Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Statewide
Region: California
Calendar Year: 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours

EXECUTIVE SUMMARY

PURPOSE AND SCOPE

North Coast Land Holdings, LLC has applied for entitlements to redevelop property on the Strawberry Peninsula in unincorporated Marin County. The proposed development would include renovation of an existing academic campus, relocation of an existing daycare center, construction of a new fitness center, construction of a new residential care facility, upgrades to existing housing and construction of new housing, retention and access improvements to existing open space and recreation areas, and creation of new bicycle and pedestrian paths throughout the property (project).

Ascent was retained by Marin County (County) to conduct this Historical Resource Evaluation Report for the North Coast Land Holdings Project. The project site is located on privately-owned lands of the former Golden Gate Baptist Theological Seminary (GGBTS) at 201 Seminary Drive, on Assessor's Parcel Number (APN) 043-261-25; 043-261-26; 043-401-05; 043-401-10; 043-401-16; 043-402-03; and 043-402-06. No development is proposed on the Richardson Bay Parcels (APN 043-262-03 and 043-262-06) and, thus, they are not included as part of the project.

Ascent inventoried the built-environment features present within the project site and evaluated the GGBTS at a district level for potential listing in the National Register of Historic Places (NRHP) and the California Register of Historical Resources (CRHR) to determine if the project has the potential to cause a substantial adverse change to historical resource under CEQA. Because the administration and academic buildings are the only features to have the potential to be individually eligible, they were evaluated for individual NRHP- and CRHR-eligibility as well. This analysis complies with Section 15064.5(a)(2)-(3) of the CEQA Guidelines.

CONCLUSION AND RECOMMENDATIONS

This investigation recorded and evaluated the GGBTS at a district level; the property is recommended not eligible for inclusion in the NRHP and CRHR. Similarly, the administration and academic buildings were evaluated for individual eligibility and recommended not eligible. Therefore, the project would have no significant impact on historical resources for the purposes of CEQA. No further investigation or treatment measures are recommended.

PERSONNEL QUALIFICATIONS

Alta Cunningham has over 19 years of experience in the environmental consulting field. Her experience as an architectural historian includes archival research, historic building and structure surveys and evaluations, evaluating project for consistency with the Secretary of the Interior's Standards, and cultural resources documentation for NEPA and CEQA projects ranging from single building evaluations to district-wide surveys for CEQA, PRC 5024, and Section 106 compliance documents. Alta has completed evaluations for higher education facilities, California's correctional facilities, pre- and post-World War II residential and commercial buildings, agricultural properties, and water conveyance systems. Alta received her Bachelor of Science in History from the University of California, Davis, and a Master of Arts in Historic Preservation from the Savannah College of Art and Design. She meets the Secretary of the Interior's Professional Qualification Standards for architectural history and history.

1 INTRODUCTION

Marin County (County) retained Ascent Environmental (Ascent) to complete a Historical Resource Evaluation Report (HRER) for the North Coast Land Holdings Project (project) to support a draft environmental impact report (Draft EIR) being prepared for the project. Ascent prepared this HRER in compliance with Section 15064.5(a)(2)-(3) of the CEQA Guidelines, using the criteria outlined in Section 5024.1 of the California Public Resources Code. This HRER details the methods and results of the study, which consisted of an archival review, field survey, and research of comparative studies, in support of the evaluation of the property.

1.1 PROJECT DESCRIPTION

The project is located on the former GGBTS campus property in the community of Strawberry, a census-designated place in unincorporated Marin County, California, next to the City of Mill Valley. The GGBTS campus address is 201 Seminary Drive on the Strawberry Peninsula, which extends into Richardson Bay. The campus consists of ten Assessor's Parcels, two of which have boundaries that extend into Richardson Bay (the "Richardson Bay Parcels"). The GGBTS campus is approximately 127 acres in size and bound by Richard Drive, Seminary Drive, and East Strawberry Drive (Figure 1-1). The properties composing the project site total approximately 104.8 acres and include APNs 043-261-25, 043-261-26, 043-401-05, 043-401-10, 043-401-16, 043-402-03, 043-402-05, and 043-402-06. No development is proposed on the Richardson Bay Parcels (APN 043-262-03 and 043-262-06) and, thus, they are not included as part of the project.

Regional access to the project site is available from U.S. Highway 101 (U.S. 101) and State Route 131 (SR 131; Tiburon Boulevard). The project site is directly accessible from Seminary Drive, both at Hodges Drive and Gilbert Drive. Other access points to the project site include Mission Drive, East Strawberry Drive, Chapel Drive, and Reed Boulevard.

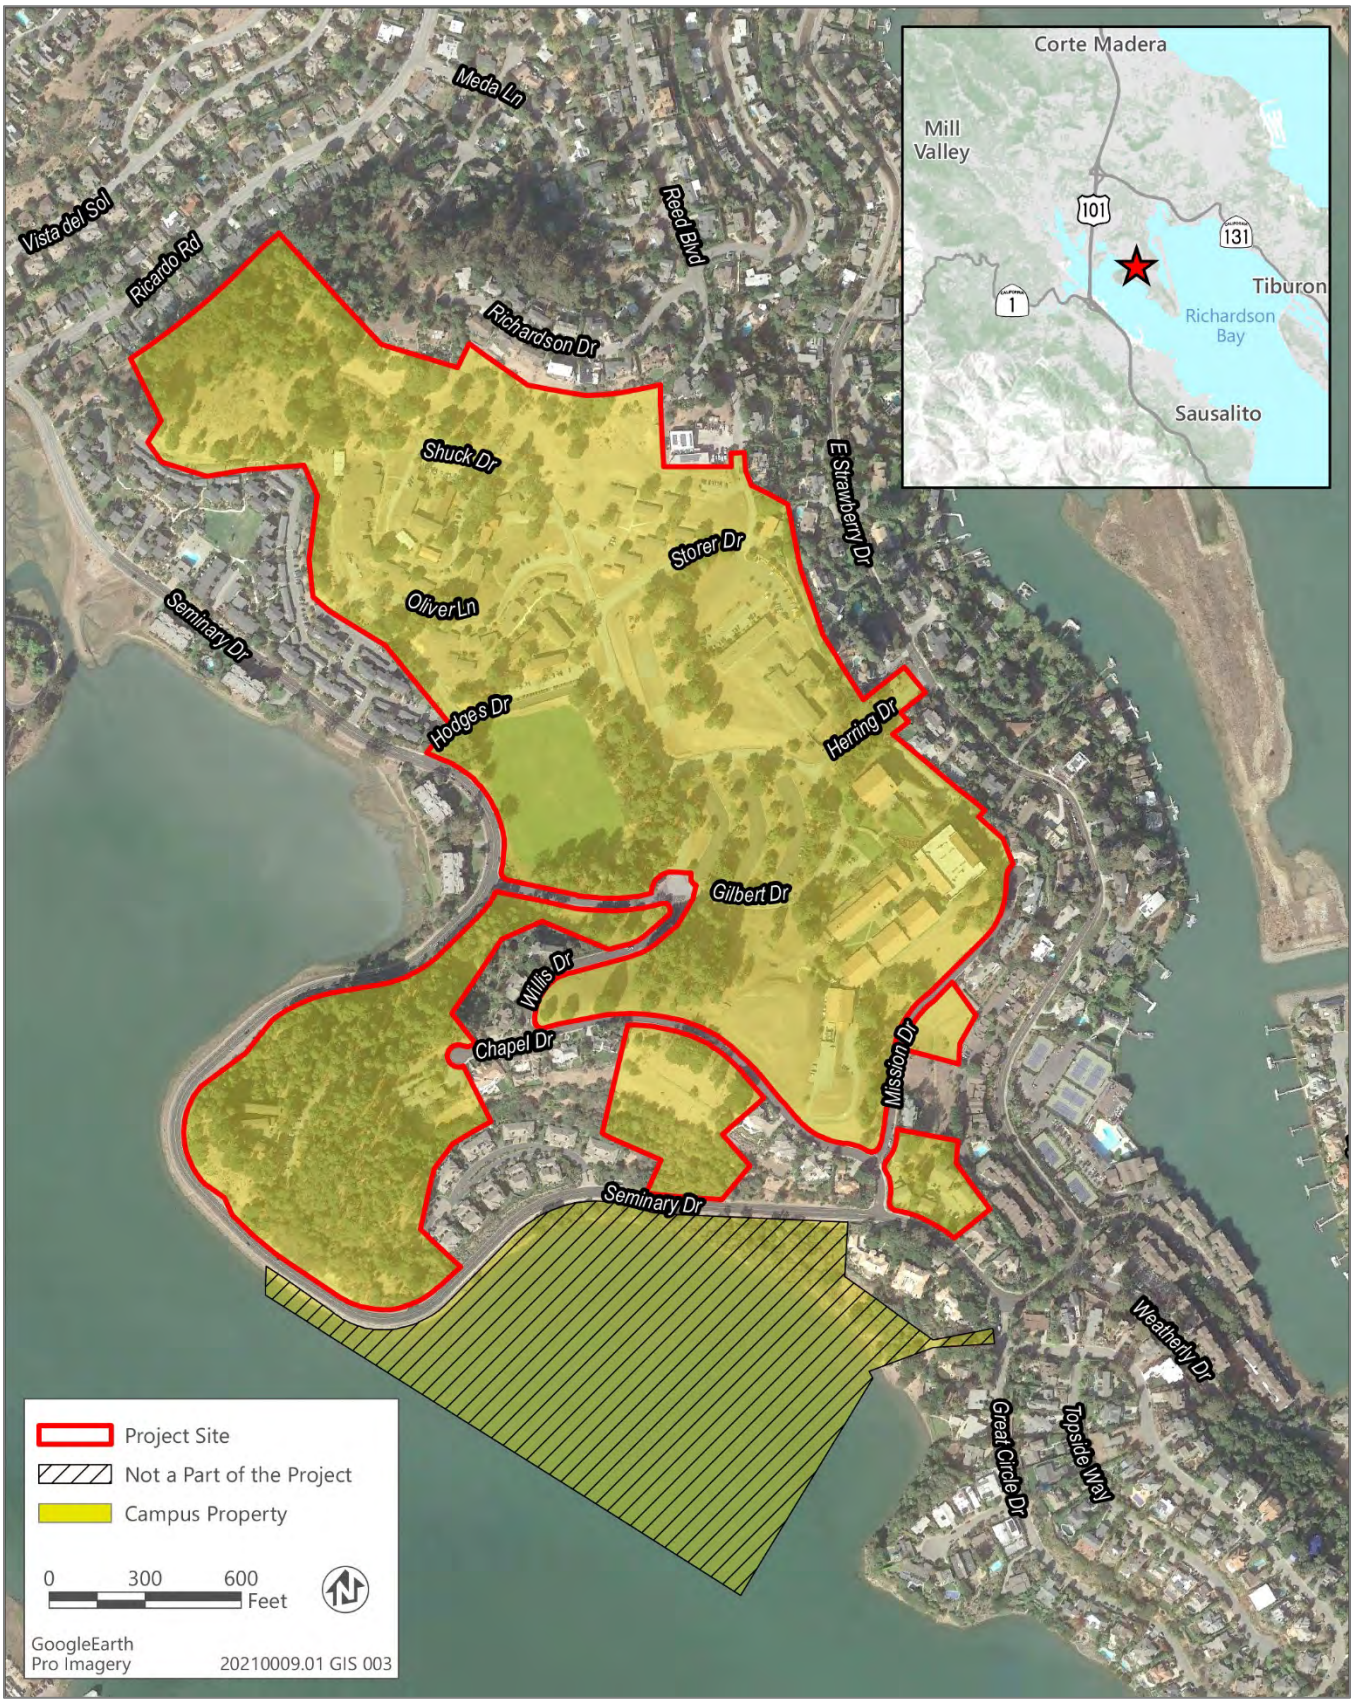
The project would include renovation of an existing academic campus, relocation of an existing daycare center, construction of a new fitness center, construction of a new residential care facility, upgrades to existing housing and construction of new housing, retention and access improvements to existing open space and recreation areas, and creation of new bicycle and pedestrian paths throughout the project site. Two new buildings would be constructed including a new 20,000-square-foot facility for the daycare and fitness center and a 267,354-square foot residential care facility. Renovation of the existing administration building will add 15,800-sqaure feet of floor area resulting in a 41,000-square foot building. Demolition of the existing maintenance building is proposed with the construction of a new 2,200-square-foot maintenance building. The addition of 324 residential units including single and multi-family residences would result in new construction as well as replace existing residences and dorm rooms. To facilitate residential and other activities, landscape and hardscape improvements associated with the school campus and residential development, including parking, playfields and a network of walkways and pedestrian-friendly streets as well as a dedicated open space with a network of trails is proposed.

1.2 REGULATORY CONTEXT

1.2.1 Federal

NATIONAL HISTORIC PRESERVATION ACT

Historic properties are protected through the National Historic Preservation Act (NHPA) of 1966 (16 USC 470f) and its implementing regulations (16 USC 470 et seq., 36 CFR 800, 36 CFR 60, and 36 CFR 63). The NHPA establishes the federal government's policy on historic preservation and the programs, including the NRHP, through which that policy is implemented. Under the NHPA, historic properties include "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places" (16 USC 470w (5)).



Source: adapted by Ascent Environmental in 2020

Figure 1-1 Project Area

The formal criteria (36 CFR 60.4) for determining NRHP eligibility are as follows:

1. The property is at least 50 years old (however, properties under 50 years of age that are of exceptional importance or are contributors to a district can also be included in the NRHP);
2. It retains integrity of location, design, setting, materials, workmanship, feeling, and associations; and
3. It possesses at least one of the following characteristics:

   Criterion A Is associated with events that have made a significant contribution to the broad patterns of history (events).

   Criterion B Is associated with the lives of persons significant in the past (persons).

   Criterion C Embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant, distinguishable entity whose components may lack individual distinction (architecture).

   Criterion D Has yielded, or may be likely to yield, information important in prehistory or history (information potential).

For a property to retain and convey historic integrity it must possess most of the seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association. **Location** is the place where the historic property was constructed or the place where a historic event occurred. Integrity of location refers to whether the property has been moved since its construction. **Design** is the combination of elements that create the form, plan, space, structure, and style of a property. **Setting** is the physical environment of a historic property that illustrates the character of the place. **Materials** are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property. **Workmanship** is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory. **Feeling** is a property's expression of the aesthetic or historic sense of a particular period of time. This is an intangible quality evoked by physical features that reflect a sense of a past time and place. **Association** is the direct link between the important historic event or person and a historic property. Continuation of historic use and occupation help maintain integrity of association.

1.2.2 State

CALIFORNIA REGISTER OF HISTORICAL RESOURCES

All properties in California that are listed in or formally determined eligible for listing in the NRHP are eligible for listing in the California Register of Historical Resources (CRHR). The CRHR is a listing of State of California resources that are significant in the context of California's history. It is a Statewide program with a scope and with criteria for inclusion similar to those used for the NRHP. In addition, properties designated under municipal or county ordinances are also eligible for listing in the CRHR.

A historic resource must be significant at the local, state, or national level under one or more of the criteria defined in the California Code of Regulations Title 15, Chapter 11.5, Section 4850 to be included in the CRHR. The CRHR criteria are tied to CEQA because any resource that meets the criteria below is considered a significant historical resource under CEQA. As noted above, all resources listed in or formally determined eligible for listing in the NRHP are automatically listed in the CRHR.

The CRHR uses four evaluation criteria for significance:

Criterion 1. Is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.

Criterion 2. Is associated with the lives of persons important to local, California, or national history.

Criterion 3. Embodies the distinctive characteristics of a type, period, region, or method of construction; represents the work of a master; or possesses high artistic values.

Criterion 4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

A property must have both significance and integrity to be considered eligible for listing in the CRHR. Loss of integrity, if sufficiently great, will overwhelm the historical significance of a resource and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Integrity is evaluated by regarding the property's retention of its location, design, setting, workmanship, materials, feeling, and association to its period of significance. These seven factors can be roughly grouped into three types of integrity considerations. Location and setting relate to the relationship between the property and its environment. Design, materials, and workmanship, as they apply to historic buildings, relate to construction methods and architectural details. Feeling and association are the least objective of the seven factors and pertain to the overall ability of the property to convey a sense of the historical time and place in which it was constructed.

CALIFORNIA ENVIRONMENTAL QUALITY ACT

CEQA requires public agencies to consider the effects of their actions on "historical resources". Pursuant to PRC Section 21084.1, a "project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment."

Historical Resources

"Historical resource" is a term with a defined statutory meaning (PRC Section 21084.1; State CEQA Guidelines Sections 15064.5[a] and [b]). Under State CEQA Guidelines Section 15064.5(a), historical resources include the following:

1) A resource listed in, or determined to be eligible by the State Historical Resources Commission for listing in, the CRHR (PRC Section 5024.1).

2) A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g), will be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

3) Any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource will be considered by the lead agency to be historically significant if the resource meets the criteria for listing in the CRHR (PRC Section 5024.1).

4) The fact that a resource is not listed in or determined to be eligible for listing in the CRHR, not included in a local register of historical resources (pursuant to PRC Section 5020.1[k]), or identified in a historical resources survey (meeting the criteria in PRC Section 5024.1[g]) does not preclude a lead agency from determining that the resource may be a historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

1.2.3 Local

MARIN COUNTYWIDE PLAN

Chapter 4, Socioeconomic Element, of the Marin Countywide Plan 2015, contains the following goals and policies replated to historical resources.

Goal HAR-1. Historical Resource Protection. Identify and protect archaeological and historical resources as major contributors to quality of life and community vitality in Marin.

Policy HAR-1.1 Preserve Historical and Archaeological Resources. Identify archaeological and historical resource sites.

Policy HAR-1.2 Document Historical Information. Provide documents, photographs, and other historical information whenever possible to be catalogued in the Anne T. Kent California Room in the Marin County Free Library.

Policy HAR-1.3 Avoid Impacts to Historical and Archaeological Resources. Ensure that human activity avoids damaging cultural resources, where feasible.

2 HISTORIC CONTEXT

2.1 DEVELOPMENT OF GOLDEN GATE BAPTIST THEOLOGICAL SEMINARY

2.1.1 Early History of the Southern Baptist Convention

The Southern Baptist Convention (SBC) is a Christian denomination based in the United States. It is the world's largest Baptist denomination, descended from Baptists who settled in the American colonies in the 17th century (Fahmy 2019). In the late 1700s as Baptists began to organize and expand, they formed missionary societies to spread the Christian lifestyle to others. These mission societies, such as the American Baptist Home Mission Society, the American Baptist Foreign Mission Society, and the American Baptist Publication Society, led to other organizational structures that would eventually define the denomination of Southern Baptists (Fairchild 2019).

By the 1830's tension began to mount between northern and southern Baptists over the issue of slavery. Northern Baptists (known today as the American Baptist Churches USA) believed God would not condone treating one race as superior to another, while southerners said that God intended for races to be separate (Fairchild 2019). In 1844, Georgia Baptists asked the Home Mission Society to appoint a slaveholder to be a missionary in Georgia. After much discussion, the appointment was declined. A few months later, the Alabama Baptist Convention asked the Foreign Mission Society if they would appoint a slaveholder as a missionary. The society said no (Baker 1979).

Virginia Baptists called for Baptists of the southern states to meet at Augusta, Georgia, in early May 1845, for the purpose of consulting "on the best means of promoting the Foreign Mission cause, and other interests of the Baptist denomination in the South" (Baker 1979). About 293 Baptist leaders of the South gathered at the First Baptist Church, Augusta, Georgia. They concluded that more could be accomplished in Christian work by the organization of a separate Baptist body for missionary work. As a result of this division, the SBC was formed (Fairchild 2019).

2.1.2 Early Attempts in California

The earliest account of Baptist missions in California was the arrival of Osgood Wheeler in February 1849. Wheeler, a pastor from the First Baptist Church of Jersey City, was sent by the American Baptist Home Mission Society of Northern Baptists and the Board of Domestic Missions of the SBC as their pioneer missionary. He and his family arrived in the first steamer to enter San Francisco's harbor, one year before California became a state (Graves 1983:15-16). Wheeler's attempts at establishing churches and congregations was not successful. It was noted that people in northern California were consumed by the Gold Rush and "gold fever." In southern California, the influence of Southern Baptists was made by lay people who migrated to the state for the land, not the gold, and they were therefore more successful (Graves 1983:25).

Southern Baptist in northern California turned to education to further their cause. In 1853, the California Baptist Education Society was organized with the goal of furthering the mission and founding a theological institution (Graves 1983:26). In 1859 Harvey Gilbert, a Southern Baptist home missionary, founded the San Rafael Baptist Institute in Marin County. Many people hoped the fledgling institute would soon become a Baptist theological school, however, the school closed after a few years as the United States was plunged into the Civil War. Soon after, the SBC withdrew all support for California work and the churches and institutes it sponsored either disappeared or found other affiliations (Gateway Seminary 2021; Wood 2019; Graves 1983:27-28).

2.1.3 Isam B. Hodges and the Southern Baptist General Convention of California

When Southern Baptists again began establishing churches in California, the first in 1936 in Kern County by the Mouser family, the need for a theological school was again recognized (Gateway Seminary 2021; Graves 1983:30). The Southern Baptist General Convention of California (Convention) organized in 1940 and included all 14 Southern Baptist churches in California. At its 1942 meeting, a plea for a Baptist school was heard, and the Convention adopted the following resolution, "We recommend that Southern Baptists in California pray, labor, and pay that these institutions which we now have may continue in their work and that we may soon have schools of our own in California to prepare our young people for greater service in the Kingdom" (Graves 1983:32-33). By this time, the Convention had a membership of 40 churches.

Gilbert's dream for a theological school in California was particularly strong in the mind of Isam B. Hodges. While a student at Southwestern Baptist Theological Seminary in Fort Worth, Texas, Hodges came to the conviction that it was God's will for him to begin a seminary in the West. In 1934, Hodges arrived in the Bay Area and within two years he was pastor of Oakland's Golden Gate Baptist Church (Gateway Seminary 2021; Wood 2019). The Golden Gate Baptist Church had been organized in 1892 with the Northern Baptist Convention; Hodges, believing that the Northern Baptists were not doing enough to grow their ministries, sought for affiliation with the Southern Baptist Convention for his church in November 1943 (Graves 1983:38-39). Hodges had established sufficient reputation among Sothern Baptists and was the president of the Convention from 1944 to 1945, providing strong leadership and support for Southern Baptist expansion in California. He urged the Home Mission Board and the Sunday School Board of the SBC to do more to support the California efforts (Graves 1983:40). In less than a decade Hodges had risen from an unemployed preacher to the president of a new Southern Baptist General Convention of California. Hodges also determined that the time was ripe to pursue his dream of a theological seminary.

2.1.4 Founding of the Golden Gate Baptist Theological Seminary

In the spring of 1944, the congregation of Golden Gate Baptist Church authorized its deacons to meet with a committee from the First Southern Baptist Church of San Francisco to formulate plans to establish a theological seminary, with the expressed purpose of training men and women for the ministry (Gateway Seminary 2021; Wood 2019; Graves 1983:31-33). The combined committee met on March 31, 1944, to formally organize GGBTS. Six deacons from each church served as members of the first board of trustees; a few weeks later three additional members were added as representatives of the Golden Gate Baptist Association. By summer of 1944, a state charter had been issued and classes began at the Golden Gate Baptist Church in Oakland (Gateway Seminary 2021; Wood 2019). The curriculum was similar to that of other seminaries of the time. Under the heading for department chairs, the following twelve were listed (Graves 1983:44):

1. Chair of Bible
2. Chair of Missions
3. Chair of Evangelism
4. Chair of Church History
5. Chair of Christian Education
6. Chair of Homiletics
7. Chair of Theology
8. Chair of New Testament Greek
9. Chair of Old Testament Hebrew
10. Chair of Christian Psychology & Christian Sociology
11. Chair of Sacred Music
12. Apologetic & Polemics

Hodges guided the school through that first year as its president, all the while writing letters to people throughout the SBC, working to gain support for his vision. The SBC approved the recommendation that the seminary become an institution of the state convention; in November 1945, the Southern Baptist General Convention of California gained ownership of the school and elected a new board of trustees. Dr. Benjamin O. Herring succeeded Hodges as president in 1946.

Although primarily an educator, Herring was active in growing the GGBTS. He wrote letters thanking the Golden Gate Baptist Church for use of their facilities while also suggesting the GGBTS should acquire housing facilities. He

repeatedly presented the case that the SBC open a Baptist College in California and petitioned Baptist churches for financial support. In early 1947 Herring was successful in moving the GGBTS to larger, more spacious quarters in nearby Berkeley. This property also included dormitories for women (Graves 1983:48,57,88). In 1949 the GGBTS was accredited by the State of California. "An exhaustive and thorough examination of the organization, faculty, program, and facilities was necessary before the coveted approval was procured. Since the State of California maintains high educational standards, the accreditation of the seminary is a noteworthy event" (Graves 1983:91). All of Herring's work contributed to the SBC accepting ownership of the school in May 1950 (Gateway Seminary 2021). Attendance had grown from 31 students in September 1946 to 177 in September 1950. Larger facilities were needed, and the GGBTS board voted to negotiate with Calvary Baptist Church for the adjacent property; plans were drawn up to accommodate 500 students, however, a loan for this work was never secured (Graves 1983:104-105).

Herring resigned his presidency in 1951 and was succeeded by Dr. Harold K. Graves from Oklahoma. Graves continued to expand the faculty and push for academic excellence. He arranged the lease of a house and 12-unit motel complex across the street from the Berkeley property to provide housing and dining facilities for single students; two houses that had been previously used as dorms were converted to office space; and he remodeled the interiors of existing facilities to maximize space (Graves 1983:130). During this time, he also continued Herring's search for a new location. In 1953 he led the acquisition of 148 acres of prime Marin County real estate, at the site of a dairy farm previously considered as a permanent location for the United Nations. Moving the GGBTS was a bold venture that would require the development and construction of all new facilities (Gateway Seminary 2021).

The campus buildings were designed by noted San Francisco architect John Carl Warnecke, known for Bay Area landmarks like Stanford University's Mapes Pavilion and the San Francisco Hilton. The campus landscape was planned and designed by influential landscape architect Lawrence Halprin who gained national attention with his work at the 1962 Seattle World's Fair and the Ghirardelli Square adaptive-reuse project in San Francisco. Halprin was also commissioned to design the landscapes at three residential colleges, Cowell College, Stevenson College, and Crown College, at the University of Santa Cruz in the 1950s. In the early 1970s, Warnecke and Halprin again worked together on the design of the United Nations Plaza at San Francisco's Civic Center (Gateway Seminary 2021; Wood 2019).

The GGBTS campus was opened in September 1959. Graves continued to lead the GGBTS until he retired and became president emeritus in 1977 (Gateway Seminary 2021; Wood 2019). Completed, the campus had nine buildings containing nearly 120,000 square feet of floor space, with 211 student housing units and spectacular views of San Francisco's skyline over the bay. Enrollment peaked in the 1970s at 750 students, most doing graduate work (Wood 2019).

Dr. William M. Pinson Jr., pastor of the First Baptist Church of Wichita Falls, Texas, became president of GGBTS after Graves in 1977. His five-year tenure saw the GGBTS continue to expand its visibility. Pinson led in the establishment of the GGBTS's regional campus in the Pacific Northwest. A steadily growing enrollment brought about the need for a new library and additional student housing at the Mill Valley Campus. They were completed before Pinson became executive director of the Baptist General Convention of Texas in 1982 (Gateway Seminary 2021).

Dr. Franklin D. Pollard, pastor of the First Baptist Church of San Antonio, Texas, was inaugurated as the fifth president of GGBTS in 1983. During his three-year administration, the GGBTS experienced the largest enrollment gain in its history, a 20 percent increase in the fall of 1984 over the previous fall. Pollard also led in a redevelopment of the GGBTS master plan so more students could study at GGBTS. He left in 1986 to become pastor of the First Baptist Church of Jackson, Mississippi (Gateway Seminary 2021).

Beginning in 1973 with the opening of the Orange County seminary, the GGBTS grew to have five campuses, which served Southern Baptist churches throughout the Western United States (Seminaries and Bible Colleges 2022).

- Seminary in Northern California, in Mill Valley, CA (San Francisco Bay Area)
- Seminary in Southern California, in Brea, CA (Orange County, California)
- Seminary in Arizona, in Scottsdale, AZ (Greater Phoenix, Arizona Area)
- Seminary in Washington, in Vancouver, WA (Greater Portland, Washington Area)
- Seminary in Colorado, in Centennial, CO (Denver Metropolitan Area)

In April 2014, the board of trustees voted to move the GGBTS's main campus from Mill Valley 400 miles south to Ontario, California and rename the school Gateway Seminary of the Southern Baptist Convention. The Marin campus was sold to North Coast Land Holdings for $84 million. In 2016, North Coast Land Holdings signed a three-year lease with Olivet University, a private evangelical Christian school. The Marin site is now called the Seminary at Strawberry and, besides having the university tenant, is a setting for weddings, seminars, and special events (Gateway Seminary 2021; Wood 2019).

2.2 SITE DEVELOPMENT HISTORY

Available online historical aerial imagery of the area is sporadic. The 1946 aerial shows the outline of the preliminary road Seminary Drive, and the campus area has been graded by 1956. By 1958, the outlines of interior roads are present, including modern day Shuck Drive, Judson Lane, Rice Lane, Hodges Drive, and Storer Drive, as well as the beginning stages of construction of the campus structures. The terraced parking lot at the GGBTS is also clearly visible. Residential development exponentially increased by 1968 with clusters along Oliver Lane, Race Lane, Lockett Lane, Chapel Drive, and along Seminary Drive and Strawberry Lane. By 1982, three elongated structures are present in the southwest corner of the campus. The 1993 aerial photograph shows a baseball diamond along Seminary Drive and Gilbert Drive; by 2018, the baseball diamond had been covered with grass, leaving what is today known as Seminary Playing Field (NETR 2022).

Historical photographs are also available from the Marin History Museum (Marin History Museum 2022). In the February 1959 photo below (Figure 2-1) the majority of residential apartments are visible, along with the cafeteria and administration building. The three apartment buildings west of Wallace Hall are not visible, nor are the three at south corner of Oliver Land and Shuck Drive (north of Maddox Hall). The seven apartment buildings north of the corner of Shuck Drive and Storer Drive had not been constructed, nor has Tichenor Village. The library, President's Home, and residences along Mission Drive and Chapel Drive intersection (Platt Village) had also not been constructed. The President's Home is visible in the August 1962 photo.

In September 1965 (Figure 2-2), the three apartment buildings west of Wallace Hall are now visible as are the three north of Maddox Hall (south corner of Oliver Land and Shuck Drive). The library, Tichenor Village, apartment buildings at the north corner of Shuck Drive and Storer Drive, and residences along Mission Drive and Chapel Drive intersection have yet to be constructed. The February 1966 photo depicts the same conditions.

Four of the apartment buildings at the north corner of Shuck Drive and Storer Drive are visible in the September 1968 photo, though the top three apartment buildings have yet to be constructed. It is unclear whether the residences along Mission Drive and Chapel Drive intersection have been constructed; the library and Tichenor Village have not. By April 1974 (Figure 2-3), the residences along Mission Drive and Chapel Drive intersection are visible, as are the final apartment buildings at the north corner of Shuck Drive and Storer Drive. The maintenance building is also visible. The presence of the library is unknown because that area of the campus is not visible in the photo; similarly, the photo is too dark and there are too many trees to tell if Tichenor Village has been constructed.

2.3 THE DESIGN TEAM

2.3.1 John Carl Warnecke

John Carl Warnecke was an award-winning architect based in the San Francisco Bay Area and was responsible for the design of numerous modernist buildings, schools, and monuments, both within the Bay Area and nation. Warnecke was born in Oakland, California on February 24, 1919. His father, Carl I. Warnecke, was a prominent Beaux Arts architect in Oakland and San Francisco, and one of the architects involved in the design of San Francisco City Hall (Smith 2010). Warnecke attended Stanford University where he met John F. Kennedy, when Kennedy was auditing business classes there. This meeting was the start of a longtime relationship that would provide Warnecke

Figure 2-2 September 1965 Historic Aerial

Source: Courtesy of Marin History Museum

Figure 2-3 April 1974 Historic Aerial

opportunities for national recognition as his career matured. After Stanford, Warnecke attended Harvard University for his master's in architecture where he studied under the Modernist master, Walter Gropius. Soon he opened his own practice, first as a solo enterprise in 1950, then as firm in 1956. By 1977, Warnecke was running the largest architectural firm in the United States, with offices in San Francisco, Los Angeles, New York, Boston, Washington, and Honolulu (Grimes 2010). Warnecke was affiliated with the National Academy of Design and was the recipient of many awards, including a National Institute of Arts and Letters prize in 1957 and the Brunner Memorial Prize in 1958.

Warnecke pioneered the idea of contextual architecture, that modern buildings could be designed in sympathy with the natural and built context. Contextual architecture reflects the setting, forms, and details of a building's surrounding landscape, not building something that contrasts and feels out of place. In the late 1950s, the architectural profession did not generally acknowledge the neighboring built environment. His project for a U.S. embassy in Bangkok in 1956 was an unbuilt work that made his reputation. The proposed building drew on mainstream Western Modernist forms, melding them with designs observed by Warnecke in Bangkok. The result was an exotic mix that drew favorable reviews. The design consisted of several floors of cantilevered balconies with lacy pre-cast concrete railings around the main office core and central courtyard. The composition floated on thin white columns over a reflecting pond. Warnecke received a letter from Finnish-American architect and industrial designer Eero Saarinen praising the design for the embassy (NPS 2001).

Among significant works of this period by Warnecke's office were the John F. Kennedy Gravesite in Arlington National Cemetery (1966); the Hawaii State Capitol (1969) in Honolulu; Logan Airport South Terminal in Boston (1977), Lafayette Square in Washington DC (1962-72), the Soviet Embassy in Washington DC (1975); the Hart Senate Office Building in Washington DC (1982), and a Sports Arena at the University of Nevada in Las Vegas (1984). His designs reflected his passion for structures that harmonize with the environment and the heritage of the places in which they were built.

Located in downtown Honolulu, the Hawaii State Capitol was commissioned and dedicated by John A. Burns, second Governor of Hawaii. It opened on March 15, 1969, replacing the former statehouse, the 'Iolani Palace. The Hawaii State Capitol is an American adaptation of the Hakonya style termed "Hawaiian international architecture". It was designed by a partnership between the firms of Belt, Lemon, and Lo (Architects Hawaii Ltd.), and John Carl Warnecke and Associates. Unlike other state capitols modeled after the United States Capitol, the Hawaii State Capitol's distinct architectural features symbolize various natural aspects of Hawaii. The building is surrounded by a reflecting pool, symbolizing the Pacific Ocean. The two legislative chambers are cone-shaped, symbolizing volcanoes that formed the Hawaiian Islands. The columns around the perimeter of the building have shapes resembling royal palm trees. There are eight columns in four rows at either side of the building, representing the eight main islands of Hawaii; sets of eight items appear in other places inside and along the outside of the building. The Capitol is built with an open-air design, allowing sun, wind, and rain to enter; the central atrium opens to the sky and rainbows can sometimes be seen inside the building when it rains. When standing in the center of the structure, the chandeliers from both legislative chambers, which represent the sun and moon, can be seen through the glass walls, while the area that is normally reserved for a rotunda in most capitol buildings is left open to the sky (Architectuul 2022).

One of the best examples of Warnecke's contextual style is the Mira Vista Elementary School in Richmond (photos below). Not only does its design and orientation provide the best angle to capture natural light but it also mimics nearby natural forms—rocks, grass, and waves—so as to blend into and become part of the natural landscape (American Institute of Architects 2018). Other notable California schools designed by Warnecke include the White Oaks Elementary School in San Jose, the Cragmont Elementary School in Berkeley, the Frank C. Havens Elementary School in Piedmont, White Oaks Elementary School in San Carlos, and numerous buildings on the Stanford, UC Berkeley, and UC Santa Cruz campuses.

2.3.2 Lawrence Halprin

Lawrence Halprin was one of the most influential landscape architects of the latter 20th century. With a career spanning more than five decades, he designed significant projects overseas and across the United States including the landscapes for the Hebrew University in Jerusalem, Israel (1960), the 1962 Seattle's World Fair, the United Nations Plaza in San Francisco (1975), Park Central Square in Springfield, Missouri (1974; listed in the NRHP in 2010), and the entrance to Yosemite Falls in Yosemite National Park (completed 2005). His designs sought to impart positive social impact and user experience, as well as convey artistic expression by bringing nature into urban spaces in unprecedented ways (Los Angeles Conservancy 2020). Halprin's notable projects in Mill Valley include the landscape designs for the Mill Valley Public Library (1966) and the Green-Johnston House at 366 Summit Avenue (1961).

Halprin was born in New York City in 1916 and raised in Brooklyn. He earned a bachelor's degree in plant sciences from Cornell in 1939 and a master's degree in horticulture in 1941 from the University of Wisconsin. Halprin found his calling after visiting Frank Lloyd Wright's Taliesin studio in Wisconsin. He attended Harvard's Graduate School of Design on scholarship, studying under early Modern masters Walter Gropius and Marcel Breuer (Los Angeles Conservancy 2020). After being injured in a kamikaze attack during World War II, Halprin went to San Francisco to recuperate. It is there he came to work with famous San Francisco landscape architect Thomas Church until he started his own firm in 1949.

Stylistically, Halprin was part of the modernist design movement. Expanding upon the principles of landscape architecture pioneered by Frederick Law Olmsted, Halprin created new types of landscapes that were dynamic, environmentally sensitive, commemorative, and eco-friendly. One of his specialties was creating grand open space networks that were carved into declining infrastructure (Cultural Landscape Foundation 2016). Halprin, like Olmsted, wanted to take the viewer on a scenic journey so he scaled his designs with the human viewpoint in mind. However, unlike Olmsted, Halprin's landscapes were inspired by, but not imitative of, nature; his signature elements included scenic vegetation, striking water features (particularly fountains; see photo below), sculptures, terraced backdrops, native stones, and concrete (Los Angeles Conservancy 2020).

Ira Keller Fountain, Portland Oregon (Cultural Landscape Foundation 2016).

One of Halprin's earliest achievements was the kidney-shaped pool at the Donnell Garden was completed in 1948 (photo below). Designed by Church, in collaboration with Halprin while he was employed in the landscape architect's office, the pool's form interprets the salt marshes in the distance and may have been one of the country's first biomorphic pools (Cultural Landscape Foundation 2016). Its distinct shape, along with the abstracted sculpture by Adaline Kent, has become an icon of mid-century Modernism and California living.

Dewey Donnell Garden Pool (El Novillero) in Sonoma County (Cultural Landscape Foundation 2016).

Halprin was commissioned to design the landscapes at three of the residential colleges at the University of Santa Cruz in the 1950s: Cowell College, Stevenson College, and Crown College. His designs incorporated the redwood groves and ocean views that are characteristic of the campus as a whole, while his individual design aesthetic is evident in the concrete terraced patios and abstract sculptures and fountains (Cultural Landscape Foundation 2016). He also designed Sproul Plaza at University California Berkeley in 1962.

Sea Ranch, located on the Sonoma Coast, is his most well-known landscape project in the Bay Area (photo below). Halprin was hired to create a master plan for the residential community in 1965; he developed guidelines and recommendations for growth that are still adhered to today. Halprin integrated emerging environmental principals into his plan, attempting minimal intrusion into the native environment (see photo below). Houses were placed within the natural framework of the coastal hills, clustered between hedgerows to provide both wind protection and ocean views (Cultural Landscape Foundation 2016).

Sea Ranch, Sonoma Cost (Cultural Landscape Foundation 2016).

Halprin continued to create until his death in 2009 at the age of 93(Los Angeles Conservancy 2020). He received numerous awards during his lifetime, including being elected a fellow in the American Society of Landscape Architects in 1969, the Architects Institute of America Gold Medal Award in 1979, and the National Medal of Arts in 2002, presented by then-President George W. Bush.

3 STUDY METHODS

3.1 RECORDS SEARCH AND LITERATURE REVIEW

Ascent obtained a cultural resources records search from the Northwest Information Center (NWIC), which is located at Sonoma State University and is part of the California Historical Resources Information System. The records search and literature review provide for identification of previously documented archaeological sites and built environment features within and near the project area and is useful for developing a context to frame assessments of the significance of each archaeological site or built environment feature. Results were returned on November 17, 2021 (NWIC File No. 21-0671; see Appendix A).

- NRHP and CRHR: listed properties
- Historic Property Data File for Marin County
- California Inventory of Historical Resources
- California Historical Landmarks
- California Points of Historical Interest
- Historical General Land Office Maps

The records search revealed that five prior cultural resource studies have been completed within portions of the project site (Table 2-1). These five reports are all archaeological in nature. An additional 13 studies have been completed within the 0.25-mile search radius.

Table 2-1 Previous Reports Identified Within the Project Site

Report Number	Author and Year	Title
11757	Holman 1990	Archaeological Field Inspection of the Seminary Drive/Lot 25 Project Area, Strawberry Point, Marin County, California (letter report)
12050	Origer 1990	Archaeological Investigation at the Golden Gate Baptist Theological Seminary, Mill Valley, Marin County, California (letter report)
19354	Wiberg 1997	Archaeological Subsurface Mechanical Testing of the Seminary Ridge Project Area, Tiburon, Marin County, California
24547	Bryne 2001	Cultural Resources Inventory of APN 043-401-09, 153 Chapel Drive, Mill Valley, Marin County, California
37430	Evans 2010	A Cultural Resources Evaluation of the Golden Gate Baptist Theological Seminary for a Master Plan Amendment, 201 Seminary Drive, Mill Valley, Marin County, California

As a result of the previous surveys, three cultural resources have been previously recorded within the project site. These three resources are archaeological in nature and are discussed in the archaeological report, Cultural Resources Assessment for the North Coast Land Holdings Project, Mill Valley, Marin County, California (Hedges et al. 2020). No built-environment resources have been previously identified within the project site.

3.2 FIELD METHODS

Field work for the project was conducted on November 22, 2021, by architectural historian Alta Cunningham, who meets the Secretary of the Interior Professional Qualification Standards for Architectural History and History. Field work consisted of an intensive pedestrian survey of the built environment features within the project site 45 years or older. Areas that are part of the 130-acre campus property but not part of the current project and do not contain

built-environment features were not surveyed. Therefore, while the project site is approximately 130 acres, survey area was approximately 95 acres.

All features surveyed were subject to written documentation on appropriate Department of Parks and Recreation (DPR) 523 forms as appropriate. Photographs that documented major characteristics and notable alterations were also taken. Completed DPR forms are compiled in Appendix B.

4 HISTORICAL RESOURCE DESCRIPTIONS

4.1 GOLDEN GATE BAPTIST THEOLOGICAL SEMINARY

GGBTS was recorded and evaluated as a potential historic district. Fifty-two historic-era buildings and structures were recorded, as shown below in Table 4-1 and in Figure 4-1. The majority of the 127-acre site is made up of 211 residential units, consisting of 16 studios, 54 one-bedroom housing units, 54 two-bedroom housing units, 18 three-bedroom housing units, three single-family homes, and 66 dormitory units (see representative photographs in Figures 4-2 through 4-4). The site also includes administrative offices, classroom space (see Figure 4-5), a library, and a cafeteria (see Figure 4-6).

Table 4-1 GGBTS Historic-era Buildings and Structures

The topography of the project site consists primarily of hillsides and knolls on the peninsula with a range of elevations from approximately 12 to 2,230 feet above mean sea level. Existing landscape within the project site includes a number of vegetation communities, including Monterey pine woodland on the southern knoll and seminary point, California sagebrush scrub on seminary point, and various planted landscape areas throughout the campus. Sensitive vegetation communities include purple needlegrass grassland and coast live oak woodland.

The eastern portion of the project site includes the academic campus and associated facilities. The Seminary Playing Field is located west of the academic campus, at the topographically lowest point of the project site. Residential uses are located throughout the project site.

The existing circulation pattern consists of private internal streets. There are no existing dedicated bicycle facilities on the internal streets. Existing bicycle features are present around the perimeter of the project site, including Class II bike lanes (i.e., dedicated on-street bike lanes) on Seminary Drive and Class III bike routes (i.e., signed, shared roadways) on Strawberry Drive.

In total, 608 existing parking spaces are located throughout the project site, including 311 residential parking spaces and 297 parking spaces for the academic campus. Residential parking is dispersed throughout the project site in various surface lots adjacent to the residential structures. Parking for the academic campus is clustered in a central three-tiered parking lot, bounded by Foreman Drive to the west and Gilbert Drive to the north, east, and south.

4.2 ADMINISTRATION BUILDING

The administration building is a two-story, 25,200-sf building with a rectangular plan. The building has a side-gabled roof clad in Spanish tiles with moderate eaves. On the east end of the building and along the primary façade, the first floor extends out passed the footprint of the second floor. This extension has a break along the primary façade to create the main entrance. The building features a curtainwall system with awning windows; metal panels are located at the base. Exposed concrete is visible at the gabled ends. Due to elevation changes accommodated by a staircase and retaining rock wall, only the second floor is visible from the majority of the courtyard at the rear, southern façade. A recessed secondary entrance, in-line with the primary entrance, is located on the southern façade.

4.3 ACADEMIC BUILDING

The academic building is a two-story, 51,200-sf building with a hyphenated rectangular plan; the building is composed of four masses connected by narrow, single-story hyphens. The building has a side-gabled roof clad in Spanish tiles with moderate eaves. Exposed concrete is visible at the gabled ends. The building features a curtainwall system with awning windows; metal panels are located at the base. The building is accessed from the courtyard located behind the administration building; double glass doors are located at each recessed hyphen. The southernmost hyphen is designed at a 90-degree angle. As with the administration building, only the second floor is visible from the courtyard.

4.4 CAFETERIA BUILDING

The cafeteria building is a one-story building with a raised basement exposed on the east end on the downhill side of the site. The building has a front gabled roof with wide eaves and clad in clay tiles and rectangular footprint. The exposed basement appears to be constructed of concrete while the first floor is a metal framed glass curtain walls. The primary (western) façade includes two sets of glazed, aluminum framed double doors and the rest of the wall consists of fixed glass panels that are both clear and opaque. A full façade, wooden, slated privacy screen supports the wide eave; this also creates a cover for the entry ways.

The southern façade includes a small portion of the raised basement at the eastern end of the façade; one door and two large vents are present. The first-floor level included a pair of solid doors; the rest of the wall consists of fixed glass panels that are both clear and opaque. The eastern façade includes the exposed portion of the raised basement the full length of the façade; there are number of solid doors and vents. The first-floor level includes fixed glass panels that are both clear and opaque.

5 HISTORICAL RESOURCES EVALUATION

5.1 GOLDEN GATE BAPTIST THEOLOGICAL SEMINARY

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a property must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. GGBTS is proclaimed as the first Baptist Seminary in the west. However, this is more correctly stated for the Berkeley campus, which was established in 1947, more than a decade prior to the Marin campus. It was at the Berkeley campus where residences were established, including dormitories for women, were GGBTS was accredited by the State of California in 1949, and where the SBC accepted ownership of the school in May 1950. Therefore, although the Marin campus of GGBTS is associated with the continued growth of the Southern Baptist Seminary in California and the west, GGBTS was fully established and growing while at the Berkeley campus. Historical research revealed no specific contributions to the Southern Baptist Convention's growth once the campus moved to Marin. Because the historic record does not show the property to be associated with events that have made a significant contribution to history, it does not appear to meet NRHP/CRHR Criterion A/1.

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a property must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The establishment of a Baptist seminary in California is credited to Isam B. Hodges, and the expansion of GGBTS in Berkeley is credited to Dr. Benjamin O. Herring and Dr. Harold K. Graves. Although Graves was responsible for the founding of the Marin campus of GGBTS, this does not rise to the level of significance necessary for NRHP or CRHR consideration. Also, while the Marin campus of GGBTS was designed by John Carl Warnecke and Lawrence Halprin, this property does not appear to be the most representative example of their work, discussed further under Criterion C. Therefore, the Marin campus of GGBTS does not appear to meet NRHP/CRHR Criterion B/2.

Under NRHP/CRHR Criterion C/3, a property must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The GGBTS campus was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin. Warnecke specialized in modernist designs, such as the Hawaii State Capitol building, and contextual architecture that reflected his passion for structures that harmonized with the environment, as seen in Mira Vista Elementary School. Halprin specialized in bringing nature into urban spaces, especially through water features, as seen in the Ira Keller Fountain, and designing landscapes that were inspired by nature, such as Sea Ranch. The GGBTS campus buildings are not examples of modernist work and there is minimal landscaping. While the GGBTS property has a park-like setting and the hillside is mirrored in the terracing of buildings and the main parking lot, the campus is not representative of Warnecke's or Halprin's work. As a whole, the GGBTS campus lacks the architectural and design values of both masters, and therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about GGBTS have been documented and are stored at the Gateway Seminary library in Ontario, California. The property does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

GGBTS retains its integrity. The property has had no demolitions or additions which detract from the original design, materials, workmanship, or feeling of the buildings or campus. While some buildings were constructed at a later time, such as the library and Tichenor Village, these additions were done in such a way as to be compatible with the original design of the buildings and campus. None have been moved from their original location; therefore, GGBTS retains integrity of association and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must

also be considered ineligible. Therefore, although GGBTS retains its integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

5.2 ADMINISTRATION BUILDING

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a building must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. The administration building was constructed to help facilitate activities at GGBTS. The historic record did not show that the construction of this building was associated with any noteworthy or specific programs to advance GGBTS or the SBC. Because the historic record does not show the building to be associated with events that have made a significant contribution to history, it does not appear to meet NRHP/CRHR Criterion A/1.

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a building must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The GGBTS was a respected program that reflected the work and contributions of many people; however, historical research did not reveal specific individually significant researchers or lecturers that have direct important association with the administration building. Also, while the building was designed by John Carl Warnecke, it does not appear to be the most representative example of his work, discussed further under Criterion C. Therefore, the administration building does not appear to meet NRHP/CRHR Criterion B/2.

Under NRHP/CRHR Criterion C/3, a building must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The administration building was designed by architect John Carl Warnecke who specialized in modernist designs, such as the Hawaii State Capitol building, and contextual architecture that reflected his passion for structures that harmonized with the environment, as seen in Mira Vista Elementary School. The administration building is a typical institutional design, not representative of modernist design or Warnecke's typical work. While the administration building is the work of a master, it lacks architectural distinction, does not have artistic qualities, and therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about the administration building has been documented and are stored at the Gateway Seminary library in Ontario, California. The building does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

The administration building retains its integrity. The building has had no known alterations which detract from the original design, materials, workmanship, or feeling of the buildings. The building has not been moved from its original location, and therefore retains integrity of association and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although the administration building retains integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

5.3 ACADEMIC BUILDING

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a building must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. The academic building was constructed to help facilitate the goal of the GGBTS and the SBC. The historic record did not show that the construction of this building was associated with any noteworthy or specific programs to advance GGBTS or the SBC. Because the historic record does not show the academic building to be associated with events that have made a significant contribution to history, it does not appear to meet NRHP/CRHR Criterion A/1.

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a building must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The GGBTS was a respected program that reflected the work and contributions of many people; however, historical research did not reveal specific individually significant researchers or lecturers that have direct important association with the academic building. Also, while the building was designed by John Carl Warnecke, it does not appear to be the most representative example of his work, discussed further under Criterion C. Therefore, the academic building does not appear to meet NRHP/CRHR Criterion B/2.

Under NRHP/CRHR Criterion C/3, a building must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The academic building was designed by architect John Carl Warnecke who specialized in modernist designs, such as the Hawaii State Capitol building, and contextual architecture that reflected his passion for structures that harmonized with the environment, as seen in Mira Vista Elementary School. The academic building is a typical institutional design, not representative of modernist design or Warnecke's typical work. While the academic building is the work of a master, it lacks architectural distinction, does not have artistic qualities, and therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about the academic building has been documented and are stored at the Gateway Seminary library in Ontario, California. The building does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

The academic building retains its integrity. The building has had no known alterations which detract from the original design, materials, workmanship, or feeling of the buildings. The building has not been moved from its original location, and therefore retains integrity of association and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although the academic building retains integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

5.4 CAFETERIA BUILDING

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a property must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. The potential significance of the cafeteria can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. The District Evaluation determined that because the historic record did not show the property to be associated with events that have made a significant contribution to history, it did not appear to meet NRHP/CRHR Criterion A/1. No additional information has been discovered that would indicate that the Cafeteria individually made a significant contribution to the broad patterns of our nation's, California's, or local history; therefore, it does not appear to meet NRHP/CRHR Criterion A/1 as an individual property.

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a property must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The establishment of a Baptist seminary in California is credited to Isam B. Hodges and the expansion of GGBTS in Berkeley is credited to Dr. Benjamin O. Herring and Dr. Harold K. Graves. The potential significance of the cafeteria can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. The District Evaluation determined that although Graves was responsible for the founding of the Marin campus of GGBTS, this does not rise to the level of significance necessary for NRHP or CRHR consideration and the Marin campus of GGBTS does not appear to meet NRHP/CRHR Criterion B/2. Also, while the Marin campus of GGBTS was designed by John Carl Warnecke and Lawrence Halprin, archival

research has revealed no such association with regards to the cafeteria, discussed further under Criterion C. Therefore, the Cafeteria does not appear to meet NRHP/CRHR Criterion B/2 as an individual property.

Under NRHP/CRHR Criterion C/3, a property must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The potential significance of the Cafeteria can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. While the GGBTS campus was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin, significant figures in the fields of architecture, the District Evaluation determined that the campus was not representative of Warnecke's or Halprin's work and did not appear eligible for inclusion in the NRHP/CRHR under Criterion C/3. While the GGBTS campus was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin archival research as revealed no such association with regards to the Cafeteria. The architect and builder of the Cafeteria are unknown and the building lacks the architectural and design values of a master, therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about the Cafeteria with regards to alterations and additions are unknown; however, the property does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

The cafeteria retains its integrity. The property has had visible no demolitions or additions which detract from the original design, materials, workmanship, or feeling of the building. The building has not been moved from its original location and no major alterations through the construction or demolition of surrounding buildings, structures, of features has occurred; therefore, the cafeteria retains integrity of location, association, and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although the cafeteria retains its integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP

6 FINDINGS AND RECOMMENDATIONS

This investigation recorded and evaluated the GGBTS at a district level; the property is recommended not eligible for inclusion in the NRHP and CRHR. The GGBTS in Marin County does not appear to meet any of the criteria necessary for listing in the NRH or the California Register of Historical Resources CRHR. The property is not associated with important events or people in history, is not representative of the typical work of John Carl Warnecke and Lawrence Halprin and is not likely to yield any additional important information about our history. Similarly, the administration and academic buildings were evaluated for individual NRHP- and CRHR-eligibility and recommended not eligible. Therefore, the project would have no impact on historical resources for the purposes of CEQA. No further investigation or treatment measures are recommended.

Please forward a copy of any resulting reports from this project to the office as soon as possible. Due to the sensitive nature of archaeological site location data, we ask that you do not include resource location maps and resource location descriptions in your report if the report is for public distribution. If you have any questions regarding the results presented herein, please contact the office at the phone number listed above.

The provision of CHRIS Data via this records search response does not in any way constitute public disclosure of records otherwise exempt from disclosure under the California Public Records Act or any other law, including, but not limited to, records related to archeological site information maintained by or on behalf of, or in the possession of, the State of California, Department of Parks and Recreation, State Historic Preservation Officer, Office of Historic Preservation, or the State Historical Resources Commission.

Due to processing delays and other factors, not all of the historical resource reports and resource records that have been submitted to the Office of Historic Preservation are available via this records search. Additional information may be available through the federal, state, and local agencies that produced or paid for historical resource management work in the search area. Additionally, Native American tribes have historical resource information not in the CHRIS Inventory, and you should contact the California Native American Heritage Commission for information on local/regional tribal contacts.

Should you require any additional information for the above referenced project, reference the record search number listed above when making inquiries. Requests made after initial invoicing will result in the preparation of a separate invoice.

Thank you for using the California Historical Resources Information System (CHRIS).

Sincerely,

Jessika Akmenkalns, Ph.D.
Researcher

***P3a. Description:** Golden Gate Baptist Theological Seminary (GGBTS) campus comprises approximately 130 acres in the community of Strawberry, a census-designated place in unincorporated Marin County, next to the City of Mill Valley. GGBTS is situated on the Strawberry Peninsula with views of San Francisco and the Bay. The campus was established in 1959 and consists of a variety of types of residential units, administrative offices, classroom space, a library, and a cafeteria. Fifty-two buildings and structures were recorded during the current survey. The campus buildings were designed by noted San Francisco architect John Carl Warnecke, and the campus landscape was planned and designed by influential landscape architect Lawrence Halprin.

D1. Historic Name: Golden Gate Baptist Theological Seminary D2. Common Name: Gateway Seminary

***D3. Detailed Description**

The GGBTS campus comprises approximately 130 acres on the Strawberry Peninsula. The buildings within the GGBTS campus are clustered in the eastern portion of the site, at the highest elevation with views of San Francisco. Much of the residential housing is situated in the northern portion of the site, separated from the academic buildings. A recreational playing field is located at the lowest point on the site, adjacent to Seminary Drive. The southwestern portion of the site is heavily wooded.

The two primary access points are along Seminary Drive at Hodges Drive and Gilbert Drive. Secondary access points are from Mission Drive, East Strawberry Drive, Chapel Drive and Reed Boulevard. Residential parking is dispersed throughout the GGBTS campus in various surface lots adjacent to the residential structures. Parking for the academic buildings is clustered in a central three-tiered parking lot, bounded by Foreman Drive to the west and Gilbert Drive to the north, east, and south (see sketch map page 4).

The built environment consists of 52 historic-era (constructed prior to 1977) buildings and structures (see Table 1). Extant building types include administrative offices, classroom space, a library, a cafeteria, utility buildings, a footbridge, dormitories, single-family homes, and studio, one-, two-, and three-bedroom apartment units. Each of the buildings identified in Table 1 have been recorded on DPR 523 primary forms. These forms follow the main GGBTS district evaluation forms (DPR-523D). Buildings with the potential for individual eligibility are also documented on building, structure, object forms (DPR-523B). Continued on page 5.

***D4. Boundary Description**:

The GGBTS campus is roughly bound by Seminary Drive and Shuck Drive on the west, Chapel Drive to the south, Mission Drive and Storer Drive on the east, and an unmarked property boundary to the north, just south of the residences along Ricardo and Richardson drives (see sketch map page 4).

***D5. Boundary Justification:**

The boundary of the GGBTS campus is the majority of the area currently owned by Marin Land Holdings, the entity who purchased the property in 2014 when sold by the GGBTS Board of Trustees. The three APNs not included do not include any building environment features.

D6. Significance: Theme Religion **Area** California
Period of Significance 1959 **Applicable Criteria** N/A

The GGBTS in Marin County does not appear to meet any of the criteria necessary for listing in the National Register of Historic Places (NRHP) or the California Register of Historical Resources (CRHR). The property is not associated with important events or people in history, is not representative of the typical work of John Carl Warnecke and Lawrence Halprin and is not likely to yield any additional important information about our history. Continued on page 15.

*D3. Detailed Description (con't)

Topography, Views, and Vistas

The GGBST campus generally encompasses the middle portions of the Strawberry Peninsula. The topography of the GGBST campus consists primarily of hillsides and knolls on the Strawberry Peninsula with a range of elevations from approximately 10 to 250 feet. The Richardson Bay shoreline is adjacent to Seminary Drive, which runs along portions of the GGBST campus boundary to the east and south. The eastern portion of the GGBST campus includes the academic buildings and associated facilities. The Seminary Playing Field is located west of the academic buildings, at the topographically lowest point of the GGBST campus and encompasses approximately two acres. At an elevation of approximately 190 feet, the central point on the GGBST campus is Chapel Hill. From Chapel Hill major ridgelines extend:

- South to Strawberry Point with a break through a saddle where Seminary Drive transitions into Strawberry Drive.
- West to the forested Seminary Point (approximate elevation 125 feet).
- North through the campus to a saddle composing Dormitory Hill (approximate elevation 115 feet) then up to near Richardson Drive residences (approximate elevation 250 feet) and then arching west down to Schuck Knoll (approximate elevation 110 feet).

Visually, a series of minor ridgelines further divide the GGBST campus. Because of its location surrounded on three sides by Richardson Bay, Seminary Point is the most prominent visual natural feature of the GGBST campus. The topography and ridgelines tend to control views into the GGBST campus such that the entire GGBST campus is generally not visible from any one surrounding location. This is particularly true from the immediate foreground and foreground distances. Due to the topography, the major portion of the GGBST campus is only visible from the southwest and west.

Overview from field at Chapel Drive and Storer Drive intersection. Gilbert Drive and terraced parking in the foreground. Shuck Drive in the center. Photo taken 11/22/2021.

Overview from Rice Lane. Oliver Lane parking in the foreground. Playground at the intersection of Shuck Drive and Storer Drive. Photo taken 11/22/2021.

View southeast from Storer Drive, behind Academic Building. Photo taken 11/22/2021.

*D3. Detailed Description (con't)

Circulation System

The eastern portion of the GGBST campus includes the academic buildings and associated facilities, generally east of Gilbert Drive, south of Storer and Herring drives, and north of Chapel Drive. The Seminary Playing Field is located west of the academic buildings, east of Seminary Drive, and between Hodges and Gilbert drives. Residential uses occur throughout the GGBTS campus, though are primarily clustered along Oliver and Rice Lanes, Lockett Lane, Chapel Drive, and along Seminary Drive. Within the GGBTS campus, these roads do not have dedicated walkways for pedestrians in the form of sidewalks, however, paved pedestrian paths are located throughout the campus. A pedestrian bridge crosses Herring Drive, connecting the cafeteria and Mallory Hall.

Pedestrian bridge crossing Herring Drive. View facing north. Photo taken 11/22/2021.

Pedestrian walkway between Judson and Rice apartments. Staircases to the left lead to Judson Lane and staircases to the right continue to Oliver Land. View facing north. Photo taken 11/22/2021.

***D3. Detailed Description (con't)**

Water, Vegetation, and Small-Scale Features

Water features within the GGBTS campus consist of lined drainage ditches, primarily along the east side of Shuck Drive north of Storer Drive and both sides of Storer Drive between Shuck Drive and Reed Boulevard. Vegetation throughout the developed areas of GGBTS consists of manicured lawns and ornamental shrubs and mature shade trees. Existing landscaping within the GGBST campus includes several vegetation communities, including Monterey pine woodland on the southern knoll/Forested Knoll and Seminary Point, California sagebrush scrub on Seminary Point, and various planted landscape areas throughout the campus. Sensitive vegetation communities include purple needlegrass grassland and coast live oak woodland. The most visible small-scale features are the walkways, staircases, and light poles concentrated around the residential development. Retaining walls are located throughout the campus.

Mature trees, landscaped grass, lined drainage ditch. South side of Storer Drive at intersection with Shuck Drive. Playground located at the right. Photo taken 11/22/2021.

Retaining wall and light posts located on the south side of Truett Hall. Facing northeast. Photo taken 11/22/2021.

Retaining wall and stairway located on the west side of the Administration Building. Facing northwest. Photo taken 11/22/2021.

***D3. Detailed Description (con't)**

Buildings and Structures

The buildings at the GGBTS campus were designed by architect John Carl Warnecke who specialized in modernist designs. However, none of the buildings could be considered modernist. The academic, administration, and cafeteria buildings are typical institutional design. The dormitories, located in the northern portion of the GGBTS campus, are two-story rectangular buildings while the apartments are arranged as duplexes (symmetrical or offset) and triplexes (cascading). Employee housing located along Mission Drive, and the president's house, located at the west end of Chapel Drive, are simple Ranch style construction. Accessory buildings, including laundry, landscaping, utilities, and bus stops, are located through the GGBTS campus.

Judson Lane apartments: symmetrical at red arrow, triplex at purple arrow, and offset duplex at blue arrow. Photo taken 11/22/2021.

Wallace, Mahone, and Carey Halls. These dormitories are located in the northeastern portion of the GGBTS campus. Photo taken 11/22/2021.

Bus stop, located on Shuck Drive north of Hodges Drive. Maddox Hall is located at the left. Photo taken 11/22/2021.

Current GGBTS campus map.

*D6. Significance (con't)

EVALUATION FRAMEWORK

Development of Golden Gate Baptist Theological Seminary

Early History of the Southern Baptist Convention

The Southern Baptist Convention (SBC) is a Christian denomination based in the United States. It is the world's largest Baptist denomination, descended from Baptists who settled in the American colonies in the 17th century (Fahmy 2019). In the late 1700s as Baptists began to organize and expand, they formed missionary societies to spread the Christian lifestyle to others. These mission societies, such as the American Baptist Home Mission Society, the American Baptist Foreign Mission Society, and the American Baptist Publication Society, led to other organizational structures that would eventually define the denomination of Southern Baptists (Fairchild 2019).

By the 1830's tension began to mount between northern and southern Baptists over the issue of slavery. Northern Baptists (known today as the American Baptist Churches USA) believed God would not condone treating one race as superior to another, while southerners said that God intended for races to be separate (Fairchild 2019). In 1844, Georgia Baptists asked the Home Mission Society to appoint a slaveholder to be a missionary in Georgia. After much discussion, the appointment was declined. A few months later, the Alabama Baptist Convention asked the Foreign Mission Society if they would appoint a slaveholder as a missionary. The society said no (Baker 1979).

Virginia Baptists called for Baptists of the southern states to meet at Augusta, Georgia, in early May 1845, for the purpose of consulting "on the best means of promoting the Foreign Mission cause, and other interests of the Baptist denomination in the South" (Baker 1979). About 293 Baptist leaders of the South gathered at the First Baptist Church, Augusta, Georgia. They concluded that more could be accomplished in Christian work by the organization of a separate Baptist body for missionary work. As a result of this division, the SBC was formed (Fairchild 2019).

Early Attempts in California

The earliest account of Baptist missions in California was the arrival of Osgood Wheeler in February 1849. Wheeler, a pastor from the First Baptist Church of Jersey City, was sent by the American Baptist Home Mission Society of Northern Baptists and the Board of Domestic Missions of the SBC as their pioneer missionary. He and his family arrived in the first steamer to enter San Francisco's harbor, one year before California became a state (Graves 1983:15-16). Wheeler's attempts at establishing churches and congregations was not successful. It was noted that people in northern California were consumed by the Gold Rush and "gold fever." In southern California, the influence of Southern Baptists was made by lay people who migrated to the state for the land, not the gold, and they were therefore more successful (Graves 1983:25).

Southern Baptist in northern California turned to education to further their cause. In 1853, the California Baptist Education Society was organized with the goal of furthering the mission and founding a theological institution (Graves 1983:26). In 1859 Harvey Gilbert, a Southern Baptist home missionary, founded the San Rafael Baptist Institute in Marin County. Many people hoped the fledgling institute would soon become a Baptist theological school, however, the school closed after a few years as the United States was plunged into the Civil War. Soon after, the SBC withdrew all support for California work and the churches and institutes it sponsored either disappeared or found other affiliations (Gateway Seminary 2021; Wood 2019; Graves 1983:27-28).

*D6. Significance (con't)

Isam B. Hodges and the Southern Baptist General Convention of California

When Southern Baptists again began establishing churches in California, the first in 1936 in Kern County by the Mouser family, the need for a theological school was again recognized (Gateway Seminary 2021; Graves 1983:30). The Southern Baptist General Convention of California (Convention) organized in 1940 and included all 14 Southern Baptist churches in California. At its 1942 meeting, a plea for a Baptist school was heard, and the Convention adopted the following resolution, "We recommend that Southern Baptists in California pray, labor, and pay that these institutions which we now have may continue in their work and that we may soon have schools of our own in California to prepare our young people for greater service in the Kingdom" (Graves 1983:32-33). By this time, the Convention had a membership of 40 churches.

Gilbert's dream for a theological school in California was particularly strong in the mind of Isam B. Hodges. While a student at Southwestern Baptist Theological Seminary in Fort Worth, Texas, Hodges came to the conviction that it was God's will for him to begin a seminary in the West. In 1934, Hodges arrived in the Bay Area and within two years he was pastor of Oakland's Golden Gate Baptist Church (Gateway Seminary 2021; Wood 2019). The Golden Gate Baptist Church had been organized in 1892 with the Northern Baptist Convention; Hodges, believing that the Northern Baptists were not doing enough to grow their ministries, sought for affiliation with the Southern Baptist Convention for his church in November 1943 (Graves 1983:38-39). Hodges had established sufficient reputation among Sothern Baptists and was the president of the Convention from 1944 to 1945, providing strong leadership and support for Southern Baptist expansion in California. He urged the Home Mission Board and the Sunday School Board of the SBC to do more to support the California efforts (Graves 1983:40). In less than a decade Hodges had risen from an unemployed preacher to the president of a new Southern Baptist General Convention of California. Hodges also determined that the time was ripe to pursue his dream of a theological seminary.

Founding of the Golden Gate Baptist Theological Seminary

In the spring of 1944, the congregation of Golden Gate Baptist Church authorized its deacons to meet with a committee from the First Southern Baptist Church of San Francisco to formulate plans to establish a theological seminary, with the expressed purpose of training men and women for the ministry (Gateway Seminary 2021; Wood 2019; Graves 1983:31-33). The combined committee met on March 31, 1944, to formally organize GGBTS. Six deacons from each church served as members of the first board of trustees; a few weeks later three additional members were added as representatives of the Golden Gate Baptist Association. By summer of 1944, a state charter had been issued and classes began at the Golden Gate Baptist Church in Oakland (Gateway Seminary 2021; Wood 2019). The curriculum was similar to that of other seminaries of the time. Under the heading for department chairs, the following twelve were listed (Graves 1983:44):

1. Chair of Bible
2. Chair of Missions
3. Chair of Evangelism
4. Chair of Church History
5. Chair of Christian Education
6. Chair of Homiletics
7. Chair of Theology
8. Chair of New Testament Greek
9. Chair of Old Testament Hebrew
10. Chair of Christian Psychology & Christian Sociology
11. Chair of Sacred Music
12. Apologetic & Polemics

*D6. Significance (con't)

Hodges guided the school through that first year as its president, all the while writing letters to people throughout the SBC, working to gain support for his vision. The SBC approved the recommendation that the seminary become an institution of the state convention; in November 1945, the Southern Baptist General Convention of California gained ownership of the school and elected a new board of trustees. Dr. Benjamin O. Herring succeeded Hodges as president in 1946.

Although primarily an educator, Herring was active in growing the GGBTS. He wrote letters thanking the Golden Gate Baptist Church for use of their facilities while also suggesting the GGBTS should acquire housing facilities. He repeatedly presented the case that the SBC open a Baptist College in California and petitioned Baptist churches for financial support. In early 1947 Herring was successful in moving the GGBTS to larger, more spacious quarters in nearby Berkeley. This property also included dormitories for women (Graves 1983:48,57,88). In 1949 the GGBTS was accredited by the State of California. "An exhaustive and thorough examination of the organization, faculty, program, and facilities was necessary before the coveted approval was procured. Since the State of California maintains high educational standards, the accreditation of the seminary is a noteworthy event" (Graves 1983:91). All of Herring's work contributed to the SBC accepting ownership of the school in May 1950 (Gateway Seminary 2021). Attendance had grown from 31 students in September 1946 to 177 in September 1950. Larger facilities were needed, and the GGBTS board voted to negotiate with Calvary Baptist Church for the adjacent property; plans were drawn up to accommodate 500 students, however, a loan for this work was never secured (Graves 1983:104-105).

Herring resigned his presidency in 1951 and was succeeded by Dr. Harold K. Graves from Oklahoma. Graves continued to expand the faculty and push for academic excellence. He arranged the lease of a house and 12-unit motel complex across the street from the Berkeley property to provide housing and dining facilities for single students; two houses that had been previously used as dorms were converted to office space; and he remodeled the interiors of existing facilities to maximize space (Graves 1983:130). During this time, he also continued Herring's search for a new location. In 1953 he led the acquisition of 148 acres of prime Marin County real estate, at the site of a dairy farm previously considered as a permanent location for the United Nations. Moving the GGBTS was a bold venture that would require the development and construction of all new facilities (Gateway Seminary 2021).

The campus buildings were designed by noted San Francisco architect John Carl Warnecke, known for Bay Area landmarks like Stanford University's Mapes Pavilion and the San Francisco Hilton. The campus landscape was planned and designed by influential landscape architect Lawrence Halprin who gained national attention with his work at the 1962 Seattle World's Fair and the Ghirardelli Square adaptive-reuse project in San Francisco. Halprin was also commissioned to design the landscapes at three residential colleges, Cowell College, Stevenson College, and Crown College, at the University of Santa Cruz in the 1950s. In the early 1970s, Warnecke and Halprin again worked together on the design of the United Nations Plaza at San Francisco's Civic Center (Gateway Seminary 2021; Wood 2019).

The GGBTS campus was opened in September 1959. Graves continued to lead the GGBTS until he retired and became president emeritus in 1977 (Gateway Seminary 2021; Wood 2019). Completed, the campus had nine buildings containing nearly 120,000 square feet of floor space, with 211 student housing units and spectacular views of San Francisco's skyline over the bay. Enrollment peaked in the 1970s at 750 students, most doing graduate work (Wood 2019).

*D6. Significance (con't)

Dr. William M. Pinson Jr., pastor of the First Baptist Church of Wichita Falls, Texas, became president of GGBTS after Graves in 1977. His five-year tenure saw the GGBTS continue to expand its visibility. Pinson led in the establishment of the GGBTS's regional campus in the Pacific Northwest. A steadily growing enrollment brought about the need for a new library and additional student housing at the Mill Valley Campus. They were completed before Pinson became executive director of the Baptist General Convention of Texas in 1982 (Gateway Seminary 2021).

Dr. Franklin D. Pollard, pastor of the First Baptist Church of San Antonio, Texas, was inaugurated as the fifth president of GGBTS in 1983. During his three-year administration, the GGBTS experienced the largest enrollment gain in its history, a 20 percent increase in the fall of 1984 over the previous fall. Pollard also led in a redevelopment of the GGBTS master plan so more students could study at GGBTS. He left in 1986 to become pastor of the First Baptist Church of Jackson, Mississippi (Gateway Seminary 2021).

Beginning in 1973 with the opening of the Orange County seminary, the GGBTS grew to have five campuses, which served Southern Baptist churches throughout the Western United States (Seminaries and Bible Colleges 2022).

- Seminary in Northern California, in Mill Valley, CA (San Francisco Bay Area)
- Seminary in Southern California, in Brea, CA (Orange County, California)
- Seminary in Arizona, in Scottsdale, AZ (Greater Phoenix, Arizona Area)
- Seminary in Washington, in Vancouver, WA (Greater Portland, Washington Area)
- Seminary in Colorado, in Centennial, CO (Denver Metropolitan Area)

In April 2014, the board of trustees voted to move the GGBTS's main campus from Mill Valley 400 miles south to Ontario, California and rename the school Gateway Seminary of the Southern Baptist Convention. The Marin campus was sold to North Coast Land Holdings for $84 million. In 2016, North Coast Land Holdings signed a three-year lease with Olivet University, a private evangelical Christian school. The Marin site is now called the Seminary at Strawberry and, besides having the university tenant, is a setting for weddings, seminars, and special events (Gateway Seminary 2021; Wood 2019).

Site Development History

Available online historical aerial imagery of the area is sporadic. The 1946 aerial shows the outline of the preliminary road Seminary Drive, and the campus area has been graded by 1956. By 1958, the outlines of interior roads are present, including modern day Shuck Drive, Judson Lane, Rice Lane, Hodges Drive, and Storer Drive, as well as the beginning stages of construction of the campus structures. The terraced parking lot at the GGBTS is also clearly visible. Residential development exponentially increased by 1968 with clusters along Oliver Lane, Rice Lane, Lockett Lane, Chapel Drive, and along Seminary Drive and Strawberry Lane. By 1982, three elongated structures are present in the southwest corner of the campus. The 1993 aerial photograph shows a baseball diamond along Seminary Drive and Gilbert Drive; by 2018, the baseball diamond had been covered with grass, leaving what is today known as Seminary Playing Field (NETR 2022).

*D6. Significance (con't)

Historical photographs are also available from the Marin History Museum (Marin History Museum 2022). In the February 1959 photo below, the majority of residential apartments are visible, along with the cafeteria and administration building. The three apartment buildings west of Wallace Hall are not visible, nor are the three at south corner of Oliver Land and Shuck Drive (north of Maddox Hall). The seven apartment buildings north of the corner of Shuck Drive and Storer Drive had not been constructed, nor has Tichenor Village. The library, President's Home, and residences along Mission Drive and Chapel Drive intersection (Platt Village) had also not been constructed. The President's Home is visible in the August 1962 photo.

In September 1965, shown below, the three apartment buildings west of Wallace Hall are now visible as are the three north of Maddox Hall (south corner of Oliver Land and Shuck Drive). The library, Tichenor Village, apartment buildings at the north corner of Shuck Drive and Storer Drive, and residences along Mission Drive and Chapel Drive intersection have yet to be constructed. The February 1966 photo depicts the same conditions.

Four of the apartment buildings at the north corner of Shuck Drive and Storer Drive are visible in the September 1968 photo, though the top three apartment buildings have yet to be constructed. It is unclear whether the residences along Mission Drive and Chapel Drive intersection have been constructed; the library and Tichenor Village have not. By April 1974, shown below, the residences along Mission Drive and Chapel Drive intersection are visible, as are the final apartment buildings at the north corner of Shuck Drive and Storer Drive. The maintenance building is also visible. The presence of the library is unknown because that area of the campus is not visible in the photo; similarly, the photo is too dark and there are too many trees to tell if Tichenor Village has been constructed.

The Design Team

John Carl Warnecke

John Carl Warnecke was an award-winning architect based in the San Francisco Bay Area and was responsible for the design of numerous modernist buildings, schools, and monuments, both within the Bay Area and nation. Warnecke was born in Oakland, California on February 24, 1919. His father, Carl I. Warnecke, was a prominent Beaux Arts architect in Oakland and San Francisco, and one of the architects involved in the design of San Francisco City Hall (Smith 2010). He attended Stanford University where he met John F. Kennedy, when Kennedy was auditing business classes there. This meeting was the start of a longtime relationship that would provide Warnecke opportunities for national recognition as his career matured. After Stanford, Warnecke attended Harvard University for his master's in architecture where he studied under the Modernist master, Walter Gropius. Soon he opened his own practice, first as a solo enterprise in 1950, then as firm in 1956. By 1977, Warnecke was running the largest architectural firm in the United States, with offices in San Francisco, Los Angeles, New York, Boston, Washington, and Honolulu (Grimes 2010). Warnecke was affiliated with the National Academy of Design and was the recipient of many awards, including a National Institute of Arts and Letters prize in 1957 and the Brunner Memorial Prize in 1958.

Warnecke pioneered the idea of contextual architecture, that modern buildings could be designed in sympathy with the natural and built context. Contextual architecture reflects the setting, forms, and details of a building's surrounding landscape, not building something that contrasts and feels out of place. In the late 1950s, the architectural profession did not generally acknowledge the neighboring built environment. His project for a U.S. embassy in Bangkok in 1956 was an unbuilt work that made his reputation. The proposed building drew on mainstream Western Modernist forms, melding them with designs observed by Warnecke in Bangkok. The result

*D6. Significance (con't)

was an exotic mix that drew favorable reviews. The design consisted of several floors of cantilevered balconies with lacy pre-cast concrete railings around the main office core and central courtyard. The composition floated on thin white columns over a reflecting pond. Warnecke received a letter from Finnish-American architect and industrial designer Eero Saarinen praising the design for the embassy (NPS 2001).

Among significant works of this period by Warnecke's office were the John F. Kennedy Gravesite in Arlington National Cemetery (1966); the Hawaii State Capitol (1969) in Honolulu; Logan Airport South Terminal in Boston (1977), Lafayette Square in Washington DC (1962-72), the Soviet Embassy in Washington DC (1975); the Hart Senate Office Building in Washington DC (1982), and a Sports Arena at the University of Nevada in Las Vegas (1984). His designs reflected his passion for structures that harmonize with the environment and the heritage of the places in which they were built.

Located in downtown Honolulu, the Hawaii State Capitol was commissioned and dedicated by John A. Burns, second Governor of Hawaii. It opened on March 15, 1969, replacing the former statehouse, the 'Iolani Palace. The Hawaii State Capitol is an American adaptation of the Hakonya style termed "Hawaiian international architecture". It was designed by a partnership between the firms of Belt, Lemon, and Lo (Architects Hawaii Ltd.), and John Carl Warnecke and Associates. Unlike other state capitols modeled after the United States Capitol, the Hawaii State Capitol's distinct architectural features symbolize various natural aspects of Hawaii. The building is surrounded by a reflecting pool, symbolizing the Pacific Ocean. The two legislative chambers are cone-shaped, symbolizing volcanoes that formed the Hawaiian Islands. The columns around the perimeter of the building have shapes resembling royal palm trees. There are eight columns in four rows at either side of the building, representing the eight main islands of Hawaii; sets of eight items appear in other places inside and along the outside of the building. The Capitol is built with an open-air design, allowing sun, wind, and rain to enter; the central atrium opens to the sky and rainbows can sometimes be seen inside the building when it rains. When standing in the center of the structure, the chandeliers from both legislative chambers, which represent the sun and moon, can be seen through the glass walls, while the area that is normally reserved for a rotunda in most capitol buildings is left open to the sky (Architectuul 2022).

One of the best examples of Warnecke's contextual style is the Mira Vista Elementary School in Richmond (photos below). Not only does its design and orientation provide the best angle to capture natural light but it also mimics nearby natural forms—rocks, grass, and waves—so as to blend into and become part of the natural landscape (American Institute of Architects 2018). Other notable California schools designed by Warnecke include the White Oaks Elementary School in San Jose, the Cragmont Elementary School in Berkeley, the Frank C. Havens Elementary School in Piedmont, White Oaks Elementary School in San Carlos, and numerous buildings on the Stanford, UC Berkeley, and UC Santa Cruz campuses.

*D6. Significance (con't)

Lawrence Halprin

Lawrence Halprin was one of the most influential landscape architects of the latter 20th century. With a career spanning more than five decades, he designed significant projects overseas and across the United States including the landscapes for the Hebrew University in Jerusalem, Israel (1960), the 1962 Seattle's World Fair, the United Nations Plaza in San Francisco (1975), Park Central Square in Springfield, Missouri (1974; listed in the NRHP in 2010), and the entrance to Yosemite Falls in Yosemite National Park (completed 2005). His designs sought to impart positive social impact and user experience, as well as convey artistic expression by bringing nature into urban spaces in unprecedented ways (Los Angeles Conservancy 2020). Halprin's notable projects in Mill Valley include the landscape designs for the Mill Valley Public Library (1966) and the Green-Johnston House at 366 Summit Avenue (1961).

Halprin was born in New York City in 1916 and raised in Brooklyn. He earned a bachelor's degree in plant sciences from Cornell in 1939 and a master's degree in horticulture in 1941 from the University of Wisconsin. Halprin found his calling after visiting Frank Lloyd Wright's Taliesin studio in Wisconsin. He attended Harvard's Graduate School of Design on scholarship, studying under early Modern masters Walter Gropius and Marcel Breuer (Los Angeles Conservancy 2020). After being injured in a kamikaze attack during World War II, Halprin went to San Francisco to recuperate. It is there he came to work with famous San Francisco landscape architect Thomas Church until he started his own firm in 1949.

Stylistically, Halprin was part of the modernist design movement. Expanding upon the principles of landscape architecture pioneered by Frederick Law Olmsted, Halprin created new types of landscapes that were dynamic, environmentally sensitive, commemorative, and eco-friendly. One of his specialties was creating grand open space networks that were carved into declining infrastructure (Cultural Landscape Foundation 2016). Halprin, like Olmsted, wanted to take the viewer on a scenic journey so he scaled his designs with the human viewpoint in mind. However, unlike Olmsted, Halprin's landscapes were inspired by, but not imitative of, nature; his signature elements included scenic vegetation, striking water features (particularly fountains; see photo below), sculptures, terraced backdrops, native stones, and concrete (Los Angeles Conservancy 2020).

Ira Keller Fountain, Portland Oregon (Cultural Landscape Foundation 2016).

***D6. Significance (con't)**

One of Halprin's earliest achievements was the kidney-shaped pool at the Donnell Garden was completed in 1948 (photo below). Designed by Church, in collaboration with Halprin while he was employed in the landscape architect's office, the pool's form interprets the salt marshes in the distance and may have been one of the country's first biomorphic pools (Cultural Landscape Foundation 2016). Its distinct shape, along with the abstracted sculpture by Adaline Kent, has become an icon of mid-century Modernism and California living.

Dewey Donnell Garden Pool (El Novillero) in Sonoma County (Cultural Landscape Foundation 2016).

Halprin was commissioned to design the landscapes at three of the residential colleges at the University of Santa Cruz in the 1950s: Cowell College, Stevenson College, and Crown College. His designs incorporated the redwood groves and ocean views that are characteristic of the campus as a whole, while his individual design aesthetic is evident in the concrete terraced patios and abstract sculptures and fountains (Cultural Landscape Foundation 2016). He also designed Sproul Plaza at University California Berkeley in 1962.

Sea Ranch, located on the Sonoma Coast, is his most well-known landscape project in the Bay Area (photo below). Halprin was hired to create a master plan for the residential community in 1965; he developed guidelines and recommendations for growth that are still adhered to today. Halprin integrated emerging environmental principals into his plan, attempting minimal intrusion into the native environment (see photo below). Houses were placed within the natural framework of the coastal hills, clustered between hedgerows to provide both wind protection and ocean views (Cultural Landscape Foundation 2016).

***D6. Significance (con't)**

Sea Ranch, Sonoma Cost (Cultural Landscape Foundation 2016).

Halprin continued to create until his death in 2009 at the age of 93(Los Angeles Conservancy 2020). He received numerous awards during his lifetime, including being elected a fellow in the American Society of Landscape Architects in 1969, the Architects Institute of America Gold Medal Award in 1979, and the National Medal of Arts in 2002, presented by then-President George W. Bush.

NRHP AND CRHR EVALUATION

Each of the buildings identified in Table 1 have been recorded on DPR 523 primary forms. These forms follow the main GGBTS district evaluation forms (DPR-523D). Buildings with the potential for individual eligibility are also documented on building, structure, object forms (DPR-523B).

Application of Significance Criteria

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a property must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. GGBTS is proclaimed as the first Baptist Seminary in the west. However, this is more correctly stated for the Berkeley campus, which was established in 1947, more than a decade prior to the Marin campus. It was at the Berkeley campus where residences were established, including dormitories for women, were GGBTS was accredited by the State of California in 1949, and where the SBC accepted ownership of the school in May 1950. Therefore, although the Marin campus of GGBTS is associated with the continued growth of the Southern Baptist Seminary in California and the west, GGBTS was fully established and growing while at the Berkeley campus. Historical research revealed no specific contributions to the Southern Baptist Convention's growth. Because the historic record does not show the property to be associated with events that have made a significant contribution to history, it does not appear to meet NRHP/CRHR Criterion A/1.

*D6. Significance (con't)

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a property must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The establishment of a Baptist seminary in California is credited to Isam B. Hodges and the expansion of GGBTS in Berkeley is credited to Dr. Benjamin O. Herring and Dr. Harold K. Graves. Although Graves was responsible for the founding of the Marin campus of GGBTS, this does not rise to the level of significance necessary for NRHP or CRHR consideration. Also, while the Marin campus of GGBTS was designed by John Carl Warnecke and Lawrence Halprin, this property does not appear to be the most representative example of their work, discussed further under Criterion C. Therefore, the Marin campus of GGBTS does not appear to meet NRHP/CRHR Criterion B/2.

Under NRHP/CRHR Criterion C/3, a property must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The GGBTS property was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin. Warnecke specialized in modernist designs, such as the Hawaii State Capitol building, and contextual architecture that reflected his passion for structures that harmonized with the environment, as seen in Mira Vista Elementary School. Halprin specialized in bringing nature into urban spaces, especially through water features, as seen in the Ira Keller Fountain, and designing landscapes that were inspired by nature, such as Sea Ranch. The buildings are not examples of modernist work and there is minimal landscaping. While the GGBTS property has a park-like setting and the hillside is mirrored in the terracing of buildings and the main parking lot, the campus is not representative of Warnecke's or Halprin's work. As a whole, GGBTS lacks the architectural and design values of both masters, and therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about GGBTS have been documented. The property does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

Integrity Consideration

GGBTS retains its integrity. The property has had no demolitions or additions which detract from the original design, materials, workmanship, or feeling of the buildings or campus. While some buildings were constructed at a later time, such as the library and Tichenor Village, these additions were done in such a way as to be compatible with the original design of the buildings and campus. None have been moved from their original location; therefore, GGBTS retains integrity of association and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although GGBTS retains its integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

***P3a. Description:** The administration building is a two-story, 25,200-sf building with a rectangular plan. The building has a side-gabled roof clad in Spanish tiles with moderate eaves. On the east end of the building and along the primary façade, the first floor extends out passed the footprint of the second floor. This extension has a break along the primary façade to create the main entrance. The building features a curtainwall system with awning windows; metal panels are located at the base. Exposed concrete is visible at the gabled ends. Due to elevation changes accommodated by a staircase and retaining rock wall, only the second floor is visible from the majority of the courtyard at the rear, southern façade. A recessed secondary entrance, in-line with the primary entrance, is located on the southern façade.

B10. Significance (continued)

NRHP and CRHR Evaluation

Application of Significance Criteria

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a building must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. The administration building was constructed to help facilitate activities at GGBTS. The historic record did not show that the construction of this building was associated with any noteworthy or specific programs to advance GGBTS or the SBC. Because the historic record does not show the building to be associated with events that have made a significant contribution to history, it does not appear to meet NRHP/CRHR Criterion A/1.

B10. Significance (continued)

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a building must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The GGBTS was a respected program that reflected the work and contributions of many people; however, historical research did not reveal specific individually significant researchers or lecturers that have direct important association with the administration building. Also, while the building was designed by John Carl Warnecke, it does not appear to be the most representative example of his work, discussed further under Criterion C. Therefore, the administration building does not appear to meet NRHP/CRHR Criterion B/2.

Under NRHP/CRHR Criterion C/3, a building must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The administration building was designed by architect John Carl Warnecke who specialized in modernist designs, such as the Hawaii State Capitol building, and contextual architecture that reflected his passion for structures that harmonized with the environment, as seen in Mira Vista Elementary School. The administration building is a typical institutional design, not representative of modernist design or Warnecke's typical work. While the administration building is the work of a master, it lacks architectural distinction, does not have artistic qualities, and therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about the administration building has been documented and are stored at the Gateway Seminary library in Ontario, California. The building does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

Integrity Consideration

The administration building retains its integrity. The building has had no known alterations which detract from the original design, materials, workmanship, or feeling of the buildings. The building has not been moved from its original location, and therefore retains integrity of association and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although the administration building retains integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

P3a. Description (continued)

The building is accessed from the courtyard located behind the administration building; double glass doors are located at each recessed hyphen. The southernmost hyphen is designed at a 90-degree angle. As with the administration building, only the second floor is visible from the courtyard.

Photo 5. Courtyard with Academic Building on the left and Administration Building on the right. Facing northeast. Photo taken 11/22/2021.

B10. Significance (continued)

NRHP and CRHR Evaluation

Application of Significance Criteria

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a property must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. The potential significance of the Academic Building can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. The District Evaluation determined that because the historic record did not show the property to be associated with events that have made a significant contribution to history, it did not appear to meet NRHP/CRHR Criterion A/1. The Academic Building was constructed to help facilitate the goal of the GGBTS and the SBC. The historic record did not show that the construction of this building was associated with any noteworthy or specific programs to advance GGBTS or the SBC. Because the historic record does not show the academic building to be associated with events that have made a significant contribution to history, it does not appear to meet NRHP/CRHR Criterion A/1.

B10. Significance (continued)

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a building must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The GGBTS was a respected program that reflected the work and contributions of many people; however, historical research did not reveal specific individually significant researchers or lecturers that have direct important association with the academic building. Also, while the building was designed by John Carl Warnecke, it does not appear to be the most representative example of his work, discussed further under Criterion C. Therefore, the academic building does not appear to meet NRHP/CRHR Criterion B/2.

Under NRHP/CRHR Criterion C/3, a building must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The academic building was designed by architect John Carl Warnecke who specialized in modernist designs, such as the Hawaii State Capitol building, and contextual architecture that reflected his passion for structures that harmonized with the environment, as seen in Mira Vista Elementary School. The academic building is a typical institutional design, not representative of modernist design or Warnecke's typical work. While the academic building is the work of a master, it lacks architectural distinction, does not have artistic qualities, and therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about the academic building has been documented and are stored at the Gateway Seminary library in Ontario, California. The building does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

Integrity Consideration

The academic building retains its integrity. The building has had no known alterations which detract from the original design, materials, workmanship, or feeling of the buildings. The building has not been moved from its original location, and therefore retains integrity of association and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although the academic building retains integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

This building does not appear to meet the criteria for individual listing on the California Register of Historical Resources (CRHR) or the National Register of Historic Places (NRHP). It was evaluated for inclusion in a potential historic district as part of the former Golden Gate Baptist Theological Seminary (GGBTS).

History of the Cafeteria at the Golden Gate Baptist Theological Seminary

The Cafeteria is part of the former GGBTS at 201 Seminary Drive in Mill Valley. The GGBTS DPR523 District Record provides a comprehensive history of the GGBTS campus and should be referenced to gain addition contextual information.

Based on aerial photography, the Cafeteria was constructed between 1958 and 1959.

P3a. Description (continued)

The primary (western) façade includes two sets of glazed, aluminum framed double doors and the rest of the wall consists of fixed glass panels that are both clear and opaque. A full façade, wooden, slated privacy screen supports the wide eave; this also creates a cover for the entry ways.

The southern façade includes a small portion of the raised basement at the eastern end of the façade; one door and two large vents are present. The first-floor level included a pair of solid doors; the rest of the wall consists of fixed glass panels that are both clear and opaque.

The eastern façade includes the exposed portion of the raised basement the full length of the façade; there are number of solid doors and vents. The first-floor level includes fixed glass panels that are both clear and opaque.

Photo 1. Primary façade with protected wood grill screen. Facing southeast. Photo taken 11/22/2021.

Photo 2. Primary (western) façade. Facing east. Photo taken 11/22/2021.

B10. Significance (continued)

NRHP and CRHR Evaluation

Application of Significance Criteria

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a property must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. The potential significance of the Cafeteria can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. The District Evaluation determined that because the historic record did not show the property to be associated with events that have made a significant contribution to history, it did not appear to meet NRHP/CRHR Criterion A/1. No additional information has been discovered that would indicate that the Cafeteria individually made a significant contribution to the broad patterns of our nation's, California's, or local history; therefore, it does not appear to meet NRHP/CRHR Criterion A/1 as an individual property.

B10. Significance (continued)

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a property must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The establishment of a Baptist seminary in California is credited to Isam B. Hodges and the expansion of GGBTS in Berkeley is credited to Dr. Benjamin O. Herring and Dr. Harold K. Graves. The potential significance of the Cafeteria can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. The District Evaluation determined that although Graves was responsible for the founding of the Marin campus of GGBTS, this does not rise to the level of significance necessary for NRHP or CRHR consideration and the Marin campus of GGBTS does not appear to meet NRHP/CRHR Criterion B/2. Also, while the Marin campus of GGBTS was designed by John Carl Warnecke and Lawrence Halprin, archival research has revealed no such association with regards to the Cafeteria, discussed further under Criterion C. Therefore, the Cafeteria does not appear to meet NRHP/CRHR Criterion B/2 as an individual property.

Under NRHP/CRHR Criterion C/3, a property must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The potential significance of the Cafeteria can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. While the GGBTS campus was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin, significant figures in the fields of architecture, the District Evaluation determined that the campus was not representative of Warnecke's or Halprin's work and did not appear eligible for inclusion in the NRHP/CRHR under Criterion C/3. While the GGBTS campus was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin archival research as revealed no such association with regards to the Cafeteria. The architect and builder of the Cafeteria are unknown and the building lacks the architectural and design values of a master, therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about the Cafeteria with regards to alterations and additions are unknown; however, the property does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

Integrity Consideration

The Cafeteria appears to retain its integrity. The property has had visible no demolitions or additions which detract from the original design, materials, workmanship, or feeling of the building. The building has not been moved from its original location and no major alterations through the construction or demolition of surrounding buildings, structures, of features has occurred; therefore, the Cafeteria retains integrity of location, association, and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although the Cafeteria retains its integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

P3a. Description (continued)

The primary (eastern) façade is asymmetrical with the entry recessed approximately in the middle consisting of a pair of wood panels doors flanked by side lights. There are windows under each of the projecting gable ends that flank the entry. The other facades were not visible from the public right-of-way.

Photo 1. Primary (eastern) façade. Facing west. Photo taken 11/22/2021.

B10. Significance (continued)

NRHP and CRHR Evaluation

Application of Significance Criteria

To be considered eligible for listing in the NRHP/CRHR under Criterion A/1, a property must be associated with events that have made a significant contribution to the broad patterns of our nation's, California's, or local history. The potential significance of the President's Home can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. The District Evaluation determined that because the historic record did not show the property to be associated with events that have made a significant contribution to history, it did not appear to meet NRHP/CRHR Criterion A/1. No additional information has been discovered that would indicate that the President's House individually made a significant contribution to the broad patterns of our nation's, California's, or local history; therefore, it does not appear to meet NRHP/CRHR Criterion A/1 as an individual property.

B10. Significance (continued)

To be considered eligible for listing in the NRHP/CRHR under Criterion B/2, a property must be associated with the lives of persons significant in our past. It must be shown that the person gained importance within his or her profession or group while working in the building. The establishment of a Baptist seminary in California is credited to Isam B. Hodges and the expansion of GGBTS in Berkeley is credited to Dr. Benjamin O. Herring and Dr. Harold K. Graves. The potential significance of the President's Home can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. The District Evaluation determined that although Graves was responsible for the founding of the Marin campus of GGBTS, this does not rise to the level of significance necessary for NRHP or CRHR consideration and the Marin campus of GGBTS does not appear to meet NRHP/CRHR Criterion B/2. Also, while the Marin campus of GGBTS was designed by John Carl Warnecke and Lawrence Halprin, archival research as revealed no such association with regards to the President's House, discussed further under Criterion C. Therefore, the President's House does not appear to meet NRHP/CRHR Criterion B/2 as an individual property.

Under NRHP/CRHR Criterion C/3, a property must embody distinctive characteristics of a type, period, or method of installation, or represent the work of a master, or possess high artistic values. The potential significance of the President's Home can best be understood in the context of the whole GGBTS campus and was evaluated as such in the District Evaluation. While the GGBTS campus was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin, significant figures in the fields of architecture, the District Evaluation determined that the campus was not representative of Warnecke's or Halprin's work and did not appear eligible for inclusion in the NRHP/CRHR under Criterion C/3. While the GGBTS campus was designed by architect John Carl Warnecke and landscape architect Lawrence Halprin archival research as revealed no such association with regards to the President's Home. The architect and builder of the President's Home are unknown and the building lacks the architectural and design values of a master, therefore does not appear to possess sufficient design or construction value to warrant inclusion in the NRHP/CRHR under Criterion C/3.

Criterion D/4 generally applies to archaeological resources, or other resources that through study of construction details can provide information that cannot be obtained in other ways. Construction details about the President's Home with regards to alterations and additions are unknown; however, the property does not appear to be significant under this criterion because it is not likely to yield any additional important information about our history.

Integrity Consideration

The President's Home appears to retain its integrity. The property has had visible no demolitions or additions which detract from the original design, materials, workmanship, or feeling of the building. The building has not been moved from its original location and no major alterations through the construction or demolition of surrounding buildings, structures, of features has occurred; therefore, the President's Home retains integrity of location, association, and setting. However, eligibility for listing on the NRHP and the CRHR rests on twin factors of significance and integrity. A resource must have both significance and integrity to be considered eligible. Loss of integrity, if sufficiently great, will become more important than the historical significance a resource may possess and render it ineligible. Likewise, a resource can have complete integrity, but if it lacks significance, it must also be considered ineligible. Therefore, although the President's Home retains its integrity, it lacks significance and therefore does not appear eligible for listing in either the CRHR or the NRHP.

P3a. Description (continued)

Bagby Hall is a two-story, building with an offset footprint. It has a side gabled roof clad in tarpaper with wide eaves, exposed rafter tails, and facia boards. It is clad in a combination of horizontal and vertical T-111 wood siding. It includes at least 16 residential units that each have an exterior entry, on the primary (northwestern) façade, consisting of a single door with a transom window. The non-transom style windows appear to be sliders. The second-floor units are accessed by a partially enclosed, exterior staircase at the northeastern end of the building which is covered by the roof. The rear (southeastern) façade includes sixteen tri-part windows; the center window appears to be fixed while the flanking windows appear to be sliders. The southwestern and northeastern facades have no window or door openings.

Gill Hall is a two story, rectangular shaped building. It has a side-gabled, tarpaper roof with wide eaves, exposed rafter tails, and facia boards. It is clad in a combination of horizontal and vertical T-111 wood siding. It includes 9 residential units, 4 downstairs and 5 upstairs, that each have an exterior entry, on the primary (northern) façade, consisting of a single door with a transom window and one slider window. The second-floor units are accessed by a partially enclosed, exterior staircases at each end of the building which are covered by the roof. A utility room and mailboxes are located on the first floor at the western end of the building. The rear (southern) façade includes 8 tri-part windows; the center window appears to be fixed while the flanking windows appear to be sliders. The eastern and western facades have no window or door openings.

Maddox Hall includes 8 residential units and consists of a double story, rectangular shaped building with a side-gabled composite shingle roof. The exterior of each of the buildings includes T-111 siding, aluminum framed windows, and open stairs for access to the second story. The rear (southwestern) façade includes 8 tri-part windows; the center window appears to be fixed while the flanking windows appear to be sliders.

Bagby and Gill Halls include transoms located over the single personnel doors while Maddox Hall includes sidelights adjacent to each of the single personnel doors.

Mallory Hall is a dormitory building and is located in northeastern portion of the GGBST campus. Mallory Hall has a truncated H-shaped footprint; the short side of the "H," closest to Storer Drive, is two stories and the long side of the "H" is one story. It has a cross gabled roof with exposed rafter tails clad in composite shingles. The wood siding is oriented both vertically and horizontally. The primary (northwestern) façade includes a pair of doors and large, fixed window. Windows on the secondary and rear facades are aluminum framed sliders.

P3a. Description (continued)

The primary (western) façade is asymmetrical with the entry recessed under the roof toward the northern end of the façade. The entry includes a craftsman-style, wood panel door with six, fixed windows; wood paneled and glazed sidelights; and a transom window. The entry is flanked by four windows with two on each side of the doorway; all windows appear to be vinyl framed replacements.

P3a. Description (continued)

All three of the buildings are two story, have rectangular footprints, and side gabled roofs clad in shingles with wide eaves with exposed rafter tails and facia boards. The buildings are wood framed and clad in T-111 siding. The primary façade of each building includes aluminum framed windows and rectangular fixed windows adjacent to the single-entry doors. There are wrought iron railings along the building exterior to access the second story entries. The rear façade of each building includes aluminum framed windows. The secondary facades of each building do not include any window or door openings.

P3a. Description (continued)

Each two-story building has a rectangular footprint and a side gabled roof with wide eaves, exposed rafter tails, and clad in composite shingles. Each is also clad in T-111 siding. There are at least 10 residential units in each building. Roofing material consists of composite shingle. The primary façade of each building includes aluminum framed windows and single-entry doors with transom windows above. There are wrought iron safety fences along the building exterior to access the second story. Additionally, the second-story contains an elevated walkway connecting the three buildings.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

300 Storer Drive is located in the northwestern portion of the GGBTS campus at the northeastern corner of Storer Drive and Reed Boulevard. The two-story, Contemporary-style residence has a low pitched, side gabled roof and a rectangular footprint. The roof includes wide eaves, the southwestern corner of which is supported by square, wooden posts to cover the entryway. The first floor is constructed of concrete cinderblock and the second floor is wood framed construction clad in horizontal wood siding, likely T-111.

P3a. Description (continued)

The second story exterior includes vertical wood siding and a single personnel door along the southern façade. Both stories include aluminum frame windows.

The primary (southern) façade includes the front door with a transom window above, which is recessed under the southwestern corner of the roof, and two windows. The two windows appear to be aluminum framed sliders with plain wooden trim. The western façade, which was only partially visible from the right-of-way, includes at least seven windows; three of the windows are sliders and there is a grouping of four fixed windows. The eastern façade includes two floors; the first floor includes a double personnel door flanked by four windows and three single roll-up garage doors at the first floor and five windows at the second floor. All of the windows on the eastern façade appear to be sliders and the one on the second floor include plain wooden trim. The northern façade was not visible from the right-of-way.

1 INTRODUCTION

The proposed North Coast Land Holdings Project (project) would redevelop the former Golden Gate Baptist Theological Seminary property on the Strawberry Peninsula in unincorporated Marin County (Figure 1). The proposed development would include improvements to an existing academic campus, relocation of an existing daycare center, construction of a new fitness center, construction of a new residential care facility, upgrades to existing housing and construction of new housing, retention and improvements to existing open space and recreation areas, and creation of new bicycle and pedestrian paths throughout the property.

This report summarizes the methods and results of a reconnaissance survey, database queries, and a review of the 2010 Biological Resources Assessment prepared by WRA Environmental Consultants (WRA 2010). The 2010 Biological Resources Assessment covered a portion of the project site (Seminary Knoll, Student Village, Seminary Point, Seminary Vista West, Chapel Hill, and Seminary Vista East) and is included in this memorandum because it provides additional information about land cover that was identified in a portion of the project site at that time. Information on the soils, landcover types, special-status species, sensitive habitats, and potential jurisdictional waters that occur or that have the potential to occur within the project site is presented in this report. This report also contains initial findings related to the potential for the project to impact these resources.

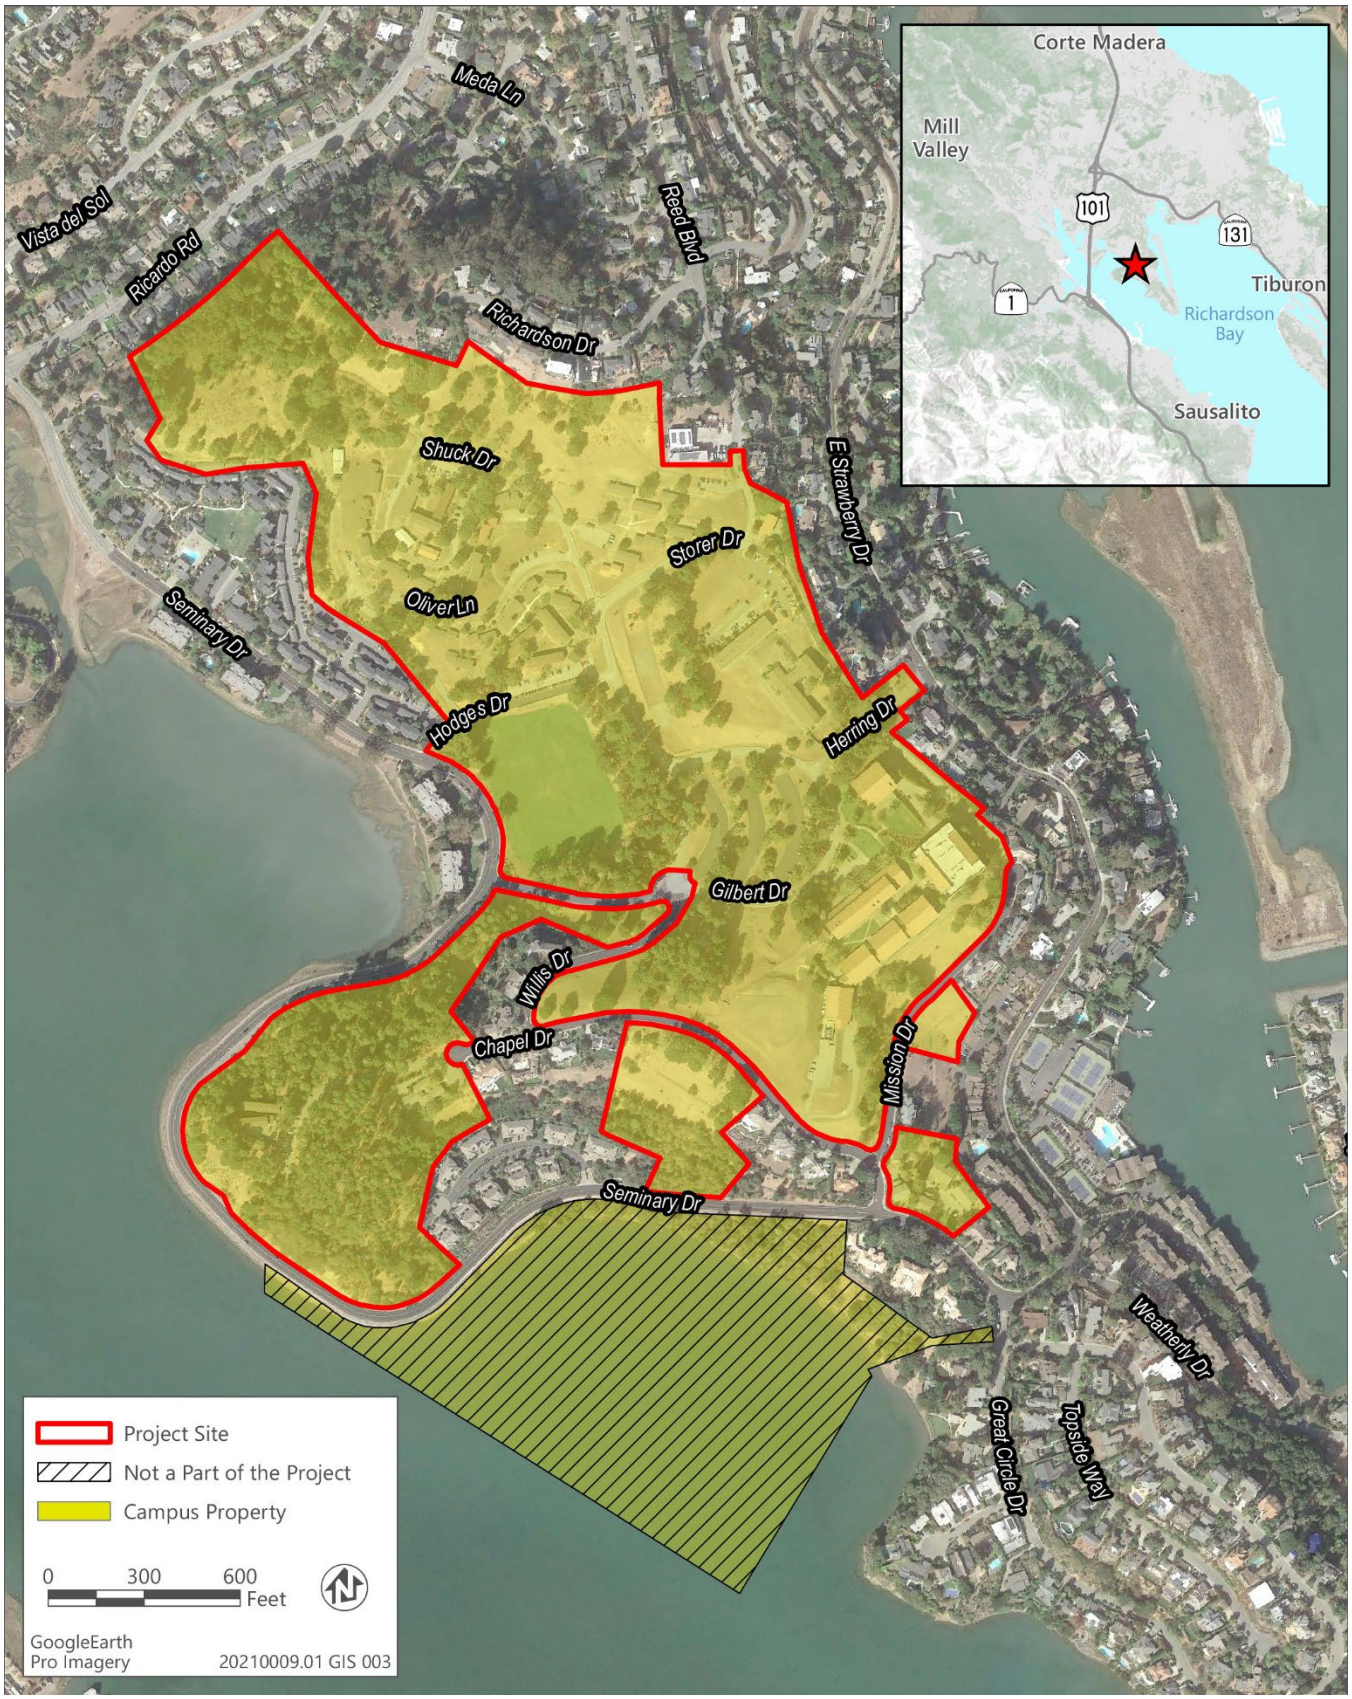
2 METHODS

The project site evaluated in this technical memorandum is shown below in Figure 1. To assess the existing conditions within the project site, a reconnaissance survey was conducted by an Ascent biologist on October 5, 2021. In addition, a search of the California Natural Diversity Data Base (CNDDB) and California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants within the Bolinas, San Geronimo, Novato, Petaluma Point, San Quentin, San Francisco North, Point Bonita, and San Rafael U.S. Geological Survey 7.5-minute quadrangles (9-quad search area, minus one quad due to the location of the project near the coast) was conducted to identify any recorded occurrences of special-status botanical or animal species in or near the project site. The Marin Fine Scale Vegetation Web Map (CNPS 2021a) was used to identify land cover in the project site, and a search of available reports and other planning documents applicable to the project site was conducted, including the 2010 Biological Resources Assessment, which covered a portion of the project site encompassing the Seminary Knoll, Student Village, Seminary Point, Seminary Vista West, Chapel Hill, and Seminary Vista East (WRA 2010).

2.1 SPECIAL-STATUS SPECIES

For the purpose of this report, special-status species are defined as species that are legally protected or that are otherwise considered sensitive by federal, state, or local resource agencies. Special-status species are species, subspecies, or varieties that fall into one or more of the following categories, regardless of their legal or protection status:

- officially listed by California or the federal government as endangered, threatened, or rare;
- a candidate for state or federal listing as endangered, threatened, or rare;
- taxa (i.e., taxonomic category or group) that meet the criteria for listing, even if not currently included on any list, as described in the definition of endangered, rare, or threatened species in the California Environmental Quality Act (CEQA) Guidelines, California Code of Regulations (CCR) Section 15380;
- species identified by California Department of Fish and Wildlife (CDFW) as species of special concern;
- species listed as fully protected under the California Fish and Game Code;
- species afforded protection under local planning documents; and



Sources: Adapted by Ascent in 2021.

Figure 1 Project Site

- plant taxa considered by the CDFW to be "rare, threatened, or endangered in California" and assigned a California Rare Plant Rank (CRPR). The CDFW system includes five rarity and endangerment ranks for categorizing plant species of concern, the three that are considered special-status for the purpose of this report area summarized as follows:
  - CRPR 1A - Plants presumed to be extinct in California;
  - CRPR 1B - Plants that are rare, threatened, or endangered in California and elsewhere; and
  - CRPR 2 - Plants that are rare, threatened, or endangered in California but more common elsewhere.

The term "California species of special concern" is applied by CDFW to animals not listed under the federal Endangered Species Act (ESA) or California Endangered Species Act (CESA), but that are considered to be declining at a rate that could result in listing, or that historically occurred in low numbers and known threats to their persistence currently exist. CDFW's fully protected status was California's first attempt to identify and protect animals that were rare or facing extinction. Most species listed as fully protected were eventually listed as threatened or endangered under CESA; however, some species remain listed as fully protected but do not have simultaneous listing under CESA. Fully protected species may not be taken or possessed at any time and no take permits can be issued for these species except for scientific research purposes or for relocation to protect livestock.

2.2 SENSITIVE NATURAL COMMUNITIES

CDFW maintains a list of plant communities that are native to California (CDFW 2021). Sensitive natural communities are ranked by CDFW from S1 to S3, where S1 is critically imperiled, S2 is imperiled, and S3 is vulnerable. CDFW's natural-community rarity rankings follow the 2009 NatureServe Conservation Status Assessments, in which all alliances are listed with a global (G) and state (S) rank, where G1 is critically imperiled, G2 is imperiled, G3 is vulnerable, G4 is apparently secure, and G5 is secure. These communities may or may not contain special-status species or their habitat. Impacts to sensitive natural communities should be analyzed under CEQA.

3 RESULTS

3.1 SOILS

The soils underlying the project site were determined using a previously prepared soils map of the area (WRA 2010), overlayed with the current project site boundary and verified using the current soils map for the entire project site (USDA 2021). There are three types of soils present in the project site and described below.

3.1.1 Los Osos-Urban Land-Bonnydoon Complex, 15-30 percent slopes

The Los Osos-Urban Land-Bonnydoon Complex, 15-30 percent slopes, soil type consists of approximately 40 percent Los Osos and similar soils, 35 percent urban land, 15 percent Bonnydoon and similar soils, and 10 percent other minor components (WRA 2010). The Los Osos soil type is well drained and is formed from weathered sandstone or shale. The Bonnydoon soil type is a somewhat excessively drained soil that is also formed from weathered sandstone or shale. Urban land is not a native soil, but is made up of asphalt, concrete, and other materials.

3.1.2 Los Osos-Urban Land-Bonnydoon Complex, 30 -50 percent slopes

The Los Osos-Urban Land-Bonnydoon Complex, 30-50 percent slopes, soil type consists of approximately 40 percent Los Osos and similar soils, 30 percent urban land, 20 percent Bonnydoon and similar soils, and 8 percent other minor components (WRA 2010). The description of the components of this complex are the same as given in Section 3.1.1.

3.1.3 Xerorthents, Fill

A small portion of the project site in the vicinity of the existing sports field is made up of xerothents fill (WRA 2010). This fill may be composed of various soil types that have been rearranged and modified from their original characteristics.

3.2 LAND COVER

The land cover types present in the project site were determined using the Marin County Fine Scale Vegetation Map, a Biological Resources Assessment covering a portion of the project site (WRA 2010), the Manual of California Vegetation Online (CNPS 2022a), and a reconnaissance-level survey on October 5, 2021. The Marin County Fine Scale Vegetation Map represents the state of the landscape in 2018 and adheres to the National Vegetation Classification (CNPS 2021a). The map classes in the fine scale vegetation map generally correspond to the alliance level of the National Vegetation Classification and the Manual of California Vegetation, and the map was created using computer-based models, aerial photo interpretation, and field verification. Although the Marin County Fine Scale Vegetation Map is highly accurate and survey plots were performed for this effort in many areas, there were no survey plots allocated to the project site for this mapping effort (CNPS 2021a), and its accuracy within the project site may not be as high as in other portions of the county. A biological resources assessment, which included field surveys, was conducted in 2010 by WRA Environmental Consultants for a portion of the current project site (i.e., the Seminary Knoll, Student Village, Seminary Point, Seminary Vista West, Chapel Hill, and Seminary Vista East portions of the project site) and classified vegetation to the alliance level where possible using the Manual of California Vegetation 2nd Edition (WRA 2010). Although the 2010 assessment is older than the Marin County Fine Scale Vegetation Map, it provides additional information about land cover that was identified in a portion of the project site at that time. Results from both sources of land cover data are disclosed in this report.

This section describes the land cover types within the project site, including land cover types defined as California sensitive natural communities (CDFW 2021), from both the Marin County Fine Scale Vegetation Map and the WRA report (2010). Figure 2 shows the vegetation types project site from the Marin County Fine Scale Vegetation Map only. Four additional vegetation types (i.e., California sagebrush scrub, French broom scrub, acacia woodland, and needle grass – melic grass grassland) were described in the WRA report as occurring in the project site, but they have not been mapped by the Marin County Fine Scale Vegetation Map. The acreages of the land cover types identified by both the Marin Fine Scale Vegetation Map and WRA report are shown in Table 1.

Table 1 Land Cover Types within the Project site

Land Cover Type	Acreage
Coast Live Oak Woodland[1]	26.71
Acacia Woodland[2]	n/a
Eucalyptus Woodland[1]	2.97
Douglas Fir/Tan Oak/Madrone Forest[1]	2.20
Monterey Pine Forest[1]	9.69
Redwood Forest[1]	0.51
California Annual and Perennial Grassland[1]	20.62

Land Cover Type	Acreage
Coyote Brush Scrub[1]	0.77
California Sagebrush Scrub[2]	n/a
French Broom Scrub[2]	n/a
Needle Grass – Melic Grass Grassland[2]	≥ 1.7*
Developed[1]	33.75
Total	**97.22**

Notes: [1]Mapped by Marin Fine Scale Vegetation Map adjusted by Ascent based on field survey; [2]Type listed in WRA report

* Acreage listed in WRA (2010) for a portion of the project site, and overlaps with other land cover types and not counted toward total acreage.

n/a = Land cover type was reported by WRA (2010) as occurring in a portion of the project site (no acreage provided). Type was not identified as occurring in the project site by the Marin County Fine Scale Map.

Source: Data downloaded from Golden Gate National Parks Conservancy in 2022 and WRA 2010; Adapted by Ascent Environmental in 2022.

3.2.1 Coast Live Oak Woodland

Coast live oak (*Quercus agrifolia*) (*Quercus agrifolia* alliance [CNPS 2022b]) is identified on the Marin Fine Scale Vegetation Map and the 2010 Biological Resources Assessment of the project site. The alliance is defined by native coast live oak making up greater than 50 percent of the canopy cover of the stand. Coast live oak woodland occurs in canyon bottoms, slopes, and flat areas where sandy or loamy soils are deep with high organic matter content. Within the project site, coast live oak woodland contains a mix of native species oaks, California bay (*Umbellularia californica*), poison oak (*Toxicodendron diversilobum*), California blackberry (*Rubus ursinus*), and creeping snowberry (*Symphoricarpos mollis*), with an understory of grasses and forbs (WRA 2010).

3.2.2 Acacia Woodland

Acacia woodland land cover type, consisting of nonnative trees, was described in the WRA report. Although this land cover type was not mapped, it was identified as occurring in the Seminary Point area and between Chapel Drive and Seminary Drive (WRA 2010) within Coast Live Oak Woodland. While this land cover type is not included in the Manual of California Vegetation, its documentation in the previous Biological Resources Assessment (WRA 2010) and its potential to be the focus of removal, warrants its discussion here.

3.2.3 Eucalyptus Woodland

Eucalyptus woodland, a nonnative plant community, is identified on the Marin Fine Scale Vegetation Map and described in the WRA report as occurring along the northern portion of the project site (WRA 2010). An additional area that was identified as "forest fragment" in the Marin Fine Scale Vegetation Map was determined to be Eucalyptus woodland by an Ascent biologist. This land cover type is made up of Tasmanian blue gum (*Eucalyptus globulus*) and red iron bark (*E. sideroxylon*). The understory of this eucalyptus woodland within the project site is dominated by French broom (*Genista monspessulana*) with few grasses and forbs (WRA 2010).

3.2.4 Douglas Fir/Tan Oak/Madrone Forest

This land cover type is shown on the Marin Fine Scale Vegetation Map at the extreme north end of the project site (Figure 2). This land cover type is not currently described in the Manual of California Vegetation (CNPS 2022a); however, its inclusion in the Manual of California Vegetation is pending and, therefore, it is included in this report. Within the project site, it is dominated by native Douglas fir (Pseudotsuga menziesii) with co-dominant and understory of native species (tanoak [*Notholithocarpus densiflorus*] and madrone [*Arbutus menziesii*]. The understory of this land cover type contains also various native shrub species.

Sources: Adapted by Ascent in 2021.

Figure 2 Land Cover

3.2.5 Monterey Pine Forest

Monterey pine forest is shown on the Marin Fine Scale Vegetation Map and was described in the WRA report (WRA 2010). A stand that was identified as Douglas Fir/Tan Oak/Madrone Forest on the Marin Fine Scale Vegetation Map within the center of the project site was determined to be Monterey pine forest during the reconnaissance survey on October 15, 2021 (Figure 2). Most of the Monterey pine forest within the project site consists of relatively open stands of Monterey pine (*Pinus radiata*) with an understory of grasses and forbs. Monterey pine stands that boarder coast live oak stands within the project site contains an understory of small coast live oaks, California bay, and poison oak. The Monterey pines on the site, while native to California, were planted in previously open grasslands as early as the 1950s (WRA 2010) and are not native to the project site. Monterey pine forest in the project site is not one of the three native stands of Monterey pine in California (Stephens et al. 2004), and therefore not a sensitive natural community (CDFW 2021).

3.2.6 Redwood Forest

At the corner of Seminary Drive and Hodges Drive there is a small stand of native coast redwood (*Sequoia sempervirens*) (Figure 2). This stand is classified on the Marin Fine Scale Vegetation Map as Evergreen Hardwood, but was determined to be dominated by redwood by following the reconnaissance survey. These trees were likely planted in this location at the edge of the athletic field. This small stand meets the definition of redwood forest due to the percentage of redwood in the canopy (CNPS 2022c); however, the understory of the stand is highly disturbed and does not function as habitat for species that would normally be found in redwood forest. Due to the likelihood that this stand was planted in this location and the lack of understory due to disturbance, this land cover type within the project area is not considered to be a sensitive natural community (CDFW 2021).

3.2.7 California Annual and Perennial Grassland

California annual and perennial grassland is identified on the Marin Fine Scale Vegetation Map as occurring in more open parts of the project site (Figure 2), and described in the previous Biological Resources Assessment as Non-Native Annual Grassland (WRA 2010). This land cover type is dominated by nonnative grasses and forbs including bromes (*Bromus* spp.), oats (*Avena* spp.), barleys (*Hordeum* spp.), and geraniums (*Geranium* spp.). Native forbs may also be present including California poppy (*Eschscholzia californica*), blue dicks (*Dichelostemma capitatus*), and lupines (*Lupinus* spp.). Few trees and shrubs are present within this land cover type (WRA 2010).

3.2.8 Coyote Brush Scrub

A portion of the project site identified as "shrub fragment" on the Marin Fine Scale Vegetation Map in the Seminary Knoll area was determined to be coyote brush scrub during the reconnaissance survey (Figure 2). Native coyote brush (*Baccharis pilularis*) forms the dominant species within this habitat type, although the species may be present as an understory species in adjacent oak woodland as well. Within the coyote brush scrub habitat, the understory is made up of native and nonnative grasses, including purple needlegrass (*Stipa pulchra*) (WRA 2010).

3.2.9 California Sagebrush Scrub

Native California sagebrush (*Artemisia californica*) is the dominant species in this landcover type, making up at least 60 percent of the relative cover within the land cover type. The understory of this landcover type is made up of native and nonnative grasses, including purple needlegrass and melic grasses (*Melica* spp.) (WRA 2010). California sagebrush scrub is not present on the Marin Fine Scale Vegetation Map or shown in Figure 2. However, this land cover type was identified as occurring in the project site by the previous Biological Resources Assessment; although this land cover type was not mapped and its location is unknown (WRA 2010).

3.2.10 French Broom Scrub

French broom scrub is dominated by the nonnative invasive broom species *Genista monspessulana*. The areas of this land cover type are typically devoid of understory and may contain some overstory trees that are not dominant (WRA 2010). French broom scrub is not present on the Marin Fine Scale Vegetation Map or shown in Figure 2. However, this land cover type was identified in the previous Biological Resources Assessment ; although this land cover type was not mapped and its location is unknown (WRA 2010).

3.2.11 Needle Grass – Melic Grass Grassland

The needle grass – melic grass grassland vegetation alliance was formally known as purple needlegrass grassland. This vegetation type was documented in the WRA report (WRA 2010) to occur within the Seminary Point, Seminary Vista West, Student Village, and Seminary Knoll portions of the project site, and is dominated by native and nonnative grasses and forbs (WRA 2010). If the relative cover of purple needle grass, *Nassella* spp., or *Melica* spp. meets the definition of the alliance in the Manual of California Vegetation, this land cover is defined as a sensitive natural community by CDFW (CDFW 2021). Needle grass – melic grass grassland is not present on the Marin Fine Scale Vegetation Map or shown in Figure 2; however, this land cover type was identified in the WRA report (as occurring within the project area (WRA 2010).

3.2.12 Developed

The Marin Fine Scale Vegetation Map identified a large portion of the project site as being made up of existing development (Figure 2). While planted trees, shrubs and nonnative grasses may be present as landscaping, sports fields, and street trees, this part of the project site is dominated by the built environment.

3.3 SPECIAL STATUS SPECIES

This section describes the results of the search of the CNDDB and CNPS databases, the reconnaissance visit to the site, and a search of available reports and other planning documents applicable to the project site.

3.3.1 Special-Status Botanical Species

The search of the CNPS (CNPS 2021b) and CNDDB (CNDDB 2021) databases identified 74 special-status botanical species that occur within the 9-quad search area (Appendix A, Table A-1). Of these 74 special-status plants, 30 are likely to occur within the project site based on their ranges and the presence of suitable land cover types (Section 3.2) and soils (Section 3.1). These species are shown along with their normal blooming period in Table 2. Project construction and vegetation removal could result in loss of individual special-status plants and habitats. These impacts may be significant under CEQA.

Table 2 Special-Status Botanical Species with the Potential to Occur in the Project site

Species	Source	Potential Blooming Period[1]										
		Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov
Napa false indigo *Amorpha californica* var. *napensis*	CNDDB/CNPS											
Bent-flowered fiddleneck *Amsinckia lunaris*	CNDDB/CNPS											
Marin manzanita *Arctostaphylos virgata*	CNDDB/CNPS											
San Francisco Bay spineflower *Chorizanthe cuspidata* var. *cuspidata*	CNDDB/CNPS								(?)			
Franciscan thistle *Cirsium andrewsii*	CNDDB/CNPS											
San Francisco collinsia *Collinsia multicolor*	CNDDB/CNPS		(?)									
Western leatherwood *Dirca occidentalis*	CNDDB/CNPS				(?)							
Koch's cord moss *Entosthodon kochii*	CNDDB/CNPS	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Minute pocket moss *Fissidens pauperculus*	CNDDB/CNPS	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Marin checker lily *Fritillaria lanceolata* var. *tristulis*	CNDDB/CNPS											
Fragrant fritillary *Fritillaria liliacea*	CNDDB/CNPS											
Diablo helianthella *Helianthella castanea*	CNDDB/CNPS											
Congested-headed hayfield tarplant *Hemizonia congesta* ssp. *congesta*	CNDDB/CNPS											
Santa Cruz tarplant *Holocarpha macradenia*	CNDDB/CNPS											
Point Reyes horkelia *Horkelia marinensis*	CNDDB/CNPS											
Thin-lobed horkelia *Horkelia tenuiloba*	CNDDB/CNPS								(?)			
Small groundcone *Kopsiopsis hookeri*	CNDDB/CNPS											
Marsh microseris *Microseris paludosa*	CNDDB/CNPS							(?)				
Marin County navarretia *Navarretia rosulata*	CNDDB/CNPS											
Choris' popcornflower *Plagiobothrys chorisianus* var. *chorisianus*	CNDDB/CNPS											
San Francisco popcornflower *Plagiobothrys diffusus*	CNDDB/CNPS											

Species	Source	Potential Blooming Period[1]										
		Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov
North Coast semaphore grass *Pleuropogon hooverianus*	CNDDB/CNPS											
Oregon polemonium *Polemonium carneum*	CNDDB/CNPS											
Adobe sanicle *Sanicula maritima*	CNDDB/CNPS											
Scouler's catchfly *Silene scouleri* ssp. *scouleri*	CNDDB/CNPS									(?)		
San Francisco campion *Silene verecunda* ssp. *verecunda*	CNDDB/CNPS		(?)					(?)	(?)			
Santa Cruz microseris *Stebbinsoseris decipiens*	CNDDB/CNPS											
Two-fork clover *Trifolium amoenum*	CNDDB/CNPS											
San Francisco owl's-clover *Triphysaria floribunda*	CNDDB/CNPS											
Coastal triquetrella *Triquetrella californica*	CNDDB/CNPS	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A	N/A

Note: CNPS = California Native Plant Society Inventory of Rare and Endangered Plants; CNDDB= California Natural Diversity Data Base; CRPR = California Rare Plant Rank

(?) denotes a period when blooming may occur but is not typical. N/A denotes species that do not have a flowers or a blooming period.

[1] The potential blooming period is blooming period published by CNPS based on recorded blooming for each species across its range and throughout time. Actual blooming periods of each species vary by year and across their ranges. The only way to know when a particular plant species is blooming in a given area is by visual confirmation of blooming in reference populations

3.3.2 Special-Status Animal Species

Although the CNDDB record search identified 41 special-status animal species documented within the 9-quad search area (Appendix A, Table A-2), eight special-status animal species were noted as known to occur or could occur within or directly adjacent to the project site. The potential for species to occur was based on species range, the presence of land cover types potentially suitable for the species (Section 3.2), and other habitat variables. These eight species, along with their listing status, preferred habitat, and potential for occurrence in the project site are summarized in below. All 41 species identified in the search are described Table A-2 in Appendix A.

MONARCH BUTTERFLY

The western population of monarch butterfly (*Danaus plexippus*) overwinters within wind protected eucalyptus, Monterey pine, and cypress groves along the coast. These overwintering roosts are typically located within 1.5 miles from the ocean or bays. Stands of mature trees within the project site are likely to be suitable for use as overwintering roosts (WRA 2010). In addition, individual monarch butterflies, larvae, and host plants have been recorded within the vicinity of the project site (Western Monarch and Milkweed Mapper 2022).

Adult monarch butterflies require a diversity of nectar resources for feeding during migration and breeding and milkweed host plants (*Asclepias* spp.) to complete their lifecycle (USFWS 2020a). During the spring and summer, adult females lay eggs on milkweed host plants, which are the only food source for larvae. Monarch butterflies may forage in various habitats within the project site, and milkweed host plants may occur in the grasslands and oak woodlands on site. Due to documented decreases in overwintering populations, the USFWS determined that the listing of monarch as threatened or endangered was warranted, but precluded by higher priority actions (USFWS 2020b).

Vegetation removal for construction and as part of the forest management plan could result in the loss of overwintering roosts and milkweed host plants. The potential significance of environmental impacts related to this issue will be addressed in the EIR.

SPECIAL-STATUS FISHES

The project site (Figure 1) does not contain habitat for special-status fishes; however, Richardson Bay, which is a part of the San Francisco Bay estuary, is adjacent to the project site. The waters of Richardson Bay are suitable habitat for Coho Salmon – Central California Coast Evolutionary Significant Unit (*Oncorhynchus kisutch*), which is listed under the ESA and CESA as endangered; and Steelhead – Central California Coast Distinct Population Segment (*Oncorhynchus mykiss irideus*) (Marin Watershed Program 2022), and Green sturgeon – southern DPS (*Acipenser medirostris*) which are listed under the ESA as threatened. Longfin Smelt (*Spirinchus thaleichthys*), which is a CDFW Species of Special Concern, may also be present in Richardson Bay. While the project would not involve fill, construction, or other direct impacts to tidal and submerged areas, Richardson Bay is located adjacent to the project site, and indirect impacts to special-status fishes may occur, such as a result of runoff from project activities. The potential significance of environmental impacts related to this issue will be addressed in the EIR.

WHITE-TAILED KITE AND OTHER NESTING BIRDS

American peregrine falcon (*Falco peregrinus anatum*) and bald eagle (*Haliaeetus leucocephalus*) have been reported to occur in the project site; however, these species are not likely to nest within the project site. The project site lacks the tall buildings or cliffs that would be suitable nesting habitat for American peregrine falcon, and the existing disturbance within the site makes nesting by bald eagles unlikely. White-tailed kite (*Elanus leucurus*) is a CDFW fully protected species that may occur within the project site year-round, and is less sensitive to disturbance than bald eagle. White-tailed kites forage within grasslands, emergent wetlands, and meadows, preying on small mammals, birds, insects, reptiles, and amphibians. Individuals nest in oaks, willows, or other tree stands with dense canopies for cover near foraging habitat (CWHR 2005). The grasslands within the project site and the nearby wetlands provide foraging habitat for white-tailed kite, and oaks and other trees within the project site may provide suitable nesting habitat for the species. White-tailed kites nest from February to October. In addition to white-tailed kite, common raptors and other common bird species are also likely to nest within the project site. Nests of common raptors and other nesting birds are protected under Section 3503 and Section 3503.5 of the California Fish and Game Code. Vegetation removal and construction activities could result in the disturbance and loss of nests of white-tailed kite and other nesting birds. The potential significance of environmental impacts related to this issue will be addressed in the EIR.

SPECIAL-STATUS BATS

Pallid bat (*Antrozous pallidus*) is a CDFW Species of Special Concern. This bat species is found in chaparral, coastal scrub, woodland, and grassland habitat. Pallid bats roost alone, in small groups, or in large groups, within crevices, caves, abandoned buildings, and the trunk cavities of large oaks and other tree species. Maternity roosts contain pups from late April through August and disperse in August through October (WBWG 2005a). Pallid bats may roost in buildings and large trees within the project site. Construction of the project and vegetation removal could result in loss of individual bats and roosts

Townsend's big eared bat (*Corynorhinus townsendii*) is a CDFW Species of Special Concern. This bat species is found throughout California in a variety of habitats. Townsend's big eared bat roosts primarily in caves and abandoned mines; however, the species has also been reported to use buildings, bridges, rock crevices and hollows in trees. Maternity colonies form between March and June and pups are born in June (WBWG 2005b). Townsend's big-eared bats could use buildings within the project site as roost sites. Therefore, construction of the project could result in loss of individual bats and roosts.

Western red bats (*Lasiurus blossevilli*) roost individually in dense clumps of foliage in riparian trees, orchards, and ornamental trees. Western red bats give birth to pups in June and the pups typically fly by August (Shump and

Shump 1982). Mature broad-leaved trees in the project site may provide suitable roosting locations for this species. Vegetation removal could result in loss of individual bats and suitable roost trees.

The potential significance of environmental impacts related to these issues will be addressed in the EIR.

3.3.3 Sensitive Natural Communities and Sensitive Habitat Types

The Seminary Point, Seminary Vista West, Student Village, and Seminary Knoll portions of the project site were identified in the WRA report as containing needle grass – melic grass grassland vegetation alliance (WRA 2010); however, the 2010 WRA report did not survey the entirety of the current project site, and this land cover type is not present on the more recent Marin County Fine Scale Vegetation Map. Therefore, the extent of this vegetation alliance within the whole project area is not known. Needle grass – melic grass grassland is designated by CDFW as a sensitive natural community. Coast live oak woodland is not considered a sensitive natural community by CDFW; however, oak woodlands are protected from conversion by the Oak Woodlands Conservation Act (Public Resources Code Section 21083.4) and are considered a sensitive habitat type in California. The potential significance of environmental impacts related to sensitive natural communities will be addressed in the EIR.

3.3.4 Potentially Jurisdictional Wetlands and Waters

A regulatory wetland delineation has not been performed within the project site, and the 2010 Biological Resources Assessment did not indicate the presence of any potentially jurisdictional wetlands or other waters in the portion of the project site that was covered in that report (WRA 2010). However, the 2010 report did not cover the entirety of the project site. Moreover, because a formal wetland delineation has not been performed, it cannot be ruled out that other potentially jurisdictional wetlands occur in the project site. A search of the National Wetlands Inventory showed that the project site contains two intermittent streams that flow under Seminary Drive and discharge into Richardson Bay near Brickyard Beach (USFWS 2022). However, no project related disturbance is anticipated to occur within the portion of the project site where these intermittent drainages are located, and therefore, no alteration of these waters is expected.

Appendix A

Special-Status Species Tables

Methods

The species tables in this appendix were developed through a review of relevant databases, and other available information. Vegetation types and habitat were identified through two reconnaissance surveys of the project site conducted on October 5, 2021 and September 1, 2022, the Marin County Fine Scale Vegetation Web Map, (CNPS 2021), and a previous biological resources assessment of a portion of the project site (WRA 2010). The National Wetlands Inventory (USFWS 2022) was reviewed for the potential occurrence of aquatic features. The California Native Plant Society (CNPS) Inventory of Rare and Endangered Plants (CNPS 2022) and CDFW's California Natural Diversity Database (CNDDB) (CNDDB 2022) were reviewed for specific information on documented observations of special-status species previously recorded in the project site and vicinity. A search of the CNDDB and CNPS was conducted for the following U.S. Geological Survey 7.5' quadrangles surrounding the project site: Bolinas, San Geronimo, Novato, Petaluma Point, San Quentin, San Francisco North, Point Bonita, and San Rafael.

Table A-1 Special-Status Botanical Species Known to Occur in the Project Region and Their Potential for Occurrence in the Project site

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
Franciscan onion *Allium peninsulare* var. *franciscanum*			1B.2	Cismontane woodland, valley and foothill grassland. Clay soils; often on serpentine; sometimes on volcanics. Dry hillsides. 16–1148 feet in elevation. Blooms as early as April in some locations. In most locations blooms May–June.	**Not expected to occur:** The project site does not include serpentine or volcanic based soils.
Sonoma alopecurus *Alopecurus aequalis* var. *sonomensis*	E		1B.1	Species found in wet areas within freshwater marshes, swamps, and riparian scrub with other wetland species. 15–1,180 feet in elevation. Blooms May–July.	**Not expected to occur:** The project site does not include any freshwater marshes, swamps, or riparian scrub. Within Marin County the species is known to occur only from the Point Reyes, Tomales Bay, and Stinson Beach areas (CNPS 2022).
Napa false indigo *Amorpha californica* var. *napensis*			1B.2	Species found in openings in forest or woodland or in chaparral. 100–2,410 feet in elevation. Blooms April–July.	**May to occur:** The project site contains forested habitat suitable for the species. The project site is within the current distribution of the species and portions of the project site are within the species' elevational range.
Bent-flowered fiddleneck *Amsinckia lunaris*			1B.2	Species found within cismontane woodland, valley and foothill grassland, and coastal bluff scrub. 10–2,610 feet in elevation. Blooms March–June.	**May to occur:** The project site contains forested habitat suitable for the species. The project site is within the elevational range of this species.
Franciscan manzanita *Arctostaphylos franciscana*	E		1B.1	Species found on serpentine outcrops in chaparral. 20–980 feet in elevation. Blooms February–April.	**Not expected to occur:** Serpentine outcrops are not found within the project site.
Mt. Tamalpais manzanita *Arctostaphylos montana* ssp. *montana*			1B.3	Species found on serpentine slopes in chaparral and grassland. 490–2,230 feet in elevation. Blooms February–April.	**Not expected to occur:** Serpentine soils are not found within the project site.
Presidio manzanita *Arctostaphylos montana* ssp. *ravenii*	E	E	1B.1	Species found on open, rocky serpentine slopes. 150–700 feet in elevation. Blooms February–March.	**Not expected to occur:** Serpentine soils are not found within the project site.

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
Marin manzanita *Arctostaphylos virgata*			1B.2	Species found within broadleafed upland forest, closed-cone coniferous forest, chaparral, and north coast coniferous forest on sandstone or granitic soils. 10–2,620 feet in elevation. Blooms January–March.	**May to occur:** The project site contains forested habitat suitable for the species. The project site is within the elevational range of this species.
Marsh sandwort *Arenaria paludicola*	E	E	1B.1	Species found growing through dense mats of *Typha, Juncus, Scirpus*, etc. in freshwater marsh and swamps. Sandy soil. 10–560 feet in elevation. Blooms May–August.	**Not expected to occur:** The project site does not include any freshwater marsh or swamp habitat.
Coastal marsh milk-vetch *Astragalus pycnostachyus* var. *pycnostachyus*			1B.2	Species found within mesic sites in dunes, coastal scrub, along streams or coastal salt marshes. 0–510 feet in elevation. Blooms April–October.	**Not expected to occur:** The project site does not include any mesic sites that would be suitable for this species. Within Marin County the species is known to occur only from the Point Reyes, Tomales Bay, and Stinson Beach areas (CNPS 2022).
Alkali milk-vetch *Astragalus tener* var. *tener*			1B.2	Species found on alkali flats, flooded lands in annual grassland, or in playas or vernal pools. 0–550 feet in elevation. Blooms March–June.	**Not expected to occur:** Alkaline soils are not found within the project site.
Thurber's reed grass *Calamagrostis crassiglumis*			2B.1	Species usually found in marshy swales surrounded by grassland or coastal scrub, or in marshes and swamps. 20–160 feet in elevation. Blooms May–August.	**Not expected to occur:** The project site does not include any marshy swales, marsh or swamp habitat that would be suitable for this species.
Tiburon mariposa-lily *Calochortus tiburonensis*	T	T	1B.1	Species found on open, rocky, slopes in serpentine grassland. 160–490 feet in elevation. Blooms March–June.	**Not expected to occur:** Serpentine soils are not found within the project site.
Coastal bluff morning-glory *Calystegia purpurata* ssp. *saxicola*			1B.2	Species found in coastal dunes, coastal scrub, coastal bluff scrub, and north coast coniferous forest. 30–340 feet in elevation. Blooms as early as March in some locations, normally blooms, April–September.	**Not expected to occur:** The project site does contain scrub habitat; however, within Marin County the species is known to occur only from the Point Reyes, and Bodega Bay areas (CNPS 2022).
Seaside bittercress *Cardamine angulata*			2B.1	Species found in wet areas and streambanks within north coast coniferous forest and lower montane coniferous forest. 300–510 feet in elevation. Blooms as early as January in some locations normally blooms, March–July.	**Not expected to occur:** Wet areas and streambanks within upland vegetation types are not found within the project site.
Bristly sedge *Carex comosa*			2B.1	Species found in marshes, swamps, and wet places such as lake margins within coastal prairie and grasslands. One site below sea level is on an island in the Delta. -15–5,320 feet in elevation. Blooms May–September.	**Not expected to occur:** The project site does not include any marsh, swamp, or lake margins within coastal prairie or grasslands that would be suitable for this species.
Lyngbye's sedge *Carex lyngbyei*			2B.2	Species found in brackish and freshwater marshes and swamps. 0–660 feet in elevation. Blooms April–August.	**Not expected to occur:** The project site does not include any marsh habitat that would be suitable for this species.
Northern meadow sedge *Carex praticola*			2B.2	Species found in moist to wet meadows and seeps. 50–10,500 feet in elevation. Blooms May–July.	**Not expected to occur:** Wet meadows and seeps are not found within the project site.

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
Tiburon paintbrush *Castilleja affinis* var. *neglecta*	E	T	1B.2	Species found on rocky serpentine sites within valley and foothill grassland. 390–1,310 feet in elevation. Blooms April–June.	**Not expected to occur:** Serpentine soils are not found within the project site.
Nicasio ceanothus *Ceanothus decornutus*			1B.2	Species found in chaparral and maritime chaparral on serpentinite, rocky, and sometimes clay soils. 770–950 feet in elevation. Blooms March–May.	**Not expected to occur:** Serpentine soils are not found within the project site.
Mason's ceanothus *Ceanothus masonii*		R	1B.2	Species found on serpentine ridges or slopes in chaparral or transition zone. 590–1,510 feet in elevation. Blooms March–April.	**Not expected to occur:** Serpentine soils are not found within the project site.
Point Reyes salty bird's-beak *Chloropyron maritimum* ssp. *palustre*			1B.2	Species usually found in coastal salt marsh with *Salicornia, Distichlis, Jaumea, Spartina*, etc. 0–380 feet in elevation. Blooms June–October.	**Not expected to occur:** The project site does not include any marsh habitat that would be suitable for this species.
San Francisco Bay spineflower *Chorizanthe cuspidata* var. *cuspidata*			1B.2	Species found on sandy soil on terraces and slopes within coastal bluff scrub, coastal dunes, coastal prairie, and coastal scrub. 10–710 feet in elevation. Normally blooms April–July and sometimes as late as August.	**May to occur:** The project site contains suitable coastal scrub and grassland habitat. The project site is within the elevational range of this species.
Franciscan thistle *Cirsium andrewsii*			1B.2	Species found in coastal bluff scrub, broadleaved upland forest, coastal scrub, and coastal prairie. Sometimes found in serpentine seeps. 0–490 feet in elevation. Blooms March–July.	**May to occur:** The project site contains forested habitat suitable for the species. The project site is within the elevational range of this species.
Mt. Tamalpais thistle *Cirsium hydrophilum* var. *vaseyi*			1B.2	Species found in serpentine seeps and streams within meadows, chaparral, upland forest, and woodland. 590–2,000 feet in elevation. Blooms May–August.	**Not expected to occur:** Serpentine soils are not found within the project site.
Presidio clarkia *Clarkia franciscana*	E	E	1B.1	Species found on serpentine outcrops in grassland or scrub. 70–1,000 feet in elevation. Blooms May–July.	**Not expected to occur:** Serpentine soils are not found within the project site.
Round-headed Chinese-houses *Collinsia corymbosa*			1B.2	Species found in coastal dunes. 30–100 feet in elevation. Blooms April–June.	**Not expected to occur:** There are no coastal dunes within the project site.
San Francisco collinsia *Collinsia multicolor*			1B.2	Species found within closed-cone coniferous forest and coastal scrub on decomposed shale (mudstone) mixed with humus, or sometimes on serpentine. 100–820 feet in elevation. Blooms as early as February in some conditions. Typical blooming in March–May.	**May to occur:** The project site contains forested habitat suitable for the species and is within the elevational range of this species.

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
Western leatherwood *Dirca occidentalis*			1B.2	Species found on brushy slopes and mesic sites including riparian areas in mixed evergreen and foothill woodland communities. 80–1,390 feet in elevation. Blooms most often January–March, and as late as April in some conditions.	**May to occur:** The project site contains brushy areas that could be suitable for this species.
Koch's cord moss *Entosthodon kochii*			1B.3	Species found growing on soil along riverbanks within woodland communities. 610–1,200 feet in elevation.	**Not expected to occur:** The project site does not contain riverine habitat for this species.
Tiburon buckwheat *Eriogonum luteolum* var. *caninum*			1B.2	Species found in chaparral, valley and foothill grassland, cismontane woodland, coastal prairie on sandy to gravelly sites serpentine soils. 0–2,300 feet in elevation. Blooms May–September.	**Not expected to occur:** Serpentine soils are not found within the project site.
Minute pocket moss *Fissidens pauperculus*			1B.2	Species found growing on damp soil in dry streambeds and on streambanks along the coast in north coast coniferous and redwood forest. 30–3,360 feet in elevation.	**Not expected to occur:** The project site does not contain stream habitat for this species.
Marin checker lily *Fritillaria lanceolata* var. *tristulis*			1B.1	Species found in canyons, riparian areas, and rock outcrops within coastal bluff scrub, coastal scrub, and coastal prairie. Often found on serpentine soils. 50–490 feet in elevation. Blooms February–May.	**May to occur:** The project site contains coastal scrub and grassland habitat suitable for the species. The project site is within the elevational range of this species.
Fragrant fritillary *Fritillaria liliacea*			1B.2	Species often found on serpentine soils; however, various soils reported though usually on clay. Found in coastal scrub, valley and foothill grassland, coastal prairie, cismontane woodland. 10–1,310 feet in elevation. Blooms February–April.	**May to occur:** The project site contains grassland habitat suitable for the species. The project site is within the elevational range of this species.
Blue coast gilia *Gilia capitata* ssp. *chamissonis*			1B.1	Species found in coastal dunes and coastal scrub. 10–660 feet in elevation. Blooms April–July.	**Not expected to occur:** The project site contains scrub habitat; however, within Marin County the species is known to occur only from the Point Reyes, Tomales Bay, and Stinson Beach areas (CNPS 2022; Calflora 2022).
Woolly-headed gilia *Gilia capitata* ssp. *tomentosa*			1B.1	Species found on rocky serpentine outcrops on the coast, within coastal bluff scrub and grassland. 70–410 feet in elevation. Blooms May–July.	**Not expected to occur:** Serpentine soils are not found within the project site.
Dark-eyed gilia *Gilia millefoliata*			1B.2	Species found in coastal dunes. 5–200 feet in elevation. Blooms April–July.	**Not expected to occur:** coastal dune habitat is not found within the project site.
Diablo helianthella *Helianthella castanea*			1B.2	Species usually found in the chaparral/oak woodland interface in rocky, azonal soils; however, also found in coastal scrub, riparian woodland, and grasslands. Often found growing in partial shade. 150–3,500 feet in elevation. Blooms March–June.	**May to occur:** The project site contains oak and grassland habitat suitable for the species. The portions of the project site are within the elevational range of this species.

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
Congested-headed hayfield tarplant *Hemizonia congesta* ssp. *congesta*			1B.2	Species grows in grassy valleys and on hills in grasslands, also found in fallow fields and along roadsides. 70–2,130 feet in elevation. Blooms April–November.	**May to occur:** The project site contains grassland habitat suitable for the species. The portions of the project site are within the elevational range of this species.
Marin western flax Hesperolinon congestum	T	T	1B.1	Species found in serpentine barrens and in serpentine grassland and chaparral. 200–1,210 feet in elevation. Blooms April–July.	**Not expected to occur:** Serpentine soils are not found within the project site.
Water star-grass *Heteranthera dubia*			2B.2	Species found in still or slow-moving water within marshes and swamps. Requires a pH of 7 or higher. Usually located in slightly eutrophic waters. 50–4,950 feet in elevation. Blooms July–October.	**Not expected to occur:** The project site does not include any marsh habitat that would be suitable for this species.
Santa Cruz tarplant *Holocarpha macradenia*	T	E	1B.1	Species often found with nonnatives on light, sandy soil or sandy clay within coastal prairie, coastal scrub, and grassland communities. 30–720 feet in elevation. Blooms June–October.	**May to occur:** The project site contains grassland and scrub habitat suitable for the species. Portions of the project site are within the elevational range of this species.
Kellogg's horkelia *Horkelia cuneata* var. *sericea*			1B.1	Species found on old dunes, coastal sandhills, and other openings within closed-cone coniferous forest, coastal scrub, coastal dunes, and chaparral. 20–710 feet in elevation. Blooms April–September.	**Not expected to occur:** The project site contains closed-cone coniferous forest and scrub habitat; however, within Marin County the species is only known from the Point Reyes area (CNPS 2022; Calflora 2022).
Point Reyes horkelia *Horkelia marinensis*			1B.2	Species found on sandy flats and dunes near the coast in grassland or scrub plant communities. 10–2,540 feet in elevation. Blooms May–September.	**May to occur:** The project site contains grassland and scrub habitat suitable for the species. Portions of the project site are within the elevational range of this species.
Thin-lobed horkelia *Horkelia tenuiloba*			1B.2	Species found on sandy soils and mesic openings within broadleaved upland forest, chaparral, and grassland. 160–1,640 feet in elevation. Blooms normally from May–July. Will bloom as late as August under certain conditions.	**May to occur:** The project site contains grassland, forest, and scrub habitat suitable for the species. Portions of the project site are within the elevational range of this species.
Island tube lichen *Hypogymnia schizidiata*			1B.3	Species grows on bark and wood of hardwoods and conifers within chaparral and closed-cone coniferous forest. 1,180–1,330 feet in elevation.	**Not expected to occur:** The project site contains closed-cone coniferous forest and scrub habitat; however, within Marin County the species is only known from the Point Reyes area (CNPS 2022).
Small groundcone *Kopsiopsis hookeri*			2B.3	Species found in open woods, shrubby places within north coast coniferous forest. Generally, grows on *Gaultheria shallon*. 390–4,710 feet in elevation. Blooms April–August.	**May to occur:** The project site contains grassland, woodland, and forest habitat suitable for the species. Portions of the project site are near the elevational range of this species.
Beach layia *Layia carnosa*	E	E	1B.1	Species found on sparsely vegetated, semi-stabilized coastal dunes, usually behind foredunes. 0–100 feet in elevation. Blooms March–July.	**Not expected to occur:** Coastal dune habitats are not found within the project site.

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
Rose leptosiphon *Leptosiphon rosaceus*			1B.1	Species found within coastal bluff scrub communities. 30–460 feet in elevation. Blooms April–July.	**Not expected to occur:** The project site contains scrub habitat; however, within Marin County the species is only known from the Point Reyes, Tomales, and Valley Ford areas (CNPS 2022).
San Francisco lessingia *Lessingia germanorum*	E	E	1B.1	Species found on remnant dunes and open sandy soils relatively free of competing plants within coastal scrub communities. 10–510 feet in elevation. Blooms as early as June under some conditions, but normally in bloom July–November.	**Not expected to occur:** The project site does not contain remnant dunes or other open sandy soils. Species is not known to occur within Marin County (CalFlora 2022).
Tamalpais lessingia *Lessingia micradenia* var. *micradenia*			1B.2	Species usually found on serpentine soils in serpentine grassland or serpentine chaparral. Often found on roadsides. 200–1,000 feet in elevation. Blooms as early as June under some conditions, but normally in bloom July–October.	**Not expected to occur:** Serpentine soils are not found within the project site.
Marsh microseris *Microseris paludosa*			1B.2	Species found in closed-cone coniferous forest, cismontane woodland, coastal scrub, and valley and foothill grassland. 20–980 feet in elevation. Blooms normally in April–June; however, may bloom in July under some conditions.	**May to occur:** The project site contains woodland, forest, scrub, and grassland habitat suitable for the species. The project site is within the elevational range of this species.
Marin County navarretia *Navarretia rosulata*			1B.2	Species found in dry, open rocky places within closed-cone coniferous forest and chaparral. Species can occur on serpentine. 660–2,080 feet in elevation. Blooms May–July.	**May to occur:** The project site contains forested and scrub habitat suitable for the species. The project site is within the elevational range of this species.
White-rayed pentachaeta *Pentachaeta bellidiflora*	E	E	1B.1	Species found on open dry rocky slopes and grassy areas within valley and foothill grassland and cismontane woodland. Species often grows on soils derived from serpentine bedrock. 120–2,000 feet in elevation. Blooms March–May.	**Not expected to occur:** Serpentine soils are not found within the project site.
Choris' popcornflower *Plagiobothrys chorisianus* var. *chorisianus*			1B.2	Species found on mesic sites within chaparral, coastal scrub, and coastal prairie. 50–530 feet in elevation. Blooms March–June.	**May to occur:** The project site contains scrub and grassland habitat suitable for this species.
San Francisco popcornflower *Plagiobothrys diffusus*		E	1B.1	Species historically found on grassy slopes with marine influence in valley and foothill grassland and coastal prairie. 150–1,180 feet in elevation. Blooms March–June.	**May to occur:** The project site contains grassland habitat suitable for the species. The project site is just below the elevational range of this species; however still may occur.
Hairless popcornflower *Plagiobothrys glaber*			1A	Species found in coastal salt marshes, wet alkaline meadows, vernal pools, and seeps. 20–590 feet in elevation. Blooms March–May.	**Not expected to occur:** The project site does not include any marsh or other wet habitats that would be suitable for this species. Alkaline soils are not present.

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
North Coast semaphore grass *Pleuropogon hooverianus*		T	1B.1	Species found in wet grassy, usually shady areas in broadleafed upland forest, north coast coniferous forest, meadows, and seeps. Sometimes found in freshwater marsh associated with forest environments. 150–3,810 feet in elevation. Blooms April–June.	**May to occur:** The project site contains forested habitat suitable for the species. Portions of the project site are within the elevational range of this species.
Oregon polemonium *Polemonium carneum*			2B.2	Species found in coastal prairie, coastal scrub, and lower montane coniferous forest. 0–6,000 feet in elevation. Blooms April–September.	**May to occur:** The project site contains grassland, scrub, and forested habitat suitable for the species.
Tamalpais oak *Quercus parvula* var. *tamalpaisensis*			1B.3	Species found in lower montane coniferous forest. 330–2,460 feet in elevation. Blooms March–April.	**Not expected to occur:** The project site does not include the lower montane coniferous forest habitat suitable for this species. The project site is also below the elevational range of the species, which is restricted to the slopes of Mt. Tamalpais and ridgelines to the north (Calflora 2022).
Adobe sanicle *Sanicula maritima*		R	1B.1	Species found in meadows, seeps, valley and foothill grassland, chaparral, and coastal prairie on moist clay or ultramafic soils. 100–790 feet in elevation. Blooms February–May.	**May to occur:** The project site contains grassland habitat suitable for the species. The project site is within the elevational range of this species.
Point Reyes checkerbloom *Sidalcea calycosa* ssp. *rhizomata*			1B.2	Species is found in freshwater marshes near the coast. 20–310 feet in elevation. Blooms April–September.	**Not expected to occur:** The project site does not include any marsh habitat that would be suitable for this species.
Marin checkerbloom *Sidalcea hickmanii* ssp. *viridis*			1B.1	Species found on serpentine or volcanic soils within chaparral communities. Species sometimes appears after burns. 160–1,410 feet in elevation. Blooms May–June.	**Not expected to occur:** Serpentine and volcanic soils are not found within the project site.
Scouler's catchfly *Silene scouleri* ssp. *scouleri*			2B.2	Species found in coastal bluff scrub, coastal prairie, and valley and foothill grassland. 0–1,970 feet in elevation. Blooms during the period March–May, or June–August, and as late as September depending on conditions.	**May to occur:** The project site contains grassland and scrub habitat suitable for the species. The project site is within the elevational range of this species.
San Francisco campion *Silene verecunda* ssp. *verecunda*			1B.2	Species found in coastal scrub, valley and foothill grassland, coastal bluff scrub, chaparral, and coastal prairie. Often grows on mudstone or shale, with one recorded site on serpentine. 10–2,120 feet in elevation. Most frequently in March–June, but may bloom as early as February and as late as August depending on conditions.	**May to occur:** The project site contains grassland and scrub habitat suitable for the species. The project site is within the elevational range of this species.
Long-styled sand-spurrey *Spergularia macrotheca* var. *longistyla*			1B.2	Species found in alkaline marshes, swamps, meadows, and seeps. 0–840 feet in elevation. Blooms February–May.	**Not expected to occur:** The project site does not include any marsh or other wet habitats that would be suitable for this species. Alkaline soils are not present.

Species	Federal Status [1]	State Status [1]	CRPR Status [1]	Habitat and Blooming Period	Potential for Occurrence [2]
Santa Cruz microseris *Stebbinsoseris decipiens*			1B.2	Species grows in open areas in loose or disturbed soil, usually derived from sandstone, shale or serpentine, on seaward slopes within broadleafed upland forest, closed-cone coniferous forest, coastal prairie, coastal scrub, valley and foothill grassland, and chaparral. 30–1,640 feet in elevation. Blooms April–May.	**May to occur:** The project site contains areas of closed-cone forest, grassland and scrub habitat suitable for this species. The project site is within the elevational range of this species.
Tamalpais jewelflower *Streptanthus batrachopus*			1B.3	Species grows on talus serpentine outcrops in Closed-cone coniferous forest, chaparral communities. 1,100–2,200 feet in elevation. Blooms April–July.	**Not expected to occur:** Serpentine soils are not found within the project site.
Tiburon jewelflower *Streptanthus glandulosus* ssp. *niger*	E	E	1B.1	Species found in shallow soils and rocky serpentine slopes within valley and foothill grassland communities. 100–490 feet in elevation. Blooms May–June.	**Not expected to occur:** Serpentine soils are not found within the project site.
Mt. Tamalpais bristly jewelflower *Streptanthus glandulosus* ssp. *pulchellus*			1B.2	Species found on serpentine slopes within chaparral and valley and foothill grassland communities. 490–2,630 feet in elevation. Blooms May–July and as late as August under certain conditions.	**Not expected to occur:** Serpentine soils are not found within the project site.
Suisun Marsh aster *Symphyotrichum lentum*			1B.2	Species grows in marshes and swamps (brackish and freshwater). Most often seen along sloughs with *Phragmites, Scirpus*, blackberry, *Typha*, etc. 0–100 feet in elevation. Blooms May–November, but may begin blooming in April in some conditions.	**Not expected to occur:** The project site does not include any marsh habitat that would be suitable for this species.
Two-fork clover *Trifolium amoenum*	E		1B.1	Species found in valley and foothill grassland and coastal bluff scrub. Sometimes found on serpentine soil, open sunny sites, or swales. Most recently cited on roadside and eroding cliff face. 20–1,020 feet in elevation. Blooms April–June.	**May to occur:** The project site contains grassland and scrub habitat suitable for this species. The project site is within the elevational range of this species.
Saline clover *Trifolium hydrophilum*			1B.2	Species found in alkaline marshes, swamps, mesic valley and foothill grassland, and vernal pools. 0–980 feet in elevation. Blooms April–June.	**Not expected to occur:** The project site does not include any marsh or other wet habitats that would be suitable for this species. Alkaline soils are not present.
San Francisco owl's-clover *Triphysaria floribunda*			1B.2	On serpentine and non-serpentine substrate (such as at Pt. Reyes) within coastal prairie, coastal scrub, and valley and foothill grassland. 0–490 feet in elevation. Blooms April–June.	**May to occur:** The project site contains grassland and scrub habitat suitable for this species. The project site is within the elevational range of this species.
Coastal triquetrella *Triquetrella californica*			1B.2	Species grows on gravel or thin soil over outcrops within 100ft from the coast in coastal scrub, grasslands. Often found in open gravels on roadsides, hillsides, rocky slopes, and fields. 30–330 feet in elevation.	**May to occur:** The project site contains grassland and scrub habitat suitable for this species. The project site is within the elevational range of this species.

Notes: CESA = California Endangered Species Act; CEQA = California Environmental Quality Act; CRPR = California Rare Plant Rank; ESA = Federal Endangered Species Act; NPPA = Native Plant Protection Act

[1] Legal Status Definitions

Federal :
E Endangered (legally protected by ESA)
T Threatened (legally protected by ESA)

State:
E Endangered (legally protected by CESA)
T Threatened (legally protected by CESA)
R Rare (legally protected by NPPA)

California Rare Plant Ranks:
1B Plant species considered rare or endangered in California and elsewhere (protected under CEQA, but not legally protected under ESA or CESA)
2 Plant species considered rare or endangered in California but more common elsewhere (protected under CEQA, but not legally protected under ESA or CESA)

Threat Ranks
0.1-Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
0.2-Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
0.3-Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

[2] Potential for Occurrence Definitions

Not expected to occur: Species is unlikely to be present on the project site due to poor habitat quality, lack of suitable habitat features, or restricted current distribution of the species.

May to occur: Suitable habitat is available at the project site and project site is within the current known distribution of the species; however, there are little to no other indicators that the species might be present.

Known to occur: The species, or evidence of its presence, was observed at the project site during reconnaissance surveys, or was reported by others.

Sources: CNDDB 2022; CNPS 2022; Calflora 2022.

Table A-2 Special-Status Animal Species Known to Occur in the Project Region and Their Potential for Occurrence in the Project site

Species	Federal Status [1]	State Status [1]	Habitat	Potential for Occurrence [2]
Invertebrates				
Bay checkerspot butterfly *Euphydryas editha bayensis*	T		Species restricted to native grasslands on outcrops of serpentine soil in the vicinity of San Francisco Bay. *Plantago erecta* is the primary host plant; *Orthocarpus densiflorus* and *O. purpurscens* are the secondary host plants.	**Not expected to occur:** Serpentine soils and associated grasslands are not found within the project site.
California freshwater shrimp *Syncaris pacifica*	E	E	Species is endemic to Marin, Napa, and Sonoma counties. Found in low elevation, low gradient streams where riparian cover is moderate to heavy. Shallow pools away from main streamflow. In winter is found under cut banks with exposed roots. In summer is found on leafy branches touching water.	**Not expected to occur:** The project site does not contain low gradient streams with riparian cover.
Callippe silverspot butterfly *Speyeria callippe callippe*	E		Species is restricted to the northern coastal scrub of the San Francisco peninsula. Hostplant is *Viola pedunculata*. Most adults found on east facing slopes. Males congregate on hilltops in search of females.	**Not expected to occur:** The project site is located outside the range of the species, which is restricted to the San Francisco peninsula.
Mission blue butterfly *Plebejus icarioides missionensis*	E		Species inhabits grasslands of the San Francisco peninsula. The species has three larval host plants: *Lupinus albifrons*, *L. variicolor*, and *L. formosus*, of which *L. albifrons* most often used.	**Not expected to occur:** The project site is located outside the range of the species, which is restricted to the San Francisco peninsula.
Monarch - California overwintering population *Danaus plexippus* pop. 1			Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roosts located in wind-protected tree groves (eucalyptus, Monterey pine, cypress), with nectar and water sources nearby.	**May occur:** The project site is located within the range of winter roosting for the species. Groves of eucalyptus on within the project site my provide sufficient shelter from wind to support overwintering monarchs.
Western bumble bee *Bombus occidentalis occidentalis*		S1S2*	Bumble bees have three basic habitat requirements: suitable nesting sites for the colonies, availability of nectar and pollen from floral resources throughout the duration of the colony period (spring, summer, and fall), and suitable overwintering sites for the queens.	**Not expected to occur:** Grassland habitat for the species is present within the project site; however, there have been no documented occurrences within Marin County since 1963 (CNDDB 2021), and the project is outside of the current distribution of the species (Xerces Society 2018).
Fish				
Coho salmon - central California coast ESU *Oncorhynchus kisutch* pop. 4	E	E	Federally listed populations between Punta Gorda and San Lorenzo River. State listing includes populations south of Punta Gorda. Species require beds of loose, silt-free, coarse gravel for spawning. Suitable streams and rivers also need cover, cool water and sufficient dissolved oxygen.	**May to occur (Adjacent):** While the natural wetland inventory (USFWS 2022) shows two intermittent streams within the project site, the project site does not include streams, or rivers that would be suitable habitat for this species. However, project activities may occur adjacent to San Francisco Bay where this species may be present.

Species	Federal Status [1]	State Status [1]	Habitat	Potential for Occurrence [2]
Eulachon *Thaleichthys pacificus*	T		Species found in Klamath River, Mad River, Redwood Creek and in small numbers in Smith River and Humboldt Bay tributaries. Species spawns in lower reaches of coastal rivers with moderate water velocities and bottom of pea-sized gravel, sand and woody debris.	**Not expected to occur:** The project site does not include streams or rivers that would be habitat for this species.
Green sturgeon – southern DPS *Acipenser medirostris* pop. 1	T	SC	Klamath/North coast flowing waters, Sacramento/San Joaquin flowing waters. These are the most marine species of sturgeon. Abundance increases northward of Point Conception. Spawns in the Sacramento, Klamath, and Trinity Rivers. Spawns at temperatures between 8-14 degrees C. Preferred spawning substrate is large cobble, but can range from clean sand to bedrock.	**May to occur (Adjacent):** While the natural wetland inventory (USFWS 2022) shows two intermittent streams within the project site, the project site does not include streams, or rivers that would be suitable habitat for this species. However, project activities may occur adjacent to San Francisco Bay where this species may be present.
Longfin smelt *Spirinchus thaleichthys*	C	SC	Species found in open waters of estuaries, mostly in middle or bottom of water column. Prefer salinities of 15-30 parts per thousand (ppt), but can be found in completely freshwater to almost pure seawater.	**May to occur (Adjacent):** The project site includes the San Francisco Bay that would be habitat for this species. While project activities would not occur within the Bay, activities may occur adjacent to the Bay where this species could be present.
Sacramento splittail *Pogonichthys macrolepidotus*		SC	Species is endemic to the lakes and rivers of the Central Valley, but now confined to the Delta, Suisun Bay and associated marshes, slow moving river sections, and dead-end sloughs. Requires flooded vegetation for spawning and foraging for young.	**Not expected to occur:** The project site does not include the Delta, Suisun Bay or associated marshes that are habitat for this species.
Southern coastal roach *Hesperoleucus venustus subditus*		SC	Found in the drainages of Tomales Bay and northern San Francisco Bay in the north, and drainages of Monterey Bay in the south.	**Not expected to occur:** While the natural wetland inventory (USFWS 2022) shows two intermittent streams within the project site, the project site does not include streams that would be suitable habitat for this species.
Steelhead - central California coast DPS *Oncorhynchus mykiss irideus* pop. 8	T		Central California coast DPS is found from Russian River, south to Soquel Creek and to, but not including Pajaro River. Also found in San Francisco and San Pablo Bay basins.	**May to occur (Adjacent):** While the National Wetlands Inventory (USFWS 2022) shows two intermittent streams within the project site, the project site does not include streams or rivers that would be suitable habitat for this species. However, project activities may occur adjacent to San Francisco Bay where this species may be present.
Tidewater goby *Eucyclogobius newberryi*	E	SC	Species found in brackish water habitats along the California coast from Agua Hedionda Lagoon, San Diego County to the mouth of the Smith River. Found in shallow lagoons and lower stream reaches, they need fairly still but not stagnant water and high oxygen levels.	**Not expected to occur:** The project site does not include brackish water habitat that would be suitable for this species.

Species	Federal Status [1]	State Status [1]	Habitat	Potential for Occurrence [2]
Tomales roach *Lavinia symmetricus* ssp. 2		SC	Species found in tributaries to Tomales Bay.	**Not expected to occur:** The project site is located outside the range of the species, which is restricted to tributaries to Tomales Bay.
Amphibians and Reptiles				
California giant salamander *Dicamptodon ensatus*		SC	Species is known from wet coastal forests near streams and seeps from Mendocino County south to Monterey County and east to Napa County. Aquatic larvae found in cold, clear streams, occasionally in lakes and ponds. Adults known from wet forests under rocks and logs near streams and lakes.	**Not expected to occur:** The project site does not provide freshwater aquatic habitat suitable for the species; therefore, upland habitat within the project site is not expected to be occupied.
California red-legged frog *Rana draytonii*	T	SC	Species found in lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.	**Not expected to occur:** Permanent freshwater aquatic habitat suitable for breeding by the species does not occur within or near the project site; therefore, wetlands and upland habitat within the project site is not expected to be occupied.
Foothill yellow-legged frog *Rana boylii*		SC	Species is found in partly-shaded, shallow streams and riffles with a rocky substrate in a variety of habitats. Need at least some cobble-sized substrate for egg-laying. Need at least 15 weeks to attain metamorphosis. The project site is within the North Coast population which is not listed under CESA or a Candidate for listing under ESA.	**Not expected to occur:** The project site does not contain perennial stream habitat suitable for this species.
Western pond turtle *Actinemys marmorata*		SC	A thoroughly aquatic turtle of ponds, marshes, rivers, streams and irrigation ditches, usually with aquatic vegetation, throughout California below 6,000 feet elevation. Species needs basking sites and suitable upland habitat (sandy banks or grassy open fields) up to 0.3 mile from water for egg-laying.	**Not expected to occur:** The project site does not contain freshwater marsh or slow-moving perennial stream habitat that is suitable for this species.
Birds				
Alameda song sparrow *Melospiza melodia pusillula*		SC	Species is a resident of salt marshes bordering south arm of San Francisco Bay. Inhabits *Salicornia* marshes; nests low in *Grindelia* bushes (high enough to escape high tides) and in *Salicornia*.	**Not expected to occur:** The project site is located outside of the known range of the species, which does not extend into Marin County (Shuford and Gardali 2008)
American peregrine falcon *Falco peregrinus anatum*		FP	Species found near wetlands, lakes, rivers, or other water; on cliffs, banks, dunes, mounds, and human-made structures. Nest consists of a scrape or a depression or ledge in an open site.	**Known to occur:** The cliffs and other similar habitat for nesting are not present within or adjacent to the project site. However, the species has been reported to occur in the project area (Appendix A of the Project EIR)
Bald eagle *Haliaeetus leucocephalus*		E FP	Ocean shore, lake margins, and rivers for both nesting and wintering. Most nests within 1 mile of water. Nests in large, old-growth, or dominant live tree with open branches, especially ponderosa pine. Roosts communally in winter.	**Known to occur:** The species has been reported to occur in the project area (Appendix A of the Project EIR); however, with the existing disturbance on the project site nesting is not likely to occur.

Species	Federal Status [1]	State Status [1]	Habitat	Potential for Occurrence [2]
Bank swallow *Riparia riparia*		T	A colonial nester, this species nests primarily in riparian and other lowland habitats west of the desert. Requires vertical banks/cliffs with fine-textured/sandy soils near streams, rivers, lakes, ocean to dig nesting hole.	**Not expected to occur:** The vertical banks and cliffs for nesting are not present within or adjacent the project site.
Black swift *Cypseloides niger*		SC	Species is found in the coastal belt of Santa Cruz and Monterey counties; central and southern Sierra Nevada; San Bernardino and San Jacinto mountains. Breeds in small colonies on cliffs behind or adjacent to waterfalls in deep canyons and sea-bluffs above the surf; forages widely.	**Not expected to occur:** The project site is located outside of the known range of the species, which does not extend into Marin County (Shuford and Gardali 2008).
Burrowing owl *Athene cunicularia*		SC	Species found in open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Species is a subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel for nest burrows.	**Not expected to occur:** The nearest documented location of the species is approximately 7.0 miles away from the project site, northwest of Mt. Tamalpais (CNDDB 2021), and the grassland within the project site is not likely to support burrowing habitat (WRA 2010).
California (Ridgway's) clapper rail *Rallus obsoletus obsoletus*	E	E FP	Species is found in salt-water and brackish marshes traversed by tidal sloughs in the vicinity of San Francisco Bay. Associated with abundant growths of pickleweed, but feeds away from cover on invertebrates from mud-bottomed sloughs.	**Not expected to occur:** The project site does not contain the salt or brackish marsh habitat required for this species. The nearest saltwater marsh to the project site is separated from the project site by Seminary drive and existing residential buildings.
California black rail *Laterallus jamaicensis coturniculus*		T FP	Species inhabits freshwater marshes, wet meadows and shallow margins of saltwater marshes bordering larger bays. Needs water depths of about 1 inch that do not fluctuate during the year and dense vegetation for nesting habitat.	**Not expected to occur:** The project site does not contain the salt or freshwater marsh habitat required for this species. The nearest saltwater marsh to the project site is separated from the project site by Seminary drive and existing residential buildings.
Northern harrier *Circus cyaneus*		SC	Species is found in coastal scrub, Great Basin grassland, riparian scrub, valley and foothill grassland, wetlands, coastal saltwater marsh, and freshwater marsh. Nest and forage in grasslands, from salt grass in desert sink to mountain cienagas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	**Not expected to occur:** The project site contains shrubby upland vegetation, and saltwater marsh areas within and adjacent to the project site provide foraging habitat for this species. However, the existing disturbance within the project site makes the upland areas likely unsuitable for this ground nesting raptor species.
Saltmarsh common yellowthroat *Geothlypis trichas sinuosa*		SC	Species is a resident of the San Francisco Bay region, in fresh and saltwater marshes. Requires thick, continuous cover down to water surface for foraging; tall grasses, tule patches, willows for nesting.	**Not expected to occur:** The project site does not contain the salt marsh habitat required for this species. The nearest saltwater marsh to the project site is separated from the project site by Seminary drive and existing residential buildings.

Species	Federal Status [1]	State Status [1]	Habitat	Potential for Occurrence [2]
San Pablo song sparrow *Melospiza melodia samuelis*		SC	Species is a resident of salt marshes along the north side of San Francisco and San Pablo bays. Inhabits tidal sloughs in the *Salicornia* marshes; nests in *Grindelia* bordering slough channels.	**Not expected to occur:** The project site does not contain the salt marsh habitat required for this species. The nearest saltwater marsh to the project site is separated from the project site by Seminary drive and existing residential development.
Short-eared owl *Asio flammeus*		SC	Species is found in swamp lands, both fresh and salt, lowland meadows, and irrigated alfalfa fields. Tule patches/tall grass needed for nesting/daytime seclusion. Nests on dry ground in depression concealed in vegetation.	**Not expected to occur:** The project site does not contain the marsh and wet lowland meadow habitat required for this species.
Western snowy plover *Charadrius alexandrinus nivosus*	T	SC	Species is found on sandy beaches, salt pond levees, and shores of large alkali lakes. Needs sandy, gravelly or friable soils for nesting.	**Not expected to occur:** The project site does not contain the sandy beaches or other sandy gravelly or friable soils for nesting.
White-tailed kite *Elanus leucurus*		FP	Species found in rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	**May occur:** The project site contains trees that are potentially suitable for nesting and open areas within and adjacent to the project site provide foraging habitat for this species.
Mammals				
American badger *Taxidea taxus*		SC	Species is most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	**Not expected to occur:** Grassland, scrub, and forest habitat is present within the project site; however, existing development and human use of the project site and vicinity likely to prevent occupancy.
Pallid bat *Antrozous pallidus*		SC	Species found in chaparral, coastal scrub, desert wash, Great Basin grassland, Great Basin scrub, Mojavean desert scrub, riparian woodland, Sonoran desert scrub, upper montane coniferous forest, and valley and foothill grassland. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	**May to occur:** The project site contains mature trees that may contain cavities suitable for roosting. Some unused buildings within the project site may also provide roosting habitat for the species.
Point Reyes jumping mouse *Zapus trinotatus orarius*		SC	Species found primarily in bunch grass marshes on the uplands of Point Reyes. Also present in coastal scrub, grassland, and meadows. Builds grassy nests on ground under vegetation, and burrows in winter.	**Not expected to occur:** The project site is located outside of the known range of the species, which is confined to the coastal area of Point Reyes and the Marin Headlands (Collins 1998a).
Point Reyes mountain beaver *Aplodontia rufa phaea*		SC	Species found in the coastal area of Point Reyes near springs or seepages, along north-facing slopes of hills and gullies in areas overgrown with sword ferns and thimbleberries.	**Not expected to occur:** The project site is located outside of the known range of the species, which is confined to the coastal area of Point Reyes.

Species	Federal Status [1]	State Status [1]	Habitat	Potential for Occurrence [2]
Salt-marsh harvest mouse *Reithrodontomys raviventris*	E	E FP	Species is found only in the saline emergent wetlands of San Francisco Bay and its tributaries. Pickleweed is primary habitat, but may occur in other marsh vegetation types and in adjacent upland areas. Does not burrow, build loosely organized nests. Requires higher areas for flood escape.	**Not expected to occur:** The project site does not contain the salt marsh or other Richardson Bay habitats. Habitat required for this species. The nearest salt water marsh to the project site is separated from the project site by Seminary drive and existing residential development.
Salt-marsh wandering shrew *Sorex vagrans halicoetes*		SC	Species found in the salt marshes of the south arm of San Francisco Bay. Medium high marsh 6-8 feet above sea level where abundant driftwood is scattered among Salicornia.	**Not expected to occur:** The project site is located outside of the known range of the species, which not known to occur in Marin County (Collins 1998b). The nearest salt water marsh to the project site is separated from the project site by Seminary drive and existing residential development.
San Pablo vole *Microtus californicus sanpabloensis*		SC	Species is found in the saltmarshes of San Pablo Creek, on the south shore of San Pablo Bay. Constructs burrow in soft soil. Forms a network of runways leading from the burrow.	**Not expected to occur:** The project site is located outside of the known range of the species, which is confined to the shores of San Pablo Bay.
Southern sea otter *Enhydra lutris nereis*	T	FP	Species found in nearshore marine environments from about Ano Nuevo, San Mateo County to Point Sal, Santa Barbara County. Needs canopies of giant kelp and bull kelp for rafting and feeding. Prefers rocky substrates with abundant invertebrates.	**Not expected to occur:** Suitable habitat of giant and bull kelp are not present in the project site.
Suisun shrew *Sorex ornatus sinuosus*		SC	Species known from the tidal marshes of the northern shores of San Pablo and Suisun bays. Requires dense low-lying cover and driftweed and other litter above the mean hightide line for nesting and foraging.	**Not expected to occur:** The project site is located outside of the known range of the species, which is confined to the shores of San Pablo Bay and Suisun Bay.
Ringtail *Bassariscus astutus*		FP	Riparian habitats, forest habitats, and shrub habitats used for denning and foraging in lower to middle elevations.	**Not expected to occur:** Ringtail have not been documented within or adjacent to the project site; however, the species is not tracked in the CNDDB. Forest and scrub habitats are present within the project site; however, existing development and human use of the project site and vicinity likely to prevent occupancy.
Townsend's big-eared bat *Corynorhinus townsendii*		SC	Species is found throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. Roosting sites limiting. Extremely sensitive to human disturbance.	**May to occur:** The species is highly associated with cave and mine habitats, and no caves or mines are present in the project site. However, some unused buildings within the project site may also provide roosting habitat for the species.

Species	Federal Status [1]	State Status [1]	Habitat	Potential for Occurrence [2]
Western red bat *Lasiurus blossevillii*		SC	Species is found in cismontane woodland, lower montane coniferous forest, riparian forest, riparian woodland. Roosts primarily in trees, 2-40 feet above ground, from sea level up through mixed conifer forests. Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging.	**May to occur:** While the species is primarily found in riparian habitats, the project site contains mature trees that may provide the appropriate leaf density for roosting bats.

Note: CEQA = California Environmental Quality Act; CNDDB = California Natural Diversity Database; DPS= Distinct Population Segment; ESU = Evolutionary Significant Unit; USFWS = U.S. Fish and Wildlife Service

* This species is included as a special-status species due to previous listing as Candidate Endangered by the California Fish and Game Commission. This candidate status was overturned by the courts in 2020; however, the species still warrants consideration under CEQA.

[1] Legal Status Definitions

Federal:

E Endangered (legally protected)
T Threatened (legally protected)
C Candidate (no formal protection)

State:

FP Fully protected (legally protected)
SC Species of special concern (no formal protection other than CEQA consideration)
E Endangered (legally protected)
T Threatened (legally protected)
S1 Critically Imperiled (no formal protection other than CEQA consideration)
S2 Imperiled (no formal protection other than CEQA consideration)

[2] Potential for Occurrence Definitions

Not expected to occur: Species is unlikely to be present in the project site due to poor habitat quality, lack of suitable habitat features, or restricted current distribution of the species.

May to occur: Suitable habitat is available in the project site and project site is within the current distribution of the species; however, there are little to no other indicators that the species might be present.

Known to occur: The species, or evidence of its presence, has been reported by others.

Subject: Sensitive Natural Communities and Sensitive Habitat Types at the North Coast Land Holdings Project Site

Dear Tammy,

This letter report describes the methods and results of a sensitive natural communities and sensitive habitats survey conducted on September 1, 2022 at the site of the North Coast Land Holdings (project), located at 201 Seminary Drive in Mill Valley, California. This report is supplemental to the Biological Resources Technical Memorandum for the project (Ascent 2022) to more thoroughly document the vegetation communities and other habitats present on the project site to determine whether they qualify as sensitive natural communities and other sensitive habitats pursuant to CEQA.

Sensitive natural communities are those native plant communities defined by the California Department of Fish and Wildlife (CDFW) as having limited distribution statewide or within a county or region and that are often vulnerable to environmental effects of projects (CDFW 2022). There are three sensitive natural communities at the project site, including 16.94 acres of Needle Grass – Melic Grass Grassland, 0.94 acre of Coyote Brush Scrub/(Needle Grass, Blue Wild Rye, California Brome), and 0.14 acre of California Bay Forest and Woodland.

Sensitive habitats include sensitive natural communities designated by CDFW, as well as those that are of special concern to resource agencies or are afforded specific consideration through CEQA, Section 1602 of the California Fish and Game Code, Section 404 of the Clean Water Act (CWA), and the state's Porter-Cologne Water Quality Control Act. In addition to sensitive natural communities, sensitive habitats on the project site include 17.11 acres of Coast Live Oak Forest and Woodland, 0.17 acre of California Sagebrush – (Purple Sage) Scrub, and 0.04 acre of fresh emergent wetland. (Figure 1).

Figure 1 Sensitive Natural Communities and Sensitive Habitats

BIOLOGICAL AND HISTORICAL SETTING

The project is an approximately 104.8-acre historical seminary campus located on the Strawberry Point peninsula in Richardson Bay, south Marin County and is within the Marin Hills California Level IV ecoregion, characterized by mountains and hills between San Francisco Bay and the San Andreas Fault. The project site is bordered by Seminary Drive to the southwest and west, and suburban residential neighborhoods to the north, northeast and south. The site is composed primarily of a mix of hardscape (e.g., paved roads, buildings) and native and naturalized vegetation cover. Prior to major grading for development of the seminary between 1953 and 1954 (Photo 1), the project site was characterized by open grasslands and patches of coastal scrub vegetation communities around the perimeter of the peninsula.

Source: Heig. 1982.

Photo 1 - Aerial view of the seminary and surrounding area from 1954.

The project site is locally surrounded by ecological preserves and recreation areas, including the 182,116-acre Golden Gate National Recreation Area to the west, and hundreds of acres of Marin County Parks Open Space Preserves to the north and east of the project site. These preserves protect and support sensitive natural communities in their original historical composition of native species and give an indication of what historical vegetation communities were present, locally and regionally, prior to development of the project site and surrounding area.

SURVEY METHODS

Prior to the conducting the field survey, Ascent botanists reviewed aerial photographs and biological and geological technical reports of prior surveys conducted for NCLH as well as studies conducted on nearby preserves to identify any unique soil types, sensitive plant communities, and aquatic features potentially present on the project site.

Ascent botanists Shannon Hickey and Pam Brillante conducted the survey for sensitive habitats and sensitive natural communities on September 1, 2022, in accordance with the protocols described in *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities* (CDFW 2018).

During the survey, the project site was traversed on foot by walking meandering transects. All vegetation communities present were surveyed thoroughly to determine if the vegetation communities meet the criteria for a sensitive natural community according to *A Manual of California Vegetation* (Sawyer et al. 2009). All plant species observed were recorded and identified to the highest taxonomic level necessary using *The Jepson Manual: Vascular Plants of California, Second Edition* (Baldwin et al. 2012). Any sensitive habitats including sensitive natural communities were digitally mapped using an Arrow Series® GNSS Global Positioning System unit.

RESULTS

Sensitive Natural Communities

The project site supports three plant communities that qualify as sensitive natural communities: Needle Grass – Melic Grass Grassland, Coyote Brush Scrub / (Needle Grass, Blue Wild Rye, California Brome), and California Bay Forest and Woodland. These communities are displayed in Figure 1 and Table 1, and described below, including representative photos.

CDFW designates sensitive natural communities based on their state rarity and threat ranking using NatureServe's Heritage Methodology. Natural communities with rarity ranks of S1 to S3, where S1 is critically imperiled, S2 is imperiled, and S3 is vulnerable, are considered sensitive natural communities to be addressed in the environmental review processes of CEQA and its equivalents. These communities may or may not contain special-status plants or their habitat (CDFW 2022).

The sensitive natural communities at the project site are described on a grosser scale, using the California Wildlife Habitat Relationships system (CWHR) (CDFW 2022). They are described at an alliance level in this report, including membership rules, according to the *Manual of California Vegetation* (MCV) (Sawyer et al. 2009). Species composition of a natural vegetation community defined in MCV must meet at least one stated membership rule. Table 1 includes a crosswalk between the CWHR and MCV naming convention, as well as the CDFW rarity ranking and corresponding acreage of each community.

Table 1 Sensitive Natural Communities and Sensitive Habitats at the Project Site

CMV	CWHR	CDFW Rarity Ranking	Acres
Needle Grass – Melic Grass Grassland	Perennial Grassland	S3	16.94
Coyote Brush Scrub / (Needle Grass, BlueWild Rye, California Brome)	Coastal Scrub	S3	0.94
California Bay Forest and Woodland	Montane Hardwood	S3	0.14

Needle Grass - Melic Grass Grassland

In this alliance, California melic (*Melica californica*), Torrey's melic (*Melica torreyana*), nodding needle grass [*Nassella (syn. Stipa) cernua*], foothill needle grass [*Nassella (syn. Stipa) lepida*] and/or purple needle grass [*Nassella (syn. Stipa) pulchra*] is dominant or characteristically present in the herbaceous layer with other perennial grasses and herbs including hook three-awn (*Aristida ternipes*), milkvetch (*Astragalus* spp.), wild oat (*Avena* spp)., brome (*Bromus* spp.), dense pine reed-grass (*Calamagrostis koelerioides*), fairy lantern *(Calochortus* spp.), morning-glory (*Calystegia* spp.), soap plant (*Chlorogalum pomeridianum*), clarkia (*Clarkia* spp.), common sandaster, (*Corethrogyne filaginifolia*), doveweed (*Croton setiger*), cryptantha (*Cryptantha* spp.), wild carrot (*Daucus pusillus*), [*Dichelostemma* (syn. *Dipterostemon*) *capitatum*], blue wild-rye (*Elymus glaucus*), wild buckwheat (*Eriogonum* spp.), storksbill (*Erodium* spp.), California poppy (*Eschscholzia californica*), California fescue (*Festuca californica*), mustard (*Hirschfeldia incana*), narrow tarplant (*Holocarpha virgata*), meadow barley (*Hordeum brachyantherum*), June grass (*Koeleria macrantha*), goldfields (*Lasthenia* spp.), plantain (*Plantago* spp.), Nevada blue grass (*Poa secunda*), sanicle (*Sanicula* spp.), western blue-eyed grass (*Sisyrinchium bellum*), clover (*Trifolium* spp), and/or fescue [*Vulpia* spp. (*syn. Festuca*)].

- Emergent trees and shrubs may be present at low cover. The herbaceous layer is generally less than 1 meter in height and cover is open to continuous. Any one of the following membership rules must be met: purple needle grass > 5 percent absolute cover as a characteristic to dominant species in the herbaceous layer.
- Purple needle grass usually > 10 percent relative cover of the herbaceous layer.
- Purple needle grass or nodding needle grass is characteristically present in the herbaceous layer with at least 2 percent absolute cover.
- Purple needle grass (or other needle grass species) has a clear presence in the stand with > 5 percent absolute cover in the herbaceous layer.
- Nodding needle grass > 30 percent relative cover in the herbaceous layer as a characteristic grass.
- California melic and/or purple needle grass > 30 percent relative cover in the herbaceous layer. Other species including Lemmon's needle grass [*Achnatherum (syn. Stipa) lemmonii]*, wild oat, brome, hayfield tarweed (*Hemizonia congesta*), wild rye [*Lolium (syn. Festuca) perennis]*, California plantain (*Plantago erecta)*, and/or English plantain (*Plantago lanceolata*) may intermix as dominant, co-dominant or characteristic taxa in associations of this alliance.
- Torrey's melic > 30 percent relative cover in the herbaceous layer and is commonly associated with serpentinite soils.
- Big squirreltail (*Elymus multisetus)* or squirreltail (*Elymus* elymoides) > 30 percent relative cover in the herbaceous layer on serpentine soils.
- California melic, Torrey's melic, and/or purple needle grass are > 30 percent relative cover in stands. Wild oat, brome, hayfield tarweed, wild rye, California plantain, English plantain, and/or clover species. intermix at > 50 percent relative cover, or > 30 percent relative cover in associations of this alliance.

Needle Grass – Melic Grass Grassland has a State Rarity Ranking of S3 (vulnerable) and comprises approximately 16.94 acres of the project site. Distribution of this vegetation community around the campus is patchy and fragmented, occurring between and around numerous buildings, paved roads, parking lots, sidewalks, and ornamental landscaping.

All the grassland in and around the campus was recently mowed at the time of the survey and the survey was conducted at the beginning of September during a drought year, making it difficult to characterize species composition in this vegetation community. However, other indications confirmed that the majority of grassland on the project site meets at least one membership rule for Needle Grass – Melic Grass Grassland [greater than 5 percent absolute cover of purple needle grass, nodding needle grass, or foothill needle grass]. Ascent botanists were able to identify grass debris laying on the ground as needle grass (*Stipa sp*.; synonym of *Nassella* sp.) and clumping of mowed bunch grasses at greater than 5 percent could be easily distinguished from mowed annual grasses and forbs (Photos 2 and 3); two open grassland areas along the northern and southern project boundaries that had not been mowed at the time of the survey supported greater than 5 to 30 percent of purple needle grass (Photos 4 and 5); and grassland areas distributed across the project site that were surveyed by WRA in 2010 were identified as purple needlegrass grassland, composed of greater than 10 percent purple needle grass and foothill needle grass (WRA 2010). Therefore, it is assumed that the mowed grassland on the project site meets the membership rules for this sensitive natural community.

Source: Ascent Environmental in 2022

Photo 6 - Needle Grass - Melic Grass Grassland with higher cover of annual grasses, facing east towards Shuck Drive (not mowed)

Species composition at the time of the surveys, in the two open areas that were not mowed (northwest corner of the project site and along the southern boundary, east of Seminary Cove Drive) includes a combination of native perennial grasses (5 percent to 35 percent cover), nonnative annual and perennial grasses (10 percent to 40 percent cover) and weedy forbs (Photos 5 and 6): purple needle grass, Torrey's melic, California melic , blue wild-rye , common velvet grass (*Holcus lanatus*), harding grass (*Phalaris aquatica*), slender oat (*Avena barbata*), yellow star thistle (*Centaurea solstitialis*), Italian thistle (*Carduus pycnocephalus*), cow parsnip (*Heracleum lanatum*), and field bindweed (*Convolvulus arvensis*).

<u>Coyote Brush Scrub / (Needle Grass, Blue Wild Rye, California Brome)</u>

In this alliance, coyote brush (*Baccharis pilularis*), California coffeeberry (*Frangula californica*) and/or coast silk tassel is dominant to co-dominant in the shrub canopy with California sage brush *(Artemisia californica*), blueblossom *(Ceanothus thyrsiflorus*), California hazelnut *(Corylus cornuta*), orange bush monkeyflower *(Diplacus aurantiacus*), California buckwheat *(Eriogonum fasciculatum*), seaside woolly sunflower (*Eriophyllum staechadifolium),* salal *(Gaultheria shallon),* ocean spray (*Holodiscus discolor*), deerweed [*Lotus scoparius (syn. Acmispon glaber)*], yellow bush lupine (*Lupinus arboreus*), wax myrtle (*Morella californica*), California blackberry (*Rubus ursinus*), white sage (Salvia apiana), purple sage (*Salvia leucophylla),* and poison oak (*Toxicodendron diversilobum*). Emergent trees may be present at low cover including bishop pine (*Pinus muricata*), Douglas-fir (*Pseudotsuga menziesii*), coast live oak (*Quercus agrifolia*) *or* California bay (*Umbellularia californica*). Any one of the following membership rules must be met:

- Coyote brush > 15 percent shrub cover over grassy understory; coyote brush relative cover > 50 percent than other shrub species.
- Coyote brush > 50 percent absolute cover in the shrub layer.
- California coffeeberry > 30 percent relative cover in the shrub canopy with coyote brush, poison oak, and other shrubs in mesic uplands.

- Coast silk tassel > 50 percent relative cover in the shrub canopy with coyote brush and other shrubs.
- Coyote brush > 50 percent relative cover in the shrub canopy, or > 30% with California coffeeberry, poison oak, and/or blackberry (*Rubus* spp.).

The coyote brush scrub in the northwestern corner of the project site comprises 0.94 acre (Photo 7). The coyote brush scrub has Needle Grass-Melic Grass Grassland in the understory (greater than 5 percent). Therefore, this natural community most closely resembles the sensitive natural community, Coyote Brush Scrub / (Needle Grass, Blue Wild Rye, California Brome), which has a Rarity Ranking of S3 (vulnerable). However, the cover area of coyote brush (*Baccharis pilularis*) appears to be increasing from what was mapped in 2010 by WRA. The understory appears to be transitioning to annual grassland with a high cover of slender oat (greater than 35 percent) and there appears to be an increase in the presence of French broom (*Genista monspessulana*) compared to landcover that was mapped in 2010 by WRA. French broom has a California Invasive Plant Council (Cal-IPC) "High" rating, defined as having "severe ecological impacts on physical processes, plant and animal communities, and vegetation structure" (Cal-IPC 2022). Other species observed in this community include California melic, blue wild-rye, harding grass, and ripgut brome (*Bromus diandrus*) in the understory, and poison oak and California bay saplings in the overstory.

Source: Ascent Environmental in 2022

Photo 7 - Coyote Brush Scrub / (Needle Grass, Blue Wild Rye, California Brome), facing north.

California Bay Forest and Woodland

California bay is dominant or co-dominant in the tree or tall shrub canopy of this alliance with big-leaf maple (*Acer macrophyllum*), California buckeye (*Aesculus californica*), white alder (*Alnus rhombifolia*), red alder (*Alnus rubra*), Pacific madrone (*Arbutus menziesii*), California hazelnut, Southern California black walnut (*Juglans californica*), *tanoak* (*Notholithocarpus densiflorus*), foothill pine (*Pinus sabiniana*), western sycamore (*Platanus racemosa*), Douglas-fir (Pseudotsuga menziesii), coast live oak, canyon live oak (*Quercus chrysolepis),* interior live oak (*Quercus wislizeni*), and coast redwood (*Sequoia sempervirens*). Any one of the following membership rules must be met:

- Conifers < 30 percent relative cover in canopy, California bay > 30 percent relative cover in the tree canopy.
- California bay usually > 50 percent relative cover in the overstory as a tree or tall shrub; when with interior live oak > 30 percent relative cover.
- California bay > 50 percent relative cover in the tree canopy, or > 30 percent relative cover with coast live oak.

California Bay Forest and Woodland, located along the southwestern boundary of the project site, has a State Rarity Ranking of S3 (vulnerable) and comprises approximately 0.14 acre. California bay is the dominant species in the overstory with annual grasses in the understory.

Other Sensitive Habitats

Coast Live Oak Woodland and Forest

Coast live oak is dominant or co-dominant in the upland tree canopy with big-leaf maple (*Acer macrophyllum*), Pacific madrone, Southern California black walnut, blue oak (Quercus douglasii), California black oak (*Quercus kelloggii)*, valley oak (*Quercus lobata*), and California bay. To meet the membership rules of the MCV alliance one of the following must be true: Coast live oak comprises greater than 50 percent of the relative cover in the tree canopy; if California bay or madrone trees are present, then coast live oak is greater than 30 percent of the relative cover in the tree canopy.

In this habitat type, coast live oak is the dominant canopy species in a single tree stratum over a shrub or herb understory and tree canopy closure ranges from 10-60 percent. The coast live oak trees often occur in a patchy distribution within a shrub matrix of species such as toyon (*Heteromeles arbutifolia*), common manzanita (*Arctostaphylos manzanita*), deer brush (*Ceanothus* spp.), and poison oak with a sparse understory of herbs. Alternatively, depending mainly on disturbance history, the oaks may be embedded in a grassland matrix comprised of a diverse mix of perennial bunchgrasses, [e.g., California brome [*Bromus carinatus* (*syn. Bromus sichensis var. Carinatus*)], purple needle grass), shrubs, and annual grasses and forbs.

Coast live oak woodland forest comprises 17.11 acres distributed throughout the project site. This habitat contains a mix of native species, including coast live oak and California bay in the overstory and California blackberry, poison oak, creeping snowberry (*Symphoricarpos mollis*), and French broom seedlings in the shrub layer, with an understory of nonnative annual grasses, including slender oat and bristly dogtail grass (*Cynosurus echinatus*).

Oak woodlands are recognized as sensitive habitats pursuant to the Oak Woodlands Conservation Act and Public Resources Code Section 21083.4, regardless of whether the oak woodland vegetation alliance is a designated sensitive natural community. Coast live oak woodland is not designated a sensitive natural community; however, it is a sensitive habitat type pursuant to CEQA.

The Marin County Wide Plan includes the following measure related to the protection of Oak woodlands:

- Policy BIO-1.3. Protect Woodlands, Forests, and Tree Resources. Protect large native trees, trees with historical importance; oak woodlands; healthy and safe eucalyptus groves that support colonies of monarch butterflies, colonial nesting birds, or known raptor sites; and forest habitats. Prevent the untimely removal of trees through implementation of standards in the Development Code and the Native Tree Preservation and Protection Ordinance. Encourage other local agencies to adopt tree preservations ordinances to protect native trees and woodlands, regardless of whether they are located in urban or undeveloped areas.

California Sagebrush - (Purple Sage) Scrub

California sagebrush and/or purple sage are dominant or co-dominant in the shrub canopy with chamise (*Adenostoma fasciculatum*), coyote brush, bladderpod [*Cleome isomeris (syn. Peritoma arborea*)], orange bush monkeyflower, bush sunflower (*Encelia californica*), brittlebush (*Encelia farinosa*), desert tea (*Ephedra californica*), interior goldenbush (*Ericameria linearifolia*), coastal wild buckwheat (*Eriogonum cinereum),* California buckwheat, golden –yarrow (*Eriophyllum confertiflorum*), chaparral yucca (*Hesperoyucca whipplei*), coastal goldenbush (*Isocoma menziesii*), heart-leaved keckiella (*Keckiella cordifolia*), southern honeysuckle (*Lonicera subspicata*), deerweed, laurel sumac (*Malosma laurina),* prickly pear (*Opuntia littoralis),* evergreen buckthorn (*Rhamnus ilicifolia),* lemonade berry

(*Rhus integrifolia),* sugar bush (*Rhus ovata*), white sage, black sage (*Salvia mellifera)* and poison oak. Emergent trees or tall shrubs may be present at low cover, including Southern California black walnut, coast live oak or black elderberry (*Sambucus nigra*). Any one of the following membership rules must be met:

- California sagebrush > 3 times cover of coyote brush and other shrub species.
- California sagebrush > 60 percent relative cover in the shrub canopy.
- California sagebrush > 60 percent relative cover in the shrub canopy or laurel sumac or orange bush monkeyflower sometimes > 30 percent relative cover.
- Both California sagebrush and California buckwheat have 30-60 percent relative cover in the shrub canopy.
- Purple sage > 30 percent relative cover, often codominant with California sagebrush.
- Purple sage > 60 percent relative cover in the shrub canopy.
- California sagebrush > 50 percent relative cover in the shrub canopy.

California Sagebrush – (Purple Sage) Scrub is located along the southwestern boundary of the project site, comprising approximately 0.17 acre. California sagebrush is the dominant species in this community. Other species observed include coyote brush and fennel.

Fresh Emergent Wetland

Wetlands that qualify as waters of the United States according to Section 404 of the Clean Water Act and or Waters of the State under the Porter-Cologne Water Quality Control Act are subject to regulation under state and federal law.

There is a total 0.04 acre of fresh emergent wetland present in two roadside ditches and along a drainage feature that appears to be the result of irrigation runoff from an adjacent residential property. The fresh emergent wetland on the project site is dominated by rabbitsfoot grass (*Polypogon monspeliensis*) and tall flatsedge (*Cyperus eragrostis*), which are common opportunistic, weedy hydrophytic species.

DISCUSSION

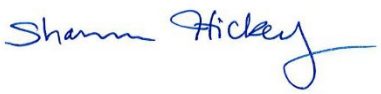
The project site is underlain by a Franciscan Complex mélange that is predominantly sandstone and shale, including chert outcrops (PRA 2016). It is likely that the presence of chert outcrops is the reason relic perennial grassland persists and has not converted to annual grassland despite significant excavation and development activities at the project site and surrounding areas, starting in the 1950s, and despite the presence of nonnative and invasive annual grasses in proximity to areas supporting perennial grassland.

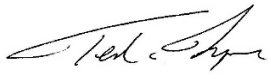
According to research for the National Park Service (NPS) in the nearby Marin Headlands, there appears to be an association between chert soils and native perennial grasslands. "At the landscape scale, the grasslands sampled in the Marin Headlands form a consistent and repeatable vegetation type that appears to be closely associated with soil derived from Franciscan complex chert, which is relatively uncommon elsewhere in the San Francisco Bay Area" (NPS 2013). Moreover… "the Marin Headlands grasslands found on chert-derived soils appear relatively resistant to undergoing succession. Succession proceeds more rapidly in productive soils (Prach et al. 1993) and it seems that the chert-derived soils are relatively shallow and less productive; hence, many grasslands in the study area have not type-converted even after decades without disturbances from grazing or fire. Like many portions of the San Francisco Bay Area, the geology of the Marin Headlands is complex and unique. Substrate or soil type has a large effect on the patterning of vegetation and dynamics" (NPS 2013).

While the project site supports Needle Grass – Melic Grass Grassland in and around the campus and as an understory to coyote brush scrub, much of this vegetation community on the project site is fragmented, between buildings and paved roads, is regularly mowed, and surrounded by development. The small patch size of the onsite perennial grassland and surrounding human disturbances reduce the habitat quality of these grasslands for native fauna. There are preserves (i.e., Golden Gate National Recreation Area, Ring Mountain Preserve, Old Saint Hilary's Preserve, La

Cresta Open Space, Atkinson Open Space, Mt Burdell Preserve) within a few miles of the project site where the characteristic signature of perennial grasslands (e.g., rough, clumpy texture) can be seen from Google Earth aerial imagery and these preserves boast the presence of protected relic perennial grasslands on their lands. Therefore, while this vegetation community is considered vulnerable in the context of the distribution of relic perennial grassland statewide, loss of perennial grassland patches from the project site would not represent a significant impact to this resource in the region because it is not functioning as a high-quality natural community and there is an abundance of high-functioning native perennial grasslands protected in preserves surrounding the project site.

Sincerely,





Name Shannon Hickey

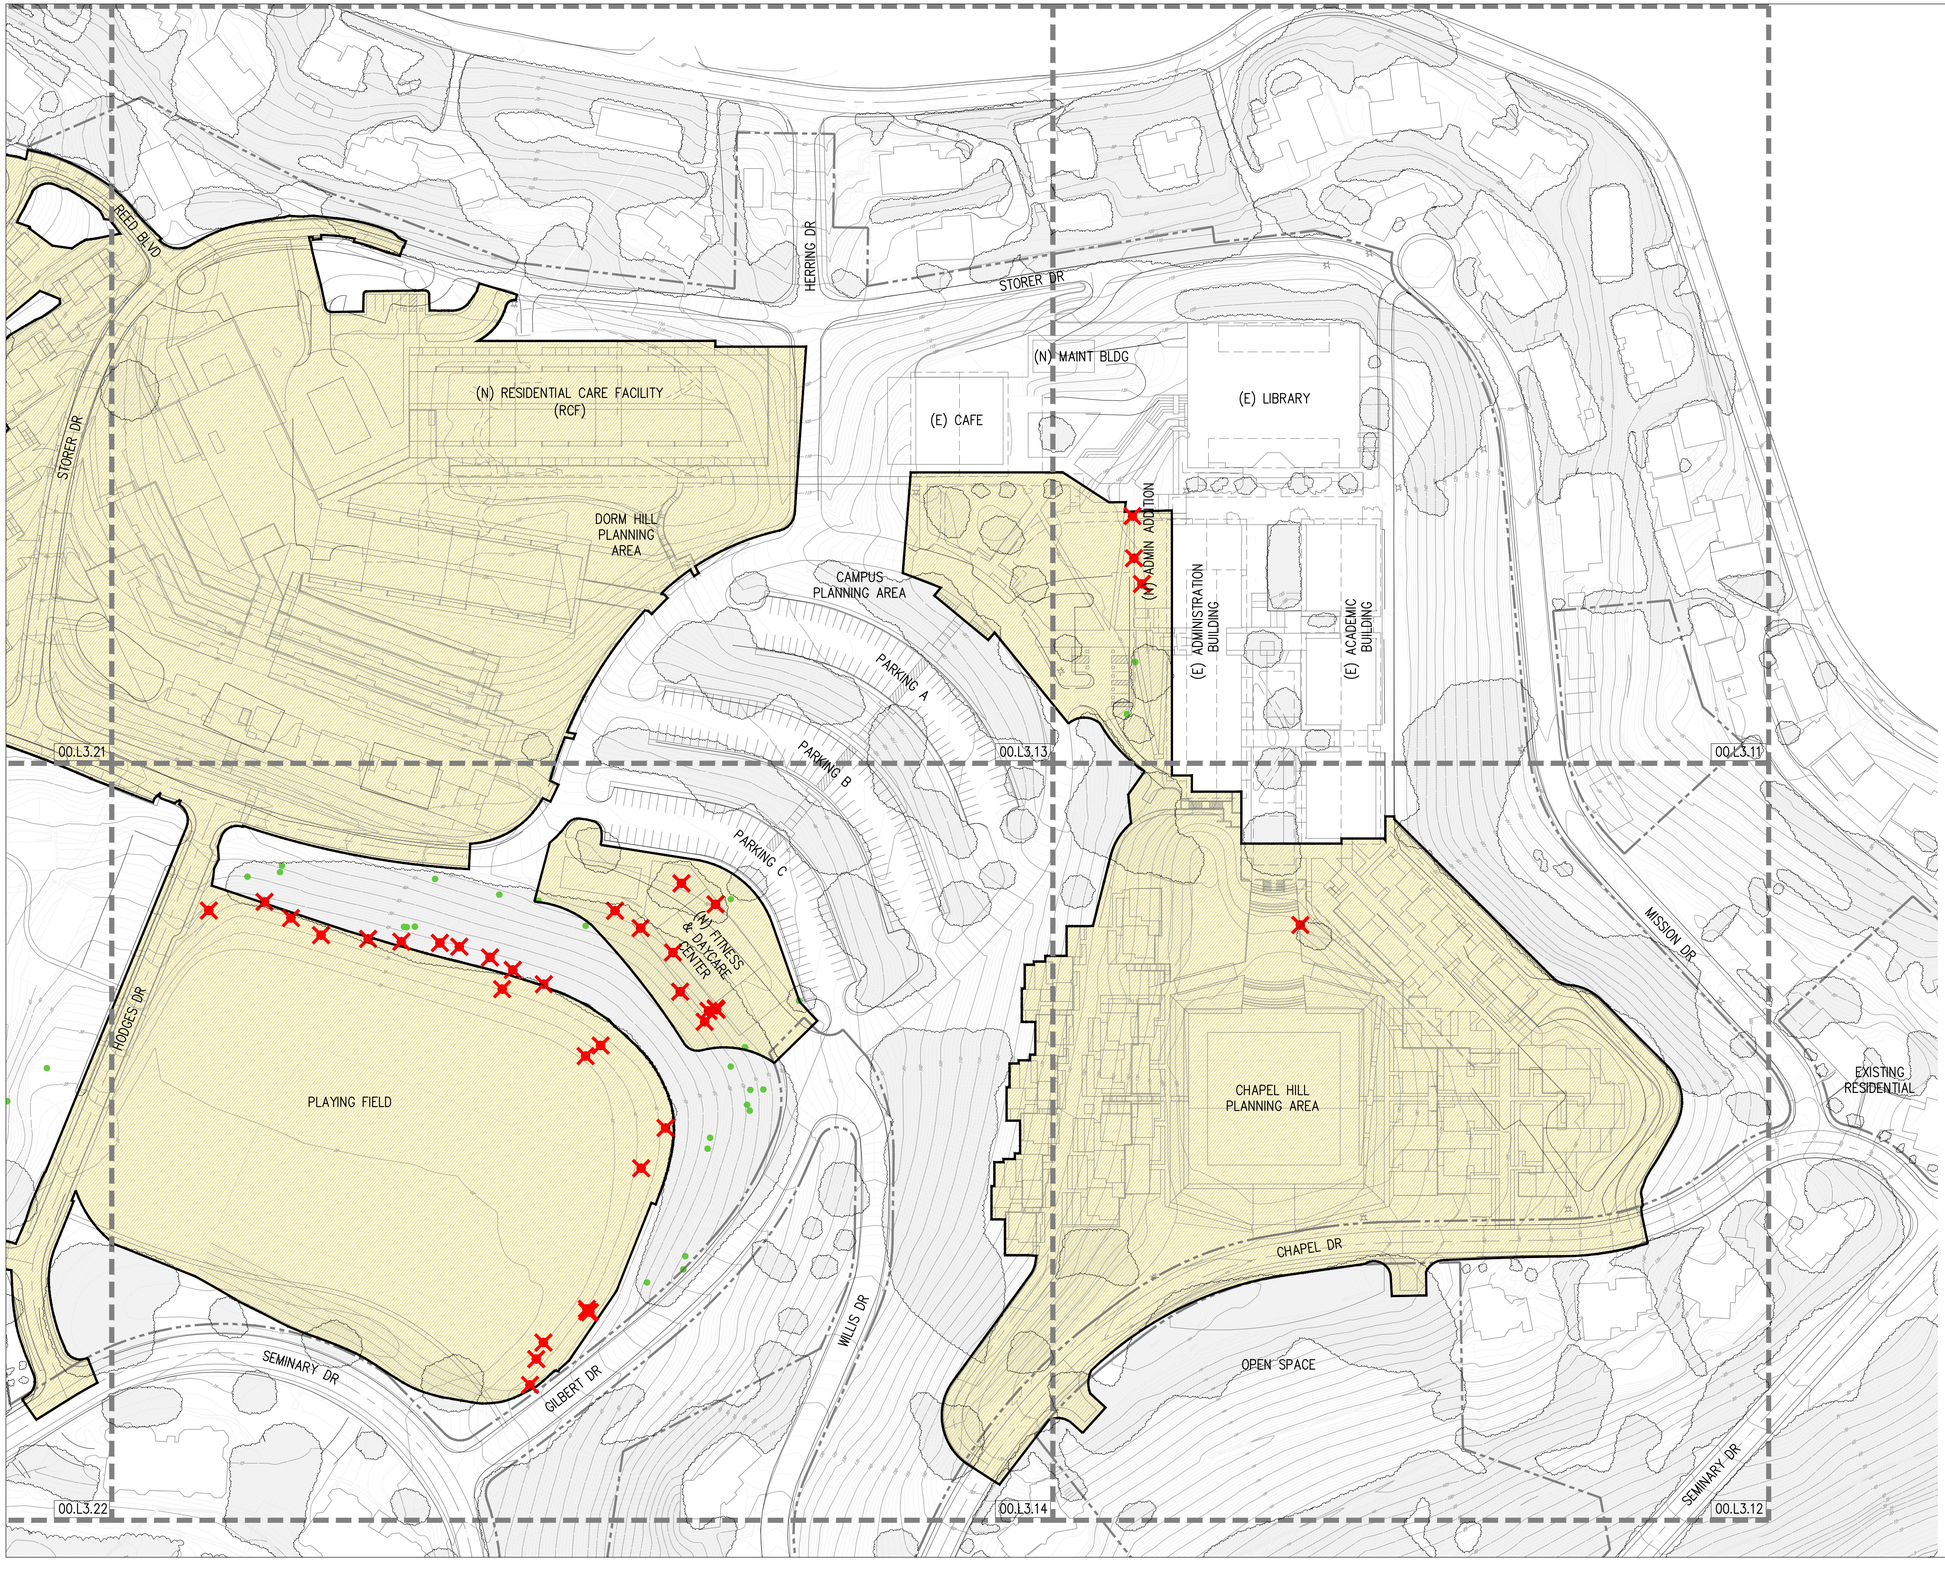
Appendix H

Forest Management and Tree Removal Plan



FOREST MANAGEMENT NOTES:

The Seminary site includes existing stands of native and non-native tree species, including coast live oak, California buckeye, Monterey pine, and acacia. Protected trees designated for removal, within the limits of grading and immediately adjacent areas, are identified on Sheets L3.11–L3.14 and Sheets L3.21–L3.24. Protected trees will be replaced at a ratio of 3:1 consistent with the Marin County Tree Ordinance (See Sheets L1.10A and L1.20A for plant lists and quantities). Other trees, consisting of predominantly non-native species within the shaded canopy symbol, generally occur outside the limits of grading.

Management goals for trees beyond the construction limits are to promote native tree establishment and improving the health of the existing trees. The other critical goal is to reduce public safety risks for both fire and structural failure of trees near public use and residential areas. Dead and dying trees will be removed and retained trees pruned to limit fire hazards (See Vegetation Management Sheets L4.10 and L4.20). Non-native, pyrophytic, and invasive species such as acacia will be removed. The stands of Monterey pine, which are at the end of their healthy lifespan and now pose significant fire and safety risks, will be removed as advised by a qualified arborist and the County Fire Marshall.

Report
Soil Engineering Consultation
The Seminary
201 Seminary Drive
Mill Valley, California

This letter presents the results of our soil engineering consultation and preliminary plan review for the proposed mixed-use development at The Seminary in Mill Valley, California. The site address is 201 Seminary Drive. A soil investigation was performed for a previously planned development on the site by Donald Herzog & Associates, Inc. (DHA), and the results were presented in their report dated August 31, 1979. DHA updated that report and provided additional information in a geotechnical reconnaissance for master plan report dated May 19, 1981. A preliminary geotechnical design report for the currently proposed development was prepared by Purcell, Rhoades & Associates (PRA), and the results were present in their report dated June 8, 2016. In those reports, the general conclusions indicate that, from a

geotechnical engineering standpoint, the project site is feasible for the proposed construction. Specific recommendations included criteria for site grading and drainage installation to upgrade areas of geotechnical concern used in conjunction with spread footings or drilled pier foundations.

The subject property is located on the Strawberry Point Peninsula in southern Marin County, California. The project site consists of several parcels that encompass a total area of about 127 acres in moderately to steeply sloping, hillside terrain. For ease in description, the project site can be divided into seven general areas of development (presented clockwise from the north):

1. Schuck Drive multi-family residences.
2. Residential care facility.
3. Fitness and daycare center.
4. Administration Building addition and new maintenance building at campus.
5. Mission Drive residences.
6. Chapel Hill residential buildings.
7. Seminary Point duplexes and single-family residences.

The planned new structures will be one-, two-, and/or three-story, wood- and steel-frame structures with concrete slab-on-grade floors or wood floors supported on joists above grade. A portion of the structures in Areas 1, 2, and 6 will utilize below grade parking levels, with retaining walls at their perimeter retaining planned cuts. The buildings will be served by new

asphalt-paved driveway and parking areas and underground utilities. Green Lane, a new public street, is also planned in Area 1 extending between the existing Reed Boulevard and Schuck Drive.

CONSULTATION

We have reviewed the 1981 DHA report and the PRA report and pertinent geologic information in our files. Our engineers also performed a site observation of the planned building areas on October 28, 2021. Based on our review and the surface features exposed, we judge that the conclusions and recommendations in the PRA report would still be applicable to the proposed construction, and the project site is suitable for the proposed mixed-use development. In addition, we are pleased to accept the responsibility as project soil engineer.

In general, we anticipate that conventional grading techniques can be used to mitigate the areas of concern that were identified in previous investigations. The mapped slope instabilities/areas of weak soil were generally less than 10 feet in depth and can be remediated with keyways and benching. Site grading can also be performed to underlie planned foundations with properly compacted, nonexpansive fill to allow for shallow spread footings and conventional slab-on-grade floors. In sloping areas where structures with raised wood floors are planned, such as the two lots in Area 5, we anticipate that drilled piers would likely be utilized. Specialized grading and deep foundations (such as driven piles) are not anticipated at this time.

Plan Review

Preliminary plans prepared by CSW/Stuber-Stroeh Engineering Group, Inc. have a latest revision date of January 31, 2020 and indicate that a majority of the planned structures will be located in areas of cut. The materials generated from the planned cuts will be placed as fill in the playing field area in the west portion of the site. Surface drainage will generally be collected in storm drain systems and treated on-site in planned bioretention areas. New paved areas will consist of asphalt concrete and aggregate base over compacted soil subgrade. Based on our plan review, we believe that the materials and methods indicated on the preliminary grading plans are in general conformance with our recommendations and the intent of the recommendations in the PRA report.

Supplemental Services

As stated in the PRA report, additional subsurface exploration work should be performed during the final design process once the specific areas of development are finalized and planned finished grades are established. Based on our review of the subsurface information provided in the reports reviewed, we judge that additional test borings and/or test pits are needed in Areas 1 through 4. We can provide recommendations for subsurface testing in these areas upon request.

We should review final grading and foundation plans for conformance with our recommendations. During construction, we

recommend that the site grading work be observed and tested by the soil engineer to verify that the actual conditions encountered are as anticipated and to modify our recommendations, if warranted. Field and laboratory tests should be performed to ascertain that the specified moisture content and degree of compaction are being attained. We recommend that the footing excavations be observed by the soil engineer to verify that the actual conditions encountered are as anticipated and to modify our recommendations, if warranted. We should observe pier drilling operations to verify that suitable bearing materials are encountered and to modify our recommendations, if warranted.

We trust this provides the information needed at this time. If you have questions regarding this matter, please do not hesitate to contact us.

Yours very truly,

REESE & ASSOCIATES

June 8, 2016

Subject: **PRELIMINARY GEOTECHNICAL DESIGN REPORT**
Proposed The Seminary Complex
201 Seminary Drive
Mill Valley, California

Mr. Orphanopoulos:

At your request, we are pleased to provide this Preliminary Geotechnical Design Report for the proposed redevelopment of the existing Golden Gate Baptist Seminary facility, in Mill Valley, California. Based upon review of drawings prepared by Mark Cavagnero Associates, Architects (MCA), and CSW/Sturber-Stroeh Engineering Group, Inc. (CSW-ST2), it is proposed in certain areas to raze existing structures and redevelop with new buildings, and in other areas have new construction. It was noted during review of proposed site plans that additional areas of new construction are proposed in areas outside of the limits of PRA's Stage 1 Feasibility Study. The purpose of this study is evaluate the proposed site development using the existing subsurface exploration, laboratory testing and engineering analysis performed to date, in order to provide recommendations to be considered in the design and construction of this project. This Preliminary Study also recommends supplemental borings and/or test pits for those areas proposed for development that were lacking specific subsurface information from prior investigations. Based upon the review of prior studies and current site review leading to the preparation of this Preliminary Geotechnical Design Report, it is our professional opinion that the site is suitable and the proposed development feasible from a geotechnical viewpoint provided the recommendations in this report are included in the design and implemented during construction of the project.

We appreciate this opportunity to be of service on this project. Please contact this office with any questions.

Very truly yours,

PURCELL, RHOADES & ASSOCIATES

SUMMARY OF CONCLUSIONS

1. The planning areas are underlain by variety of subsurface conditions, ranging from shallow bedrock to moderately deep earthflow deposits.

2. In general, the discussed planning areas are feasible for development using conventional earth moving equipment, installation of surface and subsurface drainage controls, and typical foundation construction. Foundation types include slab on grade construction with perimeter footing foundations and pier and grade beam foundation systems.

3. Prior studies identified several areas of deep colluvial soils, seepage and earthflow deposits that may impact the proposed site development and will need mitigation. PRA has not been able to confirm that the proposed mitigation indicated on Figure B-2 of Appendix B have been installed, with the exception of the reconstructed slopes designated with "R" on Figure B-2. Figure 5, Constraints Map and Approximate Mitigation Limit indicates those features that are in close proximity to the proposed developments that may require mitigation using combinations of site grading, drainage controls, and retaining walls.

4. The planning areas propose a variety of building type developments that provide for cuts and fills with retaining walls. Recommended foundation types will vary depending upon the site conditions, building types and proposed grading. It will be required that PRA review specific development plans for the various designated planning units in order to discuss with Design Professionals the specific geotechnical requirements, including foundation type, for each specific unit. It is recommended that PRA prepare Geotechnical Plan Review documents for the specific planning area under consideration in order to verify the geotechnical recommendations of PRA have been effectively incorporated into design.

5. Representatives of PRA must be present during site demolition, mass grading, and foundation excavations to observe exposed site conditions, perform compaction testing to determine relative compaction of fill, and verify foundation excavation depths into acceptable, non-yielding material. PRA reserves the right to provide supplemental recommendations at any time during planning and construction.

INTRODUCTION

The site area is within the Stawberry Point peninsula surrounded by Richardson Bay (see Figure 1, Site Location Map). The site topography has generally east-west trending with natural north and southward facing slopes that vary from 2-1/2 horizontal to 1 vertical (2-1/2:1, H:V) to 4:1. There are also localized flat knolls and marshland areas within the campus. The existing landforms and structures at this site are shown on Figure 2, Site

Aerial Photo. The currently proposed development includes several areas of multi-family residences, an athletic center, auditorium, a play field, a new class room, a tennis court, and a few new roads to access some of these facilities. This development includes the demolition of several existing structures and replacement with new structures. Site demolition and development areas are indicated in Figure 3, Site Demolition Plan, with the layout of proposed new structures and designated planning areas indicated on Figure 4. Some of the proposed new facilities are outside of the previous area of study by PRA, and it is noted later in this report where additional subsurface investigation by exploratory borings and/or test pits are recommended.

PUBLISHED DATA

In review of geotechnical information in our files and in the Marin County web site, we noted the following preliminary information:

1. the site is not traversed by a Special Studies Zone for potentially active faults
2. the site area is mapped as having an expansive soil potential of low likelihood to nil
3. a high liquefaction potential is mapped for the alluvial areas, and very low liquefaction potential is indicated for hillside areas
4. a flood potential was not indicated in the location of the proposed focused study areas

The campus has been the subject of prior geotechnical investigations and site work to improve slope stability. Prior studies prepared by Donald Herzog & Associates that were presented to our office for review and incorporation into this study are as follows:

August 31, 1979, Report - Soil Investigation, Golden Gate Baptist Theological Seminary, Mill Valley, California: Job No. 994.1.

March 22, 1982, Report - Geotechnical Reconnaissance for Master Plan, Golden Gate Baptist Theological Seminary, Mill Valley, California: Job No. 994.1.

May 19, 1982, Report - Geotechnical Reconnaissance for Master Plan, Golden Gate Baptist Theological Seminary, Mill Valley, California: Job No. 994.1.

August 10, 1982, Preliminary Report - Anticipated Remedial Measures, Golden Gate Baptist Theological Seminary, Strawberry Point, California: Job No. 994.1.

PRA performed supplemental borings for preparation of the 2010 Stage 1 Feasibility Study. The site plan showing the boring locations and the boring logs for PRA's Stage 1 Feasibility Study are presented in Appendix A of this report. The Herzog geologic map, that includes test pit and boring locations, a mitigation measures map, and the Herzog test pit and boring logs are presented in Appendix B.

SITE CONDITIONS

Site Geology

The general site geology has been previously described in the March 22, 1982 Donald Herzog & Associates report, with their Geologic Map presented in Appendix B, with their findings summarized as follows:

Regional geology maps show the site as predominantly underlain by Franciscan Complex melange, which is a unit that consists of "scrapes" of different rock types that have been mildly metamorphosed. There are blocks of very hard "greenstone" surrounded by siltstone and sandstone units. The western perimeter of this peninsula has inlets that have been mapped as having artificial fill placed over bay mud.

Rock outcrops within the area are sparse, except where exposed in cut slopes. The bedrock of the area is primarily composed of interbedded sandstones and shales of the Mesozoic-aged Franciscan Assemblage. The sandstone typically varies from light to dark brown in color; massive to thin bedded; closely to moderately fractured; moderately hard; weak to moderately strong; and moderately to deeply weathered. Shales vary from thinly laminated to very thinly bedded; dark gray in color; closely fractured to sheared; friable to weak; low to moderately hard; and moderately to deeply weathered. Other sparsely occurring Franciscan rocks include chert, metagraywacke sandstone and serpentinite. The chert is thin bedded; variable in color; moderately to closely fractured; hard; strong; and moderately weathered. It may vary from highly altered meta(?) Chert to argillaceous chert. Massive blocks of metagraywacke occur sporadically in the well-bedded sandstone and

shale, primarily in areas where the rocks appear distorted or sheared. Serpentinite is also rare and crops out as a small block in the southwest corner of the area.

The Franciscan rocks within this area display a localized uniform structural orientation. The sandstone, shale and chert commonly trend in a northwest direction, and dip moderately to steeply to the northeast. Strikes vary from North 40 degrees West to East-West, and dip northerly from 27 to 85 degrees. Zones of shearing, where the rocks are highly fractured, altered and structurally disrupted, are evident in some areas. However, these shear zones appear to be relatively small and do not significantly change the localized bedding orientation. The northwest portion of the area was previously characterized as a "melange" zone. However, the uniform orientation of the chert, shale and sandstone, as well as the fact that the chert displays a graded depositional contact with the shale and sandstone, suggests that this area is not as sheared and deformed as other typical Franciscan melange zones in the Coast Range geomorphic province.

Quaternary deposits in the area include residual soils, colluvium, landslide debris, bay mud and fill material. Soils may vary from light to dark brown sandy or clayey silts to silty clays. They are medium stiff to stiff, and moist to wet. Soil depths may vary from less than 6 inches to over 6 feet. The soils on all natural slopes are undergoing slow downslope transport in the form of creep, and the distinction between residual in-place soil and colluvium is often difficult to define.

Landslides, in the form of shallow earthflows (less than 10 feet deep), are common on natural slopes throughout the area. Flows are characterized by well defined headwall scarps, hummocky topography, lobate or delta-shaped masses near the toe of the slide, and seepage zones. The earthflows appear to be shallow seated and restricted to the unstable soils overlying the bedrock.

At the time of the March 22, 1982 DHA report, no new large scale earthflows were observed, and the extent of the slides that had been mapped in 1979 did not significantly increase as a result of the January 1982 record storm event. A few debris slides and

slumps were noted by DHA during their field investigation. Those slides were described as being of small extent (several tens of square feet) and restricted to steep cut slopes and unstable fills, with most of the failures appearing to be recent as a result of the January 1982 storm event.

It is unsubstantiated that the majority of earthflows, landslides and colluvial filled swales identified by DHA were mitigated per the recommendations of the referenced August 10, 1982 report for "Anticipated Remedial Measures", and as shown on DHA's Plate 1, "Recommended Mitigation Measures", provided in Figure B-2 of Appendix B of this study; PRA has not been able to independently confirm the presence of these mitigation measures. An exception are the reconstructed slopes designated as "R" on Figure B-2 in Appendix B, located on the south facing slope between upper and lower Chapel Drive. This slope does appear to be reconstructed, but PRA has not received any documentation of the observation and testing services provided by DHA for this reconstructed slope, nor of their observations for the other mitigation measures recommended in their report. The areas of weak soil from the Herzog map is also included as part of the Constraints Map and Approximate Mitigation Limit (see Figure 5) for this project.

Bay mud is of limited extent and restricted to areas in the southeast and west-central portion of the site. This material typically is an organic rich silt or clay of low strength and high compressibility. The bay mud deposit in the west-central portion of the campus area has been covered with fill and is not exposed at this time.

Fills are common throughout the area and generally consist of a heterogenous mixture of local sandstone and shale derived from previous site excavations. PRA has not received any documentation regarding the compaction of fills identified at this site.

Site Seismicity

The subject property, like all properties in the San Francisco Bay Area, is situated in a very seismically active region. The following statements summarize the potential impacts of the seismic setting upon development of the subject property.

Based on an analysis of the historic earthquake records of the active faults, published and unpublished data on potentially active faults and the geographic relationship between the subject property and the faults of the San Francisco Bay region, it is reasonable to conclude that the major Bay area fault systems have the greatest potential for adversely impacting the proposed development.

A coalition of scientists from the U. S. Geological Survey, Southern California Earthquake Center, and the California Geological Survey prepared the Uniform California Earthquake Rupture Forecast (2015). Data presented by this group estimates the chance of one or more large earthquakes (Magnitude 6.7 or greater) in the San Francisco Bay region within the 30 year time period between 2014 and 2043 to be approximately 72 percent. In that same time period, the chance for a magnitude 6.7 or greater earthquake on the Concord, Calaveras, Hayward, and San Andreas faults is 6.8, 7.4, 14.3, and 6.4 percent, respectively.

The site is not within a Special Studies Zone for active faults. A list of pertinent active faults, their distance, expected moment magnitude, and estimated mean peak ground acceleration (PGA) is provided below:

FAULT	DISTANCE (Miles)	MOMENT MAGNITUDE[1]	ACCELERATION (g)[2]
San Andreas (Northern)	6.8	8.0	0.50
San Gregorio	8.5	7.4	0.26
Hayward	10.9	7.3	0.20
Rodgers Creek	16.5	7.3	0.15
Point Reyes	18.1	7.0	0.12
West Napa	23.7	6.6	0.08
Concord- Green Valley	25.5	6.6	0.07
Calaveras	26.0	6.9	0.09
Greenville	31.3	6.9	0.08

(1) Estimated maximum moment magnitude from CalTrans Fault Database 2012.
(2) Mean peak horizontal ground acceleration averaged from Boore, Joyner, and Fumal (1997).

The specific hazards associated with active faults can be confined to ground shaking and ground failure due to earthquakes. Since there is no mapped active fault recognized by the California Geological Survey as crossing the site, the hazard for surface rupture through the subject site is unlikely from known active faults of the region. The subject site lies within the San Francisco Bay Area, a region of high seismic activity. The probability is very high for a major earthquake to occur in the Bay Area within the economic lifetime of the proposed structures. The seismic risk to a structure depends on the distance from the epicenter; the characteristics of the earthquake; the geologic, groundwater, and soil conditions underlying the structure and its vicinity; and the nature of the construction.

The effects of seismically-induced ground shaking at the subject property resulting from a large magnitude (6.0 or greater) earthquake on any major fault within the San Francisco Bay region can be estimated from accounts of the effects which were described shortly after the 1906 earthquake, magnitude 8.3 with an epicenter located between San Francisco and Marin Counties. Studies by Lawson (1908) and Borcherdt, et al (1975) indicate that the highest ground shaking intensities (i.e., very violent) occur within 1500 to 2000 feet of the master trace of the San Andreas fault, and that violent ground shaking generally occurs at sites that are within 1 mile of the master trace. Furthermore, sites situated between 1 and 3 miles of the master trace would likely experience very strong ground shaking intensities. Therefore, in the event of a large magnitude earthquake on the noted Bay Area faults, it is reasonable to assume that the subject property will experience strong to very strong ground shaking. It should be emphasized that this estimate is based on a small number of field observations in a region that was sparsely populated during the 1906 earthquake on the San Andreas fault.

Since these are estimates, and they are based on a small amount of data, they should be used as a general guide to reflect future ground shaking intensities. Nevertheless, we believe that it is reasonable to conclude that any structures constructed on the subject property should be expected to experience very strong ground shaking in the event of a

major earthquake on active faults within the San Francisco Bay region.

Rather rough quantitative measurement of the dynamic characteristics of an earthquake can be estimated for the proposed structure. This estimate is based upon the attenuation methods advanced by Campbell (1997), and Boore, Joyner and Fumal (1997), for estimates of ground motion characteristics expressed in terms of acceleration of gravity. Based upon this attenuation relationship, a maximum moment magnitude on the San Andreas fault would result in an estimated mean peak ground acceleration of approximately 0.5g. For comparison, the interactive web site of probabilistic seismic hazards prepared by the U. S. Geological Survey indicates that the peak ground acceleration value that would have a 20 percent chance of being exceeded in a 50 year period is approximately 0.77g.

The peak values of ground acceleration represent a single moment acceleration. Ploessel and Slosson (1974) indicate that the repeatable high ground acceleration value for epicenters within 20 miles of a site would be approximately 65 percent of the peak value shown above.

The local building codes and current CBC recommendations reflect the design parameters for mitigation of earthquake conditions. The appropriate code should be utilized for minimum design standards based upon the particular features of the structure and the recommended minimum seismic load factors.

Liquefaction Potential - General

Liquefaction occurs when loose, saturated, granular deposits or low plasticity cohesive deposits lose strength in response to increased pore pressure during cyclic seismic loading. A regional assessment of liquefaction potential within the San Francisco Bay area was conducted by representatives of the U. S. Geological Survey (Witter et al, 2006). In this assessment, the central play field area, the westerly shoreline of the Seminary Point, and the northern border of Seminary Knoll were mapped as alluvial areas with either a High, or Moderate Liquefaction Susceptibility.

Herzog logged three exploratory borings in the western northern half of the playfield area, and determined that the materials encountered either consisted of cohesive soils not susceptible to liquefaction or shallow bedrock materials.

Tsunami Hazard

The west-central portion of the site area was previously identified as within a potential tsunami runup area by Ritter and Dupre (1972), but Herzog (1982) indicated that this interpretation was in error, and this area would not be impacted by tsunami. A 2009 map issued by the California Geological Survey shows the shoreline of Strawberry Point having a potential for being inundated by a tsunami (see Appendix A, Figure 4, Tsunami Inundation Map). This map indicates that only the low lying elevation immediately adjacent to the shoreline, and the low lying elevation between Silva Island and the northwest corner of the site as being subject to potential inundation.

SITE EXPLORATION AND LABORATORY TESTING

Site Exploration

Field exploration of the site during the 2010 Stage 1 Feasibility Study by PRA consisted of logging and sampling of eight hand-excavated test probes to a maximum depth of 5 feet below existing grade on April 20 & 22, 2010, and ten exploratory borings, up to a maximum depth of about 18-1/2-feet below existing grade using either a truck-mounted Mobile B-24 drill rig or a portable, Minuteman rig on May 20, 2010. Please see Appendix A, Figure 5, Site Aerial Photo and PRA Boring Locations, for exploratory test probe and boring locations.

Relatively undisturbed soil samples for laboratory testing were recovered in a 2.5-inch outside diameter (OD) California sampler or in a 2-inch OD split spoon sampler driven by a 140-pound hammer free-falling 30 inches. The number of blows applied to advance the sampler was recorded for each 6 inches of penetration and then converted to Standard Penetration Test values and recorded on the Exploratory Boring Logs.

Logs describing the material encountered in the test probes and borings were recorded in the field by an engineer from this office and are presented in Appendix A, as Figures 6 through 23.

Laboratory Testing

Laboratory testing was conducted on selected borehole samples to obtain data on density, moisture content, unconfined compressive strength, Atterberg limits, and classification of the soil. Test results are shown on the Exploratory Boring Logs.

DESIGNATED PLANNING AREAS

Figure 4 shows designations for the various planning areas for this proposed development.

Area 1 Academic Campus Planning Area

Area 1 identified on Figure 4, includes a new athletic center and playing field on a central flat area between Hodges and Gilbert Drive, the existing academic and administrative buildings, cafeteria, and library located upon an eastern ridge area, and proposed new student center, classroom, tennis courts, and auditorium.

The proposed new athletic center and playing field area was explored by Herzog Borings 27, 28, and 29. These borings were located in the area of the athletic center and show the site area is covered with fill consisting of sandy, and clayey silt, a gravel, with relatively shallow lying (estimated as 7 to 15 feet below existing ground surface) shale, siltstone, and sandstone bedrock. The southwest facing hill slope east of this flat area is indicated in the Herzog mitigation map as having two shallow colluvial zones. No clean outs, pipe, or discharge point were observed in this area to confirm if the subdrain was installed.

The proposed new student center is located between the existing cafeteria and library. Herzog Borings 1 through 7 were drilled in the area now covered with the library. These borings show a very dense, weathered sandstone about 1-1/2- to 2- feet below the ground surface.

In the area of the proposed new class room and the auditorium, PRA had drilled Borings B-9, and B-18. This area is an elevated knob of land that had been previously graded that is referred to as Chapel Hill. Some fill was observed along the northern periphery of the flat pad. This site was explored with a B-24 drill in Boring B-9, and later with Boring B-18. B-9 was drilled in approximately the center of the knob and encountered very dense sandstone and siltstone bedrock at the surface that resulted in refusal to drilling at a depth of 1 foot below grade. Boring 18 was later drilled on the flank of this knob, near the proposed new classroom site, and encountered sandy silt with some gravel to a depth of 4 feet where a hard weathered sandstone was encountered. Boring was terminated at a depth of 8 feet below grade within very dense sandstone. Excavation for the amphitheater will require a dozer with hydraulic rippers to excavate this very dense sandstone and siltstone bedrock material.

The proposed tennis courts are located where currently Herring Drive extends southward from Storer Drive to the main parking facilities in a gap excavated in the ridge line. Grading will be needed to in-fill this gap to construct this tennis court.

Area 2 Reed/Storer/Shuck Planning Area

This area is located north of the intersection of Shuck and Storer Drives and west of Reed Boulevard, and is currently developed with residential units that will be demolished and removed (see Figure 3), and replaced with new residential units (See Figure 4) and the construction of a new Green Lane. Herzog drilled several borings (Borings 15 through 19) at the eastern portion of this planning area, and PRA also drilled Boring B-8 in the same area (See Appendix A, Figure 25). There is a narrow access path, "Lovett Lane" leading from Reed Blvd. to these existing dwelling units. This parcel has a small mudflow area which is evident by a disturbed area of 12 to 18 inches in thickness and approximately 60 feet in width (See Appendix A, Figure 25).

The exploratory borings within this sub-area determined that the site is covered by topsoil and residual soil overlying a sheared sandstone and shale bedrock. The depth to the bedrock material varied from approximately 2 to 8 feet below existing grade. The Reed

Blvd. road cut exposed a weathered sandstone and shale bedrock contact that was measured as having a strike of North 40^0 West, with a dip of 60^0 to the northeast. No free groundwater was encountered in these borings.

Area 3 Hodges/Shuck Planning Area

This planning area is a the north end of the site, and encircled by Hodges and Shuck Drive. This area is developed with residential units (See Figure 3), and these will be removed and the site developed with new residential units (See Figure 4). The currently developed portion of this planning area was not investigated by either Herzog or PRA, with the westernmost vacant area bordering Shuck Drive investigated by Herzog Test Pits 13, 14, and 15, and PRA Boring B-17 on the west (see Appendix A, Figure 24).

These explorations determined that within the Shuck Drive loop area, the test pits show a shallow earthflow overlying residual soil and colluvium, which is in turn underlain by a shale and graywacke sandstone. The depth to dense bedrock was determined in the test pits as varying from 4 to 6 feet below the existing grade. The PRA boring was advanced within the downhill loop of Shuck Drive and encountered a deep residual soil of clayey sand, sandy silt, and blue-gray silty clay overlying a siltstone bedrock at a depth of 11 feet below existing grade. The Herzog mitigation map (Appendix B, Figure B-2) indicated that a subdrain was proposed to be installed to a depth of approximately 6 feet within the earthflow. A representative of PRA reviewed the slope, but could not find clean outs, pipe or discharge points that would indicate that this subdrain was installed.

4. Dormitory Hill Planning Area

This area includes the existing dormitories on top of the flattened ridge line, and the slopes between this upper flat area and a flat area at the toe of the slope below the existing dormitories. It is proposed to demolish the existing dormitories (See Figure 3) and replace with a new upper playfield, a new road (Storer Lane), new residences on both the slope and lower flat area, and a new middle practice field on the lower flat pad. This area was investigated by Herzog exploratory Borings 8 through 14 on the upper pad, and by PRA test borings B-5, B-15, and B-16 on the lower pad.

The north side of the upper pad area is covered with a thin layer (1 foot) of sandy silt topsoil over either a mixture of sandstone and serpentine bedrock. Boring 10 midway along the upper pad encountered a brown sandy silt fill over a black-brown sandy silt topsoil over a orange brown sandstone at a depth of approximately 6 feet below existing grade. The southern portion of the upper pad encountered a shallow bedrock profile at a depth of 1 foot below grade in Borings 11 and 12, with Borings 13 and 14 encountering from 3 to 6 feet of fill along the western edge of the pad overlying either a red brown or black brown sandstone.

The lower pad area is located within the existing playground and basketball court area at the toe of a slope. The PRA borings encountered a deepening soil profile from the south to north end of this lower pad. The northern end as explored by Boring B-15 encountered a moderately deep soil profile consisting of sandy clay fill with siltstone particles to a depth of 6 feet below grade, underlain by a large siltstone "floater" within a matrix of silty clay, then transitioning to a sandy clay with sandstone rock fragments. The depth to weathered bedrock was determined as approximately 17 feet, with groundwater also encountered at this depth. Approximately midway between the northern and southern portions of this lower pad, Boring B-5 encountered a mixture of silty clay with siltstone and sandstone fragments to a depth of 2-1/2-feet, with water seepage noted at this depth. Boring B-16, located at the southern end of this lower pad encountered a very dense orange brown sandstone at the surface. The Herzog Geologic Map (Appendix B-1) had mapped the slope above the northern portion of this lower pad as an area of poor drainage, and several seepage areas were mapped on the slope. This would be consistent with the wet areas noted in Borings B5 and B15. The Herzog Mitigation Map (Appendix B-2), indicated that a subdrain was proposed just below and along the break in slope between the uppermost pad area and the intervening slope down to the lower pad (See also Figure 25). No clean outs or other indications of this subdrain were observed during our site review.

5. Shuck Drive Knoll Planning Area

This undeveloped area is located at the extreme northwestern corner of the campus. It is our understanding that a new access road (Shuck Knoll) would be constructed across a swale from Shuck Drive to a knoll of very hard greenstone rock. The center knoll area would be for construction of the Shuck Knoll loop road, with residential units developed around the periphery of the knoll on descending slopes.

The central western knoll area around elevation 104.2 is underlain by shallow, dense bedrock materials consisting of sandstone, claystone, shale, and chert, surrounded by swales filled with colluvium, and shallow earthflow and mudflow materials to a maximum depth of 10 feet in thickness. The central knoll area was investigated by Herzog in Test Pits 16 through 17, and 20, and by PRA Borings B-6, B-7, and B-17 (See Appendix A, Figure 24). The test pits and borings indicated shallow lying bedrock materials in the knoll, with bedrock depths in these data points ranging 1 to 4 feet below existing grade.

Of the swales immediately surrounding the knoll, two are shown on the Herzog mitigation map (Appendix B, B-2) as having a subdrain proposed to mitigate potential slope movement. The approximate locations have been transferred to the Site Map on Appendix A, Figure 24. One of these swales is located at the southeastern portion of the knoll and would be traversed by an access road from Shuck Drive to gain access to the knoll. This swale has approximately 4 feet of overburden. No clean outs, pipe, or discharge points were observed of these proposed Herzog subdrains.

The Shuck Drive loop area has a large shallow earthflow that begins from the south facing slope at the northern limits of the Golden Gate Baptist Theological Seminary property that flowed down past the upper loop of Shuck Drive, through the proposed development area, over the lower loop of Shuck Drive and continuing south past the southern limit and onto the adjoining property. This area is covered with trees and brush. The Herzog Mitigation Map (Appendix B, B-2 shows a subdrain proposed within the Shuck Drive loop area that terminates at the lower end of Shuck Drive. No clean outs or discharge pipes were observed in the area shown in the Herzog Mitigation Map. Three test pits were excavated

by Herzog (TP13, 14, and 15) and one boring was drilled by PRA (B-17), as described previously for the No. 3, Hodges/Shuck Planning Area.

Figure 4 shows proposed development for this area along the southeast face of the slope below the knoll. This slope has several small erosion gullies and shallow mudflows that will require shallow grading and drainage mitigation for development. Pier and grade beam foundations would likely be required for development on this slope. The western-most unit that wraps around the knoll lies at the headward edge of a previously mapped mudflow area that had some shallow mitigative grading. This area would likely require additional grading for site development.

6. Chapel Drive ("Seminary Point") Planning Area

This focused study area is located at the southwestern most portion of the campus. The site area consists of a large knob at the western end of a spur ridge, with descending slopes to Richardson Bay. The site is currently developed with three structures (Tichenor Village) that will be demolished (See Figure 3) and replaced with multi-family residential units on the flanks of this spur ridge (See Figure 4). There are no exploratory borings or test pits by Herzog in this area, and PRA hand-excavated Boring B-1 on the west-facing slope below the existing structures (See Appendix A, Figure 28). Boring B-1 encountered shallow lying, dense siltstone bedrock.

North of Tichenor Village, there are several swales that contain slopewash, colluvium and earthflow deposits. The Herzog Mitigation Map (Appendix B, B-2) indicates that only surface drainage and a few subdrains were proposed within these deposits. No clean outs, pipe, or discharge points were observed to verify the presence of these subdrains.

DISCUSSION

Based upon review of referenced documents, site review, laboratory testing and exploratory boring program, it was determined that the proposed Seminary development has a variety of subsurface conditions present that could impact the various identified planning areas. Site conditions range from surface bedrock outcrops in cut slopes to fills, alluvium, colluvium, bay mud and earthflow deposits.

The bedrock materials underlying the site are predominantly sandstone and shale (i.e., siltstone and claystone), which is the "matrix" within the melange unit of the Franciscan Complex. The sandstone and shale units are in contact with more exotic rocks of the Franciscan Complex, which include graywacke sandstone, shale, chert, and serpentinite. The bedrock units generally display a localized uniform structural orientation commonly trending in a northwesterly direction (North 40 degrees West to East-West) with a dip moderately to steeply to the northeast (17 to 85 degrees to the North). While localized shearing of the bedrock units was observed, the generally uniform structural orientation indicates that the area may not be as deformed as other typical Franciscan melange terranes within the Coast Ranges. The stability of cut slopes cut into bedrock are generally impacted by weak zones or intersecting structural discontinuities, such as bedding and joints. In general, bedding measurements indicated northeasterly dipping bedding, and therefore, more concern would be for northeasterly facing cut slopes. In review of the grading plans, an area with a potential northward facing cut slope would be during excavation to develop the auditorium. This excavation would need to be reviewed during grading to determine if adverse bedding or other intersecting discontinuities are present that would have to be mitigated during construction with shoring or temporary rock bolting.

Quaternary soil deposits at this site include topsoil, residual soils, colluvium, earthflow landslide debris, and fill material. The depth of topsoil and residual soil deposits range from a few inches to several feet in thickness. Soil deposits with a more clay like character tend to be expansive and on slopes incur slope creep. Earthflow landslide deposits range in thickness from a few feet up to on the order of 10+ feet. The Recommended Mitigation Measures Map in Appendix B, Figure B-2, indicated that at that time several of the earthflow deposits were proposed to be mitigated by the installation of a subdrain penetrating through the soil materials and into the underlying bedrock. This office has not received any report documenting the installation of the mitigation measures depicted in Appendix B, Figure B-2, but the slope condition observed between upper and lower Chapel Drive suggests that this slope was reconstructed, as indicated by an "R" on the mitigation measures map. During development of the various planning areas, where construction lies near and/or within these mitigation areas, such as indicated on the aforementioned

Appendix B, Figure B-2, and on the Constraints Map and Approximate Mitigation Limit (Figure 5), these areas would need mitigation to possibly requiring their removal and replacement with compacted, engineered buttress fills. Other mitigation measures, such as drainage controls and retaining walls may also be considered based upon the specific development area and site conditions.

Seepage is common on several slopes, particularly after seasonal rains, and there are some areas of poor surface drainage throughout the site. Several surface drain inlets and v-ditches were observed at the site that represents past efforts to mitigate surface drainage issues. Development of the proposed focused study areas will also require site specific drainage mitigation measures for both surface and subdrainage conditions. These mitigation measures would direct intercepted surface and subsurface water to controlled municipal facilities.

While indications of bedrock faults were indicated by sheared rock, there is no indication for the presence of an active earthquake fault to be present within the Campus. The site, as is expected for other areas within Mill Valley, would be expected to be impacted by seismic ground shaking during earthquakes on active faults within the San Francisco Bay region. A potential for tsunami run-up in low elevation shoreline areas is present, but these would not impact proposed development within the identified planning areas. A potential for liquefaction is indicated on published regional maps, but site specific subsurface investigations indicate a low potential for liquefaction in the suggested likely area within the play field at the site. The proposed planning areas are not underlain by subsurface materials that would be subject to liquefaction.

CONCLUSIONS

Based upon the results of the 2010 Stage 1 Feasibility Study, and this subject study, it is our opinion that the proposed developments are geotechnically feasible provided the recommendations of this report are incorporated into the design and implemented during construction. The proposed development has multiple design scenarios consisting of cuts and fills with retaining walls. Due to the various proposed construction scenarios and site

conditions, this office must review specific development plans for the respective development areas in order to provide detailed geotechnical plan reviews as a means to provide site specific recommendations to be included in the design and construction of the various planning areas. Where proposed developments encroach near or upon the areas designated in the Constraints Map and Approximate Mitigation Limit (Figure 5), mitigation of these various areas would be accomplished by combinations of site grading, drainage controls and retaining walls.

The following are preliminary site conditions for consideration in the design and development for the various planning areas:

1. Academic Campus Planning Area

New construction is planned for a student center, classroom building, an auditorium, an athletic center and playing field. The student center is listed in the planning sheets as Building Type 8, which appears to be two levels and constructed upon a level pad with project east side excavated into the hill slope via retaining wall for the eastward extension of the second level.

The borings for this site indicate the presence of shallow lying bedrock, and the student center can be constructed upon a spread footing foundation system with a concrete slab on grade floor.

The class room building is listed as Building Type 5, which has two levels constructed upon two level pads with intervening retaining walls. There are no borings or test pits near this proposed development, but the elevation of the proposed classroom would indicate that weathered bedrock should lie at relatively shallow depth. It is our opinion that the structure can be supported upon a conventional spread footing foundation with slab-on-grade floor, with retaining walls supported upon a conventional footing with keyway.

The proposed auditorium is listed as Building Type 6, with cross sections showing grading with cuts up to 28 feet below currently existing grade to construct the basement scene

area. Multiple retaining walls are proposed to be constructed, with a maximum retained height on the order of 15 feet.

Subsurface exploration of the auditorium determined shallow, very dense bedrock was present, with refusal to drilling encountered with the truck-mounted B-24 drill rig at 1 foot below existing grade. The bedrock material encountered was a very dense sandstone and siltstone. Due to the fractured nature of this bedrock, it is believed that it is rippable using a dozer with hydraulic rippers. Due to the density of the bedrock, it is likely that a conventional footing foundation system with concrete-slab-on-grade floor would be used for this development. The excavation for this auditorium will create a northeasterly cut slope that will need to be reviewed for potential exposure of northeasterly dipping bedding plans and other intersecting discontinuities that may need to be mitigated during construction by shoring, including rock bolting of adverse rock features.

The athletic center proposed adjacent to Hodges Drive is a Building Type 7 with two levels on flat ground. The borings for this area indicated the presence of fill overlying a relatively shallow lying bedrock. Preliminary grading plans indicate a significant amount of fill is proposed for this flat pad area of on the order of 20 feet at the southern limits adjacent to Seminary Drive. Conventional grading can prepare this site for a conventional footing foundation with concrete slab-on-grade floor. Exploratory borings for this are indicate deepening soils within the proposed athletic field, and there are no borings at the toe of this proposed fill near Seminary Drive. The area next to Seminary Drive needs to be explored to determine if soft soils may be present at this location. It is presently anticipated that if soils, such as Bay Mud are encountered, it would be of limited thickness that could be removed and replaced with compacted engineered fill.

2. Reed/Storer/Shuck Planning Area

This area has several shallow mudflow areas, underlain by residual soils resulting from the weathering of the underlying parent bedrock (see Appendix A, Figure 25, and Appendix B, Figures B-1 and B-2). The depth to non-yielding bedrock in this area ranges from 2 to 8 feet below existing grade. Based upon the slope and site conditions, this planning area

can be developed with surface grading and drainage controls to correct the colluvium and earth flow areas, and then supported upon either conventional footing foundation system, or a pier and grade foundation system depending upon the different site conditions. The proposed residential development in this planning area consists of three building types (10, 11, and 12). The townhouse structures are three levels with different grading situations for each development. Some buildings will be on cut, while others will be constructed upon fill with transition areas between cut and fills beneath the building pad. While individual construction plans will need to be reviewed for more specific recommendations, in general, structures founded all in cut may be constructed using conventional footing foundation systems embedded in bedrock, while structures with small fills and transitions will likely require a pier and grade beam foundation system for both the cut, transition and fill zones to provide a uniform foundation system.

Additional exploratory backhoe pits would be needed to evaluate subsurface conditions in the southern portion of the existing south facing descending slopes in this area.

3. Hodges/Shuck Planning Area

The majority of this planning area is presently developed, except for the western-most portion. This western portion is located within the Shuck Drive "loop", and is underlain by an earthflow that extends from above upper Shuck Drive at the extreme northern limits of the Campus down through the site and into a lower swale into the adjoining property. Subsurface investigation of this earthflow deposit within the Shuck Drive loop indicates the thickness of this material to vary from 4 to up to 11 feet in thickness. Development of this portion of the focused study area will require a combination of site grading, drainage controls, and perhaps retaining walls to mitigate the earthflow deposit. Depending upon the final grade elevations, grading may be required to install a buttress engineered fill to final grade elevations. Due to the presence of earthflow material upslope of the upper loop of Shuck Drive, where a level catchment and buffer area is not provided between the structure and an uphill slope, a catchment wall may be necessary to protect against the potential for impact from uphill mudflows.

The eastern portion of this planning area is developed with both structures and parking facilities within a bowl-shaped topographic area. It is recommended that additional exploratory test pits and/or borings be excavated in this area to confirm subsurface conditions.

The proposed development scheme for this planning area includes seven different building types (20, 21, 30, 31, 32, 33, and 40), that include a variety of grading scenarios. The proposed development for the eastern portion of this planning area appears to be building basically at existing grade, while other areas show significant cuts for retaining walls constructed into the hill slope, and, in select areas, a fire lane and Green Lane traversing underground garages, and in other areas there is a mix of cut and fill with transitions between cut and fill beneath the proposed structure. A combination of site grading, drainage controls, and perhaps retaining walls will be needed to mitigate the earthflows, and where necessary, replacement with compacted buttress fills. Due to the variety of development scenarios in this planning area, while conventional footing foundation system may be used for buildings all on cut with embedment into non-yielding materials or bedrock to the acceptance of the Geotechnical Engineer, building scenarios with mix of cuts and fills and where foundations are within 10 feet of a downslope may need to be supported upon a pier and grade beam foundation system. During the geotechnical plan review, recommendations will be provided for specific foundation type and mitigation measures for the specific development area under consideration.

4. Dormitory Hill Planning Area

It is proposed to demolish the existing dormitories (See Figure 3) on the upper pad and replace with a new upper playfield. There is a descending south facing slope from this upper pad to a lower flat pad that will have residences on both the slope and lower pad area with a new road (Storer Lane) constructed on the slope and a new middle practice field on the lower flat pad. There is an descending slope from this lower pad area to the existing Shuck Drive. The geotechnical investigations for this area is indicated on Appendix A, Figure 25. Herzog's Boring 9 was located near the break in slope for the upper proposed residences and indicates a 1 foot fill underlain by a brown sandstone

bedrock. This figure also indicates a thin (3 foot thick) colluvial layer that needs to be removed during grading. Also indicated on Appendix A, Figure 25 is seepage areas on the intervening slope and poor drainage on the lower pad.

The proposed residential units on the upper portion of the sloping area will be developed with units of Building Type 51, while the lower portion of this slope, the lower flat area, and the descending slope to Shuck Drive will be developed with Building Type 50. The upper units will be constructed upon the slope with cuts and retaining walls, with some walls indicated as 20 feet in height. The new Storer Lane will be constructed immediately down slope of these upper units with fill and a short retaining wall indicated on the down hill side of Storer Lane. The lower units will also require cuts and retaining walls, and a sublevel parking area indicated. The development schemes for these Building Types indicate a mix of cuts and fills and retaining walls that will require more detailed review during a plan review for these units. Due to the variation of grading required for development of these units and the proximity of the foundations to sloping ground, it is believed that while bedrock may be exposed in several locations during grading, it may be necessary for these foundation units and retaining walls be supported upon a pier and grade beam foundation system to provide a uniform lateral support. During the geotechnical plan review, recommendations will be provided for specific foundation type and mitigation measures for the specific development area under consideration.

Grading is proposed to place a 2:1 horizontal to vertical fill slope upon an existing project north facing slope that descends to and will daylight into Storer Drive. This fill will extend across this north face to include in-filling the existing Herring Drive that presently extends across Storer Drive southward to the existing main parking area. Fill on the order of 15 feet in thickness is planned to in-fill this gap and tennis courts will placed upon this fill surface.

5. Shuck Drive Knoll Planning Area

This undeveloped area is located at the extreme northwestern corner of the campus. It is our understanding that a new access road (Shuck Knoll) would be constructed across a

swale from Shuck Drive to a knoll of very hard greenstone rock. The center knoll area would be for construction of the Shuck Knoll loop road, with residential units developed around the periphery of the knoll on descending slopes. The Building Type indicated for these units is Building Type 60. Extensive grading is proposed to reduce the height of the knob, with cuts and fills with retaining walls proposed. A sublevel garage structure is proposed to be constructed beneath the living units on the eastern side of the knoll.

The geologic conditions and the geotechnical explorations performed for this planning area are as indicated in Appendix A, Figure 24. The field exploration data points indicate the presence of shallow bedrock from 1 to 4 feet below existing grade, with the swales flanking the knoll containing colluvium and earthflows to a depth of approximately 10 feet below grade. While the grading may expose bedrock in much of the area, due to the mix of cuts and fills with retaining walls and the presence of the slope, it may be necessary for these units to be supported upon a pier and grade foundation system, and the retaining walls likewise supported upon piers. Combinations of site grading, drainage controls, and perhaps retaining walls will be needed to mitigate the nearby colluvial and earthflow zones indicated on the Mitigation Measures Map, and Constraints and Approximate Mitigation Limit map (Figure 5). Due to the complexity of these development types, supplemental recommendations may be needed. During the geotechnical plan review, recommendations will be provided for specific foundation type and mitigation measures for the specific development area under consideration. Grading of the central knoll area may encounter localized hard bedrock materials requiring dozers with hydraulic rippers. There is a possibility that there may be isolated, very hard bedrock units that would resist break-up with conventional grading equipment and require specialized machines for break-up or removal. Based upon the materials observed within the proposed focused study areas, this condition is expected to be limited. The grading contractor should be made aware of these conditions in order to plan appropriate equipment and methods.

6. Chapel Drive ("Seminary Point") Planning Area

The site is currently developed with three structures (Tichenor Village) that will be demolished (See Figure 3) and replaced with multi-family residential units on the flanks of

this spur ridge (See Figure 4). There are no exploratory borings or test pits by Herzog in this area, and PRA hand-excavated Boring B-1 on the west-facing slope below the existing structures (See Appendix A, Figure 28). Boring B-1 encountered shallow lying, dense siltstone bedrock.

North and south of Tichenor Village, there are several swales that contain slopewash, colluvium and earthflow deposits that are near the proposed development (see Figure 5) that would need to be mitigated through combination of site grading, drainage controls and perhaps retaining walls. The proposed units will be of Building Type 70, which indicates the units will have a mix of cuts and fills with retaining walls. Due to sloping areas, these units may need to be supported upon a pier and grade beam foundation system. During the geotechnical plan review, recommendations will be provided for specific foundation type and mitigation measures for the specific development area under consideration.

PRELIMINARY RECOMMENDATIONS

The following recommendations are provided for preliminary planning purposes. Supplemental subsurface investigations that include test borings and/or exploratory test pits, laboratory testing and engineering analyses will be required based upon the final grading and building layout scheme. Areas requiring additional subsurface exploration include test borings in the toe area of the proposed fill planned for the main play field in the Academic Campus Planning area; and backhoe test pits in the northern portion of the Hodges/Shuck Planning Area, and the descending existing southeast facing slopes of the Reed/Storer/Shuck Planning Area. The following preliminary recommendations are to be used for planning purposes and may be modified as subsurface conditions are exposed during the supplemental investigation and during grading operations at the time of site development.

Geotechnical Hazards

Risk of geotechnical hazards will always exist due to uncertainties of geologic conditions and the unpredictability of seismic activity in the Bay Area. However, in our opinion, based on available data reviewed to date, there are no indications of geotechnical hazards that

would preclude use of the site for the proposed development, provided the recommendations provided in this report and the required supplemental geologic and geotechnical evaluations prior to site development are incorporated into the planning, design and construction of the project. We reserve the right to modify our opinions based upon new or additional information obtained the required supplemental subsurface investigation or observations made during grading operations for site development.

CBC Seismic Parameters

We have reviewed the California Building Code (CBC) and our files to provide seismic shaking criteria for your structural engineer's consideration in the foundation design of the proposed development.

SEISMIC CRITERIA	VALUE
Site Class	C
Peak Ground Acceleration (2% probability in 50 years)	0.77g
S_s Short Period 0.2-second Spectral Acceleration	1.500g
S_1 1.0 Second Spectral Acceleration	0.618g
Site Coefficient F_a	1.0
Site Coefficient F_v	1.3
Max. Short Period Spectral Response Acceleration $SM_s = F_a \times S_s$	1.500g
Max. Spectral Response Acceleration 1-second period $SM_1 = F_v \times S_1$	0.804g
Damped Design Spectral Response - Short Period $SD_s = 2/3 \times SM_s$	1.000g
Damped Design Spectral Response - 1-second Period $SD_1 = 2/3 \times SM_1$	0.536g

Grading

Preliminary conceptual grading plans were provided this office during preparation of this report, we provide the following recommendations for consideration in the design of the site

development plans. We recommend that final grading plans and building layout be reviewed by our office in order to plan the required supplemental investigation. All grading must conform to Appendix C Preliminary Grading Specifications; however, the specifications are general and would be expected to vary with site and soil conditions encountered during development.

Exploratory test pits were excavated for the Herzog geologic exploration and backfilled to less than 90% relative compaction. These test pits may be located in an area that involves a minimum amount of grading. If located within a planned improvement area, the test pits should be re-excavated and backfilled with compacted fill.

All grading must be observed by a representative of our firm. It is especially important that our representative observe demolition, and during the stripping and scarification process to observe whether undesirable materials are encountered.

The following general recommendations should be incorporated into site grading.

Cut Slopes

Generally, exposed slopes cut into firm native soil and rock should not be steeper than two horizontal to one vertical (2H:1V), and flatter slopes may be required in localized areas. The uninterrupted height of the slope must not exceed 25 feet in elevation between 6-foot wide drained benches, unless specifically reviewed with supplemental recommendations provided by the Geotechnical Engineer. The stability of cut slopes is often affected by adverse bedding, the character of the rock exposed and/or by the inclination of weak zones within the bedrock rather than the general strength of the rock being cut. The nature of the bedrock observed at this site and the regional geologic history indicates a variety of bedrock types and structural orientations may vary significantly over a short distance.

In areas where adverse orientations may exist, an engineering geologist must evaluate these cut slopes during grading. If adverse conditions are observed, we will provide recommendations regarding removal of unstable soil, keyway locations, and buttress filling or retaining wall construction for cut slope stability.

Fill Slopes

Generally, fill placed on slopes shall have a finish slope of no steeper than 2 horizontal to 1 vertical. We recommend that a keyway be excavated at least 5 feet into the underlying competent bearing soil or bedrock at the toe of the proposed fill. The bottom of the keyway should have a minimum width of 15 feet and should be sloped a minimum of 2 percent downward into the keyway heel for drainage into a subdrain system installed to collect migrating water. Due to the variable nature of the bedrock at this site, keyways will likely be deeper and wider than standard dimensions. The total depth of the keyway and the extent of the fill slope configuration should be decided in the field during grading by the geotechnical engineer or the engineer's representative.

The subdrain should consist of CalTrans Class 2 permeable material with a perforated 6-inch-diameter ABS SDR 23.5 or equivalent pipe installed on a bed of approximately 3 inches of drain rock. Perforations should be placed downward. Drainage of the system will be accomplished with non-perforated pipe extending from the subdrain pipe to an acceptable storm drain system. All subdrain and drain pipe should be placed to fall at least 1 percent toward the outlet side for flow.

Compacted fill placed within the keyway should be compacted to at least 95 percent relative compaction. Compacted fill placed above the keyway or in benched areas should be compacted to at least 90 percent of the maximum dry density. Relative compaction should be based on ASTM D 1557 test methods. On-site soil may be used as fill provided that it is moisture-conditioned to a minimum of 3 percent above the optimum moisture content.

The gradient of the exposed outboard surface of the fill slope should not exceed 2H:1V (horizontal to vertical), and the uninterrupted height of the slope must not exceed 25 feet in elevation between the 6-foot-wide drained benches. Fill from cuts on adjacent portions of the site may be used provided that our firm's representative confirms suitability. The compacted fill should continue up the slope with additional drained benches excavated into bedrock or acceptable soil as recommended by our geotechnical engineer or the engineer's representative.

Surface water runoff above the compacted fill slope must be intercepted by a concrete lined V-ditch installed on the upslope portion of the compacted fill slope and discharged to an appropriate outlet. Additional recommendations may be made for fill slope construction depending upon the soil conditions. The project civil engineer should be contacted to design the V-ditch and determine the appropriate outlet for drainage.

On-site soil generated by site grading may be used as fill provided that the soil is free of deleterious and organic materials and that it has been approved for use as fill by our geotechnical engineer or the engineer's representative. Organic strippings must not be placed within the structural fills. Samples of any proposed import fill planned for use on this project should be submitted to our geotechnical engineer or the engineer's representative for approval and appropriate testing no less than 4 working days before the expected delivery to the jobsite.

All fill to be placed at depths greater than 4 feet below final grade must be placed at a minimum of 90 percent relative compaction (i.e., 90 percent of the maximum dry density based on ASTM D 1557 test methods) and moisture-conditioned to a minimum of three 3 percent over the optimum moisture content. Fills that contain moderately expansive clay should have special preparation in the event removal is not feasible. Special preparations would include compaction to a minimum of 85 and to a maximum of 90 percent relative compaction and moisture-conditioned to a minimum of 5 percent over the optimum moisture content. Fill characterized as moderately expansive soil is

generally defined as having a plasticity index (PI) greater than 15. A representative sample of the fill should be tested for the expansiveness of the soil and approved by the geotechnical engineer or the engineer's representative. The upper 4 feet of fill constructed of nonexpansive to slightly expansive soil should be compacted to a minimum of 90 percent relative compaction and moisture-conditioned to a minimum of 3 percent over the optimum moisture content.

Expansion of near-surface soils can be greatly reduced by taking appropriate measures during grading. Selective grading to remove expansive soils and replace with low or non-expansive soils during the mass grading process is highly recommended. In areas where expansive silty clay will receive fill, we recommend scarifying the upper 12 inches, moisture-conditioning the soil to above the optimum moisture content by at least 5 percent, and recompacting the soil to a relative compaction between 85 and 90 percent. In areas where the expansive silty clay is at or near final grade, we recommend subexcavating 3 feet and replacing it with one of the following: (1) with import fill that is nonexpansive or has a low expansion potential and the approval of our geotechnical engineer, or (2) with on-site select material approved by our geotechnical engineer or the engineer's representative.

The following requirements should apply to cut, fill and transition lots.

Cut Lots

Lots entirely in cut and in material with a moderate to high expansion potential should be subexcavated a minimum of 3 feet. The exposed subgrade should be scarified to a minimum depth of 12 inches and recompacted at 85 to 90 percent relative compaction and a minimum of 5 percent over optimum moisture content. Soil with a low expansion potential should be recompacted to at least 90 percent relative compaction and at least 3 percent over optimum moisture content.

Transition Lots

Transition lots are defined as those partially in cut and partially in fill with the transition occurring within the building pad or near it. Lots with a small cut section outside the building pad should be treated as fill lots described above. Transition lots should be subexcavated a minimum depth of 3 feet and scarified to a minimum depth of 12 inches. Both the scarified material and the subexcavated material should be recompacted at 85 to 90 percent relative compaction and a minimum of 5 percent over optimum moisture content for moderately to highly expansive soil. Soil with a low expansion potential should be recompacted to at least 90 percent relative compaction and at least 3 percent over optimum moisture content.

Additional topsoil will be needed for landscaping lots cut entirely in bedrock. We recommend stockpiling the topsoil and near-surface material generated from stripping swales and low-lying areas. This material should be used for landscaping where topsoil is limited.

Permeable soil may be encountered at final cut pad elevations that could collect and direct percolated water into bedded areas and cause seepage on the lower slope. If this occurs, the pad must be over-excavated of the upper 2 feet of permeable zone and replaced with a compacted clayey soil cap (excluding highly expansive soil) to reduce infiltration of water. Compaction of the clayey soil cap should be in accordance with the compaction requirements discussed earlier in this report.

Subsurface drains should be provided where any potential seepage zones are encountered during grading. The subsurface drains would provide drainage for these areas and would increase the stability of the cut and fill areas where excessive moisture is found. We recommend that all subsurface drains be installed according to Section 9 of Appendix C.

We recommend that all finished pads be graded a minimum of 1 percent sloping downward and toward the proposed street elevation.

After mass grading is completed, if expansive soils are present, it is imperative that exposed moderately to highly expansive soil be kept moist by occasional sprinkling. If the soil dries out, we recommend that the upper 12 inches be scarified, moisture-conditioned, and recompacted in accordance with the recommendations given above. Additional subexcavation and recompaction may be required by the geotechnical engineer or the engineer's representative based on observed conditions.

Foundations

Based upon preliminary subsurface information obtained during this study, a variety of subsurface conditions, slope conditions and building types, various foundation types will be implemented at this site. In general, sites on flat ground and not adjacent to slopes can be constructed using a conventional perimeter foundation system with slab on grade floors, and sites located on or near slopes may need to be supported upon a pier and grade beam foundation system or a deepened conventional footing foundation system. During the geotechnical plan review, recommendations will be provided for specific foundation type and mitigation measures for the specific development area under consideration. Upon completion of mass grading operations, the Geotechnical Engineer will perform a lot-by-lot inventory of site conditions in order to determine if alternative foundation systems would be appropriate.

We presently anticipate that the majority of structures will be from one to three-stories in height, and of wood-frame construction. Structural loads are expected to be light to moderate. Based upon the results of our study we have provided recommendations for both conventional perimeter footing and pier and grade beam foundation systems. Geotechnical design criteria should be implemented at the discretion of the Structural Engineer based upon his review and designed in conformance with current industry standards and the geotechnical recommendations of this report. If a foundation system other than that recommended is desired, this office should be called for supplemental

recommendations. Such recommendations would be presented as an addendum to this report. The following foundation recommendations are based on the anticipated soil conditions underlying the project site. If unanticipated soil conditions are encountered at the time of grading, the design criteria may be altered at the discretion of the Geotechnical Engineer.

The excavations for foundations must be cleaned or all loose materials and debris and moistened prior to the placement of concrete. All foundation excavations must be observed by our representative to verify the condition of the bearing material. If any localized areas of loose or soft undesirable subsoil are observed in the foundation excavations, the excavation must be sub-excavated to firm soil and/or backfilled with compacted fill under the observation and testing of our representative.

Slab on Grade with Conventional Perimeter Footing

FOUNDATION DESIGN CRITERIA

Item	Criteria
Allowable Bearing Capacity*	
Soil and Compacted Fill	2,500 pounds per square foot (psf)
Bedrock	4,000 psf
Minimum conventional footing depth	18 inches below lowest adjacent grade into firm non-yielding soil or bedrock
Coefficient of Sliding Friction	
Soil and Compacted Fill	0.35
Bedrock	0.45
Passive Pressure	
Soil and Compacted Fill	350 pounds per cubic foot-equivalent fluid weight (pcf-efw), initiating at a depth of 12 inches below lowest adjacent grade.
Bedrock	450 pounds per cubic foot-equivalent fluid weight (pcf-efw), initiating at a depth of 12 inches below lowest adjacent grade.
Slab Thickness	5 inch minimum with the actual thickness to be determined by the Structural Engineer.

Slab Minimum Reinforcement	Actual steel reinforcement to be determined by the Structural Engineer.

*Allowable capacity is for dead plus live load. Bearing value may be increased by one-third for wind or seismic loads.

The structural engineer must design the structural slab based on current industry standards using the stated geotechnical criteria.

PRA is not a floor moisture proofing consultant or expert, and a qualified specialist with local knowledge of slab moisture protection systems, flooring design and other potential building components should be consulted to provide recommendations for a capillary break or other system to prevent moisture and moisture vapor transmission through the slab. The specialist should note that pre-soaking of the subgrade soil where moderately expansive soils are present prior to the placement of slab concrete is recommended. For your consideration, it is recommended that conventional floor slabs be supported on at least 4 inches of crushed rock or angular gravel. If this layer is desired to serve as a capillary break, there should be 100 percent particles passing the 1-inch sieve and less than 5 percent by weight passing the no. 4 sieve size. The placement of the capillary break should be done as soon as possible after compaction and moisture conditioning of the subgrade to reduce drying of the subgrade soil. The use of a capillary break below the slab requires the penetration of the grade beam a minimum of 4 inches into the subgrade soil to prevent exterior irrigation or storm water from penetrating below the slab.

At no time should the membrane be punctured during the construction of the concrete slab-on-grade. Improper placement of the membrane may result in adverse moisture conditions that could contribute to cracking or heaving of the slab. Excess moisture could also pass through the slab into the residence. It should be understand that the above membrane is considered a moisture retarder and not a barrier. Membranes that achieve the designation of a moisture barrier are considered 15 mil membranes

manufactured by Stego Wrap and equivalent.

Subsurface moisture and moisture vapor naturally migrate upward through the soil and, where the soil is covered by a building or pavement, this subsurface moisture will collect. To reduce the impact of the subsurface moisture and potential impact of future introduced moisture (such as landscape irrigation or precipitation), it is recommended that a vapor retarder be placed over the capillary break layer. This membrane typically consists of visqueen or polyvinyl plastic sheeting at least 10 mil in thickness. This membrane is typically overlain by a 1 to 2-inch thick layer of fine to medium grained sand to promote curing of the slab concrete, protect the membrane during construction, and provide a leveling course. It should be noted that the installation of the capillary break and vapor retarder systems may not be completely effective in preventing floor slab moisture problems. These systems typically will not necessarily assure that floor slab moisture transmission rates will not meet floor-covering manufacturer standards and that indoor humidity levels are appropriate to inhibit mold growth. The design and construction of such systems are totally dependent on the proposed use and design of the proposed building and all elements of building design and function should be considered in the slab on grade floor design. Building design and construction have a greater role in perceived moisture problems since sealed buildings/rooms or inadequate ventilation may produce excessive moisture in the building and affect air quality.

Special precautions must be taken during the placement and curing of all concrete slabs. Excessive slump (high water-cement ratio) of the concrete and/or improper curing procedures used during either hot or cold weather conditions could lead to excessive shrinkage, cracking or curling of the slabs. High water-cement ratio and/or improper curing also greatly increase the water vapor permeability of concrete. We recommend that all concrete placement and curing operations be performed in accordance with the American Concrete Institute (ACI) manual. We make no guarantee nor provide any assurance that the use of capillary break/vapor retarder systems will reduce concrete slab-on-grade floor moisture penetration to any specific rate or level, particularly those required by floor covering manufacturers. The builder

and designers should consider all available measures for floor slab moisture protection. We recommend that the project structural engineer also consider specifying air-entrainment for the concrete mix design to reduce the permeability of the concrete slab.

Pier and Grade Beam Foundation System

Structures located upon or near slopes and/or with mixed cut and fills, may need to be supported on a foundation system consisting of cast-in-place reinforced concrete piers with tie-beams that extends into and derives vertical and lateral support from the embedment into non-yielding bedrock material. During the geotechnical plan review, recommendations will be provided for specific foundation type and mitigation measures for the specific development area under consideration.

Pier Foundation System

Pier Size	Minimum diameter 18 inches with vertical forces acting in both directions using a skin friction value of:	
Skin Friction	Residual Soil	Disregard
	Compacted Fill	500 psf dead plus live load
	Bedrock	1,500 psf dead plus live load

Above may be increased by 1/3 for wind and seismic load

Minimum Penetration 8 feet into bedrock, or twice the depth of overburden soil or the depth based on the structural design, whichever is deeper

Active Value	Residual Soil	65 pcf-efw over twice the pier diameter acting over the upper 6 feet of embedment
	Compacted Fill	55 pcf-efw over twice the pier diameter acting over the upper 6 feet of embedment
	Bedrock	45 pcf-efw over twice the pier diameter acting over the upper 6 feet of embedment

Passive Value	Residual Soil	Disregard
	Compacted Fill	350 pcf-efw apply over 1-1/2 pier diameters, initiating within bedrock.
	Bedrock	500 pcf-efw apply over 1-1/2 pier diameters, initiating within bedrock.

Settlement of this foundation system constructed in compliance with this report is expected to be less than ½-inch for any given lateral 20 foot length

To reduce the potential for settlement, we recommend that the foundation excavations be cleaned of sluff and loose material prior to placing steel reinforcement and concrete.

A representative from our firm must be present to observe the foundation excavations to confirm the uniformity and the character and competence of the materials encountered in the piers.

Surface drainage will be required; gutters should be tied to tight lines discharging to the site's storm sewer system. Swales with drop inlet facilities are desirable in order to facilitate the rapid removal of all surface storm or irrigation water.

Studies have shown that trees planted within half of their mature height from the edge of the foundation have caused differential foundation movements. These will require more water in periods of extreme drought and in some cases a root injection system may be required to maintain moisture equilibrium.

The setback for structures from the top or bottom of cut or fill slopes is a minimum 10 feet, and where fill slopes exceed 30 feet, the California Building Code setback of 1/3 the height of slope for structures from the top of slope, unless evaluated by the Geotechnical Engineer to provide supplemental recommendations. Some sloughage or debris resulting from possible downhill soil erosion of cut slopes should be expected

and would require removal. An alternative protective measure would consist of constructing a low retaining wall along the base of the cut slope. This wall should have a subdrain installed behind it, parallel to the base of the slope, and at a minimum 1 percent gradient to provide gravity drainage to an approved outlet. A swale above the wall should be provided to control slope wash runoff. If retaining walls are to be constructed, they must be designed by a structural engineer, and a geotechnical engineer must review the proposed design.

We recommend periodic moistening of the building pad subgrade and foundation excavations to prevent drying of the subgrade soil. A representative of our firm must check moisture conditions in the subgrade soil and foundation excavations 48 hours prior to placing concrete. If site conditions require additional moisture conditioning, the building pad subgrade must be soaked with water for a minimum of 48 hours prior to placing concrete in the excavations or prior to placing gravel for the capillary break in slab areas.

Retaining Walls

Retaining walls should be supported on firm bedrock either through a footing, or be supported by piers that extend into and derive support from firm bedrock. The following recommendations are for a retaining wall founded in firm bedrock. The retaining wall should be designed for a fully-drained condition. The proposed design should be reviewed by our firm to confirm that the retaining wall configuration is compatible with the assumed parameters. Table 1 presents our preliminary design criteria for general retaining wall construction. Preliminary design pressures are expressed as equivalent fluid pressures. Specific criteria based upon a supplemental geotechnical study is required for retaining wall recommendations for a specific site design layout. This office should be contacted for supplemental recommendations where piers are required to achieve embedment into non-yielding bedrock.

TABLE 1

RETAINING WALL DESIGN CRITERIA

Pressures: Gradient of Backfill	Active Pressure (pcf)	Passive Pressure* (pcf)
Level	55	400
2:1 (maximum)	65	400

*Commences a minimum of 1 foot below lowest adjacent grade, except that passive pressure excludes colluvial soil over bedrock.

Walls restrained at the top should be designed with a 100 psf uniform lateral surcharge load in addition to the lateral earth pressures given above. Any wall structurally connected to a structure must be considered a restrained wall.

The design criteria are applicable for walls which have fully-drained condition. To provide fully-drained conditions, a gravel drainage system should be constructed behind the walls and have a minimum width of 12 inches. We recommend that the drainage system commence behind and at the bottom of the retaining structure's heel and extend up the retaining wall to 1 foot below grade. The drainage system should consist of Cal Trans Class II permeable material or alternate approved by our geotechnical engineer or the engineer's representative. A 4-inch diameter, perforated rigid drainpipe should be installed at the bottom of the drainage system and below the cold joint with holes facing down. The pipe should be sloped at a minimum of 1 percent and discharged to a suitable drainage facility away from all structural improvements. The area immediately behind the retaining wall should be graded so as to prevent surface water from ponding adjacent to the wall.

For backfill behind retaining structures, the zone between the structure's drainage system and the limits of excavation may be backfilled with on-site soil; however, granular material is recommended for lower lateral earth pressures. Should on-site soils be used in the zone between the structure's drainage system and the limits of excavation, the backfill materials should be compacted to 90 percent of the maximum

dry density at 2 to 4 percent above optimum moisture content as determined by American Society of Testing Materials (ASTM) D 1557-91 test methods. Over-compaction behind retaining structures tends to increase the lateral pressure against the structures and, therefore, should be avoided.

Where retaining walls are used adjacent to living areas and to reduce the potential for moisture transmission through the walls, we recommend that (1) the exterior face be hot-mopped in accordance with the manufacturer's specifications and (2) an impermeable membrane be placed over the hot-mopped surface to protect the surface from damage during rock placement. It is important that surface drainage controls also be installed to reduce the potential for moisture transmission.

Seismic Surcharge

For the purpose of providing a seismic surcharge to be considered in the design of the basement and retaining walls over 6 feet in height at this site, the methodology proposed by Seed and Whitman (1970), provides a simplified dynamic lateral force component for yielding walls as:

$$\Delta P_{AE} \sim (\tfrac{1}{2})\,(3/4)\,k_h \gamma H^2 = (3/8)\,k_h \gamma H^2$$

It has been recommended that k_h be taken as equal to the site acceleration that is consistent with the design motions of $k_h = S_{DS}/2.5$, where S_{DS} is the design, 5-percent-damped, spectral response acceleration parameter at short periods (i.e., period of 0.2 seconds). The unit weight of soil (γ) should be assumed as 120 pcf. Seed and Whitman recommended that the resultant dynamic thrust be applied at 0.6H above the base of the wall (i.e., similar to an inverted triangular pressure distribution.

Therefore, the wall design includes the active soil lateral pressure values as provided in this report, with the resultant acting at a distance of H/3 from the base of the wall; and the seismic surcharge value, as discussed above, with the resultant acting at a distance of (0.6*H) from the base of the wall. This assumes a fully drained condition,

with any superimposed loads other than retained earth, shall be considered as surcharges. Loads applied within a horizontal distance equal to wall stem height, measured from the back face of the wall shall be considered as a surcharge.

Miscellaneous Concrete Slabs-on-Grade

We recommend that the slab-on-grade be a minimum thickness of 4 inches for walkways and patios. Where expansive near-surface soil is present, we recommend reinforcing the concrete slab-on-grade floor either (1) with No. 3 reinforcing bars spaced at 18 inches on center, or (2) with an alternate reinforcement system as required by the project structural engineer. We also recommend that exterior flatwork be structurally independent of the foundation system to provide freedom of movement due to potential changes in soil volume. In general, the reinforcement should be draped or supported by concrete dobies to attain its greatest efficiency in minimizing the cracking of the slabs. Crack control joints must be located as directed by the structural engineer.

Prospective homeowners should expect some vertical displacement of exterior flatwork, sidewalks, driveways, pavements, and garage slabs. To reduce vertical displacement, we recommend presoaking all exterior flatwork areas, maintaining proper site drainage, and controlling irrigation of landscaping.

Utility Trenches

Utility trenches that parallel the sides of the buildings must be placed so that they do not extend below a line sloped down and away at a slope of 2H:1V (horizontal to vertical) from the bottom outside edge of the perimeter foundations (i.e., the base of the grade beam systems).

All trenches must be backfilled with native materials compacted uniformly to the relative compaction specified in Appendix C. If local building codes require use of sand as the trench backfill, all utility trenches entering the building must be provided with an impervious seal of either cohesive soil or lean concrete where the trench passes under the building perimeter. The impervious plug must extend 4 feet into, and out of, the

building perimeter. Jetting of trench backfill is not recommended as it may result in an unsatisfactory degree of compaction.

Drainage

Surface water must not be allowed to pond adjacent to building foundations. To preclude drainage problems, we recommend continuous roof gutters for the proposed structures. It will be necessary to direct all water collected from roof down spouts into closed conduits that lead to acceptable discharge points away from the structures.

A positive slope gradient of 2 percent down and away from the building perimeter must be applied to the finished subgrade (inclusive of topsoil). This slope must extend no less than 5 feet away from the outside building perimeter. Drainage swales with drop inlet facilities should be provided to remove runoff from around the structures.

Plants must not be placed immediately adjacent to the structures. If vegetation must be planted adjacent to the buildings, drought-resistant plants that require very little moisture and drip-irrigation systems should be used. Sprinkler heads must not be placed where they could saturate foundation soil.

The landscape architect, licensed landscapers, and prospective owners should be informed of the grading and surface drainage requirements. They should also be aware that moistening of the subgrade soils should be systematic and uniform for all sides of each structure. In the areas adjacent to the foundation or concrete slabs-on-grade, the soil should be protected from over-irrigation and from excessive drying. Shade trees or shrubs requiring large amounts of moisture from the soil should be set away from the foundations so that their roots do not influence the soil adjacent to the foundations.

Soil adjacent to foundations and the slabs-on-grade will need to be monitored by home buyers during hot and dry summer periods. Relatively constant moisture should be maintained in the soil adjacent to the foundation to keep the soil uniform and stable.

If adequate moisture is not maintained in the soil adjacent to the foundations, then the soil may either dry and separate from the foundations or the soil may become wet and expand against the foundations causing adverse movements.

Pavement Section

We recommend determining the pavement section after the completion of mass grading and the subgrade conditions are known and the approved traffic indices are supplied by the municipal engineer. It is recommended that selective grading be planned so that relatively higher R-value material, such as granular soils be placed in the upper two feet of subgrade level. Regardless of the design section, to perform to its greatest efficiency, the pavement section requires the following construction criteria:

a. Remove organic and deleterious materials from all pavement subgrade.

b. Moisture-condition the upper 6 inches of subgrade soil and compact it to a minimum relative compaction of 95 percent and to a moisture content of 2 to 4 percent over the optimum moisture content. All pavement subgrade should be stable with no "pumping" at the time the base rock is placed.

c. Use only good quality materials of the type and minimum thickness specified. All base rock should meet the *Standard Specifications* of the State of California for Class 2 base rock and should be angular in shape.

d. Compact the base rock uniformly to a minimum relative compaction of 95 percent.

e. Place the asphalt concrete only during periods of fair weather when the free air temperature is within the prescribed limits as set forth by the Asphalt Concrete Institute.

f. Compact all trench backfill under the pavement to reduce fill settlement and minimize pavement damage that may result from such settlement. Mechanical compaction is recommended because material placed by jetting or ponding will probably not attain satisfactory densities.

g. Provide adequate drainage or V-ditch systems to prevent surface water from migrating into the subgrade pavement soil from behind curb-and-gutter sections. For areas where pavement abuts landscaping, we recommend extending the concrete curb to the bottom of the base rock layer to form a cut-off wall to prevent water from migrating into the base rock.

Swimming Pools

Investigations for swimming pools were not part of this study. We recommend conducting supplemental investigations for proposed swimming pools on a site-specific basis.

Construction During Fall and Winter Seasons

Wet weather may raise the moisture content of the soil well above optimum conditions and earthwork construction may be difficult or impossible. Supplemental recommendations will be provided by our geotechnical engineer or the engineer's representative in the field, if appropriate.

Miscellaneous

Our exploration did not reveal the presence of buried items such as leaching fields, wells, storage tanks, etc. If such items are encountered during grading or during excavations of foundations, our firm should be notified immediately to provide recommendations for proper procedures. This study did not include investigations for toxic substances or groundwater contamination of any type. If such conditions are encountered during site development, additional studies will be required. No sampling or testing of soils and/or bedrock was performed to determine the presence of potential corrosive or otherwise concrete-reactive soils. Such sampling and testing can be performed during site grading.

Plan Review

Due to the various site conditions and development scenarios for this complex, the Geotechnical Engineer must review the proposed final development concepts for the specific development area under consideration in order to provide a Geotechnical Plan

Review. During the geotechnical plan review, recommendations will be provided for specific foundation type and mitigation measures for the specific development area under consideration.

Before submitting design drawings, structural calculations, and construction documents to the appropriate local agency for approval, copies of the documents must be reviewed by our firm to ensure that the recommendations in this report have been effectively incorporated.

Construction Observations

A representative of this firm must be present during grading and foundation subgrade preparation and during mitigation of the various features indicated on the Constraints Map and Approximate Mitigation Limit (Figure 5) to observe that the work performed is in conformance with specifications and recommendations provided here. We will also perform testing as necessary to evaluate the quality of the materials and their relative compaction. Our representative must also observe all foundation excavations, including during pier drilling operations to confirm embedment depth into acceptable non-yielding materials. Records will be maintained of our site visits and test results.

A Certified Engineering Geologist of PRA must observe all cut slopes and keyway excavations during the mass grading of the project.

Subexcavation of transition lots should be checked prior to backfilling to confirm that the excavation is at the necessary depth and that no adverse conditions are observed.

At the completion of site grading and foundation excavation, we will submit a summary of our observation and test results along with any necessary supplemental recommendations.

To assure that our personnel are at the site when needed, we require that you notify us at least 2 working days before the task begins.

LIMITATIONS

This report has been prepared for the exclusive use of North Coast Land Holdings, LLC, and their consultants for specific application to the proposed development. If changes occur in the nature, design location, or configuration of the proposed development, the conclusions and recommendations contained here shall not be considered valid without the review of PRA. Changes must be reviewed by our firm.

The analysis, opinions, conclusions and recommendations submitted in this report are based in part on the referenced materials, site visit and evaluation, and subsurface exploration. The nature and extent of variation among exploratory test borings, test pits and trenches may not become evident until construction. The geologic nature of the site region is highly variable and subsurface conditions encountered during mass grading may require supplemental recommendations that may alter the proposed development scheme. If variations appear, it will be necessary to re-evaluate or revise recommendations made in this report.

The recommendations in this report are contingent on PRA conducting an adequate testing and monitoring program during construction of the proposed development. Unless the construction monitoring and testing program is provided by or coordinated with our firm, PRA will not be held responsible for compliance with design recommendations presented in this report and other supplemental reports.

Our services have been provided in accordance with generally accepted geotechnical engineering practices. No warranties are made, express or implied, as to the professional opinions or advice provided. Recommendations contained in this report are valid for a period of 1 year; after 1 year they must be reviewed by this firm to determine whether or not they still apply.

EXPLORATORY BORING LOG B-18
Golden Gate Baptist Seminary
Mill Valley, California

Client: Hart Marin

FIGURE NO.
23

EXPLANATION

Lithologic contact: dashed where approximate, dotted where concealed queried where uncertain

Strike and dip of bedding

Sheared bedrock

Shallow earthflows, slumps and colluvial soils

Scarp, number indicates height in feet

Seepage

Area of poor drainage

Area of gulley erosion

Test pit (SEE APPENDIX B FOR HERZOG LOGS)

Test boring (SEE APPENDIX B FOR HERZOG LOGS)

Estimated depth to competent material

Probe drill holes–depth to rock

Franciscan Rocks

LOG OF BORING 1 7 6 1 5 3 2

Equipment 6" Solid Auger 4 1

Elevation 148± Date 8/7/79

Laboratory Tests	Drill Rate (min/ft)	Drill Pressure (psi)	* Blows/foot	Moisture Content (%)	Dry Density (pcf)	Depth (ft)	Sample	
						0		BROWN SANDY SILT (ML) ~~topsoil and fill~~
		25/3"	4			3		BROWN SANDSTONE (Bedrock) highly weathered, partially decomposed, closely jointed, fine-grained, soft, friable. used tungsten-carbide bit after 3' (FRANCISCAN FORMATION)
		40/2"	7					
		30/1"	5			6		Free water not encountered
						9		NOTE: All rocks encountered in this project belong to the Franciscan Formation, mainly sandstone and shale (Cretaceous). The sandstone is gray and brown, thickly bedded, medium-grained, containing grains of quartz and feldspar. The shale is generally well-bedded siltstone, dark gray, stained brown by iron oxides along joints.

PLATE 7

TEST PITS

	Depth (Inches)	Description
1.	0- 20	Topsoil; dark brown silty sand, loose, wet
	20- 56	Colluvium/Residual soil; light brown sand (SP) and clayey sand (SC), loose to moderately dense, wet to saturated)
	56- 84	Weathered rock; yellow-brown sandstone and interbedded gray shale, closely fractured, low hardness, friable to weak, moderately weathered, extensive seepage at 78 inches
2.	0- 12	Topsoil; dark brown sandy silt (ML), loose, moist
	12- 19	Colluvium/Residual soil; mottled, yellow, orange-brown sandy clay (CL) with sandstone and shale fragments, moderately stiff, moist
	19- 21	Weathered rock; gray clayey gravel (GC) weathered shale fragments
	21- 42	Rock; gray shale, well consolidated, very thin-bedded, vertically dipping, closely fractured, moderately hard, moderately strong, moderately weathered

3.	0- 20	Topsoil; dark brown clayey sand (SC), loose, wet
	20- 35	Colluvium; dark brown sandy clay (CL) with rock fragments, seepage at 25 inches, moderately stiff, saturated
	35- 55	Colluvium; mottled orange-brown-gray, gravelly clay (CL), stiff, saturated
	55- 80	Colluvium (?); mottled orange-brown gravelly clay (CL), stiff to very stiff, saturated.
	80- 90	Weathered rock; orange-brown-gray weathered siltstone, poorly consolidated, low hardness, friable, deeply weathered
4.	0- 20	Topsoil; dark brown sandy clay (CL), moderately stiff, wet
	20- 26	Colluvium; mottled gray-orange-brown sandy clay (CL), moderately stiff, saturated, seepage at 24 inches, grades into lower material
	26-114	Colluvium; mottled orange-brown-gray clay, very stiff, sataurated, becomes grayer and siltier at 72 inches
5.	0- 9	Topsoil; dark brown clayey sand (SC), loose, wet
	9- 11	Residual soil; orange-brown and gray sand (SP) to sandy clay (CL), moderately dense to dense, wet
	11- 66	Weathered rock; orange-brown sandstone with gray clay seams, moderately consolidated, closely to intensely fractured, low to moderately hard, weak to friable, seepage at 12 inches

6.	0- 7	Topsoil; dark brown clayey sand (SC), loose, wet to saturated, seepage at 7 inches
	7- 36	Weathered rock; orange-brown sandstone with gray clay seams, moderately consolidated, closely fractured, low hardness, weak to friable, moderately to deeply weathered
7.	0- 18	Topsoil; dark brown sandy silt (ML), loose, moist
	18- 28	Colluvium; mottled rusty brown gravelly clay (CL), moderately stiff, wet to saturated, seepage at 28 inches
	28- 60	Colluvium; mottled gray-rust brown sandy clay (CL), stiff, saturated to wet
	60- 82	Residual soil; yellow-brown sandy clay (CL), very stiff, wet
	82- 90	Weathered rock; mottled gray-orange-brown siltstone grades into orange brown sandstone, poor to moderately consolidated, intensely fractured, low hardness, friable, deeply weathered

8.	0- 7	Topsoil; dark brown silt (ML), loose, moist
	7- 23	(?)Fill; brown sand (SP) and sandstone fragments, moderately dense, wet
	23- 29	Colluvium; brown clay (CL), stiff wet
	29- 31	Residual soil; gray clay (CL), moderately stiff, wet
	31- 48	Rock; gray shale, moderately to well consolidated, very thin-bedded, bedding N70W, 46NE, intensely to closely fractured, moderaetly hard, weak to moderately strong, moderately weathered
9.	0- 18	Topsoil; dark brown silt (ML), loose, moist to wet
	18- 34	Residual soil; red-brown sandy silt (ML), moderately stiff, wet
	34- 52	Weathered rock; brown sandstone, moderately consolidated, thin-bedded, bedding N64W, 56NE, closely to intensely fractured, moderately hard, weak to moderately strong, moderately weathered, seepage at 48 inches

23.	0- 27	Topsoil; dark brown silt (ML), loose moist
	27- 36	Colluvium; mottled orange-brown clayey silt (ML) with sandstone fragments, stiff, wet to saturated, seepage at 34 inches
	36- 52	Rock; orange-brown sandstone, moderately consolidated, closely to intensely fractured, moderately hard, weak, moderately weathered
24.	0- 48	Topsoil/earthflow; dark brown silt (ML) with sandstone fragments, loose to moderately stiff, wet to saturated, seepage at 41 inches
	48- 72	Colluvium; mottled orange-brown clay (CL) with rock fragments, moderaetly stiff to very stiff, saturated
	72-160	Colluvium/residual soil; mottled yellow-brown-gray clay (CL) with rock fragments, stiff to very stiff, saturated to wet--starting to appear as residual soil in bottom.

APPENDIX C

RECOMMENDED GRADING SPECIFICATIONS

APPENDIX C

RECOMMENDED GRADING SPECIFICATIONS

THE SEMINARY
201 SEMINARY DRIVE
MILL VALLEY, CALIFORNIA

1.General

1.1 These Recommended Grading Specifications (called "Specifications" here) provide general guidelines for soil engineering aspects of grading for the subject development. The Geotechnical Engineer from PURCELL RHOADES & ASSOCIATES, Inc. (PRA) should be consulted prior to any site work connected with grading. Please refer to the following report(s) for other grading recommendations supporting these Specifications.

1. PRA, 06/8/16, PreliminaryGeotechnical Design Report, The Seminary, 201 Seminary Drive, Mill Valley, California: Job No. 14-160/7694-01.

1.2 These Specifications include the following:

- clearing, stripping, grubbing, and preparing areas to be filled
- selecting materials for fill
- placing, spreading, and compacting fill
- completing subsidiary work necessary to conform to lines, grades, and slopes shown on accepted plans
- protecting the soil in slab and foundation areas from drying out between grading and construction

1.3 Tests and observations shall be made by a representative from PRA Group, Inc. during the grading so that we can confirm that grading was performed according to these Specifications. Such confirmation in a Final grading report is often required to obtain a building permit.

1.4 PRA shall be notified at least 2 working days prior to placement of fill so arrangements for testing and observation may be made.

1.5 Grading or placement of fill done without the presence of a representative of PRA or without prior coordination between PRA and the grading contractor shall be at the contractor's risk; PRA will accept no responsibility for such work.

2. Testing

2.1 The American Society for Testing and Materials (ASTM) Test Procedure D 1557-78 shall be the standard test to define maximum densities for all compaction of fill. All densities shall be expressed as relative compaction in terms of the maximum dry density obtained in the laboratory by the foregoing standard procedure.

2.2 Field density tests shall be performed according to ASTM Test Procedures D 6938-08A. The locations and number of field density tests shall be selected by the Geotechnical Engineer or the Engineer's Representative.

3. Clearing, Stripping, Grubbing, and Preparing of Areas to Be Filled

3.1 Trees, roots, vegetation, and organic surficial soil shall be removed from structural areas unless specified otherwise by PRA. The depth of organic surficial soil to be removed will be recommended by the Geotechnical Engineer or the Engineer's Representative but, in general, will probably vary from about 2 to 4 inches.

3.2 Strippings are defined as surface vegetation and organic surficial soil. Strippings may not be used in fill unless specifically authorized and observed by the Geotechnical Engineer or the Engineer's Representative. Stripping may be stockpiled for landscaping use, with the approval of the landscape architect.

3.3 Soil deemed soft or unsuitable by the Geotechnical Engineer or the Engineer's Representative shall be removed. Loose fills and surface soil sloughs shall also be excavated.

3.4 Underground structures such as old foundations, abandoned pipelines, septic tanks, and leach fields shall be removed from the site.

3.5 The final stripping and excavation shall be approved by the Geotechnical Engineer or the Engineer's Representative before further grading is started.

3.6 The original ground on which the fill, foundation or slabs are to be placed shall be plowed or scarified at least 8 inches and until the surface is free from ruts, hummocks or uneven features which would tend to prevent compaction. The contractor shall observe the following guidelines:

- Where the slope ratio of the original ground is steeper than 5:1 (horizontal to vertical), the bank shall be stepped or benched.
- At the toe of the side slope fills, the base key shall be at least 12 feet in width, cut into firm, natural ground and sloped back into the hillside at a gradient of at least 2 percent.
- Subsequent keys or benches shall be 10 feet wide and placed no more than 4 feet in vertical height from the previous key or bench unless otherwise recommended by the Geotechnical Engineer or the Engineer's Representative.

3.7 The native subgrade soil to receive fill shall be moisture-conditioned and compacted to the requirements specified in the referenced report and below:

Minimum relative compaction:	90	percent
Minimum moisture content:	3	percent over optimum
Special considerations:	85-90	percent compaction in designated expansive soil at 5 percent over optimum moisture condition.

4. Selecting Fill

4.1 The Geotechnical Engineer or the Engineer's Representative shall evaluate suitability of materials for compacted fills. The material shall be a soil or soil-rock mixture, free of organic matter or other deleterious substances. Within 3 feet of finished grade, the compacted fill shall contain no rocks or lumps over 6 inches in diameter and none that are more than 15 percent larger than 2-1/2 inches. Rocks greater than 6 inches in diameter shall be placed in deep fills as approved by the Geotechnical Engineer or the Engineer's Representative so that they are not nested and so compaction may be achieved around them.

4.2 If imported materials are needed, they must be approved by the Geotechnical Engineer or the Engineer's Representative prior to transporting the fill to the project. Unless otherwise exempted by the Geotechnical Engineer, they should meet the following requirements:

1. The plasticity index shall not exceed 15.
2. No rocks shall exceed 6 inches in diameter.

5. Placing, Spreading, and Compacting Fill

5.1 The fill shall be placed in uniform lifts of not more than 8 inches in uncompacted thickness. Each layer shall be spread evenly and shall be thoroughly blade mixed during spreading to obtain uniformity of material. Before compaction begins, the fill shall be brought to a water content (as directed by the Geotechnical Engineer or the Engineer's Representative) that will permit proper compaction by either (1) aerating the material if it is too wet or (2) spraying the material with water if it is too dry.

5.2 After each layer has been placed, mixed, and spread evenly, it shall be compacted as specified in the referenced report and below:

Minimum relative compaction:	90	percent
Minimum moisture content:	3	percent over optimum
See Section 3.7 for expansive soil criteria		

5.3 The contractor shall use appropriate equipment to compact the fill to the specified density. Compacting shall be performed while the fill is within the specified range of moisture content. Each layer shall be compacted over its entire area, and the compacting equipment shall make enough passes to achieve the required density.

5.4 Fill placed on slopes shall be compacted by means of suitable equipment. Benching of the slopes should be done in increments of 3 to 5 feet in height until the fill is brought to its specified height or as determined by the Geotechnical Engineer or the Engineer's Representative.

5.5 When sheepsfoot rollers are used for compaction, the density tests shall be taken in the compacted material below the surface disturbed by the roller. When these tests indicate that the density of any layer of fill, or portion thereof, is below the required density, it shall be reworked until the required compaction has been obtained.

5.6 Soil shall not be placed or compacted during periods of rain or on ground which is not drained of water. Soil which has been moistened by rain or other cause shall not be compacted until the moisture content is within the limits specified in the referenced report. Prior approval by the Geotechnical Engineer or the Engineer's Representative shall be obtained before continuing grading.

6. Backfilling Trenches

6.1 Geologic exploratory trenches (or other depressions, including tree root ball areas), if any, within the proposed building or pavement areas, shall be re-excavated and backfilled to meet the requirements for compacted fill, as specified above.

6.2 The utility trenches extending under the perimeter foundation and concrete slabs-on-grade may require backfilling or plugging with impermeable soils at the building line with a 3-foot wide impermeable segment of compacted fill. Requirements will be specified during trench backfilling. Ponding or jetting of trench backfill is not recommended.

7. Removing Subsurface Pipes

7.1 The Geotechnical Engineer or Engineer's Representative shall designate the methods of removal of subsurface pipes. Depending upon depth and location, one of the following methods shall be specified:

- The pipe shall be removed, and the trench shall be filled and compacted according to applicable requirements for compacting native soil (Section 3) or fill (Section 5).
- The pipe shall be crushed in the trench, and the trench shall be filled and compacted according to applicable portions of Sections 3 and 5.
- The ends of the pipes shall be capped with concrete to prevent entrance of water. The length of the cap shall be at least 5 feet.

7.2 Any existing wells on the site shall be filled, buried and capped according to the requirements of the local regulatory agency. The final elevation of the top of the well casing shall be a minimum of 36 inches below any adjacent grade at the completion of grading or filling. Under no circumstances should structural foundations be placed over the capped wells.

8. Grading Slopes

8.1 Slopes shall be graded at gradients no steeper than 2:1 (horizontal to vertical) for fill and cut, except as noted in the referenced report.

8.2 After the slopes have been graded, they shall be track-rolled, and provisions shall be made for planting the slopes for erosion control. Drainage facilities shall be constructed to prevent water from flowing over slopes. No slope shall be left to stand through a winter season without erosion control.

9. Installing Subdrains

9.1 For subdrains, the contractor shall provide and install perforated pipe Standard Designation Ratio (SDR) 23.5 or equivalent approved by the Geotechnical Engineer or the Engineer's Representative and filter material for subdrains as shown on the plans or as directed by the PRA. The following restrictions apply:

9.1.1 Clay drain tile, concrete drain tile and perforated clay pipe shall not be permitted. Use no wyes, tees, or other joints of these materials.

9.1.2 Porous concrete pipe, perforated asbestos-cement pipe, bituminous fiber or pipe of other materials shall be permitted only on written authorization of the Geotechnical Engineer.

9.1.3 The contractor shall use ½ by 3/4 inch drain rock wrapped within a filter fabric approved by our Geotechnical Engineer, unless otherwise permitted by written authorization from the Geotechnical Engineer.

9.1.4 Unless recommended otherwise by the Geotechnical Engineer or the Engineer's Representative, the contractor shall use pipes not less than 4 inches in diameter for lateral drains up to 50 feet in length. Use pipes of not less than 6 inches in diameter for lateral drains greater than 50 feet in length. Larger minimum pipe diameters may be specified by the Geotechnical Engineer or the Engineer's Representative during construction.

10. Unusual Conditions

10.1 If unusual conditions occur during grading, the Geotechnical Engineer shall be immediately notified for recommendations.

Subject: **STAGE 1 FEASIBILITY STUDY**
Golden Gate Baptist Theological Seminary Master Plan Amendment
Mill Valley, California

Dear Mr. Hart:

As requested, we are pleased to submit this Stage 1 Feasibility Study for proposed Master Plan Amendment for development at the Golden Gate Baptist Theological Seminary in Mill Valley, California. The intent of this study is to review published data, perform a field investigation and laboratory testing of obtained soil samples, and to provide this summary report describing the feasibility for development in the specified Development Study Areas. This Stage 1 Study was originally issued June 22, 2010, and subsequently, conceptual renderings of proposed development for each study zone were issued (see Appendix C). This report has been revised to include additional observations and comments as a result of these renderings.

Based upon our review of the available documents, field investigation, laboratory testing and engineering review, it is our opinion that the designated focused study areas are feasible for consideration in development. The respective focused study areas each have geotechnical issues that can be mitigated with conventional engineering analysis and using typical construction methods.

We appreciate this opportunity to be of service on this project. Please contact this office with any questions.

Very truly yours,
PURCELL, RHOADES & ASSOCIATES

List of Appendices

Appendix A	Site Geological Map by Herzog Figure A-1 Recommended Mitigation Measures Map, Figure A-2
Appendix B	Logs of Test Pits and Exploratory Borings by Herzog
Appendix C	Conceptual Renderings for Proposed Site Development

SUMMARY OF CONCLUSIONS

1. The focused study areas are underlain by variety of subsurface conditions, ranging from shallow bedrock, to moderately deep earthflow deposits, and engineered fill slopes.

2. In general, depending upon the specific site development planned, the focused study areas are feasible for development using conventional earth moving equipment, installation of surface and subsurface drainage controls, and typical foundation construction.

3. The Seminary Knoll study area will require mitigative grading to install engineered buttress fills within swales covered with earthflow deposits, installation of surface and subsurface drainage controls, and pier and grade beam foundation systems. Depending upon the specific site development plan, a catchment or buffer area, or a catchment wall may be required upslope of the development within the loop of Shuck Drive due to the presence of earthflow deposits upslope of upper Shuck Drive.

4. The Student Village Study area had several subareas at the time this report was originally issued. Subsequently, only the central subarea adjacent to Truett Hall and the existing parking facilities is now being considered for development. Due to the variable depth to the shallow lying bedrock and the proximity of a descending slope, the site will likely be developed using a pier and grade beam foundation with piers required to provide uniform embedment in the non-yielding bedrock unit. Some surface regrading and surface and subsurface drainage controls will also likely be required.

5. The Chapel Hill study area is underlain by shallow lying, very dense sandstone and siltstone bedrock. Site development would include typical surface and subsurface drainage controls, retaining walls for sublevel areas, and conventional footing foundation system.

6. The Seminary Vista West study area is underlain by shallow lying, dense sandstone and siltstone bedrock in the proposed development area adjoining Chapel Hill Drive. The descending slope below this study area consists of a reconstructed fill slope. Due to the proximity of the steep slope, a pier and grade beam foundation system would likely be needed.

7. The proposed areas for development at the Seminary Point study area are underlain by relatively shallow lying sandstone and siltstone bedrock. Surface and subsurface drainage controls, and a pier and grade beam foundation system would be required for development of this area. Depending upon the specific development location, some regrading may be necessary due to proximity to shallow earthflow deposits.

8. The Seminary Vista East study area is covered by an earthflow deposit, underlain with bedrock with depths encountered up to 18 feet below existing grade. Due to the wet, soft earthflow materials encountered and free groundwater present, development of this

study area would require removal of the surficial materials and reconstructing the slope with an engineered buttress fill, including surface and subsurface drainage controls. A pier and grade beam foundation system that is embedded into the underlying sandstone and siltstone bedrock would be required.

SCOPE OF WORK

The scope of work for this Stage 1 Feasibility Study, as requested in the 8/11/09 RFP submitted to this office, is as follows:

Stage 1 - Feasibility Study

- Attend initial orientation meeting on-site.
- Use no paint and leave no trace of your investigation. Repair investigation holes, pits and borings to existing condition.
- Document geology with borings within possible development areas.
- Report on existence of unstable soils, soils creep, ancient landslides, hard rock and other adverse geologic conditions within possible development zones.
- Describe each potential site in terms of its geotechnical setting, sensitive areas and areas most suitable for development.
- Provide a table of proposed geotechnical mitigation measures by zone appropriate to development in Marin.
- Include a summary of conclusions at the beginning of the report.
- All maps shall be in color. Provide (1) paper copy and (1) PDF digital file.

INTRODUCTION

The site area is within the Stawberry Point peninsula surrounded by Richardson Bay (see Figure 1, Site Location Map). The site topography has generally east-west trending with natural north and southward facing slopes that vary from 2-1/2 horizontal to 1 vertical (2-1/2:1, H:V) to 4.1. There are also localized flat knolls and marshland areas within the campus (see Figure 2, Campus Plan). The campus has been developed through the years (see Figure 2), and this Stage 1 Feasibility Study focuses on 6 specific development areas being considered for future development (see Figure 3, Development Study Areas).

PUBLISHED DATA

In review of geotechnical information in our files and in the Marin County web site, we noted the following preliminary information.

- the site is not traversed by a Special Studies Zone for potentially active faults
- the site area is mapped as having an expansive soil potential of low likelihood to nil
- a high liquefaction potential is mapped for the alluvial areas, and very low liquefaction potential is indicated for hillside areas
- a flood potential was not indicated for in the location of the proposed focused study areas

Regional geology maps show the site as predominantly underlain by Franciscan Complex melange, which is a unit that consists of "scrapes" of different rock types that have been mildly metamorphosed. There are blocks of very hard "greenstone" surrounded by siltstone and sandstone units. The western perimeter of this peninsula has inlets that have been mapped as having artificial fill placed over bay mud.

The campus has been the subject of prior geotechnical investigations and site work to improve slope stability. Prior studies prepared by Donald Herzog & Associates that were presented to our office for review and incorporation into this feasibility study are as follows:

August 31, 1979, Report - Soil Investigation, Golden Gate Baptist Theological Seminary, Mill Valley, California: Job No. 994.1

March 22, 1982, Report - Geotechnical Reconnaissance for Master Plan, Golden Gate Baptist Theological Seminary, Mill Valley, California: Job No. 994.1

May 19, 1982, Report - Geotechnical Reconnaissance for Master Plan, Golden Gate Baptist Theological Seminary, Mill Valley, California: Job No. 994.1.

August 10, 1982, Preliminary Report - Anticipated Remedial Measures, Golden Gate Baptist Theological Seminary, Strawberry Point, California: Job No. 994.1.

The site plan showing the locations of the Herzog test pits and borings is presented in the Figure A-1 of Appendix A, and where such explorations contribute to the focused study area under study, is also presented with the site map of the respective study area (see Figures 24 through 29). The logs of the Herzog test pits and exploratory borings are presented in Appendix B.

SITE CONDITIONS

Site Geology

The general site geology has been previously described in the March 22, 1982 Donald Herzog & Associates report, with their Geologic Map presented in Figure A-1 of Appendix A of this Stage 1 Feasibility Study, with their findings summarized as follows:

Rock outcrops within the area are sparse, except where exposed in cut slopes. The bedrock of the area is primarily composed of interbedded sandstones and shales of the Mesozoic-aged Franciscan Assemblage. The sandstone typically varies from light to dark brown in color; massive to thin bedded; closely to moderately fractured; moderately hard; weak to moderately strong; and moderately to deeply weathered Shales vary from thinly laminated to very thinly bedded; dark gray in color; closely fractured to sheared; friable to weak; low to moderately hard; and moderately to deeply weathered. Other sparsely occurring Franciscan rocks include chert, metagraywacke sandstone and serpentinite. The chert is thin bedded; variable in color; moderately to closely fractured; hard; strong; and

moderately weathered. It may vary from highly altered meta(?) Chert to argillaceous chert. Massive blocks of metagraywacke occur sporadically in the well-bedded sandstone and shale, primarily in areas where the rocks appear distorted or sheared Serpentinite is also rare and crops out as a small block in the southwest corner of the area.

The Franciscan rocks within this area display a localized uniform structural orientation. The sandstone, shale and chert commonly trend in a northwest direction, and dip moderately to steeply to the northeast. Strikes vary from North 40 degrees West to East-West, and dip northerly from 27 to 85 degrees. Zones of shearing, where the rocks are highly fractured, altered and structurally disrupted, are evident in some areas. However, these shear zones appear to be relatively small and do not significantly change the localized bedding orientation. The northwest portion of the area was previously characterized as a "melange" zone. However, the uniform orientation of the chert, shale and sandstone, as well as the fact that the chert displays a graded depositional contact with the shale and sandstone, suggests that this area is not as sheared and deformed as other typical Franciscan melange zones in the Coast Range geomorphic province.

Quaternary deposits in the area include residual soils, colluvium, landslide debris, bay mud and fill material. Soils may vary from light to dark brown sandy or clayey silts to silty clays. They are medium stiff to stiff, and moist to wet. Soil depths may vary from less than 6 inches to over 6 feet. The soils on all natural slopes are undergoing slow downslope transport in the form of creep, and the distinction between residual in-place soil and colluvium is often difficult to define.

Landslides, in the form of shallow earthflows (less than 10 feet deep), are common on natural slopes throughout the area. Flows are characterized by well defined headwall scarps, hummocky topography, lobate or delta-shaped masses near the toe of the slide, and seepage zones. The earthflows appear to be shallow seated and restricted to the unstable soils overlying the bedrock.

At the time of the March 22, 1982 DHA report, no new large scale earthflows were observed, and the extent of the slides that had been mapped in 1979 did not significantly increase as a result of the January 1982 record storm event. A few debris slides and slumps were noted by DHA during their field investigation. Those slides were described as being of small extent (several tens of square feet) and restricted to steep cut slopes and unstable fills, with most of the failures appearing to be recent as a result of the January 1982 storm event.

The majority of earthflows, landslides and colluvial filled swales identified by DHA were reportedly mitigated per the recommendations of the referenced August 10, 1982 report for "Anticipated Remedial Measures", and as shown on DHA's Plate 1, "Recommended Mitigation Measures", provided in Figure A-2 of Appendix A of this study. These mitigation measures ranged from installation of subdrains, surface concrete v-ditches, surface grading of the surficial soils, to reconstruction of the slope with engineered buttress fills. It is reported that as recommended by DHA, south facing slope between upper and lower Chapel Drive was reconstructed with an engineered buttress fill. This slope does appear

to be reconstructed, but PRA has not received any documentation of the observation and testing services provided by DHA for this reconstructed, nor of their observations for the other mitigation measures recommended in their report. As part of this Feasibility Study, PRA performed a site review within the designated development study areas in an attempt to locate indications of the installed mitigation measures, such as drop inlets, clean outs, v-ditches, etc.

Bay mud is of limited extent and restricted to areas in the southeast and west-central portion of the site. This material typically is an organic rich silt or clay of low strength and high compressibility. The bay mud deposit in the west-central portion of the campus area has been covered with fill and is not exposed at this time.

Fills are common throughout the area and generally consist of a heterogenous mixture of local sandstone and shale derived from previous site excavations. PRA has not received any documentation regarding the compaction of fills identified at this site.

Site Seismicity

The subject property, like all properties in the San Francisco Bay Area, is situated in a very seismically active region. The following statements summarize the potential impacts of the seismic setting upon development of the subject property.

Based on an analysis of the historic earthquake records of the active faults, published and unpublished data on potentially active faults and the geographic relationship between the subject property and the faults of the San Francisco Bay region, it is reasonable to conclude that the major Bay area fault systems have the greatest potential for adversely impacting the proposed development.

A coalition of scientists from the U. S. Geological Survey, Southern California Earthquake Center, and the California Geological Survey prepared the Uniform California Earthquake Rupture Forecast (2008). Data presented by this group estimates the chance of one or more large earthquakes (Magnitude 6.7 or greater) in the San Francisco Bay region within the 30 year time period between 2007 and 2036 to be approximately 63 percent. In that same time period, the chance for a magnitude 6.7 or greater earthquake on the Concord, Calaveras, Hayward, and San Andreas faults is 3, 7, 31, and 21 percent, respectively.

The site is not within a Special Studies Zone for active faults. A list of pertinent active faults, their distance, expected moment magnitude, and estimated mean peak ground acceleration (PGA) is provided below:

FAULT	DISTANCE (Miles)	MOMENT MAGNITUDE[1]	ACCELERATION (g)[2]
San Andreas (Northern)	6.6	7.4	0.30
San Gregorio	8.4	7.0	0.21
Hayward	11.0	6.4	0.12
Rodgers Creek	16.8	7.0	0.13
Point Reyes	18.4	7.0	0.13

(1) Estimated maximum moment magnitude from CDMG (1996) Open File Report 96-08, and Cao, et al. (2002).
(2) Mean peak ground acceleration averaged from Boore, Joyner, and Fumal (1997).

The specific hazards associated with active faults can be confined to ground shaking and ground failure due to earthquakes. Since there is no mapped active fault recognized by the California Geological Survey as crossing the site, the hazard for surface rupture through the subject site is unlikely from known active faults of the region. The subject site lies within the San Francisco Bay Area, a region of high seismic activity. The probability is very high for a major earthquake to occur in the Bay Area within the economic lifetime of the proposed structures.

Ground rupture tends to occur along lines of previous fault rupture or tectonic creep. Because no known faults (active or otherwise) cross the site, this hazard is low. The project site would be susceptible to ground shaking and ground failure during a major earthquake on the significant faults of the San Francisco Bay region. The seismic risk to a structure depends on the distance from the epicenter; the characteristics of the earthquake; the geologic, groundwater, and soil conditions underlying the structure and its vicinity; and the nature of the construction. Ground shaking at the site is likely to occur during the life of the project.

The effects of seismically-induced ground shaking at the subject property resulting from a large magnitude (6.0 or greater) earthquake on any major fault within the San Francisco Bay region can be estimated from accounts of the effects which were described shortly after the 1906 earthquake, magnitude 8.3 with an epicenter located between San Francisco and Marin Counties. Studies by Lawson (1908) and Borcherdt, et al (1975) indicate that the highest ground shaking intensities (i.e., very violent) occur within 1500 to 2000 feet of the master trace of the San Andreas fault, and that violent ground shaking generally occurs at sites that are within 1 mile of the master trace. Furthermore, sites situated between 1 and 3 miles of the master trace would likely experience very strong ground shaking intensities. Therefore, in the event of a large magnitude earthquake on the noted Bay Area faults, it is reasonable to assume that the subject property will experience strong to very strong ground shaking. It should be emphasized that this estimate is based on a small number of field observations in a region that was sparsely populated during the 1906 earthquake on the San Andreas fault.

Since these are estimates, and they are based on a small amount of data, they should be used as a general guide to reflect future ground shaking intensities. Nevertheless, we believe that it is reasonable to conclude that any structures constructed on the subject property should be expected to experience very strong ground shaking in the event of a major earthquake on active faults within the San Francisco Bay region.

Rather rough quantitative measurement of the dynamic characteristics of an earthquake can be estimated for the proposed structure. This estimate is based upon the attenuation method advanced by Boore, Joyner and Fumal (1997), for estimates of ground motion characteristics expressed in terms of acceleration of gravity. Based upon this attenuation relationship, a maximum moment magnitude on the San Andreas fault would result in an estimated mean peak ground acceleration of approximately 0.3g. For comparison, the interactive web site of probabilistic seismic hazards prepared by the U. S. Geological Survey indicates that the peak ground acceleration value that would have a 20 percent chance of being exceeded in a 50 year period is approximately 0.78g.

The peak values of ground acceleration represent a single moment acceleration. Ploessel and Slosson (1974) indicate that the repeatable high ground acceleration value for epicenters within 20 miles of a site would be approximately 65 percent of the peak value shown above.

The local building codes and current CBC recommendations reflect the design parameters for mitigation of earthquake conditions. The appropriate code should be utilized for minimum design standards based upon the particular features of the structure and the recommended minimum seismic load factors.

Liquefaction Potential - General

Liquefaction occurs when loose, saturated, granular deposits or low plasticity cohesive deposits lose strength in response to increased pore pressure during cyclic seismic loading. A regional assessment of liquefaction potential within the San Francisco Bay area was conducted by representatives of the U. S. Geological Survey (Witter et al, 2006). In this assessment, the central play field area, the westerly shoreline of the Seminary Point, and the northern border of Seminary Knoll were mapped as alluvial areas with either a High, or Moderate Liquefaction Susceptibility.

Herzog logged three exploratory borings in the western northern half of the playfield area, and determined that the materials encountered either consisted of cohesive soils not susceptible to liquefaction or shallow bedrock materials.

Tsunami Hazard

The west-central portion of the site area was previously identified as within a potential tsunami runup area by Ritter and Dupre (1972), but Herzog (1982) indicated that this interpretation was in error, and this area would not be impacted by tsunami. A 2009 map issued by the California Geological Survey shows the shoreline of Strawberry Point having a potential for being inundated by a tsunami (see Figure 4, Tsunami Inundation Map). This

map indicates that only the low lying elevation immediately adjacent to the shoreline, and the low lying elevation between Silva Island and the northwest corner of the site as being subject to inundation.

SITE EXPLORATION AND LABORATORY TESTING

Site Exploration

Field exploration of the site consisted of logging and sampling of eight hand-excavated test probes to a maximum depth of 5 feet below existing grade on April 20 & 22, 2010, and ten exploratory borings, up to a maximum depth of about 18-1/2-feet below existing grade using either a truck-mounted Mobile B-24 drill rig or a portable, Minuteman rig on May 20, 2010. Please see Figure 5, Site Aerial Photo and PRA Boring Locations, for exploratory test probe and boring locations.

Relatively undisturbed soil samples for laboratory testing were recovered in a 2.5-inch outside diameter (OD) California sampler or in a 2-inch OD split spoon sampler driven by a 140-pound hammer free-falling 30 inches. The number of blows applied to advance the sampler was recorded for each 6 inches of penetration and then converted to Standard Penetration Test values and recorded on the Exploratory Boring Logs.

Logs describing the material encountered in the test probes and borings were recorded in the field by an engineer from this office and are shown on Figures 6 through 23.

Laboratory Testing

Laboratory testing was conducted on selected borehole samples to obtain data on density, moisture content, unconfined compressive strength, Atterberg limits, and classification of the soil. Test results are shown on the Exploratory Boring Logs.

FOCUSED STUDY AREAS

- **Seminary Knoll**

This area is located at the extreme western corner of the campus. It is our understanding that an access would be constructed across a swale from the presently existing maintenance building to a knoll of very hard greenstone rock. The center knoll area would be utilized for parking and structures developed around the periphery of the knoll. An additional area under consideration is the property within the loop of Shuck Drive continuing from the maintenance building and looping in a clockwise direction uphill (see Figure 24, Seminary Knoll Site Map).

The central western knoll area around elevation 104.2 is underlain by shallow, dense bedrock materials consisting of sandstone, claystone, shale, and chert, surrounded by swales filled with colluvium, and shallow earthflow and mudflow materials to a maximum depth of 10 feet in thickness. The central knoll area was investigated by Herzog in Test Pits 16 and 17, and by PRA borings 6 and 7. The test pits and borings indicated shallow

lying bedrock materials, with bedrock depths in these data points ranging 1 to 4 feet below existing grade.

Of the swales immediately surrounding the knoll, two are shown on the Herzog mitigation map (Appendix A2) as having a subdrain installed to mitigate potential slope movement. The approximate locations have been transferred to the Site Map on Figure 24. One of these swales is located at the southeastern portion of the knoll and would be traversed by an access road from Shuck Drive to gain access to the knoll. This swale has approximately 4 feet of overburden. No clean outs, pipe, or discharge points were observed of these Herzog subdrains.

The Shuck Drive loop area has a large shallow earthflow that begins from the south facing slope at the northern limits of the Golden Gate Baptist Theological Seminary property that flowed down past the upper loop of Shuck Drive, through the proposed development area, over the lower loop of Shuck Drive and continuing south past the southern limit and onto the adjoining property. This area is covered with trees and brush. The Herzog Mitigation Map (Appendix A2 shows a subdrain located within the Shuck Drive loop area that terminates at the lower end of Shuck Drive. No clean outs or discharge pipes were observed in the area shown in the Herzog Mitigation Map. Three test pits were excavated by Herzog (TP13, 14, and 15) and one boring was drilled by PRA (B-17). These explorations determined that within the Shuck Drive loop area, the test pits show a shallow earthflow overlying residual soil and colluvium, which is in turn underlain by a shale and graywacke sandstone. The depth to dense bedrock was determined in the test pits as varying from 4 to 6 feet below the existing grade. The PRA boring was advanced within the downhill loop of Shuck Drive and encountered a deep residual soil of clayey sand, sandy silt, and blue-gray silty clay overlying a siltstone bedrock at a depth of 11 feet below existing grade.

The Conceptual Rendering of proposed development for the Seminary Knoll area as presented in Appendix C shows several units along the southeast face of the slope below the knoll. This slope has several small erosion gullies and shallow mudflows that will require shallow grading and drainage mitigation for development. Pier and grade beam foundations would likely be required for development on this slope. The western most unit that wraps around the knoll lies at the headward edge of a previously mapped mudflow area that had some shallow mitigative grading. This area would likely require additional grading for site development. The northern area of the knoll is indicated on this map as having a recreation area with a swimming pool. This area lies within a saddle area at the headward edge of a previously mapped mudflow area that had only a subdrain installed. This area would require additional mitigation grading for site development

- **Student Village**

This focused study area consists of four separate sub-areas for consideration. The northern-most portion of this area lies north of the intersection of Reed Blvd. and Storer Drive. There is a narrow access path, "Lovett Lane" leading from Reed Blvd. to existing dwelling units. This parcel has a small mudflow area which is evident by a disturbed area of 12 to 18 inches in thickness and approximately 60 feet in width. The other sub areas

consist of two flat parcels adjacent to either parking facilities or Truett Hall, and a flat area below a slope used for a playground area and basketball courts. The intervening tree-covered slope rising from the court yard up to the pad adjacent to Truett Hall will not be developed.

The sub-area located north of Storer Blvd was investigated with borings B-17, 18, and 19 by Herzog Geotechnical (1979), and supplemented by PRA boring B-8 (see Figure 25, Student Village Site Map). An existing, small mudflow was identified during the 1979 Herzog study. The exploratory borings within this sub-area determined that the site is covered by topsoil and residual soil overlying a sheared sandstone and shale bedrock. The depth to the bedrock material varied from approximately 2 to 8 feet below existing grade. The Reed Blvd. road cut exposed a weathered sandstone and shale bedrock contact that was measured as having a strike of North 40^0 West, with a dip of 60^0 to the northeast. No free groundwater was encountered in these borings.

The two sub-areas located within the central portion of this focused study area adjacent to parking facilities and Truett Hall were investigated by Herzog in 1979 with exploratory borings B-8 through B-14 (see Figure 25, Student Village Site Map). The flat pad area on the north side of this subarea is covered with a thin layer (1 foot) of sandy silt topsoil over either a mixture of sandstone and serpentine bedrock. Boring 10 midway between the northern and southern subarea encountered a brown sandy silt fill over a black-brown sandy silt topsoil over a orange brown sandstone at a depth of approximately 6 feet below existing grade. The southern subarea encountered a shallow bedrock profile at a depth of 1 foot below grade in borings 11 and 12, with borings 13 and 14 encountering from 3 to 6 feet of fill overlying either a red brown of black brown sandstone.

The third subarea is located within the existing playground and basketball court area at the toe of a slope. No prior borings had been excavated within this area and was explored during this study by borings 5, 15 and 16 (see Figure 25). These borings encountered a deepening soil profile from the south to north end of this subarea. The northern end as explored by boring 15 encountered a moderately deep soil profile consisting of sandy clay fill with siltstone particles to a depth of 6 feet below grade, underlain by a large siltstone "floater" within a matrix of silty clay, then transitioning to a sandy clay with sandstone rock fragments. The depth to weathered bedrock was determined as approximately 17 feet, with groundwater also encountered at this depth. Approximately midway between the northern and southern portions of this subarea, boring 5 encountered a mixture of silty clay with siltstone and sandstone fragments to a depth of 2-1/2-feet, with water seepage noted at this depth. Boring 16, located at the southern end of this subarea encountered a very dense orange brown sandstone at the surface. It should be noted that the Herzog Geologic Map (Appendix A-1) had mapped the slope above the northern portion of this subarea as an area of poor drainage, and several seepage areas were mapped on the slope. This would be consistent with the wet areas noted in borings 5 and 15. The Herzog Mitigation Map (Appendix A-2), indicated that a subdrain was installed just below and along the break in slope between the uppermost pad area and the intervening slope down to the western most subarea (see also Figure 25). No clean outs or other indications of this subdrain was observed during our site review.

Subsequent to the field investigation performed by PRA, the Conceptual Rendering submitted to this office for the Student Village (see Appendix C) shows that it is presently planned to develop only the center sub-area adjacent to Truett Hall and the existing parking facilities. The rendering shows four separate buildings proposed. The locations of these buildings would be expected to encounter bedrock at shallow to moderate depth. Due to the proximity to the break in slope from pad level, piers may be required to provide a uniform bearing into non-yielding material throughout the foundation area.

- **Chapel Hill**

This area is an elevated knob of land that had been previously graded that is referred to as Chapel Hill (see Figure 26, Chapel Hill Site Map). Some fill was observed along the northern periphery of the flat pad, and this site is a possible location for an amphitheater that will require an excavation on the order of 12 feet below presently existing grade. This site was explored with a B-24 drill in Boring B-9, and later with Boring B-19. B-9 was drilled in approximately the center of the knob and encountered very dense sandstone and siltstone bedrock at the surface that resulted in refusal to drilling at a depth of 1 foot below grade. Boring 18 was later drilled on the flank of this knob and encountered sandy silt with some gravel to a depth of 4 feet where a hard weathered sandstone was encountered. Boring was terminated at a depth of 5 feet below grade within very dense sandstone. Excavation for the amphitheater will require a dozer with hydraulic rippers to excavate this very dense sandstone and siltstone bedrock material.

- **Seminary Vista West**

This focused study area fronts Chapel Drive and consists of a steep south-facing engineered fill slope down the lower portion of Chapel Drive and Richardson Bay. The Seminary Vista West Site Map (Figure 27) shows mapped landslides below upper Chapel Drive, with the Herzog Mitigation Map (Appendix A-2) indicating that this area was subjected to significant site grading to replace the landslide with compacted engineered fill. While no report has been provided this office regarding the mitigation work performed, the site review performed for this study observed smooth, compacted slopes and concrete v-ditches to control surface drainage. Since it is proposed to develop this site off upper Chapel Drive, two exploratory borings B-3 and B-10 was excavated in the flat area off Chapel Drive (see Figure 27) to determine subsurface conditions within this area. The hand-excavated B-3 exploratory probe encountered sandy clay with siltstone bedrock material, with refusal achieved at a depth of 1 foot below existing grade. Boring B-10 was excavated with a B-24 drill rig and verified that a very dense siltstone bedrock was present at the surface, with refusal to further drilling achieved at 2 feet below grade.

The Conceptual Rendering for the Seminary Vista (see Appendix C) shows Vista West to be developed with four units constructed off Chapel Drive. The development will be adjacent to and upon the descending southerly facing engineered fill slope. Due to the slope proximity, site foundations will consist of pier and grade beams, with embedment into uniform, non-yielding bedrock material.

- **Seminary Point**

This focused study area is located at the southwestern most portion of the campus. The site area consists of a large knob at the western end of a spur ridge, with descending slopes to Richardson Bay. The site is currently developed with three structures (Tichenor Village) that may be demolished and replaced. There is a private access road leading to Tichnenor Village from the terminus of Chapel Drive. This private paved road continues past Tichenor Village and a locked cable/chain gate as an unpaved fire road. This fire road is located approximately mid-slope on this site and continues until another locked gate, where beyond there is an existing private, key-gate controlled development at the lower portion of Chapel Drive (see Figure 28, Seminary Point Site Map). Development is being considered within this focused study area at Tichenor Village, on the slope above the Tichenor Village access road, and on the slope below the presently unpaved fire road.

North of Tichenor Village, there are several swales that contain slopewash, colluvium and earthflow deposits. The Herzog Mitigation Map (Appendix A-2) indicates that only surface drainage and a few subdrains were installed within these deposits, with no other mitigation performed Similarly, along the oversteepened slope between the fire road path extension of Chapel Drive south of Tichenor Village and the shoreline fronting Seminary Drive, there are several swales with mudflow deposits, as well as numerous road cut exposures of sandstone and shale bedrock material. As can be seen on Figure 28), there is a shallow, 4 foot thick earthflow that was previously mapped by Herzog south of the President's House that was subsequently mitigated by grading to construct an engineered compacted slope (see Appendix A, Figure A-2).

This focused study area was investigated by exploratory borings B-2, 4, 13, and 14 (see Figure 28). Boring B-1 was hand-excavated at the western end of Tichenor Village, and determined that this point is underlain by shallow lying, dense siltstone bedrock. Borings B-2, 13 and 14 were drilled along the fire road pathway south of Tichenor Village. These borings encountered residual soil overlying dense siltstone and sandstone bedrock at depths varying from 3 to 6 feet below the ground surface. Boring B-12 was excavated using a portable Minute-Man drill rig on the southeast facing slope above the repaired hillslope area. This boring encountered a thin veneer of approximately 2 feet of residual soil overlying a very dense bedrock of sandstone, siltstone, and claystone.

The Conceptual Rendering for Seminary Point (see Appendix C) shows approximately 30 different structures proposed for development. No units are proposed on the hilltop area rising from the President's House due to the presence of an archaeology site. Units are proposed upslope of the access road, at Tichenor Village, upslope and downslope of the fire access road east of Tichenor Village, and a swimming and recreation facility southwest of Tichnenor Village. The majority of the units are anticipated to encounter a shallow lying bedrock unit. The units on the descending slope below the President's House is located in a transition area from an reconstructed slope to an area that had just shallow regrading and debris removal. This area may require additional site grading for development. The remaining units may have surface grading and drainage mitigation required for site development. Depending upon the specific site grading proposed, conventional

foundations or pier and grade beam can be considered.

- **Seminary Vista East**

This focused study area lies upon the eastern-most portion of the campus on an east-facing downward slope below the adjoining Mission Drive (see Figure 29, Seminary Vista East Site Map). The geologic mapping for this study area indicates the presence of a large earthflow crossing portions of the study area, and was explored by Herzog in their test pits 10 and 11, boring 22, and supplemented with borings B-4 and B-11 by PRA. Boring 22 was excavated just off Mission Drive at the top of the lot at the southern end of this study area within one lobe of the mapped earthflow. This boring encountered approximately 9 feet of dense, gravelly silt and sand road embankment fill, overlying a brown silty clay colluvial soil, with a highly decomposed sandstone encountered at a depth of approximately 18 feet below grade with no free groundwater reported. PRA hand-excavated an exploratory probe B-4 downslope of Herzog's Boring 22. PRA's probe encountered a earthflow materials composed of sandy clay with gravel and siltstone fragments, with visible water on soil fragments.

PRA excavated Boring B-11 at the northern end of this lot within the other lobe of this earthflow, also just below Mission Drive. This boring encountered silty sand and sandy clay to a depth of approximately 6 feet below grade, underlain by saturated, dark gray sandy silt and silty clay with rock fragments to a depth of 13 feet, overlying a 3 foot thick, orange brown silty clay layer over a weathered sandstone bedrock. Free groundwater was encountered at a depth of 13 feet, with the groundwater level dropping to 17-1/2-feet below grade approximately 5 minutes after drilling completed.

The test pits excavated by Herzog approximately mid-slope of this study area encountered loose topsoil, and wet colluvial material to a depth of 12-1/2-feet in Test Pit 10, with material resembling highly weathered rock at the bottom of the pit. Test Pit 11 encountered loose topsoil and west colluvial material to a depth of 10-feet, where a weathered mottled orange-gray-brown siltstone and brown sandstone was reported. For comparison, Herzog's test pits 8 and 9 were excavated south of and outside of the earthflow on this slope, and these encountered loose topsoil, and wet colluvium to a depth of approximately 2-1/2-feet below grade, underlain by gray shale and brown sandstone.

The Herzog Mitigation Map (Appendix A-2) indicates that a single subdrain was excavated within the center portion of the swale on this lot, with a small chevron drain extended to test pit 11, where seepage was encountered.

Development is proposed between the lobs of the earthflow deposit. While this area may not be mapped as underlain by earthflow deposits, the adjacent unstable materials would require mitigation with regrading as part of the development considerations for this focus area.

Subsequent to the field investigation by PRA, a Conceptual Rendering was issued for Vista East (see Appendix C) that shows that is proposed to develop this site area with three units, with two units north of the swale and one unit to the south of the swale. As

described above, extensive grading and drainage mitigation will be required for site development at this location to mitigate the soft mudflow materials present in this area.

DISCUSSION

Based upon review of referenced documents, site review, laboratory testing and exploratory boring program, it was determined that the Golden Gate Baptist Theological Seminary Campus has a variety of subsurface conditions present that could impact the various selected focused study areas. Site conditions range from surface bedrock outcrops in cut slopes to fills, alluvium, colluvium, bay mud and earthflow deposits.

The bedrock materials underlying the site are predominantly sandstone and shale (i.e., siltstone and claystone), which is the "matrix" within the melange unit of the Franciscan Complex. The sandstone and shale units are in contact with more exotic rocks of the Franciscan Complex, which include graywacke sandstone, shale, chert, and serpentinite. The bedrock units generally display a localized uniform structural orientation commonly trending in a northwesterly direction (North 40 degrees West to East-West) with a dip moderately to steeply to the northeast (17 to 85 degrees to the North). While localized shearing of the bedrock units was observed, the generally uniform structural orientation indicates that the area may not be as deformed as other typical Franciscan melange terranes within the Coast Ranges.

Quaternary soil deposits at this site include topsoil, residual soils, colluvium, earthflow landslide debris, and fill material. The depth of topsoil and residual soil deposits range from a few inches to several feet in thickness. Soil deposits with a more clay like character tend to be expansive and on slopes incur slope creep. Earthflow landslide deposits range in thickness from a few feet up to on the order of 10+ feet. Based on the mitigation measures map in Figure A-2 of Appendix A, several of the earthflow deposits were mitigated by the installation of a subdrain penetrating through the soil materials and into the underlying bedrock. A few of these earthflow landslide deposits are indicated as being removed and replaced with compacted engineered fill. This office has not received any report documenting the installation of the mitigation measures depicted on Figure A-2 (Appendix A), but the slope condition observed between upper and lower Chapel Drive suggests that major slope reconstruction had occurred at this location.

Seepage is common on several slopes, particularly after seasonal rains, and there are some areas of poor surface drainage throughout the site. Several surface drain inlets and v-ditches were observed at the site that represents past efforts to mitigate surface drainage issues. Development of the proposed focused study areas will also require site specific drainage mitigation measures for both surface and subdrainage conditions. These mitigation measures would direct intercepted surface and subsurface water to controlled municipal facilities.

While indications of bedrock faults were indicated by sheared rock, there is no indication for the presence of an active earthquake fault to be present within the Campus. The site, as is expected for other areas within Mill Valley, would be expected to be impacted by

seismic ground shaking during earthquakes on active faults within the San Francisco Bay region. A potential for tsunami run-up in low elevation shoreline areas is present, but these would not impact proposed development within the focused study areas. A potential for liquefaction is indicated on published regional maps, but site specific subsurface investigations indicate a low potential for liquefaction in the suggested likely area within the play field at the site. The proposed focused study areas are not underlain by subsurface materials that would be subject to liquefaction.

CONCLUSIONS AND RECOMMENDATIONS

Based upon the results of this Stage 1 Feasibility Study, it is our opinion that the designated focused study areas are feasible for development, with implementation of appropriate mitigation measures. Specific design mitigation measures would be based upon site specific development plans submitted to this office for review and included in a Stage 2 Geotechnical Design Study. The following are site conditions for consideration in the design of development scenarios for the various focused study areas:

Seminary Knoll

This area consists of two subareas. The central knoll area west of Shuck Drive is underlain by shallow bedrock materials, but access would be required to cross a mapped earthflow deposit within a swale. Access would likely require removal of earthflow materials to competent, non-yielding bedrock and replacement with a compacted engineered fill buttress with surface and subsurface drainage controls. Due to the presence of several earthflow deposits surrounding the central knoll area, surface and subsurface drainage controls should be implemented to prevent surface overland flow of drainage into these swales in an uncontrolled manner. Grading of the central knoll area may encounter localized hard bedrock materials requiring dozers with hydraulic rippers. There is a possibility that there may be isolated, very hard bedrock units that would resist break-up with conventional grading equipment and require specialized machines for break-up or removal. Based upon the materials observed within the proposed focused study areas, this condition is expected to be limited. Depending upon the specific location of proposed structures, additional site grading may be required of the surficial units mapped at this site. Earthflow areas that were mitigated solely with subdrains may require additional grading and slope reconstruction to accommodate proposed development scenarios.

The subarea located within the Shuck Drive "loop", is underlain by an earthflow that extends from above upper Shuck Drive at the extreme northern limits of the Campus down through the site and into a lower swale into the adjoining property. This earthflow is indicated as having a subdrain installed to control subsurface seepage. Subsurface investigation of this earthflow deposit within the Shuck Drive loop indicates the thickness of this material to vary from 4 to up to 11 feet in thickness. Development of this portion of the focused study area would require regrading to remove the earthflow deposit. Depending upon the final grade elevations, grading may be required to install a buttress engineered fill to final grade elevations. Due to the presence of earthflow material upslope of the upper loop of Shuck Drive, where a level catchment and buffer area is not provided between the structure and an uphill slope, a catchment wall may be necessary to protect

against the potential for impact from uphill mudflows.

Due to the slope and variable rock and groundwater conditions existing at this focused study area, it is anticipated that the preferred foundation system would likely be drilled, cast in place reinforced concrete piers that extend into the underlying non-yielding bedrock.

Student Village

As previously described, this study originally consisted of four separate subareas for focused study. The northern most subarea, located above Storer Drive is overlain by a shallow mudflow area, underlain by residual soils resulting from the weathering of the underlying parent bedrock. The depth to non-yielding bedrock in this area ranges from 2 to 8 feet below existing grade. Based upon the slope and site conditions, this subarea could be developed with surface grading and drainage controls, and with either stepped, conventional footing foundation system, or a pier and grade foundation system. It is our understanding that this subarea is not being considered for development at this time.

Two subareas on the central portion of this focused study area lie upon a constructed pad adjacent to either parking facilities or Truett Hall. The exploratory borings at this location encountered either shallow bedrock or up to 6 feet of fill, depending upon the location on this relatively level pad. As shown in the Conceptual Rendering for this focus area, it is proposed to develop this subarea with four separate buildings. The location of the buildings indicate that pier and grade beams will likely be required in order to provide a uniform bearing into non-yielding bedrock materials due the variable depth of fill and colluvial soil overlying the bedrock unit, and the proximity of a descending slope.

The remaining subarea of this study area is located within an existing level area adjacent to an ascending slope presently used as a playground and basket ball court. Exploratory borings within this subarea determined a variable depth to bedrock, with deeper soils up to 17 feet in thickness at the northern end of this subarea, and with bedrock material at the surface at the south end of this subarea. The north end encountered free ground water, and is consistent with the mapping of seepage areas on the slope above this site.

Development of this subarea would require surface grading, and likely require a pier and grade beam foundation system due to the variable depth to bedrock. It is our understanding that this subarea is not presently being considered for development at this time.

Chapel Hill

This focused study area is proposed to be the location for an amphitheater, that would require an excavation of on the order of 12 feet below presently existing grade. Subsurface exploration of this study area determined shallow, dense bedrock was present, with refusal to drilling encountered with the truck-mounted B-24 drill rig. The bedrock material encountered was a very dense sandstone and siltstone. Due to the fractured nature of this bedrock, it is believed that it is rippable using a dozer with hydraulic rippers.

Depending on the specific site development plan, this site may require the construction of retaining walls with subsurface drainage controls. Due to the density of the bedrock, it is likely that a conventional footing foundation system could be constructed for this site.

Seminary Vista West

This focused study area lies upon a level area adjacent to Chapel Drive and above a descending, south-facing slope. This descending slope is indicated on the Mitigation Measures Map (Appendix A, Figure A-2) as being a reconstructed, engineered fill slope. During our site review, it was noted that the slope had been graded and concrete v-ditches installed on benches for surface drainage control. Two exploratory borings were drilled on the flat pad area adjoining Chapel Drive. These borings encountered a very dense sandstone bedrock at shallow depth. Site development issues would be implementation of surface drainage controls, and a pier and grade beam foundation system, due the proximity of the descending slope.

Seminary Point

This focused study area includes Tichenor Village, and areas south of the Village adjoining a fire road, and a south-facing slope, just south of the President's House. Exploratory borings excavated for this study area encountered relatively shallow bedrock conditions, varying from near surface to up to 6 feet below existing grade. The south-east facing slope below the President's House is mapped as reconstructed, engineered fill slope. There are several areas mapped on the downslope below Chapel Drive and north of the Tichenor Village mapped as earthflows, some of which had subdrains installed. These areas should be considered as potentially unstable until mitigated by excavation of unstable soils and founding a reconstructed, buttress fill slope founded upon non-yielding bedrock materials. Several small earthflow deposits were mapped between the unpaved fire access road and Seminary Drive along the shoreline. The Conceptual Rendering (see Appendix C) indicates that several units are proposed for development on the slope descending from the unpaved fire access road. Some slope regrading will be required, including the installation of surface and subsurface drainage controls. Due to the variable site conditions and slope in this study area, it is recommended that a pier and grade beam foundation system be used.

Seminary Vista East

This focused study area lies upon an east-facing descending slope below Mission Drive. Two lobes of earthflow deposits was mapped on this site. Exploratory borings in this study area encountered road embankment fill, a wet, colluvial soil to depths up to 18 feet below grade. PRA's boring B-11 at the north end of this lot encountered silty sand and sandy clay to a depth of 6 feet, underlain by saturated, dark gray sandy silt and silty clay with rock fragments to a depth of 13 feet below grade, in turn underlain by a 3-foot thick, orange brown silty clay layer over a weathered sandstone bedrock. Free groundwater was encountered at a depth of 13 feet below existing grade.

Due to the presence of unstable soil deposits on this slope, site development would require extensive grading to remove this earthflow material and replace with a reconstructed engineered buttress fill with subsurface drainage controls. After reconstruction of the slope had been completed, any development would be required to be supported upon a deep pier foundation system.

ANTICIPATED LEVEL OF MITIGATION

The anticipated relative level of mitigation effort required for site development within the focused study areas is presented in Table 1. This table is subjective in that within each focused study area are different subareas and potential areas for development that may have varying degrees of mitigation required within the same focus area The table presents the list of focused study areas, the categories of Grading, Foundations, Drainage Controls, and Expansive Soils, and a subjective number within the matrix under each mitigation heading with 1 being relatively minor grading required to prepare the area to receive development, and 5 is considered when major areas of regrading is anticipated to be required for site development. Similarly, the anticipated relative complexity of foundation design and construction required for site development is also numerized. The extent of surface and subdrainage controls required for site development are indicated, and the relative level of mitigation to correct for the presence of expansive soils is also listed.

BROWN SANDY SILT (ML)
~~topsoil and fill~~

BROWN SANDSTONE (Bedrock)
highly weathered, partially decomposed, closely jointed, fine-grained, soft, friable.

used tungsten-carbide bit after 3'
(FRANCISCAN FORMATION)

Free water not encountered

NOTE:

All rocks encountered in this project belong to the Franciscan Formation, mainly sandstone and shale (Cretaceous). The sandstone is gray and brown, thickly bedded, medium-grained, containing grains of quartz and feldspar. The shale is generally well-bedded siltstone, dark gray, stained brown by iron oxides along joints.

*280 lbs. falling 30 inches.
Adjusted to SPT blows.
O.D. of California Sampler = 0.3 inch.

REV. NO.

EXPLANATION

Lithologic contact; dashed where approximate, dotted where concealed queried where uncertain

Strike and dip of bedding

Sheared bedrock

Shallow earthflows, slumps and colluvial soils

Scarp, number indicates height in feet

Seepage

Area of poor drainage

Area of gulley erosion

Test pit (SEE APPENDIX B FOR HERZOG LOGS)

Test boring (SEE APPENDIX B FOR HERZOG LOGS)

Estimated depth to competent material

Probe drill holes–depth to rock

Franciscan Rocks

- Ss SANDSTONE
- Sh SHALE
- Ss/Sh SANDSTONE AND SHALE
- Ch CHERT
- Sp SERPENTINITE
- Qm BAY MUD
- Qf FILL

INTRODUCTION AND SCOPE OF WORK

This report presents the results of our recent geotechnical reconnaissance and subsurface investigation of the Golden Gate Baptist Theological Seminary at Strawberry Point.

The purpose of this investigation was to evaluate the geotechnical feasibility of proposed additional developments at the Golden Gate Baptist Theological Seminary; to identify potential geotechnical hazards; and to discuss possible mitigation measures.

PREVIOUS WORK AND WORK PERFORMED

The geology and relative stability of the study area is included on a regional map prepared by the California Division of Mines and Geology (Rice and Smith, 1976). Local mapping of the site, at a scale of 1" = 100', was performed in 1979 by Consulting Engineering Geologist, Burton H. Marliave, as part of a field reconnaissance for Donald Herzog & Associates. The results of a geotechnical reconnaiassance were presented in our report dated October 22, 1979, and a supplemental revision of that report was submitted on November 9, 1979. A detailed soil investigation was performed for three areas of the planned expansion program, and the results were presented in our report to you dated August 31, 1979.

An additional geotechnical reconnaissance of the area was made in March 1982, and the results presented in our report dated March 22, 1982. Surface and subsurface geologic features were mapped at a scale of 1" = 100' on a topographic base with a 5 foot contour interval. On the basis of that reconnaissance, and in view of proposed Master Plan expansion, four areas were identified for subsurface exploration. These areas are:

(1) the southern portion of the property, between Chapel Drive and Seminary Drive, proposed for condominium construction;

(2) the central portion of the property, between Hodges Drive and Gilbert Drive, proposed for gymnasium and day care facility;

(3) the northwest portion of the property, northwest and southeast of Shuck Drive, proposed for student and faculty housing;

(4) the southeast portion of the property, southeast of Storer Drive, proposed for single-family residential construction.

Subsurface investigations of these areas were performed on April 13 and 14, and May 2, 1982 to the extent of 6 test borings and 4 exploratory probes using a truck-mounted hollow-stem auger rig, and 23 backhoe test pits. Our Registered Geologist located the test holes, logged the conditions encountered, and obtained bulk and undisturbed soil and rock samples for visual examination and laboratory

testing. The test holes were located as indicated on Plate 1. The logs of the test borings are presented on Plates 2 through 7. The soils are described in accordance with the Unified Soil Classification System presented on Plate 8. A definition of rock terms is presented on Plate 9. Summary logs of the test pits are presented on Plates 10-21.

SITE CONDITIONS

Topography

The site is on the Strawberry Peninsula in Southern Marin County (San Rafael 7-1/2 minute quadrangle). Ground elevations range from sea level in the southeast portion of the site to 235 feet above mean sea level datum along the northern property boundary. A large portion of the area has been modified with cuts and fills to develop building sites, roadways, and parking lots.

Natural slopes generally vary from 1-1/2 horizontal to 1 vertical (1/2:1) to 4:1, although slopes on several knolls and in former marshland areas are relatively flat. Natural areas are moderately vegetated with annual grasses and some large trees. The drainage is predominantly to the southwest, into Richardson Bay.

Geology

Rock outcrops within the area are sparse, except where exposed in cut slopes. Bedrock is composed of a heterogeneous mixture of Mesozoic-aged Franciscan rocks (Rice and Smith, 1976).

The property is underlain predominantly by sandstone and shale. The sandstone typically is brown to orange-brown, and varies from medium to coarse-grained; massive to thin bedded; moderately consolidated; intensely to moderately fractured; low to moderately hard; friable to moderately strong; and moderately to deeply weathered. Shales are gray to dark gray, and vary from thinly laminated to very thinly bedded; closely fractured to crushed; low to moderately hard; friable to weak; and moderately to deeply weathered.

The sandstone and shale is in contact with other "typical" Franciscan rocks that include graywacke sandstones, shale, chert, and serpentinite. The nature of the contract is structurally complex; in places appearing faulted and sheared, while other areas suggest depositional relationships.

Graywackes are commonly dark gray to brown; well consolidated; intensely to moderately fractured; moderately hard to strong; and moderately weathered.

Chert crops out in limited areas as well bedded, resistant blocks in a sheared shale and graywacke matrix, or as irregular inclusions within sandstone and shale. At one locale, the chert is in depositional contact with shale; and does not display the typical melange characteristics.

Serpentinite is rare and crops out in the southwest corner as a small block surrounded by shale and sandstone.

The bedrock within the area generally displays a localized uniform structural orientation. The sandstones, shales and cherts commonly trend in a northwest direction, and dip moderately to steeply to the northeast. Strikes vary from North 40 degrees West to East-West, and dip northerly from 17 to 85 degrees. Zones of shearing, where the rocks are highly fractured, altered and structurally disrupted, are evident in some areas. Surface and subsurface exposures of bedding planes displaying near vertical dips suggest faulted bedrock conditions along the western margin of the property. These conditions correlate with other structural attitudes, outside the property, that are evident to the northwest and southeast.

The northwest portion of the area was previously characterized as a "Melange" zone (Rice and Smith, 1976), and the presence of sheared shale and graywacke with chert inclusions (see Test Pits 13-16) tends to confirm this interpretation. The melange shear orientation coincides with other localized shears to the northwest. However, the uniform orientation of the chert, shale and sandstone, as well as the fact that the chert displays a graded depositional contact with the shale and sandstone, suggests that this area may not be as deformed as other typical Franciscan melange zones in the Coast Range.

Soils

Quaternary deposits in the area include residual soils, colluvium, landslide debris, bay mud and fill material. Soil depths may vary from less than 6 inches to over 15 feet. The soils on natural slopes are undergoing typical slow downslope transport in the form of creep, and the distinction between residual in-place soil and colluvium is often difficult to define.

Landslides, in the form of shallow earthflows (generally less than 10 feet deep), have occurred on natural slopes at the site. Flows are characaterized by well defined headwall scarps, hummocky topography, lobate or delta-shaped masses near the toe of the slide, and seepage zones. The earthflows appear to be shallow seated and restricted to unstable soils overlying bedrock. No new large scale earthflows resulting from the severe winter storms of 1982 were observed, and the extent of the slides that had been mapped in 1979 did not significantly increase as a result of the January 1982 record storm.

A few debris slides and slumps were noted during the field investigation. These slides were of small extent (several tens of square feet) and restricted to steep cut slopes and non-engineered fills. Most of these small failures appeared recent, and probably occurred during the January storm.

Bay mud is of limited extent and is restricted to areas in the southeast and west-central portion of the site. This material typically is an organic rich silt or clay of low strength and high compressibility. The bay mud deposit in the west-central portion of the area has been covered with fill and is not exposed at this time.

Fills are common throughout the area, and generally consist of a heterogeneous mixture of local sandstone and shale derived from previous site excavations.

Drainage

Seepage is common on slopes in the area; especially where cut slopes intersect the soil/rock interface. Areas of loose fill commonly display ponded water. Some drainage ditches were noted to be clogged and non-functional, and culverted drain pipes were occassionally noted to be draining onto unprotected slopes and fills, causing gulley erosion and rilling.

Areas of Subsurface Investigation

(1) **Lower Chapel Drive Area:** The area south of Lower Chapel Drive is presently proposed for condominium construction. Test boring data (Plates 2 and 3) indicate that approximately 20 feet of weak fill and soil material overlies bedrock in this area. Based on Boring 23 (previously

drilled), 24, and 25, the depth to bedrock south of Lower Chapel Drive appears relatively uniform. Bedrock encountered north of Chapel Drive (Boring 26, and Test Pits 2, 5, and 6) was relatively shallow. The bedrock surface, from the north of Chapel Drive to test holes south of Chapel Drive, dips at an approximate 4-1/2:1 slope.

Slopes north of Lower Chapel Drive have previously been mapped as landslide debris. Test pit exploration in the area (Pits 1-7 and 22-24) indicates that soil/rock horizons are variable in depth, and we conclude that the extent of sliding is not as great as previously indicated. Pits 2-7, near the base of the slope bordering Chapel Drive, showed bedrock depths that varied from 2 feet to over 12 feet. Pits midway upslope (1, 22-24) showed depths from 3 feet to over 15 feet.

(2) Hodges Drive-Gilbert Drive Area: This flat, open space is being considered for construction of a gymnasium and possibly a day care center. Test boring data (Plates 5, 6, and 7) indicate that the northern margin of the site contains approximately 7 feet of weak fill and sediment overlying bedrock. The depth to bedrock increases to the south (Plate 6), where 14 feet of fill and sediment overlie rock.

(3) Shuck Drive Area: The slopes throughout this

area are being considered for student and faculty housing construction. Test pit data (Pits, 23, 14, and 15) for the area east of Shuck Drive indicates that 3-1/2 to 4 feet of topsoil, colluvium and minor earthflow debris overlie bedrock consisting of sheared shale and graywacke.

Slopes west and south of Shuck Drive are variable in terms of soil depth and bedrock conditions. Test Pits 17, 18, 19 and 21 indicate that from 1/2 to 7 feet of residual and colluviual soil overly sandstone bedrock. Pit 16 indicates that 4 feet of soil overly sheared shale and graywacke. The overlying soils are stiff clays and are apparently expansive, that is, they experience volumetric changes with changes in moisture content. The sheared bedrock contains extensive clay areas, and the bedrock material is also considered to have moderate expansion potential.

(4) Storer Drive Area: The slopes along the southern extent of Storer Drive are presently being considered for single-family, multiple-story units. Test Pits (8-11) and previous test borings indicate that soil depths vary from 3 feet to over 12 feet. Bedrock lithologies vary from sandstone to shale.

SEISMICITY

There are no indications of active faulting within the site. Mapped shear zones are in bedrock and represent structural deformation during pre-Quaternary time. There are no landforms within the area which indicate geologically recent offsets within bedrock or soil.

Several northwest trending active fault zones are known to exist within several miles of the site (Jennings, 1975). The shortest distance from the site to these faults, the maximum credible magnitude predicted for each fault, and the peak bedrock acceleration expected within the site are given in Table 1.

TABLE 1. SEISMIC CHARACTERISTICS OF LOCAL FAULTS

Fault System	Distance From Site (Miles)	Maximum Credible Earthquake Magnitude(1)	Peak Bedrock Acceleration(2)
San Andreas (Northern Section)	6.5	8.3	.63 g
Hayward	11.5	7.5	.40 g
Healdsburg-Rodgers Creek	18.0	7.0	.25 g

(1) The maximum credible earthquake is the severest earthquake

that appears to be reasonably capable of occurring on a given fault under presently known geologic and seismologic conditions. The maximum credible earthquake magnitudes were assigned to the various faults by using curves fitted to a plot or Richter magnitude versus length of fault rupture for historic North American earthquakes (Slemmons, 1977; and Borchert, 1975).

(2) Peak bedrock accelerations have been extrapolated from data presented by Schnabel and Seed (1973). Peak acceleration curves are based on limited data, especially for source to site distances of less than 14 miles. Peak accelerations based on these curves may be too low when sites are close to the fault (Hays, 1980).

As with the entire San Francisco Bay Area, historical earthquake records indicate a potential for strong earthquake shaking within the area, and future earthquake shaking should be anticipated. When active faults around the area are compared in terms of distance from the site, maximum predicted magnitude and estimated peak bedrock acceleration, it appears that the San Andreas fault system potentially may produce the greatest ground shaking of the area.

Liquefaction

Liquefaction is the sudden decrease of the shearing resistance of a cohesionless soil, associated with a temporary increase in the pore fluid pressure. It involves a transformation of the material into a fluid mass, and is commonly caused by shock or strain associated with earthquake shaking. An area identified as having potential

liquefaction hazard was examined with test borings (Plates 5, 6, and 7) within the west-central portion of the site. However, the cohesive nature of the soils overlying bedrock indicate that the risk of liquefaction within this area is very low.

Tsunami Hazard

The west-central portion of the area is currently within a zone that may be inundated by tsunami waves that have a runup of 20 feet at the Golden Gate (Ritter and Dupre, 1972). A tsunami having a wave height or runup of 20 feet has an estimated frequency of occurrence of 200 years (Ritter and Dupre, 1972). Areas most likely to be inundated are marshlaands, tidal flats and former bay margin lands that are now artificially filled. However, data presented by Wiegel (1975), indicates that Ritter and Dupre's interpretation of run-up height are in error by a factor of 1/2. Thus, we conclude that the west-central area probably would not be affected by a Tsunami with a run-up height of 10 feet. Furthermpore, no devastating tsunami has been recorded within the San Francisco Bay Area, and we judge the likelihood of occurrence within the site to be small. In addition, Tsunami warning networks are well developed, and should allow ample time for evacuation, if necessary.

CONCLUSIONS AND RECOMMENDATIONS

Based upon the results of our Geotechnical Investigation, we judge that the site is suitable for the planned development from a geotechnical standpoint. The major geotechnical considerations are landslides, springs, downhill creep, compressible marsh deposits, and loose fill.

The landslides at the site appear to be dormant, and are only experiencing minor creep movement. However, the slide areas are more susceptible to creep movement than is the remainder of the site. In addition, slide reactivation could be caused by severe rainfall, irrigation, water from broken underground utilities, and/or ground shaking during earthquakes. The risk of future instability can be reduced by a variety of methods.

Where reactivation does not pose a significant risk to improvements or to neighboring property, no stabilization work may be necessary. However, in these areas, the risk of future instability could be significantly reduced by installing surface and subsurface drainage improvements.

Where existing or planned new improvements are located directly below landslide areas, the landslides can be retained by reconstucting the downhill portions as compacted earth buttresses. The buttresses would be constructed by excavating the slide debris; excavating wide level keyways into firm underlying rock; installing subsurface drainage facilities consisting of drain rock and perforated pipe sloped to drain to outlets by gravity; replacing the excavated material as compacted fill to create retaining dams for the slide debris upslope; and installing appropriate surface drainage improvements. A schematic section through a toe buttress is shown on Plate 20.

Where improvements are planned, next to or upslope of unrepaired landslide areas, it will be necessary to locate the improvements away from the landslides to allow for future landslide enlargement, or else to protect the improvements with crib walls or other retaining type structures.

Where improvements are planned in slide areas, it will be necessary to reconstruct the slide areas as compacted earth buttresses with subsurface drainage facilities. This will entail excavating the slide debris; excavating wide

level keyways into the firm underlying rock; installing subsurface drainage facilities consisting of drain rock and perforated pipe sloped to drain to an outlet by gravity; replacing the fill as a compacted earth buttress; and installing surface drainage improvements. Structures and improvements can then be located on the compacted buttress. It will be necessary to use drilled, cast-in-place, reinforced concrete pier foundations to accommodate minor differential settlement and creep of the reconstructed buttress.

Where a level catchment and buffer area is not provided between the structure and an uphill slope, a catchment wall will be necessary to protect against the slight, but real, chance from mudflows from above. Such catchment walls should typically extend about 4 feet above the ground level, and should either be designed to resist large forces (on the order of 120 pcf), or else angled 45 degrees to the slope so as to divert debris. Catchment walls will probably never be used, but are prudent safety measures.

The only relatively large slides observed at the site are located on the slopes immediately above Lower Chapel Drive. If structures are built adjacent to this slope, it will be necessary to reconstruct these slides as compacted earth buttresses with subsurface drainage facilities. However, if at least a twenty-five foot wide level buffer

area, such as a road, can be provided between the structures and the toe of the slope, we judge that adequate protection can be achieved by enhancing the slope stability with surface and subsurface drainage improvements, and by protecting improvements with a large catchment structure. The catchment structure should extend at least eight feet above the ground level at the toe of the slope.

Seepage on the slopes is being caused to a large extent by ponding water in poorly graded areas, and by the lack of properly maintained ditches to carry surface water away before it can soak into the ground. Seepage can contribute to pavement failure and to instability. It will be necessary to reduce seepage by shaping areas to drain; by installing and maintaining concrete lined interceptor ditches above cut and fill banks; and by installing drainage systems from areas where water accumulates. It will also be necessary to intercept observed seepage areas by means of subsurface drains consisting of drain rock and perforated pipe sloped to drain to outlets by gravity. Water from storm drains, roof downspouts, paved areas, and subdrains should be conducted into a storm drain system.

Natural surface soils and non-engineered fills become weak and compressible when wet; experience slow downhill creep on hillsides (on the order of a small fraction of an

inch per year) as is typical of Marin County hillsides; and are unsuitable for support of foundations or fill. On hillsides, it will be necessary to key fills into firm residual soil or rock beneath the colluvium and non-engineered fills. It will also be necessary to extend foundations on hillsides into firm rock and to design foundations to resist lateral forces caused by downhill creep of the soils above the rock. Where building pad excavations extend into firm rock, we anticipate that spread footing type foundations will be suitable. In other hillside areas, we judge that drilled, cast-in-place, reinforced piers extending well into underlying rock will be necessary. It will be necessary to design the piers to resist lateral forces caused by downhill creep of the soils above the rock.

Where the depth to rock on hillsides exceeds about eight feet, the lateral forces caused by downhill creep become so large that required foundations are relatively expensive and perhaps even uneconomical. These areas should be avoided for construction; or the depth to rock reduced by site grading; or the creep forces eliminated by rebuilding these slopes as compacted earth buttresses with subsurface drainage facilities. The only potential development area where this may be necessary is in the center of the swale in the area below Storer Drive.

Where expansive soils are encountered, it will be necessary to deepen foundations to below the zone of significant seasonal moisture variation. In expansive areas, it will also be necessary to either underlie slabs with a moisture protecting and confining blanket of at least two to three feet of nonexpansive fill. Alternately, supported floors above grade could be used.

The colluvium which blankets the site is relatively weak and is subject to sloughing in steep cut banks. Cut banks in colluvium should be no steeper than 2:1, while cut banks in firm rock may be as steep as 1-1/2:1. Fill banks should be no steeper than 2:1. Existing cut banks have established deep rooted ground cover and have been time tested. Where periodic removal of debris is acceptable, these banks can remain.

Areas to receive fill should be prepared by scarifying to a depth of at least six inches, moisture conditioning as necessary, and compacting to at least 90 percent of the maximum dry density of the material per ASTM D-1557-79(C) laboratory compaction test procedure. Where fills are to be placed on hillsides, level keyways should be excavated into firm rock. Subsurface drainage systems, consisting of perforated pipe and drain rock, should be placed at the rear of the keyways as recommended by the Soil Engineer.

Fill material should then be spread in thin lifts, moisture conditioned as necessary, and compacted to at least 90 percent relative compaction. On hillsides, the fill should be continually keyed into firm rock.

The fill in the level area adjacent to Seminary Drive, between Hodges Drive and Gilbert, is underlain by soft and compressible marsh deposits known as bay mud. However, these marsh deposits are relatively thin and the majority of settlement due to existing fill loads has occurred. Foundation loads and/or additional fill loads would cause additional settlement to occur. We anticipate that approximately 2 inches of settlement will occur for each foot of additional fill placed. Foundation loads typical of single-story, wood-frame buildings would cause another inch or two of settlement to occur. We anticipate that differential settlements will be on the order of 25 percent of total settlements. Based on experience with similar projects, we anticipate that one and/or two-story, wood-frame structures in this area can be satisfactorily supported on stiff foundations supported on compacted or re-compacted fill. However, if the anticipated differential settlements are unacceptable, and/or if larger structures are planned, pile or pier foundations extending into the underlying rock will be necessary. The rock is relatively shallow, and the piles or piers should be relatively inexpensive.

The area between Lower Chapel Drive and Seminary Drive is blanketed with several feet of heterogeneous fill. Light settlement tolerant structures could be supported on stiffened spread footing foundations supported in a few feet of recompacted fill. However, the larger structures planned would impose unacceptably high bearing pressures, and are typically not settlement tolerant. It will be necessary to support these buildings on drilled, cast-in-place, reinforced concrete piers extending through the soil and into the firm underlying rock. The surface of the rock slopes flatter than 4:1, and the fill should not experience significant downhill creep. It will be necessary to recompact at least the upper three feet of fill in order to provide satisfactory support for roads and driveways. It will also be necessary to design utilities in the area with frequent flexible connectors to accommodate minor differential settlement. We judge that properly engineered utilities will perform satisfactorily with only normal maintenance.

The fill on the downhill side of Seminary Drive, opposite its intersection with Storer Drive, is also relatively deep and was placed on a hillside. It will be necessary to support units in this area on drilled piers extending into rock, and to set back at least 20 feet from the top of the bank in order to reduce the risk of potential instability.

We believe that there are no active faults at the site, and, therefore, little risk of fault related ground rupture during earthquakes. Like the entire Mill Valley area, the site is subject to severe ground shaking during earthquakes. It will be necessary to design and construct the project in strict accordance with current standards for earthquake resistant construction.

SUMMARY

In summary, we judge that the proposed project is feasible from a geotechnical standpoint. With proper engineering and construction, the risk of geotechnical problems should be well within the range generally associated with construction on similar sites in the Bay Area.

SUPPLEMENTAL WORK

Prior to developing precise building plans, detailed soil investigations, including additional subsurface exploration and laboratory testing should be performed. The results should be analyzed to provide the following geotechnical information:

1. A description of the soil conditions observed.
2. Seismic design recommendations.
3. Site grading recommendations.
4. Recommended foundation type(s) and design criteria.
5. Retaining wall design criteria.
6. Recommendations for slab-on-grade construction, if applicable.
7. Soil engineering drainge recommendations.

SOIL CLASSIFICATION CHART AND KEY TO TEST DATA

PLATE 8

ENGINEERING GEOLOGIC TERMS FOR ROCK

Relative Numerical Scale			
STRUCTURAL SPACING			
B-7	MASSIVE	more than 2 meters	more than 6 feet
B-6	THICKLY-BEDDED	60 cm - 2 meters	2 - 6 feet
B-5	MEDIUM-BEDDED	200 mm - 60 cm	8 - 24 inches
B-4	THINLY-BEDDED	20 - 60 mm	2-1/2 - 8 inches
B-3	VERY THINLY BEDDED	10 - 60 mm	3/4 - 2-1/2 inches
B-2	CLOSELY-LAMINATED	6 - 20 mm	1/4 - 3/4 inches
B-1	VERY CLOSELY-LAMINATED	less than 6 mm	less than 1/4 inch
JOINT, FRACTURE OR SHEAR SPACING			
J-6	VERY WIDELY-SPACED	more than 2 meters	more than 6 feet
J-5	WIDELY-SPACED	60 cm - 2 meters	2 - 6 feet
J-4	MODERATELY WIDELY-SPACED	200 mm - 60 cm	8 - 24 inches
J-3	CLOSELY-SPACED	60 - 200 mm	2-1/2 - 8 inches
J-2	VERY CLOSELY-SPACED	20 - 60 mm	3/4 - 2-1/2 inches
J-1	EXTREMELY CLOSELY-SPACED	less than 20 mm	less than 3/4 inch

HARDNESS		
H-1	SOFT	can be dug by hand and crushed with fingers, plastic (capable of being molded)
H-2	MODERATELY HARD	friable (grains poorly cemented), can be gouged deeply with knife and will crumble readily under light hammer blows
H-3	HARD	knife scratch leaves dust trace, will withstand a few hammer blows before breaking
H-4	VERY HARD	scratched with knife with difficulty, difficult to break with heavy ringing hammer blows
DEGREE OF WEATHERING		
W-1	HIGHLY WEATHERED	abundant fractures coated with oxides, carbonates, sulphates, mud, etc., through discoloration, rock disintigration, mineral decomposition
W-2	MODERATELY WEATHERED	some fracture coating, moderate or localized discoloration, little to no affect on cementation, slight mineral decomposition
W-3	SLIGHTLY WEATHERED	a few strained fractures, slight discoloration, little or no affect on cementation, no mineral decomposition
W-4	FRESH	unaffected by weathering agents, no appreciable change with depth

TEST PITS

	Depth (Inches)	Description
1.	0- 20	Topsoil; dark brown silty sand, loose, wet
	20- 56	Colluvium/Residual soil; light brown sand (SP) and clayey sand (SC), loose to moderately dense, wet to saturated)
	56- 84	Weathered rock; yellow-brown sandstone and interbedded gray shale, closely fractured, low hardness, friable to weak, moderately weathered, extensive seepage at 78 inches
2.	0- 12	Topsoil; dark brown sandy silt (ML), loose, moist
	12- 19	Colluvium/Residual soil; mottled, yellow, orange-brown sandy clay (CL) with sandstone and shale fragments, moderately stiff, moist
	19- 21	Weathered rock; gray clayey gravel (GC) weathered shale fragments
	21- 42	Rock; gray shale, well consolidated, very thin-bedded, vertically dipping, closely fractured, moderately hard, moderately strong, moderately weathered

3.	0- 20	Topsoil; dark brown clayey sand (SC), loose, wet
	20- 35	Colluvium; dark brown sandy clay (CL) with rock fragments, seepage at 25 inches, moderately stiff, saturated
	35- 55	Colluvium; mottled orange-brown-gray, gravelly clay (CL), stiff, saturated
	55- 80	Colluvium (?); mottled orange-brown gravelly clay (CL), stiff to very stiff, saturated.
	80- 90	Weathered rock; orange-brown-gray weathered siltstone, poorly consolidated, low hardness, friable, deeply weathered
4.	0- 20	Topsoil; dark brown sandy clay (CL), moderately stiff, wet
	20- 26	Colluvium; mottled gray-orange-brown sandy clay (CL), moderately stiff, saturated, seepage at 24 inches, grades into lower material
	26-114	Colluvium; mottled orange-brown-gray clay, very stiff, sataurated, becomes grayer and siltier at 72 inches
5.	0- 9	Topsoil; dark brown clayey sand (SC), loose, wet
	9- 11	Residual soil; orange-brown and gray sand (SP) to sandy clay (CL), moderately dense to dense, wet
	11- 66	Weathered rock; orange-brown sandstone with gray clay seams, moderately consolidated, closely to intensely fractured, low to moderately hard, weak to friable, seepage at 12 inches

6.	0- 7	Topsoil; dark brown clayey sand (SC), loose, wet to saturated, seepage at 7 inches
	7- 36	Weathered rock; orange-brown sandstone with gray clay seams, moderately consolidated, closely fractured, low hardness, weak to friable, moderately to deeply weathered
7.	0- 18	Topsoil; dark brown sandy silt (ML), loose, moist
	18- 28	Colluvium; mottled rusty brown gravelly clay (CL), moderately stiff, wet to saturated, seepage at 28 inches
	28- 60	Colluvium; mottled gray-rust brown sandy clay (CL), stiff, saturated to wet
	60- 82	Residual soil; yellow-brown sandy clay (CL), very stiff, wet
	82- 90	Weathered rock; mottled gray-orange-brown siltstone grades into orange brown sandstone, poor to moderately consolidated, intensely fractured, low hardness, friable, deeply weathered

8.	0- 7	Topsoil; dark brown silt (ML), loose, moist
	7- 23	(?)Fill; brown sand (SP) and sandstone fragments, moderately dense, wet
	23- 29	Colluvium; brown clay (CL), stiff wet
	29- 31	Residual soil; gray clay (CL), moderately stiff, wet
	31- 48	Rock; gray shale, moderately to well consolidated, very thin-bedded, bedding N70W, 46NE, intensely to closely fractured, moderaetly hard, weak to moderately strong, moderately weathered
9.	0- 18	Topsoil; dark brown silt (ML), loose, moist to wet
	18- 34	Residual soil; red-brown sandy silt (ML), moderately stiff, wet
	34- 52	Weathered rock; brown sandstone, moderately consolidated, thin-bedded, bedding N64W, 56NE, closely to intensely fractured, moderately hard, weak to moderately strong, moderately weathered, seepage at 48 inches

10.	0- 24	Topsoil; dark brown silt (ML), with brown sandstone fragments, grades into lower material, loose, moist
	24- 55	Colluvium; brown clayey sand (SC), moderately dense, wet
	55- 68	Colluvium; brown clay (CL) with minor amount of sand, very stiff, saturated, seepage at 56 inches
	68-150	Colluvium/Residual soil; mottled orange-brown silty clay (CL), with rock fragments, stiff, saturated to wet--appears to resemble highly weathered rock at bottom of pit
11.	0- 20	Topsoil; dark brown silt (ML), loose, moist
	20- 52	Colluvium; dark brown silt (ML) with sandstone rock fragments, moderately stiff, wet
	52- 96	Colluvium; mottled orange-brown sandy clay (CL), stiff, wet to saturated, seepage at 60 inches, grades into lower material
	96-108	Residual soil/Weathered rock; mottled orange-gray-brown siltstone, poorly consolidated, intensely fractured, low hardness, friable, deeply weathered
	108-122	Weathered rock; mottled orange-gray-brown siltstone and brown sandstone, properties as above
12.		Not dug

13.	0- 22	Topsoil; dark brown clayey silt (ML), loose, wet
	22- 28	Residual soil; mottled gray-brown sandy clay (CL) with shale fragments, moderately stiff, wet
	28- 40	Residual soil; mottled yellow-gray clayey sandy silt (ML), with shale fragments, stiff, moist
	40- 76	Weathered rock/rock; gray sheared shale with some inclusions of graywacke, crushed to intensely fractured, low hardness, friable, deeply weathered
	76-104	Rock; dark gray graywacke sandstone, well consolidated, closely fractured, hard, strong, moderately weathered
14.	0- 20	Topsoil; dark brown silt (ML), loose to moderately stiff, moist
	21- 30	Earthflow; red-brown clayey sand (SC) to gravelly sand (SP), loose wet, grades into lower material
	30- 46	Earthflow; light red-brown clayey gravel (GC) with brown sandstone fragments, loose, saturated, seepage at 40 inches
	46- 47	Residual soil; yellow-gray clay (CL) with shale fragments, moderately stiff, saturated, grades into lower material
	47-120	Weathered rock/rock; gray sheared shale and graywacke with light gray clay seams, intensely fractured, low to moderately hard, friable to weak, deeply weathered

15.	0- 16	Topsoil; dark brown clayey sand (SC), loose, wet
	16- 27	Earthflow; red-brown clayey sand (SC) to sand (SP) with small sandstone fragments, loose, saturated, seepage at 17 inches
	27- 28	Colluvium; mottled red-brown-yellow sandy clay (CL), moderately stiff, wet to saturated
	28- 37	Residual soil; mottled yellow-gray clay (CL) with fragments of chert and graywacke, very stiff, wet to moist
	37- 46	Residual soil; gray clay with shale and graywacke fragments, very stiff, moist
	46- 68	Rock; gray sheared shale and graywacke, low hardness, friable, deeply weathered, moist to dry, intensely sheared areas are predominantly clay
	68- 72	Rock; gray graywacke, well consolidated, closely to moderately fractured, hard, strong, moderately weathered, dry

16.	0- 13	Topsoil; dark brown sandy clay (CL), loose to moderately stiff, wet to saturated, seepage at 13 inches
	13- 47	Residual soil; gray clay (CL) with occasional rock fragments of graywacke and chert, very stiff, expansive
	47- 96	Weathered rock; momttled green-yellow-gray clay (CL) intermixed with sheared shale and graywacke, poorly consolidated, intensely fractured to crushed, low hardness, friable to plastic, deeply weathered; clay is stiff, wet to moist
17.	0- 7	Topsoil; dark brown sandy silt, loose, moist
	7- 19	Weathered rock; yellow-brown sandstone, moderately consolidated, intensely fractured, low hardness, friable to weak, grades into lower material
	19- 22	Weathered rock; yellow-brown clay (CL), moderately stiff, saturated, seepage at 19 inches
	22- 24	Weathered rock; gray clay (CL), moderaetly stiff, wet
	24- 72	Rock; gray shale and yellow-brown sandstone with gray clay seams, moderately consolidated, intensely fractured, moderately hard, friable to weak, deep to moderately weathered

18.	0- 20	Topsoil; dark brown silt (ML), loose, wet
	20- 39	Colluvium; red-brown sandy clay (CL), stiff, wet to saturated, seepage at 26 inches
	39- 55	Colluvium; mottled yellow-brown sandy clay (CL), stiff, saturated to wet
	55- 78	Weathered rock/rock; yellow-brown sandstone, moderately fractured, low to moderately hard, friable to weak, moderately weathered
19.	0- 6	Topsoil; dark brown silty sand (SM), loose, wet to saturated, seepage at 4 inches
	6- 52	Rock; yellow-brown sandstone, moderately consolidated, closely fractured, weak to friable, moderately hard, moderately weathered

20.	0- 16	Topsoil; dark brown sandy silt (ML), loose, wet to saturated, seepage at 7 inches
	16- 30	Earthflow; gray-brown clayey sand (SC), moderately dense, saturated
	30- 60	Earthflow; yellow-brown slightly sandy clay (CL), stiff, saturated
	60- 76	Colluvium; mottled yellow-brown-gray clay (CL), very stiff, saturated
	76- 89	Weathered Rock; mottled yellow-brown-gray silstone anad sandstone with clay fracture filling, poorly consolidated, intensely fractured, low hardness, friable, deeply weathered
	89- 91	Rock; yellow-brown sandstone, moderate consolidation, intensely fractured, low to moderately hard, friable to weak, moderately weathered

21.	0- 30	Topsoil; dark brown silt (ML), loose, moist
	30- 44	Colluvium/residual soil; orange-brown sandy silt (ML) with rock fragments, moderately stiff, wet
	42- 62	Residualsoil/weathered rock; orange-brown-gray siltstone, poorly consolidated, intensely fractured, low hardness, friable, deeply weathered, moist
	62- 72	Rock; gray-brown shale and orange-brown sandstone, moderately consolidated, intensely fractured, moderately hard, weak, moist
22.	0- 12	Topsoil; dark brown silt (ML), loose, moist to wet
	12-108	Colluvium; mottled yellow-brown-red gravelly silt (ML), moderately stiff, saturated and prone to caving, seepage at 48 inches
	108-120	Rock; yellow-brown sandstone, moderately consolidated, moderately hard, weak, moderately weathered

23.	0- 27	Topsoil; dark brown silt (ML), loose moist
	27- 36	Colluvium; mottled orange-brown clayey silt (ML) with sandstone fragments, stiff, wet to saturated, seepage at 34 inches
	36- 52	Rock; orange-brown sandstone, moderately consolidated, closely to intensely fractured, moderately hard, weak, moderately weathered
24.	0- 48	Topsoil/earthflow; dark brown silt (ML) with sandstone fragments, loose to moderately stiff, wet to saturated, seepage at 41 inches
	48- 72	Colluvium; mottled orange-brown clay (CL) with rock fragments, moderaetly stiff to very stiff, saturated
	72-160	Colluvium/residual soil; mottled yellow-brown-gray clay (CL) with rock fragments, stiff to very stiff, saturated to wet--starting to appear as residual soil in bottom.

SHERWOOD LOVEJOY, JR.
ENVIRONMENTAL ASSESSOR
CONSULTING HYDROGEOLOGIST

CERTIFICATION

"WE DECLARE THAT, TO THE BEST OF OUR PROFESSIONAL KNOWLEDGE AND BELIEF, WE MEET THE DEFINITION OF ENVIRONMENTAL PROFESSIONALS AS DEFINED IN §312.10 OF THIS PART."

"WE HAVE THE SPECIFIC QUALIFICATIONS BASED ON EDUCATION, TRAINING, AND EXPERIENCE TO ASSESS A PROPERTY OF THE NATURE, HISTORY, AND SETTING OF THE SUBJECT PROPERTY. WE HAVE DEVELOPED AND PERFORMED THE ALL APPROPRIATE INQUIRIES IN CONFORMANCE WITH THE STANDARDS AND PRACTICES SET FORTH IN 40 CFR PART 312."

LIMITATION

THIS PHASE I - ENVIRONMENTAL SITE ASSESSMENT REPORT (REPORT) HAS BEEN PREPARED BY THE CONSULTING GROUP (TCG) FOR THE EXCLUSIVE USE OF TCG AND NORTH COAST LAND HOLDINGS, LLC (CLIENT), AND NOT FOR USE BY ANY OTHER PARTY. ANY USE BY A THIRD PARTY OF ANY OF THE INFORMATION CONTAINED IN THIS REPORT SHALL BE AT THEIR OWN RISK AND SHALL CONSTITUTE A RELEASE AND AN AGREEMENT TO DEFEND AND INDEMNIFY TCG FROM AND AGAINST ANY AND ALL LIABILITY IN CONNECTION THEREWITH WHETHER ARISING OUT OF TCG'S NEGLIGENCE OR OTHERWISE.

ALL INTERPRETATIONS, CONCLUSIONS, AND RECOMMENDATIONS ARE BASED SOLELY ON INFORMATION GATHERED DURING THIS INVESTIGATIVE STAGE AND ON NO OTHER UNSPECIFIED INFORMATION. THIS REPORT IS PREPARED AS A TOOL FOR THE CLIENT TO USE IN DETERMINING THE CONDITION OF THE SUBJECT PROPERTY. THIS REPORT MAKES NO CERTIFICATION, EITHER IMPLIED OR OTHERWISE, THAT THE SUBJECT PROPERTY IS FREE FROM CONTAMINATION; IT SIMPLY REPORTS THE FINDINGS OF THE STUDY. SAMPLING, IF PERFORMED, IS SO SAMPLE SPECIFIC THAT IF CONTAMINANTS ARE NOT FOUND IN A SAMPLE IT DOES NOT UNIVERSALLY SUGGEST THAT THERE ARE NONE OF THESE CONTAMINANTS PRESENT AT THE SUBJECT PROPERTY. IT WOULD BE EXTREMELY DIFFICULT, IMPRACTICAL AND COSTLY TO CERTIFY THAT A SUBJECT PROPERTY WAS COMPLETELY FREE OF CONTAMINANTS AND A PHASE I - ENVIRONMENTAL SITE ASSESSMENT IS NOT INTENDED TO DO SO.

THE RESULTS AND FINDINGS CONTAINED IN THIS REPORT ARE BASED ON CERTAIN INFORMATION FROM SOURCES OUTSIDE THE CONTROL OF TCG. WHILE EXERCISING ALL REASONABLE DILIGENCE IN THE ACCEPTANCE AND USE OF INFORMATION PROVIDED, TCG DOES NOT WARRANT OR GUARANTEE THE ACCURACY THEREOF. THE REPORT WAS DEVELOPED SPECIFICALLY FOR THIS PROJECT (GOLDEN GATE BAPTIST SEMINARY, STRAWBERRY, MILL VALLEY, CA) AND SHOULD NOT BE USED FOR ANY OTHER SITE.

THIS REPORT IS COVERED BY COPYRIGHT LAW. ANY REPRODUCTION, EITHER IN TOTAL OR IN PART, WITHOUT THE PERMISSION OF TCG IS PROHIBITED.

EXECUTIVE SUMMARY

This report presents the findings of the Phase I - Environmental Site Assessment (Phase I) performed by The Consulting Group (TCG) in Mill Valley, California along Seminary Drive and East Strawberry (Subject Property). The Phase I was performed in accordance with the American Society of Testing Materials (ASTM) practice standards E1527-13, California State and Local Requirements and the EPA regulation – All Appropriate Inquiry (AAI).

The Subject Property is located (Figures 1 through 5) in a Residential area of Mill Valley, in a district known as Strawberry. The Subject Property is a Baptist seminary with a main building, several residential buildings (both dorms and multi-residential condominiums) and undeveloped grasslands. The Phase I consisted of inspection of the property and the surrounding area.

Inspection of the Subject Property revealed some of potential concern, but these possible environmental concerns are not part of a normal Phase I, so they are presented as possible concerns. There are no "Recognized Environmental Conditions" (RECs), "Controlled Recognized Environmental Conditions" (CRECs) or "Historical Recognized Environmental Conditions" (HRECs), on the Subject Property or the adjacent properties.

Table ES.1 - Items Noted in Address

Address	Non-REC	REC	CREC	HREC
Golden Gate Baptist Seminary	Suspect Asbestos Containing Material (ACM) Suspect Lead Based Paint (LBP) and Lead Containing Paint (LCM) Suspect Mercury Switches and Fluorescent Tubes Suspect PCB Light Ballasts	NONE	NONE	NONE
Notes: REC = Recognized Environmental Condition, CREC = Controlled Recognized Environmental Condition [subset of REC], HREC = Historical Recognized Environmental Condition				

The adjacent parcels are used as:

- Residential and some Commercial uses to the west/east/south/north.

A neighborhood/area drive-by did not reveal potential environmental issues (listed sites) that can be classified as RECs, CRECs or HRECs. The closest listed potential is for an Historic Auto Repair, but there is no evidence, other than the address, of its presence. The listed sites within a ¼ mile do not appear to have the potential to affect the Subject Property.

Regulatory agency databases and other sources were reviewed to determine environmental conditions at the Subject Property, adjacent properties, and/or nearby properties that may affect the Subject Property. Radii of zero miles to over one-mile were established, depending on database searched, for the search.

The Subject Property is a Baptist seminary (Figures 3 and 4). The subject property was not identified on any of the databases searched.

Adjacent/nearby or vicinity properties were identified on the following Federal, State, or regional databases[1]:

- (**LUST REG 2**) Fuel Leak List Leaking Underground Storage Tank locations. Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano, Sonoma counties.
- (**LUST**) Geotracker' s Leaking Underground Fuel Tank Report Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state. For more information on a particular leaking underground storage tank sites, please contact the appropriate regulatory agency.
- (**SLIC**) Statewide SLIC Cases, the SLIC (Spills, Leaks, Investigations and Cleanup) program is designed to protect and restore water quality from spills, leaks, and similar discharges.
- (**SLIC REG 2**) Spills, Leaks, Investigation & Cleanup Cost Recovery Listing The SLIC (Spills, Leaks, Investigations and Cleanup) program is designed to protect and restore water quality from spills, leaks, and similar discharges.
- (**RCRA-SQG**) RCRA - Small Quantity-RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites, which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.
- (**RCRA-LQG**) RCRA - Large Quantity Generators RCRA Info is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites, which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.
- (**ERNS**) Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.
- (**ENVIROSTOR**) EnviroStor Database The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifies sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor

[1] The listings are color-coded: Environmental Concern, Operating Permit, or On-List.

provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

- (**UST**) Active UST Facilities Active UST facilities gathered from the local regulatory agencies
- (**CA FID UST**) Facility Inventory Database The Facility Inventory Database (FID) contains a historical listing of active and inactive underground storage tank locations from the State Water Resource Control Board. Refer to local/county source for current data.
- (**HIST UST**) Hazardous Substance Storage Container Database The Hazardous Substance Storage Container Database is a historical listing of UST sites. Refer to local/county source for current data.
- (**SWEEPS UST**) SWEEPS UST Listing Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.
- (**DEED**) Deed Restriction Listing Site Mitigation and Brownfields Reuse Program Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.
- CHMIRS: California Hazardous Material Incident Report System California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).
- (**RCRA NonGen / NLR**) RCRA - Non Generators RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites, which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.
- (**CORTESE**) "Cortese" Hazardous Waste & Substances Sites List The sites for the list are designated by the State Water Resource Control Board (LUST), the Integrated Waste Board (SWF/LS), and the Department of Toxic Substances Control (Cal-Sites).
- (**HIST CORTESE**) Hazardous Waste & Substance Site List. The sites for the list are designated by the State Water Resource Control Board [LUST], the Integrated Waste Board [SWF/LS], and the Department of Toxic Substances Control [CALSITES]. This listing is no longer updated by the state agency.
- (**NOTIFY 65**) Proposition 65 Records Listings of all Proposition 65 incidents reported to counties by the State Water Resources Control Board and the Regional Water Quality Control Board. This database is no longer updated by the reporting agency.
- **(DRYCLEANERS**) Cleaner Facilities A list of drycleaner related facilities that have EPA ID numbers. These are facilities with certain SIC codes: power laundries, family and commercial; garment pressing and cleaner's agents; linen supply; coin-operated laundries and cleaning; dry cleaning plants, except rugs; carpet and upholster cleaning; industrial launderers; laundry and garment services.
- **(ENF**) Enforcement Action Listing A listing of Water Board Enforcement Actions. Formal is everything except Oral/Verbal Communication, Notice of Violation, Expedited Payment Letter, and Staff Enforcement Letter.
- (**HAZNET**) Facility and Manifest Data Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the

manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

- (**HWP**) EnviroStor Permitted Facilities Listing Detailed information on permitted hazardous waste facilities and corrective action ("cleanups") tracked in EnviroStor.
- (**EDR US Hist Auto Stat**) EDR Exclusive Historic Gas Stations Database has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.
- **(EDR US Hist Cleaners**) EDR Exclusive Historic Dry Cleaners Database has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.
- (**RGA LUST**) Recovered Government Archive Leaking Underground Storage Tank The EDR Recovered Government Archive Leaking Underground Storage Tank database provides a list of LUST incidents derived from historical databases and includes many records that no longer appear in current government lists. Compiled from Records formerly available from the State Water Resources Control Board in California.

A discussion regarding the sites identified, and their impact to the Subject Property, is included in the text of the report.

The historic information gathered and reviewed showed generally good correlation and nothing out of the ordinary. For the environmental liens, none were found and no use restrictions were recorded. Historical information was gathered to identify potential environmental concerns due to historical activities. Information gathered[2] was from:

- United States Geological Survey (USGS) Historical Topographical Maps,
- Historical Aerial Photographs,
- A City Directory,
- Environmental Liens and AULs,
- Geotracker, and
- Client-provided Aerial Map with Lot outlined (Figure 4).

The geology of the area is Alluvium (clayey silts and sands) extending to at least six feet below grade (fbg), but more likely, this soil type extends to about 15-20 fbg. Below this is weathered and unweathered bedrock. The Subject Property does not appear to sit on any active faults, but to the west is the San Andreas Fault, to the east is the Hayward Fault, and to the northeast is the

[2] There were no Sanborn Maps available and no Building Permits were found for the subject property.

Rogers Creek Fault, all of which can cause earth movement. The shallow groundwater in the area is in contact with the atmosphere (Water Table Condition), and appears to be variable. Regional flow is toward the bay and can be affected by topography, rainfall, and/or groundwater pumping.

As the VEC report indicates, there is no direct evidence of vapor intrusion at the Subject Property, and the fourteen (14) sites listed as possible have been dismissed in the VEC report. The report is included as Appendix 11.

A review of the radon results provided in the physical setting section of the Radius Map™ Report with GeoCheck® indicates that radon in the area is not a problem.

There is no direct environmental evidence with regard to the subsurface at the Subject Property or vicinity of impact. The Subject Property is currently a Baptist seminary, which was previously undeveloped land.

We are not recommending any further investigation. However, during any renovation or demolition activities, we recommend:

- Following all ACM and LCM regulations and requirements with regard to identifying, handling, and disposal, and
- Following all HAZMAT regulations and requirements with regard to identification, characterization, waste and debris disposal, and recycling.

1.0 - INTRODUCTION

1.1 - INTRODUCTION

This report presents the findings of the Phase I - Environmental Site Assessment (Phase I) performed by The Consulting Group (TCG) in Mill Valley, California bounded by Seminary Drive and East Strawberry Drive (Subject Property) [Figures 1 through 5]. The Phase I[3] was performed in accordance with the American Society of Testing Materials (ASTM) practice standard #E1527-13, California Requirements and the EPA regulation – All Appropriate Inquiry (AAI).

1.2 - SCOPE-OF-WORK

The Phase I study is a non-intrusive study that looks at the property, its history, and surroundings. During this project, the following scope-of-work was performed for the Phase I:

1. Site Inspection, including: Subject Property and Boundary Walk;
2. Area/Neighborhood Drive-By;
3. Search and Review of Federal, State, and Regional Databases;
4. Search and Review of Historical Topographs, Sanborn® Maps[4], Aerial Photographs, and a City Directory;
5. Search and Review of Environmental Liens and AULs, Property Tax Map, and Building Permits;
6. Search and Review of Geology, Hydrogeology, Groundwater Well information, Radon review, and a Vapor Encroachment Concern Screen Report;
7. Preparation of a Technical Report.

This document represents the technical report task of the project. Section 2 of this report describes the Subject Property Inspection and Questionnaire results; while Section 3 presents the database search and review. Section 4 presents the historical information including: maps, photos, city directory, environmental liens, and building permits. Section 5 presents the geology and hydrogeology of the area, any wells found in the area, and whether vapor intrusion should be considered an issue; while Section 6 presents our observations, conclusions, and recommendations. Section 7 presents references. Figures and Appendices are attached in support of the information presented below.

[3] The research conducted for this study and the report prepared are in general conformance with the EPA "All Appropriate Inquiries" standard and the ASTM 1527-13 "Standard Practices for Environmental Site Assessments: Phase I Environmental Site Assessment Process". The primary purpose for performing a Phase I ESA is to "…permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations (commonly known as Landowner Liability Protections) listed in Comprehensive Emergency Response Compensation and Liability Act (CERCLA) liability." (ASTM, 2013) Further, it is the goal of this study to identify business risks associated with the property associated with environmental conditions.

[4] Sanborns were not available for this site, the certification is found in Appendix 5.

2.0 - SUBJECT PROPERTY INSPECTION

2.1 - INTRODUCTION

On 09 May 2014 Sherwood Lovejoy Jr. inspected the address that makes up the parcels **#043-261-25, 043-261-26, 043-262-03, 043-262-06, 043-401-05, 043-401-10, 043-401-16, 043-402-03, 043-402-06 (**Subject Property), and its boundaries with other properties. An Area/Neighborhood Drive-by was also performed during this inspection.

2.2 - SUBJECT PROPERTY DESCRIPTION

The Subject Property is located in a commercial/residential area bounded by Seminary Drive and East Strawberry Drive, in Mill Valley, California (Figures 1 through 5). The Subject Property is a Baptist seminary. The Assessors Parcel Numbers (APNs) are **#043-261-25, 043-261-26, 043-262-03, 043-262-06, 043-401-05, 043-401-10, 043-401-16, 043-402-03, 043-402-06**. An Environmental Inspection Form (EIF) for the Subject Property is attached in Appendix 1. Neither the buyer nor the seller, have completed "Competent-Person" questionnaires[5]. Selected photographs of the Subject Property and its surroundings are included as Appendix 2.

2.3 - PROPERTY INSPECTION

On 09 May 2014, the Subject Property, and property boundaries were inspected. The Subject Property and its boundaries with adjacent parcels were walked and inspected, for any evidence of surface contamination, staining, or other unusual conditions. The Tabulated items are organized, by address, and then as a Non-RECs, Recognized Environmental Conditions (RECs)[6], Controlled RECs (CRECs), or an Historic RECs (HRECs):

[5] When the questionnaires are completed they will be submitted as an Addendum.

[6] The goal of this process is to identify Recognized Environmental Conditions associated with the property. A recognized environmental condition is defined as "…the presence or likely presence of any hazardous substances or petroleum products on a property that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property." This definition does not include "*de minimis* conditions that generally do not pose a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies" (ASTM, 2013).

Table 2.1 - Items Noted in Address

Address	Non-REC	REC	CREC	HREC
Golden Gate Baptist Seminary	Suspect Asbestos Containing Material (ACM) Suspect Lead Based Paint (LBP) and Lead Containing Paint (LCM) Suspect Mercury Switches and Fluorescent Tubes Suspect PCB Light Ballasts	NONE	NONE	NONE
Notes: REC = Recognized Environmental Condition, CREC = Controlled Recognized Environmental Condition [subset of REC], HREC = Historical Recognized Environmental Condition				

2.4 – AREA/NEIGHBORHOOD DRIVE-BY

An Area/Neighborhood Drive-By was also performed on 09 May 2014. During this inspection, nothing out of the ordinary or of concern was observed. None of the listed sites within ⅓ of a mile, which is the outer radius for the Vapor Encroachment Concern (VEC) report, are considered a REC, CREC[7], or HREC by AAI, or ASTM.

2.5 – LIMITATION OF STUDY/DATA GAPS

"Data Gaps" are missing database reports or information, but these reports are only pieces of the historical record of the Phase I and should be considered as such. There are no missing database reports for this subject property. However, missing data can be somewhat re-created by other historical reports, but you must have an understanding of the history of the building, its occupants, and the area.

There are no Sanborn Maps available for this site. The Client provided an Aerial Photo with the boundaries of the study area outlined (Figure 4).

[7] CREC is a new category under REC, where the site is undergoing mitigation supervised by an agency.

3.0 - DATABASE SEARCH AND REVIEW

3.1 - INTRODUCTION

Environmental Data Resources, Inc. (EDR), under contract to TCG, performed a database search (Radius Map™ Report with GeoCheck®). The database search and review was performed according to ASTM standards[8] with additional regional databases included to meet California requirements. The search was over five radii:

- The Subject Property
- Inside one-eighth mile radius;
- One-eighth mile to one-quarter mile radius;
- One-quarter mile to one-half mile radius; and
- One-half mile to one and one mile radius.

The results of the search and review are briefly described below. Map Index Numbers (MINs) presented in the descriptions below refer to the MINs assigned in the Database Search Report that is attached as Appendix 3. In some cases, a MIN may contain several different site listings and citations with either the same or adjoining addresses.

3.2 – SUBJECT PROPERTY

The Subject Property was not identified on any databases that were searched as part of this study.

3.3 - INSIDE ONE-EIGHTH MILE RADIUS SURVEY

Within this search radius, there are 0 MINs classified as being of environmental concern[9], 0 MINs listed as having operating permits, and 4 MINs was on hazardous substance lists. The

[8] Adherence to ASTM also complies with EPA regulations.

[9] Environmental Concerns, as depicted on the database maps, are divided into three categories: Environmental Concerns - High Priority: possible Recognized Environmental Condition (RECs); Environmental Concerns; and Environmental Concerns - With a "no further action status". The maps included in the database report illustrate the different statuses of sites and their proximity to the Subject Property.
Environmental Concerns – "Active" are those sites that have a citation, or some other listing that warrants special attention. Possible REC, or "Controlled" REC (CREC).
Environmental Concerns – "no further action" are those sites that cited, but have been closed to the satisfaction of the regulatory agencies. They are not labeled "closed" because they still operate in the manner that caused their listing in the first place. Possible "Historic" REC (HREC).
Environmental Concerns - "closed" are those sites that have met their regulatory requirements and no longer operate in the manner that caused their listing in the first place. Possible HREC.

details of the databases searched are presented in the database report included as Appendix 3. Below, if provided, we list "active" sites ("NFA" or "closed" for LUFT sites within a eighth of a mile as well), as these are the sites of potential concern. Other "NFA" or "closed" sites have met their regulatory obligations and should not be a problem in the future from their present cleanup. Following each table, if generated, we summarize the information on referenced sites as they relate to potentially affecting the Subject Property. Additional regulatory information, gathered during this Phase I that updates the database, is also presented here. A complete list of "active", "NFA", or "closed" sites, "hazardous substance" listed sites, and "operating permit" listed sites is included in the Radius Map™ Report with GeoCheck® in Appendix 3.

Based on the information in the EDR database for this search interval, our site reconnaissance, and our understanding of the area, the Subject Property outward to ⅛ of a mile had no listings for LUST or SLIC. All listings within this radius are hazardous substance lists, which are not environmental concerns. A complete list of "active", "NFA", or "closed" sites, "hazardous substance" listed sites, and "operating permit" listed sites is included in the database search report in Appendix 3.

3.4 - ONE-EIGHTH MILE TO ONE-QUARTER MILE RADIUS SURVEY

Within this search radius, there is 1 MIN classified as being of environmental concern, 2 MINs have operating permits, and 8 MINs were on hazardous substance lists.

Table 3.1 – Listed Sites Between ⅛ Mile and ¼ Mile

MIN	Name	Address	Dir	Grad	Database	Status
E15	SF SEAPLANES TOURS	240 2 REDWOOD HWY	W	D	LUST	CLOSED

Notes: MIN = map index number, Dir = direction from site, Grad = gradient, LUST = leaking underground storage tanks, CLOSED = met regulatory requirements for closure.

Based on the information in the EDR database for this search interval, and our site reconnaissance, there are no listed sites that pose a threat to the Subject Property. Following each table, if generated, we summarize the information on referenced sites as they relate to potentially affecting the Subject Property. Additional regulatory information, gathered during this Phase I that updates the database, is also presented here. A complete list of "active", "NFA", or "closed" sites, "hazardous substance" listed sites, and "operating permit" listed sites is included in the Radius Map™ Report with GeoCheck® in Appendix 3.

3.5 - ONE-QUARTER MILE TO ONE-HALF MILE RADIUS SURVEY

Within the search radius there is 8 MINs classified as being of environmental concern, 16 MINs having an operating permit, and 90 MINs on hazardous substance lists. Due to the distance from, and the unlikely event that these sites would materially affect the Subject Property, they are not presented in the text. The details of the database search are presented in the Radius Map™ Report with GeoCheck® included as Appendix 3.

3.6 – ONE-HALF MILE TO ONE MILE RADIUS SURVEY

Within the search radius there are 17 MINs classified as being of environmental concern, 13 MINs was listed as having an operating permit, and 44 MINs were on hazardous substance lists. Again, due to the distance from, and the unlikely event, if sites were listed, they would materially affect the Subject Property; they are not presented in the text. The details of the database search are presented in the Radius Map™ Report with GeoCheck® included as Appendix 3.

3.8 - UNMAPPED SITES

There were thirty-nine (39) unmapped sites: HAZNET (31), UST (3), RCRA-SQG (3), EMI (2), CAL FID UST (2), SWEEPS UST (2), and NPDES (1). Three (3) sites had multiple database listings.

4.0 - HISTORICAL INFORMATION REVIEW

4.1 - INTRODUCTION

As part of our research, we also performed a search of records. This search included:

- Historical topographic maps;
- Historic Sanborn® maps;
- Historical aerial photographs;
- A City Directory;
- An Environmental Liens and AUL Report,
- A Property Tax Report, and
- A Building Permits Report.

4.2 – HISTORICAL TOPOGRAPHIC MAPS

Eight historic topographs were reviewed and presented in Appendix 4 from 1897 to 1995. Those reviewed and attached to this report were 1897, 1947, 1950, 1954, 1968, 1980, 1993 and 1995. They were:

- The Tamalpais Quadrangle (1897, 1947 and 1950), and
- The San Rafael Quadrangle (1954, 1968, 1980, 1993 and 1995).

They show the area developing over time as a mixed residential/commercial area. In the 1954 topograph, residential units appear to be built in the vicinity, but the seminary is not shown. In 1968, the seminary area has buildings on it, and the surrounding are continues to develop through 1995.

4.3 - SANBORN® MAPS

Sanborn Maps were not available for this property. The certification of the Sanborn Maps reviewed is included as Appendix 5.

4.4 - HISTORICAL AERIAL PHOTOGRAPHS

Eleven aerial photographs were reviewed and are presented in Appendix 6 from 1946 to 2012. The years reviewed were 1946, 1956, 1968, 1974, 1982, 1987, 1993, 2005, 2009, 2010 and 2012. They confirmed what the other historic sources show. The 1956 aerial shows the beginning of

development of the seminary. The surrounding area began to develop after 1946 and continues from there. The Subject Property was present in the 1968 aerial.

4.5 – CITY DIRECTORY

Most searches span circa-1920 to the present. The city directory for the Subject Property is between 1975 and 2013. The City Directory indicates the Subject Property was listed on the City Directory. Documentation of the City Directory search is included as Appendix 7.

4.6 – ENVIRONMENTAL LIENS AND AUL REPORT

There was one deed found for this Subject Property. Below is a description of the deeds. A copy of the report is included as Appendix 8.

Deed 1:
According to the Marin County Assessor, the current owner of the subject property is Golden Gate Baptist Theological Seminary. Records were searched at the Marin County Recorder's Office back to 1980. No conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 50 acres, more or less, being a portion of Designated Remainder III, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as Instrument No. 1990-0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-261-25

Deed 2:
Type of Deed: Quitclaim Deed Title is vested in: Golden Gate Baptist Theological Seminary Title received from: Richardson Bay Sanitary District, a public corporation Deed Dated: 09/17/1991 Deed Recorded: 09/24/1991 Instrument: 91-061081 Land Record Comments: Records were searched at the Marin County Recorder's Office back to 1980. No other conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 23.61 acres, more or less, being a portion of Designated Remainder III, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as Instrument No. 1990-0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-261-26

Deed 3:
According to the Marin County Assessor, the current owner of the subject property is Golden Gate Baptist Theological Seminary. Records were searched at the Marin County Recorder's Office back to 1980. No conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 22.5 acres, more or less, being a portion of Parcel A, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as

Instrument No. 1990- 0040468, being portions of Lots 315 and 316 of Tide Land Commissioners Map No. One, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-262-03

Deed 4:

According to the Marin County Assessor, the current owner of the subject property is Golden Gate Baptist Theological Seminary. Records were searched at the Marin County Recorder's Office back to 1980. No conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 3.43 acres, more or less, being a portion of Parcel A, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as Instrument No. 1990- 0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-262-06

Deed 5:

Type of Deed: Quitclaim Deed Title is vested in: Golden Gate Baptist Theological Seminary Title received from: Richardson Bay Sanitary District, a public corporation Deed Dated: 12/13/1990 Deed Recorded: 12/18/1990 Instrument: 90-71909 Land Record Comments: Records were searched at the Marin County Recorder's Office back to 1980. No other conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 3.96 acres, more or less, being a portion of Parcel B of Designated Remainder I, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as Instrument No. 1990-0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-401-05

Deed 6:

According to the Marin County Assessor, the current owner of the subject property is Golden Gate Baptist Theological Seminary. Records were searched at the Marin County Recorder's Office back to 1980. No conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 1.54 acres, more or less, being Parcel 26, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as Instrument No. 1990-0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-401-10

Deed 7:

According to the Marin County Assessor, the current owner of the subject property is Golden Gate Baptist Theological Seminary. Records were searched at the Marin County Recorder's Office back to 1980. No conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 16.08 acres, more or less, being a portion of Parcel 25, Designated Remainder IV, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in

Book 20 of Maps, at Page 84 as Instrument No. 1990-0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-401-16

Deed 8:

According to the Marin County Assessor, the current owner of the subject property is Golden Gate Baptist Theological Seminary. Records were searched at the Marin County Recorder's Office back to 1980. No conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 1.63 acres, more or less, being Parcel 27, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as Instrument No. 1990-0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-402-03

Deed 9:

According to the Marin County Assessor, the current owner of the subject property is Golden Gate Baptist Theological Seminary. Records were searched at the Marin County Recorder's Office back to 1980. No conveyance was found of record for the subject property.

Legal Description: All that certain piece or parcel of land containing 0.760 acres, more or less, being Parcel C, Designated Remainder II, as shown on the Map of Seminary Ridge-Phase I, as filed 07/10/1990 in Book 20 of Maps, at Page 84 as Instrument No. 1990-0040468, situate and lying in the County of Marin, State of California.

Legal Current Owner: Golden Gate Baptist Theological Seminary **Property Identifiers:** 043-402-06

Environmental Liens

Found ☐ **Not Found** ☑

Other Activity And Use Limitations (AULs)

Found ☐ **Not Found** ☑

4.7 – PROPERTY TAX MAP REPORT

The Property Tax Map Report is included as Appendix 9. The parcel APN is **#: #043-261-25, 043-261-26, 043-262-03, 043-262-06, 043-401-05, 043-401-10, 043-401-16, 043-402-03, 043-402-06,** and the parcel map is in Appendix 9.

4.8 – BUILDING PERMIT REPORT

The Building Permit Report reviewed all available building permit records. The report indicted

that building permits were not found for the Subject Property, but were issued for adjacent properties between 1972 and 2012. None were for hazardous waste transport or storage.

The report is included as Appendix 10.

5.0 - GEOLOGY AND HYDROGEOLOGY

5.1 - INTRODUCTION

TCG reviewed readily available regional and local geologic and hydrogeologic information. The results of that review are briefly described below. The information reviewed included data in Appendix 3, in the Physical Setting Appendix to the Radius Map™ Report with GeoCheck® as well as other referenced material, including Appendix 11 – Vapor Encroachment Condition (VEC) screen report.

5.2 - LOCAL GEOLOGY AND HYDROGEOLOGY

The Subject Property is located north of the San Francisco Bay. The Subject Property is in a mixed residential/some commercial area of Mill Valley, district of Strawberry in Marin County with listed properties up-gradient and down-gradient. The shallow subsurface is made of alluvial deposits (clayey silts to silty sands in nature): these fine-grained soils go to approximately 6 - 20 feet below grade (fbg) according to location. Weathered and unweathered bedrock underlie the whole area at various depths and various thicknesses (Norris & Webb, 1990). The area topography is relatively hilly sloping north to south and from the subject property downward east and west (see Physical Setting Appendix to the Radius Map™ Report with GeoCheck®).

Groundwater in the area is typically a layered aquifer system with the shallowest being an unconfined aquifer (Water Table). Below this layer there are multiple layers that are considered semi-confined to confined aquifers. The shallowest aquifer that would most directly influence the Subject Property is affected by topography, seasonal rainfall, and pumping activities (Norris & Webb, 1990).

The Subject Property does not sit on any active faults, but to the west is the San Andreas Fault, to the southeast is the Hayward Fault and to the northeast is the Rogers Creek Fault, all of which can cause earth movement.

5.3 - GROUNDWATER WELLS IN THE AREA

TCG reviewed available information for groundwater wells found in the Physical Setting Appendix of Radius Map™ Report with GeoCheck®. The results of that review are briefly described below. The information reviewed is in the Physical Setting Appendix of the Radius Map™ Report with GeoCheck® included in Appendix 3.

No groundwater monitor wells were found on the Subject Property.

No wells were found the Federal database researched: **FEDERAL USGS WELL INFORMATION**.

FEDERAL USGS WELL INFORMATION

MAP ID	WELL ID	LOCATION FROM TP
None		

No wells were found the Federal database researched: **FEDERAL FRDS PUBLIC WATER SUPPLY SYSTEM INFORMATION**.

FEDERAL FRDS PUBLIC WATER SUPPLY SYSTEM INFORMATION

MAP ID	WELL ID	LOCATION FROM TP
None		

No wells were found the State database researched **STATE DATABASE WELL INFORMATION**.

STATE DATABASE WELL INFORMATION

MAP ID	WELL ID	LOCATION FROM TP
None		

The groundwater flow, according to AQUIFLOW[10], in the area is variable, while regionally it is southwesterly, toward the San Francisco Bay. Pumping wells, topography and/or seasonal rainfall can all retard/alter groundwater flow. Nothing out of the ordinary was seen.

5.4 – RADON

A review of the radon results provided in the Physical Setting Appendix of the Radius Map™ Report with GeoCheck® indicates that radon standards (Federal and State) are not exceeded and radon in the area is not a problem. The (Zip Code: 94941) average Living Area 1st floor activity is 0.450 Pico Curies/Liter (pCi/L), which the USEPA is considering this Zone 3 (<2 pCi/L - Federal EPA) indoor average level – first floor (EDR, 2014). The radon information is in Physical Setting appendix of the Radius Map™ Report with GeoCheck® included as Appendix 3.

[10] AQUIFLOW is a modeling program used to interpret groundwater flow direction and gradient.

5.5 – VAPOR ENCROACHMENT SCREEN REPORT

Fourteen (14) sites were examined in the Vapor Encroachment Concern (VEC) Screen Report. A review of the VEC Screen report (Appendix 11) indicated that the subject property address: was not found on any databases. One-listed (1) site was found within 528 feet[11], and the other thirteen (13) listed sites were found between 528 feet and 1760 feet[12].

Of the fourteen (14) listed sites, all were ruled out as a Vapor Encroachment Concern (VEC) since they are "not an environmental concern listing", closed, or outside 0.1 of a mile threshold, because they down-gradient. Chemicals of concern (COC) are not likely to be a vapor threat to the Subject Property. The report is included as Appendix 11.

[11] First threshold in the VEC calculations.
[12] Second threshold in the VEC calculations.

6.0 – OBSERVATIONS, CONCLUSIONS, AND RECOMMENDATIONS

6.1 - OBSERVATIONS

6.1.1 - General Environmental Inspection

During the general environmental inspection, we noted any evidence of contamination or the presence of structures that would lead to suspicion of contamination.

Inspection of the Subject Property revealed no "Recognized Environmental Concerns" (RECs), no "Controlled Recognized Environmental Concerns" (CRECs) and no "Historical Recognized Environmental Concerns" (HRECs), and there were issues of potential concern, as detailed in the Table below. The potential issues were non-Phase I issues that are presented here for convenience.

Table 6.1 - Items Noted in Addresses

Address	Non-REC	REC	CREC	HREC
Golden Gate Baptist Seminary	Suspect Asbestos Containing Material (ACM) Suspect Lead Based Paint (LBP) and Lead Containing Paint (LCM) Suspect Mercury Switches and Fluorescent Tubes Suspect PCB Light Ballasts	NONE	NONE	NONE
Notes: REC = Recognized Environmental Condition, CREC = Controlled Recognized Environmental Condition [subset of REC], HREC = Historical Recognized Environmental Condition				

The adjacent parcels are used as:

- residential/commercial developments to the north, south, east, and west.

During this inspection, nothing out of the ordinary was observed. An Area/Neighborhood Drive-By was also performed on 09 May 2014. During this inspection, nothing out of the ordinary or of concern was observed. None of the listed sites within ⅓ of a mile, which is the outer radius for the Vapor Encroachment Concern (VEC) report, are considered a REC, CREC[13], or HREC by AAI, or ASTM.

6.1.2 - Database Search and Review

6.1.2.1 - Within 1/8 Radius

Based on the information in the EDR database for this search interval, our site reconnaissance, and our understanding of the area, the Subject Property outward to ⅛ of a mile had no listings for LUST or SLIC. All listings within this radius are hazardous substance lists, which are not environmental concerns. A complete list of "active", "NFA", or "closed" sites, "hazardous substance" listed sites, and "operating permit" listed sites is included in the database search report in Appendix 3.

6.1.2.2 - Between 1/8 and 1/4 Mile Radius

Based on the information in the EDR database for this search interval, and our site reconnaissance, there are no listed sites that pose a threat to the Subject Property. Following each table, if generated, we summarize the information on referenced sites as they relate to potentially affecting the Subject Property. Additional regulatory information, gathered during this Phase I that updates the database, is also presented here. A complete list of "active", "NFA", or "closed" sites, "hazardous substance" listed sites, and "operating permit" listed sites is included in the Radius Map™ Report with GeoCheck® in Appendix 3.

6.1.2.3 - Between 1/4 and 1/2 Mile Radius

Within the search radius there is 8 MINs classified as being of environmental concern, 16 MINs having an operating permit, and 90 MINs on hazardous substance lists. Due to the distance from, and the unlikely event that these sites would materially affect the Subject Property, they are not presented in the text. The details of the database search are presented in the Radius Map™ Report with GeoCheck® included as Appendix 3.

[13] CREC is a new category under REC, where the site is undergoing mitigation supervised by an agency.

6.1.2.4 - Between 1/2 and 1 Mile Radius

Within the search radius there are 17 MINs classified as being of environmental concern, 13 MINs was listed as having an operating permit, and 44 MINs were on hazardous substance lists. Again, due to the distance from, and the unlikely event, if sites were listed, they would materially affect the Subject Property; they are not presented in the text. The details of the database search are presented in the Radius Map™ Report with GeoCheck® included as Appendix 3.

6.1.2.5 - Unmapped Sites

There were thirty-nine (39) unmapped sites: HAZNET (31), UST (3), RCRA-SQG (3), EMI (2), CAL FID UST (2), SWEEPS UST (2), and NPDES (1). Three (3) sites had multiple database listings.

6.1.3 - Historical Information Review

The historical information[14] review was Topographic Maps, Aerial Photographs, a City Directory, Environmental Liens, Property Tax Map and Building Permits. There was good correlation between each of these items and nothing out of the ordinary was seen. The EDR reports for each of these sources are attached in Appendices. Sanborn Maps were not found by EDR, but this did not hamper our ability to review the address.

6.1.4 - Geology and Hydrogeology

The geology of the area indicates that down to approximately 6 - 20 fbg is a fine-grained soil, depending on location on the Subject Property. Weathered and unweathered bedrock underlie this. The Subject Property does not sit on any active faults, but to the west is the San Andreas Fault, to the southeast is the Hayward Fault and to the northeast is the Rogers Creek Fault, all of which can cause earth movement. The shallow groundwater in the area appears to be variable (regional flow toward bay) and is a water table condition that is affected by topography, seasonal rainfall, and/or pumping wells. As the VEC report indicates, there is no direct evidence of vapor intrusion at the Subject Property, and the fourteen (14) sites listed as possible have been dismissed in the VEC report. A review of the radon results provided in the Physical Setting Appendix of the Radius Map™ Report with GeoCheck® indicates that radon in the area is not a problem.

[14] Sanborn maps were not available.

6.2 - CONCLUSIONS

There is no direct environmental evidence with regard to the subsurface at the Subject Property or vicinity of impact. The Subject Property is currently a Baptist Seminary, and previous use was vacant land.

6.3 - RECOMMENDATIONS

We are not recommending any further investigation. However, during any renovation or demolition activities, we recommend:

- Following all ACM and LCM regulations and requirements with regard to identifying, handling, and disposal, and
- Following all HAZMAT regulations and requirements with regard to identification, characterization, waste and debris disposal, and recycling.

GENERAL FIELD OBSERVATIONS

Subject Property:

Were there any physical signs of the following observed on the property? ☒ Yes ☐ No

☐ Underground Storage Tanks	☐ Streams, Lakes or ponds	☒ Lead Paint
☐ Aboveground Storage Tanks	☐ Storage Buildings/Rooms	☐ Unlabeled Drums
☐ Stained Soil	☐ Discarded Batteries	☒ Asbestos
☐ Vegetation Damage	☐ Oil/Gas Drums	☐ Groundwater wells
☐ Oily Sheens on Water	☐ Septic System	☐ Hydraulic Lifts
☐ Hydraulic Elevators	☐ Soil Borings	☐ Generator

Adjacent Property:

Were there any physical signs of the following observed on the property? ☒ Yes ☐ No

☐ Underground Storage Tanks	☐ Streams, Lakes or ponds	☒ Lead Paint
☐ Aboveground Storage Tanks	☐ Storage Buildings/Rooms	☐ Unlabeled Drums
☐ Stained Soil	☐ Discarded Batteries	☒ Asbestos
☐ Vegetation Damage	☐ Oil/Gas Drums	☐ Groundwater wells
☐ Oily Sheens on Water	☐ Septic System	☐ Hydraulic Lifts
☐ Hydraulic Elevators		

Comments:

Older buildings

STORAGE BUILDINGS/ROOMS, STORAGE TANKS INSPECTION

Storage Buildings/Rooms:

☐ Yes ☒ No Are any buildings or rooms present that may contain or have contained hazardous materials for purposes**?**

☐ Yes ☒ No Is there any indication that hazardous materials/waste are or have been stored on the property?

☐ Yes ☒ No Are there plans for the layout of this facility?

Underground Storage Tanks (UST's):

☐ Yes ☒ No Were any underground storage tanks observed on the property? – **removed already**

☐ Yes ☒ No Did any tanks, if present, contain any materials, liquid or solid?

☐ Yes ☒ No Was any evidence of soil contamination observed around the surface cover of the tanks, if pres the property?

☐ Yes ☒ No Were any chemical plants, manufacturing plants, gas stations or petroleum refining, delivery or facilities observed on surrounding properties?

☐ Yes ☒ No Are there plans for the underground storage tanks, if in use or present in the past?

Aboveground Storage Tanks (AST's):

☐ Yes ☒ No Were any aboveground storage tanks observed on the property? - **generator**

☐ Yes ☒ No Was any evidence of soil contamination observed around the tanks, if present, on the property?

☐ Yes ☒ No Were any chemical plants, manufacturing plants, gas stations or petroleum refining, delivery or facilities observed on surrounding properties?

☐ Yes ☒ No Are there plans for the aboveground storage tanks, if in use or present in the past?

Waste Sites:

☐ Yes ☒ No Is the subject or any neighboring property engaged in storing, transporting or producing chemicals or hazardous substances?

Comments:

WATER RESOURCES INSPECTION

Surface Water:

☐ Yes	☒ No	Are there any surface water bodies on the site or passing through it?
☐ Yes	☒ No	Was there any evidence of contamination on these surface water bodies (odors, sheen, etc)?
☐ Yes	☒ No	Are there plans for the surface water drainage system of this facility?

Groundwater:

☐ Yes	☒ No	Were any groundwater monitoring wells, in use or abandoned, observed on the property?
☐ Yes	☒ No	Was there any evidence of contamination around the well?
☐ Yes	☒ No	Was there any evidence of contamination in the well (odors, sheen, etc.)?
☐ Yes	☒ No	Are there plans for the groundwater system of this facility, if one is or was present?

Drinking Water:

☐ Yes	☒ No	Were any water wells, in use or abandoned, observed on the property?
☐ Yes	☒ No	Are these wells the primary or sole source of drinking water?
☒ Yes	☐ No	Is the property presently on a municipal water system?
☐ Yes	☒ No	Are lead or lead soldered pipes visible on the property?
☐ Yes	☒ No	Are there plans for the drinking water system of this facility?

Septic System:

☐ Yes	☒ No	Was a septic system, in use or abandoned, observed on the property?
☒ Yes	☐ No	Is the property presently on a municipal sewer system?
☐ Yes	☒ No	Are there plans for the septic system of this facility?

Drains:

☐ Yes	☒ No	Are drains present in work areas that could be used for draining liquids from cleaning or f machinery or equipment?
☐ Yes	☒ No	Are the drains full?
☐ Yes	☒ No	Are the drains coated heavily with sludge-type materials?
☐ Yes	☒ No	Are there plans for the drain system of this facility?

Comments:

Groundwater not tested

CHEMICAL, GAS & MINERAL INSPECTION

Asbestos:

- ☒ Yes ☐ No Were signs of asbestos observed on the property?
- ☒ Yes ☐ No Was the structure constructed prior to 1979?
- ☒ Yes ☐ No Were any suspected asbestos containing materials observed; such as sprayed mater fireproofing areas, pipe insulation, floor tiles, etc?

UREA Formaldehyde Foam Insulation (UFFI):

- ☐ Yes ☒ No Was any evidence of Formaldehyde Foam Insulation observed on the property?

Lead Paint:

- ☒ Yes ☐ No Was any visible evidence of peeling, cracking or flaking paint observed?
- ☒ Yes ☐ No Was any visible evidence of lead paint on the ceilings, walls or floors of any structure obse the property?

Pesticides/Herbicides:

- ☐ Yes ☒ No Does it appear pesticides or herbicides have been used in excess of normal use?
- ☐ Yes ☒ No Is the property used for agricultural purposes?
- ☐ Yes ☒ No Are there any noticeable pesticide/herbicide odors?

Fiberglass:

- ☐ Yes ☒ No Is fiberglass observed as an insulator or for any other purpose?
- ☐ Yes ☒ No Is fiberglass observed on any surface that appears worn, where individual fibers are expos condition where release into the air appears likely?

Polychlorinated Biphenyls (PCB's):

- ☒ Yes ☐ No Were any transformers, electrical devices or hydraulic equipment observed on the property lal containing PCBs
- ☐ Yes ☒ No Was there evidence of PCB contamination to the soil, surface water or groundwater observec property?
- ☒ Yes ☐ No Were any fluorescent light ballasts suspected to contain or labeled as containing PCB's observ

Mercury:

- ☒ Yes ☐ No Are there mercury switches present?
- ☒ Yes ☐ No Are there fluorescent tubes present?

Radon:

- ☐ Yes ☒ No Is there reason to suspect that radon may be a problem in the dwelling or in the immediate pr locality?
- ☐ Yes ☒ No Has screening been conducted which indicates that the property may have elevated levels of ra

Comments:

Radon not an issue

GENERAL

☐ Yes ☒ No Are there any conditions present not mentioned above that need to be corrected to remc potential risks?

☐ Yes ☒ No Activities on adjacent properties that pose potential environmental risks to the subject property

SUMMARY & CONCLUSIONS OF INSPECTION

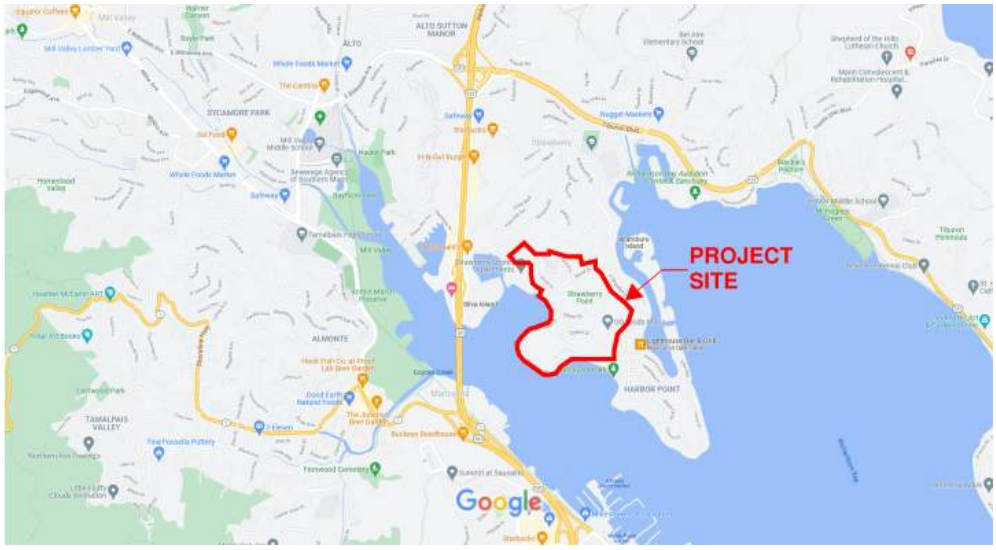
1. Introduction

The purpose of this hydrological report is to clarify pre-development and post-development drainage impacts affecting the North Coast Land Holdings project. Post-development are represented in the Improvement Plans prepared by CSW/Stuber-Stroeh Engineering Group, Inc. dated January 31, 2020. . Hydrologic calculations utilize the Rational Method while hydraulic calculations were prepared using Hydraflow Express or the Manning's equation for a given storm event. Analytical findings indicate improvements comply with the County of Marin's standards for flood prevention, drainage, and storm water quality.

FIGURE 1: VICINITY MAP



2. Pre-Project Conditions

The proposed Project is located at the Golden Gate Baptist Theological Seminary (GGBTS), within the Strawberry Point peninsula and surrounded by Richardson Bay, approximately 13 miles north of San Francisco. Specifically, the project site is bounded by Seminary Drive on the west and south; E Strawberry Drive on the east; and private developments on the north. The overall site encompasses 127.3 acres of grass-covered land scattered with trees and the GGBTS campus residences. The subject area encompasses 71.54 acres.

Site topography generally slopes east-west with natural north and southward facing slopes which vary from 2-1/3 horizontal to 1 vertical (1-1/2:1, H:V) to 4:1. There are also localized relatively level knolls within the campus. Existing developments include the Golden Gate Baptist Theological Seminary, which consists of several academic core buildings, and an assortment of residences. Open spaces are hilly with good vegetative cover, good drainage, and scattered with a variety of trees, primarily Monterey Pine.

3. Post-Project Conditions

Project improvements include development and redevelopment of portions of the GGBTS site in general accordance with the approved master plan. Proposed site enhancements include:

- New 20,000-square-foot facility to house a pre-school (3,000 square feet) and fitness center (17,000 square feet)
- Replace a majority of the existing residences and dorm rooms with a mixture of single-family and multi-family residences, and construct new single-family and multi-family residences. A total of 336 residential units are proposed
- New 267,354-square-foot residential care facility that would contain 100 independent living and 44 to 50 assisted living and memory care apartments
- Renovate the Administration Building and add a total of 15,800 square feet of floor area, resulting in a 41,000-square-foot Administration Building
- Demolish the existing maintenance building and construct a new 2,200-square-foot maintenance building in a different location
- Install landscape and hardscape improvements associated with the school campus and the residential development, including parking, playfields and a network of walkways and pedestrian-friendly streets
- Provide open space (approximately 70-percent of the site) and establish a network of trails throughout the project area

4. Analysis

4.1 Criteria

Drainage calculations meet the requirements of Marin County Code of Ordinances 24.04.520 – Hydrologic and Hydraulic Design. Drainage calculations for future storm events apply the 100-year design storm.

The Rational Method is used in conjunction with the Hydrograph Method to model the pre-development and post-development drainage of the site. Runoff coefficients and drainage areas are calculated using AutoCAD. Rainfall intensities are based on NOAA precipitation frequency estimates. Excel and Hydrographs software are utilized to generate runoff quantities from the hydrological information.

4.2 Hydrology

4.2.1. Rational Method

Peak flows are determined using methodology contained within the County of Marin Hydrology Manual, Simplified Instructions, dated 8/2/2000, which specifies that the Rational Method be used to calculate design peak discharge. The Rational Method is based on the following formula:

$$\boldsymbol{Q = CIA}$$

Where:

Q = Peak Flow Rate, cfs

C = Runoff Coefficient

I = Rainfall Intensity, in/hr

A = Tributary Area, acres

4.2.2. Time of Concentration

The initial Time of Travel for overland flow sheet flow is determined using the overland flow formula per the County of Marin's Hydrology Manual.

Shallow concentrated flow travel time is calculated from the USDA "Urban Hydrology for Small Watersheds" Technical Release 55 (TR-55), Figure 3-1 entitled "Average velocities for estimating travel time for shallow concentrated flow."

Channelized flow travel time and pipe flow travel time are calculated from Manning's Equation in conjunction with hand calculations, Hydrographs, Express software, and Excel.

4.2.3. Rainfall Intensity

Storm intensities (I) for the 100-year storm event is derived using the National Oceanic and Atmospheric Administration's (NOAA) Atlas 14 Point Precipitation Frequency Estimates.

4.2.4. Runoff Coefficient, CalTrans

The runoff coefficients utilized in this report is determined using Figure 819.2A "Runoff Coefficients for Undeveloped Areas" of the Caltrans Highway Design Manual. C=0.53 is applied for the existing ground cover, C=0.53 being the C-value for the topographic condition of "hilly, with average slopes of 10-30%, poor soil infiltration capacity, fair to good grassland or woodland, and well defined system of small drainage ways." C=0.90 was used for impervious areas, C=0.60 for proposed landscaped areas, and

C=0.35 for proposed stormwater bioretention areas. A weighted runoff coefficient is calculated using the terms below:

Weighted Runoff Coefficients are defined as follows:

$$C_{\text{weighted}} = \frac{C_1A_1 + C_2A_2 + C_3A_3 \ \ldots}{A_1 + A_2 + A_3 \ldots}$$

4.2.5. Area of Calculation

Area of calculation is found using AutoCAD software. The Area of Calculation is the area bound by the subshed that drains to a certain drainage outlet. Subsheds bound by either the existing property boundary or the limits of development are included in the Study.

4.2.6. Precipitation Frequency Estimate

The SCS Hydrograph Method is used to determine the peak discharge rate for a 100-year storm frequency event for the watershed tributary to the project site. The SCS Method calculates peak runoff for small watersheds using predetermined regional rainfall distributions in combination with rainfall information from isopluvial maps developed by the National Oceanic Atmospheric Administration (NOAA). The predetermined distributions were developed to cover four geographic regions of the 50 United States. Marin County falls into a region considered to be subject to Distribution IA according to Figure B-2 in the TR-55 manual. Data for point precipitation frequency estimates, available through the internet from NOAA Atlas 14 maps, for this project site, are found in Appendix E.

4.3. Hydraulics

4.3.1. Storm Drain System Modeling

Pipe Sizes are evaluated using AutoCAD Express Tools. Pipe parameters (diameter, slope, manning's roughness coefficient, etc.), are inputted into Express and pipes are sized based on Marin County CA Code of Ordinances described below.

Pipe sizes shall be based upon Marin County CA Code of Ordinances 24.04.520-Hydrologic and hydraulic design. Pipe sizes ware based upon the 100-year storm passing seventy percent as open channel flow with no head allowed at the inlet.

4.3.2. Stormwater Detention Modeling

Stormwater detention is sized using an iterative process in Hydrographs as described below.

Hydrographs are generated for each subshed (pre-development and post-development conditions) and then routed through a detention area using the Hydrographs software. Hydrographs is a software that models a design storm through a detention pond. Parameters of the detention pond can be adjusted so that post-development peak discharge does not exceed pre-development peak discharge. Once those parameters are determined, Hydrographs generates a hydrograph and calculates the maximum storage volume required.

Proposed stormwater detention is located throughout the Site via bioretention areas.

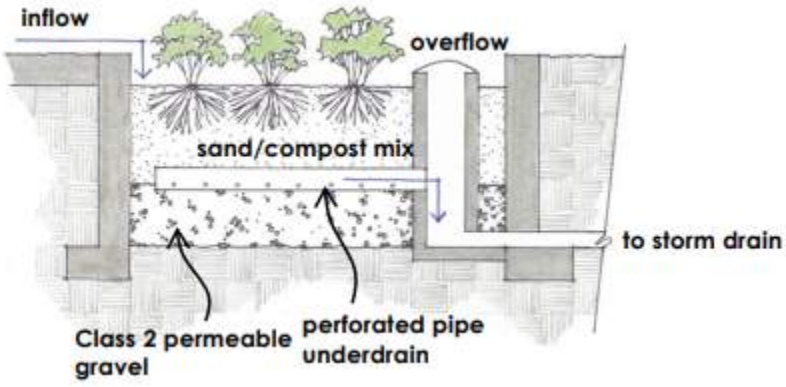
4.3.2. Stormwater Treatment

Project improvements will comply with the Bay Area Stormwater Management Agencies Association (BASMAA) post-construction manual. BASMAA provides a low impact development approach to implementing Provision E.12 of the Phase II Small MS4 General Permit. Provision E.12, "Post-Construction Stormwater Management Program," mandates the County to control pollutants in runoff from newly created or replaced impervious surfaces. To meet the requirements for a Regulated Project, site design measures will include:

- Routing runoff to stormwater treatment facilities (i.e. bioretention area) sized and designed according to Chapter 4 of the BASMAA Post-Construction Manual
- Providing for ongoing maintenance of bioretention facilities
- Identifying potential source of pollutants and implement corresponding source control measures
- Limiting clearing, grading, and soil compaction
- Reducing impervious surfaces
- Reducing runoff by dispersing runoff to landscape areas
- Conserving natural areas of the site consistent with local General Plan policies
- Protecting slopes against erosion

Stormwater treatment areas for the site development include the use of bioretention facilities (Figure 2). The bioretention facilities will be designed and constructed in accordance with BASMAA standards for treatment of runoff from each Drainage Management Area (DMA) or subsheds. Bioretention areas are sized at approximately 4% of the equivalent DMA. The project DMAs and treatment areas are shown in the Stormwater Control Plans (Appendix B).

FIGURE 2: BIORETENTION FACILITY



5. Base Flood Hydraulic Study

5.1 Standards and Methodology

100-year flood information (the base flood information) for existing conditions is taken from Federal Emergency Management Agency (FEMA) Flood Insurance Rate Map (FIRM) for Marin County, California, and Incorporated Areas, Map Number 06041C0469E dated March 17, 2014.

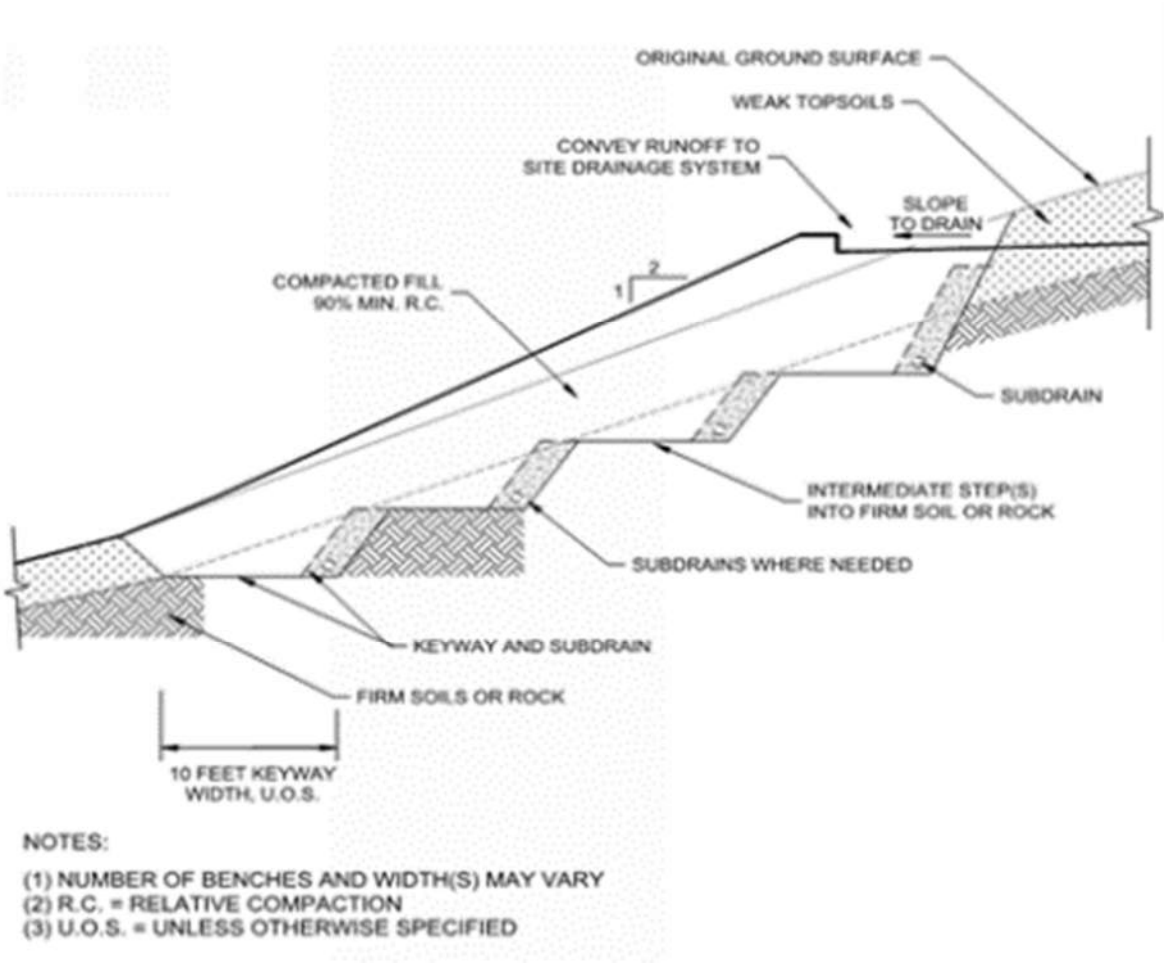
The project site is within FEMA flood zone X. Zone X is the area determined to be outside the 500-year flood. Flood zone AE includes areas of high risk flooding with a base flood elevation of 9.0 feet. Zone AE is offsite and west of Seminary Drive as indicated in Sheet C2.01 in the design plans.

Base flood elevations will remain unchanged by the proposed development.

6. Groundwater

Soil borings by the Geotechnical Engineer revealed varying groundwater seepage from 2.5 to 17 feet deep. As shown in sheet C2.01, "Geotechnical and Flood Zone Map", areas of weak soil resulting from poor drainage and seepage are indicated. Groundwater elevations are highly dependent on storm events and fluctuate seasonally. Project improvements within areas that may experience seasonal high groundwater will include the use of interceptor subdrains to divert the water around the improvement (i.e. building, retaining wall, roadway, etc.). An interceptor subdrain is a gravel-filled trench installed across a contour that collects groundwater traveling on an impermeable soil horizon. An example of an interceptor subdrain for a new roadway installed on a hillside is shown below.

FIGURE 3: TYPICAL HILLSIDE FILL CONSTRUCTION



Groundwater collected in the subdrains is diverted to an outfall dissipater. The dissipater is also a gravel-filled trench with a perforated pipe, which allows water to seep back into the soils below the improvement.

Groundwater seepage surfacing as a spring may also be created through the improper installation of a utility trench or a leaky water main. A recent and substantial repair of a private site water main was completed when surfacing water was observed. New utility trenches on sloped terrain where seasonal high groundwater is anticipated, will utilize check dams to help prevent surfacing groundwater, erosion, and slope instability.

7. Results

TABLE 1: PEAK DISCHARGE RATE, 100-YEAR STORM

Location	Pre-Project Q_{100} (cfs)	Post-Project Q_{100} (cfs)	% Difference
Subshed 1A	1.71	1.76	2.9%
Subshed 1B	94.23	94.28	0.05%
Subshed 2A	3.34	4.63	38.6%
Subshed 2B	0.32	0.38	18.7%
Subshed 2C	12.55	13.13	4.6%
Subshed 2D	2.93	2.77	-5.4%
Subshed 3A	17.92	19.31	7.7%
Subshed 3B	16.43	16.61	1.1%
Subshed 4A	2.89	1.43	-50.5%
Subshed 4B	1.21	1.77	46.2%
Subshed 4C	4.24	4.79	12.9%
Subshed 4D	2.10	2.54	20.9%
Subshed 4E	2.10	4.02	191.4%
Subshed 5A	20.31	17.39	-14.3%

TABLE 2: PEAK DISCHARGE RATE WITH DETENTION, 100-YEAR STORM

Location	Pre-Project Q_{100} (cfs)	Post-Project Q_{100} (cfs)	% Difference	Stormwater Detention Required (cf)	Stormwater Detention Proposed (cf)
Subshed 1A	1.71	1.15	-32.7%	310	986
Subshed 1B	94.23	71.68	-23.9%	50,516	57,187
Subshed 2A	3.34	3.26	-2.3%	977	1,557
Subshed 2B	0.32	0.29	-9.3%	0	0
Subshed 2C	12.55	10.50	-16.3%	3,178	4,849
Subshed 2D	2.93	2.68	-8.5%	0	0
Subshed 3A	17.92	14.94	-16.6%	8,100	10,101
Subshed 3B	16.43	13.76	-16.2%	5,902	8,209
Subshed 4A	2.89	1.32	-54.3%	95	225
Subshed 4B	1.21	1.12	-7.4%	378	1,566
Subshed 4C	4.24	3.84	-9.4%	960	1,350
Subshed 4D	2.10	1.87	-10.9%	427	585
Subshed 4E	2.10	1.97	-6.2%	2,101	2,632
Subshed 5A	20.31	15.20	-25.1%	4,073	5,616

8. Sea Level Rise

To help address potential vulnerability from Sea Level Rise (SLR) along the bay shoreline, Marin County prepared the Marin Bay Waterfront Adaptation and Vulnerability Evaluation (BayWAVE). The fundamental goal of the BayWAVE project is to increase awareness and preparation for future impacts. SLR scenarios include near-term, mid-term, and long-term impacts with and without a 100-year storm event. As indicated in the southern study area of the BayWAVE (Appendix H), there are no buildings or roadways vulnerable to future SLR in the long-term scenario with 60-inches of SLR and 100-year storm event. Additionally, as shown in the Bay Area SLR Analysis and Mapping Project (Appendix H), there are no significant impacts to the project site or overtopping of Seminary Drive along the project frontage.

9. Conclusion

As indicated in the hydrological calculations, there is an overall increase between pre-development and post-development in peak runoff in the 100-year storm for subsheds 1A, 1B, 2A, 2B, 2C, 3A, 3B, 4B, 4C, 4D and 4E (See Appendix A maps for subshed /DMA locations). There is a decrease in subsheds 2D, 4A and 5A. Stormwater runoff increase results from additional impervious areas and accrual of adjacent subshed areas. To mitigate increased runoff, bioretention facilities will be installed to increase detention time, such that the 100-year post-development peak discharge flow rates does not exceed pre-development peak discharge rates. Consequently, there are no significant impacts to the County's off-site storm drainage system.

The hydraulic calculations support project drainage improvements to convey runoff from the project site for the 100-year storm event. Stormwater treatment for smaller, more frequent storm events occur within the bioretention facilities. Bioretention facilities will be designed in accordance with BASMAA guidelines.

Erosion, seasonal springs, and slope instability resulting from high groundwater elevations may be mitigated with interceptor subdrains as indicated in Section 6. Groundwater seepage within the project site will require review and approval by the project Geotechnical Engineer.

COUNTY OF MARIN
DEPARTMENT OF PUBLIC WORKS

HYDROLOGY MANUAL
SIMPLIFIED INSTRUCTIONS

(Revision: 8/2/00)

The instructions:

1. Determine the Time of Concentration (t_c)

$$t_c = \frac{1.8(1.1-C)\sqrt{L}}{\sqrt[3]{S(100)}} + 5Min$$

C = Runoff Coefficient *

L = Longest run in feet

S = Average Slope in ft/ft $= \frac{\Delta H}{L}$

2. Determine Zone from Map V
3. Determine I_{60} from Map I
4. From appropriate Zone Chart (Chart K), find correct curve using the I_{60} and 1 hour intersect.
5. Follow this curve to the t_c intersect.
6. Read i on Y-axis.
7. Utilize this value into $Q=CiA$

   C = Runoff Coefficient *

   i = Intensity (I_{60})

   A = Drainage Area in Acres

   Q = Discharge/Capacity in Cubic Feet per Second (cfs)

* There is often much discussion as to what value to use for "C" for a specific site. What we are concerned with here, however, is the major event. These often occur in the mid to late season and after one or more days of light rainfall. Thus the ground is close to saturation and "C" is approaching 1.0. To cut to the chase, we recommend a "C" value of at least 0.7.

Figure 819.2A

Runoff Coefficients for Undeveloped Areas

Watershed Types

	Extreme	High	Normal	Low
Relief	.28 -.35 Steep, rugged terrain with average slopes above 30%	.20 -.28 Hilly, with average slopes of 10 to 30%	.14 -.20 Rolling, with average slopes of 5 to 10%	.08 -.14 Relatively flat land, with average slopes of 0 to 5%
Soil Infiltration	.12 -.16 No effective soil cover, either rock or thin soil mantle of negligible infiltration capacity	.08 -.12 Slow to take up water, clay or shallow loam soils of low infiltration capacity, imperfectly or poorly drained	.06 -.08 Normal; well drained light or medium textured soils, sandy loams, silt and silt loams	.04 -.06 High; deep sand or other soil that takes up water readily, very light well drained soils
Vegetal Cover	.12 -.16 No effective plant cover, bare or very sparse cover	.08 -.12 Poor to fair; clean cultivation crops, or poor natural cover, less than 20% of drainage area over good cover	.06 -.08 Fair to good; about 50% of area in good grassland or woodland, not more than 50% of area in cultivated crops	.04 -.06 Good to excellent; about 90% of drainage area in good grassland, woodland or equivalent cover
Surface Storage	.10 -.12 Negligible surface depression few and shallow; drainageways steep and small, no marshes	.08 -.10 Low; well defined system of small drainageways; no ponds or marshes	.06 -.08 Normal; considerable surface depression storage; lakes and pond marshes	.04 -.06 High; surface storage, high; drainage system not sharply defined; large flood plain storage or large number of ponds or marshes

Given An undeveloped watershed consisting of;
1) rolling terrain with average slopes of 5%,
2) clay type soils,
3) good grassland area, and
4) normal surface depressions.

Solution:

Relief	0.14
Soil Infiltration	0.08
Vegetal Cover	0.04
Surface Storage	0.06
C=	0.32

Find The runoff coefficient, C, for the above watershed.

[1] Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Appendix G – FEMA Flood Insurance Maps

NOTES TO USERS

This map is for use in administering the National Flood Insurance Program. It does not necessarily identify all areas subject to flooding, particularly from local drainage sources of small size. The **community map repository** should be consulted for possible updated or additional flood hazard information.

To obtain more detailed information in areas where **Base Flood Elevations** (BFEs) and/or **floodways** have been determined, users are encouraged to consult the Flood Profiles and Floodway Data and/or Summary of Stillwater Elevations tables contained within the Flood Insurance Study (FIS) report that accompanies this FIRM. Users should be aware that BFEs shown on the FIRM represent rounded whole-foot elevations. These BFEs are intended for flood insurance rating purposes only and should not be used as the sole source of flood elevation information. Accordingly, flood elevation data presented in the FIS report should be utilized in conjunction with the FIRM for purposes of construction and/or floodplain management.

Coastal Base Flood Elevations shown on this map apply only landward of 0.0' North American Vertical Datum of 1988 (NAVD 88). Users of this FIRM should be aware that coastal flood elevations are also provided in the Summary of Stillwater Elevations table in the Flood Insurance Study report for this jurisdiction. Elevations shown in the Summary of Stillwater Elevations table should be used for construction and/or floodplain management purposes when they are higher than the elevations shown on this FIRM.

Boundaries of the **floodways** were computed at cross sections and interpolated between cross sections. The floodways were based on hydraulic considerations with regard to requirements of the National Flood Insurance Program. Floodway widths and other pertinent floodway data are provided in the Flood Insurance Study report for this jurisdiction.

Certain areas not in Special Flood Hazard Areas may be protected by **flood control structures.** Refer to Section 2.4 "Flood Protection Measures" of the Flood Insurance Study report for information on flood control structures for this jurisdiction.

The **projection** used in the preparation of this map was California State Plane zone III (FIPSZONE 0403). The **horizontal datum** was NAD83 HARN, GRS1980 spheroid. Differences in datum, spheroid, projection or State Plane zones used in the production of FIRMs for adjacent jurisdictions may result in slight positional differences in map features across jurisdiction boundaries. These differences do not affect the accuracy of the FIRM.

Flood elevations on this map are referenced to the North American Vertical Datum of 1988. These flood elevations must be compared to structure and ground elevations referenced to the same **vertical datum.** For information regarding conversion between the National Geodetic Vertical Datum of 1929 and the North American Vertical Datum of 1988, visit the National Geodetic Survey website at http://www.ngs.noaa.gov/ or contact the National Geodetic Survey at the following address:

NGS Information Services
NOAA, N/NGS12
National Geodetic Survey
SSMC–3, #9202
1315 East–West Highway
Silver Spring, MD 20910–3282

To obtain current elevation, description, and/or location information for **bench marks** shown on this map, please contact the Information Services Branch of the National Geodetic Survey at **(301) 713–3242,** or visit its website at http://www.ngs.noaa.gov/.

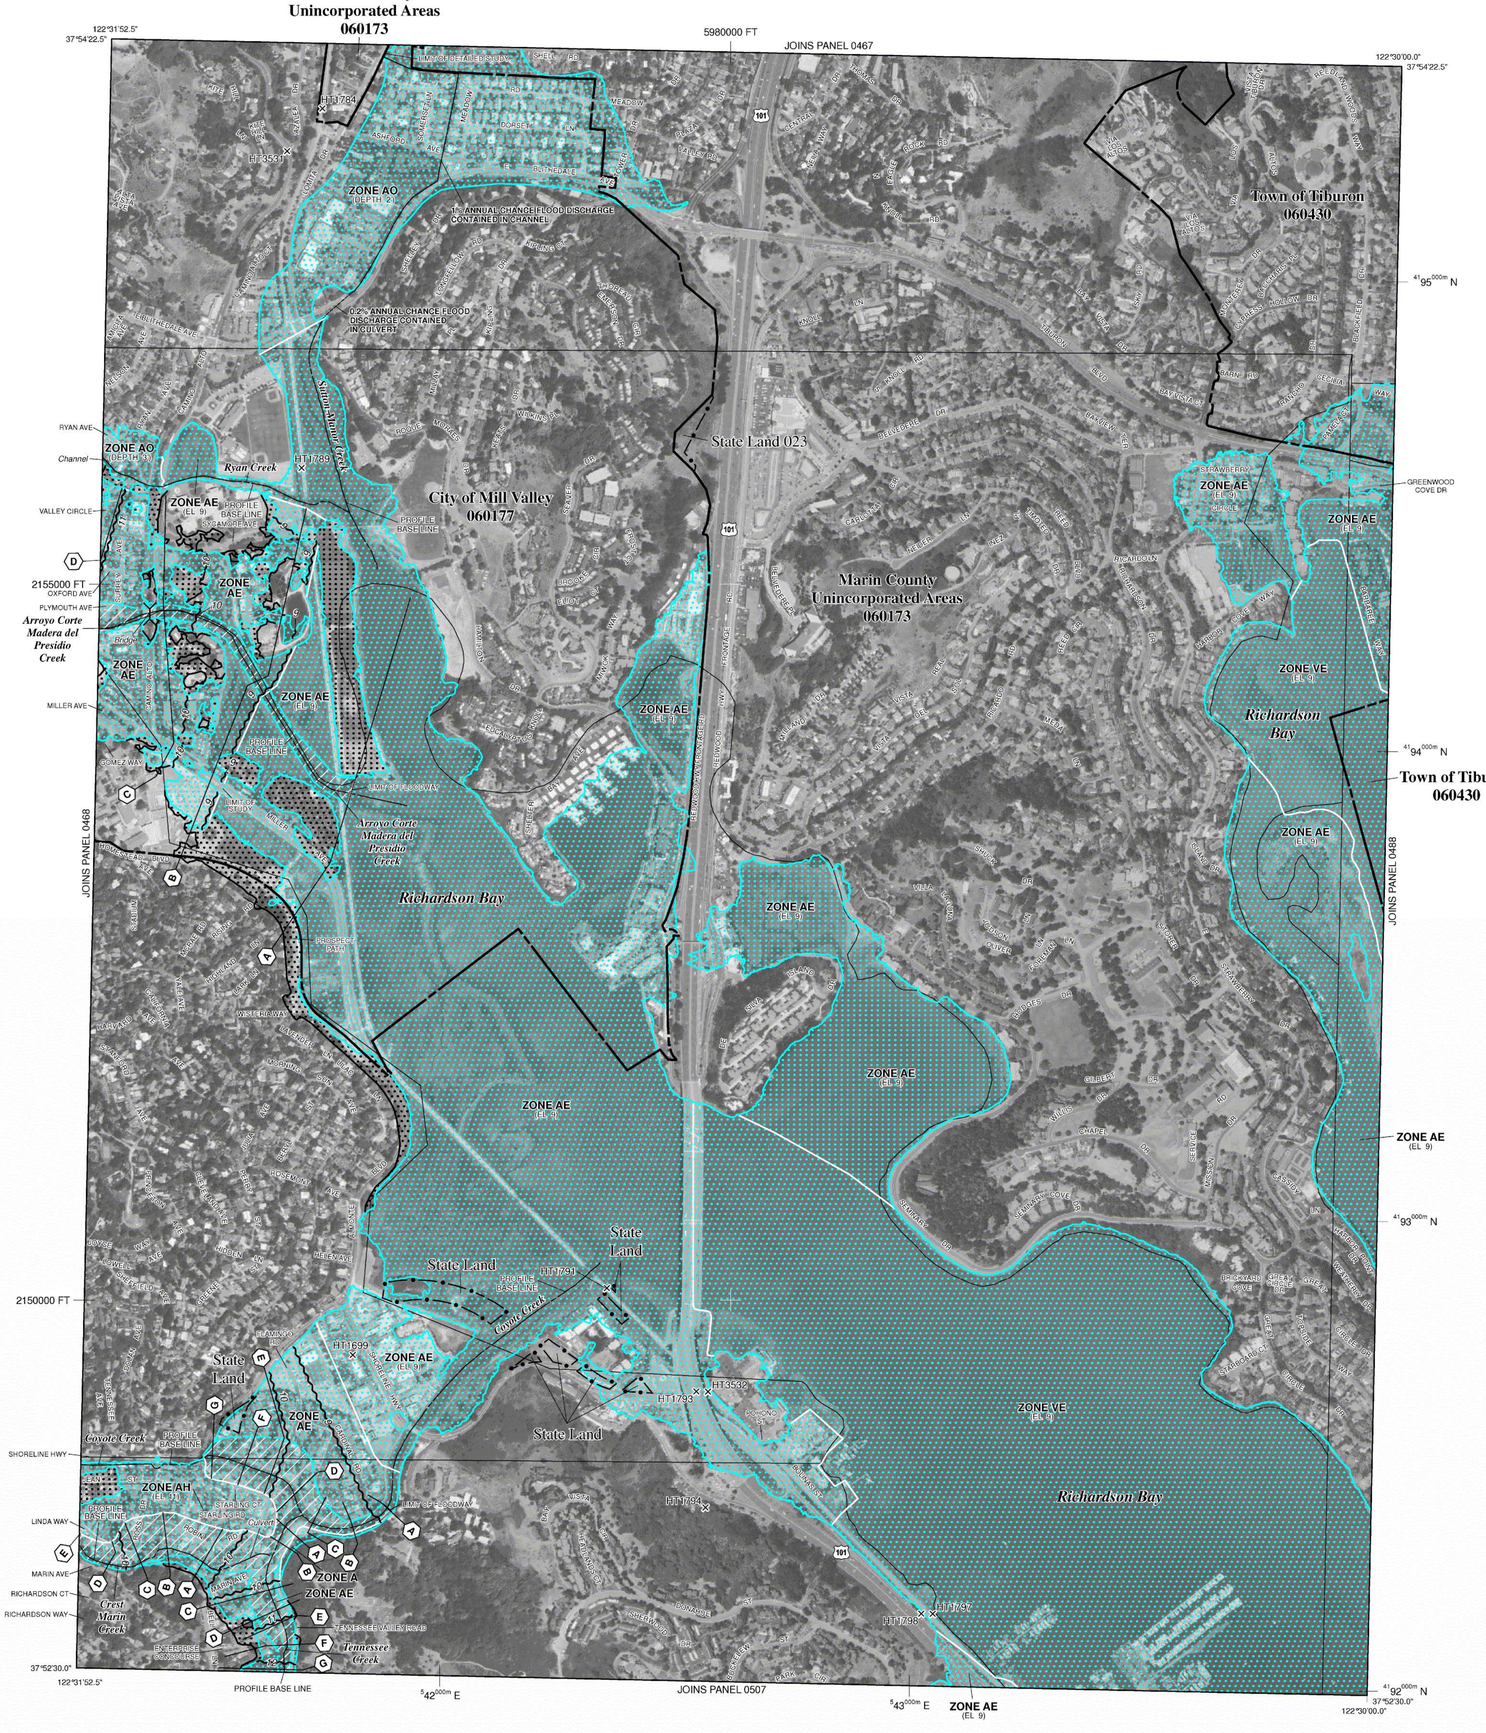
Base map information shown on this FIRM was provided in digital format by the USDA National Agriculture Imagery Program (NAIP). This information was photogrammetrically compiled at a scale of 1:24,000 from aerial photography dated 2009. Additional information was provided in digital format by Marin County.

This map may reflect more detailed or up to date stream channel configurations than those shown on the previous FIRM. The floodplains and floodways that were transferred from the previous FIRM may have been adjusted to conform to these new stream channel configurations and improved topographic data. The profile baselines depicted on this map represent the hydraulic modeling baselines that match the flood profiles and Floodway Data Tables if applicable, in the FIS report. As a result, the profile baselines may deviate significantly from the new base map channel representation and may appear outside of the floodplain.

Corporate limits shown on this map are based on the best data available at the time of publication. Because changes due to annexations or de-annexations may have occurred after this map was published, map users should contact appropriate community officials to verify current corporate limit locations.

Please refer to the separately printed **Map Index** for an overview map of the county showing the layout of map panels; community map repository addresses; and a Listing of Communities table containing National Flood Insurance Program dates for each community as well as a listing of the panels on which each community is located.

For information and questions about this map, available products associated with this FIRM including historic versions of this FIRM, how to order products or the National Flood Insurance Program in general, please call the FEMA Map Information eXchange at 1-877-FEMA-MAP (1-877-336-2627) or visit the **FEMA Map Service Center** website at http://msc.fema.gov. Available products may include previously issued Letters of Map Change, a Flood Insurance Study Report, and/or digital versions of this map. Many of these products can be ordered or obtained directly from the website. Users may determine the current map date for each FIRM panel by visiting the **FEMA Map Service Center** website or by calling the FEMA Map Information eXchange.



LEGEND

SPECIAL FLOOD HAZARD AREAS (SFHAs) SUBJECT TO INUNDATION BY THE 1% ANNUAL CHANCE FLOOD

The 1% annual chance flood (100-year flood), also known as the base flood, is the flood that has a 1% chance of being equalled or exceeded in any given year. The Special Flood Hazard Area is the area subject to flooding by the 1% annual chance flood. Areas of Special Flood Hazard include Zones A, AE, AH, AO, AR, A99, V and VE. The Base Flood Elevation is the water-surface elevation of the 1% annual chance flood.

ZONE A	No Base Flood Elevations determined.
ZONE AE	Base Flood Elevations determined.
ZONE AH	Flood depths of 1 to 3 feet (usually areas of ponding); Base Flood Elevations determined.
ZONE AO	Flood depths of 1 to 3 feet (usually sheet flow on sloping terrain); average depths determined. For areas of alluvial fan flooding, velocities also determined.
ZONE AR	Special Flood Hazard Area formerly protected from the 1% annual chance flood by a flood control system that was subsequently decertified. Zone AR indicates that the former flood control system is being restored to provide protection from the 1% annual chance or greater flood.
ZONE A99	Area to be protected from 1% annual chance flood by a Federal flood protection system under construction; no Base Flood Elevations determined.
ZONE V	Coastal flood zone with velocity hazard (wave action); no Base Flood Elevations determined.
ZONE VE	Coastal flood zone with velocity hazard (wave action); Base Flood Elevations determined.

FLOODWAY AREAS IN ZONE AE

The floodway is the channel of a stream plus any adjacent floodplain areas that must be kept free of encroachment so that the 1% annual chance flood can be carried without substantial increases in flood heights.

OTHER FLOOD AREAS

ZONE X	Areas of 0.2% annual chance flood; areas of 1% annual chance flood with average depths of less than 1 foot or with drainage areas less than 1 square mile; and areas protected by levees from 1% annual chance flood.

OTHER AREAS

ZONE X	Areas determined to be outside the 0.2% annual chance floodplain.
ZONE D	Areas in which flood hazards are undetermined, but possible.

COASTAL BARRIER RESOURCES SYSTEM (CBRS) AREAS

OTHERWISE PROTECTED AREAS (OPAs)

CBRS areas and OPAs are normally located within or adjacent to Special Flood Hazard Areas.

- 1% annual chance floodplain boundary
- 0.2% annual chance floodplain boundary
- Floodway boundary
- Zone D boundary
- CBRS and OPA boundary
- Boundary dividing Special Flood Hazard Areas of different Base Flood Elevations, flood depths or flood velocities.
- 513 — Base Flood Elevation line and value; elevation in feet*
- (EL 987) — Base Flood Elevation value where uniform within zone; elevation in feet*

* Referred to the North American Vertical Datum of 1988 (NAVD 88)

- A — A — Cross section line
- 23 — 23 — Transect line
- 97°07'30", 32°22'30" — Geographic coordinates referenced to the North American Datum of 1983 (NAD 83)
- 4275000mN — 1000-meter Universal Transverse Mercator grid ticks, zone 10
- 6000000 FT — 5000-foot grid ticks: California State Plane coordinate system, zone III (FIPSZONE 0403), Lambert Conformal Conic
- DX5510 × — Bench mark (see explanation in Notes to Users section of this FIRM panel)
- M1.5 — River Mile

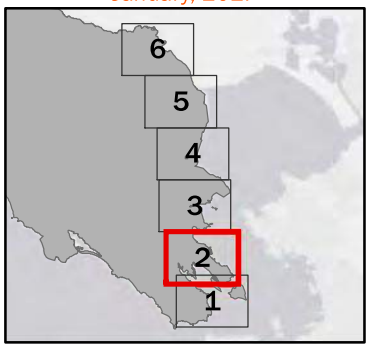
January, 2017



The inundation maps and the associated analyses provide a regional-scale illustration of inundation and coastal flooding due to specific sea level rise and storm surge scenarios, and are intended to improve sea level rise awareness and preparedness. The maps are not detailed to the parcel-scale and should not be used for navigation, permitting, regulatory, or other legal uses. Flooding due to sea level rise and storm surges is possible in areas outside of those predicted in these maps, and the maps do not guarantee the safety of an individual or structure. Nor do the maps model flooding from other sources, such as riverine or surface water flooding from rainfall-runoff events. The contributors and sponsors of this product do not assume liability for any injury, death, property damage, or other effects of flooding. The maps relied on a 1-meter digital elevation model created from LiDAR data collected in 2010 and additional survey data (where available). Although reasonable care was taken to capture all relevant topographic features and structures that may impact coastal inundation, it is possible that structures may not be fully represented, especially those that are narrower than the 1-meter horizontal map scale. The maps are based on model outputs and do not account for all of the complex and dynamic San Francisco Bay processes or future conditions such as erosion, subsidence, future construction or shoreline protection upgrades, or other changes to San Francisco Bay or the region that may occur in response to sea level rise. These inundation maps should not be used for detailed design or construction and users should consult a licensed engineer for information regarding existing and future flood risk at an individual site. For more context about the maps and analyses, including a description of the data and methods used, please see the Adapting to Rising Tides Bay Area Sea Level Rise Analysis and Mapping project report. The inundation maps and associated analyses are provided "as is." Neither BATA, the Metropolitan Transportation Commission, the Bay Conservation and Development Commission, the California Coastal Conservancy, the San Francisco Public Utilities Commission, nor their contractors, make any warranty whatsoever, whether expressed or implied, as to the accuracy, thoroughness, value, quality, validity, merchantability, suitability, condition, or fitness for a particular purpose of the inundation maps and associated analyses, nor as to whether the inundation maps and associated analyses are error-free, up-to-date, complete or based upon accurate or meaningful facts.

Appendix O

Draft Community Plan Amendment

RECEIVED
FEB 05 2020
COUNTY OF MARIN
COMMUNITY DEVELOPMENT AGENCY
PLANNING DIVISION

II. Goals.

A. Community Amenities

It is the desire of the Community to assure that future development provide for such amenities as visual backdrops, neighborhood separators, retention of ridgelines, and protection of environmentally important areas, through careful planning and clustering of structures. In addition, all means of open space acquisition should be pursued, including purchase and dedication.

B. Housing Balance

The Community desires to retain a character that identifies the Strawberry area as a family-oriented community. Such an identity is established by the visual, physical setting of the community, as well as by families who reside there. It is important that the social patterns, personal interaction, sights and sounds that typify single family neighborhoods be maintained and strengthened. If new development is to occur, it can strengthen this character by providing the traditional setting of detached single-family units within any new development proposed for the area. Development plan proposals should give the highest priority to incorporating detached single-family homes into the plan. Where physical constraints or opportunities dictate another housing type (i.e., attached units), the Community goal is to ei~~i~~nsure that unit size and project amenities are designed to provide the opportunity for and encourage occupancy by families with children. In this manner then the Community wishes to ei~~i~~nsure a housing balance that will continue to provide for families.

C. Transportation

The Community desires that the movement of traffic through the Strawberry area be safe for both pedestrians and vehicles. The Community further desires that existing traffic movement not be further interrupted by new development and that existing potentially hazardous conditions for pedestrians and vehicles be improved to an acceptable level of safety. Therefore, it is the goal of the Community that the overall density of new development in Strawberry be scaled to ensure future acceptable traffic levels of service. Where levels of service or safety are now currently unacceptable, or where service levels or safety conditions will deteriorate due to traffic generated by new development, improvements shall be required in conjunction with that new development. These improvements should be considered as appropriate mitigation measures to be applied to new development. Owners of the large undeveloped properties in the Strawberry area (DeSilva Island, Watertank Hill, ~~Golden Gate Baptist Theological Seminary~~ and Strawberry Spit/Point) will be required to contribute on a proportional basis to the funding necessary to construct required improvements. The proportion of the funding to be required from each property owner is to be determined by the traffic generated by each development and the impact of that traffic on the intersection or road to be improved. The formula for proportionality and method of collection requires further study and should be determined in the near future.

COUNTY OF MARIN
COMMUNITY DEVELOPMENT AGENCY
PLANNING DIVISION

II. Goals.

A. Community Amenities

It is the desire of the Community to assure that future development provide for such amenities as visual backdrops, neighborhood separators, retention of ridgelines, and protection of environmentally important areas, through careful planning and clustering of structures. In addition, all means of open space acquisition should be pursued, including purchase and dedication.

B. Housing Balance

The Community desires to retain a character that identifies the Strawberry area as a family-oriented community. Such an identity is established by the visual, physical setting of the community, as well as by families who reside there. It is important that the social patterns, personal interaction, sights and sounds that typify single family neighborhoods be maintained and strengthened. If new development is to occur, it can strengthen this character by providing the traditional setting of detached single-family units within any new development proposed for the area. Development plan proposals should give the highest priority to incorporating detached single-family homes into the plan. Where physical constraints or opportunities dictate another housing type (i.e., attached units), the Community goal is to ~~e~~insure that unit size and project amenities are designed to provide the opportunity for and encourage occupancy by families with children. In this manner then the Community wishes to ~~e~~insure a housing balance that will continue to provide for families.

C. Transportation

The Community desires that the movement of traffic through the Strawberry area be safe for both pedestrians and vehicles. The Community further desires that existing traffic movement not be further interrupted by new development and that existing potentially hazardous conditions for pedestrians and vehicles be improved to an acceptable level of safety. Therefore, it is the goal of the Community that the overall density of new development in Strawberry be scaled to ensure future acceptable traffic levels of service. Where levels of service or safety are now currently unacceptable, or where service levels or safety conditions will deteriorate due to traffic generated by new development, improvements shall be required in conjunction with that new development. These improvements should be considered as appropriate mitigation measures to be applied to new development. Owners of the large undeveloped properties in the Strawberry area (DeSilva Island, Watertank Hill, ~~Golden Gate Baptist Theological Seminary~~ and Strawberry Spit/Point) will be required to contribute on a proportional basis to the funding necessary to construct required improvements. The proportion of the funding to be required from each property owner is to be determined by the traffic generated by each development and the impact of that traffic on the intersection or road to be improved. The formula for proportionality and method of collection requires further study and should be determined in the near future.

III. Development Guidelines.

C. Former Golden Gate Baptist Theological Seminary site – (See Map 4)

Description	
A.P. #	~~43-261-03,05,20 & 22~~ 043-261-25; 043-261-26; 043-262-03, 043-262-06; 043-401-05; 043-401-10; 043-401-16; 043-402-03; 043-402-06
Area	~~125.19~~123.35 acres of land, 22.25 acres of land underwater.
Existing zoning/density	RMP ~~2.1~~2.47; MF2 (1-4 units/acre)
Existing development	211 residential dwellings ~~for students and faculty~~available to the public. Various buildings utilized for educational ~~and religious~~ purposes.

LAND USE – A ~~combination of student/faculty housing, educational and religious uses and activities~~college/university use with a student population of approximately 1,000 ~~were~~ was granted for this property by Use Permit in 1953 overlaid on the site's base zoning of RMP 2.47. Extensive facilities including housing, administrative and educational buildings were built subsequently. These uses continue to be appropriate for the property. However, since that Use Permit was issued, the plans of the Seminary and the character of the community and the zoning applied to the property have changed. Any further development of ~~all of~~ the ~~Seminary~~ property must be established in a Master Plan because it is now subject to a Planned District classification. In general, it is recommended that ~~Seminary religious,~~ educational buildings, and uses and ~~student~~ housing be located on the central portion of the property. The areas located at the periphery of the ~~Seminary~~ property would be appropriate for ~~a limited number of~~ single-family detached residences ~~which would not be part of the Seminary's student and faculty housing~~. Development in these areas should be planned and designed to blend into the existing community.

The development potential of the ~~Seminary~~ property was discussed with the Citizen's Advisory Committee, the property owners and their representatives, and reviewed in the field by walking the property. The exact development of the property will be established in the more detailed review of a Master Plan application. ~~However, the following development was determined to be the maximum desirable based on the projected traffic impact and the context of the property within the community.~~ The following was originally determined to be the maximum desirable development based on the projected traffic impact and the context property within the community.

(1) 24 single-family detached residences located on the periphery of the ~~Seminary~~ property.

(2) 36 attached units.

(3) ~~90-100~~200-250 ~~student~~ housing units

(4) Some additional development related to the educational ~~and religious~~ use of the ~~Seminary~~ property itself. However, the only such development specifically discussed as part of this Community Plan Amendment was a chapel. Other potential development includes a student union building and additional classrooms (shown in the 1955 Use Permit) and a gymnasium (new Use). Any such development should be located adjacent to the existing campus development. The extent of additions to the campus should be determined in a Master Plan which evaluates such development in the context of all development on the property.

The following discussion sets out specific guidelines for the development potential of the portion of the property surrounding the ~~Seminary~~ campus area in consideration of a Master Plan. The areas discussed are identified by numbers on Map 4. The guidelines include a range of development that may be appropriate. Not all of them can be exercised and be consistent with the maximum development identified for this property. Any Master Plan application should be evaluated against these guidelines and the other provisions of the Strawberry Community Plan. The maintenance or improvement of existing service levels at the Seminary/101/Frontage Road interchange should be a prime determinate of the development that is permitted at this location.

(Area 1) Storer Drive Extension. Approximately six (6) single-family detached dwellings behind existing development on East Strawberry Drive would be appropriate. Alternatively, approximately 10-15 attached dwellings behind the existing apartments on East Strawberry Drive and approximately 3 single-family detached dwellings would also be suitable.

(Area 2) Platt Court Existing ~~Faculty~~ units – Existing use should remain; however, if the ~~Seminary~~ landowner desires to redevelop this area, approximately three (3) single-family detached dwelling units could be built on site.

(Area 3) Seminary Drive area at intersection with Great Circle Drive – Two single-family detached dwelling units could be located in this area.

(Area 4) Seminary Drive area adjacent to Brickyard Park – Development in this area should be single-family detached dwelling units, approximately 3 to 4 in number. Single-family homes should be located on the level plateau area below the road and on top of the bluff above the shore. Dwellings should be sited so that views of Richardson Bay from existing dwellings are not blocked. Lots should be designed so that public access to the shoreline is wide and inviting and that the level area up to the bluff cannot be fenced off but will remain open to the public.

(Area 5) Slope between Chapel and Seminary Drive – Development in this area should be entirely single-family detached dwellings and approximately 10 in number. This land use is recommended to maintain the single-family character of the neighborhood. The access to the dwellings would be obtained from either Chapel or Seminary Drive. A band of open undeveloped land should extend from Chapel Drive to Seminary Drive. Alternative development in this area could be a combination of single-family detached dwellings below the ridge and small scale attached units in the bowl area adjacent to Seminary Drive.

(Area 6) Any expansion of the campus or ~~student~~ housing should be developed in this area. Hilltop adjacent to Chapel Drive is a prominent visual landmark within the Community and should remain undeveloped, if possible. However, if development of this site is to occur, it should be limited to either structures for ~~Seminary~~ campus activities or allocated for housing. ~~No housing should be placed on this site.~~ Structures should be designed and placed so that they are as unobtrusive as possible. This should be accomplished by placing structures in the northern quadrant of the site and by "benching" the slope to provide a lower building pad and profile. Landscaping should also be incorporated into the site plan to screen views of the structure from existing dwellings. The existing views from residences along Hillard Drive should not be blocked be development on this hilltop.

(Area 7) Reed Boulevard – Two single-family detached dwelling units should be located on ~~Seminary~~ the property with frontage on Reed Boulevard.

(Area 8) Area between Seminary, Gilbert, Willis, Chapel Drive and the Forested Knoll – This area does not include the athletic field nor the slopes adjacent to it. The field and slopes should be considered as part of the campus and neither the property owner nor the public consider market housing as an appropriate use for this area.

If the ~~seminary~~ landowner desires to develop attached dwelling units as apartments or to be sold as condominiums, such units could be located off of Chapel Drive at the top of the slope above Seminary Drive south of the Athletic Field and Gilbert Drive. Apartments or ~~C~~condominiums in this location could be compatible with the existing multiple development south of Seminary Drive next to Richardson Bay, and yet would be visually separated from the single-family detached dwellings located on the Point. A maximum of 36 units might be located in this area.

Alternatively, a smaller number, a maximum of 10, single-family detached units could be located in this area.

Zoning/Density – Maintain the existing Planned Development zoning designation of RMP. Densities to be established upon specific review of a master plan for the property. Allowable densities to be subject to the preceding land use recommendations and the following policies.

Location of Development – The shoreline area adjacent to Brickyard Park should remain undeveloped because it can provide public view of and access to the Bay. The Forested Knoll ~~(Area 6)~~ above Seminary Drive should remain undeveloped because it is a prominent visual landmark in the Community. Other portions of the property may be developed as outlined previously.

Traffic/Circulation – Driveways for individual lots should be kept to a minimum along Seminary Drive by combining entrances wherever possible.

Traffic generated by this development will add to the unacceptable level of congestion projected to occur at the intersection of Highway 101, Seminary Drive interchange ramps and the Redwood Frontage Road. To mitigate this impact, the developer shall be required to contribute, on a proportional basis, along with the other three major Strawberry developers, to the funding required to reconstruct this intersection, including the installation of a traffic signal. This problem is discussed in more detail in the Transportation portion of the Plan.

Traffic generated from this project will add to the safety problems for pedestrians walking on East Strawberry Drive. To mitigate this impact, the developer should be required to participate, proportionately, in the financing of a sidewalk or similar improvements which would separate pedestrian and vehicular traffic, on East Strawberry Drive from Great Circle Road to Strawberry Point School.

Design Guidelines – Development at the higher elevations between Chapel and Seminary Drives should be designed to retain an appearance of openness to the slopes, placing units below the ridge and grouping them toward the western and eastern portion of this area, so that the central portion of the slope and ridge remains open. This openness should be achieved by expanses of undeveloped areas rather than relying on space and landscaping between individual units; therefore, lots should not be uniformly placed across the ridge.

A complete landscaping plan should be incorporated into the site design. That plan should include placement and selection of landscaping materials to screen units on this site. Such landscaping should be installed as part of the site improvements and individual occupancy permits should be issued only after the landscaping is installed.

~~Student h~~Housing proposed for the knoll adjacent to Shuck Drive should be sited to minimize grading for structures and parking areas. The site plan should be designed so that direct views of ~~student~~ units from existing dwellings, especially those on Milland and Ricardo Drives, are screened. A landscape plan providing a "green belt" buffer of landscaping between ~~student~~ housing and existing dwellings should be incorporated

into the site plan. ~~Student h~~Housing should be sited so as to provide at a minimum the same distances between new structures as currently exists between existing structures.

The review of any proposed master plan for the ~~Seminary~~ property should include a discussion of the existing and potential public uses of and activities at the campus. Currently, the Community is not fully informed of the existing campus public activity programs. It would be beneficial if the ~~Seminary~~ landowner and Community could establish a formal understanding of the recreational opportunities and educational activities available. Possibly the Strawberry Recreation District could assist the ~~Seminary~~ landowner in establishing and publicizing these public uses and activities.

[1] Obtained from the FHWA Roadway Construction Noise Model, January 2006. Table 1.

[2] Based on Figure 6-5 from the Federal Transit Noise and Vibration Impact Assessment, 2006 (pg 6-23).

[3] Based on the following from the Federal Transit Noise and Vibration Impact Assessment, 2006 (pg 12-3).

$L_{eq}(equip) = E.L.+10*\log (U.F.) - 20*\log (D/50) - 10*G*\log (D/50)$

Where: E.L. = Emission Level;

U.F.= Usage Factor;

G = Constant that accounts for topography and ground effects (FTA 2006: pg 6-23); and

D = Distance from source to receiver.

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 12-3 and 12-4 of FTA 2006.

Computation of the ground factor is based on the equation presentd in Figure 6-23 on pg. 6-23 of FTA 2006, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)

							0.66			
							0.66			

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 12-3 and 12-4 of FTA 2006.

Computation of the ground factor is based on the equation presentd in Figure 6-23 on pg. 6-23 of FTA 2006, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)

							0.66			
							0.66			
							0.66			

Notes:
Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 12-3 and 12-4 of FTA 2006.

Computation of the ground factor is based on the equation presentd in Figure 6-23 on pg. 6-23 of FTA 2006, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

Distance Propagation Calculations for Stationary Sources of Ground Vibration

KEY: Orange cells are for input.

Grey cells are intermediate calculations performed by the model.

Green cells are data to present in a written analysis (output).

STEP 1: Determine units in which to perform calculation.

— If vibration decibels (VdB), then use Table A and proceed to Steps 2A and 3A.

— If peak particle velocity (PPV), then use Table B and proceed to Steps 2B and 3B.

STEP 2A: Identify the vibration source and enter the reference vibration level (VdB) and distance.

STEP 3A: Select the distance to the receiver.

Table A. Propagation of vibration decibels (VdB) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
MF to SE	vibration level (VdB)	@	distance (ft)	vibration level (VdB)	@	distance (ft)
Vibratory Roller	94	@	50	100.7	@	30

STEP 2B: Identify the vibration source and enter the reference peak particle velocity (PPV) and distance.

STEP 3B: Select the distance to the receiver.

Table B. Propagation of peak particle velocity (PPV) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
MF to SE	vibration level (PPV)	@	distance (ft)	vibration level (PPV)	@	distance (ft)
Vibratory Roller	0.210	@	25	0.160	@	30

Notes:

Computation of propagated vibration levels is based on the equations presented on pg. 12-11 of FTA 2006. Estimates of attenuated vibration levels do not account for reductions from intervening underground barriers or other underground structures of any type, or changes in soil type.

Federal Transit Association (FTA). 2006 (May). Transit Noise and Vibration Impact Assessment. FTA-VA-90-1003-06. Washington, D.C. Available: <http://www.fta.dot.gov/documents/FTA_Noise_and_Vibration_Manual.pdf>. Accessed: September 24, 2010.

Attenuation Calculations for Stationary Noise Sources

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor			
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)	
HVAC LEQ	75.0	@	3	soft	8	5	0.63	42.8	@	50	
HVAC LEQ	75.0	@	3	soft	8	5	0.63	45.4	@	40	
				hard	8	5	0.00	#DIV/0!	@	50	
				hard	8	5	0.00	#DIV/0!	@	50	
				hard	8	5	0.00	#DIV/0!	@	71	
				soft	8	5	0.63	#DIV/0!	@	80	
				soft	8	5	0.63	#DIV/0!	@	80	
				soft	8	5	0.63	#DIV/0!	@	1000	
							0.66				
							0.66				
							0.66				
							0.66				
							0.66				
							0.66				

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 176 and 177 of FTA 2018.

Computation of the ground factor is based on the equation presentd in Table 4-26 on pg. 86 of FTA 2018, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

I. INTRODUCTION

This report addresses the impacts that transportation and land use changes related to the North Coast Land Holding Project would have on vehicle miles traveled (VMT), pedestrian and bicycle facilities, transit service, emergency access, and safety.

Project Study Area

The approximately 127-acre project site is located on the former Golden Gate Baptist Theological Seminary campus property in the community of Strawberry, a census-designated place in unincorporated Marin County. The campus is generally bounded by Seminary Drive, East Strawberry Drive, Ricardo Road, and Richardson Drive.

Regional access to the project site is available from US Highway 101 (US 101) and State Route 131 (SR 131; Tiburon Boulevard). From US 101 off-ramps, ingress to the project site is available through the Redwood Highway Frontage Road to Seminary Drive, and egress returning to the freeway on-ramps is available through Seminary Drive and the Highway Frontage Road to US 101 on-ramp. The project site is accessible from Seminary Drive at Hodges Drive and Gilbert Drive. Other access points to the project site include Mission Drive, East Strawberry Drive, Chapel Drive, and Reed Boulevard.

Project Description

The academic campus is currently tenant-occupied by Olivet University, a private Christian university. As of September 2020, at the time of the NOP, enrollment consisted of approximately 100 students on campus. Most of the students and their families live off-site and commute to the campus. The academic campus is staffed with approximately 24 employees. The existing 3,000-sf daycare facility occupies the southern portion of the Academic Campus Planning Area and is located in the academic building. The daycare serves the families of the academic campus, residents connected with the campus, and other southern Marin County community residents. Current enrollment is approximately 60 children, with approximately 16 total staff. Eight to 12 staff are working onsite on any given day, depending on the age of the children enrolled that particular day. In total, there are 145 existing residential units within the project site. This includes 16 market-rate studios, 54 one-bedroom housing units, 54 two-bedroom housing units, 18 three-bedroom housing units, and 3 single-family residences. There are also 66 dormitory rooms with 7 shared kitchens. The existing housing is occupied by approximately 320 residents,[1] including general public occupants as well as students, faculty, staff, and families affiliated with the academic campus.

The proposed project includes reconfiguration of the existing academic campus to improve accessibility and facilitate construction of new residential uses in the Chapel Hill and Shuck Drive Knoll Planning Areas.

[1] Based on occupancy estimates provided by applicant.

The existing academic building, cafeteria, and library would be retained in their current locations. The administration building would be renovated and would include the addition of a 15,800-sf structure along the northern façade of the existing building. The academic campus would continue to be occupied by a university or college, with a maximum enrollment of 1,000 higher education students.

The proposed project would retain some housing units, replace existing housing, and increase the total number of residences. The applicant proposes to retain 13 existing residential units within the project site and replace remaining residential units with new housing. Proposed new housing would include replacement of 139 residential units and construction of 184 new units consisting of single-family and multi-family residences, as well as a residential care facility (counted as one residential unit but supporting up to 155 residents). A total of 324 residential units would be constructed. A total of 50 residential units would be affordable housing for low-income residents. The affordable units will be inclusionary; dispersed throughout the project site; and comparable in location, size, and exterior design to the remaining units in the overall residential development. For the purposes of this traffic assessment, all the residential units would be available for lease to the broader community since there would be no restricted units.

The proposed project would include a new 267,354-sf residential care facility located in the eastern portion of the project site, within the Dormitory Hill Planning Area, situated northwest of the academic campus and north of the central tiered parking lot. The residential care facility would be designed to serve adults 55 and older with capacity to house up to 170 residents. The housing would consist of up to 100 independent living apartments and 50 assisted living and memory care residences. In addition to the proposed housing, the residential care facility would include public dining, wellness, and lounge areas, as well as support and back-of-house facilities for Certified Medical Technical personnel.

The proposed project includes a new facility that would contain a 3,000-sf daycare and a 17,000-sf fitness center. The daycare and fitness center would be located in a shared facility that would be situated in the central portion of the project site, east of the Seminary Playing Field and west of the three-tiered parking lot. The existing daycare would continue to operate on-site but would be relocated from the academic building into the new space within the proposed daycare and fitness center. Enrollment at the daycare would be limited to the current enrollment of 60 children, with preference given to families in the community. Fitness center membership would be limited to on-site residents, affiliates of the academic campus, and residents of the surrounding community that are within walking distance of the facility.

Buildout of the project would increase the total number of parking spaces from 608 existing spaces to 944 parking spaces. Of the existing residential parking spaces, 51 spaces would be retained, and an additional 652 residential parking spaces would be added for residential housing and the residential care facility, resulting in a total of 703 residential parking spaces on the project site.

Vehicular access to the project site from US 101 would not be altered for the project. The project does not include proposed off-site transportation infrastructure improvements between the project and the US 101 freeway.

The project would be designed to encourage pedestrian and bicycle transportation, including features such as complete streets elements, secure bicycle parking, trails and walkways, and Class III bike routes on interior streets. The existing circulation pattern would be maintained but would be enhanced with pedestrian and bicycle path connections. Off-site improvements include a road and walkway extension at Gilbert Drive, a walkway extension from Herring Drive to Strawberry Drive, and walkway improvements along Mission Drive.

Report Organization

The remainder of this report is divided into the following chapters:

Chapter 2 – Environmental Setting describes the existing transportation network in the proposed project study area, including the surrounding roadway network. Additionally, this section describes the pedestrian facilities, bicycle facilities, public transit network, emergency service access, and safety data.

Chapter 3 – Methodology describes the study analysis scenarios, the 2040 No Project transportation system, VMT forecasts, and standards of significance.

Chapter 4 – Impact Assessment describes the anticipated VMT for the Proposed Project and identifies the extent to which the Proposed Project would impact the transportation system.

II. ENVIRONMENTAL SETTING

Terminology

The following are definitions for terms used in this section.

- **Vehicle miles traveled (VMT)**. A measure of network use or efficiency that accounts for the number of daily vehicle trips generated times the length or distance of those trips. VMT is generally expressed as VMT per capita for a typical weekday. For instance, the 2013 average daily residential VMT per capita for the nine county Bay Area region was 15.3 miles per person per day.
- **Greenhouse gases (GHG)**. Gases in the atmosphere that absorb infrared light, thereby retaining heat in the atmosphere and contributing to a greenhouse effect.

Regulatory Framework

This section summarizes key federal, state, regional, and local regulations and programs related to transportation impacts resulting from the proposed project.

Federal Regulations

Americans with Disabilities Act (ADA)

The Americans with Disabilities Act (ADA) of 1990 prohibits discrimination against people with disabilities in several areas including employment, transportation, public accommodations, and access to state and local government' programs and services. The ADA applies to both public and private ground transportation providers. Key requirements include providing accessible access routes and paths of travel, accessible transit service and vehicles, accessible transit stops, accessible parking spaces, and accessible transport communication systems.

The U.S. Access Board publishes guidelines under ADA that address access to sidewalks and streets, crosswalks, curb ramps, pedestrian signals, on-street parking, and other components of public right-of-way. The guidelines also review shared use paths, which are designed primarily for use by bicyclists and pedestrians for transportation and recreation purposes.

Public Right-of-Way Accessibility Guidelines (PROWAG)

PROWAG are minimum guidelines issued under Title II of the ADA by the U.S. Access Board in September 2023 for the accessibility of pedestrian facilities in the public right-of-way. These guidelines ensure that facilities used by pedestrians, such as sidewalks and crosswalks, constructed or altered in the public right-of-way are readily accessible to and usable by pedestrians with disabilities.

State Regulations

Senate Bill (SB) 743

With the passage of SB 743 (September 27, 2013) and the subsequent adoption of revised California Environmental Quality Act (CEQA) Guidelines in 2019, level of service (LOS) can no longer be used as a criterion for identifying significant transportation impacts for most projects under CEQA. LOS measures the average amount of delay experienced by vehicle drivers at an intersection during the most congested time of day, while the new CEQA metric (vehicle miles traveled, or VMT) measures the total number of daily miles traveled by vehicles on the roadway network and the impacts on the environment from those miles traveled.

In other words, SB 743 changes the focus of transportation impact analysis in CEQA from measuring impacts to drivers, to measuring the impact of driving. Land use projects with one or more of the following characteristics would have lesser VMT impacts:

- Higher land use densities
- Mix of project uses
- Support of a citywide jobs-housing balance (i.e., provide housing in a job rich area, or vice versa)
- Proximity to the core of a region
- Proximity to high quality transit service
- Located in highly walkable or bikeable areas

This shift in transportation impact criteria is expected to better align transportation impact analysis and mitigation outcomes with the state's goals to reduce GHG emissions, encourage infill development, and improve public health through more active transportation. Specific to SB 743, Section 15064.3(c) of the revised Guidelines states that, "a lead agency may elect to be governed by the provisions of this section immediately. Beginning on July 1, 2020, the provisions of this section shall apply statewide." However, CEQA Statute Section 21099(b)(2) states that, "upon certification of the guidelines by the Secretary of the Natural Resources Agency pursuant to this section, automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the Guidelines."

Although the State's Office of Planning and Research provides recommendations for adopting new VMT analysis guidelines, lead agencies have the final say in designing their methodology. Lead agencies must select their preferred method of estimating and forecasting VMT, their preferred significance thresholds for baseline and cumulative conditions, and the mitigation strategies they consider feasible. Lead agencies must prove that their selected analysis methodology aligns with SB 743's goals to promote infill development, reduce GHGs, and reduce VMT.

California Department of Transportation

Caltrans is responsible for operating and maintaining the State Highway System. In the project vicinity, US 101 falls under Caltrans jurisdiction. Caltrans provides administrative support for transportation programming decisions made by the California Transportation Commission for state funding programs. The State Transportation Improvement Program is a multiyear capital improvement program that sets priorities and funds transportation projects envisioned in long-range transportation plans.

Transportation Impact Study Guide (TISG)

The TISG replaced the Guide for the Preparation of Traffic Impact Studies (Caltrans, 2002) for use with local development projects and went into effect July 1, 2020. The TISG was prepared by Caltrans to provide guidance to lead agencies regarding Caltrans review of a land use project or plan's transportation analysis using a VMT metric. This guidance is not binding and is intended to be a reference and informational document.

Interim Local Development Intergovernmental Review (LDIGR) Safety Review Practitioners Guidance

The Interim Safety Review Practitioners Guidance (Caltrans, December 18, 2020) provides guidance to district staff and other Caltrans personnel, lead agencies, developers, and consultants conducting safety reviews for proposed land use projects and plans affecting the State Highway System.

Deputy Directive DD-64-R1 – Complete Streets – Integrating the Transportation System

Caltrans provides for the needs of travelers of all ages and abilities in all programming, planning, design, construction, operations, and maintenance activities and products on the State Highway System. Caltrans views all transportation improvements as opportunities to improve safety, access, and mobility for all travelers in California and recognizes bicycles, pedestrians, and transit modes as integral elements of the transportation system.

Caltrans develops multimodal projects in balance with community goals, plans, and values. Implicit in these objectives is addressing the safety and mobility needs of bicyclists, pedestrians, and transit users in all projects, regardless of funding. Bicycle, pedestrian, and transit travel is facilitated by creating "complete streets," beginning early in the system planning process and continuing through project delivery and maintenance, and operations.

Regional Plans and Regulations

Plan Bay Area 2050

Plan Bay Area is the Bay Area's Regional Transportation Plan (RTP)/Sustainable Community Strategy (SCS). *Plan Bay Area* 2050, adopted jointly by the Association of Bay Area Governments (ABAG) and MTC on October 21, 2021, is the current version of the plan. The 2050 *Plan Bay Area* is an update to the 2013 *Plan Bay Area*, with updated planning assumptions that incorporate key economic, demographic, and financial trends from the last several years. This document describes how the San Francisco Bay Area will develop

over the next three decades and the SCS integrates transportation, land use, and housing to meet GHG reduction targets set by California Air Resources Board (CARB).

Bay Area Clean Air Plan

The Bay Area Air Quality Management District (BAAQMD) adopted the 2017 *Clean Air Plan, Spare the Air, Cool the Climate* (Clean Air Plan) on April 19, 2017. The 2017 Clean Air Plan also lays the groundwork for reducing GHG emissions in the Bay Area to meet the state's 2030 GHG reduction target and 2050 GHG reduction goal. It also includes a vision for the Bay Area in a post-carbon year 2050 that encompasses the following:

- Walk, bicycle, and use public transit for the majority of trips and use electric-powered autonomous public transit fleets.
- Incubate and produce clean energy technologies.
- A comprehensive multipollutant control strategy has been developed to be implemented in the next three to five years to address public health and climate change and to set a pathway to achieve the 2050 vision. The control strategy includes 85 control measures to reduce emissions of ozone, particulate matter, toxic air contaminants, and GHG from a full range of emission sources. These control measures cover eight sectors that contribute to GHG emissions including transportation. The control strategy includes the following relevant priorities that relate to the transportation sector:
    - Decrease demand for fossil fuels (gasoline, diesel, and natural gas).
    - Increase efficiency of the energy and transportation systems.
    - Reduce demand for vehicle travel, and high-carbon goods and services.
    - Electrify the transportation and building sectors.

Bay Area Commuter Benefits Plan

Under Air District Regulation 14, Model Source Emissions Reduction Measures, Rule 1, Bay Area Commuter Benefits Program, employers with 50 or more full-time employees within the BAAQMD are required to register and offer commuter benefits to employees. In partnership with the BAAQMD and the MTC, the rule's purpose is to improve air quality, reduce GHG emissions, and decrease the Bay Area's traffic congestion by encouraging employees to use alternative commute modes, such as transit, vanpool, carpool, bicycling, and walking. The benefits program allows employees to choose from one of four commuter benefit options including a pre-tax benefit, employer-provided subsidy, employer-provided transit, and alternative commute benefit.

Local Regulations

Marin Countywide Plan

The Marin Countywide Plan was adopted on November 6, 2007 and last updated in 2015. It sets forth overarching goals and objectives related to transportation and circulation in the context of planned land use within the unincorporated county.

Relevant transportation goals and policy statements from the Transportation and Circulation Element of the General Plan are provided below.

- **TR-1.1: Manage Travel Demand**. Improve the operating efficiency of the transportation system by reducing vehicle travel demand and provide opportunities for other modes of travel. Before funding transportation improvements consider alternatives—such as Transportation Demand Management (TDM)—and prioritize projects that will reduce fossil fuel use and reduce single-occupancy vehicle trips.
- **TR-1.4: Share the Costs for Improvements**. Require new development to pay for or otherwise improve its fair share of the transportation system impacts.
- **TR-1.5: Require Necessary Transportation Improvements**. Require necessary transportation improvements to be in place, or otherwise guaranteed to result in their timely installation, before or concurrent with new developments. In evaluating whether a transportation improvement is necessary, the county shall consider alternatives to the improvement consistent with Policy TR-1.1, Manage Travel Demand, and the extent to which the improvement will offset the traffic impacts generated by proposed and expected development and restore acceptable traffic levels of service.
- **TR-1.8: Reduce Vehicle Miles Traveled (VMT)**. Reduce the rate of increase for total vehicle miles traveled by single-occupant automobile to not exceed the population growth rate.
- **TR-2.1: Improve the Bicycle and Pedestrian Network**. Promote adequate bicycle and pedestrian links, to the extent feasible, throughout the county, including streetscape improvements and standards that are safe and pedestrian and bicycle friendly.
- **TR-2.2: Provide New Bicycle and Pedestrian Facilities**. Where appropriate, require new development to provide trails or roadways and paths for use by bicycles and/or on-street bicycle and pedestrian facilities. In-lieu fees may be accepted if warranted in certain cases.
- **TR-3.1: Encourage and Support the Expansion of Local Bus and Ferry Services**. Encourage expansion and improvement of local bus and ferry services to all areas of the county.

The Countywide Plan contains the following Implementation Program regarding vehicle miles traveled (VMT).

- **TR-1.*s*: VMT Reduction Monitoring and Implementation and Transportation Demand Management Program.** Develop and implement a countywide program for monitoring and reducing VMT consistent with state and regional efforts and based on information from state and regional planning agencies. Identify and require in new developments specific transportation demand management (TDM) strategies for reducing the VMT below levels that would otherwise

occur. Consider the following types of strategies for inclusion in the VMT Reduction Monitoring and Implementation and Transportation Demand Management Program:

- Increased transit.
- All new residential projects consisting of 25 units or more should be located within 1/2 mile of a transit node, shuttle service, or bus route with regularly scheduled, daily service.
- New multi-family projects consisting of 25 units or more should include TDM measures, such as reduced parking for affordable or senior projects, subsidized public transportation passes, or ride-matching programs, based on site-specific review. For market-rate projects, consider TDM programs such as charging parking fees separate from rent.
- Safe, convenient connections should be provided to existing pedestrian and bicycle facilities, and secure bicycle parking should be provided in new non-residential developments.
- TDM should be required for new or expanded projects with 50 employees or more, including programs such as parking cash out, subsidized transit passes, ride-sharing incentives, and bicycle storage facilities.

Marin County Municipal Code

The ordinances of the County of Marin are codified in the Marin County Code. Title 24 of the Marin County Code establishes standards of improvement and construction for the development of land within the unincorporated area of Marin County. Section 24.04.110 sets forth minimum widths and Section 24.04.120 sets forth maximum grades for streets. The minimum paved width for a limited residential road is 20 feet with shoulders or 24 feet with curbs; for a minor residential road it is 28 feet; for a residential road it is 36 feet; and for a collector road it is 40 feet. Maximum grades are 6% for arterial and collector roads, 12% for residential roads, and 18% for minor and limited residential roads.

County of Marin Bicycle and Pedestrian Master Plan

The Marin County Unincorporated Area Bicycle and Pedestrian Plan (Plan) was adopted on February 27, 2018. The update to the Plan was completed as part of a countywide effort to update all local bicycle and pedestrian master plans and focuses on specific recommendations for the unincorporated areas of Marin County. Relevant transportation goal and policy statements from the Plan are listed below.

- **Goal 1 Increased Bicyclists and Pedestrian Access** – Expand bicycle and pedestrian facilities and access in and between neighborhoods, employment centers, shopping areas, schools, and recreational sites, in pursuit of the Marin Countywide Plan goal of having 20% of all trips made by walking or biking by 2020 and add a 2030 goal of 25% bicycling and walking mode share. Provide facilities that are accessible to the greatest number of users.
- **Goal 2 Bicycle Transportation** – Make the bicycle an integral part of daily life in Marin County, particularly for trips of less than five miles, by implementing and maintaining a bikeway network, providing end-of-trip facilities, improving bicycle/transit integration, encouraging bicycle use, and making bicycling safer and more convenient for people of all ages and abilities.

- **Goal 3 Pedestrian Transportation** – Encourage walking as a daily form of transportation in Marin County by completing a pedestrian network that services short trips and transit, improving the quality of the pedestrian environment, improving the health of all citizens, and increasing safety, convenience, and access opportunities for all users.

Relevant proposed bicycle improvements from the Plan in the study area are listed below.

- Class II bike lane on Tiburon Boulevard from US 101 to Trestle Glen Boulevard
- Class II bike lane on the Redwood Highway Frontage Road on the east side of US 101 from Tiburon Boulevard to just south of the signalized intersection of US 101 northbound ramps/De Silva Island Drive
- Class II bike lane on Seminary Drive from the Redwood Highway Frontage Road to Gilbert Drive

Existing Conditions

Street System

The project area is mostly composed of local roads with single travel lanes in each direction, typically with unmarked lanes. A few notable collector roads (e.g., Seminary Drive, E Strawberry Drive) have more formal striping and connect to arterials such as Tiburon Boulevard and eventually Highway 101. Other properties of significant streets observed are summarized in **Table 1** below.

Table 1: Significant Streets in Study Area

Name	Class	Lanes
Highway 101	Freeway	5 NB travel lanes, 4 SB travel lanes
Tiburon Boulevard	Arterial (not county maintained)	2 in each direction
Redwood Highway Frontage Road (east)	Collector	1 travel lane in each direction, on-street parking on one side
Redwood Highway Frontage Road (west)	Collector (not county maintained)	1 travel lane in each direction, on-street parking on one side
Seminary Drive	Collector	1 travel lane in each direction, on-street parking on both sides
E Strawberry Drive	Collector	1 travel lane in each direction, on-street parking on one side
Belvedere Drive	Collector	1 travel lane in each direction, on-street parking on both sides
Reed Boulevard	Local	No marked lanes, on-street parking curb on one side
Ricardo Road	Local	1 travel lane in each direction, on-street parking on both sides
Vista del Sol	Local	No marked lanes
Chapel Drive	Local	No marked lanes
Mission Drive	Local	No marked lanes
Gilbert Drive	Local	No marked lanes
Herring Drive	Local (not county maintained)	No marked lanes
Hodges Drive	Local (not county maintained)	No marked lanes
Storer Drive	Local (not county maintained)	No marked lanes
Shuck Drive	Local (not county maintained)	No marked lanes

Figure 1 also maps these streets of significance within the study area.

Pedestrian Facilities

Most of the study area outside of the immediate project site does not have dedicated walkways for pedestrians in the form of sidewalks. Walkway segments along several primary pedestrian routes serving the project area were verified, including the following roads:

- Seminary Drive
- E Strawberry Drive
- Chapel Drive
- Mission Drive
- Belvedere Drive and Reed Boulevard adjacent to the Strawberry Village Shopping Center
- Knoll Lane
- Redwood Highway Frontage Road (east side)

Many sidewalks were found to have gaps that required pedestrians to temporarily enter vehicle travel lanes to proceed (e.g., Knoll Lane) or were replaced with dirt trails at geographically challenging points (e.g., Seminary Drive). In one example, there is no sidewalk in a segment of E Strawberry Drive between Harbor Cove Way and Island Drive where the roadway is split into two levels due to steep terrain, leaving little space between vehicle travel lanes and the adjacent homes. For other streets, sidewalks exist only on one side of the road for long stretches (e.g., Chapel Drive and Mission Drive).

Sidewalks also narrowed (to less than 4 feet wide) along some roads, such as along segments of E Strawberry Drive and Redwood Highway Frontage Road.

A map of observed pedestrian walkways and trails serving the project area is provided in **Figure 2**.

Bicycle Facilities

Caltrans recognizes four classifications of bicycle facilities.

- Class I – commonly referred to as bike paths, are facilities separated from automobile traffic for the exclusive use of bicyclists.
- Class II – commonly referred to as bike lanes, are dedicated facilities for bicyclists immediately adjacent to automobile traffic.
- Class III – commonly referred to as bike routes, are on-street routes where bicyclists and automobiles share the road.
- Class IV – commonly referred to as cycle tracks or protected bike lanes, are facilities that combine elements of Class I and Class II facilities to offer an exclusive bicycle route immediately adjacent to a roadway similar to a Class II facility, while providing a physical separation from traffic with raised curb, plastic delineators, or parked automobiles.

There are no documented Class I or Class IV bicycle facilities in the project study area, with most roads having no facilities at all. Four roads have noted significant (classed) facilities in county documents and official data sources such as Marin GeoHub as shown in **Table 2** below.

Table 2: Existing Bicycle Facilities

Road	Documented Class
Seminary Drive	Class II
E Strawberry Drive	Class III
Belvedere Drive	Class III
Redwood Highway Frontage Road	Class III

However, signage to suggest the roadways are meant to be shared between automobiles and bicyclists is lacking along most of the claimed Class III routes. The addition of pavement markings (such as sharrows) would increase the visibility and discoverability of these routes.

Along Seminary Drive, there is a segment of the road (roughly between Ricardo Road and Hodges Drive) that is signed as a shared bike route (Class III) in between two Class II segments. Most of the Class III facilities in the community do not have signs or striping designating them as such.

Another Class II segment is located along the north side of Belvedere Drive between Bayview Terrace and Ricardo Road.

Another short segment of a Class II facility is located on the north side of Tiburon Boulevard just east of Highway 101.

These findings are summarized in the map of all bicycling facilities (**Figure 3**).

Transit Facilities

Regional Bus Service by Golden Gate Transit

The Golden Gate Bridge and Highway Transportation District (GGBHTD) operates two fixed-route transit services: Golden Gate Transit (GGT) regional bus service and Golden Gate Ferry (GGF).

Regional bus service began in 1972 and is currently provided on 8 fixed routes as of June 2022 (a greatly reduced post-pandemic schedule from a prior peak of 28 routes). These routes fall into two categories:

- **Regional** routes provide daily service throughout the day and evening between San Francisco, Marin, Sonoma, and Contra Costa Counties. These include Routes 101, 130, 150, and 580.
- **Commute** routes provide service primarily during weekday morning and afternoon peak periods between San Francisco, Marin, and Sonoma Counties. These include Routes 114, 132, 154, and 172.

Golden Gate Transit serves the project area primarily via three routes that make stops at two bus pad stations along the side of Highway 101: the Seminary Drive Bus Pad and Tiburon Wye Bus Pad. The Seminary Drive Bus Pad also doubles as a park-and-ride station with a small, attached no-fee parking lot.

The three routes that stop at these bus pads are:

- Route 130 (Regional): San Rafael – Marin City – Sausalito – San Francisco
- Route 132 (Commute): San Anselmo – San Rafael – San Francisco
- Route 150 (Regional): San Rafael – Marin City – San Francisco

There is another set of pads to the south of the project area (the Pohono Street Park & Ride and the Manzanita Park & Ride) which also acts as stops for Route 132, 150, and Route 114—the last of which traverses through Mill Valley with a terminus at E Blithedale Avenue and Tower Drive / Kipling Drive, near the Tiburon Wye Bus Pad.

Local Bus Service by Marin Transit

Marin Transit provides a total of 19 fixed routes as of July 2022, including nine local routes, six community shuttle routes, two rural fixed routes (a.k.a. West Marin Stagecoach), and one Muir Woods shuttle service within Marin County. Marin Transit also offers Connect, an on-demand service available approximately 2.5 miles around each SMART station in Marin County. Marin Transit bus and shuttle services carried over 3.2 million passenger trips per year before 2020.

Marin Transit owns 113 transit vehicles including 13 community shuttles, 6 stagecoach vehicles, 35 paratransit vehicles, 4 Connect vans, 15 narrow-bodied rural buses, 28 hybrid diesel-electric buses, 10 articulated buses, and 2 battery electric buses as of 2020.

Marin Transit sells 1-day and 31-day passes, each good for unlimited rides during the valid period. The 31-day pass costs $40 for adults and youth and $20 for seniors and persons with disabilities. A 1-day pass,

purchasable on a bus, costs $5 for adults and $2.50 for seniors, youth, and persons with disabilities. A one-way cash fare costs $2 for adults and $1 for seniors, youth, and persons with disabilities. Transit is free for children five and under (up to two per adult).

Marin Transit also offers an annual Youth Pass through Marin County schools such as Strawberry Point School in the study area. With the pass, registered Marin County students and youth ages 18 and under ride on local routes in Marin without paying any additional fare. The Youth Pass costs $325 per year.

Local transit routes that serve the study area include the following:

- Route 17 (Local): San Rafael – Strawberry – Mill Valley – Marin City – Sausalito
- Route 22 (Local): San Rafael – San Anselmo – Ross – College of Marin – Larkspur – Corte Madera – Strawberry – Marin City
- Route 36 (Local): Canal – San Rafael – Hwy 101 – Marin City
- Route 71 (Local): Sausalito – Marin City – San Rafael – Ignacio – Novato
- Route 219 (Community Shuttle): Tiburon – Strawberry – Seminary

Routes 17, 22, 36, and 219 make notable stops around the Strawberry Village Shopping Center and also have stops that are walkable to the Seminary Drive and Tiburon Wye bus pads where riders can transfer to Route 71 or Golden Gate Transit regional routes.

The West Marin Stagecoach Route 61 also makes a stop at the Pohono Street Park & Ride and the Manzanita Park & Ride to the south of the project area.

Both Marin Transit and Golden Gate Transit routes and stops are summarized in **Figure 4**.

Mobility Services and Programs

Shared Mobility Options

According to the Shared-Use Mobility Center, shared mobility is defined as transportation services and resources that are shared among users, either concurrently or one after another. The services are grouped into five different shared mobility typologies:

- Bike-sharing/Scooter-sharing
- Carsharing
- Ride-sharing/Ride-hailing
- Public Transit
- Microtransit (e.g., shared scooters)/Shuttles

Bike-sharing, carsharing, scooter-sharing, or microtransit services are not currently provided in the study area. They are, however, provided in many other Bay Area cities.

Traditional ride-sharing includes carpooling, vanpooling, and real-time matching of drivers and passengers through mobile apps in which the passenger pays a share of the trip cost. Ride-hailing providers such as Uber and Lyft use online platforms to connect passengers with drivers who use personal, non-commercial, vehicles. UberPool and Lyft Line are ride-sharing options that allow drivers to carry multiple passengers who split the cost of a trip. Uber has also partnered with the Transportation Authority of Marin as part of the Connect2Transit program which includes the Marin Transit Connect on-demand service.

Taxis and limos are regulated for-hire vehicles. Numerous companies provide these services in the study area.

Emergency Vehicle Access

Southern Marin Fire Protection District (SMFD) Station 9 Strawberry is the fire station that serves the project site and the surrounding Strawberry community. The station is located at 308 Reed Boulevard, roughly in the center of the Strawberry community and a few hundred feet north of the intersection of Reed Boulevard/Storer Drive and the northern boundary of the project site. In addition to the Strawberry community, Station 9 Strawberry serves from Mill Valley to Tiburon to the Golden Gate Bridge. The station serves portions of the Golden Gate National Recreational Area (GGNRA) and US 101 north to the Paradise Drive interchange in Corte Madera.

Based on consultation with SMFD Chiefs,[2] the following are primary egress routes from the station based on the call destination.

- Project Site: south on Reed Boulevard.
- Redwood Highway Frontage Road/US 101 South/US 101 North: north on Reed Boulevard, west on Meda Lane, and west on Ricardo Road/Seminary Drive to Redwood Highway Frontage Road.
- Tiburon: north of Reed Boulevard, east on Ricardo Road/Ricardo Lane, and north on E Strawberry Drive to Tiburon Boulevard (SR 131).
- Seminary Drive: south on Reed Boulevard, west on Storer Drive, south on Shuck Drive, and west on Hodges Drive.
- South Strawberry Area: south on Reed Boulevard, east on Storer Drive, and east on Herring Drive to E Strawberry Drive.

[2] July 21, 2022, calls with Chief Ted Petersen and Adam Vollmer.

Transportation Safety

The 2018 Marin Travel Safety Plan was a collaborative effort between unincorporated Marin County and all 11 incorporated cities and towns. The purpose was to provide a systemic safety analysis for motorists, motorcyclists, bicyclists, and pedestrians on non-state arterial and collector roadways. The Plan was funded through a Systemic Safety Program grant provided by Caltrans. The intent was to provide a proactive collision analysis, identify high risk locations and collision patterns, develop a list of systemic low-cost and longer-term countermeasures, and help secure funding to address key safety issues.

During the five-year period in which crashes were evaluated, 22.6% of all crashes in the county occurred in Unincorporated Marin County, lower than the county's 26% share of the total county population. Notable collision profiles in Unincorporated Marin County include high rates of bicycle collisions, pedestrian collisions involving senior over the age of 65, speed related collisions, motorcycle collisions, and collisions with vehicles hitting fixed objects. According to the California Office of Traffic Safety, in 2019 Marin County ranked among the top 10 California counties for collisions where victims were killed and/or injured involving pedestrians, pedestrians 65 or older, and bicyclists.

The 2018 Marin Travel Safety Plan identified safety countermeasures for 12 corridors and 13 intersections in Unincorporated Marin County. This includes a corridor improvement to the Redwood Highway Frontage Road from the US 101 ramp to De Silva Island Road. The corridor improvements included improved signal timing and detection, enhanced pedestrian crossing improvements, guardrail, and bike lanes (green pain through the intersection to delineate conflict zones). Intersection improvements were identified at the East Blithedale Avenue/Tower Drive/Kipling Drive intersection including improved signal timing and detection and enhanced pedestrian crossing improvements. Subsequent to completion of the Plan, Marin County received $2.8 million in Highway Safety Improvement Program (HSIP) grant funds from Caltrans to implement safety countermeasures identified in the plan at 51 signalized intersections in unincorporated Marin County and within 11 incorporated cities.

Collision History

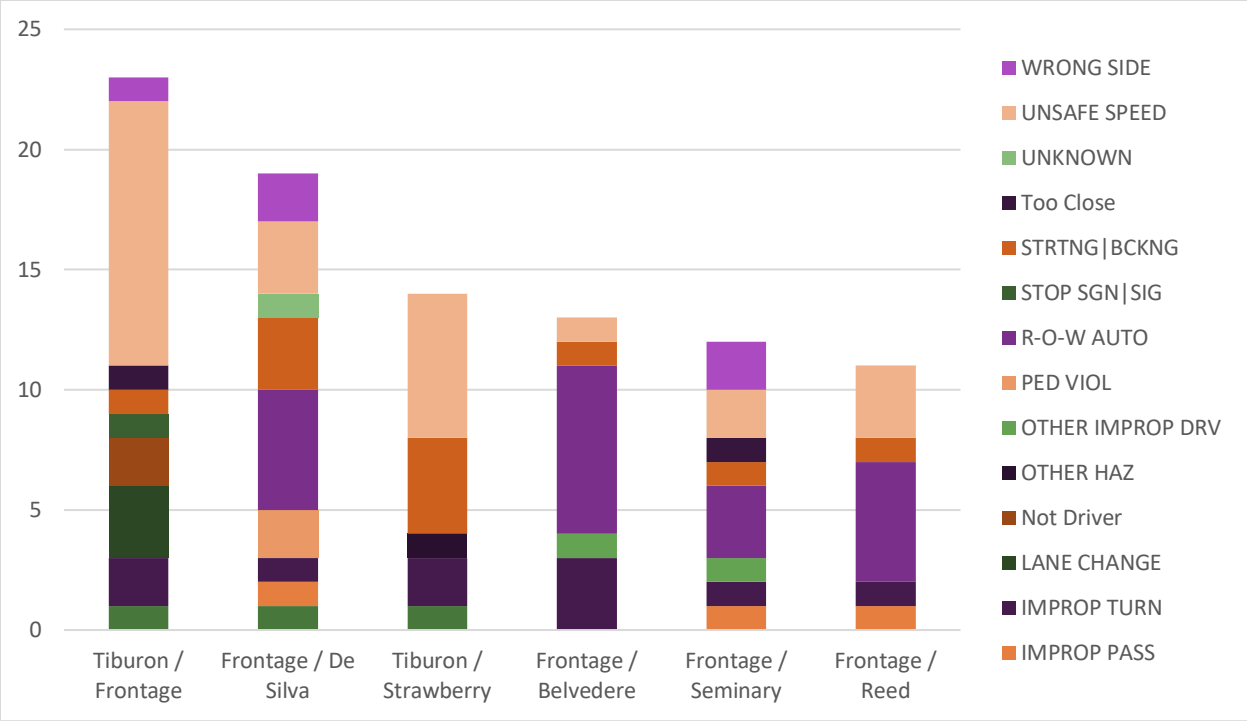
In the five years between 2015-2019, there were 168 collisions identified in the project study area from California SWITRS data. 67% of collisions (113) only involved property damage primarily to vehicles while 33% (55) resulted in injury to vehicle occupants (45), pedestrians (3), or bicyclists (7).

A review of crash data from 2015-2019 reveals that certain intersections in the study area are more prone to collisions and injuries than others. **Table 3** below provides details for all intersections with more than two collisions over that five-year period.

Table 3: Study Area Collision Data

Intersection	Collisions	w/Injury	Primary Collision Factor
Tiburon Blvd (SR-131) / Redwood Hwy Frontage Rd	23	7 (30%)	11 Unsafe Speed (48%)
Redwood Hwy Frontage Rd / De Silva Island	19	8 (42%)	5 R-O-W Auto (26%)
Tiburon Blvd (SR-131) / E Strawberry Dr	14	8 (57%)	6 Unsafe Speed (43%)
Redwood Hwy Frontage Rd / Belvedere Dr	13	1 (8%)	7 R-O-W Auto (54%)
Redwood Hwy Frontage Rd / Seminary Dr	12	2 (17%)	3 R-O-W Auto (25%)
Redwood Hwy Frontage Rd / Reed Blvd	11	3 (27%)	5 R-O-W Auto (27%)
E Strawberry Dr / Belvedere Dr	6	3 (50%)	2 Improper Turn, R-O-W Auto (33%)
Tiburon Blvd (SR-131) / Knoll Ln	6	1 (17%)	3 Unsafe Speed (50%)
Reed Blvd / Belvedere Dr	5	3 (60%)	2 Improper Pass (40%)
E Strawberry Dr / Strawberry Dr	5	2 (40%)	Various
E Strawberry Dr / Harbor Cove	4	1 (25%)	2 Improper Turn (50%)
Redwood Hwy Frontage Rd / US-101	4	1 (25%)	Various
E Strawberry Dr / Cassidy Ln	3	1 (33%)	Various
Reed Blvd / Knoll Ln	3	1 (33%)	2 Improper Turn (67%)
Tiburon Blvd (SR-131) / US-101	3	2 (67%)	2 Unsafe Speed (67%)
Ricardo Rd / Richardson Dr	3	0 (0%)	Various
Seminary Dr / Hodges Dr	3	0 (0%)	Various

Across all crashes, the most prominent collision factor was Unsafe Speed (41 out of the 168 total), followed by R-O-W Auto (28) and Improper Turn (27). A total of 17 collisions (10.1%) involved drivers under the influence of drugs or alcohol. The chart below shows the distribution of collision factors for the most crash-prone intersections.



Other relevant statistics from the collision data include the following:

- 120/168 (71%) of collisions occurred during the daytime
- 41/168 (24%) of collisions involved a parked vehicle or other fixed object
    - Two collisions involved an animal
- 54 (32%) collisions were rear-ends, 41 (24%) were sideswipes, and 30 (18%) were broadside collisions
    - Six collisions were head-on and two involved an overturned vehicle

III. METHODOLOGY

Analysis Scenarios

The transportation modeling and analysis was conducted for the following scenarios.

- Existing Conditions – existing setting based on traffic counts collected in December 2021. This scenario serves as the baseline or point of comparison for environmental impact significance determinations related to the proposed project.
- 2040 No Project – conditions with 2040 land use forecasts and transportation infrastructure assumptions for Unincorporated Marin County based on Plan Bay Area 2040 as developed by MTC.
- 2040 Plus Project – conditions with 2040 land use forecasts and transportation infrastructure assumptions for the proposed project.

2040 No Project Transportation System

The following roadway improvements or transportation programs, as provided by Transportation Authority of Marin (TAM) staff, are incorporated in the 2040 No Project scenario.

- Minor Highway Improvements – Highway Interchange Improvements, Bicycle/Pedestrian Crossings, and Auxiliary Lanes
- Minor Roadway Projects – Highway Safety Improvement Program (HSIP) Projects and Sea Level Rise Improvements
- Minor Transit Improvements – Fleet expansion/facilities, Access to Transit, and Transit Service Expansion
- New Bicycle & Pedestrian Facilities including North South Greenway Projects, SMART Multi Use Path, Cross Marin Bikeway, Approaches to Richmond San Rafael Bridge, Safe Pathways Projects, Small Safety Projects, and Safe Route to Transit Projects
- Management Systems – Ramp Metering Phase 1 & 2, and Innovative Technology
- Safety and Security – Safe Routes to School Program and Crossing Guard Program
- Travel Demand Management – TDM Program, Alternative Fuels Program, and Traveler Information Programs
- Multimodal Streetscape Improvements – Local Road Improvements

Project Trip Generation

The purpose of the vehicular trip generation estimate is to approximate the number of new vehicle trips entering and exiting the site for various purposes (e.g., residential, employee, student, and visitor trips) during a selected time period. The proposed Project will contain a mix of land uses including a new

daycare and fitness center, new residential care facility, upgrades to existing housing and construction of new housing, and renovation of academic campus buildings. **Table 4** presents the net buildout development program as of June 14, 2022.

Table 4: Project Land Use Program

Land Use	Units	Total
Day Care Center	Square Feet / Children	3,000 / 60
Fitness Center	Square Feet	17,000
Residential Care Facility	Square Feet / Residents	267,354 / 170
Assisted Living and Memory Care Residences	Units / Residents	50 / 40
Independent Living Residences	Units / Residents	100 / 130
Academic Campus	Students / Faculty & Staff	1,000 / 240
Residential – Single Family Units	Dwelling Units (DU)	11
Residential – Multi-Family Units (market)	Dwelling Units (DU)	275
Residential – Multi-Family Units (affordable)	Dwelling Units (DU)	50

Source: Ascent Environmental, 2022.

Trip Generation Methodology

The project site is currently occupied by academic and residential uses. The trip generation assessment identifies the total number of external vehicle trips generated by the project site at build-out as well as the net number of trips generated by subtracting the number of trips generated by project build-out from trips generated by existing uses. The trip generation assessment also considers internal trip making between the academic uses, residential uses, day care, and fitness center. Because the project description does not include dedicated housing for the academic campus, the build-out trip generation assessment is based on traditional travel relationships between the adjacent uses.

Current accepted methodologies, such as the Institute of Transportation Engineers' (ITE) *Trip Generation* methodology, are primarily based on data collected at suburban, single-use, freestanding sites. These defining characteristics limit their applicability to mixed-use or multi-use development projects, such as this project, which, given its land use mix, design features, and setting, would include characteristics that influence travel behavior differently from typical single-use suburban developments. Thus, traditional data and methodologies, such as ITE, would not accurately estimate the project vehicle trip generation.

In response to the limitations in the ITE methodology, and to provide a straightforward and empirically validated method of estimating vehicle trip generation at mixed-use developments, the US Environmental Protection Agency (EPA) sponsored a national study of trip generation characteristics of multi-use sites. Travel survey data was gathered from 239 mixed-use developments (MXDs) in six major metropolitan regions and correlated with characteristics of the sites and their surroundings. The findings indicate that the amount of external traffic generated is affected by a wide variety of factors including the mix of employment and residents, the overall size and density of the development, the internal connectivity for walking or

driving among land uses, the availability of transit service, and the surrounding trip destinations within the immediate area outside the project site.

These characteristics were related to trip behavior observed at the study development sites using statistical techniques. These statistical relationships produced equations, known as the EPA MXD model, which allow predicting external vehicle trip reduction as a function of the MXD characteristics. Applying external vehicle trip reduction percentage to "raw trips," as predicted by ITE, produces an estimate for the number of vehicle trips traveling into or out of the site.

The MXD model has been approved for use by the EPA.[3] It has also been peer-reviewed in the ASCE Journal of Urban Planning and Development,[4] peer-reviewed in a 2012 TRB paper evaluating various smart growth trip generation methodologies,[5] recommended by SANDAG for use on mixed-use smart growth developments,[6] promoted in an American Planning Association (APA) Planning Advisory Service (PAS)[7] which recommended it for evaluating traffic generation of mixed-use and other forms of smart growth. It has also been used successfully in multiple certified EIRs in California.

Internal Capture

Internal trips are responsible for an 8% reduction of daily external vehicle trips, a 16% reduction of AM peak hour external vehicle trips, and a 17% reduction of PM peak hour external vehicle trips. Some examples of an internal trip would be a parent living in one of the project dwelling units dropping off a student at the day care center, a person living in one of the project dwelling units working at or attending classes at the campus, or a student exercising at the fitness center. Some of these trips would potentially still occur by vehicle, though they would remain internal to the larger project site.

In total, the MXD trip generation methodology is responsible for a 12% reduction of daily external vehicle trips, a 20% reduction of AM peak hour external vehicle trips, and a 20% reduction of PM peak hour external vehicle trips when compared to the unadjusted ITE methodology.

Input values were collected for the MXD model for use in application on the project trip generation. The MXD model uses internal project information such as land use mix, project area, intersection density, and transit stop placement as well as local and regional demographic data such as average household size and

vehicle ownership, employment within one mile of the site, and employment within a 30-minute transit trip.

Project Trip Generation

Input values were collected for the MXD model for use in application on the project trip generation. The MXD model uses internal project information such as land use mix, project area, intersection density, and transit stop placement as well as local and regional demographic data such as average household size and vehicle ownership, employment within one mile of the site, and employment within a 30-minute transit trip.

In addition, the MXD model was used to estimate the total number of trips generated by the existing land uses, which include a day care center, 145 residential dwelling units, and a 66-bed dormitory, and the existing academic campus. The total net trip generation for the project consists of the MXD estimated project trips minus the MXD estimated existing trips.

Table 5 summarizes the estimated trip generation for the project using the MXD methodology for a typical weekday. As shown in Table 5, the project is estimated to generate 2,608 net new daily vehicle trips, with 179 net new trips during the AM peak hour, and 227 net new trips during the PM peak hour.

Table 5: Project Trip Generation

Land Use	Daily Trips	Weekday Am Peak Hour			Weekday Pm Peak Hour		
		In	Out	Total	In	Out	Total
Build-out Trips Generated by Project Site							
Day Care Center	245	25	22	47	22	25	47

Project Parking Generation

The required parking supply for development projects in Marin County is specified in Section 24.04.340 of the Marin County Municipal Code. The municipal code specifies parking requirements for the residential components of the project but does not provide parking requirements for a college campus. According to the municipal code, the project is required to provide a total of 539 parking spaces for the proposed residential uses, which would be accommodated by the proposal to provide 703 parking spaces. To supplement the above information on required parking supply per County municipal code, because the municipal codes does not include parking requirements for a college campus, the following is an assessment of estimated parking demand levels for the proposed project uses.

The purpose of the parking generation estimate is to approximate the peak parking demand levels for various purposes (e.g., residential, employee, student, and visitor trips) for a typical weekday. Parking demand levels are estimated based on peak parking rates identified in ITE *Parking Generation* manuals that are based on surveys conducted for individual land use categories throughout the US. This assessment does not assume shared parking of facilities between the residential and academic campus areas. **Table 6** summarizes the estimated build-out parking demand for the project for a typical weekday.

Table 6: Project Peak Weekday Parking Demand

Land Use	ITE Land Use Code	ITE Edition	Units	Total	Parking Rate	Parking Demand
Day Care Center	565	5th	KSF	3	2.45	7
Fitness Center	492	5th	KSF	17	4.73	80
Assisted Living	254	5th	UNITS	50	0.4	20
Independent Living	253	5th	UNITS	100	0.3	30
Academic Campus	550	5th	TOTAL POP	1240	0.28	347
Residential – Single Family	210	4th	UNITS	11	1.83	20
Residential – Multi-Family	221	5th	UNITS	275	1.31	360
Residential – Affordable	223	5th	UNITS	50	0.99	50
					TOTAL	**915**

Source: ITE Parking Generation (5th and 4th Editions); Fehr & Peers.
Notes: KSF=1,000 square feet; TOTAL POP=campus students, faculty, and staff.

The parking demand estimate of 915 spaces represents the number of parked vehicles during a weekday peak period. The desired parking supply is based on providing additional parking such that occupancy levels do not exceed a threshold such as 90%. Application of a 90% threshold would result in a total parking supply of about 1,016 parking spaces at build-out. This includes about 400 parking spaces for the 275 multi-family residential units, 385 parking spaces for the academic campus, 90 parking spaces for the fitness center, and 55 parking spaces for the affordable multi-family residential units.

VMT Forecasts

This section describes the methodology for VMT forecasts developed for this transportation assessment and as supporting data for other assessments in the CEQA document including the GHG assessment. The new CEQA Guidelines Section 15064.3(b)(4) establishes that the lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled and may revise those estimates to reflect professional judgment based on substantial evidence.

The VMT forecasts generated for this CEQA assessment were produced using the Transportation Authority of Marin Demand Model (TAMDM). For this CEQA assessment, the 2015 base year for TAMDM was updated and validated for a new 2019 base year for the City of San Rafael General Plan Update. A key reason for applying the updated 2019 base year is that it includes the SMART rail system that was not in place in 2015. This analysis includes a 2040 No Project scenario that is based on the TAMDM horizon year and reflects land use changes and transportation improvements consistent with the San Rafael General Plan 2040 adopted in 2021. The 2019 base year model developed for the San Rafael General Plan Update was validated based on model confidence thresholds defined in the California Transportation Commission 2017 RTP guidelines.

For this project, the network and land use inputs for the study area for the model's 2019 base year were reviewed and enhanced to provide the level of detail necessary for the study. A model validation was performed for the study sub-area and model validation measures in the RTP guidelines were met for the 2019 base year for 73 study road segments in the study area as shown in **Table 7** below.

Table 7: Project Study Area Model Validation Results (2017 California RTP Guidelines)

Validation Measure	AM Peak Period (4-Hour)	PM Peak Period (4-Hour)	Daily	Threshold
Volume-to-Count Ratio (Sum of all locations)[1] =	0.96	1.07	0.98	None specified[2]
Percent of Links within Caltrans Deviation Allowance[1] =	79.5%	75.3%	79.5%	At Least 75%
Percent Root Mean Square Error (RMSE)[1] =	30.5%	23.0%	19.3%	Below 40%
Correlation Coefficient[1] =	0.98	0.99	0.99	At Least 0.88
Number of Links/Validation Locations =	73	73	73	

Source: Fehr & Peers.
Notes:
1. Static Validation Criteria and Thresholds, 2017 California Regional Transportation Plan Guidelines, California Transportation Commission.
2. Although no specific threshold is specified, a threshold of "within 10%" of the sum of all locations was applied.

The VMT estimates were produced using the updated 2019 TAMDM model for all 1,400 analysis zones within Marin County as well as for the entire Bay Area.

Standards of Significance

The general standard applied for determining transportation impacts is whether a project conflicts with or is inconsistent with CEQA Guidelines Section 15064.3(b) which provides the criteria for analyzing transportation impacts. For land use projects, this involves assessing whether VMT exceeds an applicable threshold of significance.

Vehicle Miles Traveled (VMT)

CEQA Guidelines section 15064.3, subdivision (b) identifies criteria for analyzing transportation impacts. For land use projects, the section indicates that vehicle miles traveled (VMT) exceeding an applicable threshold of significance may indicate a significant impact. The section indicates that projects that decrease VMT in a project area compared to existing conditions should be presumed to have a less than significant transportation impact. The section also indicates that projects within one-half mile of either an existing major transit stop or a stop along an existing high quality transit corridor should generally be presumed to cause a less than significant transportation impact.

CEQA section 15064.3 (b) also indicates that a lead agency has discretion to choose the most appropriate methodology to evaluate a project's vehicle miles traveled, including whether to express the change in absolute terms, per capita, per household or in any other measure. A lead agency may use models to estimate a project's vehicle miles traveled and may revise those estimates to reflect professional judgment based on substantial evidence.

Marin County has not adopted CEQA thresholds of significance to determine the significance of transportation impacts of projects for VMT. As such, the VMT thresholds applied for this project are ad hoc VMT thresholds developed in consultation with Marin County staff based on goals and policies in the Marin Countywide Plan and informed by state and regional efforts.

The Marin Countywide Plan includes the following relevant goals and policy statements for VMT in the Transportation and Circulation Element.

- **TR-1.8: Reduce Vehicle Miles Traveled (VMT)**. Reduce the rate of increase for total vehicle miles traveled by single-occupant automobile to not exceed the population growth rate.

The Countywide Plan contains the following Implementation Program regarding vehicle miles traveled (VMT).

- **TR-1.s: VMT Reduction Monitoring and Implementation and Transportation Demand Management Program.** Develop and implement a countywide program for monitoring and reducing VMT consistent with state and regional efforts and based on information from state and regional planning agencies. Identify and require in new developments specific transportation demand management (TDM) strategies for reducing the VMT below levels that would otherwise occur. Consider the following types of strategies for inclusion in the VMT Reduction Monitoring and Implementation and Transportation Demand Management Program:

- Increased transit.
- All new residential projects consisting of 25 units or more should be located within 1/2 mile of a transit node, shuttle service, or bus route with regularly scheduled, daily service.
- New multi-family projects consisting of 25 units or more should include TDM measures, such as reduced parking for affordable or senior projects, subsidized public transportation passes, or ride-matching programs, based on site-specific review. For market-rate projects, consider TDM programs such as charging parking fees separate from rent.
- Safe, convenient connections should be provided to existing pedestrian and bicycle facilities, and secure bicycle parking should be provided in new non-residential developments.
- TDM should be required for new or expanded projects with 50 employees or more, including programs such as parking cash out, subsidized transit passes, ride-sharing incentives, and bicycle storage facilities.

The policies and programs identified in the Countywide Plan call for reducing the rate of VMT increase and implementation of a countywide program for monitoring and reducing VMT consistent with state and regional efforts and based on information from state and regional planning agencies. To help lead agencies with implementation of updated CEQA guidelines related to analyzing transportation impacts, the Governor's Office of Planning and Research (OPR) provides advice and recommendations in a *Technical Advisory*.[8] The 2018 OPR Technical Advisory indicates that "achieving a 15 percent lower per capita (residential) or per employee (office) VMT than existing development is both generally achievable and is supported by evidence that connects this level of reduction to the State's emissions goals". The 15 percent threshold was originally tied to the 2017 Scoping Plan prepared by the California Air Resources Board (ARB). That plan was updated by ARB in 2022 and now contains a 30 percent below 2019 level recommendation for statewide VMT to achieve the state's goal of carbon neutrality by 2045. The ad hoc VMT threshold applied for this assessment is 30 percent below 2019 VMT levels and evaluates the project's change in vehicle miles traveled on a per capita basis.

For mixed-use projects, the 2018 OPR Technical Advisory advises that lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail). Because the project description does not include a permanent dedication of project housing for campus students or employees, VMT impacts for this project are determined separately for the residential uses and the academic campus uses.

For the assessment of residential uses, VMT impacts would be significant if the project exceeds the following threshold:

- Home-based VMT per resident exceeds 30% below average 2019 rate for full nine-county Bay Area.

[8] Governor's Office of Planning and Research, *Technical Advisory on Evaluating Transportation Impacts in CEQA*, 2018.

Neither the Marin Countywide Plan nor the 2018 OPR Technical Advisory provides guidance on developing a VMT significance threshold for academic campuses. Development of a VMT threshold for the academic campus use considered the intent of the Countywide Plan, CEQA Guidelines, and OPR guidance. The VMT significance threshold also considered thresholds applied for previous CEQA VMT assessments of land use projects by University of California (UC) and California State University (CSU) campuses. While the methodology and thresholds varied depending on the context of the land use project being evaluated, a common approach for UC and CSU campuses is that the proposed project VMT per service population (i.e., total students, faculty, and staff) rate was compared to a value of 15 percent below baseline conditions, which in most cases was the current campus VMT per service population rate but in a few cases were the overall regional or citywide VMT per service population rate. The 15 percent value was based on the OPR Technical Advisory that was relevant at the time of those studies. The VMT threshold applied for the proposed academic campus uses involves comparing the total VMT per service population for build-out of the proposed campus uses to the VMT per service population of existing campus uses and updating the threshold value to be consistent with the most current ARB VMT reduction recommendations.

For the assessment of academic campus uses, VMT impacts would be significant if the project exceeds the following threshold:

- Total Planned Campus VMT per service population (i.e., students, faculty, and staff) exceeds 30% below the 2019 Campus VMT per service population.

Bicycle/Pedestrian

Bicycle/pedestrian impacts would be significant if the project:

- Would conflict with a program, plan, ordinance, or policy addressing bicycle and pedestrian facilities
- Does not include provisions for pedestrian and bicycle circulation and bicycle and motorcycle parking and security

Transit

Transit impacts would be significant if the project:

- Would conflict with a program, plan, ordinance, or policy addressing transit services or facilities

Site Circulation

Site circulation impacts would be significant if the project:

- Conflicts with a program, project, ordinance, or policy addressing the circulation system
- Does not have adequate parking or internal circulation capacity to accommodate projected traffic so that off-site areas are not adversely impacted

Emergency Vehicle Access

Emergency access impacts would be significant if the project:

- Results in inadequate emergency access

Transportation Safety

Safety impacts would be significant if the project:

- Would substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

IV. IMPACT ASSESSMENT

The section addresses potential transportation impacts related to vehicle miles traveled (VMT), pedestrian facilities, bicycle facilities, transit services, site circulation, emergency vehicle access, cumulative VMT, and construction traffic.

Vehicle Miles Traveled

IMPACT TRAN-1 Implementation of the proposed project would generate an increase in vehicle miles traveled (VMT) that may have a significant impact on the environment.

Implementation of the proposed project by 2040 would result in a total of up to about 850 residents (i.e., 680 residents of the 336 single family and multi-family units, 170 new residents for the residential care facility), 1,000 students, and 310 employees (240 campus employees, 36 new employees for the residential care facility, and 34 new employees for the fitness center).

The following impact assessment separately evaluates VMT impacts for the residential uses (single family, multi-family, and residential care facility residents) and the campus (students, faculty, and staff).

Existing plus Project VMT for Residential Uses

For this assessment of Existing plus Project VMT for residential uses, the 2015 baseline version and 2019 forecast year of the TAMDM countywide travel demand model were not applied to estimate existing plus project VMT for residential uses because travel conditions for residential uses have changed since 2015 due to a number of factors, most notably the effects of the Covid Pandemic and shifts in travel patterns including a significant increase in work from home levels, reduced commuting, and increased local travel. A "post-Covid" version of the TAMDM model is not currently available.

In recent years, big data companies have expanded their capabilities and are able to estimate vehicle trip rates and vehicle trip lengths for residents that can be used to estimate VMT per capita for discrete areas. Recent post-Covid data from these big data companies more accurately represents actual travel activity occurring today than the 2015 horizon year of the TAMDM model as it is based on contemporary data collected from a large database of mobile devices over the course of a year and the VMT rates are calculated based on trips from start to finish with no boundaries. Fehr & Peers developed specifications and obtained data from big data provider StreetLight, and subsequently developed VMT per capita estimates for residential uses by Census Block Group. StreetLight uses a large database of location-based service (LBS) data from GPS enabled devices and connected vehicle data to provide anonymized vehicle trip rate and vehicle trip length data by census block group for designated time periods by trip purpose and type of traveler. This data is available for 2019 and 2022.

The 2019 VMT per capita estimates are used to identify the baseline and applicable threshold, which is 30 percent below the regional average for 2019. The 2022 VMT per capita estimates were evaluated for four

census block groups that include the project site to identify estimates of project Home VMT per capita, as future residents of the proposed project housing are anticipated to have similar VMT per capita rates as existing residents in the surrounding neighborhoods. The following VMT per capita rates were identified.

- Existing plus Project Average Home VMT per capita (2022 data): 19.1
- Regional Average Home VMT per capita (2019 data): 19.6
- Threshold: 30 percent below Regional Average VMT per capita (2019 data): 13.7

The Existing plus Project Average Home-Based VMT per capita is estimated to be 19.1, which is 39 percent higher than the regional VMT threshold of 13.7.

IMPACT 1a – VMT for Residential Uses

The effect of VMT generated by the proposed residential uses, under Existing plus Project conditions, is considered a **significant impact** as the Home-Based VMT per capita for the residential units would not be 30 percent below the regional Home-Based VMT per capita threshold.

Mitigation Measure 1a: TDM Measures. As noted above, the Countywide Plan contains Implementation Program **TR-1.*s*: VMT Reduction Monitoring and Implementation and Transportation Demand Management Program** regarding vehicle miles traveled (VMT). The implementation program requires that the County develop and implement a VMT Reduction Monitoring and Implementation and Transportation Demand Management Program (TDM). This policy indicates that development of a TDM program is the preferred VMT reduction method for Marin County. A countywide TDM program has not yet been developed. Absent any countywide VMT reduction program, it likely would be infeasible for any new residential project in high VMT generating areas such as the Strawberry community to achieve VMT reductions of more than 30 percent through traditional transit, bike, or walk strategies, especially considering the uncertainty about how work from home (which is resulting in increased non-work vehicle trip making around residential areas) will play out over time.

Based on the remote location of the campus, the high incomes of residents of the market rate units, and the distance to transit stops, it is not anticipated that traditional Transportation Demand Management (TDM) measures to encourage increased use of transit, bicycle or pedestrian travel to the campus would be effective in significantly reducing VMT. The establishment of a dedicated level of remote course work and office hours may reduce VMT depending on how schedules are structured. It is anticipated that the most effective VMT reduction measure would be a permanent dedication of a substantial share of the market rate housing units for campus faculty and staff.

Prior to the issuance of the first building permit in the first phase of development, the project applicant shall develop a Transportation Demand Management (TDM) program for the proposed market residential units, including any anticipated phasing, and shall submit the TDM program to the County Planning Department for review and approval. The TDM program should strive to achieve a 39% reduction in

weekday home-based VMT per resident generated by the proposed market single family and multi-family residential uses to reduce impacts to a less-than-significant level.

The project applicant shall be responsible for preparing and implementing the TDM Program. The project applicant shall be responsible for funding and overseeing the delivery of trip reduction/TDM proposed programs and strategies to achieve the maximum feasible trip reduction as determined in collaboration with County staff, which may include, but are not limited to, the following:

1. Permanent dedication of market residential units for use by academic campus employees or students;
2. Dedicated shuttle for residents of market units and/or academic campus employees and/or students;
3. Establishment of carpool, buspool, or vanpool programs;
4. Vanpool purchase incentives;
5. Cash allowances, passes or other public transit subsidies and purchase incentives;
6. Parking fees set at levels sufficient to incentivize alternative modes;
7. Full or partial parking subsidies for ride-sharing vehicles;
8. Bicycle programs including bike purchase incentives, storage, maintenance program, and on-site education program;
9. On-site bike share program;
10. Dedicated employee or student housing for adjacent campus;
11. Designation of an on-site transportation coordinator for the project.

Even with implementation of Mitigation Measure 1a, because the effectiveness of VMT reduction strategies is not certain, the proposed residential uses may not achieve the overall VMT threshold reduction level. Disruptive changes to transportation such as transportation network companies (i.e., Uber, Lyft), increased delivery services (Amazon, UPS, FedEx, food, etc.), and autonomous vehicles may increase VMT beyond current levels.

Significance after Mitigation: A VMT reduction of 39 percent would be required to reduce Existing plus Project VMT rates to more than 30 percent below the existing regional average. The total estimated VMT reduction for the residential uses with traditional TDM measures is 5 percent, unless a significant level of housing is dedicated employee or student housing for the adjacent campus, based on the surrounding community context for the project. As such, after mitigation, the existing plus project VMT impact would be **Significant and Unavoidable** for the market residential uses.

Existing plus Project VMT for Campus Uses

For this assessment of Existing plus Project VMT for campus uses, a 2019 version of the TAMDM countywide travel demand model was applied to estimate existing plus project VMT per service population (i.e., faculty, staff, and students). Given the small size of the existing campus and the remote nature of classes in recent years, as well as the fact that mobile device travel data from providers such as Streetlight is aggregated to zones and not available at the parcel level for privacy reasons, this data cannot be used to estimate VMT for this project.

Table 8 provides a summary of the VMT forecasts for the campus elements of the proposed project including the fitness center and day care center uses. OPR does not provide a VMT threshold for university campuses. For the purposes of this assessment, Total VMT forecasts are prepared for both the existing campus and future campus. The Total VMT forecasts are then divided by the service population (i.e., students, faculty, and staff) to develop a VMT per capita value. The campus uses would be considered to result in a significant VMT impact if the Existing plus Project campus VMT per capita exceeds a level of 30% below the existing campus VMT per capita. The VMT forecasts indicate that the proposed campus uses would result in an Existing plus Project VMT per service population that is 30% below the VMT per service population for existing campus uses.

Table 8: Daily Vehicle Miles Traveled (VMT) for Campus Uses

Scenario	Total Campus VMT	Total Campus VMT Per Service Population
BASELINE (2019)	1,688	13.61
EXISTING PLUS PROJECT	11,883	9.58
PERCENT CHANGE – 2040 Plus Total VMT for Campus Uses per Service Population Rate Compared to Baseline (2019) Rate for Existing Campus Uses		
EXISTING PLUS PROJECT		-30%

Notes:
1. Service population = campus students, faculty, and staff. The current estimated service population for campus uses is 124 and the proposed population for campus uses would be 1,240 at build-out.

Source: Fehr & Peers.

IMPACT 1b – VMT for Campus Uses

The effect of VMT generated by the proposed campus uses, under Existing plus Project conditions, is considered a **less-than-significant impact**.

Pedestrian

IMPACT TRAN-2 Implementation of the proposed project would not result in potential conflicts with adopted policies, plans or programs regarding pedestrian facilities that may have a significant impact on the environment.

The current project site has pedestrian paths that link buildings within the academic campus area, between the academic campus and the adjacent dormitory hill area, and between parking lots and adjacent multi-family residential units. There are no sidewalks along the internal project streets, which range from about 20 to 30 feet in width.

Goal 1 of the Marin County Bicycle and Pedestrian Master Plan is to expand bicycle and pedestrian facilities and access in and between neighborhoods, employment centers, shopping areas, schools, and recreational sites, in pursuit of the Marin Countywide Plan goal of having 20% of all trips made by walking or biking by 2020 and add a 2030 goal of 25% bicycling and walking mode share. Goal 2 of the Plan is to encourage walking as a daily form of transportation in Marin County by completing a pedestrian network that services short trips and transit.

The proposed project includes the provision of new trails and walkways within the academic campus area as well as within the residential planning areas. New pedestrian facilities would be provided along Gilbert Drive, Hodges Drive, Mission Drive, Shuck Drive, and Storer Drive.

The bus hub located at the US 101/Seminary Drive interchange is a walking distance of about 0.75 miles from the entrance to the project site and about 1.2 miles to the academic campus area. Bus routes serving the Seminary Drive Bus Pad and bus stops at the US 101/Seminary Drive interchange include Marin Transit routes 17 (Downtown San Rafael-Sausalito), 22 (Downtown San Rafael-Marin City), 36 (Canal-Marin City), 71 (Novato-Marin City), and 219 (Tiburon-Strawberry) as well as Golden Gate Transit routes 130 (San Rafael-San Francisco), 132 (San Anselmo-San Francisco), and 150 (San Rafael-San Francisco). There are currently pedestrian facilities between these bus stops along US 101 and the entrance to the project site. The new trails and walkways described above within the project site would provide continuous pedestrian facilities between the US 101 bus hub and the academic campus area as well as new residential units.

A bus stop located on Tiburon Boulevard just east of East Strawberry Drive, about a one mile walk from the academic campus area, is served by Marin Transit 219 (Tiburon-Strawberry). There is no sidewalk on East Strawberry Drive between Harbor Cove Way and Island Drive, a distance of about 0.3 miles. Most of this roadway segment is split level, with the southbound travel lane at a higher elevation than the northbound travel lane, with a shoulder that is used for parking.

Impact TRAN-2: Implementation of the proposed project would not result in conflicts with adopted policies, plans, or programs or otherwise decrease the performance or safety of pedestrian facilities.

Significance without Mitigation: Less than Significant.

Bicycle

IMPACT TRAN-3 Implementation of the proposed project would not result in potential conflicts with adopted policies, plans or programs regarding bicycle facilities that may have a significant impact on the environment.

Relevant transportation goals and policy statements from the Transportation and Circulation Element of the General Plan require new development to provide new bicycle and pedestrian facilities.

A Class II bike lane is currently provided on Seminary Drive between Gilbert Drive and Weatherly Drive. The remainder of Seminary Drive is designated in the Marin County Bicycle and Pedestrian Master Plan as an existing Class III route that is proposed to be a Class II bike lane. The segment of the Redwood Highway Frontage Road on the east side of US 101 is similarly designated in the Bicycle and Pedestrian Master Plan as an existing Class III route that is proposed to be a Class II bike lane. The segment of the Redwood Highway Frontage Road on the west side of US 101 is designated as an existing Class III route from Hamilton Drive to the south. East Strawberry Drive (from Tiburon Boulevard to Weatherly Drive) and Belvedere Drive (from East Strawberry Drive to Redwood Highway Frontage Road) are designated as existing Class III routes. Class II bike lanes are dedicated facilities for bicyclists immediately adjacent to automobile traffic and Class III routes are on-street routes where bicyclists and automobiles share the road. There are currently no markings or signage of the Class III routes in the study area.

The Bicycle and Pedestrian Master Plan shows the following planned bicycle facilities in the study area:

- Class II bike lane on Tiburon Boulevard from US 101 to Trestle Glen Boulevard
- Class II bike lane on the Redwood Highway Frontage Road on the east side of US 101 from Tiburon Boulevard to just south of the signalized intersection of US 101 northbound ramps/De Silva Island Drive
- Class II bike lane on Seminary Drive from the Redwood Highway Frontage Road to Gilbert Drive

As mentioned earlier, Goal 1 of the Marin County Bicycle and Pedestrian Master Plan is to expand bicycle and pedestrian facilities and access in and between neighborhoods, employment centers, shopping areas, schools, and recreational sites. Goal 2 of the Plan is to make the bicycle an integral part of daily life in Marin County, particularly for trips of less than five miles, by implementing and maintaining a bikeway network, providing end-of-trip facilities, improving bicycle/transit integration, encouraging bicycle use, and making bicycling safer and more convenient for people of all ages and abilities. County of Marin staff have indicated that the project will be required to construct bike lanes along the project frontage on Seminary Drive.

The proposed project includes the designation of Class III bike routes on internal streets including Chapel Drive, Gilbert Drive, Hodges Drive, Shuck Drive, Storer Drive and Willis Drive. The most direct route for future campus affiliates or residents wishing to access regional bike facilities would be to travel north along East Strawberry Drive to planned new bike facilities along Tiburon Boulevard or travel west along Seminary Drive to the Redwood Highway Frontage Road to Hamilton Drive to the North-South Greenway.

Impact TRAN-3: Implementation of the proposed project would not result in conflicts with adopted policies, plans, or programs or otherwise decrease the performance or safety of bicycle facilities.

Significance without Mitigation: Less than Significant.

Transit

IMPACT TRAN-4 Implementation of the proposed project would not result in potential conflicts with adopted policies, plans or programs regarding public transit that may have a significant impact on the environment.

The bus hub located at the US 101/Seminary Drive interchange is a walking distance of about 0.75 miles from the entrance to the project site and about 1.2 miles to the academic campus area. Bus routes serving the Seminary Drive Bus Pad and bus stops at the US 101/Seminary Drive interchange include Marin Transit routes 17 (Downtown San Rafael-Sausalito), 22 (Downtown San Rafael-Marin City), 36 (Canal-Marin City), 71 (Novato-Marin City), and 219 (Tiburon-Strawberry) as well as Golden Gate Transit routes 130 (San Rafael-San Francisco), 132 (San Anselmo-San Francisco), and 150 (San Rafael-San Francisco). A bus stop located on Tiburon Boulevard just east of East Strawberry Drive, about a one mile walk from the academic campus area, is served by Marin Transit 219 (Tiburon-Strawberry).

In 2019, 66% of workers living in the Strawberry census designated place drove alone to work, 12.3% worked from home, 8.4% carpooled, 8% took transit, 4.7% walked, and the balance commuted via motorcycle.[9]

Transit agencies throughout the Bay Area have seen substantial declines in ridership due to COVID. The monthly bus ridership for all Golden Gate transit routes was 105,347 in May 2022, about 39% of the pre-COVID ridership level of 270,372 in May 2019. The monthly bus ridership for all Marin transit routes was 229,604 in March 2022, about 85% of the pre-COVID ridership level of 270,669 in March 2019.

Policy TR-3.1 in the Marin Countywide Plan calls for encouraging the expansion and improvement of local bus and ferry services to all areas of the county.

Impact TRAN-4: Implementation of the proposed project would not result in conflicts with adopted policies, plans, or programs or otherwise decrease the performance or safety of transit facilities or services.

Significance without Mitigation: Less than Significant.

[9] *Data USA*, Deloitte, Data Wheel, and Professor Cesar Hidalgo.

Safety

IMPACT TRAN-5 Implementation of the proposed project would substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment) that may have a significant impact on the environment..

As detailed in the project description, the project involves renovation of an existing academic campus, relocation of an existing daycare center, construction of a new fitness center and residential care facility, upgrades to existing housing and construction of new housing, retention and access improvements to existing open space and recreation areas, and the provision of new bicycle and pedestrian paths within the project site.

The project would be subject to review by County staff, thus ensuring all Federal and County standards and regulations regarding design, accessibility, and safety would be met. Federal accessibility standards and regulations are identified in ADA and PROWAG guidelines. The project would be required to comply with County of Marin roadway design standards as identified in the Uniform Construction Standards (Marin County 2018a) and Marin County Code (Marin County 2022), including those identified in Chapter 19.05, pertaining to regulations regarding streets improvements abutting building sites, and Title 24 of the Marin County Code, which includes the County's Development Standards. Section 24.04.110 sets forth minimum widths, and Section 24.04.120 sets forth minimum grades for streets. The minimum paved width for a limited residential road is 20 feet with shoulders or 24 feet with curbs. For a minor residential road, the minimum paved road width is 28 feet; for a residential road it is 36 feet; and for a collector road it is 40 feet. Maximum grades are 6 percent for arterial and collector roads, 12 percent for residential roads, and 18 percent for minor and limited residential roads.

Hodges Drive and Gilbert Drive would serve as the main access to Seminary Drive for residential and campus uses, respectively, and would each carry more than 1,000 daily vehicle trips at build-out; thus, both roadways would be classified as collector streets under the Marin County Code (Appendix Q). The streets within the project site range in width from approximately 20 feet to 28 feet without shoulders; thus, the existing roadways do not satisfy the minimum required width for collector and local streets (i.e., 40 feet and 36 feet, respectively).

A total of 608 parking spaces are currently located throughout the project site including 311 residential parking spaces and 297 parking spaces for the academic campus. The project would provide a total of 944 parking spaces in a three-tiered parking lot and in underground garages in residential structures and garages in duplexes. This includes 51 existing residential spaces, 467 spaces for new residential development, 185 spaces for the residential care facility, and 241 spaces for the academic campus. The TIS found that a total of 915 parking stalls would be necessary to meet demand during a typical weekday (Appendix Q). Based on Marin County Municipal Code parking requirements as well as the estimated parking demand based on ITE parking rates, the parking provided for residential uses would be adequate. However, the 241 parking spaces for the academic campus would not be sufficient to meet demand at build-out, thus resulting in a secondary impact would occur caused by overflow parking potentially

impacting emergency vehicle access and impacting cyclists using on-street bike lanes that could be blocked illegally by parked campus vehicles. An additional 144 parking spaces would be required to meet the estimated demand for the academic campus. Approximately 60 percent of the proposed academic campus build-out could be accommodated with the proposed parking supply.

Given the location of academic uses on the eastern end of the project site, the most likely location for spillover parking to occur would be on the west side of East Strawberry Drive, both north and south of Herring Drive. The shoulder on the west side of East Strawberry Drive along this segment is about seven feet wide, which is sufficient for a parked vehicle; however, there is no sidewalk on the west side of East Strawberry Drive in this area. Students or employees parking on this portion of East Strawberry Drive would either walk in the southbound travel lane or cross the street twice to use the sidewalk on the east side of the roadway, creating potential conflicts between pedestrians and vehicles. Therefore, because some of the internal roadways would not meet County roadway width requirements and the project would not supply the necessary number of parking spaces to avoid parking spillover, the project could potentially result in a substantial increase in transportation hazards related to operations.

Impact TRAN-5: Implementation of the proposed project would substantially increase hazards due to a geometric design feature that would result in a significant impact.

Streets within the project site do not meet County design standards regarding roadway widths and may not meet ADA or PROWAG accessibility guidelines. As planned, the project would not provide adequate parking supply for the academic campus, which could result in parking spill over on surrounding streets where sidewalks and crosswalks do not exist; thus resulting in potential conflicts between pedestrians and vehicles. For these reasons, the project could substantially increase hazards due to a geometric design feature or incompatible uses. Therefore, this impact would be **potentially significant.**

> **Mitigation Measure 5a: Meet ADA and PROWAG guidelines for transportation accessibility. Widen Hodges Drive and Gilbert Drive to Meet County of Marin Roadway Standards** The project applicant shall provide roadway, parking, and pedestrian facilities that meet ADA and PROWAG guidelines. The project applicant shall incorporate into the project the widening of Hodges Drive and Gilbert Drive to meet County of Marin roadway design standards as identified in Municipal Code Section 24.04.110. The project shall be subject to review by County of Marin Public Works staff to ensure all County requirements and regulations are met and ensure the safe movement of all modes of transportation navigating the project site. The project applicant shall submit a waiver request for any existing or planned road, pedestrian, bicycle, transit, or parking facilities or services on the site that will not meet County roadway, ADA, or PROWAG standards.
>
> **Mitigation Measure 5b: Implement Measures to Reduce Parking Demand and/or Increase Supply for the Academic Campus** At build-out of the academic campus, it is estimated that there would be a parking deficit of 144 parking spaces. To address this deficit and the resulting secondary impacts, the project applicant shall prioritize implementation of parking reduction measures for faculty, staff, and students of the academic campus. Based on the remote location of the campus, it is not anticipated that traditional Transportation Demand Management (TDM)

measures to encourage increased use of transit, bicycle or pedestrian travel to the campus would be effective without substantial incentives and a dedicated shuttle service to campus. The establishment of a dedicated level of remote course work and office hours may reduce parking demand depending on how schedules are structured. It is anticipated that the most effective parking demand reduction measure would be a permanent dedication of a share of the market rate housing units for campus faculty and staff, which would also reduce VMT impacts for the project housing uses. Prior to expanding the academic campus beyond 50 percent of the proposed build-out, the project applicant shall submit a parking study that documents academic campus parking usage and any parking overflow onto adjacent residential streets (based on surveys and analysis conducted by an independent professional transportation consultant approved by County staff) as well as the status of all parking demand reduction measures. The study shall verify that campus parking occupancy levels do not exceed 90 percent. Should there be excess parking occupancy and overflow conditions, the project applicant shall implement additional parking reduction measures and/or new parking supply improvements to address parking shortfalls before any additional campus expansion. All parking shall be located on the project site and within the vicinity of the facility that it serves. Off-site overflow parking is not an acceptable strategy.

Significance after Mitigation: Implementation of Mitigation Measure 5a requires the project applicant to design internal roadways to meet County of Marin design standards, and Mitigation Measure 5b requires the project applicant to implement parking reduction and/or supply measures to meet anticipated demand of the academic campus. The implementation of the mitigation measures identified above would reduce safety impacts exacerbated by the project. Therefore, the impact would be **less than significant with mitigation incorporated.**

Emergency Vehicle Access

IMPACT TRAN-6 Implementation of the proposed project would not result in potential conflicts with adopted policies, plans or programs regarding emergency vehicle access that may have a significant impact on the environment.

Emergency vehicle access impacts would be significant if the project resulted in inadequate emergency access. This assessment reviews both the ability of emergency vehicles to access the project site as well as the effect of added vehicle trips on key egress routes through the Strawberry community for fire vehicles from Southern Marin Fire Protection District (SMFD) Station 9 Strawberry.

Access to the project site for emergency vehicles is provided via multiple connections to Seminary Drive on the west and south, Reed Avenue on the north and Herring Drive on the east. Fire Station 9 Strawberry is located about 400 feet north of the campus on Reed Avenue, providing a high level of emergency vehicle access to the site. Other first responders would most likely access the campus via US 101, the ramps onto the Redwood Highway Frontage Road, and Seminary Drive. The existing connections to the project site provide adequate access for emergency vehicles.

As noted earlier, based on consultation with SMFD Chiefs, the following are the primary egress routes for fire trucks from Station 9 Strawberry through the Strawberry community based on the call destination and streets where the project would add vehicle trips.

- Redwood Highway Frontage Road/US 101 South/US 101 North: north on Reed Boulevard, west on Meda Lane, and west on Ricardo Road/Seminary Drive to Redwood Highway Frontage Road.
- Tiburon: north of Reed Boulevard, east on Ricardo Road/Ricardo Lane, and north on E Strawberry Drive to Tiburon Boulevard (SR 131).

As shown in Table 5, the project would result in a net addition of about 180 vehicle trips during a weekday AM peak hour and 230 vehicle trips during a weekday PM peak hour. The following is an estimated trip distribution of the added vehicles on key routes based on count data collected at the project site and throughout the Strawberry community.

- TO WEST (via Seminary Drive to Redwood Frontage Road): 85% of housing trips, 80% of campus trips
- TO NORTH (via E Strawberry Drive): 13% of housing trips, 18% of campus trips
- TO NORTH (via Reed Boulevard): 2% of housing trips, 2% of campus trips

The proposed project would add the following number of net new trips to the following key fire egress routes.

- TO WEST (segment of Seminary Drive just east of Redwood Hwy Frontage Road)
    - AM Peak Hour – adds 145 net peak trips

    - PM Peak Hour – adds 185 net peak trips

- TO NORTH (segment of Reed Boulevard just north of Storer Drive)
    - AM Peak Hour – adds 5 net peak trips
    - PM Peak Hour – adds 5 net peak trips
- TO NORTH (segment of E Strawberry Drive just south of Tiburon Boulevard)
    - AM Peak Hour – adds 30 net peak trips
    - PM Peak Hour – adds 40 net peak trips

The proposed project would add the greatest level of net new peak hour trips to the segment of Seminary Drive just east of Redwood Highway Frontage Road, with about 145 net new peak hour trips during the AM peak hour and 185 net new trips during the PM peak hour. That represents an increase in existing volumes of about 28% during the AM peak hour and 35% during the PM peak hour. Under Cumulative plus Project conditions, the westbound delay during the AM peak hour at the Redwood Highway Frontage Road/Seminary Drive intersection would increase from about 19 to 23 seconds per vehicle (westbound approach during the AM peak hour changes from Level of Service B to C) with added project trips. This level of added traffic is potentially significant to response times for fire trucks along this segment of Seminary Drive from Station 9 Strawberry.

Impact TRAN-6: Implementation of the proposed project would potentially result in conflicts with adopted policies, plans, or programs or otherwise decrease emergency vehicle access. This is due to the potential impact of added vehicle trips on the segment of Seminary Drive, east of the Redwood Highway Frontage Road, on response times for fire trucks from Station 9 Strawberry.

> **Mitigation Measure TRAN-6:** The project applicant shall construct a roundabout at the intersection of Seminary Drive/Ricardo Road/Vista Del Sol. The design of the roundabout, and potential advance warning devices to stop traffic entering the roundabout when fire trucks are traveling through the intersection, shall be reviewed and approved by the SMFD.
>
> An alternative mitigation measure to the addition of a roundabout would be a traffic signal at the intersection of Seminary Drive/Ricardo Road/Vista Del Sol with interconnect to the traffic signal at the Redwood Highway Frontage Road/Seminary Drive intersection. Emergency vehicle pre-emption devices shall be implemented at both intersection traffic signals. If the alternative traffic signal is implemented, design of the improvements shall be reviewed and approved by the SMFD.

Significance after Mitigation: Less than Significant.

Construction Traffic

IMPACT TRAN-7 Implementation of the proposed project would generate construction traffic that may have a significant impact on the environment.

Construction of the entire project would take approximately four years and would be initiated in 2023 and completed by 2027. Buildout of the project is proposed to occur within several phases categorized by the project components: residential development, academic uses, and landscaping and site improvements. The construction labor force would fluctuate depending on the phase of work. The approximate number of on-site workers could range from 10-160 people depending on project component and phase. All construction staging would occur within the project site. The project would require approximately 220,000 cubic yards of cut and fill, which would be balanced on-site.

In conformance with Marin County Development Code Section 6.70.030, construction activities would occur between the hours of 7:00 a.m. to 6:00 p.m., Monday through Friday, and from 9:00 a.m. to 5:00 p.m. on Saturdays. The operation of loud noise-generating construction equipment (e.g., backhoes, generators, and jackhammers) would be limited to the hours of 8:00 a.m. to 5:00 p.m., Monday through Friday. Construction activities would be prohibited on Sundays and holidays.

Construction of the proposed project, including site preparation and construction, and delivery activities, would generate employee trips and a variety of construction-related vehicles. Construction activities would include disruptions to the transportation network near the project site, including the possibility of temporary lane closures, street closures, sidewalk closures, and bikeway closures. This may impact the movement of agricultural vehicles and equipment during construction. Bicycle and transit access may also be disrupted. These activities could result in degraded roadway conditions.

Impact TRAN-7: Implementation of the proposed project would result in the addition of construction traffic that would result in a significant impact.

> **Mitigation Measure 7: Construction Traffic Control Plan**. Prior to any construction activities for the proposed project, the applicant shall prepare a detailed Construction Traffic Control Plan and submit it for review and approval by the County Department of Public Works. The applicant and the county shall consult with Caltrans, Golden Gate Transit, Marin Transit, Southern Marin Fire Protection District (SMFD) Station 9 Strawberry staff, and other local emergency service providers for their input prior to approving the Plan. The plan shall ensure that acceptable operating conditions on local roadways and freeway facilities are maintained during construction. At a minimum, the plan shall include:
>
> - The number of truck trips, time, and day of street closures
> - Time of day of arrival and departure of trucks
> - Limitations on the size and type of trucks, provision of a staging area with a limitation on the number of trucks that can be waiting
> - Provision of a truck circulation pattern

- Provision of a driveway access plan so that safe vehicular, pedestrian, and bicycle movements are maintained (e.g., steel plates, minimum distances of open trenches, and private vehicle pick-up and drop-off areas)
- Maintain safe and efficient access routes for emergency vehicles
- Maintain safe and efficient access routes for vehicles
- Manual traffic control when necessary
- Proper advance warning and posted signage concerning street closures
- Provisions for pedestrian safety

A copy of the construction traffic control plan shall be submitted to local emergency response agencies and these agencies shall be notified at least 14 days before the commencement of construction that would partially or fully obstruct roadways.

Mitigation Measure 7 would reduce the construction traffic impacts to a less-than-significant level.

Significance after Mitigation: Less than significant

Cumulative VMT

IMPACT TRAN-8 The change in VMT would be cumulatively considerable.

Cumulative plus Project VMT for Residential Uses

VMT forecasts[10] generated from the TAMDM countywide travel demand model indicate that Home-based VMT per resident is forecast to decline by about five percent at both the regional and Marin County levels between 2015 and 2040. Because the long-term trend of VMT rates is forecast to decrease slightly, the Existing plus Project VMT assessment described in IMPACT TRAN-1 is applicable to determining that the project's market residential uses would have a considerable contribution to cumulative VMT impacts and the project's campus uses would have a less than considerable contribution to cumulative VMT impacts.

IMPACT 8a – VMT for Residential Uses

The cumulative effect of VMT generated by proposed project residential uses is considered a **significant impact**.

> **Mitigation Measure 8a: Implement Mitigation Measure 1a**.
>
> **Significance after Mitigation:** The most effective VMT mitigation strategies for residential uses would be a permanent dedication of a portion of the housing for campus employees or students. A VMT reduction of more than 30 percent would be required to reduce Cumulative plus Project VMT rates to more than 30 percent below the existing regional average. The total potential VMT reduction for the market residential uses is 5 percent, unless a significant level of housing is dedicated employee or student housing for the adjacent campus, based on the surrounding community context for the project. As such, after mitigation, the cumulative project VMT impact would be **Significant and Unavoidable** for the residential uses.

Cumulative plus Project VMT for Campus Uses

IMPACT 8b – VMT for Campus Uses

The effect of VMT generated by the proposed campus uses, under Cumulative plus Project conditions, is considered a **less-than-significant impact**.

Appendix R

LOS Assessment Memo

FEHR PEERS

Memorandum

Date: October 10, 2022

To: Zach Miller, Ascent Environmental

From: Bob Grandy, Emily Chen, and Brian Lin

Subject: Marin North Coast Land Holdings (NCLH) - Level of Service (LOS) Assessment

SF21-1170

This memorandum provides a LOS Assessment for County Merits Findings to identify whether study intersections would meet the County LOS standard with the addition of NCLH project traffic. This assessment may not be used to determine CEQA impacts but may inform decisions about potential conditions of approval.

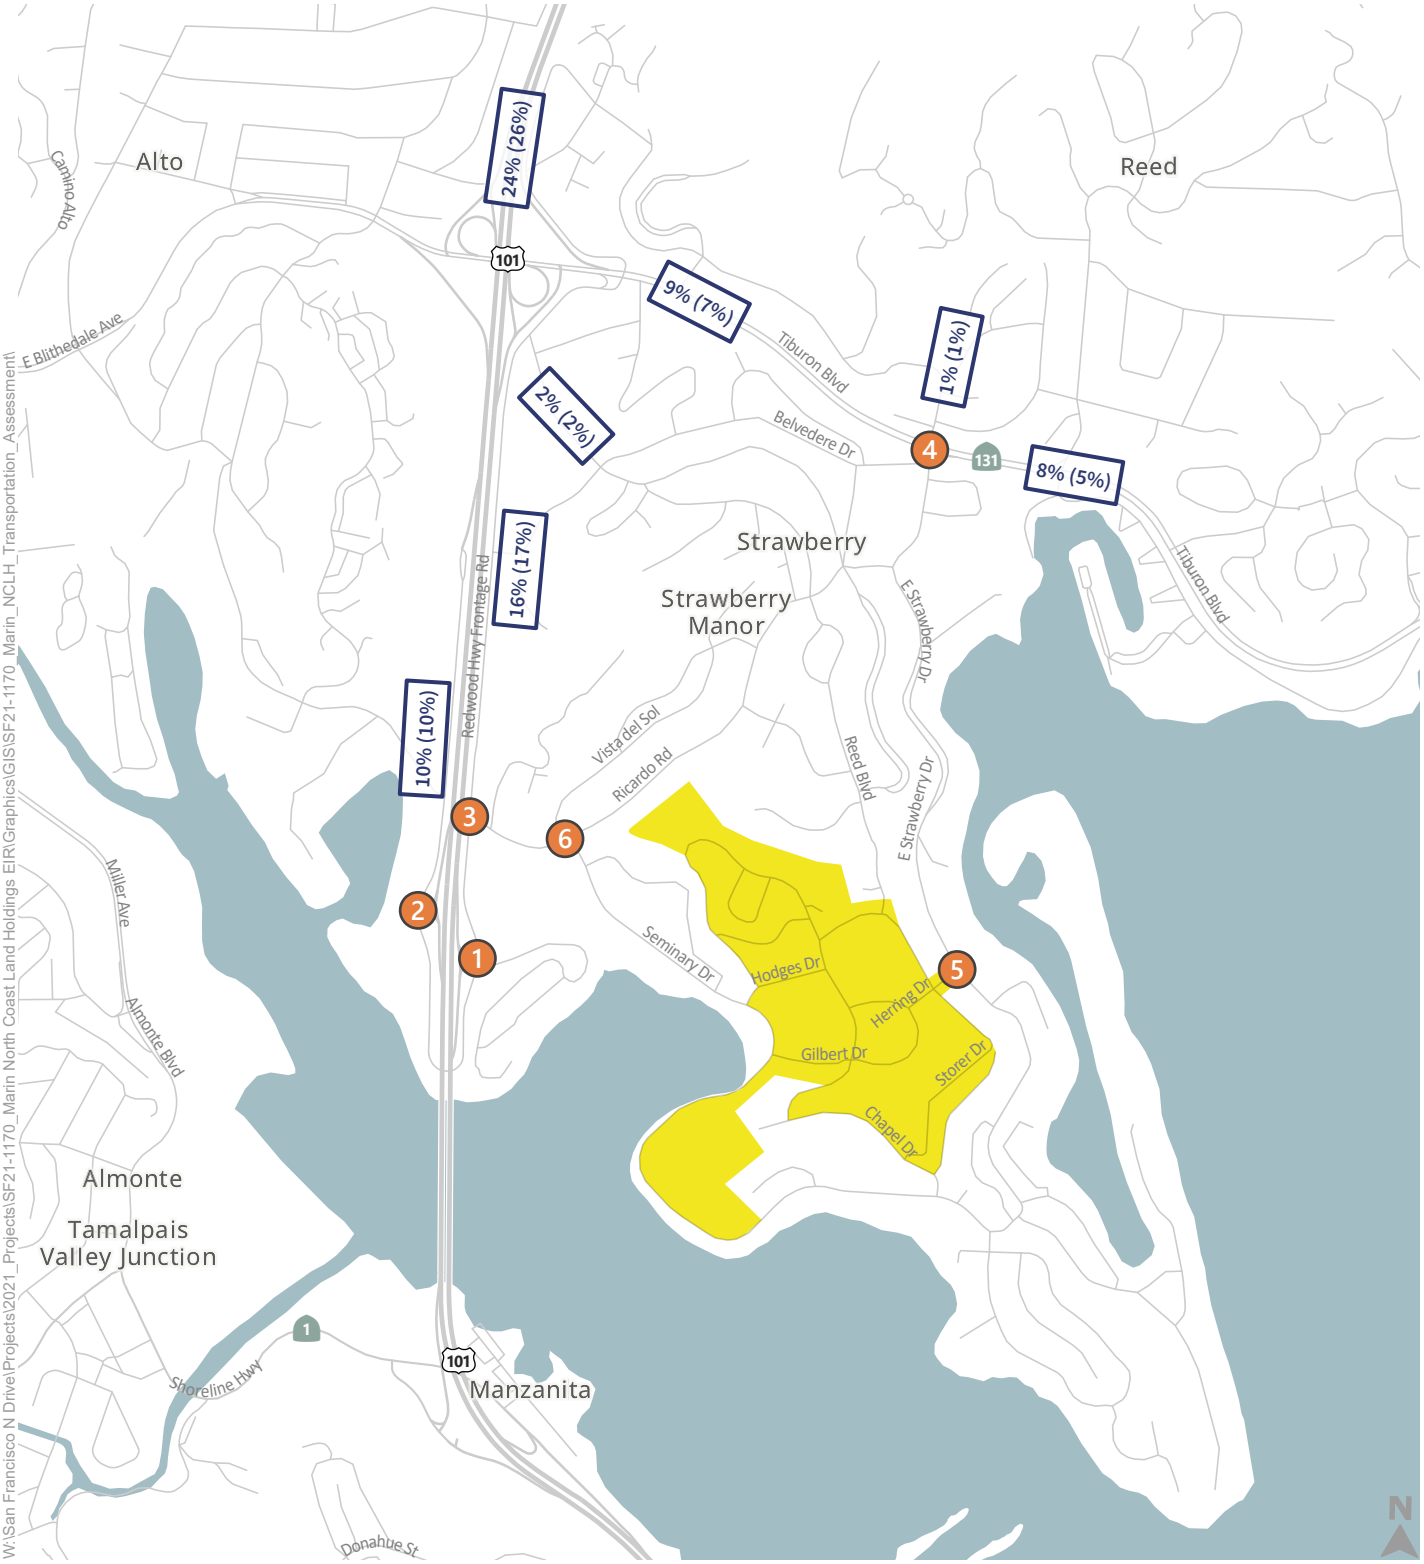
Study Intersections

The LOS Assessment is conducted for the following intersections. **Figure 1** shows the street network, location of the study intersections, and project trip distribution.

1. US 101 northbound ramps/Redwood Highway Frontage Road/De Silva Island Road
2. US 101 southbound ramps/Redwood Highway Frontage Road
3. Redwood Highway Frontage Road/Seminary Drive
4. Tiburon Boulevard/E. Strawberry Drive
5. E. Strawberry Drive/Herring Drive
6. Seminary Drive/Ricardo Road/Vista Del Sol

County LOS Standard

Policy TR-1.2 and Implementation Plan TR-1.e of the existing Marin Countywide Plan establishes LOS D or better for urban and suburban arterials and LOS E or better for freeways and rural expressways. Only the Congestion Management Program specified roadway and highway segments operating at a lower LOS than the standard in 1991 are grandfathered and may continue to operate at the lower LOS standard until such time as the roads are improved or the traffic load or demand is reduced or diverted. Unless determined to be infeasible, alternatives that reduce fossil fuels and single occupancy vehicle use should be considered a priority over infrastructure improvements such as road widening.



Study Intersections

XX% (YY%) Campus Distribution (Residential Distribution)

Campus/Project Boundary

Figure 1

Study Intersections and Project Trip Distribution

Intersection LOS Definitions, which identify LOS based on vehicle delay, for the signalized and stop controlled intersections evaluated in this LOS Assessment are based on the Sixth Edition (latest version) of the Highway Capacity Manual.

Study Scenarios

The transportation modeling and analysis was conducted for the following scenarios.

- Existing Conditions – existing setting based on traffic counts collected in December 2021.
- Existing Plus Project – addition of the increment of project trips, between existing and proposed development levels, to existing traffic counts.
- 2040 No Project – conditions with 2040 land use forecasts and transportation infrastructure assumptions for Unincorporated Marin County based on Plan Bay Area 2040 as developed by MTC.
- 2040 Plus Project – conditions with 2040 land use forecasts and transportation infrastructure assumptions for the proposed project.

2040 No Project Transportation System

The following roadway improvements or transportation programs, as provided by Transportation Authority of Marin (TAM) staff, are incorporated in the 2040 No Project scenario.

- Minor Highway Improvements – Highway Interchange Improvements, Bicycle/Pedestrian Crossings, and Auxiliary Lanes
- Minor Roadway Projects – Highway Safety Improvement Program (HSIP) Projects and Sea Level Rise Improvements
- Minor Transit Improvements – Fleet expansion/facilities, Access to Transit, and Transit Service Expansion
- New Bicycle & Pedestrian Facilities including North South Greenway Projects, SMART Multi Use Path, Cross Marin Bikeway, Approaches to Richmond San Rafael Bridge, Safe Pathways Projects, Small Safety Projects, and Safe Route to Transit Projects
- Management Systems – Ramp Metering Phase 1 & 2, and Innovative Technology
- Safety and Security – Safe Routes to School Program and Crossing Guard Program
- Travel Demand Management – TDM Program, Alternative Fuels Program, and Traveler Information Programs
- Multimodal Streetscape Improvements – Local Road Improvements

Travel Model Validation

The following section describes the methodology for forecasts developed for this LOS Assessment.

The forecasts generated for this LOS assessment were produced using the Transportation Authority of Marin Demand Model (TAMDM). For this assessment, the 2015 base year for TAMDM was updated and validated for a new 2019 base year for the City of San Rafael General Plan Update. A key reason for applying the updated 2019 base year is that it includes the SMART rail system that was not in place in 2015. This analysis includes a 2040 No Project scenario that is based on the TAMDM horizon year and reflects land use changes and transportation improvements consistent with the San Rafael General Plan 2040 adopted in 2021. The 2019 base year model developed for the San Rafael General Plan Update was validated based on model confidence thresholds defined in the California Transportation Commission 2017 RTP guidelines.

For this project, the network and land use inputs for the study area for the model's 2019 base year were reviewed and enhanced to provide the level of detail necessary for the study. A model validation was performed for the study sub-area and model validation measures in the RTP guidelines were met for the 2019 base year for 73 study road segments in the study area as shown in **Table 1** below.

Table 1: Study Area Model Validation Results (2017 California RTP Guidelines)

Validation Measure	AM Peak Period (4-Hour)	PM Peak Period (4-Hour)	Daily	Threshold
Volume-to-Count Ratio (Sum of all locations)[1] =	0.96	1.07	0.98	None specified[2]
Percent of Links within Caltrans Deviation Allowance[1] =	79.5%	75.3%	79.5%	At Least 75%
Percent Root Mean Square Error (RMSE)[1] =	30.5%	23.0%	19.3%	Below 40%
Correlation Coefficient[1] =	0.98	0.99	0.99	At Least 0.88
Number of Links/Validation Locations =	73	73	73	

Source: Fehr & Peers.
Notes:
1. Static Validation Criteria and Thresholds, 2017 California Regional Transportation Plan Guidelines, California Transportation Commission.
2. Although no specific threshold is specified, a threshold of "within 10%" of the sum of all locations was applied.

Project Trip Generation

The purpose of the vehicular trip generation estimate is to approximate the number of new vehicle trips entering and exiting the site for various purposes (e.g., residential, employee, student, and visitor trips) during a selected time period. The proposed project will contain a mix of land uses including a new daycare and fitness center, new residential care facility, upgrades to existing housing and construction of new housing, and renovation of academic campus buildings. **Table 2** presents the buildout development program.

Table 2: Project Land Use Program

Land Use	Units	Total
Day Care Center	Square Feet / Children	3,000 / 60
Fitness Center	Square Feet	17,000
Residential Care Facility	Square Feet / Residents	267,354 / 170
Assisted Living and Memory Care Residences	Units / Residents	50 / 40
Independent Living Residences	Units / Residents	100 / 130
Academic Campus	Students / Faculty & Staff	1,000 / 240
Residential – Single Family Units	Dwelling Units (DU)	11
Residential – Multi-Family Units (market)	Dwelling Units (DU)	275
Residential – Multi-Family Units (affordable)	Dwelling Units (DU)	50

Source: Ascent Environmental, June 2022.

Trip Generation Methodology

The project site is currently occupied by academic and residential uses. The trip generation assessment identifies the total number of external vehicle trips generated by the project site at build-out as well as the net number of trips generated by subtracting the number of trips generated by existing uses from trips generated by project build-out. The trip generation assessment also considers internal trip making between the academic uses, residential uses, day care, and fitness center. Because the project description does not include dedicated housing for the academic campus, the build-out trip generation assessment is based on traditional travel relationships between the adjacent uses.

Current accepted methodologies, such as the Institute of Transportation Engineers' (ITE) *Trip Generation* methodology, are primarily based on data collected at suburban, single-use, freestanding sites. These defining characteristics limit their applicability to mixed-use or multi-use development projects, such as this project, which, given its land use mix, design features, and setting, would include characteristics that influence travel behavior differently from typical single-

use suburban developments. Thus, traditional data and methodologies, such as ITE, would not accurately estimate the project vehicle trip generation.

In response to the limitations in the ITE methodology, and to provide a straightforward and empirically validated method of estimating vehicle trip generation at mixed-use developments, the US Environmental Protection Agency (EPA) sponsored a national study of trip generation characteristics of multi-use sites. Travel survey data was gathered from 239 mixed-use developments (MXDs) in six major metropolitan regions and correlated with characteristics of the sites and their surroundings. The findings indicate that the amount of external traffic generated is affected by a wide variety of factors including the mix of employment and residents, the overall size and density of the development, the internal connectivity for walking or driving among land uses, the availability of transit service, and the surrounding trip destinations within the immediate area outside the project site.

These characteristics were related to trip behavior observed at the study development sites using statistical techniques. These statistical relationships produced equations, known as the EPA MXD model, which allow predicting external vehicle trip reduction as a function of the MXD characteristics. Applying external vehicle trip reduction percentage to "raw trips," as predicted by ITE, produces an estimate for the number of vehicle trips traveling into or out of the site.

The MXD model has been approved for use by the EPA.[1] It has also been peer-reviewed in the ASCE Journal of Urban Planning and Development,[2] peer-reviewed in a 2012 TRB paper evaluating various smart growth trip generation methodologies,[3] recommended by SANDAG for use on mixed-use smart growth developments,[4] promoted in an American Planning Association (APA) Planning Advisory Service (PAS)[5] which recommended it for evaluating traffic generation of mixed-use and other forms of smart growth. It has also been used successfully in multiple certified EIRs in California.

Internal Capture

Internal trips are responsible for an 8% reduction of daily external vehicle trips, a 16% reduction of AM peak hour external vehicle trips, and a 17% reduction of PM peak hour external vehicle trips. Some examples of an internal trip would be a parent living in one of the project dwelling units dropping off a student at the day care center, a person living in one of the project dwelling units working at or attending classes at the campus, or a student exercising at the fitness center. Some of these trips would potentially still occur by vehicle, though they would remain internal to the larger project site.

In total, the MXD trip generation methodology is responsible for a 12% reduction of daily external vehicle trips, a 20% reduction of AM peak hour external vehicle trips, and a 20% reduction of PM peak hour external vehicle trips when compared to the unadjusted ITE methodology.

Input values were collected for the MXD model for use in application on the project trip generation. The MXD model uses internal project information such as land use mix, project area, intersection density, and transit stop placement as well as local and regional demographic data such as average household size and vehicle ownership, employment within one mile of the site, and employment within a 30-minute transit trip.

Project Trip Generation

Input values were collected for the MXD model for use in application on the project trip generation. The MXD model uses internal project information such as land use mix, project area, intersection density, and transit stop placement as well as local and regional demographic data such as average household size and vehicle ownership, employment within one mile of the site, and employment within a 30-minute transit trip.

In addition, the MXD model was used to estimate the total number of trips generated by the existing land uses, which include a day care center, 145 residential dwelling units, and a 66-bed dormitory, and the existing academic campus. The total net trip generation for the project consists of the MXD estimated project trips minus the MXD estimated existing trips.

Table 3 summarizes the estimated trip generation for the project using the MXD methodology for a typical weekday. As shown in **Table 3**, the project is estimated to generate 2,608 net new daily vehicle trips, with 179 net new trips during the AM peak hour, and 227 net new trips during the PM peak hour.

Source: Fehr & Peers.

Summary

The proposed project would add 179 net new project trips during the AM peak hour and 227 net new project trips during the PM peak hour. The majority of these net new trips would travel to and from the west via Seminary Drive to the Redwood Highway Frontage Road where access to US 101 as well as commercial uses along the frontage road including the Strawberry Village Shopping Center is provided.

The intersections would operate at LOS C or better conditions under all scenarios, which meets the County LOS standard. No roadway or intersection changes would be required to meet the LOS standard.

Intersection Summary		
HCM 6th Ctrl Delay		26.4
HCM 6th LOS		C

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Intersection Summary		
HCM 6th Ctrl Delay		22.5
HCM 6th LOS		C

Notes

* HCM 6th computational engine requires equal clearance times for the phases crossing the barrier.

Unsignalized Delay for [NBR, SBR] is excluded from calculations of the approach delay and intersection delay.

Seminary Utility Usage Summary Memorandum

CSW | ST2 THE SEMINARY AT STRAWBERRY

MEMORANDUM

TO: Tammy Taylor

FROM: Richard Souza, P.E.

DATE: September 19, 2022

SUBJECT: Seminary Utility Usage Summary

This memorandum summarizes utility usage and assumptions for existing residential, commercial, campus, and ancillary facilities in the Seminary at Strawberry. Average water and electrical consumptions were taken from agency meter readings. Average sewer flows reflect water usage with reductions for irrigation and individual consumption. Entitlement / historic usage were acquired from State Water Resource Control Board (SWRCB) information for Marin County and adjusted per Marin County Marin Municipal Water District (MMWD) 2020 Water Management Plan report. The entitlement/historic water numbers are shown for the current entitlements based on the existing allowable uses for the property. The existing/current use is shown for the year 2020

AVERAGE DAILY USE

	Entitlement / Historic Use	Existing / Current Use*
Water	94,858 gal	61,712 gal
Sewer	66,679 gal	37,012 gal
Electrical	7,370 kWh	2,762 kWh

* Water Meter Readings from 2020 and Electric Meter Readings from 2020 to 2021

ENTILEMENT / HISTORIC USE

Water. Historic water use for campus, ancillary, and residential facilities assume a 157 gpd per capita based on SWRCB records and adjusted 43% higher for pre 1994 per the MMWD 2020 Water Management Plan report. Water use by single-family residential units constructed from 1994 to 2009 had an average 18% higher use than units constructed 2010; and, later a 43% higher water use than units constructed prior to 1994 per MMWD records.

Sewer. Utilization rates for sewerage facilities are based on water use. Sewer flows for campus and ancillary facilities assume a 10% reduction from water use for individual consumption and irrigation. Single-family residential sewer flows assume a 30% reduction and multi-family residential assume a 10% reduction from water use.

Electrical. Average electrical use rate derive from an electrical meter serving the campus and apartment facilities. Single-family residential use assumes 20kWh and multi-family residential use assumes 10 kWh.

Listed below are average daily flow rates for water, sewer, and electrical facilities based on use.

ENTITLED / HISTORIC UTILITY USAGE SUMMARY

	Planning Area	Unit Type	Unit Count	Floor Area	Water GPD	Sewer GPD	Electrical kWh/Day
Academic Campus (Assumes 1,000 students and 100 employess)	Administration Bld	Existing Bld		25,200	5,108	4,597	1,036

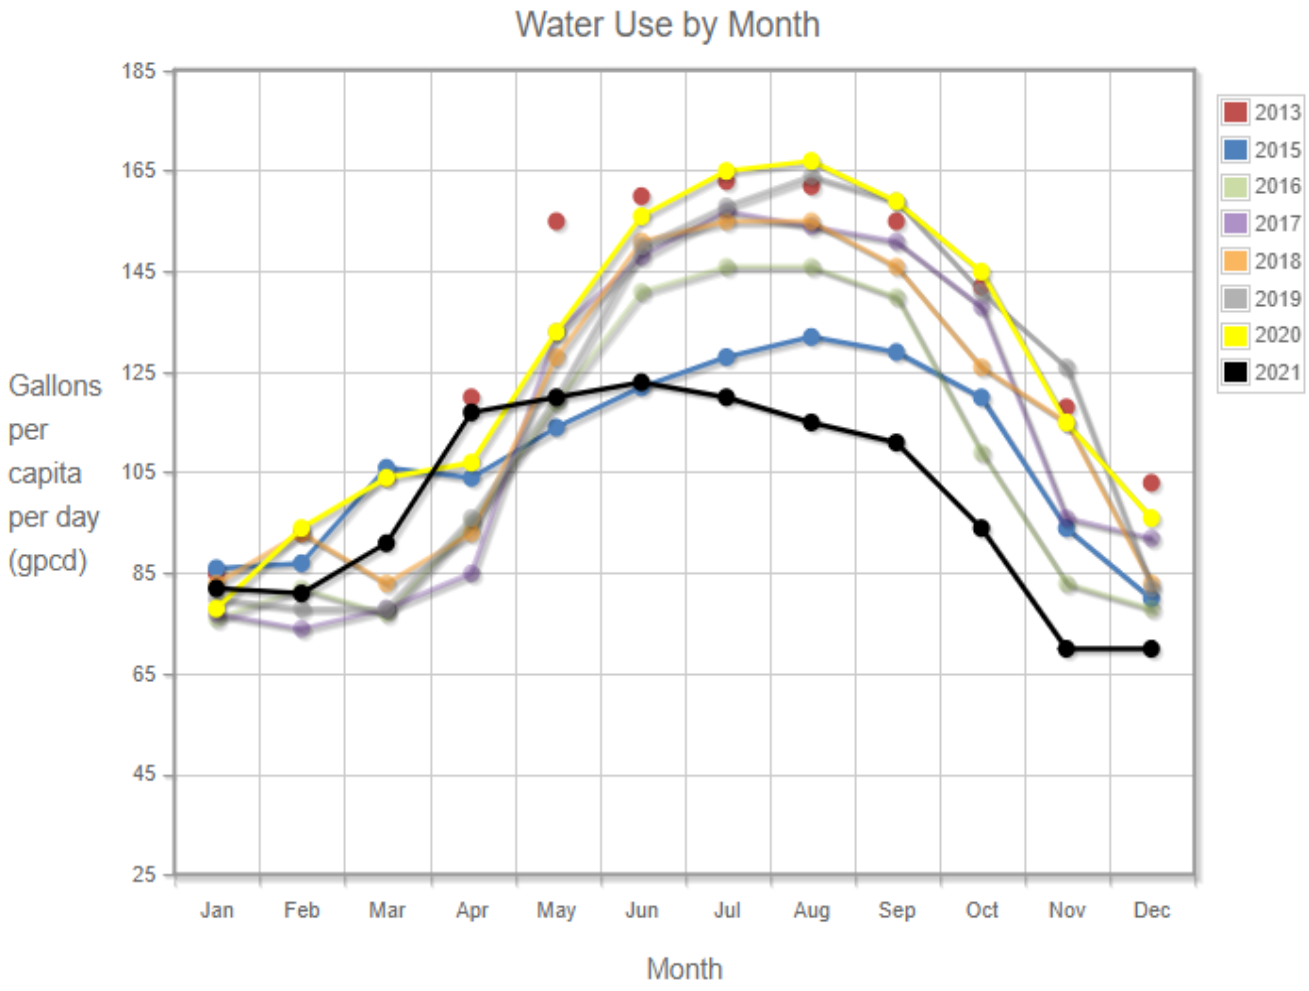
Average Daily Use =					**94,858**	**66,679**	**7,370**

EXISTING / CURRENT USE

Water. Three (3) water meters provide the use records for existing facilities. A 4-inch water meter services the academic campus, ancillary facilities, and a portion of the residential buildings.. An 1-inch and 1.5-inch water meter provide residential usage. Water meter readings during the 2020 period was used to determine the average daily use. The 61,712 gallon-per-day (gpd) average use in that year is an appropriate base for this analysis. The variance from month to month results from low or no irrigation use during the wet weather season. Residential water consumption assumes 110 gpd per capita based on SWRCB for Marin County. As indicated in the MMWD graph below, average water use varies monthly around the average per capita use.



Sewer. Utilization rates for sewerage facilities are based on percentages of water consumptions. No flow meters or other records are available. Sewer flows for campus and ancillary facilities assume a 10% reduction from water use rates for drinking and irrigation. Single-family residential use assumes a 30% reduction and multi-family residential assume a 10% reduction for drinking and irrigation.

Electrical. Average electrical use rate derive from a meter serving the campus and apartments. Single-family residential use assumes 10kWh and multi-family residential use assumes 5 kWh.

Listed below are average daily flow rates for water, sewer, and electrical facilities based on use.

EXISTING / CURRENT UTILITY USAGE SUMMARY

	Planning Area	Unit Type	Unit Count	Floor Area	Water GPD	Sewer GPD	Electrical kWh/Day
Academic Campus	Administration Bld	Existing Bld		25,200	4,157	3,741	478
	Academic Bld	Existing Bld		51,200	8,446	7,601	971
(Assumes 350 students	Cafeteria	Existing Bld		10,000	1,650	1,485	190
& employees per day)	Library	Existing Bld		32,000	5,279	4,751	607
	Maintenance Bld	Existing Bld		2,200	363	327	42
	Subtotal =				19,893	17,904	2,287
	Percentage of Use =				32%	48%	83%
Ancillary Buildings	Day Care			6,400	2,274	2,046	263
	Playing Field			2 Acres	20,400		
	Campus Parking	297 Stalls		1 Acre			10.8
	Subtotal =				22,674	2,046	274
	Percentage of Use =				37%	6%	10%
Existing Residential To Remain	Reed Blvd (SFR)
