental issues for the subject property (SP) and other properties in the vicinity. The database search firm utilized the more stringent of the approximate minimum search distances specified in the Scope of Work described in Section 1.4 for each of the referenced Local, State and Federal environmental agency and other databases. The definition of the databases searched and the associated search radius distances from the SP are identified in the regulatory agency database search report.

The regulatory agency database search report commonly lists a number of sites identified as "unmappable and/or orphan." The database search firm was unable to confirm the physical locations of these sites relative to the SP or to assess whether they were located within the designated search radii. *EAI* independently reviewed the locations of these "unmappable" sites, to the extent possible, using various maps and our knowledge of the SP area. Any of the "unmappable" sites determined to be within the designated search radii were included in our evaluation of the various listed release sites that might result in a potential ASTM *recognized environmental condition* (REC) of the SP.

An ASTM REC refers to the presence or likely presence of any hazardous substances or petroleum products in, on, or at the SP: due to release into the environment; under conditions indicative of a release into the environment; or under conditions that pose a material threat of a future release into the environment.

An ASTM *controlled recognized environmental condition (CREC)* refers to a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory agency authorities, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls.

An ASTM *historical recognized environmental condition (HREC)* refers to a past release of any hazardous substances or petroleum products that has occurred in connection with the SP and has been addressed to the satisfaction of the applicable regulatory agency authorities, or meeting unrestricted use criteria established by a regulatory authority, without subjecting the SP or its improvements to any required engineering or other types of controls.

EAI reviewed the results of the database search report to note reported environmental release sites in the vicinity of the SP that were considered to have a potential to have adversely impacted the SP (i.e., are known to have or are expected to result in an ASTM REC). Reported release sites identified in the regulatory agency database search report were evaluated with respect to the nature and extent of a given release, the distance of the reported release site from the SP, the stratigraphy of soils, the expected soil permeability, and the topographic position of a reported release site with respect to known or expected local and/or regional groundwater movement direction. Those release sites that were considered likely to have impacted the SP are identified in the report as ASTM RECs, as defined in the latest version of ASTM Standard 1527. Sites that were listed in the database search report, but not identified as a release site (for example, a site listed as a hazardous waste generator but not as having had a release), and release sites that were listed as being "closed" by the regulatory agencies were not considered likely to have impacted the SP.

San Diego, CA 92108
Contact: Fred Allee

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Enviroapplications Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # 87B5-4E3C-8B59

PO # 80.TBDCarMaxOceanside1.19.02.0

Project Proposed CarMax - Oceanside

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: 87B5-4E3C-8B59

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Enviroapplications Inc. (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

Disclaimer - Copyright and Trademark Notice

This Report contains certain information obtained from a variety of public and other sources reasonably available to Environmental Data Resources, Inc. It cannot be concluded from this Report that coverage information for the target and surrounding properties does not exist from other sources. NO WARRANTY EXPRESSED OR IMPLIED, IS MADE WHATSOEVER IN CONNECTION WITH THIS REPORT. ENVIRONMENTAL DATA RESOURCES, INC. SPECIFICALLY DISCLAIMS THE MAKING OF ANY SUCH WARRANTIES, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR USE OR PURPOSE. ALL RISK IS ASSUMED BY THE USER. IN NO EVENT SHALL ENVIRONMENTAL DATA RESOURCES, INC. BE LIABLE TO ANYONE, WHETHER ARISING OUT OF ERRORS OR OMISSIONS, NEGLIGENCE, ACCIDENT OR ANY OTHER CAUSE, FOR ANY LOSS OF DAMAGE, INCLUDING, WITHOUT LIMITATION, SPECIAL, INCIDENTAL, CONSEQUENTIAL, OR EXEMPLARY DAMAGES. ANY LIABILITY ON THE PART OF ENVIRONMENTAL DATA RESOURCES, INC. IS STRICTLY LIMITED TO A REFUND OF THE AMOUNT PAID FOR THIS REPORT. Purchaser accepts this Report "AS IS". Any analyses, estimates, ratings, environmental risk levels or risk codes provided in this Report are provided for illustrative purposes only, and are not intended to provide, nor should they be interpreted as providing any facts regarding, or prediction or forecast of, any environmental risk for any property. Only a Phase I Environmental Site Assessment performed by an environmental professional can provide information regarding the environmental risk for any property. Additionally, the information provided in this Report is not to be construed as legal advice.

FREDERIC A. ALLEE, E.I.T.
Senior Chemical/Environmental Engineer, Project Manager, QA/QC Reviewer

B.S. Chemical Engineering (Minors: Musical Performance and Numerical Analysis), 1984
University of California, San Diego (UCSD)

Overall Expertise

Mr. Allee has more than 34 years of professional experience primarily in environmental consulting, vapor intrusion and human health risk assessment, hazardous materials and waste management; project management, and, environmental due diligence. This experience includes all aspects of projects dealing with the application of technologies to the assessment and mitigation of contaminated sites.

Early work following college included geotechnical consulting, landfill gas management and construction materials testing and inspection. As an Environmental Regulator/Project Manager with the County of San Diego, he conducted compliance inspections of industries using hazardous materials and generating hazardous wastes; participated on interagency enforcement action teams; reviewed and evaluated technical reports relating to the discovery, assessment, and remediation of sites contaminated with hazardous materials/wastes; and directed the investigation and remediation of sites contaminated with petroleum, solvents, pesticides, heavy metals, asbestos, and other hazardous wastes. He provided regulatory oversight during the assessment and cleanup of over 350 contaminated sites worth more than $350 million, and was responsible for the regulatory closure of more than 200 contaminated sites.

Later, as a Project Engineer he provided technical support for the Navy's Site Characterization and Analysis Penetrometer System (SCAPS), the EPA's Hazardous Waste Compliance Monitoring for Mexican/U.S. Customs and environmental inspectors' training program, the Navy's Comprehensive Long-term Environmental Action for Navy (CLEAN) program, the DOD's Unexploded Ordnance (UXO) contaminated land Advanced Technology Demonstration (ATD) program, the Naval Environmental Leadership Program (NELP), the EPA's Superfund Innovative Technologies Evaluation (SITE) program, and several U.S.-to-Mexico technology transfer projects under the EPA's RCRA Enforcement and Permitting Assistance (REPA) program including the start of Border XXI. Mr. Allee remains active along the border as a reviewer for Border 2012 (the next milestone of border XXI). A variety of projects for private-sector clients have included contaminated site closures for major oil companies, cities, municipal water districts, and several different types of commercial companies. He additionally served as the Site Safety Officer responsible for health and safety issues during approximately 25 projects. Mr. Allee has participated in projects involving asbestos assessment and abatement, where he supervised sampling and disposal activities. He assisted the County of San Diego U.S./Mexico Border Environmental Health Specialist during the period from 1989 to 1992 in his efforts to train local health department, customs, and environmental agency inspectors on both sides of the border. Because of his interest in trans-border affairs, Mr. Allee utilized off-work hours to assist the Chief Technical Advisor to (and Hazardous Material Instructor for) the Tijuana Mayor's Office of Disaster Preparedness, the Tijuana Fire and Police Departments, the Baja California Department of Ecology, the Baja California Secretariat of Environmental Health Services, and the Federal Secretariat of Environmental Affairs. Mr. Allee has guest lectured for environmental science classes offered through both the University of California, San Diego and Riverside, Southwestern College, has instructed courses at NAS North Island; and, has been an instructor for the Certified Hazardous Materials Manager (CHMM) exam review. A sampling of his project experience is presented on the following pages.

Project Experience

Management

- Currently providing technical assistance and management for environmental due diligence, contaminant vapor intrusion risk assessment, litigation support, and closure of multiple projects involving release sites for major petroleum companies, other companies, municipalities and government.

- Lead technical teams in laboratory, office, and field settings ranging from management of 12 staff members supporting a full-service construction materials testing laboratory to management of support staff in report preparation while working in the geotechnical and environmental consulting industries. Performed management of site assessment and mitigation efforts simultaneously at as many as 140 contaminated sites, including review and comment on Work Plans, Sampling and Analysis Plans (SAPs), and a wide variety of Technical Reports. Also managed budgeting, regulatory permitting, multiple subcontractors, and sub-consultant, client and community relations and technology vendors, on a variety of both Federal government and private-sector client projects.

- Provided management, as well as regulatory, technical, and field support efforts as needed, for projects conducted at several military facilities under the Navy's CLEAN I and II with Engineering Field Activity West. Included preparation of cost estimates, work plans, sampling plans, quality assurance project plans, health and safety plans, monthly status reports, and technical memorandums and reports. Performed all work on these projects with the goal of mitigating human health and environmental impact concerns leading to closure of the sites by Records of Decision with the oversight agencies.

Engineering and Technology

- Provided project engineering services for the UXO ATDs that took place at the Yuma Proving Ground in Arizona during mid to late 1995. Performed work under contract to the Naval Explosive Ordnance Disposal Technology Division. Also conducted planning and preparation meetings with Yuma Proving Ground representatives, and arranged procurement of equipment and supplies necessary for the demonstration. Included airborne and portable earth-based innovative technologies utilizing combinations of new ground penetrating radar and magnetometer systems.

- Provided engineering support to SITE that included technical and regulatory expertise as needed for a contract to support the EPA's SITE program. Reviewed laboratory sample analysis data for the wastes generated during a SITE demonstration for the Fiery Marsh site at NAS North Island (IR Site 9); completed the necessary Navy, regulatory agency, and civilian disposal company paperwork regarding the wastes; then coordinated the proper recycling, treatment, and disposal of the wastes.

- Provided technical support on an as-needed basis for the U.S. Navy's SCAPS contract. Projects included dense data assessment of several Southwest Division CLEAN underground storage tank (UST) petroleum release sites. Also assisted with the development and testing of SCAPS (a laser-induced fluorescent detector integrated with a cone penetrometer capable of providing real time, in-situ measurement of petroleum contaminant concentrations). Assisted in the field deployment and testing of new SCAPS sensors that were to be used to detect chlorinated solvents, saturated zone interface and hydrogeologic parameters, and heavy metals.

Chemical/Environmental Emergency Response

Responded to approximately 20 emergency response incidents involving abandoned and spilled chemicals from illegal methamphetamine drug labs, fires at industrial facilities (including plating facilities), radioactive sources at landfills, and pesticide spills. Included selection and use of appropriate personal protective equipment (Levels A-C), selection and use of monitoring equipment (CGI/HNu/Draeger tubes and radiation meters), establishment of work zones, containment of spills, identification and categorization of known and unknown chemicals (HAZCAT) with supervision and documentation of cleanup actions.

- Responded to a public emergency incident that involved gasoline released to storm drain systems. Monitored areas for explosive conditions and potential ignition sources. Supervised and documented the cleanup actions taken by a contractor.

- Served on a team that investigated asbestos-contaminated soils that had been placed as fill during construction of a residential area in Paradise Hills, California. Included research of Potentially Responsible Parties (PRPs) who may have disposed of waste asbestos. Provided technical support of the U.S. EPA cleanup that was conducted based on the team's site assessment data.

- Served as the local Regulatory Oversight Specialist for a diesel and gasoline release to Rattlesnake Creek in Poway, California. Performed environmental engineering evaluations and cost analysis related to mitigating further releases to the creek. Began enforcement on PRP when they refused to abate situation as required by law. Provided all technical data to U.S. EPA Region IX when they assumed management and cleanup of the site as an emergency response in conjunction with the U.S. Coast Guard.

Preparedness and Prevention

- Inspected more than 150 businesses that were handling enough hazardous materials to necessitate creation of Chemical Emergency Contingency Plans. Assisted these businesses (including aerospace, plating, equipment manufacturing, furniture building, wastewater treatment related to coating operations, and auto painting) in the preparation of these plans. Facilitated contact between operators of similar industries in order to foster information exchange regarding process safety improvements.

- Served as Site Safety Officer and as a technology observer for the demonstration team during the UXO Detection, Identification, and Remediation Advanced Technology Demonstration at the Yuma Proving Ground in Arizona.

Spill Prevention Control and Countermeasures (SPCC) Plans

- Helped businesses to identify storm drain openings and other pathways by which accidental chemical releases might leave their control. Suggested methods (still) successfully being used to control access to pathways. Conducted re-inspections when warranted.

  Participated as a member of the San Diego Hazardous Waste Task Force (a multi-agency environmental crimes enforcement team) inspection of an aerospace company. Inspection verified and documented the complete lack of a SPCC Plan at the facility and indicated that several serious releases to the environment had occurred as a result. Involved environmental releases of post-process sludges containing heavy metals from metals finishing, plating, and production lines as well as improper handling and releases of both hydrocarbon-based and halogenated solvents.

Technical Support

- Has been instructor for more than 25 courses on emergency response, site assessment, remediation, and public relations for the University of California at San Diego, University of California at Riverside and Southwestern Community College Extensions.

- Assisted the Border Environmental Health Specialist to train County of San Diego Environmental Health Department, U.S. Customs, Environmental, Disaster Preparedness, Fire Department, and local law enforcement inspectors on both sides of the U.S./Mexico border. Regularly interacted with the EPA's REPA program staff to achieve technology transfer objectives.

- Trained U.S. and Mexican Customs and Environmental Inspectors in hazardous waste compliance monitoring. Assisted with the development of course materials for ongoing training, assembled actual contraband hazardous waste case studies, facilitated classes, and participated in the first train-the-trainers session to turn the technology transfer effort over to state and local agency experts in Arizona, California, New Mexico, and Texas.

- Worked through a REPA contract supporting EPA's Border XXI Program aimed at defining a shared vision between governments and communities along the U.S./Mexico border committed to environmental protection and sustainable development. Assisted in authoring guidance documents for Border XXI serving as both Facilitator and Note Taker during Border XXI community meetings along the Arizona/California border. Served as coauthor of the summary document for the meetings, while coordinating the delivery of court reporter transcripts from the meetings held in Arizona, California, New Mexico, and Texas to the EPA. Personal involvement continues with Border XXI as a Citizen Expert.

- Served as a Consultant to EPA officials who participated in the Border XXI binational meeting in Tijuana, Mexico that was held following the domestic community meetings. Also took notes for the public health and safety, emergency response, and solid waste management binational task group sub-meetings.

- Served as co-chairman of the County of San Diego Site Assessment and Mitigation Division's technical work group that developed guidelines for preparation of Community Health and Safety Plans prior to performing environmental assessment and cleanup work at contaminated sites in San Diego County.

- Provided technical and administrative support to US EPA Region 9 during a long-term assessment and cleanup of a release of diesel fuel, kerosene and gasoline to Rattlesnake Creek in Poway, California.

Project Work Plans

- Prepared more than 250 assessment and remediation work plans for all types and sizes of public, municipal, private and U.S. Navy contaminated sites.

- Provided technical review and comment on more than 200 assessment and remediation work plans while working as a regulator.

- Prepared the technology demonstration plan for the U.S. Navy Site Characterization and Analysis Penetrometer System, which led to Cal-EPA and U.S. EPA certification of the technology.

Enforcement

- Provided documentation and information to the County of San Diego District Attorney's Office for an enforcement case on a Clean Water Act (CWA) violation regarding a release of petroleum to a waterway at a gas station release site.

- Provided expert testimony in court for the County of San Diego District Attorney's Office on an enforcement case regarding illegal abandonment and disposal of hazardous materials to the ground. Collected samples of hazardous materials, hazardous wastes, soil, and water to help provide evidence to prove the case.

- Assisted in planning and conducting a field investigation for the County of San Diego's Hazardous Material Task Force on an illegal hazardous waste dumping case.

International

- Provided environmental engineering services on a voluntary basis as a consultant for hazardous materials and public health and safety affairs. Involvement included subterranean explosive gas migration assessment and control, explosive sewer-storm drain conditions abatement, chemical emergency response drills, and air monitoring equipment training and procurement for municipalities and clients in the Republic of Mexico.

- Provided waste sampling and characterization services to Mexican manufacturing companies to characterize waste streams for recycling, treatment, and disposal under Mexican environmental agency scrutiny.

- Provided RCRA enforcement, permitting, and assistance (REPA) for a contract to support the EPA's REPA program, which consisted primarily of technology transfer regarding the management of hazardous materials and wastes to officials of the Republic of Mexico.

Other Related Experience

- Conducted expanded scope Phase I ESAs for two cellular communications Clients to ecologically (natural resources) and archaeologically (cultural and paleontological resources) evaluate remote, FCC-approved, cellular communications equipment and antennae station sites in compliance with CEQA/NEPA guidelines and requirements. Several sites in San Diego, Imperial and Riverside Counties were evaluated. Per CEQA/NEPA requirements, prepared and submitted written requests to government agencies, non-governmental agencies, academic institutions and foundations to assemble the required information. The information was then summarized and included, along with information addressing ASTM Phase I ESA standard criteria, in written reports to the Clients for assembly of final construction permitting packages to be submitted to the FCC, other agencies and stakeholders.

- Proposed, designed, budgeted, and coordinated groundwater and soil exploration and remediation projects. Performed projects involving air pollution control and air resources management. Also provided client support and engineering services, including quality assurance/quality control (QA/QC), during projects. Assisted staff-level engineers and geologists, and provided support for all projects involving regulatory compliance and/or permitting.

- Served as a Hazardous Materials Specialist for the County of San Diego's Department of Environmental Health. Provided consultation and education related to hazardous material and waste management to industry. Inspected hazardous waste generators assisting them in complying with applicable environmental regulations. Educated generators regarding resource recovery methods for hazardous liquids (e.g., used oil and solvents). Conducted special projects as assigned for both industry compliance and site assessment and mitigation.

- Served as Staff Engineer performing various duties to help operate a full-service construction materials testing laboratory. Supervised and scheduled lab and field activities for 4 to 12 engineering and geologic technicians. Assisted environmental engineering group as Staff Chemical/Environmental Engineer on environmental projects, as necessary.

- Served as a Student Engineer at a San Diego utility performing air quality control inspections that involved power plant exhaust stack emissions monitoring and sampling, and conducted laboratory chemical analyses of the air samples. Summarized the inspections for use by the company's management in documenting compliance with local, state, and federal air pollution control regulations. Conducted boiler efficiency testing procedures for two power plants.

Professional Certifications and Registrations

Engineer-in-Training, California (No. XE065066), 1986
Certificate in Hazardous Materials Management, UCSD, 1990
Colorado Listed Environmental Consultant 2000 - 2019
Equivalent 40-Hour OSHA Health & Safety Training (Agency-Grandfathered), 1989
8-Hour OSHA Site Supervisor's Certification, 1992
8-Hour OSHA Health & Safety Annual Update Certification, 1990 - 2018

Continuing Education and Training

Petroleum Vapor Intrusion Webinars - USEPA/OSWER/OUST, Cal/EPA DTSC 2010-2019
Mold Consulting Seminar, SECOR International Inc. - P.A. Platcow, CIH, 2003
8 Hour CPR and First Aid Courses, 1987 – 2015
Chevron Loss Prevention Training, SECOR International Inc. – P.A. Platcow, CIH, 2001
Top Quality Management and Streamlining Principles in Government, MRI, 1992
Incinerable Hazardous Waste Minimization Workshop, Cal-EPA, 1991
Waste Classification and the Land Ban Courses, U.S. EPA, 1990
Hazardous Waste Element of the San Diego Regional Solid Waste Management Plan, UCSD, 1990
Bioremediation of Contaminated Groundwater, Dr. Michael Piotrowski, 1990
Introduction to Environmental/Human Toxicology, UCSD, 1990
Update on Environmental Bioremediation, CDOHS, 1990
How to be a More Effective Supervisor, Career Track, 1990
Environmental Health Services Cross Orientation, County of San Diego (SD), 1990
Hazardous Incident Response Team Annual Level A Emergency Exercises, County of SD, 1990
Court Enforcement Case Preparation, San Diego County District Attorney's Office, 1990
Regulatory Framework for Toxic Substances Courses, UCSD, 1989
Aquifer Testing Methods Symposium, CDOHS, 1989

AB3777 Risk Management and Prevention Planning, UCSD, 1989
Assessment and Remediation of Chemicals in the Environment, UCSD, 1989

Allee, F.A. and C. Bejar L., "Introduction to the Regulation of Hazardous Materials and Wastes: San Diego County's Industry Compliance Program: The Nelco Oil Co., National City Case Study," presented to the Fall 1992 Hazardous Materials Management Series Class, SWC, San Diego, California, October 27, 1992.

Allee, F.A., "Introduction to the County of San Diego's Site Assessment and Mitigation Division: Regulations, Organization Structure, and Operations," presented to the Fall 1992 Regulatory Framework for Toxic Substances Class, UCSD, September 1992, 1993, 1994, 1997.

BERNARD A. SENTIANIN, PG
Senior Geologist

M.S. Geology, 1989
San Diego State University
B.A. Geology, 1985
California State University, Bakersfield

As a senior project manager, he has hands on experience investigating, designing, installing, and managing large scale projects involving excavation/removals, above ground and in-situ remediation, soil vapor extraction, ventilation, and groundwater extraction/treatment. He has 30 years of environmental project management experience, and over 32 years professional geologic experience. Mr. Sentianin has extensive experience in planning, implementing and evaluating Phase I and Phase II environmental assessments in commercial real estate transactions.

Professional Experience

1997 TO 2019 Senior Geologist, EEI - As Senior Geologist of EEI since 1997, Mr. Sentianin provides consulting and technical services as a project manager, expert witness, third party reviewer, and senior geologist for development related due diligence, and well as investigation and cleanup efforts at sites impacted by Petroleum Hydrocarbons, heavy metals, pesticides, and chlorinated solvents.

1991 TO 1997 Senior Geologist, Senior Project Manager for PW Environmental - Established in-house engineering and consulting services for mid-sized environmental contractor. Established regulatory, vendor, and client contacts. Initiated policies governing technical report content and format and instituted in- house training program for new technical staff. Selected prioritized and procured required support equipment. Actively managed Phase I and Phase II investigation and remediation projects. Reviewed assessment data, prepared feasibility studies, and evaluated remedial alternatives while preparing Remedial Action Plans (RAP) for fuel, heavy metal, and solvent-impacted sites. Prepared health-based risk assessment on large cleanup site adjacent to health care facility. Permitted, implemented, and successfully completed the first in-situ groundwater bioremediation system in Ventura County. Reviewed and implemented numerous Phase I and Phase II environmental site assessments throughout Central and Southern California.

1989 TO 1991 Staff/Project Geologist for Nachant Environmental, Inc. - Planned, implemented, and managed environmental site investigations and remediation projects following appropriate regulatory and professional guidelines. Prepared and reviewed project cost proposals, correspondence, regulatory permits, assessment and investigation reports, and remedial action plans.

1987 to 1989 Teaching Assistant - San Diego State University Department of Geological Sciences and Department of Engineering.

Project Experience

Former Asphalt Plant, San Jose, CA. Assisted developer client with managing a large industrial site with multiple issues and negotiating closure requirements with Santa Clara County Environmental Health. Conducted additional investigations necessary to satisfy regulatory requirements, allowing development to continue while keeping residual petroleum contamination in place under managed conditions. Prepared closure report and summary of previous remedial and investigative efforts, obtaining closure.

Former Light Industrial Properties, Campbell, CA. Assisted residential developer with due diligence, investigation, and ultimately remediation of several contiguous industrial properties, formerly utilized for automotive repair, auto body work, construction material sales, and heavy equipment rental. Addressed City of Campbell and San Francisco Regional Water Quality Control Board concerns, obtaining approval/closure of open cases, allowing full development as multifamily residential.

Residential and Commercial Redevelopment Projects, Bay Area, CA. Conducted environmental due diligence and assisted with redevelopment planning for residential and commercial developers throughout the Bay Area and Sacramento Basin, including the communities of San Jose, Millbrae, Menlo Park, Sunnyvale, Oakland, Berkeley, Union City, Fremont, Antioch, Santa Rosa, Windsor, and the greater Sacramento metropolitan area including Stockton, Sacramento, West Sacramento, Roseville, Lincoln, Linda, and Auburn.

Southside Garden and Fremont Mews, Sacramento, CA. Conducted Phase I and Phase II environmental site assessments and evaluated environmental concerns on two community garden projects on behalf of the Capitol Area Development Authority. Coordinated regulatory oversight with Sacramento County Environmental Management Division and the State Office of Environmental Health Hazard Assessment. Prepared and evaluated requests for proposals for cleanup contractors and provided remediation oversight and management. Prepared closure documentation and obtained regulatory signoff form both the Southside Garden and Fremont Mews projects.

K Street Corridor – Sacramento, CA. Evaluated and conducted Phase I environmental site assessments on three block area of downtown Sacramento, as well as a number of individual properties in other areas within the K Street Corridor, on behalf of the City of Sacramento Downtown Development Group.

Globe Mills, Sacramento, CA. Conducted Phase I and Phase II environmental site assessment, evaluated environmental concerns and managed remediation for adaptive reuse project on behalf of Sacramento Housing and Redevelopment Agency. Coordinated regulatory oversight of the project with Sacramento County Environmental Management Division.

Electronics Manufacturing Facility/Fueling Depot, Santa Monica, CA. Performed soil and groundwater investigation, feasibility testing and evaluation of fuel hydrocarbon and chlorinated solvent plumes. Prepared RAP with design criteria for soil vapor extraction. After approval of RAP by State regulators, implemented and successfully completed remediation at site, obtaining closure.

Former Aerospace Facility, Santa Ana, CA. Evaluated existing Phase I and Phase II assessments. Performed soil, soil vapor, and groundwater investigations of chlorinated solvent plumes at multiple locations on site. Modeled and evaluated potential plume source areas. Initiated site-specific sampling protocol for chlorinated solvents. Liaison with lead regulatory agency regarding regional contamination issues and site closure requirements.

Major Land Owner/Developer, San Juan Capistrano, CA. Conducted Phase I and Phase II environmental site assessments at multiple sites in southern Orange County. Evaluated potential environmental concerns related to sand & gravel operations, fueling facilities, ordinance testing facilities, aerospace engineering labs, vehicle maintenance and repair facilities, agricultural operations, and illicit dump sites.

CRAIG SMITH, PG
Principal Scientist

M.S. Geology, 1986
San Diego State University
B.A. Chemistry, 1981
University of California, San Diego

Mr. Smith has over 25 years of professional experience in research, development, analyses and project management for both the U.S. Government and private sectors. His areas of expertise include environmental site assessment, due diligence for real estate transactions, site remediation and remedial system design, soil vapor and indoor air quality with respect to human health risk assessment, chemical engineering, analytical chemistry, modeling of groundwater and air, regulatory permitting (air and health agency), project supervision and strategy. Mr. Smith has been involved with development of *in-situ* environmental sensor technology and applications. Mr. Smith's academic and professional work has resulted in journal publication of several publications.

Professional Experience

Assessment

- Managed hazardous waste site assessments and supervised site remediation activities. Prepared proposals, cost estimates, performed modeling and analysis of environmental data and trends, prepared reports, and supervised all phases of projects. Involved with over 400 subsurface hazardous waste investigations focusing on petroleum, hydrocarbon, volatile organic compounds (VOCs), dry cleaning solvents, pesticide, asbestos, and metal contaminants. Mr. Smith personally managed over 100 of these projects.

- Managed regional account with major financial institution performing Phase I due diligence environmental assessments and subsequent Phase II assessments as necessary; over 100 annually. Assessments performed in accordance with current ASTM Standards, Bank Standards, and SBA.

- Both managed and conducted environmental site assessment of former and active dry cleaning facilities and plants involving tetrachloroethylene, Stoddard Solvent, and associated product impurities and degradation products.

- Managed assessment of downtown San Diego city block occupied by abandoned dairy industrial/commercial outlet. Performed investigation of fuel oil, waste oil, gasoline and kerosene in soil and ground water and ammonia refrigeration system with asbestos insulation. Prepared a feasibility study discussing remedial options, management plans, and cost/benefit analysis.

- Planned and directed assessment of heavy metal contaminated soil (lead, nickel, cadmium, copper, zinc) at a downtown San Diego metal supply company historically specializing in steel distribution, wagon makers' materials, blacksmith's supplies, while later plumbing and on-site galvanizing was performed.

- Performed subsurface assessment of 50,000-gallon gasoline spill at retail service station. Contamination extended greater than 100 feet below the ground surface. Modeled, designed and installed vapor-extraction well system.

- Directed assessment of non-permitted landfill at industrial-complex construction site in Southern California. Identified high molecular weight hydrocarbons, metals, pesticides and VOCs. Prepared remedial feasibility/risk assessment study with associate costs/benefit analysis involving 30,000 yards of stockpiled soils and remaining in-situ soils.

Remediation

- Managed and designed over fifteen fuel hydrocarbon remediation projects including high and low-volume soil vacuum extraction, soil ventilation, above- and below-ground water perfusion bioremediation and in-situ bioremediation. Monitored and interpreted data related to changes of subsurface environments due to the effects of remediation. Prepared and obtained Air District Permits and performed source compliance demonstrations.

- Designed and directed air permitting and RAP preparation of in-situ vapor extraction of paint-thinner contaminated soil extending to 50 feet below the ground surface. Both catalytic and thermal-oxidation vapor treatment technologies were implemented. Preliminary verification borings indicate residual hydrocarbon concentration less than 100 ppm remain in subsurface soils.

- Supervised and directed remedial excavation of soil contaminated with fuel hydrocarbons, solvents, and/or metals. Soils were segregated based on olfactory observations and field instrument measurements, and statistically characterized (where beneficial), to assess the most cost-effective disposal/treatment options.

- Installation of dual-pump free-product recovery system at service station. Pump effluent directed through separators and water polished with carbon prior to disclosure to POTW.

- Installed and operated vapor extraction equipment at multiple dry cleaning facilities reducing soil and soil vapor contaminant concentrations to regulatory acceptable levels to allow case site closure.

Research and Development

- Involved with development and improvement of vapor extraction systems and their controls.

- Developed electrode/electrolyte/buffer system to accurately measure pH *in situ*, for use in oceanographic expeditions. pH accuracy to ± 0.001 pH units.

- Synthesized experimental organic semiconductors followed by chemical modification and semiconductor property measurements.

- Performed engineering of water soluble drag reducing polymers. Experience included polymer design, synthesis, and property evaluation. Molecular weight measurements performed using HPLC,

LC, LALLS, and viscosity techniques. Polymer performance evaluated using varying diameter pipe flow studies.

- Utilized X-ray diffraction analyses of clay cuttings derived from oil exploration and production wells to assess petroleum mitigation and accumulation. Identified chemical and diagenetic trends and their relationships to natural gas production. Prepared journal publications.

- Performed general DOD chemical research, development, and experimentation using PID, FID, AA, XRD, and FTIR instrumentation. Security clearance: Secret.

- Analyzed oceanographic data, programmed, designed/engineered and executed chemical experiments. Alkalinity, pH, $C0_2$ and O_2 were emphasized for evaluation of bioactivity. Involved with ultrapurification of chemicals used in organic syntheses, extensive use of diffusion pumps; and inert environment settings (glove box). Security clearance: Secret

EXECUTIVE SUMMARY

This air quality impact study has been completed to determine air quality impacts (if any) associated with the development of the proposed CarMax auto sales dealership. The project is to be located on the southside of the 4000 block of Plaza Drive west of the Oceanside DMV in Oceanside, California. The project site is 10.98 acres.

Based upon this analysis, no direct or cumulative air quality impacts are expected from construction. Therefore, mitigation measures for criteria pollutants and fugitive dust from construction are not required. It should be noted that the project applicant has indicated that as a design feature all diesel equipment would be Tier 4 and that the grading contractor follow Best Management Practices (BMPs) for grading as it relates to minimizing air quality emissions and would comply with all SDAPCD rules and regulations.

A diesel particulate health risk analysis was conducted, and based on diesel exhaust emission quantities, the proposed project would generate less than significant diesel particulate health risk impacts during construction. Again, as a design feature, the project will utilize Tier 4 construction equipment and since all air quality modeling assumptions have included this feature, the Tier 4 construction equipment would be a requirement for the project to implement and would be a condition of approval by the City of Oceanside for this project.

The proposed project was analyzed for both a winter and summer operational environment. Based on the models, the project would not create any significant operation air quality impacts. Therefore, no operational mitigation measures are required.

Odor impacts from construction operations would be expected though would be considered short-term events and would not be considered a significant impact. Long term operational odors would not be expected.

Based on review of the traffic study, the nearest cumulative construction projects would be two housing projects located over ½ mile away each and the Tri City Hospital which in mostly constructed and operational. Given this, the proposed project is expected to generate less than significant cumulative construction emission impacts.

Finally, the Project site is zoned commercial and would not require a rezone for construction and operations. Thus, the project would be consistent with the growth assumptions in the City's General Plan and would not conflict with the RAQS or SIP.

1.0 INTRODUCTION

1.1 Purpose of this Study

The purpose of this Air Quality study is to determine potential air quality impacts (if any) that may be created by construction, area or operational emissions (short term or long term) from the proposed Project. Should impacts be determined, the intent of this study would be to recommend suitable mitigation measures to mitigate those impacts to the extent feasible.

1.2 Project Location

The project is located on the south side of the 4000 block of Plaza Drive west of the Oceanside DMV in Oceanside, California. The project site is south of State Route 78 and approximately 4 miles east of Interstate 5. Locally, the project site is located south of the intersection of Plaza Drive and Thunder Drive. The project site is more specifically situated just south of the Tri-City Hospital. A general project vicinity map is shown in Figure 1–A on the following page.

1.3 Project Description

The proposed CarMax project would be situated on an overall vacant site which is 10.98 acres in total size. The project would consist of roughly 11,450 square feet (SF) of facilities and 476 parking spaces of which the majority of the locations would be for car sales. The project would also have roughly 2.34 acres of open space and landscaped areas. Construction of the project would begin early 2021 and be completed in just over one year. A site development plan is shown in Figure 1-B on Page 3 of this report.

2.0 EXISTING ENVIRONMENTAL SETTING

2.1 Existing Setting

The existing site is located in the City of Oceanside and is zoned commercial. Land uses surrounding the Project mostly include both commercial and single family residential which are adjacent to the Project site. Finally, the Tri-City Hospital is located just north of the project. Elevations at the property range between 190 and 210 feet above mean sea level.

2.2 Climate and Meteorology

Climate within the San Diego Air Basin (SDAB) area often varies dramatically over short geographical distances with cooler temperatures on the western coast gradually warming to the east as prevailing winds from the west heats up. Most of southern California is dominated by high-pressure systems for much of the year, which keeps San Diego mostly sunny and warm. Typically, during the winter months, the high-pressure system drops to the south and brings cooler, moister weather from the north. It is common for inversion layers to develop within high-pressure areas, which mostly define pressure patterns over the SDAB. These inversions are caused when a thin layer of the atmosphere increases in temperature with height. An inversion acts like a lid preventing vertical mixing of air through convective overturning.

Meteorological trends within Oceanside produce daytime highs typically ranging between 65ºF in the winter to approximately 78ºF in the summer with August usually being the hottest month. Median temperatures range from approximately 55ºF in the winter to approximately 70ºF in the summer. The average humidity is approximately 64% in the winter and about 72% in the summer (City-Data, 2020).

2.3 Regulatory Standards

2.3.1 Federal Standards and Definitions

The Federal Air Quality Standards were developed per the requirements of The Federal Clean Air Act, which is a federal law that was passed in 1970 and further amended in 1990. This law provides the basis for the national air pollution control effort. An important element of the act included the development of national ambient air quality standards (NAAQS) for major air pollutants.

The Clean Air Act established two types of air quality standards otherwise known as primary and secondary standards. ***Primary Standards*** set limits for the intention of protecting public

health, which includes sensitive populations such as people with asthma, children and elderly. ***Secondary Standards*** set limits to protect public welfare to include the protection against decreased visibility, damage to animals, crops, vegetation and buildings.

The EPA Office of Air Quality Planning and Standards (OAQPS) has set National Ambient Air Quality Standards for principal pollutants, which are called "criteria" pollutants. These pollutants are defined below:

1. ***Carbon Monoxide (CO):*** *is a colorless, odorless, and tasteless gas and is produced from the partial combustion of carbon-containing compounds, notably in internal-combustion engines. Carbon monoxide usually forms when there is a reduced availability of oxygen present during the combustion process. Exposure to CO near the levels of the ambient air quality standards can lead to fatigue, headaches, confusion, and dizziness. CO interferes with the blood's ability to carry oxygen.*
2. ***Lead (Pb):*** *is a potent neurotoxin that accumulates in soft tissues and bone over time. The major sources of lead emissions have historically been motor vehicles (such as cars and trucks) and industrial sources. Because lead is only slowly excreted, exposures to small amounts of lead from a variety of sources can accumulate to harmful levels. Effects from inhalation of lead near the level of the ambient air quality standard include impaired blood formation and nerve conduction. Lead can adversely affect the nervous, reproductive, digestive, immune, and blood-forming systems. Symptoms can include fatigue, anxiety, short-term memory loss, depression, weakness in the extremities, and learning disabilities in children.*
3. ***Nitrogen Dioxide (NO_2):*** *is a reactive, oxidizing gas capable of damaging cells lining the respiratory tract and is one of the nitrogen oxides emitted from high-temperature combustion, such as those occurring in trucks, cars, power plants, home heaters, and gas stoves. In the presence of other air contaminants, NO_2 is usually visible as a reddish-brown air layer over urban areas. NO_2 along with other traffic-related pollutants is associated with respiratory symptoms, respiratory illness and respiratory impairment. Studies in animals have reported biochemical, structural, and cellular changes in the lung when exposed to NO_2 above the level of the current state air quality standard. Clinical studies of human subjects suggest that NO_2 exposure to levels near the current standard may worsen the effect of allergens in allergic asthmatics, especially in children.*
4. ***Particulate Matter (PM_{10} or $PM_{2.5}$):*** *is a complex mixture of tiny particles that consists of dry solid fragments, solid cores with liquid coatings, and small droplets of liquid. These particles vary in shape, size and chemical composition, and can be made up of multiple materials such as metal, soot, soil, and dust. PM_{10} particles are 10 microns (µm) or less and $PM_{2.5}$ particles are 2.5 (µm) or less. These particles can contribute significantly to regional haze and reduction of visibility in California. Exposure to PM levels exceeding current air quality standards increases the risk of allergies such as asthma and respiratory illness.*

5. ***Ozone (O_3)****: is a highly oxidative unstable gas capable of damaging the linings of the respiratory tract. This pollutant forms in the atmosphere through reactions between chemicals directly emitted from vehicles, industrial plants, and many other sources. Exposure to ozone above ambient air quality standards can lead to human health effects such as lung inflammation, tissue damage and impaired lung functioning. Ozone can also damage materials such as rubber, fabrics and plastics.*
6. ***Sulfur Dioxide (SO_2)****: is a gaseous compound of sulfur and oxygen and is formed when sulfur-containing fuel is burned by mobile sources, such as locomotives, ships, and off-road diesel equipment. SO_2 is also emitted from several industrial processes, such as petroleum refining and metal processing. Effects from SO_2 exposures at levels near the one-hour standard include bronchoconstriction accompanied by symptoms, which may include wheezing, shortness of breath and chest tightness, especially during exercise or physical activity. Children, the elderly, and people with asthma, cardiovascular disease or chronic lung disease (such as bronchitis or emphysema) are most susceptible to these symptoms. Continued exposure at elevated levels of SO_2 results in increased incidence of pulmonary symptoms and disease, decreased pulmonary function, and increased risk of mortality.*

2.3.2 State Standards and Definitions

The State of California Air Resources Board (ARB) sets the laws and regulations for air quality on the state level. The California Ambient Air Quality Standards (CAAQS) are either the same as or more restrictive then the NAAQS and also set limits for four additional contaminants. Table 2.1 on the following page identifies both the NAAQS and CAAQS. The additional contaminants as regulated by the CAAQS are defined below:

1. ***Visibility Reducing Particles****: Particles in the air that obstruct the visibility.*
2. ***Sulfates****: are salts of Sulfuric Acid. Sulfates occur as microscopic particles (aerosols) resulting from fossil fuel and biomass combustion. They increase the acidity of the atmosphere and form acid rain.*
3. ***Hydrogen Sulfide (H_2S)****: is a colorless, toxic and flammable gas with a recognizable smell of rotten eggs or flatulence. H_2S occurs naturally in crude petroleum, natural gas, volcanic gases, and hot springs. Usually, H_2S is formed from bacterial breakdown of organic matter. Exposure to low concentrations of hydrogen sulfide may cause irritation to the eyes, nose, or throat. It may also cause difficulty in breathing for some people with asthma. Brief exposures to high concentrations of hydrogen sulfide (greater than 500 ppm) can cause a loss of consciousness and possibly death.*
4. ***Vinyl Chloride****: also known as chloroethene and is a toxic, carcinogenic, colorless gas with a sweet odor. It is an industrial chemical mainly used to produce its polymer, polyvinyl chloride (PVC).*

Table 2.1: Ambient Air Quality Standards

Ambient Air Quality Standards						
Pollutant	**Average Time**	**California Standards[1]**		**Federal Standards[2]**		
		Concentration[3]	Method[4]	Primary[3,5]	Secondary[3,6]	Method[7]
Ozone (O_3)[8]	1 Hour	0.09 ppm (180 µg/m3)	Ultraviolet Photometry	-	Same as Primary Standard	Ultraviolet Photometry
	8 Hour	0.070 ppm (137 µg/m3)		0.070 ppm (137 µg/m3)		
Respirable Particulate Matter (PM10)[9]	24 Hour	50 µg/m3	Gravimetric or Beta Attenuation	150 µg/m3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	20 µg/m3		-		
Fine Particulate Matter (PM2.5)[9]	24 Hour	No Separate State Standard		35 µg/m3	Same as Primary Standard	Inertial Separation and Gravimetric Analysis
	Annual Arithmetic Mean	12 µg/m3	Gravimetric or Beta Attenuation	12.0 µg/m3	15 µg/m3	
Carbon Monoxide (CO)	8 hour	9.0 ppm (10mg/m3)	Non-Dispersive Infrared Photometry (NDIR)	9 ppm (10 mg/m3)	-	Non-Dispersive Infrared Photometry
	1 hour	20 ppm (23 mg/m3)		35 ppm (40 mg/m3)		
	8 Hour (Lake Tahoe)	6 ppm (7 mg/m3)		-	-	-
Nitrogen Dioxide (NO_2)[10]	Annual Arithmetic Mean	0.030 ppm (57 µg/m3)	Gas Phase Chemiluminescence	0.053 ppm (100 µg/m3)[8]	Same as Primary Standard	Gas Phase Chemiluminescence
	1 Hour	0.18 ppm (339 µg/m3)		0.100 ppm[8] (188/ µg/m3)	-	
Sulfur Dioxide (SO_2)[11]	Annual Arithmetic Mean	-	Ultraviolet Fluorescence	0.030 ppm[10] (for Certain Areas)	-	Ultraviolet Flourescence; Spectrophotometry (Pararoosaniline Method)[9]
	24 Hour	0.04 ppm (105 µg/m3)		0.14 ppm[10] (for Certain Areas) (See Footnote 9)	-	
	3 Hour	-		-	0.5 ppm (1300 µg/m3)	
	1 Hour	0.25 ppm (655 µg/m3)		75 ppb (196 µg/m3)	-	
Lead[12,13]	30 Day Average	1.5 µg/m3	Atomic Absorption	-		-
	Calendar Quarter	-		1.5 µg/m3	Same as Primary Standard	High Volume Sampler and Atomic Absorption
	Rolling 3-Month Average	-		0.15 µg/m3		
Visibility Reducing Particles	8 Hour	See footnote 13				
Sulfates	24 Hour	25 µg/m3	Ion Chromatography			
Hydrogen Sulfide	1 Hour	0.03 ppm (42 µg/m3)	Ultraviolet Fluorescence			
Vinyl Chloride[12]	24 Hour	0.01 ppm (26 µg/m3)	Gas Chromatography			

1. California standards for ozone, carbon monoxide (except 8-hour Lake Tahoe), sulfur dioxide (1 and 24 hour), nitrogen dioxide, and particulate matter (PM10, PM2.5, and visibility reducing particles), are values that are not to be exceeded. All others are not to be equaled or exceeded. California ambient air quality standards are listed in the Table of Standards in Section 70200 of Title 17 of the California Code of Regulations.
2. National standards (other than ozone, particulate matter, and those based on annual arithmetic mean) are not to be exceeded more than once a year. The ozone standard is attained when the fourth highest 8-hour concentration measured at each site in a year, averaged over three years, is equal to or less than the standard. For PM10, the 24-hour standard is attained when the expected number of days per calendar year with a 24-hour average concentration above 150 µg/m3 is equal to or less than one. For PM2.5, the 24-hour standard is attained when 98 percent of the daily concentrations, averaged over three years, are equal to or less than the standard. Contact the U.S. EPA for further clarification and current national policies.
3. Concentration expressed first in units in which it was promulgated. Equivalent units given in parentheses are based upon a reference temperature of 25°C and a reference pressure of 760 torr. Most measurements of air quality are to be corrected to a reference temperature of 25°C and a reference pressure of 760 torr; ppm in this table refers to ppm by volume, or micromoles of pollutant per mole of gas.
4. Any equivalent procedure which can be shown to the satisfaction of the ARB to give equivalent results at or near the level of the air quality standard may be used.
5. National Primary Standards: The levels of air quality necessary, with an adequate margin of safety to protect the public health.
6. National Secondary Standards: The levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant.
7. Reference method as described by the EPA. An "equivalent method" of measurement may be used but must have a "consistent relationship to the reference method" and must be approved by the EPA.
8. On October 1, 2015, the national 8-hour ozone primary and secondary standards were lowered from 0.075 to 0.070 ppm.
9. On December 14, 2012, the national annual PM2.5 primary standard was lowered from 15 µg/m3 to 12.0 µg/m3 . The existing national 24- hour PM2.5 standards (primary and secondary) were retained at 35 µg/m3 , as was the annual secondary standard of 15 µg/m3 . The existing 24-hour PM10 standards (primary and secondary) of 150 µg/m3 also were retained. The form of the annual primary and secondary standards is the annual mean, averaged over 3 years.
10. To attain the 1-hour national standard, the 3-year average of the annual 98th percentile of the 1-hour daily maximum concentrations at each site must not exceed 100 ppb. Note that the national 1-hour standard is in units of parts per billion (ppb). California standards are in units of parts per million (ppm). To directly compare the national 1-hour standard to the California standards the units can be converted from ppb to ppm. In this case, the national standard of 100 ppb is identical to 0.100 ppm.
11. On June 2, 2010, a new 1-hour SO2 standard was established and the existing 24-hour and annual primary standards were revoked. To attain the 1-hour national standard, the 3-year average of the annual 99th percentile of the 1-hour daily maximum concentrations at each site must not exceed 75 ppb. The 1971 SO2 national standards (24-hour and annual) remain in effect until one year after an area is designated for the 2010 standard, except that in areas designated nonattainment for the 1971 standards, the 1971 standards remain in effect until implementation plans to attain or maintain the 2010 standards are approved.
12. The ARB has identified lead and vinyl chloride as 'toxic air contaminants' with no threshold level of exposure for adverse health effects determined. These actions allow for the implementation of control measures at levels below the ambient concentrations specified for these pollutants.
13. The national standard for lead was revised on October 15, 2008 to a rolling 3-month average. The 1978 lead standard (1.5 µg/m3 as a quarterly average) remains in effect until one year after an area is designated for the 2008 standard, except that in areas designated nonattainment for the 1978 standard, the 1978 standard remains in effect until implementation plans to attain or maintain the 2008 standard are approved.
14. In 1989, the ARB converted both the general statewide 10-mile visibility standard and the Lake Tahoe 30-mile visibility standard to instrumental equivalents, which are "extinction of 0.23 per kilometer" and "extinction of 0.07 per kilometer" for the statewide and Lake Tahoe Air Basin standards, respectively.

Source: (WRCC, 2018)

2.3.3 Regional Standards

The State of California has 35 specific air districts, which are each responsible for ensuring that the criteria pollutants are below the NAAQS and CAAQS. Air basins that exceed either the NAAQS or the CAAQS for any criteria pollutants are designated as "non-attainment areas" for that pollutant. Currently, there are 15 non-attainment areas for the federal ozone standard and two non-attainment areas for the PM2.5 standard and many areas are in non-attainment for PM10 as well. California therefore created the California State Implementation Plan (SIP), which is designed to provide control measures needed to attain ambient air quality standards.

The San Diego Air Pollution Control District (SDAPCD) is the government agency which regulates sources of air pollution within County and all Cities within. Therefore, the SDAPCD developed a Regional Air Quality Strategy (RAQS) to provide control measures to try to achieve attainment status for state ozone standards with control measures focused on Volatile Organic Compounds (VOCs) and oxides of nitrogen (NOX). Currently, San Diego is in "non-attainment" status for federal and state O3 and State PM10 and PM2.5. An attainment plan is available for O3. The RAQS was adopted in 1992 and has been updated as recently as 2016 which was the latest update incorporating minor changes to the prior 2009 update.

The 2016 update mostly summarizes how the 2009 update has lowered NOX and VOCs emissions which reduces ozone and clarifies and enhances emission reductions by introducing for discussion three new VOC and four new NOX reduction measures. NOX and VOCs are precursors to the formation of ozone in the atmosphere. The criteria pollutant standards are generally attained when each monitor within the region has had no exceedances during the previous three calendar years. A complete listing of the current attainment status for criteria pollutants with respect to both federal and state nonattainment status by pollutants for County is shown in Table 2.2 on the following page (SDAPCD, 2018).

The RAQS is largely based on population predictions by the San Diego Association of Governments (SANDAG). Projects that produce less growth than predicted by SANDAG would generally conform to the RAQS. Projects that create more growth than projected by SANDAG may create a significant impact if the Project produces unmitigable air quality emissions or if the Project produces cumulative impacts.

Table 2.2: San Diego County Air Basin Attainment Status by Pollutant

Criteria Pollutant	Federal Designation	State Designation
Ozone (8-Hour)	Nonattainment	Nonattainment
Ozone (1-Hour)	Attainment *	Nonattainment
Carbon Monoxide	Attainment	Attainment
PM10	Unclassifiable **	Nonattainment
PM2.5	Attainment	Nonattainment
Nitrogen Dioxide	Attainment	Attainment
Sulfur Dioxide	Attainment	Attainment
Lead	Attainment	Attainment
Sulfates	No Federal Standard	Attainment
Hydrogen Sulfide	No Federal Standard	Unclassified
Visibility	No Federal Standard	Unclassified

** The federal 1-hour standard of 12 pphm was in effect from 1979 through June 15, 2005. The revoked standard is referenced here because it was employed for such a long period and because this benchmark is addressed in State Implementation Plans.*
*** At the time of designation, if the available data does not support a designation of attainment or nonattainment, the area is designated as unclassifiable.*
(SDAPCD, 2018)

2.4 California Environmental Quality Act (CEQA) Significance Thresholds

The California Environmental Quality Act Guidelines provide a checklist to identify the significance of air quality impacts. These guidelines are found in Appendix G of the CEQA guidelines and are as follows:

AIR QUALITY -- Where available, the significance criteria established by the applicable air quality management or air pollution control district may be relied upon to make the following determinations. Would the Project:

A: Conflict with or obstruct implementation of the San Diego Regional Air Quality Strategy (RAQS) or applicable portions of the State Implementation Plan (SIP)?

B: Result in emissions that would violate any air quality standard or contribute substantially to an existing or projected air quality violation?

C: Result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable Federal or State ambient air quality standard (PM_{10}, $PM_{2.5}$ or exceed quantitative thresholds for O_3 precursors, oxides of nitrogen [NO_X] and Volatile Organic Compounds [VOCs]?

D: Expose sensitive receptors (including, but not limited to, schools, hospitals, resident care facilities, or day-care centers) to substantial pollutant concentrations?

E: *Create objectionable odors affecting a substantial number of people?*

2.5 SDAPCD Rule 20.2 – Air Quality Impact Assessment Screening Thresholds

The SDAPCD has established thresholds in Rule 20.2 for new or modified stationary sources. The County's Guidelines for Determining Significance and Report Format and Content Requirements incorporate screening level thresholds from Rule 20.2 for use in all County related Air Quality Impact Assessments (AQIA) and for determining CEQA air quality impacts (County of San Diego, 2007). These screening criteria can be used to demonstrate that a project's total emissions would not result in a significant impact as defined by CEQA. Also, since SDAPCD does not have air quality impact threshold for VOCs, it is acceptable to use the Coachella Valley VOC threshold from South Coast Air Quality Management District (SCAQMD). Should emissions be found to exceed these thresholds, additional modeling is required to demonstrate that the project's total air quality impacts are below the state and federal ambient air quality standards. These screening thresholds for construction and daily operations are shown in Table 2.3 on the following page.

Non-Criteria pollutants such as Hazardous Air Pollutants (HAPs) or Toxic Air Contaminants (TACs) are also regulated by the SDAPCD. Rule 1200 (Toxic Air Contaminants - New Source Review) adopted on June 12, 1996, requires evaluation of potential health risks for any new, relocated, or modified emission unit which may increase emissions of one or more toxic air contaminants. The rule requires that projects that propose to increase cancer risk to between 1 and 10 in one million need to implement toxics best available control technology (T-BACT) or impose the most effective emission limitation, emission control device or control technique to reduce the cancer risk. At no time shall the Project increase the incremental cancer risk to over 10 in one million or a health hazard index (chronic and acute) greater than one. Projects creating cancer risks less than one in one million are not required to implement T-BACT technology.

The U.S. EPA uses the term VOC and the CARB's Emission Inventory Branch (EIB) uses the term Reactive Organic Gases (ROG) to essentially define the same thing. There are minor deviations between compounds that define each term however for purposes of this study we will assume they are essentially the same due to the fact SCAQMD interchanges these words and because Air Quality models directly calculates ROG in place of VOC.

Table 2.3: Screening Level Thresholds for Criteria Pollutants

Pollutant	Total Emissions (Pounds per Day)
Construction Emissions	
Respirable Particulate Matter (PM_{10} and $PM_{2.5}$)	100 and 55
Nitrogen Oxide (NO_x)	250
Sulfur Oxide (SO_x)	250
Carbon Monoxide (CO)	550
Volatile Organic Compounds (VOCs)	75
Reactive Organic Gases (ROG) SCAQMD	75
Operational Emissions	
Respirable Particulate Matter (PM_{10} and $PM_{2.5}$)	100 and 55
Nitrogen Oxide (NO_x)	250
Sulfur Oxide (SO_x)	250
Carbon Monoxide (CO)	550
Lead and Lead Compounds	3.2
Volatile Organic Compounds (VOCs)	75
Reactive Organic Gases (ROG) SCAQMD	75

2.6 Local Air Quality

Criteria pollutants are measured continuously throughout the San Diego Air Basin. This data is used to track ambient air quality patterns throughout the County. As mentioned earlier, this data is also used to determine attainment status when compared to the NAAQS and CAAQS. The SDAPCD is responsible for monitoring and reporting monitoring data (SDAPCD, 2018). SDAPCD operates monitoring sites, which collect data on criteria pollutants.

The closest monitoring locations to the Project site is the Camp Pendleton monitoring location roughly 9.0 miles to the north, and the Camp Pendleton monitoring station roughly 12.9 miles to the east. Table 2.4 on the following page identifies the criteria pollutants monitored at the aforementioned stations.

Table 2.4: Three-Year Ambient Air Quality Summary near the Project Site

Pollutant	Closest Recorded Ambient Monitoring Site	Averaging Time	CAAQS	NAAQS	2015	2016	2017	Days Exceeded over 3 years
O_3 (ppm)	Camp Pendleton or Escondido Monitoring Station	1 Hour	0.09 ppm	No Standard	0.09	0.08	0.09	0
		8 Hour	0.070 ppm	0.070 ppm	0.08	0.07	0.08	10
* PM_{10} ($\mu g/m^3$)		24 Hour	50 $\mu g/m^3$	150 $\mu g/m^3$	30	-	-	N/A
		Annual Arithmetic Mean	20 $\mu g/m^3$	No Standard	19.4	-	-	N/A
* $PM_{2.5}$ ($\mu g/m^3$)		24 Hour	No Standard	35 $\mu g/m^3$	29.4	-	-	N/A
		Annual Arithmetic Mean	12 $\mu g/m^3$	15 $\mu g/m^3$	8.6	-	-	N/A
NO_2 (ppm)		Annual Arithmetic Mean	0.030 ppm	0.053 ppm	0.006	0.006	0.006	N/A
		1 Hour	0.18 ppm	0.100 ppm	0.060	0.072	0.063	N/A
* CO (ppm)		1 Hour	20 ppm	35 ppm	3.1	-	-	N/A
		8 Hour	9 ppm	9 ppm	2.0	-	-	N/A

Notes:
1. - Yearly maximums marked with "-" indicated data was not available for either monitoring station.
2. Days exceeded marked with "N/A" indicate no data available
3. * Data was selected from the Escondido Monitoring Station. All other data presented was collected at the Camp Pendleton Monitoring Station.
4. SO_2 is only monitored at the El Cajon Monitoring Station. Within the entire County of San Diego, SO_2 emissions within the County are essentially Zero for all metrics including the Average, Maximum 24 hour and 1- hour standards. The Highest 1-hr measurement identified is .004 ppm and the most restrictive standard (CAAQS for SO_2) is 0.25 ppm.

3.0 METHODOLOGY

3.1 Construction Emissions Calculations

Air Quality impacts related to construction and daily operations were calculated using the latest CalEEMod 2016.3.2 air quality model, which was developed by BREEZE Software for South Coast Air Quality Management District (SCAQMD) in 2017. The construction module in CalEEMod is used to calculate the emissions associated with the construction of the Project and uses methodologies presented in the U.S. EPA AP-42 document with emphasis on Chapter 11.9. The CalEEMod input/output model is shown in ***Attachment A*** to this report.

The AERMOD dispersion model will be used to determine the concentration for air pollutants at any location near the pollutant generator. Additionally, the model will predict the maximum exposure distance and concentrations. The notable toxic air contaminant from construction is diesel exhaust since exposure to diesel exhaust is known to cause cancer and acute and chronic health effects. Diesel exhaust emissions can be estimated using the annual PM_{10} exhaust emissions from onsite construction operations obtained from the annual CalEEMod model output by summing each onsite source for the construction duration. The AERMOD files for the Project are provided in ***Attachment B*** which include the project design feature to utilize Tier 4 diesel equipment.

Once the dispersed concentrations of diesel particulates are estimated in the surrounding air, they are used to evaluate estimated exposure to people. Exposure is evaluated by calculating the dose in milligrams per kilogram body weight per day (mg/kg/d). For residential exposure, the breathing rates are determined for specific age groups, so inhalation dose (Dose-air) is calculated for each of these age groups, 3rd trimester, 0<2, 2<9, 2<16, 16<30 and 16-70 years. The following algorithms calculate this dose for exposure through the inhalation pathways. The worst-case cancer risk dose calculation is defined in Equation 1 below (OEHHA, February 2015):

Equation 1 $$Dose_{air} = C_{air} * (BR/BW) * A * EF * (1x10^{-6})$$

$Dose_{air}$	=	Dose through inhalation (mg/kg/d)
C_{air}	=	Concentration in air (µg/m3) Annual average DPM concentration in µg/m3 -AERMOD predicts annual averages.
BR/BW	=	Daily breathing rate normalized to body weight (L/kg BW-day). See Table I.2 for the daily breathing rate for each age range.
A	=	Inhalation absorption factor (assumed to be 1)
EF	=	Exposure frequency (unitless, days/365 days)
1x10-6	=	Milligrams to micrograms conversion (10^{-3} mg/ µg), cubic meters to liters conversion (10^{-3} m^3/l)

Cancer risk is calculated by multiplying the daily inhalation or oral dose, by a cancer potency factor, the age sensitivity factor, the frequency of time spent at home and the exposure duration divided by averaging time, to yield the excess cancer risk. As described below, the excess cancer risk is calculated separately for each age grouping and then summed to yield cancer risk for any given location. Specific factors as modeled are shown within the Project models attached to this report. The worst-case cancer risk calculation is defined in Equation 2 below (OEHHA, February 2015):

Equation 2

$$RISK_{inh\text{-}res} = DOSE_{air} \times CPF \times ASF \times ED/AT \times FAH$$

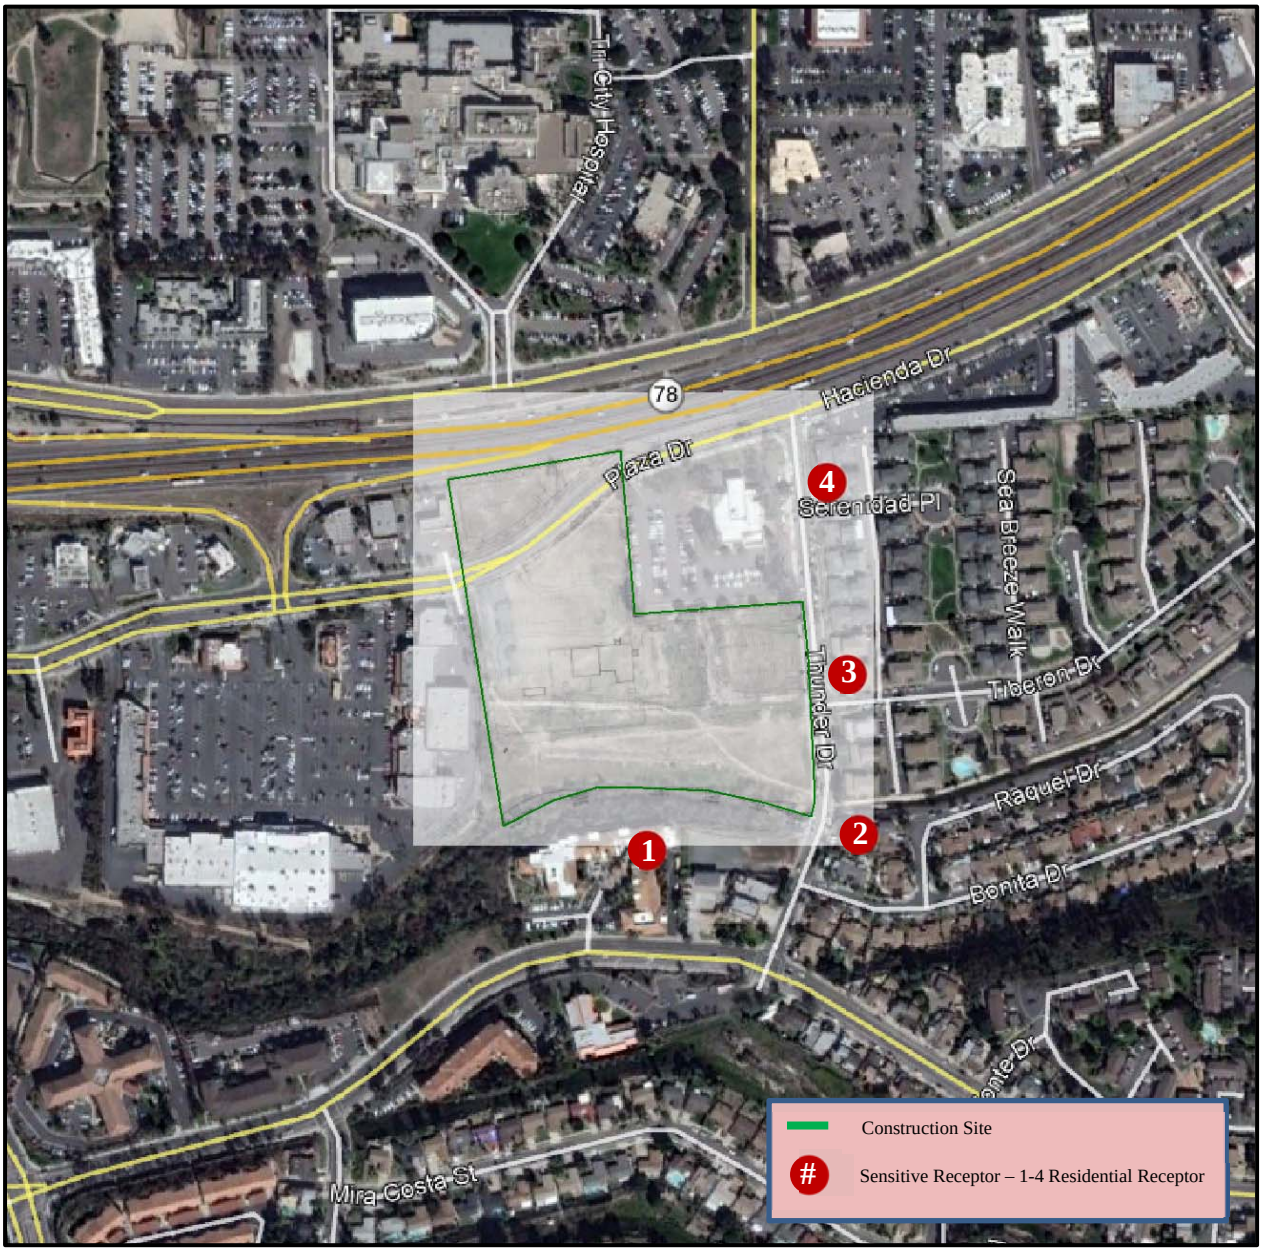
$RISK_{inh\text{-}res}$	=	Residential inhalation cancer risk
$DOSE_{air}$	=	Daily inhalation dose (mg/kg-day)
CPF	=	Inhalation cancer potency factor ($mg/kg\text{-}day^{-1}$)
ASF	=	Age sensitivity factor for a specified age group (unitless)
ED	=	Exposure duration (in years) for a specified age group
AT	=	Averaging time for lifetime cancer risk (years)
FAH	=	Fraction of time spent at home (unitless)

The California Office of Environmental Health Hazard Assessment (OEHHA) recommends that an exposure duration (residency time) of 30 years be used to estimate individual cancer risk for the Maximally Exposed Individual Resident (MEIR). OEHHA also recommends that the 30-year exposure duration be used as the basis for public notification and risk reduction audits and plans. Exposure durations of 9-years and 70-years are also recommended to be evaluated for the MEIR to show the range of cancer risk based on residency periods. If a facility is notifying the public regarding cancer risk, the 9-and 70-year cancer risk estimates are useful for people who have resided in their current residence for periods shorter and longer than 30 years. Health risk calculations are shown in ***Attachment C*** to this report.

Non-Cancer risks or risks defined as chronic or acute are also known with respect to DPM and are determined by the hazard index. To calculate hazard index, DPM concentration is divided by its chronic Reference Exposure Levels (REL). Where the total equals or exceeds one, a health hazard is presumed to exist. RELs are published by the Office of Environmental Health Hazard Assessment (OEHHA, February 2015). Diesel Exhaust has a REL of 5 $\mu g/m^3$ and targets the respiratory system.

A graphical representation of the modeling locations is shown on a site aerial below in Figure 3-A. The red points (1-4) represent the sensitive residential receptor locations where air quality emissions are calculated by AERMOD.

Figure 3-A: Construction Health Risk Model Setup



Source: (Google Earth Pro, 2019)

3.2 Construction Assumptions

The Project construction dates were estimated based on a construction kickoff in 2021 with construction completed in 2022. CalEEMod Version 2016.3.2 was utilized for all construction calculations and has been manually updated to reflect SDAPCD Rule 67 paint Volatile Organic Compound (VOC) limits. Table 3.1 shows the expected timeframes for the construction processes for all the Proposed Project infrastructure, facilities, improvements and structures at the site, as well as the expected number of pieces of equipment have been verified by the applicants Project Engineer.

Table 3.1: Expected Construction Equipment

Equipment Identification	Proposed Start	Proposed Completion	Quantity
Site Preparation	1/1/2021	1/14/2021	
Rubber Tired Dozers			3
Tractors/Loaders/Backhoes			4
Grading	1/15/2021	2/11/2021	
Excavators			1
Graders			1
Rubber Tired Dozers			1
Tractors/Loaders/Backhoes			3
Paving	2/12/2021	3/11/2021	
Pavers			2
Paving Equipment			2
Rollers			2
Building Construction	3/12/2021	1/27/2022	
Cranes			1
Forklifts			3
Generator Sets			1
Tractors/Loaders/Backhoes			3
Welders			1
Architectural Coating	12/31/2021	1/27/2022	
Air Compressors			1
Total Days			
This equipment list is based upon equipment inventory within CALEEMOD 2016.3.2. The quantity and types are based upon assumptions from Projects of similar size and scope in the County of San Diego and the City of Oceanside.			

3.3 Operational Emissions

Once construction is completed the Proposed Project would generate emissions from daily operations which would include sources such as area, energy, waste and water uses, which are also calculated within CalEEMod. Area Sources include consumer products, landscaping

and architectural coatings as part of regular maintenance. It is assumed that an average of 10 percent of the structural surface area will be re-painted with coatings compliant with SDAPCD Rule 67. Energy sources would be from uses such as onsite natural gas use and electricity which are based on default settings within CalEEMod.

Finally, the Project would also generate emissions through the use of vehicles for transportation. The Project was estimated to generate 475 ADT which includes test drives as identified within the project traffic study (LOS Engineering, 2020). These daily trips were utilized within the CalEEMod analysis using an urban setting. The operational model is also shown in ***Attachment A*** at the end of this report.

3.4 Odor Impacts

Potential onsite odor generators would only be expected during short term construction activities such as paving and possibly painting however, the odors would be considered short term and would not have a potential to create offensive odors and would therefore not be considered an impact under CEQA.

4.0 FINDINGS

4.1 Construction Findings

Construction of the proposed project is expected to start early 2021. The CarMax project will be constructed in two phases. Site preparation, remedial grading, and paving will last for approximately three months and construction-related activities will last for approximately 10 months for a total of 13 months. Grading activities would have a net surplus of soil and would require an export of roughly 10,700 cubic yards off site. The construction emissions are shown in Table 4.1 below.

Given these findings, no direct construction impacts are expected. Mitigation measures for criteria pollutants and fugitive dust from construction is not required. The project applicant has indicated that as a design feature all diesel equipment would be Tier 4 and that the grading contractor follow Best Management Practices (BMPs) for grading as it relates to minimizing air quality emissions and would comply with all SDAPCD rules and regulations.

Table 4.1: Expected Construction Emissions Summary – Pounds per Day

Year	ROG	NO_x	CO	SO_2	PM_{10} (Dust)	PM_{10} (Exhaust)	PM_{10} (Total)	$PM_{2.5}$ (Dust)	$PM_{2.5}$ (Exhaust)	$PM_{2.5}$ (Total)
2021	8.76	18.76	22.83	0.08	18.21	0.10	18.28	9.97	0.10	10.03
2022	8.74	5.75	22.59	0.05	1.05	0.06	1.11	0.28	0.06	0.34
Significance Threshold (lb/day)	75	250	550	250	-	-	100	-	-	55
Impact?	**No**	**No**	**No**	**No**	-	-	**No**	-	-	**No**

4.2 Construction Health Risks

The nearest sensitive receptors to the Project site are identified in Figure 3-A above. Based upon the annual air quality modeling results attached to this report, worst-case PM_{10} from exhaust emissions would cumulatively produce 0.00589 tons (over the total construction duration of 391-days) or an average of 0.000158 grams/second. The average emission rate over the grading area is 3.55×10^{-9} g/m^2/s, which was calculated as follows:

$$\frac{0.000158\,\frac{grams}{second}}{10.98\,acres * 4{,}046\,\frac{meters^2}{acre}} = 3.55 * 10^{-9}\,\frac{\frac{grams}{meters^2}}{second}$$

Utilizing the AERMOD dispersion model, we find that the worst-case annual concentration of DPM from construction is 0.036 µg/m^3. Utilizing the risk equation identified above in Section 3.1, the inhalation cancer risk for the closest residential receptor was found to be 7.97 which would not exceed the 10 per one million exposed significance threshold. Given this, a less than significant health risk impact would be expected.

Finally, there are known chronic health risks associated with diesel exhaust which are considered non-cancer risks. These risks are calculated based on methods identified in Section 3.1 of this report. From this we find that the annual concentration of 0.036 µg/m3 divided by the REL of 5 µg/m^3 yields a Health Hazard Index of 0.0072, which is less than one. Therefore, a less than significant chronic health risk is expected.

4.3 Operational Findings

Project Buildout is expected in 2022 and the first full year of operations would be expected in 2023 and was modeled as such. Additionally, the model was run for the winter, summer scenarios to determine maximum daily operational impacts for operation.

The expected daily pollutant generation can be calculated utilizing the product of the average daily miles traveled and the expected emissions inventory calculated by EMFAC2014; CALEEMOD 2016.3.2 performs this calculation. The daily pollutants calculated for summer and winter are shown in Tables 4.2 and 4.3. Based upon these calculations, the proposed project would produce less than significant air quality impacts under CEQA.

Table 4.2: Expected Summer Daily Pollutant Generation

	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Area	0.36	0.00	0.05	0.00	0.00	0.00
Energy	0.00	0.04	0.03	0.00	0.00	0.00
Mobile	0.53	1.75	4.05	0.01	1.01	0.28
Total (Unmitigated)	**0.90**	**1.78**	**4.13**	**0.01**	**1.02**	**0.28**
County Thresholds	75	250	550	250	100	55
Significant?	**No**	**No**	**No**	**No**	**No**	**No**

Daily pollutant generation assumes trip distances within CalEEMod
The final numbers are all rounded within Excel and are reported as rounded numbers.

Table 4.3: Expected Winter Daily Pollutant Generation

	ROG	NO_x	CO	SO_x	PM_{10}	$PM_{2.5}$
Area	0.36	0.00	0.05	0.00	0.00	0.00
Energy	0.00	0.04	0.03	0.00	0.00	0.00
Mobile	0.51	1.77	4.27	0.01	1.01	0.28
Total (Unmitigated)	**0.88**	**1.80**	**4.35**	**0.01**	**1.02**	**0.28**
County Thresholds	75	250	550	250	100	55
Significant?	**No**	**No**	**No**	**No**	**No**	**No**

Daily pollutant generation assumes trip distances within CalEEMod
The final numbers are all rounded within Excel and are reported as rounded numbers.

4.4 Odor Impact Findings

Odor impacts from construction operations would be considered short term and would not be considered an impact. The project would be a car sales facility which are not known to cause long term odor impacts. Given this a less than significant odor impact is expected for both short and long term scenarios.

4.5 Cumulative Impact Findings

The Project would not generate significant construction or operational impacts as demonstrated within this analysis. Furthermore, the Project would not cause any significant traffic impacts or add a significant number of vehicular trips to the offsite roadway network as was identified in the project traffic study.

An AERMOD analysis has been prepared with four sensitive receptors adjacent and near the Project site. It was found that no significant cancer health risks could be tied to construction assuming the project utilizes Tier 4 construction equipment which is a design feature of the project.

Based on review of the traffic study, the nearest cumulative construction projects would be two housing projects located over ½ mile away each and the Tri City Hospital which in mostly constructed and operational. Given this, the proposed project is expected to generate less than significant cumulative construction emission impacts.

Finally, the Project site is zoned commercial and would not require a rezone for construction and operations. Thus, the project would be consistent with the growth assumptions in the City's General Plan and would not conflict with the RAQS or SIP.

4.6 Conclusion of Findings

Based upon this analysis, no direct or cumulative air quality impacts are expected from construction. Therefore, mitigation measures for criteria pollutants and fugitive dust from construction are not required. It should be noted that the project applicant has indicated that as a design feature all diesel equipment would be Tier 4 and that the grading contractor follow Best Management Practices (BMPs) for grading as it relates to minimizing air quality emissions and would comply with all SDAPCD rules and regulations.

A diesel particulate health risk analysis was conducted, and based on diesel exhaust emission quantities, the proposed project would generate less than significant diesel particulate health risk impacts during construction. Again, as a design feature, the project will utilize Tier 4 construction equipment and since all air quality modeling assumptions have included this feature, the Tier 4 construction equipment would be a requirement for the project to implement and would be a condition of approval by the City of Oceanside for this project.

The proposed project was analyzed for both a winter and summer operational environment. Based on the models, the project would not create any significant operation air quality impacts. Therefore, no operational mitigation measures are required.

Odor impacts from construction operations would be expected though would be considered short-term events and would not be considered a significant impact. Long term operational odors would not be expected.

Based on review of the traffic study, the nearest cumulative construction projects would be two housing projects located over ½ mile away each and the Tri City Hospital which in mostly constructed and operational. Given this, the proposed project is expected to generate less than significant cumulative construction emission impacts.

Finally, the Project site is zoned commercial and would not require a rezone for construction and operations. Thus, the project would be consistent with the growth assumptions in the City's General Plan and would not conflict with the RAQS or SIP.

 **Model Is Setup For Calculation of Average CONCentration Values.

   --  DEPOSITION LOGIC  --
 **NO GAS DEPOSITION Data Provided.
 **NO PARTICLE DEPOSITION Data Provided.
 **Model Uses NO DRY DEPLETION.  DRYDPLT  =  F
 **Model Uses NO WET DEPLETION.  WETDPLT  =  F
```

**Model Uses RURAL Dispersion Only.

**Model Uses Regulatory DEFAULT Options:
1. Stack-tip Downwash.
2. Model Accounts for ELEVated Terrain Effects.
3. Use Calms Processing Routine.
4. Use Missing Data Processing Routine.
5. No Exponential Decay.

**Other Options Specified:
CCVR_Sub - Meteorological data includes CCVR substitutions
TEMP_Sub - Meteorological data includes TEMP substitutions

**Model Assumes No FLAGPOLE Receptor Heights.

**The User Specified a Pollutant Type of: PM10

**Model Calculates ANNUAL Averages Only

**This Run Includes: 1 Source(s); 1 Source Group(s); and 4 Receptor(s)

with: 0 POINT(s), including
0 POINTCAP(s) and 0 POINTHOR(s)
and: 0 VOLUME source(s)
and: 1 AREA type source(s)
and: 0 LINE source(s)
and: 0 RLINE/RLINEXT source(s)
and: 0 OPENPIT source(s)
and: 0 BUOYANT LINE source(s) with 0 line(s)

**Model Set To Continue RUNning After the Setup Testing.

**The AERMET Input Meteorological Data Version Date: 15181

**Output Options Selected:
Model Outputs Tables of ANNUAL Averages by Receptor
Model Outputs External File(s) of High Values for Plotting (PLOTFILE Keyword)

**NOTE: The Following Flags May Appear Following CONC Values: c for Calm Hours
m for Missing Hours
b for Both Calm and Missing Hours

**Misc. Inputs: Base Elev. for Pot. Temp. Profile (m MSL) = 0.00 ; Decay Coef. = 0.000 ; Rot. Angle = 0.0
Emission Units = GRAMS/SEC ; Emission Rate Unit Factor = 0.10000E+07
Output Units = MICROGRAMS/M**3

**Approximate Storage Requirements of Model = 3.5 MB of RAM.

**Input Runstream File: aermod.inp

**Output Print File: aermod.out

EXECUTIVE SUMMARY

This Biological Technical Report (BTR) was prepared for the proposed CarMax Auto Superstore (proposed project) located in the City of Oceanside. It documents the existing biological conditions within and adjacent to the approximately 14.915-acre survey area, which includes the approximately 10.981 acres within two undeveloped parcels and an approximately 3.935-acre, 50-foot survey buffer surrounding these parcels. The information provided in this report is based on the results of a general biological survey conducted on July 22, 2019; a focused jurisdictional delineation conducted on August 29, 2019; and subsequent focused surveys for sensitive plant species, fairy shrimp, coastal California gnatcatcher (*Polioptila californica californica*), and least Bell's vireo (*Vireo bellii pusillus*).

Eight vegetation communities and land cover types were documented within the approximately 14.915-acre survey area during the general biological survey, including disturbed Diegan coastal sage scrub, southern riparian forest, developed land, disturbed land, iceplant, ornamental, and ruderal. The proposed project has the potential to result in direct impacts to approximately 7.041 acres of vegetation communities and land cover types identified within the proposed project footprint, including approximately 6.695 acres of permanent, direct impacts within the proposed project development footprint and approximately 0.346 acre within the proposed sewer realignment footprint. Direct impacts to approximately 6.633 acres of non-sensitive upland habitats (i.e., developed land, disturbed land, iceplant, ornamental, and ruderal) would not be considered significant and would not require any avoidance, minimization, or mitigation measures. Implementation of avoidance and minimization measures (AMMs) would provide resource protection; however, unavoidable direct impacts to approximately 0.408 acre of disturbed Diegan coastal sage scrub would be considered significant and would require mitigation measures to reduce these impacts to below a level of significance.

The proposed project also has the potential to result in indirect impacts to sensitive vegetation (i.e., disturbed Diegan coastal sage scrub) that occurs adjacent to the proposed project footprint. Indirect impacts, including fugitive dust accumulation from adjacent construction activities, could occur to a small patch of disturbed Diegan coastal sage scrub located approximately 15 feet south of the proposed sewer realignment footprint. If the fugitive dust is allowed to remain on the leaves of the individual plants within this sensitive vegetation community, it could interfere with photosynthesis and germination. Through implementation of appropriate AMMs, indirect impacts to disturbed Diegan coastal sage scrub are anticipated to be avoided, and no mitigation measures are anticipated.

Focused sensitive plant species surveys and focused *Brodiaea* species surveys were conducted for the proposed project. However, the proposed project site was mowed before the second sensitive plant survey and after four of the six planned *Brodiaea* species surveys. During the general and focused surveys conducted for the proposed project, one sensitive plant species – San Diego sagewort (*Artemisia palmeri*) – was observed within the proposed project survey area. Approximately 44 individual San

Diego sagewort, a CRPR List 4.2 sensitive plant, were documented on the stream bank just south of Buena Vista Creek, adjacent to and south of the survey area, during the general biological survey conducted on July 22, 2019. Based on the results of the partial sensitive plant species surveys, three other sensitive plant species have a low to moderate potential to occur within the survey area, including southern tarplant (*Centromadia parryi* ssp. *australis*), smooth tarplant (*Centromadia pungens ssp. laevis*), and Del Mar Mesa sand aster (*Corethrogyne filaginifolia* var. *linifolia*). Implementation of the AMMs would provide resource protection; however, focused sensitive plant surveys should be conducted during spring and summer 2021, to determine if additional AMMs and mitigation measures are required to reduce unavoidable impacts to below a level of significance.

Focused sensitive wildlife species surveys were conducted for fairy shrimp, coastal California gnatcatcher, and least Bell's vireo. No fairy shrimp were detected during the 2019/2020 wet season surveys or during the 2020 dry season surveys. No coastal California gnatcatchers were detected during the focused 2020 coastal California gnatcatcher surveys; however, a pair of coastal California gnatcatchers were observed foraging within the survey area but outside of the proposed project footprint during the jurisdictional delineation conducted on August 29, 2019. Thus, this species is anticipated to forage but not nest on-site. One foraging least Bell's vireo was detected during the focused 2020 least Bell's vireo surveys and is not expected to nest on-site. In addition, two other sensitive wildlife species – Cooper's hawk (*Accipiter cooperii*) and yellow warbler (*Setophaga petechia*) were detected on-site. Implementation of the AMMs would provide additional resource protection, and implementation of mitigation measures for additional pre-construction surveys would be required to reduce unavoidable impacts to below a level of significance.

Potentially jurisdictional resources were identified and delineated during the jurisdictional delineation. The southern riparian forest along Buena Vista Creek is a potentially jurisdictional U.S. Army Corps of Engineers (USACE) and Regional Water Quality Control Board (RWQCB) Wetland Waters of the U.S. (WoUS) and Waters of the State (WoS) and potentially jurisdictional California Department of Fish and Wildlife (CDFW) Riparian; the open water is a potentially jurisdictional USACE and RWQCB Non-Wetland WoUS and WoS and potentially jurisdictional CDFW Streambed; and a portion of the disturbed land, developed land, and iceplant adjacent to Buena Vista Creek is a potentially jurisdictional CDFW Streambed. No direct or indirect impacts to riparian habitat are anticipated to result from proposed project construction. The proposed project has been designed to include the mandatory 100-foot buffer from the riparian habitat boundary, as mapped during the formal jurisdictional delineation. This 100-foot buffer includes both the 50-foot biological buffer as well as the mandatory 50-foot planning buffer. The proposed project is anticipated to encroach approximately 6 feet into a small portion of the 50-foot planning buffer during the proposed sewer realignment. As a result, temporary direct impacts would occur to approximately 0.008 acre (344 square feet) of disturbed habitat within the planning buffer. Because these impacts are so small and because they are located at least 94 feet from the riparian habitat, no direct impacts to riparian habitat is anticipated. Implementation of AMMs would provide additional resource protection; however, no additional AMMs or mitigation measures would be required.

SECTION 1.0 – INTRODUCTION

The purpose of this BTR for the proposed CarMax Auto Superstore (proposed project) located in the City of Oceanside (Appendix A: Figure 1) is (1) to document the existing biological conditions within and adjacent to the approximately 14.915-acre survey area, which includes the approximately 10.981 acres within two undeveloped parcels and an approximately 3.935-acre, 50-foot survey buffer surrounding these parcels; (2) to evaluate the proposed project survey area and the vicinity for the potential to support sensitive biological resources; (3) to provide an analysis of the potential impacts associated with the proposed project; and (4) to provide a discussion of avoidance, minimization, and mitigation measures for potential impacts to sensitive biological resources.

1.1 PROPOSED PROJECT LOCATION

The proposed project occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 2019; Appendix A: Figures 2 and 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Appendix A: Figures 2 and 3). It is bordered to the north by State Route 78, to east by Thunder Drive and residential development, to the south by Buena Vista Creek and residential development, and to the west by a commercial shopping center (e.g., grocery store, restaurants, motel, other retail stores). Plaza Drive separates the two parcels in the northwest portion of the proposed project area, and the Oceanside Department of Motor Vehicles occupies the property northeast of the proposed project site.

1.2 PROPOSED PROJECT DESCRIPTION

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, sales building with an attached presentation area, service building, non-public carwash, sales display area, customer and employee parking lot, vehicle storage area, and associated access driveways and landscaped areas. In addition, a retaining wall will be required along the southern boundary of the proposed project footprint, because of the exiting grades within the proposed project area.

There are two existing sewer lines that currently run along the southern boundary of the proposed automobile dealership – a 12-inch sewer line owned by the City of Oceanside and a 21-inch sewer line owned by the City of Vista. The proposed retaining wall would be located within 5 feet of both of these existing sewer lines, and the footing would be located on top of the existing 21-inch sewer line. Based on the age of the existing sewer lines, both the City of Oceanside and the City of Vista will not allow the footings to be placed on top of the existing sewer lines or within 10 feet of the existing sewer lines for safety and access reasons. Therefore, both of the existing sewer lines will require relocation and realignment outside of the developed area and south of and immediately adjacent to the proposed retaining wall.

SECTION 2.0 – METHODS AND SURVEY LIMITATIONS

Busby Biological Services, Inc. (BBS) conducted background research, a general biological resources survey, a focused jurisdictional determination, and focused sensitive species surveys for the proposed project. The methods used for each of these are presented below.

2.1 BACKGROUND RESEARCH

Prior to conducting the general biological resources survey, jurisdictional delineation, and focused sensitive species surveys, BBS reviewed the draft City of Oceanside Subarea Plan (SAP; City of Oceanside 2010), the North County Multiple Habitat Conservation Plan (MHCP; San Diego Association of Governments [SANDAG] 2003), online current and historical aerial imagery (Google Earth 2019; Nationwide Environmental Title Research, LLC [NETR] 2019), U.S. Fish and Wildlife Service (USFWS) critical habitat maps (USFWS 2019a), the CDFW California Natural Diversity Database (CNDDB; CDFW 2019a); USFWS National Wetland Inventory (NWI) maps (USFWS 2019b), U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soil survey maps (USDA 2019a), and the USGS San Luis Rey 7.5-minute topographic quadrangle map (USGS 2019). Information from these resources informed the general biological resources survey, the jurisdictional determination, and the focused surveys within the proposed project survey area.

2.2 GENERAL BIOLOGICAL RESOURCES SURVEY

The general biological resources survey, which included vegetation mapping, general sensitive species habitat assessments, and a jurisdictional resources assessment, was conducted on foot to document the existing biological resources and assess the potential for sensitive biological resources to occur within and immediately adjacent to the proposed project site.

Vegetation communities and land cover types were classified following Holland (1986) as modified by Oberbauer et al. (2008), and mapped by hand onto aerial imagery with a 1 inch equals 100 feet scale, noting dominant plant species within these vegetation communities. The hand-drawn vegetation community and land cover type boundaries were provided to a Geographic Information Systems (GIS) Analyst and were digitized in the office using GIS software.

During the general biological resources survey, the survey area was generally assessed for potential jurisdictional resources, such as Wetland and Non-Wetland WoUS as well as Wetland and Non-Wetland WoS (including potential wetlands and vernal pools) that are regulated by USACE, CDFW, RWQCB, and/or the City of Oceanside. In addition, habitats within an appropriate buffer of the proposed project area were assessed to determine the potential for these areas to support sensitive plant and wildlife species. A 50-foot buffer was used for sensitive plant species; a 300-foot buffer was used for coastal California gnatcatcher (*Polioptila californica californica*); and a 500-foot buffer

was used for least Bell's vireo (*Vireo bellii pusillus*), southwestern willow flycatcher (*Empidonax traillii extimus*), and raptors.

Plant species observed directly and wildlife species observed and/or detected indirectly through sign (e.g., scat, tracks, burrows, vocalization) within the survey area were noted. Digital photographs of representative areas were taken during the survey (Appendix B).

2.3 JURISDICTIONAL DELINEATION

The jurisdictional delineation and mapping of the survey area was conducted on foot to determine the location and extent of resources potentially under the jurisdiction of USACE, RWQCB, and CDFW. A hand-held, sub-meter Global Positioning System (GPS) device was used to record the locations of sample points and boundaries of potentially jurisdictional resources. Mapped wetland boundaries are considered to be a line across which the vegetation, soil, and hydrologic characteristics begin/cease to meet wetland criteria.

Vegetation communities and land cover types were classified following Holland (1986) as modified by Oberbauer *et al.* (2008), and mapped by hand onto aerial imagery with a 1 inch equals 100 feet scale, noting dominant plant species within these vegetation communities. These hand-drawn vegetation community and land cover type boundaries were provided to a GIS Analyst and were digitized using GIS software. Digital photographs of sample points and representative areas were taken during the survey.

2.3.1 U.S. Army Corps of Engineers Jurisdiction

Data was collected at upland and wetland sample points by assessing the vegetative, soil, and hydrologic characteristics within and immediately adjacent to areas that were determined to support potential USACE jurisdictional resources following the technical guidelines provided in the following manuals:

- USACE *Wetlands Delineation Manual* (USACE 1987)
- USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0; USACE 2008)
- *USACE A Delineation Manual, A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2010)

USACE *Wetland Determination Data Forms – Arid West Region* (USACE 2008) were completed at appropriate upland and wetland sample points. Non-Wetland WoUS were delineated based on the presence of OHWM indicators, and an OHWM data sheet was recorded where appropriate.

USACE Wetlands

Several parameters were considered to determine whether the sample point is within a USACE wetland. The following three wetland parameters typically must be satisfied to classify an area as a jurisdictional USACE wetland under normal circumstances: (1) a predominance of hydrophytic vegetation, (2) the presence of hydric soils, and (3) the presence of wetland hydrology. Details of the application of these techniques are described below.

- **Hydrophytic Vegetation:** Hydrophytic vegetation is defined as "the community of macrophytes that occurs in areas where inundation and soil saturation is either permanent, or of sufficient frequency and duration to exert a controlling influence on the plant species present" (USACE 2008). For the purposes of this jurisdictional delineation, five levels of wetland indicator status were used to assess the presence of hydrophytic vegetation, based on the most current National Wetland Plant List (USACE 2016). Plant species were classified as:
    - obligate wetland plants (OBL), which area plants that almost always (estimated probability greater than 99 percent) occur in wetlands but rarely are found in non-wetlands under natural conditions;
    - facultative wetland plants (FACW), which are plants that usually (estimated probability from 67 percent to 99 percent) occur in wetlands but are occasionally found elsewhere under natural conditions;
    - facultative plants (FAC), which are plants with a similar likelihood (estimated probability from 33 percent to 67 percent) of occurring in both wetlands and non-wetlands under natural conditions;
    - facultative upland plants (FACU), which area plants that sometimes (estimated probability from 1 percent to 33 percent) occur in wetlands, but occur more often in non-wetlands under natural conditions; or
    - obligate upland plants (UPL), which are plants that rarely (estimated probability <1 percent) occur in wetlands, but almost always occur in non-wetlands under natural conditions].
    - A no indicator (NI) status designates that insufficient information was available to determine an indicator status.

  Hydrophytic vegetation was determined to be present if any one of the following three indicator tests were satisfied:
    - the Dominance Test (Indicator 1), where "more than 50 percent of the dominant plant species across all strata were rated OBL, FACW, or FAC";
    - the Prevalence Test (Indicator 2), where there were indicators of hydric soils and wetland hydrology, and the prevalence index was 3.0 or less, which is a weighted-average wetland indicator status of all plant species by abundance (percent cover); and/or
    - the Plant Morphological Adaptations Test (Indicator 3), where there were indicators of hydric soils and wetland hydrology present, and either the Dominance Test (Indicator 1) or Prevalence Test (Indicator 2) were satisfied after reconsideration of the indicator status of certain plant species that exhibited morphological adaptations for life in wetlands.

- **Hydric Soils:** Hydric soils are defined as "a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part" (USACE 2008). For the purposes of this jurisdictional delineation, the hydric soil indicators described in the USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008) and *National Technical Committee for Hydric Soils (NTCHS) Field Indicators of Hydric Soils in the United States* (USDA 2019b) were used to assess the presence of hydric soils. Soil test pits were dug to the depth needed to document the soil chroma index using the Munsell® Soil Color Charts (Munsell® Color 2000), as well as additional hydric soil indicators (*e.g.,* hydrogen sulfide, sandy redox, depleted matrix, redox dark surface, depleted dark surface) detailed in the *Arid West Supplement* (USACE 2008) and the *Field Indicators of Hydric Soils in the United States* (USDA 2019b). The soil was determined to be hydric if one or more hydric soil indicators were present.

- **Wetland Hydrology:** Wetland hydrology is indicated by the presence of surficial or sub-surficial hydrologic characteristics long enough during the growing season to show that the presence of water has an overriding influence on the characteristics of vegetation and soils due to anaerobic and reducing conditions, respectively; thus, for an area to be defined as a wetland, periodic inundation or saturation of soils during the growing season must be determined to be present (USACE 2008). For the purposes of this delineation, the wetland hydrology indicators (*e.g.* inundation, watermarks, drift lines, sediment deposits, drainage patterns, saturation) described in the USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008) were used to assess the presence of wetland hydrology. Wetland hydrology was determined to be present if one or more primary indicators, or two or more secondary indicators were observed.

A USACE Wetland Determination Data Form was completed for each of the sample points to document the conditions at that point.

USACE Non-Wetland Waters of the U.S.

The USACE defines Non-Wetland WoUS as drainages, or portions thereof, which have strong hydrology indicators such as the presence of seasonal flows and an OHWM. An OHWM is defined as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as [a] clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (USACE 1987). In general, Non-Wetland WoUS are delineated by the lateral and upstream/downstream extent of the OHWM of the particular drainage or depression. The method for identification of lateral limits for potential Non-Wetland WoUS are detailed in the USACE *A Delineation Manual, A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2010).

Areas delineated as Non-Wetland WoUS may lack hydrophytic vegetation or hydric soil characteristics. Hydrophytic vegetation may be absent for various reasons, such as the lack of sufficient water flow to support hydrophytic vegetation or the influence of frequent scouring resulting from rapid water flow. Hydric soil indicators may be missing for various reasons, such as the lack of sufficient water or the presence of steep topography that precludes ponding and prohibits the development of hydric soils.

2.3.2 Regional Water Quality Control Board Jurisdiction

RWQCB jurisdiction typically extends to all WoUS as considered jurisdictional by the USACE as well as to isolated waters and wetlands. Section 401 of the Clean Water Act (CWA) gives the RWQCB the authority to regulate any proposed activities that may affect water quality.

2.3.3 California Department of Fish and Wildlife Jurisdiction

CDFW jurisdiction typically includes water features with a defined bed and bank and associated riparian vegetation. CDFW typically extends its jurisdictional limit to the top of a stream, the bank of a lake, or the outer edge of the riparian vegetation, whichever is wider. CDFW jurisdictional habitat allows for a wide variety of habitat types to be jurisdictional, including some that do not include wetland species (e.g., oak woodland, alluvial fan sage scrub). In addition, CDFW asserts jurisdiction over vernal pools when California state threatened and/or endangered species are present.

2.4 FOCUSED SENSITIVE SPECIES SURVEYS

Focused surveys were conducted for sensitive plant species, fairy shrimp, coastal California gnatcatcher, and least Bell's vireo. The methods for each are described below.

2.4.1 Sensitive Plant Species Surveys

In addition to the database search and background research described in Section 2.1, above, other references were consulted to better understand the historical location data and distribution of the sensitive plant species in San Diego County, including research using the San Diego Natural History Museum's (SDNHM) plant distribution mapping and voucher specimen lists and local biologists' knowledge of sensitive plant species likely to occur in the area.

A focused habitat assessment for sensitive plant species was conducted during the general biological resources survey (Section 2.2, above) to evaluate the proposed project survey area for its potential to support sensitive plant species. Potentially suitable habitats were mapped in the field using aerial imagery of the proposed project survey area (1 inch = 200 feet) and a handheld GPS unit. Potentially suitable habitat areas were digitized using Google™ Earth based on field notes and waypoints collected in the field.

Based on the results of the historical species database search and the focused habitat assessment, a list of the sensitive plant species that have potential to occur within or adjacent to the proposed project survey area was developed, and focused sensitive plant surveys as well as focused *Brodiaea* species surveys were conducted. The methods used for each survey are provided, below.

Focused Sensitive Plant Species Surveys

Focused sensitive plant surveys were conducted by walking meandering transects throughout the proposed project survey area. If a sensitive plant species was observed during these focused surveys, a waypoint was taken with a handheld GPS unit that recorded the plant's location and the elevation above mean sea level (amsl) and incorporated into the Geographic Information System (GIS) database.

Focused *Brodiaea* Species Surveys

Focused *Brodiaea* species surveys consisted of proposed project survey area site checks, reference site checks, and focused surveys. The methods for each are described below.

Proposed Project Survey Area & Reference Site Checks

Early in the growing season, site checks were conducted within suitable habitat identified within the proposed project survey area to document early emergent *Brodiaea* vegetation. If a location for a potential *Brodiaea* species was observed, it was recorded using a handheld GPS unit to facilitate subsequent surveys.

In addition, known reference populations in the vicinity of the proposed project area were monitored to determine when *Brodiaea* species had emerged and were observable, to assure the focused *Brodiaea* species surveys for the proposed project were conducted during the appropriate survey windows.

Focused Surveys

Once thread-leaved brodiaea (*Brodiaea filifolia*) was observed at a reference population, focused thread-leaved brodiaea and Orcutt's brodiaea (*B. orcuttii*) surveys were initiated in the potentially suitable habitat within the proposed project survey area. If a *Brodiaea* species was documented, biologists mapped the locations of and counted all individuals observed. Each observation was also mapped by hand onto the aerial photograph (either a point or a polygon), the number of individuals was estimated, and a GPS point for the plant/population location was collected.

2.4.2 Fairy Shrimp Surveys

The protocol-level fairy shrimp surveys conducted for the proposed project followed the current USFWS survey guidelines, titled *Survey Guidelines for the Listed Large*

Branchiopods and dated November 13, 2017. These survey guidelines define a complete large branchiopod survey as a complete wet season survey and a complete dry season survey that are conducted within a 3-year period. Both wet and dry season fairy shrimp surveys were conducted for the proposed project. The methods used for each are described below.

Wet Season Fairy Shrimp Surveys

Protocol-level wet season surveys were initiated immediately following the first rain event of the 2019/2020 rainy season. During the first survey visit, the proposed project site was examined for ponded areas. All ponded areas were included in each survey visit.

During the first sampling visit to each inundated basin, data recorded included the estimated maximum surface area of each basin, the estimated maximum depth of each basin, and existing habitat condition (e.g., disturbance level, type of basin). During each sampling round, all basins that were inundated during the previous sampling round were visited to determine if the basins were still holding water and required sampling. If a rain event occurred between sampling rounds, all known basins were sampled, and the proposed project survey area was assessed for potential basins that may have been inundated by the rain event.

During each sampling round, data for each inundated basin was recorded, including air temperature, water temperature, average depth, approximate size, habitat condition (if changed), voucher information, and other relevant notes. Each inundated basin was sampled by sweeping a hand-held net through the water and examining the net contents with all aquatic species recorded. If fairy shrimp species were observed, the reproductive status and approximate numbers of fairy shrimp in each basin were noted, and, when possible, identified to species in the field with a hand lens or in the lab with a microscope.

If encountered in any inundated basins, mature male and female fairy shrimp voucher specimens were collected from sampled basins. The collected shrimp are then identified to the species level with the aid of a stereo dissection scope, and subsequently provided to the Natural History Museum of Los Angeles for preservation.

Dry Season Fairy Shrimp Surveys

Protocol-level dry season fairy shrimp surveys include soil sample collection, soil sample processing and analysis, and – if needed – fairy shrimp hydration, rearing, hatching, and identification. The methods used for each are described, below.

Soil Sample Collection

Soil samples were collected from all basins within the proposed project survey area that provided potential fairy shrimp habitat during the 2019/2020 wet season fairy shrimp

surveys. These basins had been mapped and photographed during the 2019/2020 wet season surveys.

A hand trowel was used to collect the appropriate number and volume of samples from the top 1 to 3 centimeters of soil within each basin based on Table 1 of the current USFWS protocol. These soil samples were collected into paper bags, with the basin number written on each bag to inform the lab analysis, and logged in the soil sample collection table.

Soil Sample Processing and Analysis

The soil samples were taken to an approved laboratory for processing and analysis. The soil samples were hydrated and processed through a series of sieves to separate fairy shrimp cysts from the soil. The sieves used were of 710-, 355-, and 212-micron pore size screens, and the final sieve pore size is smaller than the target fairy shrimp genera (i.e., *Branchinecta, Streptocephalus*) average cyst diameter and, therefore, would retain any cysts present within the soil samples. The remaining material on the final sieve was then placed in a brine solution to help separate organic material from inorganic material. The remaining organic material was then filtered through a standard coffee filter and allowed to dry. The dried organic material was then examined under a microscope to determine if fairy shrimp cysts were present. For all identified cysts, cyst surface characteristics were then used to identify cysts to genus.

Fairy Shrimp Hydration, Rearing, Hatching, and Identification

Two species of fairy shrimp in the genus *Branchinecta* have the potential to occur in the proposed project survey area. Because these cysts cannot be identified to species under the microscope, the *Branchinecta* cysts require hydration, hatching, rearing, and subsequent identification to identify them to species.

When identified during the soil sample processing and analysis, *Branchinecta* cysts are hydrated by placing them into plastic containers filled with approximately 525 milliliters of filtered, non-chlorinated drinking water. The coffee filters with the collected cysts are slowly opened over the containers and gently shaken to allow the material to fall into the water. The sides of the filters are then rubbed against one another to release any additional material. Finally, a squirt bottle with filtered, non-chlorinated drinking water is used to spray any additional material from the filters into the containers.

The containers are given sample identification numbers and placed on a table in a climate-controlled room. Lighting in the room is provided by indirect sunlight as well as an overhead, full spectrum light that is kept on approximately 12 hours a day to help emulate outside, spring season lighting conditions. An overhead fan also is kept on at a low level to provide for some air movement across the water surface in the sample containers.

The samples are checked daily to see if any fairy shrimp have emerged. Once nauplii are observed, feeding begins. The hatched shrimp are fed a single drop of prepared

food on a daily basis until they are collected for identification. The food used is typically a mix of active brewer's yeast, sugar, powdered fish food, and water.

The hatched shrimp are allowed to continue under these conditions until they reach maturity, as determined by reaching full size, antennal development (males), and brood pouch (females). Once mature, the fairy shrimp are collected for identification by pouring the material in the container through a small strainer. Collected shrimp are then placed into a dish of carbonated water to slowly asphyxiate them. Once dead, the collected shrimp are placed in a 27- by 57-millimeter (5-dram) clean glass vial, filled with 70 percent ethyl alcohol. The collected shrimp are then identified to the species level with the aid of a stereo dissection scope, and subsequently provided to the Natural History Museum of Los Angeles for preservation.

2.4.3 Coastal California Gnatcatcher Surveys

Focused, protocol-level coastal California gnatcatcher surveys were conducted in accordance with the current USFWS survey protocol for the species, titled *Coastal California Gnatcatcher* (Polioptila californica californica) *Presence/Absence Survey Guidelines* and dated February 28, 1997 (USFWS 1997). The proposed project survey area consisted of all suitable habitat within the proposed project area and within a 300-foot survey buffer around the proposed project area. Because proposed project is located in the City of Oceanside, currently a non-NCCP participant, a total of six focused, protocol-level coastal California gnatcatcher survey rounds, spaced at least 1 week apart were conducted during the protocol survey window of March 15 to June 30.

All coastal California gnatcatcher surveys were conducted between 0600 and 1200 and avoided periods of adverse weather conditions (e.g., excessively hot or cold temperatures, high winds, steady rain, dense fog, other inclement weather conditions) that would impede detection of the coastal California gnatcatcher. Surveys were conducted by slowly walking throughout all suitable habitat within the survey area, visually searching with binoculars, and using auditory cues to detect the coastal California gnatcatcher. Various routes were utilized to conduct an unbiased survey of the suitable habitat within the survey area. Pre-recorded coastal California gnatcatcher vocalization playbacks were only used to elicit initial calls from coastal California gnatcatcher and were not used frequently or to illicit further behaviors. Pre-recorded vocalizations were played for periods of 5 to 15 seconds and were generally repeated approximately every 100 feet within the surveyed habitat.

Sensitive species detections, including coastal California gnatcatcher detections, were recorded electronically using a hand-held GPS unit and by hand onto a high-resolution aerial image of the survey area. In addition, relevant information about the detections (e.g., age, sex, number of individuals detected) was noted when necessary. Other wildlife species observed directly or detected indirectly by sign (e.g., scat, tracks, calls, and other evidence) also were recorded.

2.4.4 Least Bell's Vireo Surveys

Focused, protocol-level least Bell's vireo surveys were conducted in accordance with the current USFWS survey protocol, titled *Least Bell's Vireo Survey Guidelines*

(USFWS 2001). Eight surveys were conducted at least 10 days apart during the protocol survey window of April 10 to July 31.

All least Bell's vireo surveys were conducted between approximately dawn and 1100 and avoided periods of adverse weather conditions (e.g., excessively hot or cold temperatures, high winds, steady rain, dense fog, and other inclement weather conditions) that would impede detection of the least Bell's vireo. Surveyors slowly walked throughout the suitable habitat within the survey area and used visual and auditory cues to detect the least Bell's vireo. Various routes were utilized to conduct an unbiased survey of the potentially suitable habitat within the survey area, while taking care not to disturb sensitive habitat or potential nest areas.

Sensitive species detections were recorded electronically using a hand-held GPS unit and/or by hand onto a high-resolution aerial image of the survey area, and relevant information (e.g., age, sex, number of individuals detected) was noted if least Bell's vireo were detected. In addition, numbers and locations of parasitic brown-headed cowbirds were recorded, if present, and other wildlife species observed directly or detected indirectly by sign, including scat, tracks, calls, and other evidence were recorded.

2.5 SURVEY LIMITATIONS

It should be noted that the results of the general biological surveys and jurisdictional delineation reflect the existing conditions at the time of the survey, which naturally change over time. In addition, the jurisdictional resource boundaries may be subject to verification by the regulatory agencies. In addition, the plant and wildlife species lists do not provide a comprehensive list of all species that occur within or utilize the survey area, because the survey conducted was a general, diurnal biological survey that does not account for all potentially occurring rare species, nocturnal species, secretive species, or seasonal/migratory species.

SECTION 3.0 – RESULTS

BBS Biologist Darin Busby conducted a general biological resources survey of the approximately 14.915-acre survey area (i.e., the proposed project site and 50-foot survey buffer) on July 22, 2019, between the hours of 1000 and 1245. Weather conditions during the survey included temperatures ranging from 73 to 82 degrees Fahrenheit, wind speeds ranging from 0 to 4 miles per hour, cloud cover ranging from 10 to 100 percent, and no precipitation. Following the general biological resources survey, biologists Darin Busby and Brian Lohstroh conducted a focused jurisdictional delineation within the approximately 14.915-acre survey area on August 29, 2019.

The following sections (1) describe the general botanical and zoological resources and the sensitive biological resources observed and/or detected within the survey area during the general biological resources survey and (2) provide an assessment of the potential for additional sensitive biological resources to occur within and immediately adjacent to the proposed project site. Table 1 below provides a summary of the general and focused surveys conducted for the proposed project.

Table 1. Summary of General and Focused Surveys

Survey Type		Date	Surveyor
Biological Resources Survey		7/22/19	D. Busby
Wetland Delineation		8/29/19	D. Busby, B. Lohstroh
Sensitive Plant Survey		5/15/20	E. Kentner
Brodiaea Species Survey		2/14/20 to 6/15/20	C. Vettes, E. LaCoste
Fairy Shrimp Surveys	Wet Season	12/3/19 to 3/19/20	E. LaCoste
	Dry Season	8/11/20	E. LaCoste, G. Mason
Coastal California Gnatcatcher Surveys		5/7/20 to 7/12/20	D. Busby, C. Vettes
Least Bell's Vireo Surveys		5/7/20 top 7/29/20	D. Busby, C. Vettes, E. LaCoste

3.1 TOPOGRAPHY AND SOILS

The majority of the proposed project area is relatively flat with a drop in elevation to the south towards Buena Vista Creek, with elevations ranging from approximately 220 to 180 feet above mean sea level (amsl). Buena Vista Creek occurs along the southern boundary of the proposed project area and runs from east to west, eventually connecting to Buena Vista Lagoon and the Pacific Ocean approximately 4 miles west of the survey area. The NWI classifies Buena Vista Creek as a freshwater forested/shrub wetland (USFWS 2019b). Buena Vista Creek is one of six creeks located within the

210-square-mile Carlsbad Hydrologic Unit (HU), which is one of 11 HUs identified in San Diego County by the RWQCB.

The following two soil types occur within the survey area: (1) Las Flores loamy fine sand, 5 to 9 percent slopes, eroded and (2) Visalia sandy loam, 2 to 5 percent slopes (USDA 2019a; Appendix A: Figure 4). Soils observed in the field within the soil test pits appeared to exhibit characteristics similar to those mapped within the proposed project area, with the exception of fill soils and riprap along some portions of Buena Vista Creek (USDA 2019a).

Las Flores loamy fine sand, 5 to 9 percent slopes, eroded is the most common soil type within the survey area. Las Flores loamy fine sands are derived from weathered marine sandstone that consist of loamy fine sands with a sandy clay subsoil. This soil is moderately well drained, has slow to medium runoff, and a slight to moderate erosion hazard. Las Flores soils are not listed as hydric soils in California (USDA 2019a).

Visalia sandy loam, 2 to 5 percent slopes occurs in and adjacent to Buena Vista Creek, in the southern portion of the survey area (USDA 2019a). Visalia sandy loams are derived from granitic parent material that developed on alluvial fans and flood plains. This soil has a topsoil rich in organic matter, is well-drained to moderately well-drained, has slow to medium runoff, is moderately permeable, and has a slight to moderate erosion hazard. Visalia sandy loams are listed as a hydric soil on the USDA Hydric Soils List (USDA 2019a).

3.2 BOTANICAL RESOURCES

A total of 63 plant species were observed within the survey area during the various general and focused surveys conducted between July 22, 2019 and July 29, 2020. Of these 63 plant species observed, 37 (59 percent) of these species are considered non-native and/or naturalized into the area, and 26 (41 percent) of these species are considered native. One of the 63 plant species, San Diego sagewort (*Artemisia palmeri*), found adjacent to and south of the survey area is considered sensitive (Appendix B). A list of plant species observed within the survey area is included as Appendix C.

BBS mapped the vegetation communities and land cover types within the approximately 14.915-acre survey area. BBS documented eight vegetation communities and land cover types within the survey area – disturbed Diegan coastal sage scrub, southern riparian forest, developed land, disturbed land, iceplant, ornamental, and ruderal (Appendix A: Figure 4; Appendix B). The eight vegetation communities and land cover types are summarized in Table 1, and briefly described in the following paragraphs. The total acreages do not always add up to the sum of the approximate acreage breakdown within the survey area; however, they represent the actual total without the rounding error(s). Appendix B provides representative photographs of the survey area.

Table 1. Vegetation Communities and Land Cover Types within the Survey area

Vegetation Community/ Land Cover Type	SAP Habitat Group	Within Parcels (acres*)	Within 50-foot Survey Buffer (acres*)	Total (acres*)
Disturbed Diegan Coastal Sage Scrub	C	0.448	0.003	0.451
Southern Riparian Forest	A	0.518	0.868	1.386
Open Water	A	0.018	0.035	0.054
Developed Land	-	0.455	2.184	2.639
Disturbed Land	F	8.109	0.542	8.650
Iceplant	F	0.454	--	0.454
Ornamental	F	0.138	0.302	0.440
Ruderal	F	0.841	--	0.841
	TOTAL**	**10.981**	**3.935**	**14.915**

*Acreages are approximate and rounded to the nearest thousandth of an acre.
**Total acreages represent the actual acreages without the rounding error.

3.2.1 Disturbed Diegan Coastal Sage Scrub (Oberbauer Code 32510, Updated Holland Code 32500)

Diegan coastal sage scrub is a vegetation community that consists mainly of low, soft-woody sub-shrubs (approximately 3 feet high) that are most actively growing in winter and early spring. Many taxa within this community are facultatively drought-deciduous. Stem- and leaf-succulents are also often present but are usually not conspicuously dominant species. Dominant shrub species in this vegetation type vary, depending on local site factors and levels of disturbance. Diegan coastal sage scrub is typically found on dry sites, such as steep, south-facing slopes or clay-rich soils ranging from coastal Los Angeles County into northern Baja California, Mexico.

Disturbed Diegan coastal sage scrub is similar to Diegan coastal sage scrub, described above, but it was classified as disturbed where mechanical or natural disturbance has reduced the overall cover of the community resulting in large areas colonized by herbaceous weedy species and/or bare ground. Some disturbance types include clearing, grading, scraping, off-road vehicle damage, or illegal trash disposal.

Approximately 0.451 acre of disturbed Diegan coastal sage scrub occurs within three small patches within the survey area, including approximately 0.448 acre on the southern parcel and approximately 0.003 acre in the 50-foot survey buffer (Appendix A: Figure 4). The disturbed Diegan coastal sage scrub is moderately dense with shrub heights primarily ranging from 1 to 4 feet, and is dominated by native plant species such as California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), but also contains a high proportion of non-native plant species, such as crown daisy (*Glebionis coronaria*), black mustard

(*Brassica nigra*), short-pod mustard (*Hirschfeldia incana*), sweet fennel (*Foeniculum vulgare*), Russian thistle (*Salsola tragus*), and chess (*Bromus* spp.). Some areas of disturbed Diegan coastal sage scrub have been altered by mechanical disturbance.

3.2.2 Southern Riparian Forest (Oberbauer Code 61300, Holland Code 61300)

Southern riparian forest is composed of winter-deciduous, broad-leaved tree species that require water near the soil surface and is most often found along stream courses. Typically this community contains a dense canopy of trees located within moist canyons and drainage bottoms and is dominated by species such as willow (*Salix* spp.), cottonwood (*Populus* sp.), and western sycamore (*Platanus racemosa*). Associated understory species can include species such as mulefat (*Baccharis salicifolia*), stinging nettle (*Urtica dioica* ssp. *holosericea*), and wild grape (*Vitis girdiana*).

Approximately 1.386 acres of southern riparian forest occur along Buena Vista Creek within the survey area, including approximately 0.518 acre within the southern parcel boundary and approximately 0.868 acre in the 50-foot survey buffer (Appendix A: Figure 4). This vegetation community contains a moderately dense canopy, primarily ranging in height from 15 to 20 feet, and is dominated by native plant species such as narrow-leaf willow (*Salix exigua*), arroyo willow (*Salix lasiolepis*), mulefat, cattail (*Typha* sp.), wild grape, but also contains non-native plant species such as Brazilian pepper tree (*Schinus terebinthifolius*), giant reed (*Arundo donax*), and castor bean (*Ricinus communis*).

3.2.3 Open Water (Oberbauer Code 64140, Holland Code 64140)

Open water is comprised of year-round bodies of fresh water with extremely low salinity that typically takes the form of lakes, streams, ponds, or rivers. Open water includes portions of water bodies that are usually covered by water and contain less than 10 percent vegetative cover.
Approximately 0.054 acre of open water occurs along Buena Vista Creek within the southeastern portion of the survey area, including approximately 0.018 acre within the southern parcel boundary and approximately 0.035 acre in the 50-foot survey buffer (Appendix A: Figure 4).

3.2.4 Developed Land (No Tier; Oberbauer Code 12000, No Holland Code)

Developed land has been constructed upon or otherwise physically altered to the extent that native vegetation is no longer supported. Developed land contains permanent or semi-permanent structures, pavement or hardscape, and landscaped areas that often require irrigation.

A total of approximately 2.639 acres of developed land occur within the survey area, including approximately 0.455 acre within the southern parcel boundary and approximately 2.184 acres within the 50-foot survey buffer (Appendix A: Figure 4). Within the survey area, developed land occurs as sidewalks, roadways, parking lots, and commercial buildings.

3.2.5 Disturbed Land (Oberbauer Code 11300, No Holland Code)

Disturbed land includes areas that retain a soil substrate but have been physically disturbed by previous human activity. These areas are no longer recognizable as a native or naturalized vegetation community. Vegetation, if present, is typically composed of predominately non-native species introduced and established through human action. These areas are not typically artificially irrigated but receive water from precipitation and runoff. Examples of disturbed land include areas that have been graded, cleared for fuel management purposes, graded construction pads, staging areas, off-road vehicle trails, and old home sites.

A total of approximately 8.650 acres of disturbed land occur throughout the survey area, with approximately 8.109 acres within the two parcel boundaries and approximately 0.542 acre in the 50-foot survey buffer (Appendix A: Figure 4). These areas are within or adjacent to areas that appear to be altered by regular human mechanical disturbance activities, such as grading or brush management. The disturbed land is dominated by bare ground and non-native plant species such as black mustard, tocalote (*Centaurea melitensis*), spotted spurge (*Chamaesyce maculata*), bur-clover (*Medicago polymorpha*), and chess, but also contains scattered native plant species, such as spreading goldenbush (*Isocoma menziesii* var. *menziesii*), tarweed (*Deinandra fasciculata*), coyote brush (*Baccharis pilularis*), and dove weed (*Croton setigerus*).

3.2.6 Iceplant (No Oberbauer Code, No Holland Code)

Iceplant is not a vegetation community described by Holland (1986) or Oberbauer et al. (2008). However, it was used for the vegetation mapping for the proposed project to indicate areas that are dominated by iceplant (*Carpobrotus* ssp.), which has been introduced and established through human action. Areas mapped as iceplant are no longer recognizable as a native or naturalized vegetation community. These areas are not typically artificially irrigated but receive water from precipitation and runoff.

A total of approximately 0.454 acre of iceplant occurs within five small patches in the survey area, all of which occurs on the southeastern parcel boundaries (Appendix A: Figure 4). In addition to non-native iceplant, this land-cover type contains non-native grasses, such as wild oat (*Avena fatua*) and chess.

3.2.7 Ornamental (No Oberbauer Code, No Holland Code)

Ornamental vegetation is not recognized by Holland (1986) or Oberbauer et al. (2008). It typically consists of non-native landscape and/or garden plantings that have been planted in association with buildings, roads, or other development. San Diego County supports more than 250 different types of ornamental trees and numerous other shrubs and herbs that decorate urban areas.

A total of approximately 0.440 acre of ornamental vegetation occurs in small, scattered patches along the perimeter of the survey area, including approximately 0.138 acre

within the parcel boundaries and approximately 0.302 acre within the 50-foot survey buffer (Appendix A: Figure 4). Ornamental vegetation is composed of various non-native plant species used for landscaping, such as Brazilian pepper tree, red gum (*Eucalyptus camaldulensis*), natal plum (*Carissa macrocarpa*), and Mexican fan palm (*Washingtonia robusta*).

3.2.8 Ruderal (No Oberbauer Code, No Holland Code)

Ruderal areas are not recognized by Holland (1986) or Oberbauer et al. (2008). They are typically dominated by non-native, weedy species and are no longer recognizable as a native or naturalized vegetation community. These areas are not typically artificially irrigated but receive water from precipitation and runoff. The species composition in ruderal areas can be similar to the species composition in disturbed areas; however, ruderal areas do no typically receive the frequent mechanical disturbance that occurs in disturbed areas.

A total of approximately 0.841 acre of ruderal vegetation occurs within four small patches in the survey area, all of which occurs within the southern parcel boundaries (Appendix A: Figure 4). These areas are dominated by non-native plant species, such as black mustard, short-pod mustard, tocalote, wild oat, and chess, but also contain scattered native plant species, such as spreading goldenbush, tarweed, and coyote brush.

3.3 ZOOLOGICAL RESOURCES

A total of 47 wildlife species were detected within the survey area during the various general and focused surveys conducted between July 22, 2019 and July 29, 2020, including two butterflies, one reptile, 41 birds, and three mammals. Representative species detected are typical of the habitats present within and adjacent to the survey area and included cabbage white butterfly (*Pieris rapae*), western fence lizard (*Sceloporus occidentalis*), Anna's hummingbird (*Calypte anna*), western scrub-jay (*Aphelocoma californica*), spotted towhee (*Pipilo maculatus*), house finch (*Carpodacus mexicanus frontalis*), and California ground squirrel (*Spermophilus beecheyi*). A list of wildlife species detected within the survey area is included as Appendix D.

3.4 SENSITIVE BIOLOGICAL RESOURCES

Sensitive biological resources include sensitive vegetation communities, sensitive plant and wildlife species, wildlife movement corridors and nursery sites, and jurisdictional resources. For purposes of this report, "sensitive species" are defined as draft Oceanside SAP-covered species; species considered rare, threatened, endangered, endemic, and/or sensitive by USFWS, California Native Plant Society (CNPS), and/or CDFW; and avian species covered by the Migratory Bird Treaty Act (MBTA) and/or California Fish and Game Code (CFGC) Section 3503.5.

Assessments for the potential occurrence of sensitive biological resources are based upon known ranges, habitat preferences for the species, historical species occurrence

records from the CNDDB (CDFW 2019a), and species occurrence records from the vicinity of the BSA from other databases (County of San Diego 2019, CNPS 2019, USFWS 2019c). No focused sensitive species surveys were conducted for the proposed project. The following sections provide definitions for each of these sensitive biological resources and describe the sensitive biological resources that are known to occur or have a potential to occur within and/or adjacent to the survey area.

3.4.1 Sensitive Vegetation Communities

Sensitive vegetation communities are vegetation assemblages, associations, or subassociations that have cumulative losses throughout the region, have relatively limited distribution, support or potentially support sensitive species, or have particular value to other wildlife. Typically, sensitive vegetation communities are considered sensitive whether or not they have been disturbed. Sensitive vegetation communities are regulated by various local, state, and federal resource agencies.

The sensitive vegetation communities that occur on-site include the following:

- Approximately 0.451 acre of disturbed Diegan coastal sage scrub
- Approximately 1.386 acres of southern riparian forest
- Approximately 0.054 acre of open water

3.4.2 Sensitive Plant Species

For purposes of this report, sensitive plant species include those that are (1) listed as threatened or endangered or proposed for listing by federal or state agencies; (2) California Rare Plant Ranks (CRPR) List 1 or List 2 (CNPS 2019); or (3) considered rare, endangered, or threatened by CDFW (CDFW 2019b) or other local conservation organizations or specialists. Noteworthy plant species are considered to be those that are CRPR List 3 or List 4 (CNPS 2019).
The literature review and database search resulted in a list of 56 sensitive plant species that have historically occurred within 3 miles of the proposed project survey area. All 56 species along with their current status, habitat description, and potential for occurrence are included in Appendix E.

Focused sensitive plant species surveys were conducted for the proposed project in 2020. The results of these sensitive plant species surveys are summarized below. The full sensitive plant species survey summary report is included as Appendix F, and the full *Brodiaea* species survey summary report is included as Appendix G.

Only one sensitive plant species – San Diego sagewort – was observed during the general and focused surveys conducted for the proposed project.

Focused Sensitive Plant Species Surveys

Based on the weather and blooming trends observed in San Diego County during spring 2020, two rounds of surveys were planned. Ed Kentner (Kentner Botanical) conducted the first focused sensitive plant survey on May 15, 2020; however, when he arrived at the proposed project site on June 8, 2020, to conduct the second focused sensitive plant survey, he found that the site had been mowed sometime between the afternoon of June 4, 2020, and the morning of June 8, 2020. Therefore, the second sensitive plant survey was not conducted. A complete list of plant species observed on-site during the 2019 general biological survey, 2019 focused jurisdictional delineation, and/or 2020 focused sensitive plant surveys is included as Appendix C.

The results of the sensitive plant species surveys and focused *Brodiaea* species surveys were used to reevaluate the potential for occurrence for the initial 56 sensitive plant species with a potential for occurrence within the proposed project survey area (Attachment 2). Of the 56 species, 52 are not expected to occur on-site based on the existing site conditions and the results of the May 2020 sensitive plant survey. Of the remaining four, only one – San Diego sagewort – was observed on-site. The other three – southern tarplant (*Centromadia parryi* ssp. *australis*), smooth tarplant (*Centromadia pungens ssp. laevis*), and Del Mar Mesa sand aster (*Corethrogyne filaginifolia* var. *linifolia*) – were not observed during the May 2020 sensitive plant survey; however, the site was mowed before the June 2020 sensitive plant survey, when these species would have been observable if on-site. Therefore, there is still a low to moderate potential for occurrence for each of these species. Detailed species accounts for these four species are provided below.

San Diego Sagewort

San Diego sagewort is a CRPR 4.2 species (limited distribution and moderately threatened in California). It is a deciduous shrub in the Asteraceae family that typically blooms from May to September. This species is found in mesic, sandy soils along drainages in chaparral, coastal sage scrub, and riparian habitats (CNPS 2020). San Diego sagewort is known from San Diego County and in Baja California, Mexico, at elevations between 0 and 2,230 feet amsl (Calflora 2020). This species is threatened by development, flood control projects, and possibly by non-native plant species (CNPS 2020).

San Diego sagewort is present adjacent to and south of the survey area (Appendix A: Figure 4). This species was observed along the southern bank of Buena Vista Creek during the 2019 general biological survey, 2019 focused jurisdictional delineation, and 2020 focused sensitive plant surveys. It is within the proposed project survey area but well outside the proposed project footprint.

Southern Tarplant

Southern tarplant is a CRPR 1B.1 species (rare, threatened, or endangered in California and elsewhere). It is an annual herb in the Asteraceae family that typically blooms from

May to November. This species is found in vernal pools, along the margins of marshes, and in vernally mesic areas within grasslands (CNPS 2020). Southern tarplant is known from coastal California, from Santa Barbara County south into Baja California, Mexico, at elevations between 0 and 1,410 feet amsl (Calflora 2020). This species is threatened by habitat disturbance, population fragmentation, urbanization, development, illegal vehicle activity, foot traffic, grazing, and competition from non-native plants (CNPS 2020).

Southern tarplant has a low to moderate potential to occur within the proposed project survey area. While no historical species occurrence records for southern tarplant exist within 3 miles of survey area (CDFW 2020a), marginally suitable habitat exists within the survey area. The survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.

Smooth Tarplant

Smooth tarplant is a CRPR 1B.1 species (rare, threatened, or endangered in California and elsewhere). It is an annual herb in the Asteraceae family that typically blooms from April to September. This species is found in alkaline soils associated with chenopod scrub, meadows and seeps, playas, riparian woodland, and grasslands (CNPS 2020). Smooth tarplant is known from Los Angeles, Riverside, San Bernardino, and San Diego counties (CNPS 2020) at elevations between 330 to 2,000 feet amsl (Calflora 2020). This species is threatened by foot traffic, agriculture, road maintenance, disking, urbanization, hydrological alterations, and flood control projects (CNPS 2020).

Smooth tarplant has a low to moderate potential to occur within the proposed project survey area. Historical species occurrence records for smooth tarplant exist within 3 miles of survey area (CDFW 2020a), but only marginally suitable habitat exists within the survey area, and the survey area is just outside of the known elevation range for this species. The survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.

Del Mar Mesa Sand Aster

Del Mar Mesa sand aster is a CRPR 1B.1 species (rare, threatened, or endangered in California and elsewhere) and a proposed Oceanside Subarea Plan Narrow Endemic species. It is a perennial herb in the Asteraceae family that typically blooms from May to September. This species is found in sandy soils in coastal bluff scrub, coastal sage scrub, and openings in maritime chaparral (CNPS 2020). Del Mar Mesa sand aster is endemic to San Diego County (CNPS 2020), and is found at elevations between 0 to 425 feet amsl (Calflora 2020). This species is threatened by development, trampling, non-native plant species, and road maintenance (CNPS 2020).

Del Mar Mesa sand aster has a low to moderate potential to occur within the proposed project survey area. Historical species occurrence records for Del Mar Mesa sand aster exist within 3 miles of survey area (CDFW 2020a), but only marginally suitable habitat exists within the survey area. *Corethrogyne filaginifolia* was observed during the May

2020 sensitive plant surveys; however, the survey area was mowed before the planned June 2020 survey, which would have been used to determine if the *Corethrogyne filaginifolia* present on-site is this variety or another more common one.

Focused *Brodiaea* Species Surveys

In addition to the sensitive plant species surveys, BBS conducted focused surveys for thread-leaved brodiaea and Orcutt's brodiaea. BBS biologist Erik LaCoste conducted site checks within suitable habitat identified within the proposed project survey area to document early emergent *Brodiaea* vegetation. These site checks occurred on February 14 and 25 as well as March 5, 13, and 19, 2020, in conjunction with the focused fairy shrimp surveys that were conducted for the proposed project.

To determine when to initiate focused surveys, BBS biologist Melissa Busby coordinated with regional biologists who were monitoring reference sites during the 2020 survey window to determine when other *Brodiaea* populations within the vicinity of the proposed project had emerged and were observable. In addition, BBS biologist Charles Vettes monitored a known reference population in the vicinity of the proposed project to determine when *Brodiaea* species in close proximity to the proposed project had emerged and were observable. During his site visit on May 7, 2020, Charles Vettes documented that the thread-leaved brodiaea at the reference population had emerged but only a few were blooming and easily observable. In addition, Erik LaCoste documented blooming Orcutt's brodiaea on June 2, 2020, during a survey for an additional nearby property.

Following the observation of thread-leaved brodiaea at the nearby reference population on May 7, 2020, BBS biologists began focused, presence/absence surveys within the proposed project survey area. Six surveys were conducted by BBS biologists between May 14 and June 15, 2020. No thread-leaved brodiaea or Orcutt's brodiaea were observed during the first four focused *Brodiaea* species surveys conducted between May 14 and June 4, 2020. Between June 4 and June 8, 2020, the proposed project area was mowed. BBS biologists continued to survey the proposed project area for any sign of potential *Brodiaea* species, including two additional surveys on June 12 and June 15, 2020. No potential *Brodiaea* species were documented during these two visits.

3.4.3 Sensitive Wildlife Species

For purposes of this report, sensitive wildlife species include those that are (1) listed as threatened or endangered or proposed for listing by USFWS or CDFW; (2) designated as "fully protected" by CDFW, (3) considered "species of special concern" by CDFW, and/or (4) considered "taxa to watch" by CDFW (CDFW 2019c). Species that are covered by the federal MBTA were also considered. As the list of species covered under the MBTA is extensive, these species are not included in the sensitive wildlife species table. However, they are addressed further in Section 4.1.3 and 5.2.1, below.

The literature review and database search resulted in a list of 46 sensitive wildlife species that have historically occurred within 3 miles of the survey area. All 46 species along with their current status, habitat association, and potential for occurrence are included in Appendix H.

Focused fairy shrimp, coastal California gnatcatcher, and least Bell's vireo surveys were conducted for the proposed project. The results of these sensitive wildlife species surveys are summarized below.

Four sensitive wildlife species – Cooper's hawk (*Accipiter cooperii*), coastal California gnatcatcher, least Bell's vireo, and yellow warbler (*Setophaga petechia*) – were detected during the general and focused surveys conducted for the proposed project.

Focused Fairy Shrimp Surveys

Focused protocol-level fairy shrimp surveys were conducted in 2019/2020 for the proposed project. As stated in Section 2.4.2 above, both wet and dry season fairy shrimp surveys were completed. The full wet season fairy shrimp survey summary report is included as Appendix I, and the full dry season fairy shrimp survey summary report is included as Appendix J. A summary of each of the surveys is described below.

2019/2020 Wet Season Surveys

The 2019/2020 wet season surveys were initiated on December 3, 2019, following the first significant rain event in November/December 2019, and consisted of a total of seven sampling visits by USFWS-permitted biologist Erik LaCoste (TE-027736-6). Wet season surveys continued until March 19, 2020; however, surveys were put on hold on March 24, 2020.

During the 2019/2020 wet season surveys, BBS identified and surveyed a total of 12 basins within the proposed project area (Attachment 1: Figure 4). Basins surveyed included road ruts, ditches, detention basins, and other depressions that became inundated at some point during the 2019/2020 wet season. The majority of the basins in the proposed project area appear to be continually impacted by foot traffic and vehicle activity.

Fairy shrimp were not detected in any basins during the seven surveys that were conducted during the 2019/2020 wet season survey. Additionally, no other aquatic species were observed during these surveys.

2020 Dry Season Surveys

The dry season survey consisted of soil sample collection and soil sample processing and analysis. Soil sample collection was performed by USFWS-permitted biologist Erik LaCoste (TE-027736-6) on August 11, 2020. An appropriate amount of soil was collected from each of the basins identified during the wet season survey. Collected soil was then transferred to Alden Environmental, Inc. for processing and analysis.

Soil sample processing and analysis was by performed in the lab by Alden Environmental, Inc., USFWS-permitted biologist Greg Mason (TE-58862A-1). Following the appropriate methods to separate fairy shrimp cysts from soil samples, it was determined that no cysts were present in the collected soil samples. Water fleas (class Cladocera) and seed shrimp (class Ostracoda) – both common, non-sensitive invertebrate species that occur in ephemeral basins – were identified in basins 3 and 9, respectively.

Because there were no fairy shrimp cysts extracted from any of the soil samples collected from the basins, fairy shrimp hydration, rearing, hatching, and identification was unnecessary and not performed.

Survey Completion

A complete fairy shrimp survey includes a full wet season survey and a full dry season survey. BBS provided USFWS with the results of both the partial wet season surveys and full dry season surveys. BBS also provided detailed survey information about vernal pool indicator plant species and other surveys performed for the proposed project. Based upon the data provided through these discussions, USFWS biologists Janet Stuckrath and David Zoutendyk confirmed in an email on September 15, 2020, that the data provided for the 2019/2020 wet season surveys and the 2020 dry season surveys was adequate to be considered a complete fairy shrimp survey.

Focused Coastal California Gnatcatcher Surveys

Focused, protocol-level coastal California gnatcatcher surveys were conducted for the proposed project. As stated in Section 2.4.3 above, the focused surveys were completed according to the current USFWS survey protocol for this species. The full coastal California gnatcatcher survey summary report is included as Appendix K.

A habitat assessment was conducted by USFWS-permitted biologist Darin Busby (TE-115373-4) on July 22, 2019. A total of approximately 0.57 acre of potentially suitable coastal California gnatcatcher habitat was identified within the proposed project footprint and 300-foot survey buffer during the assessment.

BBS biologists Darin Busby and Charles Vettes (TE-20160B-2) conducted six focused, protocol-level coastal California gnatcatcher surveys between May 7 and June 12, 2020. All surveys were conducted during appropriate weather conditions. Although a gnatcatcher pair was detected by Mr. Busby in the proposed project area during the wetland delineation survey on August 19, 2019, coastal California gnatcatcher was not detected during the 2020 focused, protocol-level surveys.

Focused Least Bell's Vireo Surveys

Focused, protocol-level least Bell's vireo surveys were conducted for the proposed project. As stated in Section 2.4.4 above, the focused surveys were completed

according to the current USFWS survey protocol for this species. The full least Bell's vireo survey summary report is included as Appendix L.

A habitat assessment was conducted by BBS biologist Darin Busby on July 22, 2019. A total of approximately 2.83 acres of potentially suitable least Bell's vireo habitat was identified within the proposed project footprint and 500-foot survey buffer during the assessment.

BBS biologists Darin Busby, Charles Vettes, and Erik LaCoste conducted eight focused, protocol-level least Bell's vireo surveys between May 7 and July 29, 2020. All surveys were conducted during appropriate weather conditions. Although no breeding least Bell's vireo pairs were detected in the proposed project area, a single least Bell's vireo was detected during the eighth and final survey on July 29, 2020. The least Bell's vireo was detected within the 500-foot buffer area southwest of the proposed project area. After a relatively short observation time, the individual least Bell's vireo disappeared downstream towards the west and was not detected again during the survey.

3.4.4 Critical Habitat

Under the ESA, USFWS designates certain areas as "critical habitat" if they determine that these geographic areas are essential for the conservation and/or recovery of a federally listed threatened or endangered species, whether or not the species currently occupies the area. Critical habitat areas often require special management and protection to assure they will remain suitable for the federally listed species for which they have been designated. While federally listed species are protected by the ESA whether or not they are in an area that is designated as critical habitat, projects proposed within or adjacent to critical habitat must demonstrate that implementation of the project would not destroy or significantly impact the functions and values of the critical habitat.

Critical habitat for the coastal California gnatcatcher has been designated within the Buena Vista Creek Mitigation Area, located along the southern boundary of the survey area (Appendix A: Figure 4).

No other critical habitat has been designated within the vicinity of the proposed project.

3.4.5 Wildlife Movement Corridors

Wildlife corridors are essential to maintain populations of healthy and genetically diverse plant and wildlife species. Wildlife corridors are considered sensitive by municipal, state, and federal resource conservation agencies. These corridors allow wildlife to move between adjoining open space areas that are becoming increasingly isolated due to habitat fragmentation urbanization, rugged terrain, and/or changes in vegetation (Beier and Loe 1992).

Wildlife corridors can be classified as either regional corridors or local corridors. Regional corridors are defined as those linking two or more large areas of natural open space, and local corridors are defined as those allowing resident animals to access

critical resources (e.g., food, cover, water) in a smaller area that might otherwise be isolated by some form of urban development (e.g., roads, housing tracts).

Within these wildlife corridors, wildlife movement activities typically fall into one of three movement categories: (1) dispersal (i.e., juvenile animals from natal areas or individuals extending range distributions), (2) seasonal migration, and (3) movement related to home range activities (e.g., foraging for food or water, defending territories, searching for mates).

The proposed project is dominated by disturbed and ruderal land that completely surrounded by commercial and residential development with the exception of the narrow riparian corridor along the southern boundary. Despite being surrounded by urban development, noise, and lighting, the riparian corridor provides a vital swath of undeveloped open space that appears to provide limited yet sufficient connectivity to be considered part of both a local and regional wildlife corridor. The proposed project site, however, is outside of the Wildlife Corridor Planning Zone (WCPZ).

3.4.6 Jurisdictional Resources

Jurisdictional resources are considered sensitive biological resources and are regulated by the USACE, CDFW, RWQCB, and/or the City of Oceanside pursuant to federal, state, and local regulations, outlined below.

USACE regulates the discharge of dredged and/or fill material, both temporary and permanent, into Wetland and Non-Wetland WoUS, pursuant to Section 404 of the CWA. USACE Non-Wetland WoUS are delineated by the lateral and upstream/downstream extent of the OHWM. USACE Wetland WoUS are areas that contain wetland hydrology, hydric soils, and hydrophytic vegetation. Swales and erosional features (e.g., gullies; small washes characterized by low volume, infrequent, and short duration flow) are generally not considered WoUS because they are not tributaries or they do not have a significant nexus to downstream TNWs.

RWQCB regulates wastewater discharge, dredged and/or fill material, or other alterations of Wetland and Non-Wetland WoS, including isolated waters such as vernal pools and other waters showing lack of connectivity to a TNW, pursuant to Section 401 of the CWA and Section 13000 et. seq. of the CWC under the Porter-Cologne Water Quality Control Act.

CDFW regulates activities that would substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake, pursuant to CFGC Section 1600 et. seq.. CDFW typically extends its jurisdictional limit to the top of a stream, the bank of a lake, or the outer edge of the riparian vegetation, whichever is wider. CDFW Streambeds include watercourses having a surface or subsurface flow that supports riparian vegetation. In addition, CDFW asserts jurisdiction over vernal pools when California state threatened and/or endangered species are present.

Jurisdictional status is preliminary, and the regulatory agencies will make a final determination of jurisdictional boundaries. Thus, these resources are referred to as 'potentially jurisdictional' until finalized through coordination with the resource agencies. The wetlands and riparian area within and adjacent to Buena Vista Creek in the southern portion of the survey area were the only potentially jurisdictional resources identified within the survey area. Buena Vista Creek is an intermittent creek that occurs along the southern boundary of the proposed project area and runs from east to west, eventually connecting to Buena Vista Lagoon and the Pacific Ocean approximately 4 miles west of the survey area. A desktop review of historical aerial imagery of the survey area does not show any clear evidence of potentially jurisdictional resources outside of Buena Vista Creek, which was later confirmed during the jurisdictional delineation (NETR 2019); therefore, data was collected only at Sample Points along Buena Vista Creek.

Buena Vista Creek receives moderate to high velocity water flows during wet times of the year, when groundwater and direct precipitation provide water for stream flow, and then receives either low velocity water flows from direct precipitation and urban runoff or no flows during dry times of the year when groundwater has dropped. Buena Vista Creek supported low velocity flows at the time of the jurisdictional delineation on August 29, 2019. Buena Vista Creek enters the proposed project area through a large box culvert in the southeastern corner of the survey area where it transitions from an open concrete channel upstream, east of Thunder Drive, to an earthen, riparian lined drainage within the proposed project area. Buena Vista Creek runs west to exit the proposed project area in the southwestern corner of the survey area where it continues as an earthen, riparian lined drainage off-site. The intermittent flow regime in Buena Vista Creek allows the portion of the drainage within the proposed project area to support mature southern riparian forest.

The following two sections describe the data that was collected at each Sample Point during the jurisdictional delineation on August 29, 2019, and the summary of potentially jurisdictional resources that occur within the approximately 14.915-acre survey area. Additional information can be found in the Jurisdictional Delineation Report, which is included as Appendix G to this BTR.

Summary of Sample Points

A total of six Sample Points were investigated in or adjacent to locations representative of potentially jurisdictional areas along Buena Vista Creek in the southern portion of the survey area (Appendix G). Soil pits were excavated to depths of 16 to 18 inches at all six Sample Points. Data collected at these Sample Points were recorded on USACE *Wetland Determination Data Forms – Arid West Region Version 2.0* (USACE 2008; Appendix G). Photographs of each wetland Sample Point as well as other representative photographs of these potentially jurisdictional resources are included as part of Appendix G of this report.

To summarize, Sample Points 1, 3, and 5 were determined to be within the limits of a potentially jurisdictional USACE and RWQCB Wetland WoUS and WoS and potentially

jurisdictional CDFW Riparian, while Sample Points 4 and 6 were determined to be just within the limits of a potentially jurisdictional CDFW Riparian. Sample Point 2 was determined to be within an upland and not within the limits of a potentially jurisdictional USACE, RWQCB, or CDFW resource. Sample Points were investigated only along the north bank of Buena Vista Creek because the southern bank is outside the project boundary and well beyond any proposed direct or indirect impacts. Because Sample Points were not investigated along the southern bank of Buena Vista Creek, the limits of jurisdictional areas along the southern bank of Buena Vista Creek were inferred based on data collected at Sample Points 1 through 6 along the northern bank of Buena Vista Creek. Additional information on the data collected at each of the six Sample Points along the northern bank of Buena Vista Creek can be found in the Jurisdictional Delineation Report, which is included as Appendix G to this BTR.

Summary of Potentially Jurisdictional Resources

The southern riparian forest along Buena Vista Creek is a potentially jurisdictional USACE and RWQCB Wetland WoUS and WoS and potentially jurisdictional CDFW Riparian; the open water is a potentially jurisdictional USACE and RWQCB Non-Wetland WoUS and WoS and potentially jurisdictional CDFW Streambed; and a portion of the disturbed land, developed land, and iceplant adjacent to Buena Vista Creek is a potentially jurisdictional CDFW Streambed (Appendix A: Figure 5 and Appendix G). Table 2 provides a breakdown of the potentially jurisdictional resources within the survey area. Figure 5 (Appendix A) provides the locations of these potentially jurisdictional resources and Appendix G provides representative photographs of the potentially jurisdictional resources and each Sample Point.

Table 2. Potentially Jurisdictional Resources within Survey Area

Regulatory Agency	Linear Feet	Acres*	Square Feet	Width Range (feet)
USACE/RWQCB				
Wetland WoUS/WoS	760	0.646	28,121	20 - 55
Non-Wetland WoUS/WoS	41	0.054	2,349	15 - 45
TOTAL	**801**	**0.700**	**30,470**	**15 - 55**
CDFW				
Riparian	760	1.386	60,371	70 - 105
Streambed	212	0.122	5,270	82 - 90
TOTAL	**972**	**1.508****	**65,640**	**70 - 105**

*Acreages are approximate and rounded to the nearest thousandth of an acre.
**Total acreages represent the actual acreages without the rounding error.

Potential USACE Jurisdiction

Potential USACE jurisdiction within the survey area totals approximately 0.700 acre, composed of approximately 0.646 acre of Wetland WoUS and approximately 0.054 acre of Non-Wetland WoUS (Appendix A: Figure 5; Appendix G). The potential USACE Wetland WoUS include the southern riparian forest along the portion of Buena Vista Creek within the survey area, and the potential USACE Non-Wetland WoUS include open water within Buena Vista Creek at the eastern end of the survey area (Appendix A: Figure 5; Appendix G).

Potential RWQCB Jurisdiction

There are no potentially jurisdictional isolated WoS within the survey area subject to exclusive RWQCB jurisdiction pursuant to the State Porter-Cologne Water Quality Control Act. Therefore, the RWQCB's potential jurisdiction extends to all potential USACE WoUS within the survey area, which includes a total of approximately 0.700 acre, composed of approximately 0.646 acre of Wetland WoS and approximately 0.054 acre of Non-Wetland WoS (Appendix A: Figure 5; Appendix G). The potential RWQCB Wetland WoS include the southern riparian forest along the portion of Buena Vista Creek within the survey area, and the potential RWQCB Non-Wetland WoS include open water within Buena Vista Creek at the eastern end of the survey area (Appendix A: Figure 5; Appendix G).

Potential CDFW Jurisdiction

Potential CDFW jurisdiction within the survey area totals approximately 1.508 acres, composed of approximately 1.386 acres of Riparian and approximately 0.122 acre of Streambed (Appendix A: Figure 5; Appendix G). Potential CDFW Riparian includes the southern riparian forest along the portion of Buena Vista Creek within the survey area, and potential CDFW Streambed includes open water, disturbed land, developed land, and iceplant within and adjacent to Buena Vista Creek that are outside the CDFW Riparian areas but between the lateral limits of the stream banks (Appendix A: Figure 5; Appendix G).

SECTION 4.0 – REGULATORY CONTEXT

This section provides a summary of the federal, state, and local regulations that are applicable to the proposed project

4.1 APPLICABLE FEDERAL REGULATIONS

Applicable federal regulations that apply to the proposed project are discussed in this section.

4.1.1 Federal Endangered Species Act

The federal ESA, which is administered by USFWS, provides the legal framework for the listing of species that are threatened and/or endangered with extinction as well as for the protection of listed species (i.e., threatened or endangered species) and their habitats. Projects activities that jeopardize threatened or endangered species and the habitats upon which they rely are considered 'take' under the ESA. The ESA defines 'take' as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct."

4.1.2 Rivers and Harbors Act & Clean Water Act

The Rivers and Harbors Act of 1899 and the CWA provide guidance for project activities within non-marine traditional navigable waters (TNWs) and/or WoUS. The discharge of any pollutant from a point source into TNWs is illegal unless a permit under the CWA's provisions is acquired. Permitting for projects that include both permanent and temporary dredging and filling in Wetlands and WoUS is overseen by the USACE under Section 404 of the CWA. Projects can be permitted on an individual basis or covered by one of several approved nationwide permits or regional general permits. In addition, RWQCB issues Water Quality Certifications under Section 401 of the CWA for project activities that fill or dredge within Wetland and Non-Wetland WoUS and WoS, including isolated waters such as vernal pools and other waters showing lack of connectivity to a TNW.

4.1.3 Migratory Bird Treaty Act

All migratory bird species that are native to the U.S. or its territories are protected under the federal MBTA, as amended under the Migratory Bird Treaty Reform Act of 2004. The MBTA prohibits the killing or transport of native migratory birds or any part, nest, or egg of any such bird unless allowed by another regulation adopted in accordance with the MBTA. No permit is issued under the MBTA, and the MBTA does not mandate specific protection measures. However, typical pre-construction requirements include nesting bird surveys during the avian breeding season and avoidance measures if nesting birds are discovered within or adjacent to a project. In addition, the USFWS commonly places restrictions on disturbances allowed near active raptor nests.

4.2 APPLICABLE STATE REGULATIONS

Applicable state regulations that apply to the proposed project are discussed in this section.

4.2.1 California Environmental Quality Act

The California Environmental Quality Act (CEQA) requires an environmental review for projects with potentially adverse impacts on the environment. Adverse environmental impacts are typically mitigated in accordance with existing state laws and regulations.

4.2.2 California Endangered Species Act

The California Endangered Species Act (CESA) is similar to the federal ESA in that it provides the legal framework for the listing and protection of species (and their habitats) that are identified as being endangered or threatened with extinction. CESA is administered by CDFW and allows "take" of listed plant and wildlife species either by concurring with a federal Incidental Take Permit under the CFGC Section 2080.1 or, for species that are state-listed but not federally listed, issuing an Incidental Take Permit under CFGC Section 2081 if specific criteria are met. The Oceanside SAP is considered an Incidental Take Permit pursuant to CFGC Section 2081.

4.2.3 California Fish and Game Code

The CFGC provides protection for several types of sensitive biological resources. CFGC Section 3503 and 3513 protects avian species, their nests, and their eggs from being "taken" unless authorized by CDFW through implementation of appropriate avoidance, minimization, and/or mitigation measures. CFGC Sections 1600 through 1603 regulate project activities within rivers, streams, lakes, wetlands, and riparian habitat. CDFW can issue a Lake or Streambed Alteration (LSA) Agreement for projects affecting these jurisdictional resources. If the activity will not substantially adversely affect any CDFW jurisdictional resources, the entity may commence the activity without a LSA Agreement.

4.2.4 Native Plant Protection Act

The Native Plant Protection Act (NPPA), under CFGC Sections 1900 through 1913, regulates collection, transport, and commerce in plants that are listed as rare or endangered.

4.2.5 Natural Community Conservation Planning Act

CDFW's Natural Community Conservation Planning Act (NCCP Act) is a combined effort by the State of California and both public and private partners to take an ecosystem approach to protecting and preserving biological diversity. CDFW and USFWS provide support, direction, and guidance to local agencies to develop an NCCP

that identifies economic activity that is compatible with the longterm, regional protection of plants, wildlife, and their habitats. The applicable NCCP for the proposed project – the Oceanside SAP within the MHCP – is discussed in Local Regulations, below.

4.2.6 Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act regulates water quality for project activities in California. Pursuant to the Porter-Cologne Act, under Section 13000 et seq. of the California Water Code (CWC), the RWQCB issues Water Quality Certifications for project activities that fill or dredge within Wetland and Non-Wetland WoUS and WoS, including isolated waters – such as vernal pools – and other waters showing lack of connectivity to a TNW.

4.3 APPLICABLE LOCAL REGULATIONS

Applicable local programs and regulations are discussed in this section.

4.3.1 North County Multiple Habitat Conservation Plan

The North County Multiple Habitat Conservation Plan (MHCP; SANDAG 2003) is a comprehensive conservation planning process that was developed to create, manage, and monitor an ecosystem preserve in northwestern San Diego County. It is one of three subregional plans that will contribute to a regional preserve system in San Diego County. The MHCP is intended to conserve not only habitat that is already in public ownership but also other areas that will offer protection to rare, threatened, and endangered plants and wildlife.

The MHCP was adopted and certified by the SANDAG Board of Directors on March 28, 2003. The MHCP encompasses the cities of Carlsbad, Encinitas, Escondido, Oceanside, San Marcos, Solana Beach, and Vista. Each of these cities must adopt its own SAP that identifies city-specific regulations and policies pertaining to the sensitive resources found within that jurisdiction.

4.3.2 Draft Oceanside Subarea Plan

The draft Oceanside SAP (City of Oceanside 2010) is a draft Habitat Conservation Plan/Natural Community Conservation Plan (HCP/NCCP) prepared pursuant to the ESA and the NCCP Act, both described above. This SAP is a component of the MHCP and addresses how the City of Oceanside will conserve the biodiversity and ecosystem function in the City of Oceanside and surrounding areas while also allowing for continued economic development within its jurisdiction.

The draft Oceanside SAP has not been adopted by City Council, and implementing agreements with CDFW and USFWS have not been signed; therefore, incidental take permits currently cannot be issued under the draft Oceanside SAP. However, the draft Oceanside SAP provides guidance for project proponents to determine potential impacts to biological resources that may result from implementation of a proposed

project and to develop appropriate avoidance, minimization, and mitigation measures to reduce proposed project impacts to below a level of significance.

Until the draft Oceanside SAP is officially adopted, proposed projects within the City of Oceanside will need to comply with other state and federal regulations, and project proponents will have to coordinate with CDFW and/or USFWS to obtain incidental take permits for their projects.

Applicable sections of the draft Oceanside SAP include the Preserve Design and Assembly, Vegetation Community Mitigation Standards, Narrow Endemic Species Standards, Wetlands Mitigation Standards, Conservation and Buffer Requirements along Tributaries and Creeks, Off-site Mitigation Zone, and Fire and Fuel Management Standards. These are discussed in further detail, below.

Preserve Design and Assembly

Under the draft Oceanside SAP, a habitat conservation program was designed, which includes the establishment of the City of Oceanside's Preserve. The Preserve will include a variety of conserved lands, including both existing and proposed conservation banks, public and private open space, on-site and off-site mitigation land for future projects, and other lands dedicated in the future for conservation purposes. Opportunities and constraints associated with biologically valuable lands were examined during the draft Oceanside SAP Preserve assembly process. Properties that, if conserved, would best achieve the biological goals of the plan while minimizing the detrimental effects on other land use issues (e.g., property rights, economic benefits) were identified to be incorporated into the Preserve. The draft Oceanside SAP habitat conservation program is anticipated to result in the preservation of 2,873 acres of natural habitat within the City of Oceanside.

In addition to future acquisitions, the draft Oceanside SAP Preserve includes lands that currently are designated and managed as conservation banks or mitigation areas. One of the Major Mitigation Areas – the Buena Vista Creek Mitigation Area – is located along the southern boundary of the proposed project. The approximately 3.32-acre site served as mitigation for the Mossy Nissan car dealership located at just west of College Boulevard and south of Haymar Drive in the Off-site Mitigation Zone.

Narrow Endemic Species Standards

A Narrow Endemic Species is a term used for "species that are highly restricted by their habitat affinities, edaphic requirements, or other ecological factors, and that have limited but important populations within the MHCP area, such that substantial loss of these populations or their habitat within the MHCP area might jeopardize the continued existence or recovery of that species" (City of Oceanside 2010). The draft Oceanside SAP classifies 16 plant species and 6 wildlife species as Narrow Endemic Species.

For Narrow Endemic Species, the policies outlined in the MHCP and incorporated into the draft Oceanside SAP require maximum avoidance of project impacts, minimization

of unavoidable impacts, and species-specific mitigation measures for unavoidable impacts, with a goal of achieving no net loss of these populations within the Focused Planning Area (FPA), and no more than 20 percent total loss in the City of Oceanside.

Mitigation options for unavoidable impacts are discussed in Section 7 of the draft Oceanside SAP. Regardless of the mitigation measures, the City of Oceanside may not permit more than a 5 percent overall loss of a Narrow Endemic Species population or occupied acreage, whichever is most appropriate for the species as determined by the City of Oceanside and Wildlife Agencies, within Focused Planning Areas, or more than a 20 percent overall loss within the entire City of Oceanside.

Wetlands Mitigation Standards

The draft Oceanside SAP addresses avoidance, minimization, and mitigation measures for wetland habitats subject to potential impacts. All unavoidable impacts to wetlands and wetland habitats must be reviewed and approved by federal and/or state agencies having jurisdiction over those areas, and all projects will be required to comply with these terms, which meet federal and MHCP policies of no net loss of wetland functions and values. Wetland habitats are expected to continue to be regulated by federal and state agencies; however, the permitting process is expected to be expedited upon confirmation that a proposed project is consistent with the conditions outlined in the final Oceanside SAP and MHCP. Compliance with the final Oceanside SAP and MHCP will constitute the full extent of mitigation measures required or recommended by CDFW and/or USFWS for potential take of wetland dependent covered species.

The following standards and policies apply to all wetland vegetation communities within the City of Oceanside:

- **No Net Loss Policy.** For all wetland vegetation communities (Table 5-2 of the draft Oceanside SAP) the City of Oceanside will require, in priority order, maximum avoidance of impacts, minimization of unavoidable impacts, and mitigation of unavoidable impacts. Mitigation of unavoidable impacts will be designed to achieve no net loss of both wetland vegetation acreage and biological functions and values within the City of Oceanside.

- **Findings for Unavoidable Impacts.** Any proposed project that is anticipated to directly or indirectly impact wetlands or wetland vegetation communities anywhere within the City of Oceanside will fully disclose and analyze such impacts in a CEQA document and in a findings document prepared under a City of Oceanside implementing ordinance that addresses consistency with the Oceanside SAP and MHCP. The CEQA document or findings document must fully analyze and factually substantiate that impacts to wetlands were avoided and or that they area minimized to the maximum extent possible while maintaining some economic or productive use of the property. Feasible alternatives to avoid the impacts shall be described and analyzed, and reasons that these alternatives were not pursued shall be fully described and factually substantiated.

For unavoidable impacts, all feasible means of minimizing encroachment into wetlands or wetland vegetation communities shall be fully addressed. The alternative that has the fewest overall anticipated impacts is defined as that which has the least impact on sensitive biological resources and Preserve configuration, considering both wetland and upland impacts together.

- **Mitigation for Unavoidable Impacts.** To achieve the no net loss standard, mitigation for unavoidable impacts (e.g., wetland habitat creation) should occur on-site or within the affected drainage and/or watershed. Off-site mitigation may occur as long as the mitigation site contributes to the City of Oceanside's preserve design and has biological functions and values (e.g., by adjacency to other preserve areas) similar to or better than the wetland resource that is being impacted. All wetland mitigation sites shall be designated as Preserve, be protected by conservation easements, and be managed in perpetuity for their biological resources and value.

Conservation and Buffer Requirements along Tributaries and Creeks

For proposed projects that include development or other discretionary actions that are proposed in or adjacent to riparian habitats (not including the San Luis Rey River), the riparian area and other wetland habitats or associated natural habitats shall be designated as biological open space and incorporated into the Preserve. In addition, a 100-foot upland buffer on riparian habitats, which starts at the edge of the riparian vegetation, shall be established and will include a minimum 50-foot biological buffer plus a minimum 50-foot planning buffer. The 50-foot biological buffer shall occur immediately adjacent to the riparian habitat, and the following uses are prohibited in the 50-foot biological buffer: (1) new development; (2) foot paths, bikeways, and passive recreational uses not already planned; and (3) fuel modification activities for new development. In the event that natural habitats do not occur within the 50-foot biological buffer at the time of proposed project implementation, native habitats appropriate to the location and soils (e.g., coastal sage scrub). The 50-foot planning buffer shall occur immediately adjacent to the biological buffer and shall serve as an area of transition between the 50-foot biological buffer and specified land uses on adjoining uplands.

Off-site Mitigation Zone

Impacts to biological resources within the Off-site Mitigation Zone must be mitigated within the WCPZ or Pre-approved Mitigation Areas. On-site mitigation credit is generally *not* allowed within the Off-site Mitigation Zone, with the following exceptions:

- **Pre-approved Mitigation Areas**. Lands designated as Pre-approved Mitigation Areas that occur within the Off-site Mitigation Zone may receive on-site mitigation credit.

- **Narrow Endemic Species**. On-site mitigation credit may be allowed if the on-site mitigation will conserve a significant population of a narrow endemic species.

- **Wildlife Agency Approved Site.** Lands that contain critical wetlands, coastal California gnatcatcher habitat, or habitat for other covered species may receive on-site mitigation credit if written approval from the applicable wildlife agencies is obtained.

Fire and Fuel Management Standards

For all future development projects, fire breaks and fuel modification zones must be addressed in accordance with the City of Oceanside's Fire Ordinance and must be considered part of the development footprint for determining project impacts and mitigation requirements. Proposed projects occurring in or adjacent to an area designated as very high fire hazard zones are required to create a minimum of a 100-foot fuel management zone from all proposed structures. Proposed projects occurring in or adjacent to an area that is not designated as very high hazard is not required to maintain the 100-foot fuel management zones; however, new development must have a minimum setback of 30 feet from small areas of brush and grass. Generally, fuel modification activities in upland habitats (e.g., coastal sage scrub, grassland) include removal of dead brush, selective vegetation thinning, and vegetation trimming that retains root structure to prevent erosion and allows for regrowth of the vegetation. Fuel breaks and fuel modification zones shall not be permitted in the 50-foot biological buffer or in the 50-foot planning buffer and cannot be counted as biological open space for the purpose of determining on-site or off-site mitigation credit.

SECTION 5.0 – PROPOSED PROJECT IMPACTS

Biological resources may be either directly or indirectly impacted by a project. Furthermore, direct and indirect impacts may be permanent or temporary in nature. These types of impacts are defined as follows:

- ***Direct impacts*** are defined as any disturbance, alteration, or destruction of biological resources that could result from project related activities. Examples of direct impacts include diverting surface water flows, encroaching into wetlands, clearing vegetation, and taking an individual species and/or its associated plant communities.

- ***Indirect impacts*** are defined as any disturbance, alteration, or destruction of biological resources that could result from project related activities. Examples of indirect impacts include increased human activity, elevated noise and dust levels, decreased water quality, soil compaction, and the introduction of invasive wildlife (i.e., domestic cats and dogs) and plants.

- ***Permanent impacts*** are defined as those that result in the irreversible removal or destruction of biological resources. Examples of permanent impacts include constructing a building or permanent road on an area containing biological resources.

- ***Temporary impacts*** are those impacts considered to have reversible effects on biological resources. Examples of temporary impacts include the removal of vegetation for construction activities and subsequently allowing the natural vegetation to recolonize the impact area, the accumulation of dust on adjacent vegetation during construction, or the increased noise levels that may interfere with the breeding behaviors of wildlife species.

Project impacts can also be classified as cumulative impacts, which are incremental impacts from two or more past, present, or probable future projects whose individual impacts can be individually minor but when combined are considerable. However, if a project complies with the draft Oceanside SAP, it should not result in cumulative impacts to vegetation communities or to covered species.

5.1 CRITERIA FOR DETERMINING IMPACT SIGNIFICANCE

The potential proposed project impacts on biological resources were assessed according to guidelines set forth under CEQA. Based on the CEQA guidelines, an impact would be considered significant if the project would result in one of the following criteria:

A. Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW or USFWS

B. Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS
C. Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other mean
D. Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites
E. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance
F. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan

Significant proposed project impacts would require appropriate avoidance, minimization, and/or mitigation measures to reduce the impacts to below a level of significance.

5.2 PROPOSED PROJECT IMPACT ANALYSIS

Potential impacts to sensitive biological resources identified within and adjacent to the survey area are discussed by Criterion A through F, below.

5.2.1 Criterion A

Would the proposed project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by CDFW or USFWS?

The proposed project has the potential to result in significant impacts to sensitive plant and wildlife species that may occur within and/or adjacent to the proposed project footprint, which includes both the approximately 6.695-acre proposed project development footprint and the approximately 0.346-acre proposed sewer realignment footprint. These potential impacts are discussed in detail, below.

Sensitive Plant Species

Four rounds of focused *Brodiaea* species surveys were conducted within the proposed project survey area, and one round of focused sensitive plant surveys was conducted within the proposed project survey area; however, the proposed project site was mowed prior to the last two planned *Brodiaea* species surveys and prior to the second sensitive plant survey.

Based on the data collected during the *Brodiaea* species surveys and focused sensitive plant surveys, the potential for occurrence for the 56 sensitive plant species that were evaluated for their potential to occur within the survey area was updated. One sensitive

plant species – San Diego sagewort – was observed within the survey area. Of the remaining 55 species, 52 species are not expected to occur within the proposed project survey area, and three – southern tarplant, smooth tarplant, and Del Mar Mesa sand aster – have a low to moderate potential to occur within the survey area.

The proposed project has been designed to include the requisite 100-foot wetland buffer, which includes the 50-foot biological buffer on the jurisdictional resources as well as the requisite 50-foot planning buffer. Therefore, impacts to San Diego sagewort have been avoided, and no additional AMMs (Section 6.0, below) or mitigation measures (Section 7.0, below) are anticipated for this species.

Through implementation of **BIO-1** (Section 7.0, below), pre-construction sensitive plant species surveys would determine the presence/absence of sensitive plant species with a potential to occur within the proposed project survey area and would develop appropriate AMMs (Section 6.0, below) and/or mitigation measures to reduce anticipated impacts to below a level of significance.

Sensitive Wildlife Species

Focused sensitive wildlife surveys were conducted for fairy shrimp, coastal California gnatcatcher, and least Bell's vireo. While results were negative for listed fairy shrimp species and coastal California gnatcatcher, least Bell's vireo was documented in the survey area during surveys. However, because the proposed project would not result in the removal of least Bell's vireo habitat, no direct impacts are anticipated. Therefore, the proposed project has the potential to result in indirect impacts to least Bell's vireo that occur within the survey area. These potential impacts are discussed in further detail, below.

Impacts to Sensitive Invertebrate Species

No fairy shrimp or other sensitive invertebrate species were documented during the general and focused wildlife species surveys conducted for the proposed project. The focused fairy shrimp surveys are valid for 3 years, or until the beginning of the 2022/2023 wet season. Implementation of AMMs (Section 6.0, below) would provide additional resource protection, and implementation of **BIO-2** (Section 7.0, below) would assure that impacts to sensitive invertebrate species remain below a level of significance. As such, no additional AMMs or mitigation measures are anticipated for sensitive invertebrate species.

Impacts to Sensitive Herpetofauna Species

No sensitive herpetofauna species were documented within the proposed project survey area during any of the surveys conducted for the proposed project. The proposed project could result in direct impacts to sensitive herpetofauna species that occur within the proposed project footprint; however, suitable habitat within the proposed project footprint comprises a small fraction of the habitat for the local herpetofauna populations, and it is contiguous with habitat extending east and west within the fully protected

Buena Vista Creek Mitigation Area. The proposed project is not expected to reduce the populations of any herpetofauna species to below a self-sustaining level. Therefore, the proposed project is not anticipated to result in any significant impacts to sensitive herpetofauna species. Implementation of AMMs (Section 6.0, below) would provide additional resource protections to assure that impacts to sensitive herpetofauna remain below a level of significance. As such, no additional AMMs or mitigation measures would be required for sensitive herpetofauna species.

Impacts to Sensitive Bird Species

A pair of coastal California gnatcatchers was documented incidentally during the jurisdictional delineation conducted for the proposed project; however, no coastal California gnatcatchers were detected during the 2020 focused surveys. Therefore, it is assumed that the pair was foraging but not breeding within the proposed project surveys area. In addition, a single, foraging least Bell's vireo was detected during the 2020 focused surveys. Results of these surveys are valid until the beginning of breeding season 2021.

Implementation of AMMs (Section 6.0, below) would provide additional resource protection, and to and **BIO-3** (Section 7.0 below) would assure that impacts to coastal California gnatcatcher remain below a level of significance. As such, no additional AMMs or mitigation measures would be required for coastal California gnatcatcher.

Implementation of AMMs (Section 6.0, below) would provide additional resource protection, and to and **BIO-4** (Section 7.0 below) would assure that impacts to least Bell's vireo remain below a level of significance. As such, no additional AMMs or mitigation measures would be required for least Bell's vireo.

Two other sensitive bird species – Cooper's hawk and yellow warbler – were detected during the general and focused surveys conducted for the proposed project. In addition, other sensitive MBTA-covered bird species have a potential to occur on-site and within the Buena Vista Creek Mitigation Area. The proposed project could result in direct and indirect impacts to Cooper's hawk, yellow warbler, and other MBTA-covered bird species that occur within and adjacent to the proposed project footprint if construction occurs during the breeding season (i.e., January to September for raptors, February to September for other avian species). Implementation of AMMs (Section 6.0, below), specifically the additional resource protection and avian protection requirements, would assure that direct and indirect impacts to MBTA-covered species remain below a level of significance. As such, no additional AMMs or mitigation measures would be required for MBTA-covered species.

Impacts to Sensitive Mammal Species

No direct or indirect impacts to sensitive mammal species are expected to occur from implementation of the proposed project. Implementation of AMMs (Section 6.0, below) would provide additional resource protection to assure that unanticipated impacts to

sensitive mammal species remain below a level of significance. As such, no additional AMMs or mitigation measures would be required for sensitive mammal species.

5.2.2 Criterion B

Would the proposed project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS?

The proposed project has the potential to result in significant impacts to sensitive vegetation communities that occur within and adjacent to the proposed project footprint.

Direct Impacts to Sensitive Vegetation Communities

The proposed project has the potential to result in direct impacts to approximately 7.041 acres of vegetation communities and land cover types identified within the proposed project footprint, including approximately 6.695 acres of permanent, direct impacts within the proposed project development footprint and approximately 0.346 acre within the proposed sewer realignment footprint. These direct impacts are summarized in Table 3, below.

Table 3. Anticipated Impacts on Vegetation Communities/Land Cover Types

Vegetation Community/ Land Cover Type	SAP Habitat Group	Permanent Direct Impacts (acres*)	Temporary Direct Impacts (acres*)	Total Direct Impacts (acres*)
Disturbed Diegan Coastal Sage Scrub	C	0.408	--	0.408
Southern Riparian Forest	A	--	--	--
Open Water	A	--	--	--
Developed Land	-	0.007	0.001	0.007
Disturbed Land	F	5.425	0.209	5.63
Iceplant	F	0.228	0.042	0.270
Ornamental	F	0.124	0.004	0.128
Ruderal	F	0.502	0.090	0.592
	TOTAL**	**6.695**	**0.346**	**7.041**

*Acreages are approximate and rounded to the nearest thousandth of an acre.
**Total acreages represent the actual acreages without the rounding error.

Direct impacts to approximately 6.633 acres of non-sensitive upland habitats (i.e., developed land, disturbed land, iceplant, ornamental, and ruderal) would not be considered significant and would not require any avoidance, minimization, or mitigation measures. As such, these impacts are not discussed further in this report.

Unavoidable direct impacts to approximately 0.408 acre of disturbed Diegan coastal sage scrub would be considered significant. Implementation of AMMs (Section 6.0, below) would provide additional resource protection(e.g., flagging of sensitive resources/work areas, biological monitoring), and implementation of **BIO-5** (Section 7.0, below) would assure that these unavoidable direct impacts to disturbed Diegan coastal sage scrub are reduced to below a level of significance. As such, no additional AMMs or mitigation measures would be required for sensitive mammal species.

No direct impacts to riparian habitat are anticipated to result from proposed project construction. The proposed project has been designed to include the mandatory 100-foot buffer from the riparian habitat boundary, as mapped during the formal jurisdictional delineation conducted in 2019. This 100-foot buffer includes both the 50-foot biological buffer as well as the mandatory 50-foot planning buffer. The proposed project is anticipated to encroach temporarily, approximately 6 feet into a small portion of the 50-foot planning buffer during the proposed sewer realignment (Appendix A: Figure 6). As a result, temporary direct impacts would occur to approximately 0.008 acre (344 square feet) of disturbed habitat within the planning buffer. These impacts are considered temporary because they would recover on their own within one growing season. In addition, because these impacts are so small and because they are located at least 94 feet from the riparian habitat, no direct impacts to riparian habitat is anticipated. Implementation of AMMs (Section 6.0, below) would provide additional resource protection (e.g., flagging of sensitive resources/work areas, biological monitoring) to assure that no significant impacts occur to riparian habitat. As such, no additional AMMs or mitigation measures would be required.

Indirect Impacts to Sensitive Vegetation Communities

Indirect impacts to sensitive vegetation (i.e., disturbed Diegan coastal sage scrub) could occur during proposed project construction. Indirect impacts, including fugitive dust accumulation from adjacent construction activities, could occur to a small patch of disturbed Diegan coastal sage scrub located approximately 15 feet south of the proposed sewer realignment footprint. If the fugitive dust is allowed to remain on the leaves of the individual plants within this sensitive vegetation community, it could interfere with photosynthesis and germination. Implementaiton of AMMs (Section 6.0, below) would provide additional resource protection (e.g., flagging of sensitive resources/work areas, biological monitoring) to assure that indirect impacts to disturbed Diegan coastal sage scrub are avoided. Therefore, no additional AMMs or mitigation measures would be required.

No indirect impacts to riparian habitat are anticipated to result from proposed project construction. The proposed project has been designed to include the mandatory 100-foot buffer from the riparian habitat boundary, as mapped during the formal jurisdictional delineation conducted in 2019. This 100-foot buffer includes both the 50-foot biological buffer as well as the mandatory 50-foot planning buffer. Because the proposed project has been designed to include this 100-foot buffer, no indirect impacts to riparian habitat are anticipated. Implementaiton of AMMs (Section 6.0, below) would provide additional resource protection (e.g., flagging of sensitive resources/work areas, biological

monitoring) to assure that indirect impacts to riparian habitat are avoided. Therefore, no additional AMMs or mitigation measures would be required.

Impacts to Critical Habitat

No impacts to critical habitat are expected to occur from implementation of the proposed project. Critical habitat for the coastal California gnatcatcher has been designated within the Buena Vista Creek Mitigation Area. The proposed project has been designed to include the 100-foot buffer on the riparian vegetation associated with Buena Vista Creek (Appendix A: Figure 6), which equates to an approximately 80- to 140-foot buffer on the designated coastal California gnatcatcher critical habitat. In addition, implementation of Implementaiton of AMMs (Section 6.0, below) would provide additional resource protection (e.g., flagging of sensitive resources/work areas, biological monitoring) to assure that no indirect impacts occur to this critical habitat. As such, no additional AMMs or mitigation measures would be required for critical habitat.

5.2.3 Criterion C

Would the proposed project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other mean?

No impacts to potentially jurisdictional resources are expected to occur from implementation of the proposed project. The proposed project has been designed to include the mandatory 100-foot buffer from the riparian habitat boundary, as mapped during the formal jurisdictional delineation conducted in 2019. This 100-foot buffer includes both the 50-foot biological buffer as well as the mandatory 50-foot planning buffer. Because the proposed project has been designed to include this 100-foot buffer, no impacts to riparian habitat are anticipated. Implementaiton of AMMs (Section 6.0, below) would provide additional resource protection (e.g., flagging of sensitive resources/work areas, biological monitoring) to assure impacts to jurisdictional resources are avoided. As such, no additional AMMs or mitigation measures would be required for jurisdictional resources.

5.2.4 Criterion D

Would the proposed project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?

No impacts to wildlife corridors or native wildlife nursery sites are expected to occur from implementation of the proposed project. The proposed project is not located in the WCPZ; however, Buena Vista Creek and the associated Buena Vista Creek Mitigation Area along the southern boundary of the survey area provide sufficient connectivity to be considered part of both a local and regional wildlife corridor. Because the proposed project has been designed to include the 100-foot buffer on the riparian vegetation

associated with Buena Vista Creek (Appendix A: Figure 6), no impacts to wildlife corridors are anticipated. Implementation of AMMs (Section 6.0, below) would provide additional resource protection (e.g., flagging of sensitive resources/work areas, biological monitoring) to assure that no indirect impacts occur to this wildlife corridor. As such, no additional AMMs or mitigation measures would be required for wildlife corridors.

5.2.5 Criterion E

Would the proposed project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

The proposed project is not anticipated to conflict with any local policies or ordinances. Implementaiton of AMMs (Section 6.0, below) would provide additional resource protection to protect biological resources. In addition, implementation of **BIO-1** through **BIO-5** would assure potential impacts to sensitive biological resources are mitigated to below a level of significance. As such, no additional AMMs or mitigation measures are anticipated.

5.2.5 Criterion F

Would the proposed project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

The draft Oceanside SAP is the only applicable local, regional, or state plan that applies to the proposed project. While the draft Oceanside SAP has not been formally adopted, the proposed project was designed to comply with the measures outlined in the MHCP and the draft Oceanside SAP. Therefore, the proposed project is not anticipated to conflict with the draft Oceanside SAP. As such, no additional AMMs or mitigation measures are anticipated.

SECTION 6.0 – AVOIDANCE & MINIMIZATION MEASURES

The proposed project has been designed to include the following measures to avoid or minimize potential proposed project impacts to the maximum extent feasible. These AMMs were developed pursuant to Section 5.2.8 of the draft Oceanside SAP and include several AMMs and Best Management Practices (BMPs) that should be implemented because the proposed project may result in impacts to sensitive biological resources.

AMM-1: Pre-Construction Measures

Pre-Construction Meeting: A qualified biological monitor shall attend the pre-construction meeting, discuss the project's biological monitoring program with construction contractors, and arrange to perform any follow up mitigation measures and reporting for the proposed project.

Resource Delineation & Protection Measures: Prior to construction activities, a qualified biological monitor shall supervise the placement of orange construction fencing or equivalent along the limits of disturbance adjacent to sensitive biological habitats and verify compliance with any other project mitigation measures. This pre-construction phase shall include flagging sensitive plant species and delineating buffers to protect sensitive biological resources (e.g., habitats, flora and fauna species, nesting birds) during construction activities. In addition, appropriate BMPs shall be installed as applicable to provide fugitive dust control, minimize lighting and noise in adjacent habitats, and avoid the introduction of exotic and invasive plant and animal species into the area. Responsible construction practices as well as storm water and runoff management shall also be included as part of the BMPs.

Contractor Environmental Awareness Training: Prior to commencement of construction activities, a qualified biological monitor shall meet with all construction contractors to conduct an on-site contractor environmental awareness training to discuss the need to avoid impacts outside of the approved construction area and to protect sensitive flora and fauna (e.g., explain construction limits flagging, discuss sensitive resource flagging, review wetland buffers, clarify acceptable access routes/methods and staging areas).

Avian Protection Requirements: To avoid impacts to sensitive avian species (e.g., any species identified as a listed, candidate, sensitive, or special status species; any species covered by the MBTA), vegetation clearing should occur outside of the breeding season for these species (February 1 to September 15). If vegetation clearing must occur during the breeding season, a qualified biological monitor shall conduct a pre-construction survey to determine the presence or absence of nesting birds on the proposed area of disturbance. The pre-construction survey shall be conducted no more than 4 calendar days prior to the start of construction activities (including removal of vegetation). The results

of the pre-construction nesting bird survey shall be submitted to the City of Oceanside for review and approval prior to initiating any construction activities.

If nesting birds are detected, a letter report or mitigation plan shall be prepared and shall include proposed measures to be implemented to ensure that take of birds or eggs or disturbance of breeding activities is avoided. The report or mitigation plan shall be submitted to the City of Oceanside for review and approval and shall implemented to the satisfaction of the City of Oceanside. The qualified biological monitor shall verify and approve that all measures identified in the report or mitigation plan are in place prior to and/or during construction.

AMM-2: Construction Measures

Biological Monitoring: All construction activities, including access and staging, shall be restricted to areas previously identified and depicted on the approved project plans. A qualified biological monitor shall monitor construction activities as needed to verify that construction activities do not encroach into biologically sensitive areas and that, if applicable, the mitigation measures developed to accommodate any sensitive species located during the pre-construction surveys are being implemented. The qualified biological monitor will complete a Daily Biological Monitoring Form to document all construction and monitoring activities.

Subsequent Resource Identification: The qualified biological monitor shall note/act to prevent any new disturbances to habitat, flora, and/or fauna on-site (e.g., flag newly identified sensitive resources for avoidance during access). If active nests or other previously unknown sensitive resources are detected, all project activities that directly impact the resource shall be delayed until species-specific local, state, or federal regulations have been determined and applied by the qualified biological monitor.

AMM-3: Post-Construction Measures

Once the proposed project has been completed, a post-construction report that summarizes the construction activities, actual project impacts, and AMMs/mitigation measures implemented before and during construction will be prepared for the proposed project. If project impacts exceed the approved totals, additional impacts shall be mitigated in accordance with the draft Oceanside SAP and other applicable local, state, and federal laws. The qualified biological monitor shall submit the post-construction report to the City of Oceanside within 30 days of construction completion.

SECTION 7.0 – MITIGATION MEASURES

Mitigation measures are required for significant impacts to sensitive biological resources to reduce impacts to below a level of significance. Mitigation measures typically include compensatory measures for unavoidable impacts. Proposed project activities could result in direct and/or indirect impacts to sensitive biological resources both within and adjacent to the proposed project footprint. The paragraphs below describe general and specific avoidance, minimization, and mitigation measures recommended to reduce potentially significant impacts to sensitive biological resources resulting from the proposed project to below a level of significance.

BIO-1: Sensitive Plant Surveys

The results of the 2020 *Brodiaea* species surveys are valid until spring 2021. The results of the 2020 sensitive plant surveys were incomplete, because the proposed project survey area was mowed prior to the second survey. Because construction is not anticipated to begin before summer 2021, additional focused sensitive plants species surveys should be conducted for the proposed project. These focused surveys should include general rare plant surveys as well as focused Brodiaea species surveys. Two general rare plant surveys should be conducted for the proposed project – one in early spring 2021 and one in late spring/early summer 2021 – to document any sensitive plant species that occur within the survey area. In addition, six focused Brodiaea species surveys should be conducted in spring 2021, with the timing based on the emergence of the species documented during reference site checks.

If no sensitive plant species are documented within the survey area, no additional AMMs or mitigation measures would be required.

If sensitive plant species are documented within the survey area, impacts to these species should be avoided to the extent feasible. Unavoidable impacts should be minimized and/or mitigated through compensatory measures (e.g., restoration, transplantation, habitat preservation) that will be determined based on the species present, population estimate, and significance of the proposed impacts. All significant, unavoidable impacts would require additional mitigation measures to reduce these impacts to below a level of significance.

BIO-2: Focused Fairy Shrimp Surveys

The results of the 2019/2020 wet season fairy shrimp surveys combined with the 2020 dry season surveys are valid until the 2022/2023 rainy season. If construction has not been initiated prior to the 2022/2023 wet season, additional pre-construction surveys should be conducted prior to construction initiation to update the status of these species within the proposed project survey area.

If sensitive fairy shrimp species are documented within the survey area, impacts to listed fairy shrimp should be avoided to the extent feasible. Unavoidable

impacts to these species would be considered significant and would require consultation with the USFWS under Section 10(a)(1)(B) of the ESA to develop project-specific minimization and mitigation measures to reduce these impacts to below a level of significance.

BIO-3: Coastal California Gnatcatcher Surveys

The results of the 2020 focused coastal California gnatcatcher surveys are valid until the beginning of breeding season 2021. If construction has not been initiated prior to the 2021 survey season, additional pre-construction surveys should be conducted prior to construction initiation to determine if coastal California gnatcatcher is present in the proposed project survey area.

Impacts to coastal California gnatcatcher should be avoided to the extent feasible. Unavoidable impacts to this species would be considered significant and would require consultation with the USFWS under Section 10(a)(1)(B) of the ESA to develop project-specific minimization and mitigation measures (e.g., construction outside of breeding season, habitat protection, noise attenuation) to reduce these impacts to below a level of significance.

BIO-4: Least Bell's Vireo Surveys

The results of the 2020 focused least Bell's vireo surveys are valid until the beginning of breeding season 2021. If construction has not been initiated prior to the 2021 survey season, additional pre-construction surveys should be conducted prior to construction initiation to determine if least Bell's vireo is present in the proposed project survey area.

Impacts to least Bell's vireo should be avoided to the extent feasible. Unavoidable impacts to this species would be considered significant and would require consultation with the USFWS under Section 10(a)(1)(B) of the ESA to develop project-specific minimization and mitigation measures (e.g., construction outside of breeding season, habitat protection, noise attenuation) to reduce these impacts to below a level of significance.

BIO-5 : Sensitive Vegetation Impacts

The proposed project would result in impacts to 0.408 acre of sensitive upland habitat (disturbed Diegan coastal sage scrub, Group C). The proposed project is located in the Off-Site Mitigation Zone; therefore, the disturbed Diegan coastal sage scrub may be removed but must be mitigated within the WCPZ or within a Pre-Approved Mitigation Area at a 3:1 ratio. As such, preservation of 1.224 acres of Diegan coastal sage scrub would be required at an existing mitigation bank or within a Pre-Approved Mitigation Area to be determined and approved through discussions with the City of Oceanside.

APPENDIX B
Representative Photographs

	Photograph 1. View of southern riparian forest in Buena Visa Creek along the southern boundary of the survey area, within the limits of potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and CDFW Riparian. Disturbed and ruderal land dominate the north side of the creek (Facing east; July 22, 2019).
	Photograph 2. View of open water and southern riparian forest in southeastern corner of the survey area, within the limits of potentially jurisdictional USACE and RWQCB wetland and non-wetland WoUS and WoS, and CDFW Riparian and Streambed (Facing west; July 22, 2019).

	Photograph 3. View of several San Diego sagewort, a CRPR 4.2 species, found adjacent to and south of the survey area along the southern bank of Buena Vista Creek (Facing west; July 22, 2019).
	Photograph 4. View of disturbed land in western portion of survey area that has cracked soils in a shallow depression, indicating this area has potential to pond and hold water long enough to support fairy shrimp, such as the federally endangered San Diego fairy shrimp (Facing east; July 22, 2019).

	Photograph 5. View of disturbed Diegan coastal sage scrub, iceplant, and disturbed land in central portion of survey area (Facing north; July 22, 2019).
	Photograph 6. View of disturbed and ruderal land in central portion of survey area (Facing west; July 22, 2019).

	Photograph 7. View of disturbed land in central portion of survey area (Facing southeast; July 22, 2019).
	Photograph 8. View of disturbed land in northern portion of survey area (Facing east; July 22, 2019).

APPENDIX C
Plant Species Observed within the Survey Area

APPENDIX C
Plant Species Observed within the Proposed Project Survey Area

Major Clade	Family	Scientific name	Common name	Nativity
Eudicots				
	Adoxaceae (Muskroot family)			
		Sambucus nigra subsp. caerulea	Mexican elderberry	Native
	Aizoaceae (Fig-marigold family)			
		Carpobrotus chilensis	Sea fig	Naturalized
		Carpobrotus edulis	Hottentot fig	Naturalized
	Anacardiaceae (Sumac family)			
		Schinus terebinthifolius	Brazilian pepper tree	Naturalized
	Apiaceae (Carrot family)			
		Apium graveolens	Common celery	Naturalized
		Conium maculatum	Poison hemlock	Naturalized
		Foeniculum vulgare	Sweet fennel	Naturalized
	Apocynaceae (Dogbane family)			
		Carissa macrocarpa	NatalpPlum	Non-native
	Asteraceae (Aster family)			
		Ambrosia psilostachya	Cuman ragweed	Native
		Artemisia californica	Coastal sagebrush	Native
		Artemisia douglasiana	Douglas' sagewort	Native
		Artemisia palmeri	San Diego sagewort	Native
		Baccharis pilularis	Coyotebrush	Native
		Baccharis salicifolia subsp. salicifolia	Mule fat	Native
		Carduus pycnocephalus subsp. pycnocephalus	Italian thistle	Naturalized
		Centaurea melitensis	Maltese star-thistle	Naturalized
		Corethrogyne filaginifolia	California aster	Native
		Deinandra fasciculata	Clustered tarweed	Native
		Erigeron bonariensis	Asthmaweed	Naturalized
		Glebionis coronaria	Crown daisy	Naturalized
		Hedypnois cretica	Cretanweed	Naturalized
		Heterotheca grandiflora	Telegraphweed	Native
		Hypochaeris glabra	Smooth cat's ear	Naturalized

Major Clade	Family	Scientific name	Common name	Nativity
		Isocoma menziesii	Menzies' goldenbush	Native
		Lactuca serriola	Prickly lettuce	Naturalized
		Logfia gallica	Narrowleaf cottonrose	Naturalized
		Osmadenia tenella	False rosinweed	Native
		Pseudognaphalium biolettii	Two-color rabbit-tobacco	Native
		Pseudognaphalium stramineum	Cottonbatting plant	Native
		Pulicaria paludosa	Spanish false fleabane	Naturalized
		Sonchus asper subsp. asper	Prickly sow thistle	Naturalized
		Sonchus oleraceus	Common sowthistle	Naturalized
		Xanthium strumarium	Rough cocklebur	Native
	Boraginaceae (Borage family)			
		Amsinckia menziesii	Menzies' fiddleneck	Native
		Plagiobothrys collinus	Cooper's popcornflower	Native
	Brassicaceae (Mustard family)			
		Brassica nigra	Black mustard	Naturalized
		Brassica tournefortii	Saharan mustard	Naturalized
		Hirschfeldia incana	Shortpod mustard	Naturalized
		Lepidium	Pepperweed	Native
		Raphanus sativus	Cultivated radish	Naturalized
		Sisymbrium orientale	Indian hedgemustard	Naturalized
	Caryophyllaceae (Pink family)			
		Achyronychia cooperi	Onyxflower	Native
		Silene gallica	Common catchfly	Naturalized
	Chenopodiaceae (Goosefoot family)			
		Atriplex semibaccata	Australian saltbush	Naturalized
		Chenopodium album	Lambsquarters	Naturalized
		Chenopodium murale	Nettleleaf goosefoot	Naturalized
		Salsola australis	Russian thistle	Naturalized
	Convolvulaceae (Morning-glory family)			
		Convolvulus arvensis	Field bindweed	Naturalized

Major Clade	Family	Scientific name	Common name	Nativity
	Crassulaceae (Stonecrop family)			
		Crassula connata	Sand pygmyweed	Native
	Euphorbiaceae (Spurge family)			
		Croton setigerus	Dove weed	Native
		Euphorbia maculata	Spotted sandmat	Naturalized
		Euphorbia peplus	Petty spurge	Naturalized
		Ricinus communis	Castorbean	Naturalized
	Fabaceae (Pea family)			
		Acmispon americanus var. americanus	Spanish clover	Native
		Acmispon glaber	Common deerweed	Native
		Acmispon micranthus	San Diego bird's-foot trefoil	Native
		Medicago polymorpha	Burclover	Naturalized
		Melilotus indicus	Sourclover	Naturalized
		Parkinsonia aculeata	Jerusalem thorn	Naturalized
	Fagaceae (Beech family)			
		Quercus agrifolia	California live oak	Native
	Geraniaceae (Geranium family)			
		Erodium botrys	Longbeak stork's bill	Naturalized
		Erodium cicutarium	Redstem stork's bill	Naturalized
		Geranium carolinianum	Carolina geranium	Native
	Lamiaceae (Mint family)			
		Marrubium vulgare	Horehound	Naturalized
		Salvia mellifera	Black sage	Native
	Lythraceae (Loosestrife family)			
		Lythrum hyssopifolia		Naturalized
	Malvaceae (Mallow family)			
		Malva parviflora	Cheeseweed mallow	Naturalized
		Malvella leprosa	Alkali mallow	Native
	Moraceae (Fig family)			
		Ficus carica	Common Fig	Naturalized
	Myrsinaceae (Myrisine family)			
		Lysimachia arvensis	Scarlet pimpernel	Naturalized

Major Clade	Family	Scientific name	Common name	Nativity
	Myrtaceae (Myrtle family)			
		Eucalyptus citriodora	Lemon-scented gum	Naturalized
		Eucalyptus camaldulensis	Red gum	Naturalized
	Onagraceae (Evening primrose family)			
		Oenothera elata	Marsh evening primrose	Native
	Oxalidaceae (Wood-Sorrel family)			
		Oxalis pes-caprae	Bermuda buttercup	Naturalized
	Plantaginaceae (Plantain family)			
		Plantago erecta	Dotseed plantain	Native
		Plantago lanceolata	Narrowleaf plantain	Naturalized
	Platanaceae (Plane-tree family)			
		Platanus racemosa	California sycamore	Native
	Polygonaceae (Buckwheat family)			
		Eriogonum fasciculatum	Eastern Mojave buckwheat	Native
		Rumex crispus	Curly dock	Naturalized
	Salicaceae (Willow family)			
		Salix exigua	Narrowleaf willow	Native
		Salix laevigata	Red willow	Native
		Salix lasiolepis	Arroyo willow	Native
	Solanaceae (Potato family)			
		Datura wrightii	Sacred thorn-apple	Native
		Nicotiana glauca	Tree tobacco	Naturalized
		Solanum rostratum	Buffalobur nightshade	Naturalized
	Tropaeolaceae (Nasturtium family)			
		Tropaeolum majus	Garden nasturtium	Naturalized
	Vitaceae (Grape family)			
		Parthenocissus quinquefolia	Virginia creeper	Non-native
		Vitis girdiana	Wild grape	Native

Major Clade	Family	Scientific name	Common name	Nativity
Monocots				
	Arecaceae (Palm family)			
		Washingtonia robusta	Washington fan palm	Naturalized
	Cyperaceae (Sedge family)			
		Cyperus eragrostis	Tall flatsedge	Native
	Iridaceae (Iris family)			
		Sisyrinchium bellum	Western blue-eyed grass	Native
	Poaceae (Grass family)			
		Arundo donax	Giant reed	Naturalized
		Avena barbata	Lopsided oat	Naturalized
		Avena fatua	Wild oat	Naturalized
		Bromus diandrus	Ripgut brome	Naturalized
		Bromus hordeaceus	Soft brome	Naturalized
		Bromus madritensis subsp. rubens	Red brome	Naturalized
		Cynodon dactylon	Bermudagrass	Naturalized
		Distichlis spicata	Saltgrass	Native
		Festuca myuros	Rattail sixweeks grass	Naturalized
		Festuca perennis	Perennial ryegrass	Naturalized
		Gastridium phleoides	Nit grass	Naturalized
		Hordeum murinum	Mouse barley	Naturalized
		Pennisetum setaceum	Crimson fountaingrass	Naturalized
		Phalaris minor	Littleseed canarygrass	Naturalized
		Polypogon monspeliensis	Annual rabbitsfoot grass	Naturalized
		Stipa miliacea var. miliacea	Smilograss	Naturalized
		Stipa pulchra	Purple needlegrass	Native
	Typhaceae (Cattail family)			
		Typha	Cattail	Native

APPENDIX D
Wildlife Species Detected within the Survey Area

APPENDIX D
Wildlife Species Detected within the Proposed Project Survey Area

SCIENTIFIC NAME	COMMON NAME	METHOD OF IDENTIFICATION
INVERTEBRATES		
Class: Insecta	**Insects**	
Order: Lepidoptera	**Butterflies**	
Pieris rapae	Cabbage White	O
Pontia protodice	Checkered White	O
VERTEBRATES		
Class: Sauropsida	**Reptiles**	
Sceloporus occidentalis	Western Fence Lizard	O
Class: Aves	**Birds**	
Order Accipitriformes	**Hawks and Vultures**	
*Accipiter cooperii**	Cooper's Hawk	O
Buteo jamaicensis	Red-tailed Hawk	
Order Anseriformes	**Ducks, Geese, and Swans**	
Anas platyrhynchos	Mallard	O
Order Columbiformes	**Pigeons and Doves**	
Zenaida macroura	Mourning Dove	O
Columba livia	Rock Pigeon	
Order Gruiformes	**Coots, Cranes, and Rails**	
Fulica americana	American Coot	
Order Apodiformes	**Swifts and Hummingbirds**	
Calypte anna	Anna's Hummingbird	O, V
*Calypte costae**	Costa's Hummingbird	
Selasphorus sasin	Allen's Hummingbird	
Order Charadriiformes	**Gulls, Terns, and Plovers**	
Charadrius vociferus	Killdeer	
Order Passeriformes	**Perching Birds**	
Psaltriparus minimus	Bushtit	
Pheucticus melanocephalus	Black-headed Grosbeak	
Sayornis nigricans	Black Phoebe	O
Tyrannus verticalis	Western Kingbird	O
Tyrannus vociferans	Cassin's Kingbird	
*Vireo bellii pusillus**	Least Bell's Vireo	O
Empidonax difficilis	Pacific-Slope Flycatcher	V
Aphelocoma californica	Western Scrub-Jay	O, V
Corvus brachyrhynchos	American Crow	O, V
Corvus corax	Common Raven	
Lonchura punctulata	Scaly-breasted Munia	
Melozone crissalis	California Towhee	
Pipilo maculatus	Spotted Towhee	O, V
*Polioptila californica californica**	Coastal California Gnatcatcher	O, V
Chamaea fasciata	Wrentit	
Melospiza melodia	Song Sparrow	V
Carpodacus mexicanus	House Finch	O, V

Carduelis psaltria	Lesser Goldfinch	O, V
Petrochelidon pyrrhonota	Cliff Swallow	
Stelgidopteryx serripennis	Northern Rough-winged Swallow	
Icterus cucullatus	Hooded Oriole	
Molothrus ater	Brown-headed Cowbird	
Mimus polyglottos	Northern Mockingbird	
Geothlypis trichas	Common Yellowthroat	
Leiothlypis celata	Orange-crowned Warbler	
*Setophaga petechia**	Yellow Warbler	
Sturnus vulgaris	European Starling	
Thryomanes bewickii	Bewick's Wren	
*Sialia Mexicana**	Western Bluebird	
Order Pelecaniformes	**Pelicans, Boobies, and Cormorants**	
*Butorides virescens**	Green Heron	
Order Piciformes	**Woodpeckers**	
Dryobates nuttallii	Nuttall's Woodpecker	
Class: Mammalia	**Mammals**	
Order Rodentia	**Rodents**	
Otospermophilus beecheyi	California Ground Squirrel	O
Order Carnivora	**Carnivores**	
Canis lupus familiaris	Domestic Dog	S
Order Lagamorpha	Hares, Rabbits, and Pikas	
Sylvilagus bachmani	Brush Rabbit	

Method of Identification:
O = observed
V = vocalization
S = scat

APPENDIX E
Sensitive Plant Species with a Potential to Occur within the Survey Area

APPENDIX E
Sensitive Plant Species with a Potential to Occur within the Proposed Project Survey Area

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
San Diego thornmint (*Acanthomintha ilicifolia*)	FT SE CRPR 1B.1 SAP PC SAP NE	Annual herb. Blooms Apr-Jun. Clay openings in vernal pools, chaparral, coastal sage scrub, grassland. (CNPS 2020) Elev 150-3,085ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Nuttall's acmispon (Acmispon prostratus)	CRPR 1B.1 SAP PC SAP NE	Annual herb. Blooms Mar-Jun/Jul. Sandy substrate in coastal dunes, coastal sage scrub (CNPS 2020) Elev 0-2,395ft. (Calfora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
spineshrub (*Adolphia californica*)	CRPR 2B.1	Perennial deciduous shrub. Blooms Dec-May. Clay soils in chaparral, coastal sage scrub, grassland. (CNPS 2020) Elev 15-1,115ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego ambrosia (*Ambrosia pumila*)	FE CRPR 1B.1 SAP PC SAP NE	Perennial rhizomatous herb. Blooms Apr-Oct. Often in disturbed areas with sandy loam or clay soils, sometimes alkaline areas, in chaparral, coastal sage scrub, grassland, vernal pools. (CNPS 2020) Elev 50-785ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Del Mar manzanita (*Arctostaphylos glandulosa* ssp. *crassifolia*)	FE CRPR 1B.1 SAP NE	Perennial evergreen shrub. Blooms Dec-Jun. Sandy soils in maritime chaparral. (CNPS 2020) Elev 115-820ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego sagewort (*Artemisia palmeri*)	CRPR 4.2	Perennial deciduous shrub. Blooms May-Sep. Sandy, mesic areas in chaparral,	Present. Approximately 44 individuals were observed adjacent to and south of the survey area, on the stream bank just

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
		coastal sage scrub, riparian habitats. (CNPS 2020) Elev 0-2,230ft. (Calflora 2020)	south of Buena Vista Creek, on July 22, 2019. This species was also documented during the May 2020 focused rare plant survey.
Coulter's saltbush (*Atriplex coulteri*)	CRPR 1B.2	Perennial herb. Blooms Mar-Oct. Alkaline or clay soils in coastal dunes, coastal bluff scrub, coastal sage scrub, grassland. (CNPS 2020) Elev 0-1,510ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
South coast saltscale (*Atriplex pacifica*)	CRPR 1B.2	Annual herb. Blooms Mar-Oct. Playas, coastal dunes, coastal bluff scrub, coastal sage scrub. (CNPS 2020) Elev 8-1,050ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area but species is restricted to sandy soils along the immediate coast. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Encinitas baccharis (*Baccharis vanessae*)	FT SE CRPR 1B.1 SAP NE	Perennial deciduous shrub. Blooms Aug-Nov. Sandstone in maritime chaparral, cismontane woodland. (CNPS 2020) Elev 245-2,460ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, no suitable soils exist within survey area, and the survey area is just outside of the known elevation range of this species. In addition, this species was not observed during the May 2020 focused rare plant surveys, when it would have been observable.
San Diego sunflower (*Bahiopsis laciniata*)	CRPR 4.2	Perennial shrub. Blooms Feb-Aug. Dry slopes in coastal sage scrub, chaparral. Elev 50-2,690ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Nevin's barberry (*Berberis nevinii*)	FE SE CRPR 1B.1	Perennial evergreen shrub. Blooms Feb/Mar-Jun. Sandy or gravelly soils in chaparral, coastal sage scrub, cismontane woodland, riparian scrub. (CNPS 2020) Elev 115-1,575ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
thread-leaved brodiaea (*Brodiaea filifolia*)	FT SE CRPR 1B.1 SAP PC SAP NE	Perennial bulbiferous herb. Blooms Mar-Jun. Typically clay soils in vernal pools, playas, chaparral, coastal sage scrub, cismontane woodland, grassland. (CNPS	Not Expected. Historical records exist within 3 miles of survey area and moderately suitable habitat exists within survey area despite disturbance from mowing and past grading activities; however, this species was not observed

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
		2020) Elev 130-3,640ft. (Calflora 2020)	during the May 2020 focused rare plant surveys or during the 2020 focused *Brodiaea* species surveys that were conducted during the appropriate blooming period, before the site was mowed in early June 2020.
Orcutt's brodiaea (*Brodiaea orcuttii*)	CRPR 1B.1	Perennial bulbiferous herb. Blooms May-Jul. Typically mesic, clay soils (sometimes serpentinite) in vernal pools, chaparral, cismontane woodland, closed-cone coniferous forest, meadows & seeps, grassland. (CNPS 2020) Elev 330-5,610ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and the survey area is located just outside of the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys or during the 2020 focused *Brodiaea* species surveys that were conducted during the appropriate blooming period, before the site was mowed in early June 2020.
Brewer's calandrinia (*Calandrinia breweri*)	CRPR 4.2	Annual herb. Blooms Mar–Jun. Sandy/loamy soils typically after fire or other disturbance in chaparral, coastal sage scrub. (CNPS 2020) Elev 150-3,510ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Payson's jewelflower (*Caulanthus simulans*)	CRPR 4.2	Annual herb. Blooms Feb/Mar-May/Jun. Sandy, granitic areas in chaparral, coastal sage scrub. (CNPS 2020) Elev 2,460-5,805ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, limited suitable soils exist within survey area, and the survey area is well outside of the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
wart-stemmed ceanothus (*Ceanothus verrucosus*)	CRPR 2B.2	Perennial evergreen shrub. Blooms Dec-May. Chaparral. (CNPS 2020) Elev 15-1,115ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
southern tarplant (*Centromadia parryi* ssp. *australis*)	CRPR 1B.1	Annual herb. Blooms May-Nov. Vernal pools, along the margins of marshes, in vernally mesic areas within grassland. (CNPS 2020) Elev 0-1,410ft. (Calflora 2020)	Low to moderate. While no historical records exist within 3 miles of survey area and only marginally suitable habitat exists within the survey area, the survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
smooth tarplant (*Centromadia pungens ssp. laevis*)	CRPR 1B.1	Annual herb. Blooms Apr-Sep. Alkaline soils within chenopod scrub, meadows & seeps, playas, riparian woodland, grassland. (CNPS 2020) Elev 330-2,000ft. (Calflora 2020)	Low to moderate. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within the survey area, the survey area is just outside of the known elevation range for this species, and the survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.
Orcutt's spineflower (*Chorizanthe orcuttiana*)	FE SE CRPR 1B.1 SAP NE	Annual herb. Blooms Mar-May. Sandy openings in maritime chaparral, coastal sage scrub, closed-cone coniferous forest. (CNPS 2020) Elev 150-490ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*)	CRPR 1B.2	Annual herb. Blooms Apr-Jul. Clay soils, in vernal pools, chaparral, coastal sage scrub, meadows & seeps, grassland. (CNPS 2020) Elev 330-5,315ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys or during the focused 2020 *Brodiaea* species surveys.
seaside cistanthe (*Cistanthe maritima*)	CRPR 4.2	Annual herb. Blooms Feb/Mar-Jun/Aug. Sandy soils in coastal bluff scrub, coastal sage scrub, grassland. (CNPS 2020) Elev 50-590ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
San Miguel savory (*Clinopodium chandleri*)	CRPR 1B.2	Perennial shrub. Blooms Mar-Jul. Rocky, gabbroic, or metavolcanic areas in chaparral, coastal sage scrub, cismontane woodland, riparian woodland, grassland. (CNPS 2020) Elev 1,345-3,410ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, no suitable soils exist within survey area, and the survey area is outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
summer-holly (*Comarostaphylis diversifolia* ssp. *diversifolia*)	CRPR 1B.2	Perennial evergreen shrub. Blooms Apr-Jun. Chaparral, cismontane woodland. (CNPS 2020) Elev 130-1,835ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
			have been observable.
Del Mar Mesa sand aster (*Corethrogyne filaginifolia* var. *linifolia*)	CRPR 1B.1 SAP NE	Perennial herb. Blooms May-Sep. Sandy soils in coastal bluff scrub, coastal sage scrub, openings in maritime chaparral. (CNPS 2020) Elev 0-425ft. (Calflora 2020)	Low to moderate. Historical records exist within 3 miles of survey area, and marginally suitable habitat exists within survey area. While this species was not observed during the May 2020 focused rare plant surveys, the survey area was mowed in early June, before the planned June 2020 rare plant survey which would have been used to determine if this species is present within the survey area.
Wiggin's cryptantha (*Cryptantha wigginsii*)	CRPR 1B.2	Annual herb. Blooms Feb-Jun. Often clay soils in coastal scrub. Elev. 65-905ft. (CNPS 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
snake cholla (*Cylindropuntia californica* var. *californica*)	CRPR 1B.1	Perennial stem succulent. Blooms Apr-May. Chaparral, coastal sage scrub. (CNPS 2020) Elev 65-885ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
western dichondra (*Dichondra occidentalis)*	CRPR 4.2	Perennial rhizomatous herb. Blooms Jan/Mar-Jul. Coastal sage scrub, chaparral, cismontane woodland, grassland. (CNPS 2020) Elev 130-1,510ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
short-leaved dudleya (*Dudleya blochmaniae* ssp. *brevifolia*)	CRPR 1B.1 SAP PC	Perennial herb. Blooms Apr-May. Sandstone in coastal sage scrub and openings in maritime chaparral. (CNPS 2020) Elev 330-460ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, no suitable soils exist within survey area, and the survey area is outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
variegated dudleya (*Dudleya variegata*)	CRPR 1B.2 SAP NE	Perennial herb. Blooms Apr-Jun. Clay soils in vernal pools, chaparral, cismontane woodland, coastal sage scrub, grassland. (CNPS 2020) Elev 115-1,015ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
sticky dudleya (*Dudleya viscida*)	CRPR 1B.2 SAP PC	Perennial herb. Blooms May-Jun. Rocky areas in coastal bluff scrub, chaparral, coastal scrub, cismontane woodland. (CNPS 2020) Elev 15-2,330ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
Palmer's goldenbush (*Ericameria palmeri* var. *palmeri*)	CRPR 1B.1	Perennial evergreen shrub. Blooms Jul/Sep-Nov. Mesic areas in chaparral, coastal sage scrub. (CNPS 2020) Elev 100-1,085ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
coast wallflower (*Erysimum ammophilum*)	CRPR 1B.2	Perennial herb. Blooms Feb-Jun. Sandy openings in coastal dunes, maritime chaparral, coastal sage scrub. (CNPS 2020) Elev 15-330ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
San Diego button-celery (*Eryngium aristulatum* var. *parishii*)	FE SE CRPR 1B.1 SAP NE	Annual/perennial herb. Blooms Apr-Jun. Mesic soils in vernal pools, coastal sage scrub, grassland. (CNPS 2020) Elev 115-2,495ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
cliff spurge (*Euphorbia misera*)	CRPR 2B.2	Perennial shrub. Blooms Dec-Aug/Oct. Rocky areas in coastal bluff scrub, coastal sage scrub, Mojavean desert scrub. (CNPS 2020) Elev 0-920ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego barrel cactus (*Ferocactus viridescens*)	CRPR 2B.1 SAP PC	Perennial stem succulent. Blooms May-Jun. Chaparral, coastal sage scrub, grassland, vernal pools. (CNPS 2020) Elev 15-885ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
Palmer's grapplinghook	CRPR 4.2	Annual herb. Blooms Mar-May. Clay soils in open grassy	Not Expected. Historical records exist within 3 miles of survey area, and

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
(*Harpagonella palmeri*)		areas associated with chaparral, coastal sage scrub, grassland. (CNPS 2020) Elev 150-3,970ft. (Calflora 2020)	moderately suitable habitat exists within survey area. However, this species was not observed during the May 2020 focused rare plant surveys.
Orcutt's hazardia (*Hazardia orcuttii*)	CRPR 1B.1 SAP PC SAP NE	Perennial evergreen shrub. Blooms Aug-Oct. Often clay soils in maritime chaparral, coastal scrub. (CNPS 2020) Elev. 0-330ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
graceful tarplant (*Holocarpha virgata* ssp. *elongata*)	CRPR 4.2	Annual herb. Blooms May-Nov. Chaparral, cismontane woodland, coastal sage scrub, grassland. (CNPS 2020) Elev 65-2,755ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
decumbent goldenbush (*Isocoma menziesii* var. *decumbens*)	CRPR 1B.2	Perennial shrub. Blooms Apr-Nov. sandy, often disturbed areas in coastal sage scrub, chaparral. (CNPS 2020) Elev 65-1,640ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego marsh-elder (*Iva hayesiana*)	CRPR 2B.2 SAP PC	Perennial herb. Blooms Apr-Oct. Marshes & swamps, playas. (CNPS 2020) Elev 15-855ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and moderately suitable habitat exists within survey area. However, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
spiny rush (*Juncus acutus* ssp. *leopoldii*)	CRPR 4.2	Perennial rhizomatous herb. Blooms Mar/May-Jun. Coastal salt marsh, alkaline meadows & seeps, mesic soils in coastal dunes. (CNPS 2020) Elev 0-1,310ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and moderately suitable habitat exists within survey area. However, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*)	CRPR 1B.1	Annual herb. Blooms Feb-Jun. Coastal salt marsh, playas, vernal pools. (CNPS 2020) Elev 0-1,905ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
			the focused 2020 *Brodiaea* species surveys.
Robinson's pepper-grass (*Lepidium virginicum* var. *robinsonii*)	CRPR 4.3	Annual herb. Blooms Jan-Jul. Chaparral, coastal sage scrub. (CNPS 2020) Elev 180-2,525ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
sea dahlia (*Leptosyne maritima*)	CRPR 2B.2	Perennial herb. Blooms Mar-May. Coastal bluff scrub, coastal sage scrub. (CNPS 2020) Elev 0-425ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
little mousetail (*Myosurus minimus* ssp. *apus*)	CRPR 3.1 SAP NE	Annual herb. Blooms Mar-Jun. Alkaline soils in vernal pools, grassland. Elev 65-2,100ft. (CNPS 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Mud nama (*Nama stenocarpa*)	CRPR 2B.1	Annual/perennial herb. Blooms Jan-Jul. Marshes & swamps, lake margins, riverbanks. (CNPS 2020) Elev 15-2,100ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
spreading navarretia (*Navarretia fossalis*)	FT CRPR 1B.1 SAP NE	Annual herb. Blooms Apr-Jun. Shallow freshwater marsh, playas, vernal pools, chenopod scrub. (CNPS 2020) Elev 360-1,705ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
California Orcutt grass (*Orcuttia californica*)	FE SE CRPR 1B.1 SAP NE	Annual herb. Blooms Apr-Aug. Vernal pools. (CNPS 2020) Elev 460-2,200ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
			the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
short-lobed broomrape (*Orobanche parishii* ssp. *brachyloba*)	CRPR 4.2	Parasitic, perennial herb. Blooms Apr-Oct. Sandy soils associated with coastal bluff scrub, coastal dunes, coastal sage scrub. (CNPS 2020) Elev 280-655ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, limited suitable soils exist within survey area, and the survey area is just outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
San Diego mesa mint (*Pogogyne abramsii*)	FE SE CRPR 1B.1	Annual herb. Blooms Mar-Jul. Vernal pools. (CNPS 2020) Elev 360-590ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Nuttall's scrub oak (*Quercus dumosa*)	CRPR 1B.1 SAP PC	Perennial evergreen shrub. Blooms Feb-Apr/May-Aug. Sandy or clay loam soils associated with chaparral, coastal sage scrub, closed-cone coniferous forest. (CNPS 2020) Elev 50-4,035ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
small-leaved rose (*Rosa minutifolia*)	SE CRPR 2B.1	Perennial deciduous shrub. Blooms Jan-Jun. Chaparral, coastal sage scrub. (CNPS 2020) Elev 425-560ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
ashy spike-moss (*Selaginella cinerascens*)	CRPR 4.1	Perennial rhizomatous herb (fern). No blooming period. Chaparral, coastal sage scrub. (CNPS 2020) Elev. 35-1,245ft.	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
		(Calflora 2020)	focused rare plant surveys, and it would have been observable.
chaparral ragwort (*Senecio aphanactis*)	CRPR 2B.2	Annual herb. Blooms Jan-Apr/May. Chaparral, coastal sage scrub, cismontane woodland, sometimes in alkaline soils. (CNPS 2020) Elev 425-2,165ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
purple stemodia (*Stemodia durantifolia*)	CRPR 2B.1	Perennial herb. Blooms year-round. Mesic, sandy soils in wetland/riparian. Elev 50-560ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Parry's tetracoccus (*Tetracoccus dioicus*)	CRPR 1B.2	Perennial deciduous shrub. Blooms Apr-May. Chaparral, coastal sage scrub. (CNPS 2020) Elev 490-2,725ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.

STATUS CODES

Federal

FE = Federal-listed endangered species

FT = Federal-listed threatened species

State

SE = State-listed endangered species

California Native Plant Society Rare Plant Ranking

1B =Species rare, threatened, or endangered in California and elsewhere. These species are eligible for state listing.

2B =Species rare, threatened, or endangered in California but more common elsewhere. These species are eligible for state listing.

3 = A review list for plants about which more information is needed. These species lack necessary data to assign them to another list or reject them.

4 = A watch list of species of limited distribution. These species need to be monitored for changes in the status of their populations.

.1 =Species seriously threatened in California (over 80% of occurrences threatened; high degree and immediacy of threat)

.2 =Species fairly threatened in California (20-80% occurrences threatened; moderate degree and immediacy of threat)

.3 =Species not very threatened in California (<20% of occurrences threatened; low degree and immediacy of threat or no current threats known

RE: 2020 Focused Sensitive Plant Survey Summary Report for the Proposed CarMax Auto Superstore Project, City of Oceanside, San Diego County, California

Ms. Hill:

This letter report summarizes the results of the focused, presence/absence sensitive plant surveys conducted in 2020 for the proposed CarMax Auto Superstore project (project) located in the City of Oceanside, San Diego County, California (Attachment 1: Figures 1 through 4). Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. to conduct these surveys on behalf of Centerpoint Integrated Solutions to determine the presence/absence of sensitive plant species with a potential to occur within the proposed project survey area, which includes the proposed project area and a 50-foot survey buffer (Attachment 1: Figure 4).

This survey summary report provides a brief description of the proposed project as well as the methods used for the surveys and the results of the 2020 surveys conducted for the proposed project.

PROPOSED PROJECT LOCATION AND DESCRIPTION

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, sales building with an attached presentation area, service building/area, and non-public carwash with associated access driveways, parking lots, and landscaped areas. In addition, a retaining wall will be required along the southern boundary of the property because of the exiting grades in that area.

The 10.54-acre proposed project area occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 1968; Attachment 1: Figure 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN

168-012-43 (Attachment 1: Figure 4). It is bordered to the north by State Route 78; to east by Thunder Drive, the California Department of Motor Vehicles (DMV), and residential development; to the south by Buena Vista Creek and Brookdale Senior Living facility; and to the west by the Tri-City Crossroads Shopping Center (Attachment 1: Figures 2 through 4). Plaza Drive separates the two parcels in the northwest portion of the proposed project area. Elevations within the proposed project area range from approximately 177 to 220 feet above mean sea level (Attachment 1: Figures 3 and 4).

The dominant vegetation communities and land cover types within the proposed project survey area include disturbed, ruderal, southern riparian forest, disturbed Diegan coastal sage scrub, developed and ornamental. Other vegetation communities present within the proposed project area in smaller proportions include iceplant and open water (Attachment 1: Figure 4). The section of Buena Vista Creek on the southern border of the proposed project area is part of the Buena Vista Creek Mitigation Area.

METHODS

The methods used to conduct the 2020 sensitive plant species surveys within the proposed project survey area are presented in this section.

Background Research & Habitat Assessment

A literature review was conducted to inform the general biological survey and habitat assessment conducted for the proposed project. In addition, historical species occurrence databases (e.g., California Natural Diversity Database [CNDDB; CDFW 2020a], SanGIS 2020, USFWS 2020) were searched to determine what rare plant species had been reported historically from within a 3-mile buffer of the proposed project. In addition, other references were consulted to better understand the historical location data and distribution of these sensitive species in San Diego County, including research using the San Diego Natural History Museum's (SDNHM) plant distribution mapping and voucher specimen lists and local knowledge of sensitive plant species likely to occur in the area.

For purposes of this report, sensitive plant species include those that are (1) listed as threatened or endangered or proposed for listing by federal or state agencies; (2) California Rare Plant Ranks (CRPR) List 1 or List 2 (CNPS 2020); or (3) considered rare, endangered, or threatened by CDFW (CDFW 2020b) or other local conservation organizations or specialists. Noteworthy plant species are considered to be those that are CRPR List 3 or List 4 (CNPS 2020). Table 1, below, provides additional details for each sensitivity classification.

Table 1: Status Abbreviations and Explanations

STATUS ABBREVIATION		STATUS EXPLANATION
Federal	FE	federally listed endangered species
	FT	federally listed threatened species
	FC	federal candidate species, proposed for listing
State	SE	California state-listed endangered species
	ST	California state-listed threatened species
	SR	California state-listed rare species (plants only)
California Rare Plant Rank (CRPR)	1A	presumed extirpated in California and rare or extinct elsewhere
	1B	rare, threatened, or endangered in California and elsewhere
	2A	presumed extirpated in California but more common elsewhere
	2B	rare, threatened, or endangered in California but more common elsewhere
	3	more information needed
	4	limited distribution
CRPR Threat Rank	0.1	Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
	0.2	Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
	0.3	Not very threatened in California (<20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

A focused habitat assessment for sensitive plant species was conducted in summer 2019 to evaluate the current proposed project survey area for its potential to support sensitive plant species. Potentially suitable habitats were mapped in the field using aerial imagery of the proposed project survey area (1 inch = 200 feet) and handheld Global Positioning Systems (GPS) units. Potentially suitable habitat areas were digitized using Google™ Earth based on field notes and waypoints collected in the field.

Based on the results of the historical species database search and the focused habitat assessment, a list of the sensitive plant species that have potential to occur within or adjacent to the proposed project survey area was developed (Attachment 2).

Focused Surveys

Focused sensitive plant surveys were conducted by walking meandering transects throughout the proposed project survey area. If a sensitive plant species was observed during these focused surveys, a waypoint was taken with a handheld Global Positioning System (GPS) that recorded the plant's location and the elevation above mean sea level (amsl) and incorporated into the Geographic Information System (GIS) database.

Plant names used herein follow the *Checklist of the Vascular Plants of San Diego County, 5th edition* (*Checklist*; Rebman and Simpson 2014). Additional plant references used included *The Jepson manual: vascular plants of California, Second Edition* (*Jepson Manual*; UC Berkeley 2020), and the San Diego Plant Atlas (SDNHM 2020).

RESULTS

The results of the 2020 sensitive plant surveys conducted for the proposed project are presented in this section.

Background Research & Habitat Assessment

The literature review and database search resulted in a list of 56 sensitive plant species that have historically occurred within 3 miles of the survey area and/or that were determined to have a potential to occur within the proposed project survey area (CDFW 2020a, USFWS 2020a). Following the habitat assessment conducted by BBS biologist Darin Busby on July 22, 2019, the majority of these sensitive plant species (49 of the 56 species) were determined to have a low potential to occur or were not expected to occur within the proposed project survey area, because of habitat specific requirements or because the survey area is outside their known range. Of the remaining seven species, six species – thread-leaved brodiaea (*Brodiaea filifolia*), Orcutt's brodiaea (*Brodiaea orcuttii*), Palmer's grapplinghook (*Harpagonella palmeri*), San Diego marsh-elder (*Iva hayesiana*), spiny rush (*Juncus acutus*), and Robinson's peppergrass (*Lepidium virginicum* var. *robinsonii*) – had a moderate potential to occur, and one – San Diego sagewort (*Artemesia palmeri*) – was observed during the general biological survey.

Focused Surveys

Based on the weather and blooming trends observed in San Diego County during spring 2020, two rounds of surveys were planned. Ed Kentner (Kentner Botanical) conducted the first focused sensitive plant survey on May 15, 2020; however, when he arrived at the proposed project site on June 8, 2020, to conduct the second focused sensitive plant survey, he found that the site had been mowed sometime between the afternoon of June 4, 2020, and the morning of June 8, 2020. Therefore, the second sensitive plant survey was not conducted. A complete list of plant species observed on-site during the 2019 general biological survey, 2019 focused jurisdictional delineation, and/or 2020 focused sensitive plant surveys is included as Attachment 3.

In addition to the sensitive plant surveys, BBS conducted focused surveys for thread-leaved brodiaea and Orcutt's brodiaea. BBS conducted site checks within suitable habitat identified within the proposed project survey area to document early emergent *Brodiaea* vegetation. These site checks occurred on February 14 and 25

as well as March 5, 13, and 19, 2020, in conjunction with the focused fairy shrimp surveys that were conducted for the proposed project. No thread-leaved brodiaea or Orcutt's brodiaea were observed during the first four focused *Brodiaea* species surveys conducted between May 14 and June 4, 2020. Between June 4 and June 8, 2020, the proposed project area was mowed. BBS biologists continued to survey the proposed project area for any sign of potential *Brodiaea* species, including two additional surveys on June 12 and June 15, 2020. No potential *Brodiaea* species were documented during these two visits. A separate survey summary report was prepared for the focused *Brodiaea* species surveys.

The results of the sensitive plant surveys were used to reevaluate the potential for occurrence for the initial 56 sensitive plant species with a potential for occurrence within the proposed project survey area (Attachment 2). Of the 56 species, 52 are not expected to occur on-site based on the existing site conditions and the results of the May 2020 sensitive plant survey. Of the remaining four, only one – San Diego sagewort – was observed on-site. The other three – southern tarplant (*Centromadia parryi* ssp. *australis*), smooth tarplant (*Centromadia pungens ssp. laevis*), and Del Mar Mesa sand aster (*Corethrogyne filaginifolia* var. *linifolia*) – were not observed during the May 2020 sensitive plant survey; however, the site was mowed before the June 2020 sensitive plant survey, when these species would have been observable if on-site. Therefore, there is still a low to moderate potential for occurrence for each of these species. Detailed species accounts for these four species are provided below.

San Diego Sagewort (*Artemisia palmeri*)

San Diego sagewort is a CRPR 4.2 species (limited distribution and moderately threatened in California). It is a deciduous shrub in the Asteraceae family that typically blooms from May to September. This species is found in mesic, sandy soils along drainages in chaparral, coastal sage scrub, and riparian habitats (CNPS 2020). San Diego sagewort is known from San Diego County and in Baja California, Mexico, at elevations between 0 and 2,230 feet amsl (Calflora 2020). This species is threatened by development, flood control projects, and possibly by non-native plant species (CNPS 2020).

San Diego sagewort is present adjacent to and south of the survey area (Appendix A: Figure 4). This species was observed along the southern bank of Buena Vista Creek during the 2019 general biological survey, 2019 focused jurisdictional delineation, and 2020 focused sensitive plant surveys. It is within the proposed project survey area but well outside the proposed project footprint.

Southern Tarplant (*Centromadia parryi* ssp. *australis*)

Southern tarplant is a CRPR 1B.1 species (rare, threatened, or endangered in California and elsewhere). It is an annual herb in the Asteraceae family that typically blooms from May to November. This species is found in vernal pools,

along the margins of marshes, and in vernally mesic areas within grasslands (CNPS 2020). Southern tarplant is known from coastal California, from Santa Barbara County south into Baja California, Mexico, at elevations between 0 and 1,410 feet amsl (Calflora 2020). This species is threatened by habitat disturbance, population fragmentation, urbanization, development, illegal vehicle activity, foot traffic, grazing, and competition from non-native plants (CNPS 2020).

Southern tarplant has a low to moderate potential to occur within the proposed project survey area. While no historical species occurrence records for southern tarplant exist within 3 miles of survey area (CDFW 2020a), marginally suitable habitat exists within the survey area. The survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.

Smooth Tarplant (*Centromadia pungens ssp. laevis*)

Smooth tarplant is a CRPR 1B.1 species (rare, threatened, or endangered in California and elsewhere). It is an annual herb in the Asteraceae family that typically blooms from April to September. This species is found in alkaline soils associated with chenopod scrub, meadows and seeps, playas, riparian woodlan, and grasslands (CNPS 2020). Smooth tarplant is known from Los Angeles, Riverside, San Bernardino, and San Diego counties (CNPS 2020) at elevations between 330 to 2,000 feet amsl (Calflora 2020). This species is threatened by foot traffic, agriculture, road maintenance, disking, urbanization, hydrological alterations, and flood control projects (CNPS 2020).

Smooth tarplant has a low to moderate potential to occur within the proposed project survey area. Historical species occurrence records for smooth tarplant exist within 3 miles of survey area (CDFW 2020a), but only marginally suitable habitat exists within the survey area, and the survey area is just outside of the known elevation range for this species. The survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.

Del Mar Mesa Sand Aster (*Corethrogyne filaginifolia* var. *linifolia*)

Del Mar Mesa sand aster is a CRPR 1B.1 species (rare, threatened, or endangered in California and elsewhere) and a proposed Oceanside Subarea Plan Narrow Endemic species. It is a perennial herb in the Asteraceae family that typically blooms from May to September. This species is found in sandy soils in coastal bluff scrub, coastal sage scrub, and openings in maritime chaparral (CNPS 2020). Del Mar Mesa sand aster is endemic to San Diego County (CNPS 2020), and is found at elevations between 0 to 425 feet amsl (Calflora 2020). This species is threatened by development, trampling, non-native plant species, and road maintenance (CNPS 2020).

Del Mar Mesa sand aster has a low to moderate potential to occur within the proposed project survey area. Historical species occurrence records for Del Mar Mesa sand aster exist within 3 miles of survey area (CDFW 2020a), but only marginally suitable habitat exists within the survey area. *Corethrogyne filaginifolia* was observed during the May 2020 sensitive plant surveys; however, the survey area was mowed before the planned June 2020 survey, which would have been used to determine if the *Corethrogyne filaginifolia* present on-site is this variety or another more common one.

SUMMARY

Only one sensitive plant species – San Diego sagewort – was documented within the proposed project survey area during the May 2020 sensitive plant surveys conducted for the proposed project (Attachment 1: Figure 4). Three sensitive plant species – southern tarplant, smooth tarplant, and Del Mar Mesa sand aster – continue to have a low to moderate potential for occurrence because their presence/absence could not be determined during the May 2020 sensitive plant survey, and the site was mowed prior to the planned June 8, 2020, sensitive plant survey.

Please do not hesitate to contact Melissa Busby at melissa@busbybiological.com or 858.334.9507 if you have any questions.

Sincerely,

Melissa Busby
Owner/Principal Biologist

Plant Species with a Potential for Occurrence in the Proposed Project Survey Area

ATTACHMENT 2
Sensitive Plant Species with a Potential to Occur within the Proposed Project Survey Area

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
San Diego thornmint (*Acanthomintha ilicifolia*)	FT SE CRPR 1B.1 SAP PC SAP NE	Annual herb. Blooms Apr-Jun. Clay openings in vernal pools, chaparral, coastal sage scrub, grassland. (CNPS 2020) Elev 150-3,085ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Nuttall's acmispon (Acmispon prostratus)	CRPR 1B.1 SAP PC SAP NE	Annual herb. Blooms Mar-Jun/Jul. Sandy substrate in coastal dunes, coastal sage scrub (CNPS 2020) Elev 0-2,395ft. (Calfora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
spineshrub (*Adolphia californica*)	CRPR 2B.1	Perennial deciduous shrub. Blooms Dec-May. Clay soils in chaparral, coastal sage scrub, grassland. (CNPS 2020) Elev 15-1,115ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego ambrosia (*Ambrosia pumila*)	FE CRPR 1B.1 SAP PC SAP NE	Perennial rhizomatous herb. Blooms Apr-Oct. Often in disturbed areas with sandy loam or clay soils, sometimes alkaline areas, in chaparral, coastal sage scrub, grassland, vernal pools. (CNPS 2020) Elev 50-785ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Del Mar manzanita (*Arctostaphylos glandulosa* ssp. *crassifolia*)	FE CRPR 1B.1 SAP NE	Perennial evergreen shrub. Blooms Dec-Jun. Sandy soils in maritime chaparral. (CNPS 2020) Elev 115-820ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego sagewort (*Artemisia palmeri*)	CRPR 4.2	Perennial deciduous shrub. Blooms May-Sep. Sandy, mesic areas in chaparral,	Present. Approximately 44 individuals were observed adjacent to and south of the survey area, on the stream bank just

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
		coastal sage scrub, riparian habitats. (CNPS 2020) Elev 0-2,230ft. (Calflora 2020)	south of Buena Vista Creek, on July 22, 2019. This species was also documented during the May 2020 focused rare plant survey.
Coulter's saltbush (*Atriplex coulteri*)	CRPR 1B.2	Perennial herb. Blooms Mar-Oct. Alkaline or clay soils in coastal dunes, coastal bluff scrub, coastal sage scrub, grassland. (CNPS 2020) Elev 0-1,510ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
South coast saltscale (*Atriplex pacifica*)	CRPR 1B.2	Annual herb. Blooms Mar-Oct. Playas, coastal dunes, coastal bluff scrub, coastal sage scrub. (CNPS 2020) Elev 8-1,050ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area but species is restricted to sandy soils along the immediate coast. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Encinitas baccharis (*Baccharis vanessae*)	FT SE CRPR 1B.1 SAP NE	Perennial deciduous shrub. Blooms Aug-Nov. Sandstone in maritime chaparral, cismontane woodland. (CNPS 2020) Elev 245-2,460ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, no suitable soils exist within survey area, and the survey area is just outside of the known elevation range of this species. In addition, this species was not observed during the May 2020 focused rare plant surveys, when it would have been observable.
San Diego sunflower (*Bahiopsis laciniata*)	CRPR 4.2	Perennial shrub. Blooms Feb-Aug. Dry slopes in coastal sage scrub, chaparral. Elev 50-2,690ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Nevin's barberry (*Berberis nevinii*)	FE SE CRPR 1B.1	Perennial evergreen shrub. Blooms Feb/Mar-Jun. Sandy or gravelly soils in chaparral, coastal sage scrub, cismontane woodland, riparian scrub. (CNPS 2020) Elev 115-1,575ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
thread-leaved brodiaea (*Brodiaea filifolia*)	FT SE CRPR 1B.1 SAP PC SAP NE	Perennial bulbiferous herb. Blooms Mar-Jun. Typically clay soils in vernal pools, playas, chaparral, coastal sage scrub, cismontane woodland, grassland. (CNPS	Not Expected. Historical records exist within 3 miles of survey area and moderately suitable habitat exists within survey area despite disturbance from mowing and past grading activities; however, this species was not observed

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
		2020) Elev 130-3,640ft. (Calflora 2020)	during the May 2020 focused rare plant surveys or during the 2020 focused *Brodiaea* species surveys that were conducted during the appropriate blooming period, before the site was mowed in early June 2020.
Orcutt's brodiaea (*Brodiaea orcuttii*)	CRPR 1B.1	Perennial bulbiferous herb. Blooms May-Jul. Typically mesic, clay soils (sometimes serpentinite) in vernal pools, chaparral, cismontane woodland, closed-cone coniferous forest, meadows & seeps, grassland. (CNPS 2020) Elev 330-5,610ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and the survey area is located just outside of the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys or during the 2020 focused *Brodiaea* species surveys that were conducted during the appropriate blooming period, before the site was mowed in early June 2020.
Brewer's calandrinia (*Calandrinia breweri*)	CRPR 4.2	Annual herb. Blooms Mar–Jun. Sandy/loamy soils typically after fire or other disturbance in chaparral, coastal sage scrub. (CNPS 2020) Elev 150-3,510ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Payson's jewelflower (*Caulanthus simulans*)	CRPR 4.2	Annual herb. Blooms Feb/Mar-May/Jun. Sandy, granitic areas in chaparral, coastal sage scrub. (CNPS 2020) Elev 2,460-5,805ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, limited suitable soils exist within survey area, and the survey area is well outside of the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
wart-stemmed ceanothus (*Ceanothus verrucosus*)	CRPR 2B.2	Perennial evergreen shrub. Blooms Dec-May. Chaparral. (CNPS 2020) Elev 15-1,115ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
southern tarplant (*Centromadia parryi* ssp. *australis*)	CRPR 1B.1	Annual herb. Blooms May-Nov. Vernal pools, along the margins of marshes, in vernally mesic areas within grassland. (CNPS 2020) Elev 0-1,410ft. (Calflora 2020)	Low to moderate. While no historical records exist within 3 miles of survey area and only marginally suitable habitat exists within the survey area, the survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
smooth tarplant (*Centromadia pungens ssp. laevis*)	CRPR 1B.1	Annual herb. Blooms Apr-Sep. Alkaline soils within chenopod scrub, meadows & seeps, playas, riparian woodland, grassland. (CNPS 2020) Elev 330-2,000ft. (Calflora 2020)	Low to moderate. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within the survey area, the survey area is just outside of the known elevation range for this species, and the survey area was mowed before the planned June 2020 survey, which would have been used to determine if this species is present onsite.
Orcutt's spineflower (*Chorizanthe orcuttiana*)	FE SE CRPR 1B.1 SAP NE	Annual herb. Blooms Mar-May. Sandy openings in maritime chaparral, coastal sage scrub, closed-cone coniferous forest. (CNPS 2020) Elev 150-490ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
long-spined spineflower (*Chorizanthe polygonoides* var. *longispina*)	CRPR 1B.2	Annual herb. Blooms Apr-Jul. Clay soils, in vernal pools, chaparral, coastal sage scrub, meadows & seeps, grassland. (CNPS 2020) Elev 330-5,315ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys or during the focused 2020 *Brodiaea* species surveys.
seaside cistanthe (*Cistanthe maritima*)	CRPR 4.2	Annual herb. Blooms Feb/Mar-Jun/Aug. Sandy soils in coastal bluff scrub, coastal sage scrub, grassland. (CNPS 2020) Elev 50-590ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
San Miguel savory (*Clinopodium chandleri*)	CRPR 1B.2	Perennial shrub. Blooms Mar-Jul. Rocky, gabbroic, or metavolcanic areas in chaparral, coastal sage scrub, cismontane woodland, riparian woodland, grassland. (CNPS 2020) Elev 1,345-3,410ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, no suitable soils exist within survey area, and the survey area is outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
summer-holly (*Comarostaphylis diversifolia* ssp. *diversifolia*)	CRPR 1B.2	Perennial evergreen shrub. Blooms Apr-Jun. Chaparral, cismontane woodland. (CNPS 2020) Elev 130-1,835ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
			have been observable.
Del Mar Mesa sand aster (*Corethrogyne filaginifolia* var. *linifolia*)	CRPR 1B.1 SAP NE	Perennial herb. Blooms May-Sep. Sandy soils in coastal bluff scrub, coastal sage scrub, openings in maritime chaparral. (CNPS 2020) Elev 0-425ft. (Calflora 2020)	Low to moderate. Historical records exist within 3 miles of survey area, and marginally suitable habitat exists within survey area. While this species was not observed during the May 2020 focused rare plant surveys, the survey area was mowed in early June, before the planned June 2020 rare plant survey which would have been used to determine if this species is present within the survey area.
Wiggin's cryptantha (*Cryptantha wigginsii*)	CRPR 1B.2	Annual herb. Blooms Feb-Jun. Often clay soils in coastal scrub. Elev. 65-905ft. (CNPS 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
snake cholla (*Cylindropuntia californica* var. *californica*)	CRPR 1B.1	Perennial stem succulent. Blooms Apr-May. Chaparral, coastal sage scrub. (CNPS 2020) Elev 65-885ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
western dichondra (*Dichondra occidentalis)*	CRPR 4.2	Perennial rhizomatous herb. Blooms Jan/Mar-Jul. Coastal sage scrub, chaparral, cismontane woodland, grassland. (CNPS 2020) Elev 130-1,510ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
short-leaved dudleya (*Dudleya blochmaniae* ssp. *brevifolia*)	CRPR 1B.1 SAP PC	Perennial herb. Blooms Apr-May. Sandstone in coastal sage scrub and openings in maritime chaparral. (CNPS 2020) Elev 330-460ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, no suitable soils exist within survey area, and the survey area is outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
variegated dudleya (*Dudleya variegata*)	CRPR 1B.2 SAP NE	Perennial herb. Blooms Apr-Jun. Clay soils in vernal pools, chaparral, cismontane woodland, coastal sage scrub, grassland. (CNPS 2020) Elev 115-1,015ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
sticky dudleya (*Dudleya viscida*)	CRPR 1B.2 SAP PC	Perennial herb. Blooms May-Jun. Rocky areas in coastal bluff scrub, chaparral, coastal scrub, cismontane woodland. (CNPS 2020) Elev 15-2,330ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
Palmer's goldenbush (*Ericameria palmeri* var. *palmeri*)	CRPR 1B.1	Perennial evergreen shrub. Blooms Jul/Sep-Nov. Mesic areas in chaparral, coastal sage scrub. (CNPS 2020) Elev 100-1,085ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
coast wallflower (*Erysimum ammophilum*)	CRPR 1B.2	Perennial herb. Blooms Feb-Jun. Sandy openings in coastal dunes, maritime chaparral, coastal sage scrub. (CNPS 2020) Elev 15-330ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and limited suitable soils exist within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
San Diego button-celery (*Eryngium aristulatum* var. *parishii*)	FE SE CRPR 1B.1 SAP NE	Annual/perennial herb. Blooms Apr-Jun. Mesic soils in vernal pools, coastal sage scrub, grassland. (CNPS 2020) Elev 115-2,495ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
cliff spurge (*Euphorbia misera*)	CRPR 2B.2	Perennial shrub. Blooms Dec-Aug/Oct. Rocky areas in coastal bluff scrub, coastal sage scrub, Mojavean desert scrub. (CNPS 2020) Elev 0-920ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego barrel cactus (*Ferocactus viridescens*)	CRPR 2B.1 SAP PC	Perennial stem succulent. Blooms May-Jun. Chaparral, coastal sage scrub, grassland, vernal pools. (CNPS 2020) Elev 15-885ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
Palmer's grapplinghook	CRPR 4.2	Annual herb. Blooms Mar-May. Clay soils in open grassy	Not Expected. Historical records exist within 3 miles of survey area, and

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
(*Harpagonella palmeri*)		areas associated with chaparral, coastal sage scrub, grassland. (CNPS 2020) Elev 150-3,970ft. (Calflora 2020)	moderately suitable habitat exists within survey area. However, this species was not observed during the May 2020 focused rare plant surveys.
Orcutt's hazardia (*Hazardia orcuttii*)	CRPR 1B.1 SAP PC SAP NE	Perennial evergreen shrub. Blooms Aug-Oct. Often clay soils in maritime chaparral, coastal scrub. (CNPS 2020) Elev. 0-330ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
graceful tarplant (*Holocarpha virgata* ssp. *elongata*)	CRPR 4.2	Annual herb. Blooms May-Nov. Chaparral, cismontane woodland, coastal sage scrub, grassland. (CNPS 2020) Elev 65-2,755ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
decumbent goldenbush (*Isocoma menziesii* var. *decumbens*)	CRPR 1B.2	Perennial shrub. Blooms Apr-Nov. sandy, often disturbed areas in coastal sage scrub, chaparral. (CNPS 2020) Elev 65-1,640ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
San Diego marsh-elder (*Iva hayesiana*)	CRPR 2B.2 SAP PC	Perennial herb. Blooms Apr-Oct. Marshes & swamps, playas. (CNPS 2020) Elev 15-855ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and moderately suitable habitat exists within survey area. However, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
spiny rush (*Juncus acutus* ssp. *leopoldii*)	CRPR 4.2	Perennial rhizomatous herb. Blooms Mar/May-Jun. Coastal salt marsh, alkaline meadows & seeps, mesic soils in coastal dunes. (CNPS 2020) Elev 0-1,310ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and moderately suitable habitat exists within survey area. However, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
Coulter's goldfields (*Lasthenia glabrata* ssp. *coulteri*)	CRPR 1B.1	Annual herb. Blooms Feb-Jun. Coastal salt marsh, playas, vernal pools. (CNPS 2020) Elev 0-1,905ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
			the focused 2020 *Brodiaea* species surveys.
Robinson's pepper-grass (*Lepidium virginicum* var. *robinsonii*)	CRPR 4.3	Annual herb. Blooms Jan-Jul. Chaparral, coastal sage scrub. (CNPS 2020) Elev 180-2,525ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
sea dahlia (*Leptosyne maritima*)	CRPR 2B.2	Perennial herb. Blooms Mar-May. Coastal bluff scrub, coastal sage scrub. (CNPS 2020) Elev 0-425ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
little mousetail (*Myosurus minimus* ssp. *apus*)	CRPR 3.1 SAP NE	Annual herb. Blooms Mar-Jun. Alkaline soils in vernal pools, grassland. Elev 65-2,100ft. (CNPS 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Mud nama (*Nama stenocarpa*)	CRPR 2B.1	Annual/perennial herb. Blooms Jan-Jul. Marshes & swamps, lake margins, riverbanks. (CNPS 2020) Elev 15-2,100ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
spreading navarretia (*Navarretia fossalis*)	FT CRPR 1B.1 SAP NE	Annual herb. Blooms Apr-Jun. Shallow freshwater marsh, playas, vernal pools, chenopod scrub. (CNPS 2020) Elev 360-1,705ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
California Orcutt grass (*Orcuttia californica*)	FE SE CRPR 1B.1 SAP NE	Annual herb. Blooms Apr-Aug. Vernal pools. (CNPS 2020) Elev 460-2,200ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for

			the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
short-lobed broomrape (*Orobanche parishii* ssp. *brachyloba*)	CRPR 4.2	Parasitic, perennial herb. Blooms Apr-Oct. Sandy soils associated with coastal bluff scrub, coastal dunes, coastal sage scrub. (CNPS 2020) Elev 280-655ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, limited suitable soils exist within survey area, and the survey area is just outside the known elevation range for this species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
San Diego mesa mint (*Pogogyne abramsii*)	FE SE CRPR 1B.1	Annual herb. Blooms Mar-Jul. Vernal pools. (CNPS 2020) Elev 360-590ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, focused 2019/2020 fairy shrimp surveys, or during the focused 2020 *Brodiaea* species surveys.
Nuttall's scrub oak (*Quercus dumosa*)	CRPR 1B.1 SAP PC	Perennial evergreen shrub. Blooms Feb-Apr/May-Aug. Sandy or clay loam soils associated with chaparral, coastal sage scrub, closed-cone coniferous forest. (CNPS 2020) Elev 50-4,035ft. (Calflora 2020)	Not Expected. Historical records exist within 3 miles of survey area, but only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
small-leaved rose (*Rosa minutifolia*)	SE CRPR 2B.1	Perennial deciduous shrub. Blooms Jan-Jun. Chaparral, coastal sage scrub. (CNPS 2020) Elev 425-560ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.
ashy spike-moss (*Selaginella cinerascens*)	CRPR 4.1	Perennial rhizomatous herb (fern). No blooming period. Chaparral, coastal sage scrub. (CNPS 2020) Elev. 35-1,245ft.	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020

SPECIES NAME	STATUS	HABITAT DESCRIPTION*	POTENTIAL FOR OCCURRENCE
		(Calflora 2020)	focused rare plant surveys, and it would have been observable.
chaparral ragwort (*Senecio aphanactis*)	CRPR 2B.2	Annual herb. Blooms Jan-Apr/May. Chaparral, coastal sage scrub, cismontane woodland, sometimes in alkaline soils. (CNPS 2020) Elev 425-2,165ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys.
purple stemodia (*Stemodia durantifolia*)	CRPR 2B.1	Perennial herb. Blooms year-round. Mesic, sandy soils in wetland/riparian. Elev 50-560ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, and only marginally suitable habitat exists within survey area. In addition, this species was not observed during the May 2020 focused rare plant surveys.
Parry's tetracoccus (*Tetracoccus dioicus*)	CRPR 1B.2	Perennial deciduous shrub. Blooms Apr-May. Chaparral, coastal sage scrub. (CNPS 2020) Elev 490-2,725ft. (Calflora 2020)	Not Expected. No historical records exist within 3 miles of survey area, only marginally suitable habitat exists within survey area, and the survey area is just outside of the known elevation range for the species. In addition, this species was not observed during the May 2020 focused rare plant surveys, and it would have been observable.

STATUS CODES

Plant Species Observed within the Proposed Project Survey Area

Major Clade	Family	Scientific name	Common name	Nativity
Eudicots				
	Adoxaceae (Muskroot family)			
		Sambucus nigra subsp. caerulea	Mexican elderberry	Native
	Aizoaceae (Fig-marigold family)			
		Carpobrotus chilensis	Sea fig	Naturalized
		Carpobrotus edulis	Hottentot fig	Naturalized
	Anacardiaceae (Sumac family)			
		Schinus terebinthifolius	Brazilian pepper tree	Naturalized
	Apiaceae (Carrot family)			
		Apium graveolens	Common celery	Naturalized
		Conium maculatum	Poison hemlock	Naturalized
		Foeniculum vulgare	Sweet fennel	Naturalized
	Apocynaceae (Dogbane family)			
		Carissa macrocarpa	NatalpPlum	Non-native
	Asteraceae (Aster family)			
		Ambrosia psilostachya	Cuman ragweed	Native
		Artemisia californica	Coastal sagebrush	Native
		Artemisia douglasiana	Douglas' sagewort	Native
		Artemisia palmeri	San Diego sagewort	Native
		Baccharis pilularis	Coyotebrush	Native
		Baccharis salicifolia subsp. salicifolia	Mule fat	Native
		Carduus pycnocephalus subsp. pycnocephalus	Italian thistle	Naturalized
		Centaurea melitensis	Maltese star-thistle	Naturalized
		Corethrogyne filaginifolia	California aster	Native
		Deinandra fasciculata	Clustered tarweed	Native
		Erigeron bonariensis	Asthmaweed	Naturalized
		Glebionis coronaria	Crown daisy	Naturalized
		Hedypnois cretica	Cretanweed	Naturalized
		Heterotheca grandiflora	Telegraphweed	Native
		Hypochaeris glabra	Smooth cat's ear	Naturalized

Major Clade	Family	Scientific name	Common name	Nativity
		Isocoma menziesii	Menzies' goldenbush	Native
		Lactuca serriola	Prickly lettuce	Naturalized
		Logfia gallica	Narrowleaf cottonrose	Naturalized
		Osmadenia tenella	False rosinweed	Native
		Pseudognaphalium biolettii	Two-color rabbit-tobacco	Native
		Pseudognaphalium stramineum	Cottonbatting plant	Native
		Pulicaria paludosa	Spanish false fleabane	Naturalized
		Sonchus asper subsp. asper	Prickly sow thistle	Naturalized
		Sonchus oleraceus	Common sowthistle	Naturalized
		Xanthium strumarium	Rough cocklebur	Native
	Boraginaceae (Borage family)			
		Amsinckia menziesii	Menzies' fiddleneck	Native
		Plagiobothrys collinus	Cooper's popcornflower	Native
	Brassicaceae (Mustard family)			
		Brassica nigra	Black mustard	Naturalized
		Brassica tournefortii	Saharan mustard	Naturalized
		Hirschfeldia incana	Shortpod mustard	Naturalized
		Lepidium	Pepperweed	Native
		Raphanus sativus	Cultivated radish	Naturalized
		Sisymbrium orientale	Indian hedgemustard	Naturalized
	Caryophyllaceae (Pink family)			
		Achyronychia cooperi	Onyxflower	Native
		Silene gallica	Common catchfly	Naturalized
	Chenopodiaceae (Goosefoot family)			
		Atriplex semibaccata	Australian saltbush	Naturalized
		Chenopodium album	Lambsquarters	Naturalized
		Chenopodium murale	Nettleleaf goosefoot	Naturalized
		Salsola australis	Russian thistle	Naturalized
	Convolvulaceae (Morning-glory family)			
		Convolvulus arvensis	Field bindweed	Naturalized

Major Clade	Family	Scientific name	Common name	Nativity
	Crassulaceae (Stonecrop family)			
		Crassula connata	Sand pygmyweed	Native
	Euphorbiaceae (Spurge family)			
		Croton setigerus	Dove weed	Native
		Euphorbia maculata	Spotted sandmat	Naturalized
		Euphorbia peplus	Petty spurge	Naturalized
		Ricinus communis	Castorbean	Naturalized
	Fabaceae (Pea family)			
		Acmispon americanus var. americanus	Spanish clover	Native
		Acmispon glaber	Common deerweed	Native
		Acmispon micranthus	San Diego bird's-foot trefoil	Native
		Medicago polymorpha	Burclover	Naturalized
		Melilotus indicus	Sourclover	Naturalized
		Parkinsonia aculeata	Jerusalem thorn	Naturalized
	Fagaceae (Beech family)			
		Quercus agrifolia	California live oak	Native
	Geraniaceae (Geranium family)			
		Erodium botrys	Longbeak stork's bill	Naturalized
		Erodium cicutarium	Redstem stork's bill	Naturalized
		Geranium carolinianum	Carolina geranium	Native
	Lamiaceae (Mint family)			
		Marrubium vulgare	Horehound	Naturalized
		Salvia mellifera	Black sage	Native
	Lythraceae (Loosestrife family)			
		Lythrum hyssopifolia		Naturalized
	Malvaceae (Mallow family)			
		Malva parviflora	Cheeseweed mallow	Naturalized
		Malvella leprosa	Alkali mallow	Native
	Moraceae (Fig family)			
		Ficus carica	Common Fig	Naturalized
	Myrsinaceae (Myrisine family)			
		Lysimachia arvensis	Scarlet pimpernel	Naturalized

Major Clade	Family	Scientific name	Common name	Nativity
	Myrtaceae (Myrtle family)			
		Eucalyptus citriodora	Lemon-scented gum	Naturalized
		Eucalyptus camaldulensis	Red gum	Naturalized
	Onagraceae (Evening primrose family)			
		Oenothera elata	Marsh evening primrose	Native
	Oxalidaceae (Wood-Sorrel family)			
		Oxalis pes-caprae	Bermuda buttercup	Naturalized
	Plantaginaceae (Plantain family)			
		Plantago erecta	Dotseed plantain	Native
		Plantago lanceolata	Narrowleaf plantain	Naturalized
	Platanaceae (Plane-tree family)			
		Platanus racemosa	California sycamore	Native
	Polygonaceae (Buckwheat family)			
		Eriogonum fasciculatum	Eastern Mojave buckwheat	Native
		Rumex crispus	Curly dock	Naturalized
	Salicaceae (Willow family)			
		Salix exigua	Narrowleaf willow	Native
		Salix laevigata	Red willow	Native
		Salix lasiolepis	Arroyo willow	Native
	Solanaceae (Potato family)			
		Datura wrightii	Sacred thorn-apple	Native
		Nicotiana glauca	Tree tobacco	Naturalized
		Solanum rostratum	Buffalobur nightshade	Naturalized
	Tropaeolaceae (Nasturtium family)			
		Tropaeolum majus	Garden nasturtium	Naturalized
	Vitaceae (Grape family)			
		Parthenocissus quinquefolia	Virginia creeper	Non-native
		Vitis girdiana	Wild grape	Native

Major Clade	Family	Scientific name	Common name	Nativity
Monocots				
	Arecaceae (Palm family)			
		Washingtonia robusta	Washington fan palm	Naturalized
	Cyperaceae (Sedge family)			
		Cyperus eragrostis	Tall flatsedge	Native
	Iridaceae (Iris family)			
		Sisyrinchium bellum	Western blue-eyed grass	Native
	Poaceae (Grass family)			
		Arundo donax	Giant reed	Naturalized
		Avena barbata	Lopsided oat	Naturalized
		Avena fatua	Wild oat	Naturalized
		Bromus diandrus	Ripgut brome	Naturalized
		Bromus hordeaceus	Soft brome	Naturalized
		Bromus madritensis subsp. rubens	Red brome	Naturalized
		Cynodon dactylon	Bermudagrass	Naturalized
		Distichlis spicata	Saltgrass	Native
		Festuca myuros	Rattail sixweeks grass	Naturalized
		Festuca perennis	Perennial ryegrass	Naturalized
		Gastridium phleoides	Nit grass	Naturalized
		Hordeum murinum	Mouse barley	Naturalized
		Pennisetum setaceum	Crimson fountaingrass	Naturalized
		Phalaris minor	Littleseed canarygrass	Naturalized
		Polypogon monspeliensis	Annual rabbitsfoot grass	Naturalized
		Stipa miliacea var. miliacea	Smilograss	Naturalized
		Stipa pulchra	Purple needlegrass	Native
	Typhaceae (Cattail family)			
		Typha	Cattail	Native

APPENDIX G
Brodiaea Species Survey Summary Report

BUSBY
Biological Services

September 8, 2020

San Diego, CA 92108

RE: 2020 *Brodiaea* Species Survey Summary Report for the Proposed CarMax Auto Superstore Project, City of Oceanside, San Diego County, California

Ms. Hill:

This letter report summarizes the results of the focused, presence/absence *Brodiaea* species surveys conducted in 2020 for the proposed CarMax Auto Superstore project (project) located in the City of Oceanside, San Diego County, California (Attachment 1: Figures 1 through 4). Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. to conduct these surveys on behalf of Centerpoint Integrated Solutions to determine the presence/absence of *Brodiaea* species within the proposed project survey area, which includes the proposed project area and a 50-foot survey buffer (Attachment 1: Figure 4).

This survey summary report provides background information for the proposed project and *Brodiaea* species with a potential for occurrence within the proposed project surveys area as well as the methods used for the surveys and the results of the 2020 surveys conducted for the proposed project.

BACKGROUND INFORMATION

A brief summary of the proposed project and *Brodiaea* species information are provided in this section.

Proposed Project Location and Description

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, sales building with an attached presentation area, service building/area, and non-public carwash with associated access driveways, parking lots, and landscaped areas. In addition, a retaining wall will be required along the southern boundary of the property because of the exiting grades in that area.

The 10.54-acre proposed project area occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 1968; Attachment 1: Figure 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Attachment 1: Figure 4). It is bordered to the north by State Route 78; to east by Thunder Drive, the California Department of Motor Vehicles (DMV), and residential development; to the south by Buena Vista Creek and Brookdale Senior Living facility; and to the west by the Tri-City Crossroads Shopping Center (Attachment 1: Figures 2 through 4). Plaza Drive separates the two parcels in the northwest portion of the proposed project area. Elevations within the proposed project area range from approximately 177 to 220 feet above mean sea level (Attachment 1: Figures 3 and 4).

The dominant vegetation communities and land cover types within the proposed project survey area include disturbed, ruderal, southern riparian forest, disturbed Diegan coastal sage scrub, developed and ornamental. Other vegetation communities present within the proposed project area in smaller proportions include iceplant and open water (Attachment 1: Figure 4). The section of Buena Vista Creek on the southern border of the proposed project area is part of the Buena Vista Creek Mitigation Area.

Brodiaea **Species Information**

Two sensitive *Brodiaea* species have a potential to occur within the proposed project survey area – thread-leaved brodiaea (*Brodiaea filifolia*) and Orcutt's brodiaea (*Brodiaea orcutti*). Species information for each of these is provided below.

Thread-leaved Brodiaea

Thread-leaved brodiaea is a federally listed threatened species, a state-listed endangered species, a California Rare Plant Rank (CRPR) 1B.1 species (seriously threatened in California and elsewhere), and a proposed Oceanside SAP-covered species. This species is a perennial, bulbiferous herb in the Themidaceae family that is native to and endemic to California; it regrows annually from an underground corm and typically blooms from March to July. Not all thread-leaved brodiaea individuals in a population emerge and/or flower each year. Thus, only a portion of the actual thread-leaved brodiaea population is observable each year, as many non-emergent corms remain dormant below the ground during each growing season.

Thread-leaved brodiaea is found in southern California from northwestern San Diego County, southern Orange County, western San Bernardino County, eastern Los Angeles County, and far southwest Riverside County (NatureServe 2020, Calflora 2020). This species is typically found in clay soils associated with vernal pools within grasslands, coastal sage scrub, chaparral, and cismontane woodland.

at elevations ranging from 130 feet to 3,640 feet above mean sea level (NatureServe 2020, Calfora 2020).

Threats to thread-leaved brodiaea include loss of habitat from urbanization, agricultural conversion, alteration of hydrology, impacts from livestock grazing, vehicle and foot traffic, discing for fire suppression, and competition from non-native plants (California Native Plant Society [CNPS] 2020). Thread-leaved brodiaea was state-listed as endangered in 1982 and federally listed as threatened in 1998. When the species was listed by USFWS in 1998, there were fewer than 40 known extant occurrences; however, this number has increased to about 106 known extant occurrences (CNPS 2020).

Orcutt's Brodiaea

Orcutt's brodiaea is a CRPR 1B.1 species (seriously threatened in California and elsewhere). It is a bulbiferous herb in the Themidaceae family herb that regrows annually from an underground corm, typically blooming from May to July (Calfora 2020). Like thread-leaved brodiaea discussed above, not all Orcutt's brodiaea individuals in a population emerge and/or flower each year. Thus, many non-emergent corms may remain dormant below the ground during each growing season.

Orcutt's brodiaea is found in a narrow range, from San Bernardino County south through San Diego County and into northern Baja California, Mexico (Calflora 2020, NatureServe 2020). This species is typically found in mesic, clay soils and sometimes in serpentinite soils in vernal pools associated with chaparral, cismontane woodland, closed-cone coniferous forest, meadows and seeps, and grassland at elevations ranging from 330 feet to 5,610 feet above mean sea level (NatureServe 2020, Calfora 2020).

Threats to Orcutt's brodiaea include loss of habitat from urbanization, agricultural conversion, alteration of hydrology, impacts from livestock grazing, competition from non-native plants, military activities, vehicle and foot traffic, road construction and maintenance, and illegal dumping (CNPS 2020).

METHODS

The methods used to conduct the 2020 *Brodiaea* species surveys within the proposed project survey area are presented in this section.

Background Research & Habitat Assessment

A literature review was conducted to inform the general biological survey and habitat assessment conducted for the proposed project. In addition, historical species occurrence databases (e.g., California Natural Diversity Database [CNDDB], SanGIS, CNPS) were searched, and other references were consulted to

better understand the historical location data and distribution of these sensitive species in San Diego County.

A focused habitat assessment for sensitive plant species was conducted in summer 2019 to evaluate the current proposed project survey area for its potential to support sensitive plant species. Potentially suitable habitats were mapped in the field using aerial imagery of the proposed project survey area (1 inch = 200 feet) and handheld Global Positioning Systems (GPS) units. Potentially suitable habitat areas were digitized using Google™ Earth based on field notes and waypoints collected in the field.

Proposed Project Survey Area & Reference Site Checks

Early in the growing season, BBS conducted site checks within suitable habitat identified within the proposed project survey area to document early emergent *Brodiaea* vegetation. When identified, locations of potential *Brodiaea* species were documented using a handheld GPS unit.

In addition, BBS biologists monitored known reference populations in the vicinity of the proposed project area to determine when *Brodiaea* species had emerged and were observable, to assure the focused surveys for the proposed project were conducted during the appropriate survey windows.

Focused Surveys

Once thread-leaved brodiaea was observed at the reference population, focused thread-leaved brodiaea and Orcutt's brodiaea surveys were initiated in the potentially suitable habitat within the proposed project survey area. For all *Brodiaea* species observations, biologists mapped the locations of and counted all individuals observed. Biologists also mapped the observations by hand onto the aerial photograph (either a point or a polygon), estimated the number of individuals, and collected a GPS point for the plant/population location.

RESULTS

The results of the 2020 *Brodiaea* species surveys conducted for the proposed project are presented in this section.

Background Research & Habitat Assessment

The literature review and historical occurrence database search conducted for the proposed project indicted that historical records for two *Brodiaea* species – thread-leaved brodiaea and Orcutt's brodiaea – exist within 3 miles of the proposed project survey area (CDFW 2019).

The habitat assessment conducted by BBS biologist Darin Busby on July 22, 2019, confirmed that moderately suitable habitat for both of these species occurs within the proposed project survey area. The suitable habitat within the proposed project survey area is dominated by disturbed habitat with pockets of ruderal, iceplant, ornamental, and disturbed Diegan coastal sage scrub (Attachment 1: Figure 4).

Based on the historical occurrence data and presence of moderately suitable habitat on-site, thread-leaved brodiaea and Orcutt's brodiaea were determined to have a moderate potential to occur within the proposed project survey area, and focused presence/absence surveys for both species were scheduled for 2020.

Proposed Project Survey Area & Reference Site Checks

BBS biologist Erik LaCoste conducted site checks within suitable habitat identified within the proposed project survey area to document early emergent *Brodiaea* vegetation. These site checks occurred on February 14 and 25 as well as March 5, 13, and 19, 2020, in conjunction with the focused fairy shrimp surveys that were conducted for the proposed project.

To determine when to initiate focused surveys, BBS biologist Melissa Busby coordinated with regional biologists who were monitoring reference sites during the 2020 survey window to determine when other *Brodiaea* populations within the vicinity of the proposed project had emerged and were observable. In addition, BBS biologist Charles Vettes monitored a known reference population in the vicinity of the proposed project to determine when *Brodiaea* species in close proximity to the proposed project had emerged and were observable. During his site visit on May 7, 2020, Charles Vettes documented that the thread-leaved brodiaea at the reference population had emerged but only a few were blooming and easily observable. In addition, Erik LaCoste documented blooming Orcutt's brodiaea on June 2, 2020, during a survey for an additional nearby property.

Focused Survey

Following the observation of thread-leaved brodiaea at the nearby reference population on May 7, 2020, BBS biologists began focused, presence/absence surveys within the proposed project survey area. Six surveys were conducted by BBS biologists between May 14 and June 15, 2020. Surveys were conducted during appropriate weather conditions. Dates and survey conditions during the focused surveys are provided in Table 1, below.

Table 1. Brodiaea Survey Conditions

Survey #	Date	Time		Weather				Surveyor
				Temp (°F)	Wind (mph)	Clouds (% cover)	Precipitation	
1	5/14/20	Start	0945	67	2-3	25	0	D. Busby C. Vettes
		End	1215	70	4-6	5	0	
2	5/21/20	Start	1130	72	3-5	0	0	D. Busby
		End	1530	75	4-8	0	0	
3	5/28/20	Start	0845	67	0-1	50	0	D. Busby
		End	1245	76	3-5	0	0	
4	6/4/20	Start	0900	66	1-3	100	0	D. Busby
		End	1145	71	3-5	50	0	
6/4/20 -6/8/20		*Project Area Mowed*						
5	7/7/20	Site check for Emergent *Brodiaea*						C. Vettes
6	7/17/20	Site check for Emergent *Brodiaea*						C. Vettes

No thread-leaved brodiaea or Orcutt's brodiaea were observed during the first four focused *Brodiaea* species surveys conducted by Darin Busby and/or Charles Vettes between May 14 and June 4, 2020. Between June 4 and June 8, 2020, the proposed project area was mowed. BBS biologists continued to assess the proposed project area for any sign of potential *Brodiaea* species, including two additional surveys on June 12 and June 15, 2020. No potential *Brodiaea* species were documented during these two visits.

SUMMARY

No thread-leaved brodiaea or Orcutt's brodiaea were observed during the focused Brodiaea surveys conducted during the 2020 survey window.

Please do not hesitate to contact Melissa Busby at melissa@busbybiological.com or 858.334.9507 if you have any questions.

Sincerely,

Melissa Busby
Owner/Principal Biologist

APPENDIX H
Sensitive Wildlife Species with a Potential to Occur within the Survey Area

APPENDIX H
Sensitive Wildlife Species with a Potential to Occur within the Proposed Project Survey Area

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
Invertebrates			
San Diego fairy shrimp (*Branchinecta sandiegonensis*)	FE SAP NE	Vernal pools, swales, ditches, road ruts. Adult emerge typically mid-December to early May.	Not expected. No historical records exist within 3 miles of survey area, and limited suitable habitat exists within survey area. In addition, this species was not observed during focused 2019/2020 large Brachiopod surveys.
Riverside fairy shrimp (*Streptocephalus woottoni*)	FE SAP NE	Vernal pools, swales, ditches, road ruts that are long-lasting (i.e., several months).	Not expected. No historical records exist within 3 miles of survey area, and limited suitable habitat exists within survey area. In addition, this species was not observed during focused 2019/2020 large Brachiopod surveys.
Quino checkerspot butterfly (*Euphydryas editha quino*)	FE	Open, dry areas in foothills, mesas, lake margins where principal larval host plants dot-seed plantain, and secondary host plants woolly plantain, white snapdragon, thread-leaved bird's beak, and purple owl's clover occurs. Adult emergence mid-January to April.	Not expected. Suitable habitat does not exist within survey area, historical records do not exist within 3 miles of survey area, survey area is not in known range of this species, and survey area is outside USFWS Recommended Survey Area.
Vertebrates			
Amphibians			
arroyo toad (*Anaxyrus californicus*)	FE SSC SAP PC	Breeds in shallow pools along stream edges with sand/gravel flats between March and June. Adults use upland habitat up to within one mile of breeding sites. Non-breeding habitat includes sage scrub, mixed chaparral, oak woodland habitats.	Not expected. Survey area in known range of species; however, suitable habitat does not exist within survey area and historical records do not exist within 3 miles of survey area.

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
western spadefoot (*Spea hammondii*)	SSC SAP PC	Breeds in temporal pools and slow-moving sections of streams. Adults use lowland, foothill, and mountain habitats including washes, river floodplains, alluvial fans, playas, alkali flats, temporary ponds, vernal pools, mixed woodlands, grasslands, coastal sage scrub, and chaparral. Prefers open areas with sandy or gravelly soils but may be found in vernal pools containing clay soils.	Low. No historical records exist within 3 miles of survey area; however, survey area in known range of this species and moderately suitable habitat exists in survey area. However, not detected during 2019/2020 large Brachiopod surveys when the species would likely have been detected.
Reptiles			
Western pond turtle (*Emys marmorata*)	SSC SAP PC	Ponds, small lakes, marshes, slow-moving, sometimes brackish water with abundant vegetation, rocky or muddy bottoms, basking areas, in woodland, forest, and grassland. Breeds on land April-May, hibernates during the winter.	Not expected. Survey area in known range of species; however, historical records do not exist within 3 miles of survey area and only marginally suitable habitat exists within survey area.
silvery legless lizard (*Anniella pulchra pulchra*)	SSC	Leaf litter and loose soil on beaches and in coastal scrub, chaparral, and open riparian habitats. Sandy washes and beach dunes are used for burrowing, while logs and leaf litter are used for cover and feeding.	Low. No historical records exist within 3 miles of survey area; however, survey area in known range of this species and marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
coast [Blainville's] horned lizard (*Phrynosoma blainvillii)*	SSC	Open chaparral, coastal sage scrub with sandy, loose soil. Partially dependent on harvester ants for forage.	Low. Survey area in known range of this species and historical records exist within 3 miles of survey area; however, marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Coronado skink (*Plestiodon skiltonianus interparietalis*)	SSC	Associated with mesic areas. grasslands, open woodlands and forest, broken chaparral, rocky habitats near streams.	Low. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Belding's orange-throated whiptail (*Aspidoscelis*	SSC SAP PC	Pristine open coastal sage scrub, chaparral, and streamside growth with loose sandy soils,	Low. Survey area in known range of this species, historical records exist within 3 miles of survey area, and

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
hyperythra beldingi)		revegetation sites.	moderately suitable habitat exists within survey area. However, not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
coast patch-nosed snake (*Salvadora hexalepis virgultea*)	SSC	Chaparral and semi-arid areas with brushy or shrubby vegetation in canyons, plains and rocky hillsides.	Low. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
red diamond rattlesnake (*Crotalus ruber*)	SSC	Coastal sage scrub, open chaparral, woodland, grassland, and cultivated areas.	Low. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
south coast gartersnake (*Thamnophis sirtalis*)	SSC	Habitats near permanent water with riparian vegetation for foraging and refuge.	Low. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
two-striped gartersnake (*Thamnophis hammondii*)	SSC	Permanent fresh water, inhabiting streams, ponds, vernal pools. Occupies adjacent coastal sage scrub and grasslands during the winter.	Low. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Birds			
least bittern (*Ixobrychus exilis hesperis*)	SSC	Brackish and freshwater marshes in the coastal lowland. Rare summer resident, rare in winter.	Low. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
Cooper's hawk (*Accipiter cooperii*)	WL (nesting) SAP PC	Mature forest, open woodlands, wood edges, river groves. Parks and residential areas.	Present. A single Cooper's hawk was detected during least Bell's vireo surveys conducted on May 7, June 26, and July 17, 2020. Survey area in known range of this species and moderately suitable habitat exists in survey area.
osprey (*Pandion haliaetus*)	WL (nesting) SAP PC	Coast, lowland lakes, rarely foothills and mountain lakes. Uncommon fall/winter resident, rare in spring and summer. Fish are the primary prey item.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of the survey area and suitable habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
golden eagle (*Aquila chrysaetos*)	FP WL BGEPA (nesting and wintering) SAP PC	Require vast foraging areas in grassland, broken chaparral, or sage scrub. Nest in cliffs and boulders. In the county, wintering range does not differ greatly from breeding distribution. Uncommon resident.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of the survey area and suitable habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Swainson's hawk (*Buteo swainsoni*)	ST (nesting)	Plains, range, open hills, sparse trees. Rare spring migrant. Local breeding population now extirpated.	Not expected. Although survey area in known range of this species and historical records exist within 3 miles of the survey area, suitable habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Northern harrier (*Circus cyaneus*)	SSC (nesting)	Coastal lowland, marshes, grassland, agricultural fields. Migrant and winter resident, rare summer resident.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of the survey area and suitable habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
White-tailed kite (*Elanus leucurus majusculus*)	FP (nesting)	Nest in riparian woodland, oaks, sycamores. Forage in open, grassy areas. Year-round resident.	Low. Survey area in known range of this species, historical records exist within 3 miles of survey area, and marginal and limited suitable nesting habitat exists in survey area. However, not detected during any of the 2019 or 2020 focused surveys conducted in the project area.

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
Bald eagle (*Haliaeetus leucocephalus*)	FDL SE BGEPA FP (nesting and wintering)	Rivers, lakes. Rare winter visitor, rare fall migrant. Feed mainly on fish.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of the survey area and suitable habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
American peregrine falcon (*Falco peregrinus anatum*)	FDL SDL FP (nesting) SAP PC	Nests on cliff ledges, old raptor or raven nests, and man-made structures. Forages in open coastal areas, mud flats. Rare inland. Rare fall and winter resident, casual in late spring and early summer.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of the survey area and suitable habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
western yellow-billed cuckoo (*Coccyzus americanus occidentalis*)	FT SE (nesting)	Extensive riparian woodlands. Summer resident. Very localized breeding.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of the survey area and suitable nesting habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
burrowing owl (*Athene cunicularia*)	SSC (burrow sites and some wintering sites)	Grassland, agricultural land, coastal dunes. Declining resident.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of the survey area and suitable habitat or burrow complexes do not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
southwestern willow flycatcher (*Empidonax traillii extimus*)	FE SE (nesting) SAP PC	Nests in extensive willow-dominated riparian foists and woodlands. Occasionally oak woodlands. Rare spring and fall migrant, rare summer resident.	Not expected. Survey area in known range of this species and historical records exist within 3 miles of the survey area; however, suitable and extensive riparian nesting habitat does not exist in survey area. Not detected during 2020 least Bell's vireo surveys when the species would most likely have been detected.
least Bell's vireo (*Vireo bellii pusillus*)	FE SE (nesting) SAP PC	Willow-dominated successional woodland or scrub, Baccharis scrub, mixed oak/willow woodland, and elderberry scrub in riparian habitat. Nests and forages in vegetation along streams and rivers that measures approximately 3 to 6 feet in height and has a dense,	Present. A single least Bell's vireo was observed during a focused survey for this species conducted on July 29, 2020. Survey area in known range of this species, historical records exist within 3 miles of survey area, and moderately suitable riparian habitat exists in survey area.

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
		stratified canopy.	
California horned lark (*Eremophila alpestris actia*)	WL	Sandy shores, mesas, disturbed areas, grasslands, agricultural lands, sparse scrub communities.	Low. Survey area in known range of this species, historical records exist within 3 miles of survey area, and moderately suitable habitat exists in survey area. However, not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*)	SSC SAP NE	Maritime succulent scrub, coastal sage scrub with Opuntia thickets. Rare localized resident.	Not expected. Survey area in known range of this species and historical records exist within 3 miles of survey area but no suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Clark's marsh wren (*Cistothorus palustris clarkae*)	SSC	Marsh habitat, primarily freshwater and brackish marshes dominated by bulrushes (*Scirpus* spp.) or cattails (*Typha* spp.).	Low. Survey area in known range of this species; however, historical records do not exist within 3 miles of survey area and only limited and marginal habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
coastal California gnatcatcher (*Polioptila californica californica*)	FT SSC SAP PC	Coastal sage scrub, maritime succulent scrub. Resident.	Present. Pair was detected foraging in survey area during jurisdictional wetland delineation on August 29, 2019. Marginally suitable nesting habitat in survey area but moderately suitable nesting habitat adjacent to survey area. However, coastal California gnatcatcher was not detected during 2020 focused surveys for this species.
yellow warbler (*Setophaga petechia*)	SSC (nesting)	Well-developed riparian habitats, often with mature willows	Present. Yellow warbler was detected during focused least Bell's vireo surveys conducted on May 7, May 21, June 4, and June 26, 2020. Survey area in known range of this species, historical records exist within 3 miles of survey area, and suitable habitat exists in survey area.

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
yellow-breasted chat (*Icteria virens*)	SSC (nesting) SAP PC	Dense riparian woodland. Localized summer resident.	Not expected. Survey area in known range of this species and historical records exist within 3 miles of survey area, but limited suitable nesting habitat exists in survey area. Not detected during focused 2020 least Bell's vireo surveys when this species would most likely have been detected.
tricolored blackbird (*Agelaius tricolor*)	ST SSC (nesting colonies)	Freshwater marshes agricultural areas, lakeshores, parks. Localized resident. Breeding colonies well documented, inland San Diego County	Not expected. Survey area in known range of species; however, no historical records exist within 3 miles of the survey area and suitable habitat does not exist in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
southern California rufous-crowned sparrow (*Aimophila ruficeps canescens*)	WL SAP PC	Coastal sage scrub, chaparral, grassland. Resident.	Low. Survey area in known range of this species, historical records exist within 3 miles of survey area, and moderately suitable habitat exists in survey area. However, this species was not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
grasshopper sparrow (*Ammodramus savannarum*)	SSC (nesting)	Tall grass areas. Localized summer resident, rare in winter.	Low. Survey area in known range of species; however, no historical records exist within 3 miles of the survey area and marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Mammals			
Mexican long-tongued bat (*Choeronycteris mexicana*)	SSC	Sightings in San Diego County very rare. Migratory.	Low. No historical records exist within 3 miles of survey area; however, survey area in known range of this species and marginally suitable roosting and foraging habitat present in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Townsend's big-eared bat (*Corynorhinus townsendii*)	SSC	Caves, mines, buildings. Found in a variety of habitats, arid and mesic. Individual or colonial. Extremely sensitive to disturbance.	Low. No historical records exist within 3 miles of survey area; however, survey area in known range of this species and marginally suitable roosting and foraging habitat present in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
western red bat	SSC	Roosts in small colonies in the	Low. No historical records exist within

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
(*Lasiurus blossevillii*)		foliage of trees and shrubs in edge areas adjacent to streams and open fields, preferring foraging areas that are distant from human habitation	3 miles of survey area; however, survey area in known range of this species and marginally suitable roosting and foraging habitat present in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
western yellow bat (*Lasiurus xanthinus*)	SSC	Roosts in trees on the underside of leaves, particularly palm trees. Associated with dry, thorny vegetation and palm oases in desert habitats.	Low. Survey area in known range of this species, historical records exist within 3 miles of survey area, and marginally suitable roosting and foraging habitat present in survey area. However, not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
pocketed free-tailed bat (*Nyctinomops femorosaccus*)	SSC	Rugged canyons of arid desert areas. Roosts in crevices high on cliff faces.	Not expected. Survey area in known range of this species and historical records exist within 3 miles of survey area, but no foraging or roosting habitat in survey area. However, not detected during any of the surveys conducted during 2019 or 2020 in the project area.
San Diego black-tailed jackrabbit (*Lepus californicus bennettii*)	SSC SAP PC	Open areas of scrub, grasslands, agricultural fields.	Not expected. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Stephens' kangaroo rat (*Dipodomys simulans*)	FE SE SAP PC	Grassland, open areas.	Not expected. Survey area in known range of this species and historical records exist within 3 miles of survey area, but no suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
Dulzura pocket mouse (*Chaetodipus californicus femoralis*)	SSC	Dense chamise-redshank & montane chaparral, coastal sage scrub, sagebrush, annual grassland, probably most attracted to interface of grassland and brush.	Low. Survey area in known range of this species; however, no historical records exist within 3 miles of survey area and only marginally suitable habitat exists in survey area. Not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
northwestern San Diego pocket mouse (*Chaetodipus fallax fallax*)	SSC SAP PC	San Diego County west of mountains in sparse, disturbed coastal sage scrub or grasslands with sandy soils.	Low. Survey area in known range of this species, historical records exist within 3 miles of survey area, and marginally suitable habitat present in

COMMON NAME	STATUS	HABITAT ASSOCIATION	POTENTIAL FOR OCCURRENCE
			survey area. However, not detected during any of the 2019 or 2020 focused surveys conducted in the project area.
San Diego desert woodrat (*Neotoma lepida intermedia*)	SSC	Open coastal sage scrub and chaparral.	Low. Survey area in known range of this species, historical records exist within 3 miles of survey area, and marginally suitable habitat present in survey area. However, not detected during any of the 2019 or 2020 focused surveys conducted in the project area.

STATUS CODES

RE: Survey Summary Report for the 2019/2020 Protocol-Level, Wet Season Large Branchiopod Survey for the Proposed Carmax Development Project, Oceanside, California

Ms. Love:

This letter provides a summary of the 2019/2020 protocol-level, wet season survey for federally listed large branchiopod species (i.e., fairy shrimp species) conducted by Busby Biological Services, Inc. (BBS) for EnviroApplications, Inc. on behalf of Centerpoint Integrated Solutions for the proposed CarMax Auto Superstore Project (proposed project) located in Oceanside, California (Attachment 1: Figures 1 through 3).

The 2019/2020 focused, protocol-level, wet season fairy shrimp survey followed the most recent U.S. Fish and Wildlife Service (USFWS) survey guidelines, titled *Survey Guidelines for the Listed Large Branchiopods* and dated November 13, 2017 (USFWS 2017); however, the surveys were put on hold as of March 24, 2020.

The following report provides a brief description of the proposed project, the fairy shrimp species that have a potential to occur within the proposed project survey area, the survey methods, and the results of the 2019/2020 focused wet season fairy shrimp surveys that were conducted through March 24, 2020.

BACKGROUND INFORMATION

A brief summary of the proposed project and fairy shrimp with a potential for occurrence are provided in this section.

Proposed Project Location and Description

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, sales building with an attached presentation area, service building/area, and non-public carwash with associated access driveways, parking lots, and landscaped

areas. In addition, a retaining wall will be required along the southern boundary of the proposed project because of the exiting grades within the proposed project area.

The proposed project occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 2019; Attachment 1: Figures 2 and 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Attachment 1: Figures 2 and 3). It is bordered to the north by State Route 78, to east by Thunder Drive and residential development, to the south by Buena Vista Creek and residential development, and to the west by a commercial shopping center (e.g., grocery store, restaurants, motel, other retail stores). Plaza Drive separates the two parcels in the northwest portion of the proposed project area, and the Oceanside Department of Motor Vehicles (DMV) occupies the property northeast of the proposed project site.

Elevations within the proposed project area range from approximately 177 to 220 feet above mean sea level. The dominant vegetation communities and land cover types within the proposed project area include disturbed, ruderal, southern riparian forest, disturbed Diegan coastal sage scrub, developed and ornamental. Other vegetation communities present within the proposed project area in smaller proportions include iceplant and open water (Attachment 1: Figure 3). The section of Buena Vista Creek on the southern border of the proposed project area is part of the Buena Vista Creek Mitigation Area.

Fairy Shrimp Species Information

The proposed project area supports several basins (e.g. road ruts, tire tracks, other depressions) that have the potential to support fairy shrimp species. In addition to the common, non-sensitive versatile fairy shrimp (*Branchinecta lindahli*), two federally listed fairy shrimp species have a potential to occur, including San Diego fairy shrimp (*Branchinecta sandiegonensis*) and Riverside fairy shrimp (*Streptocephalus woottoni*).

The San Diego fairy shrimp was federally listed as endangered in February 1997 (USFWS 1997). On December 12, 2007, USFWS published a Final Rule revising the critical habitat for the San Diego fairy shrimp that became effective on January 11, 2008 (USFWS 2007). This revised Final Rule designated critical habitat for the San Diego fairy shrimp to include approximately 3,082 acres of habitat in five units, with a total of 29 subunits throughout Orange and San Diego counties, California. Critical habitat for San Diego fairy shrimp does not occur on or adjacent to the proposed project area (USFWS 2007).

The Riverside fairy shrimp was federally listed as endangered in August 1993 (USFWS 1993). On December 4, 2012, USFWS published a Final Rule revising the critical habitat for the Riverside fairy shrimp that became effective on January 3, 2013 (USFWS 2012). The previous critical habitat consisted of land in four units in Ventura, Orange, and San Diego counties, California. The revised critical habitat now includes land in

three units in Ventura, Orange, and San Diego counties, California, for a total of approximately 1,724 acres. Critical habitat for Riverside fairy shrimp does not occur on or adjacent to the proposed project area (USFWS 2012).

SURVEY METHODS

The focused 2019/2020 wet season fairy shrimp survey was conducted in accordance with the current USFWS survey guidelines, titled *Survey Guidelines for the Listed Large Branchiopods* and dated November 13, 2017. Following approval from USFWS, BBS initiated surveys immediately following the first rain event of the 2019/2020 rainy season. During the first survey visit, the proposed project site was examined for ponded areas. All ponded areas were included in each survey visit. During the first sampling visit to each inundated basin, BBS recorded the estimated maximum surface area of each basin, the estimated maximum depth of each basin, and existing habitat condition (e.g., disturbance level, type of basin). During each sampling round, BBS visited all basins that were inundated during the previous sampling round to determine if the basins were still holding water. If a rain event occurred between sampling rounds, BBS also visited all known and potential basins that may have been inundated by the rain event.

During each sampling round, BBS biologists recorded information about each inundated basin, such as air temperature, water temperature, average depth, approximate size, habitat condition (if changed), voucher information, and other relevant notes. BBS sampled each inundated basin by sweeping a hand-held net through the water and examining the net contents with all aquatic species recorded. If fairy shrimp species were observed, BBS noted the reproductive status and approximate numbers of fairy shrimp in each basin and, when possible, identified the species in the field with a hand lens or in the lab with a microscope.

If encountered in any inundated basins, mature male and female fairy shrimp voucher specimens were collected from sampled basins during the 2019/2020 wet season surveys. All fairy shrimp voucher specimens, along with a copy of the Vernal Pool Data Sheet, would be submitted to the collections department at the Natural History Museum of Los Angeles.

RESULTS

The 2019/2020 wet season survey consisted of a total of seven sampling visits by USFWS-permitted biologists Erik LaCoste (TE-027736-6). Surveys were initiated on December 3, 2019, and continued until March 19, 2020; however, surveys were put on hold on March 24, 2020. Table 1 below, provides a summary of the 2019/2020 wet season survey effort.

Table 1. Summary of 2019/2020 Wet Season Survey Effort

Survey Round	Date	Surveyor	FS Species Detected
1	12/3/19	E. LaCoste	None
2	12/11/19	E. LaCoste	None
3	12/18/19	E. LaCoste	None
4	1/22/20	E. LaCoste	None
5	1/31.20	E. LaCoste	None
6	3/13/20	E. LaCoste	None
7	3/19/20	E. LaCoste	None

None = All basins sampled but no fairy shrimp

Summary of Rainfall for 2019/2020 Wet Season

BBS monitored the rain events for the 2019/2020 rainy season using rainfall data from the National Oceanic and Atmospheric Administration website (NOAA 2019 and 2020) to determine an appropriate sampling schedule. Table 2, below, provides a summary of the monthly rainfall totals for the 2019/2020 survey season as well as the historical average monthly rainfall totals based on the weather data from the Oceanside Municipal Airport, California weather station (NOAA 2019 and 2020).

Table 2. Summary of Rainfall for Oceanside Municipal Airport, CA

Month	Rainfall Total (inches)*	
	2019/2020	Historical Average
October 2019	0	0.07
November 2019	3.55	1.03
December 2019	3.61	2.15
January 2020	0.61	2.65
February 2020	0.42	3.07
March 2020	3.81**	1.87
Total	**12.0**	**10.84**

* https://w2.weather.gov/climate/xmacis.php?wfo=sgx
** Represents rainfall totals through March 22, 2020

Rainfall totals for the area began with above average totals during November and December 2019, fell below average for January and February 2020, then rebounded to above average again during the first 3 weeks of March 2020 (NOAA 2019 and 2020). Although a significant amount of rain fell early (November and December 2019), pools in the project area failed to inundate for longer than a week at a time (Surveys 1 through 3). Following rain events in January and February, pools failed again to inundate for significant time (Surveys 4 and 5). Not until March 2020, following significant and consistent rainfall, did pools on site inundate for greater than 2 weeks (Surveys 6 and 7).

Southern California is currently classified as being under “normal conditions” according to the Palmer Drought Index (National Integrated Drought Information Center 2020). The Palmer Drought Index is a measurement of dryness based on

recent precipitation and temperature, which can be used to determine long-term drought conditions on a regional level. The index classifies a 0 as “normal conditions”, with negative numbers under “drought conditions” and positive numbers under “moist conditions”.

2019/2020 Wet Season Sampling

For the 2019/2020 wet season, the survey was initiated immediately following the first significant rain event in November/December 2019. During the 2019/20120 wet season survey, BBS surveyed a total of 12 basins within the proposed project area (Attachment 1: Figure 4). Basins surveyed included road ruts, ditches, detention basins, and other depressions that became inundated at some point during the 2019/2020 wet season. The majority of the basins in the proposed project area appear to be impacted by foot traffic and vehicle activity.

Midway through the wet season fairy shrimp surveys, Basin 4 was destroyed by illegal vehicle activity. Basin 4 was a manmade, road rut located in the abandoned parking lot used by the seasonal pumpkin patch/Christmas tree farm. This basin measured approximately 8 inches wide, 2 feet long, and 1 inch deep with a substrate of decomposed granite. Once it was destroyed, no ponding was documented; therefore, it was not surveyed again during the 2020 wet season surveys or during the 2020 dry season sampling.

Fairy shrimp were not detected in any basins during the seven surveys that were conducted during the 2019/2020 wet season survey. Additionally, no other aquatic species were observed during these surveys.

Attachment 1: Figure 4 depicts the location of the sampled basins. Attachment 2: Basin Conditions by Survey provides a summary for each basin by date and includes information specific to the date each basin was sampled. Attachment 3: Basin Conditions Summary Table provides the basin number, actual maximum depth, estimated maximum depth, actual maximum surface area, and estimated maximum surface area for each basin. The table also summarizes the habitat condition, disturbance type, and disturbance level and provides the GPS coordinates for each basin. Attachment 4 provides example photographs of several sampled basins. Copies of the original field datasheets are provided in Attachment 5.

SUMMARY

No fairy shrimp species were detected in any of the 12 basins during the seven focused survey visits conducted during the 2019/2020 wet season survey. Rainfall during the 2019/2020 wet season was slightly above average, and southern California is currently classified as being under “Normal” moisture conditions according to the Palmer Drought Index (National Integrated Drought Information Center 2020). Surveys were put on hold as of March 24, 2020, before the 2019/2020 wet season survey was completed.

I certify that the information in this survey report and attached exhibits fully and accurately represent my work.

Please do not hesitate to contact me at erik@busbybiological.com or 760.500.8802 if you have any questions.

Sincerely,

Erik LaCoste
Senior Biologist

APPENDIX J
Focused Dry Season Fairy Shrimp Survey Summary Report

BUSBY
Biological Services

September 18, 2020

Ms. Stacey Love
Recovery Permit Coordinator
Carlsbad Fish and Wildlife Office
2177 Salk Avenue, Suite 250
Carlsbad, California 92008

RE: 2020 Survey Summary Summary Report for the Protocol-Level, Dry Season Large Branchiopod Survey for the Proposed Carmax Development Project, Oceanside, California

Ms. Love:

This letter report provides a summary of the 2020 protocol-level, dry season survey for federally listed large branchiopod species (i.e., fairy shrimp species) conducted for the proposed CarMax Auto Superstore project (proposed project). Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. to conduct these surveys on behalf of Centerpoint Integrated Solutions to determine the presence/absence of listed large brachiopod species within the proposed project area.

The 2020 focused, protocol-level, dry season fairy shrimp survey followed the most recent U.S. Fish and Wildlife Service (USFWS) survey guidelines, titled *Survey Guidelines for the Listed Large Branchiopods* and dated November 13, 2017 (USFWS 2017).

The following report provides a brief description of the proposed project, the fairy shrimp species that have a potential to occur within the proposed project survey area, the survey methods, and the results of the 2020 focused dry season fairy shrimp survey.

BACKGROUND INFORMATION

A brief summary of the proposed project and fairy shrimp with a potential for occurrence are provided in this section.

Proposed Project Location and Description

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, sales building with an attached presentation area, service building/area, and non-public carwash with associated access driveways, parking

lots, and landscaped areas. In addition, a retaining wall will be required along the southern boundary of the property because of the exiting grades in that area.

The 10.54-acre proposed project area occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 1968; Attachment 1: Figures 1 through 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Attachment 1: Figures 2 and 3). It is bordered to the north by State Route 78, to east by Thunder Drive and residential development, to the south by Buena Vista Creek and residential development, and to the west by a commercial shopping center (e.g., grocery store, restaurants, motel, other retail stores). Plaza Drive separates the two parcels in the northwest portion of the proposed project area, and the Oceanside Department of Motor Vehicles (DMV) occupies the property northeast of the proposed project site.

Elevations within the proposed project area range from approximately 177 to 220 feet above mean sea level. The dominant vegetation communities and land cover types within the proposed project area include disturbed, ruderal, southern riparian forest, disturbed Diegan coastal sage scrub, developed and ornamental. Other vegetation communities present within the proposed project area in smaller proportions include iceplant and open water (Attachment 1: Figure 3). The section of Buena Vista Creek on the southern border of the proposed project area is part of the Buena Vista Creek Mitigation Area.

Fairy Shrimp Species Information

The proposed project area supports few basins (e.g. road ruts, tire tracks, other depressions) that have the potential to support fairy shrimp species. In addition to the common, non-sensitive versatile fairy shrimp (*Branchinecta lindahli*), two federally listed fairy shrimp species have a potential to occur, including San Diego fairy shrimp (*Branchinecta sandiegonensis*) and Riverside fairy shrimp (*Streptocephalus woottoni*).

The San Diego fairy shrimp was federally listed as endangered in February 1997 (USFWS 1997). On December 12, 2007, USFWS published a Final Rule revising the critical habitat for the San Diego fairy shrimp that became effective on January 11, 2008 (USFWS 2007). This revised Final Rule designated critical habitat for the San Diego fairy shrimp to include approximately 3,082 acres of habitat in five units, with a total of 29 subunits throughout Orange and San Diego counties, California. Critical habitat for San Diego fairy shrimp does not occur on or adjacent to the proposed project area (USFWS 2007).

The Riverside fairy shrimp was federally listed as endangered in August 1993 (USFWS 1993). On December 4, 2012, USFWS published a Final Rule revising the critical habitat for the Riverside fairy shrimp that became effective on January 3, 2013 (USFWS 2012). The previous critical habitat consisted of land in four units in

Ventura, Orange, and San Diego counties, California. The revised critical habitat now includes land in three units in Ventura, Orange, and San Diego counties, California, for a total of approximately 1,724 acres. Critical habitat for Riverside fairy shrimp does not occur on or adjacent to the proposed project area (USFWS 2012).

SURVEY METHODS

The focused 2020 dry season fairy shrimp survey followed the most recent U.S. Fish and Wildlife Service (USFWS) survey guidelines, titled *Survey Guidelines for the Listed Large Branchiopods* and dated November 13, 2017, which defines a complete large branchiopod survey as a complete wet season survey and a complete dry season survey that are conducted within a 3-year period.

Soil Sample Collection

Soil samples were collected from all basins within the proposed project survey area that provided potential fairy shrimp habitat during the 2019/2020 wet season fairy shrimp surveys (Attachment 1: Figure 4). These basins had been mapped (Attachment 1: Figure 4) and photographed (Attachment 2) previously during the 2019/2020 wet season surveys.

A hand trowel was used to collect the appropriate number and volume of samples from the top 1 to 3 centimeters of soil within each basin based on Table 1 of the current USFWS protocol. These soil samples were collected into paper bags, with the basin number written on each bag to inform the lab analysis, and logged in the soil sample collection table.

Soil Sample Processing and Analysis

The soil samples were taken to an approved laboratory for processing and analysis. The soil samples were hydrated and processed through a series of sieves to separate fairy shrimp cysts from the soil. The sieves used were of 710-, 355-, and 212-micron pore size screens, and the final sieve pore size is smaller than the target fairy shrimp genera (i.e., *Branchinecta, Streptocephalus*) average cyst diameter and, therefore, would retain any cysts present within the soil samples. The remaining material on the final sieve was then placed in a brine solution to help separate organic material from inorganic material. The remaining organic material was then filtered through a standard coffee filter and allowed to dry. The dried organic material was then examined under a microscope to determine if fairy shrimp cysts were present. For all identified cysts, cyst surface characteristics were then used to identify cysts to genus.

Fairy Shrimp Hydration, Rearing, Hatching, and Identification

Two species of fairy shrimp in the genus *Branchinecta* have the potential to occur in the proposed project survey area. Because these cysts cannot be identified to

species under the microscope, the *Branchinecta* cysts require hydration, hatching, rearing, and subsequent identification to identify them to species.

When identified during the soil sample processing and analysis, *Branchinecta* cysts are hydrated by placing them into plastic containers filled with approximately 525 milliliters of filtered, non-chlorinated drinking water. The coffee filters with the collected cysts are slowly opened over the containers and gently shaken to allow the material to fall into the water. The sides of the filters are then rubbed against one another to release any additional material. Finally, a squirt bottle with filtered, non-chlorinated drinking water is used to spray any additional material from the filters into the containers.

The containers are given sample identification numbers and placed on a table in a climate-controlled room. Lighting in the room is provided by indirect sunlight as well as an overhead, full spectrum light that is kept on approximately 12 hours a day to help emulate outside, spring season lighting conditions. An overhead fan also is kept on at a low level to provide for some air movement across the water surface in the sample containers.

The samples are checked daily to see if any fairy shrimp have emerged. Once nauplii are observed, feeding begins. The hatched shrimp are fed a single drop of prepared food on a daily basis until they are collected for identification. The food used is typically a mix of active brewer's yeast, sugar, powdered fish food, and water.

The hatched shrimp are allowed to continue under these conditions until they reach maturity, as determined by reaching full size, antennal development (males), and brood pouch (females). Once mature, the fairy shrimp are collected for identification by pouring the material in the container through a small strainer. Collected shrimp are then placed into a dish of carbonated water to slowly asphyxiate them. Once dead, the collected shrimp are placed in a 27- by 57-millimeter (5-dram) clean glass vial, filled with 70 percent ethyl alcohol. The collected shrimp are then identified to the species level with the aid of a stereo dissection scope, and subsequently provided to the Natural History Museum of Los Angeles for preservation.

SURVEY RESULTS

The results for these surveys are summarized below and are also provided in Attachments 3 and 4.

Soil Sample Collection

BBS biologist Erik LaCoste (TE-027736-6) collected samples from each of the basins identified within the proposed project survey area during the 2019/2020 wet season surveys conducted for the proposed project. The samples collected are summarized in Table 1, below.

Table 1. Soil Sample Collection Summary

Feature ID	Depth (cm)		Surface Area (sq m)		Dry Season Samples		
	Depth - Actual Average	Depth - Est. Actual	Surface Area - Actual Average	Surface Area - Est. Actual	Min. Number of Samples	Actual number of Samples	Approximate Volume (mL)

12	2	8	4	6.00	10-25	12	1200

*samples were no more than 100 mL each

Originally, 12 basins were included in the wet season analysis. However, midway through the wet season fairy shrimp surveys, Basin 4 was destroyed by illegal vehicle activity. Basin 4 was a manmade, road rut located in the abandoned parking lot used by the seasonal pumpkin patch/Christmas tree farm. This basin measured approximately 8 inches wide, 2 feet long, and 1 inch deep with a substrate of decomposed granite. Once it was destroyed, no ponding was documented, and soil samples were not collected for dry season analysis.

Mr. LaCoste collected soil from the 11 remaining basins on August 11, 2020 (Attachment 1: Figure 4). Soil samples were then submitted to Alden Environmental, Inc. for processing and identification. Table 2 provides the results of the dry season collection.

Table 2. Dry Season Survey Results

Soils Sample Processing and Analysis

Alden Environmental, Inc. biologist Greg Mason (TE-58862A-1) processed the soil samples from all 11 basins. A total of 127 subsamples from the 11 basins were analyzed to determine if fairy shrimp cysts were present. No fairy shrimp cysts from either the genus *Branchinecta* or *Streptocephalus* were recovered from any of the basins.

Water fleas (class Cladocera) and seed shrimp (class Ostracoda) – both common, non-sensitive species that occur in ephemeral basins – were identified in basins 3 and 9, respectively.

Representative photographs of the basins are provided in Attachment 2. A summary of results by basin is provided in Table 2, above, and Attachments 3 and 4.

Fairy Shrimp Hydration, Rearing, Hatching, and Identification

Soil hydration was unnecessary due to the lack of cyst presence in any of the analyzed soil samples.

SUMMARY

No *Branchinecta* spp. or *Streptocephalus woottoni* cysts were identified during the dry season soil analysis.

This dry season fairy shrimp survey satisfies a portion of the current USFWS survey requirements, which include a minimum of one complete dry season survey and one complete wet season survey within a 3-year period.

I certify that the information in this survey report and attached exhibits fully and accurately represent my work.

If you have any questions or comments regarding this survey report, please do not hesitate to contact me at 760.500.8802 or erik@busbybiological.com.

Subject: Dry Sampling Results

Dear Ms. Busby:

This letter presents the results of dry season sampling conducted on soil samples collected from 11 basins on the Oceanside Carmax project.

Methods

On Wednesday, August 12, 2020 Alden received soil samples collected from 11 basins determined to have potential to support fairy shrimp species. The soil was provided in bags labeled with the basin number. The collected soil from each basin was divided into100ml subsamples, based on the area of the pool. Each sample was then hydrated and processed through a series of sieves to separate out fairy shrimp cysts that may be present. The sieves used were of 710-, 355-, and 212-µm pore size screens. The final sieve pore size is smaller than the target fairy shrimp genera (*Branchinecta* and *Streptocephalus*) average cyst diameter and therefore would retain cysts. The material remaining on the final sieve was next placed in a brine solution to help separate organic from inorganic material. The organic portion was then filtered through a standard coffee filter and allowed to dry. The dried material on the filters was then examined under a stereo dissecting scope to determine if cysts were present. Cyst surface characteristics were then used to identify cysts to genus, if present.

Results

A total of 127 subsamples from the 11 basins were analyzed to determine if fairy shrimp cysts were present. No fairy shrimp cysts from either the genus *Branchinecta* or *Streptocephalus* were recovered from any of the basins (Table 1).

APPENDIX K
Focused Coastal California Gnatcatcher Survey Summary Report

BUSBY
Biological Services

August 14, 2020

Ms. Stacey Love
Recovery Permits Coordinator
Carlsbad Fish and Wildlife Office
2177 Salk Avenue, Suite 250
Carlsbad, California 92008

RE: 2020 Coastal California Gnatcatcher Survey Summary Report for the Proposed CarMax Auto Superstore Project, City of Oceanside, San Diego County, California

Ms. Love:

This letter report summarizes the results of the focused, protocol-level, presence/absence surveys for the federally listed threatened coastal California gnatcatcher (*Polioptila californica californica*) conducted during the 2020 breeding season for the proposed CarMax Auto Superstore project (project). Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. to conduct these surveys on behalf of Centerpoint Integrated Solutions to determine the presence/absence of coastal California gnatcatcher within and adjacent to the proposed project area.

BACKGROUND INFORMATION

A brief summary of the proposed project and coastal California gnatcatcher are provided in this section.

Proposed Project Location and Description

The 10.54-acre proposed project area occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 1968; Attachment A: Figures 1 through 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Attachment A: Figures 2 and 3). It is bordered to the north by State Route 78; to east by Thunder Drive, the California Department of Motor Vehicles (DMV), and residential development; to the south by Buena Vista Creek and Brookdale Senior Living facility; and to the west by the Tri-City Crossroads Shopping Center (Attachment 1: Figure 3). Plaza Drive separates the two parcels in the northwest portion of the proposed project area. Elevations within the proposed project area range from approximately 177 to 220 feet above mean sea level.

The section of Buena Vista Creek on the southern border of the proposed project area is part of the Buena Vista Creek Mitigation Area and is designated as USFWS Coastal California Gnatcatcher Critical Habitat (USFWS 2019). The dominant vegetation communities and land cover types within the proposed project area include disturbed, ruderal, southern riparian forest, disturbed Diegan coastal sage scrub, developed, and ornamental. Other vegetation communities present within the proposed project area in smaller proportions include iceplant and open water (Attachment 1: Figure 3).

The City of Oceanside is one of seven cities participating in the North County Multiple Habitat Conservation Plan (MHCP; SANDAG 2003), which is part of the Natural Community Conservation Planning (NCCP) program. Although the City of Oceanside currently has a draft City of Oceanside Subarea Plan (SAP; City of Oceanside 2010), implementing agreements with California Department of Fish and Wildlife (CDFW) and U.S. Fish and Wildlife Service (USFWS) have not been signed; therefore, the City of Oceanside is currently considered a non-NCCP participant.

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, sales building with an attached presentation area, service building/area, and non-public carwash with associated access driveways, parking lots, and landscaped areas. In addition, a retaining wall will be required along the southern boundary of the property because of the exiting grades in that area.

Coastal California Gnatcatcher Species Information

The coastal California gnatcatcher is a small, blue-gray, non-migratory songbird that is a federally listed threatened species and a CDFW species of special concern. It has also been a focal species of regional planning and conservation efforts under the NCCP program. One of three subspecies of the California gnatcatcher (*Polioptila californica*), the coastal California gnatcatcher occurs on coastal slopes and foothills in southern Ventura County, Los Angeles County, Orange County, southwestern San Bernardino County, western Riverside County, and San Diego County; and northwestern Baja California, Mexico (Atwood 1990).

This species typically occurs from sea level to approximately 2,500 feet above mean sea level within coastal sage scrub habitat dominated by California sagebrush (*Artemisia californica*; Atwood 1990). Other plant species important for nesting and foraging of this subspecies include California buckwheat (*Eriogonum fasciculatum*), white sage (*Salvia apiana*), black sage (*Salvia mellifera*), coyote brush (*Baccharis pilularis*), and broom baccharis (*Baccharis sarothroides*). Chamise (*Adenostoma fasciculatum*) dominated habitats may also support breeding pairs, especially where coastal sage scrub occurs nearby or forms a component of the habitat (Bontrager 1991). The coastal California gnatcatcher breeding season

extends from mid-February through the end of August, with peak nesting activity occurring from mid-March through mid-May (Mock et al. 1990).

Primary threats to the coastal California gnatcatcher include habitat loss, fragmentation, and adverse modification from urban and agricultural development; wildfires; invasive non-native plants; grazing; nest predation; and brood parasitism by brown-headed cowbirds (*Molothrus ater*; Mock et al. 1990).

METHODS

The methods used to conduct the habitat assessment and focused, protocol-level least Bell's vireo surveys are presented in this section.

Habitat Assessment Methods

A qualified biologist conducted a focused habitat assessment for coastal California gnatcatcher within the proposed project area and a 300-foot buffer of all proposed project features. The habitat assessment was conducted by assessing the vegetation communities, and parameters such as species composition, height, density, and disturbance type and amount, for their potential to support the coastal California gnatcatcher. Polygons of suitable coastal California gnatcatcher habitat were drawn by hand onto a high-resolution aerial field map, which were later screen-digitized in the office by a Geographic Information Systems (GIS) specialist using ArcGIS software.

Focused Survey Methods

Because the proposed project is located in the City of Oceanside, currently a non-NCCP participant, a total of six focused, protocol-level coastal California gnatcatcher survey rounds, spaced at least 1 week apart, were conducted by USFWS-permitted BBS biologists Darin Busby (TE-115373-4) and Charles Vettes (TE-20160B-2). All surveys were conducted in accordance with the current USFWS survey protocol for the species, titled *Coastal California Gnatcatcher* (Polioptila californica californica) *Presence/Absence Survey Guidelines* and dated February 28, 1997 (USFWS 1997). The survey area consists of all suitable habitat within the proposed project area and within a 300-foot survey buffer around the proposed project area.

The coastal California gnatcatcher surveys were conducted between 0600 and 1200 and avoided periods of adverse weather conditions (e.g., excessively hot or cold temperatures, high winds, steady rain, dense fog, other inclement weather conditions) that would impede detection of the coastal California gnatcatcher. Surveys were conducted by slowly walking throughout all suitable habitat within the survey area, visually searching with binoculars, and using auditory cues to detect the coastal California gnatcatcher. Various routes were utilized to conduct an unbiased survey of the suitable habitat within the survey area. Pre-recorded coastal

California gnatcatcher vocalization playbacks were only used to elicit initial calls from coastal California gnatcatcher and were not used frequently or to elicit further behaviors. Pre-recorded vocalizations were played for periods of 5 to 15 seconds and were generally repeated approximately every 100 feet within the surveyed habitat.

Sensitive species detections, including coastal California gnatcatcher detections, were recorded electronically using a hand-held Global Positioning System (GPS) device and by hand onto a high-resolution aerial image of the survey area. In addition, relevant information about the detections (e.g., age, sex, number of individuals detected) was noted when necessary. Other wildlife species observed directly or detected indirectly by sign (e.g., scat, tracks, calls, and other evidence) also were recorded.

RESULTS

The results of the habitat assessment and focused, protocol-level coastal California gnatcatcher surveys are presented in this section.

Habitat Assessment Results

BBS biologist Darin Busby identified a total of approximately 0.57 acre of potentially suitable coastal California gnatcatcher within the proposed project footprint and 300-foot survey buffer during the habitat assessment conducted on July 22, 2019 (Attachment 1: Figure 3). The potentially suitable coastal California gnatcatcher includes disturbed Diegan coastal sage scrub. The disturbed Diegan coastal sage scrub within the survey area provides low to moderate quality habitat for coastal California gnatcatcher. This habitat is characterized by having an open canopy with low to moderately-dense shrub cover that ranges in shrub height from approximately 1 to 4 feet and is dominated by California sagebrush, coastal goldenbush (*Isocoma menziessi*) and black sage (Attachment 1; Figure 3).

Focused Survey Results

BBS biologists Mr. Busby (TE-115373-4) and Mr. Vettes (TE-20160B-2) conducted six focused, protocol-level coastal California gnatcatcher surveys between May 7 and June 12, 2020. Surveys were conducted during appropriate weather conditions. No coastal California gnatcatchers were detected during any of the six survey rounds. Table 1 below provides a summary of survey dates, times, weather, conditions, and surveyors.

Table 1. Coastal California Gnatcatcher Survey Conditions

4	5/28/20	0745-0845	65-67	0-1	100-50	0	Darin Busby
5	6/04/20	0745-0845	64-65	0-3	100-100	0	Darin Busby
6	6/12/20	0710-0810	62-65	1-4	100-40	0	Charles Vettes

A total of 37 wildlife species were detected during the focused surveys (Attachment 2). Although coastal California gnatcatcher was not detected during the focused, protocol-level surveys, an incidental coastal California gnatcatcher pair was observed in the southwest corner of the proposed project area by Mr. Busby during a wetland delineation on August 19, 2019. In addition, yellow warbler (*Setophaga petechia*), a CDFW species of special concern and Cooper's hawk (*Accipiter cooperii*) a CDFW watch list species were detected during surveys (Attachment 1; Figure 3). It should be noted that the locations of yellow warblers in Attachment 1: Figure 3 may reflect repeated detections of the same individuals from one survey to the next and are not intended to represent the quantity of individuals present.

SUMMARY

During the 2020 focused, protocol-level coastal California gnatcatcher surveys, no gnatcatcher individuals were detected within the survey area. Based on the data collected during the surveys, there are no coastal California gnatcatcher individuals or pairs located within the survey area. The observation of an incidental pair in 2019 suggests this parcel of land may serve as a corridor to the coastal California gnatcatcher and other migratory bird species, providing foraging but not breeding habitat for the coastal California gnatcatcher.

Please do not hesitate to contact Darin Busby at darin@busbybiological.com or 858.334.9508 if you have any questions.

Sincerely,

Darin Busby
Principal Biologist

RE: 2020 Least Bell's Vireo Survey Summary Report for the Proposed CarMax Auto Superstore Project, City of Oceanside, San Diego County, California

Ms. Love:

This letter report summarizes the results of the focused, protocol-level, presence/absence surveys for the federally and state-listed endangered least Bell's vireo (*Vireo bellii pusillus*) conducted in 2020 for the proposed CarMax Auto Superstore project (project). Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. to conduct these surveys on behalf of Centerpoint Integrated Solutions to determine the presence/absence of least Bell's vireo within and adjacent to the proposed project area.

BACKGROUND INFORMATION

A brief summary of the proposed project and least Bell's vireo are provided in this section.

Proposed Project Location and Description

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, sales building with an attached presentation area, service building/area, and non-public carwash with associated access driveways, parking lots, and landscaped areas. In addition, a retaining wall will be required along the southern boundary of the property because of the exiting grades in that area.

The 10.54-acre proposed project area occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 1968; Attachment A: Figures 1 through 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Attachment A: Figures 2 and 3). It is bordered to the north by State Route 78; to east by Thunder Drive, the California Department of Motor Vehicles (DMV), and residential development; to the south by Buena Vista Creek and Brookdale Senior Living facility; and to the west by the Tri-City Crossroads

Shopping Center (Attachment 1: Figure 3). Plaza Drive separates the two parcels in the northwest portion of the proposed project area. Elevations within the proposed project area range from approximately 177 to 220 feet above mean sea level.

The dominant vegetation communities and land cover types within the proposed project area include disturbed, ruderal, southern riparian forest, disturbed Diegan coastal sage scrub, developed and ornamental. Other vegetation communities present within the proposed project area in smaller proportions include iceplant and open water (Attachment 1: Figure 3). The section of Buena Vista Creek on the southern border of the proposed project area is part of the Buena Vista Creek Mitigation Area.

Least Bell's Vireo Species Information

The least Bell's vireo is a small, olive-gray colored, migratory songbird that is federally and state-listed as endangered. One of four subspecies of Bell's vireo, the least Bell's vireo is endemic to California and Baja California, Mexico. This highly migratory species arrives in California in mid-March and departs by late September to fly south to wintering grounds near the tip of Baja California, Mexico. This species formally bred in lowland riparian habitat ranging from coastal Southern California through the Sacramento and San Joaquin Valleys as far north as Redbluff, and other scattered locations east of the Sierra Nevada (U.S. Fish and Wildlife Service [USFWS] 1998; Grinnell and Miller 1986).

The least Bell's vireo is dependent upon riparian habitat during the breeding season and prefers willow-dominated woodland or scrub that typically exists along streams and rivers. Other habitat types used include *Baccharis* scrub, mixed oak/willow woodland, mesquite woodland, and elderberry scrub. Habitat characteristics that appear to be essential for vireo occupation include dense cover from 3 to 6 feet in height for nesting and foraging, and a stratified canopy providing both foraging habitat and song perches for territorial advertisement.

By the time least Bell's vireo was listed by the California Department of Fish and Wildlife (CDFW) in 1984, it had been extirpated from much of its former range and was restricted to eight counties south from Santa Barbara, with just 300 pairs statewide (Unitt 2004). Declines were caused by widespread clearing of riparian habitat combined with brood parasitism by brown-headed cowbirds (*Molothrus ater*), whose increase in California was as dramatic as the species' decline. Currently, with restriction of habitat destruction, extensive cowbird trapping, and protection from the federal and state Endangered Species Acts, populations have recovered in some areas of cismontane southern California. Populations are expanding into former ranges, with the northernmost sighting from Santa Clara County, California (Brown 1993, Kus 2002). San Diego County holds the largest breeding population of least Bell's vireo in the state, where it is a fairly common breeder in appropriate habitats, primarily in the coastal lowlands (Unitt 2004).

METHODS

The methods used to conduct the habitat assessment and focused, protocol-level least Bell's vireo surveys are presented in this section.

Habitat Assessment Methods

A qualified biologist conducted a focused habitat assessment for least Bell's vireo within the proposed project area and a 500-foot buffer of all proposed project features. The habitat assessment was conducted by assessing the vegetation communities, and parameters such as species composition, height, density, and disturbance type and amount, for their potential to support the least Bell's vireo. Polygons of suitable least Bell's vireo habitat were drawn by hand onto a high-resolution aerial field map, which were later screen-digitized in the office by a Geographic Information Systems (GIS) specialist using ArcGIS software.

Focused Survey Methods

Qualified BBS biologists conducted focused, protocol-level surveys for the least Bell's vireo in accordance with the current USFWS survey protocol, titled *Least Bell's Vireo Survey Guidelines* (USFWS 2001). Eight surveys were conducted at least 10 days apart during the protocol survey window of April 10 to July 31. All surveys were conducted between approximately dawn and 1100 and avoided periods of adverse weather conditions (e.g., excessively hot or cold temperatures, high winds, steady rain, dense fog, and other inclement weather conditions) that would impede detection of the least Bell's vireo. Surveyors slowly walked throughout the suitable habitat within the survey area and used visual and auditory cues to detect the least Bell's vireo. Various routes were utilized to conduct an unbiased survey of the potentially suitable habitat within the survey area, while taking care not to disturb sensitive habitat or potential nest areas. No more than approximately 3 linear kilometers (50 hectares) of suitable habitat was surveyed per day, per the protocol.

Sensitive species detections were recorded electronically using a hand-held Global Positioning Systems (GPS) device and/or by hand onto a high-resolution aerial image of the survey area, and relevant information (e.g., age, sex, number of individuals detected) was noted if least Bell's vireo were detected. In addition, numbers and locations of parasitic brown-headed cowbirds were recorded, if present, and other wildlife species observed directly or detected indirectly by sign, including scat, tracks, calls, and other evidence were recorded.

RESULTS

The results of the habitat assessment and focused, protocol-level least Bell's vireo surveys are presented in this section.

Habitat Assessment Results

BBS biologist Darin Busby identified a total of approximately 2.83 acres of potentially suitable least Bell's vireo habitat within the proposed project footprint and 500-foot survey buffer during the habitat assessment conducted on July 22, 2019 (Attachment 1: Figure 3). The potentially suitable least Bell's vireo habitat within the survey area is dominated by southern riparian forest within Buena Vista Creek (Attachment A: Figure 3). This vegetation community contains a moderately dense canopy, primarily ranging in height from 15 to 20 feet, and is dominated by native plant species such as narrow-leaf willow (*Salix exigua*), arroyo willow (*Salix lasiolepis*), mulefat (*Baccharis salicifolia*), cattail (*Typha* sp.), wild grape (*Vitis girdiana*), but also contains non-native plant species such as Brazilian pepper tree (*Schinus terebinthifolius*), giant reed (*Arundo donax*), and castor bean (*Ricinus communis*).

Focused Survey Results

BBS biologists Charles Vettes, Darin Busby, and Erik LaCoste conducted eight focused, protocol-level surveys between May 7 and July 29, 2020. Surveys were conducted during appropriate weather conditions. Dates and survey conditions during the focused surveys are provided in Table 1, below.

Table 1. Survey Conditions

Survey #	Date	Time		Weather				Surveyor
				Temp (°F)	Wind (mph)	Clouds (% cover)	Precipitation	
1	5/7/20	Start	0705	62	0-2	0	0	C. Vettes
		End	0905	68	1-3	15	0	
2	5/21/20	Start	0845	68	1-3	10	0	D. Busby
		End	1015	70	3-5	0	0	
3	6/4/20	Start	0615	62	0-1	100	0	D. Busby
		End	0745	64	0-1	100	0	
4	6/15/20	Start	0815	65	1-2	100	0	C. Vettes
		End	0930	66	2-4	100	0	
5	6/26/20	Start	0905	64	4-7	100	0	C. Vettes
		End	1005	66	1-3	100	0	
6	7/7/20	Start	0845	68	2-3	10	0	C. Vettes
		End	0945	71	2-4	0	0	
7	7/17/20	Start	0815	68	1-2	100	0	C. Vettes
		End	0915	70	1-2	100	0	
8	7/29/20	Start	0810	64	0-1	100	0	E. LaCoste
		End	0930	67	0-1	10	0	

No breeding least Bell's vireo were detected during the 2020 focused, protocol-level surveys. However, a single least Bell's vireo was detected during the eighth and final survey on July 29, 2020. The least Bell's vireo was detected within the 500-foot buffer area southwest of the proposed project area. The individual least Bell's vireo, which appeared to be an adult, was observed foraging for approximately 15

minutes. After the relatively short observation time, the individual least Bell's vireo disappeared downstream towards the west and was not detected again during the survey. Habitat downstream consists of southern riparian forest and is connected to similar habitat to that found in the survey area. It is likely that this individual least Bell's vireo was breeding outside the survey area and was only using the survey area as adjacent foraging habitat during this final survey. No other least Bell's vireos were detected at any other time during surveys.

A total of 39 bird species were detected during the focused least Bell's vireo surveys (Attachment 2). Two sensitive species – yellow warbler (*Dendroica petechia*), a CDFW species of special concern, and Cooper's hawk (*Accipiter cooperii*), a CDFW watch list species – were detected during these surveys (Attachment 1: Figure 3). It should be noted that the locations of yellow warblers in Attachment 1: Figure 3 may reflect repeated detections of the same individuals from one survey to the next and are not intended to represent the quantity of individuals present.

SUMMARY

A single least Bell's vireo was detected foraging within the survey area during the final survey conducted on July 29, 2020. No breeding least Bell's vireo were detected within the survey area during the focused, protocol-level surveys conducted for the species during the 2020 breeding season.

Please do not hesitate to contact Darin Busby at darin@busbybiological.com or 858.334.9508 if you have any questions.

Sincerely,

Darin Busby
Principal Biologist

EXECUTIVE SUMMARY

This jurisdictional delineation report identifies the extent of U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and California Department of Fish and Wildlife (CDFW) potentially jurisdictional resources that were observed and mapped during the focused jurisdictional delineation conducted for the proposed CarMax Auto Superstore Project in Oceanside, California, on August 29, 2019. The survey area is approximately 14.915 acres, which consists of the approximately 10.981-acre proposed project area and an approximately 3.935-acre, 50-foot survey buffer surrounding the proposed project area.

Potential USACE jurisdiction within the survey area totals approximately 0.700 acre, composed of approximately 0.646 acre of wetland waters of the U.S. (WoUS) and approximately 0.054 acre of non-wetland WoUS. The potential USACE wetland WoUS include the southern riparian forest along the majority of the portion Buena Vista Creek within the survey area, and the potential USACE non-wetland WoUS include open water within Buena Vista Creek at the eastern end of the survey area.

Potential RWQCB jurisdiction extends to all potential USACE WoUS within the survey area, which includes a total of approximately 0.700 acre, composed of approximately 0.646 acre of wetland waters of the State (WoS) and approximately 0.054 acre of non-wetland WoS. The potential RWQCB wetland WoS include the southern riparian forest along the majority of the portion of Buena Vista Creek within the survey area, and the potential RWQCB non-wetlands WoS include open water within Buena Vista Creek at the eastern end of the survey area.

Potential CDFW jurisdiction within the survey area totals approximately 1.508 acres, composed of approximately 1.386 acres of Riparian and approximately 0.122 acre of Streambed. Potential CDFW Riparian includes the southern riparian forest along the majority of the portion of Buena Vista Creek within the survey area, and potential CDFW Streambed includes open water, disturbed land, developed land, and iceplant within and adjacent to Buena Vista Creek that are outside the CDFW Riparian but between the lateral limits of the stream banks.

Potential USACE, RWQCB, and CDFW jurisdictional resources are regulated by federal and state governments under a no-net-loss policy, and all impacts are considered significant and should be avoided to the greatest extent possible. Potential impacts to USACE, RWQCB, and CDFW jurisdictional resources can be avoided through direct avoidance of jurisdictional resources, establishment of appropriate wetland buffers, and implementation of specific Best Management Practices. Unavoidable and authorized impacts may require mitigation through habitat creation, enhancement, or preservation as determined by a qualified restoration biologist in consultation with the regulatory agencies during the permitting process. Any impacts to USACE, RWQCB, and CDFW jurisdictional resources may require a Section 404 permit authorization from USACE, a 1602 Lake and Streambed Alteration Agreement from CDFW, and a 401 State Water Quality Certification from RWQCB.

1.0 INTRODUCTION

Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. on behalf of CarMax to conduct a jurisdictional delineation and prepare a jurisdictional delineation report for the proposed CarMax Auto Superstore (proposed project) in the City of Oceanside, San Diego County, California (Appendix A: Figures 1 through 3). The jurisdictional delineation was conducted on August 29, 2019, within an approximately 14.915-acre survey area, which consists of the approximately 10.981-acre proposed project area an approximately 3.935-acre, 50-foot survey buffer surrounding the proposed project area. The proposed project consists of the construction of a CarMax pre-owned automobile dealership, service building and non-public carwash with associated access driveways, parking lots, and landscaped areas. In addition, the proposed project will include a sales building with an attached presentation area, a service area, and a non-public carwash.

The proposed project occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 2019; Appendix A: Figure 3). The proposed project site is situated on two vacant and undeveloped parcels, Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Appendix A: Figures 2, 3, and 4). It is bordered to the north by State Route 78, to east by Thunder Drive and residential development, to the south by Buena Vista Creek and the City of Oceanside Fire Department (Station 4), and to the west by a commercial shopping center (*e.g.,* grocery store, restaurants, motel, other retail stores). Plaza Drive separates the two parcels in the northwest portion of the proposed project area, and the Oceanside Department of Motor Vehicles occupies the property northeast of the proposed project site.

Eight vegetation communities and land cover types were mapped within the survey area during the general biological resources survey conducted on July 22, 2019, including disturbed Diegan coastal sage scrub, southern riparian forest, open water, developed land, disturbed land, iceplant, ornamental, and ruderal (Appendix A: Figure 5). The majority of the survey area is dominated by disturbed land. Southern riparian forest within and adjacent to Buena Vista Creek and small scattered patches of disturbed Diegan coastal sage scrub in the southern half of the survey area are the only native vegetation communities that occur within the survey area.

The jurisdictional delineation was conducted within the survey area to identify and map existing waters of the U.S. (WoUS) and waters of the State (WoS) that are potentially subject to the regulatory jurisdiction of the U.S. Army Corps of Engineers (USACE) pursuant to Section 404 of the Clean Water Act (CWA; 33 USC 1344); Regional Water Quality Control Board (RWQCB) pursuant to Section 401 of the CWA; and the California Department of Fish and Wildlife (CDFW) pursuant to Sections 1600 *et seq.* of the California Fish and Game Code (CFGC). The jurisdictional resource boundaries may be subject to verification by the regulatory agencies. No proposed project impacts or impact analysis is presented in this report; however, this report will also serve as a supplemental document to the Biological Technical Report (BTR), which will, among other things, evaluate potential project impacts to jurisdictional resources and determine potential permit requirements for the project.

2.0 REGULATORY CONTEXT

This section provides a summary of the federal, state, and local wetland regulations that are applicable to the proposed project.

2.1 Applicable Federal Regulations

The Rivers and Harbors Act of 1899 and the CWA of 1972 provide guidance for project activities within non-marine, Traditional Navigable Waters (TNWs) and/or WoUS. The discharge of any pollutant from a point source into TNWs is illegal unless a permit under the CWA's provisions is acquired. Permitting for projects that include both permanent and temporary dredging and filling in wetland and non-wetland waters of the U.S. is overseen by the USACE under Section 404 of the CWA. Projects can be permitted on an individual basis or be covered by one of several approved nationwide permits or regional general permits. In addition, RWQCB issues Water Quality Certifications under Section 401 of the CWA for project activities that fill or dredge within wetland and non-wetland WoUS and WoS, including isolated waters, such as vernal pools and other waters showing lack of connectivity to a TNW.

2.2 Applicable State Regulations

The CFGC, Sections 1600 through 1603, provides guidance for project activities within rivers, streams, lakes, riparian habitat, and other wetlands as well as vernal pools when California state threatened and/or endangered species are present. CFGC Section 1602 requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following:

- Substantially divert or obstruct the natural flow of any river, stream, or lake;
- Substantially change or use any material from the bed, channel, or bank of any river, stream, or lake; or
- Deposit debris, waste, or other materials that could pass into any river, stream, or lake.

CDFW can issue a Lake or Streambed Alteration (LSA) Agreement for projects that substantially adversely affect CDFW jurisdictional resources. If the activity will not substantially adversely affect any CDFW jurisdictional resources, the entity may commence the activity without a LSA Agreement.

The Porter-Cologne Water Quality Control Act provides guidance for project activities that may affect water quality in California. Pursuant to the Porter-Cologne Act, under Section 13000 et seq. of the California Water Code (CWC), the RWQCB issues Water Quality Certifications for project activities that fill or dredge within wetland and non-wetland WoUS and WoS, including isolated waters – such as vernal pools – and other waters showing lack of connectivity to a TNW.

3.0 METHODS AND SURVEY LIMITATIONS

BBS performed background research and conducted a jurisdictional delineation to identify all potentially jurisdictional USACE and RWQCB Wetland and Non-Wetland WoUS and WoS and CDFW Riparian and Streambed that may be impacted by the proposed project. The jurisdictional delineation was conducted within an approximately 14.915-acre survey area, which consists of the approximately 10.981-acre proposed project area and an approximately 3.935-acre, 50-foot survey buffer surrounding the proposed project area. The methods used for the background research and the initial field surveys are summarized below.

3.1 Project Background Research

Prior to conducting the jurisdictional delineation, BBS reviewed the draft City of Oceanside Subarea Plan (SAP; City 2010), the North County Multiple Habitat Conservation Plan (MHCP; San Diego Association of Governments [SANDAG] 2003), online current and historical aerial imagery (Google Earth 2019; Nationwide Environmental Title Research, LLC [NETR] 2019), U.S. Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) maps (USFWS 2019), U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soil survey maps (USDA 2019), and the USGS San Luis Rey 7.5-minute topographic quadrangle map (USGS 2019). Information from these resources informed both the fieldwork and jurisdictional determination within the survey area.

3.2 Jurisdictional Delineation

The jurisdictional delineation and mapping of the survey area was conducted on foot to determine the location and extent of resources potentially under the jurisdiction of USACE, RWQCB, and CDFW. A hand-held, sub-meter Global Positioning System (GPS) device was used to record the locations of sample points and boundaries of potentially jurisdictional resources. Mapped wetland boundaries are considered to be a line across which the vegetation, soil, and hydrologic characteristics begin/cease to meet wetland criteria.

Vegetation communities and land cover types were classified following Holland (1986) as modified by Oberbauer *et al.* (2008), and mapped by hand onto aerial imagery with a 1 inch equals 100 feet scale, noting dominant plant species within these vegetation communities. These hand-drawn vegetation community and land cover type boundaries were provided to a Geographic Information Systems (GIS) Analyst and were digitized using GIS software.

Digital photographs of sample points and representative areas were taken during the survey. It should be noted that the results of the jurisdictional delineation and vegetation mapping reflect the existing conditions at the time of the survey, which naturally change over time. In addition, the jurisdictional resource boundaries may be subject to verification by the regulatory agencies.

3.2.1 U.S. Army Corps of Engineers Jurisdiction

Data was collected at upland and wetland sample points by assessing the vegetative, soil, and hydrologic characteristics within and immediately adjacent to areas that were determined to support potential USACE jurisdictional resources following the technical guidelines provided in the following manuals:

- USACE *Wetlands Delineation Manual* (USACE 1987)
- USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0; USACE 2008)
- *USACE A Delineation Manual, A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2010)

USACE *Wetland Determination Data Forms – Arid West Region* (USACE 2008) were completed at appropriate upland and wetland sample points. Non-wetland WoUS were delineated based on the presence of ordinary high watermark (OHWM) indicators, and an OHWM data sheet was recorded where appropriate.

USACE Wetlands

Several parameters were considered to determine whether the sample point is within a USACE wetland. The following three wetland parameters typically must be satisfied to classify an area as a jurisdictional USACE wetland under normal circumstances: (1) a predominance of hydrophytic vegetation, (2) the presence of hydric soils, and (3) the presence of wetland hydrology. Details of the application of these techniques are described below. USACE Wetland Determination Data Forms are included as Appendix B to this report.

- **Hydrophytic Vegetation:** Hydrophytic vegetation is defined as "the community of macrophytes that occurs in areas where inundation and soil saturation is either permanent, or of sufficient frequency and duration to exert a controlling influence on the plant species present" (USACE 2008). For the purposes of this jurisdictional delineation, five levels of wetland indicator status were used to assess the presence of hydrophytic vegetation, based on the most current National Wetland Plant List (USACE 2016). Plant species were classified as:
    - obligate wetland plants (OBL), which area plants that almost always (estimated probability greater than 99 percent [%]) occur in wetlands but rarely are found in non-wetlands under natural conditions;
    - facultative wetland plants (FACW), which are plants that usually (estimated probability from 67% to 99%) occur in wetlands but are occasionally found elsewhere under natural conditions;
    - facultative plants (FAC), which are plants with a similar likelihood (estimated probability from 33% to 67%) of occurring in both wetlands and non-wetlands under natural conditions;

- facultative upland plants (FACU), which area plants that sometimes (estimated probability from 1% to 33%) occur in wetlands, but occur more often in non-wetlands under natural conditions; or
- obligate upland plants (UPL), which are plants that rarely (estimated probability <1%) occur in wetlands, but almost always occur in non-wetlands under natural conditions].
- A no indicator (NI) status designates that insufficient information was available to determine an indicator status.

Hydrophytic vegetation was determined to be present if any one of the following three indicator tests were satisfied:

- the Dominance Test (Indicator 1), where "more than 50% of the dominant plant species across all strata were rated OBL, FACW, or FAC";
- the Prevalence Test (Indicator 2), where there were indicators of hydric soils and wetland hydrology, and the prevalence index was 3.0 or less, which is a weighted-average wetland indicator status of all plant species by abundance (percent cover); and/or
- the Plant Morphological Adaptations Test (Indicator 3), where there were indicators of hydric soils and wetland hydrology present, and either the Dominance Test (Indicator 1) or Prevalence Test (Indicator 2) were satisfied after reconsideration of the indicator status of certain plant species that exhibited morphological adaptations for life in wetlands.

- **Hydric Soils:** Hydric soils are defined as "a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part" (USACE 2008). For the purposes of this jurisdictional delineation, the hydric soil indicators described in the USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008) and *National Technical Committee for Hydric Soils (NTCHS) Field Indicators of Hydric Soils in the United States* (USDA 2016) were used to assess the presence of hydric soils. Soil test pits were dug to the depth needed to document the soil chroma index using the Munsell® Soil Color Charts (Munsell® Color 2000), as well as additional hydric soil indicators (*e.g.,* hydrogen sulfide, sandy redox, depleted matrix, redox dark surface, depleted dark surface) detailed in the *Arid West Supplement* (USACE 2008) and the *Field Indicators of Hydric Soils in the United States* (USDA 2016). The soil was determined to be hydric if one or more hydric soil indicators were present.

- **Wetland Hydrology:** Wetland hydrology is indicated by the presence of surficial or sub-surficial hydrologic characteristics long enough during the growing season to show that the presence of water has an overriding influence on the characteristics of vegetation and soils due to anaerobic and reducing conditions, respectively; thus, for an area to be defined as a wetland, periodic inundation or saturation of soils during the growing season must be determined to be present (USACE 2008). For the purposes of this delineation, the wetland hydrology indicators (*e.g.* inundation, watermarks, drift lines, sediment deposits, drainage patterns, saturation) described in the USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008)

were used to assess the presence of wetland hydrology. Wetland hydrology was determined to be present if one or more primary indicators, or two or more secondary indicators were observed.

USACE Non-Wetland Waters of the U.S.

The USACE defines non-wetland WoUS as drainages, or portions thereof, which have strong hydrology indicators such as the presence of seasonal flows and an OHWM. An OHWM is defined as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as [a] clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (USACE 1987). In general, non-wetland WoUS are delineated by the lateral and upstream/downstream extent of the OHWM of the particular drainage or depression. The method for identification of lateral limits for potential non-wetland WoUS are detailed in the USACE *A Delineation Manual, A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2010).

Areas delineated as non-wetland WoUS may lack hydrophytic vegetation or hydric soil characteristics. Hydrophytic vegetation may be absent for various reasons, such as the lack of sufficient water flow to support hydrophytic vegetation or the influence of frequent scouring resulting from rapid water flow. Hydric soil indicators may be missing for various reasons, such as the lack of sufficient water or the presence of steep topography that precludes ponding and prohibits the development of hydric soils.

3.2.2 Regional Water Quality Control Board Jurisdiction

RWQCB jurisdiction typically extends to all WoUS as considered jurisdictional by the USACE as well as to isolated waters and wetlands. Section 401 of the CWA gives the RWQCB the authority to regulate any proposed activities that may affect water quality.

3.2.3 California Department of Fish and Wildlife Jurisdiction

CDFW jurisdiction typically includes water features with a defined bed and bank and associated riparian vegetation. CDFW typically extends its jurisdictional limit to the top of a stream, the bank of a lake, or the outer edge of the riparian vegetation, whichever is wider. CDFW jurisdictional habitat allows for a wide variety of habitat types to be jurisdictional, including some that do not include wetland species (*e.g.,* oak woodland, alluvial fan sage scrub). In addition, CDFW asserts jurisdiction over vernal pools when California state threatened and/or endangered species are present.

4.0 RESULTS

Biologists Darin Busby and Brian Lohstroh conducted a focused jurisdictional delineation within the approximately 14.915-acre survey area on August 29, 2019. The following sections describe and the jurisdictional resources observed during the jurisdictional delineation.

4.1 Physical Characteristics of Survey Area

The majority of the proposed project area is relatively flat with a drop in elevation to the south towards Buena Vista Creek, with elevations ranging from approximately 220 to 180 feet above mean sea level (amsl). Buena Vista Creek occurs along the southern boundary of the proposed project area and runs from east to west, eventually connecting to Buena Vista Lagoon and the Pacific Ocean approximately 4 miles west of the survey area. The NWI classifies Buena Vista Creek as a freshwater forested/shrub wetland (USFWS 2019). Buena Vista Creek is one of six creeks located within the 210-square-mile Carlsbad Hydrologic Unit (HU), which is one of 11 HUs identified in San Diego County by the RWQCB.

4.1.1 Soils

The following two soil types occur within the survey area: (1) Las Flores loamy fine sand, 5 to 9% slopes, eroded and (2) Visalia sandy loam, 2 to 5% slopes (USDA 2019; Appendix A: Figure 4). Soils observed in the field within the soil test pits appeared to exhibit characteristics similar to those mapped within the proposed project area, with the exception of fill soils and riprap along some portions of Buena Vista Creek (USDA 2019).

Las Flores loamy fine sand, 5 to 9% slopes, eroded is the most common soil type within the survey area. Las Flores loamy fine sands are derived from weathered marine sandstone that consist of loamy fine sands with a sandy clay subsoil. This soil is moderately well-drained, has slow to medium runoff, and a slight to moderate erosion hazard. Las Flores soils are not listed as hydric soils in California (USDA 2019).

Visalia sandy loam, 2 to 5% slopes occurs in and adjacent to Buena Vista Creek, in the southern portion of the survey area (USDA 2019). Visalia sandy loams are derived from granitic parent material that developed on alluvial fans and flood plains. This soil has a topsoil rich in organic matter, is well-drained to moderately well-drained, has slow to medium runoff, is moderately permeable, and has a slight to moderate erosion hazard. Visalia sandy loams are listed as a hydric soil on the USDA Hydric Soils List (USDA 2019).

4.1.2 Vegetation Communities and Land Cover Types

The following eight vegetation communities and land cover types were mapped within the approximately 14.915-acre survey area during the general biological resources survey conducted on July 22, 2019: disturbed Diegan coastal sage scrub, southern riparian forest, open water, developed land, disturbed land, iceplant, ornamental, and ruderal (Appendix A: Figure 5; Table 1). The majority of the survey area is dominated by disturbed land. Southern riparian forest within and adjacent to Buena Vista Creek and

small scattered patches of disturbed Diegan coastal sage scrub in the southern half of the survey area are the only native vegetation communities that occur within the survey area.

Table 1. Vegetation Communities and Land Cover Types within Survey Area

Vegetation Community/ Land-Cover Type	Within Proposed Project Area (acres*)	Within Survey Buffer (acres*)	Total (acres*)
Developed	0.455	2.184	2.639
Disturbed Diegan Coastal Sage Scrub	0.448	0.003	0.451
Disturbed Habitat	8.109	0.542	8.650
Iceplant	0.454	--	0.454
Ornamental	0.138	0.302	0.440
Ruderal	0.841	--	0.841
Southern Riparian Forest	0.518	0.868	1.386
Open Water	0.018	0.035	0.054
TOTAL	**10.981****	**3.935****	**14.915****

*Acreages are approximate and rounded to the nearest thousandth of an acre.
**Total acreages represent the actual acreages without the rounding error.

4.2 Jurisdictional Delineation

The wetlands and riparian area within and adjacent to Buena Vista Creek in the southern portion of the survey area were the only jurisdictional resources identified within the survey area. Buena Vista Creek is an intermittent creek that occurs along the southern boundary of the proposed project area and runs from east to west, eventually connecting to Buena Vista Lagoon and the Pacific Ocean approximately 4 miles west of the survey area. A desktop review of historical aerial imagery of the survey area does not show any clear evidence of jurisdictional resources outside of Buena Vista Creek, which was later confirmed during the jurisdictional delineation (NETR 2019); therefore, data was collected only at Sample Points along Buena Vista Creek.

Buena Vista Creek receives moderate to high velocity water flows during wet times of the year, when groundwater and direct precipitation provide water for stream flow, and then receives either low velocity water flows from direct precipitation and urban runoff or no flows during dry times of the year when groundwater has dropped. Buena Vista Creek supported low velocity flows at the time of the jurisdictional delineation on August 29, 2019. Buena Vista Creek enters the proposed project area through a large box culvert in the southeastern corner of the survey area where it transitions from an open concrete channel upstream, east of Thunder Drive, to an earthen, riparian lined drainage within the proposed project area. Buena Vista Creek runs west to exit the proposed project area in the southwestern corner of the survey area where it continues as an earthen, riparian lined drainage offsite. The intermittent flow regime in Buena Vista Creek allows the portion of the drainage within the proposed project area to support mature southern riparian forest.

The following two sections describe the data that was collected at each Sample Point during the jurisdictional delineation on August 29, 2019, and the summary of jurisdictional resources that occur within the approximately 14.915-acre survey area.

4.2.1 Summary of Sample Points

A total of six Sample Points were investigated in or adjacent to locations representative of potentially jurisdictional areas along Buena Vista Creek in the southern portion of the survey area (Appendix A: Figures 4 and 5). Soil pits were excavated to depths of 16 to 18 inches at all six Sample Points. Data collected at these Sample Points were recorded on USACE *Wetland Determination Data Forms – Arid West Region Version 2.0* (USACE 2008; Appendix B). Photographs of each wetland Sample Point as well as other representative photographs of these potentially jurisdictional resources are included in Appendix C of this report.

To summarize, Sample Points 1, 3, and 5 were determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian, while Sample Points 4 and 6 were determined to be just within the limits of a potentially jurisdictional CDFW Riparian. Sample Point 2 was determined to be within an upland and not within the limits of a potentially jurisdictional USACE, RWQCB, or CDFW resource. Sample Points were investigated only along the north bank of Buena Vista Creek because the southern bank is outside the project boundary and well beyond any proposed direct or indirect impacts. Because Sample Points were not investigated along the southern bank of Buena Vista Creek, the limits of jurisdictional areas along the southern bank of Buena Vista Creek were inferred based on data collected at Sample Points 1 through 6 along the northern bank of Buena Vista Creek. The following paragraphs summarize the data collected at each of the six Sample Points along the northern bank of Buena Vista Creek.

Sample Point 1 was determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian. Sample Point 1 is within southern riparian forest, approximately 1 foot north of flowing water at the bottom of the bank along the northern edge of Buena Vista Creek. This Sample Point is dominated by hydrophytic vegetation, hydric soils, and wetland hydrology. Dominant hydrophytic plant species occur witin the tree stratum, including arroyo willow (*Salix lasiolepis*; FACW) and mulefat (*Baccharis salicifolia*; FACW). Hydric soil indcators include a depleted martrix (F3) as evident by low soil chroma within the upper 16 inches. Riprap and possible fill soils were observed adjacent to Sample Point 1. Primary wetland hydrology indicators include saturation (A3) at a depth of 16 inches and inundation visible on aerial imagery (B7). Secondary wetland hydrology indicators include water marks (B1), sediment deposits (B2), drift deposits (B3), and drainage patterns (B10). USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 2 was determined to be outside the limits of a potentially jurisdictional area. Sample Point 2 is in disturbed habitat on an upland terrace approximately 3 feet north and outside of the riparian vegetation and the top of the creek bank, and

approximately 20 feet north of the wetland boundary adjacent to Sample Point 1. Sample Point 2 does not contain hydrophytic vegetation, hydric soils, and wetland hydrology. Sample Point 2 is dominated by upland vegetation, such as short-pod mustard (*Hirschfeldia incana*; NI), western ragweed (*Ambrosia psilostachya*; FACU), rattail fescue (*Vulpia myuros*; FACU), Italian thistle (*Carduus pycnocephalus*; FACU), and fennel (*Foeniculum vulgare*; NI). USDA soil survey maps show this portion of the survey area containing Las Flores loamy fine sand, 5 to 9% slopes, eroded (USDA 2019).

Sample Point 3 was determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian. Sample Point 3 is within southern riparian forest approximately 6 inches north of flowing water at the bottom of the bank along the northern edge of Buena Vista Creek. This Sample Point is dominated by hydrophytic vegetation, hydric soils, and wetland hydrology. Dominant hydrophytic plant species occur witin the tree and herb stratum, including polished willow (*Salix laevigata*; FACW), evening primrose (*Oenothera elata;* FACW), tall cyperus (*Cyperus eragrostis*; FACW), and celery (*Apium graveolens*; FACW). Hydric soil indicators include a depleted martrix (F3) as evident by low soil chroma within the upper 18 inches. Primary wetland hydrology indicators include a high water table (A2) at a depth of 12 inches, saturation (A3) at a depth of 8 inches, and inundation visible on aerial imagery (B7). Secondary wetland hydrology indicators include water marks (B1), sediment deposits (B2), drift deposits (B3), and drainage patterns (B10). USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 4 was determined to be outside the limits of a potentially jurisdictional USACE wetland WoUS and WoS but within the limits of a potentially jurisdictional CDFW Riparian. Sample Point 4 is on an upland terrace approximately 5 feet north of the wetland boundary adjacent to Sample Point 3 and 15 feet south of the top of the stream bank. Although Sample Point 4 occurs in CDFW Riparian as indicated on Figure 5 (Appendix A), Sample Point 4 occurs in a patch of ruderal land dominated by radish (*Raphanus sativus*; NI) beneath a canopy of southern riparian forest that is dominated by a cluster of Brazilian peppertree (*Schinus terebinthifolia*; FAC) and does not contain hydrophytic vegetation, hydric soils, and wetland hydrology. USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 5 was determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian. Sample Point 5 is within southern riparian forest approximately 6 feet north of flowing water at the bottom of the bank along the northern edge of Buena Vista Creek and is dominated by hydrophytic vegetation, hydric soils, and wetland hydrology. Dominant hydrophytic plant species occur within the tree and herb stratum, including arroyo willow (FACW), giant reed (*Arundo donax*; FACW), and Spanish false fleabane (*Pulicaria paludosa*; FAC). Hydric soil indicators include hydrogen sulfide (A4), depleted below a dark surface (A11), sandy gleyed matrix (S4), sandy redox (S5), and a depleted martrix (F3) as evident by low soil chroma and redox concentrations along pore linings within the upper 16 inches. Primary wetland hydrology indicators include a saturation

(A3) at a depth of 8 inches, inundation visible on aerial imagery (B7), hydrogen sulfide odor (C1), and oxidized rhizospheres along living roots (C3). Secondary wetland hydrology indicators include water marks (B1), sediment deposits (B2), drift deposits (B3), and drainage patterns (B10). In addition, saturation was observed at 16 inches below the surface. USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 6 was determined to be outside the limits of a potentially jurisdictional USACE wetland WoUS and WoS within the limits of a potentially jurisdictional CDFW Riparian. Sample Point 6 is on an upland terrace approximately 15 feet north of the wetland boundary adjacent to Sample Point 5 and 15 feet south of the top of the stream bank. Although Sample Point 6 occurs in CDFW Riparian as indicated on Figure 5 (Appendix A), this Sample Point occurs beneath a canopy of southern riparian forest with an understory of ruderal land dominated by iceplant (*Carpobrotus sp.*; NI), short-pod mustard (NI), Italian thistle (NI), and foxtail chess (*Bromus madritensis*; UPL) and surrounded by coyote brush (*Baccharis pilularis*; NI) and does not contain hydrophytic vegetation, hydric soils, and wetland hydrology. USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

4.2.2 Summary of Potentially Jurisdictional resources

The southern riparian forest along Buena Vista Creek is a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian; the open water is a potentially jurisdictional USACE and RWQCB non-wetland WoUS and WoS and potentially jurisdictional CDFW Streambed; and a portion of the disturbed land, developed land, and iceplant adjacent to Buena Vista Creek is a potentially jurisdictional CDFW Streambed (Appendix A: Figure 5). Table 2 provides a breakdown of the potentially jurisdictional resources within the survey area, Figure 5 (Appendix A) shows the locations of these resources, and Appendix C provides representative photographs of the potentially jurisdictional resources and photographs of each Sample Point.

Table 2. Potentially Jurisdictional Resources within Survey Area

Regulatory Agency	Linear Feet	Acres*	Square Feet	Width Range (feet)
USACE/RWQCB				
Wetland WoUS/WoS	760	0.646	28,121	20 - 55
Non-Wetland WoUS/WoS	41	0.054	2,349	15 - 45
TOTAL	**801**	**0.700**	**30,470**	**15 - 55**
CDFW				
Riparian	760	1.386	60,371	70 - 105
Streambed	212	0.122	5,270	82 - 90
TOTAL	**972**	**1.508****	**65,640**	**70 - 105**

*Acreages are approximate and rounded to the nearest thousandth of an acre.
**Total acreages represent the actual acreages without the rounding error.

USACE = U.S. Army Corps of Engineers; RWQCB = Regional Water Quality Control Board; CDFW = California Department of Fish and Wildlife; WoUS = Waters of the U.S.; WoS = Waters of the State

Potential USACE Jurisdiction

Potential USACE jurisdiction within the survey area totals approximately 0.700 acre, composed of approximately 0.646 acre of wetland WoUS and approximately 0.054 acre of non-wetland WoUS (Table 2; Attachment A: Figure 5). The potential USACE wetland WoUS include the southern riparian forest along the portion of Buena Vista Creek wihtin the survey area, and the potential USACE non-wetland WoUS include open water within Buena Vista Creek at the eastern end of the survey area (Attachment A: Figure 5).

Potential RWQCB Jurisdiction

There are no potentially jurisdictional isolated WoS within the survey area subject to exclusive RWQCB jurisdiction pursuant to the State Porter-Cologne Water Quality Control Act. Therefore, the RWQCB's potential jurisdiction extends to all potential USACE WoUS within the survey area, which includes a total of approximately 0.700 acre, composed of approximately 0.646 acre of wetland WoS and approximately 0.054 acre of non-wetland WoS (Table 2; Attachment A: Figure 5). The potential RWQCB wetland WoS include the southern riparian forest along the portion of Buena Vista Creek within the survey area, and the potential RWQCB non-wetland WoS include open water within Buena Vista Creek at the eastern end of the survey area (Attachment A: Figure 5).

Potential CDFW Jurisdiction

Potential CDFW jurisdiction within the survey area totals approximately 1.508 acres, composed of approximately 1.386 acres of Riparian and approximately 0.122 acre of Streambed (Table 2; Attachment A: Figure 5). Potential CDFW Riparian includes the southern riparian forest along the portion of Buena Vista Creek within the survey area, and potential CDFW Streambed includes open water, disturbed land, developed land, and iceplant within and adjacent to Buena Vista Creek that are outside the CDFW Riparian areas but between the lateral limits of the stream banks (Attachment A: Figure 5).

5.0 CONCLUSION AND RECOMMENDATIONS

This jurisdictional delineation report identifies the extent of potential USACE, RWQCB, and CDFW jurisdictional resources within the survey area using the current regulations, written policies, and guidance from these regulatory agencies. These jurisdictional boundaries may be subject to verification by the regulatory agencies. No proposed project impacts or impact analysis is presented in this report; however, this report will serve as a supplemental document to the BTR, which will, among other things, evaluate potential project impacts to jurisdictional resources and determine potential permit requirements for the project.

Potential USACE, RWQCB, and CDFW jurisdictional resources are regulated by the federal and state governments under a no-net-loss policy, and all impacts are considered significant and should be avoided to the greatest extent possible. Potential impacts to the functions and values and the chemical, physical, and biological integrity of USACE, RWQCB, and CDFW jurisdictional resources can be avoided through direct avoidance of jurisdictional resources, establishment of appropriate wetland buffers, and implementation of specific Best Management Practices. Unavoidable and authorized impacts may require mitigation through habitat creation, enhancement, and/or preservation as determined by a qualified restoration biologist in consultation with the regulatory agencies during the permitting process. Any impacts to USACE, RWQCB, and CDFW jurisdictional resources may require a Section 404 permit authorization from USACE, a 1602 LSA Agreement from CDFW, and a 401 State Water Quality Certification from RWQCB.

APPENDIX B
USACE Wetland Data Forms

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Proposed CarMax Auto Superstore City/County: Oceanside, San Diego Sampling Date: 8/29/19

Applicant/Owner: EnviroApplications, Inc. State: CA Sampling Point: 1

Investigator(s): Darin Busby, Brian Lohstroh Section, Township, Range: Township 11 South, Range 4 West

Landform (hillslope, terrace, etc.): Creek bank Local relief (concave, convex, none): Concave Slope (%): 45

Subregion (LRR): C - Mediterranean California Lat: 33.181161 Long: -117.290007 Datum: WGS84

Soil Map Unit Name: Visalia sandy loam, 2 to 5 percent slopes NWI classification: Wetland (PSS/FOCx)

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓ No _____	**Is the Sampled Area within a Wetland?** Yes ✓ No _____
Hydric Soil Present?	Yes ✓ No _____	
Wetland Hydrology Present?	Yes ✓ No _____	

Remarks:

Wetland sample point approximately 1 foot north of flowing water at bottom of bank along edge of Buena Vista Creek, an intermittent creek dominated by riparian vegetation and visibly inundated on aerial imagery

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: 15 X 15 ft.)	Absolute % Cover	Dominant Species?	Indicator Status
1. Salix lasiolepis	90	Y	FACW
2. Baccharis salicifolia	10	N	FACW
3.			
4.			
	100	= Total Cover	
Sapling/Shrub Stratum (Plot size: _____)

2.			
3.			
4.			
5.			
		= Total Cover	
Herb Stratum (Plot size: 5 X 5 ft.)			
1. Xanthium strumarium	8	Y	FAC
2. Ricinus communis	5	N	FACU
3.			
4.			
5.			
6.			
7.			
8.			
	13	= Total Cover	
Woody Vine Stratum (Plot size: 15 X 15 ft.)			
1. Parthenocissus quinquefolia	10	Y	FACU
2.			
	10	= Total Cover	

% Bare Ground in Herb Stratum 87 % Cover of Biotic Crust 0

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 2 (A)

Total Number of Dominant Species Across All Strata: 3 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 67% (A/B)

Prevalence Index worksheet:

Total % Cover of:		Multiply by:	
OBL species	0	x 1 =	0
FACW species	100	x 2 =	200
FAC species	8	x 3 =	24
FACU species	15	x 4 =	60
UPL species	0	x 5 =	0
Column Totals:	123 (A)		284 (B)

Prevalence Index = B/A = 2.3

Hydrophytic Vegetation Indicators:

✓ Dominance Test is >50%

✓ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ✓ No _____

Remarks:

Sample point located below riparian canopy at bottom of bank along edge of Buena Vista Creek.

SOIL

Sampling Point: 1

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	%	Redox Features Color (moist)	%	Type[1]	Loc[2]	Texture	Remarks
0-4	10YR 3/1	100					Clayey fine	Clayey fine sand
4-16	10YR 4/1	50	Gleyed2 4/10 G	50	D	M	Clayey fine	Clayey fine sand

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)

- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ✓ No ___

Remarks:

Soil Map Unit is on NRCS hydric soils list. Sample point located at bottom of bank along edge of Buena Vista Creek. Creek bank contains a mix of rip-rap and soil.

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ✓ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ✓ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ✓ Water Marks (B1) (**Riverine**)
- ✓ Sediment Deposits (B2) (**Riverine**)
- ✓ Drift Deposits (B3) (**Riverine**)
- ✓ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No ✓ Depth (inches): _____

Water Table Present? Yes ___ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ✓ No ___ Depth (inches): 16

Wetland Hydrology Present? Yes ✓ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Buena Vista Creek is an intermittent creek that is visibly inundated on aerial imagery.

Remarks:

Sample point located approximately 1 foot north of flowing water at bottom of bank along edge of Buena Vista Creek.

Re: Biological Constraints for the Proposed CarMax Auto Superstore on Assessor's Parcel Numbers 168-012-42 and 168-012-43 in the City of Oceanside, California

Ms. Hill:

Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. on behalf of CarMax to conduct a general biological resources survey and prepare a biological constraints report for the proposed CarMax Auto Superstore (proposed project) in the City of Oceanside, San Diego County, California (Attachment 1: Figures 1 through 3). The general biological resources survey was conducted on July 22, 2019, within an approximately 14.914-acre survey area, which consists of the 10.524-acre property and a 4.390-acre, 50-foot survey buffer surrounding the property.

The purpose of this biological constraints report is to provide a brief discussion of the applicable local, state, and federal biological regulations relevant to the proposed project; provide a brief discussion of the existing biological conditions, potential and known sensitive biological resources, and potential wetlands within the survey area; and provide a discussion of the potential biological constraints associated with the proposed project.

EXECUTIVE SUMMARY

The general biological resources survey conducted within the approximately 14.914-acre survey area consisted of vegetation mapping, general sensitive species habitat assessments, and a jurisdictional resources assessment.

The survey area contains seven vegetation communities and land cover types, including disturbed Diegan coastal sage scrub, southern riparian forest, developed land, disturbed land, iceplant, ornamental, and ruderal. It is anticipated that proposed impacts to disturbed Diegan coastal sage scrub can be mitigated at a 2:1 ratio, proposed impacts to southern riparian forest can be mitigated at a 3:1 ratio,

and a Habitat Development Fee may be required for impacts to disturbed land, iceplant, ornamental, and ruderal.

One sensitive plant species, San Diego sagewort (*Artemisia palmeri*), was observed during the general biological resources survey. Several other sensitive plant species were not observed but have a low to moderate potential to occur within the survey area based on site-specific conditions and known species ranges and habitat requirements. Therefore, focused sensitive plant surveys during the appropriate blooming period(s) within the survey area would likely be required to determine if the proposed project has the potential to impact any sensitive plant species.

No sensitive wildlife species were detected during the general biological resources survey; however, the survey area has a potential to support several sensitive species, including San Diego fairyshrimp (*Branchinecta sandiegonensis*), vernal pool fairy shrimp (*Branchinecta lynchi*), least Bell's vireo (*Vireo bellii pusillus*), and coastal California gnatcatcher (*Polioptila californica californica*). Therefore, focused surveys for these species may be required to determine if they occur within the survey area and to determine if the proposed project has the potential to impact any of these sensitive wildlife species. In addition, raptors and Migratory Bird Treaty Act (MBTA)-covered species have a potential to nest within or adjacent to the survey area during the breeding season (January 15 to August 31). Direct and indirect impacts to these species can be avoided by scheduling work outside the breeding season or conducting pre-construction nesting bird survey during the breeding, and implementing avoidance, minimization, and mitigation measures if any nesting raptors or MBTA-covered birds occur within and/or immediately adjacent to the proposed project site.

The southern portion of the survey area along Buena Vista Creek contains potential jurisdictional resources under the jurisdiction of U.S. Army Corps of Engineers (USACE), California Department of Fish and Wildlife (CDFW), Regional Water Quality Control Board (RWQCB), and/or the City of Oceanside. A focused wetland delineation may be required by the regulatory agencies to provide data to support the jurisdictional limits and to ensure the proposed project includes a required 100-foot buffer zone from all jurisdictional resources.

Based on the general biological resources survey conducted for the proposed project and based on our understanding of the draft Oceanside SAP, BBS does not anticipate that sensitive biological resources would prevent the proposed project from being permitted. However, BBS anticipates that the regulatory agencies will request additional focused biological surveys to document presence/absence of sensitive species as well as a Biological Technical Report that analyses the potential project impacts and proposes avoidance, minimization, and mitigation measures.

1.0 INTRODUCTION

The proposed project consists of the construction of a CarMax pre-owned automobile dealership, service building and non-public carwash with associated access driveways, parking lots, and landscaped areas. In addition, the proposed project will include a sales building with an attached presentation area, a service area, and a non-public carwash.

The proposed project occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 2019; Attachment 1: Figure 3). The proposed project site is situated on vacant and undeveloped Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Attachment 1: Figures 2, 3, and 4). It is bordered to the north by State Route 78, to east by Thunder Drive and residential development, to the south by Buena Vista Creek and residential development, and to the west by a commercial shopping center (e.g., grocery store, restaurants, motel, other retail stores). Plaza Drive separates the two parcels in the northwest portion of the proposed project area, and the Oceanside Department of Motor Vehicles occupies the property northeast of the proposed project site.

In general, the proposed project area is relatively flat with a drop in elevation to the south towards Buena Vista Creek, with elevations ranging from approximately 220 to 180 feet above mean sea level (amsl).

2.0 METHODS

Prior to conducting the general biological resources survey, BBS reviewed the City of Oceanside Subarea Plan (Oceanside SAP; City 2010), the North County Multiple Habitat Conservation Plan (MHCP; San Diego Association of Governments [SANDAG] 2003), aerial imagery, U.S. Fish and Wildlife Service (USFWS) critical habitat maps (USFWS 2019), and the CDFW California Natural Diversity Database (CNDDB; CDFW 2019a).

The general biological resources survey, which included vegetation mapping, general sensitive species habitat assessments, and a jurisdictional resources assessment, was conducted on foot to document the existing biological resources and assess the potential for sensitive biological resources to occur within and immediately adjacent to the proposed project site. Vegetation communities and land cover types were classified following Holland (1986) as modified by Oberbauer et al. (2008), and mapped by hand onto aerial imagery with a 1 inch equals 100 feet scale, noting dominant plant species within these vegetation communities. The survey area was generally assessed for jurisdictional resources, such as Wetland and Non-Wetland Waters of the U.S. and State (including potential wetlands and vernal pools), that are regulated by USACE, CDFW, RWQCB, and/or the City of Oceanside. In addition, habitats within an appropriate buffer of the proposed project area were assessed to determine the potential for these areas to support sensitive

plant and wildlife species. A 50-foot buffer was used for sensitive plant species; a 300-foot buffer was used for coastal California gnatcatcher; and a 500-foot buffer was used for least Bell's vireo, southwestern willow flycatcher (*Empidonax traillii extimus*), and raptors.

Digital photographs of representative areas were taken during the survey. The hand-drawn vegetation community and land cover type boundaries were provided to a Geographic Information Systems (GIS) Analyst and were digitized in the office using GIS software.

Plant and wildlife species observed directly and/or detected indirectly through sign (e.g., scat, tracks, burrows, vocalization) within the survey area were noted and are included as Attachments 2 and 3, respectively. However, these species lists do not provide a comprehensive list of all species that occur within or utilize the survey area, because the survey conducted was a general survey that does not account for all potentially occurring rare species, nocturnal species, secretive species, or seasonal species.

3.0 APPLICABLE REGULATIONS

This section provides a summary of the federal, state, and local regulations that are applicable to the proposed project.

3.1 Federal Regulations

The federal Endangered Species Act (ESA), which is administered by USFWS, provides the legal framework for the listing of species that are threatened and/or endangered with extinction as well as for the protection of listed species (i.e., threatened or endangered species) and their habitats. Projects activities that jeopardize threatened or endangered species and the habitats upon which they rely are considered 'take' under the ESA. The ESA defines 'take' as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or attempt to engage in any such conduct."

All migratory bird species that are native to the U.S. or its territories are protected under the federal MBTA, as amended under the Migratory Bird Treaty Reform Act of 2004. The MBTA prohibits the killing or transport of native migratory birds or any part, nest, or egg of any such bird unless allowed by another regulation adopted in accordance with the MBTA. No permit is issued under the MBTA, and the MBTA does not mandate specific protection measures. However, typical pre-construction requirements include nesting bird surveys during the avian breeding season and avoidance measures if nesting birds are discovered within or adjacent to a project. In addition, the USFWS commonly places restrictions on disturbances allowed near active raptor nests.

The Rivers and Harbors Act of 1899 and the Clean Water Act (CWA) provide guidance for project activities within non-marine navigable waters and/or waters of the U.S. The discharge of any pollutant from a point source into navigable waters is illegal unless a permit under the CWA's provisions is acquired. Permitting for projects that include both permanent and temporary dredging and filling in wetlands and waters of the U.S. is overseen by the USACE under Section 404 of the CWA. Projects can be permitted on an individual basis or covered by one of several approved nationwide permits or regional general permits. In addition, RWQCB issues Water Quality Certifications under Section 401 of the CWA for project activities that fill or dredge within Wetland and Non-Wetland Waters of the U.S. and State, including isolated waters such as vernal pools and other waters showing lack of connectivity to a Traditional Navigable Waters (TNW).

3.2 State of California Regulations

The California Endangered Species Act (CESA) is similar to the federal ESA in that it provides the legal framework for the listing and protection of species (and their habitats) that are identified as being endangered or threatened with extinction. CESA is administered by CDFW and allows "take" of listed plant and wildlife species either by concurring with a federal Incidental Take Permit under the Fish and Game Code (CFGC) Section 2080.1 or, for species that are state-listed but not federally listed, issuing an Incidental Take Permit under CFGC Section 2081 if specific criteria are met. The Oceanside SAP is considered an Incidental Take Permit pursuant to CFGC Section 2081.

The Native Plant Protection Act (NPPA), under CFGC Sections 1900 through 1913, regulates collection, transport, and commerce in plants that are listed as rare or endangered.

The California Environmental Quality Act (CEQA) requires an environmental review for projects with potentially adverse impacts on the environment. Adverse environmental impacts are typically mitigated in accordance with existing state laws and regulations.

The CFGC provides protection for several types of sensitive biological resources. CDFC Section 3503 and 3513 protects avian species, their nests, and their eggs from being "taken" unless authorized by CDFW through implementation of appropriate avoidance, minimization, and/or mitigation measures. CFGC Sections 1600 through 1603 regulate project activities within rivers, streams, lakes, wetlands, and riparian habitat. CDFW can issue a Lake or Streambed Alteration (LSA) Agreement for projects affecting these jurisdictional resources. If the activity will not substantially adversely affect any CDFW jurisdictional resources, the entity may commence the activity without a LSA Agreement.

The Porter-Cologne Water Quality Control Act regulates water quality for project activities in California. Pursuant to the Porter-Cologne Act, under Section 13000 et

seq. of the California Water Code (CWC), the RWQCB issues Water Quality Certifications for project activities that fill or dredge within Wetland and Non-Wetland Waters of the U.S. and State, including isolated waters – such as vernal pools – and other waters showing lack of connectivity to a TNW.

CDFW's Natural Community Conservation Planning (NCCP) program is a combined effort by the State of California and both public and private partners to take an ecosystem approach to protecting and preserving biological diversity. CDFW and USFWS provide support, direction, and guidance to local agencies to develop an NCCP that identifies economic activity that is compatible with the longterm, regional protection of plants, wildlife, and their habitats. The applicable NCCP for the proposed project – the Oceanside SAP within the MHCP – is discussed in Local Regulations, below.

3.3 Local Regulations

The North County MHCP (SANDAG 2003) is a comprehensive conservation planning process that was developed to create, manage, and monitor an ecosystem preserve in northwestern San Diego County. It is one of three subregional plans that will contribute to a regional preserve system in San Diego County. The MHCP is intended to conserve not only habitat that is already in public ownership but also other areas that will offer protection to rare, threatened, and endangered plants and wildlife. The MHCP encompasses the cities of Carlsbad, Encinitas, Escondido, Oceanside, San Marcos, Solana Beach, and Vista. Each of these cities has its own SAP that identifies city-specific regulations and policies pertaining to the sensitive resources found within that jurisdiction.

The draft Oceanside SAP (City of Oceanside 2010) has not been adopted by City Council and implementing agreements with CDFW and USFWS have not been signed; therefore, incidental take permits currently cannot be issued under the Oceanside SAP. However, the draft Oceanside SAP provides guidance for project proponents to determine potential impacts to biological resources that may result from implementation of a proposed project and to develop appropriate avoidance, minimization, and mitigation measures to reduce proposed project impacts to below a level of significance. Until the Oceanside ' is officially adopted, proposed projects within the City of Oceanside will need to comply with other state and federal regulations, and project proponents will have to coordinate with CDFW and/or USFWS to obtain incidental take permits for their projects.

4.0 RESULTS

BBS Biologist Darin Busby conducted a general biological resources survey of the survey area (i.e., the proposed project site and 50-foot survey buffer) on July 22, 2019, between the hours of 1000 and 1245. Weather conditions during the survey included temperatures ranging from 73 to 82 degrees Fahrenheit, wind speeds

ranging from 0 to 4 miles per hour, cloud cover ranging from 10 to 100 percent, and no precipitation.

The following sections (1) describe the general botanical and zoological resources and the sensitive biological resources observed and/or detected within the survey area during the general biological resources survey and (2) provide an assessment of the potential for additional sensitive biological resources to occur within and immediately adjacent to the proposed project site**.**

4.1 Botanical Resources

A total of 52 plant species were observed within the survey area (Attachment 3). Of these 52 plant species observed, 27 (52 percent) of these species are considered non-native and/or naturalized into the area, and 25 (48 percent) of these species are considered native. One of the 52 plant species, San Diego sagewort (*Artemisia palmeri*), found adjacent to and south of the survey area is considered sensitive. A list of plant species observed within the survey area is included as Attachment 2.

BBS mapped the vegetation communities and land cover types on the proposed project site and within a 50-foot buffer of the proposed project site. BBS documented seven vegetation communities and land cover types within the survey area – disturbed Diegan coastal sage scrub, southern riparian forest, developed land, disturbed land, iceplant, ornamental, and ruderal (Attachment 1: Figure 4). The seven vegetation communities and land cover types are summarized in Table 1, and briefly described in the following paragraphs.

Table 1. Vegetation Communities and Land Cover Types within the Survey area

Vegetation Community/ Land Cover Type	SAP Habitat Group	Within Parcels (acres)	Within 50-foot Survey Buffer (acres)	Total (acres)
Disturbed Diegan Coastal Sage Scrub	C	0.447	0.003	0.451
Southern Riparian Forest	A	0.565	0.864	1.429
Developed Land	-	0.049	2.632	2.681
Disturbed Land	F	8.042	0.587	8.629
Iceplant	F	0.448	--	0.448
Ornamental	F	0.136	0.304	0.440
Ruderal	F	0.837	--	0.837
TOTAL		**10.524**	**4.390**	**14.914**

Disturbed Diegan Coastal Sage Scrub (Oberbauer Code 32510, Updated Holland Code 32500)

Diegan coastal sage scrub is a vegetation community that consists mainly of low, soft-woody sub-shrubs (approximately 3 feet high) that are most actively growing in winter and early spring. Many taxa within this community are facultatively drought-deciduous. Stem- and leaf-succulents are also often present but are usually not conspicuously dominant species. Dominant shrub species in this vegetation type vary, depending on local site factors and levels of disturbance. Diegan coastal sage scrub is typically found on dry sites, such as steep, south-facing slopes or clay-rich soils ranging from coastal Los Angeles County into northern Baja California, Mexico.

Disturbed Diegan coastal sage scrub is similar to Diegan coastal sage scrub, described above, but it was classified as disturbed where mechanical or natural disturbance has reduced the overall cover of the community resulting in large areas colonized by herbaceous weedy species and/or bare ground. Some disturbance types include clearing, grading, scraping, off-road vehicle damage, or illegal trash disposal.

Approximately 0.451 acre of disturbed Diegan coastal sage scrub occurs within three small patches within the survey area, including approximately 0.447 acre on the southern parcel and approximately 0.003 acre in the 50-foot survey buffer (Attachment 1: Figure 4). The disturbed Diegan coastal sage scrub is moderately dense with shrub heights primarily ranging from 1 to 4 feet, and is dominated by native plant species such as California sagebrush (*Artemisia californica*), California buckwheat (*Eriogonum fasciculatum*), black sage (*Salvia mellifera*), but also contains a high proportion of non-native plant species, such as crown daisy (*Glebionis coronaria*), black mustard (*Brassica nigra*), short-pod mustard (*Hirschfeldia incana*), sweet fennel (*Foeniculum vulgare*), Russian thistle (*Salsola tragus*), and chess (*Bromus* spp.). Some areas of disturbed Diegan coastal sage scrub have been altered by mechanical disturbance.

Southern Riparian Forest

Southern riparian forest is composed of winter-deciduous, broad-leaved tree species that require water near the soil surface and is most often found along stream courses. Typically this community contains a dense canopy of trees located within moist canyons and drainage bottoms and is dominated by species such as willow (*Salix* spp.), cottonwood (*Populus* sp.), and western sycamore (*Platanus racemosa*). Associated understory species can include species such as mulefat (*Baccharis salicifolia*), stinging nettle (*Urtica dioica* ssp. *holosericea*), and wild grape (*Vitis girdiana*).

Approximately 1.429 acres of southern riparian forest occur along Buena Vista Creek within the survey area, including approximately 0.565 acre within the

southern parcel boundary and approximately 0.864 acre in the 50-foot survey buffer (Attachment 1: Figure 4). This vegetation community contains a moderately dense canopy, primarily ranging in height from 15 to 20 feet, and is dominated by native plant species such as narrow-leaf willow (*Salix exigua*), arroyo willow (*Salix lasiolepis*), mulefat, cattail (*Typha* sp.), wild grape, but also contains non-native plant species such as Brazilian pepper tree (*Schinus terebinthifolius*), giant reed (*Arundo donax*), and castor bean (*Ricinus communis*).

Developed Land (No Tier; Oberbauer Code 12000, No Holland Code)

Developed land has been constructed upon or otherwise physically altered to the extent that native vegetation is no longer supported. Developed land contains permanent or semi-permanent structures, pavement or hardscape, and landscaped areas that often require irrigation.

A total of approximately 2.681 acres of developed land occur within the survey area, including approximately 0.049 acre within the southern parcel boundary and approximately 2.632 acres within the 50-foot survey buffer (Attachment 1: Figure 4). Within the survey area, developed land occurs as sidewalks, roadways, parking lots, and commercial buildings.

Disturbed Land (Oberbauer Code 11300, No Holland Code)

Disturbed land includes areas that retain a soil substrate but have been physically disturbed by previous human activity. These areas are no longer recognizable as a native or naturalized vegetation community. Vegetation, if present, is typically composed of predominately non-native species introduced and established through human action. These areas are not typically artificially irrigated but receive water from precipitation and runoff. Examples of disturbed land include areas that have been graded, cleared for fuel management purposes, graded construction pads, staging areas, off-road vehicle trails, and old home sites.

A total of approximately 8.629 acres of disturbed land occur throughout the survey area, with approximately 8.042 acres within the two parcel boundaries and approximately 0.587 acre in the 50-foot survey buffer (Attachment 1: Figure 4). These areas are within or adjacent to areas that appear to be altered by regular human mechanical disturbance activities, such as grading or brush management. The disturbed land is dominated by bare ground and non-native plant species such as black mustard, tocalote (*Centaurea melitensis*), spotted spurge (*Chamaesyce maculata*), bur-clover (*Medicago polymorpha*), and chess, but also contains scattered native plant species, such as spreading goldenbush (*Isocoma menziesii* var. *menziesii*), tarweed (*Deinandra fasciculata*), coyote brush (*Baccharis pilularis*), and dove weed (*Croton setigerus*).

Iceplant (No Oberbauer Code, No Holland Code)

Iceplant is not a vegetation community described by Holland (1986) or Oberbauer et al. (2008). However, it was used for the vegetation mapping for the proposed project to indicate areas that are dominated by iceplant (*Carpobrotus* sps.), which has been introduced and established through human action. Areas mapped as iceplant are no longer recognizable as a native or naturalized vegetation community. These areas are not typically artificially irrigated but receive water from precipitation and runoff.

A total of approximately 0.448 acre of iceplant occurs within five small patches in the survey area, all of which occurs on the southeastern parcel boundaries (Attachment 1: Figure 4). In addition to non-native iceplant, this land-cover type contains non-native grasses, such as wild oat (*Avena fatua*) and chess.

Ornamental (No Oberbauer Code, No Holland Code)

Ornamental vegetation is not recognized by Holland (1986) or Oberbauer et al. (2008). It typically consists of non-native landscape and/or garden plantings that have been planted in association with buildings, roads, or other development. San Diego County supports more than 250 different types of ornamental trees and numerous other shrubs and herbs that decorate urban areas.

A total of approximately 0.440 acre of ornamental vegetation occurs in small scattered patches along the perimeter of the survey area, including approximately 0.136 acre within the parcel boundaries and approximately 0.304 acre within the 50-foot survey buffer (Attachment 1: Figure 4). Ornamental vegetation is composed of various non-native plant species used for landscaping, such as Brazilian pepper tree, red gum (*Eucalyptus camaldulensis*), natal plum (*Carissa macrocarpa*), and Mexican fan palm (*Washingtonia robusta*).

Ruderal (No Oberbauer Code, No Holland Code)

Ruderal areas are not recognized by Holland (1986) or Oberbauer et al. (2008). They are typically dominated by non-native, weedy species and are no longer recognizable as a native or naturalized vegetation community. These areas are not typically artificially irrigated but receive water from precipitation and runoff. The species composition in ruderal areas can be similar to the species composition in disturbed areas; however, ruderal areas do no typically receive the frequent mechanical disturbance that occurs in disturbed areas.

A total of approximately 0.837 acre of ruderal vegetation occurs within four small patches in the survey area, all of which occurs within the southern parcel boundaries (Attachment 1: Figure 4). These areas are dominated by non-native plant species, such as black mustard, short-pod mustard, tocalote, wild oat, and

chess, but also contain scattered native plant species, such as spreading goldenbush, tarweed, and coyote brush.

4.2 Zoological Resources

A total of 17 wildlife species were detected within the survey area during the general biological resources survey conducted on July 22, 2019. Representative species detected are typical of the habitats present within and adjacent to the survey area and included cabbage white butterfly (*Pieris rapae*), western fence lizard (*Sceloporus occidentalis*), Anna's hummingbird (*Calypte anna*), western scrub-jay (*Aphelocoma californica*), spotted towhee (*Pipilo maculatus*), house finch (*Carpodacus mexicanus frontalis*), and California ground squirrel (*Spermophilus beecheyi*). A list of wildlife species detected within the survey area is included as Attachment 3.

4.3 Sensitive Biological Resources

Sensitive biological resources include sensitive vegetation communities, sensitive plant and wildlife species, jurisdictional resources, critical habitat, and wildlife movement corridors and nursery sites. Assessments for the potential occurrence of sensitive biological resources are based upon known ranges, habitat preferences for the species, historical species occurrence records from the CNDDB (CDFW 2019), and species occurrence records from the vicinity of the proposed project from other databases (County of San Diego 2019, CNPS 2019). No focused sensitive species surveys were conducted for the proposed project. The following sections provide definitions for each of these sensitive biological resources and describe the sensitive biological resources that are known to occur or have a potential to occur within and/or adjacent to the proposed project.

Sensitive Vegetation Communities

Sensitive vegetation communities are vegetation assemblages, associations, or subassociations that have cumulative losses throughout the region, have relatively limited distribution, support or potentially support sensitive species, or have particular value to other wildlife. Typically, sensitive vegetation communities are considered sensitive whether or not they have been disturbed. Sensitive vegetation communities are regulated by various local, state, and federal resource agencies.

The sensitive vegetation communities that occur within the survey area include disturbed Diegan coastal sage scrub and southern riparian forest.

Sensitive Plant Species

For purposes of this report, sensitive plant species include those that are (1) listed as threatened or endangered or proposed for listing by federal or state agencies; (2) California Rare Plant Ranks (CRPR) List 1 or List 2 (CNPS 2019); or

(3) considered rare, endangered, or threatened by CDFW (CDFW 2019b) or other local conservation organizations or specialists. Noteworthy plant species are considered to be those that are CRPR List 3 or List 4 (CNPS 2019).

Although a focused sensitive plant survey was not conducted on-site, approximately 44 individual San Diego sagewort, a CRPR List 4.2 sensitive plant, was found adjacent to the survey area, on the stream bank just south of Buena Vista Creek.

In addition, a literature review and database search resulted in a list of 22 sensitive plant species that have historically occurred within 3 miles of the survey area. The majority of these sensitive plants species are not expected to occur within the survey area, because of habitat specific requirements or because the survey area is outside their known range. However, several other sensitive plant species, including a few on the database list, were not observed during the general biological resources survey but have a low to moderate potential to occur within the survey area based on site-specific conditions and known species ranges and habitat requirements. Examples of potentially occurring sensitive plant species include, but are not limited to, thread-leaved brodiaea (*Brodiaea filifolia*), smooth tarplant (*Centromadia pungens* ssp. *laevis*), San Diego marsh-elder (*Iva hayesiana*), narrow tarplant (*Holocarpha virgata* ssp. *elongate*), spiny rush (*Juncus acutus*), and small-flowered morning glory (*Convolvulus simulans*).

Sensitive Wildlife Species

For purposes of this report, sensitive wildlife species include those that are (1) listed as threatened or endangered or proposed for listing by USFWS or CDFW; (2) designated as “fully protected” by CDFW, (3) considered “species of special concern” by CDFW, and/or (4) considered “taxa to watch” by CDFW (CDFW 2019c). Species that are covered by the federal MBTA were also considered.

Although no sensitive wildlife species were detected during the general biological resources survey, the literature review and database search resulted in a list of 26 sensitive wildlife species that have historically occurred within 3 miles of the survey area or have potential to occur within the survey area based site specific conditions and known species ranges and habitat requirements (CDFW 2019a).

The San Diego fairy shrimp, a federally listed endangered species, and vernal pool fairy shrimp, a federally listed threatened species, have a moderate potential to occur within the survey area. These species occur within a variety of areas that seasonally inundate during the wet season, including vernal pools, road ruts, tire tracks, ditches, detention basins, other depressions, when they hatch from resting eggs to adult form. The proposed project site is relatively flat and contains several depressions with clay soils or topography that has a potential to inundate for extended periods during the wet season and provide habitat for mature fairy shrimp.

The least Bell's vireo, a federally and state-listed endangered species has a moderate potential to nest and forage within Buena Vista Creek along the southern perimeter of survey area. This migrant species that arrives in California in mid-March and departs by late September is dependent upon riparian habitat during the breeding season and prefers willow-dominated woodland or scrub that typically exists along streams and rivers.

A small portion of the southern survey area contains disturbed Diegan coastal sage scrub, a vegetation community that is known to support the coastal California gnatcatcher, a federally listed threatened species and CDFW species of special concern, that is restricted to coastal sage scrub from coastal southern California to the southern tip of Baja California, Mexico. The disturbed Diegan coastal sage within the survey area is composed of three small patches that are low in quality, total less than a half an acre, and are surrounded by disturbed land and dense commercial and residential development. However, moderately suitable habitat for the species exists to the southwest of the property and critical habitat for the coastal California gnatcatcher has been designated within the Buena Vista Creek Mitigation Area, located along the southern boundary of the survey area (Attachment 1: Figure 4). Therefore, the species has a low potential to nest and forage within the southern portion of the survey are but has a moderate potential to nest and forage adjacent to the survey area.

Raptors and MBTA-covered species have a low to moderate potential to nest within or adjacent to the survey area during the breeding season (January 15 to August 31).

Jurisdictional Resources

Jurisdictional resources are considered sensitive biological resources and are regulated by the USACE, CDFW, RWQCB, and/or the City of Oceanside pursuant to federal, state, and local regulations, described below.

USACE regulates the discharge of dredged and/or fill material, both temporary and permanent, into Wetland and Non-Wetland Waters of the U.S., pursuant to Section 404 of the CWA. USACE Non-Wetland Waters of the U.S. are delineated by the lateral and upstream/downstream extent of the ordinary high watermark (OHWM). USACE Wetland Waters of the U.S. are areas that contain wetland hydrology, hydric soils, and hydrophytic vegetation. Swales and erosional features (e.g., gullies; small washes characterized by low volume, infrequent, and short duration flow) are generally not considered Waters of the U.S. because they are not tributaries or they do not have a significant nexus to downstream TNWs.

RWQCB regulates wastewater discharge, dredged and/or fill material, or other alterations of Wetland and Non-Wetland Waters of the State, including isolated waters such as vernal pools and other waters showing lack of connectivity to a

TNW, pursuant to Section 401 of the CWA and Section 13000 et. seq. of the CWC under the Porter-Cologne Water Quality Control Act.

CDFW regulates activities that would substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake, pursuant to CFGC Section 1600 et. seq. CDFW typically extends its jurisdictional limit to the top of a stream, the bank of a lake, or the outer edge of the riparian vegetation, whichever is wider. CDFW Streambeds include watercourses having a surface or subsurface flow that supports riparian vegetation. In addition, CDFW asserts jurisdiction over vernal pools when California state threatened and/or endangered species are present.

The Oceanside SAP provides guidance for avoidance, minimization, and mitigation measures for potential impacts to wetlands. Proposed projects that have potential wetland impacts would be required to show that these impacts were avoided to the maximum extent feasible and that unavoidable impacts were minimized and mitigated to achieve a no net loss not only of wetland acreage but of the functions and values of the impacted system. In addition, at a minimum, a 100-foot buffer of wetland habitats (i.e., a 50-foot biological buffer plus a 50-foot planning buffer) must be established for projects that are proposed within or adjacent to wetland areas.

A general assessment of potential jurisdictional resources was conducted for the proposed project. Potential jurisdictional resources occur within and/or immediately adjacent to Buena Vista Creek, including potential wetland and non-wetland waters of the U.S. as regulated by USACE, potential wetland and non-wetland waters of the State as regulated by RWQCB, and potential riparian and streambed as regulated by CDFW (Attachment 1: Figure 4). The proposed project is not anticipated to support isolated waters, such as vernal pools, because of the heavily disturbed nature of the site.

Critical Habitat

Under the ESA, USFWS designates certain areas as “critical habitat” if they determine that these geographic areas are essential for the conservation and/or recovery of a federally listed threatened or endangered species, whether or not the species currently occupies the area. Critical habitat areas often require special management and protection to assure they will remain suitable for the federally listed species for which they have been designated. While federally listed species are protected by the ESA whether or not they are in an area that is designated as critical habitat, projects proposed within or adjacent to critical habitat must demonstrate that implementation of the project would not destroy or significantly impact the functions and values of the critical habitat.

Critical habitat for the coastal California gnatcatcher has been designated within the Buena Vista Creek Mitigation Area, located along the southern boundary of the survey area (Attachment 1: Figure 4).

Wildlife Movement Corridors

Wildlife movement corridors are essential to maintain populations of healthy and genetically diverse plant and wildlife species. Wildlife corridors are considered sensitive by local, state, and federal resource and conservation agencies, because these corridors allow wildlife to move between adjoining open space areas that are becoming increasingly isolated as open space becomes fragmented from urbanization, rugged terrain, and/or changes in vegetation (Beier and Loe 1992).

Wildlife corridors can be classified as either regional corridors or local corridors. Regional corridors are defined as those linking two or more large areas of natural open space, and local corridors are defined as those allowing resident animals to access critical resources (e.g., food, cover, water) in a smaller area that might otherwise be isolated by some form of urban development (e.g., roads, housing tracts).

The proposed project is dominated by disturbed and ruderal land that completely surrounded by commercial and residential development with the exception of the narrow riparian corridor along the southern boundary. Despite being surrounded by urban development, noise, and lighting, the riparian corridor provides a vital swath of undeveloped open space that appears to provide limited yet sufficient connectivity to be considered part of both a local and regional wildlife corridor. The proposed project site, however, is outside of the Wildlife Corridor Planning Zone (WCPZ).

5.0 PROPOSED PROJECT BIOLOGICAL CONSTRAINTS

BBS conducted the background research and general biological resources survey to identify potential constraints for the proposed project.

As stated previously, the draft Oceanside SAP has not been adopted by City Council and implementing agreements with CDFW and USFWS have not been signed; therefore, incidental take permits currently cannot be issued under the Oceanside SAP. Thus, the draft Oceanside SAP may be used to provide guidance to determine potential impacts to biological resources that may result from implementation of a proposed project and to develop appropriate avoidance, minimization, and mitigation measures to reduce proposed project impacts to below a level of significance. However, until the Oceanside SAP is officially adopted, proposed projects within the City of Oceanside will need to comply with other state and federal regulations, and project proponents will have to coordinate with CDFW and/or USFWS to obtain incidental take permits for their projects.

Based on the draft Oceanside SAP (City of Oceanside 2010), the proposed project is located outside the WCPZ and in an Off-site Mitigation Zone. The portion of Buena Vista Creek that runs along the southern portion of the proposed project is part of the Buena Vista Creek Mitigation Area, a hard line preserve (City of

Oceanside 2010; Attachment 1: Figure 4).

Potential proposed project constraints are discussed by resource, below.

5.1 Sensitive Vegetation Communities

Sensitive vegetation communities that occur within the survey area include disturbed Diegan coastal sage scrub and southern riparian forest.

The proposed project is located in an Off-site Mitigation Zone (City of Oceanside 2010). According to the draft Oceanside SAP, natural vegetation within an off-site mitigation zone may be removed as long as all impacts are mitigated at an appropriate mitigation area within the City of Oceanside. However, as an enrolled jurisdiction whose SAP has not yet been approved, the City of Oceanside is only allowed a loss of up to 5 percent of its coastal sage scrub habitat. The City of Oceanside has already reached its 5 percent limit; therefore, the City of Oceanside would need to coordinate with the County of San Diego (County) to obtain permission to use a portion of the County's take allowance for coastal sage scrub impacts, unless the Oceanside SAP is approved prior to approval of the proposed project.

According to the draft Oceanside SAP, mitigation for impacts within the Off-site Mitigation Zone is required either within the WCPZ or a Pre-approved Mitigation Area (PAMA). Alternatively, conservation and management of on-site vegetation immediately adjacent to an identified preserve may be used for on-site mitigation, if accompanied by a preserve boundary adjustment which is found to be justifiable and biologically superior to mitigation within the WCPZ or a PAMA. All mitigation sites must be designated as preserve, be protected by conservation easements, have a permanent responsible party clearly designated, and be managed in perpetuity for their biological resources and value.

The following recommended mitigation ratios/fees will be subject to final approval by the resource agencies:

- 3:1 ratio for impacts to southern riparian forest (Habitat Group A);
- 2:1 ratio for impacts to disturbed Diegan coastal sage scrub (Habitat Group C); and
- a Habitat Development Fee may be required for impacts to disturbed land, iceplant, ornamental, and ruderal (Habitat Group F).

5.2 Sensitive Plant Species

No focused sensitive plant surveys were conducted for the proposed project; however, San Diego sagewort, a CRPR List 4.2 sensitive plant, was found adjacent to the survey area, on the stream bank just south of Buena Vista Creek. In addition, several other sensitive plant species, with examples listed in Section 4.3, have a low to moderate potential to occur within the survey area based on site-specific

conditions and known species ranges and habitat requirements. Therefore, focused sensitive plant surveys during the appropriate blooming period(s) within the survey area would likely be required to determine if the proposed project has the potential to impact any sensitive plant species.

If sensitive plant species occur within or immediately adjacent to the proposed project footprint, appropriate avoidance, minimization, and/or mitigation measures based on the number and sensitivity of plant species present would likely be required to reduce impacts to below a level of significance.

5.3 Sensitive Wildlife Species

No focused wildlife surveys were conducted for the proposed project, and no sensitive wildlife species were detected during the general biological resources survey. However, several sensitive wildlife species have a potential to occur within the survey area, as discussed below.

San Diego fairy shrimp and vernal pool fairy shrimp have a moderate potential to occur in several depressions that occur throughout the survey area. Therefore, focused fairy shrimp surveys may be required to determine if these species occur within the survey area and to determine if the proposed project has the potential to impact these species.

Least Bell's vireo has a moderate potential to nest and forage within the southern riparian forest in Buena Vista Creek, along the southern perimeter of the survey area. Therefore, focused least Bell's vireo surveys may be required to determine if the species utilizes the habitat within Buena Vista Creek. While no direct impacts to the southern riparian forest or to the least Bell's vireo are anticipated, any proposed project activities within 500 feet of occupied least Bell's vireo habitat must be analyzed for the potential to indirectly impact the species.

The coastal California gnatcatcher has a low potential to nest and forage within the southern portion of the survey area but has a moderate potential to nest and forage adjacent to the survey area. Therefore, focused coastal California gnatcatcher surveys may be required to determine if the species utilizes the property and Diegan coastal sage scrub within 300 feet of the property to analyzed the proposed project's potential to directly and indirectly impact the species.

MBTA-covered species have a potential to nest within or adjacent to the survey area during the breeding season (January 15 to August 31). Therefore, proposed project construction should occur outside of the breeding season to avoid impacts to MBTA-covered species. If project construction cannot be entirely constructed outside of the breeding season, then a pre-construction nesting bird survey may be required, and additional avoidance, minimization, and mitigation measures may be required if MBTA-covered birds and/or their nests occur within and/or immediately adjacent to the proposed project site.

If other sensitive wildlife species are determined to occur within or adjacent to the proposed project site, appropriate avoidance, minimization, and/or mitigation measures based on the location and species present would likely be required to reduce impacts to below a level of significance.

5.4 Jurisdictional Resources

A focused wetland delineation was not conducted for the proposed project; however, the estimated limits of jurisdiction were estimated during the general biological resources survey based on the presence of wetland hydrology and hydrophytic vegetation along Buena Vista Creek in the southern portion of the survey area. A focused wetland delineation may be required by the regulatory agencies to provide data to support the jurisdictional limits.

The proposed project should be designed to avoid impacts to the jurisdictional resources located within and adjacent to the survey area, and the proposed project should include the appropriate 100-foot buffer zone, as required in the draft Oceanside SAP. If impacts to the jurisdictional resources can be completely avoided, no USACE, RWQCB, CDFW, or City of Oceanside permits are anticipated for the proposed project.

5.5 Critical Habitat

Critical habitat for the coastal California gnatcatcher has been designated within the Buena Vista Creek Mitigation Area, which occurs along the southern boundary of the survey area (Attachment 1: Figure 4). Therefore, focused coastal California gnatcatcher surveys may be required to determine if the species utilizes the property and Diegan coastal sage scrub within 300 feet of the property to analyzed the proposed project's potential to directly and indirectly impact the species.

5.6 Wildlife Movement Corridors and Nursery Sites

The proposed project is not located in the WCPZ; however, Buena Vista Creek along the southern boundary of the survey area provides a vital swath of undeveloped open space that appears to provide limited yet sufficient connectivity to be considered part of both a local and regional wildlife corridor. With the implementation of the other avoidance, minimization, and mitigation measures required for the sensitive resources above, specifically with the inclusion of the 100-foot wetland buffer, the functions and values of this wildlife corridor would be maintained. As such, no additional avoidance, minimization, and/or mitigation measures are anticipated.

6.0 Conclusion

Based on the general biological resources survey conducted for the proposed project and based on our understanding of the draft Oceanside SAP, BBS does not

anticipate that sensitive biological resources would prevent the proposed project from being permitted. However, BBS anticipates that the regulatory agencies will request additional biological surveys to document presence/absence of sensitive species as well as a Biological Technical Report that analyses the potential project impacts and proposes avoidance, minimization, and mitigation measures.

If you have any questions about the information provided in this report, please do not hesitate to contact me at darin@busbybiological.com or 858.334.9508

EXECUTIVE SUMMARY

This jurisdictional delineation report identifies the extent of U.S. Army Corps of Engineers (USACE), Regional Water Quality Control Board (RWQCB), and California Department of Fish and Wildlife (CDFW) potentially jurisdictional resources that were observed and mapped during the focused jurisdictional delineation conducted for the proposed CarMax Auto Superstore Project in Oceanside, California, on August 29, 2019. The survey area is approximately 14.915 acres, which consists of the approximately 10.981-acre proposed project area and an approximately 3.935-acre, 50-foot survey buffer surrounding the proposed project area.

Potential USACE jurisdiction within the survey area totals approximately 0.700 acre, composed of approximately 0.646 acre of wetland waters of the U.S. (WoUS) and approximately 0.054 acre of non-wetland WoUS. The potential USACE wetland WoUS include the southern riparian forest along the majority of the portion Buena Vista Creek within the survey area, and the potential USACE non-wetland WoUS include open water within Buena Vista Creek at the eastern end of the survey area.

Potential RWQCB jurisdiction extends to all potential USACE WoUS within the survey area, which includes a total of approximately 0.700 acre, composed of approximately 0.646 acre of wetland waters of the State (WoS) and approximately 0.054 acre of non-wetland WoS. The potential RWQCB wetland WoS include the southern riparian forest along the majority of the portion of Buena Vista Creek within the survey area, and the potential RWQCB non-wetlands WoS include open water within Buena Vista Creek at the eastern end of the survey area.

Potential CDFW jurisdiction within the survey area totals approximately 1.508 acres, composed of approximately 1.386 acres of Riparian and approximately 0.122 acre of Streambed. Potential CDFW Riparian includes the southern riparian forest along the majority of the portion of Buena Vista Creek within the survey area, and potential CDFW Streambed includes open water, disturbed land, developed land, and iceplant within and adjacent to Buena Vista Creek that are outside the CDFW Riparian but between the lateral limits of the stream banks.

Potential USACE, RWQCB, and CDFW jurisdictional resources are regulated by federal and state governments under a no-net-loss policy, and all impacts are considered significant and should be avoided to the greatest extent possible. Potential impacts to USACE, RWQCB, and CDFW jurisdictional resources can be avoided through direct avoidance of jurisdictional resources, establishment of appropriate wetland buffers, and implementation of specific Best Management Practices. Unavoidable and authorized impacts may require mitigation through habitat creation, enhancement, or preservation as determined by a qualified restoration biologist in consultation with the regulatory agencies during the permitting process. Any impacts to USACE, RWQCB, and CDFW jurisdictional resources may require a Section 404 permit authorization from USACE, a 1602 Lake and Streambed Alteration Agreement from CDFW, and a 401 State Water Quality Certification from RWQCB.

1.0 INTRODUCTION

Busby Biological Services, Inc. (BBS) was contracted by EnviroApplications, Inc. on behalf of CarMax to conduct a jurisdictional delineation and prepare a jurisdictional delineation report for the proposed CarMax Auto Superstore (proposed project) in the City of Oceanside, San Diego County, California (Appendix A: Figures 1 through 3). The jurisdictional delineation was conducted on August 29, 2019, within an approximately 14.915-acre survey area, which consists of the approximately 10.981-acre proposed project area an approximately 3.935-acre, 50-foot survey buffer surrounding the proposed project area. The proposed project consists of the construction of a CarMax pre-owned automobile dealership, service building and non-public carwash with associated access driveways, parking lots, and landscaped areas. In addition, the proposed project will include a sales building with an attached presentation area, a service area, and a non-public carwash.

The proposed project occurs within the U.S. Geological Survey (USGS) San Luis Rey 7.5-minute quadrangle, in the City of Oceanside, California (USGS 2019; Appendix A: Figure 3). The proposed project site is situated on two vacant and undeveloped parcels, Assessor's Parcel Number (APN) 168-012-42 and APN 168-012-43 (Appendix A: Figures 2, 3, and 4). It is bordered to the north by State Route 78, to east by Thunder Drive and residential development, to the south by Buena Vista Creek and the City of Oceanside Fire Department (Station 4), and to the west by a commercial shopping center (*e.g.,* grocery store, restaurants, motel, other retail stores). Plaza Drive separates the two parcels in the northwest portion of the proposed project area, and the Oceanside Department of Motor Vehicles occupies the property northeast of the proposed project site.

Eight vegetation communities and land cover types were mapped within the survey area during the general biological resources survey conducted on July 22, 2019, including disturbed Diegan coastal sage scrub, southern riparian forest, open water, developed land, disturbed land, iceplant, ornamental, and ruderal (Appendix A: Figure 5). The majority of the survey area is dominated by disturbed land. Southern riparian forest within and adjacent to Buena Vista Creek and small scattered patches of disturbed Diegan coastal sage scrub in the southern half of the survey area are the only native vegetation communities that occur within the survey area.

The jurisdictional delineation was conducted within the survey area to identify and map existing waters of the U.S. (WoUS) and waters of the State (WoS) that are potentially subject to the regulatory jurisdiction of the U.S. Army Corps of Engineers (USACE) pursuant to Section 404 of the Clean Water Act (CWA; 33 USC 1344); Regional Water Quality Control Board (RWQCB) pursuant to Section 401 of the CWA; and the California Department of Fish and Wildlife (CDFW) pursuant to Sections 1600 *et seq.* of the California Fish and Game Code (CFGC). The jurisdictional resource boundaries may be subject to verification by the regulatory agencies. No proposed project impacts or impact analysis is presented in this report; however, this report will also serve as a supplemental document to the Biological Technical Report (BTR), which will, among other things, evaluate potential project impacts to jurisdictional resources and determine potential permit requirements for the project.

2.0 REGULATORY CONTEXT

This section provides a summary of the federal, state, and local wetland regulations that are applicable to the proposed project.

2.1 Applicable Federal Regulations

The Rivers and Harbors Act of 1899 and the CWA of 1972 provide guidance for project activities within non-marine, Traditional Navigable Waters (TNWs) and/or WoUS. The discharge of any pollutant from a point source into TNWs is illegal unless a permit under the CWA's provisions is acquired. Permitting for projects that include both permanent and temporary dredging and filling in wetland and non-wetland waters of the U.S. is overseen by the USACE under Section 404 of the CWA. Projects can be permitted on an individual basis or be covered by one of several approved nationwide permits or regional general permits. In addition, RWQCB issues Water Quality Certifications under Section 401 of the CWA for project activities that fill or dredge within wetland and non-wetland WoUS and WoS, including isolated waters, such as vernal pools and other waters showing lack of connectivity to a TNW.

2.2 Applicable State Regulations

The CFGC, Sections 1600 through 1603, provides guidance for project activities within rivers, streams, lakes, riparian habitat, and other wetlands as well as vernal pools when California state threatened and/or endangered species are present. CFGC Section 1602 requires an entity to notify CDFW prior to commencing any activity that may do one or more of the following:

- Substantially divert or obstruct the natural flow of any river, stream, or lake;
- Substantially change or use any material from the bed, channel, or bank of any river, stream, or lake; or
- Deposit debris, waste, or other materials that could pass into any river, stream, or lake.

CDFW can issue a Lake or Streambed Alteration (LSA) Agreement for projects that substantially adversely affect CDFW jurisdictional resources. If the activity will not substantially adversely affect any CDFW jurisdictional resources, the entity may commence the activity without a LSA Agreement.

The Porter-Cologne Water Quality Control Act provides guidance for project activities that may affect water quality in California. Pursuant to the Porter-Cologne Act, under Section 13000 et seq. of the California Water Code (CWC), the RWQCB issues Water Quality Certifications for project activities that fill or dredge within wetland and non-wetland WoUS and WoS, including isolated waters – such as vernal pools – and other waters showing lack of connectivity to a TNW.

3.0 METHODS AND SURVEY LIMITATIONS

BBS performed background research and conducted a jurisdictional delineation to identify all potentially jurisdictional USACE and RWQCB Wetland and Non-Wetland WoUS and WoS and CDFW Riparian and Streambed that may be impacted by the proposed project. The jurisdictional delineation was conducted within an approximately 14.915-acre survey area, which consists of the approximately 10.981-acre proposed project area and an approximately 3.935-acre, 50-foot survey buffer surrounding the proposed project area. The methods used for the background research and the initial field surveys are summarized below.

3.1 Project Background Research

Prior to conducting the jurisdictional delineation, BBS reviewed the draft City of Oceanside Subarea Plan (SAP; City 2010), the North County Multiple Habitat Conservation Plan (MHCP; San Diego Association of Governments [SANDAG] 2003), online current and historical aerial imagery (Google Earth 2019; Nationwide Environmental Title Research, LLC [NETR] 2019), U.S. Fish and Wildlife Service (USFWS) National Wetland Inventory (NWI) maps (USFWS 2019), U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soil survey maps (USDA 2019), and the USGS San Luis Rey 7.5-minute topographic quadrangle map (USGS 2019). Information from these resources informed both the fieldwork and jurisdictional determination within the survey area.

3.2 Jurisdictional Delineation

The jurisdictional delineation and mapping of the survey area was conducted on foot to determine the location and extent of resources potentially under the jurisdiction of USACE, RWQCB, and CDFW. A hand-held, sub-meter Global Positioning System (GPS) device was used to record the locations of sample points and boundaries of potentially jurisdictional resources. Mapped wetland boundaries are considered to be a line across which the vegetation, soil, and hydrologic characteristics begin/cease to meet wetland criteria.

Vegetation communities and land cover types were classified following Holland (1986) as modified by Oberbauer *et al.* (2008), and mapped by hand onto aerial imagery with a 1 inch equals 100 feet scale, noting dominant plant species within these vegetation communities. These hand-drawn vegetation community and land cover type boundaries were provided to a Geographic Information Systems (GIS) Analyst and were digitized using GIS software.

Digital photographs of sample points and representative areas were taken during the survey. It should be noted that the results of the jurisdictional delineation and vegetation mapping reflect the existing conditions at the time of the survey, which naturally change over time. In addition, the jurisdictional resource boundaries may be subject to verification by the regulatory agencies.

3.2.1 U.S. Army Corps of Engineers Jurisdiction

Data was collected at upland and wetland sample points by assessing the vegetative, soil, and hydrologic characteristics within and immediately adjacent to areas that were determined to support potential USACE jurisdictional resources following the technical guidelines provided in the following manuals:

- USACE *Wetlands Delineation Manual* (USACE 1987)
- USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0; USACE 2008)
- *USACE A Delineation Manual, A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2010)

USACE *Wetland Determination Data Forms – Arid West Region* (USACE 2008) were completed at appropriate upland and wetland sample points. Non-wetland WoUS were delineated based on the presence of ordinary high watermark (OHWM) indicators, and an OHWM data sheet was recorded where appropriate.

USACE Wetlands

Several parameters were considered to determine whether the sample point is within a USACE wetland. The following three wetland parameters typically must be satisfied to classify an area as a jurisdictional USACE wetland under normal circumstances: (1) a predominance of hydrophytic vegetation, (2) the presence of hydric soils, and (3) the presence of wetland hydrology. Details of the application of these techniques are described below. USACE Wetland Determination Data Forms are included as Appendix B to this report.

- **Hydrophytic Vegetation:** Hydrophytic vegetation is defined as "the community of macrophytes that occurs in areas where inundation and soil saturation is either permanent, or of sufficient frequency and duration to exert a controlling influence on the plant species present" (USACE 2008). For the purposes of this jurisdictional delineation, five levels of wetland indicator status were used to assess the presence of hydrophytic vegetation, based on the most current National Wetland Plant List (USACE 2016). Plant species were classified as:
    - obligate wetland plants (OBL), which area plants that almost always (estimated probability greater than 99 percent [%]) occur in wetlands but rarely are found in non-wetlands under natural conditions;
    - facultative wetland plants (FACW), which are plants that usually (estimated probability from 67% to 99%) occur in wetlands but are occasionally found elsewhere under natural conditions;
    - facultative plants (FAC), which are plants with a similar likelihood (estimated probability from 33% to 67%) of occurring in both wetlands and non-wetlands under natural conditions;

- facultative upland plants (FACU), which area plants that sometimes (estimated probability from 1% to 33%) occur in wetlands, but occur more often in non-wetlands under natural conditions; or
- obligate upland plants (UPL), which are plants that rarely (estimated probability <1%) occur in wetlands, but almost always occur in non-wetlands under natural conditions].
- A no indicator (NI) status designates that insufficient information was available to determine an indicator status.

Hydrophytic vegetation was determined to be present if any one of the following three indicator tests were satisfied:

- the Dominance Test (Indicator 1), where "more than 50% of the dominant plant species across all strata were rated OBL, FACW, or FAC";
- the Prevalence Test (Indicator 2), where there were indicators of hydric soils and wetland hydrology, and the prevalence index was 3.0 or less, which is a weighted-average wetland indicator status of all plant species by abundance (percent cover); and/or
- the Plant Morphological Adaptations Test (Indicator 3), where there were indicators of hydric soils and wetland hydrology present, and either the Dominance Test (Indicator 1) or Prevalence Test (Indicator 2) were satisfied after reconsideration of the indicator status of certain plant species that exhibited morphological adaptations for life in wetlands.

- **Hydric Soils:** Hydric soils are defined as "a soil that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part" (USACE 2008). For the purposes of this jurisdictional delineation, the hydric soil indicators described in the USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008) and *National Technical Committee for Hydric Soils (NTCHS) Field Indicators of Hydric Soils in the United States* (USDA 2016) were used to assess the presence of hydric soils. Soil test pits were dug to the depth needed to document the soil chroma index using the Munsell® Soil Color Charts (Munsell® Color 2000), as well as additional hydric soil indicators (*e.g.,* hydrogen sulfide, sandy redox, depleted matrix, redox dark surface, depleted dark surface) detailed in the *Arid West Supplement* (USACE 2008) and the *Field Indicators of Hydric Soils in the United States* (USDA 2016). The soil was determined to be hydric if one or more hydric soil indicators were present.

- **Wetland Hydrology:** Wetland hydrology is indicated by the presence of surficial or sub-surficial hydrologic characteristics long enough during the growing season to show that the presence of water has an overriding influence on the characteristics of vegetation and soils due to anaerobic and reducing conditions, respectively; thus, for an area to be defined as a wetland, periodic inundation or saturation of soils during the growing season must be determined to be present (USACE 2008). For the purposes of this delineation, the wetland hydrology indicators (*e.g.* inundation, watermarks, drift lines, sediment deposits, drainage patterns, saturation) described in the USACE *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (USACE 2008)

were used to assess the presence of wetland hydrology. Wetland hydrology was determined to be present if one or more primary indicators, or two or more secondary indicators were observed.

USACE Non-Wetland Waters of the U.S.

The USACE defines non-wetland WoUS as drainages, or portions thereof, which have strong hydrology indicators such as the presence of seasonal flows and an OHWM. An OHWM is defined as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as [a] clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (USACE 1987). In general, non-wetland WoUS are delineated by the lateral and upstream/downstream extent of the OHWM of the particular drainage or depression. The method for identification of lateral limits for potential non-wetland WoUS are detailed in the USACE *A Delineation Manual, A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (USACE 2010).

Areas delineated as non-wetland WoUS may lack hydrophytic vegetation or hydric soil characteristics. Hydrophytic vegetation may be absent for various reasons, such as the lack of sufficient water flow to support hydrophytic vegetation or the influence of frequent scouring resulting from rapid water flow. Hydric soil indicators may be missing for various reasons, such as the lack of sufficient water or the presence of steep topography that precludes ponding and prohibits the development of hydric soils.

3.2.2 Regional Water Quality Control Board Jurisdiction

RWQCB jurisdiction typically extends to all WoUS as considered jurisdictional by the USACE as well as to isolated waters and wetlands. Section 401 of the CWA gives the RWQCB the authority to regulate any proposed activities that may affect water quality.

3.2.3 California Department of Fish and Wildlife Jurisdiction

CDFW jurisdiction typically includes water features with a defined bed and bank and associated riparian vegetation. CDFW typically extends its jurisdictional limit to the top of a stream, the bank of a lake, or the outer edge of the riparian vegetation, whichever is wider. CDFW jurisdictional habitat allows for a wide variety of habitat types to be jurisdictional, including some that do not include wetland species (*e.g.,* oak woodland, alluvial fan sage scrub). In addition, CDFW asserts jurisdiction over vernal pools when California state threatened and/or endangered species are present.

4.0 RESULTS

Biologists Darin Busby and Brian Lohstroh conducted a focused jurisdictional delineation within the approximately 14.915-acre survey area on August 29, 2019. The following sections describe and the jurisdictional resources observed during the jurisdictional delineation.

4.1 Physical Characteristics of Survey Area

The majority of the proposed project area is relatively flat with a drop in elevation to the south towards Buena Vista Creek, with elevations ranging from approximately 220 to 180 feet above mean sea level (amsl). Buena Vista Creek occurs along the southern boundary of the proposed project area and runs from east to west, eventually connecting to Buena Vista Lagoon and the Pacific Ocean approximately 4 miles west of the survey area. The NWI classifies Buena Vista Creek as a freshwater forested/shrub wetland (USFWS 2019). Buena Vista Creek is one of six creeks located within the 210-square-mile Carlsbad Hydrologic Unit (HU), which is one of 11 HUs identified in San Diego County by the RWQCB.

4.1.1 Soils

The following two soil types occur within the survey area: (1) Las Flores loamy fine sand, 5 to 9% slopes, eroded and (2) Visalia sandy loam, 2 to 5% slopes (USDA 2019; Appendix A: Figure 4). Soils observed in the field within the soil test pits appeared to exhibit characteristics similar to those mapped within the proposed project area, with the exception of fill soils and riprap along some portions of Buena Vista Creek (USDA 2019).

Las Flores loamy fine sand, 5 to 9% slopes, eroded is the most common soil type within the survey area. Las Flores loamy fine sands are derived from weathered marine sandstone that consist of loamy fine sands with a sandy clay subsoil. This soil is moderately well-drained, has slow to medium runoff, and a slight to moderate erosion hazard. Las Flores soils are not listed as hydric soils in California (USDA 2019).

Visalia sandy loam, 2 to 5% slopes occurs in and adjacent to Buena Vista Creek, in the southern portion of the survey area (USDA 2019). Visalia sandy loams are derived from granitic parent material that developed on alluvial fans and flood plains. This soil has a topsoil rich in organic matter, is well-drained to moderately well-drained, has slow to medium runoff, is moderately permeable, and has a slight to moderate erosion hazard. Visalia sandy loams are listed as a hydric soil on the USDA Hydric Soils List (USDA 2019).

4.1.2 Vegetation Communities and Land Cover Types

The following eight vegetation communities and land cover types were mapped within the approximately 14.915-acre survey area during the general biological resources survey conducted on July 22, 2019: disturbed Diegan coastal sage scrub, southern riparian forest, open water, developed land, disturbed land, iceplant, ornamental, and ruderal (Appendix A: Figure 5; Table 1). The majority of the survey area is dominated by disturbed land. Southern riparian forest within and adjacent to Buena Vista Creek and

small scattered patches of disturbed Diegan coastal sage scrub in the southern half of the survey area are the only native vegetation communities that occur within the survey area.

Table 1. Vegetation Communities and Land Cover Types within Survey Area

Vegetation Community/ Land-Cover Type	Within Proposed Project Area (acres*)	Within Survey Buffer (acres*)	Total (acres*)
Developed	0.455	2.184	2.639
Disturbed Diegan Coastal Sage Scrub	0.448	0.003	0.451
Disturbed Habitat	8.109	0.542	8.650
Iceplant	0.454	--	0.454
Ornamental	0.138	0.302	0.440
Ruderal	0.841	--	0.841
Southern Riparian Forest	0.518	0.868	1.386
Open Water	0.018	0.035	0.054
TOTAL	**10.981****	**3.935****	**14.915****

*Acreages are approximate and rounded to the nearest thousandth of an acre.
**Total acreages represent the actual acreages without the rounding error.

4.2 Jurisdictional Delineation

The wetlands and riparian area within and adjacent to Buena Vista Creek in the southern portion of the survey area were the only jurisdictional resources identified within the survey area. Buena Vista Creek is an intermittent creek that occurs along the southern boundary of the proposed project area and runs from east to west, eventually connecting to Buena Vista Lagoon and the Pacific Ocean approximately 4 miles west of the survey area. A desktop review of historical aerial imagery of the survey area does not show any clear evidence of jurisdictional resources outside of Buena Vista Creek, which was later confirmed during the jurisdictional delineation (NETR 2019); therefore, data was collected only at Sample Points along Buena Vista Creek.

Buena Vista Creek receives moderate to high velocity water flows during wet times of the year, when groundwater and direct precipitation provide water for stream flow, and then receives either low velocity water flows from direct precipitation and urban runoff or no flows during dry times of the year when groundwater has dropped. Buena Vista Creek supported low velocity flows at the time of the jurisdictional delineation on August 29, 2019. Buena Vista Creek enters the proposed project area through a large box culvert in the southeastern corner of the survey area where it transitions from an open concrete channel upstream, east of Thunder Drive, to an earthen, riparian lined drainage within the proposed project area. Buena Vista Creek runs west to exit the proposed project area in the southwestern corner of the survey area where it continues as an earthen, riparian lined drainage offsite. The intermittent flow regime in Buena Vista Creek allows the portion of the drainage within the proposed project area to support mature southern riparian forest.

The following two sections describe the data that was collected at each Sample Point during the jurisdictional delineation on August 29, 2019, and the summary of jurisdictional resources that occur within the approximately 14.915-acre survey area.

4.2.1 Summary of Sample Points

A total of six Sample Points were investigated in or adjacent to locations representative of potentially jurisdictional areas along Buena Vista Creek in the southern portion of the survey area (Appendix A: Figures 4 and 5). Soil pits were excavated to depths of 16 to 18 inches at all six Sample Points. Data collected at these Sample Points were recorded on USACE *Wetland Determination Data Forms – Arid West Region Version 2.0* (USACE 2008; Appendix B). Photographs of each wetland Sample Point as well as other representative photographs of these potentially jurisdictional resources are included in Appendix C of this report.

To summarize, Sample Points 1, 3, and 5 were determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian, while Sample Points 4 and 6 were determined to be just within the limits of a potentially jurisdictional CDFW Riparian. Sample Point 2 was determined to be within an upland and not within the limits of a potentially jurisdictional USACE, RWQCB, or CDFW resource. Sample Points were investigated only along the north bank of Buena Vista Creek because the southern bank is outside the project boundary and well beyond any proposed direct or indirect impacts. Because Sample Points were not investigated along the southern bank of Buena Vista Creek, the limits of jurisdictional areas along the southern bank of Buena Vista Creek were inferred based on data collected at Sample Points 1 through 6 along the northern bank of Buena Vista Creek. The following paragraphs summarize the data collected at each of the six Sample Points along the northern bank of Buena Vista Creek.

Sample Point 1 was determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian. Sample Point 1 is within southern riparian forest, approximately 1 foot north of flowing water at the bottom of the bank along the northern edge of Buena Vista Creek. This Sample Point is dominated by hydrophytic vegetation, hydric soils, and wetland hydrology. Dominant hydrophytic plant species occur witin the tree stratum, including arroyo willow (*Salix lasiolepis*; FACW) and mulefat (*Baccharis salicifolia*; FACW). Hydric soil indcators include a depleted martrix (F3) as evident by low soil chroma within the upper 16 inches. Riprap and possible fill soils were observed adjacent to Sample Point 1. Primary wetland hydrology indicators include saturation (A3) at a depth of 16 inches and inundation visible on aerial imagery (B7). Secondary wetland hydrology indicators include water marks (B1), sediment deposits (B2), drift deposits (B3), and drainage patterns (B10). USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 2 was determined to be outside the limits of a potentially jurisdictional area. Sample Point 2 is in disturbed habitat on an upland terrace approximately 3 feet north and outside of the riparian vegetation and the top of the creek bank, and

approximately 20 feet north of the wetland boundary adjacent to Sample Point 1. Sample Point 2 does not contain hydrophytic vegetation, hydric soils, and wetland hydrology. Sample Point 2 is dominated by upland vegetation, such as short-pod mustard (*Hirschfeldia incana*; NI), western ragweed (*Ambrosia psilostachya*; FACU), rattail fescue (*Vulpia myuros*; FACU), Italian thistle (*Carduus pycnocephalus*; FACU), and fennel (*Foeniculum vulgare*; NI). USDA soil survey maps show this portion of the survey area containing Las Flores loamy fine sand, 5 to 9% slopes, eroded (USDA 2019).

Sample Point 3 was determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian. Sample Point 3 is within southern riparian forest approximately 6 inches north of flowing water at the bottom of the bank along the northern edge of Buena Vista Creek. This Sample Point is dominated by hydrophytic vegetation, hydric soils, and wetland hydrology. Dominant hydrophytic plant species occur witin the tree and herb stratum, including polished willow (*Salix laevigata*; FACW), evening primrose (*Oenothera elata;* FACW), tall cyperus (*Cyperus eragrostis*; FACW), and celery (*Apium graveolens*; FACW). Hydric soil indicators include a depleted martrix (F3) as evident by low soil chroma within the upper 18 inches. Primary wetland hydrology indicators include a high water table (A2) at a depth of 12 inches, saturation (A3) at a depth of 8 inches, and inundation visible on aerial imagery (B7). Secondary wetland hydrology indicators include water marks (B1), sediment deposits (B2), drift deposits (B3), and drainage patterns (B10). USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 4 was determined to be outside the limits of a potentially jurisdictional USACE wetland WoUS and WoS but within the limits of a potentially jurisdictional CDFW Riparian. Sample Point 4 is on an upland terrace approximately 5 feet north of the wetland boundary adjacent to Sample Point 3 and 15 feet south of the top of the stream bank. Although Sample Point 4 occurs in CDFW Riparian as indicated on Figure 5 (Appendix A), Sample Point 4 occurs in a patch of ruderal land dominated by radish (*Raphanus sativus*; NI) beneath a canopy of southern riparian forest that is dominated by a cluster of Brazilian peppertree (*Schinus terebinthifolia*; FAC) and does not contain hydrophytic vegetation, hydric soils, and wetland hydrology. USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 5 was determined to be within the limits of a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian. Sample Point 5 is within southern riparian forest approximately 6 feet north of flowing water at the bottom of the bank along the northern edge of Buena Vista Creek and is dominated by hydrophytic vegetation, hydric soils, and wetland hydrology. Dominant hydrophytic plant species occur within the tree and herb stratum, including arroyo willow (FACW), giant reed (*Arundo donax*; FACW), and Spanish false fleabane (*Pulicaria paludosa*; FAC). Hydric soil indicators include hydrogen sulfide (A4), depleted below a dark surface (A11), sandy gleyed matrix (S4), sandy redox (S5), and a depleted martrix (F3) as evident by low soil chroma and redox concentrations along pore linings within the upper 16 inches. Primary wetland hydrology indicators include a saturation

(A3) at a depth of 8 inches, inundation visible on aerial imagery (B7), hydrogen sulfide odor (C1), and oxidized rhizospheres along living roots (C3). Secondary wetland hydrology indicators include water marks (B1), sediment deposits (B2), drift deposits (B3), and drainage patterns (B10). In addition, saturation was observed at 16 inches below the surface. USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

Sample Point 6 was determined to be outside the limits of a potentially jurisdictional USACE wetland WoUS and WoS within the limits of a potentially jurisdictional CDFW Riparian. Sample Point 6 is on an upland terrace approximately 15 feet north of the wetland boundary adjacent to Sample Point 5 and 15 feet south of the top of the stream bank. Although Sample Point 6 occurs in CDFW Riparian as indicated on Figure 5 (Appendix A), this Sample Point occurs beneath a canopy of southern riparian forest with an understory of ruderal land dominated by iceplant (*Carpobrotus sp.*; NI), short-pod mustard (NI), Italian thistle (NI), and foxtail chess (*Bromus madritensis*; UPL) and surrounded by coyote brush (*Baccharis pilularis*; NI) and does not contain hydrophytic vegetation, hydric soils, and wetland hydrology. USDA soil survey maps show this portion of the survey area containing Visalia sandy loam, 2 to 5% slopes (USDA 2019).

4.2.2 Summary of Potentially Jurisdictional resources

The southern riparian forest along Buena Vista Creek is a potentially jurisdictional USACE and RWQCB wetland WoUS and WoS and potentially jurisdictional CDFW Riparian; the open water is a potentially jurisdictional USACE and RWQCB non-wetland WoUS and WoS and potentially jurisdictional CDFW Streambed; and a portion of the disturbed land, developed land, and iceplant adjacent to Buena Vista Creek is a potentially jurisdictional CDFW Streambed (Appendix A: Figure 5). Table 2 provides a breakdown of the potentially jurisdictional resources within the survey area, Figure 5 (Appendix A) shows the locations of these resources, and Appendix C provides representative photographs of the potentially jurisdictional resources and photographs of each Sample Point.

Table 2. Potentially Jurisdictional Resources within Survey Area

Regulatory Agency	Linear Feet	Acres*	Square Feet	Width Range (feet)
USACE/RWQCB				
Wetland WoUS/WoS	760	0.646	28,121	20 - 55
Non-Wetland WoUS/WoS	41	0.054	2,349	15 - 45
TOTAL	**801**	**0.700**	**30,470**	**15 - 55**
CDFW				
Riparian	760	1.386	60,371	70 - 105
Streambed	212	0.122	5,270	82 - 90
TOTAL	**972**	**1.508****	**65,640**	**70 - 105**

*Acreages are approximate and rounded to the nearest thousandth of an acre.
**Total acreages represent the actual acreages without the rounding error.

USACE = U.S. Army Corps of Engineers; RWQCB = Regional Water Quality Control Board; CDFW = California Department of Fish and Wildlife; WoUS = Waters of the U.S.; WoS = Waters of the State

Potential USACE Jurisdiction

Potential USACE jurisdiction within the survey area totals approximately 0.700 acre, composed of approximately 0.646 acre of wetland WoUS and approximately 0.054 acre of non-wetland WoUS (Table 2; Attachment A: Figure 5). The potential USACE wetland WoUS include the southern riparian forest along the portion of Buena Vista Creek wihtin the survey area, and the potential USACE non-wetland WoUS include open water within Buena Vista Creek at the eastern end of the survey area (Attachment A: Figure 5).

Potential RWQCB Jurisdiction

There are no potentially jurisdictional isolated WoS within the survey area subject to exclusive RWQCB jurisdiction pursuant to the State Porter-Cologne Water Quality Control Act. Therefore, the RWQCB's potential jurisdiction extends to all potential USACE WoUS within the survey area, which includes a total of approximately 0.700 acre, composed of approximately 0.646 acre of wetland WoS and approximately 0.054 acre of non-wetland WoS (Table 2; Attachment A: Figure 5). The potential RWQCB wetland WoS include the southern riparian forest along the portion of Buena Vista Creek within the survey area, and the potential RWQCB non-wetland WoS include open water within Buena Vista Creek at the eastern end of the survey area (Attachment A: Figure 5).

Potential CDFW Jurisdiction

Potential CDFW jurisdiction within the survey area totals approximately 1.508 acres, composed of approximately 1.386 acres of Riparian and approximately 0.122 acre of Streambed (Table 2; Attachment A: Figure 5). Potential CDFW Riparian includes the southern riparian forest along the portion of Buena Vista Creek within the survey area, and potential CDFW Streambed includes open water, disturbed land, developed land, and iceplant within and adjacent to Buena Vista Creek that are outside the CDFW Riparian areas but between the lateral limits of the stream banks (Attachment A: Figure 5).

5.0 CONCLUSION AND RECOMMENDATIONS

This jurisdictional delineation report identifies the extent of potential USACE, RWQCB, and CDFW jurisdictional resources within the survey area using the current regulations, written policies, and guidance from these regulatory agencies. These jurisdictional boundaries may be subject to verification by the regulatory agencies. No proposed project impacts or impact analysis is presented in this report; however, this report will serve as a supplemental document to the BTR, which will, among other things, evaluate potential project impacts to jurisdictional resources and determine potential permit requirements for the project.

Potential USACE, RWQCB, and CDFW jurisdictional resources are regulated by the federal and state governments under a no-net-loss policy, and all impacts are considered significant and should be avoided to the greatest extent possible. Potential impacts to the functions and values and the chemical, physical, and biological integrity of USACE, RWQCB, and CDFW jurisdictional resources can be avoided through direct avoidance of jurisdictional resources, establishment of appropriate wetland buffers, and implementation of specific Best Management Practices. Unavoidable and authorized impacts may require mitigation through habitat creation, enhancement, and/or preservation as determined by a qualified restoration biologist in consultation with the regulatory agencies during the permitting process. Any impacts to USACE, RWQCB, and CDFW jurisdictional resources may require a Section 404 permit authorization from USACE, a 1602 LSA Agreement from CDFW, and a 401 State Water Quality Certification from RWQCB.

Water Table Present? Yes ___ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ✓ No ___ Depth (inches): 16

Wetland Hydrology Present? Yes ✓ No ___

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Buena Vista Creek is an intermittent creek that is visibly inundated on aerial imagery.

Remarks:

Sample point located approximately 1 foot north of flowing water at bottom of bank along edge of Buena Vista Creek.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: Proposed CarMax Auto Superstore City/County: Oceanside, San Diego Sampling Date: 8/29/19

San Diego, CA 92108

Re: Archaeological Survey Report for the Carmax Project, Oceanside, California

Dear Ms. Hill:

This report presents the results of a cultural resources study previously conducted by ASM Affiliates, Inc. (ASM) in 2018 for the parcel currently proposed for the Carmax Project (Project). The Project area is located in the City of Oceanside, San Diego County, California. This study was performed in accordance with the California Environmental Quality Act (CEQA) to determine the presence or absence of potentially significant cultural resources within the Project area. The City of Oceanside is the lead agency for the Project. This cultural resources study is a review of all relevant site records and reports on file with the South Coastal Information Center (SCIC) of the California Historical Resources Information System (CHRIS) at San Diego State University within a one-mile (mi.) search radius, a pedestrian survey of the Project area by a qualified archaeologist and a review of the Sacred Lands File held by the Native American Heritage Commission (NAHC). This report includes the results of the study, as well as a brief prehistoric and historic background summary for the area, and conclusions and cultural resource management recommendations.

Project Location

The Project area consists of approximately 11 acres in Assessor Parcel Numbers (APN) 168-01-242 and 168-01-243 within the City Oceanside, California. The Project area is shown on the San Luis Rey USGS 7.5' Quad, within Township 11 South Range 4 West, unsectioned Agua Hedionda Land Grant (Figures 1 and 2). The Project proposes to grade the parcels for future development.

Cultural Setting

Prehistory

Archaeological fieldwork along the southern California coast has documented a diverse range of human occupation extending from the early Holocene into the Ethnohistoric period (Erlandson and Colten 1991; Jones 1992; Moratto 1984). A variety of different regional chronologies, often with overlapping terminology, have been used in coastal southern California, and they vary from region to region (Moratto 1984). Today, the prehistory of San Diego County is generally divided into three major temporal periods: Paleo-Indian, Archaic, and Late Prehistoric. These time periods are characterized by patterns in material culture that are thought to represent distinct regional trends in the economic and social organization of prehistoric groups. In addition, particular scholars referring to specific areas utilize a number of cultural terms synonymously with these temporal labels: San Dieguito for Paleo-Indian, La Jolla for Archaic, and San Luis Rey for Late

Prehistoric (Meighan 1959; Moriarty 1966; Rogers 1939, 1945; True 1966, Wallace 1978; Warren 1964).

Paleo-Indian Period

The antiquity of human occupation in the New World has been the subject of considerable debate over the last few decades. The most widely accepted model currently is that humans first entered the western hemisphere between 12,000 and 15,000 years B.P. While there is no firm evidence of human occupation in coastal southern California prior to 12,000 B.P., dates as early as 23,000 B.P. and even 48,000 B.P. have been reported (Bada et al. 1974; Carter 1980; Rogers 1974). The amino acid racemization technique used to date these sites has been largely discredited, however, by more recent accelerator radiocarbon dating of early human remains along the California coast (Taylor et al. 1985). Despite intense interest and a long history of research, no widely accepted evidence of human occupation in North America prior to 15,000 B.P. has emerged.

As in most of North America, the earliest recognized period of California prehistory is termed Paleo-Indian. In southern California, this period is usually considered to date from at least 10,000 B.P. until 8500 to 7200 B.P. (Moratto 1984; Warren et al. 2008), and is represented by what is known as the San Dieguito complex (Rogers 1966). Within the local classificatory system, San Dieguito assemblages are composed almost entirely of flaked stone tools, including scrapers, choppers, and large projectile points (Warren 1987; Warren et al. 2008).

Archaic Period

The Archaic period (also referred to as the Early Milling period) extends back at least 7,200 years, possibly to as early as 9000 B.P. (Moratto 1984; Rogers 1966; Warren et al. 2008). Archaic subsistence is generally considered to have differed from Paleo-Indian subsistence in two major ways. First, gathering activities were emphasized over hunting, with shellfish and seed collecting having a high importance. Second, milling technology, frequently employing portable ground stone slabs, was developed. In reality, the implications of this transition are poorly understood from both an economic and a cultural standpoint (see Warren et al. 2008 for an excellent review).

Early Archaic occupations in San Diego County are most apparent along the coast and the major drainage systems that extend inland from the coastal plains (Moratto 1984). Coastal Archaic sites are characterized by cobble tools, basin metates, manos, discoidals, a small number of “Pinto” and “Elko” series dart points, and flexed burials. Together, these elements typify what is termed the La Jolla complex in San Diego County, which appears as the early coastal manifestation of a more diversified way of life.

Late Prehistoric Period

Assemblages derived from Late Prehistoric sites in San Diego County differ in many ways from those in the Archaic tradition. The occurrence of small, pressure-flaked projectile points, the replacement of flexed inhumations with cremations, the introduction of ceramics, and an emphasis on inland plant food collection, processing, and storage (especially acorns) are cultural patterns that were well established by the second millennium A.D. The centralized and seasonally permanent residential patterns that had begun to emerge during the Archaic period became well established in most areas. Inland semisedentary villages appeared along major watercourses in the foothills and in montane valleys where seasonal exploitation of acorns and piñon nuts was

common, resulting in milling stations on bedrock outcrops. Mortars for acorn processing increased in frequency relative to seed-grinding basins.

Ethnohistoric Period

In ethnohistoric times, two main cultural groups occupied San Diego County: the Uto-Aztecan-speaking Luiseño in the north and the Kumeyaay, Ipai/Tipai or Diegueño in the south. Traditionally, Luiseño territory encompassed an area from roughly Batiquitos Lagoon on the coast, east to Lake Henshaw, north into Riverside County, and west through San Juan Capistrano to the coast (Bean and Shipek 1978; Kroeber 1925; Rivers 1993). The region inhabited by various groups of the Kumeyaay was much larger and probably extended from Batiquitos lagoon eastward into the Imperial Valley and southward through much of northern Baja California (Almstedt 1982; Gifford 1931; Hedges 1975; Luomala 1978; Shipek 1982; Spier 1923).

The term Luiseño is derived from association with the San Luis Rey Mission, on the San Luis Rey River. The Luiseño people had a fairly rigid social structure and a moderately high population density (Bean and Shipek 1978). Maximum population estimates at Spanish contact range from 5,000 (Kroeber 1925) to 10,000 (White 1963). With a territory extending for almost 4,000 km², maximum population density estimates range from 1.25 to 2.5 persons per km² (3.3 to 6.7 persons per mi.2). White (1963) estimated that the Luiseño included approximately 50 villages of 200 individuals each, while Oxendine (1983), using Portolá expedition observations, indicated that village size was closer to 60. Recent research with mission records suggests that village size varied significantly in the eighteenth century, with larger villages such as Topome along the Santa Margarita River consisting of multiple clans (Johnson and Crawford 1999).

The Luiseño were divided into several autonomous lineages or kin groups based on patrilineal descent groups and a patrilocal residential pattern. Each Luiseño lineage was based around an autonomous village that held collective ownership over a well-defined territory for hunting and gathering, and violations of trespass were punished (Bean and Shipek 1978). Village territories may have ranged from as small as 10 km² near the coast along major drainages such as the San Luis Rey River (Oxendine 1983:45) to as large as 100 km² elsewhere (White 1963). A variety of shorter-term residential camps (such as for acorn gathering) and specialized localities occurred within each village territory (Oxendine 1983; White 1963). There are varied estimates for the length of the annual stay at the main village, and True et al. (1974) have even suggested a seasonal pattern with two permanent base camps, one in a major valley and another in the mountain region. Leadership included hereditary chiefs and council members who had specialized knowledge and authority over specific religious, economic, and warfare issues. Leaders conducted elaborate ceremonies; ritual and ceremonial specialists maintained ceremonial knowledge in secrecy and passed on the knowledge to only one heir (White 1963; Winterrowd and Shipek 1986). These leaders and specialists made use of fenced-in ceremonial structures, located in the village center.

Economic activities took place on the community and extended household levels, and varied significantly between coastal and inland areas (Bean and Shipek 1978:552). Community-wide efforts included fire management for game drives, and systematic use of fire to facilitate grasslands and increase yields of key plants and animals. Such burning was regularly mentioned in early Spanish accounts (Bean and Lawton 1976; Blackburn and Anderson 1993). Acorns, gathered in upland areas, have been considered the most important food source. Seeds from grasses, manzanita, sage, sunflowers, lemonade berry, chia, and other plants were also used, along with

various wild greens and fruits. Deer, antelope, small game, and birds were exploited. Coastal marine animals utilized as food included sea mammals, fish, crustaceans, and mollusks. Near-shore fishing was done from light balsa reed or dugout canoes. Some accounts indicate that coastal communities exploited local shellfish in the winter (Sparkman 1908; White 1963), and during times of stress the interior Luiseño traveled to the coast to obtain shellfish, fish, and even some land mammals (White 1963). Bean and Shipek (1978) noted that most inland groups also had fishing and gathering locations on the coast that they visited annually when the tides were low or when the inland resources were scarce, typically from January through March.

Rigid gender division of labor did not exist, but women generally collected plant resources and men hunted (Bean and Shipek 1978). Houses were dispersed throughout villages. Lowland village houses were conical structures covered with tule bundles, and other structures included sweathouses, ceremonial enclosures, ramadas, and acorn granaries. Domestic implements included wooden utensils, baskets, ceramic cooking and storage vessels, and milling tools. Hunting implements included bow and arrow, curved throwing sticks, nets, and snares. Nets and hooks made of shell and bone were used for fishing.

Historic Period

The Hispanic era in California's history includes the Spanish Colonial (1769-1821) and Mexican Republic (1821-1846) periods. This era witnessed the transition from a society dominated by religious and military institutions consisting of missions and presidios to a civilian population residing on large ranchos or in pueblos (Chapman 1925).

On July 20, 1769, Father Juan Crespí arrived in the San Luis Rey River Valley with the Portolá expedition to Monterey. His report back to his superiors declaring it an ideal location for a mission led to the eventual founding of Mission San Luis Rey de Francia (Pourade 1961:115). The mission was formally dedicated on June 13, 1798. Named for King Louis IX of France, this mission became known as the "King of Missions" due to its size and success. At its height, San Luis Rey became one of the most populous and successful of the missions. In 1824, it had an Indian neophyte population of 3,000 and the extensive mission lands supported 1,500 horses, 2,800 sheep, and 22,000 cattle (Pourade 1961:139).

The effects of missionization and the introduction of Old World diseases, greatly reduced the Native American population of southern California. Inland Luiseño groups were not heavily affected by Spanish influence until 1816, when an outpost of the mission was established 32 km further inland at Pala (Sparkman 1908). Most villagers, however, continued to maintain many of their aboriginal customs and simply adopted the agricultural and animal husbandry practices learned from Spaniards.

Mexico won independence from Spain in 1821, and with it the process of dismantling of the mission system began to unfold. The 1833 Secularization Act passed by the Mexican Congress ordered half of all mission lands to be transferred to the Indians, and the other half to remain in trust and managed by an appointed administrator. These orders were never implemented due to several factors that conspired to prevent the Indians from regaining their patrimony. By 1835, the missions, including Mission San Luis Rey, were secularized.

The subsequent American period (1846 to present) witnessed the development of San Diego County in various ways. This time period includes the rather rapid dominance over Californio culture by Anglo-Victorian (Yankee) culture and the rise of urban centers and rural communities. A Frontier period from 1850 to 1870 saw the region's transformation from a feudal-like society to an aggressive capitalistic economy in which American entrepreneurs gained control of most large ranchos and transformed San Diego into a merchant-dominated market town. Between 1870 and 1930, urban development established the cities of San Diego, National City, Coronado, El Cajon, Escondido, La Mesa, Oceanside, and Chula Vista, while a rural society based on family-owned farms organized by rural school district communities also developed, especially in the northern region of the county. The Army and Navy took an increased interest in the San Diego harbor between 1900 and 1940. The Army established coastal defense fortifications at Fort Rosecrans on Point Loma, and the Navy developed major facilities in the bay (Fredericks 1979; Van Wormer and Roth 1985). The 1920s brought a land boom (Robinson 1942) that stimulated development throughout the city and county, particularly in the Point Loma, Pacific Beach, and Mission Beach areas. Development stalled during the depression years of the 1930s, but World War II ushered in a period of growth based on expanding defense industries.

City of Oceanside

In the late 1860s and 1870s, settlers began to arrive in the San Luis Rey Valley. These settlers, who came from eastern states and a wide variety of European countries, raised dairy cattle, sheep and horses, grew barley and alfalfa, and maintained bee colonies. A small townsite began to grow adjacent to the San Luis Rey mission. In 1880, the California Southern Railroad was formed to construct a rail line between San Diego and San Bernardino. By 1882, they had constructed 211 mi. of track from National City to Fallbrook Junction, just north of Oceanside, and inland through Temecula Canyon and Colton and San Bernardino. The history of the City of Oceanside began in earnest in 1881 when Andrew Jackson Meyers, a store keeper in San Luis Rey, was granted a 160-acre homestead grant just south of Rancho Santa Margarita in what is now the City of Oceanside. Cave Johnson Couts Jr. surveyed and mapped out a town site, which was to become known as Oceanside (Flanigan et al. 1992:2-4; Hawthorne 2000:31-33).

Lots in the newly platted town sold quickly. By 1886, Oceanside had a population of 350 and by July 3, 1888, when Oceanside was incorporated, the population had grown to approximately 1,000. By then Oceanside was a boomtown with a growing population. It boasted several impressive buildings including the South Pacific Hotel near Third and Pacific and the Bank of Oceanside on the corner of Second and Hill, an orchestra, opera house and a variety of businesses. A wharf company was founded in 1887 and a wharf was constructed in 1888 at the foot of Wisconsin. Oceanside also had a two-story school with three teachers, and several newspapers including the Oceanside Blade and Oceanside Headlight. South Oceanside was founded by J. Chauncey Hayes and a second school was built there. The first Oceanside wharf was destroyed by a storm during the winter of 1890 and 1891. The second pier, constructed at the location of the present pier, was the first of five piers constructed at that location in the City's history (Hawthorne 2000:31-38).

The railroad, which had played a key role in the founding of Oceanside, continued to play an important role in the future development of the City. The inland route that had opened in 1882 was prone to flooding, and by 1888, California Southern had built a coastal rail line north of Oceanside to Santa Ana and Fullerton, thereby linking San Diego directly to Los Angeles. Trains ferried thousands of prospective buyers to Oceanside in the boom years of the 1880s and its location on

the main line between San Diego and Los Angeles continued to be key in the development of the town.

Oceanside's boom was short-lived, however. Like the rest of San Diego County, Oceanside experienced an unexpected bust as the real estate market, which had been fueled by land speculators who drove land prices up from $10 an acre to over $100, suddenly collapsed. Land prices plummeted and the trainloads of speculators that had arrived daily in Oceanside disappeared. Between 1888 and 1920, the City had a net population increase of only 164 people (Wiersma and Taschner 1981).

The 1920s brought a renaissance for Oceanside, as local businessmen guided by the Chamber of Commerce organized to attract new residents and businesses to the City. The city infrastructure was also improved, including the roads, sewers, and water supply. In 1923, most of the major city streets were paved. Access to Oceanside was improved by a number of important road projects including a road linking Oceanside to northern Imperial County. It was thought that this would attract visitors from the desert during the summer months. The City also embarked on an aggressive advertising campaign extolling the virtues of Oceanside. As a result of the planning, advertising and public improvements, the City of Oceanside prospered during the 1920s and the population grew from 1,164 in 1920 to 3,508 in 1930. The jewels in Oceanside's commercial development were the construction of the 650-seat Palomar Theater, completed in 1924, and the 1,224-ft. long pier, the longest pier on the West Coast, which opened in July 1927 (Wiersma and Taschner 1981).

Oceanside suffered economic decline during the depression years, but its population continued to grow reaching 4,650 by 1940. A new fire and police station, designed by innovative architect Irving Gill, were constructed in 1930, followed in 1934 by a new Mission Revival-style City Hall, also designed by Gill. Oceanside High School was renovated by award-winning school architect Theodore Kistner in 1934 with funds provided by the Works Progress Administration. While the Chamber of Commerce continued to advertise Oceanside as a city "Where Life Is Worth Living," the high unemployment rates throughout the country curtailed vacation travel and the economy of Oceanside suffered (Flanigan et al. 1992:2-11).

In February 1942, the government purchased the entire 125,000-acre Rancho Santa Margarita for $4.15 million. The founding of Camp Pendleton just north of Oceanside, the largest Marine Corps Base in the nation, created a boom for the Oceanside economy and was the catalyst that transformed a small town into a modern city. Demand for housing and services within Oceanside also increased dramatically and the population of the city grew to 12,888 by 1950. Houses and apartment buildings were constructed in large numbers to accommodate the ever-expanding population. When the war years were over, tourism again became a key component in the economy of the city. When the old steel pier was damaged by a storm in 1943, the loss to the tourist industry was thought to be so severe that the people of Oceanside passed a $200,000 bond issue to construct the longest pier (1,900 ft.) on the West Coast (Hawthorne 2000:137).

The economic growth of Oceanside over time has depended to a great extent on the presence of Camp Pendleton. The outbreak of the Korean War in the early 1950s ensured the growth of Camp Pendleton, which was known as "The Gateway to Korea." The population of Oceanside doubled during the decade to 25,000 as military families settled in the city, increasing demand for services.

In the first five years of the 1950s, Oceanside annexed 34 additional areas. The school population also grew rapidly. In the early 1960s, a bond issue was passed for the construction of Mira Costa College, a two-year college serving Oceanside and the surrounding areas. Oceanside experienced another boom in the 1960s and 1970s during the Vietnam War.

As Oceanside expanded to a total of 40.7 square mi. and a population over 100,000 in the late 1980s, much of the development was taking place in suburban areas of the City and the downtown area experienced a decline. In 1985, the City of Oceanside began a redevelopment program. The aim of redevelopment has been to revitalize the downtown area, eliminate urban blight, promote development, create jobs, increase the tax base and develop a positive environment to attract both residents and visitors to the downtown (Flanigan et al. 1992:2-13). The redevelopment program has succeeded in revitalizing the downtown area. A new transit center was constructed in 1983, the pier, beachfront and parks were refurbished, and a new Civic Center was completed in the late 1980s. In recent years the economy of Oceanside has diversified to include biotech and medtech industries, ensuring continued growth and prosperity.

Regulatory Environment

California Environmental Quality Act

CEQA requires that all private and public activities not specifically exempted be evaluated for their potential for environmental damage, including effects to historical resources. Historical resources are recognized as part of the environment under CEQA. The act defines historical resources as "any object, building, structure, site, area, or place that is historically significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California" (Division I, Public Resources Code, Section 5021.1[b]).

Lead agencies have a responsibility to evaluate historical resources against the California Register of Historical Resources (CRHR) criteria prior to making a finding as to a proposed project's potential for impacts to historical resources. Mitigation of adverse impacts is required if the proposed project will cause substantial adverse change to a historical resource. Substantial adverse change includes demolition, destruction, relocation, or alteration such that the significance of a historical resource would be impaired. While demolition and destruction are fairly obvious significant impacts, it is more difficult to assess when change, alteration, or relocation crosses the threshold of substantial adverse change. The CEQA Guidelines provide that a project that demolishes or alters those physical characteristics of a historical resource that convey its historical significance (i.e., its character-defining features) is considered to materially impair the resource's significance. The CRHR is used in the consideration of historical resources relative to significance for purposes of CEQA. The CRHR includes resources listed in, or formally determined eligible for listing in, the NRHP and some California State Landmarks and Points of Historical Interest. Properties of local significance that have been designated under a local preservation ordinance (local landmarks or landmark districts), or that have been identified in a local historical resources inventory, may be eligible for listing in the CRHR and are presumed to be significant resources for purposes of CEQA unless a preponderance of evidence indicates otherwise.

Generally, a resource shall be considered by the lead agency to be "historically significant" if the resource meets the criteria for listing on the CRHR (Pub. Res. Code SS5024.1, Title 14 CCR, Section 4852), which consist of the following:

A. it is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or
B. it is associated with the lives of persons important to local, California, or national history; or
C. it embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master, or possesses high artistic values; or
D. it has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

Oceanside Historical Site

Ordinance No. 82-14, § 1, 9-8-82 of the City of Oceanside's Municipal Code established the criteria for which a property is eligible as an Oceanside Historical Site:

a) It exemplifies or reflects special elements of the city's cultural, social, economic, political, aesthetic, engineering, or architectural history; or
b) It is identified with persons or events significant in local, state, or national history; or
c) It embodies distinctive characteristics of a style, type, period, or method of construction, or is a valuable example of the use of indigenous materials or craftsmanship; or
d) It is representative of the notable work of a builder, designer, or architect; or
e) It is found by the council to have significant characteristics which should come under the protection of this chapter.

Study Methods

Methods used to assess the presence or absence of cultural resources within the Project area included a search of existing records and an intensive field survey. The records search was received from the SCIC on March 20, 2018 (Appendix A). The search included the Project area and a radius of 1 mi. around it. A records search of the Sacred Lands File held by the NAHC was requested on January 9, 2018 (Appendix B). Historic aerial photographs and maps, provided by historicaerials.com, of the Project area were also examined.

The field survey was conducted on January 12, 2018 by ASM Associate Archaeologist Joel Lennen, M.A. Field methods consisted of a pedestrian survey of the Project area by the archaeologist in transects spaced at 10-m intervals. The Project area was photographed, and all visible soils were examined for cultural resources.

Study Results

SCIC Records Search Results

Seventy-five cultural resource studies have previously addressed the 1-mi. record search radius surrounding the Project area. Of these reports, none were recorded within the Project area, although two were broad regional studies. Descriptions of the cultural resource studies that included areas within the records search radius are provided in Table 1.

The records search identified 26 cultural resources that were previously recorded within the 1-mi. record search radius (Table 2). Of these resources, none were recorded within the Project area.

A search of the historic addresses on file at the SCIC identified six previously recorded historic addresses within the 1-mi. record search radius (see Table 2).

NAHC Records Search Results

A record search of the Sacred Lands File held by the NAHC was requested on January 9, 2018. On January 10, 2018 the NAHC responded the record search had negative results. The NAHC provided a list of 35 tribal entities and individuals to contact for additional information. The City of Oceanside should contact the listed tribal entities and individuals directly during their AB-52 consultation. All correspondence pertaining to the NAHC is included in Appendix B.

Archival Research

Historic aerial photographs and maps of the Project area were examined from historicaerials.com. The 1938 historic aerial photograph shows the Project area is largely undeveloped and Buena Vista Creek is present along the southern boundary of the Project area. A road running north-south bisects the western portion of the Project area. To the west of the road, the ground has been cleared, possibly for agricultural uses. The 1946 historic aerial photograph only shows the northern edge of the Project area. The road along the western side of the Project area is still present and the portion of the Project area that is visible does not appear to be in use. The 1947 and 1953 historic aerial photographs also show the roadway, and no other development within the Project area. The 1964 historic aerial photograph also shows the roadway and an additional road running east-west at the southern end of the Project area, immediately north of the creek. The 1967 and 1980 aerial photograph shows several roadways and grading across the Project area. The 1990 aerial photograph shows the Project area and the surrounding area in the same condition as it is currently.

The 1893, 1897, 1901, 1907, 1911, 1920, 1925, 1931, 1939, and 1947 USGS Topographic maps of the Project area show a roadway possibly bisecting the Project area running east-west. However, they also show Buena Vista Creek farther south that its current alignment, and it is possible that these maps are not accurate within the vicinity of the Project area. Starting in 1907 the maps also show a building that is possibly within the Project area. The 1949 USGS Topographic map shows a road bisecting the Project area running north-south, also shown on the 1938 and later aerial photographs. It also shows Buena Vista Creek in its current alignment. No changes are visible on

the 1955, 1961, 1966, 1969, and 1971 USGS Topographic Maps. The 1978 USGS Topographic map shows the current alignment of Thunder Drive, although Plaza Drive dead ends within the Project area. It also shows the development and highways adjacent to the Project area. The 2000 USGS Topographic Map shows the current alignment of the streets adjacent to the Project area, as well as an additional road present within the Project area running east-west along the southern boundary of the Project area.

Survey Conditions and Results

ASM Associate Archaeologist Joel Lennen, M.A., surveyed the Project area on January 12, 2018. The weather was mostly sunny with temperatures that varied from 63-65 degrees. The vegetation consisted mostly of non-native short grasses and buckwheat, with an increase in flora density and diversity (e.g. eucalyptus trees, tall grasses, succulents) along the creek on the southern boundary of the Project area (Figures 3 - 5). There was 90 percent ground surface visibility in the central portion of the Project area, and approximately 40 percent ground surface visibility in the southern and northern portions. A moderate amount of imported gravel and modern refuse (e.g. plastic bottles, glass, food containers, etc.) was noted to be scattered throughout the parcel wherever the ground surface was exposed. The refuse was denser along the creek where there was also a temporary shelter (i.e. pitched tent using tarps and ropes). The southern third of the Project area has been impacted by grading that created three terraces that ascend northwards from the creek. Two footpaths largely devoid of vegetation ran along the bottom two terraces, oriented east-to-west. No historic or prehistoric cultural resources were noted during the survey.

The Project area was resurveyed by ASM Associate Archaeologist Douglas Drake, M.A., on Monday, July 29, 2019. The Project area was found to be in the same general condition as described at the time of the previous survey. No historic or prehistoric cultural resources were noted during the resurvey of the Project area.

Conclusions and Cultural Resource Management Recommendations

Twenty-six cultural resources were recorded within the one-mile record search radius around the Project area. No cultural resources have been previously recorded within the Project area. The previous pedestrian archaeological survey (January 2018) and resurvey (July 2019) of the Project area were negative and no cultural resources have been identified within the Project area. The record search of the Sacred Lands File held by the NAHC had negative results. Based on these data, there is a low potential for impacts to historical resources associated with the implementation of the proposed Carmax Project, as none have been identified within the Project area.

Construction monitoring by a qualified archaeologist and Native American monitor is recommended during the initial ground disturbance within the Project area due to the Project's proximity to Buena Vista Creek and the potential for buried cultural resources within the alluvial deposits along the creek. In the event that any previously undetected cultural resources are encountered during monitoring, evaluation of their significance may be required for CEQA compliance. The monitor should temporarily halt work in the immediate area and contact you to discuss the appropriate steps to be taken to determine the potential significance of the discovery, in coordination with the City of Oceanside. A qualified archaeologist may be required to evaluate the discovery, determine the appropriate avoidance or other mitigation measures, and determine if

additional archaeological work is needed. Should you have any questions regarding this study, please do not hesitate to contact me.

Respectfully submitted,

Stephen Harvey, M.A., RPA
Senior Archaeologist

Re: Sacred Land Search Request for the Plaza Drive Project, Oceanside, San Diego County, California

Dear Dr. Totton,

ASM Affiliates, Inc. (ASM) is conducting a cultural resource survey for the Plaza Drive Project (Project), in Oceanside, San Diego County, California. The Project is located on the San Luis Rey USGS 7.5' Quad, within the, Township 11 South, Range 4 West, unsectioned Agua Hedionda Land Grant (Figure 1). City of Oceanside is the lead agency for the Project. This study is being undertaken in compliance with the California Environmental Quality Act. The Project proposes grading the approximately 11-acre project area for future development.

A records search for the project area was conducted by the South Coastal Information Center. I am writing to inquire if you have registered any Tribal Cultural Resources, traditional cultural properties, or areas of heritage sensitivity within this proposed project area? Please submit your response to me at our Carlsbad office, listed below. Feel free to call, write, or e-mail if you have any questions. We appreciate any information you can provide on this project.

Sincerely,

Shelby G. Castells

RE: Proposed Plaza Drive Project, City of Oceanside; San Luis Rey USGS Quadrangle, San Diego County, California

Dear Ms. Castells:

A record search of the Native American Heritage Commission (NAHC) *Sacred Lands File* was completed for the area of potential project effect (APE) referenced above with negative results. Please note that the absence of specific site information in the *Sacred Lands File* does not indicate the absence of Native American cultural resources in any APE.

Attached is a list of tribes culturally affiliated to the project area. I suggest you contact all of the listed Tribes. If they cannot supply information, they might recommend others with specific knowledge. The list should provide a starting place to locate areas of potential adverse impact within the APE. By contacting all those on the list, your organization will be better able to respond to claims of failure to consult. If a response has not been received within two weeks of notification, the NAHC requests that you follow-up with a telephone call to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from any of these individuals or groups, please notify me. With your assistance we are able to assure that our lists contain current information. If you have any questions or need additional information, please contact via email: gayle.totton@nahc.ca.gov.

Sincerely,

Gayle Totton, M.A., PhD.

1.0 INTRODUCTION

1.1 Purpose

The purpose of this Geotechnical Evaluation is to provide preliminary geotechnical information to CenterPoint Integrated Solutions, LLC ("Client") regarding the subject property in the City of Oceanside, San Diego County, California. The information gathered in this evaluation is intended to provide the Client with an understanding of the physical conditions of site-specific subsurface soils, groundwater, and the regional geologic setting which could affect the cost or design of the proposed development at the property (**Figure 1** -Site Vicinity Map, **Figure 2**-Aerial Site Map).

This Geotechnical Evaluation has been conducted in general accordance with accepted geotechnical engineering principles and in general conformance with the approved proposal and cost estimate for the project by EEI, dated December 19, 2018.

EEI conducted onsite field exploration on July 12, 29, 30, and 31, 2019 that included eleven (11) CPT soundings which were advanced within the property to evaluate liquefaction potential of onsite soils, and the excavation of twenty-one (21) exploratory trenches within the subject property in order to collect soil samples and characterize the subsurface soils. This Geotechnical Evaluation has been prepared for the sole use of CenterPoint Integrated Solutions, LLC. Other parties, without the express written consent of EEI and CenterPoint Integrated Solutions, LLC should not rely upon this Geotechnical Evaluation.

1.2 Project Description

Based on conceptual information provided by the Client (CarMax, 2019), we understand that the current proposed development will consist of a new CarMax sales building (5,005 ft^2), service building (4,309 ft^2), presentation building (1,197 ft^2), carwash (936 ft^2), paved parking and drive areas, associated landscaping, and other improvements. No grading plans have been provided to us at this time, but grading is expected to consist of cut-and-fill of no greater than 5-feet, exclusive of remedial grading.

No foundation plans were provided to us at this time. However; based on the preliminary information furnished by the client, wall and column foundation loads on the order of 4 kips per lineal foot and 120 kips, respectively are considered.

1.3 Scope of Services

The scope of our services included:

- A review of readily available data pertinent to the subject property, including published and unpublished geotechnical/geologic reports/maps, and soils data for the area (**References**).

- Conducting a geotechnical reconnaissance of the subject property and nearby vicinity.

- Coordination with Underground Service Alert (USA) to identify the presence of underground utilities for clearance of proposed boring locations.

- Subsurface exploration including the advancement of eleven (11) CPT soundings placed across the property to depths of 19 to 38 feet below ground surface (bgs). Excavation, logging, and sampling of twenty-one (21) exploratory trenches in readily accessible areas of the subject property to depths of approximately 7 feet to 15.5 feet bgs. The approximate locations of each of our CPT soundings and exploratory trenches are presented on **Figure 3** (Geotechnical Map).

- An evaluation of seismicity and geologic hazards including an evaluation of faulting and liquefaction potential.

- Completion of laboratory testing of representative earth materials encountered onsite to ascertain their pertinent soils engineering properties (**Appendix B.1**).

- The preparation of this report which presents our preliminary geotechnical findings, conclusions, and recommendations.

2.0 BACKGROUND

2.1 Subject Property Description

Based on the information provided by the Client, our previous work on the subject property, and a review of the Google Earth™ online aerial photography resources, the overall property consists of an approximately 10.4-acre parcel that is located in the City of Oceanside, San Diego County, California. The property is bounded by the State Route 78 freeway on the north; Thunder Drive on the east; commercial developments on the west; and Buena Vista Creek to the south. The northern part of the property is bisected by Plaza Drive, which becomes Hacienda Drive at the very northeastern corner of the property. The surface slopes gently towards Buena Vista Creek along the southern boundary. The elevation varies from a high of approximately 214 feet above mean sea level (msl) in the northern part of the property, to 180 feet above msl in the southern part of the property. A north-south trending channel cuts across the central part of the property.

The subject property is mostly undeveloped. A billboard is located in the northern part of the property, off of Plaza Drive, and a sewer easement transects the very eastern part of the property from north to south.

The center of the subject property is approximately situated at 33.1821° north latitude and 117.2890° west longitude (Google Earth™, 2016).

2.2 Previous Geotechnical Review

Historic aerial photographs show that the subject site and surroundings were undeveloped until the mid-1960s when light grading occurred along the northern part of the property, related to the expansion of Highway 78. Further grading occurred due to development of the residential properties to the east in the 1970s, and the commercial developments to the northeast and the west in the 1990s. A prior geotechnical evaluation report was prepared by NorCal Engineering for proposed developments on the subject site (NorCal Engineering, 2007). The following is a brief summary of the NorCal Engineering report and its general finding.

NorCal Engineering (hereafter referred to as NorCal) performed a preliminary geotechnical engineering study in 2007. Their study consisted of drilling nine borings across the property to depths of 10 to 50 feet bgs. In their borings, NorCal encountered 1 to 4 feet of fill consisting of silty sand and sandy clay overlying alluvium consisting of clayey sand and sandy clay. Bedrock was encountered at depths greater than 18 feet bgs and consisted of siltstone and sandstone. They did not encounter groundwater during their subsurface exploration. NorCal's lab testing indicated that the subsurface fill and alluvial soils were low to moderately expansive; negligibly corrosive to metal and concrete; corrosive to ferrous metals; and an R-Value of 25. Norcal concluded that the project was feasible from a geotechnical standpoint and provided grading and foundation recommendations. Development never occurred, and the subject site remains undeveloped. The locations of NorCal's borings are shown on **Figure 3**. NorCal's boring logs and lab tests can be found in **Appendix A** and **Appendix B**, respectively.

2.3 Topography

The center of the subject property is approximately situated at 33.1821° north latitude and 117.2890° west longitude (Google Earth®, 2019). The subject property is located in the 7.5-minute San Luis Rey Topographic Quadrangle (USGS, 2019). The property is relatively flat, with a gentle southward slope towards Buena Vista Creek. The elevation varies from a high of 214 feet above mean sea level (msl) in the northern part of the property, to 180 feet above msl in the southern part of the property.
A north-south trending channel cuts across the central part of the property.

3.0 FIELD EXPLORATION, SUBSURFACE CONDITIONS AND LABORATORY TESTING

3.1 Field Exploration

Field work for our Geotechnical Evaluation was conducted on July 12, 29, 30, and 31, 2019. A total of twenty-one (21) exploratory trenches and eleven (11) CPT soundings were advanced at the subject property in readily accessible areas.

CPT soundings were advanced to depths of 19 and 38 feet bgs. Trench depths ranged from approximately 7 to 15.5 feet bgs and were logged under the supervision of a Registered Professional Engineer and Certified Engineering Geologist at EEI. . The trenches were excavated using a Bobcat E50 excavator that reached depths of up to 15.5 feet bgs. The bucket on the excavator was 2 feet in width. Representative bulk samples were also collected for appropriate laboratory testing. The locations of CPT soundings and trenches can be seen on **Figure 3**. CPT soundings and trench logs can be found in **Appendix A.**

3.2 Laboratory Testing

Selected samples obtained from our borings were tested to evaluate pertinent soil classification and engineering properties and enable development of geotechnical conclusions and recommendations. The laboratory tests consisted of:

- Moisture Content and Dry Density
- Grain size Analysis
- Atterberg Limits
- Expansion Index

- Maximum Density and Optimum Moisture
- Direct Shear
- R-Value
- Corrosion

The results of the laboratory tests from this report, and brief explanations of test procedures, are presented in **Appendix B.**

4.0 GEOLOGIC SETTING AND SUBSURFACE CONDITIONS

4.1 Geologic Setting

Regionally, the subject property lies within the Peninsular Ranges Geomorphic Province of southern California. This province consists of a series of ranges separated by northwest trending valleys; sub parallel to branches of the San Andreas Fault (CGS, 2002). The Peninsular Ranges geomorphic province, one of the largest geomorphic units in western North America, extends from the Transverse Ranges geomorphic province and the Los Angeles Basin, south to Baja California. It is bound on the west by the Pacific Ocean, on the south by the Gulf of California and on the east by the Colorado Desert Province. The Peninsular Ranges are essentially a series of northwest-southeast oriented fault blocks (CGS, 2002). Major fault zones and subordinate fault zones found in the Peninsular Ranges Province typically trend in a northwest-southeast direction. Regional geologic maps of the subject property and vicinity (Kennedy & Tan, 2007) indicate the property is underlain by late Pleistocene to Holocene Young Alluvial Flood Plain deposits (map symbol Qya). These deposits consist of poorly sorted sands, gravels, silts and clay that were deposited by the San Luis Rey river.

4.2 Subsurface Conditions

The subsurface materials encountered during our subsurface investigation consisted of artificial fill, Quaternary-aged alluvium, and Eocene-aged Santiago Formation. A brief description of the subsurface conditions is provided in following sections.

Detailed descriptions of the subsurface conditions are provided on the trench logs and CPT Soundings presented in **Appendix A.**

Artificial Fill – The surface of the subject site is covered by artificial fill. The fill consists of silty to sandy clay, clayey sand, and clayey silt that was grayish to reddish-brown mottled, damp to slightly moist, and medium stiff to stiff at the time of our subsurface exploration. Brick fragments and other detritus are common in the fill. The fill varies in depth across the property from 2 to 12 feet, being shallowest in the northern part of the property along Plaza/Hacienda Dr. and increasing in thickness towards the southern part of the property. The thickest fill deposits occur along the north-south trending channel in the central part of the property, where mounds of fill were placed on either side of the channel. Contours of approximate fill thickness are presented in **Figure 4**.

Quaternary Alluvial Flood Plain Deposits – Quaternary-aged older alluvium was encountered in all of the trenches except T-19 and T-20 underlying the fill. The alluvium consists of sandy clay that was light grayish brown mottled, slightly moist, and medium stiff to hard at the time of our subsurface exploration. Caliche stringers are common and the alluvium also contains traces of fine-grained sand.

The thickness of the alluvium varies from one to at least 11.5 feet, with the thickest sections of alluvium being located in the central parts of the subject property.

Eocene Santiago Formation – Eocene-aged Santiago Formation was encountered in trenches T-1, T-2, T-3, T-4, T-5, T-7, T-12, T-16, T-17, T-18, T-19, T-20, and T-21 underlying the fill and alluvium. The Santiago Formation consists of clayey sandstone that was light yellowish-brown to light grayish-brown mottled, slightly moist to moist, and soft to hard at the time of our subsurface exploration. The sandstone was massive and friable. It was encountered at depths varying from 3 to 11 feet bgs.

4.3 Groundwater

Groundwater was not encountered in any of our trenches at the time of our subsurface exploration to the maximum explored depth of 15.5 feet bgs. Additionally; groundwater was not encountered in NorCal borings to the maximum depth of their exploration of 50 feet at the time of their subsurface investigation (2007). It should be noted that fluctuations in groundwater may result from variations in the ground surface topography, subsurface stratification, precipitation, irrigation and other factors that may not be currently evident. In general, groundwater is often expected to follow the direction of surface topography. Based on topography, local groundwater flow is expected to be in a westerly direction.

5.0 GEOLOGIC HAZARDS

5.1 California Building Code Seismic Design Parameters

EEI utilized seismic design criteria provided in the CBC (2016) and ASCE 7-10. Final selection of the appropriate seismic design coefficients should be made by the structural consultant based on the local laws and ordinances, expected building response, and desired level of conservatism. The site coefficients and adjusted maximum considered earthquake spectral response accelerations in accordance with the 2016 California Building Code are presented in **Table 1**.

TABLE 1
2016 CBC Seismic Design Parameters

Parameter	Value
Site Coordinats	Latitude 33.1821° Longitude -117.2890°
Site Classification	D
Short Period Site Coefficient: $\mathbf{F_a}$	1.077
1-Second Period Site Coefficient: $\mathbf{F_v}$	1.589
Mapped Spectral Acceleration Value at Short Period: $\mathbf{S_s}$	1.058g
Mapped Spectral Acceleration Value at 1-Second Period: $\mathbf{S_1}$	0.411g
Adjusted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration at Short Period: $\mathbf{S_{MS}}$	1.139g

TABLE 1 2016 CBC Seismic Design Parameters	
Parameter	**Value**
Adjusted Maximum Considered Earthquake (MCE_R) Spectral Response Acceleration at 1-Second Period: $\mathbf{S_{M1}}$	0.653g
Design Spectral Response Acceleration at Short Periods: $\mathbf{S_{DS}}$	0.759g
Design Spectral Response Acceleration at 1-Second Period: $\mathbf{S_{D1}}$	0.435g
Seismic Design Category: **SDC**	D
Peak Ground Acceleration adjusted for Site Class Effects: $\mathbf{PGA_M}$	0.441g

5.2 Faulting and Surface Rupture

The subject property is located within an area of California known to contain a number of active and potentially active faults. There are no known active faults crossing the property (Jennings and Bryant, 2010) and the property is not within a State of California Earthquake Fault Zone (Hart and Bryant, 1997; CDMG, 2000). The closest known active fault is the Newport-Inglewood Fault Zone, located offshore approximately 8.34 miles west of the property (USGS, 2008). Therefore, the potential for surface rupture at the property is considered low. Three of the closest faults along with their distance from the property and Maximum Magnitude are shown in **Table 2.**

TABLE 2 Nearby Active Faults		
Fault	**Distance in Miles (Kilometers)[1]**	**Maximum Magnitude[1]**
Newport-Inglewood (Offshore)	8.34 (13.42)	7.5
Rose Canyon	8.38 (13.49)	6.9
Elsinore	19.58 (31.51)	7.8

1. USGS Online Fault Search (2008)

5.3 Landslides and Slope Stability

The subject property and surrounding areas are generally relatively flat. As a result, we consider the potential for landslides or slope instabilities to occur at the property to be negligible.

5.4 Liquefaction Potential and Lateral Spreading

Liquefaction occurs when loose, saturated, generally cohesionless fine sands and non-plastic silts are subjected to strong ground shaking. The soils lose shear strength and become liquid; potentially resulting in large total and differential ground surface settlements as well as possible lateral spreading during an earthquake. Seismically induced settlement can occur in response to liquefaction of saturated loose granular soils, as well as the reorientation of soil particles during strong shaking of loose, unsaturated sands.

Due to the lack of shallow groundwater at the subject site, and the presence of firm bedrock at depths of 3 to 11 feet bgs, the probability of liquefaction, seismically induced settlement, and lateral spreading at the subject site is considered to be low.

5.5 Tsunamis, Flooding and Seiches

The subject property is not located within a Tsunami Evacuation Area; therefore, damage due to tsunamis is considered low.

EEI reviewed the Federal Emergency Management Agency (FEMA, 2012) Flood Insurance Rate Map (FIRM) panel 06073C0766G to determine if the subject property was located within an area designated as a Flood Hazard Zone. The southern part of the property along Buena Vista Creek is located in a special flood hazard area (**Figure 3**). The rest of the property is located in Zone X, which is an area that is outside of the 0.2% annual chance flood zone.

Seiches are periodic oscillations in large bodies of water such as lakes, harbors, bays, or reservoirs. The subject property is not located immediately adjacent to any lakes or confined bodies of water; therefore, the potential for a seiche to affect the site is considered low.

5.6 Expansive Soil

Generally site soils possess moderate expansive characteristics. However; localized areas of highly expansive soils are also present at the site. Expansive soil influence is considered to pose the greatest potential risk to the proposed improvements and, as such, should be given careful consideration by the project architect and structural engineer. Following recommendations in this report are to minimize the possible adverse effect of the expansive soil activity on the proposed improvements.

6.0 CONCLUSIONS

Based on our field exploration, laboratory testing and engineering and geologic analysis, it is our opinion that the subject property is suitable for the proposed development project from a geotechnical engineering and geologic viewpoint. However, there are existing geotechnical conditions associated with the property that will warrant mitigation and/or consideration during planning stages.

If site plans and/or the proposed building locations are revised, additional field studies may be warranted to address proposed site-specific conditions. The main geotechnical conclusions for the project are presented in the following text.

- A total of eleven (11) CPT Soundings were advanced within the subject property during this evaluation to depths of 19 to 38 feet bgs, and twenty-one (21) exploratory trenches were excavated to maximum depths of 7 to 15.5 feet bgs. The property is underlain by artificial fill, Quaternary-aged alluvial deposits, and Eocene-aged Capistrano Formation bedrock.

- Artificial fill varies in thickness from 2 to 12 feet, with the thickest portions being located in the southern/central portion of the subject site. The fill consists of grayish-brown silty to sandy clay, clayey sand, and clayey silt that was damp to slightly moist and medium stiff to stiff at the time of our subsurface exploration.

- The alluvium underlies the fill and overlies bedrock. It was encountered in all of the trenches except T-19 and T-20. The thickness of the alluvium varied from one to greater than 11 feet, with the thickest sections being in the southern part of the subject site. The alluvium consists of clayey sand to sandy clay that was light grayish brown mottled, slightly moist, and medium dense/medium stiff to hard at the time of our subsurface exploration

- The Capistrano Formation bedrock underlies the alluvium and was encountered in trenches T-1, T-2, T-3, T-4, T-5, T-7, T-12, T-16, T-17, T-18, T-19, T-20, and T-21. The Santiago Formation consists of clayey sandstone that was light yellowish-brown to light grayish-brown mottled, slightly moist to moist, and soft to hard at the time of our subsurface exploration.

- Onsite soils appear to be suitable for use as structural fill provided they are moisture conditioned (as needed), meet EEI's recommendations for size (**Section 7.4**), and are properly compacted.

- Groundwater was not encountered in any of our exploratory trenches to the maximum explored depth of 15.5 feet bgs during this evaluation. Additionally; groundwater was not encountered in NorCal borings to the maximum depth of their exploration of 50 feet at the time of their subsurface investigation (2007).

- Standard heavy-duty grading equipment is anticipated to excavate the onsite fill and natural deposits.

- The subject property is located within an area of southern California recognized as having a number of active and potentially-active faults located nearby. Our review indicates that there are no known active faults mapped as crossing the property and the property is not located within an Earthquake Fault Zone.

- Based on EEI's evaluation, Earth materials underlying the subject property are not considered to be susceptible to liquefaction, seismically induced settlement, and lateral spreading.

- Generally site soils possess moderate expansive characteristics. However; localized areas of highly expansive soils are also present at the site.

- The existing fill and upper portions of alluvial deposits are variable in density and are considered potentially compressible. As such, they are considered unsuitable for the support of the proposed improvements. Therefore, these materials should be removed to the contact with firm underlying deposits and replaced as properly compacted fill. Removal depth of unsuitable fill and upper alluvial deposits will vary across the site and generally increases towards the southern end of the property. **Figure 4** shows the approximate depths of removals.

- Based on our analysis we judge that a "Conventional Shallow Foundation System" or a "Mat Foundation System" founded on the properly placed fill blanket could provide the most reasonable foundation system for the proposed building.

7.0 RECOMMENDATIONS

The recommendations presented herein should be incorporated into the planning and design phases of development. Guidelines for site preparation, earthwork, and onsite improvements are provided in the following sections.

7.1 General

Grading should conform to the guidelines presented in the 2016 California Building Code (CBC, 2016), as well as the requirements of the City of Oceanside. Additionally, general Earthwork and Grading Guidelines are provided herein as **Appendix C**.

During earthwork operations, removals and reprocessing of unsuitable fill and alluvial materials, as well as general grading procedures of the contractor should be observed and the fill placed should be tested by representatives of the geotechnical engineer, EEI. If any unusual or unexpected conditions are exposed in the field, they should be reviewed by the geotechnical engineer and if warranted, modified and/or additional recommendations are offered.

The recommendations presented herein have been completed using the preliminary information provided to us regarding site development. EEI should be provided with grading and foundation plans once they are available so that we can determine if the recommendations provided in this report remain applicable.

7.2 Site Preparation and Grading

Debris and other deleterious material, such as organic soils, tree rootballs and/or environmentally impacted earth materials (if any) should be removed from the subject property prior to the start of grading. The existing uncontrolled fill and soft alluvium deposits should over-excavated to the contact with firm underlying deposits. Areas to receive fill should be properly scarified and/or benched in accordance with current industry standards of practice and guidelines specified in the CBC (2016) and the requirements of the local jurisdiction.

Abandoned trenches should be properly backfilled and tested. If unanticipated subsurface improvements (utility lines, septic systems, wells, utilities, etc.) are encountered during earthwork construction, the Geotechnical Engineer should be informed and appropriate remedial recommendations would then be provided.

7.3 Earthwork

Prior to the start of grading operations, utility lines within the project area, if any, should be Located and marked in the field so they can be rerouted or protected during the site Development. All debris and perishable material should be removed from the site.

The area of site preparation should extend at least five feet beyond any proposed improvements (e.g., building foot print, appurtenant structures, sidewalks, walkways, pavement areas, etc.). Any existing fill soil and perishable material should be excavated to contact with the firm underlying alluvial/bedrock deposits. A minimum of 12 feet of removal and recompaction should be anticipated.

To minimize the effect of differential settlement on the proposed improvements; foundation systems of the proposed improvements should be supported on a minimum five (5) foot thick of properly compacted fill blanket.

Temporary construction slopes, sheeting and bracing should be provided by the contractor, as necessary, to protect workers in the excavation. Where excavations undermine existing improvements, temporary structural support should be provided to reduce risk of damage resulting from undercutting. Permanent cut and fill slopes should not be constructed steeper than 2:1.

Where fill is to be placed, the upper 6 to 8 inches of surface exposed by the excavation should be scarified, moisture-conditioned to 2 percent to 4 percent over optimum moisture content, and compacted to minimum 90 percent relative compaction[1]. The fill soil should then be placed in layers less than 8 inches in loose thickness and moisture conditioned to 2 to 4 percent over optimum moisture content, and compacted to minimum 90 percent relative compaction. If localized areas of relatively loose soil prevent proper compaction, over-excavation and re-compaction will be necessary.

The on-site soils are generally suitable for use as compacted fill and backfill. Import fill soils (if planned), should conform to the specifications presented in this report.

7.4 Fill Material and Placement

Where fill is to be placed, the upper 6 to 8-inches of surface exposed by the excavation should be scarified, moisture-conditioned to 2 percent to 4 percent over optimum moisture content, and compacted to minimum 90 percent relative compaction. The fill soil should then be placed in layers less than 8 inches in loose thickness and moisture conditioned to 2 to 4 percent over optimum moisture content, and compacted to minimum 90 percent relative compaction. If localized areas of relatively loose soil prevent proper compaction, over-excavation and re-compaction will be necessary.

Fill material should be free of organic matter (less than 2 percent organics by weight) and other deleterious material. Fill material should not contain rocks greater than 6-inches in maximum dimension. The on-site soils are generally suitable for use as compacted fill.

7.4.1 Import Fill and Select Backfill Material

The import fill and select backfill material should be free of perishable material and should meet the following criteria:

a.	Maximum particle size	1 inch
b.	Maximum Liquid Limit (LL)	5%
c.	Maximum Plasticity Index (PI)	0%
d.	Maximum percentage passing No. 200 sieve	20%
e.	Minimum sand equivalent	30
f.	Maximum Expansive Index (EI) (ASTM D-2849)	20

[1] Relative compaction refers to the in-place dry density of soil expressed as a percentage of the maximum dry density of the same material, as determined by the ASTM (D1557) test method. Optimum moisture content corresponding to the maximum dry density, as determined by the ASTM (D1557) test method.

The earthwork contractor should ensure that all proposed fill materials are approved by the Geotechnical Engineer prior to use. Representative soil samples should be made available for testing at least ten working days prior to import to allow for laboratory tests.

7.5 Temporary Site Excavations

Based on the results of our subsurface exploration, we anticipate that excavations can generally be accomplished by conventional heavy duty earth moving equipment in good working condition. Excavations in the onsite materials could generate oversize materials. Oversize materials should be placed in accordance with **Section 7.4** and the Earthwork and Grading Guidelines.

Temporary excavations within the onsite materials (considered to be a Type C soil per OSHA guidelines) should be stable at 1.5H: 1V inclinations for short durations during construction, and where cuts do not exceed 15 feet in height. Some sloughing of surface soils should be anticipated. Temporary excavations 4 feet deep or less can be made vertically. The faces of temporary slopes should be inspected daily by the contractor's Competent Person before personnel are allowed to enter the excavation. Any zones of potential instability, sloughing or raveling should be brought to the attention of the Engineer and corrective action implemented before personnel begin working in the excavation.

Excavated soils should not be stockpiled behind temporary excavations within a distance equal to the depth of the excavation. EEI should be notified if other surcharge loads are anticipated so that lateral load criteria can be developed for the specific situation. If temporary slopes are to be maintained during the rainy season, berms are recommended along the tops of slopes to prevent runoff water from entering the excavation and eroding the slope faces.

7.6 Yielding Subgrade Conditions

The soils encountered at the subject property can exhibit "pumping" or yielding if they become saturated. This can often occur in response to periods of significant precipitation, such as during the winter rainy season. If this occurs and in order to help stabilize the yielding subgrade soils within the bottom of the removal areas, the contractor can consider the placement of stabilization fabric or geo-grid over the yielding areas, depending on the relative severity.

Mirafi 600X (or approved equivalent) stabilization fabric may be used for areas with low to moderate yielding conditions. Geo-grid such as Tensar TX-5 may be used for areas with moderate to severe yielding conditions. Uniform sized, ¾- to 2-inch crushed rock should be placed over the stabilization fabric or geo-grid. A 12-inch thick section of crushed rock will typically be necessary to stabilize yielding ground. A filter fabric should be placed over the crushed rock to prevent migration of fines into the rock and subsequent settlement of the overlying fill. Fill soils, which should be placed and compacted in accordance with the recommendations presented herein, should then be placed over the filter fabric until design finish grades are reached. The crushed rock and stabilization fabric or geo-grid should extend at least 5 feet laterally beyond the limits of the yielding areas.

These operations should be performed under the observation and testing of a representative of the project Geotechnical Engineer in order to evaluate the effectiveness of these measures and to provide additional recommendations for mitigation, as necessary.

7.7 Shrinkage and Bulking

Several factors will impact earthwork balancing on the subject property, including shrinkage, bulking, subsidence, trench spoils from utilities and footing excavations, and final pavement section thickness as well as the accuracy of topography. Shrinkage, bulking and subsidence are primarily dependent upon the degree of compactive effort achieved during construction. Shrinkage, bulking and subsidence should be considered by the project civil engineer relative to final site balancing. It is recommended that the site development be planned to include an area that could be raised or lowered to accommodate final site balancing.

8.0 FOUNDATION RECOMMENDATIONS

8.1 General

In the foundation recommendations provided herein are based on the proposed development information provided by the Client. EEI should be provided with grading and foundation plans once they are available so that we can determine if the recommendations provided in this report remain applicable. Recommendations by the project's design-structural engineer or architect may exceed the following minimum recommendations. However; if analyses by the structural engineer result in less critical details than are provided herein as minimums, the minimums presented herein should be adopted.

8.2 Preliminary Foundation Design

Provided the subject property is graded in conformance with the intent of our recommendations presented herein, California Building Code (CBC, 2016) and local grading ordinances, as well as general Earthwork and Grading Guidelines provided as **Appendix C;** the proposed commercial development can be supported on a “Conventional Shallow Foundation System” or a “Mat Foundation System” founded on the properly placed fill blanket which could provide the most reasonable foundation system for the proposed building.

The following are the recommended design parameters for foundation systems for each alternative.

8.2.2 Shallow Conventional Foundations

Foundation support for the proposed development could be derived by utilizing a conventional, shallow continuous and isolated spread foundation system embedded within the newly placed properly compacted blanket fill soils in accordance with the following criteria:

- Minimum depth measured from lowest adjacent grade ..... 2 feet
- Minimum footing width ..... 1.5 feet
- Allowable bearing capacity (pounds per square foot), (FS $\geq$ 3)
  a. Sustained loads ..... 2,000 psf
  b. Total loads (1/3 allowable increase for wind and seismic) ..... 2,650 psf
- Resistance to lateral loads
  a. Passive soils resistance (pounds per cubic foot) ..... 200 psf
  b. Coefficient of sliding friction 0.35

Footings can be designed to resist lateral loads by using a combination of sliding friction and passive resistance. The coefficient of friction should be applied to dead load forces only; and Passive resistance should be reduced by one third. For foundations with no sliding friction at the base (foundations resisting uplift loads), 100% of passive resistance could be utilizes. The upper one foot of passive resistance should be neglected where the soil is not confined by the slabs or pavement.

For the properly constructed foundations in accordance with the foregoing criteria, total static post-construction settlement from the anticipated structural loads is estimated to be on the order of 1 inch. Differential settlement on the order of ½ of total settlement should be anticipated between the similarly loaded adjacent footings.

8.2.3 Mat Foundation

As an alternative, a "Mat Foundation System" founded within the proposed properly compacted fill blanket could be utilized as the foundation system. Allowable design parameters for the mat foundations are as follows:

- Minimum embedment depth from lowest adjacent grade ..... 2 feet
- Modulus of Subgrade Reaction ..... 120 pci
  (**This value is based on a unit square-foot area and must be adjusted for large mats)**
- Allowable bearing capacity (pounds per square foot), (FS $\geq$ 3)
  c. Sustained loads ..... 1,500 psf
  d. Total loads (1/3 allowable increase for wind and seismic) ..... 2,050 psf
- Resistance to lateral loads
  c. Passive soils resistance (pounds per cubic foot) ..... 200 psf
  d. Coefficient of sliding friction 0.35

Lateral resistance for the mat foundation may be calculated by using a combination of sliding friction and passive resistance. The coefficient of friction should be applied to dead load forces only. Passive resistance should be reduced by one-third and the upper one-foot of passive resistance should be neglected where the soil is not confined by the slabs or pavement.

For the properly constructed foundations in accordance with the foregoing criteria, total static post-construction settlement from the anticipated structural loads is estimated to be on the order of one-inch. Differential settlement on the order of 1/2 of total settlement should be anticipated.

8.3 Deep Foundations (Cast-In-Drilled-Hole Piles)

Support for light poles, fences, and other similar features could utilize deep foundations deriving their support from underlying properly compacted fill and firm alluvium and bedrock deposits.

The load carrying capacity of drilled, cast-in-place piles will be developed through skin friction acting over the surface area of the piles in underlying firm materials. An allowable skin friction of 250 pound per square foot (psf) for gravity loads may be assumed. The allowable vertical

compression capacities may be increased by 33 percent to accommodate temporary loads such as from wind or seismic forces. The allowable vertical pile capacities are based on the supporting capacities of the underlying soils. The structural capacity of the piles should be checked. For sustained tension loads, 50 percent of the compression capacities should be used. Piles should be spaced at least three diameters apart. The vertical load carrying capacities within the upper 5 foot of piles should be ignored where the soil is not confined by the slabs or pavement. It is estimated that settlement of the proposed piles will be less than ½ inch.

Lateral loads can be resisted by an allowable passive resistance (equivalent fluid pressure) of 200 psf (with a maximum value of 2,000 psf). The upper 5 foot of passive resistance should be neglected where the soil is not confined by the slabs or pavement.

Design of isolated, Cast-in-Drilled-Hole piles could utilize CBC-2016, Section 1807A-3 design method.

For Piles located adjacent to or on slope the vertical and lateral capacities of the pile within the 15 foot horizontal distance to descending slope face should be ignored.

8.3.1 Installation

For the friction piles, care must be taken to ream the pile excavation within the bearing zone in order to clean the excavation side walls of any smear resulting from the drilling operation.

The bottom of the excavation should be reasonably free of loose or sloughed materials. In our opinion, drilled, cast-in-place (CIDH) piles at the site can generally be constructed by drilling uncased holes with conventional bucket auger drilling equipment.

However; localized sloughing and/or caving could not be ruled out. Difficulties related to drilling in caving soils may be encountered during the construction of CIDH piles at the site. Proper quality and construction control during CIDH pile installation is critical.

General guidelines for CIDH pile construction are provided in Federal Highway Administration (1998) and Caltrans Standard Specifications (2006) and should be followed.

During concrete placement, concrete should not be allowed to free-fall more than 5 feet. Additionally, concrete should be placed so that it does not strike the walls of the excavation, which should increase sloughing and would tend to segregate the aggregate in the concrete.

8.4 Footing Setbacks

Footings adjacent to unlined drainage swales or underground utilities (if any) should be deepened to a minimum of 6-inches below the invert of the adjacent unlined swale or utilities. This distance is measured from the footing face at the bearing elevation. Footings for structures adjacent to retaining walls should be deepened so as to extend below a 1:1 projection from the heel of the wall. Alternatively, walls may be designed to accommodate structural loads from buildings or appurtenances.

8.5 Interior Slabs-on-Grade

The subgrade beneath the slab-on-grade floors should be compacted by rolling with a smooth-wheeled rubber tired, or vibratory roller to produce a uniformly dense, non-yielding surface. The project Structural Engineer should design the interior concrete slab-on-grade floor. For the preliminary design of the slab, project structural engineer could utilize acceptable design methods by California Building Code (CBC) such as Wire Reinforcement Institute (WRI) design method. On a preliminary basis, for WRI method a minimum of site soil Plasticity Index (PI) and site soil Expansion Index (EI) of 25 percent and 75 respectively should be utilized. However; as a minimum it is recommended that a 5-inch thick slab, reinforced with No. 4 bars located at 12-inches on center, both ways, be constructed. A layer of free draining, clean ¾-inch crushed rock, at least 6-inches thick should be placed below the slab.

In addition, the soil subgrade in the upper three feet should be thoroughly pre-saturated to 30 percent above optimum moisture content.

A moisture vapor retarder/barrier should be placed beneath slabs where moisture sensitive floor coverings will be installed. Typically, plastic is used as a vapor retardant. If plastic is used, a minimum 15-mil is recommended. The plastic should comply with ASTM E1745. Plastic installation should comply with ASTM E1643.

Current construction practice typically includes placement of a 2-inch thick sand cushion between the bottom of the concrete slab and the moisture vapor retarder/barrier. This cushion can provide some protection to the vapor retarder/barrier during construction, and may assist in reducing the potential for edge curling in the slab during curing. However, the sand layer also provides a source of moisture vapor to the underside of the slab that can increase the time required to reduce moisture vapor emissions to limits acceptable for the type of floor covering placed on top of the slab. The slab can be placed directly on the vapor retarder/barrier. The floor covering manufacturer should be contacted to determine the volume of moisture vapor allowable and any treatment needed to reduce moisture vapor emissions to acceptable limits for the particular type of floor covering installed. The project team should determine the appropriate treatment for the specific application.

8.6 Exterior Slabs-on-Grade (Hardscape)

It is recommended that a minimum 5-inch thick slab reinforced with No.4 bars located at 18-inches on center, both ways, be constructed. At the exterior edges of the flatwork, a thickened edge is recommended. The thickened edges should be a minimum of 8-inches deep and 6-inches wide and reinforced with two No.4 bars at top and bottom.

Slabs should be provided with weakened plane joints. Joints should be placed in accordance with the American Concrete Institute (ACI) guidelines. Proper control joints should be provided to reduce the potential for damage resulting from shrinkage. Subgrade materials should not be allowed to desiccate between grading and the construction of the concrete slabs. The floor slab subgrade should be thoroughly and uniformly moistened prior to placing concrete.

All dedicated exterior flatwork should conform to standards provided by the governing agency including section composition, supporting material thickness and any requirements for reinforcing steel. Concrete mix proportions and construction techniques, including the addition of water and improper curing, can adversely affect the finished quality of the concrete and result in cracking and spalling of the slab. We

recommend that all placement and curing be performed in accordance with procedures outlined by the American Concrete Institute and/or Portland Cement Association. Special consideration should be given to concrete placed and cured during hot or cold weather conditions.

8.7 Conventional Retaining Walls

8.7.1 Foundations

The recommendations provided in the foundation section of this report are also applicable to conventional retaining walls.

8.7.2 Lateral Earth Pressures

The active earth pressure for the design of unrestrained earth retaining structures with level backfills can be taken as equivalent to the pressure of a fluid weighing 40 pcf. The at-rest earth pressure for the design of restrained earth retaining structures (such as basement walls or re-entrant corners) with level backfills can be taken as equivalent to the pressure of a fluid weighing 60 pcf. The above values assume a granular and drained backfill condition. If expansive soils are used to backfill the proposed walls, increased active and at-rest earth pressures will need to be utilized for retaining wall design, and can be provided upon request. An additional 20 pcf should be added to these values for walls with a 2:1 H: V sloping backfill.

An increase in earth pressure equivalent to an additional 2 feet of retained soil can be used to account for surcharge loads from light traffic. The above values do not include a factor of safety. Appropriate factors of safety should be incorporated into the design. If any other surcharge loads are anticipated, EEI should be contacted for the necessary increase in soil pressure.

8.7.3 Retaining Wall Drainage

Retaining walls should be designed to resist hydrostatic pressures or be provided with a backdrain to reduce the accumulation of hydrostatic pressures. Backdrains may consist of a 2-foot wide zone of ¾-inch crushed rock. The backdrain should be separated from the adjacent soils using a non-woven filter fabric, such as Mirafi 140N or equivalent. Weep holes should be provided or a perforated pipe (Schedule 40 PVC) should be installed at the base of the backdrain and sloped to discharge to a suitable storm drain facility. As an alternative, a geocomposite drainage system such as Miradrain 6000 or equivalent placed behind the wall and connected to a suitable storm drain facility can be used. The project architect should provide waterproofing specifications and details.

8.7.4 Seismic Earth Pressure

If required, the seismic earth pressures can be taken as equivalent to the pressure of a fluid weighing 13 pounds per cubic foot (pcf) for flexible walls and 25 pcf for restrained walls. These values are for level backfill conditions and do not include a factor of safety. Appropriate factors of safety should be incorporated into the design. This pressure is in addition to the un-factored static pressures. The allowable passive pressure and bearing capacity can be increased by ⅓ in determining the stability of the wall.

8.7.5 Backfill

All backfill soils should be compacted to at least 90 percent relative compaction. Backfill soils should consist of granular, free-draining material having an expansion index of 50 or less determined in accordance with ASTM D4829. Expansive or clayey soil should not be used for backfill material. Additionally, fill within 3 feet from the back of the wall should not contain rocks greater than 3-inches in any dimension. The wall should not be backfilled until it has reached an adequate strength.

8.8 Corrosivity

Three samples of the onsite soils were tested to provide a preliminary indication of the corrosion potential of the onsite soils. The test results are presented in **Appendix B.1**. A brief discussion of the corrosion test results is provided in the following section.

- The samples tested have soluble sulfate concentrations varying from 0.016 to 0.081 percent, which indicates that the samples have a negligible corrosion potential relative to concrete.
- The samples tested have chloride concentrations varying from 0.033 to 0.058 percent, which indicates that the samples have a negligible chloride corrosion potential relative to metal.
- The samples tested have a minimum resistivity of 290 ohm-cm, which indicates the samples are extremely corrosive to ferrous metals.
- The samples tested have pH varying from 7.2 to 8.6, which indicates that the samples are slightly to moderately alkaline.

Additional testing should be performed after grading to evaluate the as-graded corrosion potential of the onsite soils. We are not corrosion engineers. A corrosion consultant should be retained to provide corrosion control recommendations if deemed necessary.

8.9 Concrete

Laboratory testing of the site soils indicted the presence of low levels of sulfate content. However; it is recommended the concrete should utilize at least type II cement with maximum 0.5 water/cement ratio in accordance with California building Code (CBC) Standard 1904.3.1. Concrete mix design, materials, placement, curing, and finishing should be in conformance with the standard specifications for public works construction “Green book”, and American Concrete Institute (ACI) specifications.

9.0 PRELIMINARY PAVEMENT DESIGN RECOMMENDATIONS

Deleterious material, excessively wet or dry pockets, concentrated zones of oversized rock fragments, and any other unsuitable yielding materials encountered during grading should be removed. Once compacted fill and/or native soils are brought to the proposed pavement subgrade elevations, the subgrade should be proof-rolled in order to check for a uniform firm and unyielding surface. Representatives of the project Geotechnical Engineer should observe all grading and fill placement.

The upper 12-inches of pavement subgrade soils should be scarified; moisture conditioned to at least optimum moisture content and compacted to at least 95 percent of the laboratory standard (ASTM D1557). If loose or yielding materials are encountered during subgrade preparation, evaluation should be performed by EEI. Aggregate base materials should be properly prepared (i.e., processed and moisture conditioned) and compacted to at least 95 percent of the maximum dry density as determined by ASTM D1557. Aggregate base materials should conform to Caltrans specifications for Class 2 aggregate base. All pavement section changes should be properly transitioned. Although not anticipated, if adverse conditions are encountered during the preparation of subgrade materials, special construction methods may need to be employed. A representative of the project Geotechnical Engineer should be present for the preparation of subgrade and aggregate base.

Laboratory test results indicated range of R-Values of 13 to 32. Based on these R-Values; CBR Values of 4 to 5 was estimated. For design purposes we have assumed a CBR value of 4. This assumed CBR value should be verified by testing of soils exposed at subgrade after grading has been completed, and pavement thickness modified if necessary.

The corresponding Modulus of Subgrade Reaction (K-Value) was estimated at 120 pounds per square inch per inch (psi/in) based on ACI 330R-08. Asphaltic Concrete Pavement design was calculated in accordance with the AASHTO design methods for heavy and light traffic of 75,000 ESAL's and 7,500 ESAL's, respectively. Rigid pavement sections were evaluated in general accordance with ACI 330R-08, based on average daily truck traffic of 10 for car and truck traffic and 700 for loading docks and trash truck pads.

TABLE 3
Preliminary Pavement Design Recommendations

Traffic Level	Pavement Surface	Aggregate Base Material [1]
7,500 ESAL - 75,000 ESAL	3.5-inches Asphalt Concrete	6.0-inches
Concrete Pavement - Cars and Trucks	5.5-inches Portland Cement Concrete [2.3]	4.0-inches
Concrete Pavement Loading Docks and Trash Truck Pads	7.5-inches Portland Cement Concrete [2,3]	4.0-inches

(1) Caltrans Class 2 aggregate base
(2) Reinforcement and control joints placed in accordance with the structural engineer's requirements
(3) Assumes Concrete Modulus of Rupture=600 psi

10.0 DEVELOPMENT RECOMMENDATIONS

10.1 Landscape Maintenance and Planting

Water is known to decrease the physical strength of earth materials, significantly reducing stability by high moisture conditions. Surface drainage away from foundations and graded slopes should be maintained. Only the volume and frequency of irrigation necessary to sustain plant life should be applied.

Consideration should be given to selecting lightweight, deep rooted types of landscape vegetation which require low irrigation that are capable of surviving the local climate. From a soils engineering viewpoint, "leaching" of the onsite soils is not recommended for establishing landscaping. If landscape soils are processed for the addition of amendments, the processed soils should be re-compacted to at least 90 percent relative compaction (based on ASTM D1557).

10.2 Site Drainage

Positive site drainage should be maintained at all times. Drainage should not flow uncontrolled over slopes. Runoff should be channeled away from slopes and structures and not allowed to pond and/or seep uncontrolled into the ground. Pad drainage should be directed toward an acceptable outlet. Consideration should be given to eliminating open bottom planters directly adjacent to proposed structures for a minimum distance of 10 feet. As an alternative, closed-bottom type planters could be utilized, with a properly designed drain outlet placed in the bottom of the planter.

Final surface grades around structures should be designed to collect and direct surface water away from structures and toward appropriate drainage facilities. The ground around the structure should be graded so that surface water flows rapidly away from the structure without ponding. In general, we recommend that the ground adjacent to the structure slope away at a gradient of at least 2 percent. Densely vegetated areas where runoff can be impaired should have a minimum gradient of at least 5 percent within the first 5 feet from the structure. Roof gutters with downspouts that discharge directly into a closed drainage system are recommended on structures. Drainage patterns established at the time of fine grading should be maintained throughout the life of the proposed structures.

10.3 Additional Site Improvements

Recommendations for additional grading can be provided upon request. If in the future, additional property improvements are planned for the subject property, recommendations concerning the design and construction of improvements would be provided upon request.

10.4 Utility Trench Backfill

Fill around the pipe should be placed in accordance with details shown on the drawings and should be placed in layers not to exceed 8-inches loose (unless otherwise approved by the geotechnical engineer) and compacted to at least 90 percent of the maximum dry density as determined in accordance with ASTM D1557 (Modified Proctor). The geotechnical engineer should approve all backfill material.

Select material should be used when called for on the drawings, or when recommended by the geotechnical engineer. Care should be taken during backfill and compaction operations to maintain alignment and prevent damage to the joints. The backfill should be kept free from oversized material, chunks of highly plastic clay, or other unsuitable or deleterious material. Backfill soils should be non-expansive, non-corrosive, and compatible with native earth materials. Backfill materials and testing should be in accordance with the CBC (2016), and the requirements of the local governing jurisdiction.

Pipe backfill areas should be graded and maintained in such a condition that erosion or saturation will not damage the pipe bedding or backfill. Flooding trench backfill is not recommended. Heavy equipment should not be operated over any pipe until it has been properly backfilled with a minimum of 2 to 3 feet of cover. The utility trench should be systematically backfilled to allow maximum time for natural settlement. Backfill should not occur over porous, wet, or spongy subgrade surfaces. Should these conditions exist, the areas should be removed, replaced and recompacted.

11.0 PLAN REVIEW

Once detailed grading and foundation plans are available, they should be submitted to EEI for review and comment, to reduce the potential for discrepancies between plans and recommendations presented herein. If conditions found differ substantially from those stated; appropriate recommendations will be provided. Additional field studies may be warranted.

12.0 LIMITATIONS

This Geotechnical Evaluation has been conducted in accordance with generally accepted geotechnical engineering principles and practices. Findings provided herein have been derived in accordance with current standards of practice, and no warranty is expressed or implied. Standards of practice are subject to change with time. This report has been prepared for the sole use of CenterPoint Integrated Solutions, LLC (Client), within a reasonable time from its authorization.

Subject property conditions, land use (both onsite and offsite), or other factors may change as a result of manmade influences, and additional work may be required with the passage of time. This Geotechnical Evaluation should not be relied upon by other parties without the express written consent of EEI and the Client; therefore, any use or reliance upon this Geotechnical Evaluation by a party other than the Client should be solely at the risk of such third party and without legal recourse against EEI, its employees, officers, or directors, regardless of whether the action in which recovery of damages is brought or based upon contract, tort, statue, or otherwise. The Client has the responsibility to see that all parties to the project, including the designer, contractor, subcontractor, and building official, etc. are aware of this report in its complete form. This report contains information that may be used in the preparation of contract specifications; however, the report is not designed as a specification document, and may not contain sufficient information for use without additional assessment. EEI assumes no responsibility or liability for work or testing performed by others. In addition, this report may be subject to review by the controlling authorities.

				OH	ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS

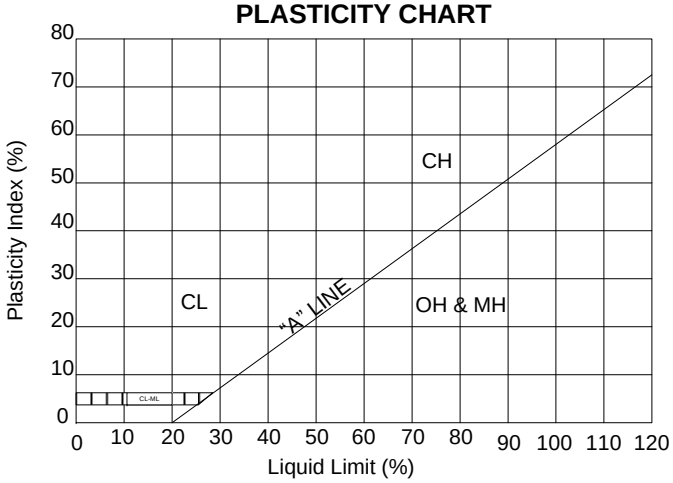
SAMPLER TYPES

- SPT
- Modified California (2.5" I.D.)
- Bulk
- Rock Core
- Shelby Tube
- Water Level

OTHER TESTS

ATT – Atterberg Limit (Plasticity Index)
CD – Consolidated Drained Triaxial
CON – Consolidation
COR – Corrosivity)
DS – Direct Shear
EI – Expansion Index
MAX – Maximum Density
RV – R-Value
SA – Sieve Analysis
-#200 - Percent Passing #200 Sieve
TV – Torvane Shear
UU – Unconsolidated Undrained Triaxial

PLASTICITY CHART

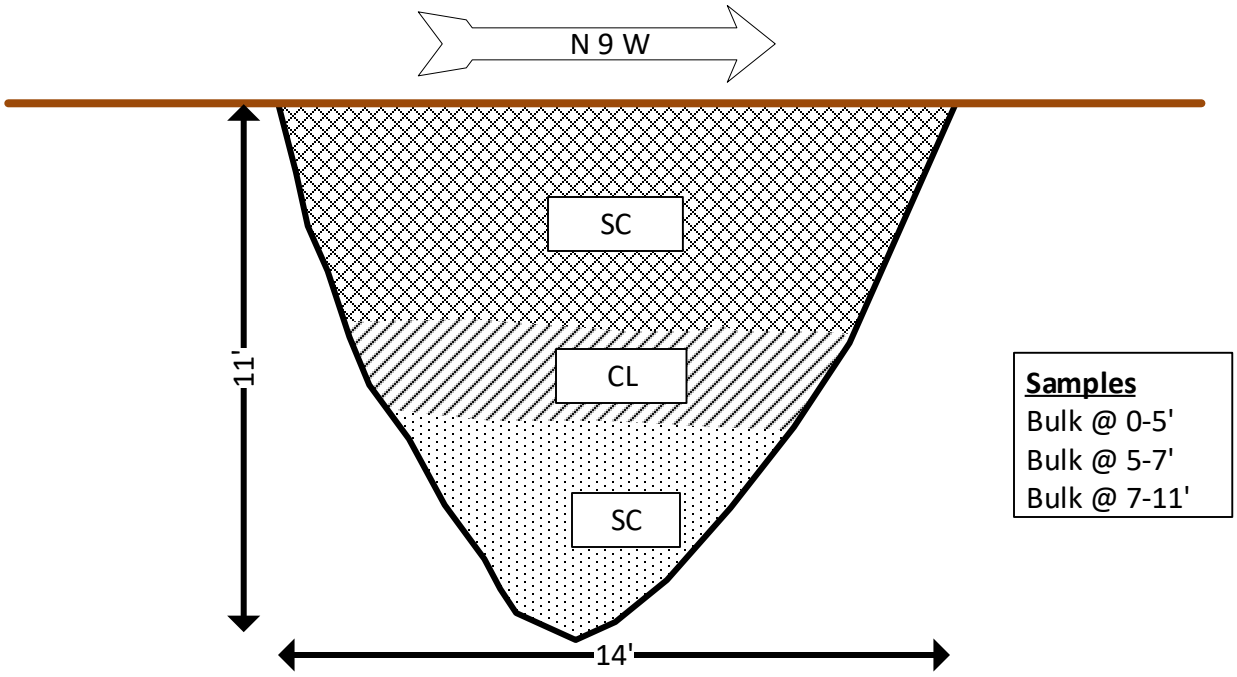


PENETRATION RESISTANCE
(Recorded As Blows/Foot)

SAND & GRAVEL		SILT & CLAY		
Relative Density	Blows/Foot* N_{60}	Consistency	Blows/Foot* N_{60}	Strength**(KSF)
Very Loose	0-4	Very Soft	0 - 2	0 – 0.5
Loose	4-10	Soft	2 - 4	0.5 – 1.0
Medium Dense	10-30	Medium Stiff	4 - 8	1.0 – 2.0
Dense	30-50	Stiff	8 - 15	2.0 – 4.0
Very Dense	Over 50	Very Stiff	15 - 30	4.0 – 8.0
		Hard	Over 30	Over 8.0

* Number of blows of 140LB hammer falling 30 inches to drive a 2 inch O.D. (1-3/8 inch I.D.) split barrel sampler the last 12 inches of an 18-inch drive (ASTM-1586 Standard Penetration Test)

** Undrained shear strength in kips/sq. ft. As determined by laboratory testing or approximated by the standard penetration test, pocket penetrometer, torvane, or visual observation



Samples
Bulk @ 0-5'
Bulk @ 5-7'
Bulk @ 7-11'

Geologic Description:

0' ARTIFICIAL FILL

@ 0 - 5' Clayey SAND (SC) – grayish to reddish-brown mottled, dry to slightly moist, medium dense, faint lifts, abundant roots, oxidation mottled, fine to medium-grained sand, gravel sized sandstone and brick fragments, low to medium plasticity.

5' OLDER ALLUVIUM

@ 5' - 7' Sandy CLAY (CL) – light grayish-brown mottled, slightly moist, stiff to hard, caliche "blobs" and stringers, minor roots, pinhole porosity, very fine to fine-grained sand, low to medium plasticity, horizontal contact with underlying bedrock.

7' SANTIAGO FORMATION

@ 7' - 11' Clayey SANDSTONE, light yellowish to grayish-brown mottled, moist, loose, massive, fine-grained sand, friable, moderately well indurated.

Total Trench Depth = 11'
No Groundwater; Trench Backfilled

Trench Excavated on July 29, 2019

APPENDIX C
EARTHWORK AND GRADING GUIDELINES

EEI
Engineering Solutions

EARTHWORK AND GRADING GUIDELINES

GENERAL

These guidelines present general procedures and recommendations for earthwork and grading as required on the approved grading plans, including preparation of areas to be filled, placement of fill and installation of subdrains and excavations. The recommendations contained in the geotechnical report are applicable to each specific project, are part of the earthwork and grading guidelines and would supersede the provisions contained hereafter in the case of conflict. Observations and/or testing performed by the consultant during the course of grading may result in revised recommendations which could supersede these guidelines or the recommendations contained in the geotechnical report. Figures A through O is provided at the back of this appendix, exhibiting generalized cross sections relating to these guidelines.

The contractor is responsible for the satisfactory completion of all earthworks in accordance with provisions of the project plans and specifications. The project soil engineer and engineering geologist (geotechnical consultant) or their representatives should provide observation and testing services, and geotechnical consultation throughout the duration of the project.

EARTHWORK OBSERVATIONS AND TESTING

Geotechnical Consultant

Prior to the commencement of grading, a qualified geotechnical consultant (a soil engineer and engineering geologist) should be employed for the purpose of observing earthwork procedures and testing the fills for conformance with the recommendations of the geotechnical report, the approved grading plans, and applicable grading codes and ordinances.

The geotechnical consultant should provide testing and observation so that determination may be made that the work is being completed as specified. It is the responsibility of the contractor to assist the consultant and keep them aware of work schedules and predicted changes, so that the consultant may schedule their personnel accordingly.

All removals, prepared ground to receive fill, key excavations, and subdrains should be observed and documented by the project engineering geologist and/or soil engineer prior to placing any fill. It is the contractor's responsibility to notify the engineering geologist and soil engineer when such areas are ready for observation.

Laboratory and Field Tests

Maximum dry density tests to determine the degree of compaction should be performed in accordance with American Standard Testing Materials test method ASTM designation D-1557-78. Random field compaction tests should be performed in accordance with test method ASTM designations D-1556-82, D-2937 or D-2922 & D-3017, at intervals of approximately two feet of fill height per 10,000 sq. ft. or every one thousand cubic yards of fill placed. These criteria would vary depending on the soil conditions and the size of the project. The location and frequency of testing would be at the discretion of the geotechnical consultant

Contractor's Responsibility

All clearing, site preparation, and earthwork performed on the project should be conducted by the contractor, with observation by geotechnical consultants and staged approval by the appropriate governing agencies. It is the contractor's responsibility to prepare the ground surface to receive the fill to the satisfaction of the soil engineer, and to place, spread, moisture condition, mix and compact the fill in accordance with the recommendations of the soil engineer. The contractor should also remove all major deleterious material considered unsatisfactory by the soil engineer.

It is the sole responsibility of the contractor to provide adequate equipment and methods to accomplish the earthwork in accordance with applicable grading guidelines, codes or agency ordinances, and approved grading plans. Sufficient watering apparatus and compaction equipment should be provided by the contractor with due consideration for the fill material, rate of placement, and climatic conditions. If, in the opinion of the geotechnical consultant, unsatisfactory conditions such as questionable weather, excessive oversized rock, deleterious material or insufficient support equipment are resulting in a quality of work that is not acceptable, the consultant will inform the contractor, and the contractor is expected to rectify the conditions, and if necessary, stop work until conditions are satisfactory.

The contractor will properly grade all surfaces to maintain good drainage and prevent ponding of water. The contractor will take action to control surface water and to prevent erosion control measures that have been installed.

SITE PREPARATION

All vegetation including brush, trees, thick grasses, organic debris, and other deleterious material should be removed and disposed of offsite, and must be concluded prior to placing fill. Existing fill, soil, alluvium, colluvium, or rock materials determined by the soil engineer or engineering geologist as unsuitable for structural in-place support should be removed prior to fill placement. Depending upon the soil conditions, these materials may be reused as compacted fills. Any materials incorporated as part of the compacted fills should be approved by the soil engineer.

Any underground structures such as cesspools, cisterns, mining shafts, tunnels, septic tanks, wells, pipelines, or other structures not located prior to grading are to be removed or treated in a manner recommended by the soil engineer. Soft, dry, spongy, highly fractured, or otherwise unsuitable ground extending to such a depth that surface processing cannot adequately improve the condition should be over excavated down to firm ground and approved by the soil engineer before compaction and filling operations continue. Over excavated and processed soils which

have been properly mixed and moisture-conditioned should be recompacted to the minimum relative compaction as specified in these guidelines.

Existing ground which is determined to be satisfactory for support of the fills should be scarified to a minimum depth of 6 inches, or as directed by the soil engineer. After the scarified ground is brought to optimum moisture (or greater) and mixed, the materials should be compacted as specified herein. If the scarified zone is greater than 6 inches in depth, it may be necessary to remove the excess and place the material in lifts restricted to 6 inches in compacted thickness.

Existing grind which is not satisfactory to support compacted fill should be over excavated as required in the geotechnical report or by the onsite soils engineer and/or engineering geologists. Scarification, discing, or other acceptable form of mixing should continue until the soils are broken down and free of large fragments or clods, until the working surface is reasonably uniform and free from ruts, hollows, hummocks, or other uneven features which would inhibit compaction as described above.

Where fills are to be placed on ground with slopes steeper than 5:1 (horizontal to vertical) gradient, the ground should be benched. The lowest bench, which will act as a key, should be a minimum of 12 feet wide and should be at least two feet deep into competent material, approved by the soil engineer and/or engineering geologist. In fill over cut slope conditions, the recommended minimum width of the lowest bench or key is at least 15 feet with the key excavated on competent material, as designated by the Geotechnical Consultant. As a general rule, unless superseded by the Soil Engineer, the minimum width of fill keys should be approximately equal to one-half (½) the height of the slope.

Standard benching is typically four feet (minimum) vertically, exposing competent material. Benching may be used to remove unsuitable materials, although it is understood that the vertical height of the bench may exceed four feet. Pre stripping may be considered for removal of unsuitable materials in excess of four feet in thickness.

All areas to receive fill, including processed areas, removal areas, and toe of fill benches should be observed and approved by the soil engineer and/or engineering geologist prior to placement of fill. Fills may then be properly placed and compacted until design grades are attained.

COMPACTED FILLS

Earth materials imported or excavated on the property may be utilized as fill provided that each soil type has been accepted by the soil engineer. These materials should be free of roots, tree branches, other organic matter or other deleterious materials. All unsuitable materials should be removed from the fill as directed by the soil engineer. Soils of poor gradation, undesirable expansion potential, or substandard strength characteristics may be designated unsuitable by the consultant and may require mixing with other earth materials to serve as a satisfactory fill material.

Fill materials generated from benching operations should be dispersed throughout the fill area. Benching operations should not result in the benched material being placed only within a single equipment width away from the fill/bedrock contact.

Oversized materials, defined as rock or other irreducible materials with a maximum size exceeding 12 inches in one dimension, should not be buried or placed in fills unless the location of materials and disposal methods are specifically approved by the soil engineer. Oversized material should be taken offsite or placed in accordance with recommendations of the soil engineer in areas designated as suitable for rock disposal. Oversized material should not be placed vertically within 10 feet of finish grade or horizontally within 20 feet of slope faces.

To facilitate trenching, rock should not be placed within the range of foundation excavations or future utilities unless specifically approved by the soil engineer and/or the representative developers.

If import fill material is required for grading, representative samples of the material should be analyzed in the laboratory by the soil engineer to determine its physical properties. If any material other than that previously analyzed is imported to the fill or encountered during grading, analysis of this material should be conducted by the soil engineer as soon as practical.

Fill material should be placed in areas prepared to receive fill in near-horizontal layers that should not exceed six inches compacted in thickness. The soil engineer may approve thicker lifts if testing indicates the grading procedures are such that adequate compaction is being achieved. Each layer should be spread evenly and mixed to attain uniformity of material and moisture suitable for compaction.

Fill materials at moisture content less than optimum should be watered and mixed, and “wet” fill materials should be aerated by scarification, or should be mixed with drier material. Moisture conditioning and mixing of fill materials should continue until the fill materials have uniform moisture content at or above optimum moisture.

After each layer has been evenly spread, moisture-conditioned and mixed, it should be uniformly compacted to a minimum of 90 percent of maximum density as determined by ASTM test designation, D 1557-78, or as otherwise recommended by the soil engineer. Compaction equipment should be adequately sized and should be reliable to efficiently achieve the required degree of compaction.

Where tests indicate that the density of any layer of fill, or portion thereof, is below the required relative compaction or improper moisture content, the particular layer or portion will be reworked until the required density and/or moisture content has been attained. No additional fill will be placed in an area until the last placed lift of fill has been tested and found to meet the density and moisture requirements, and is approved by the soil engineer.

Compaction of slopes should be accomplished by over-building the outside edge a minimum of three feet horizontally, and subsequently trimming back to the finish design slope configuration. Testing will be performed as the fill is horizontally placed to evaluate compaction as the fill core is being developed. Special efforts may be necessary to attain the specified compaction in the fill slope zone. Final slope shaping should be performed by trimming and removing loose materials with appropriate equipment. A final determination of fill slope compaction should be based on observation and/or testing of the finished slope face.

If an alternative to over-building and cutting back the compacted fill slope is selected, then additional efforts should be made to achieve the required compaction in the outer 10 feet of each lift of fill by undertaking the following:

- Equipment consisting of a heavy short-shanked sheepsfoot should be used to roll (horizontal) parallel to the slopes continuously as fill is placed. The sheepsfoot roller should also be used to roll perpendicular to the slopes, and extend out over the slope to provide adequate compaction to the face slope.

- Loose fill should not be spilled out over the face of the slope as each lift is compacted. Any loose fill spilled over a previously completed slope face should be trimmed off or be subject to re-rolling.

- Field compaction tests will be made in the outer two to five feet of the slope at two to three foot vertical intervals, subsequent to compaction operations.

- After completion of the slope, the slope face should be shaped with a small dozer and then re-rolled with a sheepsfoot to achieve compaction to near the slope face. Subsequent to testing to verify compaction, the slopes should be grid-rolled to achieve adequate compaction to the slope face. Final testing should be used to confirm compaction after grid rolling.

- Where testing indicates less than adequate compaction, the contractor will be responsible to process, moisture condition, mix and recompact the slope materials as necessary to achieve compaction. Additional testing should be performed to verify compaction.

- Erosion control and drainage devices should be designed by the project civil engineer in compliance with the ordinances of the controlling governmental agencies, and/or in accordance with the recommendations of the soil engineer or engineering geologist.

EXCAVATIONS

Excavations and cut slopes should be observed and mapped during grading by the engineering geologist. If directed by the engineering geologist, further excavations or over-excavation and refilling of cut areas should be performed. When fills over cut slopes are to be graded, the cut portion of the slope should be observed by the engineering geologist prior to placement of the overlying fill portion of the slope. The engineering geologist should observe all cut slopes and should be notified by the contractor when cut slopes are started.

If, during the course of grading, unanticipated adverse or potentially adverse geologic conditions are encountered, the engineering geologist and soil engineer should investigate, evaluate and make recommendations to mitigate (or limit) these conditions. The need for cut slope buttressing or stabilizing should be based on as-grading evaluations by the engineering geologist, whether anticipated previously or not.

Unless otherwise specified in soil and geological reports, no cut slopes should be excavated higher or steeper than that allowed by the ordinances of controlling governmental agencies. Additionally, short-term stability of temporary cut slopes is the contractor's responsibility.

Erosion control and drainage devices should be designed by the project civil engineer and should be constructed in compliance with the ordinances of the controlling governmental agencies, and/or in accordance with the recommendations of the soil engineer or engineering geologist.

SUBDRAIN INSTALLATION

Subdrains should be installed in accordance with the approved embedment material, alignment and details indicated by the geotechnical consultant. Subdrain locations or construction materials should not be changed or modified without approval of the geotechnical consultant. The soil engineer and/or engineering geologist may recommend and direct changes in subdrain line, grade and drain material in the field, pending exposed conditions. The location of constructed subdrains should be recorded by the project civil engineer.

COMPLETION

Consultation, observation and testing by the geotechnical consultant should be completed during grading operations in order to state an opinion that all cut and filled areas are graded in accordance with the approved project specifications.

After completion of grading and after the soil engineer and engineering geologist have finished their observations, final reports should be submitted subject to review by the controlling governmental agencies. No additional grading should be undertaken without prior notification of the soil engineer and/or engineering geologist.

All finished cut and fill slopes should be protected from erosion, including but not limited to planting in accordance with the plan design specifications and/or as recommended by a landscape architect. Such protection and/or planning should be undertaken as soon as possible after completion of grading.

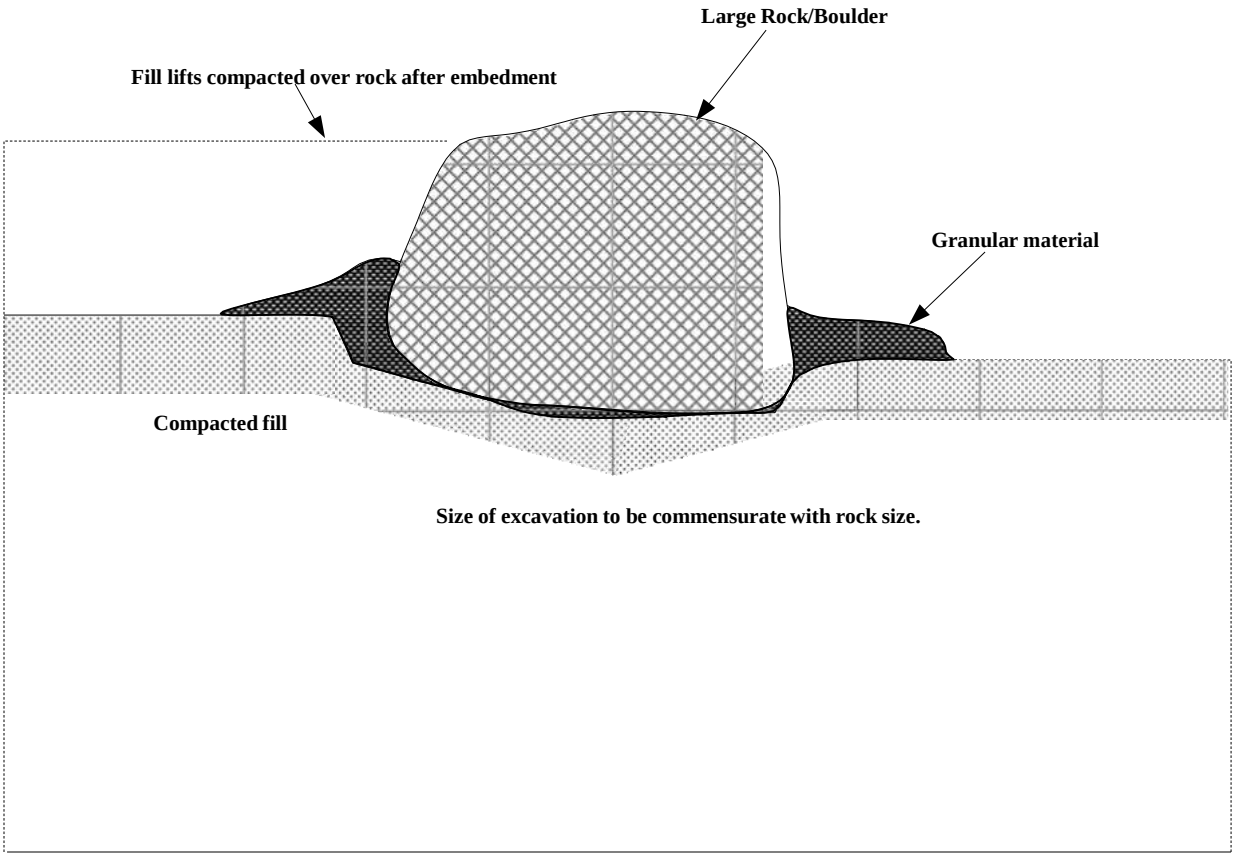
ROCK DISPOSAL PITS



Note: (1) Large rock is defined as having a diameter larger than 3 feet in maximum size.
(2) Pit shall be excavated into compacted fill to a depth equal to half of the rock size.
(3) Granular soil shall be pushed into the pit and then flooded around the rock using a sheepsfoot to help with compaction.
(4) A minimum of 3 feet of compacted fill should be laid over each pit.
(5) Pits shall have at least 15 feet of separation between one another, horizontally.
(6) Pits shall be placed at least 20 feet from any fill slope.
(7) Pits shall be used only in deep fill areas.

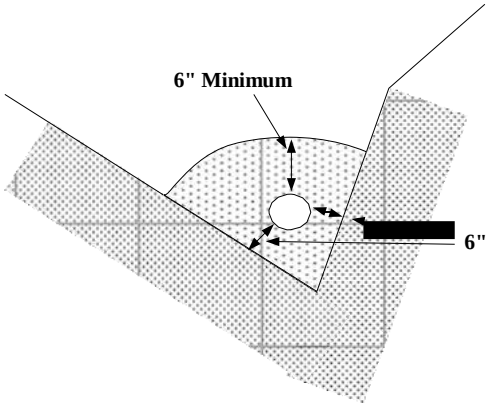
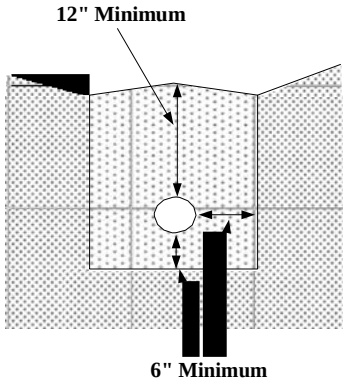
CANYON SUBDRAIN ALTERNATE DETAILS

Alternate 1: Perforated Pipe and Filter Material



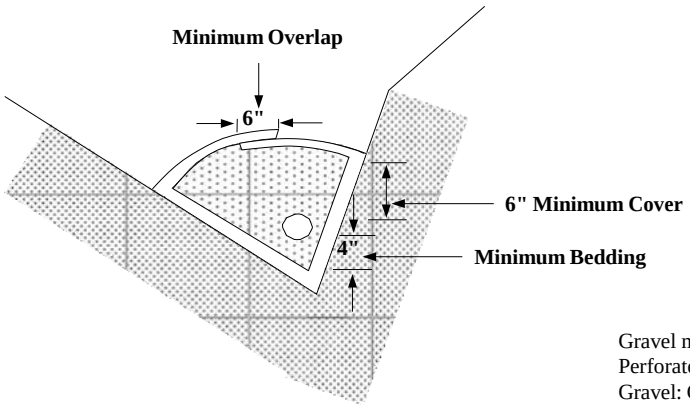
Filter material: Minimum volume of 9 feet^3/linear foot.
6" diameter ABS or PVC pipe or approved substitute with minimum 8 (¼" diameter) perforations per linear foot in bottom half of pipe.
ASTM D 2751, SDR 35 or ASTM D 1527, Schedule 40.
ASTM D 3034, SDR 35 or ASTM D 1785, Schedule 40.
For continuous run in excess of 500 feet use 8" diameter pipe.

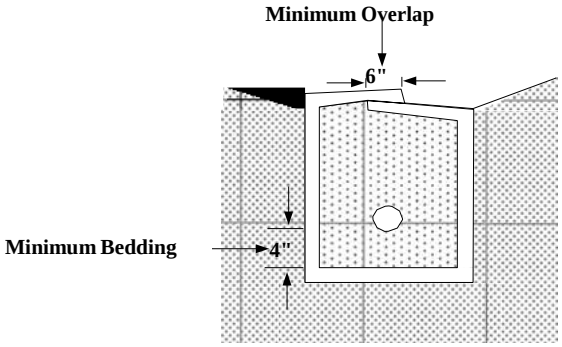


Filter Material

Sieve Size	Percent Passing
1"	100
¾"	90-100
3/8"	40-100
No. 4	25-40
No. 8	18-33
No. 30	5-15
No. 50	0-7
No. 200	0-3

Alternate 2: Perforated Pipe, Gravel and Filter Fabric





Gravel material 9 feet^3/linear foot.
Perforated pipe: see alternate 1.
Gravel: Clean ¾" rock or approved substitute.
Filter Fabric: Mirafi 140 or approved substitute.

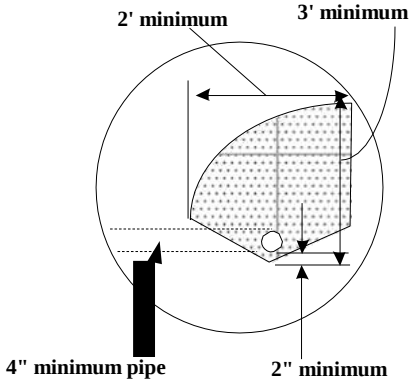
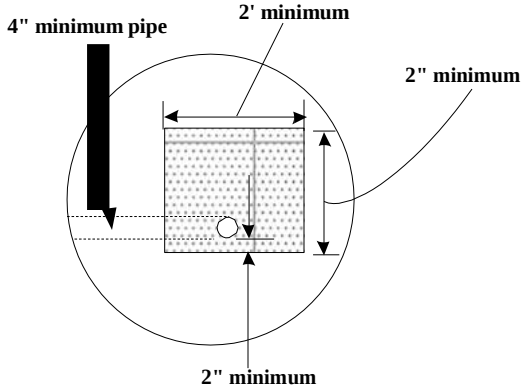
TYPICAL STABILIZATION BUTTRESS SUBDRAIN DETAIL





Filter Material: Minimum of 5 ft^3/linear foot of pipe or 4 ft^3/linear foot of pipe when placed in square cut trench.

Alternative In Lieu Of Filter Material: Gravel may be encased in approved filter fabric. Filter fabric shall be mirafi 140 or equivalent. Filter fabric shall be lapped a minimum of 12" on all joints.

Minimum 4" Diameter Pipe: ABS-ASTM D-2751, SDR 35 or ASTM D-1527 schedule 40 PVC-ASTM D-3034, SDR 35 or ASTM D-1785 schedule 40 with a crushing strength of 1,000 pounds minimum, and a minimum of 8 uniformly spaced perforations per foot of pipe installed with perforations at bottom of pipe. Provide cap at upstream end of pipe. Slope at 2% to outlet pipe. Outlet pipe shall be connected to the subdrain pipe with tee or elbow.

Note: (1) Trench for outlet pipes shall be backfilled with onsite soil.
(2) Backdrains and lateral drains shall be located at the elevation of every bench drain. First drain shall be located at the elevation just above the lower lot grade. Additional drains may be required at the discretion of the soils engineer and/or engineering geologist.

Filter Material – Shall be of the following specification or an approved equivalent:

Filter Material

Sieve Size	Percent Passing
1"	100
¾"	90-100
3/8"	40-100
No. 4	25-40
No. 8	18-33
No. 30	5-15

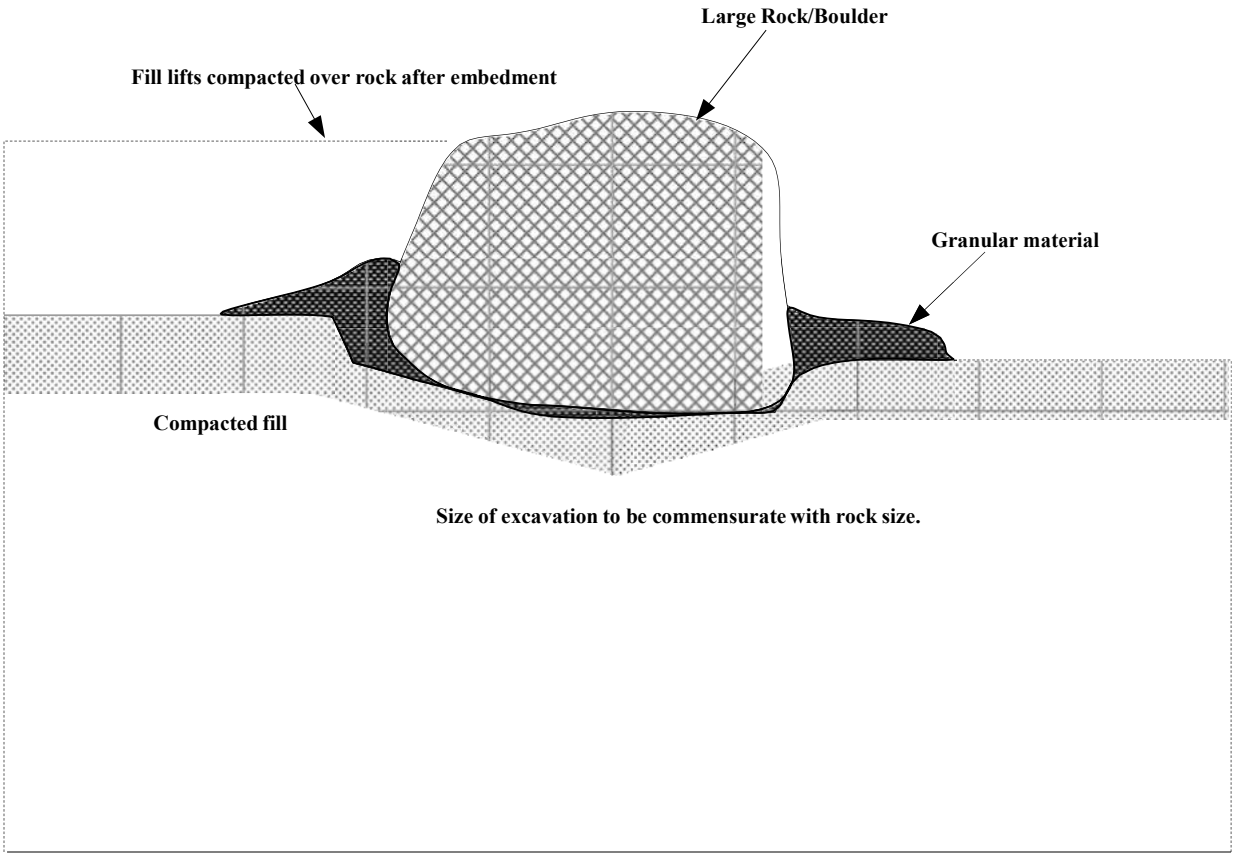
ROCK DISPOSAL PITS



Note: (1) Large rock is defined as having a diameter larger than 3 feet in maximum size.
(2) Pit shall be excavated into compacted fill to a depth equal to half of the rock size.
(3) Granular soil shall be pushed into the pit and then flooded around the rock using a sheepsfoot to help with compaction.
(4) A minimum of 3 feet of compacted fill should be laid over each pit.
(5) Pits shall have at least 15 feet of separation between one another, horizontally.
(6) Pits shall be placed at least 20 feet from any fill slope.
(7) Pits shall be used only in deep fill areas.

RE: CarMax Auto Store Development Greenhouse Gas Screening Letter - City of Oceanside

The purpose of this Greenhouse Gas (GHG) screening letter is to identify potential GHG impacts, if any, which may be created from the construction and operation of the proposed CarMax Auto Store located on the south side of the 4000 block of Plaza Drive west of the Oceanside DMV in Oceanside, California. The project site is south of State Route 78 and approximately 4 miles east of Interstate 5. Locally, the project site is located south of the intersection of Plaza Drive and Thunder Drive.

GHG Thresholds:

California State laws governing GHG emissions within the state are generally written to conform to both the Global Warming Solutions Act of 2006 (AB 32) and Senate Bill 32 (SB 32). These laws were written to reduce GHG emissions within the state to goals set forth within the laws therein. The current goals for the State are to reduce GHG emissions by 40 percent below 1990 levels by 2030. In order to meet the requirements of the State's laws, the City of Oceanside has adopted a screening threshold of 900 metric tons of GHG's per year or the utilization of an efficiency/service population thresholds (City of Oceanside, 2019) which are identified below:

- Projects that will be implemented prior to 2020 must show that GHG emissions related to both construction and operation will not exceed 4.0 MT CO_2e/service population per year.
- Projects that will not be implemented prior to 2020 must show that GHG emissions related to both construction and operations will not exceed 3.5 MT CO_2e/service population per year.

Construction Description

The Project construction dates were estimated based on a construction kickoff in 2021 with construction completed in 2022. Table 1 shows the expected timeframes for the construction processes for all the Proposed Project infrastructure, facilities, improvements and structures at

the site, as well as the expected number of pieces of equipment have been verified by the applicants Project Engineer.

Table 1: Expected Construction Equipment

Equipment Identification	Proposed Start	Proposed Completion	Quantity

Generator Sets			1
Tractors/Loaders/Backhoes			3
Welders			1
Architectural Coating	12/31/2021	1/27/2022	
Air Compressors			1
This equipment list is based upon equipment inventory within CALEEMOD 2016.3.2. The quantity and types are based upon assumptions from Projects of similar size and scope in the County of San Diego and the City of Oceanside.			

Operations

Once construction is completed the proposed project would generate air quality and GHG emissions from daily operations which would include sources such as Area, Energy, Mobile, Solid waste and Water uses. The proposed project is expected to be fully operational sometime in 2022 and would generate the first complete year of GHG emissions in 2023. The Project was estimated to generate 475 ADT which includes test drives as identified within the project traffic study (LOS Engineering, 2020). Based on this, it is expected that each customer would consist of one incoming trip and one outgoing trip or up to 237 customers daily.

Modeling

The GHG emissions were calculated using the latest CalEEMod 2016.3.2 air quality model which was developed by Breeze Software for South Coast Air Quality Management District (SCAQMD). The City of Oceanside also recommends the use of CalEEMod 2016.3.2 which utilizes EMFAC 2014 to determine both short and long-term daily air quality emissions as well as GHG estimates. The modeling results are provided as an attachment to this letter.

Construction GHG Findings

The construction GHG emissions as calculated in CalEEMod are reported in pounds per day and are shown in Table 2 below. Total cumulative or combined construction emissions (from 2021 and 2022) are generated prior to operations though will ultimately contribute to yearly emission levels of the Project as a whole. Because of this, it is acceptable to average the total construction emission over a 30-year period (South Coast Air Quality Management District, 2014) which represents an average lifecycle of a project such as CarMax. GHGs related to construction are shown in Table 2. Based on this, it is expected that the 30 year average would be which would be 18.52 MT CO_2e per year.

Table 2: Expected Annual Construction CO_2e Emissions Summary MT/Year

Year	Bio-CO2	NBio-CO2	Total CO2	CH4	N2O	CO2e
2021	0.00	514.14	514.14	0.09	0.00	516.46
2022	0.00	39.03	39.03	0.01	0.00	39.19
Total						555.65
Yearly Average Construction Emissions (MT CO_2e /year over 30 years)						**18.52**

Operational Air Quality Findings

As previously discussed, operational GHG emissions generated from Area, Energy, Mobile, Solid Waste and Water uses is also calculated within CalEEMod. Operational emissions from the proposed project would also include amortized construction emissions construction emissions from Table 2 above. Based on these findings, combined operational and construction GHG emissions will generate 308.36 Metric Tons of CO_2e each year during a typical operational year as can be seen in Table 3 below. Given this, the project would not exceed the City's 900 MT CO_2e screening threshold and would therefore generate less than significant GHG impacts.

Hedy Levine
REC Consultants
2442 Second Avenue
San Diego, CA 92101

Ldn Consulting, Inc.
42428 Chisolm Trail, Murrieta CA 92562
phone 760-473-1253
Fax 760-689-4943

Table 3: Expected Operational Emissions Summary MT/Year

Year	Bio-CO2	NBio-CO2	Total CO2	CH4	N2O	CO2e
Area	0.00	0.01	0.01	0.00	0.00	0.01
Energy	0.00	59.94	59.94	0.00	0.00	60.16
Mobile	0.00	198.90	198.90	0.01	0.00	199.20
Waste	8.88	0.00	8.88	0.52	0.00	22.00
Water	0.34	6.98	7.32	0.04	0.00	8.47
Total Operations						289.84
Total Construction Emissions (Amortized over 30 Years from Table 5.1 above)						18.52
Total Cumulative Operations (Construction + Operations)						**308.36**
CarMax Customers Per Day						**237**
Emissions per SP						**1.30**

Furthermore, since the project would serve up to 237 customers per day, it is reasonable to assume that this would be the service population for the project. Given this, the project would generate roughly 1.3 MT/SP. Since the project would also generate less than 3.5 MT/SP, the project would generate less than significant GHG impacts. Based upon these findings, the proposed project would not generate significant greenhouse gas impacts under CEQA and would therefore not be required to implement any mitigation measures to move forward.

Sincerely Ldn Consulting,

Jeremy Louden

CHAPTER 1 - EXECUTIVE SUMMARY

1.1 – Introduction

The Carmax project site is located near the southwest corner of Plaza Drive and Thunder Drive in the City of Oceanside, California.

Runoff from the existing site surface flows to four points of discharge, two of them on Plaza Drive, one on Thunder Drive and the one to Buena Vista Creek.

The study analyzes existing and developed conditions for 100-year peak flowrates from the development to the existing points of discharge.

The southern portion of the property lies within Zone X of the FEMA 100-year floodplain (FEMA FIRM Panel 06073C0758G effective 5/16/19) and riparian buffer. However, development of the property will not encroach on either of these boundaries. Therefore, no Map Revision will be required.

Treatment of storm water runoff from the site has been addressed in a separate report – the “Storm Water Quality Management Plan for Carmax Oceanside”, dated November 2019 by REC. Hydromodification (HMP) analysis has been addressed in a separate report titled “Technical Memorandum: SWMM Modeling for Carmax Oceanside” dated November 2019 by REC.

Per County of San Diego drainage criteria the Modified Rational Method is used to determine peak design flowrates when the contributing drainage area is less than one square mile. Since the total watershed area discharging from the site is less than one square mile, AES computer software was used to model the pre- and post- developed condition runoff response per the Modified Rational Method.

Methodology used for the computation of design rainfall events, runoff coefficients, and rainfall intensity values are consistent with criteria set forth in the “County of San Diego Drainage Design Manual”. A more detailed explanation of methodology used for this analysis is listed in Chapter 2 of this report.

Developed condition peak flows were calculated using AES. The corresponding hydrographs were generated using the RickRat Hydro program by Rick Engineering. Hyraulic Modified-Puls detention basin routing of the AES rational method hydrology was performed using the Army Corps of Engineers HEC-HMS 4.2.1 software.

1.2 – Summary of Existing Conditions

In existing conditions, the Carmax project site is a vacant, previously graded lot. The site is divided into “North” and “South” portions separated by Plaza Drive.

Existing runoff from the north site drains via overland flow to the southwest corner of the site where it sheet flows over the existing berm and onto Plaza Drive. Runoff from the existing south site drains south towards Buena Vista Creek with a small portion draining east over the sidewalk and curb and onto Thunder Drive.

Per NOAA Precipitation Frequency Data Server, the 100-year design rainfall depth for the project site is 3.02 inches. The project runoff coefficient was calculated using the Caltrans Highway Design Manual. Figure 819.2A of the Highway Design Manual determines runoff coefficients for undeveloped areas based on watershed type. This table was used to determine the runoff coefficient of the site, calculations are summarized hereon:

Relief:	10% steep – 0.32 90% Normal – 0.17 (0.1)(0.32) + (0.9)(0.17) = 0.185
Soil Infiltration:	Soil type-D – 0.12
Vegetal Cover:	8% fair to good – 0.07 92% poor to fair – 0.12 (0.08)(0.07) + (0.92)(0.12) = 0.116
Storage:	Negligible – 0.11
Total*:*	(0.185) + (0.12) + (0.116) + (0.11) = 0.531
‘C’ Modification for Q100:	(0.531) $\times$ (1.25) = *0.66*

Thus a site coefficient of 0.66 is used for pre-development conditions.

Table 1 on the following page summarizes the existing condition design 100-year peak flow from the project site.

Table 1 – SUMMARY OF EXISTING CONDITIONS FLOWS

Discharge Location	Drainage Area (Ac)	Runoff Coefficient (C)	100-Year Peak Flow (cfs)
POC-1	1.44	0.66	5.11
POC-2	0.21	0.66	0.82
POC-3	6.89	0.66	23.74
POC-4	0.27	0.66	1.07
TOTAL	**8.81**		

1.3 – Summary of Developed Conditions

The north site is constructed solely of permeable pavement, therefore, pre- and post-development runoff remains constant. Runoff from the south site is directed to a proprietary underground detention system near the southeast corner of the site. Mitigated peak flows are then drained from the detention facility via a 24" storm drain to POC-3, at the southwest corner of the site, where runoff ultimately meets existing Buena Vista Creek.

Per NOAA Precipitation Frequency Data Server the design 100-year rainfall depth for the project site is 3.02 inches. The project runoff coefficient was calculated using the Caltrans Highway Design Manual. Figure 819.2B of the Highway Design Manual determines runoff coefficients for developed areas. This table was used to determine the runoff coefficient of the site, calculations are summarized hereon:

Type of Drainage Area: Parking lot and building – 0.75
(applicable to roofs, business with high density, multi-units, streets)

'C' Modification for Q100: $(0.75) \times (1.25) = \underline{0.94}$

Thus a site coefficient of 0.94 is used for post-development conditions. The developed site has an approximate impervious footprint of 5.798 acres.

Table 2 summarizes the unmitigated developed condition design 100-year peak flow from the project site.

Table 2 – SUMMARY OF UNMITIGATED - DEVELOPED CONDITIONS FLOWS

Discharge Location	Drainage Area (Ac)	Runoff Coefficient (C)	100-Year Peak Flow (cfs)
POC-1	1.44	0.66	5.59
POC-2	0.35	0.94	2.15
POC-3	6.89	0.94	44.38
POC-4	0.13	0.94	1.05
TOTAL	**8.81**		

Prior to discharging from the project site, first flush runoff will be treated via a underground open bottom proprietary BMP in accordance with standards set forth by the Regional Water Quality Control Board and the County of San Diego's BMP Design Manual (see "Storm Water Quality Management Plan for Carmax Oceanside").

Runoff from the developed site drains to a single onsite underground detention system. Peak flows are mitigated via this facility prior to discharging to the proprietary underground water quality system. Once through the proprietary underground water quality system, runoff will discharge to POC-3, the existing point of discharge from the site.

A summary of the detention basin is provided in Table 3.

Table 3 – SUMMARY OF UNDERGROUND BMP DIMENSIONS

1st Outlet:
Diameter: 2.3125"
Number of Orifices: 2
Invert Elev: 0.0' (invert of the tanks is assumed to be 0.0).

2nd Outlet:
Slot Dimensions: 12" wide by 2.5" tall.
Number of Slots: 3
Invert Elev: 1.25'

3rd Outlet:
Slot Dimensions: 15" wide by 8" tall.
Number of Slots: 3
Invert Elev: 2.25'

4th Outlet (Overspill):
Weir Length: 12 ft (3' x 3' opening)
Invert Elev: 3.75'

Notes:
(1): It is assumed WQ volume is to be treated after storm water leaves underground detention system. All elevations measured from the invert of the underground detention system.
(2): Depth of ponding beneath structure emergency spillway.
(3): Overflow length, the internal length of the emergency spillway.
(4): Total depth of underground BMP from soffit to invert.

The developed condition peak flows were calculated using the Modified Rational Method. The corresponding hydrographs were generated using the RickRat Hydro program by Rick Engineering (a 5 minute time step was used to generate the hydrograph as HMS only has time step allowances for 1,2,3,4,5,6 and 10 minute increments). This hydrograph was then routed through the proposed on-site detention facility in HEC-HMS. The HMS Modified-Puls results are summarized in Table 4.

Rational method hydrographs, stage-storage, stage-discharge relationships, outlet structure configurations and HEC-HMS model output is provided in Chapter 5 of this report.

Table 4 summarizes the peak inflow and discharge from the detention facility.

Table 4 – SUMMARY OF DETENTION ROUTING

Detention Basin	100-Year Peak Inflow (cfs)	100-Year Peak Outflow (cfs)	Peak Water Surface Elevation[(1)] (ft)
BMP-1	43.78	23.84	3.75

Notes: (1) Elevation above the first surface inlet invert.

1.4 – Summary of Results

Table 5 summarizes developed and existing condition drainage areas and resultant 100-year peak flow rates at the receiving discharge location from the Carmax site. Per NOAA Precipitation Frequency Data Server, the design 100-year rainfall depth for the site area is 3.02 inches.

Table 5 – SUMMARY OF PEAK FLOWS

Discharge Location	Area (ac)			100 Year Peak Flow (cfs)		
	Existing	Developed	Difference	Existing	Developed	Difference
POC-1	1.44	1.44	0.00	5.11	5.59	0.48
POC-2	0.21	0.35	0.14	0.82	2.15	1.33
POC-3	6.89	6.89	0.00	23.74	22.42	-1.32
POC-4	0.27	0.13	-0.14	1.07	1.05	-0.02

As illustrated in Table 5, the proposed Carmax project site will reduce peak flows for the large majority of the site. POC-1 and POC-2 at Plaza Drive increase slightly due to the widening and expansion of Plaza Drive. Runoff discharging at these POC's will make its way west towards the intersection of Highway 78 and Plaza Drive where said runoff enters curb inlets on the north and south sides of Plaza Drive, respectively. At final engineering the downstream curb inlets and pipes on the north and south sides of Plaza Drive will be examined to ensure existing capacity is adequate for additional runoff resulting from Plaza Drive expansion.

POC-3 is reduced by 1.32 cfs. POC-4 decreases by 0.02 cfs. POC-3 and POC-4 ultimately confluence at POC-3 in Buena Vista Creek, therefore, the total net increase of 0.49 cfs is insignificant as it discharges directly to a receiving water body. There will be no impact to downstream storm drains of flood channels.

All developed runoff will receive water quality treatment in accordance with the site specific SWQMP, whether that be treatment via proprietary BMP or green streets.

Final design details will be provided at the final engineering phase of the development.

1.5 – Hydraulic Analysis

Detailed hydraulic analysis to be provided at final engineering.

1.6 – Conclusions

This report has been prepared in accordance with the County of San Diego Hydrology Manual. This report has evaluated and addressed the potential impacts and proposed mitigation measures. A summary of the facts and findings associated with this project and the measures addressed by this report is as follows:

- The project will not alter drainage patterns on the site or increase net runoff after development.
- The ultimate discharge points will not be changed.
- Graded areas and slopes will be hydroseeded to reduce or eliminate sediment discharge.
- Hydraulic analysis to be provided at final engineering

CHAPTER 2 - METHODOLOGY

2.1 – County of San Diego Design Criteria

SECTION 3
RATIONAL METHOD AND MODIFIED RATIONAL METHOD

3.1 THE RATIONAL METHOD

The Rational Method (RM) is a mathematical formula used to determine the maximum runoff rate from a given rainfall. It has particular application in urban storm drainage, where it is used to estimate peak runoff rates from small urban and rural watersheds for the design of storm drains and small drainage structures. The RM is recommended for analyzing the runoff response from drainage areas up to approximately 1 square mile in size. It should not be used in instances where there is a junction of independent drainage systems or for drainage areas greater than approximately 1 square mile in size. In these instances, the Modified Rational Method (MRM) should be used for junctions of independent drainage systems in watersheds up to approximately 1 square mile in size (see Section 3.4); or the NRCS Hydrologic Method should be used for watersheds greater than approximately 1 square mile in size (see Section 4).

The RM can be applied using any design storm frequency (e.g., 100-year, 50-year, 10-year, etc.). The local agency determines the design storm frequency that must be used based on the type of project and specific local requirements. A discussion of design storm frequency is provided in Section 2.3 of this manual. A procedure has been developed that converts the 6-hour and 24-hour precipitation isopluvial map data to an Intensity-Duration curve that can be used for the rainfall intensity in the RM formula as shown in Figure 3-1. The RM is applicable to a 6-hour storm duration because the procedure uses Intensity-Duration Design Charts that are based on a 6-hour storm duration.

3.1.1 Rational Method Formula

The RM formula estimates the peak rate of runoff at any location in a watershed as a function of the drainage area (A), runoff coefficient (C), and rainfall intensity (I) for a duration equal to the time of concentration (T_c), which is the time required for water to

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

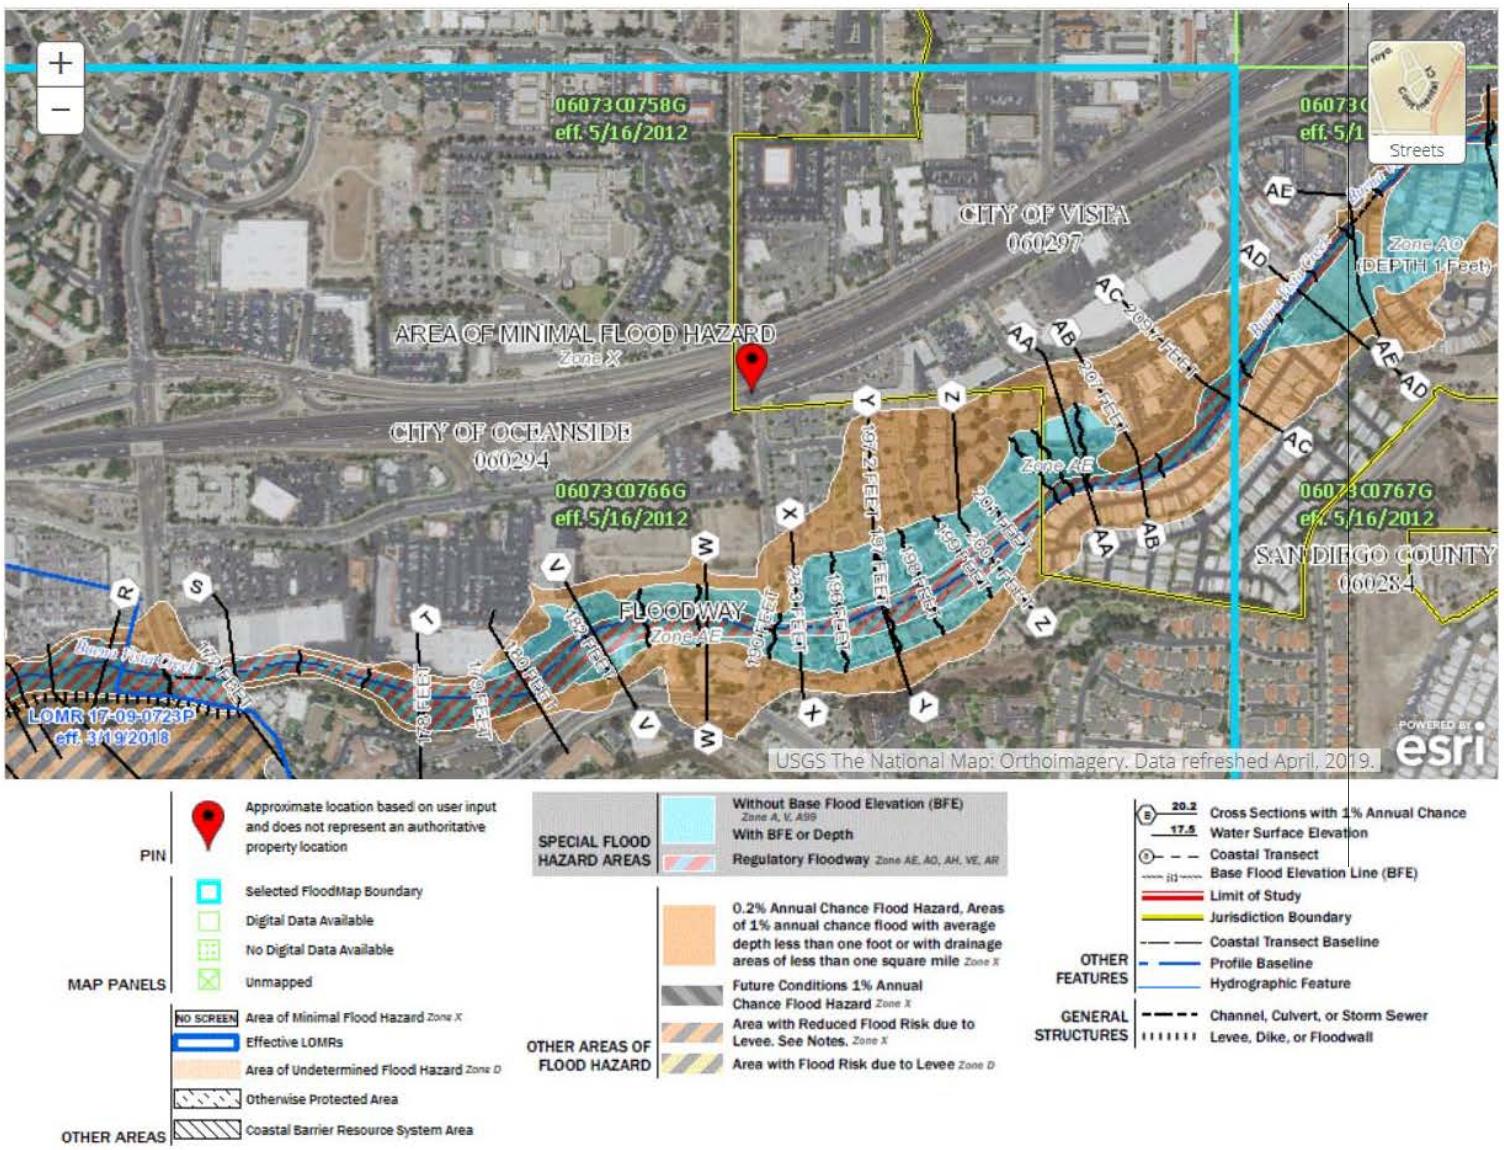
2.3 – FEMA Flood Map

FEMA FLOOD MAP – CARMAX OCEANSIDE



2.4 – Runoff Coefficient Determination

the rainfall intensity, (i) in the equation expressed in inches per hour, requires that the storm duration and the time of concentration (t_c) be equal. Therefore, the first step in estimating (i) is to estimate (t_c). Methods for determining time of concentration are discussed under Index 816.6.

- Once the time of concentration, (t_c), is estimated, the rainfall intensity, (i), corresponding to a storm of equal duration, may be obtained from available sources such as intensity-duration-frequency (IDF) curves. For IDF curve generating software, see http://hdsc.nws.noaa.gov/hdsc/pfds/.

The runoff coefficients given in Figure 819.2A and Table 819.2B are applicable for storms of up to 5 or 10 year frequencies. Less frequent, higher intensity storms usually require modification of the coefficient because infiltration, detention, and other losses have a proportionally smaller effect on the total runoff volume. The adjustment of the rational method for use with major storms can be made by multiplying the coefficient by a frequency factor, C(f). Values of C(f) are given below. Under no circumstances should the product of C(f) times C exceed 1.0.

Frequency (yrs)	C(f)
25	1.1
50	1.2
100	1.25

(2) Regional Analysis Methods. Regional analysis methods utilize records for streams or drainage areas in the vicinity of the stream under consideration which would have similar characteristics to develop peak discharge estimates. These methods provide techniques for estimating annual peak stream discharge at any site, gaged or ungaged, for probability of recurrence from 50 percent (2 years) to 1 percent (100 years). Application of these methods is convenient, but the procedure is subject to some limitations.

Regional Flood - Frequency equations developed by the U.S. Geological Survey for use in California are given in Figure 819.2C and Table 819.7A. These equations are based on regional regression analysis of data from stream gauging stations. The equations in Figure 819.2C were derived from data gathered and analyzed through 2006, while the regions covered by Table 819.7A are reflective of a 1994 study of the Southwestern U.S, which has been supplemented by a more recent 2007 Study of California Desert Region Hydrology. Information on use and development of this method may be found in "Methods for Determining Magnitude and Frequency of Floods in California Based on Data through Water Year 2006" by the U.S. Department of the Interior, Geological Survey.

The Regional Flood-Frequency equations are applicable only to sites within the flood-frequency regions for which they were derived and on streams with virtually natural flows. The equations are not directly applicable to streams in urban areas affected substantially by urban development. In urban areas the equations may be used to estimate peak discharge values under natural conditions and then by use of the techniques described in the publication or HDS No. 2, adjust the discharge values to compensate for urbanization. A method for directly estimating design discharges for some gaged and ungaged streams is also provided in HDS No. 2. The method is applicable to streams on or nearby those for which study data are available.

(3) Flood Frequency Analysis

(a) If there are two gaged sites with similar watershed characteristics but one has a short record and the other has a longer record of peak flows, a two-station comparison analysis can be conducted to extend the equivalent length of record at the shorter gaged site.

(b) Flood-frequency relations at sites near gaged sites on the same stream (or in a similar watershed) can be estimated using a ratio of drainage area for the ungaged and gaged sites.

(c) At a gaged site, weighted estimates of peak discharges based on the station flood-frequency relation and the regional

Runoff Coefficients for Undeveloped Areas

Watershed Types

	Extreme	High	Normal	Low
Relief	.28 -.35 Steep, rugged terrain with average slopes above 30%	.20 -.28 Hilly, with average slopes of 10 to 30%	.14 -.20 Rolling, with average slopes of 5 to 10%	.08 -.14 Relatively flat land, with average slopes of 0 to 5%
Soil Infiltration	.12 -.16 No effective soil cover, either rock or thin soil mantle of negligible infiltration capacity	.08 -.12 Slow to take up water, clay or shallow loam soils of low infiltration capacity, imperfectly or poorly drained	.06 -.08 Normal; well drained light or medium textured soils, sandy loams, silt and silt loams	.04 -.06 High; deep sand or other soil that takes up water readily, very light well drained soils
Vegetal Cover	.12 -.16 No effective plant cover, bare or very sparse cover	.08 -.12 Poor to fair; clean cultivation crops, or poor natural cover, less than 20% of drainage area over good cover	.06 -.08 Fair to good; about 50% of area in good grassland or woodland, not more than 50% of area in cultivated crops	.04 -.06 Good to excellent; about 90% of drainage area in good grassland, woodland or equivalent cover
Surface Storage	.10 -.12 Negligible surface depression few and shallow; drainageways steep and small, no marshes	.08 -.10 Low; well defined system of small drainageways; no ponds or marshes	.06 -.08 Normal; considerable surface depression storage; lakes and pond marshes	.04 -.06 High; surface storage, high; drainage system not sharply defined; large floodplain storage or large number of ponds or marshes
Given	An undeveloped watershed consisting of; 1) rolling terrain with average slopes of 5%, 2) clay type soils, 3) good grassland area, and 4) normal surface depressions.		Solution: Relief 0.14 Soil Infiltration 0.08 Vegetal Cover 0.04 Surface Storage 0.06 C = 0.32	
Find	The runoff coefficient, C, for the above watershed.			

Table 819.2B

Runoff Coefficients for Developed Areas (1)

Type of Drainage Area	Runoff Coefficient
Business:	
Downtown areas	0.70 - 0.95
Neighborhood areas	0.50 - 0.70
Residential:	
Single-family areas	0.30 - 0.50
Multi-units, detached	0.40 - 0.60
Multi-units, attached	0.60 - 0.75
Suburban	0.25 - 0.40
Apartment dwelling areas	0.50 - 0.70
Industrial:	
Light areas	0.50 - 0.80
Heavy areas	0.60 - 0.90
Parks, cemeteries:	0.10 - 0.25
Playgrounds:	0.20 - 0.40
Railroad yard areas:	0.20 - 0.40
Unimproved areas:	0.10 - 0.30
Lawns:	
Sandy soil, flat, 2%	0.05 - 0.10
Sandy soil, average, 2-7%	0.10 - 0.15
Sandy soil, steep, 7%	0.15 - 0.20
Heavy soil, flat, 2%	0.13 - 0.17
Heavy soil, average, 2-7%	0.18 - 0.22
Heavy soil, steep, 7%	0.25 - 0.35
Streets:	
Asphaltic	0.70 - 0.95
Concrete	0.80 - 0.95
Brick	0.70 - 0.85
Drives and walks	0.75 - 0.85
Roofs:	0.75 - 0.95

NOTES:
(1) From HDS No. 2.

regression equations are considered the best estimates of flood frequency and are used to reduce the time-sampling error that may occur in a station flood-frequency estimate.

(d) The flood-frequency flows and the maximum peak discharges at several stations in a region should be used whenever possible for comparison with the peak discharge estimated at an ungaged site using a rainfall-runoff approach or regional regression equation. The watershed characteristics at the ungaged and gaged sites should be similar.

(4) National Resources Conservation Service (NRCS) Methods. The Soil Conservation Service's SCS (former title) National Engineering Handbook, 1972, and their 1975, "Urban Hydrology for Small Watersheds", Technical Release 55 (TR-55), present a graphical method for estimating peak discharge. Most NRCS equations and curves provide results in terms of inches of runoff for unit hydrograph development and are not applicable to the estimation of a peak design discharge unless the design hydrograph is first developed in accordance with prescribed NRCS procedures. NRCS methods and procedures are applicable to drainage areas less than 3 square miles (approx. 2,000 acres) and result in a design hydrograph and design discharge that are functionally acceptable to form the basis for the design of highway drainage facilities.

819.3 Statistical Methods

Statistical methods of predicting stream discharge utilize numerical data to describe the process. Statistical methods, in general, do not require as much subjective judgment to apply as the previously described deterministic methods. They are usually well documented mathematical procedures which are applied to measured or observed data. The accuracy of statistical methods can also be measured quantitatively. However, to assure that statistical method results are valid, the method and procedures used should be verified by an experienced engineer with a thorough knowledge of engineering statistics.

2.5 – Urban Watershed Overland Time of Flow Nomograph

Note that the Initial Time of Concentration should be reflective of the general land-use at the upstream end of a drainage basin. A single lot with an area of two or less acres does not have a significant effect where the drainage basin area is 20 to 600 acres.

Table 3-2 provides limits of the length (Maximum Length (L_M)) of sheet flow to be used in hydrology studies. Initial T_i values based on average C values for the Land Use Element are also included. These values can be used in planning and design applications as described below. Exceptions may be approved by the "Regulating Agency" when submitted with a detailed study.

Table 3-2

MAXIMUM OVERLAND FLOW LENGTH (L_M)

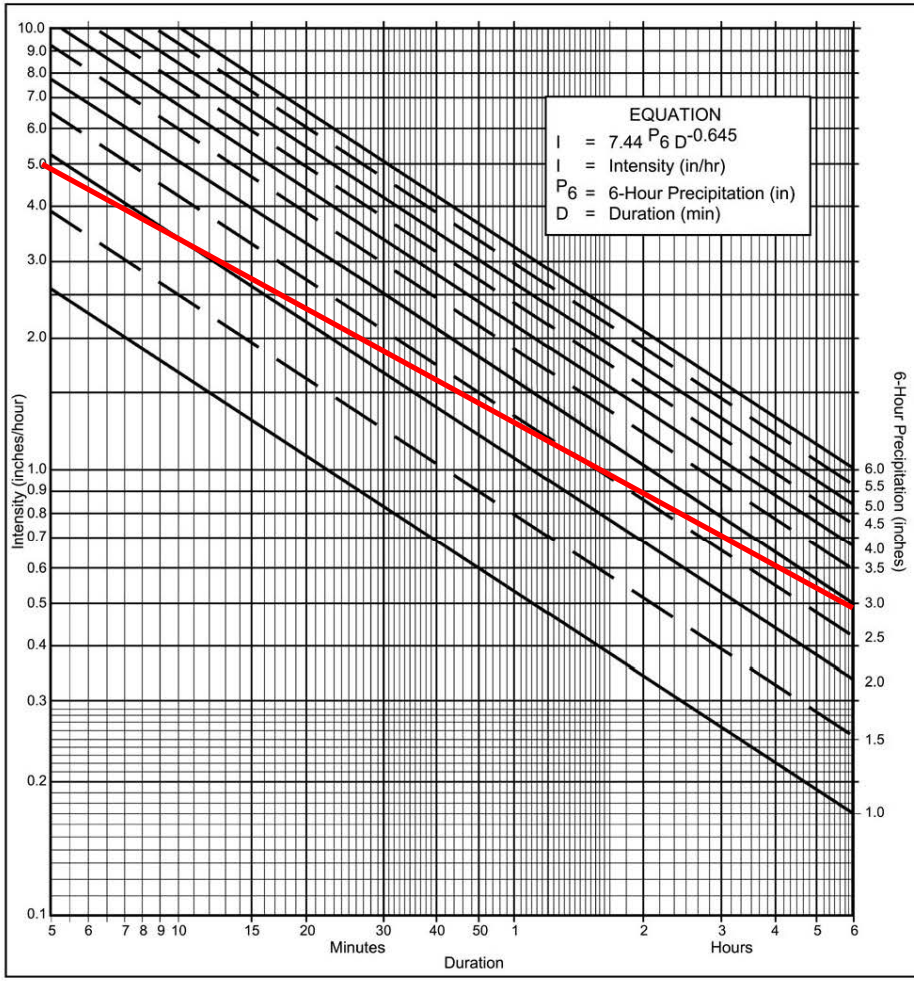
2.6 – County of San Diego Intensity- Duration Curve



Directions for Application:

(1) From precipitation maps determine 6 hr and 24 hr amounts for the selected frequency. These maps are included in the County Hydrology Manual (10, 50, and 100 yr maps included in the Design and Procedure Manual).

(2) Adjust 6 hr precipitation (if necessary) so that it is within the range of 45% to 65% of the 24 hr precipitation (not applicaple to Desert).

(3) Plot 6 hr precipitation on the right side of the chart.

(4) Draw a line through the point parallel to the plotted lines.

(5) This line is the intensity-duration curve for the location being analyzed.

Application Form:

(a) Selected frequency 100 year

(b) P_6 = 3.02 in., P_{24} = 5.05, $\frac{P_6}{P_{24}}$ = 59.8 %(2)

(c) Adjusted P_6(2) = _____ in.

(d) t_x = _____ min.

(e) I = _____ in./hr.

Note: This chart replaces the Intensity-Duration-Frequency curves used since 1965.

P6	1	1.5	2	2.5	3	3.5	4	4.5	5	5.5	6

FIGURE 3-1

2.7 – Model Development Summary (from County of San Diego Hydrology Manual)

3.2 DEVELOPING INPUT DATA FOR THE RATIONAL METHOD

This section describes the development of the necessary data to perform RM calculations. Section 3.3 describes the RM calculation process. Input data for calculating peak flows and T_c's with the RM should be developed as follows:

1. On a topographic base map, outline the overall drainage area boundary, showing adjacent drains, existing and proposed drains, and overland flow paths.

2. Verify the accuracy of the drainage map in the field.

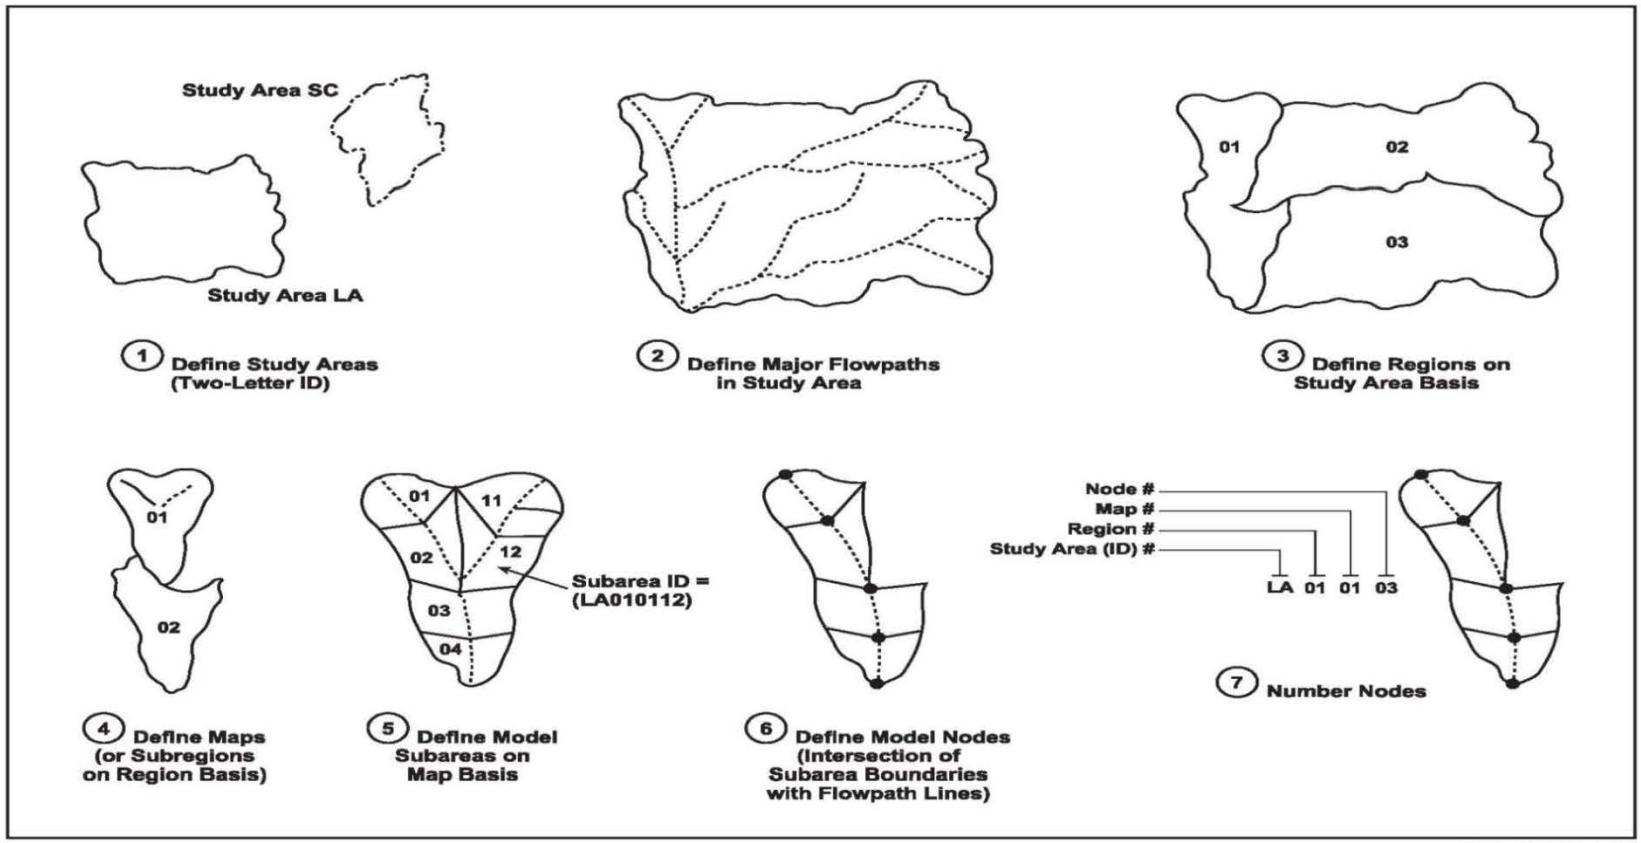
3. Divide the drainage area into subareas by locating significant points of interest. These divisions should be based on topography, soil type, and land use. Ensure that an appropriate first subarea is delineated. For natural areas, the first subarea flow path length should be less than or equal to 4,000 feet plus the overland flow length (Table 3-2). For developed areas, the initial subarea flow path length should be consistent with Table 3-2. The topography and slope within the initial subarea should be generally uniform.

4. Working from upstream to downstream, assign a number representing each subarea in the drainage system to each point of interest. Figure 3-8 provides guidelines for node numbers for geographic information system (GIS)-based studies.

5. Measure each subarea in the drainage area to determine its size in acres (A).

6. Determine the length and effective slope of the flow path in each subarea.

7. Identify the soil type for each subarea.



GIS/Hydrologic Model
Data Base Linkage Setup:
Nodes, Subareas, Links

FIGURE
3-8

8. Determine the runoff coefficient (C) for each subarea based on Table 3-1. If the subarea contains more than one type of development classification, use a proportionate average for C. In determining C for the subarea, use future land use taken from the applicable community plan, Multiple Species Conservation Plan, National Forest land use plan, etc.

9. Calculate the CA value for the subarea.

10. Calculate the Σ(CA) value(s) for the subareas upstream of the point(s) of interest.

11. Determine P_6 and P_{24} for the study using the isopluvial maps provided in Appendix B. If necessary, adjust the value for P_6 to be within 45% to 65% of the value for P_{24}.

See Section 3.3 for a description of the RM calculation process.

3.3 Performing Rational Method Calculations

This section describes the RM calculation process. Using the input data, calculation of peak flows and T_c's should be performed as follows:

1. Determine T_i for the first subarea. Use Table 3-2 or Figure 3-3 as discussed in Section 3.1.4. If the watershed is natural, the travel time to the downstream end of the first subarea can be added to T_i to obtain the T_c. Refer to paragraph 3.1.4.2 (a).

2. Determine I for the subarea using Figure 3-1. If T_i was less than 5 minutes, use the 5 minute time to determine intensity for calculating the flow.

3. Calculate the peak discharge flow rate for the subarea, where $Q_p = \Sigma(CA)\, I$.
In case that the downstream flow rate is less than the upstream flow rate, due to the long travel time that is not offset by the additional subarea runoff, use the upstream peak flow for design purposes until downstream flows increase again.

4. Estimate the T_t to the next point of interest.

5. Add the T_t to the previous T_c to obtain a new T_c.

6. Continue with step 2, above, until the final point of interest is reached.

Note: The MRM should be used to calculate the peak discharge when there is a junction from independent subareas into the drainage system.

3.4 MODIFIED RATIONAL METHOD (FOR JUNCTION ANALYSIS)

The purpose of this section is to describe the steps necessary to develop a hydrology report for a small watershed using the MRM. It is necessary to use the MRM if the watershed contains junctions of independent drainage systems. The process is based on the design manuals of the City/County of San Diego. The general process description for using this method, including an example of the application of this method, is described below.

The engineer should only use the MRM for drainage areas up to approximately 1 square mile in size. If the watershed will significantly exceed 1 square mile then the NRCS method described in Section 4 should be used. The engineer may choose to use either the RM or the MRM for calculations for up to an approximately 1-square-mile area and then transition the study to the NRCS method for additional downstream areas that exceed approximately 1 square mile. The transition process is described in Section 4.

3.4.1 Modified Rational Method General Process Description

The general process for the MRM differs from the RM only when a junction of independent drainage systems is reached. The peak Q, T_c, and I for each of the independent drainage systems at the point of the junction are calculated by the RM. The independent drainage systems are then combined using the MRM procedure described below. The peak Q, T_c, and I for each of the independent drainage systems at the point of the junction must be calculated prior to using the MRM procedure to combine the independent drainage systems, as these

values will be used for the MRM calculations. After the independent drainage systems have been combined, RM calculations are continued to the next point of interest.

3.4.2 Procedure for Combining Independent Drainage Systems at a Junction

Calculate the peak Q, T_c, and I for each of the independent drainage systems at the point of the junction. These values will be used for the MRM calculations.

At the junction of two or more independent drainage systems, the respective peak flows are combined to obtain the maximum flow out of the junction at T_c. Based on the approximation that total runoff increases directly in proportion to time, a general equation may be written to determine the maximum Q and its corresponding T_c using the peak Q, T_c, and I for each of the independent drainage systems at the point immediately before the junction. The general equation requires that contributing Q's be numbered in order of increasing T_c.

Let Q_1, T_1, and I_1 correspond to the tributary area with the shortest T_c. Likewise, let Q_2, T_2, and I_2 correspond to the tributary area with the next longer T_c; Q_3, T_3, and I_3 correspond to the tributary area with the next longer T_c; and so on. When only two independent drainage systems are combined, leave Q_3, T_3, and I_3 out of the equation. Combine the independent drainage systems using the junction equation below:

Junction Equation: $T_1 < T_2 < T_3$

$$Q_{T1} = Q_1 + \frac{T_1}{T_2} Q_2 + \frac{T_1}{T_3} Q_3$$

$$Q_{T2} = Q_2 + \frac{I_2}{I_1} Q_1 + \frac{T_2}{T_3} Q_3$$

$$Q_{T3} = Q_3 + \frac{I_3}{I_1} Q_1 + \frac{I_3}{I_2} Q_2$$

Calculate Q_{T1}, Q_{T2}, and Q_{T3}. Select the largest Q and use the T_c associated with that Q for further calculations (see the three Notes for options). If the largest calculated Q's are equal (e.g., $Q_{T1} = Q_{T2} > Q_{T3}$), use the shorter of the T_c's associated with that Q.

This equation may be expanded for a junction of more than three independent drainage systems using the same concept. The concept is that when Q from a selected subarea (e.g., Q_2) is combined with Q from another subarea with a shorter T_c (e.g., Q_1), the Q from the subarea with the shorter T_c is reduced by the ratio of the I's (I_2/I_1); and when Q from a selected subarea (e.g., Q_2) is combined with Q from another subarea with a longer T_c (e.g., Q_3), the Q from the subarea with the longer T_c is reduced by the ratio of the T_c's (T_2/T_3).

Note #1: At a junction of two independent drainage systems that have the same T_c, the tributary flows may be added to obtain the Q_p.

$$Q_p = Q_1 + Q_2 \text{; when } T_1 = T_2 \text{; and } T_c = T_1 = T_2$$

This can be verified by using the junction equation above. Let Q_3, T_3, and $I_3 = 0$. When T_1 and T_2 are the same, I_1 and I_2 are also the same, and T_1/T_2 and $I_2/I_1 = 1$. T_1/T_2 and I_2/I_1 are cancelled from the equations. At this point, $Q_{T1} = Q_{T2} = Q_1 + Q_2$.

Note #2: In the upstream part of a watershed, a conservative computation is acceptable. When the times of concentration (T_c's) are relatively close in magnitude (within 10%), use the shorter T_c for the intensity and the equation $Q = \Sigma(CA)I$.

Note #3: . An optional method of determining the T_c is to use the equation
$T_c = [(\Sigma (CA)7.44\ P_6)/Q]^{1.55}$

This equation is from $Q = \Sigma(CA)I = \Sigma(CA)(7.44\ P_6/T_c^{.645})$ and solving for T_c. The advantage in this option is that the T_c is consistent with the peak flow Q, and avoids inappropriate fluctuation in downstream flows in some cases.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Diego County Area, California
Survey Area Data: Version 14, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Nov 3, 2014—Nov 22, 2014

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
LeC2	Las Flores loamy fine sand, 5 to 9 percent slopes, eroded	D	10.9	87.8%
VaB	Visalia sandy loam, 2 to 5 percent slopes	A	1.5	12.2%
Totals for Area of Interest			**12.4**	**100.0%**

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

Aggregation Method: Dominant Condition

Aggregation is the process by which a set of component attribute values is reduced to a single value that represents the map unit as a whole.

A map unit is typically composed of one or more "components". A component is either some type of soil or some nonsoil entity, e.g., rock outcrop. For the attribute being aggregated, the first step of the aggregation process is to derive one attribute value for each of a map unit's components. From this set of component attributes, the next step of the aggregation process derives a single value that represents the map unit as a whole. Once a single value for each map unit is derived, a thematic map for soil map units can be rendered. Aggregation must be done because, on any soil map, map units are delineated but components are not.

For each of a map unit's components, a corresponding percent composition is recorded. A percent composition of 60 indicates that the corresponding component typically makes up approximately 60% of the map unit. Percent composition is a critical factor in some, but not all, aggregation methods.

The aggregation method "Dominant Condition" first groups like attribute values for the components in a map unit. For each group, percent composition is set to the sum of the percent composition of all components participating in that group. These groups now represent "conditions" rather than components. The attribute value associated with the group with the highest cumulative percent composition is returned. If more than one group shares the highest cumulative percent composition, the corresponding "tie-break" rule determines which value should be returned. The "tie-break" rule indicates whether the lower or higher group value should be returned in the case of a percent composition tie. The result returned by this aggregation method represents the dominant condition throughout the map unit only when no tie has occurred.

Component Percent Cutoff: None Specified

Components whose percent composition is below the cutoff value will not be considered. If no cutoff value is specified, all components in the database will be considered. The data for some contrasting soils of minor extent may not be in the database, and therefore are not considered.

Tie-break Rule: Higher

The tie-break rule indicates which value should be selected from a set of multiple candidate values, or which value should be selected in the event of a percent composition tie.

5.3 – HEC-HMS Modified-Puls Routing Results

Project: Detention2 Simulation Run: Run 1

Reservoir: Reservoir-1

Start of Run:	01Jan2000, 00:00	Basin Model:	Basin 1
End of Run:	01Jan2000, 07:00	Meteorologic Model:	Met 1
Compute Time:	27Feb2020, 16:20:51	Control Specifications:	Control 1

Volume Units: IN

Computed Results

Peak Inflow:	43.7800 (CFS)	Date/Time of Peak Inflow:	01Jan2000, 04:05
Peak Discharge:	21.1334 (CFS)	Date/Time of Peak Discharge	01Jan2000, 04:08
Inflow Volume:	n/a	Peak Storage:	0.5418 (AC-FT)
Discharge Volume	n/a	Peak Elevation:	3.8712 (FT)

How to Use This Template

This template, assembled by GHD Inc. on behalf of the City of Oceanside, is for the development of Storm Water Quality Management Plans (SWQMPs) for Priority Development Projects (PDPs) proposed within Oceanside, CA. It is based on requirements set forth in the Regional Water Quality Control Board's National Pollutant Discharge Elimination System MS4 Permit that covers the San Diego Region (Order No. R9-2013-0001).

All references within the template refer to the City of Oceanside BMP Design Manual dated February 2016 (Manual). Use of this template in conjunction with the Manual is intended to help a project applicant develop a SWQMP compliant with City of Oceanside and MS4 Permit requirements.

Template Date: February 16, 2016

Assembled By:

Quick Reference Guide

Item	Project Information
Project Name	CarMax Oceanside
Application Number(s)	Click here to enter text.
Project Address	SWC Plaza Drive & Thunder Drive, Oceanside, CA
Total Parcel Area	478,210 sq. ft.
Project Description	The site is divided into "North" and "South" portions separated by Plaza Drive. The "North" site is bound to the north by Highway 78 and to the south by Plaza Drive. The "South" side is bound to the north by Plaza Drive and to the south by Buena Vista Creek. The existing site is vacant with sparse vegetation. The preliminary soils report determined the existing site has been previously filled. The existing and proposed use is "Community Commercial District." The project proposes a 5.9 acre Carmax dealership, service center, sales floor, and carwash on existing 10.98 acre site. Proposed dealership will include 502 asphalt concrete parking spaces on both north and south sides of Plaza Drive. Offsite surface improvements include the full width improvements and dedication of Plaza Drive to an 84' right-of-way width. Offsite utility improvements include the extension of the existing water main at Plaza Drive from the NWC of the project site to the intersection of Plaza Drive and Thunder Drive as well as the replacement and relocation of existing City of Oceanside and City of Vista sewer trunk lines along the southern portion of the project site.
Proposed Disturbed Area	383,838 sq. ft.
Created or Replaced Impervious	252,548 sq. ft.
Project Hydrologic Unit Watershed	☐ Santa Maria ☐ San Luis Rey ☒ Carlsbad
Required to implement HMP	☒ Yes ☐ No

CERTIFICATION PAGE

Project Name: Carmax Oceanside
Permit Application Number: [D19-00021; CUP19-00029]

I hereby declare that I am the Engineer in Responsible Charge of design of storm water BMPs for this project, and that I have exercised responsible charge over the design of the project as defined in Section 6703 of the Business and Professions Code, and that the design is consistent with the requirements of the City of Oceanside BMP Design Manual, which is based on the requirements of San Diego Regional Water Quality Control Board Order No. R9-2013-0001 (MS4 Permit).

I have read and understand that the City has adopted minimum requirements for managing urban runoff, including storm water, from land development activities, as described in the BMP Design Manual. I certify that this SWQMP has been completed to the best of my ability and accurately reflects the project being proposed and the applicable source control and site design BMPs proposed to minimize the potentially negative impacts of this project's land development activities on water quality. I understand and acknowledge that the plan check review of this SWQMP by City staff is confined to a review and does not relieve me, as the Engineer in Responsible Charge of design of storm water BMPs for this project, of my responsibilities for project design.

As Engineer of Work, I agree to indemnify, defend, and hold harmless the City of Oceanside, its officers, agents, and employees from any and all liability, claims, damages, or injuries to any person or property which might arise from the negligent acts, errors, or omissions of the Engineer of Work, my employees, agents or consultants.

Project Vicinity Map

Applicability of Permanent, Post-Construction Storm Water BMP Requirements (Storm Water Intake Form for all Development Permit Applications)	Form I-1

Project Identification

Project Name: Carmax Oceanside	
Permit Application Number: D19-00021; CUP19-00029	Date: 02/28/20

Determination of Requirements

The purpose of this form is to identify permanent, post-construction requirements that apply to the project. This form serves as a short summary of applicable requirements, in some cases referencing separate forms that will serve as the backup for the determination of requirements.

Answer each step below, starting with Step 1 and progressing through each step until reaching "Stop".
Refer to the manual sections and/or separate forms referenced in each step below.

Step	Answer	Progression
Step 1: Is the project a "development project"? See Section 1.3 of the manual for guidance.	☒Yes	Go to Step 2.
	☐No	Stop. Permanent BMP requirements do not apply. No SWQMP will be required. Provide discussion below.
Discussion / justification if the project is not a "development project" (e.g., the project includes *only* interior remodels within an existing building):		
Step 2: Is the project a Standard Project, PDP, or exception to PDP definitions? To answer this item, see Section 1.4 of the manual *in its entirety* for guidance, AND complete Form I-2, Project Type Determination.	☐Standard Project	Stop. Standard Project requirements apply, including Standard Project SWQMP.
	☒PDP	PDP requirements apply, including PDP SWQMP. Go to Step 3.
	☐ Exception to PDP definitions	Stop. Standard Project requirements apply. Provide discussion and list any additional requirements below. Prepare Standard Project SWQMP.
Discussion / justification, and additional requirements for exceptions to PDP definitions, if applicable:		

Form I-1 Page 2 of 2		
Step	**Answer**	**Progression**
Step 3. Is the project subject to earlier PDP requirements due to a prior lawful approval? See Section 1.10 of the manual for guidance.	☐Yes	Consult the [City Engineer] to determine requirements. Provide discussion and identify requirements below. Go to Step 4.
	☒No	BMP Design Manual PDP requirements apply. Go to Step 4.
Discussion / justification of prior lawful approval, and identify requirements (*not required if prior lawful approval does not apply*):		
Step 4. Do hydromodification control requirements apply? See Section 1.6 of the manual for guidance.	☒Yes	PDP structural BMPs required for pollutant control (Chapter 5) and hydromodification control (Chapter 6). Go to Step 5.
	☐No	Stop. PDP structural BMPs required for pollutant control (Chapter 5) only. Provide brief discussion of exemption to hydromodification control below.
Discussion / justification if hydromodification control requirements do <u>not</u> apply:		
Step 5. Does protection of critical coarse sediment yield areas apply? See Section 6.2 of the manual for guidance.	☐Yes	Management measures required for protection of critical coarse sediment yield areas (Chapter 6.2). Stop.
	☒No	Management measures not required for protection of critical coarse sediment yield areas. Provide brief discussion below. Stop.
Discussion / justification if protection of critical coarse sediment yield areas does <u>not</u> apply: Project will not impact any potential critical coarse sediment yield areas according to the WMAA map.		

Project Type Determination Checklist			Form I-2
Project Information			
Project Name: Carmax Oceanside			
Permit Application Number: D19-00021; CUP19-00029			
Project Type Determination: Standard Project or PDP			
The project is (select one): × New Development ☐ Redevelopment			
The total proposed newly created or replaced impervious area is: 252,548 ft² (5.798 acres)			
Is the project in any of the following categories, (a) through (f)?			
Yes ☒	No ☐	(a)	New development projects that create 10,000 square feet or more of impervious surfaces (collectively over the entire project site). This includes commercial, industrial, residential, mixed-use, and public development projects on public or private land.
Yes ☒	No ☐	(b)	Redevelopment projects that create and/or replace 5,000 square feet or more of impervious surface (collectively over the entire project site on an existing site of 10,000 square feet or more of impervious surfaces). This includes commercial, industrial, residential, mixed-use, and public development projects on public or private land.
Yes ☒	No ☐	(c)	New and redevelopment projects that create 5,000 square feet or more of impervious surface (collectively over the entire project site), and support one or more of the following uses: (i) Restaurants. This category is defined as a facility that sells prepared foods and drinks for consumption, including stationary lunch counters and refreshment stands selling prepared foods and drinks for immediate consumption SIC code 5812). (ii) Hillside development projects. This category includes development on any natural slope that is twenty-five percent or greater. (iii) Parking lots. This category is defined as a land area or facility for the temporary parking or storage of motor vehicles used personally, for business, or for commerce. (iv) Streets, roads, highways, freeways, and driveways. This category is defined as any paved impervious surface used for the transportation of automobiles, trucks, motorcycles, and other vehicles.

Form I-2 Page 2 of 2			
Yes ☒	No ☐	(d)	New or redevelopment projects that create or replace 2,500 square feet or more of impervious surface (collectively over the entire project site), and discharging directly to an Environmentally Sensitive Area (ESA). "Discharging directly to" includes flow that is conveyed overland a distance of 200 feet or less from the project to the ESA, or conveyed in a pipe or open channel any distance as an isolated flow from the project to the ESA (i.e. not commingled with flows from adjacent lands). Note: ESAs are areas that include but are not limited to all Clean Water Act Section 303(d) impaired water bodies; areas designated as Areas of Special Biological Significance by the State Water Board and SDRWQCB; State Water Quality Protected Areas; water bodies designated with the RARE beneficial use by the State Water Board and SDRWQCB; and any other equivalent environmentally sensitive areas which have been identified by the Copermittees. See manual Section 1.4.2 for additional guidance.
Yes ☒	No ☐	(e)	New development projects that support one or more of the following uses: (i) Automotive repair shops. This category is defined as a facility that is categorized in any one of the following SIC codes: 5013, 5014, 5541, 7532-7534, or 7536-7539. (ii) Retail gasoline outlets. This category includes retail gasoline outlets that meet the following criteria: (a) 5,000 square feet or more or (b) a projected Average Daily Traffic of 100 or more vehicles per day.
Yes ☒	No ☐	(f)	New or redevelopment projects that result in the disturbance of one or more acres of land and are expected to generate pollutants post construction. *Note: See manual Section 1.4.2 for additional guidance.*

Does the project meet the definition of one or more of the PDP categories (a) through (f) listed above?

☐ No – the project is not a PDP (Standard Project).

☒ Yes – the project is a PDP.

The following is for redevelopment PDPs only:

The area of existing (pre-project) impervious area at the project site is: _____ ft² (A)
The total proposed newly created or replaced impervious area is: _____ ft² (B)
Percent impervious surface created or replaced (A/B)*100: _____%
The percent impervious surface created or replaced is (select one based on the above calculation):

☐ less than or equal to fifty percent (50%) – only new impervious areas are considered PDP

OR

☐ greater than fifty percent (50%) – the entire project site is a PDP

Site Information Checklist For PDPs	Form I-3B (PDPs)
Project Summary Information	
Project Name	Carmax Oceanside
Project Address	SWC of Plaza Drive and Thunder Drive
Assessor's Parcel Number(s)	168-012-42, 43
Permit Application Number	D19-00021; CUP19-00029
Project Watershed (Hydrologic Unit)	Select One: ☐Santa Margarita 902 ☐San Luis Rey 903 ☒Carlsbad 904
Parcel Area (total area of Assessor's Parcel(s) associated with the project)	10.98 Acres (478,210 Square Feet)
Area to be disturbed by the project (Project Area)	8.81 Acres (383,838 Square Feet)
Project Proposed Impervious Area (subset of Project Area)	5.798 Acres (252,548 Square Feet)
Project Proposed Pervious Area (subset of Project Area)	3.01 Acres (131,291 Square Feet)
Note: Proposed Impervious Area + Proposed Pervious Area = Area to be Disturbed by the Project. This may be less than the Parcel Area.	

Hydrologic Unit	Hydrologic Area	Hydrologic Sub-Area
Santa Margarita 902.00	☐ Ysidora 902.10	☐ Lower Ysidora 902.11
San Luis Rey 903.00	☐ Lower San Luis 903.10	☐ Mission 903.11
		☐ Bonsall 903.12
Carlsbad 904.00	☐ Loma Alta 904.10	Not Applicable

Form I-3B Page 2 of 10
Description of Existing Site Condition and Drainage Patterns
Current Status of the Site (select all that apply): ☐Existing development ☒Previously graded but not built out ☐Agricultural or other non-impervious use ☒Vacant, undeveloped/natural Description / Additional Information: The site has been previously graded and backfilled to varying depths of 2'-12' across the site. The site has been left vacant and undeveloped since approximately the 1990's. Disturbed native vegetation exists on-site.
Existing Land Cover Includes (select all that apply): ☒Vegetative Cover ☒Non-Vegetated Pervious Areas ☐Impervious Areas Description / Additional Information: The majority of the site is non-vegetated pervious area. A small portion of the site to the south and southeast of the site contains disturbed vegetation.
Underlying Soil belongs to Hydrologic Soil Group (select all that apply): ☐NRCS Type A ☐NRCS Type B ☐NRCS Type C ☒NRCS Type D
Approximate Depth to Groundwater: ☐Groundwater Depth < 5 feet ☐5 feet < Groundwater Depth < 10 feet ☐10 feet < Groundwater Depth < 20 feet ☒Groundwater Depth > 20 feet

Description of Existing Site Topography and Drainage [How is storm water runoff conveyed from the site? At a minimum, this description should answer (1) whether existing drainage conveyance is natural or urban; (2) describe existing constructed storm water conveyance systems, if applicable; and (3) is runoff from offsite conveyed through the site? If so, describe]:

The site is divided into a "North" and "South" portions separated by Plaza Drive. The "North" site is bound to the north by Highway 78 and to the south by Plaza Drive. This portion of the site surface flows to the southwest corner of the site where it eventually makes its way onto Plaza Drive. Plaza Drive drainage flows west towards the intersection of Highway 78 and Plaza Drive where it enters a curb inlet which will ultimately drain to Buena Vista Creek.

The "South" site is bound to the north by Plaza Drive, to the south by Buena Vista Creek, to the west by an existing shopping center and to the east by Thunder Drive. This portion of the site surface flows in a southwesterly general direction. The south site sheet flows directly into Buena Vista Creek.

The neighboring DMV parking lot slopes down towards the project site at an approximate slope of 2:1. This permeable slope area consists of approximately 12,546 SF. This areas drainage is conveyed through the project site via surface flow and ultimately drains into Buena Vista Creek at the southwest corner of the site.

Description of Proposed Site Development and Drainage Patterns

Project Description / Proposed Land Use and/or Activities:

Project proposes a 5.789 acre Carmax dealership, service center, sales floor, and carwash on existing 10.98 acre site. Proposed dealership will include 502 asphalt concrete parking spaces on both north and south sides of Plaza Drive. Offsite surface improvements include the full width improvements and dedication of Plaza Drive to an 84' right-of-way width. The full width improvements will include an additional travel lane as well as curb, gutter and sidewalk on both north and south sides of Plaza Drive. The "north" side will be constructed solely of permeable materials therefore; no storm water mitigation or water quality is necessary.

The "south" side storm water runoff will be conveyed through underground pipes from various parts of the site to an underground partial infiltration proprietary bio-filtration system. This partial infiltration proprietary bio-filtration system consists of 58 proprietary underground vaults. The vaults will be open bottom and will sit on a 6" gravel layer. The proprietary partial infiltration bio-filtration system will take care of 14% of the site DCV as shown in the bio-filtration retention calculations attached as well as address Q100 and hydromodification concerns. The remaining 86% of the site DCV will then enter a proprietary water quality modular wetland. Once the DCV has been treated it will exit the modular wetland at the southwest corner of the site and enter Buena Vista Creek (POC-3) as it does in existing conditions.

The Plaza Drive expansion on both the north and south sides will be treated via tree wells. The design calls for (4) 30' trees on each side to treat the proposed road expansion for hydromodification and water quality. The (4) 30' trees will also treat the existing road area for water quality purposes. The County spreadsheet detailing these calculations is attached to this report.

List/describe proposed impervious features of the project (e.g., buildings, roadways, parking lots, courtyards, athletic courts, other impervious features):

Impervious features on the "south" side consist of parking lots, sales floor building, carwash, and service center. Offsite impervious features consist of Plaza Drive road widening and curb, gutter and sidewalk improvements.

List/describe proposed pervious features of the project (e.g., landscape areas):

The "north" side will be constructed solely of permeable material. On the "south" side proposed pervious features include landscape islands within parking lot. Offsite pervious features include parkway landscape areas on Plaza Drive and Thunder Drive as well as 12' DG sewer easement and access road to the south of the site. The site will not be developed south of the 12' DG sewer easement and therefore will remain pervious, see DMA exhibit for reference. Existing slope area north of the site between the existing DMV and the proposed parking lot will also remain as permeable landscaped areas.

Does the project include grading and changes to site topography?

☒Yes

☐No

Description / Additional Information:

The site will be graded to allow for a shallower slope from existing conditions. The site is designed to be a balanced site and will ultimately require 13,000 CY of earthwork. The proposed site grading will generally slope south, in the same direction as existing conditions. The site will create various low points throughout that will ultimately discharge at the same location as existing conditions.

Does the project include changes to site drainage (e.g., installation of new storm water conveyance systems)?

☒Yes

☐No

Description / Additional Information:

The "north" side will drain in the same manner as existing conditions. The site will be constructed using permeable materials that will outlet via an under sidewalk drain at POC-1. The "south" side will drain via a series of on-site storm drain inlets. All inlets will direct storm water to the proprietary underground bio-filtration system that will ultimately outlet at POC-3.

Form I-3B Page 5 of 10

Identify whether any of the following features, activities, and/or pollutant source areas will be present (select all that apply):

☒Onsite storm drain inlets

☒Interior floor drains and elevator shaft sump pumps

☐Interior parking garages

☒Need for future indoor & structural pest control

☒Landscape/outdoor pesticide use

☒Pools, spas, ponds, decorative fountains, and other water features

☐Food service

☒Refuse areas

☐Industrial processes

☐Outdoor storage of equipment or materials

☒Vehicle and equipment cleaning

☒Vehicle/equipment repair and maintenance

☒Fuel dispensing areas

☐Loading docks

☐Fire sprinkler test water

☒Miscellaneous drain or wash water

☒Plazas, sidewalks, and parking lots

Form I-3B Page 6 of 10		
Identification of Receiving Water Pollutants of Concern		
Describe path of storm water from the project site to the Pacific Ocean (or bay, lagoon, lake or reservoir, as applicable): Runoff from the "north" site will be discharged via under sidewalk drain onto Plaza Drive. The discharge will flow west and enter a curb inlet just east of the intersection of Plaza Drive and Highway 78. The discharge will then flow via a series of underground pipes into Buena Vista Creek. Buena Vista creek flows west and ultimately contributes to Buena Vista Lagoon. Buena Vista Lagoon then discharges into the Pacific Ocean. The "south" side will flow into a proprietary underground bio-filtration system that will be discharged into Buena Vista Creek and then will follow the flow path of the north side development towards Buena Vista Creek and ultimately into the Pacific Ocean.		
List any 303(d) impaired water bodies within the path of storm water from the project site to the Pacific Ocean (or bay, lagoon, lake or reservoir, as applicable), identify the pollutant(s)/stressor(s) causing impairment, and identify any TMDLs for the impaired water bodies:		
303(d) Impaired Water Body	**Pollutant(s)/Stressor(s)**	**TMDLs**
Buena Vista Creek	Benthic Community Effects – hydromodification, illicit connections, urban runoff Selenium – Source Unknown	N/A
Buena Vista Lagoon	Indicator Bacteria – Source unknown Nutrients – Source unknown Sedimentation/Siltation – Source unknown	N/A
Pacific Ocean Shoreline, Buena Vista Creek HA, at Buena Vista Lagoon Outlet	Indicator bacteria – Trash Nutrients – Source unknown Sedimentation/Siltation – Source unknown	N/A

Form I-3B Page 7 of 10			
Identification of Project Site Pollutants* ***Identification of project site pollutants is only required if flow-thru treatment BMPs are implemented onsite in lieu of retention or biofiltration BMPs (note the project must also participate in an alternative compliance program unless prior lawful approval to meet earlier PDP requirements is demonstrated)**			
Identify pollutants expected from the project site based on all proposed use(s) of the site (see manual Appendix B.6):			
Pollutant	**Not Applicable to the Project Site**	**Expected from the Project Site**	**Also a Receiving Water Pollutant of Concern**
Sediment		X	X
Nutrients		X	X
Heavy Metals		X	X
Organic Compounds	X		X
Trash & Debris		X	X
Oxygen Demanding Substances		X	X
Oil & Grease		X	X
Bacteria & Viruses		X	X
Pesticides		X	X

Note: Indicator Bacteria shall be addressed as a Pollutant of Concern (POC) for projects located in the Lower San Luis Hydrologic Area and for projects that discharge to the Pacific Ocean Shoreline within the boundaries of the City of Oceanside.

Note: Nutrients shall be addressed as a Pollutant of Concern (POC) for projects located in the Loma Alta Hydrologic Area.

Hydromodification Management Requirements

Do hydromodification management requirements apply (see Section 1.6 of the manual)?

☒Yes, hydromodification management flow control structural BMPs required.

☐No, the project will discharge runoff directly to existing underground storm drains discharging directly to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean.

☐No, the project will discharge runoff directly to conveyance channels whose bed and bank are concrete-lined all the way from the point of discharge to water storage reservoirs, lakes, enclosed embayments, or the Pacific Ocean.

☐No, the project will discharge runoff directly to an area identified as appropriate for an exemption by the WMAA for the watershed in which the project resides.

Description / Additional Information (to be provided if a 'No' answer has been selected above):

Critical Coarse Sediment Yield Areas*

***This Section only required if hydromodification management requirements apply**

Based on the maps provided within the WMAA, do potential critical coarse sediment yield areas exist within the project drainage boundaries?

☐Yes

☒No, no critical coarse sediment yield areas to be protected based on WMAA maps

If yes, have any of the optional analyses presented in Section 6.2 of the manual been performed?

☐6.2.1 Verification of GLUs Onsite

☐6.2.2 Downstream Systems Sensitivity to Coarse Sediment

☐6.2.3 Optional Additional Analysis of Potential Critical Coarse Sediment Yield Areas Onsite

☐No optional analyses performed, the project will avoid critical coarse sediment yield areas identified based on WMAA maps

If optional analyses were performed, what is the final result?

☐No critical coarse sediment yield areas to be protected based on verification of GLUs onsite.

☐Critical coarse sediment yield areas exist but additional analysis has determined that protection is not required. Documentation attached in Attachment 8 of the SWQMP.

☐Critical coarse sediment yield areas exist and require protection. The project will implement management measures described in Sections 6.2.4 and 6.2.5 as applicable, and the areas are identified on the SWQMP Exhibit.

Discussion / Additional Information:

Flow Control for Post-Project Runoff*

***This Section only required if hydromodification management requirements apply**

List and describe point(s) of compliance (POCs) for flow control for hydromodification management (see Section 6.3.1). For each POC, provide a POC identification name or number correlating to the project's HMP Exhibit and a receiving channel identification name or number correlating to the project's HMP Exhibit.

The site will discharge to four different POC's. The northerly site, DMA-1A, B, and C, will drain to POC-1 via permeable pavement materials and then to an under sidewalk drain that will outlet at the existing POC on Plaza Drive known as POC-1. POC-2 located on Plaza Drive will discharge runoff from the existing Plaza Drive street section as well as the additional Plaza Drive improvements. POC-3 near the southwesterly corner of the project site will drain the majority of the project site via storm drain and headwall. The existing POC-4 drains a small portion of the proposed driveways on Thunder Drive. Storm water flowing through POC-4 will make its way into a downstream curb inlet and into Buena Vista Creek.

Has a geomorphic assessment been performed for the receiving channel(s)?

☒No, the low flow threshold is 0.1Q2 (default low flow threshold)

☐Yes, the result is the low flow threshold is 0.1Q2

☐Yes, the result is the low flow threshold is 0.3Q2

☐Yes, the result is the low flow threshold is 0.5Q2

If a geomorphic assessment has been performed, provide title, date, and preparer:

Discussion / Additional Information: (optional)

Form I-3B Page 10 of 10
Other Site Requirements and Constraints
When applicable, list other site requirements or constraints that will influence storm water management design, such as zoning requirements including setbacks and open space, or local codes governing minimum street width, sidewalk construction, allowable pavement types, and drainage requirements. The north side of the site will be constructed of fully permeable materials and outlet at POC-1 in post-construction. The south side of the site is constrained by a wetland buffer to Buena Vista Creek. Therefore all water quality treatment and storage must remain on the north side of the wetland buffer. The existing Plaza Drive will be expanded to a full right-of-way width of 84'. This expansion will include an additional travel lane in each direction, a center turning lane, curb, gutter and sidewalk on north and south sides of Plaza Drive. Expansion of Plaza Drive will require storm water treatment. Plaza Drive expansion will be treated via tree wells with under sidewalk drains. The tree wells are sized to treat the existing road for water quality purposes and treat the Plaza Drive expansion for water quality and hydromodification.
Optional Additional Information or Continuation of Previous Sections As Needed

This space provided for additional information or continuation of information from previous sections as needed.

Source Control BMP Checklist for All Development Projects (Standard Projects and PDPs)	Form I-4

Project Identification

Project Name: Carmax Oceanside

Permit Application Number: D19-00021; CUP19-00029

Source Control BMPs

All development projects must implement source control BMPs SC-1 through SC-6 where applicable and feasible. See Chapter 4 and Appendix E of the manual for information to implement source control BMPs shown in this checklist.

Answer each category below pursuant to the following.

- "Yes" means the project will implement the source control BMP as described in Chapter 4 and/or Appendix E of the manual. Discussion / justification is not required.
- "No" means the BMP is applicable to the project but it is not feasible to implement. Discussion / justification must be provided.
- "N/A" means the BMP is not applicable at the project site because the project does not include the feature that is addressed by the BMP (e.g., the project has no outdoor materials storage areas). Discussion / justification may be provided.

Source Control Requirement	Implemented?		
SC-1 Prevention of Illicit Discharges into the MS4	☒ Yes	☐ No	☐ N/A
Discussion / justification if SC-1 not implemented:			
SC-2 Storm Drain Stenciling or Signage	☒ Yes	☐ No	☐ N/A
Discussion / justification if SC-2 not implemented:			
SC-3 Protect Outdoor Materials Storage Areas from Rainfall, Run-On, Runoff, and Wind Dispersal	☐ Yes	☐ No	☒ N/A
Discussion / justification if SC-3 not implemented:			

Form I-4 Page 2 of 3			
Source Control Requirement	**Implemented?**		
SC-4 Protect Materials Stored in Outdoor Work Areas from Rainfall, Run-On, Runoff, and Wind Dispersal	☐ Yes	☐ No	☒ N/A
Discussion / justification if SC-4 not implemented:			
SC-5 Protect Trash Storage Areas from Rainfall, Run-On, Runoff, and Wind Dispersal	☒ Yes	☐ No	☐ N/A
Discussion / justification if SC-5 not implemented:			

Form I-4 Page 3 of 3			
SC-6 Additional BMPs Based on Potential Sources of Runoff Pollutants (must answer for each source listed below)	**Implemented?**		
Onsite storm drain inlets	☒ Yes	☐ No	☐ N/A
Interior floor drains and elevator shaft sump pumps	☒ Yes	☐ No	☐ N/A
Interior parking garages	☐ Yes	☐ No	☒ N/A
Need for future indoor & structural pest control	☒ Yes	☐ No	☐ N/A
Landscape/outdoor pesticide use	☒ Yes	☐ No	☐ N/A
Pools, spas, ponds, decorative fountains, and other water features	☐ Yes	☐ No	☒ N/A
Food service	☐ Yes	☐ No	☒ N/A
Refuse area	☒ Yes	☐ No	☐ N/A
Industrial processes	☐ Yes	☐ No	☒ N/A
Outdoor storage of equipment or materials	☐ Yes	☐ No	☒ N/A
Vehicle and equipment cleaning	☒ Yes	☐ No	☐ N/A
Vehicle/equipment repair and maintenance	☒ Yes	☐ No	☐ N/A
Fuel dispensing areas	☒ Yes	☐ No	☐ N/A
Loading docks	☐ Yes	☐ No	☒ N/A
Fire sprinkler test water	☒ Yes	☐ No	☐ N/A
Miscellaneous drain or wash water	☒ Yes	☐ No	☐ N/A
Plazas, sidewalks, and parking lots	☒ Yes	☐ No	☐ N/A

Discussion / justification if SC-6 not implemented. Clearly identify which sources of runoff pollutants are discussed. Justification must be provided for all "No" answers shown above.

Onsite Storm Drain Inlets

- Mark all inlets with the words "No Dumping! Flows to Ocean" or similar
- Maintain and periodically repair or replace inlet markings
- Provide storm water pollution prevention information to new site owners, lessees, or operators

Interior Floor Drains and Elevator Shaft Sump Pumps

- Interior floor drains and elevator shaft sump pumps will be plumbed to sanitary sewer
- Inspect and maintain drains to prevent blockages and overflow

Need for Future Indoor & Structural Pest Control

- Note building design features that discourage entry of pests.
- Provide integrated pest management information to owners, lessees, and operators

Landscape/ Outdoor Pesticide Use

- Preserve existing drought tolerant trees, shrubs, and ground cover to the maximum extent possible
- Design landscaping to minimize irrigation and runoff, propose surface infiltration where appropriate, and minimize the use of fertilizers and pesticides that can contribute to storm water pollution.
- Where landscape areas are used to retain or detail storm water, specify plants that are tolerant of periodic saturated soil conditions.
- Consider using pest-resistant plans, especially adjacent to hardscape
- To ensure successful establishment, select plans appropriate to site soils, slopes, climate, sun, wind, rain, land use, air, movement, ecological consistency, and plant interactions
- Maintain landscaping using minimum or no pesticides
- See applicable operational BMP's in Fact Sheet SC-41 "Building and Grounds Maintenance", in CASQA Storm Water Quality Handbooks
- Provide IPM information to new owners, lessees, and operators.

Refuse Areas

- Provide adequate number of receptacles. Inspect receptacles regularly; repair or replace leaky receptacles. Keep receptacles covered. Prohibit/prevent dumping of liquid or hazardous wastes. Post "No hazardous materials" signs. Inspect and pick-up litter daily and clean up spills immediately. Keep spill control materials available on-site. See fact sheet SC-34, "Waste Handling and Disposal" in the CASQA Storm Water Quality Handbooks.

Fire Sprinkler Test Water

- Provide means to drain fire sprinkler test water to sanitary sewer.

Miscellaneous Drain or Wash Water

- Boiler drain lines must be directly or indirectly connected to the sanitary sewer system and may not discharge to the storm drain system.
- Condensate drain lines may discharge to landscaped areas if the flow is small enough that runoff will not occur. Condensate drain lines may not discharge to the storm drain system.
- Rooftop mounted equipment with potential to produce pollutants must be roofed and/or have secondary containment.
- Any drainage sumps onsite must feature a sediment sump to reduce the quantity of sediment in pumped water.
- Avoid roofing, gutters, and trim made of copper or other unprotected metals that may leach into runoff.

Plazas, Sidewalks, and Parking Lots

- Plazas, sidewalks and parking lots must be swept regularly to prevent the accumulation of litter and debris.
- Debris from pressure washing must be collected to prevent entry into the storm drain system. Wash water containing any cleaning agent or degreaser must be collected and discharged to the sanitary sewer system and not discharged to a storm drain.

The following activities and/or features are not part of proposed commercial development: interior parking garages, pools, spas, ponds, decorative fountains, and other water features, industrial processes, and loading docks. The following outdoor activities are discouraged: storage of equipment or materials, vehicle/ equipment cleaning, repair, and/or maintenance.

Site Design BMP Checklist for All Development Projects (Standard Projects and PDPs)	Form I-5

Project Identification

Project Name: Carmax Oceanside

Permit Application Number: D19-00021; CUP19-00029

Site Design BMPs

All development projects must implement site design BMPs SD-1 through SD-8 where applicable and feasible. See Chapter 4 and Appendix E of the manual for information to implement site design BMPs shown in this checklist.

Answer each category below pursuant to the following.

- "Yes" means the project will implement the site design BMP as described in Chapter 4 and/or Appendix E of the manual. Discussion / justification is not required.
- "No" means the BMP is applicable to the project but it is not feasible to implement. Discussion / justification must be provided.
- "N/A" means the BMP is not applicable at the project site because the project does not include the feature that is addressed by the BMP (e.g., the project site has no existing natural areas to conserve). Discussion / justification may be provided.

Site Design Requirement	Applied?		
SD-1 Maintain Natural Drainage Pathways and Hydrologic Features	☒ Yes	☐ No	☐ N/A
Discussion / justification if SD-1 not implemented:			
SD-2 Conserve Natural Areas, Soils, and Vegetation	☒ Yes	☐ No	☐ N/A
Discussion / justification if SD-2 not implemented:			
SD-3 Minimize Impervious Area	☒ Yes	☐ No	☐ N/A
Discussion / justification if SD-3 not implemented:			
SD-4 Minimize Soil Compaction	☒ Yes	☐ No	☐ N/A
Discussion / justification if SD-4 not implemented:			

Form I-5 Page 2 of 2			
Site Design Requirement	**Applied?**		
SD-5 Impervious Area Dispersion	☒ Yes	☐ No	☐ N/A
Discussion / justification if SD-5 not implemented:			
SD-6 Runoff Collection	☐ Yes	☐ No	☒ N/A
Discussion / justification if SD-6 not implemented: Runoff collection is infeasible. Runoff will be directed to underground detention system before release into Buena Vista Creek.			
SD-7 Landscaping with Native or Drought Tolerant Species	☒ Yes	☐ No	☐ N/A
Discussion / justification if SD-7 not implemented:			
SD-8 Harvesting and Using Precipitation	☐ Yes	☐ No	☒ N/A
Discussion / justification if SD-8 not implemented: Harvest and reuse of precipitation is infeasible, all runoff will be directed towards an underground detention system. The use of rain barrels is infeasible due to restrictions in available space to include them. The project proposes approximately 502 parking spaces, sales office space, service center, and car wash. In order for the project to be profitable there are a minimum amount of parking spaces required and because of southerly site constraints the project cannot be expanded, therefore rain harvesting space is infeasible.			

Summary of PDP Structural BMPs	Form I-6 (PDPs)
Project Identification	
Project Name: Carmax Oceanside	
Permit Application Number: D19-00021; CUP19-00029	
PDP Structural BMPs	
All PDPs must implement structural BMPs for storm water pollutant control (see Chapter 5 of the manual). Selection of PDP structural BMPs for storm water pollutant control must be based on the selection process described in Chapter 5. PDPs subject to hydromodification management requirements must also implement structural BMPs for flow control for hydromodification management (see Chapter 6 of the manual). Both storm water pollutant control and flow control for hydromodification management can be achieved within the same structural BMP(s). PDP structural BMPs must be verified by the local jurisdiction at the completion of construction. This may include requiring the project owner or project owner's representative to certify construction of the structural BMPs (see Section 1.12 of the manual). PDP structural BMPs must be maintained into perpetuity, and the local jurisdiction must confirm the maintenance (see Section 7 of the manual). Use this form to provide narrative description of the general strategy for structural BMP implementation at the project site in the box below. Then complete the PDP structural BMP summary information sheet (page 3 of this form) for each structural BMP within the project (copy the BMP summary information page as many times as needed to provide summary information for each individual structural BMP).	

Describe the general strategy for structural BMP implementation at the site. This information must describe how the steps for selecting and designing storm water pollutant control BMPs presented in Section 5.1 of the manual were followed, and the results (type of BMPs selected). For projects requiring hydromodification flow control BMPs, indicate whether pollutant control and flow control BMPs are integrated or separate.

The proposed project site was delineated in different DMA's per Section 3.3.3 of the City of Oceanside BMP Design Manual. There are a total of eight DMA areas and four POC's.

There are a total of three DMA areas contributing to POC-1. DMA-1A is comprised of permeable pavement and therefore is self-retaining. DMA-1B is the proposed Plaza Drive street expansion and DMA-1C is the northerly half of existing Plaza Drive. Water quality for this area will be addressed tree wells along the Plaza Drive right-of-way (ROW). Detailed calculations will be included as part of the Plaza Drive improvement plan submittal.

Two DMA areas contribute to POC-2. DMA-2A is the southerly half of the existing Plaza Drive while DMA-2B is the proposed southerly expansion of Plaza Drive. Water quality for these areas will be provided via tree wells. Detailed calculations to be provided as part of the Plaza Drive improvement plan submittal.

DMA-3A and 3B contribute to POC-3. DMA-3A is made up of the majority of the proposed Carmax site. The area will drain to an underground proprietary bio-filtration system comprised of concrete vaults with an open bottom. According to the Preliminary Percolation Evaluation report provided by EEI Engineering Solutions dated October 25, 2019 partial infiltration is feasible. Infiltration will be achieved via the open-bottom proprietary underground system which will sit over a 6" layer of gravel. The open-bottom tanks will also retain 14% of the DMA-3A's DCV as well as address Q100 and hydromodification concerns. The DCV was calculated using the City's Design Capture volume spreadsheet most adequate for proprietary BMP's. Retention calculations are also attached in Appendix 1. The remaining 86% of the DCV will then flow from the underground retention system into a proprietary bio-filtration system, also known as a modular wetland. The modular wetland will then treat the remaining DCV before ultimately discharging into Buena Vista Creek at the southwest corner of the site (POC-3). DMA-3B is solely permeable area and is classified as a bypass area. The area drains in a southwesterly direction towards POC-3; due to its permeability it is self-treating and therefore does not require water quality treatment.

Runoff from DMA-4 will contribute to POC-4. Runoff will bypass treatment as this is a driveway entrance to the site and is topographically unable to be treated. The area is classified as de-minimus. Storm water runoff will leave the site via curb and gutter and flow south towards a curb inlet on Thunder Drive. Water will then enter Buena Vista Creek and ultimately confluence at POC-3.

Form I-6 Page 3 of 4 (Copy as many as needed)	
Structural BMP Summary Information **(Copy this page as needed to provide information for each individual proposed structural BMP)**	
Structural BMP ID No. : BMP-1	
Construction Plan Sheet No. C-4	
Type of structural BMP: ☐Retention by harvest and use (HU-1) ☐Retention by infiltration basin (INF-1) ☐Retention by bioretention (INF-2) ☐Retention by permeable pavement (INF-3) ☒Partial retention by biofiltration with partial retention (PR-1) ☐Biofiltration (BF-1) ☐Flow-thru treatment control with prior lawful approval to meet earlier PDP requirements (provide BMP type/description in discussion section below) ☐Flow-thru treatment control included as pre-treatment/forebay for an onsite retention or biofiltration BMP (provide BMP type/description and indicate which onsite retention or biofiltration BMP it serves in discussion section below) ☐Flow-thru treatment control with alternative compliance (provide BMP type/description in discussion section below) ☒Detention pond or vault for hydromodification management ☒Other (describe in discussion section below) The structural BMP provided are underground concrete storage vaults with an open bottom in combination with a proprietary bio-filtration device. Together these provide the retention and water quality treatment required for the site.
