Notice of Preparation of Environmental Impact Report

North Coast Land Holdings, LLC Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit **Project ID:** P1490

APN(s): 043-261-25; 043-261-26; 043-262-03; 043-262-06; 043-401-05; 043-401-10; 043-401-16; 043-402-03; 043-402-06

Project Address: 201 Seminary Drive, Mill Valley, CA 94941 **Applicant:** North Coast Land Holdings, LLC.

Project Planner: Michelle Levenson, Senior Planner **Phone:** (415) 473-6269

Email: envplanning@marincounty.org

Project Summary: The applicant, North Coast Land Holdings, LLC, is supplementing its previously submitted Community Plan Amendment request with an application for Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit approval to allow the redevelopment of portions of the existing Seminary campus (please see project details on website links referenced below).

Comment period commences: September 25, 2020 **Comment period deadline:** October 26, 2020

Project details: Available on the environmental and planning project webpages under current projects: https://www.marincounty.org/depts/cd/divisions/environmental-review

Appeal Rights: If you disagree with the foregoing determination regarding environmental review of the project, you may appeal it to the Board of Supervisors. A Petition for Appeal and a $1,408.00 filing fee must be submitted in the Community Development Agency - Planning Division, Room 308, Civic Center, San Rafael, within five business days, or no later than 4:00 P.M., October 2, 2020.

More information about this application is available online at http://www.marincounty.org/depts/cd/divisions/planning/projects, where projects are listed for the Alto Strawberry area.

Governor's Office of Planning & Research
OCT 30 2020
STATE CLEARINGHOUSE

COUNTY OF MARIN

COMMUNITY DEVELOPMENT AGENCY
PLANNING DIVISION

NOTICE OF MARIN COUNTY BOARD OF SUPERVISORS HEARING
Appeal of the Environmental Manager's Determination-Notice of Preparation (NOP) of Environmental Impact Report (EIR), North Coast Land Holdings LLC Planning Application on the former Golden Gate Baptist Seminary Site,
201 Seminary Drive, Mill Valley
APN 043-261-25 and -26; 043-262-03 and -06;
043-401-05, -10 and -16; and 043-402-03 and -06
Project ID P1490

NOTICE IS HEREBY GIVEN that the Marin County Board of Supervisors will consider issuing a decision on the Appeal of the Environmental Manager's Determination that the North Coast Land Holdings LLC Planning Application requires the preparation of an Environmental Impact Report (EIR) pursuant to the California Environmental Quality Act (CEQA) and the County's Environmental Impact Review Guidelines, during a public hearing scheduled on Tuesday, November 10, 2020. The applicant for the appeal is Riley F. Hurd, III, on behalf of the Seminary Neighborhood Association. The property is located at 201 Seminary Drive, Mill Valley, (the former Golden Gate Baptist Seminary site) further identified as Assessor's Parcel 043-261-25 and -26; 043-262-03 and -06; 043-401-05, -10 and -16; and 043-402-03 and -06.

The project that is the subject of the appeal consists of the following: North Coast Land Holdings, LLC has submitted an application for development on the former Golden Gate Baptist Seminary property on the Strawberry Peninsula in Mill Valley. The proposed project includes a residential care facility for senior citizens and would replace a majority of the existing residential housing, as well as provide new residential housing. In addition, a pre-school and fitness center that would both be open to the public are proposed. Twenty percent of the proposed units would be reserved as below market rate housing. More than 75 percent of the 127-acre campus would be preserved as open space, athletic fields, paths and plazas. No change to the scope of the existing use permit for higher educational use is being proposed.

For information regarding environmental review of the application, please visit the Environmental Review Division's project webpage at: https://www.marincounty.org/depts/cd/divisions/environmental-review/current-eir-projects/north-coast-land-holdings-llc.
For more information about the planning application, please visit the Planning Division's project webpage at:
https://www.marincounty.org/depts/cd/divisions/environmental-review/current-eir-projects/north-coast-land-holdings-llc.
Project plans and other documents related to the application and environmental review are available on the project webpages, where you can subscribe to receive email notifications and updates.

In compliance with local and state shelter-in-place orders, and as allowed by Governor Newsom's Executive Order N-29-20, the Board of Supervisors' will not be providing a location for the public to attend the hearing in person. Members of the public may attend and participate in this Board hearing online, using Zoom. To participate in a Board hearing please visit the Board hearings webpage at: https://www.marincounty.org/depts/bs/meeting-archive and follow the instructions provided. You can call (415) 473-7331 if you need more information about the hearing.

The time of the hearing will be indicated on the hearing agenda posted on the Board of Supervisors hearing webpage on the Thursday before the hearing. A staff report will be available on the project webpage on Friday, November 6, 2020.

If you challenge the decision on this application in court, you may be limited to raising only those issues you or someone else raised at the public hearing described in this notice, or in written correspondence delivered to the Community Development Agency, Planning Division during or prior to the public hearing. (Government Code Section 65009(b)(2).)

October 26, 2020

Rachel Reid
Environmental Manager

All public meetings and events sponsored or conducted by the County of Marin are held in accessible sites. Requests for accommodations may be made by calling (415) 473-4381 (Voice) 473-3232 (TDD/TTY) or by e-mail at disabilityaccess@marincounty.org at least four work days in advance of the event. Copies of documents are available in alternative formats, upon request.

REVISED NOTICE OF PREPARATION AND EXTENSION OF THE COMMENT PERIOD FOR THE NORTH COAST LAND HOLDINGS LLC PLANNING APPLICATION ON THE FORMER GOLDEN GATE BAPTIST SEMINARY SITE, 201 SEMINARY DRIVE, MILL VALLEY APN 043-261-25 AND -26; 043-262-03 AND -06; 043-401-05, -10 AND -16; AND 043-402-03 AND -06 PROJECT ID P1490

NOTICE IS HEREBY GIVEN that the previous Notice of Preparation for this project has been revised and the comment period extended.

Marin County will be preparing an Environmental Impact Report (EIR) for the North Coast Land Holdings, LLC. Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit project. Marin County is the lead agency, pursuant to the State Guidelines for the California Environmental Quality Act (State CEQA Guidelines Section 15050) for the preparation of an EIR. This EIR is being prepared by Marin County in accordance with CEQA, the State of California CEQA Guidelines, and County Environmental Impact Review Guidelines. The property is located at 201 Seminary Drive, Mill Valley, (the former Golden Gate Baptist Seminary site) further identified as Assessor's Parcels 043-261-25 and -26; 043-262-03 and -06; 043-401-05, -10 and -16; and 043-402-03 and -06.

North Coast Land Holdings, LLC has submitted an application for development on the former Golden Gate Baptist Seminary property on the Strawberry Peninsula in Mill Valley. The proposed project includes construction of a new residential care facility with up to 100 independent and 50 assisted living and memory care apartments for senior citizens and 336 single- and multi-family residential units that would replace a majority of the existing residential housing. Fifty of the proposed residential units would be reserved as below market rate housing. In addition, a pre-school (3,000 square feet) and fitness center (17,000 square feet) that would both be open to the public are proposed, and an existing maintenance building would be replaced. More than 70 percent of the 127-acre campus would be preserved as open space, athletic fields, paths and plazas. No change to the scope of the existing use permit allowing up to a maximum of 1,000 students for higher educational use is being proposed. A 15,800 square foot addition is proposed as part of the renovation of the Administration Building, resulting in a 41,000 square foot building.

The EIR will evaluate the project with respect to all of the following topical issues, but will focus on some issues more than others. The topical areas that will be addressed in the EIR include: Aesthetics, Agricultural and Forestry Resources, Air Quality, Biological Resources, Cultural Resources, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Mandatory Findings of Significance, Mineral Resources, Noise, Population and Housing, Public Services, Recreation, Transportation, Tribal Cultural Resources, Utilities and Service Systems, and Wildfire.

For information regarding environmental review of the application, please visit the Environmental Review Division's project webpage at:
https://www.marincounty.org/depts/cd/divisions/environmental-review/current-eir-projects/north-coast-land-holdings-llc.
For more information about the planning application, please visit the Planning Division's project webpage at:
https://www.marincounty.org/depts/cd/divisions/environmental-review/current-eir-projects/north-coast-land-holdings-llc.

Project plans and other documents related to the application and environmental review are available on the project webpages, where you can subscribe to receive email notifications and updates.

To ensure that the EIR for this project is thorough and adequate, and meets the needs of all agencies reviewing it, we are soliciting comments on specific issues to be included in the environmental review. Public comments on the scope of issues to be evaluated in the EIR are encouraged.

If you wish to comment during the Notice of Preparation (NOP) comment period we will accept written comments about the scope of the environmental report until the close of the extended NOP comment period at 4:00 p.m. on **Monday, February 1, 2021.** Commenters are advised to mail written comments postmarked on or before February 1, 2021 to the attention of Rachel Reid, Environmental Planning Manager at 3501 Civic Center Drive, Suite 308, San Rafael, CA 94903. Comments can also be submitted by email to **envplanning@marincounty.org** before the end of the comment period deadline. If you have any questions, or need additional information about the project merits, please contact Michelle Levenson, Senior Planner at (415) 473-3615. A public scoping session will be held at a date to be determined, and a subsequent notice will be issued once it is scheduled.

If you challenge the decision on this application in court, you may be limited to raising only those issues you or someone else raised at the public hearing described in this notice, or in written correspondence delivered to the Community Development Agency, Planning Division during or prior to the public hearing. (Government Code Section 65009(b)(2).)

Re: 2020090488, North Coast Land Holdings, LLC Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit Project, Marin County

Dear Ms. Taylor:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

a. A brief description of the project.

b. The lead agency contact information.

c. Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).

d. A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

a. For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

a. Alternatives to the project.

b. Recommended mitigation measures.

c. Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

a. Type of environmental review necessary.

b. Significance of the tribal cultural resources.

c. Significance of the project's impacts on tribal cultural resources.

d. If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

a. Whether the proposed project has a significant impact on an identified tribal cultural resource.

b. Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

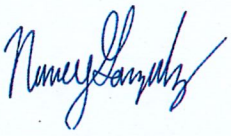
a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Nancy.Gonzalez-Lopez@nahc.ca.gov.

Sincerely,



Nancy Gonzalez-Lopez
Cultural Resources Analyst

North Coast Land Holdings – Notice of Preparation (NOP) of an Environmental Impact report (EIR)

Dear Michelle Levenson:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the North Coast Land Holdings project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system. The following comments are based on our review of the September 2020 NOP.

Project Understanding

The proposed project includes the following components: 1) construct a new 20,000 square feet (s.f.) facility to house a pre-school and fitness center; 2) replace a majority of the existing residences and dorm rooms with a mixture of single-family and multi-family residences and construct new single-family and multi-family residence (336 units in total); 3) construct a new 267,354 s.f. residential care facility; 4) renovate and expand the Administration Building; 5) demolish the existing maintenance building and construct a new 2,200 s.f. one in a different location; 6) install landscape and hardscape improvements associated with the school campus and residential development; and 7) provide open space and establish a network of trails throughout the project area. This 123-acre project site is located north of the Golden Gate Bridge and adjacent to US-101 and the Seminary Drive exit.

Travel Impact Analysis
With the enactment of Senate Bill (SB) 743, Caltrans is focused on maximizing efficient development patterns, innovative travel demand reduction strategies, and multimodal improvements. For more information on how Caltrans assesses Transportation Impact Studies, please review Caltrans' Transportation Impact Study Guide. The detailed Vehicle Miles Traveled (VMT) analysis should include the following:

- A VMT analysis pursuant to the County's guidelines or, if the County has no guidelines, the Office of Planning and Research's Guidelines. Projects that result in automobile VMT per capita above the threshold of significance for existing (i.e. baseline) city-wide or regional values for similar land use types may indicate a significant impact. If necessary, mitigation for increasing VMT should be identified. Mitigation should support the use of transit and active transportation modes. Potential mitigation measures that include the requirements of other agencies such as Caltrans are fully enforceable through permit conditions, agreements, or other legally-binding instruments under the control of the City.

- A schematic illustration of walking, biking and auto conditions at the project site and study area roadways. Potential safety issues for all road users should be identified and fully mitigated.

- The project's primary and secondary effects on pedestrians, bicycles, travelers with disabilities and transit performance should be evaluated, including countermeasures and trade-offs resulting from mitigating VMT increases. Access to pedestrians, bicycle, and transit facilities must be maintained.

- Clarification of the intensity of events/receptions to be held at the location and how the associated travel demand and VMT will be mitigated.

Additionally, potential impacts due to the project generated trips on the US-101 should be analyzed, given that the project is in proximity to US-101. Please submit the transportation impact study to Caltrans when it becomes available.

Sea Level Rise
The effects of sea level rise may have impact on the transportation facilities located in the project area. California Executive Order (EO) S-13-08 directs State agencies planning construction projects in areas vulnerable to sea level rise to begin planning for potential impacts by considering a range of sea level

rise scenarios for years 2050 and 2100. Higher water levels may increase erosion rates, change environmental characteristics that affect materials durability, lead to increased groundwater levels and change sediment movement along shores and at estuaries and river mouths, as well as affect sole pore pressure at dikes and levees on which the transportation facilities are constructed. All these factors must be addressed through the geotechnical and hydrological studies conducted in coordination with Caltrans.

Construction-Related Impacts

Because the project area is within close vicinity of US-101, potential impacts to the State Right-of-Way (ROW) from project-related temporary access points should be analyzed. Mitigation for significant impacts due to construction and noise should be identified in the DEIR. Project work that requires movement of oversized or excessive load vehicles on state roadways requires a transportation permit that is issued by Caltrans. To apply, visit: https://dot.ca.gov/programs/traffic-operations/transportation-permits.

Prior to construction, coordination may be required with Caltrans to develop a Transportation Management Plan (TMP) to reduce construction traffic impacts to US-101.

Lead Agency

As the Lead Agency, the County of Marin is responsible for all project mitigation, including any needed improvements to the State Transportation Network (STN). The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, please contact Yunsheng Luo at Yunsheng.Luo@dot.ca.gov. Additionally, for future notifications and requests for review of new projects, please contact LDIGR-D4@dot.ca.gov.

Sincerely,

Mark Leong

Subject: North Coast Land Holdings, LLC, Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal, Notice of Preparation of a Draft Environmental Impact Report, SCH No. 2020090488, Marin County

Dear Ms. Levenson:

The California Department of Fish and Wildlife (CDFW) reviewed the County of Marin's (County) Notice of Preparation (NOP) of a draft Environmental Impact Report (EIR) provided for the North Coast Land Holdings, LLC, Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal (Project) located at 201 Seminary Drive, Mill Valley, CA 94941, Marin County.

CDFW is a Trustee Agency with responsibility under the California Environmental Quality Act (CEQA) §15386 for commenting on projects that could impact fish, plant, and wildlife resources. CDFW is also considered a Responsible Agency if a project would require discretionary approval, such as the California Endangered Species Act (CESA) Permit, the Native Plant Protection Act, the Lake and Streambed Alteration Agreement (LSAA) and other provisions of the Fish and Game Code that afford protection to the State's fish and wildlife trust resources. Pursuant to our jurisdiction, CDFW has the following concerns, comments, and recommendations regarding the Project.

PROJECT DESCRIPTION AND LOCATION

Proponent: North Coast Land Holdings, LLC

Objective: The Project will develop a residential care facility for senior citizens, residential housing, pre-school, and fitness center on the 127-acre Golden Gate Baptist Seminary property. Pre-existing buildings, including seminary dorm rooms, residences, and a maintenance building will be demolished or renovated.

Location: The Project is located at 201 Seminary Drive, Mill Valley, CA 94941. While identified as within Mill Valley, the Project occurs in unincorporated Marin County in census-designated Strawberry. The Project is approximately bounded by Richardson

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Bay to the west, Seminary Drive to the south, Storer Drive to the east, and Ricardo Road to the north. It is east of U.S. Route 101.

The CEQA Guidelines (§§15124 and 15378) require that the draft EIR incorporate a full Project description, including reasonably foreseeable future phases of the Project, and that contains sufficient information to evaluate and review the Project's environmental impact. Please include a complete description of the following Project components in the Project description:

- Footprints of permanent Project features and temporarily impacted areas, such as staging areas and access routes.
- Encroachments into riparian habitats, wetlands, or other sensitive areas.
- Tree removal, including the number of trees by species, diameter at breast height, and health status.
- Area and plans for proposed buildings/structures, demolition of existing structures, renovation of existing structures, ground disturbing activities, fencing, paving, stationary machinery, landscaping, and stormwater systems.
- Operational features of the Project, including level of anticipated human presence (describe seasonal or daily peaks in activity, if relevant), artificial lighting/light reflection, noise and greenhouse gas generation, traffic generation, and other features.
- Construction schedule, activities, equipment, and crew sizes.

ENVIRONMENTAL SETTING

Sufficient information regarding the environmental setting is necessary to understand the Project's, and its alternative's (if applicable), significant impacts on the environment (CEQA Guidelines, §§15125 and 15360). CDFW recommends that the CEQA document prepared for the Project provide baseline habitat assessments for special-status plant, fish, and wildlife species located and potentially located within the Project area and surrounding lands, including all rare, threatened, or endangered species (CEQA Guidelines, §15380). Fully protected, threatened or endangered, candidate, and other special-status species that are known to occur, or have the potential to occur in or near the Project site, include, but are not limited to:

- Tiburon jewelflower (*Streptanthus glandulosus* ssp. *niger*), state and federally listed as endangered, California Rare Plant Rank (CRPR) 1B.1
- Salt marsh harvest mouse (*Reithrodontomys raviventris*), state and federally listed as endangered, California fully protected species
- California Ridgway's rail (*Rallus obsoletus obsoletus*), federally and state listed

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

as endangered, California fully protected species

- California black rail (*Laterallus jamaicensis coturniculus*), state listed as threatened, California fully protected species
- Longfin smelt (*Spirinchus thaleichthys*), state listed as threatened and federal candidate for listing
- Pallid bat (*Antrozous pallidus*), California Species of Special Concern (SSC)
- Townsend's big-eared bat (*Corynorhinus townsendii*), SSC
- Western red bat (*Lasiurus blossevillii*), SSC
- Hairless popcorn flower (*Plagiobothrys glaber*), CRPR 1A
- Franciscan thistle (*Cirsium andrewsii*), CRPR 1B.2
- White-tailed kite (*Elanus leucurus*), California fully protected species
- Oak woodland (*Quercus* spp.), Areas of Conservation Emphasis-Terrestrial Significant Habitat[1] and sensitive natural community[2]

Habitat descriptions and species profiles should include information from multiple sources: aerial imagery, historical and recent survey data, field reconnaissance, scientific literature and reports, and findings from "positive occurrence" databases such as California Natural Diversity Database (CNDDB). Based on the data and information from the habitat assessment, the CEQA document can then adequately assess which special-status species are likely to occur in the Project vicinity.

CDFW recommends that during Project planning and prior to Project implementation, surveys be conducted for special-status species with potential to occur, following recommended survey protocols if available. Survey and monitoring protocols and guidelines are available at: https://wildlife.ca.gov/Conservation/Survey-Protocols.

Botanical surveys for special-status plant species, including those with a California Rare Plant Rank (http://www.cnps.org/cnps/rareplants/inventory/), must be conducted during the blooming period for all sensitive plant species potentially occurring within the Project area and require the identification of reference populations. Please refer to CDFW protocols for surveying and evaluating impacts to rare plants available at: https://wildlife.ca.gov/Conservation/Plants.

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

IMPACT ANALYSIS AND MITIGATION MEASURES

The CEQA Guidelines (§15126.2) necessitate that the draft EIR discuss all direct and indirect impacts (temporary and permanent) that may occur with implementation of the Project. This includes evaluating and describing impacts such as:

- Potential for "take" of special-status species.
- Loss or modification of breeding, nesting, dispersal and foraging habitat, including vegetation removal, alteration of soils and hydrology, and removal of habitat structural features (e.g. snags, roosts, overhanging banks, and anthropogenic habitat such as buildings).
- Loss or modification of sensitive natural communities or vegetation associations.
- Permanent and temporary habitat disturbances associated with ground disturbance, noise, lighting, reflection, air pollution, traffic, or human presence.
- Obstruction of movement corridors, fish passage, or access to water sources and other core habitat features.

The CEQA document also should identify reasonably foreseeable future projects in the Project vicinity, disclose any cumulative impacts associated with these projects, determine the significance of each cumulative impact, and assess the significance of the project's contribution to the impact (CEQA Guidelines, §15355). Although a project's impacts may be insignificant individually, its contributions to a cumulative impact may be considerable; a contribution to a significant cumulative impact – e.g., reduction of available habitat for a listed species – should be considered cumulatively considerable without mitigation to minimize or avoid the impact.

Based on the comprehensive analysis of the direct, indirect, and cumulative impacts of the Project, the CEQA Guidelines (§§ 15021, 15063, 15071, 15126.2, 15126.4 and 15370) direct the lead agency to consider and describe all feasible mitigation measures to avoid potentially significant impacts in the draft EIR, and/or mitigate significant impacts of the Project on the environment. This includes a discussion of take avoidance and minimization measures for special-status species, which are recommended to be developed in early consultation with the U.S. Fish and Wildlife Service (USFWS), the National Marine Fisheries Service and CDFW. These measures can then be incorporated as enforceable Project conditions to reduce potential impacts to biological resources to less-than-significant levels. Fully protected species such as California black rail and white-tailed kite may not be taken or possessed at any time (Fish and Game Code § 3511). Therefore, the draft EIR is advised to include measures to ensure complete take avoidance of these fully protected species. CDFW recommends the following mitigation measures be incorporated into the draft EIR to reduce potentially significant impacts to special-status species:

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Mitigation Measure 1: Special-Status Plant Surveys and Avoidance

A Qualified Biologist shall conduct a survey during the appropriate blooming period for all special-status plants that have the potential to occur on the Project site the season prior to the start of construction. Surveys should be conducted following *Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities*, prepared by CDFW, dated March 20, 2018[3]. If special-status plants are found during surveys, the Project will be re-designed to avoid impacts to special-status plants to the greatest extent feasible. If impacts to special-status plants cannot be avoided completely during construction, the draft EIR should outline adequate compensatory mitigation, and, for species listed as threatened or endangered pursuant to CESA, the Project will apply for an Incidental Take Permit from CDFW.

Mitigation Measure 2: California Ridgway's Rail and California Black Rail Habitat Assessment, Surveys, and Avoidance

The CEQA document should outline the location of salt marsh habitat relative to the Project activities. Any Project activities within or adjacent to tidal marsh or suitable California Ridgway's rail (CRR) or California black rail (CBR) habitat shall be avoided during rail breeding season, (January 15 to August 31 for CRR, February 1 to August 31 for CBR), each year unless appropriately timed, yearly protocol level surveys are conducted and survey methodology and results are submitted to and accepted by CDFW, or, the Project implements noise and vegetation avoidance measures below. Surveys shall focus on suitable habitat that may be disturbed by Project activities during the breeding season to ensure that CRR or CBR are not nesting in these locations.

If breeding rails are determined to be present, no activities, visual disturbance (direct line of sight) and/or an increase in the ambient noise level shall occur within 700 feet of areas where CRR or CBR have been detected during the breeding season. If surveys have not been conducted, all work shall be conducted 700 feet from rail habitat during nesting season.

If work must be done during the breeding season within 700 feet of CRR or CBR habitat, noise levels cannot exceed 10 dBA over existing ambient noise levels and a noise attenuating fence or visual barrier must be installed to reduce visual and/or acoustic impacts.

Mitigation Measure 3: Salt Marsh Harvest Mouse Habitat Assessment and Avoidance

The CEQA document should outline the location of salt marsh habitat relative to the Project activities. Prior to impacting salt marsh habitat, a Qualified Biologist or Biological

[3] https://www.wildlife.ca.gov/Conservation/Survey-Protocols#377281280-plants

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Monitor, familiar with salt marsh harvest mouse (SMHM), shall walk through and inspect suitable habitat prior to vegetation removal and search for signs of harvest mice or other sensitive wildlife and plants. Following inspection, personnel, under the supervision of the qualified biologist, will disturb (e.g., flush) vegetation to force movement of SMHM into adjacent marsh areas. Flushing of vegetation will first occur in the center of the site then progress toward the two sides away from the open water areas or in this case, away from impacted habitat. Immediately following vegetation flushing, personnel, under the supervision of the qualified biologist or biological monitor, will remove vegetation with hand tools (e.g. weed-eater, hoe, rake, trowel, shovel, grazing) so that vegetation is no taller than two inches.

After vegetation removal, a mouse-proof barrier shall be placed along the edge of the area removed of vegetation to further reduce the likelihood of SMHM returning to the area prior to construction. The fence shall be made of a heavy plastic sheeting material that does not allow salt marsh harvest mice to pass through or climb, and the bottom shall be buried to a depth of 4 inches so that salt marsh harvest mouse cannot crawl under the fence. Fence height shall be at least 12 inches higher than the highest adjacent vegetation with a maximum height of 4 feet. All supports for the exclusion fencing shall be placed on the inside of the work area. An approximately 2-foot wide de-vegetated buffer shall be created along the habitat side of the exclusion fence. The SMHM exclusion fencing shall remain in operating condition throughout the duration of the Project. The Qualified Biologist or Biological Monitor shall daily inspect the integrity of the exclusion fencing to ensure there are no gaps, tears or damage. Maintenance of the fencing shall be conducted as needed. Any necessary repairs to the fencing shall be completed within 24 hours of the initial observance of the damage. Any mice found along or outside the fence shall be closely monitored until they move away from the Project area.

Mitigation Measure 4: Nesting Bird Surveys and Protections

If construction, grading, vegetation removal, or other Project-related activities are scheduled during the nesting season of protected raptors and migratory birds, February 1 to August 31, a focused survey for active nests of such birds shall be conducted by a Qualified Biologist within 7 days prior to the beginning of Project-related activities. If an active nest is found, Permittee shall consult with USFWS and CDFW regarding appropriate action to comply with the Migratory Bird Treaty Act of 1918 and Fish and Game Code. If a lapse in Project-related work of 7 days or longer occurs, another focused survey shall be required before Project work can be reinitiated.

Mitigation Measure 5: Roosting Bat Surveys and Protections-Buildings

Buildings shall be surveyed for bats by a Qualified Bat Biologist within 15 days prior to any building demolition or renovation. Demolition or renovation plans shall cease if bats are found roosting within the buildings until proper eviction and exclusion plans have

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

been implemented. Eviction and exclusion of bats shall consist of daytime installation of blockage material or one-way exits between March 1 and April 15 or September 1 and October 15 (outside of maternity season and hibernation season). Exclusion materials shall be re-evaluated for effectiveness by the Qualified Biologist up to two weeks prior to building demolition.

Mitigation Measure 6: Roosting Bat Surveys and Protections-Trees

Removal of trees containing suitable potential bat roosting habitat in the form of crevices, cavities, or exfoliating bark, as with exclusion/eviction from buildings, must be conducted only during seasonal periods of bat activity, and under supervision of a Qualified Bat Biologist. Trees within the Project area shall be assessed by a Qualified Bat Biologist within 15 days prior to any tree removal. If trees are identified as potential bat roost trees, tree removal shall occur outside of the maternity season and hibernation season and via a two-step method conducted over two consecutive days. On day one, create noise and vibration by cutting non-habitat branches and limbs from habitat trees using chainsaws only (no excavators or other heavy machinery). The noise and vibration disturbance, together with the visible alteration of the tree, is effective in causing bats that emerge nightly not to return to the roost that night. On day two, the remainder of the tree will be removed.

Mitigation Measure 7: Tree Removal Mitigation

Live trees removed from the Project area shall be replaced on-site at the following ratios:

Oak trees:

- 4:1 replacement for trees 5 to 10 inches diameter at breast height (DBH)
- 5:1 replacement for trees greater than 10 inches to 15 inches DBH
- 15:1 replacement for trees greater than 15-inch DBH, which are considered old-growth oaks

Replacement oaks will come from nursery stock grown from locally sourced acorns, or from acorns gathered locally, preferably from the same watershed in which they are planted.

Other tree species greater than or equal to 6-inch DBH will be mitigated at the following ratios:

- 1:1 replacement for non-native trees
- 3:1 replacement for native trees

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Sea Level Rise

The Project should assess potential sea-level rise in the area and evaluate development location and habitat impacts with future conditions in mind. The State of California Sea-Level Rise Guidance/2018 Update[4] provides a science-based methodology for state and local governments to analyze and assess the risks associated with sea-level rise and incorporate sea-level rise into their planning, permitting, and investment decisions. The Marin Shoreline Sea Level Rise Vulnerability Assessment/Bay Waterfront Adaptation & Vulnerability Evaluation (BayWAVE)[5] provides context and estimates of the physical and fiscal impacts across the County's bayside shoreline over the coming decades. It includes sea level rise scenarios ranging from 10 inches in the near-term (15 years) to 20 inches in the medium-term (mid-century) and to 60 inches in the long-term (end of century). Since the purpose of the Project is to provide long-term residential and associated structures and it is located on a small peninsula in Richardson Bay, CDFW recommends incorporating the long-term (end of century) scenarios for sea level rise to fully evaluate Project impacts.

REGULATORY REQUIREMENTS

California Endangered Species Act

Please be advised that a CESA Incidental Take Permit (ITP) must be obtained if the Project has the potential to result in take[6] of plants or animals listed under CESA, either during construction or over the life of the Project. Issuance of a CESA Permit is subject to CEQA documentation; the CEQA document must specify impacts, mitigation measures, and a mitigation monitoring and reporting program. If the Project will impact CESA listed species, early consultation is encouraged, as significant modification to the Project and mitigation measures may be required in order to obtain a CESA ITP.

CEQA requires a Mandatory Finding of Significance if a project is likely to substantially restrict the range or reduce the population of a threatened or endangered species. (Pub. Resources Code, §§ 21001, subd. (c), 21083; CEQA Guidelines, §§ 15380, 15064, and 15065). Impacts must be avoided or mitigated to less-than-significant levels unless the CEQA Lead Agency makes and supports Findings of Overriding Consideration (FOC).

---

[4] California Natural Resources Agency. 2018. State of California Sea-level Rise Guidance. https://opc.ca.gov/webmaster/ftp/pdf/agenda_items/20180314/Item3_Exhibit-A_OPC_SLR_Guidance-rd3.pdf

[5] Marin County. 2017. Marin Shoreline Sea Level Rise Vulnerability Assessment/Bay Waterfront Adaptation & Vulnerability Evaluation. Prepared by BVB Consulting LLC for Marin County Department of Public Works, June 2017. https://www.marincounty.org/-/media/files/departments/cd/planning/slr/baywave/vulnerability-assessment-final/final_allpages_bvbconsulting_reduced.pdf?la=en

[6] Take is defined in Fish and Game Code section 86 as hunt, pursue, catch, capture, or kill, or attempt any of those activities.

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

The CEQA Lead Agency's FOC does not eliminate the project proponent's obligation to comply with CESA.

Lake and Streambed Alteration Agreement

CDFW requires an LSA Notification, pursuant to Fish and Game Code section 1600 et. seq., for Project activities affecting lakes or streams and associated riparian habitat. Notification is required for any activity that may substantially divert or obstruct the natural flow; change or use material from the bed, channel, or bank including associated riparian or wetland resources; or deposit or dispose of material where it may pass into a river, lake or stream. Work within ephemeral streams, washes, watercourses with a subsurface flow, and floodplains are subject to notification requirements. CDFW will consider the CEQA document for the project and may issue an LSA Agreement. CDFW may not execute the final LSA Agreement until it has complied with CEQA as a Responsible Agency.

Migratory Birds and Raptors

CDFW also has authority over actions that may disturb or destroy active nest sites or take birds without authorization. Fish and Game Code sections protecting birds, their eggs, and nests include sections 3503, 3503.5, and 3513. Fully protected species may not be taken or possessed at any time (Fish and Game Code, § 3511). Migratory birds are also protected under the federal Migratory Bird Treaty Act.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special-status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNNDB online field survey form and other methods for submitting data can be found at https://wildlife.ca.gov/Data/CNDDB/Submitting-Data. The types of information reported to CNDDB can be found at https://wildlife.ca.gov/Data/CNDDB/Plants-and-Animals.

FILING FEES

CDFW anticipates that the Project will have an impact on fish and/or wildlife, and assessment of filing fees is necessary (Fish and Game Code, § 711.4; Pub. Resources Code, § 21089). Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW.

Rachel,

Thank you for the opportunity to comment on the scope of the EIR analysis for this significant development project. The City of Mill Valley provided EIR Scoping comments on the Seminary development project via mail to your office prior to the end of the comment period on May 25, 2021. A copy of this letter is attached for your convenience and as information to other adjacent jurisdictions and Supervisor Moulton-Peters.

We look forward to working with you as this project progresses. Please contact me if you have any questions.

Best regards,
Lisa

San Rafael, CA 94903

Dear Rachel,

Thank you for this opportunity to provide comments on the EIR Notice of Preparation for the revised North Coast Land Holdings, LLC development project located at the former Golden Gate Baptist Seminary property. The City of Mill Valley has provided input on the previous project concepts in 2015/2016 (Branson High School Campus) and 2018 (mixed-use development with college component) due to the significant scale of the project and proximity to the Mill Valley General Plan Sphere of Influence. The City of Mill Valley will continue to actively engage in the process as it unfolds.

As previously stated, the City of Mill Valley recognizes that redevelopment of the Seminary property will have potentially significant impacts upon Southern Marin, both positive and negative. Mill Valley has vital interests in the proposed land use changes and intensity for this site. Project-related impacts to local and regional traffic are the primary area of concern and staff expects this issue to receive intensive evaluation in the Draft EIR. On the positive side, we recognize the importance of new and affordable housing, community-serving facilities, and educational opportunities.

City staff have reviewed the proposed Scope of Work for the EIR and provide the following comments on the proposed Draft Transportation Impact Study (TIS) that will include CEQA impact analysis of vehicle miles travelled (VMT), as well as a Level of Service (LOS) assessment of vehicle delay. Similar to the County of Marin General Plan, the Mill Valley General Plan contains policies and standards related to LOS. It is important to local jurisdictions for the EIR to carefully analyze LOS impacts and transportation mitigations needed to improve local circulation post project implementation.

For the LOS assessment, please include the following intersections in the analysis during weekday and weekend peak periods:

Redwood Highway Frontage Road/Tiburon Blvd
US 101 Northbound offramp/Tiburon Blvd
US 101 Southbound offramp/Tiburon Blvd
US 101 Northbound onramp/eastbound Tiburon Blvd
US 101 Southbound onramp/eastbound E. Blithedale Avenue
E. Blithedale/Tower/Kipling
E. Blithedale/Lomita/Roque Moraes
E. Blithedale/Camino Alto

For the traffic scenarios being analyzed, the baseline should reflect current school traffic to local schools including Edna Maguire, Mill Valley Middle School, and Tampalpais High School. The cumulative analysis should reflect projected school enrollment and post-Covid travel projections.

If the above analysis indicates inconsistency with County General Plan policies, including CD-5.2 and TR-1.e., the City requests that Improvement Measures be identified for the project merits analysis and recommended Conditions of Approval. Further, staff recommends that identified Improvement Measures be reviewed for CEQA compliance within the EIR. Measures to be evaluated shall include:

- Infrastructure improvements;
- Review of wayfinding signage, turning restrictions, and/or roadway operational changes to encourage drivers to use the Redwood Highway Frontage Road/De Silva Island Road 101 northbound onramp and the "Seminary Drive"/Redwood Highway Frontage Road 101 southbound onramp rather than using Tiburon Blvd to leave the site. For arrivals, directions on websites and other materials should direct people to exit Hwy 101 at these locations;
- Transportation Demand Management improvements that encourage off-peak travel in addition to VMT mitigation measures.

In addition to the analysis of vehicles, the Transportation Impact Study should forecast project-related and cumulative increases in bicycle use. Improvement Measures should be developed for constrained corridors providing access to the project, including the Mill Valley-Sausalito Multiple-Use Path.

Please contact Lisa Newman, Senior Planner (lnewman@cityofmillvalley.org / 415-384-4811) or me (pkelly@cityofmillvalley.org / 415-388-4039) if you have questions regarding these comments. Thank you for your consideration of local interests and concerns in preparation of the EIR.

Best regards,

Patrick Kelly, AICP, Director
Mill Valley Planning and Building Department

SUBJECT: Notice of Preparation of an Environmental Impact Report for the North Coast Land Holdings LLC Planning Application on the Former Golden Baptist Seminary Site; BCDC Inquiry File No. MC.MC.7415.26

Dear Ms. Reid:

Thank you for the opportunity to comment on the Notice of Preparation (NOP) of the Environmental Impact Report (EIR) on the North Coast Land Holdings Project received by our office on April 27, 2021. We understand that the proposed project includes construction of a new residential care facility with up to 100 independent and 50 assisted living and memory care apartments for senior citizens, 336 single- and multi-family residential units that would replace a majority of the existing residential housing, a pre-school (3,000 square feet) and fitness center (17,000 square feet) that would both be open to the public, and the replacement of an existing maintenance building, with more than 70 percent of the 127-acre campus intended for open space, athletic fields, paths and plazas.

The San Francisco Bay Conservation and Development Commission (BCDC or the Commission) is a responsible agency for this project and will rely on the EIR when considering approvals related to the project. While the description of the project in the NOP is not specific enough for BCDC staff to comment on every potential issue that could be raised with respect to BCDC's laws and policies, staff has prepared the following comments outlining issues under BCDC's jurisdiction that should be addressed as part of the EIR. Please note that the Commission itself has not reviewed the NOP. The following comments are based on BCDC staff review of the NOP, the *San Francisco Bay Plan* (Bay Plan), and the McAteer-Petris Act (Title 7.2 of the California Government Code (CGC)), the State legislative act by which the Commission and the Bay Plan is authorized.

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

1. **JURISDICTION**

Portions of the project site identified in the NOP are within BCDC's permitting jurisdiction. Via the McAteer-Petris Act, the California Legislature has charged BCDC with granting or denying permits for any proposed fill, extraction, or substantial change in use in any part of the San Francisco Bay, its tidelands, and shoreline (CGC § 66632). More simply, BCDC jurisdiction can be understood in two categories:

"Bay Jurisdiction": San Francisco Bay, being all areas subject to tidal action, including tidelands (land lying between mean high tide and mean low tide) and submerged lands (CGC § 66610(a)).

"Shoreline Jurisdiction": A shoreline band consisting of all territory located between the shoreline of the Bay and 100 feet landward of and parallel to the shoreline (CGC § 66610(b)).

Of the nine parcels identified in the NOP, three parcels fall within one or both areas of BCDC's permitting jurisdiction:

- **Parcel A.** Parcel **043-401-16 (Parcel A)** is a land parcel whose western edge falls within the 100-foot shoreline band, and thus under BCDC's shoreline jurisdiction.
- **Parcel B.** Parcel **043-262-06 (Parcel B)** is a land parcel whose western edge falls within the 100-foot shoreline band and, likewise, falls under our shoreline jurisdiction.
- **Parcel C.** Parcel **043-262-03 (Parcel C)** is a Bay parcel that is largely submerged, but whose eastern edge includes land along the 100-foot shoreline band. This parcel is therefore under both Bay jurisdiction and shoreline jurisdiction.

The EIR should map and describe the elements of the project that will occur within BCDC's permitting jurisdiction, distinguishing between the Bay and shoreline band jurisdictions. Approval of BCDC permits requires consistency with the McAteer-Petris Act and the Bay Plan, portions of which will be discussed below under their corresponding CEQA Appendix G topics.

2. **LAND USE AND PLANNING**

The EIR should refer to the Bay Plan and McAteer-Petris Act when considering the proposed project's consistency with land use plans, policies, or regulations adopted for the purpose of avoiding or mitigating an environmental effect. Bay Plan establishes policies for development and resource conservation within BCDC's jurisdiction, covering

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

public access; the protection of Bay resources, including fish, other aquatic organisms, and wildlife; water quality; climate change; fills; shoreline protection; water-related uses; appearance, design, and scenic views; and mitigation.

3. **AESTHETICS**

The EIR should cite the Bay Plan and BCDC's Public Access Design Guidelines in the regulatory settings for the aesthetics analysis and discuss the project's consistency with these policies.

The Bay Plan's Appearance, Design, and Scenic Views policies are concerned with preserving and enhancing the scenic quality of the Bay and shoreline and ensuring that shoreline access paths feel inviting to the public. The policies state, in part, that "all bayfront development should be designed to enhance the pleasure of the user or viewer of the Bay," and "maximum efforts should be made to provide, enhance, or preserve views of the Bay and shoreline" (Policy 2); "structures and facilities that do not take advantage of or visually complement the Bay should be located and designed so as not to impact visually on the Bay and shoreline" (Policy 4); "access routes to Bay crossings should be designed so as to orient the traveler to the Bay" and "guardrails, fences, landscaping, and other structures related to such routes should be designed and located so as to maintain and to take advantage of Bay views" (Policy 7); and "views of the Bay from vista points and from roads should be maintained by appropriate arrangements and heights of all developments and landscaping between the view areas and the water" (Policy 14).

The construction of numerous residential buildings could drastically change the look and feel of the surrounding areas. Although the NOP does not state the exact location of the residential buildings, it is likely that the siting of large residential buildings near the shoreline will affect Bay view corridors. Thus, the EIR should evaluate whether the proposed development would have an adverse effect on scenic vistas and physical and visual public access to the Bay and shoreline.

4. **RECREATION**

The Bay Plan's Recreation policies state, in part, that "diverse and accessible water-oriented recreational facilities, such as marinas, launch ramps, beaches, and fishing piers, should be provided to meet the needs of a growing and diversifying population" (Policy 1). The EIR should consider the possible impacts the project may have on existing public access spaces nearby, including a BCDC designated Water Access Point in Brickyard Park and an approximately 1-mile segment of the Bay Trail. The Bay Trail runs along the shoreline adjacent to Parcel A, and along Seminary Drive adjacent to Parcel B's eastern border. These segments of the trail can be viewed at https://baytrail.org/baytrailmap.html.

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

The NOP does not indicate whether any part of the 70 percent of the project area that is reserved for open space, athletic fields, paths and plazas will be open to the public. The EIR should map these facilities, determine the number of people they can accommodate and what, if any, part of these proposed facilities will be open to the public, and discuss the impact that public interaction with these facilities will have on the neighborhood. This will aid BCDC in determining whether the project will invite or discourage the public from venturing towards the shoreline from the nearest public thoroughfare.

As a matter of course, the construction of a preschool, fitness center, residential care facility, and apartment complex will bring more people to the Strawberry area. The EIR should therefore project the number of new residents, workers, customers, and other users expected at the site, their impact on existing public access areas, and evaluate whether the proposed new public access areas will accommodate these users and/or mitigate for these impacts.

Additionally, given the large quantity of assisted care housing for elderly residents, the EIR should consider the accessibility of public spaces within and adjacent to the project sites. The Bay Plan's Public Access Policy 8 states, in part, that public access improvements "should provide barrier free access for persons with disabilities, […] include an ongoing maintenance program, and should be identified with appropriate signs." For purposes of evaluating the accessibility of public access provisions, the EIR should also refer to California Building Code (CBC) Chapter 11B, Division 4 standards for accessible routes.

Providing this information will aid the Commission in determining whether the public access proposed with the project is the maximum feasible and consistent with the project.

5. **GEOLOGY AND SOILS**

The McAteer-Petris Act defines fill as "earth or any other substance or material, including pilings or structures placed on pilings, and structures floating at some or all times and moored for extended periods, such as houseboats and floating docks" (CGC § 66632). It is unclear from the NOP if the proposed project would require any filling of the Bay, or whether any portion of the proposed project would be taking place on fill. If, however, the project does involve fill, the preparers should keep in mind the Bay Plan's Safety of Fills finding that "hazards exist on the poor soils throughout the Bay Area, including soft natural soils, steep slopes, earthquake fault zones, and extensively graded areas," and that in order to "reduce risk of life and damage to property, special consideration must be given to construction on filled lands in San Francisco Bay" (Finding 1).

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

The EIR should clearly state whether any aspect of the project involves fill, map those locations, and identify the materials to be used and the purpose for which they are to be used. The impact analysis of proposed fill should include discussion of the structural integrity of all proposed development given the seismological risk involved. Additionally, to aid BCDC's efforts to understand the sediment composition of the Bay and shoreline, the EIR should provide as much information on the existing soil in the project area as possible.

6. **HAZARDS AND HAZARDOUS MATERIALS**

The Bay Plan's Safety of Fills policies state that even where "the Bay Plan indicates that a fill may be permissible, no fill or building should be constructed if hazards cannot be overcome adequately for the intended use in accordance with the criteria prescribed by the Engineering Criteria Review Board" (Policy 2). The Bay Plan's Water Quality policies also have relevance to the EIR's hazards and hazardous materials discussion. New projects are required to be "sited, designed, constructed, and maintained to prevent or […] minimize the discharge of pollutants in the Bay" by controlling pollutant sources at the project site, using appropriate construction materials, and applying best management practices (Policy 3).

The EIR should identify whether any portions of the project site are polluted with toxic or hazardous substances, any anticipated effects associated with such pollution, and the role other regulatory agencies, including the State and Regional water boards and the Department of Toxic Substances Control, will take in reviewing and approving the project. In addition to Bay-related hazards, the EIR should also address include air pollution and refuse. Given that any increase in population will likely be accompanied by an increase in automobile traffic, the EIR should address the impact of projected traffic on pollution, and whether such pollution may have a negative impact on wildlife in the area. Furthermore, as the assisted living and memory care apartments may include medical facilities or involve storage, dispensation, or disposal of medical supplies and waste, the EIR should discuss the impacts of potentially toxic medical supplies and biohazards. The EIR should also identify the provision of waste disposal systems for such chemical hazards and evaluate their safety and efficacy.

7. **HYDROLOGY AND WATER QUALITY**

The EIR's hydrology and water quality analysis should refer to the following Bay Plan policies when considering the potential significance of any impacts.

Water Quality. Water Quality policies in the Bay Plan include requirements that water pollution be "prevented to the greatest extent feasible" (Policy 1); water quality "should be maintained at a level that will support and promote the beneficial uses of the Bay as identified in the Regional Water Quality Control Board's Water Quality Control Plan" and "should be protected from all harmful or potentially harmful pollutants" (Policy 2); "new

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

projects should be sited, designed, constructed, and maintained to prevent or minimize the discharge of pollutants into the Bay" (Policy 3); projects in an area polluted with toxic or hazardous substances "will not cause harm to the public, to Bay resources, or to the beneficial uses of the Bay" (Policy 4); and, to protect the Bay from nonpoint source pollution, "new development should be sited and designed consistent with standards in municipal stormwater permits and State and regional stormwater management guidelines," and "to offset impacts from increased impervious areas and land disturbances" (Policy 6).

The proposed facilities – especially the residential developments – will require plumbing and wastewater infrastructure to support the large number of residents and visitors they will likely induce to the project sites. The EIR should map and describe sewer and other wastewater systems that will serve the proposed developments and clearly identify the location and expected contents of any drains that empty into the Bay. The EIR should also determine the capacity and vulnerability of these systems, and discuss the impacts of possible damage, overload, and malfunction, especially where such events might result in flooding. This will aid BCDC in assessing the risk of contamination in the Bay and safety hazards for people and wildlife in the Bay and on the shoreline.

Climate Change. Although climate change is not a requisite consideration in CEQA analyses, BCDC highly recommends that the EIR investigate the probability and impact of sea level rise as a matter of hydrology and water quality, and to consider how sea level rise may affect the significance of impacts in other topic areas, such as those related to geological hazards. Sea level rise threatens water quality not only through the release of contaminants into shoreline developments by overland flooding, but also through groundwater contamination caused by saltwater incursions into fresh groundwater reservoirs.

The Bay Plan's Climate Change policies require shoreline projects to provide a risk assessment by a qualified engineer that takes into account "the best estimates of future sea level rise" and current and planned flood protection (Policy 2); projects within areas determined through a risk assessment to be "vulnerable to future shoreline flooding that threatens public safety […] should be designed to be resilient to a mid-century sea level rise projection" (Policy 3); and if a proposed project is likely to remain in place longer than mid-century, "an adaptive management plan should be developed to address long-term impacts […] using the best available science-based projection for sea level rise at the end of the century" (Policy 3). As of May 2021, the best available science-based projections for sea level rise can be found in the State of California's 2018 Sea-Level Rise Guidance, available at: http://www.opc.ca.gov/webmaster/ftp/pdf/agenda_items/20180314/Item3_Exhibit-A_OPC_SLR_Guidance-rd3.pdf.

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

The EIR should also determine the locations of possible groundwater incursions, and analyze the impact of saline groundwater rise on the level and quality of fresh groundwater and the efficacy of possible prevention and mitigation methods (e.g., groundwater barriers).

Flooding. The Bay Plan's Safety of Fills policies state, in part, that the project should be "properly engineered to provide erosion control and flood protection for the expected life of the project based on a 100-year flood event that takes future sea level rise into account, by 'professionals knowledgeable of the Commission's concerns, such as civil engineers experienced in coastal processes'" (Policy 1); "authorized protective projects should be regularly maintained according to a long-term maintenance program to assure that the shoreline will be protected from tidal erosion and flooding" (Policy 4); "shoreline protection projects should include components to retain safe and convenient water access, for activities such as fishing, swimming, and boating" (Policy 6), and "all contamination remediation projects in the Bay or along the Bay shoreline should integrate the best available science on sea level rise, storm surge, and associated groundwater level changes into the project design in order to protect human and ecological health by preventing the mobilization of contaminants into the environment" (Policy 8).

The EIR should discuss the impact of the project on water quality in the Bay and shoreline areas, and their effectiveness against flooding from sea level rise, groundwater rise, runoff, and flash floods. To this end, the EIR discussion of flood hazards and the potential for flooding to result in the release of pollutants should include a description of the project site's existing and future vulnerability to inundation and storm surge. This description should identify the Mean Higher High Water line, the 100-year flood elevation, mid-and end of century sea level projections using the 2018 State of California Sea Level Rise Guidance, anticipated site-specific storm surge effects, and a preliminary assessment of the proposed project's vulnerability to future flooding and sea level rise. In addition, the EIR should describe how the project has been designed to tolerate, adapt to, and manage shoreline flooding at the site to ensure the project is resilient to mid-century sea level rise projections, and, if it is likely to remain in place longer than mid-century, how it can adapt to conditions at the end of the century.

Resources available to assist the preparers of the EIR in the above assessments include Adapting to Rising Tides (ART) maps and data products developed by BCDC, including the Bay Shoreline Flood Explorer (http://www.adaptingtorisingtides.org/maps-and-data-products), and the Sea Level Rise and Coastal Flooding Impacts Viewer developed by NOAA Coastal Services Center in collaboration with a number of other agencies and organizations (https://coast.noaa.gov/slr).

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

8. **UTILITIES AND SERVICE SYSTEMS**

The introduction of new residential housing units may require construction or expansion of the existing infrastructure for utilities and service systems to meet the needs of increased population. The Bay Plan's Other Uses of the Bay and Shoreline policies state, in part, that "high voltage transmission lines should be placed in the Bay only when there is no reasonable alternative" (Policy 5); power distribution and telephone lines should either be placed underground [or in an attractive, streamlined overhead arrangement] in any new residential, commercial, public, or view area near the shores of the Bay (Policy 6); and sewage treatment or wastewater reclamation plants, power plants and pipeline terminal and distribution facilities may be located near the shoreline if they "do not interfere with and are not incompatible with residential, recreational, or other public uses of the Bay and shoreline" (Policies 7, 9, and 13).

The EIR should map and determine the current capacity of any existing utilities and service systems in the project area. The EIR should also map any proposed additions, removals, or improvements to these systems, analyze their safety and capacity, and whether they comply with the Bay Plan's policies on where and how such facilities should be installed. This will aid BCDC in determining the impact they might have on appearance and public access.

Additionally, the EIR should project the output of waste produced by operations in the new developments, and identify the waste disposal services that will be used to manage that output. If the assisted living units operate in any way as a healthcare facility which might introduce hazardous medical waste to the area, the EIR should discuss the capacity of those services for handing such waste.

9. **TRANSPORTATION**

The Bay Plan's Transportation policies address transportation as a matter of reducing fill, providing that "county congestion management agencies and other public and private transportation authorities should avoid planning or funding roads that would require fill in the Bay and certain waterways" (Policy 1); and that transportation projects on the Bay shoreline "should be designed to maintain and enhance visual and physical access to the Bay and along the Bay shoreline" and "should include pedestrian and bicycle paths that will either be a part of the Bay Trail or connect the Bay Trail with other regional and community trails" (Policy 4).

The Bay Plan also addresses transportation issues in its Public Access policies. Under the McAteer-Petris Act, the project must provide "maximum feasible public access, consistent with a proposed project." The Bay Plan's Public Access Policies expound on this directive, stating, in part, that "maximum feasible access to and along the waterfront and on any permitted fills should be provided in and through every new development in the Bay or on the shoreline" (Policy 2); "access to and along the

DocuSign Envelope ID: 3B1912E7-84EA-4D98-B016-167932BD30EA

waterfront should be provided by walkways, trails, or other appropriate means and connect to the nearest public thoroughfare where convenient parking or public transportation may be available" (Policy 10); "roads near the edge of the water should be designed as scenic parkways for slow-moving, principally recreational traffic" and "should maintain and enhance visual access for the traveler" (Policy 11); and that all such access should be sited, designed, and managed "to prevent significant adverse effects on wildlife" (Policy 4) and "avoid significant adverse impacts from sea level rise and shoreline flooding" (Policy 6).

The EIR should discuss how the proposed project's siting and the projected influx of new people to the area will impact traffic in the area, and how that traffic will impact air quality and noise. The EIR should discuss changes to road design and traffic patterns, identifying any areas expected to experience congestion or high speeds. In particular, the EIR should discuss the potential for construction vehicles and commuter traffic to impact users of the Bay Trail segment. If the project's site access improvements would affect the configuration of Seminary Drive, the EIR should discuss whether those improvements would pose a safety hazard for users of the Bay Trail segment. If the analysis shows that the project would result in increased traffic congestion along the Bay Trail, the EIR should discuss whether the increase would pose a safety hazard for users of the trail or otherwise affect its usability.

The EIR should also map existing and proposed parking spaces, identify where and when these parking accommodations are available to the public, and determine whether they meet CBC 11-B standards for accessibility. This will aid BCDC in determining whether the project provides adequate public access accommodations commensurate with the projected increase in population and vehicle traffic.

We appreciate your attention to the topics discussed above and for the opportunity to make the above comments on the scope of the EIR. If you have any questions or concerns regarding this matter, please do not hesitate to contact me at (415)-352-3654 or by email at shruti.sinha@bcdc.ca.gov.

Sincerely,

Subject: Fwd: North Coast Land Holdings Community Plan Amendment/Master Plan Amendment/Design Review/Tree Removal Permit/Master Use Permit/Tentative Map on the Golden Gate Baptist Seminary property Update

I have been a resident of Strawberry for 44 years.

This incredible piece of property MUST HAVE MAXIMUM NUMBER of low cost and affordable homes for the many people who work in Marin and need them (teachers, medical workers, caregivers, fire fighters, postal workers.....you know what I mean.
The development plan should not be determined by a few nearby neighbors.

PLEASE MAKE IT HAPPEN.

Thank you

Barbara Rowe

Subject: North Coast Land Holdings Community Plan Amendment/Master Plan Amendment/Design Review/Tree Removal Permit/Master Use Permit/Tentative Map on the Golden Gate Baptist Seminary property Update

Greetings Subscriber,
This is to announce that the Notice of Preparation of an Environmental Impact Report for the North Coast Land Holdings, LLC Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit (Project ID P1490) has been released and is available to review online. Please review the environmental project webpage through this link for more information. The Planning project page can also be viewed through this link. If you wish to comment during the Notice of Preparation (NOP) comment period we will accept written comments about the scope of the environmental report until the close of the NOP comment period at **4:00 p.m.** on **Monday, October 26, 2020**. Commenters are advised to mail written comments postmarked on or before October 26, 2020 to the attention of Rachel Reid, Environmental Planning Manager at 3501 Civic Center Drive, Suite 308, San Rafael, CA 94903. Comments can also be submitted via email to envplanning@marincounty.org before the end of the comment period deadline. Please visit the above linked webpages for more information. If you disagree with the foregoing determination regarding environmental review of the project, you may appeal it to the Board of Supervisors. A Petition for Appeal and a $1,408.00 filing fee must be submitted in the Community Development Agency - Planning Division, Room 308, Civic Center, San Rafael, within five business days, or no later than 4:00 P.M., Friday, October 2, 2020.

If you are a person with a disability and require an accommodation, copies of documents are available in alternative formats upon request by calling (415) 473-4381 (Voice), (415) 473-3232 (TDD/TTY), or by email.

As a 25 year resident of Strawberry, I am appalled to know that you are going ahead with the EIR.

The disregard for the Strawberry Design Review Board recommendation and Strawberry community input is shameful.

I am in complete support of Riley Hurd's letter of appeal to the Board of Supervisors, dated October 1, 2020.

OBJECTION AND OPPOSITION TO APPLICATION

Dear Michelle Levenson:

I, by and through my Trust, am the owner of residential real property located entirely within the unincorporated CDP of the County of Marin commonly known as Strawberry and/or Alto Strawberry, which is within the scope of Project No. P1490.

Without waiving any of the objections set forth below to the fatally defective purported Notice of Preparation of Environmental Impact Report ("Notice") I hereby OBJECT to the application of North Coast Land Holdings, LLC relative to the referenced project and further object to the preparation of the proposed environmental review and preparation of an Environmental Impact Report ("EIR").

First of all, I was not provided with proper or adequate notice of the application because, for the reasons I shall discuss below, the Notice I received was improperly addressed to me, inadequate and legally insufficient. I include herewith as Exhibit "A" a true copy of the document I received on Saturday September 24, 2020, purporting to be the Notice. Even though the Notice was allegedly mailed to me on September 25, 2020, I did not receive it in a timely manner because it was addressed to me at "160 Seminary Drive, Unit 3C, Mill Valley, California 94941." That is not now, nor has it ever been, my address for any purpose; I have no idea where that address and have never been there.

Next, the Notice states that the "comment period" for anyone choosing to offer comments on the proposal set forth in the Notice opens on September 25, 2020, the same day it was allegedly mailed. The Notice further states that the comment period closes on October 26, 2020. Inasmuch as the Notice was not mailed *before* the opening of the comment period (September 25, 2020), it is fatally defective because the full thirty day period for comment was not afforded.

Additionally, because the Notice was mailed to me at an incorrect address I was not provided with proper or timely notice of the proposed action, thus the Notice is fatally defective in that regard as well.

Moreover, the Notice is vague and uncertain. It does not adequately describe the scope of the project under consideration as it simply refers the reader to some vague and obscure websites for further vague and obscure information, which requires the reader to attempt to figure out, from vague and incomprehensible data, what the scope of the proposed project is. It also assumes everybody has online access so such vague and obscure information, a false assumption. Notwithstanding that, most lawyers could not figure this out; I doubt any non-lawyer who is not trained in urban planning would even have a clue. The absence of adequate information in the Notice is, in and of itself, a fatal defect that should bar the proposed review and ensuing EIR.

Next, the Notice also states that an administrative appeal may be taken "within five business days, or no later than 4:00 P.M., October 2, 2020." For the reasons stated above, it would have been impossible to file an appeal "within five business days" because (i) the defective Notice does not state when the "five business days" begins to run, and (ii) it was not properly addressed to me in any event. Additionally, the last day to file an appeal, according to the Notice, was October 2, 2020, twenty-four days *before* the close of the comment period of October 26, 2020, rendering the comment period a sham. Accordingly, the Notice is fatally defective in these respects as well.

Finally, the Notice is thus fatally defective for each, every, and all of the reasons set forth above. Accordingly, the County cannot proceed with the applicant's Application an EIR report or if one has been prepared is must be recalled, set aside and vacated.

IMPROPER CONDUCT BY COUNTY BUREAUCRATS

I am absolutely convinced that the way this matter has been handled by Marin staffers and the Board of Supervisors as well, and the decision to proceed with the review set forth in the Notice, the outcome was predetermined long before the Notice was sent out, and that the act of sending out the Notice was nothing more than a pretext, sham in the form of a lame and hollow attempt to give the mere appearance of compliance with the law solely for the purpose of providing some county bureaucrat with an empty and disingenuous means of stating they followed the law when in fact they had not.

It is absolutely crystal clear to me that the entire Board of Supervisors and the Marin Planning Department, collectively and individually, are not acting in good faith or in the best interests of those of us who elected the several members of the Board of Supervisors who are supposed to act in our best interest; rather, their goal and motive was, and it still is, to embrace, adopt and advance the flawed policy of the far-left state government in its quest to impose its far-left agenda on every city and county in this state. They accomplish this by enacting state laws to circumvent local zoning and other local controls in order to replace local controls with incompatible and inconsistent state controls thereby usurping local control and subordinating the rights of homeowners and businesses to those of the unfortunate ranks of the homeless population. The state's way of handling the unfortunate homeless crisis is to simply shove it down our throats without regard to local needs and desires. There are plenty of venues throughout this state, such as the Central Valley, that are better suited to handle the unfortunate homeless problem. But the state politicians, including Newsom, cannot get cities and counties to implement what they want. These politicians are not interested in examining such alternative venues because their goal is a total egalitarian state, so they simply enact state legislation to put the clamps on local governments' right to govern locally. Marin, which for decades has been a unique and very safe place to live, will soon be indistinguishable from San Francisco with all the crime and blight that prevails there. This is a major concern of many, perhaps most, residents of Marin.

I am most hopeful that the horrible things that are now taking place in Marin will bring about major changes in the elected composition of every city council in Marin and the Marin Board of Supervisors as well so that those who are elected to hold office to represent us actually represent the interests of only the residents of Marin, not the entire state of California, and when the state attempts to usurp local power and shove down our throats problems occurring outside Marin we can at least be assured that our elected local officials will have our backs and will zealously defend our interests against the state.

Nothing contained herein is in any way intended to, nor should it be deemed as, a waiver of the defects discussed above as well as all rights and remedies I have or may have.

Very truly yours,

Re: North Coast Land Holdings Community Plan Amendment/Master Plan/Design Review/Master Use Permit/Tentative Map/Tree Removal Permit on the former Golden Gate Baptist Seminary property (P1490)

Dear Members of the Board of Supervisors,

I write to you as a past President of the Strawberry Point Homeowners Association. While I no longer speak for the HOA, I am confident my views reflect my fellow homeowners.

I consider myself neither naïve, nor particularly cynical, yet am astonished at the Planning Department decision to go ahead, again, with an environmental review of the North Coast Plan.

Thirty years ago, I had the honor to work with Al Aramburu and the Planning Department on a solution to long-standing issues in our community and was delighted in the thoughtfulness and professionalism of the Department. Yet this current decision leaves me incredulous. The Strawberry Design Review Board again unanimously rejected the North Coast Plan, given that it was even more intensive than the plan originally presented and rejected by your Board. And how can North Coast's simply lining out sections of our Community Plan possibly be acceptable?

In the intervening years between the 1953 adoption of the CUP, Strawberry Point was developed. Strawberry Spit was developed. Seminary Cove was built out. Homes were added on Chapel and Storer Drives. And throughout Strawberry, undeveloped lots were turned into homes. Meanwhile, the two roads leading in and out of Strawberry remain essentially as they were in 1953. Narrow and frequently congested. Occasionally impassable on East Strawberry when the elementary school is transitioning.

When Branson briefly considered moving into the Seminary property, its own traffic study indicated that it would need to take extreme measures to mitigate the additional traffic. And that was for a day school where carpooling was an option and where thoughts of going beyond 400 students was something for the far distant future, it at all.

In the experience of our 33 years in Strawberry, the Baptist Seminary never had more than a few hundred students on campus, and overwhelmingly they lived on site. To move to a 1,000 student (plus

staff) college, plus all of the additional non-student housing and recreational activities being proposed, this plan should be a non-starter.

What the thinking is of North Coast does make me feel cynical. Perhaps this is how things are done in Texas? Perhaps one of the wealthiest families in America believes it can buy whatever it wants? Perhaps it is believing that the residents' concerns of this unincorporated area served by a single member of the Board won't be taken seriously by the other members of your Board? I don't know.

However, I ask your Board to take into consideration the unanimous recommendation of the Strawberry Design Review Board and the points elaborated in the Appeal by Mr. Hurd and again reject the environmental review by the Planning Department.

Thank you for your time and consideration.

Regards,

-sd

Subject: NORTHCAL EIR PREPAREDNESS

Paul Kayfetz would like information about:
.
337 to 546 townhouses, a quarter of a million square foot set of buildings for 150 seniors with attendants, and several business structures are proposed.

Not included in the Environmental Review is the claimed existing right to also build and operate a 1000 student commuter college.

The 1000 students and 2000 staff -- not afforded on-campus housing -- would be looking for housing in Marin.

These 1200 individuals, some with thus would be displacing that many others seeking Marin housing.

Or, they would be added to the bridge traffic in the morning and afternoon rush hours.

A primary reason for the Appeal in front of the Supervisors on November 10 is that the College and its 1200 person housing/traffic impact are excluded from the Project Environmental Review.

OBJECTION AND OPPOSITION TO APPLICATION

Dear Michelle Levenson:

I, by and through my Trust, am the owner of residential real property located entirely within the unincorporated CDP of the County of Marin commonly known as Strawberry and/or Alto Strawberry, which is within the scope of Project No. P1490.

Without waiving any of the objections set forth below to the fatally defective purported Notice of Preparation of Environmental Impact Report ("Notice") I hereby OBJECT to the application of North Coast Land Holdings, LLC relative to the referenced project and further object to the preparation of the proposed environmental review and preparation of an Environmental Impact Report ("EIR").

First of all, I was not provided with proper or adequate notice of the application because, for the reasons I shall discuss below, the Notice I received was improperly addressed to me, inadequate and legally insufficient. I include herewith as Exhibit "A" a true copy of the document I received on Saturday September 24, 2020, purporting to be the Notice. Even though the Notice was allegedly mailed to me on September 25, 2020, I did not receive it in a timely manner because it was addressed to me at "160 Seminary Drive, Unit 3C, Mill Valley, California 94941." That is not now, nor has it ever been, my address for any purpose; I have no idea where that address and have never been there.

COPY

Next, the Notice states that the "comment period" for anyone choosing to offer comments on the proposal set forth in the Notice opens on September 25, 2020, the same day it was allegedly mailed. The Notice further states that the comment period closes on October 26, 2020. Inasmuch as the Notice was not mailed *before* the opening of the comment period (September 25, 2020), it is fatally defective because the full thirty day period for comment was not afforded.

Additionally, because the Notice was mailed to me at an incorrect address I was not provided with proper or timely notice of the proposed action, thus the Notice is fatally defective in that regard as well.

Moreover, the Notice is vague and uncertain. It does not adequately describe the scope of the project under consideration as it simply refers the reader to some vague and obscure websites for further vague and obscure information, which requires the reader to attempt to figure out, from vague and incomprehensible data, what the scope of the proposed project is. It also assumes everybody has online access so such vague and obscure information, a false assumption. Notwithstanding that, most lawyers could not figure this out; I doubt any non-lawyer who is not trained in urban planning would even have a clue. The absence of adequate information in the Notice is, in and of itself, a fatal defect that should bar the proposed review and ensuing EIR.

Next, the Notice also states that an administrative appeal may be taken "within five business days, or no later than 4:00 P.M., October 2, 2020." For the reasons stated above, it would have been impossible to file an appeal "within five business days" because (i) the defective Notice does not state when the "five business days" begins to run, and (ii) it was not properly addressed to me in any event. Additionally, the last day to file an appeal, according to the Notice, was October 2, 2020, twenty-four days *before* the close of the comment period of October 26, 2020, rendering the comment period a sham. Accordingly, the Notice is fatally defective in these respects as well.

Finally, the Notice is thus fatally defective for each, every, and all of the reasons set forth above. Accordingly, the County cannot proceed with the applicant's Application an EIR report or if one has been prepared is must be recalled, set aside and vacated.

Mill Valley, CA

December 5, 2020

379 East Strawberry Drive
Mill Valley, CA 94941

From: Alexander L. Johnson, Strawberry Resident

To: Rachel Reid, Environmental Planning Manager, Country of Marin

Re: Revised Notice of Preparation and Extension of Comment Period for Environmental Impact Report for The North Coast Land Holdings. Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit project

Dear Planning Manger Reid:

To ensure the EIR is thorough and adequate, please consider the negative impact on Transportation safety and usability for bikers and pedestrians on East Strawberry Drive resulting from added vehicle traffic due to the proposed development.

In this area there are no sidewalks in many places nor safe shoulders. Increased vehicle traffic between Heron Drive and Strawberry Point Elementary school will put our residents and children at risk.

Any increase in risk of traffic fatalities due to this development should not be acceptable to our community.

Please see Exhibits (Photos) 1-5 which are attached on subsequent pages and are integral context to my comments below.

Background:

- The neighborhood is heavily residential.
- Strawberry Point Elementary School has 300+ students
- Many neighborhood students walk and bike to School for transportation using East Strawberry Drive.
- The roadway today has the lowest form of biker safety (Class III Bike Lane – Shared Roadway) – no barriers at all. Any additional traffic will increase hazards for pedestrians and bikers.
- There are no sidewalks on long sections of E. Strawberry Drive between the between Heron Drive (road outlet from Proposed North Coast Development) and Strawberry Point School, making the road even more dangerous.

Concerns for EIR to Address:

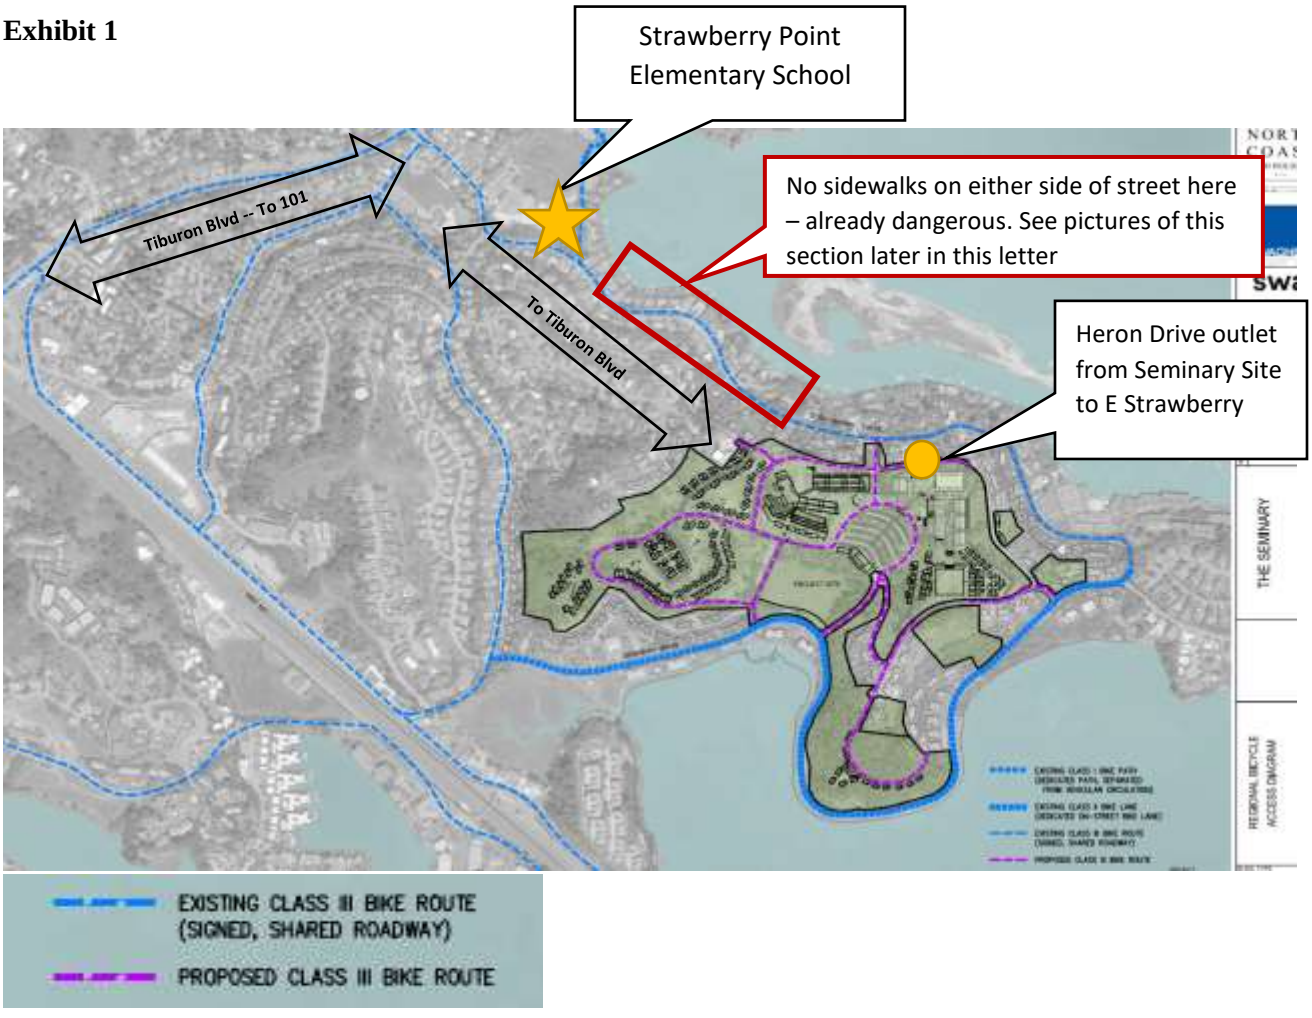
- **Added Risk of Injury on Street from More Cars.** Consider how the added traffic will create added risk to pedestrians and bikers on E. Strawberry Drive as there is already substantial risk cars hitting pedestrians.
- **Traffic Volumes Not Consistent With Road Capacity Or Intended Use**. Consider that E. Strawberry Drive is a small back road. If the proposed school and large number of general residences are built as proposed there will be substantial added vehicle traffic along E Strawberry Drive, and such traffic is not consistent with the intended use or capacity of the road as build today.

- **Shortcut will add even more traffic**. Consider the possibility that North Coast school and resident traffic will use East Strawberry as 'shortcut' to/from the Heron Drive / North Coast Development. The is because the easiest and fastest way to/ from 101S to/from the Seminary Development will be to use Tiburon Blvd Exit to East Strawberry Drive rather than go farther south and use the Seminary Exit off the 101S.
- **Intensity of Use of Road during Peak School Walking Hours.** Consider not just the amount of daily traffic increase, but the increase at specific hours. Given the proposed use of the development (large school and residences) a large percentage of new traffic trips will occur at the same time (7-9 AM, and 2-5 PM) as Strawberry Point Elementary children are walking and biking to and from school along the exact same route on East Strawberry Drive.
- **Reduced Use of Biking and Walking in Area.** Such increase in traffic will reduce usage of biking and walking on this and surrounding 'feeder streets' as it will become a high-risk method of transportation. This will lower value of living in the area

As a resident of Marin and Strawberry, please add these important transportation issues to the EIR for consideration and analysis.

Sincerely,
Alexander L. Johnson

Exhibit 1



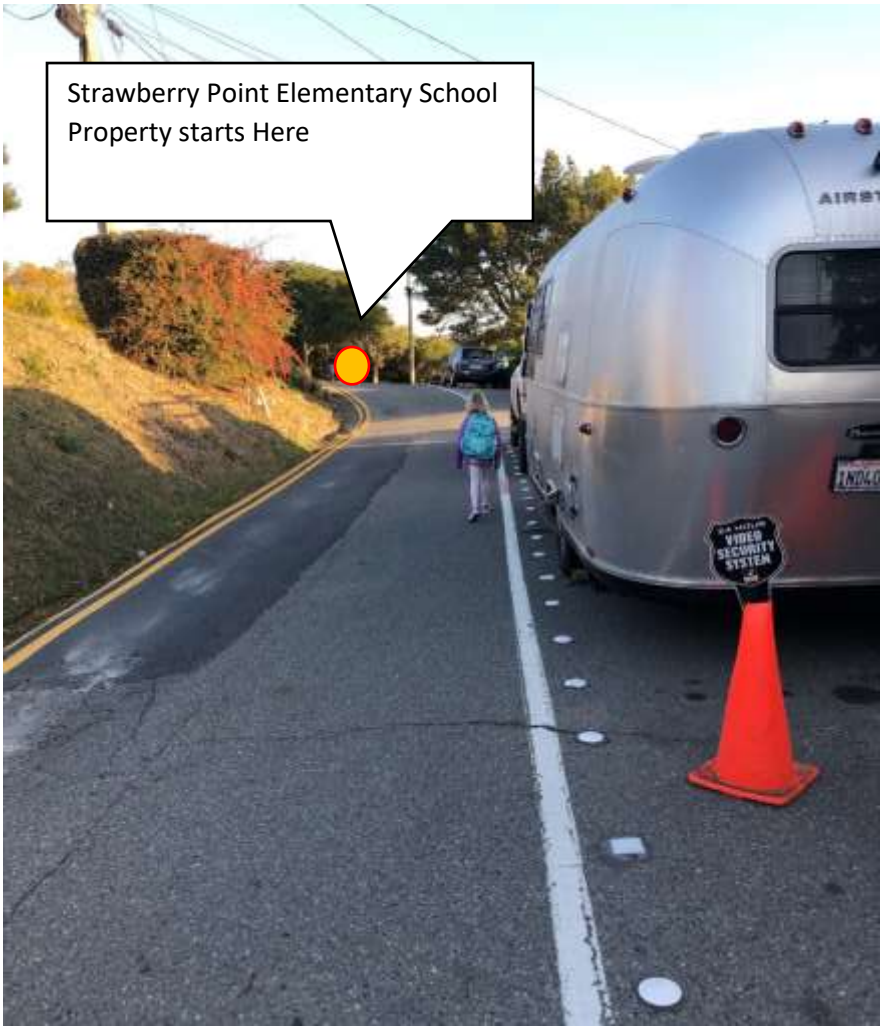
Exhibits 2-6 (All Pictures of East Strawberry Drive in Red Section on Map Above)

East Strawberry Drive

No sidewalks for pedestrians or dedicated bike lanes; walkers, & bikers

More cars would have high negative impact on safely here.

New Car Traffic to /from Heron Drive would use this road.



East Strawberry Drive: Blind Corner with limited sight lines

East Strawberry Drive: Example of typical roadway without roadway separation sidewalks on East Strawberry in this section

Children at Strawberry Point Elementary are encouraged to bike and walk to school as part of Marin County Initiatives.

This is a 'reward stamp' for a child walking to Strawberry Point Elementary by using the route shown earlier in the pictures.

Any increase in child risk of

Mill Valley, CA: Pedestrian Hit and Injured by Vehicle at Strawberry Drive and Cove Way

1 Sustains Minor Injuries in Mill Valley Pedestrian Accident at Strawberry Drive and Cove Way

Mill Valley, California (October 9, 2020) – The California Highway Patrol is investigating the circumstances that led to a pedestrian accident Thursday morning at an intersection in Mill Valley.

Mill Valley, CA: Pedestrian Hit and Injured by Vehicle at Strawberry Drive and Cove Way

The minor injury crash happened at the intersection of Strawberry Drive and Harbor Cove Way in Mill Valley at about 9:40 a.m.

As per the report, a white Nissan Rogue hit an individual at the Mill Valley intersection in unclear circumstances.

The initial report indicated that there were no footpaths or traffic control at the scene where the crash occurred.

Subject: North Coast Land Holding Application for GG Baptist Seminary Site

Ladies /Gentleman - I have lived 2 doors from the Seminary for over 36 years. (we live at 303 Reed Blvd almost across from the fire dept.) I CAN NOT believe what NC Land Holding is applying for. It can not be accepted. Over the years we have seen this property go through many changes. With all these changes the the biggest by far is the massive increase of traffic on Reed blvd. This traffic is not limited just to cars and trucks, but also residence with kids walking and riding their bikes. Some also have dogs. To this point, it took me over 2 years to have a long stretch of the curb painted red so "people" could not park there. Even so many do including worker's trucks. The red curbs stretches from the fire house past 300 Reed. My concern was not just with the increase of traffic coming and going into the seminary but MAINLY so the FIRE TRUCKS can get out of their station for their constant emergencies. Even with the new red curbs, It is amazing how often there are issues. So fare so good!!!!!! Trouble is just around the corner. One other point on is issue: not recently I was driving from Strawberry shopping center to my home. Some one passed me going to the seminary!!!!! It blew me away.

I have followed the different possible options for this property. I had a few of the property "tours" from different developers. First of all, I never trusted any of them. I did trust what The Branson School proposed to do. Our son went there and we know the school very well. However even that option would have had SO many issues. We are glad that never worked out. I can not image how this property could have low income housing, a large student body, pre school, fitness center , etc etc.. The impact on the overall environment would be so tragic. The traffic issues would be incredible and should not be allowed. The NC Landing is "blowing smoke". I have had too many dealings with developers over the years. My wife are 76 and not any smarter than other.....we have just had more experience in our life.

You are welcome to call us. My cell is (415) 328-5913 Please do not hesitate.

Respectfully submitted,
Don Newhouse

Subject: Important information regarding the NCLH application for the Seminary

Dear Tom and esteemed others,

Attached please find an important letter regarding the seminary property. I understand it is 6-pages long, but I would ask that you pay it special attention.

This letter is not simply a regurgitation of old arguments, it is the result of countless hours of research of old minutes, documents, and the law. We have determined that the now-expired Master Plan for the property superseded the old CUP for the Seminary. What this means is that the applicant needs a new CUP if they want to run a school. This isn't actually that surprising given that the old permit was for a self-contained seminary, but we now have direct proof of this fact.

This also explains why the EIR process has been so cumbersome. The missing details on the school are preventing any type of meaningful review that would inform the County decisionmakers. You can't analyze a project if the data on the biggest part just isn't provided.

Thank you for your attention to this matter, and please consider the letter a comment regarding the EIR NOP, as well as the merits, and include it in the administrative record.

Thank you,

Riley F. Hurd III, Esq.

Re: North Coast Land Holdings (P1490) -- New CUP required for educational use

Dear Mr. Lai:

Our office continues to represent the Seminary Neighborhood Association in connection with North Coast Land Holdings' proposal to redevelop the old Seminary site. This letter is regarding a critical missing component of the application currently on file with the County.

Specifically, if NCLH seeks an educational use at the property, a new CUP for that use is required. The 1953 Use Permit allowing a self-contained seminary to operate at the property was superseded by the approval of a 1984 Master Plan for the site. When the Master Plan expired, so did the right to operate an educational use. Accordingly, in order for the current application to be complete, it must also include a request for a Use Permit for a school, and clearly describe the operational characteristics of said school such that there can be meaningful environmental review, as well as an informed consideration of the required CUP findings.

Background

The Golden Gate Baptist Theological Seminary ("GGBTS") bought the Strawberry property in September of 1953. In October of 1953, the GGBTS obtained an initial CUP from the County that allowed for a very specific use: "**a Theological Seminary and dormitories and other building incidental to such use**."

USE PERMIT

Under the provisions of Section 20 of Ord. No. 264, the Zoning Ordinance of the County of Marin, State of California.

A USE PERMIT is hereby granted authorizing Edward D. Landels
(Name of person)
to permit the construction of a Theological Seminary and dormitories and xxx other buildings incidental to such use, subject to the attached con-
(Use of land, building or structure proposed to be conducted) dition.

The record for the CUP indicates that there were specific operational characteristics that were a part of the Seminary's application, and that a single initial condition of approval was also placed on the CUP.

On October 6, 1953, the Planning Director for the County wrote a staff report for the Board of Supervisors in advance of their consideration of the Seminary's Use Permit. This report set forth a set of six "general facts" regarding the application. In summary, the general facts about the application were as follows:

1. The property would be developed as a "self-contained unit."
2. A buffer of "recreational open land" would surround the entire property.
3. There would be approximately 1,000 students, and **all of the students would be housed on-site**. Married students would live in on-site apartments, and single students would live in on-site dorms.
4. The community supported the presence of a post-graduate institution.
5. The community liked that the school would pay its fair share to local service districts.
6. Further review of a development plan for the property would be needed to ensure an appropriate layout of buildings on the site.

The conclusion of the October 6, 1953, staff report noted that the Planning Commission voted to recommend that the Board of Supervisors approve the CUP **"as above set forth,"** on the condition that the Seminary come back to the Commission for approval of a development plan for the property.

The Board of Supervisors then approved the application, **inclusive of its details regarding housing, open space, and enrollment,** and did impose the condition that "prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission."

After approval of the initial 1953 CUP, GGBTS spent years developing a campus plan and returning to the Planning Commission for what the minutes repeatedly describe as **"Reconsideration of Use Permit."** The record is clear that many conditions beyond the sole original condition were added to the CUP over the years. For example, on July 29, 1957, a hearing was held regarding "**reconsideration of original use permit conditions**." At this hearing, a condition regarding the construction of one of the residences on the Seminary property was amended (i.e. the condition **already existed**, so clearly more conditions were added beyond the first one). The CUP, and its conditions, evolved as the Campus Plan was developed, and new and different conditions were added.

On October 28, 1957, another use permit condition was amended regarding the dedication of West Seminary Drive. Even on April 3, 1958, the Planning Commission was holding a hearing for the GGBTS project labeled "**reconsideration of use permit conditions**." Clearly, the original condition to the CUP that the applicants return to the Planning Commission for approval of their development plan led to a much more robust and evolved set of conditions and an ultimate CUP allowing for the construction of the project.

Why does all of this matter?

Because, in the early 1980's, GGBTS applied for a Master Plan for the entire property in order to allow for more development. The narrative in this Master Plan indicates that, at the time, GGBTS felt it had a vested right in its existing CUP, and therefore a Master Plan was not necessary for further development. However, the Master Plan itself states that **GGBTS ultimately decided not to try and rely on any allegedly remaining vested rights, and instead applied for, and fully participated in, the Master Plan process.** The Master Plan was eventually approved by the County Board of Supervisors in March of 1984.

Condition 19 of the Master Plan stated the following:

> **"With the approval of this Master Plan, the previously approved 1959 Campus Plan Use Permit shall become null and void and of no further effect or benefit."**

The Master Plan is unequivocal that it became the governing entitlement document for the property, and that the CUP, as amended by the many hearings through 1959, was now null and void.

However, when asked about this specific language, we were informed by County staff that the term "1959 Campus Plan Use Permit" was not referring to the use permit for the property, but instead to an approval for a roadway. Only recently have we actually been provided with the document that the County claimed was nullified by the Master Plan, and it simply is not, and cannot be, the referenced "1959 Campus Plan Use Permit."

Instead, what the County provided was a document entitled "**Improvement Agreement** Under Conditional Use Permit." Just as it sounds, this document is an improvement agreement by which the GGBTS agrees to dedicate and bond a roadway, which was a condition of its amended CUP. All throughout the Improvement Agreement there are specific references to the actual use permit that required the improvement agreement. Nearly all of the WHEREAS sections of the Improvement Agreement reference the Use Permit granted to GGBTS, and that the Improvement Agreement is being entered into as a condition of said use permit. Despite further requests, the County has failed/refused to provide the actual ultimate CUP referenced time and again in years of minutes.

It is unclear how or why the County would ever assert that an Improvement Agreement was somehow the document deemed null and void by the Master Plan, when the Master Plan so clearly states it is replacing a 1959 Campus **Use Permit**. Unfortunately/mysteriously, the staff report for the BOS meeting where the Master Plan was approved has gone missing from the County files. There are multiple examples countywide of Master Plans in the 80's replacing Conditional Use Permits from the 50's and 60's. During this era, Master Plans were utilized as site-specific zoning, approving both **uses** and physical development. That's exactly what happened here. If the County is unaware of these examples, we are happy to provide specific references.

GGBTS ended up obtaining quite a windfall from the Master Plan, including a significant amount of market rate housing, which was supposedly going to finance future school infrastructure. Of course, we now know that the market rate housing was built and sold, but the needed campus improvements were never made.

Ultimately, on December 12, 2017, after many extensions, the Master Plan for the Seminary expired. When the Plan expired, the property reverted back to its traditional RMP zoning designation, which, pursuant to Table 2-3 in Code Section 22.10.030, **only allows educational uses with a conditional use permit**. Accordingly, if NCLH seeks to establish a new academic use at the property, a new Master Use Permit is required.

What if the 1953 Use Permit Still Applies?

It doesn't matter, **unless** NCLH is interested in running a self-contained seminary. While CUPs run with the land (unless nullified) -- "Subsequent owners of the land have no greater rights than those of the owner at the time the conditional use permit was issued." A use permit, "is both a grant of authority to use and a limitation on the authorized uses of the property." (*Sports Arenas Properties, Inc. v. City of San Diego* (1985) 40 Cal. 3d. 808, 815.) "Absence of conditions in the use permit does not mean that the permittee may make use of the property permitted neither by the use permit nor by the zoning ordinance without permit." (*Id.*) "A use permit "must be read **in the light of the application for it**, and when that is done, it is apparent that the terms of the permit are clear." (*Id.* at 815-16.)

Here, GGBTS applied for and was granted a CUP for a theological seminary and, pursuant to the cases cited above, the terms of the application as described by the Planning Director's report to the Board are tantamount to "conditions." Setting case law aside, it is clear that the terms of the application describe and control the use being approved. The applicant has stated *as nauseum* that they have a right to an enrollment level of 1,000 students. This number only comes from the project description, not from a particular condition. Specifically, the project description stated:

> "There would be approximately 1,000 students, and **all of the students would be housed on-site**. Married students would live in on-site apartments, and single students would live in on-site dorms."

So, any assertion of a right to 1,000 students cannot ignore the words immediately following that number, which clearly required all students to be housed on site. One cannot cherry pick only the project specifications they desire, while ignoring other specifics that may be limiting.

The difference between the community impacts of a seminary, versus the impacts of other types of schools, cannot be understated. It was these very differences that played a central part in the granting of the CUP in the first place (the self-contained nature of the Seminary carried the day).

Other types of school uses generate significantly more vehicle trips, noise, and other impacts, at a level far greater than the self-contained post-graduate institution contemplated in 1953. So, even if the voided CUP were somehow still valid, it would only allow for a theological seminary with on-campus housing, not any and every "school" type of use.

Conclusion

In order for the current application to be complete, it must include a request for a Use Permit for a school, and clearly describe the operational characteristics of said school such that there can be a meaningful environmental review, as well as an informed consideration of the required CUP findings. The current failure to provide **any information whatsoever** about the new school use, which is central to the property, and most significant in its impact, leaves a gaping hole in the application. It is this total lack of data that caused the Seminary Neighborhood Association to appeal the decision to start an EIR. Despite requests from the Board of Supervisors, and assurances from planning staff, there has yet to be any description of the new school use the applicant seeks to entitle. The County needs to hit pause until this information is provided.

Any entitlement or EIR without a school CUP will be null and void, and subject to legal challenge. Accordingly, it seems best for all involved that the school be described and analyzed.

Thank you.

Very Truly Yours,

Riley F. Hurd III

Attachments: water_supply_systems_capacity.pdf

Ladies/gentlemen:

I am writing as a former MMWD Board member and President to reflect my concern that MMWD does not have the continuously available water supply, critical distribution/transmission infrastructure, nor the pumping capacity to reliably supply potable water to its 61,900 service connections while at the same time being able to deliver the required instantaneous flow for fire suppression. The Paradise fires in 2018 should have taught us that it would not take more than 12 hours for all of Mt. Tamalpais to burn. Unfortunately, major fire suppression has never been a meaningful part of MMWD's demand/capacity analysis.

I have attached a U.S. Fire Administration report entitled "Water Supply Systems and Evaluation Methods" for your review and education. It addresses formulas for calculating appropriate capacity levels. I think you will find that current demand, even in non-drought years, exceeds responsible capacity levels. Building additional demand without substantially increasing water capacity is imprudent.

Please don't hesitate to contact me if you have any questions or require additional clarification.

Sincerely,

Richard L. Harris, Jr.

Acknowledgment

This project was performed by the Society of Fire Protection Engineers (SFPE) and was supported by the Department of Homeland Security's Science and Technology Directorate and the U.S. Fire Administration (USFA). SFPE is an engineering association for advancing the science and practice of fire protection engineering. Water supply is an important subject to the fire service, fire protection engineers, and city managers. These manuals are intended to provide a reference for concepts and terminology to facilitate communication and understanding between these organizations.

About the Author

Dr. Harry E. Hickey's career in fire protection spans more than 50 years. He taught Fire Protection Engineering at the University of Maryland for 26 years. He also has extensive experience in the fire services both as a firefighter, fire officer and Emergency Coordinator. His combination of municipal fire administration and fire protection engineering experience provides him with unique insight into the challenges of design and operation of municipal water supplies.

He received his Ph.D. in Public Administration from American University in Washington, DC. He has authored many book and articles including *Public Fire Safety, A Systems Approach*, *Fire Protection Hydraulics*, and two editions of *The Fire Suppression Rating Schedule Handbook*.

CHAPTER 1: Fundamental Considerations

Water for human consumption comes from one of two basic sources:

1) Water from a well to supply an individual residence, well water for farmstead properties, and well water for small public sector properties that include schools, public buildings, and small commercial enterprises.
2) Municipal water systems that provide potable water to a wide array of commercial property and domestic use buildings including apartments, condominiums, duplex housing, and single family dwellings.

This chapter uses the Washington, DC, Water System as an example in order to introduce concepts associated with a fundamental understanding of water distribution systems. This system was selected because it typifies many of the water systems in the United States that rely on water sources including rivers, lakes, and low-level water retention dams. Other water supply sources are examined under Topic 3 in this chapter.

Understanding the fundamentals of a municipal water supply delivery system is essential to closely examining the many features of a water system and the many options in designing a water delivery system. Chapter 1 provides a basic overview of:

- The Anatomy of a Water System
- The Need for a Continuously Available Water Supply
- Considerations for Establishing Municipal Water Supply Systems
- Classification of Water Supply Sources
- The Classification of Water Supply Systems

TOPIC 1: Anatomy of a Water System

The purpose of municipal water delivery systems is to transport potable water from a water treatment facility to residential consumers, for use as drinking water, water for cooking, water for sanitary conditions, and other water use in a domestic environment. Water supply also is essential for business and industry to operate in a municipal environment. Of no less importance is the need to supply water to properly located fire hydrants to provide the public with an effective level of fire protection. Municipal water systems also may need to provide water for special services that include street cleaning, the selling of water to contractors for erecting buildings, parks and recreation, and miscellaneous uses.

A water system has two primary requirements: First, it needs to deliver **adequate** amounts of water to meet consumer consumption requirements plus needed fire flow requirements. Second, the water system needs to be **reliable**; the required amount of water needs to be available 24 hours a day, 365 days a year.

Anatomy may be defined as "separating or dividing a function into parts for detailed examination." (1) A water supply system is analogous to the human circulatory system. The heart pumps blood through the arteries, veins, and capillaries to supply oxygen to all part of the body. A water pump supplies water through primary, secondary, and distributor water mains to supply water to consumers and for fire protection.

This section examines the functional components of the water system by tracking the water from the sources that feed the municipal water system to the water *tap*. The term *tap* is used in a generic sense to mean any reference point on the water distribution piping where a connection or tap is made to supply a lateral pipe to a domestic connection, a commercial connection, or a lateral line to a fire hydrant.

Washington, DC, has a very old water system that has been updated in many ways. It serves as an excellent example of a basic municipal water supply system. Variations to this system are reviewed later in this manual.

Every municipal water system has to have a water supply source that is both adequate and reliable for the city to be served. The primary water source of water for Washington, DC, is the Potomac River. With minor exceptions due to ice jams and flooding, this water supply has been reliable since before the Civil War. Water is fed to the city from intakes at Great Falls and Little Falls both by a gravity aqueduct and by a more modern pumping station. The aqueduct water serves residents of the District of Columbia, Arlington County, Virginia, and Falls Church, Virginia.

Figure 1-1 illustrates a progressive view of the water system. Two holding reservoirs supply water to a treatment plant that processes the water to remove impurities and adds chemicals to bring the water into compliance with the Environmental Protection Agency (EPA) regulations on *clean water* for drinking and commercial cooking. The actual water treatment process is discussed. The purified water, or *finished water*, then is pumped to several different storage tanks and storage basins around the city for release into the distribution system piping network on demand for consumer use or in the case of a working fire. Depending on the different elevations points throughout the city, additional pumping stations are provided to maintain adequate pressure in the water system during varying periods of consumer use or emergency waster supply demand requirements. Water flows from the storage locations through the primary, secondary, and distributor mains to supply service lines to individual water consumers and lateral lines to supply fire hydrants.

This simplified illustration tracks raw water that originated at the Potomac River through the treatment plant, the storage of water, and the movement of water through different sizes of water mains to service outlets throughout the city to supply consumer demands. At the same time, water in the street mains is maintained at adequate pressure to supply fire department pumpers that may need to take water from fire hydrant to suppress structural fires and handle other emergency situations.

Figure 1-2 illustrates eight basic steps that are used to produce a supply of potable water. These specific steps are associated with the treatment plant for the city of Washington, DC, and fit into the treatment facility portion of **Figure 1-1**. While this is a generally acceptable method of purifying water, it should be recognized that every water supply has its own specific requirements for establishing potability. Chapters 2 and 3 continue the discussion of processing water for consumer use and establishing water quality standards by the EPA.

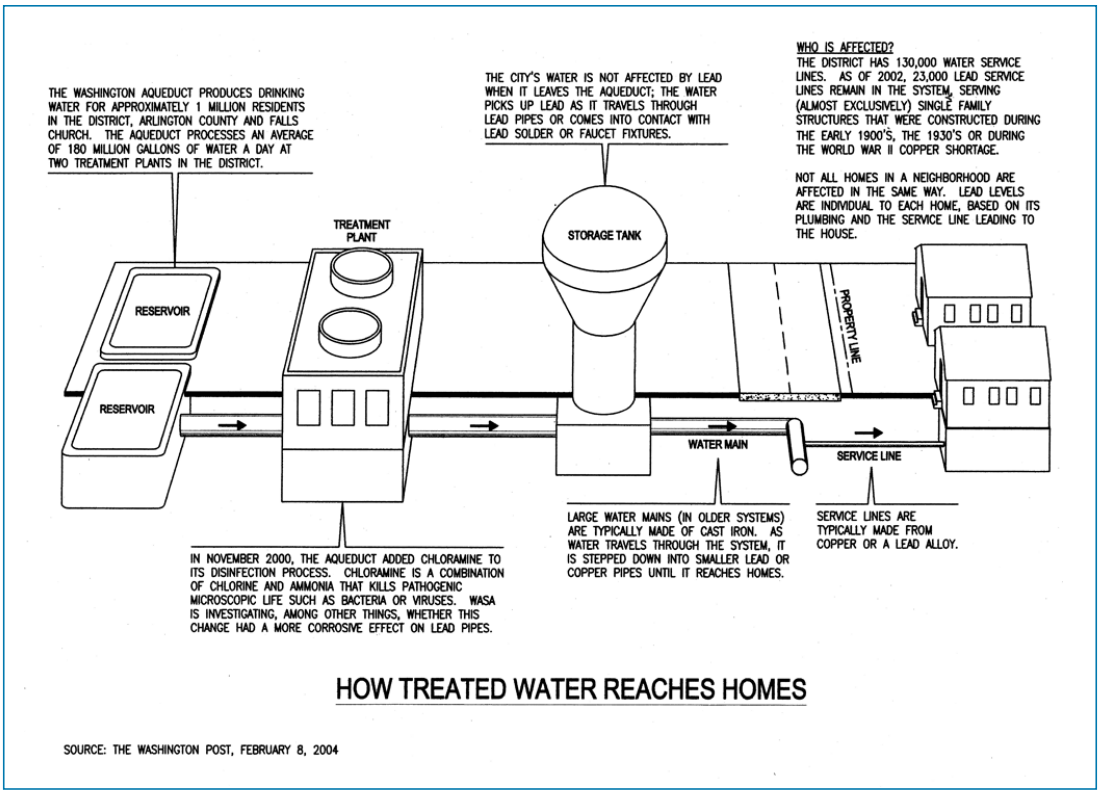

Figure 1-1: Features of a Small Community Water Distribution System

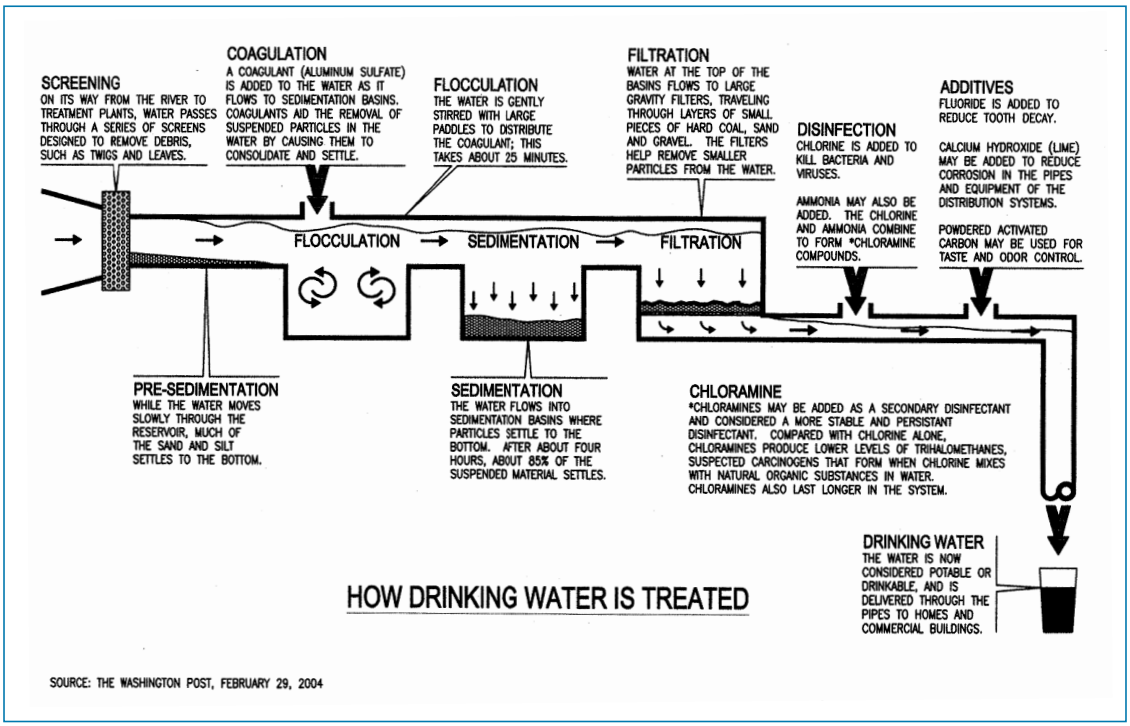

Figure 1-2: Features of a Minimum Size Community Water Distribution System

Step 1: Screening - Water passes through a series of screens designed to remove debris such as twigs, leaves, paper, stones, and other foreign matter. Screens are frequently removed for cleaning or are back-washed from high-pressure pumps to prevent clogging.

Step 2: Presedimentation - While the water moves slowly through each reservoir, much of the sand and silt settles to the bottom. Treatment lines and basins are shut down periodically during times of minimum domestic consumption for cleaning. This applies to the portions of the physical plant described in Steps 2 through 8.

Step 3: Coagulation - A coagulant, aluminum sulfate, is added to the water as it flows to sedimentation basins. Coagulants aid in the removal of suspended particles in the water by causing them to consolidate and settle.

Step 4: Flocculation - The water is gently stirred with large paddles to distribute the coagulant. This takes approximately 25 minutes.

Step 5: Sedimentation - The water flows into sedimentation basins where particles settle to the bottom. After about 4 hours, roughly 85 percent of the suspended material settles out.

Step 6: Filtration - Water at the top of the basins flow to large gravity filters, traveling through layers of small pieces of hard coal, sand, and gravel. The filters help remove smaller particles from the water.

Step 7: Disinfection - This may be accomplished by these methods:

- Chlorine is added to kill bacteria and viruses.
- Ammonia also is added.
- The chlorine and ammonia combine to form chloramines compounds.

Step 8: Additives - Depending on the quality of the water at this point, the following additives may be injected into the water stream to accomplish the stated benefits:

- Fluoride is added to reduce tooth decay.
- Calcium hydroxide is added to reduce corrosion in the pipes and equipment of the distribution system.

After processing, the water is considered potable or suitable for drinking and is delivered through the pipes to homes and businesses throughout the city. However, due to special conditions associated with the District of Columbia Water Delivery System, two other additives have been introduced into the water supply before it enters the water distribution system:

1) Chloramines were added recently as a secondary disinfectant because they were considered to be more stable and persistent compared to the chlorine alone. Chloramines produce lower levels of trihalomethanes, a suspected carcinogen that forms when chlorine mixes with the natural organic substances in water. Chloramines also are favored because the have a longer use expectancy time in the water supply without settling out.
2) The District of Columbia has experienced a severe problem of excessive traces of lead in the finished water from old lead-lined pipes in portions of the city. To counteract this problem, orthophosphates have been added to the drinking water to reduce the lead level. Orthophosphates form a protective coating on pipes to prevent lead from leaching into the water.

There are several different adaptations of the components of water systems in order to provide adequate water pressure throughout the entire water distribution system and to assure an adequate quantity of water to meet domestic consumption needs, fire protection needs, and special-use needs. Different arrangements for supplying municipal water, and the arrangements of water storage in municipal water systems are explored in Chapter 4.

Topic 2: Continuous Availability of Water Supply

A municipal water supply system cannot service its customers unless there is a continuous supply of water to meet domestic consumption needs in the broadest sense and water needs for structural fire protection. Water sources need to be selected carefully to make sure that this fundamental requirement is met. Two main factors that affect water supply selection are

1) Quality of water: Water must be treated or purified to meet Regulatory Requirements established by the EPA (United States Government). The requirements are divided into 2 categories:
   a. residential communities with populations not exceeding 3,000; and
   b. combined residential and commercial communities that serve a population demand over 3,000.

   Water quality standards are covered in Chapter 3.
2) Quantity of water: The quantity of water must be adequate to meet consumer consumption and fire-flow demands at any time of the day, day of week, and week of the year.

Maintaining a continuous or uninterrupted supply of water for municipal demands is a major challenge to many municipalities because of the following conditions:

- droughts;
- growing demands that cannot be met by the treatment plant;
- lack of adequate storage capacity;
- other communities drawing water from the same supply sources such as a lake or a river;
- a major commercial fire or wild land/urban interface fire that exhausts the water supply; and
- undetected underground leakage on the pipe distribution system.

A municipality must recognize that the quantity of available water needs to be such that maximum daily consumption demands are satisfied at all times, even during periods of drought or after years of community growth. The water delivery system needs to expand as the municipality expands.

Design Considerations

In the design and construction of community water systems, economics are extremely important. This dictates that the source of supply should be selected so that little maintenance for the operational factors will be required to furnish an adequate supply of water to the community. Even though surface water supplies such as lakes and rivers, with proper treatments, are by far the more suitable from the standpoint of adequacy, the use of surface water supply systems is confined to municipalities that have a water demand in excess of 75,000 gallons per day domestic consumption to be economically feasible. This translates to a community of about 300 residents with 12 commercial establishments, but with no manufacturing, and the ability to supply a fire flow of 500 gallons per minute (gpm) for 2 hours. This also means that ground water sources are suitable only for quite small communities typically found in more rural areas of the country.

There is an important exception to the above conclusions that ground water sources typically are limited to the very small communities. This assumes that a well site or a few well sites use well pumps to supply water directly into the distribution system after water treatment. Ground water sources can be used to pump water directly into holding basins, small reservoirs, ground-level storage tanks, or even elevated storage tanks where the amount of treated water in storage governs both the population served and the available water supply for fire protection. A southern city, which shall remain nameless, with a population

of approximately 75,000 obtains all its water from well sites and then pumps this water into storage which then supplies the distribution system upon demand. However, the price per thousand gallons of finished water is substantially higher than where surface water is used as a community water supply.

Ground Water

In the original planning of ground water supplies, little can be done about determining the chemical quality of the water because the water will be obtained from several well-defined and different water-bearing geological layers or strata. The chemical or mineral quality of the water contributed from each of these water-bearing formations or *aquifers* will be dependent on the dissolution of material within the formation. Therefore, water withdrawn from any ground water source will be a composite of these individual aquifers. The water quality can be determined by actual sampling and analysis of the completed wells. Local and State health departments, along with State departments of environmental conservation (DECs), will have general and helpful information on water quality within their jurisdiction from years of test data. Most State geologists and hydrologists also will have information on both quantity and quality of water within certain regions of their State. All such information is valuable, and should be obtained when considering ground water sources as either primary or secondary supply sources.

Ground water generally will be considered the most readily available source of water because it can be tapped from below the water table beneath the earth. In contrast, surface waters may not be readily available. In many cases, impounding reservoirs provide adequate water for large communities. The water then must be piped some distance to service the community. The quality of the water also may need to be considered when investigating surface waters because of pollution, which may render available water unusable for potable water supplies, even if complete treatment is provided.

Ground water is an integral part of the hydrological cycle of rain and evaporation of water between the earth's bodies of water and the vast moisture content of the atmosphere. This portion of the water cycle

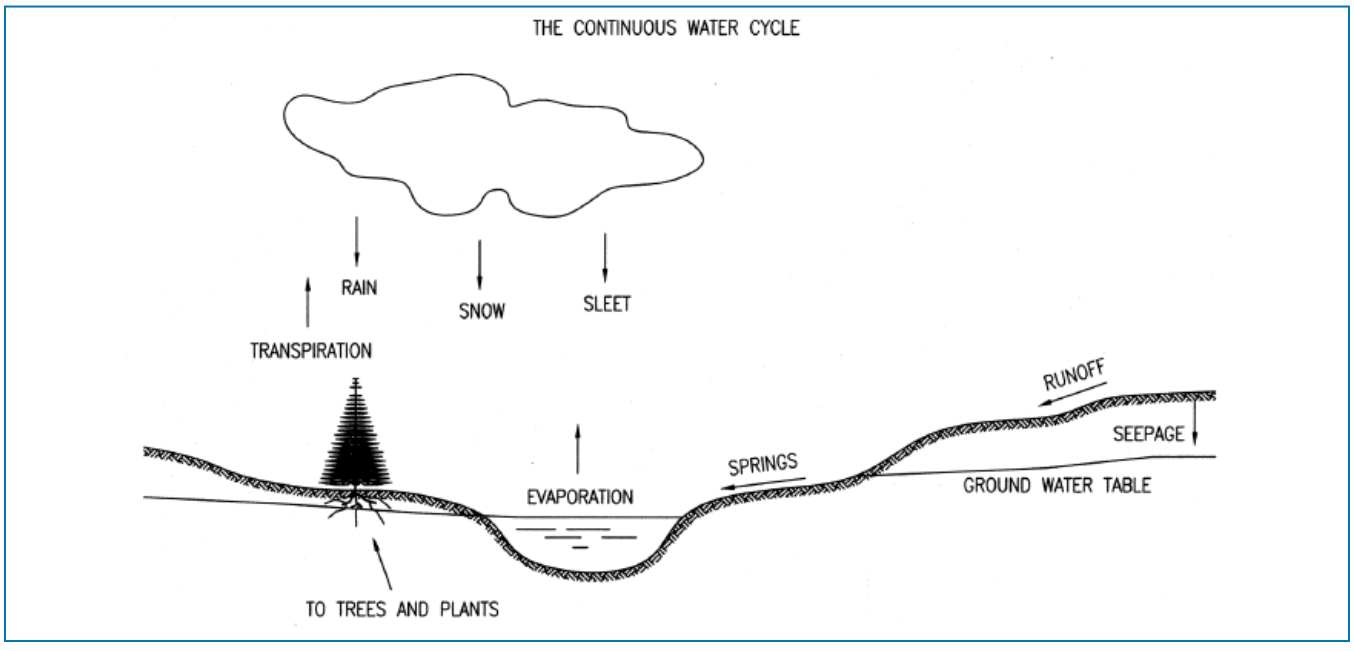

Figure 1-3: Typical Small City Distribution System

is illustrated in **Figure 1-3**. The water content of the atmosphere precipitates from small nuclei and falls to the earth in the form of rain, sleet, and snow. Approximately 70 percent of this precipitation finds its way into the streams, rivers, and finally to the oceans. The remaining 30 percent seeps into the earth and joins the ground water table. Some of this water returns as surface water from springs, flowing wells, etc. Some is used by plants and trees. The remaining portion joins the ground water and appears in layers known as aquifers. The seepage of this water through the earth depends on properties of the soil and rock formations under the earth's surface. Seepage is much greater through porous formations than through the impervious formations. Water seeps at much greater rates through fissures or cracks within the underlying formations. Ground water in the aquifers flows from higher elevations to lower elevations.

In the continuous cycle of water transportation from the earth to the atmosphere, water leaves the earth by evaporation from bodies of water and transpiration from plant life, and returns to the atmosphere where it is retained until again released in the form of rain, sleet, or snow. Replenishment of the ground water table may be accomplished to some extent by the location of ponds and lakes on watersheds. This phenomenon, relating to ponds and lakes, is reversible, as it supplements the ground water table during periods of drought and supplements sustaining flows during the wet season.

TOPIC 3: Municipal Water Supply Considerations

There are two fundamental considerations for both designing and evaluating municipal water supply systems. The first and most important is the quality of the water for human consumption—*drinking water*. The second is the quantity of water required.

In recent years the standards for water quality have been transferred from State health control agencies to the Federal government through two organizations:

1) The United Sates Public Health Service.
2) The EPA.

Water quality is the subject of Chapter 3. Some foundation concepts that relate to the other topic of Chapter 1 will be covered.

The quality of water provided by a municipal water system is based on three distinct characteristics, each of which may independently govern the desirable portability of the water. These characteristics are

1) **Physical quality of water**: The physical quality of water is the *appearance* of the water to the consumer. Physical quality includes the clearness of the water, taste, odor, and temperature. For water to be of attractive physical quality, it must be clear in appearance, or have low turbidity (less than 5.0 units of turbidity). The color of the water must be low in concentration so as not to distract the consumer's attention. Color should be less than 15.0 units of color.

   The water should be free of substances that may produce taste and odors upon the addition of chlorine, or upon use of water for cooking purposes. It also should be free of trouble-producing organisms such as aromatic oils of algae or higher bacteria.

   The temperature of the water will affect the attractiveness to the extent that use by consumers will decrease if the water is of extremely high temperature. Ground water temperatures vary slightly from around 40 to 55 °F (4 to 13 °C). Such temperature changes are dependent upon well depth and aboveground storage facilities. Surface water temperatures vary with seasonal change from around 40 to 80 °F (4 to 27 °C) with even higher temperatures in the deep South and Southwest.

2) **Bacterial quality of water**: The most important quality of water is that of bacteria content. In the early 20th century, disease outbreaks from water and food-borne bacteria were common throughout the world. Progress in bacteriology and water treatment engineering has all but eliminated outbreaks of water-borne communicable diseases in the United States. Chapters 2 and 3 address this issue in detail.

3) **Water chemistry**: Water is an excellent solvent, so it is not surprising that it picks up other chemicals. During this cycle of water movement, water picks up many solid and gaseous components. As the raindrops fall to the earth, they absorb gases. Most gases within the atmosphere are carbon, sulphur, and nitrogen compounds. The raindrops may also pick up particulate materials in the atmosphere. Many of the particulates are soluble in water and will dissolve within the raindrop.

   Other constituents are added to the water cycle from surface or ground water flow. Many and varied constituents are added to the water from dissolution of rocks and minerals which come in contact with the water and its movement. Of particular importance to the water supplier are the following constituents:

   ~ acidity and alkalinity;
   ~ calcium;
   ~ carbon compounds;
   ~ chlorides;
   ~ fluorides;
   ~ iron;
   ~ magnesium;
   ~ manganese;
   ~ nitrogen compounds;
   ~ silica; and
   ~ sulphur compounds.

   All of the above and others dissolved in water, determine the chemical quality of the water. Each of these constituents has threshold limits that are governed by the EPA, as discussed later.

Municipal Water System Demands

The demand for water supplied by a municipal water system has two driving components: 1) consumer consumption: the amount of water in gpm or gallons per day that is used by all of the taps on the water mains to supply single-family homes, multiple-family residences of all types, health care facilities, schools at all levels of education, commercial enterprises, industrial complexes, and adjunct uses (street cleaning; water fountains; watering public grass areas; shrubs, trees, and flowers; parks and recreation including swimming pools; and the sale of water to contractors for building roads, structures, etc.) and 2) an adequate and reliable water supply for fire protection. Each of these topics is considered in length in future chapters. However, some important terms associated with water demand need to be identified and operationally defined at this time because these terms will be used throughout both the *Concepts Manual* and the *Evaluation Manual* on Municipal Water Supply Systems.

Consumer consumption: Consumer consumption is assessed by determining the amount of water that actually is used by consumers, based on three levels of usage as follows:

1) **Average daily consumption (ADC)**: Each municipal water system services a defined population as determined by census figures. For example, assume that the municipality in question has a population of 22,570. It was determined from water meter readings that the average daily consumption was 137 gallons per person per day or the community consumed 22,570 × 137 gallons = 3,092,090 gallons. This means that on an average day, the water supply works need to have available nearly 3.1 million gallons of water over a 24-hour period, or an average delivery rate of 2,147 gpm of finished water delivered into the water supply distribution system.

   An ADC rate of 137 gallons per day per person is just below the 2003 American Water Works Association (AWWA) average of 141 gallons per day per person. The number reflects the total amount of water used in a day by the population and does not consider usage by different classes of occupancy including commerce and industry. AWWA reports this figure varies considerably by State and region. This information will be broken down in detail in Chapter 5.

2) **Maximum Daily Consumption (MDC)**: This value represents the single day within a year-long period on which the consumption rate was the highest. AWWA reports that the MDC rate for any given community is approximately 150 percent of the ADC rate. For the average community in the United States, this would be 221 gallons per day per person. The MDC rate often is reached in the summer months or during times of peak water demand for industrial use. For example, a company in a community of about 14,000 in western New York produces ketchup for a major retailer during the tomato season. In this case, the MDC rate went to 420 gallons per day per person, a rate of 4,083 gpm at the peak delivery time into the distribution system. When the plant was working at full capacity, a rate of only 130 gpm was available in the center of the municipality for fire protection.

3) **Instantaneous flow demand**: There are generally two peak periods in the day when consumption is greatest: between 7 a.m. to 9 a.m. and between 5 p.m. to 7 p.m.

   The water supply superintendent, or a person of equal responsibility, has to predict these rates in order to control the amount of water delivered to the water distribution system and water pressure such that any given tap can supply water at the desired pressure.

Fire flow demand: At any time, the municipal water supply system should be able to deliver needed fire flows to representative fire risks throughout the municipality from properly located fire hydrants.

An adequate amount of water is essential to confining, controlling, and extinguishing hostile fires in structures. The actual amount of water needed differs throughout a municipality, based on different building and occupant conditions. Therefore, water damage for structural fire protection must be determined at a number of different locations throughout a given municipality or fire protection district. These locations are selected by the Insurance Services Office, Inc. (ISO), to represent typical fire risks, including residential, commercial, mercantile, institutional, and industrial properties for insurance rating purposes.

According to the ISO, the minimum creditable water supply is 250 gpm for 2 hours or a total water supply of 30,000 gallons. Most residential occupancies have a minimum water requirement of 500 gpm, and commercial properties can range up to 12,000 gpm for 4 hours. Chapter 6 covers this subject in detail.

Topic 4: Water Sources

Before moving forward with specific details of municipal water systems, we will identify the primary sources of water available for use by municipal water systems and the adequacy and reliability of each. Many municipal water systems use more then one type of water source.

Impounding Reservoirs

Reservoirs created by placing dams across rivers, streams, or at the neck of a valley to capture runoff have been a source of North American municipal water supplies since the mid-1600s. The Grand Coulee Dam on the Columbia River provides water not only to municipal water systems but also to irrigation systems. Reservoir systems are especially common in the northern and northeastern United States. A dam just 200 feet high at the overflow point can create a pressure of nearly 87 pounds per square inch (psi) pressure at the base of the dam. In many cases, this permits the water to flow through the lower portion of the dam to the treatment plant without any pumping requirements.

[Sidebar: Basic concept of hydraulics applied to water supply systems will be covered in *The Manual on Evaluation Municipal Water Supply Systems.*]

In Topic 1, an analogy was made between a water system and the circulatory system of a human being, with the water pump serving as the heart of a municipal water system. In the case of properly designed reservoirs, the head of water creates a pressure to move the water not only through the treatment plant but also through the water distribution system. This concept is illustrated in **Figure 1-1**. Many communities in the United States were supplied with water without pumping stations until after World War II, when increasing demand required the installation of pumps to maintain needed water pressure on the system or to pump water up to grading tanks on the water system that then would supply water by gravity feed to portions of the municipality.

Impounding reservoir systems without a mechanical interface are considered the most reliable and economical source of municipal water supply. More recently constructed water supply systems use this concept through the use of standpipe tanks or gravity tanks on water systems when there is a minimum demand on the system. When there is a higher demand, the water flows by gravity feed from these holding tanks to meet the system demand. Standpipe tanks and gravity tanks will be covered in a subsequent chapter.

Fresh-Water Lakes

The best examples of fresh-water lakes for supplying municipal water come from communities surrounding the Great Lakes, including Chicago, Detroit, Cleveland, Erie, PA, Buffalo, NY, and Rochester, NY. These lakes are supplied by countless streams and rivers that, in turn, are supplied from water runoff from hills, especially during the winter and spring seasons. This is generally considered a functionally, inexhaustible supply of water, provided the intake lines are below the ice formation level, in order to prevent jamming at the inlet ports of the water supply system.

Inland fresh water lakes, such as the Finger Lakes in New York, also supply water to many municipalities. Manmade lakes may be an important solution for coping with increasing water demand.

Without question, rivers across the country provide the most primary sources of water for municipal water systems. The Colorado, the Missouri, the Mississippi, the Ohio, the Tenessee, the Hudson, the Susquehanna, the Potomac; the list could go on and on. However, water shortages are reported on some of these rivers because of the reduction in snowfall and rainfall during periods of the year. Several articles call attention to the radical reduction in the waterway of the Missouri River of late, and the fact that some municipalities have actually run out of water at their intake locations.

Side water damming is one approach to retaining water during dry spells. Other approaches to this problem include cross-connecting rivers and lakes with aqueducts that could be opened on demand to move water from one region to another. There even has been consideration of a transcontinental aqueduct

that could be fed from the North to supply the South, the East, and the West. When desalination becomes economically feasible, this aqueduct could be supplied from both oceans.

Wells

Driven or bored wells are excavated to the level of the water table. Artesian or flow wells are a special classification of wells in which the water is trapped below a rock formation, which causes the water to be under pressure of varying intensity. When a tap is made through the bedrock, the water flows to the surface under pressure. This pressure may be sufficient to move the water to the treatment plant. All other types of well require low-lift or high-lift pumps depending on the depth of the water or the distance of the water from the surface.

Wells are the primary source of water for municipalities with populations up to around 5,000. Larger municipalities may use a series of well fields, and usually pump up to gravity tanks to provide the required flow and pressure to the distribution system. **Figure 1-1** illustrated a basic well site, treatment plant, and elevated storage of the finished water.

In many parts of the country, especially on the east coast, the underground supply of water is not being replenished as quickly as it is being consumed. At the end of 2005, this was a special problem in the States of New York, Pennsylvania, Ohio, Virginia, and Florida. In some cases, water is being transported by tanker trucks to meet the minimum needs for domestic consumption. Alternative water sources such as streams, rivers, ponds, and lakes are the only source of water supplies for mobile tankers to provide fire protection. This subject will be covered in a later chapter.

Oceans and Bays

Until recently, the salinity of the water has made this source unacceptable for human consumption and therefore, not a source for municipal water supplies. New technology is now making desalination cost-effective.

Water systems using ocean and bay water for fire protection have been used on both the east coast and west coast for over a century. Pumping stations provide both low-pressure and high-pressure water supplies to specially marked fire hydrants, primarily in the commercial and industrial districts of large cities like New York, Philadelphia, and San Francisco. Some coastal communities in Florida make use of limited coverage fire protection systems that take water from the Atlantic Ocean or the Gulf of Mexico.

Topic 5: Classification of Water Systems

Civil engineers have developed three classifications for water supplies:

1) **Fresh water**: This implies that the water source comes from either the surface of the earth or from the natural runoff of water through the water cycle discussed in Topic 2. By definition, these waters are not "brackish," are not to be considered "polluted," and have no trace of salt. This category includes only those water supplies that can be treated by standard methods covered in Chapter 3 to meet EPA criteria for human consumption. Availability of fresh water supplies is becoming an ever-increasing problem throughout the United States. What this means to the consumer is that, like almost every other commodity, the unit cost of finished water is rising, more in some areas of the country then in others. Municipalities need to enforce the Federal government's Clean Water Act.

2) **Salt water**: As stated above, salt water traditionally has not been used as a source of water for domestic consumption. However, recent developments in the reverse osmosis and filtering technology allow the elimination of almost all salt content from ocean waters. The military has used this basic technology aboard ships and through special army units since the Vietnam era, but it has not been cost-effective for municipal water systems.

   The latest technology is in evidence in the Tampa Bay, Florida, municipal water system which now satisfies 60 percent of the consumer use needs from a salt water source. This technology has great promise for coastal areas of the country and possibly for transport to interior regions of the country. Cape May, NJ, opened two desalination plants in July 1998. This is certainly the wave of the future for many, many municipal water supply systems.

3) **Reclaimed water**: Sewer water also is required by health regulation to be filtered and treated before it can be discharged into lakes, rivers, and landfills. Once this process has been completed it can be "reclaimed" by going through another treatment plant process for re-entry into a municipal water system. Although technology is available, the cost is unacceptable for most cities. However, scientific work still is progressing in this area.

Chapter 2: Processed Water for Domestic Consumption

Surface Water Sources

Surface water sources are derived directly from stream and river flow, or are stored prior to use, usually from behind high- or low-level dams that form water retention lakes anywhere from a few acres to many square miles in size. Factors such as chemical and bacterial quality greatly influence the economics of water treatment and the physical quality of the water.

Surface water supplies are divided into two distinct classifications, filtered and unfiltered. These classifications are based upon the type of treatment necessary to produce potable water, and upon the quality of such water prior to any required treatment process.

Topic 1: Unfiltered Surface Water Sources

In many instances, a water supply is delivered from a watershed area that is entirely owned or completely controlled by the water company or water authority.

The enforcement of specific rules and regulations is necessary to ensure water quality with an unfiltered water supply. All types of habitation, cultivation, recreation, or other nonwatershed-related use need to be prohibited. In addition, forest fires could create widespread erosion problems, making the water unsuitable unless complete treatment in the form of coagulation and filtration is used. Therefore, a well-planned forestry program including timbering operations, thinning, reforestation, and maintenance of fire lanes throughout the entire watershed area should be inaugurated under the supervision of a trained forester.

All such operational plans should include location and construction of logging roads, repair of equipment, refueling of equipment, and sanitation procedures for workers within the watershed area. Care should be taken so that the discharge of greases, oils, and other fuels is avoided to the fullest extent possible. Sanitation rules involving the disposal of excreta and garbage should be strictly enforced. Central stations, for use by workers, for the disposal of excreta and garbage should be established, preferably below the water works intake. If such stations are located above the intake works, extreme care should be taken in their location and their use should be rigidly enforced.

The entire watershed area should be posted and properly patrolled. The frequency of inspections should depend upon the potential hazard for pollution. If the area is more isolated, the frequency may be monthly; otherwise, constant patrolling should be established. Required water treatment facilities must be adequately supervised on a daily basis or more frequently as deemed necessary!

Treatment of water derived from such a controlled watershed usually consists of coarse screening and continuous chlorination. Preferred treatment would consist of fine screening, pressure sand filtration, pH adjustment, corrosion control, and continuous chlorination.

Watershed sizes and yields will be discussed in the following section, applicable to both unfiltered and filtered supplies.

Topic 2: Filtered Surface Water Sources

Surface water sources requiring complete treatment include those that are not entirely owned, supervised, or controlled by the water company or authority. The water will contain *normal* bacteria content commonly associated to the community life; this excludes gross pollution from sewage, industrial waste, or additives to "spoil" the water. Given these exclusions, proper treatment will render the water potable.

Present EPA bacterial standards indicate that the bacterial load should be less than 5,000 coliforms per 100 milliliters. Present-day loadings indicate that complete treatment of the water, providing coagulation and super-chlorination, will capably treat bacterial loading much greater then this. Water from human-inhabited environments generally will contain high turbidity and possibly some taste- and odor-producing substances.

The final decision in the selection of a source of water for a surface supply should balance consideration of both water quality and water quantity. Water quality includes such factors as bacteria, suitability for treatment, taste- and odor-producing substances, and the effect of further land use along the tributary streams from which the water is to be taken. The source should be adequate for many years into the future, taking into account expected community growth.

In the balance of quality and quantity of water sources, it is desirable to use the largest watershed or resource possible. However, this is not possible in many cases because of the existing pollution of such a source. Therefore, to reach this balance, smaller watershed areas are developed by means of raw water impoundments, often with low-level dams, thereby meeting the requirements of an average water quality with a better-than-average water yield.

The pollution problem of large water sources is becoming more apparent. These larger bodies of water are more suitable for receiving sewage and industrial waste because of dilution and oxygen assimilating capacity. From the polytonal standpoint, the water quality of smaller lakes, rivers, and streams probably will be the most suitable for municipal water supplies in the future.

There are several methods of evaluating the yield of a watershed, storage requirements:

- The MASS Diagram allows the use of past records of rainfall and runoff, gauging station measurements of stream runoff. On the MASS Diagram, the accumulated stream measurement is plotted versus time. On the same diagram, the maximum daily draft is plotted in the same manner (as accumulated values). The required amount of storage is equivalent to the largest depression or dip within the curve, plotted from runoff and as measured down from a parallel of draft.
- Applying storage requirement information from other water management system companies within the same catchment basin. Such information should include a draft, yield of watershed per square mile, and adequacy of present storage, with figures indicating draw-down of these facilities during extended drought periods.

- With knowledge of average yield of a watershed, the maximum daily draft of the community supply provides a reservoir with storage of 180 days' capacity with additional capacity for silting and evaporation.

Using a simplified method with a combination of the above methods, along with accepted practice and experience, it is possible to derive certain simplified equations that will provide reliable information concerning watershed yield, maximum daily draft, and the required storage for known watershed areas and predesignated drafts. These drafts may be stated as follows:

From un-impounded streams or rivers where the water is taken directed from the flowing water, by means of a small diversion dam, the draft will depend directly upon the minimum stream flow.

Experience over the years has indicated that the *minimum* dependable yields for watershed areas will be approximately within the values in **Table 2-1**.

Table 2-1

Average Annual Rainfall: Inches per Year	Minimum Dependable Yield: MGD per Square Mile*
30	0.0055
32	0.0062
34	0.0075
36	0.0088
40	0.012
42	0.014
44	0.016
46	0.020
48	0.023
50	0.026
52	0.030
54	0.035
56	0.040
58	0.048
60	0.056

*MGD = Million Gallons per Day

Dependable draft rate (DD) can be calculated based on watershed area and yield. The water system should be designed so the water source will be dependable for a long period of time. If the area of the watershed is 27 square miles (and the annual rainfall is 46 inches per year), what would be the dependable draft available from the retention area of the watershed?

$$\underset{\text{(MGD)}}{\text{Dependable Draft (DD)}} = \underset{\text{(Square Miles)}}{\text{Area of Watershed } (W_i)} \times \underset{\text{(MGD) per Square Miles Table 2.1}}{\text{Minimum Yield of Watershed (Y)}}$$

A simplified formula can be used for the determination of the amount of storage required to supply certain daily requirements from a known watershed area. This formula relates back to the previous operation for minimum dependable yield of watershed areas based on average rainfall data. An impoundment should not be expected to yield an average daily amount greater than 25 times the

minimum dependable yield of the watershed area. The following simplified formula is applied to relate draft and watershed to area reservoir volume.

Volume of Storage Required in Million Gallons* = Draft in MGD − Minimum Dependable Yield (MGD) per Square Mile × Area of Watershed In Square Miles

$$V_r = 4.68 \times (24 - 0.02 \times 72)^2$$

$$= 2{,}370 \text{ Million Gallons}$$

It is possible to calculate the maximum actual draft for an existing reservoir using the same equation, if the volume of storage, the minimum dependable yield of the watershed, and the watershed area are known.

$$DACT = DD + (0.214V_r)^{1/2}$$

or

$$DACT = (W_s \times Y) + (0.214V_r)^{1/2}$$

V_r = Reservoir Volume

DACT = Actual Draft

DD = Dependable Draft = $W_s \times Y$

For example, given the area of the watershed as 75 square miles and an average rainfall of 46 inches per year, the amount of storage can be calculated using the above equation with the values from **Table 2-1**.

TOPIC 3: Water Treatment Plants

The treatment facilities for surface water sources are more complex than ground water treatment facilities in both design and operational standpoints, because of the lower quality of the raw water to be treated. Such treatment facilities generally include the following components:

1) **Intake works:** The intake works are structures that are used to divert and lift the water from a stream or impoundment to the treatment works. Intake structures may be concrete in the form of towers with multiple ports located at different elevations, or a crib weighted down within a stream channel. When intakes are located in stream channels, it is important to protect them from floodwaters or damage from floating debris. If possible, the intake structure should be located in the quiescent portion of a stream rather than the highly turbulent portion. The location and design of the structure will minimize the entrance of sand, silt, fish, and debris. Rough or course screening is necessary, and openings should be provided with bars spaced from 1 to 3 inches apart, with the area of the openings restricting the entrance velocity to less than 20 feet per minute. If a diversion dam is used within the stream channel, provisions should be made for the removal of silt and sediment from behind the dam.

   All raw water pumping facilities should be provided in duplicate. Standby or auxiliary gasoline- or diesel-driven pumps also should be provided for large installations. For proper maintenance of equipment, all-weather roads should serve all installations easily.

   The intake structure for raw water impoundment should be located within the deeper portions of the reservoir. Inlets for the intake structure should be located at various levels, depending on the mean and low water level and depth of the water at this location. Surface water is subject to algae growths,

whereas the lower waters carry organic matter, silt, and high concentrations of iron, manganese, and sulphide. Course screening or gratings should be provided and designed as mentioned to satisfy stream intakes.

All piping or tunnels for intake structures should be designed for water velocities of 2 to 4 feet per second in order to be self-cleaning. Fine screens are desirable for the protection of water pumps from grit and other debris.

2) **Raw water impoundments:** The capacity of the raw water reservoir should be calculated in accordance with the material presented previously. Certain basic requirements need to be followed concerning the preparation of the reservoir:

   a) An adequate amount of land should be purchased in addition to that acquired for the water area so that proper controls may be put into place regarding the prevention of pollution from use of the land along the water's edge. The additional strip of land should be measured from the high water margin of the reservoir. It will also be used for patrol and reservoir maintenance programs.

   b) An area of 2 feet above the high water margin and 5 feet below the mean level of the reservoir should be cleared and grubbed of all growth. This will prevent the creation of an environment for breeding insects.

   c) The entire area below the 5 foot level from mean water elevation should be cleared and grubbed of all growth. It may be desirable to cut off stumps of 6" and larger at ground level. All such material should be burned or removed from the reservoir area to prevent the presence of organic decay, which leads to taste and odor problems. Care should be taken in the planning of the clearing and grubbing program for large reservoirs. The long period of time involved in construction of the dam, spillway, and intake structure will provide ample time for the vegetation to regrow, necessitating clearing and grubbing the reservoir a second time.

   d) Of extreme importance is the preparation of the areas where the tributary streams enter the reservoir, as these areas usually will be somewhat swampy. Therefore, islands should be constructed to give deeper water areas **or** the material dredged entirely from the reservoir. In many cases, small impoundments are constructed within these areas so that it is possible to control the breeding of mosquitoes by fluctuation of the water level within the small impoundment. The small impoundment must be constructed with the toe of the dam within the larger reservoir in order to prevent the creation of a shallow water area. It will also serve a secondary purpose in that not only will it provide some additional storage, but it also will act as a settling basin for incoming silt from the watershed area.

   e) Raw water pipelines: All pipes or tunnels used for intake conduits should be designed for water velocities of from 2 to 4 feet per second in order to be self- cleaning. An adequate number of blowoff valves and air relief valves should be provided along all pipelines for maintenance purposes.

3) **Water treatment plants:** The water treatment plant provides chemical treatment in the form of coagulation of suspended solids, screening or filtering, corrosion control, and chlorination. These processes result in high quality, potable water. The principle of operation is that the water enters the plant; chemicals are added; mixing, sedimentation, and filtration follow; then final adjustment of the water is provided for corrosion control and disinfection. Details of design of these appurtenances are as follows:

Mixing process: One of the most important processes in water treatment is the mixing process whereby the added chemicals are mixed in proper proportion to the incoming water, thus causing precipitation. Mixing may be done by hydraulics or by mechanical equipment:

a) **Baffle mixing:** Acceptable practice for a baffle mixing basin, either around-the-end or over-and-under, is that a velocity of 1.5 feet per second be maintained for the first third of the basin, a velocity of 1.75 feet per second through the last third. In many cases, a flash mechanical mixer at the entrance of the baffled basin will assist in the coagulation process. The flash mixer should have a shaft speed of 350 to 750 revolutions per minute (rpm) and the time of the mix should be from 1 to 5 minutes.

b) **Mechanical mixing:** Mixing should be adequate to disperse the chemicals thoroughly in the raw water prior to its entrance into the flocculation basin. If the mix is done by high-velocity mixers, such as by pump or turbine-type mixer, the velocity should be 5 feet per second or greater, and the retention time should be 1 minute, more or less. If a flash mixer is used, it should be as discussed above under baffle mixing. Paddle-type mixers equipped with variable speed regulators should provide a peripheral speed of 1 to 3 feet per second and a retention time of not less than 5 minutes.

   Air mixing devices provide benefits in addition to agitation or mixing of the chemicals. Air being blown through the basin provides this additional treatment in the removal of taste and odors from the water. It also provides oxidation of iron and manganese to aid in their removal. Air mixing units should be designed to provide three stages of agitation: violent, intermediate, and quiescent. The requirement of the air supply is at least 0.5 cubic feet or air per square foot of tank area or 0.05 to 0.20 cubic feet of air per gallon of water. The time of aeration contact of the water should be from 10 to 30 minutes. Air mixing devices may be used in conjunction with either baffle or mechanical mixers.

   The final step of mechanical mixing is that of mechanical flocculation, that is, the slow agitation of the fine flox to hold it in suspension so that the size may build up before the sedimentation process. Mechanical flocculators should be of variable speed, with the peripheral speed of the paddles being from 0.5 to 2.0 feet per second. The basin should be sized to provide a retention period of from 20 to 40 minutes.

All conduits carrying coagulated water to the sedimentation basin should be designed to provide a velocity of 0.5 to 1.0 feet per second. Less than 0.3 feet per second, the floc will settle, while at greater than 1.0 feet per second, it will be broken up. Therefore, the 0.5 feet per second is considered the optimum velocity for coagulated water.

4) **Sedimentation basin:** The sedimentation basin is provided for the removal of the floc from the coagulation process. In a well-operated plant, the majority of the purification process takes place in this coagulation process. Therefore, the design of this basin is of importance. The sedimentation basin consists of a diffusion wall and the basin itself. The diffusion wall acts to diffuse the floc over the entire width of the basin. It should be located from 5 to 10 feet from the end of the basin. The size and number of the slots within the wall should be based on a velocity of 0.4 to 0.8 feet per second through the slots and to provide uniform distribution and velocity across the basin. The diffusion wall may be omitted, provided that other methods are used to give this uniformity of distribution.

   The sedimentation basin should provide a theoretical detention period of at least four hours. The velocity of flow through the basin should be from 0.3 to a maximum of 1.0 feet per minute. The

length-to-width ratio of the basin should be from 2 to 1 to a maximum of 3 to 1. The depth of the basin should be from 10 to 16 feet.

The bottom of the basin should be sloped to a drain sized to empty the basin within a period of 4 hours. An independent overflow should be provided for each basin. The outlet device for settling tanks should be either of the submerged weir-type or large openings to prevent high velocities.

5) **Solids contact or up-flow units:** In fairly recent years, the solids contact or up- flow unit has come into use. This compact unit provides chemical mixing and sedimentation where the settled floc is recirculated to mix with the newly formed floc, thus providing a heavy floc for settling. This type of unit also provides for continuous sludge removal by an automatic timing device. Even though these units have been used in the water softening processes for many years, their application to clarification of turbid waters for community systems requires care in design and operation.

   The maximum rise rate of the clarification of water should be in the range of 1.00 to 1.25 gpm per square foot of clarification area. In certain instances where the quality of raw water contains a high concentration of hardness, the rise rate may be increased to 2.25, but in doing so considerable study should be made of the year-round water quality.

   The detention period for this type of treatment unit should not be less than 2 hours, with a mixing and flocculating zone averaging not less than 35 minutes. At the greater rise rates, the detention period may be lowered accordingly, but not less than 1 hour. The mixing device should be a variable speed type agitator with a ratio of 2 to 1, and should be designed so that there will be no dead space in the bottom zone of mixing. Sludge removal from the unit should be somewhat continuous, with the sludge removal mechanism controlled by an adjustable automatic timer. The effluent weir of the unit should provide for uniform collection of the clarification area at a lead not to exceed 7 gpm per foot of weir length.

6) **Rapid gravity sand filters:** Sand filters provide the final treatment for the removal of suspended matter for the water. Filtration as a treatment process provides greatest efficiency when a layer of floc creates a mat on the sand surface to filter through. Sand filters are designed on the basis of filtration and backwash rate. The filtration rate is established at 2 gpm per square foot of filter area. In certain instances, this rate may be increased to 3 gpm per square foot of filter area, in which case the plant design and operation must be extremely good that the backwash water rate is established at 24 inches rise per minute. This will give a flow of 15 gpm per square foot of filter area. When Anthrafilt is used, the backwash rate should be around 18 inches rise per minute. To meet these two flow conditions, the filter underdrain and other controls must be designed properly.

   For proper operation of a filter, proper controls and gauges must be installed on the filter. These include rate-of-flow controller, loss of head gauges, rate of flow gauges, and wash water rate gauges. Filter bottoms must be adequate to provide filtration and backwash water flows. Bottoms may be either cast-iron manifolds, concrete cast-in-place, or precast plates or blocks. Surface agitator or sweeps are very desirable for proper cleaning of the filter media during the washing cycle.

   Filter sand should be of the following specifications:

   - Effective size: 0.35 to 0.55 millimeters;
   - Uniformity coefficient: 1.70 or less;
   - Dust content: Less than 0.5 percent; and
   - Depth of sand: 24 to 30 inches.

If Anthrafilt is used, the following specifications apply:

- Effective size: 0.65 to 0.75 millimeters;
- Uniformity coefficient: 1.7 or less; and
- Water wash rate: should be adjusted to give 18-inch rise per minute.

Supporting gravel for the filter media should consist of:

- First 3-inch layer of 5/8- to 1-inch size stone;
- Second 3-inch layer of 3/8- to 5/8-inch size stone;
- Third 3-inch layer of 3/16- to 3/8-inch size stone; and
- Fourth 3-inch layer of number 10 to 3/16-inch stone or Torpedo sand.

To provide for proper expansion of the filter media curing the washing cycle, the minimum distance from the top of the wash through to the top of media should be at least 27 inches. Wash water troughs to the top of the media should be at least 27 inches, and should be of dimensions adequate to carry the maximum wash water rate. The spacing of such troughs should not be greater than 5 to 7 feet.

7) **Chemical feed equipment:** Chemical feed equipment should be of dependable make and accuracy to provide correct dosages. They should be sufficient in number so that split dosage is unnecessary for any one machine except the chlorinator, which is best operated from a panel and has several points of application. Dry chemical feeders should have capacities ranging from 50 to 100 pounds per million gallons of water treated. The upper limit should be provided for the coagulant feed machines.

   Chlorinators and chlorine cylinders should be kept in separate rooms from the other feeders for safety reasons. Leakage of chlorine gas will react with dampened metal surfaces to cause corrosion. The chlorinator room should be provided with an exhaust fan located approximately 6 inches above the floor and with a capacity sufficient for two complete air changes per minute. The fan control should be located outside the chlorinator room. A gas mask also should be stored outside the room.

   When fluoride compounds are added to the water, the storage of the fluoride chemicals should be kept separate from other chemical storage so as to eliminate the danger of mixing this chemical with other water treatment chemicals.

Topic 4: Auxiliary Facilities for Surface Water Treatment

Additional auxiliary facilities are required as part of the water plant:

1) Laboratory: The laboratory for proper operation and control should be equipped adequately for daily bacterial and chemical analysis of water quality.

2) Chemical storage: Storage areas for treatment of chemicals, should be ample to store at least a month's supply of chemicals. It is preferable to have several months of storage area so that the chemicals may be bought in bulk quantity. All chemical storage areas should be located in the driest portion of the plant to prevent moisture difficulties.

3) Finished water storage: This essentially involves clear wells and clear well storage. The basins or reservoirs used for storage of finished water should provide at least 10 to 12 hours of storage based on the maximum consumption expected during that period of time. Together with elevated storage, the total storage should be 1 day's supply, but not less than 75,000 gallons. The clear wells should be constructed of concrete or fabricated of steel. These reservoirs or basins should be covered, and have

watertight access manholes. This should be well-ventilated and contain adequate overflow pipes and drains. All such outlets or openings should be screened with at least a 16-mesh screening. The inlets should be arranged so circulation of water is provided.

4) **Finished water pumping:** Finished water pumping facilities should consist of redundant pumping units. A generator driven by a gasoline or diesel engine should be available as auxiliary power for the plant and pump operation in case of outside utility power failure. For larger installations, pumps should vary in number and capacity from 100 percent to 150 percent to 250 percent of plant capacity.

Topic 5: Ground Subsurface Water Sources

Ground water sources or wells usually are characterized by water quality that has a pH from 6.8 to 7.4 (a low concentration of iron, which varies from 0.1 to approximately 1.0 parts per million), and, in some areas, by the presence of hydrogen sulphide. With the low pH, the carbon dioxide concentration increases to create corrosion problems. The range of carbon dioxide extent from about 3 to 5 parts per million at a pH of 7.4 to about 20 to 25 parts per million at a pH of 6.0. With the corrosion problem and the presence of iron and possibly hydrogen sulphide in ground water, the use of certain treatment is sometimes a must with ground water supplies. Treatment facilities involving the removal or prevention of such trouble will be discussed below.

1) Aeration: Aeration provides for the exchange of gases so that either removal or oxidation of matter will take place in the exchange interface of water and air. Aerator are used to eliminate carbon dioxide from the water, release hydrogen sulphide, aid in the decomposition of organic matter, control taste and odors, and in the oxidation of iron and manganese for removal of these troublesome compounds. Aerators are usually of the gravity type in which the water is discharged through nozzles into the air and allowed to trickle over cascades or perforated plates or trays with or without special type of media. Other types of aeration processes use the blowing of air through the water media.

Aerators should be designed so that adequate exposre time and contact may be had. It has been found that coke trays and spray fountains provide around 75 percent removal of carbon dioxide. Hydrogen sulphide is loosely held and is easily eliminated through the gaseous phase exchange of aerators.

2) Pressure filters: Pressure filters using sand and gravel have been used in the field of water treatment and swimming pools for many years. This use in the treatment of ground water supplies is also common. Pressure filters using sand and gravel, crushed pyrolusite ore (natural manganese oxide), or ion-exchange resins are in common use in water treatment. When used with aerators and sedimentation basins, they are effective in the removal of iron and manganese, or in conjunction with chemical treatment for the removal of excess hardness from water.

For removal of iron and manganese, pretreatment in the form of aeration and ph adjustment to above 7.0 is required prior to sedimentation, which is followed by filtration. In this process, the iron and manganese are oxidized by aeration to form a precipitate, which is settled; the filter in this case is used to remove the fine suspended matter that remains in suspension. The oxidation of the iron and manganese takes place as the water flows over the contact media of coke located on trays within the aerator.

A filter that has been pretreated with sodium permanganate is used to retain the oxidized iron and manganese. Such beds must be cleaned and regenerated by the use of sodium permanganate.

Pressure filters should be designed with proper piping for backwater, waste times, loss of head gauges, and sight glass indicators. Pressure filters operate at pressures of 20 to 45 pounds per square inch.

Pressure filters may be used in the softening process of water in conjunction with either solid contact units or conventional coagulation treatment units using the lime-soda chemical precipitation process. In such cases, filters must be employed to provide for the removal of suspended matter from the water.

Special types of units using filter boxes with zeolites, in place of filter media, are used for the softening of water. In the ion-exchange process, the ions of magnesium and calcium, components of hardness in water, are exchanged within the ion-exchange resins of sodium ion. In other words, the ions that which cause hardness in water are removed and an ion, which does not possess hardness characteristics, is placed into solution in their place. When the resins become saturated with calcium and magnesium ions, it is then necessary to regenerate the resins by use of salt brines to remove the calcium.

3) **Corrosion control and chlorination:** Other equipment commonly used in the treatment of ground waste supplies, deals with the problem of corrosion control, the pump and distribution system, and the application of chlorination and fluorides to the water in proper dosage. The dosages of these materials are relatively small; therefore, in most cases, they are applied in solution form. All such solution feeders should be of dependable make and of a capacity to provide chemical dosages up to some 10 parts per million, considering the percent of solution strength available and the discharge rate of the source.

Summary Statement

In many instances, it is desirable to use more than one of the surface or ground water sources described in this chapter for a given community water system. The overall design would be based on the development of the individual sources in accordance with what has been discussed previously.

CHAPTER 3: Water Quality Standards: A General Perspective on Water Quality

The objective of a community water distribution system that provides drinking water is to deliver sufficient quantities of water where and when it is needed at an acceptable level of quality (the desired chemical and physical characteristics of the water). For the water to be high quality, it must first be free of all harmful bacteria or the index organisms (which will indicate that pathogenic bacteria may find their way into the water supply). (2)

Next, the water must be free of objectionable taste and odors that may be caused by either undesirable chemicals or organisms. It follows that drinking water must be low in concentrations of troublesome minerals, such as iron, sulphur, manganese, calcium, magnesium, and other agents that will make the water unsuitable for use by excessive discoloration or hardness, or nonpotable from the standpoint of high chemical content. Finally, the water must be noncorrosive so that it will not react with plumbing fixtures or pipelines to cause failure of such lines, necessitating frequent replacement, or cause the staining of plumbing fixtures.

The quantity of available supply must be such that the maximum daily demands of the community are satisfied at all times, even during extended periods of drought or after years of community growth. The water supply for most communities not only needs to meet consumer demand but it needs to meet needed fire-flow demand where fire hydrants are installed for the protection of built areas of the community. The same water that supplies domestic taps also supplies fire hydrants, unless there is a separate water system for fire protection.

Although water quality may be acceptable when the water leaves a community treatment plant, transformations can occur as water travels through a distribution system. In the past, water distribution systems were designed and operated mainly on the basis of hydraulic reliability and economics, with little attention paid to the water quality in the distribution system, except when serious problems arose from citizen complaints. This attitude has changed significantly as community water suppliers realize the important influence that time spent in a water distribution system, referenced as resident time, can have on water quality, health concerns, and the conditions of underground water mains.

This chapter is about current water quality standards in the United States including the Safe Drinking Water Act of 2004, factors leading to water quality deterioration in distribution systems, The EPA criteria for "safe" water, and the recognition that there will be a continued "tightening on water quality standards" in the future. All of this is going to require communities to have the methods for monitoring water quality conditions and techniques for modeling water quality transport and transformation. (1)

Factors Leading to Water Quality Deterioration

Water storage facilities, after-water treatment, and the pipe network in a community that transports water from the water storage location(s) to supply point of consumption, constitutes a complex network of entrapped water where uncontrolled chemical and biological reactors can produce significant variations in water quality in both time and space. The primary factors of water quality deterioration in distribution systems include the following:

- contamination via cross-connections or from leaky pipe joints;
- corrosion of iron pipes and dissolution of lead and copper from pipe walls and joints;
- loss of disinfectant residual in storage facilities with long resident time (this can also occur from long resident time in water mains where the flow velocity is inadequate to keep all of the water moving);
- bacterial regrowth and harboring of opportunistic pathogens;
- supply sources going online and offline;
- reactions of disinfectants with organic and inorganic compounds resulting in taste and odor problems;
- increased turbidity caused by particulate resuspension; and
- new formation of disinfection byproducts, some of which could be suspected carcinogens.

The driving factors affecting water quality in a distribution system:

- the quality of the treated water fed to the system;
- the material and condition of the water pipes, distribution system valves, and storage facilities that make up the water system; and
- the amount of time water is retained in the system.

With reference to the last item, it is most important to understand that on a looped pipe network system, the water reaching any particular consumer is actually a blend of water parcels that may originate from different sources at different points in time and follow different flow paths. (See Chapter 4—Topic 5: Designing and Reinforcing Municipal Water Supply Systems Using Looped Water Mains.)

Looped water mains can have an enormous influence on the relation between residence time and water quality. Actions that can be taken to improve water quality or prevent its deterioration in the distribution system include

- changes in treatment practices;
- pipe repair;
- periodic flushing of the water system through fire hydrants;
- relining or replacing pipes; and
- modifications to the water supply operation by circulating water in storage.

Finding an optimal combination of these actions can involve trade-offs between cost, hydraulic reliability, and risk impaired water quality. The issue of water quality for a given community will be referenced in future chapters.

Definitions

The terminology associated with water systems is very specialized and extensive. Throughout all of this text, care is taken to define terms. Important terms frequently used pertaining to water quality issues in water distribution systems are defined below. (2)

Advective Transport: The movement of water quality constituents at the same mean velocity and direction as the bulk carrier fluid.

Aerobic Zone: An area where dissolved oxygen is present.

Alkalinity: Ability of water to neutralize changes in pH.

Anaerobic Zone: An area devoid of dissolved oxygen.

Biofilm: A consortium of microorganisms attached to a solid surface along with a surrounding slimy matrix of extra cellular organic polymers.

Bulk Reactions: Reactions that take place within the volume of water not in contact with the wall of a pipe.

Coliform Bacteria: A group of bacteria associated with the intestinal tract of warm-blooded animals as well as vegetable matter and soil, the presence of which is considered to be an indirect indication of possible fecal contamination.

Disinfection Byproducts: Products of the reaction between a water disinfectant (such as chlorine or ozone) and naturally occurring organic matter in water, some of which are suspected human carcinogens.

Dispersive Transport: Movement of a water-quality constituent caused by concentration gradients.

Euclerian Approach: A modeling framework that assumes a fixed frame of reference when developing conservation of mass, momentum, and energy flow for a fluid control volume.

First-order Reaction: A chemical reaction where the rate of growth or decay of a constituent is proportional to its concentration.

Heterotropic Bacteria: The class of single-cell microorganisms that require organic carbon from both respiration and cell synthesis.

Lagrangain Approach: Modeling framework that assumes a moving frame of reference when developing conservation of mass, momentum, and energy flow for a fluid control volume.

Opportunistic Pathogens: Organisms that may exist as part of the normal body croflora but under certain conditions cause disease in compromised hosts, such as in the elderly, newborns, victims of Acquired Immunodeficiency Syndrom (AIDS), and cancer patients receiving chemotherapy.

Pipe Wall Reactions: Reactions occurring between water quality constituents and materials originating from the wall of a pipe, such as released iron or biofilm slime.

Standpipe: A ground level storage tank whose height is greater than its width.

Tracer Chemical: A nonreactive chemical whose presence is used to track the flow path and travel time of water originating from a particular point of addition.

Topological Sort: A renumbering of the nodes in a directed node-link network, so that all links directed into a given node are connected to nodes of a lower number.

Tubercle: An encrustation growing inward from the wall of a pipe caused by the buildup over time of oxidized corrosion products.

Water Age: The average amount of time that a parcel of water has been in the distribution system.

Regulatory Requirements

In the United States, the baseline regulatory requirements on water quality are set by the EPA. These requirements are enforced by that agency and by the individual States as have been granted primacy by this agency. Individual States may institute more stringent requirements if they deem them to be necessary. Although regulations historically have applied to the point at which water enters the distribution system, there is a trend toward the development of regulations at the point of use.

Shaping the Future of Water Quality and Water Delivery

The Safe Drinking Water Act passed by Congress has set both the tone and the stage for water quality in the United States for years to come. Before addressing the existing national primary drinking water quality regulations, it is important to cover some important perspectives that are shaping the future of community water supplies with a primary focus on maintaining and improving water quality for consumer consumption. Several primary topics are reviewed below:

The Need to Plan Now!

The following quoted statement provided an important perspective on the future of water supplies in the United States, and a brief but extremely important statement on water quality.

> Water utilities across the United States provide an essential service to millions of people every day. In fact, it is a service that is often taken for granted. Water utilities will continue to be challenged by industry trends, such as increasing customer expectations, more stringent regulatory requirements on water quality, increasing water resource demands, and aging infrastructure, while endeavoring to maintain low utility rates. The major challenge over the next decade will be to understand these trends and focus investments of limited resources to create the greatest benefits for both the utility and the consumer in the long run. (1) (Earl Nightingale. The HDR Company, March 2004.)

The HDR Company also provides a prospectus on six topics that address the future of water quality in the United States. A synopsis of each topic is presented below: (1)

1) **Community:** Consumer sentiment and perceptions will drive changes in water utility communications and services. Expectations for water performance have never been higher. Readily available water quality information, together with highly publicized contaminant issues, such as arsenic, have increased consumer scrutiny regarding the quality and safety of public water sources. The Arsenic Rule, which lowers the maximum contaminant level to 10 µg/L, became enforceable in 2006 and affects 41,000 water systems across the country. Of those, about 3,000 are small or very small water systems that have no water treatment infrastructure and limited financial resources. Recognizing this problem, the American Water Works Research Foundation, assisted by HDR developed and demonstrated arsenic removal technologies appropriate for application to small water systems. This involved bench-scale and full-scale studies of 13 different technology variations with help from universities and utilities in Montana, Arizona, and California. With this information, communities are able to address consumer concerns responsibly and confidently. As utilities move forward in this age of bottled water and "treatment at the tap" technology, water supply professionals need to understand the technology and communication tools to meet customer's changing needs and expectations.

2) **Water supply:** Water is considered to be a finite global resource. The U.S. population is expanding at the rate of approximately 1 percent per year, and is projected to exceed 400 million by 2050. Consequently, protection of water resources and innovative applications of reuse treatment technologies will be vital in providing an uninterrupted supply of safe drinking water for future generations. Watershed protection will continue to be an area of intense activity.

   As the cost of water treatment continues to escalate to meet drinking water demand and water quality regulations, focusing on improving the quality of raw water sources has to be paramount. The increasing frequency of drought conditions and natural cover fuel fires and forest fires on watershed lands adds to these treatment challenges. As fresh water is exhausted, desalination will become increasingly popular in coastal areas.

   The bottom line is—*Easily accessible fresh water supplies are all but gone!* Some creative solutions to these problems will be presented throughout this manual.

3) **Advanced water treatment technology:** As communities plan improvements to treatment processes, advanced drinking water technologies will become a major factor for future regulatory compliance. One emerging regulatory issue is the removal/inactivation of the pathogen Cryptosporidium. Low-pressure membrane technology and ultraviolet irradiation have developed as two key advanced treatment technologies that can be used to assist water systems in eliminating the Cryptosporidium threat to their customers. Reduced costs and increased competition are taking these extremely feasible alternative technologies. The HDR Company is assisting communities such as Kennewick, Washington, in taking advantage of recent advances in submerged membrane technology to expand the capacity of their existing filter basins, while at the same time improving the quality of water to their customers at minimal increased costs.

4) **Water distribution systems:** Water distribution systems are the next frontier facing regulatory pressure relative to water quality. The Total Coliform Rule and the corrosion requirements of the Lead and Copper Rule are only the beginning. As part of the Stage 2 Disinfectants/Disinfection By-Products Rule, systems will conduct an initial distribution evaluation to find sites in the system that have the highest disinfection by-product levels, and new sampling sites will be selected to capture those peak concentrations. Utilities will be paying more attention to the design of distribution infrastructure to reduce water age as defined above. Systems will look for distribution system management practices to minimize potential problems and better control and improve distribution system quality. Of special concern is compliance with both existing and proposed regulations relative to aging distribution systems.

5) **Asset management:** Identifying and prioritizing in investments in operations, maintenance, and capital improvements is a critical challenge facing municipal administrators and managers. This is especially true as water utilities strive to maintain or increase level of service, meet regulatory requirements, and reinvest in an aging infrastructure through improved asset management. Water utilities need *now* to examine their business practices and how decisions are to be made to meet the ever-increasing demands by the EPA for a more stringent delivery of improved drinking water quality.

   Understanding the life cycle and the different practices and procedures for supplying water to consumers, and the system needs to supply both maximum consumer consumption demands and fire flow demands simultaneously, is a real challenge for any water system. Typically when normal consumption increases, water supply for fire protection decreases. This is especially true for older water systems. Therefore, municipal officials, water supply officials, and fire service officials need to examine municipal water supplies from a systems approach that considers community assets and the impact that the water system has on fire insurance rates in the city. This is essential for redesigning a

water system and optimizing the way the water supply business is done with a focus on minimizing water delivery performance failures.

6) **Reuse/Recycle:** HDR states, "*…to meet water demands for today and the future, many utilities are developing a balanced portfolio of water resources from traditional and other type of facilities and management techniques.*" (1)

This portfolio needs to include programs such as water transfers between existing systems, improved water conservation, the feasibility of separate water systems for domestic consumption and fire protection, desalination for coastal cities, possible pumping to counties inward from coastal areas, and examining the costs and benefits. Of course, the political considerations of adopting a county-wide water authority to monitor water quality throughout the county and prepare disaster management plans to supply potable water in case of a system interruption are extensive. Alternative water supplies for fire protection where there are no fire hydrants recognized by the ISO is another need. At least one mobile water purification unit should be available in each of the 4,001 listed counties in the United States.

Recycled water is being used in a variety of ways, such as ground water recharge, sea water intrusion barriers, landscape and agricultural irrigation, and industrial and commercial uses. Two examples of wastewater reuse are supplementing surface water that support aquatic life where water supplies are either limited due to poor water quality or limited by availability. Advanced wastewater treatment technologies such as new filtration technologies, membranes, and membrane bioreactors provide innovative solutions to support the substitution of reclaimed water for nonpotable uses. In some cases, reclaimed water is used for indirect potable use via ground water recharge.

Environmental Protection Agency (EPA) Standards for Water Quality—2005

The existing National Primary Drinking Water Regulations are divided into five primary categories with four evaluation areas, plus comments for each category. The following material is presented to provide conceptual understanding of these regulations. **All** municipal officials, including the fire service, need to be aware of the complexity of water quality standards and their individual roles in maintaining these standards.

Due to the amount of material to be presented, two chart sets are provided.

- Chart I: Regulation—Name of Contaminant—Allowable Million Gallons per Liter (unless noted)—Health Effects of Contaminant.
- Chart II: Regulation—Monitoring Requirements—Special Comments.

Chart I

Regulations	Name of Contaminant	Mg/L	Health Effects of Contaminant
Inorganic Chemicals (IOCs)	Antimony	0.006	Increase in blood cholesterol Decrease in blood sugar
	Asbestos	7 MFL	Increased risk of developing benign intestinal polyps
	Barium	2.0	Increase in blood pressure
	Beryllium	0.004	Intestinal lesions
	Cadmium	0.005	Kidney damage
	Chromium (total)	0.1	Allergic dermatitis

Regulations	Name of Contaminant	Mg/L	Health Effects of Contaminant
	Copper	TT (AL=1.3)	Gastrointestinal/Liver/Kidney problems
	Cyanide	0.2	Thyroid/Neurological effects
	Fluoride	4.0	Skeletal problems
	Lead	TT (AL=0.015)	Kidney problems, high blood pressure, delays in physical and mental development in infants and children
	Mercury (inorganic)	0.002	Kidney damage
	Nitrate (as N)	10.0	Methemoglobinemia (blue baby syndrome/diuresis
	Nitrite (as N)	1.0	Methemoglobinemia (blue baby syndrome/diuresis
	Selenium	0.05	Hair or fingernail loss Numbness of fingers or toes Circulatory problems
	Thallium	0.002	Hair loss, changes in blood Kidney/Liver/Intestine problems
	Arsenic Rule		
	Arsenic	0.010	Cancer risk/Cardiovascular and dermal problems
	Radionuclides		
	Combined Radium 226 and 228	5pCi/L	Cancer risk
	Gross Alpha (Excluding Radon and Uranium)	15pCi/L	Cancer risk
	Beta Particles and Photon Emitters	4 mem ede/year	Cancer risk
	Uranium	0.030	Kidney problems and cancer risk
Organic Chemicals	**Synthetic Organic Chemicals (SOCs)**		
	2,3,7,8-TCDD (Dioxin)	1.0000003	Cancer risk/Reproductive system problems
	2,4,5-TP (Silvers)	0.05	Liver problems
	2.4-D	0.07	Adrenal gland/Liver/Kidney problems
	Acrylamide	TT	Cancer risk/nervous system Blood problems
	Alachor	0/002	Cancer risk/Eye/Liver Kidney/Spleen problems
	Atrazine	0.003	Cardiovascular problems Reproductive system problems
	Carbofuran	0.04	Blood/Nervous system Reproductive system problems
	Chlordane	0.002	Cancer risk/Liver Nervous system problems
	Dalapon	0.2	Kidney problems
	Di (2-ethylhexyl) adipate	0.4	Liver/Weight loss Reproductive system problems
	1,2-Dibromo-3 chloropropane (DBCP)	0.002	Cancer risk Reproductive system problems

Regulations	Name of Contaminant	Mg/L	Health Effects of Contaminant
	Di (2-ethylexyl)phthalate	0.006	Cancer risk/Liver Reproductive system problems
	Dinosb	0.007	Reproductive system problems
	Diquat	0.02	Osular problems
	Endothall	0.1	Stomach/Intestinal problems
	Endrin	0.002	Liver problems
	Epichlorohydrin	TT	Cancer risk/Stomach problems
	Ethylene Dibromide (EDB)	0.00005	Cancer risk/Liver/Kidney/Stomach Reproductive system problems
	Glyphosate	0.7	Kidney and reproductive system problems
	Hepatachlor	0.004	Cancer risk/Liver problems
	Hepatachlor Epoxide	0.0002	Cancer risk/Liver problems
	Hexachlorcyclopentadine	0.05	Kidney/Stomach problems
	Lindane	0.002	Kidney/Liver problems
	Metoxychlor	0.04	Reproductive system problems
	Oxamyl (Vydate)	0.2	Nervous system problems
	Benzo[a]0pyrene (PAHs)	0002	Cancer risk Reproductive system problems
	Polychlorinated	0.005	Cancer risk/Thymus gland/
	Biphenyls		Immune deficiencies/Nervous or reproductive system problems
	Pentachloropenol	0.001	Cancer risk/Liver/Kidney problems
	Picloram	0.5	Liver problems
	Simazine	0.004	Problems with blood
	Toxaphene	0.003	Cancer risk/Liver/Kidney/Thyroid problems
	Volatile Organic Chemicals (VOCs)		
	1,1,1-Trichoroethane	0.2	Liver/Circulatory/Nervous system problems
	1,1,2-Trichoroethane	0.005	Kidney/Liver/Immune system problems
	1,1-Dichoroethyhlne	0.007	Liver problems
	1,2,4-Trichlorobenzene	0.07	Adrenal gland problems
	1,2-Dicloroehane	0.005	Cancer risk
	1,2-Dichloropropane	0.005	Cancer risk
	Bezene	0.005	Cancer risk/Anemia/Blood problems
	Carbon Tetrachloride	0.005	Cancer risk/Liver problems
	Chlorbenzene	0.1	Kidney/Liver problems
	Cis 1,2-Dichloroethylene	0.07	Liver problems
	Dichlormethane	0.005	Cancer risk/Liver problems
	Ethylbenzene	0.7	Kidney/Liver problems
	Ortho-Dichlorobenzine	0.6	Kidney/Liver/Circulatory problems
	Para-Dichlorobenzene	0.075	Kidney/Liver/Spleen/

Regulations	Name of Contaminant	Mg/L	Health Effects of Contaminant
	Circulatory problems		
	Styrene	0.1	Kidney/Liver/Circulatory problems
	Tetrachloroethylene		
	(PCE)	0.005	Cancer risk/Liver problems
	Toluene	1.0	Kidney/Liver and
	nervous system problems		
	Trans-1,2-Dichloroethylene	0.1	Liver problems
	Trichloroethylene	0.005	Cancer risk/Liver problems
	Vinyl Chloride	0.002	Cancer risk
	Xylenes (total)	10.0	Nervous system problems
Microbiological Contaminants			
	Total Coliform Rule	See Comments	Coliforms are bacteria that are naturally present in the environment and are used as an indicator that other, potentially harmful, bacteria may be present. The presence of fecal coliform or E-Coli may indicate potential contamination that can cause diarrhea, cramps, nausea, headaches, or other symptoms.
	Surface Water Treatment Rule (TCR)		
	Turbidity	TT	None. Interferes with disinfection.
	Giardia lambia	TT	Gastrointestinal illness, Giardiasis
	Enteric Viruses	TT	Gastrointestinal and other viral infections
	Ligionella	TT	Legionnaire's disease
	Heterotrophic Plate Count	TT	None. Used to measure a variety of common bacteria in water. Lower bacteria concentrations indicates better maintained water systems.
	Interim Enhanced Surface Water Treatment Rule (IESWTR)		
	Turbidity	TT	None. Interferes with disinfection.
	Cyptosporidium	TT	Gastrointestinal illness, Cyptosporidiosis
	Long-Term (1) Enhanced Surface Water Treatment Rule (LTIESWTR)		
	Turbidity	TT	None. Interferes with disinfection.
	Cyptosporidium	TT	Gastrointestinal illness, Cyptosporidiosis
Disinfectants and Disinfection Byproducts			
	Stage 1 D/DBPR Disinfectants		
	Chlorine	4.0 as Cl (2)	Eye/Nose irritation Stomach discomfort
	Chloramines	4.0 as Cl (2)	Eye/Nose irritation Stomach discomfort/Anemia
	Chlorine Dioxide	0.8 as ClO (2)	Anemia/Nervous system problems

Regulations	Name of Contaminant	Mg/L	Health Effects of Contaminant
	Disinfection Byproducts		
	Total Triholomethanes	0.080	Cancer risk Potential reproductive system effects
	Liver/Kidney		
	Haloacetic Acids	0.060	Cancer risk
	Chlorite	1.0	Anemia/Nervous system problems
	Bromate	0.010	Cancer risk
	Total Organic Carbon	TT	

Chart II

Regulations	Name of Contaminant	Monitoring Requirements
Inorganic Chemicals (IOCs)	Antimony	Surface water—once a year Ground water—once every 3 years for IOC's, not including Asbestos, Lead, Copper, Nitrite or radionuclides
	Asbestos	Once every 9 years
	Copper	Same as Lead
	Lead	Followup monitoring every 6 months after corrosion controls are initiated or optimized. Systems consistently meeting AL can reduce monitoring to once per year and then every 3 years after that.
	Nitrate (as N)	Ground water—annually Surface water—quarterly initially, then annually Repeat frequently as determined by State requirements.
	Arsenic	Same as IOCs.
	Combined Radium	Sample point is the distribution system entry point that is representative of all sources being used. Four consecutive quarterly samples must be taken at all sample points.
	Beta Particles and Photon Emitters	The primary agency must designate the system as vulnerable. Once deemed vulnerable, quarterly samples must be taken for beta emitters and annual samples taken for Tritium and Strontium-90 at the distribution system entry point. Compliance is based on the running annual average of four quarterly samples taken at each sample point.
	Uranium	Same as Combined Radium and Gross Alpha
Microbiological Contaminants	Total Coliforms	For both surface and ground waters, the total number and location of samples is based on the population served and a system-specific sampling plan.
	Surface Water	Grab samples at least every 4 hours for continuous monitoring. Continuous chlorine residual required for systems greater than 3,300 persons. One to four grab samples per day are allowed for systems with less than 3,300 persons.
	Treatment Rule (SWTR)	

Regulations	Name of Contaminant	Monitoring Requirements
	Turbidity	Conventional and direct filtration systems must measure combined effluent turbidity at least every 4 hours and continuously monitor turbidity of each individual filter.
	Filter Back	No monitoring is required, but water systems must collect and retain the following information for review by the primary agency: • Copy of recycle notification and information submitted to the primary agency. • List of all recycle flows and frequency returned. • Average and maximum filter backwash flow rate (gpm) along with the average and maximum filter backwash duration. • Typical filter run time and written summary of how the filter run length is determined. • The treatment provided for recycle flow. • Design data on the treatment provided for the recycle flow, dimensions for recycle flow treatment processes, hydraulic loading rates, type of chemicals used along with the dose and frequency used, and frequency at which solids are removed.
	Wash Rule	
	Long-Term Surface Water Rule (LTSWR)	
	Turbidity	Conventional and direct filtration systems must measure combined filter and effluent turbidity at least every 4 hours and continuously monitor turbidity of each individual filter.
Disinfectants and Disinfection Byproducts		
	Disinfectants	Monitor the same as for the Total Coliform Rule. Compliance is based on running annual arithmetic average of monthly averages. Daily sample at distribution system entry point.
	Disinfectant	Four quarterly distribution samples. Compliance on running annual average of quarterly average.
	Chlorine	Daily sample at distribution system entry point.
	Bromate	One sample per month (ozone systems only) and running annual average.
	Total Organic Carbon Byproducts	Source treated Water TOC sample once a month.

The Future of Environmental Protection Agency Regulation

The following information pertains to the *projected regulatory schedule* that covers a time period to 2011. It is imperative that local governments keep current on the actual implementation or modifications to these proposed regulations.

1) Regulation on the contaminant *Alicarb.* This applies to a contaminant that could adversely affect the nervous system. Regulations originally were proposed in 1991. EPA will re-examine risk assessment and occurrence data and determine what further action is appropriate. Final promulgation is set with a projected effective date of 2008.

2) Radon Rule Adjustment. Radon presents a potential cancer risk. The proposed rule adjustment would be to increase the monitoring requirements. A proposed effective date for new regulations is set for 2007.

3) Revisions to the Total Coliform Rule (TCR). Coliforms may be indicators of harmful bacteria in the water supply. The revisions proposed address requirements to finished water quality in the distribution system as well as to evaluate alternative monitoring strategies. A firm proposal is scheduled for final promulgation in 2007, with an effective date of 2010.

4) A proposed Stage 2 regulation on disinfectants and disinfection. This has implications for health problems associated with water supplies, including cancer risk, potential reproductive system effect, liver, kidney, and nervous system problems. The rule would apply to all community and nontransient noncommunity water systems that add a disinfectant other than UV or deliver water that has been disinfected. Final promulgation is set with an effective date of 2008.

5) Long-Term 2: Enhanced Surface Treatment Rule applies to all public water systems that use surface or ground water. It is most important to protect against gastrointestinal illnesses. Beginning 6 months after the actual promulgation, monthly monitoring of the water source for Cryptosporidium for 2 years will be to characterize the source water. For small systems, E-Coli concentrations will be in lieu of Gryptosporidium. Based upon the conditions found, the levels of additional removal beyond that provided by conventional treatment or direct filtration will be identified. To meet the additional removal requirements, the water system would select the appropriate tool(s) from the Microbial Toolbox. Note that ultraviolet light disinfection would be allowed under this rule. For implementation, large and medium systems where the population served was greater than 10,000, have 3 years after source water characteristics or 6 years after rule promulgation to meet the higher removal requirements. Small systems will be on a delayed schedule.

6) Ground Water Rule (GWR): The new ground water rule also is aimed at preventing Gastrointestinal disorders and illness. It specifies monthly sampling and testing of the source water for E-Coli, Enterococci, or Coliphage for systems not treating to a 4-log inactivation or removal of viruses and raw water from a sensitive aquifer. Continuous monitoring of the treatment techniques for water systems serving a population greater than 3,300, while smaller water systems will be required only to take grab samples. The effective date for this rule is 2007.

7) Six-Year Review of Regulations: In June 2002, the EPA proposed to review the total Colifom Rule (TCR), based on its review of the existing regulations. However, based on revised risk assessments, several contaminations could be proposed "out of cycle." Potential "out of cycle" revisions are possible for Atrazine, TCE, Fluoride, Chromium, and particularly Chromium VI.

8) Contaminant Candidate List (CCL) and Regulatory Determinations: The CCL is a starting point to make a regulatory determination on whether to rule a specific contaminant or not. EPA proposed the first regulatory determinations in April 2002, and proposed **not** to regulate any of the priority contaminants from the first CCL. This assessment on some contaminants such as Perchlorate and MTBE, are being completed and are likely to be the first "out of cycle" regulations from CCL regulatory determinations. No effective date has been set at this writing.

9) Endocrine disruptors: Some scientists have proposed that certain chemicals might be disrupting the endocrine system of humans and wildlife. To that end, the EPA is developing a screening program to identify the chemicals that should be monitored to determine the spread of endocrine disruptors. Criteria to select priority chemicals for screening are to be finalized in the near future. The EPA plans to propose a rule to implement the screen process. There is no established timeline on this subject.

Water Quality Monitoring

It is difficult to use monitoring data alone to understand the fate of transformation of substances in drinking water as the water moves through the distribution system. Even medium-sized cities have thousands of miles of pipes, making it impossible to achieve widespread monitoring. The flow paths and the travel paths of water through these systems are highly variable because of the single-point feed or the looped layout of the pipe network and the continuous changes in water usage over time. The common use of storage facilities in the system makes things even more variable. At different times of the day, a specific location in the pipe network might be relatively new water from the treatment works when storage tanks are being refilled, or old water when storage tanks are being emptied. It is usually impractical to experiment on the entire distribution system by seeing how changes in pumping schedules, storage facility operations, or treatment methods affect the quality of water received by the consumer.

For these reasons, mathematical modeling of water quality behavior in distribution systems has become an attractive supplement to monitoring. These models offer a cost-effective way to study the spatial and temporal variation of a number of water quality constituents including:

- the fraction of water originating from a particular source;
- the age or time of residence, of water in the system;
- the concentration of a nonreactive tracer compound either added or removed from the water system (e.g., fluoride or sodium);
- the concentration and loss rate of secondary disinfectant (e.g., chlorine); and
- the concentration and growth rate of disinfection byproducts such as THMs, and the number and mass of attached and free-flowing bacteria in the system.

The models can be used to assist managers to perform a variety of water quality related studies. Examples include the following:

- calibrating and testing hydraulic models of the system through the use of chemical tracers;
- locating and sizing storage facilities and modifying system operations to reduce the age of the water;
- modifying the design and operation of the system to provide a desired blend of waters from different sources;
- finding the best combination of pipe replacement, pipe relining, pipe cleaning, reduction in storage holding time, location, and injection rate at booster stations to maintain desired disinfection levels throughout the system;
- assessing and minimizing the risk of consumer exposure to disinfectant byproducts; and
- assessing the systems vulnerability to incidents of external contamination.

CHAPTER 4: Water Distribution System Design Concepts

Water Supply Source Classifications

Chapters 2 and 3 both described two basic sources of water that are used for community water supply systems as follows:

1) Ground water sources (wells), which indicate that the water is below ground level or below the earth's surface. It is necessary to dig or bore a well in order to tap into the water source. This is also generally referred to as a "well-water source." Artesian wells may have water that is trapped below a rock formation so that the water is under pressure. When an auger breaks through the rock formation, there may be sufficient water under pressure to force the water to the earth's surface where it is then pumped to the water treatment facility and either to finished water storage or pumped directly into the distribution system. All other well sites require a well pump to raise water to the earth surface. Depending on the depth of the well, the pump may be able to transport the water directly to the water treatment facility; otherwise, one or more pumps are needed in series to move water to the treatment location. **Figure 4-1** shows a typical arrangement of a well water pump to treatment facility arrangement.

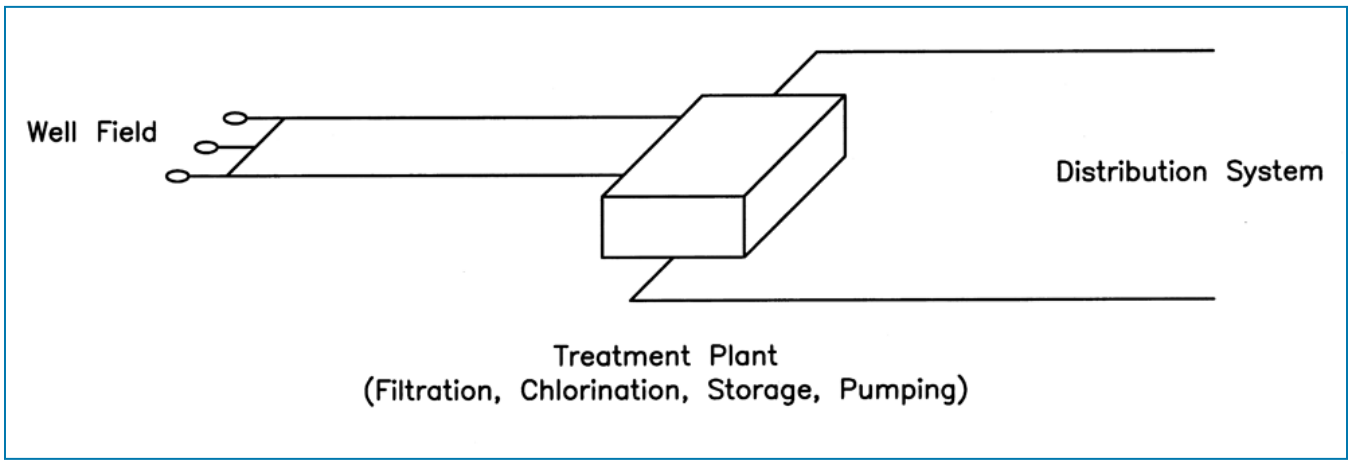

Figure 4-1

2) Surface waters represent the second general classification of water supplies. This means that the water is taken from aboveground water sources that include both large and small natural lakes, and high and low reservoir lakes formed by manmade dams to retain the water, rivers, and streams.

Water System Components

It is essential to understand the basic types of water supply systems and the physical arrangement of system components prior to discussing either design or evaluation concepts associated with these components. There are two basic types of water supply systems to create water pressure within the distribution system to supply water to built areas of a community, and to provide required water pressure to fire hydrants located on the water supply system. These two types of water systems that supply water under pressure for consumer consumption and fire protection are

1) **Gravity feed systems.**
2) **Pumping pressure systems:** Each of these systems must take water from a supply source, pass the water through a treatment plant, and then transport the water into the distribution system. It needs to be recognized that community water systems can be divided into four basic classification according to the water source:
   a) High or low reservoirs that hold nonpotable water for gravity feed.
   b) Pumping station systems that use ground water from streams, rivers, canals, man-made or natural lakes, and other special provisions for impound water. In these types of systems, the raw water is pumped from the source point to the treatment plant and then either pumped directly into the distribution system or into storage to be used on demand by the community.
   c) Pumps at well sites that pump water to the treatment facility. Based on the difference in elevation between the treatment facility and the community to be served, the water may flow by gravity through the distribution systems, or there may be the need for another pumping station.
   d) A combination of gravity flow and one or more pumping stations to transport the water from the source point to all of the water demand points on the distribution system.

Water System Classifications

Communities up to about 15,000 population may have a relatively simple, straightforward classification for their municipal water supply. However, large cities can have a very complex water system. There are some basic water system classifications that have been established to provide a basic reference for examining the adequacy and reliability or water systems. These are identified as follows along with referenced illustrations:

1) High-level reservoir system: This classification refers to a water source that is at least 100 feet in elevation above the treatment facility in order to provide sufficient head pressure so that nonpumping station is required. The water should be a natural impounded lake with a properly installed flow pipe between a source point in the lake and the treatment facility, or the impounded lake may be created by a dam on a stream or a runoff area in a valley that will allow the water to back up behind the dam. This is illustrated in **Figure 4-2**.

This type of system gives the opportunity to develop a very reliable water supply system. If there is sufficient elevation difference between the water intake source on the reservoir system and the distribution piping in the community, it is possible to design a water system that does not require one or more pumping stations. The head pressure for supplying water to the treatment plant and from the treatment plant to the distribution system is sufficient to meet both consumer demand and needed fire flows. This is also a very economical system since there is no substantial power requirement to run the water system beyond normal lighting requirements and requirements for establishing the level of water quality needed for the community.

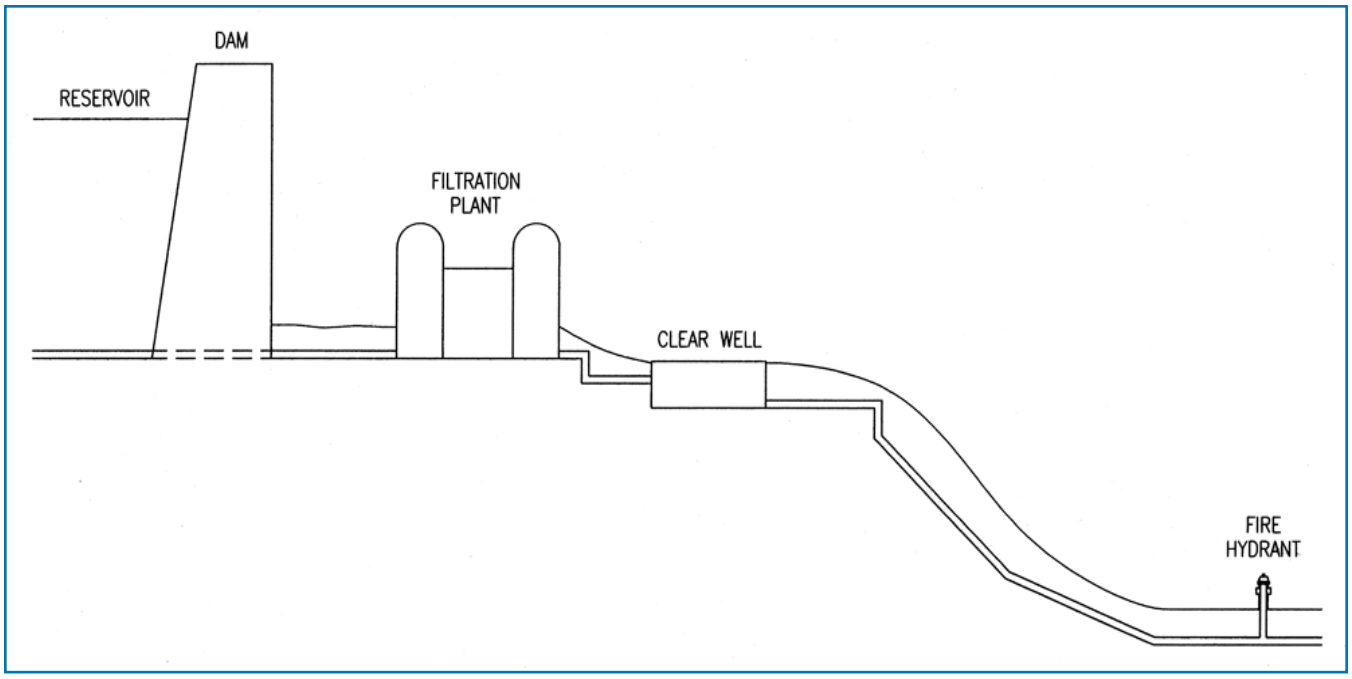

Figure 4-2

High-level reservoir systems are found in high hills and mountain regions of the country and around the Great Lakes, where the lake plain has foothills of 200 to 500 feet above the lake level. These systems are highly reliable under all weather conditions that may cause disruption to the other types of systems discussed below. Typically, reservoir water supplies can be controlled at the surface level so as to minimize the amount of water treatment necessary to meet current and future water quality requirements.

A gravity flow system that does not require a pump interface is considered the most reliable type of water system, since there is no mechanical component to break down or fail when the power source goes down. For the same reasons, it is the most economical type of water supply system to operate.

2) **Low level reservoir systems:** Low-level dams, usually up to about 20 feet high, are typically built on steam flow that is considered reliable year round. The reservoir basin may be bulldozed to form a small lake that will supply water to communities of populations up to about 25,000. One type of low-level reservoir provides a channel from a major river or lake to form a small lake behind a low-level dam. If there is an expected variation in the water level from the primary source, such as a drought or heavy freezing in the winter months, a gated pipe with an earth cover is used to prevent backfeed to the primary water supply source. A basic configuration for a low-level dam is depicted in **Figure 4-3.**

Low-level retention dams typically require a pumping station to transport water to the treatment plant and, if the land area is relatively flat, a second pumping station to pump treated water directly to the distribution system or to elevated storage to provide the required pressure and volume to meet instantaneous flow demand. The elevated storage can be designed to minimize the direct pumping requirements.

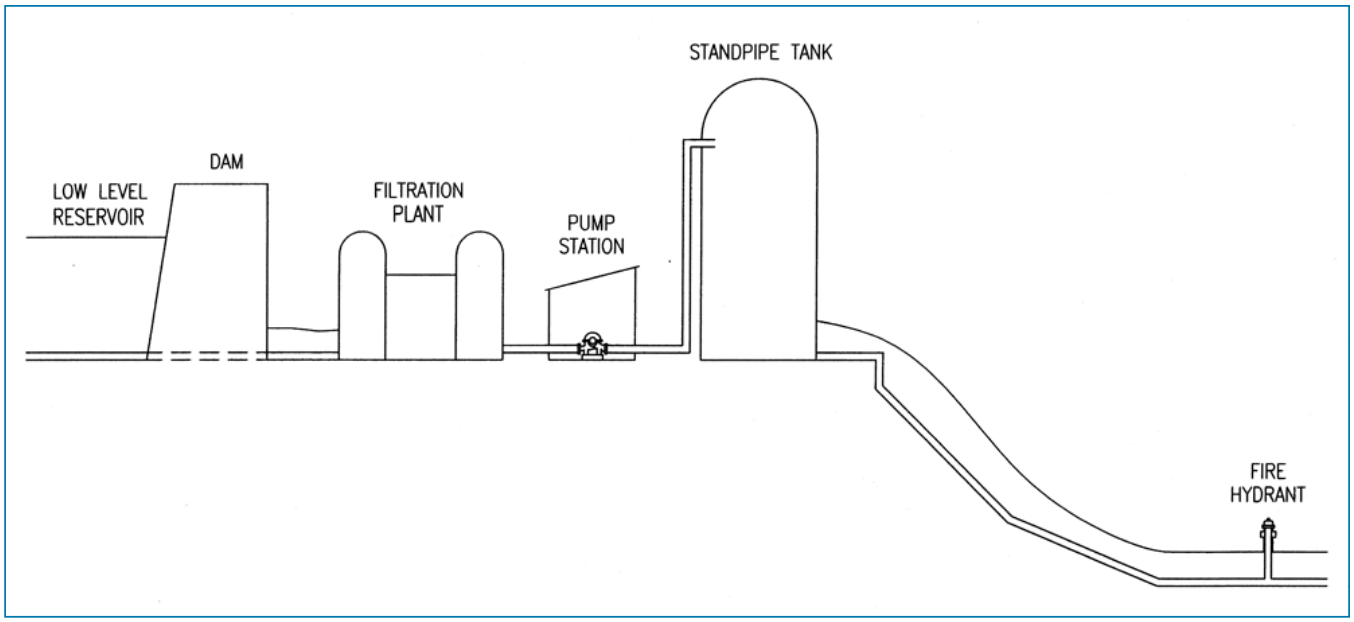

Figure 4-3

3) **Direct pumping systems:** **Figure 4-4** illustrates how a direct pumping station feeds water to the treatment plant and then a second pumping system transports water to a storage holding area, such as a clear well, to a standpipe storage tank that is maintained full as domestic consumption varies throughout a single day. This minimizes the time the pump or pumps actually have to run. The pumps also may be designed and arranged to pump the treated water directly into the distribution system when there is a high demand on the water system. This could occur when there is a major fire in the community.

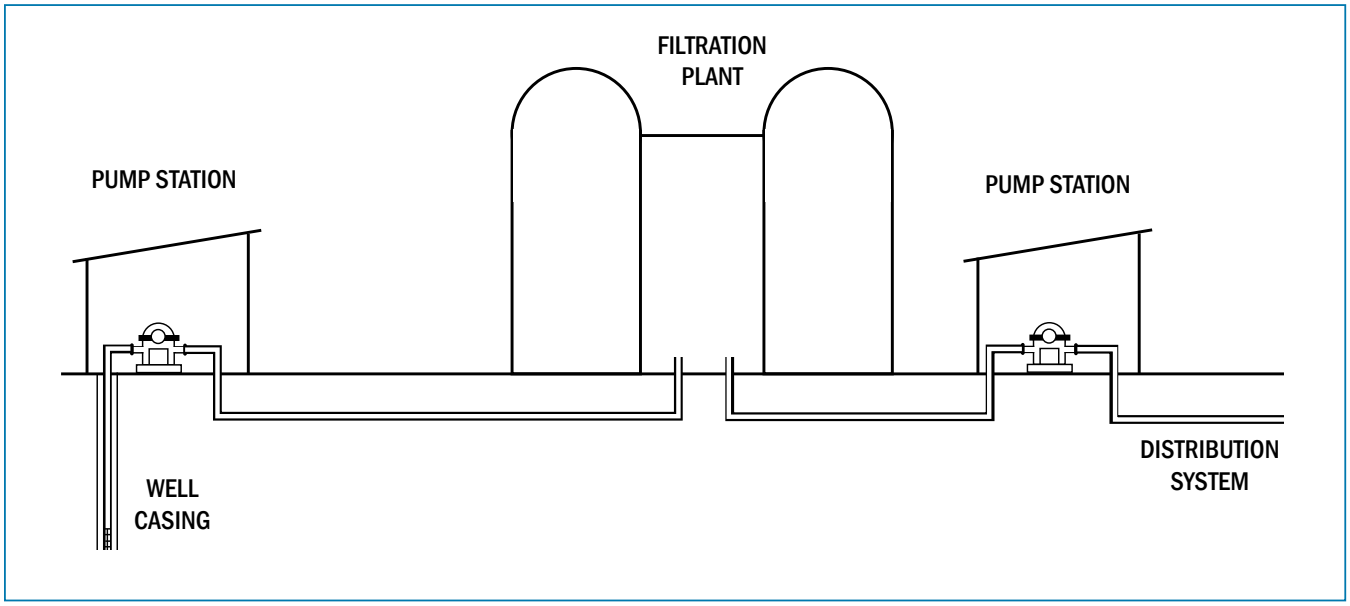

Figure 4-4

4) **Pumping station at well sites and gravity storage:** In this type of supply system, one drilled well, or a field of wells, feed water to a ground-level pumping station. This concept is presented in **Figure 4-5**. Chapter 3 indicates that the water treatment for ground water supplies may be less rigorous than for surface water supplies. The quality of the ground water in many areas of the country is so good that the only treatment necessary is chlorination through an injection method in the pipes that carry the non-potable water. In most cases, any other required water treatment generally is handled in a similar manner. The treated water either flows by gravity to the distribution system or is pumped to one or more elevated storage tanks. Potable water flows by gravity from the storage tank to the distribution system. Small communities that essentially operate off individual wells might want to consider this type of system. This is a more efficient way to provide water that is reliable year round, and is a system that can meet both consumer demands and needed fire flow requirements. This concept should be investigated with reference to the reduction in fire insurance premiums as the result of having a recognized water delivery system.

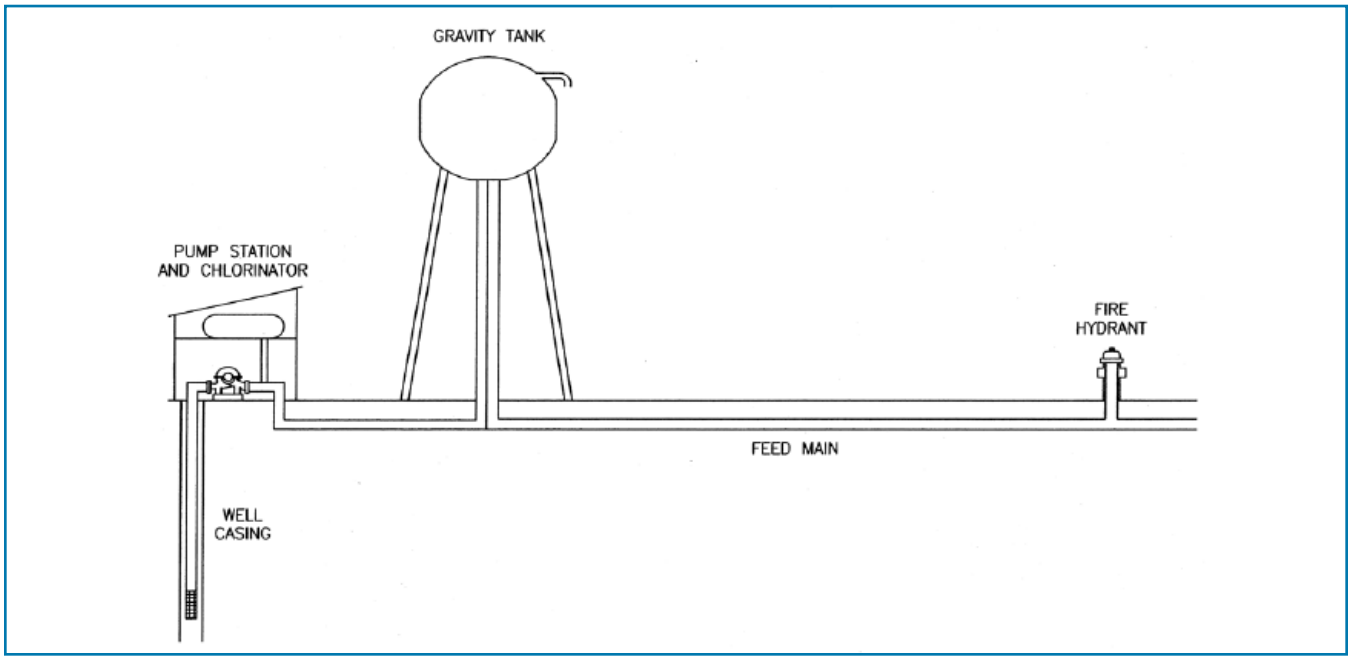

Figure 4-5

Composite Water Supply Systems

While the descriptions and configurations reviewed above cover the basic types of community water supply systems, specific conditions of areas served by the water system and, most importantly, the topography, may require a "composite system" that uses components from more than one of the "typical water systems." Some examples:

- Adding pumping stations to a gravity reservoir system to increase pressure and volume during peak demand periods including a fire flow requirement
- Gravity tank supplies often have more than one storage tank to meet daily consumption requirements. On smaller water systems, gravity tanks may be needed to meet both volume and pressure requirements in case of a "working structure fire."

- Booster pumping stations may be installed where there is a need for more than one service level based on pressure demand.
- Well fields may have a number of different lift pumps that transport water to a filtration plant instead of localized purification.
- Direct pumping into the distribution system may be supplemented by gravity tanks that "float" on the system to maintain pressure and flow characteristics during different demand periods through the day and night.
- Gravity tanks are especially useful for improving the reliability of any water system.

System Demand and Water Design and Flow Criteria

Overview

The following information is a synopsis of the subject title by the AWWA *Manual of Water Supply Practices* M-31. (7) This material reviews the *significant* relationships between the various demands placed on a water distribution system and outlines recommended design-flow criteria. However, before system demands or design-flow criteria can be reviewed, a basic understanding of a water distribution system and its specific components is needed. The following is a basic review of water distribution systems and the requirements placed on specific elements of a water system.

Methods of water distribution: Water is dispersed throughout the distribution system in a number of different ways, depending on local conditions or on regulations and requirements that influence water system design. The common methods of water distribution to the pipe network are reviewed under the following titles.

1) **Gravity distribution:** This is possible when the treated water source is a retention pond, clear well, or storage tank at some needed elevation above the community. In this type of system, sufficient pressure is available due to gravity to maintain water pressure in the mains for domestic consumption and fire service demand. This is the most reliable method of distribution if the piping leading from the treated water source to the community is adequate in size and safeguarded against accidental breaks. Higher pressures for firefighting, however, requires the use of mobile fire department pumpers and, in some cases, stationary booster pumps on the water system to provide needed fire flows at representative fire hydrants with a residual pressure of 20 psi.
2) **Pumps and elevated storage:** Through the use of pumps and elevated storage, the excess water pumped during periods of low consumption is stored in elevated tanks or reservoirs. During periods of high consumption, the stored water supplements the water that is being pumped. This method allows fairly uniform flow rates and pressures throughout the water system. Consequently, this method generally is economical because the pumps may be operated at their rated capacity. Since the stored water supplements the supply used for fires and system breakdowns, this method of operation is fairly reliable. However, it is necessary that fire department pumpers be available to boost the pressure from fire hydrant to delivery water through hose streams at the proper nozzle pressure to confine, control, and extinguish developing structural fires and other related fire events. A more complete understanding of these concepts is presented under **distribution storage** below.
3) **Pumps without storage:** When stationary pumps are used to distribute water, and no storage is provided on the distribution system, the pumps force water at the required volume and pressure directly into the mains. The outlet for the water is through domestic taps on the system or through fire

hydrants. This is the least desirable type of distribution system because a power failure could interrupt the water supply. In addition, as consumption varies, the pressure in the water mains is most likely to fluctuate. To conform to varying rates, several pumps are made available to add water output when needed, a procedure requiring constant attention at the water plant. Another disadvantage is the fact that the peak power demand of the water plant is likely to occur during periods of high electric power consumption, thus increasing power costs to operate the water system. However, one advantage of direct pumping is that a large stationary fire pump may be used on demand for structure fires. This pump increases the residual pressure to any desired amount permitted by the construction of the water mains.

Rates of Water Use

Three historical or predicted water demand rates are involved in the discussion of water system demand and design flow rate criteria for both consumer consumption and needed fire flow. These are as follows: (7)

1) **Average daily consumption:** This is the average of the total amount of water used each day during a 1-year period (usually expressed in million gallons per day, MGD)
2) **Maximum daily consumption:** This is the maximum total amount of water used during any 24-hour period in a 3-year period. This number should consider and exclude any unusual and excessive identified used of water that would affect the calculation. Such abnormal uses would include a water main break, a large-scale fire, or an abnormal industrial demand. This is often referred to as the MDC rate.
3) **Maximum hourly demand:** This is the maximum amount of water used in any single hour, of any day, in a 3-year period. It is normally expressed in gallons per day. It is determined in gallons per day by multiplying the peak hours by 24. This can also be express as MHD.

Distribution System Appurtenances

Piping and valve arrangement: *Water systems typically have three classifications of pipe used to transport to demand points throughout a community. These are identified as follows:*

1) **Primary feeders:** These are large pipes, usually with diameters ranging from 12 to 36 inches, based on the size of the population served. Primary feeders transport water form the water treatment plant to corporation line of the community and/or to major water storage locations within the community.
2) **Secondary feeders:** These are connected to the primary feeders to transport water along the major streets of the community. Secondary feeders need to be in place to supply all commercial property, public buildings, and private sector buildings that have a needed fire flow over 1,000 gpm. Secondary feeders typically are 10 to 16 inches in diameter.
3) **Distributor mains:** These are used to transport water from the secondary feeders to individual streets in the areas of the community that have small businesses like convenience stores and gas stations but, more importantly, along residential streets. The minimum pipe size should be 6 inches and, based on the system design, a possible dead- end pipe may need to be 8 or even 10 inches.

The sizes of pipe associated with the three classifications of pipe in a typical water system are approximations. The needed pipe size throughout the built-upon areas of a community is based on the hydraulic gradient of the community, consumer consumption profiles through the community, needed fire flow at representative locations throughout the community, and, quite importantly, the two methods for laying and connecting pipe throughout the community. The traditional pipe system design is referred to as a *Single-Point Feed System*. This is illustrated in **Figure 4-6**. In this case, water moves from the treatment plant to the community corporation line with a single primary feeder. The primary feed, in turn, supplies

the secondary feeders along the main streets of the community, and the distributor mains supply the block frontage along the residential streets. Note that any demand point on the system for either consumer consumption or fire flow through a fire hydrant, is fed from one direction only. In the single- point feed system, the pipe sizes need to meet the maximum daily consumption demand plus the needed fire flow. This results in a larger pipe than is needed under normal daily usage, without any fires. The second major weakness of this type of system is that there may be a lot of dead-end mains in the residential areas and at the end of secondary mains. This leads to the stagnation of water which rapidly reduces the quality of water, as discussed in Chapter 3.

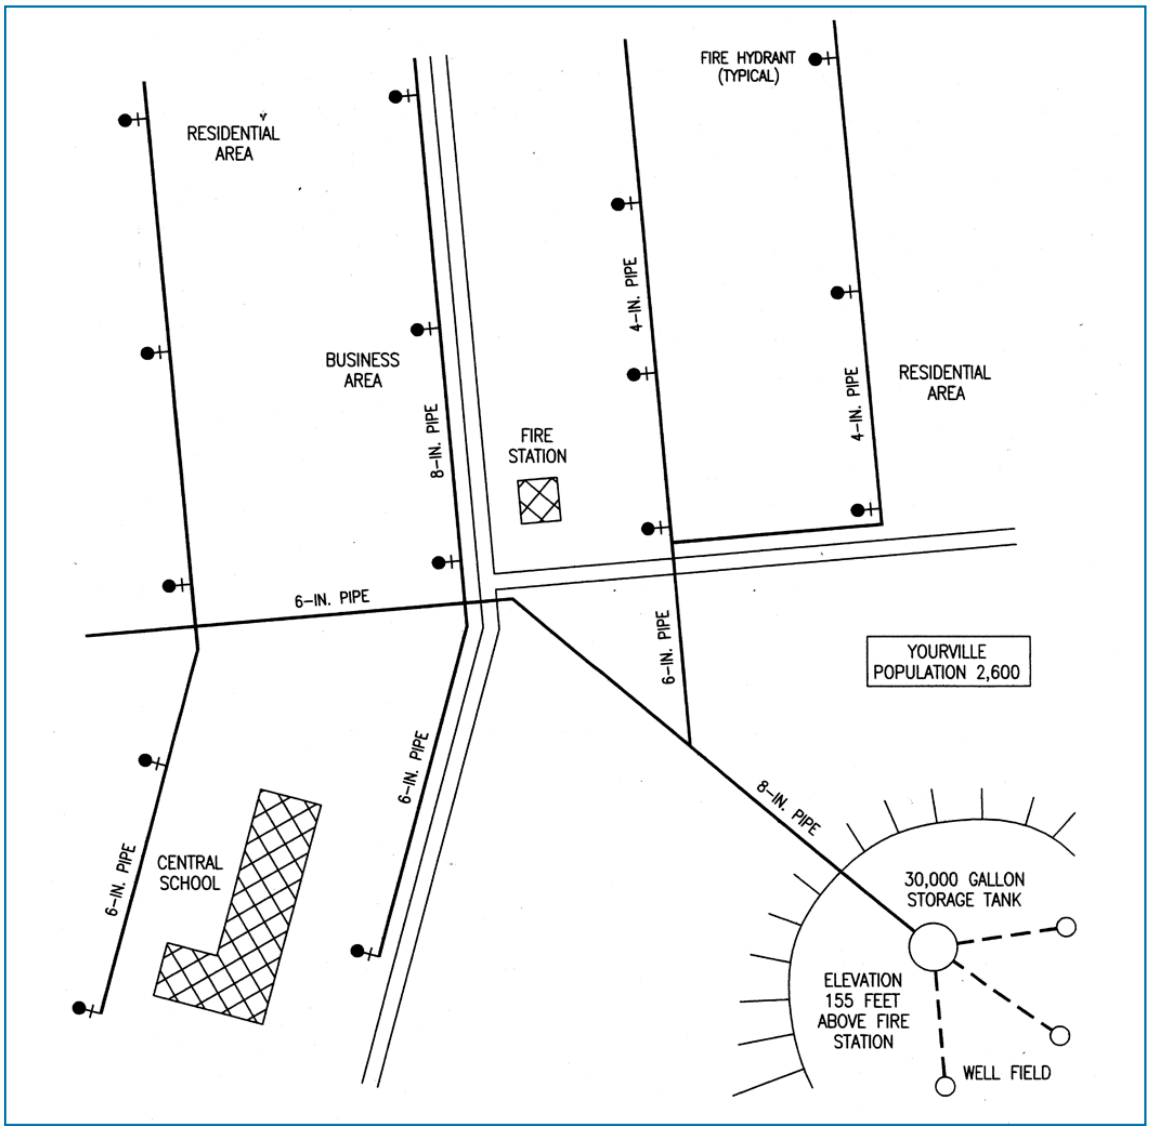

Figure 4-6: Features of a Small Community Water Distribution System

The more modern approach to water system design is to loop all the water mains, or cross-tie the mains, so that at any demand point the water is supplied from two directions. A basic *Pipe Looped* water system is depicted in **Figure 4-7**. This allows the designing engineer to develop a hydraulic model of the system and to determine mathematically the proper size of pipe according to flow paths to meet the consumer and needed fire flow demand points.

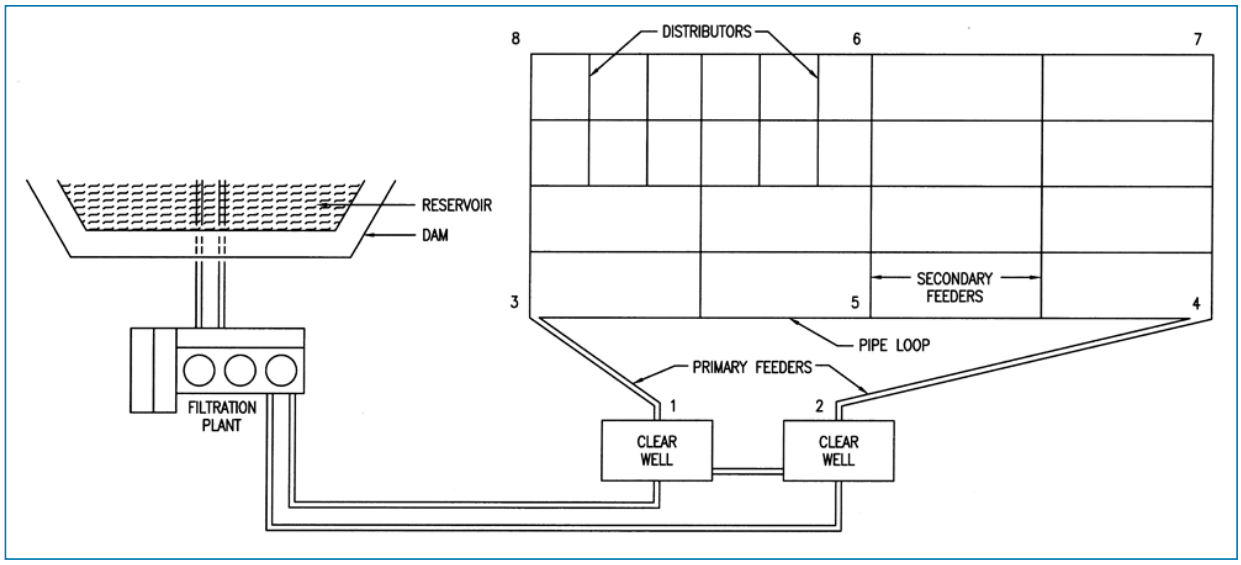

Figure 4-7: Layout of a Typical Looped Water Distribution System

It is important to note that many older water systems have been updated. By laying a primary feeder around the perimeter of the community to tie in all of the dead-end mains to improve both flow distribution and water pressures through the community. A simple example of this concept is presented in **Figure 4-8**.

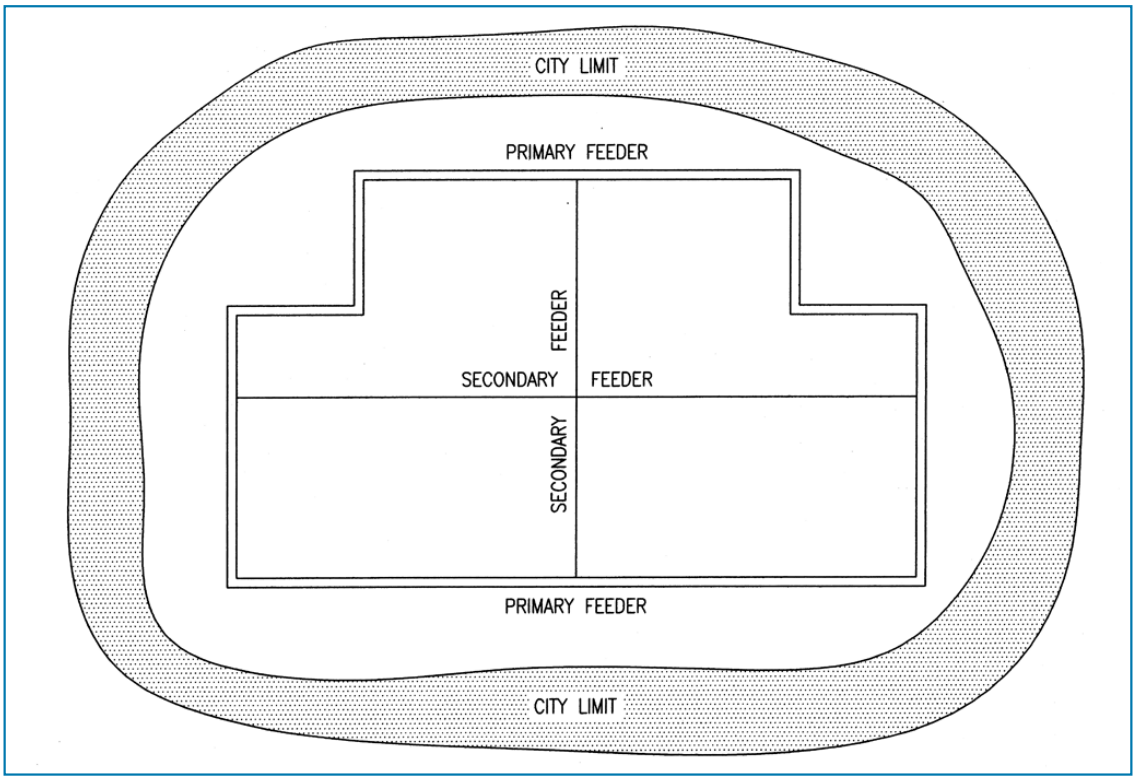

Figure 4-8: Typical Small City Distribution System

The following provisions conform to the current recommended practices of the AWWA.

- In small cities, the primary feeders should form a loop about 3,000 feet in length or two-thirds of the distance from the center of the community to the outskirts. The primary feeders should have control valves not over 1 mile apart, and the mains connecting them also should be valved where they connect. This configuration is necessary so that interruptions in service will not require shutting down the feeder main.
- In large cities, the primary feeders should be arranged into several interlocking loops, with the mains not over 3,000 feet apart. Looping allows continuous service through the rest of the primary mains even when one portion is shut down temporarily for repairs. Under normal conditions, looping also allows supply from two directions for large fire flows. Large feeders and long feeders should be equipped with blow-off valves at low points and air-relief valves at high points.
- The secondary feeders carry large quantities of water from the primary feeders to points in the system in order to provide for normal supply and fire fighting. They form smaller loops within the loops of the primary mains by running from one primary feeder to another. Secondary feeders should be spaced only a few blocks apart. The spacing allows concentration of large amounts of water for fire fighting without excessive heat loss and resulting low pressure.
- Small distribution mains for a grid over the area to be served supply water to fire hydrants and service pipes for residences and other smaller buildings. The size of these mains usually will be determined by the design flow. In residential areas, particularly where there are heavy uses for lawn watering, it may be necessary to determine the maximum consumer water demand.

This network of pipes throughout all the outlying sections of a community may consist of single mains or dual mains as depicted in **Figures 4-9** and **4-10**. **Table 4-1** presents a comparison of the repair procedures needed for single and dual main systems.

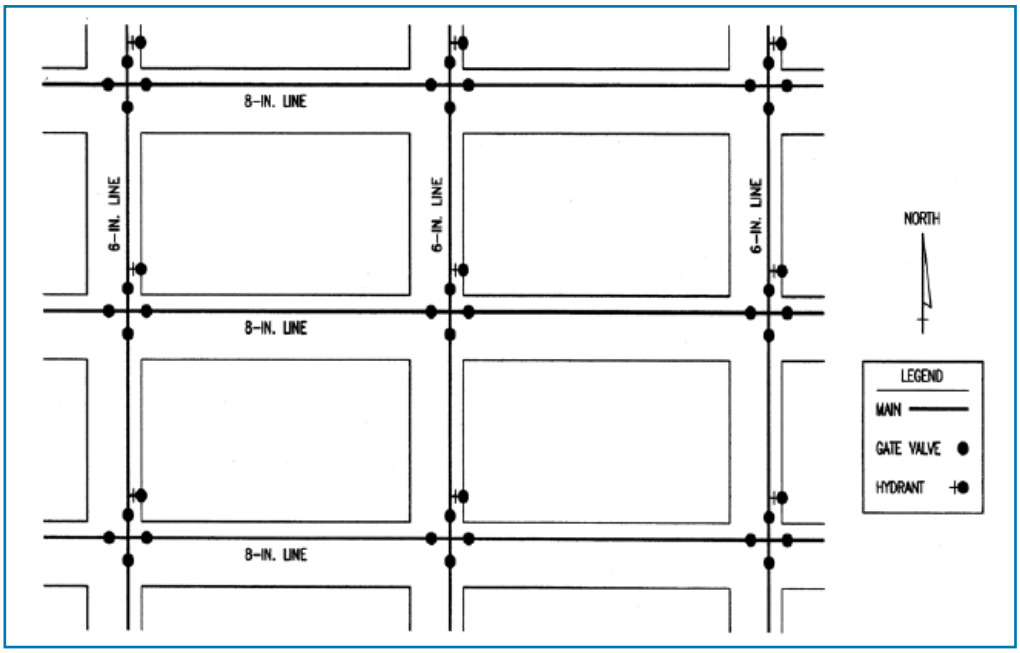

Figure 4-9: Single Main System Layout

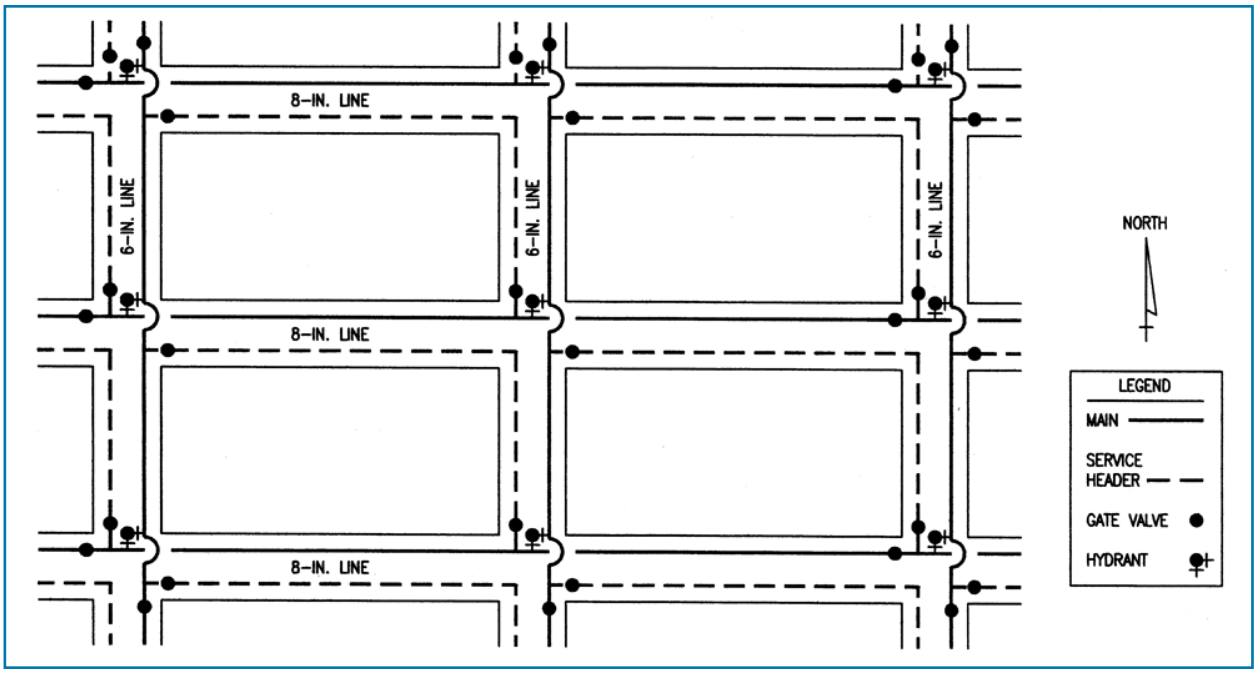

Figure 4-10: Dual Main System Layout

Table 4-1: Comparisons of Repair Procedures for Single and Dual Main Water Systems

Breakdown Points	Single Main Systems	Dual Main Systems
Fire hydrant	Close on hydrant valve.	Close to hydrant valves.
East-west mains	Close four valves on main. This dead-ends supply to one hydrant and cuts out intermediate service taps. It also dead-ends supply to eastern intersections.	Close two valves on main and one valve on each of the connected hydrants and service headers. Hydrants and service headers remain in commission. House service taps on mains are placed out of commission. Service headers are dead-ended.
North-south mains	Close two valves on main. One hydrant and intermediate house taps are placed out of commission.	Same as east-west main

The described network of pipes throughout all but the outlying sections of a community may consist of single mains or dual mains as presented in **Figure 4-9** and **Figure 4-10**.

The AWWA generally installs valves on a community water system on mains in the following recommended manner:

- four at crosses;
- three at tees; and
- one on each hydrant branch lines.

This is done in order to facilitate sectionalizing the water system for repairs and cleaning of the water units. In dual main systems, service headers are added on the south and west side of the streets, and piping is generally placed between the street curb and the sidewalks. In a scheme suggested by Ballou, valves are installed in the following manner: (2)

- one on each main at intervals of two blocks;
- one at the intersection of the service header; and
- one on each end of hydrant branches that are more than 10 feet long.

Service operations and conditions in breakdowns and cleaning can then be compared, as was shown in **Table 4-1**.

The hydraulic advantages of dual main systems over single main systems depend more or less on local conditions, because service headers generally do not contribute to flow outside their own area. More importantly, if broken, piping in dual main systems will not impair the usefulness of hydrants or create dead-end mains.

The dual main systems frequently will compare favorably in cost with single main systems. The advantages are that repairs can be made and new services laid without interfering with traffic or damaging the pavement, repairs can be made at lower costs, leakage usually is reduced, since service lines (which are liable to have heavy leakage) are reduced in length, and service pipes need not be laid where the main passes vacant lots, thereby reducing idle investment and minimizing resident time of water in the mains. Minimum use service mains are the common source of serious water system leaks.

Distribution piping should be sized to meet design flow as determined hydraulic analysis on water system flow gradients. The minimum size of water mains, for providing fire protection and serving fire hydrants, is 6 inches in diameter. Larger size mains will be necessary to achieve required fire flow and maintain residual pressure specified for both domestic consumption of fire flow. The piping must meet the minimum standards specified in **Table 4-2**.

Table 4-2: Minimum Standards for Distribution Piping

Appurtenance	Minimum Standard
Pipe Lines:	
Smallest pipe lines in the network	6 inches
Smallest branching pipes that are dead ends	8 inches
Largest spacing of a 6 or 8 inch grid	600 feet
Smallest pipes in the high value district	8 inches
Smallest pipes on principal streets in the central business or commercial district or business property complexes	12 inches
Largest spacing of primary and secondary feeders	3,000 feet
Valves:	
Spacing in single and dual main systems	
Largest spacing on long branches	800 feet
Largest spacing in commercial and high value districts	500 feet

Hydrant Locations

All built-upon areas of a community should be served by a water distribution system that not only provides taps for consumer consumption, but also provides approved fire hydrants for installation at locations and with spacing considerations for convenient use by fire department pumping equipment and

to meet needed fire flows in the proximity of the buildings to be protected. In North America there are two basic methods for the distribution of fire hydrants in a community. The first method is commonly used in Canada. It is mentioned briefly here because the method has been used in some of the northern States that border Canada. This method is fully described in *Water Supply for Public Fire Protection, A Guide to Recommended Practices*. (8)

The second method is a linear method document in the ISO's *Fire Suppression Rating Schedule* that is used to establish Public Protection Classifications (PPCs) using a scale of 1 to 10, with 1 representing the best possible classification and a 10 indicating no recognized fire protection for establishing insurance rates. While the classification system is somewhat complex, the lower or better the Class number, the lower the property fire insurance rates. In other words, a community classed as an 8 would be expected to pay much higher fire insurance premiums than a community that has a Class 4 rating. The community water supply evaluation accounts for 40 percent of the entire evaluation. The distribution and location of fire hydrants, based on needed fire flows for commercial buildings, is an important part of this evaluation. (4)

The needed location of fire hydrants in a community according to the Grading Schedule criteria can be briefly summarized as follows: The ISO evaluation procedures examines a number of representative locations throughout a community based on the population of the community; the number of installed fire hydrants on the water system; and property types, which include commercial, industrial, and residential properties along with educational facilities, public buildings, such as courthouses, libraries, hospitals, and all other places of public assembly. Buildings upon land areas within a community that do not have a fire hydrant within 1,000 feet of a structure also are evaluated. For a fire hydrant to be credited in the community survey, it must be within 1,000 feet of the property to be protected. Flow tests are conducted to determine that each fire hydrant delivers a minimum of 250 gpm at 20 psi residual pressure for a duration of 2 hours. Installed fire hydrants that do not have this capability receive no credit for insurance rating purposes although they may be used for limited fire suppression capability.

Of importance is that the fire hydrant spacing in a community is also evaluated. For individual property evaluations, the following maximum gpm flow is limited by the hydrant spacing from the risk site. Measurement is made according to the distance that a fire hoseline has to be laid to the fire risk building.

- 1,000 gpm may be credited for a fire hydrant within 300 feet.
- 670 gpm for fire hydrants from 301 to 600 feet.
- 250 gpm for fire hydrants from 601 to 1,000 feet.

Additional spacing criteria may be adopted by local building codes and/or the governmental authority having jurisdiction over a specific building. Commercial buildings that are protected by approved automatic sprinkler systems may have special requirements by individual insurance companies for fire hydrant locations that may be used to reinforce the water supply volume and pressure by fire department pumpers to control and extinguish interior fires. Municipal officials need to call these special needs to the attention of community property protected by automatic sprinkler systems.

In addition to the above provisions, it is a recommended practice that the maximum lineal distance between fire hydrants along streets in congested areas and high fire risk areas with frame buildings and/or high combustible storage (such as lumber), be located 300 feet apart and a maximum of 600 feet, in light residential areas with building separations of **over** 50 feet. Other good practices for the installation of fire hydrants calls for at least one fire hydrant at every street intersection, in the middle of long blocks (especially where the needed fire flow exceeds 1,300 gpm), and near the end of long dead-end streams.

Hydrants should be required within large complexes that are accessible to fire department apparatus equipped with mobile pumps.

A key consideration: It is essential that the planning of fire hydrant locations be a ***cooperative*** *effort between the community water department, the fire department, the building and zoning department, and with the insurance carrier for large commercial and industrial complexes. The proper location of the fire hydrants definitely can have a positive impact on property fire insurance rates.*

Installation of Fire Hydrants

The proper installation of fire hydrants on municipal water systems has to give consideration the construction features of the fire hydrant. (10) These include, but are not limited to the following features for providing adequate and reliable water supplies for fire protection.

- The nominal diameter of the bottom valve opening needs to be at least 4 inches for supplying two 2-1/2-inch outlets. However, it is recommended that at least one large diameter outlet be provided for the connection hose to a mobile fire department pumper. Today, it is generally recommended that the bottom valve be a minimum of 6 inches.
- The net area of the hydrant barrel and foot piece at the smallest part is not to be less then 120 percent of that of the net opening of the main valve.
- A sufficient waterway through the fire hydrant needs to be provided to minimize friction loss in the fire hydrant. The hydrant designed should not permit more that 5 psi loss from the main valve intake to the discharge side of the fire hydrant with design flows of no less then 1000 gallons per minute. This information is obtained from the Underwriters Laboratories, Inc. (UL) listing.
- A positive-operating, corrosion-resistant drain or drip valve is to be provided.
- A uniform sized pentagonal operating nut measuring 1-1/2 inch from point to the flat at the base and 2-7/16 inches at the top. The faces should be tapered uniformly and not less than 1 inch.

Fire hydrant bonnets, barrels, and foot piece are generally made of cast iron with internal working parts of bronze. Valve facings should be of a suitable, yielding material such as rubber or a composition material. Fire hydrants are available a number of different configurations, which should be adapted to the installation location.

Types of Fire Hydrants

Two types of fire hydrants are generally in use today. The most common is the base valve or dry barrel, in which the assembly controlling the water supply from municipal water system pipes is below the frost line between the foot valve or "piece" and the barrel of the fire hydrant. This common type of fire hydrant is illustrated in **Figure 4-11.** The barrel on this type of fire hydrant is normally dry, with water being admitted only when there is a fire or when the hydrant is flow tested; other uses of this fire hydrant are discouraged. A drain valve at the base of the barrel is open when the main valve is closed, thus allowing residual water in the barrel of the hydrant to drain out. This type of fire hydrant needs to be installed whenever there is a chance the temperature will go below freezing, because the valve assembly and water supply are installed below the frost line determined from climatic conditions.

The second type of basic fire hydrant is the wet-barrel type which is normally limited to the southern and western States where protracted *freezing* is most unlikely; temperatures inside the hydrant barrel must remain above freezing at all times. This type of fire hydrant usually has a compression valve at each outlet, but they may have another valve in the bonnet that controls the water flow to each of the hose outlets. This type of fire hydrant is illustrated in **Figure 4-12.**

In the side Figure, a base valve, or a dry barrel is illustrated with nomenclature identified. When installed, the valve is below the frost line. This type of fire hydrant also is known as a "frost-proof" fire hydrant. (Source: *Mueller Company*)

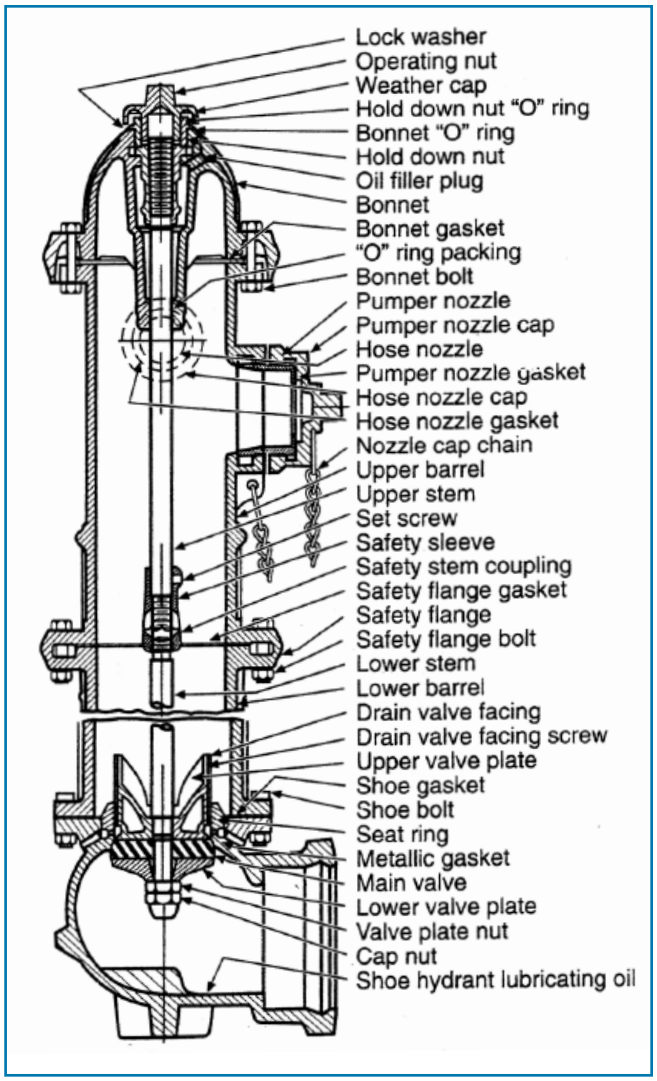

Figure 4-11:
Dry Barrel Fire Hydrant

Installation Positioning

The following guidelines have been prepared by the International Fire Service Training Association. (11)

1) The large-diameter outlet on a fire hydrant, normally 4 inches to 6 inches, should be positioned perpendicular to the curb line on streets or to the edge of the roadway where a fire department can connect hose from the fire hydrant to the intake of the mobile fire pump.
2) The maximum connection distance between the large-diameter outlet on a fire hydrant and the intake connection on a mobile pumper should not exceed 15 feet; less than 10 feet is preferable except for special situations such as parking lots and parking garages.

   The responsible fire department should be consulted on special fire hydrant installation problems.
3) There should be no obstructions within 10 feet of any installed fire hydrant. Such obstructions generally include traffic standards, sign posts, utility poles, trees, shrubbery, and fences.

   A *wet-barrel* or California-type fire hydrant maybe used where freezing temperatures are not encountered. There is a compression valve at each outlet. (Sources: Mueller Company)
4) The clearance between the bottom *of any* hydrant capped outlet to the ground level or hard surface levels is not to be less than 18 inches. To provide for connecting different types of hose fittings to the fire hydrant.
5) All fire hydrants needs to be painted a bright color and that color maintained for visibility by approaching fire apparatus from all directions.

Installation Drainage

Drainage is necessary for fire hydrant equipped with drain ports, and can be provided by excavating a pit about 2 feet in diameter and 2 feet below the base of the fire hydrant and filling it compactly with course gravel or stones placed around the bowl of the fire hydrant to a level 6 inches above the waste opening. If the drip valve of the hydrant is below ground water level, it maybe plugged to exclude ground water. In this case, water should be pumped out to prevent freezing. This same procedure should be followed for

older installed fire hydrants not equipped with drain features and that have been install for many years. (10)

General Maintenance of Fire Hydrants

A major item of periodic maintenance recommended on a quarterly schedule is a check for any external damage to each fire hydrant and a check for leaks in the fire hydrant mechanism that include 1) the main valve assembly when the fire hydrant is closed, 2) the drip valve when the main valve is open but outlet are capped, and 3) the mains the supply each fire hydrant. Stethoscope-like listening devices are available to make these checks.

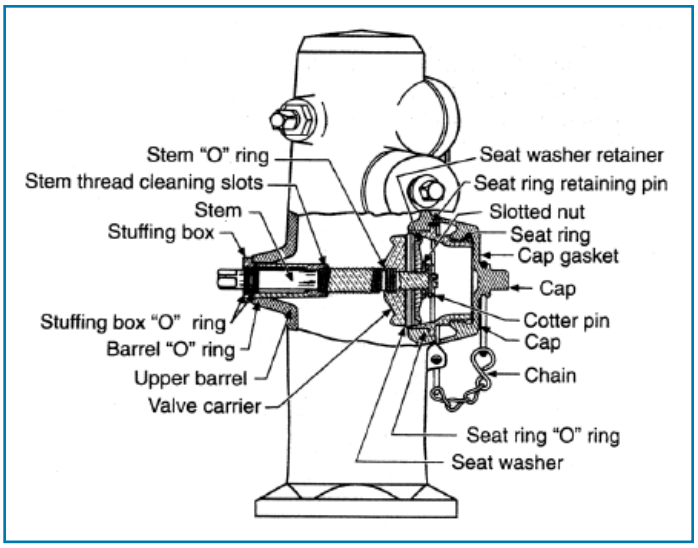

Figure 4-12: Wet Barrel Fire Hydrant

Maintenance routines provide for an operating test, repair of any leaks, and pumping out of fire hydrants where necessary. Threads of the outlet, caps, and the valve steam should be lubricated with graphite. Hydrants should be kept painted on a scheduled basis for proper location during an emergency, but care should be taken to avoid accumulation of paint that might prevent easy removal of caps or operation of valve stems. (10)

System Evaluation and Design

The designing and evaluating of community water supply distribution systems has to consider the amount of water for the commercial interests, governmental property, educational facilities, and all classifications of residential property as presented above in a general relationship to average and maximum daily consumption demand. At any time of the day, the day of the week, or the week of a given year, a structure fire or other fire emergency such as transportation vehicle fires or, in some cases, natural cover fires may erupt. Water is the primary agent of choice to confine, control, and extinguish structural fires. Some new development in fire extinguishing agents may be used for rapid knockdown of a fire, but a well-developed structure fire still requires established needed fire flows from fire hydrants to control and extinguish developing fires. Each community needs to evaluate and design or modify the design of the community water system to meet present-day needs to address future demands based on growth of the built area and population increases, along with the need to meet EPA criteria for water quality, as discussed in Chapter 3. This will be an ever-increasing demand and challenge for *every* community water distribution system.

Some specific guidelines on consumer consumption requirements and needed fire flows, are established by the ISO, which represents in excess of 130 property and casualty underwriters in the United States in developing advisory insurance rates. The following topics address some fundamental information on understanding 1) water system demands, 2) determining design flow, and the very important topic of 3) water storage on a community water system. This should provide community leaders, municipal officials, fire department officials, water supply superintendents, and consulting engineers on water systems, a common knowledge base so that they all can sit at the same table and have a meaningful dialog about the present and future state of a specific water system and even how it may relate to adjacent water supplies in nearby community water systems.

1) **Water system demands:** Water demands need to be assessed on the basis of the following considerations:

   a) The year and date the water supply system was commissioned or started supplying water through the distribution system. Hopefully, there is a water supply system map that will detail where pipes were laid, the size of the pipes, the pipe material, the location of the valves, the location, size and type of fire hydrants along with the lateral size and valving arrangements.

   b) These water maps need to show all extension and changes to the water system covering the same topics as above.

   A clear and accurate knowledge of the water system in place is needed before discussing changes to be made to existing systems. If this is to be a new community water system, all of these details should be laid out on a proposed street map for evaluation. If an Engineering Firm uses different criteria, it should conform to the most current publications of the AWWA, the National Fire Protection Association (NFPA), the ISO, the Civil Engineering Handbook, and any special State or county regulations.

   There should be no oversight in considering both short-term and long-term goals. The primary objective is to make sure that the community is being serviced adequately. If there are deficiencies in meeting current or future goals because of economic constraints, this needs to be identified for the areas of the community where there may be inadequate flows to meet consumer consumption during peak water demand, so that constraints such as watering lawns and washing cars, can be placed on water usage. If available fire flows do not meet needed fire flows in specific districts of the community, the fire department needs to know these conditions on virtually a real-time basis. The local fire department may need to plan on relaying water from larger supply mains to fire sites using large-diameter hose or the existing water supply may need to be augmented by an alternative water supply using mobile takers from adjacent fire departments under automatic-aid and mutual-aid arrangements. Another alternative is to provide retention ponds in the community to capture runoff. Retention ponds may be outfitted with dry hydrants as a supplementary water supply for fire protection.

   [Sidebar: Refer to Chapter 6 for further discussion of Alternative Water Supplies.]

2) **Planning water demand changes:** Special planning is needed when new water demands will be placed on a specific community water system. This point cannot be overstressed. The amount of construction performed and the amount of construction that realistically can be accomplished to provide adequate service are dependent on when the construction will be needed. Ultimately, final development should be consistent with the utility's ability to provide consumer consumption and fire protection at the same time. Fire protection must not lag behind supplying domestic taps, as often occurs in new residential areas of communities. The planning and installation phase should assure that water supply for fire protection is *never* interrupted. There have been too many large-loss structure fires because the water system was shut down in the vicinity of the fire site.

   The ideal way to develop a water distribution system would be to construct a distribution network of pipe that would adequately serve the short-range and long-range development of the service area. Individual construction projects, developments, subdivisions, and industrial complexes then could be developed without checking for adjustments to ensure that the original design plans remain adequate for all projected consumer consumption and fire protection demand. However, in reality, the best of plans needs to be adaptable to change measures where growth, moves, and demand may decline in older portions of a community. Therefore, the design for the source, through the treatment plant to the distribution system, must provide for growth and change in the delivery demand points. The best water system is the one that is designed with a vision for the future. Existing water systems have to be

evaluated and redesigned with a future perspective that includes a rehabilitation and/or replacement of existing system components due to the age factor. The maintenance of old infrastructures may be more expensive than the replacement with a better designed system that will meet both the future needs of water quality and distribution system demand.

The bottom line is that a water supply system cannot remain constant. It is the responsibility of elected officials, water supply superintendents and their staff, hydrologist, geologists, professional civil engineers, rural and urban planners as appropriate, fire officials and fire protection engineers, and representatives from the insurance industry to sit at the table and plan water systems for the future with due consideration to all of the regulations and requirements that are being placed on water systems at this time and in the future, especially as programmed by the EPA. The cost to do this is not going to be any small thing, so the financial planning is just as important as the physical planning.

It is now recommended that every 3 to 5 years, as a minimum, existing water distribution systems be evaluated thoroughly for requirements that would be placed on it by development and reconstruction for a 20-year period into the future. A plan then should be developed for meeting those needs. In this way, individual improvements and projects can be evaluated and made to conform, generally, to long-term development and contingency plans for such events as serious system interruptions caused by natural disasters and terrorism attacks without undue additional expense to either the developer or the utility.

Basic Concepts in Determining Design Flow at System Demand Points

The first step in evaluating or designing a water delivery system is to determine design flows for all of the representative built-upon regions of the community and the community expansion plans. The fundamentals of calculating water system design flow are as follows:

1) Determine the average daily demand.

   [Sidebar: See Chapter 5 for guidance on determining flow demands by areas of the community.]

2) Determine the maximum daily demand or estimate it from the average daily demand.
3) Determine the maximum hourly demand from consumption records or for new areas of the community, estimate from the average daily rate.
4) Determine the ISO needed fire flow that is discussed in Chapter 5. Actually, two methods of determining fire flow are presented for evaluation but only the ISO method is used for establishing PPCs advisory insurance rates used by most property and casualty underwriters.
5) Determine the required flow for sprinkler system requirements plus a supplemental allowance for fire streams if a commercial property is protected by an automatic sprinkler system.
6) Select an appropriate design flow for the community water system. This is the greater of the following two conditions: either the sum of the required fire flow for the most stringent situation which, not considering property protected by automatic sprinklers, plus the maximum daily consumption demand; or the maximum hourly demand, whichever is greater.

The community water supply planning group must exercise good judgment based on the facts at this point. The following example makes this point very clear. It relates to communities that have manufacturing plants or seasonal agricultural processing and canning plants.

In this example, the property in question is identified as a manufacturing facility that uses large amounts of water for only 8 hours during one shift per day, 5 days a week. With relatively little domestic use, the maximum hourly demand would be in excess of what the water supply committee would expect from normal projection data and examining the average daily demand. In this case, the water system serving

the facility should be designed to provide the required flow plus the maximum hourly flow. It would be costly and essentially irresponsible to consider treating a fire at this facility on the basis of an average daily demand that has no real meaning in the particular context. Furthermore, commercial properties that have a high peak demand for short periods of time should work with the community to provide private water storage to meet these peak periods. This could save major water treatment costs and pipe design costs to transport water to these specific demand points that have an infrequent need for the supply.

It is very important to design and evaluate a given water system using the design flow as generally determined by the above considerations so as to ensure the adequacy and reliability of the system. Therefore, it is essential that all of the issues relating to water system adequacy and reliability as presented under **Water Supply Concepts and Evaluation Methods** be considered carefully when considering the future design of a new or existing community water system.

Distribution System Storage

Finished water placed in storage within the framework of a community water system, may just be one of the most important aspects of achieving optimal performance, reliability, and cost effectiveness in water system design. It should be understood that water storage facilities have a far-reaching effect on a water systems ability to provide needed fire flows when the fire cannot be immediately extinguished by the first arriving fire company. The two common methods of storing water on a water distribution system are discussed below under:

- ground level storage; and
- elevated storage.

There are relative merits to both types of storage. Prior to examining these two common types of water storage, preliminary considerations need to be examined on the basic purpose of water storage.

Functions of water system distribution system storage: Storage capacity within the framework of a distribution system enables the system to process water at a time when a treatment facility would be unable to meet the systems demands or when the treatment facility is idle. Stored water provides the possibility to distribute the treated or finished water to one or more locations in the service areas that provides the best flow and pressure to the end user.

1) **Advantages:** The principle advantages of water distribution storage include the fact that storage equalized demands on supply sources, water treatment facilities, plus the transmission and distribution mans. As a result, the sizes or capacities of these elements need not be as large as would be required if storage was not provided. Additionally, system flows and pressure can be improved and balanced or stabilized to better serve both consumer and required fire flows throughout the service area. Finally, reserve supplies are provided in the distribution system for other emergencies such as power outages and breaks in the water distribution system.
2) **Storage as a function of meeting system demands and required fire flows:** The location, capacity, and evaluation, if required, of distribution system storage are considerations that are closely associated with system demands and the variation in demands that occur throughout the day in different parts of the system. System demand can be determined only after careful analysis of an entire distribution system by professional engineers in cooperation with local authorities and the water supply planning committee as identified above. However, there are some general rules that may serve as a guide to such an analysis. **Table 4-3** lists daily and hourly variation for a typical city and the resulting treated water storage depletion.

Table 4-3: Water Use and Storage Depletion for Maximum Day in a Typical City

Hour	Ratio of Hourly Demand Rate to Maximum Day Demand Rate*	Hourly Variation in Distribution Storage Reserve Mil Gallons	Cumulative Storage Depletion Mil Gallons
7–8 a.m.	1.00	-0.00	0.00
8–9	1.10	-0.10	0.10
9–10	1.25	-0.25	1.35
10–11	1.28	-0.28	0.63
11–12	1.20	-0.20	0.83
12–1 p.m.	1.18	-0.18	1.01
1–2	1.16	-0.16	1.17
2–3	1.10	-0.10	1.27
3–4	1.00	-0.00	1.27
4–5	1.08	-0.08	1.35
5–6	1.15	-0.15	1.50
6–7	1.30	-0.30	1.80
7–8	1.60	-0.60	2.40
8–9	1.40	-0.40	2.80
9–10	1.25	-0.25	3.05#
10–11	0.90	+0.10	2.95
11–12	0.85	+0.15	2.80
12–1 a.m.	0.70	+0.30	2.50
1–2	0.60	+0.40	2.10
2–3	0.50	+0.50	1.60
3–4	0.50	+0.50	1.10
4–5	0.50	+0.50	0.60
5–6	0.60	+0.40	0.40
6–7	0.80	+0.20	0.20

* Average day—16 million gallons; Maximum day—25 million gallons; constant hourly supply rate (at maximum day demand rate), 24 million gallons per day or 1 million gallons per hour.

\# Maximum storage depletion.

Of course, each water system has its own requirements. Furthermore, it should be recognized that only in rare cases can distribution storage be justified economically in an amount greater than what will take care of normal daily variation and provide the needed reserve for fire protection and minor emergencies. In systems of moderate size, the amount of water storage available for equalizing water production is 30 percent to 40 percent of the total storage available for water pressure equalization purposes and emergency water supply reserves. In normal system operations, some water from storage should be used each day not only to maintain uniformity in production and pumping, but also to ensure circulation of the stored water for purposes of maintaining water quality. The best economical arrangement for the storage of water for delivery to the distribution system is to bring all storage to full capacity at night when there is minimal domestic consumption and then increase as needed when storage capacity drops to between 40 percent and 50 percent at each storage point location during the day. In the event of a working structural fire in a

community at any time of day or night, pump capacity should be brought on line to compensate for the fire flow being used.

Normally, it is more advantageous to provide several smaller storage units in different parts of the system than it is to provide equivalent capacity at a central location. Small pipelines are required to serve decentralized storage, and other things being equal, a lower flow-line evaluation and pumping head result.

Elevated and Ground Storage

Storage within the distribution system is normally provided in one of two ways:

1) Elevated storage.
2) Ground-level storage with high service pumping.

It should be recognized that elevated storage provides the best, most reliable, and most useful form of water storage, particularly for fire suppression requirements.

Ground-level storage: Since water kept in ground storage is not under pressure, it must be delivered to the water demand points by pumping equipment. This arrangement especially limits water system effectiveness for fire protection in three ways:

1) There must be sufficient excess pumping capacity to deliver the peak consumer consumption demand use as well as any fire demand which requires unnecessary investment in pumping capacity, **or** if the pumping capacity is deficient to meet this demand, it could adversely impact on the ISO PPC which drives fire insurance rates in the community.
2) Standby power sources and standby pumping systems must be maintained at **all times** because the system cannot function without the pumps.
3) The distribution lines to all points in the distribution system must be significantly oversized to handle peak demand use, plus required fire flow, no matter where a fire could occur in the community.

However, in hilly areas it is frequently possible to install ground-level reservoirs at a sufficient elevation so that the water would "float" on the distribution system. This may eliminate the need for pumps at the ground-storage facility or reserve pumps only for high demand periods. If the desired overflow elevation can be achieved on a hill, a considerably larger storage capacity can be installed when compared to an elevated tank. This may result in placement of the storage facility on a hill in a less desirable location and then use transmission mains down to the primary feeder pipes. Such placement would provide larger storage capacity than could be achieved by an elevated tank(s) or it would provide the equivalent storage more economically.

Where ground storage is used in areas with high fire risk, buildings with flows of 1,000 gpm or more, the energy would be needed to deliver the water that is lost on the initial delivery of water to the water system. The water must be repumped and repressurized with the consequence of additional or more standby generators and more standby pumps to provide fire flow adequacy. In addition, the system's high-service pumps must be either variable speed or controlled by discharge valves to maintain constant system pressures. This equipment is expensive, uses additional electric power, and requires extensive operation and maintenance. Frequently, the additional capital costs for pumps, generators, and back-up systems, and the long-term energy costs significantly increase the costs of a ground storage system.

Elevated storage: Properly sized elevated water tanks provide dedicated fire storage and are used to maintain constant system pressure.

Domestic water supplies are fed regularly to the system from the top 1 to 15 feet of water in elevated tanks. As the water level in the tank drops, the tank controls call for additional high-service pumps to start in order to satisfy the system demand and refill the tanks. The high-service pumps are constant-speed units, which can be operated at their highest efficiency point virtually all of the time. The remaining water in the tanks, which is roughly 70 percent to 75 percent capacity, normally is held in reserve as dedicated fire storage. This reserve will feed the system automatically as the fire flow demand and the domestic use demand at a specific time exceed the capacity of the system's high-service pumps.

Pumping for distribution storage: The two types of distribution storage, ground and elevated, have in turn, two types of pumping systems. One is a direct pumping system, in which the instantaneous system demand is met by pumping, with no elevated storage provided. The second type is an indirect pumping system in which the pumping station lifts water to a reservoir or elevated storage tank, which floats on the system and provides system pressure by gravity. Basic details on each type of system are presented below:

- Direct pumping: This system relates to older water systems and, with the exception of small communities, is generally very rare today, but some do exist. Variable-speed pumping units that operate off direct pressure are also in use in some medium sized communities. Hydropneumatic tanks at that pumping station provide some storage. These tanks permit the pumping station pumps to start and stop, based on a variable system pressure preset by controls operating off the tank.
- Indirect pumping: In an indirect pumping system, the pumping station with one or more pumps is not associated with the demands of the major load center on the water system. It is operated from the water level difference in the service or elevated storage cent(s), enabling the prescribed water level in the tank to be maintained. The majority of water systems today have an elevated storage tank or reservoir (or both) on high ground, floating on the water distribution system. This arrangement permits the pumping station to operate at a uniform rate, with the storage either making up or absorbing the difference between station discharge and system demand.

Analysis of storage: Two variations of distribution storage design affect the operation and reliability of a water system's capability to meet consumer consumption and fire suppression capabilities. These variations involve placement of the storage between the supply point and the major load center or beyond the major load center. An analysis of the following storage designs will be made in the remainder of this chapter:

- System A: a pumping station supplying the major center of the demand (load) with no elevated storage;
- System B: a pumping station supplying the major center with an elevated storage tank between the supply and the demand (load) point; and
- System C: a pumping station supplying the major center of demand with an elevated storage tank beyond the demand (load) point.

System Criteria

- Normal minimum working pressure in the distribution system should be approximately 50 psi and not less than 35 psi during a maximum hour. A normal working pressure in most systems will vary between 50 and 56 psi.
- System must be designed to maintain a minimum pressure of 20 psi at ground level at all fire hydrants on the distribution system under required fire flow conditions.
- Maximum day demand is 1.5 times the average daily demand.
- Maximum hour demand is 2.25 times the average daily demand.

Components of the Model System

The model system used in the analysis of the three systems (i.e., A, B, and C) has the following characteristics:

- population = 27,000;
- water demand rules:
  - Average Daily Consumption (ADC) = 27,000 × 150 gpcd = 4.0 mgd,
  - Maximum Daily Consumption (MDC) = 4.0 × 1.5 = 6.0 mgd, and
  - Maximum Hour Consumption (MHC) = 6.0 × 1.5 = 9.0 mgd;
- needed fire flow (NFF):
  - Maximum NFF is 5,000 gpm = 7.2 mgd, and
  - Maximum Day Rate plus NFF: 6.0 + 7.2 = 13.2 mgd; and
- pressure profile:
  - Minimum pressure at the major load center = 50 psi, and
  - Minimum pressure on the maximum day plus fire flow = 20 psi

Special Note: System pipelines are all expressed as equivalent lengths of 24-inch pipe with a C factor of 120. The hydraulic gradient is the slope of the line joining the elevations to which water would rise in pipes freely vented and under atmospheric pressure.

System A: No storage: If no storage is provided in System A, as depicted in **Figure 4-13**, at a given demand rate, the pumping station hydraulic gradient must be sufficient to overcome system losses at a demand rate and maintain a minimum of 115 feet at the major load center. Thus, the pumping heads required maintaining 115 feet plus the head loss in 40,000 feet of equivalent pipe for the various conditions as follows:

Demand Rates		Pumping Head Required
Average day, 4.0 mgd:	115 + (0.67 × 40)	= 142 ft.
Maximum day, 6.0 mgd:	115 + (1.42 × 40)	= 172 ft.
Maximum hour, 9.0 mgd:	80 + (3.0 × 40)	= 200 ft.
Maximum day + NFF, 13.2 mgd:	46 + (6.1 × 40)	= 290 ft.

System B: Storage ahead of the load center: If, as shown in **Figure 4-12**, a 1.0-million-gallon storage tank is located 130 feet above datum plane and at a distance of 35,000 feet from the pump station (5,000 feet ahead of the major load center), the pumping head of a given pumping rate must be sufficient to pump against a head at the storage tank and overcome system losses at the pumping rate.

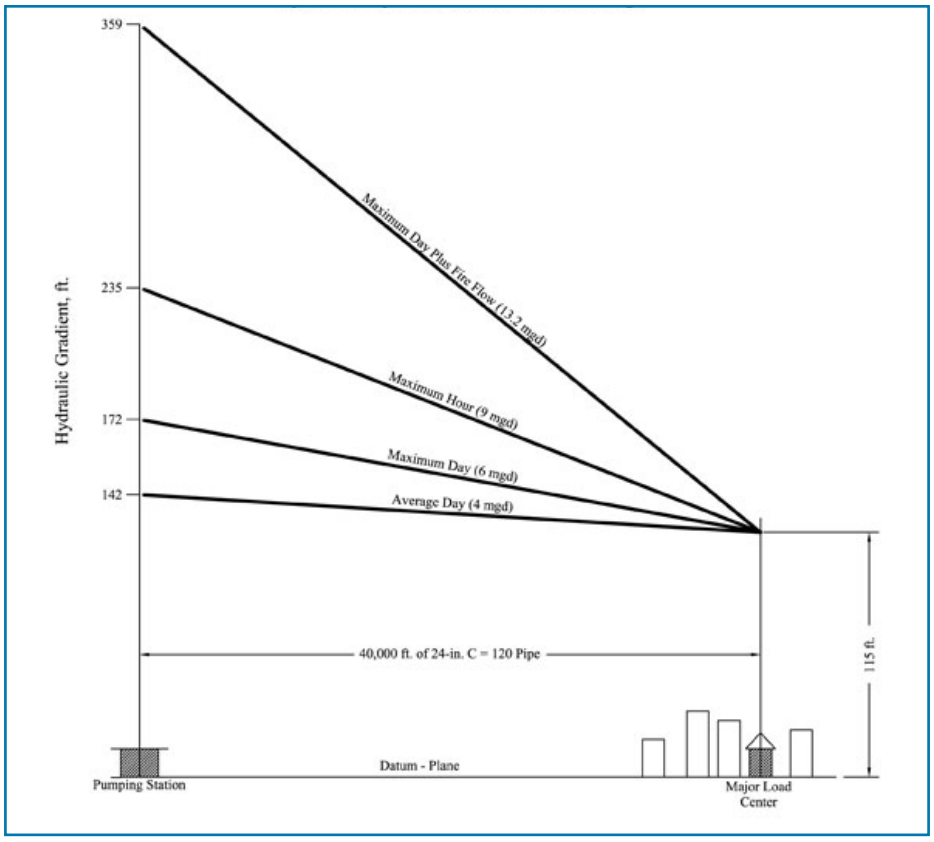

Figure 4-13: System A—Hydraulic Gradient with no Storage

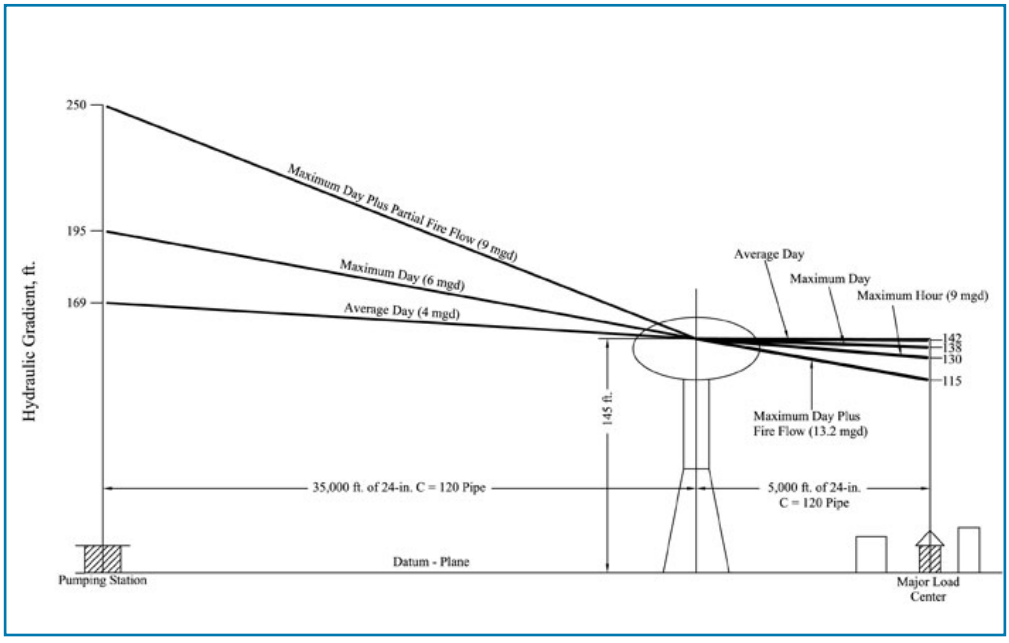

Figure 4-14: System B—Hydraulic Gradients with Storage Between Pump Station and the Load Center

Average day demand: At the average day demand, the required pumping rate with no water taken from storage is 4.0 mgd. The pumping head required is equal to the hydraulic gradient at the tank, plus the head loss in 35,000 feet of equivalent pipe at 4.0 mgd, or 130 + (0.67 × 35) = 153 feet. The hydraulic gradient at the load center is the hydraulic gradient at the tank, minus the head loss in 5,000 feet of equivalent pipe or 130—(0.67 × 5) = 127 feet.

Maximum day demand: At the maximum day demand, the required pumping rate is 6 mgd with no water taken from storage. The pumping head required is equal to the hydraulic gradient at the tank, plus the head loss in 35,000 feet of equivalent pipe at 6.0 mgd or 130 + (1.42 × 35) = 195 feet. The hydraulic gradient at the load center is the hydraulic gradient at the tank, minus the head loss in 5,000 feet of equivalent pipe at 6.0 mgd or 130—(1.42 × 5) = 123 feet.

Maximum hour demand: At the maximum hour demand, the flow at the load center must be 9 mgd and the pressure should be no lower than 35 psi or 80 feet. The pumping head required is equal to the hydraulic gradient at the tank, plus the head loss in 35,000 feet of equivalent pipe at the chosen pumping rate. If 1.0 mgd is to be supplied from the tank storage and the remaining 8 mgd is to be supplied from pumping, the pumping head required is 130 + (2.41 × 35) = 214 feet as depicted in **Figure 4-14**.

Maximum day rate plus needed fire flow: At the maximum day rate plus the fire demand, the flow to load center must be at a 13.3 mgd rate at a minimum pressure of 20 psi or 46 feet. If 1 mgd is supplied from storage, the pump station would have to pump the remaining 12.2 mgd, and the pumping head required is then equal to the hydraulic gradient at the tank plus the head loss in 35,000 feet of equivalent pipe at 12.2 mgd or 100 + (5.2 × 35) = 282 feet.

Demand Rates	Theoretical Pumping Head Required
Average day rate, 4.0 mgd: no water from storage	= 153 ft.
Maximum day rate, 6.0 mgd: no water from storage	= 180 ft.
Maximum hour rate, 9.0 mgd: 8.0 mgd rate from pump(s) and 1.0 mgd rate from storage	= 214 ft.
Maximum day rate plus fire flow, 13.2 mgd: 12.2 mgd rate from the pumps plus 1.0 mgd rate from storage	= 282 ft.

System C: Storage beyond load center: In the arrangement shown in **Figure 4-15**, 1.0 million gallons of storage is provided 5,000 feet beyond the load center, or 45,000 feet from the pump station, at an elevation of 119 feet above the datum plane. When no waste is being taken from storage at a given demand rate, the pumping head must be sufficient to pump against the head at the tank and overcome losses between the pump station and the load center at that demand rate. When part of the demand is being supplied from storage, the pumping head needs only to be sufficient to pump against the head at the load center and overcome losses in the pipeline between the pump station and the load center.

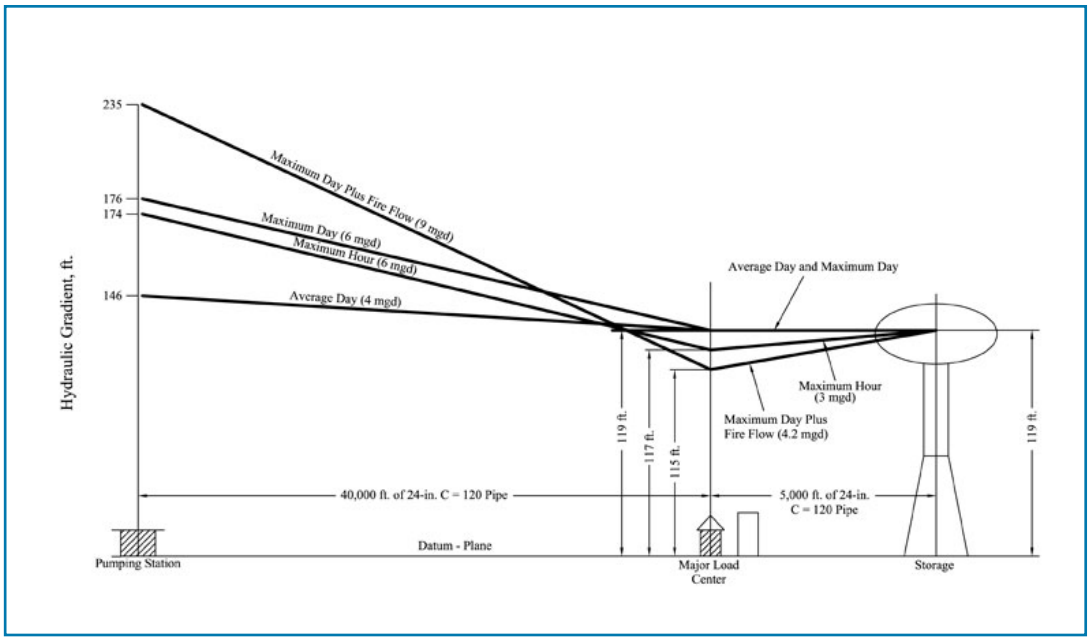

Figure 4-15: System C—Hydraulic Gradients with Storage Beyond the Load Center

Average day demand: At the average day demand, the required pumping rate is 4.0 mgd with no water taken from storage. The pumping head required is equal to the hydraulic gradient at the tank, plus the head loss in 40,000 feet of equivalent pipe or 119 + (0.67 × 40) = 146 feet. The hydraulic gradient at the load center is thus identified as that at the tank, or 119 feet.

Maximum day demand: At the maximum day demand, the required pumping rate is 6.0 mgd with no water taken from storage. The pumping head required is equal to the hydraulic gradient at the tank, plus the head loss in 40,000 feet of equivalent pipe at 6.0 mgd, or 119 + (1.42 × 40) = 176 feet. The hydraulic gradient at the load center is thus identified as that at the tank, or 119 feet.

Maximum hour demand: For a maximum hour demand which in the example is 9.0 mgd, the working pressure can be lowered to 35 psi or 80 feet of head. The storage tank could supply water at a rate of 700 gpm or 1.0 mgd during the hour and the remaining 8.0 mgd would be supplied from pumping. They hydraulic gradient at the load center is the hydraulic gradient at the tank, minus the head loss in the 5,000 feet of pipe between the tank and the load center at the storage discharge rate of 1.0 mgd, or 119—(0.05 × 5) = approximately 119 feet. The pumping head required is equal to the hydraulic gradient at the load center plus the head loss in 40,000 feet of equivalent pipe at 8.0 mgd, which is 119 + (2.41 × 40) = 215 feet.

Maximum day rate plus needed fire flow: The pressure at the load center can be lowered to 20 psi or 46 feet during a fire. Assuming the storage tank is full (1.0 mgd) this flow can move from the tank to the load center at 2,800 gpm or a 4.0 mgd rate. Thus, the remainder of the demand, which is 9.0 mgd, must be supplied by pumping. The pumping head required is equal to the hydraulic gradient at the load center or 46 feet plus the head loss in 40,000 feet of equivalent pipe, or 46 + (3 × 40) = 166 feet of head.

Demand Rates	Theoretical Pumping Head Required
Average Day Rate, 4.0 mgd: no water from storage	= 146 ft.
Maximum Day Rate, 6.0 mgd: no water from storage	= 176 ft.
Maximum Hour Rate, 9.0 mgd: 8.0 mgd rate from pump(s) and 1.0 mgd rate from tank storage	= 215ft.
Maximum Day Rate plus Fire Flow, 13.2 mgd: 9.2 mgd rate from the pumps plus 4.0 mgd rate from tank storage	= 166 ft.

Comparison of System Examples

The Comparison of System A with System C: If no storage is provided, 124 feet (290 feet—166 feet) more pumping head is required to furnish the maximum day demand plus fire flow than if adequate storage is provided beyond the load center. With the increased pumping rates required with no storage, the power needed is approximately 1,100 hp, as contrasted to 495 hp with the storage (more than twice as much). Similarly, furnishing the maximum hour demand without storage would require 500 hp, as opposed to 245 hp, still more than twice as much.

The capacities of the pumps required under these two conditions would be 13.2 mgd at 359 feet of head, as contrasted to 9.0 mgd at 235 feet of head, as opposed to 6.0 mgd at 174 feet of head. During average and maximum day demands, the pumping head at the source is approximately the same.

Comparison of System B with System C: In comparing storage located between the source and the load center with storage located beyond the load center, the example illustrates that pumping heads at the pumps are substantially lower under all conditions if the load center is located in the pumping station and the elevated storage.

Recommended Practice on Water Storage

The AWWA's *Manual of Water Supply Practices* (M-31) states that the recommended design is to have the major load center located between the pumping station and an elevated storage tank of sufficient capacity. This system is the most cost-effective design from a capital cost and operating cost standpoint. All those individuals that are involved in the planning, designing, and evaluating community water systems need to keep this concept in mind. It is not a rule but it is a good practical guide.

CHAPTER 5: Consumer Consumption and Needed Fire Flow

The previous chapters have stressed the fact that community water systems need to provide an adequate and reliable source of treated water for consumer consumption and commercial use. In addition, water has to be made available for structural fire suppression and for other emergencies, such as hazardous material incidents, transportation vehicle fires, natural cover fuel fires, within a community that expose a community and water supplies for installed fire suppression systems, including automatic sprinkler systems. Because of economic considerations associated with the water system infrastructure, all but the very largest cities have water systems that provide one water system for consumer consumption and fire protection. As reflected in Chapter 4, water demand needs to be provided during all periods of each day, day of the week, and week of the year for consumer use plus the capability to meet required fire flows when a serious fire erupts in a community. The question now to be answered is how much water is needed for domestic consumption and how much is required to meet needed fire flows at representative locations throughout a community such as commercial, industrial, and residential areas. This chapter provides guidelines estimating water supply needs.

The basic question to be answered by a community water planning board or commission is "how much water will our system be required to deliver and to where, both today and in the future?" The answer to this question will require the acquisition of basic information about the community, including historical water usage, population trends, planned growth, topography, and existing system capabilities, to name just a few. This information can then be used to plan for the logical extension of the existing system and to determine needed improvement to provide sufficient water supply at demand pressures throughout the community.

Water Demands

The first consideration of a water distribution system is the determination of the quantity of water that will be required, with provision for the estimated requirements for the future.

In terms of total quantity for domestic consumption, the water demand in a community usually is estimated on the basis of per capita demand. According to a study published by the U.S. Geological Survey, the average was estimated to be about 105 gallons per day per capita in 1990. However, by the year 2000, the AWWA estimated the per capita use was 140 gallons per day. Water demand has been demonstrated to vary rather significantly by State as reflected in the referenced 1990 study. This is illustrated in **Table 5-1**.

The water usage shown above illustrates a wide variation. Per capita use varies from a low use in Maine of 58 gallons per day capita to Utah with 218 gallons per day per capita. These variations depend on geographical location, climate, size of the community, extent of industrialization, and other influencing factors unique to most communities. Because of these variations, the only reliable way to estimate future water demand is to study each community separately, determining existing water use characteristics and extrapolating future water demand using population trends.

In terms of how the total water use is distributed within a community throughout the day, perhaps the best indicator is land use. In a metered community, the best way to determine water demand by land use is to examine actual water usage for the various types of land uses. The goal of examining actual water usage is to develop water "duties" for the various types of land uses that can be used for future planning. Water duties are normally developed for the following land uses:

- Single-family residential—Some communities have low, medium, and high density zones.
- Multifamily residential.
- Commercial—Normally divided according to office and retail categories with a separate category for shopping plazas.
- Industrial—Normally divided into light and heavy categories and separate categories for high-end users.
- Public buildings—Normally include courthouses, libraries, post office, police stations and jails, community and senior centers, fire stations, fire training areas, and elementary or high schools.
- Public property—Normally includes parks, grassed areas that are watered, swimming pools, etc.
- Special properties—Normally includes Federal and State buildings, colleges and universities, local airports, and any other properties not identified above.

Water duties normally are expressed either by specific establishments or in gallons per acre per day. It may be wise to conduct parallel studies to examine any differentials for the community at large. Differences can be examined by specific land usage.

Table 5-2 presents water use for many different establishments. Although the rates may vary widely, they are useful in estimating total water use for individual users when no other data are available.

Table 5-2: Typical Rates of Water Use for Various Establishments

User	Range of Flow Gallons per Person on Units per Day
Airport, per passenger	3–5
Assembly hall	2–3
Bowling alley, per alley	16–26
Camp	
Pioneer type	21–32
Children's w/central toilet and bath	42–53
Day, no meals	42–53
Luxury w/private bath	79–106
Labor	37–53
Trailer w/private toilet and bath per night	132–159
Country clubs	
Residential type	79–159
Transient type serving meals	16–26
Dwelling unit, residential	
Apartment house on individual well	79–106
Apartment House on public water supply	79–132
Note: higher if unmetered	
Boarding house	40–58
Hotel	53–106
Lodging house and tourist home	32–53
Motel	106–159
Private dwelling on an individual well	53–159
Note: use same values for metered supply	
Private dwelling on a nonmetered public water supply	106–211
Factory, sanitary wastes, per shift	40–100
Fairground (based on daily attendance)	1–2
Institution	
Average type	106–159
Hospital	185–317
Office space	11–16
Park and recreational facilities w/flush toilets	5–11

A Suitable Approach for Studying Consumer Use Water Demand

A large-scale community map is needed. The actual scale has to be determined by the typical distance between street intersections in a community. Identify the class of properties along both sides of the street between intersection streets, or to dead ends or where a street leaves the corporation line. Using the guidelines from **Tables 5-2** and **5-3**, estimate the gallon per day rate along street fronts or use contiguous blocks to form a square or rectangle with approximately 43,000 square feet which is generally equivalent to an acre. Plot this information on the street map and sum the gallons of water required for the community for normal daily consumption.

Fire Suppression Water Demand

Criteria for establishing needed fire flows: an adequate amount of water is essential for confining, controlling, and extinguishing hostile fires in structures. The actual amount of water needed differs throughout a community due to different building and occupant conditions. Therefore, water demand for structural fire protection has to be determined at a number of different locations throughout a given community or fire protection district established at the local or county level of government in the United States.

The ISO evaluates the fire suppression capabilities of communities according to 10 classifications of service. These classifications are conducted as part of the fire and property insurance rating system for over 130 insurance companies writing this type of insurance in the United States. Three protection features are evaluated, and a percent of credit is assigned to each feature as follows:

1) Fire Department	50 percent
2) Water Supply	40 percent
3) Receiving and Handling Fire Alarms	10 percent
Total	100 percent

The weight given to water supply stresses the need for an adequate water supply for structural fire suppression. The water supply evaluation considers the ability of the water system to meet consumer consumption plus fire flow under average and maximum daily conditions. Approaches to evaluating a municipal water system are presented in a companion document titled *Evaluating Municipal Water Supply System*. The following material is restricted to the determination of needed fire flows at representative locations throughout the community. These locations are selected by the ISO to represent both typical and special fire risks including commercial, mercantile, industrial, institutional, and residential properties for insurance rating purposes.

Needed fire flow is the amount of water considered necessary to control a major developing fire in a specific building. The amount of water needed is expressed in gpm at 20 psi residual pressure for a duration ranging from 2 to 4 hours. The minimum needed fire flow for any single building is 500 gpm for 2 hours. The maximum needed fire flow is 12,000 gpm for 4 hours.

Needed fire flow at selected sites throughout a given community is intended as one measure used to compare and contrast available fire flow to a specification fire flow. Studies conducted by insurance industry over many years shows a high statistical correlation between the amount of water actually used to confine, control, and extinguish a dingle building fire and the amount of water determined form the application of the needed fire flow analysis. It is important to recognize that a fire that spreads beyond the

building or origin requires larger amounts of water for longer periods of time. The ISO Fire Suppression Rating Schedule (FSRS or Grading Schedule) provides one analytical method for determining capability to suppress a developing fire in representative buildings throughout a given community.

Water supply studies further indicate it is unusual for an existing water distribution system to provide sufficient volume and pressure to meet every SFF. However, in designing a new water supply and distribution system or expansion to an existing system, or improvements to components of an existing water supply, pipe network and hydrant installation, plans should consider water delivery rates and pressure profiles to provide needed fire flow at specific locations throughout a community as determined by the ISO. Upon request, the ISO can provide a listing of needed fire flows at representative locations for a given community. (1) In meeting fire flow objectives, a water supply system should be capable of delivering the maximum needed fire flow within the built-upon area served by the water system.

Basic Needed Fire Flow Formula: A needed fire flow for an individual building is computed from the formula below: (2)

$$\mathbf{NFF}i = (\mathbf{C}i) \times (\mathbf{O}i) \times [1 + \mathbf{P}i]$$

The calculation of needed fire flow, in gallons per minute (gpm), for a subject building, considers the construction (C*i*), occupancy (O*i*), exposure (X*i*), and communication (P*i*) factors of that building or fire division as outlined below.

- **Construction factor (C*i*):** This portion of the needed fire flow attributed to the type of construction and square footage of the subject building is determined by the following formula from the ISO Grading Schedule.

  C*i* = 18F (A*i*) (0.5) where:

  F = coefficient related to the class of construction as follows:

  F = 1.5 for construction Class 1 (frame)

  F = 1.0 for construction Class 2 (brick-joist or joisted masonry)

  F = 0.8 for construction Class 3 (noncombustible) and construction Class 4 (masonry—noncombustible)

  F = 0.6 for construction Class 5 (modified fire resistive) and construction Class 6 (full fire resistive)

  A*i* = effective area (the total square foot of the largest floor in the building plus the following percentage of other floors:

  – For buildings of construction Class 1 to 4: 50 percent of all other floors

  – For buildings of construction Class 5 and 6: if all vertical openings in the building have 1 to 1-1/2 hour or more protection, 25 percent of the area, not exceeding the two largest floors. The doors shall be automatic or self-closing and labeled as class B fire doors. In other buildings, 50 percent of the area, not exceeding eight floors.

[Sidebar: ISO has additional explanatory information on calculating the effective area. There is no need to know this information, since ISO will provide such details on any specific building upon request. The intent of discussing this formula is to make the reader aware of the factors that influence the needed fire flow calculation process.]

The maximum value of C*i* is limited to the following:

- 8,000 gpm for construction Class 1 and 2
- 6,000 gpm for construction Class 3 to 6
- 6,000 gpm for a one-story building of any class of construction

The minimum value of C*i* is 500 gpm. The calculated value of C*i* should be rounded to the nearest 250 gpm.

- **Occupancy factor (O*i*):** given in **Table 5-4**, reflects the influence of the occupancy in the subject building on the needed fire flow. Representative lists of occupancies by combustibility class are given in **Figures 5-1** and **5-2**.
- **Exposures (X*i*) and communications (P*i*) factors:** The exposures and communications factors reflect the influence of exposed and communicating building on the needed fire flow. A value for (X*i* + P*i*) shall be developed for each side of the subject building as follows:

$$(X + P)i = 1.0 + \sum_{i=1}^{n} (Xi + Pi), \text{ maximum } 1.75$$

where: n = number of sides of subject building

The factor for X*i* (exposure) depends on the construction and length-height value (length of wall in feet times height in stories) of the exposed building and the distance between facing walls of the subject building and the exposed building. This factor shall be selected from **Table 5-5**.

The factor for P*i* (communications) depends on the protection for communicating party wall openings and the length and construction of communications between fire divisions. The factor shall be selected from **Table 5-6**. When more then one communications type exists in any one side wall, apply only the largest P*i* for that side. When there is no communication on a side, P*i* = 0.

Notes: 1. The reader should refer to the 1980 Fire Suppression Rating Schedule, published by ISO Commercial Risk Services, New York (1980), for complete information regarding factors for communication.

2. When a party wall has communicating openings protected by a single automatic or self-closing class B fire door, it qualifies as a division wall for reduction of area.

3. Where communications are protected by a recognized water curtain, the value of P*i* is 0.

* The factor for P*i* depends on the protection for communicating party wall openings and the length and construction of communications between fire divisions. P*i* shall be selected from this table. When more than one communication type exists in any one side wall, apply only the largest factor P*i* for that side. When there is no communication on a side, P*i* = 0. (Party wall means a division wall rated 1 hour or more with labeled class B fire doors on openings.)

For over 50 ft, P*i* = 0

For unprotected passageways of this length, consider the two buildings as a single fire division.

Special Notes on the Determination of Needed fire flows

1) When a wood-shingle roof covering on a building or on exposed buildings can contribute to spreading fires, add 500 gpm to the needed fire flow.
2) The needed fire flow shall not exceed 12,000 gpm nor be less than 500 gpm.
3) The needed fire flow shall be rounded to the nearest 250 gpm if less than 2,500 gpm, and to the nearest 500 gpm if greater than 2,500 gpm.
4) For one- and- two family dwellings not exceeding two stories in height, the needed fire flow listed in **Table 5-7** shall be used.

Table 5-7: Needed fire flow for One-and Two- Family Dwellings*

Distance Between Buildings Feet	Needed fire flow gpm
Over 100	500
31–100	750
11–30	1,000
Less than 11	1,500

*Dwellings not to exceed two stories in height.

[Side bar: Many communities today are allowing contractors in subdivisions to build one family homes 20 feet apart. Note that this would require a needed fire flow of 1,000 gpm for all residential areas with this separation distance because of the identified exposure problem.]

5) The water supply for buildings protected by automatic sprinkler systems that are in compliance with the NFPA Standard 13 and inspected semiannually are "coded" as sprinkler buildings for fire insurance rating purposes. The water demand requirement for these buildings is determined from the stated NFPA standard including the allowance for hose steams where required.

CHAPTER 6: Alternative Water Supplies

People living in local communities generally assume that there is a water supply system that will meet their domestic needs, and that there will be water available from fire hydrants to fight building fires. (1) Concurrently, people living outside incorporated areas and in rural areas do not generally expect to have water mains that supply residential and commercial property. Water supply for structural firefighting was limited to that carried on the first alarm response to a given fire site. Water supply for the urban landscape and the rural landscape was pretty well divided until the late 1970's. Today's suburban and rural growth patterns are making this dichotomy on water supply very fuzzy.

The grow pattern of homes, schools, and commercial property outside of incorporated villages, towns, and cities requires a new understanding of water supply for consumer consumption, the adequacy and reliability of developed water supplies for both consumer consumption and fire protection. These newly built-upon land areas may have one of the following arrangements for meeting water supply needs:

- Each occupied building is supplied by well water on the owner's land site; there are no water mains or public fire hydrants. This method of water supply applies to single family dwellings, schools, small commercial property such as a convenience store, etc.
- Both commercial and housing developers may take a tract of land and sell building lots. The developer also may be the builder, or there may be several contractors available for building on the individual lots. Generally there is a small water system to meet the domestic consumption needs. The underground piping may be 2-inch to 3-inch pipe along street fronts, and taps are made on these lines to feed each home or small business. The water supply is typically from wells that is treated and pumped into to a ground-level or elevated storage tank to flow by gravity on demand through the pipe lines. The size of the water mains is inadequate to supply water for fire protection.
- The above description of land development may be modified in the following way. The developer plans that "someday" the growing community will be large enough to require a higher yield water source, and the associated need for a water treatment plant. These kinds of development often are planned to be located near a river, fresh water lake, or a good flow stream where a low-level dam can be erected to form a holding basin or reservoir of water for the water system. Recognizing this potential need, a decision is made to install fire hydrants in the development to save installation costs in the future. These hydrants then will be connected to 6-inch or larger pipe that will be laid in the same trench as the domestic piping system. The futuristic drawings and plans look good on paper. However, the installation of the fire hydrants may not follow the plan. There are several document cases where the installed fire hydrants are fed by the domestic system, the small-diameter pipe. When questioned about this practice, the response is often that the fire hydrants are used to water the green areas, trees, and to keeps the streets clean. However, this gives a false sense of security for the property owners where this practice is in place. The water supply simply is inadequate for fire protection, and it may be inadequate for these adjunct services in the community.

All of these noted water supply arrangements are of much interest and concern to property and casualty insurance companies that write insurance policies with coverage for fire loss. The ISO represents over 160 companies in the United States that write homeowners and commercial property fire insurance policies and packaged insurance policies that cover fire loss. In an ISO 2005 publication on *Effective Fire Protection—A National Concern*, there is startling information on the lack of community water supplies in fire districts across the country. For insurance rating purposes, the ISO has identified 48,515 fire districts or insurance-graded areas in the United States. Each area is evaluated by the ISO for fire suppression effectiveness using criteria developed for three needed fire protection services: 1) Receiving and Handling Fire Alarms, 2) Fire Department, and 3) Water Supply. Water supply accounts for 40 percent of the total evaluation. A *Grading Evaluation* conducted by ISO Field Representatives results in establishing a community or fire district PPC on a Scale of 1 to 10. Out of all the fire districts in the Nation, there are only 52 cities, communities for fire districts (i.e., a county might be a fire district based on local government administration and management).

From a water supply perspective, it is important to identify and consider the Class 9 and Class 10 properties. Class 10 property, for insurance rating purposes, is located beyond 5 travel miles for the first-due engine company responding from an ISO-recognized fire department, and there is **no** recognized water supply. The message is that there can be no effective fire protection if there is not a sufficient fire apparatus response time and personnel to fight fires, and there is insufficient water to extinguish fires. The likelihood of a total property loss from a developing fire in a structure in Class 10 *Graded Area* is statistically high. Generally, most fire insurance carriers will not underwrite fire insurance policies where there is an ISO Classification of 10. Some insurers will write this property at a very high premium. The latest ISO studies indicates that 2.9 percent of the Nation's fire districts receive a Class 10 designation.

In contrast, a Class 9 is assigned to a *Graded Area* structural property is within 5 travel miles of the first-due fire department engine company, but there is **no** recognized water supply. The same study referred to above indicates that 32.2 percent of the Nation's fire districts receive a Class 9 designation. The bottom line is that in this classification there is reasonable response from a fire company, but the water supply to fight a fire does not meet recognized criteria for the very large majority of the insurance industry. There is a defined probability of loss reduction with Class 9 property over Class 10 property. This property group includes farmstead property; isolated homes away from a community; and vacation homes on lakes, in the mountains, or at the sea-shore, that are not near a municipal water system with fire hydrants.

It is of a major concern to realize that, by combining the Class 9 and Class 10 fire districts together, 35.1 percent of the entire Nation's fire districts do not have a recognized water supply!

Now, it is essential to define a recognized water supply by the insurance industry. The ISO *Fire Suppression Rating Schedule*, or *Grading Schedule* for short, states that the minimum recognized water supply for structural fire protection is 250 gpm for a 2-hour duration; the minimum volume of water is 30,000 gallons. However, the minimum water supply for any single structure is 500 gpm for 2 hours. Prorated credit is given if only 250 gpm is available; no credit is given if a structure is not protected by 250 gpm for 2 hours.

All of the above means that 17,029 fire districts in the United States either have no municipal water supply system, or the existing water supply system does not have the capability to supply 250 gpm for 2 hours.

So, if this manual is restricted to discussing municipal water supply systems, it leaves out over one-third of the Nation's fire districts. Therefore, it is essential to discuss alternative water supplies to meet fire protection needs. Alternative water supply methods are essential to augmenting existing municipal water supplies where the existing system cannot meet needed fire flows. Furthermore, alternative water supply methods can be used where a water supply system's service has been interrupted for whatever

reason. Some of those reasons include storm damage, power failures to pumping equipment, drought conditions where there just is no water available, and, after 9-11, the ever-present threat of terrorism or simple sabotage to a water system. Therefore, this chapter is devoted to presenting the major concepts of alternative water supplies as developed through a partnership project between the U.S. Fire Administration (USFA) and the ISO.

Alternative Water Supply Concepts

The primary objective of alternative water supplies is for fire district or ISO *Graded Areas* that do not have recognized water supplies to plan and establish a water delivery program that will deliver a minimum of 250 gpm for 2 hours to all structural property within the fire district. There are three adjunct objectives to alternative water supply programs:

1) Raise the bar and make the minimum water delivery capability to all structural property in a given fire district or *Graded Area* 500 gpm. This will significantly increase the ability of responding fire departments to confine, control, and extinguish developing fires in structures, and will improve the credit given by the ISO for water supply significantly when conducting a PPC evaluation of the *Graded Area*.
2) Use developed alternative water supply delivery programs to augment existing municipal water supplies at the site of representative fire risks where there is a deficiency in meeting needed fire flows. Many municipal water systems, especially in the small communities, cannot meet needed fire flows on dead-end water mains and near the perimeter of the water distribution system. There also may be a deficiency in the capability of a given water supply system to meet high fire flow demands in the central business district and at specific fire risks such as schools and hospitals in the community.
3) Alternative water supplies can be used for emergency water supply in case there is disruption to any part or all of a municipal water system in order to maintain fire protection capability. There is the growing potential for alternative water supplies to be used for domestic consumption capability in the case that a municipal water system is down for 1) the lack of sufficient intake water supply due to drought conditions in the area, 2) due to equipment failures for a variety of reasons including power outages, and 3) domestic water supply capability when used with portable water supply purification equipment. In this later case, the military has in place water purification equipment to change seawater into drinking water. Now, the technology is in place that uses reverse osmosis processes and new technology for membrane filtering so that mobile filtration units can take any brackish water or salt water and treat this water to EPA standards. Such a unit has been purchased by a county fire department on Long Island, New York. This technology may be important to homeland security when addressing possible terrorist threats, or to the Federal Emergency Management Agency (FEMA) when considering disasters of the magnitude of Hurricane Katrina.

Where Are Alternative Water Supplies Needed?

Alternative water supplies are needed for the fire protection structural property that is not within 1,000 feet of a recognized fire hydrant (i.e., a fire hydrant that has the demonstrated capability to delivery a *minimum* of 250 gpm for a 2-hour duration). A scaled fire district map is needed to identify structural fire risks that are beyond 1,000 feet of a recognized fire hydrant. This may require running fire-flow tests to determine the capability of fire hydrants on the perimeter of water systems especially in smaller communities.

Water Supply Officer

Fire districts or fire departments that are serious about establishing an alternative water delivery program need to appoint a Water Supply Officer to coordinate *all* activities associated with the delivery of water supplies to fire risks throughout the fire area, to augment any existing water supplies that have deficiencies in meeting needed fire flows, and to meet special emergency needs using alternative water supplies. It should be understood by the appointing fire protection organization and the area local government that this individual has the authority and responsibility to organize, implement, and maintain the alternative water supply program. Often this assignment is given to an assistant fire chief as part of the training for effective incident command.

The individual selected for the water supply officer position must be trained to have knowledge about all aspects of the alternative water supply program, and be able to communicate effectively about program elements to fire department personnel, local and State authorities, and the public at large. Typical task performance for alternative water supply officers is referenced in the USFA/ISO *User Workbook and Alternative Water Supplies* noted with the chapter References. Additional knowledge and proficiency comes from actually establishing a water delivery program and through consulting other appropriate references at the end of this chapter.

Identifying and Certifying Alternative Water Supplies

It needs to be reinforced that the ISO's *Fire Suppression Rating Schedule* documents a minimum recognized available fire flow of 250 gpm for a duration of 2 hours for structural property. This applies whether a structural fire risk is served by a municipal water supply system providing water for consumer use or not. In suburban and rural areas without water delivery from a municipal water system supplying fire hydrants, provisions need to be made by the jurisdictional fire department to *transport* water oat structural fires and other fire emergencies using fire pumpers, pumper-tankers, and mobile water tankers. To meet the minimum specified flow of 250 gpm for 2 hours or a higher flow as determined by the needed fire flow for specific fire risks, water supply sources need to be provided throughout a fire protection district or *Graded Area*.

These water supply sources are divided into two categories: 1) natural water sources and 2) developed water sources. Several subclassifications of water sources are identified under each category outlined below:

Natural Water Source Classifications	*Developed Water Source Classifications*
Ponds	Cisterns
Lakes	Rivers
Streams	Driven wells
Reservoirs	Aboveground storage tanks
Streams	Belowground storage tanks
Rivers	Elevated storage tanks
Irrigation channels	Swimming pools
	Domestic water systems

1. **Factors associated with the reliability of water sources.**
   - Natural water sources are susceptible to drought conditions in most parts of the country.
   - Ground-level water sources in rural areas may be used by farmstead property owners to feed animals and water crops.
   - Farm ponds, lakes, streams, and rivers may freeze to varying levels during periods of severe cold weather.
   - Silt and debris can accumulate in a pond, lake, or reservoir, reducing the actual volume of water available for fire while the surface level of the water source remains constant.
   - Streams and rivers may reach flood stage and overflow the retaining banks making the water source nonaccessible.
2. **Factors of accessibility.**
   - All natural water sources used for fire protection should be accessible by all-weather roads and adequately plowed during and after snowfall in snow-belt areas.
   - The planning of new dedicated ponds and small lakes for fire protection should consider placement near well-traveled roads to permit filling mobile tankers for water shuttle operations.
   - A dry hydrant location, a drafting site, or a water fill site needs a constructed pad where a mobile pumper can draft water.
   - Bridges used for water supply access require special considerations. Fire apparatus cannot park on bridges to fill mobile water tankers in several States by law because the apparatus would block traffic. In many cases, it is best to have a dry hydrant fill point away from a bridge because this will reduce the water lift height and it will remove a very heavy weight from the bridge in rural areas. Fire departments need to check with the specific State Department of Transportation and abide by he laws governing this situation.
   - Access to fire sites and water fill sites using routes with bridges, especially in rural areas, needs to be carefully evaluated. A very large number of bridges were built for farm-to-market use. Now they carry increased traffic loads with the expansion of rural and suburban growth. NFPA 1142, Standard on Water Supplies for Suburban and Rural Fire Protection states that, "the general condition of bridges in the rural areas of most states is poor." The nature and extent of the rural and suburban bridge problem makes it a serious consideration when planning alternative water supply programs. This is an especially important consideration when planning transportation routes for fully loaded mobile tankers.
   - Access to private water supplies needs to be evaluated. Fire departments should establish a water usage agreement with the owner(s) of water supplies located on private property to gain access to water sources before the occurrence of a fire. Written agreements should be made in close cooperation with the municipal town or county attorney, Furthermore, it is highly desirable that the agreement be reviewed by a representative of the highway or the county road department or other person who will build, service, and maintain the access area or road leading to the water supply; this includes persons who will perform such functions as snow plowing in specific areas of the country. The property owner should have a copy of the agreement that will be used by different fire departments with approval of their county, township or political jurisdiction.
   - Alternative water supply sources should be provided at location to service structural property. A basic guideline to follow is that mobile tanker apparatus should not have to travel more than 2

miles to reach a recognized water source for refilling the tanker. However, the number of mobile water tankers available to respond to a given fire site will affect this guideline.

- Identification of water resources is most important. The responsible water supply officer should install or cause to be installed an appropriate reflective sign at each water supply point identifying the site for fire department use and including a site number for each recognized water source. NFPA recommends that this number be 3 inches high with a 2-inch stroke.
- Water maps should be prepared with access locations. The responsible water supply office should maintain a map showing the location and amount of water available at each water site. A copy of this map should be located in the jurisdictional fire alarm office or Emergency Operations Center (EOC), and a copy should be carried in the first-due engine company in the Graded Area (i.e., pumper or pumper-tanker) that responds to areas beyond recognized fire hydrants. All area fire chiefs' vehicles and the water supply officer's emergency response vehicle also should carry a current map along with the necessary prefire plans to implement an alternative water supply delivery system throughout the fire protection jurisdiction or Graded Area of responsibility.

3. Reliability of Natural Water Supplies.

- Impounded water supplies: These supply sources consist of naturally developed ponds in low-lying areas that are accessible by all-weather roads, constructed ponds for fire protection, and small lakes that are natural or manmade with a retention dam at the outflow location. NFPA 1142, 2002 edition, states that the quantity of water considered available for natural water supplies "is the minimum available during a drought with an average 50 year frequency that has been certified by a Professional Engineer or Hydrologist, or other similar qualified person." (__)
- Flowing streams: For all flowing streams, (i.e., rivers, streams, and creeks) NFPA 1142 states, "the quantity of water to be considered is the minimum rate of flow during a drought with an average 50 year frequency as obtained by a licensed Professional Engineer, Hydrologist, Geologist or similar qualified person."

Rural Fire Protection Districts have experienced difficulty in obtaining written certification that impounded water supplies or flow streams that established impounded water supplies or flowing stream supplies meet the minimum ISO criteria of 30,000 gallons under drought conditions as specified above. The problem is twofold: 1) it appears that many professional civil engineers lack the background and experience to make such certifications. Geologist and hydrologist are more suitable for certifying natural water supplies. 2) Professionals typically charge from $300 a day and up to research natural water sources and provide professional certification; typically rural fire protection districts simply do not have this kind of money available for this purpose.

It is generally recommended that local fire protection jurisdictions contact the State or county office of soil and water conservation as an important resource in establishing alternative water supply sites, obtaining guidance on installing dry type fire hydrants at specific water supply sites, and obtaining funds for installing dry hydrants and certifying alternative water sources. Other resources for assistance resources that can be consulted for assistance on certifying ground level water supplies include

- NRCS—Natural Resources Conservation Services;
- DEC—Department of Environmental Conservation; and
- Army Corp of Engineers.

4. Developed sources of alternative water supplies.

There appears to be a growing trend in suburban and rural areas to avoid the complications and possible unreliability of static and flowing water sources by using developed sources of water supplies to meet water supply needs for fire protection. This involves providing containers for water supplies at strategic locations throughout a fire district. The storage supplies are easy to calculate, these can be readily assessed by ISO field representatives, and in the long run maybe more economically feasible. Most important reliability of each water supply is constant because the supply source is not subject to drought or their environmental conditions. Furthermore, fire protection jurisdictions do not need to have the water supply certified by a professional person. The following approaches for providing alternative water supplies can be directly evaluated by a representative of the ISO without a third party certification.

- Cisterns: Cisterns are typically installed below ground water storage tanks constructed of reinforced concrete equipped with a dry hydrant. **Figure 6-1** shows a cutaway view of a cistern documented in NFPA 1142. (__) This same reference provides guides to cistern specifications, construction protection against freezing, inspection, maintenance, and topping off the water supply.
- Fiberglass underground storage tanks: The Xerxes Corporation manufactures fiberglass reinforced plastic (FRP) tanks that offer an important option for the underground storage of water. The features and benefits include
  - rustproof, long lasting fiberglass;
  - internal rib design for added strength and robustness;
  - ease of shipment and installation;
  - manufactured to applicable requirements of Underwriters Laboratories (UL) 1316 including watertight specifications to prevent leakage or seepage into the container;
  - comparable with American National Standards Institute/National Science Foundation (ANSI/NSF) Standard 61;
  - available in standard and custom designs;
  - available in single-wall, double-wall, and triple-wall construction to meet local soil conditions;
  - available in holding capacities from 600 gallons to 50,000 gallons; two or more tanks may be interconnected to provide large capacities; and
  - a special 30,000-gallon size is manufactured specifically for fire protection requirements with a full bottom antivortex outlet that can be concreted to a dry hydrant as illustrated in **Figure 6-2**.
- Aboveground storage tanks: Fiberglass and steel storage tanks maybe mounted aboveground as a water storage supply for fire protection. However, this type of storage is limited to regions of the country where temperatures are above freezing; the cost of auxiliary heating in other climates is probably unacceptable. In Southern and Western States, railroad tank cars located on a track siding are kept full of water for fire protection. A 6-inch supply line goes from a suction sump in the tank to a nearby wet-type fire hydrant.
- Elevated water storage tanks: Elevated tanks maybe installed as a sole source of water supply for fire protection for rural fire departments. These tanks typically are supplied by a well pump and are located at fire stations for refilling fire apparatus water tanks, including mobile water tankers.
- Driven wells: These types of wells generally are installed in rural areas for crop irrigation and may be used for alternative water supplies under specified conditions. The well supply may have a feed main to a dry hydrant located by an access road. This permits testing the well supply for flow rate capability. The volume of water from a given well needs to be determined by draw down tests.

- **Swimming pools:** The ISO *only accepts* swimming pools as an alternative water supply source where:
  - the pool capacity equals or exceeds 30,000 gallons of water;
  - the pool remains at the full level year round;
  - access is provided to the pool for a mobile pumper to draft water from the pool, **or** a 6-inch pipe is run from the pool to a pumper connection location point.

  Each individual swimming pool needs to be evaluated by an ISO Field Representative.
- **Private domestic water systems:** Suburban residential communities and large farmstead properties, especially dairy farms with milking parlors, actually have small self-contained water systems supplied by wells that have the capability of delivering 250 gpm or more. It is determined from tests that a dedicated water system can supply 250 gpm for 2 hours, the property association or the property owner should contact their insurance carrier(s) to initiate an ISO evaluation of the system.
- **Municipal water supply systems:** Recognized fire hydrants on municipal water systems (i.e., Those hydrant tested to demonstrate a delivery of 250 gpm or more for 2 hours) may be used to fill mobile water tankers or to relay water to protect areas beyond 1,000 feet of the hydrant. This is a very **important** source of water supply when planning alternative water delivery program, since it may be one of the most reliable water sources for fire protection beyond water mains.

5. Dry fire hydrant programs.

Alternative water supply program for suburban and rural areas need to consider *carefully* the advantages of installing dry (fire) hydrants at ponds, lakes, river, streams, or on water storage tanks to provide ready access to water supplies for sustained structural fire suppression capability. The term "dry hydrant" refers to a special type of hydrant that is installed at or on a water source that has **no** static water head or pressure and is intended to provide water *strictly* for fire protection. Dry hydrants significantly improve structural fire protection in suburban and rural areas where there is no municipal water supply for the following reasons:

- Each individual dry hydrant has a specific location at a named water source to maximize the water available for supplying a fire department pumper.
- A fire department pumper crew can connect one section of hard suction hose rapidly between the dry hydrant outlet and a mobile pumper intake of the correct diameter. The eliminates the time-consuming effort to connect two or more sections of suction hose together, attach a straining device, and correctly placed the suction hose and strainer in the water source.
- A solid earthen, blacktop, or concrete pad is prepared near the dry hydrant for safety of the fire apparatus and personnel working at the dry hydrant location.
- Locate dry hydrant cap suction connections within 18 feet of a hard surface road or drive-off to the pumper location pad. In snow-belt areas, the drive-off pad area needs to be arranged for easy snow plowing. There should be no significant accumulation of snow around the dry hydrant area during and after snowfalls.
- All dry hydrants used for providing water to an ISO *Graded Area* need an individual hydrant identification number posted near the dry hydrant. Dry hydrant locations and the reference number need to be plotted on a fire protection jurisdiction highway map. This map will improve the ability of ISO personnel to evaluate water delivery capability throughout a fire protection district.

Prior to the installation of a dry hydrant, it is essential that the location of each dry hydrant be carefully planned, design criteria established, construction details documented and prepared but **not** signed. This process is necessary to obtain installation permits from the authority having jurisdiction (AHJ). Suburban and rural areas are encouraged to contact the county office of soil and water conservation, the regional office of natural resources conservation (NRC) and/or the department of environmental conservation (DEC). The NFPA's Standards Committee on Suburban and Rural Fire Protection is working with DEC to provide a means whereby the agency will supply installation drawings for a fire hydrant at a specific water site based on drought conditions in the area and the potential reduced capacity from freezing ice over the intake port. It is then expected that the ISO will accept the dry hydrant installed according to the drawings without a further certification process. However, such a program is still a way from reality.

Figure 6-3 illustrates a typical dry hydrant installation for a water source that has been certified for hold 30,000 gallons of water during drought conditions. It is essential to observe the following when examining and evaluating dry hydrant installation drawings and the actual field installation:

- Note that a hard surface or *packed dirt pad* needs to be provided for locating a supply pumper or a fill site pumper at the dry hydrant location.
- The pad area and surroundings need to be cleared of encroaching ground cover and maintained to prevent soil erosion.
- A dry hydrant marker with the dry hydrant number needs to be placed in a conspicuous location near the *pad* area.
- Figure 1 indicates a measure of 20 feet of elevation difference as a maximum figure for drafting water between the indicated surface level of the water and the centerline of the "steamer" connection or hydrant outlet. Both the mechanical efficiency of the mobile pumping unit and the elevation above sea level act to affect the ability to draft water with an elevation differential of 20 feet. A standard 10 feet of head differential between the two elevation points referenced should be established where possible.
- The distance between the raked-off finished ground surface and the steamer hose connection outlet centerline should be 12 inches. It is essential that the centerline of the hydrant hose connection be below the centerline of the pump intake in order to avoid an air lock in the suction hose.
- The dry hydrant riser pipe, top elbow, and outlet connection (i.e., hydrant head) are typically 6 inches in diameter. The threaded hose connection provides for a 6 inch waterway. The hose threads should typically be National Standards Thread (NST). Hose adapters **may need to be provided** for any pumping units that still do not have NST hose threads.

[Sidebar: The issue of proper hose threads is extremely important. In 2003, the USFA reported the identification of 19 difference "steamer" or large outlet diameter hose threads in use in the United States.]

- Low-level vegetation, preferably one that can be mowed, should be planted around the riser pipe and along the embankment to prevent erosion
- The underground lateral pipe connecting the strainer with the elbow section or single elbow to the riser is usually 6 inch in rural areas. A larger size lateral pipe maybe needed where:
  - A dry hydrant flow greater than 1,000 gpm is needed; or
  - The length of the lateral suction pipe exceeds 50 feet.

- In either case, an increased pipe size may be needed to reduce friction loss at higher flows. The following guideline is useful to estimate maximum flows in PVC pipe per 100 feet of pipe with connector fittings:

Pipe Diameter	Flow in gpm
6 inch	1,000
8 inch	1,250
10 inch	1,500

It cannot be reinforced enough that the water level above the installed strainer needs to be 2 feet above the minimum drought level certified for a specific water source to avoid a vortex at the entrance to the suction pipe and loss of prime on the intake side of the mobile pump. A vortex box to house the pipe strainer maybe constructed to avoid this problem.

6. Methods of delivering Alternative water supplies.

The ISO does not prescribe any specific method of delivering alternative water supplies to a fire site. In fact, ISO encourages the development of innovative techniques and methods to improve current approaches to water delivery operations for fire protection beyond 1,000 feet of recognized fire hydrants. It appears that the majority of existing water delivery program have evolved from one or both of the following approaches to transporting water from a recognized source location (i.e., pond, lake stream, river, storage tank, etc,. as noted above) to an identified fire risk site.

- Use of mobile tankers to "haul" or "shuttle" water between a designated water fill site and the fire site.
- Use three or more mobile pumper to transport water through one or more hose lines from a water source to the fire site. There are two basic types of water relays: 1) closed-end relay, and 2) open-end relay.

Establishing an Alternative Water Delivery Program

The first organized effort to establish alternative water supply programs appears to have emerged in the late 1970s. There is documentation of these programs in the States of California, Georgia, Florida, New York, and North Carolina. One specific program was established between the ISO and the Wyoming County Bureau of Fire in western New York State. The State Fire Coordinator for the Bureau of Fire was interested in developing a program that would improve the semiprotected areas of the county to a protected classification for insurance rating purposes. It was reasoned that not only would this effort improve rural fire protection but it also would reduce property insurance rates rather significantly. Working with the ISO Field Representative out of Rochester, New York, deputy fire coordinators started a Master Plan to deliver needed fire flows at representative sites throughout the individual fire districts in the county. There was little published material beyond the general criteria obtain from the ISO.

Wyoming County was, at that time, a mostly rural county with several small communities. Dairy farming was the primary livelihood. It was estimated that the county had around 40,000 people and 400,000 thousand cows; it was rural America in every sense of the word. However it was a thriving county and energized to do things better.

The county was very fortunate to have a County Office of Soil and Water Conservation, with a graduate of Cornell University in both Agricultural Engineering and Civil Engineering. The individual was essential

to the certification of farm ponds, small lakes, and streams running through the county that could be developed as water resources for the alternative water delivery program. By the mid-1980s the program was in progress with seven participating fire districts. However, the progress was slow and tedious because of all the paperwork that needed to be generated for conducting a water delivery demonstration for the ISO.

The small village of Strykersville, New York, in Wyoming County is certainly one of the first ISO *Graded Areas* an improved Public Protection Classification (PPC™) based on a successful water delivery demonstration using both a tanker shuttle operation and a water relay from a nearby creek to delivery 1,550 gallons of water a minute at the Catholic Church near the center of the community. The PPC Class actually improved from a Semi-Protection Class 9, since there was no recognized water supply to a Class 7 Protected Classification. This occurred in 1990 and it was estimated at that time that the residents of the community would receive an insurance premium reduction of $1.37 per $100 of evaluation; commercial property would be more, but this was not determined for each property in this class for the community. Voluntary contributions to the volunteer fire department tripled the next year in gratitude for this achievement. Approximately 35 percent of the county fire districts now have an ISO PPC of 8 or better. This process continues in the county, but it has slowed down because of the lack of funds at the county level to continue this effort.

A significant program was initiated in 2000 to give alternative water supply programs a national perspective and to encourage suburban and rural fire protection districts without recognized water supplies to plan and implement water delivery programs. The USFA joined in a partnership effort with the ISO to develop A User Planning Guide and a User Workbook on Alternative Water Supplies. In addition, two companion videotapes are available with the titles 1) *Planning for Alternative Water Supply* and 2) *Implementing An Alternative Water Supply Program*. These videotapes were introduced at the International Association of Fire Chiefs (IAFC) Conference, Denver, Colorado, in August of 2005.

[Sidebar: The references at the end of this chapter provide information on how to obtain the *User Plan Guide*, the *Workbook*, and the two videotapes on alternative water supplies from the USFA.]

The USFA encourages fire departments in conjunction with the communities they serve to develop and implement long-range plans. The USFA has developed a planning model that incorporates the systems approach to planning on public fire defenses. This planning model is easily adapted to establish an alternative water supply project for a specific fire protection jurisdiction as follows:

Phase I: Preparing and organizing to plan.

1) A fire protection jurisdiction recognizes the **need** to deliver water in sufficient quantities to control and extinguish structural fires in response areas without water mains supplying fire hydrants.
2) An organization meeting is held with at least the following representatives attending:
   a) The ranking political official (i.e., mayor or township manager) at the local government level and the county executive at the county level of government.
   b) The elected official responsible for fire protection.
   c) The fire chief and fire company officers for the fire district under consideration, and county fire officials where the county has planning responsibilities.
   d) A community water supply superintendent if there is a recognized water supply system in the fire district.

e) The ISO Field Representative who has responsibility for the identified fire protection jurisdiction.

3) The ISO Field Representative discusses the ISO criteria for obtaining a recognized alternative water supply program for the graded area the process to reach this goal.

[Side bar: The ISO Field Representative plays a **key** role in all three phases of the alternative water supply planning process. Both the *User Guide* and *Workbook* are based on a water delivery program that will result in the *Graded Area* receiving an ISO PPC.]

Phase II: Conduct the Planning Process

1) Identify resources for conducting alternative water supply delivery demonstration project. These resources include a) mobile fire apparatus and equipment and response personnel, and b) available outside aid in the form of mutual-aid and automatic-aid from surrounding fire districts.
2) The ISO Field Representative identifies a minimum of five representative fire risks in the *Graded Area* for determining a response evaluation. In cooperation with local authorities, the ISO Field Representative selects **one** representative fire risk site where a water delivery demonstration is to be conducted.
3) Arrangements are made for the ISO Field Representative to witness a water delivery demonstration at the selected fire risk site.
4) After a successful water delivery demonstration has been completed, the ISO Field Representative will evaluate water delivery to the remaining fires risks in the *Graded Area* using a computer simulation model developed by the ISO.

[Sidebar: ISO's Alterative Water Supply Computer Simulation Model reduces the time of preparation required by a fire district before a Grading Reclassification can be completed. This overcomes a major problem associated with the early work on alternative water supplies as identified above.]

Phase III: Adopt and implement the plan.

1) After the ISO completes the alternative water delivery capability evaluation throughout the *Graded Area*, the fire protection jurisdiction submits a request to ISO, Inc. for a Public Protection Reclassification.
2) The reclassification includes a current evaluation of: a) receiving and handling fire alarms, b) fire department, and c) water supply. Note: Results of the alternative water supply evaluation replaces a component evaluation of a municipal water supply.
3) The alternative water supply program is implemented in the fire protection jurisdiction. This means that all future alarms of fire for a structure fire will receive a response of equipment and personnel to place in service an alternative water supply to meet as close as possible the needed fire flow for the fire risk.

Summary

The model alternative water supply program follows the steps below:

- Establish needed fire flows throughout the *Graded Area*.
- Define the geographical area to be protected.
- Identify the representative fire risks and basic fire department response information to each potential fire site.
- Identify the water sources that will be used to transport water to the representative fire risks, and review the certification of each water source to determine that it is capable of delivering 250 gpm for a during of 2 hours under the specified drought conditions.

- Determine the water transport methods to be used for each representative fire site. This is typically a water shuttle operation using mobile tanker apparatus that maybe be augmented by a water relay operation.
- Identify fire apparatus resource capability.
- Evaluate fire apparatus travel plans.
- Prepare a preliminary operations plan.
- Conduct a water delivery demonstration project.
- Analyze the completed water delivery demonstration.
- Prepare operation plans for the remaining representative fire site.
- Request an ISO Reclassification.
- Determine the benefits of the improved PPC on Property Fire Insurance Rates.

CHAPTER 7 IMPACTS OF FIRE FLOW ON DISTRIBUTION SYSTEMS WATER QUALITY, DESIGN, AND OPERATION

Background Statement

In 2002, The American Water Works Research Foundation and KIWA of the Netherlands convened a panel of engineers, scientists, university professors, municipal water works officials, senior fire officers, and insurance industry personnel to study, explore, and evaluate, as this Chapter title indicates, *Impacts of Fire Flow on Distribution Systems Water Quality, Design, and Operations.* This study was jointly funded by the AWWA, the AWWA Research Foundation, and KIWA of the Netherlands, who assume no responsibility for the content of the research study reported in a publication by the Chapter title above or the facts and opinions of the panel participant's as expressed in the report.

The following information is excerpted from this study because the information presented is essential to understanding current issues associated with public-sector water supplies and the potential impact that the private sector has on needed water supplies for fire protection. It should be understood that there are two approaches to the confinement, control, and extinguishment of developing fires in structures. The conventional approach is to have a public fire department respond to a structure fire with engine companies and ladder companies to "handle" everything from a wastebasket fire to a fully involved structure fire. The alternative approach is to install automatic sprinkler systems in both residential and commercial properties either to extinguish a developing fire immediately, or to confine a fire to the room of origin to be completely extinguished by a fire department.

The installation of automatic sprinkler systems transfers a significant portion of the cost of water supplies for fire protection to the private sector. The private sector assumes the cost of the installation of automatic sprinkler systems, maintenance, and periodic testing. There are economic incentives in the form of insurance premium reductions for commercial property owners with installed and maintained sprinkler systems and even some insurance incentives for residential sprinkler system installations.

As stated in previous chapters, the primary objective of a public water system is to provide sufficient potable water at an acceptable level of water quality now determined by the EPA in the United States. The decision for a public water supply to provide fire flows can have significant impacts on the design and operations of the systems. This is why there is a large number of small villages and towns under approximately 5,000 population that do not have installed fire hydrants on a small water distribution system.

Typically, the election to provide fire flows and fire hydrants results in increased water supply pipe diameters, leading to higher capital costs, and greater provision for reliability and redundancy in the distribution system. It may also, however, have some negative water quality implications. This "oversizing" to meet what some consider to be relatively infrequent fire events can result in increased

water resident times in larger size pipe, thus increasing the possibility of disinfectant residual loss, and enhancing the formation of disinfection byproducts, and bacterial growth in the water mains. Larger diameter pipes also result in lower water flow velocities in the water system that lead, in turn, to the deposition of sediments.

Background

The study group determined that there is no legal requirement in the United States for the water distribution system to provide fire flows. Municipalities and township may develop ordinances that require water systems to provide fire protection. At the same time, an inadequate fire protection system provides a false sense of security. Fire flow requirements generally are based on fire codes developed by independent groups including the Building Officials and Code Administrators (BOCA), the International Conference of Building Officials (ICBO), the Southern Building Code Congress International (SBCCI), and the National Board of Fire Underwriters' up to 1970. Since 1970, the insurance criteria has been developed by the ISO.

In the absence of a fire, the obligation to provide fire protection substantially extends the time that the water, after treatment, resides in the distribution system, including its service reservoirs, before it reaches the users. Degradation of water quality in conventional potable water distribution systems has been shown to be a function of the length of time that water is retained in the distribution system and the very slow velocities of water in the lines that feed residential areas, to the point where they protect microorganisms in the water and, over time, restrict flow capacities of the pipes. (Geldreich 1996)

Water quality changes that occur within the distribution system are of increasing concern.

Water distribution system design often is dictated by the need to provide fire flows. This leads to oversizing of the system for most normal conditions. An oversized system increases the resident time of water, increasing the possibility for depletion of disinfectant residual and the formation of disinfection by-products. An oversized water distribution system also increases the associated capital and operation and maintenance (O&M) costs. This is particularly true in the case of pumping, when elevated tanks are maintained at high levels in order to provide sufficient fire flow capacity and minimum pressures on fire hydrants. Therefore, there is a clear need to evaluate fire flow requirements and to determine improvements in water quality and reductions in capital and O&M costs that could be achieved if fire flow requirements are reduced or eliminated.

Study Objectives and Scope

The objectives of the stated project were as follows:

- determine the economic and water quality impacts of designing systems to meet fire flow requirements;
- review national and international criteria for providing fire flows; and
- identify alternative methods and technologies for firefighting appropriate for present-day situations.

This review of the study report addresses each of these topics in order.

The Impact on Water Quality by Designing Water Distribution Systems to Meet Fire Flow Requirements

In order to evaluate the economic and water quality impacts associated with fire flow requirements, hydraulic water quality modeling of hypothetical and actual distribution systems was conducted. The EPA's EPANET model was used to conduct the modeling. The hydraulic evaluation considered changes in infrastructure sizing and operating practices, primarily related to storage volumes, which could be realized if fire flow requirements were reduced or eliminated. The economic impact of these changes was estimated to evaluate the financial impacts of providing fire flows. The key water quality parameter considered was water age. The residence time of water in the distribution system can be a key indicator of water quality, as it plays a major role in determining disinfectant residuals and disinfection byproduct formation. The significant findings are as follows.

Mathematical models were applied to various systems designs and different levels of fire flow in order to study the resulting economic and water quality impacts. The following overall approach was used in conducting this analysis:

1) A modified version of EPANET distribution system model (Rossman 2000) was applied in steady-state mode to a specified network design to determine if it would meet minimum pressure requirements under a) maximum day demand plus fire flow Requirements, and b) peak hour demand conditions.
2) Three levels of fire protection were studied
    a) The first level is maximum day demand plus fire flow capacity in which fire flows meet the needed fire flow requirements as defined by the ISO for Public Protection Requirements (see Chapter 5 for details on the ISO needed fire flow calculations).
    b) The second level is maximum day demand plus reduced fire flow capacity associated with the hose stream requirements that are needed to augment fire protection provided by automatic sprinkler systems.
    c) The third level is no fire flow requirement (i.e., peak hour demand for consumer consumption). This alternative would be consistent with a dual water system briefly discussed under alternative technologies later in this review and in Chapter 8 of the manual.
3) A modified EPANET model was applied using an interactive approach in which pipe diameters were downsized under the constraint that minimum pressure requirements were met under both peak hour conditions and maximum day plus fire flow requirements at all demand nodes. This step was repeated for the three levels of fire protection described in the previous step.
4) The EPANET model was applied in extended period simulation (EPS) mode to determine distribution system storage requirements and to ascertain that minimum pressures and flows could be met over the full duration of a fire (i.e., 2 to 4 hours).
5) EPANET model was applied in the EPS mode to estimate water age under minimum daily demand conditions in order to calculate the average demand-weighted water age.
6) The results of the EPANET minimum day demand application were examined to determine whether sufficiently high velocities occurred to ensure "self-cleaning" of the pipes. The criterion used by KIWA that a minimum velocity (1.3 feet per second(fps)) occurs at least once a day was employed as the evaluation measure.

7) A cost model developed by EPA (Gumerman, Burris, and Burris, 1992; Clark et al., 2001) was applied to determine the capital costs of pipes, tanks, and other facilities for the various distribution system designs associated with each level of fire protection facilities.
8) The redundancy and reliability of each of the distribution system designs was qualitatively evaluated.

In addition to the standard procedures outlined above, a tank water age model, CompTank, developed as part of an earlier AWWA Research Foundation sponsored project (Grayman et al., 2000) was applied to develop general guidelines for storage requirements to meet various levels of fire protection.

EPANET Distribution System Model

Hydraulic analysis of flows and pressures in a distribution system has been a standard form of engineering analysis since its development by Dr. Hardy Cross in 1936. Water distribution system computer models have been in use since the middle 1960s and have evolved into sophisticated, user-friendly tools that are capable of simulating large distribution systems (Walski, Chase, and Savic, 2001). In more recent years, the ability to model water utility and water age has been added to hydraulic models (Clark and Grayman, 1998). There are many commercial models that offer a wide range of capabilities in distribution system modeling EPANET is an open-structured, public domain hydraulic and water quality model developed by USEPA and is used worldwide (Rossman, 2000.) EPANET was selected for the stated research project.

In order to facilitate the examination of required pipe sizes, the standard EPANET model was modified for use in the study project. This modified version allows the user to examine all nodes quickly in terms of their ability to deliver specified fire flow quantities while meeting a specified pressure requirement at the fire flow node; 20 psi was selected. The model also may be used to automatically downsize pipes to the minimum diameter required to deliver a specified fire flow plus normal usage.

Costing Model

EPA has developed a model consisting of cost equations for pumps, pump stations, including new facilities and expansion of existing pipes (Clark et al., 2001). The model represents the base construction cost data for the purchase and installation of an item, such as a particular type of pump installation. Cost estimates can be developed based on a series of separate items that can be added to the base installed costs. To convert the base construction cost into capital cost, the cost data must be aggregated for the entire project, and additions made that include the following items:

- general contractors overhead and profit;
- engineering;
- land or right-of-way acquisitions;
- legal, fiscal, and administrative costs; and
- interest during construction.

O&M requirements for pumping stations include electrical energy, maintenance materials, and labor. Total O&M cost is a composite of the energy, maintenance material, and labor costs.

Observations from Model Runs

- As the development increases consumer demand, peak demand flow becomes a controlling factor and pipe size is determined by peak flow rather than maximum demand **day** plus fire flow requirements. When peak flow is the controlling factor, then the system also should meet fire flow requirements. As peak flow decreases, water demand decreases; a system design based on peak flow will not necessarily meet fire flow requirements.
- A network design using a looped feeder system results in overall smaller diameter pipe sizes and lower water usage than either the regular grid system or the branching network system. However, the branching network results in significantly lower costs than the other networks because of the reduction in total length of pipe despite the larger pipe diameters required. This may explain why many distribution subdivisions are built with branching type systems rather than looping systems. It was further identified that the nonlooped configuration used in this analysis results in longer connection lines, as compared to the looped configurations.
- Examination of the branching systems shows that such systems provide no service redundancy and are thus inherently less reliable (i.e., more vulnerable to service shutdowns) than looping systems. In a branching system, any outage along a single pipe results in loss of service to all downstream consumers. In a looping system, alternative paths generally will provide some degree of service even if one pipe is out of service.
- As pipe size increase to meet fire flow requirements, the average maximum velocities in individual pipes tend to decrease, resulting in a greater potential for sedimentation, deposition, and water age. This conclusion is supported by the larger percentage of pipes that do not meet the KIWA velocity goal (minimum velocity of at least 1.3 fps at least once a day as the fire flow requirement increases).

Analysis of Distribution System Storage

Storage is an important component in almost all distribution systems. It can serve the following purposes (Walski, 2000):

- Equalization: Demands in a water system generally vary over the course of the day, while water utilities prefer to operate their treatment facilities at a relatively constant rate. Distribution system water tanks and reservoirs frequently operate in fill and draw operations over the course of the day, thus providing the storage to accommodate the constant variations in water supply and demand. However, time-of-day variations in energy pricing may influence when wells and pumps are operated.
- Pressure maintenance: The water level in tanks and reservoirs largely determine the pressure in areas served by a storage facility. In order to provide sufficient pressure, in many situations, particularly at the top of the pressure zone, the water level in a storage facility must be maintained within a specific range.
- Fire storage: Required or needed fire flows can be provided through a combination of fire storage in water tanks and reservoirs, or through larger transmission lines and increased treatment capacities. In many water systems it appears that fire storage is the more economical means of meeting fire flow requirements. Dedicated water in storage for fire protection needs to be recycled weekly to prevent excessive aging and sedimentation. This can be done by bringing the tank "on line" and refilling from the top using a total flow meter to replenish the gallons of water drained from the tank. This technique keeps the tank 90 percent full at all times.

- Emergency storage: In addition to fires, other emergencies such as power outages, equipment failures, water main breaks, and temporary loss of water supply facilities can result in insufficient water supply within the distribution system. Storage provides a mechanism for providing water under such emergency conditions.

In order to accommodate the various purposes of a water tank or reservoir, they are generally designed with a given amount of capacity targeted to each of the following specific uses:

- Equalization storage: Storage used to allow for normal fill and draw patterns.
- Ineffective (passive) storage: Storage used to provide the minimum pressure requirements.
- Fire storage: Storage to meet sufficient, required, or needed fire flows.
- Emergency storage: Storage reserved for emergencies other than fires.

The actual storage requirements in each of these categories vary in different storage facilities based on local regulations, operating conditions, and hydraulic conditions. It should be understood that at some water utilities, fire storage and emergency storage may be combined, based on the assumption that both fires and other emergencies are rare events and the simultaneous occurrence of fires and other emergencies are unlikely.

[Sidebar: This study was completed before 9-11 at the World Trade Center. Today, FEMA considers the probability threat level for simultaneous events, which could way overtax even a very large city water supply.]

The primary emphasis of the study under review is to evaluate the impact of fire flow requirements on water storage capacity. Storage capacity is aggregated into three categories: 1) equalization, 2) fire demand, and 3) reserve storage. Reserve storage corresponds to capacity that is not used for either a joint equalization or simply fire flow demand and includes both ineffective storage and emergency (other than fire) storage. In order to develop a general relationship, the following assumptions were made

- The tank or reservoir is completely and instantaneously mixed during the fill cycle.
- The storage facility operates with a 12-hour draw and 12-hour fill cycle at constant fill and draw rate with the water level variation over the full range of the equalization storage volume.
- The water level in the tank is at its maximum level at the start of the draw cycle and again at the end of the fill cycle.

The types of storage and the fill and draw pattern used in the analysis are illustrated in **Figure 7-1.**

Though primarily designed for the hydraulic purposes outlined above, storage also can have a negative impact on water quality due to age as previously identified. Loss of disinfectant residual, bacterial regrowth, taste and odor production, and formation of disinfectant by-products are potential water quality problems associated with water aging. Improper mixing in storage facilities can exacerbate the water aging problems by creating dead or stagnant zones of even older water (Grayman et al., 2000.) A quantitative assessment of the impacts of providing fire storage on water age is provided in **Figure 7-1**.

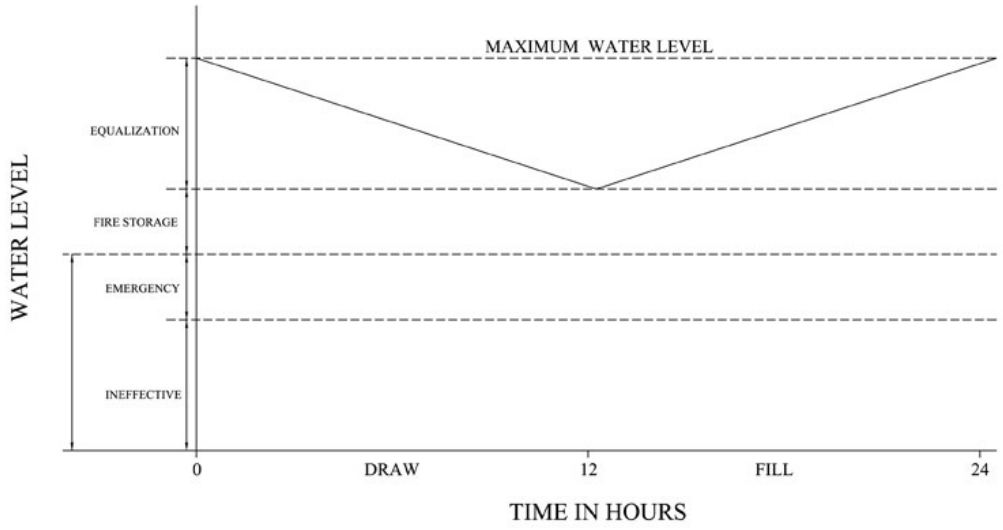

Figure 7-1

Factors Used in the Analysis of Water Storage

Study Set 1: Summary and Conclusions

Designing a water system with sufficient capacity to meet fire flow requirements or needed fire flows can result in major economic and water quality impacts. Typically these impacts are manifested in increased pipe diameters, greater provision for reliability and redundancy in system design, increased system costs, and increased potential for reduced water quality.

A method has been developed for approximating minimum pipe diameters required in a water system for various levels of fire flow and peak hour conditions. The economic and water quality consequences of these design choices have been evaluated.

The methodology has been demonstrated by applying it to a realistic, though hypothetical distribution system. System requirements for four different scenarios were evaluated:

1) Existing pipe and storage sizes.
2) Modified (downsized) pipes and storage that will still meet the full fire flow requirements.
3) Modified pipe sizes and system storage to meet a reduced fire flow requirement associated with having sprinkler systems in all structures.
4) Modified pipe sizes and system storage with no fire flow requirements.

The adequacy of the various system design options was evaluated in terms of their capability to meet fire flow requirements and to satisfy normal demands. Each option was examined in terms of its ability to meet maximum day conditions with a fire flow requirement superimposed and to meet peak hour conditions. The analysis includes both a steady-state assessment and an EPS that tests the ability of the

system to deliver flow over the duration of a fire ranging from 2 hours to 4 hours. Subsequent to the identification of the system configurations under the four design options described above, additional modeling was performed to:

1) Determine the cost of the resulting networks.
2) Determine the water quality consequences of the reduced pipe diameters and storage requirements.

In order to make the results more generally applicable, the same method was applied to a generalized network using four different design criteria, and three different fire flow requirements, under three different population densities. A series of observations result from this analysis concerning the impact of these assumptions on pipe diameters, pipe costs, water age, and velocities.

Review of National and International Criteria and Providing Fire Flows

Water companies throughout North America and Europe, whether private or publicly owned, operate within a regulated environment and strive to provide the highest levels of service to their customers at levels of costs that reflect good value for the money invested in the water treatment and distributions systems. (Water UK and LGA, 1998) In terms of water supply for domestic purpose, "the highest level of service" usually means to provide a water service to customers at acceptable minimum flow and pressure, as well as supply water that meets applicable water quality regulations and is aesthetically pleasing. Water requirements for fire suppression or installed fire protection, on the other hand, are usually added to the requirements for domestic purposes and are commonly calculated according to discrete areas belonging to different fire risk categories that are based on type of construction and building size. As discussed in greater detail below, fire flow requirements vary greatly among countries. These variations may be attributed to the *differences in construction materials and structural types* that exist among countries. The following review is by country that provided literature on water supply requirements.

United States

Throughout the United States, it generally is left up to the local authorities to determine the fire flow requirements for their jurisdiction. The fire flow requirements sometimes are specified in the model building codes or fire codes; however, if the political jurisdiction wishes to determine its own set of fire flow requirements, there are three methods reported in the literature from the AWWA. Each of these methods is identified below without full elaboration, for two of the methods are discussed in other referenced Chapters, and a third method has not been adopted by any standards or codes. Basic details are provided so that these methods can be compared and contrasted to other countries.

- The ISO Needed Fire Flow Method: Refer to Chapter 6. The ISO Method is used to determine needed fire flows for insurance rating purposes. This is a recommended practice for communities but there is no legal requirement that political jurisdiction meet needed fire flow criteria. However, municipal water supplies that do meet needed fire flow criteria may find that their commercial property owners are paying higher insurance rates; it may have less impact on residential property owners. The ISO method for calculating the needed fire flow considers the construction (Ci), occupancy (Oi) exposure (Xi), and communications (Pi) factors of a building or fire division. Exposure and communication factors reflect the influence of exposed and communicating buildings on the needed fire flow (ISO

2001). The ISO Method is most likely to produce the most realistic requirements (Farrell, 1996). Fire flow is calculated by the formula: NFFi = (Ci) (Oi) (X + P)I.

- Illinois Institute of Technology Research Institute (IITRI). The IITRI method is based on data collected from actual fire in server types of commercial occupancies in Chicago and to determine the water application rate necessary to *control* a fire as a function of the fire area. Using a curve fitting analysis, the IITRI method developed two equations solely based on flow area. The method has not been adopted by any code- or standards-making organization.
- Iowa State University Method. The ISU method for calculating a required fire flow addresses both the quantity of water required to extinguish a fire, and the effects of various application rate and firefighting techniques. The equation used for this method is based on the consumption of fuel being dependent on the available oxygen supply in a 90 percent closed compartment or space and vaporization of applied water into steam. (AWWA, 1998) A limitation of this equation is a result of the assumption that the entire compartment or space be entirely involved in fire. Therefore, the critical consideration involved in applying the ISU method is how a fire department fights structural fires. (Burns and Phelps, 1994) This method is discussed further in Chapter 6, and it should be noted that this method is fully explained in NFPA 1142.

In addition to these basic methods, building codes and standards in the United States also specify water supply requirements for fire protection. The following building code information was identified from a review of the literature.

BOCA: The BOCA National Fire Code references the NFPA Codes and Standards for the determination of required fire flows.

ICBO: The Uniform Fire Code defines fire flow as the flow rate of a water supply, measured at 20 psi residual pressure, that is available for firefighting (ICBO, 1997). For one- and two-family dwellings, a fire area that does not exceed 3,600 square feet, the minimum fire flow requirements are 1,000 gpm. For other types of construction, the minimum required fire flow and flow duration for buildings are indicated in **Table 7-1**.

Table 7-1: Minimum Required Fire Flows and Flow Duration

Fire Area in Sq. Ft.*	Fire Flow in gpm	Duration in Hours
3,600 —70,900	1,500—2,750	2
13,400 —128,700	3,000—3,750	3
23,300 —295,900 and greater	4,000—8,000	4

Source: ICBO 1997 *Fire areas for specific types of construction are provided in Appendix III-C, Fire Hydrant Locations and Distribution of the UFC (ICBO) 1997.

NFPA: NFPA leaves it up to the Authority Having Jurisdiction to determine the required fire flows for the local conditions in the form of local codes, ordinances, or resolutions. These local codes may, however, specify the minimum water supply requirements that must be available for firefighting purposes in areas where adequate and reliable water supply systems for firefighting purposes do not exist. The fire department having jurisdiction should perform an onsite survey of all building, including types of construction, occupancies, and exposures within the applicable jurisdiction to

obtain the information needed to compute the minimum water supplies required (NFPA, 1999). NFPA 1142 provides calculations for determining the minimum firefighting water supply for structures based on their exposure hazard, total area of the structure, occupancy hazard classification number, and the construction classification number. Tables specify the minimum water supply to be 2,000 gallons and the maximum supply of 5,000,000 gallons that must be available in storage for firefighting purposes.

Canada

It is the responsibility of the provinces and territories throughout Canada to determine fire flow requirements. The following is a summary regarding some of the codes and guidelines used by local authorities in Canada for determining the required fire flows for their province or territory.

- National Building Code (NBC): The NBC does not dictate the required fire flow, but states that an adequate water supply for firefighting should be provided for every building (Farrell, 1996).
- Alberta Building Code: In 1973, Alberta became the first province to adopt the NBC by reference, making some amendment as noted in the Alberta Code (ABC) (Farrell, 1996). The ABC provides a formula for calculating the supply of water to be available for fire-fighting purposes. The formula is based on the total building volume, a water supply coefficient, and a spatial coefficient. The water supply coefficient is selected from a table provided in the ABC, while the spatial coefficient is equal to either 1.5 or 1.0 based on the limiting distance between buildings. The water supply should be capable of being delivered at a rate of not less than 700 gpm for any building required to have a total quantity of water less than 20,000 gallons and a rate of not less than 950 gpm for a building requiring a quantity not less than 40,000 gallons (Farrell, 1996).
- Fire Underwriters Survey (FSU): Similar to the ISO in the United States, the FSU has developed a "Guide to Recommended Practices" and is responsible for performing the review and evaluation of the adequacy of fire protection for municipalities and rating them accordingly. The FSU requirement for fire flow is based on building characteristics including the type of construction, floor area, number of stories, nature of occupancy, automatic sprinkler protection, and exposure risk. The minimum recommended fire flow is 500 gpm, and the maximum recommended fire flow is 12,000 gpm (O'Farrell 1996).

[Sidebar: with a few exceptions, this is the same criteria used by ISO in the USA.]

- Water supply standards: The water supply standards for the City of Edmonton, Alberta, Canada require a separate fire flow of 8 gpm to be imposed at a node adjacent to all high-value properties, e.g., schools and shopping centers. A separate fire flow of 1,600 gpm also is imposed at a node of the weakest link or farthest from the source of supply within the network for a single-family residential development. The residual pressure in all cases for any node within the network should not be less than 20 psi at ground level (Farrell, 1996).

Europe

There are no fire protection standards that apply to all European countries; therefore, each country must develop or adopt its own fire flow requirements.

Germany

The German standards for fire water requirements (DVGW 1978) are based on very detailed fire risk categories that assign the level of risk according to four classes of building use and three classes of fire

spread risk (i.e., low, moderate, and high). German standards for building use categories are presented in Table 7-2.

Table 7-2: German Standards by Building Use Categories

Category	Description	Number of Stories	Floor Area Ratio*	Volume-Area Ratio
1	Small Building	__ 2	__ 0.4	__
2	Residential, light industrial, mixed residential, business mixed	_ 3	__0.3-0	__
3	Central Business District, Light Industrial	3	0.7-1.2	__
4	Central Business District, Heavy Industrial	1	1.0-2.4	__9

Source: Adapted from DVGW 1978.

* Floor Area Ratio = Total area of building/Footprint area.

Volume-Area Ratio = Total building volume/Footprint area.

The combined risk categories result in a fire flow requirements ranging from 200 gpm for the lowest risk area to 850 gpm for the highest risk area. The German standards require that all fire risk flows should be maintained for at least 2 hours with the residual fire pressure (the minimum pressure required during fire flow conditions) of 20 psi for all categories of risk.

United Kingdom

The flow rates that the UK Fire Services ideally require to fight fires are based on the national document on the provision of water for firefighting (Water UK and LGA, 1998.) Similar to German standards, fire flow requirements are determined based on the categories of premises to be protected. Table 7-3 shows UK fire flow requirements ranging from 120 gpm for the lowest risk areas to 1,200 gpm for the highest risk areas.

The UK guidance document does not stipulate the period for which the required fire flow for a specific risk category should be maintained, or the residual fire pressure.

Table 7-3 Categories of Premises and Fire Flows as Required in the UK

Category	Description	Fire Flow in gpm
1	Housing:	
	• Not more than two floor	Minimum of 250
	• More than two floors	300 to 550
2	Transportation (lorry/coach parks multistory car parks, service stations)	396
3	Industry:	
	• Up to 1 hector	300
	• 1 to 2 hectors	550
	• 2 to 3 hectors	800
	• Over 3 hectors	1,200
4	Shopping, office, recreation and tourism	300 to 1,200
5	Education, health and community facilities	
	• Village hall	250
	• Primary schools and single story Health centers	300
	• Secondary schools, college, and large Health and community facilities	550

Source: Adapted from Water UK and LGA ,1998.

Greece

The Technical Chamber of Greece (1996) stipulates that fire flows should be maintained for at least 30 minutes at a level that ranges from 200 gpm to 1,900 gpm depending on the risk category. The required residual pressure, which is 60 psi for all categories, indicates that the main rationale behind the residual fire pressure in this case may not be to act as a safety factor to prevent negative pressures developing in the water supply network (as in other countries), but to supply pressure directly to fire hoses.

France

The French standard for fire water requirement (Circulaire 1951, 1957, and 1967) require flows of 260 gpm supplied for 3 hours as a minimum. Similar to other European standards, fire flow requirements are determined based on the risk associated with premises to be protected, and in case of increased risk (e.g., factories, apartment buildings, etc.) the requirement will increase accordingly. The level of risk and required fire flows are determined based on assessment by the firefighting services. As a consequence of this approach, more stringent requirements can be imposed (Ruellan and Tiret, 1990). Such an example is given for the City of Paris where the requirements range from 530 gpm for a house with not more than two floors, to 2,640 gpm for industrial zones of importance to the general public. Although there were attempts in 1977 and 1978 to re-evaluate these standards, the standards described were still in use in France in 2002.

Spain

Similar to the French standards, the Spanish standards for fire water requirements (Real Decreed 1942/1993) require flows of 260 gpm to be supplied over 2 hours. The required minimum pressure is 13 psi.

Netherlands

In the Netherlands, water requirements historically are calculated based on now outdated KIWA Mededeling 50 (KIWA, 1977) according to defined risk areas a) the high-risk fire flows (required provision of 1,600 gpm to be supplied over 6 hours), or b) the low-risk fire flows (400 gpm to be supplied for 2 hours), which are the highest amount the European countries defined in the subject report. The required fire pressure specified in this document is 30 psi for all categories of risk. However, there are still 10 to 20 percent of the higher risk buildings that will require fire flows of 260 gpm. These higher risk standards are considered to be more of an exception than a rule. In the Netherlands, the fire department typically relies on the water utility for the first 15 to 30 minutes of a fire, after which time they use nonpotable water sources such as canals.

The Identification of Alternative Methods and Technologies for Structural Fire Suppression

Automatic Suppression Technologies

A host of structural fire suppression technologies were reviewed by both Committee and supporting staff that could have a positive impact on reducing water demand for structural fire suppression. The following is a synopsis of the technologies presented in the document under review for this manual. However, there has been significant advancement in several of these technologies along with better performance indicator since the AWWARF/KIWA report was published in 2002. Therefore much of the detailed information is left to be presented in Chapter 9—Viable Approach to Providing Adequate and Reliable Water Supplies for Fire Suppression and Chapter 10—The Latest Concepts on Water Supply Systems.

1. Automatic sprinklers.

Automatic fire sprinkler systems were the first and still are the foremost form of automated fire suppression system used throughout the world. With over 100 years of operating history and a 95 percent plus success record, these systems represent one of the most readily available means for effective fire suppression for a wide range of different occupancies. The success story with automatic sprinkler systems in confining, controlling, and extinguishing developing fires in structures has been a phenomenon.

When used in a closed-head sprinkler system, each individual fire sprinkler is, in a sense, its own fire detector and suppression device. A fire sprinkler is constructed of a mental frame with a threaded pipe inlet and a water distribution deflector; on the interior of the threaded inlet there is a discharge orifice through which the water discharges; a cap covers the discharge orifice. This cap is held in place by one of several types of heat responsive actuation mechanisms, (e.g., fusible link, chemical pellet, frangible bulb, or a special heat responsive element that opens and closes the orifice based on the heat intensity. The distinctions among the different types of actuation mechanisms is not significant relative to the sprinkler heads basic operation; only to the sensitivity of the operation. Each actuation mechanism has a predetermined (based on hazard to be protected and as defined by code) temperature set point. Once the mechanism has been heated to this set point, the mechanism will fuse, melt, rupture or other wise

open the orifice allowing the water pressure in the piping system (in a wet pipe system) allowing water to discharge in a defined pattern over the fire.

Fire sprinklers have orifices ranging from 0.25-inch diameter up to 0.75-inch diameter, depending on the type of hazard or occupancy classification to be protected. Temperature actuation set points range from a low of 135 °F (57 °C) up to 650 °F (343 °C) Set points also are selected based on occupancy. Sprinkler water flow rate is a product of the square root of the water pressure at the sprinkler orifice multiplied by a K factor representing the sprinkler discharge characteristics. K factor ranges are from 1.3 up to 14.5, and even larger (for what are termed large drop-type sprinkler heads). The "standard" sprinkler as defined by NFPA 13 has a 1.2 inch (0.5) diameter orifice and a K factor of 5.6 and an actuation temperature of 155 °F (68 °C). At 15 psi, a "standard" open sprinkler head delivers just under 25 gpm.

Sprinkler systems are designed and arrange with special control valves that include wet-pipe systems, dry-pipe systems, preaction systems, and other special, less frequently used, systems. Wet-pipe sprinkler systems are by far the most common type of sprinkler system in service in commercial and residential properties today. Wet pipe, as the name implies, means that the piping distribution system to each sprinkler head is charged with water under pressure. It is important to note that in this type of closed head system, each sprinkler fuses individually in response to heat input from a fire. Only those sprinklers directly exposed to the heat of the fire will actuate to spray downward onto the developing fire. A common *misconception* is that when a sprinkler system actuates, all heads open simultaneously; this only happens with deluge systems, which are installed for very special hazardous situations. System actuation is alarmed through instrumentation at the system riser fed by a lead-in water main that detects water flow into the system and is wired to a local remote fire alarm panel.

Dry-pipe sprinkler systems operate similar to a wet-pipe system, except that the piping distribution system to feed the sprinkler heads is charged with air or an inert gas under a specified pressure. When an individual sprinkler head fuses, air or gas is discharged initially until the air pressure is depleted to a point where a differential type check valve located in the system riser will open and allow water to flow into the piping distribution system. Again, water flow is monitored by means of instrumentation to immediately sound an alarm. Dry-pipe systems typically are installed for the protection of areas where the sprinkler distribution piping is located in an unheated space such that if water were present, it could freeze and damage the piping, resulting in undesirable non-fire-related discharge of water. The design water flow requirements for a dry-pipe sprinkler system are basically the same as for wet-pipe systems except for the main control valve arrangement.

Preaction sprinkler systems are used in areas such as a rare book collection, where non-fire-related water discharge (e.g., due to sprinkler head or sprinkler piping) could be damaging. This system combines the design features of the dry-pipe sprinkler piping system and is charged with air or more likely. Today, with an inert gas with a separate fire detection systems in the protected space. Special pre-action control valve is located at the system riser and is tied to the fire detectors in the protected space. The preaction valve will not open to release water into the system until a fire alarm signal is received from the fire detectors. The signal will release the valve to admit water into the distribution system piping, but water discharge *still will not* occur until the heat of the fire has fused the actuation mechanism of an individual sprinkler head. Repeating, but this point is most important, water will only discharge from the sprinklers that have been heated to their actuation set point temperature. When the system is in a standby (non-fire situation) condition, the pressure of the inert gas (i.e., air) in the piping is monitored by a low-pressure switch. If a low air pressure condition occurs due to pipe damage or sprinkler head damage, a trouble alarm will sound so that repairs can be made prior to any water discharge.

2. Deluge sprinklers and water spray systems.

Deluge sprinklers and water spray systems operate in a manner similar to the preaction systems described above. The difference in these types of systems is that the actuation mechanisms in each sprinkler head has been removed so that all heads open on the system and water will discharge simultaneously. In both types of systems, fire detection devices are placed throughout the protected space and will actuate a normally closed deluge type valve at the system riser to flood the distribution piping and discharge water from all sprinklers or spray nozzles. Deluge sprinklers and water spray systems differ from one another only in that deluge sprinklers are standard type sprinkler head and are used for general floor area protection the same as other types of sprinkler systems. However, water spray nozzles are of a different design where the water pattern is directed at 30, 60, or 90 degrees from the nozzle orifice and are used for specialized applications such as the oil in transformers or to protect exposed structural steel. Both deluge sprinkler systems and water spray systems typically are limited to use in high-challenge, rapidly developing fire hazard applications. Deluge systems may be used to protect the storage of piled combustibles such as bailed cotton, cardboard containers, or containers on flammable and combustible liquids. These types of systems are for special hazard protection only. They are *inappropriate* for use in other types of occupancies due to water damage potential.

3. Foam-based sprinklers.

Wet-pipe, dry-pipe, preaction, deluge, and water spray type fire protection systems, when used for the protection of high challenging type fire hazards that include flammable liquid hydrocarbons, can be enhanced by the *addition* through injection of one of several types of fire fighting foam agents. The current basic foam classes include protein foam, fluoro-protein foams and Aqueous Film Forming Foam (AFFF) for flammable liquid fires and synthetic surfactant foams better know as Class A foams for ordinary combustibles and structural firefighting. These foams maybe used with fixed system applications and also are used commonly with manual hose streams and master stream applications in high hazard facilities.

The important concept here is that all of the firefighting foams are reported to extinguish fires in both ordinary combustibles faster and with less water than plan water alone; this reduces the water demand for firefighting. Foam in general tend to form a foam blanket that helps exclude oxygen and reduces vapor emissions from the fuel surface while allowing water droplets to settle out of the emulsion and provide cooling at the flame-fuel interface. While surfactant foaming agents are effective in controlling and extinguishing flammable liquid fires and there is increased applications of the newer Class A foams for more rapid control and extinguishment of developing structural fires in residential occupancies, this technology does not have a sufficient history of carefully documented successes to consider the reduction of needed fire flows at this time. Furthermore, the surfactant foams ultimately are carried to wastewater in the fire runoff. This may create an environmental concern regarding discharge of these "soaps" to wastewater streams in certain jurisdictions.

[Sidebar: See further details on Class A Foam in Chapter 9.]

4. Residential and fast-response sprinklers.

Within the past two decades, substantial decreases in the actuation time of sprinkler heads has been recognized. The design of sprinkler actuation mechanisms now incorporates a value known as the Response Time Index (RTI). RTI is a measure of thermal sensitivity, namely, the rate at which the sprinkler element can absorb heat from its surroundings, before actuating. RTI incorporates the concept of thermal lag in that while all actuation mechanisms are set to fuse at a given temperature, the mass of the actuating element introduces a lag time for heat flow into the element.

Significant research product development has led to two distinct types of state-of-the-art sprinklers, both having faster response times: the residential sprinkler and the quick-response sprinkler. Both residential and quick-response sprinklers incorporate lower mass fusible links or frangible bulbs that decrease RTI. The difference in the two types are in their discharge characteristics. Residential sprinkler systems have a modified water discharge pattern where more of the water discharged is contained in the upper portion of the horizontal discharge profile. This is necessary because residential sprinkler system design places a high reliance on the fire being suppressed with a single operating sprinkler head. The distribution pattern of the head must therefore protect draperies and higher elevation combustibles that are more typical to a residence than other types of occupancies. This discharge pattern also helps ensure that fire gases at the ceiling of an enclosure are cooled effectively, thereby reducing the likelihood of "flashover" and additional sprinklers actuating.

5. Water mist technology.

In the case of water mist fire suppression systems, it might be observed that something seventy years old is now a "new thing" again. Water mist technology was originally developed in Europe in the 1940s as application for marine engine and fuel space fire protection. In the 1950s a significant interest and research was direct at water mist as one of the agent most viable for replacing the Halon 1301 fire extinguishing agent. Federal regulations stopped the use of Halon 1301 by 1980 as a significant threat to Ozone depletion in the atmosphere. Beginning at the turn of the 21st century, significant interest and research has been directed at water mist as one of the agents most viable for replacing Halon in certain applications.

Water mist systems are defined by the different methods in which the mist is formed and the characteristics of the droplet size and distribution of the discharged mist from nozzles. Water mist droplets are formed through specially designed nozzles at pressures typically higher than those of standard sprinklers. The pressure is generated by high-pressure pumps or accumulators usually containing air or nitrogen, or even a combination of both. Water droplet size and discharge momentum are critical parameter in system design.

Additional Methods of Reducing or Augmenting Water Supplies for Fire Protection

The AWWA Research Foundation and KIWA Study on the impact of fire flows on municipal water distributions system also considered additional topics that include, 1) Surface Water Sources and Private Water Tanks, 2) Use of Non-potable Water Delivery Systems for Fire Protection, and 3) Continuing Sprinkler Technology. This study was completed in 2001 and published in 2002. Since that time there has been significant progress in these areas along with water mist technology that has been supported by the USFA in partnership program with the ISO, the National Institute of Science and Technology (NIST), the NPFA Committee on Suburban and Rural Water Supply, Standard 1142, and the Marriott Corporation. This update information is presented in Chapter 9 on Viable Approach to Reducing Needed Fire Flow or Providing Independent Water Supplies For Fire Protection.

Study Summary Statement of Importance

This referenced study provides the following conclusions based on the information through the year 2001.

Water-efficient fire suppression technologies suggest the use of less water than conventional standards. In particular, the universal application of automatic sprinkler systems provide the most proven method of reducing loss of life and property due to fire, while at the same time, providing faster response to the fire and requiring significantly less water than conventional fire fighting techniques. It is recommended that the universal application of automatic fire sprinklers be adopted by local jurisdictions.

Project Advisory Committee

Note: Three committee sessions were held in the Philadelphia area and numerous phone contacts were made over a 2-year period. Some of the following individuals prepared separate documents that were used in writing the final study report.

- Mr. Isaac Pai, Long Beach Water Department, Long Beach, CA.
- Mr. Jonathan Clement, Black & Veatch, Boston, MA.
- Mr. William Kirkpatrick, East Bay Municipal Utility District, Oakland, CA.
- Mr. Jan Vreeburg, KIWA, the Netherlands.
- Mr. Jeffrey Swertfeger, Cincinnati Water Works (CWW), Cincinnati, OH.
- Mr. P.K. Tudor, Delaware County Water Company (DEL-CO), OH.
- Mr. Lewis Rossman, U.S. Environmental Agency, (USEPA), for modifications made to the EPANET software
- Mr. Scott Mitchell, American Fire Sprinkler Association (AFSA)
- Dr. Harry E. Hickey, Professor of Engineering, University of Maryland (Retired) representing the Insurance Services Office, Inc.
- Dr. Tom Walski, Haestad Methods, Waterbury, CT.

The authors would also like to thank the workshop participants for their input; these individuals include

- Dr. Yakir Hasit, Parsons Corporation
- Mr. Joan Hammel and Ms. Heidi Gorrill, Roy Weston, Inc.
- Mr. Michael Schmidt, ACE-INA Holdings

- Mr. Edward Straw, Senior Technical Engineer, Insurance Services Office, Inc.
- David Hauue and Mr. Hilosh Puchovsky, National Fire Protection Association (NFPA)
- Roland Huggins, ASFA, Mr. Timothy MacDonald, City of Cambridge Water Department
- Mr. Fern Marcuccio and Mr. Rob Cowan, Regional Municipality of Ottawa-Carleton
- Mr. David Hartman, CWW
- Mr. Ken Thompson, Irvine Ranch Water District
- Mr. Lou Chanin, United Water New Jersey
- Mr. Calvin Banning, Duke Engineering & Services
- Mr. Malcolm Brandt, Black & Veatch

CHAPTER 8: DUAL WATER SYSTEMS

Basic Concepts

The use of dual water distribution systems, one for potable water for consumer consumption and the other for nonpotable water is becoming a common practice. The main reason for this condition is the diminishing supplies of high-quality water resources, rapidly escalating costs for developing new water sources or for treating poor quality water, and, of no less importance, the increasing costs involved in discharging wastewater into the environment.

When faced with the task of developing additional water sources, community water utility managers and design engineers are increasingly evaluating the potential for dual water systems to serve their community's needs. Development of a dual water system maybe less costly and less wasteful than existing practices that use potable water for purposes that do no require the high quality of water prescribed by the EPA. Properly treated and distributed nonpotable water, as defined by the American Water Works Association (AWWA Manual M-24) can safely be used for irrigation, industrial applications, structural fire suppression, and a wide range of other nonpotable urban purposes to be identified in this Chapter. (1) The bottom line is that these practices conserve limited high-quality treated water for drinking, cooking and other uses requiring potable water that meets EPA quality standards.

Although several States have established regulations for the distribution and use of nonpotable water as defined in AWWA M-24, national standards and guidelines have not yet been established. The AWWA Distribution and Plant Operations Division Committee on Dual Water Distribution Systems, which prepared the stated manual, believes that more study is needed before national standards can be adopted. The following synoptic review of the AWWA concepts on dual water systems are of significant importance in providing needed fire flows without using domestic water. If this could become a reality, then water supplies for fire protection could be designed independent of consumer consumption requirements and provide avoidance for meeting consumption requirements along with needed fire flows on the same water system.

AWWA clearly states that it does not endorse the concepts and information on existing and hypothetical water systems presented in AWWA M-24. This is documentation for review, study, and comment. But the material provided needs to be considered carefully in relation to providing required water supplies by adopted building codes or needed fire flows by the insurance industry. It is also observed that a second approach to dual water supplies are not discussed in the AWWA M-24 Manual. To avoid a semantics problem, this second approach will be defined as a *Separate Water System* and will be discussed in Chapter 9.

Background Information

With increasing urban and industrial development, and with most high-quality sources of substantial water yield already developed, surpluses of high-quality water for the future are becoming less available, and in many areas of the country especially on the East and West Coasts they are nearly exhausted. Using *wastewater* treatment effluents for industrial, urban needs, or agricultural irrigation purposes is a very important way a nonpotable water supply can lessen the demand on potable water sources. An example is the introduction of wastewater treatment effluent for use in the steel industry in Baltimore in the 1950s. (2) Another example is the distribution of reclaimed wastewater to several industries in Colorado Springs in 1960 to relieve the demand on limited freshwater supplies.

Two primary factors have accelerated the development of dual distribution systems. First is the need for water supplies that do not necessarily need to be of potable quality for urban and industrial use. Second is new requirements for costly advanced wastewater treatment facilities, including nutrient and organic removal, to protect the receiving water supplies such as stream, rivers, lakes, and oceans.

Using reclaimed wastewater for nonpotable purposes may reduce water treatment costs when nutrient removal is not only unnecessary but wasteful. This is the case for urban and agricultural irrigation because nutrients already in the wastewater can replace those that would ordinarily need to be added. An example of this would be a golf course watered with reclaimed water. An extensive distribution system for urban irrigation, including the watering of parks, school and college campuses, median strips, and residential lawns, is an important element of reclaimed wastewater system used for other nonpotable purposes.

Although there are many dual distribution systems of varying degrees of complexity, the Federal government has not yet established guidelines for nonportable distribution systems. Some State governments have established standards and guidelines for reclaimed water quality and its nonpotable use. This Chapter present a general summary of current practices for dual water distribution systems with a special focus on the application of these systems to providing an alternative approach to providing required and needed fire flows for structural fire suppression operations. A limited application of this concept is found in the States of Arizona, California, and Florida.

Potential Applications for Dual Distribution Systems

With many successful dual water distribution system now in operation, running from systems that are just one or two major customers to systems that serve all properties in the community, water supply professionals are now considering dual distributions that address special water supply demands and water pollution control problems. These special problems including providing water for fire protection may necessitate new piping system configurations and the engineering of pipe sizes to meet fire flow requirements. This raises the issue of the need for more than one type of reclaimed water distribution system for a given community. The following situations in which a dual water distribution system would be worth evaluating are described under the following topics.

1. Limited water resources.

Competition of existing water resources or limitations on these resources often make acquisition of additional water resources politically and financial difficulty. For example, obtaining additional water resources might require inter-basin (raw water) transfer, which is less politically acceptable now than it was in earlier years of water resource development. Greater knowledge of groundwater hydrology has

illuminated the danger of excessive withdrawls from aquifers, which can result in continually increasing costs of pumping, impaired water quality, and land subsidence. Limited resources create a situation in which water reclamation and a dual distribution system may become attractive.

2. Limited water supplies.

When demand is expected to exceed the yield from existing water supply facilities, and additional facilities need to be constructed, the gradual introduction of a nonpotable water might be appropriate. Water users, whether industrial, commercial, or municipal, may well be served with reclaimed wastewater in place of potable water at a cost substantially lower than the cost of developing new high-quality water sources of supply for potable purposes.

3. Polluted sources.

The 1982 United States Public Health Service Drinking Water Standards recommended that "water supply should be obtained from the most desirable source which is feasible..." (USPHS 1982). The EPA National Interim Primary Drinking Water Regulations adopted in 1995 state that "priority should be given to the selection of the purest source." Many communities have selected the highest quality available which varies widely by region of the country. Additional development may require use of a more polluted source which extrapolates the cost of water treatment to meet EPA regulations. In the past, engineers believed that they could render almost any polluted water safe for potable supply through adequate treatment; generally from coagulation, filtration, and disinfection. However, the "chemical revolution" in the United States since the 1950s resulted in thousands of synthetic organic chemicals that are not readily degraded in the environment. The number of contaminants regulated in potable water has grown from 4 in 1925 to a projected legislated number exceeding 150 by 2000. The treatment of water that will meet drinking water standards in the future will cost considerably more than it does in 2005. Polluted sources of water may therefore be less suitable for potable water supplies but well suited for one or more nonpotable purposes.

4. Rigorous wastewater treatment.

To restore and preserve the quality of North American water, treatment requirements for community wastewater have become increasingly stringent and costly. In many cases, nutrients may need to be removed. If the wastewater can be used in industry for urban irrigation, some advanced treatment, including nutrient removal, may not be necessary and may in fact be undesirable. The operation and maintenance of advanced physical and chemical wastewater treatments facilities are generally more costly than treatment for nonpotable reuse. If wastewater can be used productively, the savings in wastewater treatment can be passed on to users, making water reclamation and dual distribution systems more economically attractive.

Sources of Nonpotable Water

The most commonly used source of nonpotable water is water reclaimed from local wastewater plants, which is generated near customers that can use it. The technology needed to assure the required quality of water is well established. Treatment of secondary effluent is accomplished by coagulation, conventional filtration, and disinfection. Other sources of nonpotable water include brackish or mineralized surface waters and groundwater, including seawater, certain industrial wastewaters and ground waters, and irrigation return flows. The focus of this Chapter is on reclaimed water from sewage treatment plants. Chapter 10 discusses completely *separate* independent water supplies for fire protection that include streams, rivers, both small and large lakes, and ocean water.

Potential Uses of Nonpotable Water

A significant objective of this Water Supply Concepts Manual is to examine ways to reduce required or needed fire flows **or** examine viable approaches to providing water for structural fire suppression without using water treated to EPA specifications for water treatment. This is to reduce the demand for high-quality potable water and to reduce the operating costs for water treatment facilities and the distribution pipe sizes needed to supply domestic water at peak demand **and** needed fire flows simultaneously.

It is very important to understand that water for fire protection is not the only requirement that drives the size and cost of water treatment plants and distribution system design. Typical discussion of water treatment is confined to the need of treated water to meet health standards, for residential use, hospitals, nursing homes, restaurants, and basically where water is involved in the human consumption process. Forgotten are the myriad uses of water by the Federal government, State government, county government, local community government, commerce and industry, and homeowners that may not require a high quality of water.

Potential Uses for Nonpotable Water

A dual water system that reuses treated sanitation water under less stringent criteria than potable drinking water has many uses that can significantly reduce the need for potable water from traditional municipal water delivery system. Some examples include the following:

1) Public uses:
   a) Park irrigation and water amenities, such as ornamental fountains.
   b) School or campus landscaping and playground irrigation, median strips and roadway right-of way landscaping irrigation.
   c) Recreational facilities, such as gold-course irrigation, tennis court wetting, washing, and ski-slope artificial snow.
   d) Cemeteries and nurseries.
   e) Public facility toilet and urinal flushing.
2) Public and Private Sector Fire Protection:
   a) Separate water system to provide fire hydrant water that is independent of the municipal water supply system to provide better adequacy and reliability in terms of designed flow rates at specified fire risks and pressure to supply fire department pumpers at substantially lower operating costs than is possible with combined systems.
   b) Providing piped water systems to cope with the Urban/Wildland interface problem in many States. Provide water supplies for fixed fire protection systems including foam system, water spray systems, standpipe system. Note: Probably should not be used for commercial or domestic automatic sprinkler systems.
   c) *** Key Consideration: A dual water system would improve the reliability of a water system for homeland security. If the municipal water system was contaminated or disrupted, there would be a secondary supply that could be used with portable purification units to supply domestic water as well as providing water for emergency services.
3) Industrial and Commercial Uses:

a) Cooling-tower make-up water.
b) Boiler feed water make-up water.
c) Stack gas scrubbers.
d) Process water.
e) Crop irrigation.
f) Construction, including concrete manufacturer, soil compaction, and dust control.
g) Toilet and urinal flushing.
h) Street cleaning and car washing.

4) Residential uses:
   a) Lawn watering.
   b) Toilet flushing.

All of these applications are being practiced. For example, toilet flushing with reclaimed water has been practiced in Grand Canyon Village, Arizona, since 1926. A relatively recent development in Singapore is the use of reclaimed water, originally intended for industrial process water for toilet flushing in a highrise housing estate for some 25,000 people since 1991 (3), reclaimed water has been used for toilet flushing in several highrise buildings in the Irvin Branch, CA, Water District. A growing practice in the United States is the reclamation of wastewater originating in shopping malls and office complexes for toilet flushing in the same complexes. This practice reduces the volume of wastewater discharge.

Other uses of nonpotable water include enhancing wetland and ground water recharging.

Nonpotable Water Reuse Legislation

The rapid growth in the number of nonpotable water reuse project indicates that the potential for nonpotable water reuse *needs to be* evaluated whenever communities need additional water supplies for domestic consumption and/or fire protection. In three principal States, California, Florida, and Arizona, nonpotable water reuse is stimulated through legislation. It is important to understand the current state of this legislation which is in the foundation stage for moving the application of Dual Water Systems using reclaimed water forward to meet Federal and State requirements to protect public health, and with special attention to using this type of water supply for fire protection purposes.

The following is a summary of State reuse regulations based on a survey of all States conducted by the EPA to develop guidelines for reuse of water. Appropriate regulatory agencies in all 50 States were contacted by mail in September 1990 by EPA and asked to provide information concerning their current regulations governing water reuse. After the followup contacts, all 50 States responded to the request for information. All of the information presented in below is considered current as of March 1992. The literature from the AWWA does not indicate an update on this information.

As of the stated study date above, it was determined that most States do not have regulations that cover all the potential uses of reclaimed water. The notable exceptions are Arizona, California, Florida, Texas, Oregon, Colorado, Nevada, and Hawaii, which have extensive regulations prescribing requirements according to the various uses of the reclaimed water. Other States may have regulations or guidelines that focus on land treatment of wastewater effluent. These guidelines emphasize additional treatment of effluent disposal rather than beneficial reuse, even though the effluent may be used for irrigation or agricultural sites, golf courses, and public-access lands.

Based on the survey, current regulations generally are divided into the following reuse categories:

- Unrestricted urban use for irrigation of areas in which public access is not restricted. This includes such areas as parks, playground, schoolyards, and residences; and uses such as toilet flushing, air conditioning, building construction, ornamental fountains, aesthetic impoundments, such as reflection pools, and urban and rural fire protection.
- Restricted urban reuse: irrigation of areas which public access cannot be controlled, such as golf courses, cemeteries, and highway medians.
- Agricultural reuse of food crops: irrigation of food crops intended for human consumption. This category is often further classified as to whether the food crop is to be processed or consumed raw.
- Agricultural reuse on nonfood crops: irrigation of food fodder, fiber and seed crops, pasture lands, commercial nurseries, and sod farms.
- Unrestricted recreational reuse: an impoundment of reclaimed water for which no limitations are imposed on body-contact, water recreation activities.
- Restricted recreational reuse: an impoundment of reclaimed water for which recreation is limited to fishing, boating, and other noncontact recreational activities.
- Environmental reuse: reclaimed water used to create artificial wetlands, enhance natural wetlands, and to sustain stream flows.
- Industrial reuse: reclaimed water used in industrial facilities primarily for cooling-system makeup, boiler feed water, process water, and general wash down.

Reclaimed Water Quality and Treatment Requirements

Requirements for water quality and treatment of water reuse receive the most attention in State regulations. States with water reuse regulations or guidelines have set standards for reclaimed water quality, specified minimum treatment requirements, or both. Generally, when unrestricted public exposure is likely in the reuse application, wastewater must be treated to the highest degree possible before its application. Where exposure is not likely, however, a lower level of treatment usually is accepted. The number of States with regulations or guidelines on this subject is presented in **Table 8-1**.

Water quality limits are commonly imposed on biochemical oxygen demand (BOD), total suspended solids (TSS), total or fecal coliform counts, and turbidity. Coliform counts and turbidity are generally used as indicators to determine the effectiveness of disinfection. A limit on turbidity is usually not specified or required unless there is a need to achieve a high level of disinfection.

Table 8-1: Number of States with Regulations or Guidelines for Each Type of Reuse Application

Types of Reuse	Number of States
Unrestricted Urban Irrigation	22
Toilet Flushing	3
Structural Fire Protection	2
Building Construction	4
Landscape Impoundment	7
Street Cleaning	1
Restricted Urban	27
Agricultural (Food Crops)	19
Agricultural Non-food Crops	35
Unrestricted Recreational	5
Restricted Recreational	7
Environmental Wetlands	3
Industrial	6

Reclaimed Water Monitoring Requirements

Reclaimed water monitoring requirements, as well as the type of reuse, vary greatly from State to State. For unrestricted urban reuse, Arizona requires sampling for fecal coliform on a daily basis, but for agricultural reuse of on nonfood crops, such sampling is required only once a month. Arizona also requires turbidity to be monitored on a continuous basis when a limited turbidity is specified.

California, Florida, and Washington also require continuous online monitoring of turbidity. Oregon, on the other hand required that turbidity be monitored hourly and the sampling for total coliform be conducted either once a day or once a week, depending on the type of reuse application.

California requires total coliform samples to be taken on a daily basis and turbidity to be monitored on a continuous basis. For unrestricted urban reuse, as well as agricultural reuse on food crops, Florida requires the continuous online monitoring of turbidity and chlorine residual. Even though no limits on turbidity are specified in Florida, continuous monitoring serves as an online surrogate for suspended solids. In addition, Florida requires that the TSS limit must be achieved prior to disinfection and the fecal coliform samples be take on a daily basis. Other States determine monitoring requirement on a case-by-case basis, depending on the type of reuse.

Treatment Facility Reliability

To achieve reliability in reclamation facilities, some States have adopted regulations or guidelines to ensure that reclaimed water of required quality will be delivered. Methods of ensuring reliability consist of alarms that warn of power failure of essential unit processes, automatic standby power sources, emergency storage, and the provision that each treatment process be equipped with multiple units or a backup unit.

California Title 22 Regulations provide design and operational considerations covering alarms, power supplies, emergency storage and disposal, treatment processes, and chemical supply, storage, and feed facilities. For treatment processes, a variety of reliability features are acceptable in California.

Groundwater Monitoring

Groundwater monitoring programs associated with irrigation of reclaimed water are required by Arkansas. Delaware, Florida, Georgia, Hawaii, Illinois, Maryland, Missouri, Montana, New Jersey, South Carolina, Tennessee, Washington, West Virginia, and Wisconsin. In general, these groundwater monitoring programs require that one well be placed up-gradient of the reuse site to assess background and incoming groundwater conditions with the aquifer in question. In addition, two wells are to be placed down-gradient of the reuse site. Some States also require that a well be placed within each reuse site. Florida generally requires a minimum of three monitoring wells at each reuse site, although for systems that involve unrestricted urban reuse, they require a plan to monitor typical areas. South Carolina's guidelines suggest that a minimum of nine wells be placed on 18-hole golf courses that irrigate with reclaimed water. Sampling parameters and the frequency of sampling are generally considered on a case-by-case basis.

Treatment for Reclaimed Water

The latest documented information on the general state of water regulations and basic support information on this topic is presented above. Now it is important to present some of the specific aspects of water for nonpotable use. The focus of the following information applies specifically to reclaimed water but also references not potable treatment for other uses as specified.

The major water-quality parameters include biodegradable organics, suspended solids, plant nutrients, dissolved solids, and pathogens. The required treatment of wastewater depends on the highest use of reclaimed water in the system. Usually reclaimed water is treated to meet unrestricted urban reuse, which requires the highest-quality reclaimed water.

For example, water for body-contact recreational use could require a high degree of removal of all constituents except dissolved solids. Orchard irrigation via surface furrows could require relatively lower degrees of all removals and probably no intentional removal of nutrients or dissolved solids if wastewater is the source of supply. Certain industrial water demands, such as water for cooling towers, could require a very high degree of removal of dissolved solids, including conversion of ammonia and phosphorus, and silica removal. The following information gives an overview to the treatment process:

Basic Treatment Process

1) **Biodegradable organics:** Biodegradable organics are often measured as biochemical oxygen demand (BOD), chemical demand (COD), and total organic carbon (TOC). Starting with wastewater, gravity sedimentation removes 30 to 40 percent BOD, producing water acceptable for flood irrigation. Biological processes remove 85 to 98 percent BOD, producing water acceptable for landscape irrigation, Chemical coagulation and filtration remove greater than 99 percent of BOD, producing recreation water. Activate carbon removes virtually all BOD, producing water that may be suitable for *groundwater* injection, or the replenishment of groundwater. This is a very important concept as groundwaters in most areas are receding; in fast-growing residential areas the recession process is alarming.

2) **Suspended solids:** Suspended solids often are measured as total or volatile suspended solids in all but very low concentrations (i.e., less than 5 mg/L), otherwise turbidity is used as an indication of solids concentration, and the percentage removal from wastewater is approximately the same as with BOD.
3) **Plant nutrients:** Plant nutrient is generally not beneficial for irrigation uses, where the nutrients effectively replace commercial fertilizer. Removal might be beneficial for certain industrial process where inhibition of biological growths or corrosion control is important. Nutrient-removal processes are usually specific to a given nutrient, such as P or N, or to the specific form of the nutrient, Examples would be nitrification to convert ammonia-N to nitrate-N and identification to convert nitrate-N to nitrogen gas.
4) **Dissolved solids:** Dissolved solids usually include inorganic constituents, major anions, and cautions. They are often measured indirectly as electrical conductivity, directly as dissolved solids by evaporation, or partially as specific ions. Removal of dissolved solids is beneficial to some extent for irrigation reuse and to a greater extent for various industrial uses. Dissolved-solids-removal processes vary greatly, both by method and effectiveness. Some remove dissolved solids in general, as with reverse osmosis, while others remove only one constituent, as with selective ion exchange.
5) **Pathogens:** The presence of bacterial and viral pathogens and sometimes parasites, is often measured indirectly by an indicator organism, such as coliform bacteria. The removal of pathogens is necessary for all reuses. The degree of removal required depends on the specific reuse, including the extent of direct and indirect exposure of the general public to the reclaimed-water supply. Disinfection is usually accomplished with chlorine, although other methods, such as ozoneation and ultraviolet-light radiation, are being used.

Reclamation Plants

Reclaimed water can enter the nonpotable water distribution system from a wastewater treatment plant, which provides secondary treatment as well as filtration and disinfection. Secondary treatment consists of screening and grit removal sedimentation, and low-rate treatment processes, such as stabilization ponds and aerated lagoons; or high-rate processes such as activated sludge, trickling filters, or rotating biological contractors. Experience with such plants demonstrates that a high quality secondary effluent, treated with small doses of coagulant, polymer, or both, direct sand filtration, or chlorine disinfection can meet unrestricted urban reuse requirements (Okum, 1991).

One advantage of using reclamation plants is that they can be located in the area where the reclaimed water is needed. Excess flow, excess reclaimed water, and the sludge can be returned to the trunk sewer to be handled at the central wastewater plant.

Design aspects of reclamation plants include standby power supplies, standby or replacement equipment, treatment-process redundancy, emergency storage or replacement equipment, treatment-process redundancy, emergency storage and disposal provision (including alarm systems), monitoring equipment, and automatic actuators. Operational aspects include the development, documentation, and exercise of sound routine and contingency operation procedures, and a comprehensive preventative maintenance program. All of these considerations help to ensure that only water of acceptable quality is delivered to the reclaimed water distribution system.

Storage

Matching the nonpotable water system supply with demand is important, particularly when wastewater is the course of supply for nonpotable water. Wastewater flow generally is constant throughout the year, while nonpotable demand (typically irrigation water and possibly water for fire protection) has irregular and instantaneous flow demand. The variance between supply of reclaimed water and demand can be compensated in several ways including the following:

- store enough nonpotable water to balance supply and demand;
- supplement nonpotable water with another source to satisfy peak demand;
- dispose of excess nonpotable water; and
- a combination of the above.

The reliability required of a nonpotable water system is usually not as great as that of a potable water system. This is primary true where nonpotable water is used for irrigation purposes, street cleaning, and other intermittent uses. However, if nonpotable water is to be used for toilet facilities, fire protection, and industrial process water that reliability has to design for 24-7 continuous use at specified design requirements.

Where fire flows may be provided by the nonpotable water source system, storage should be sized to meet required or needed fire flows for the representative fire risk locations. A second design possibility is to have the potable water system meet a minimum fire flow demand of 500 gpm at 20 psi throughout **ALL** built-upon areas of the community, and use treated reclaimed water to meet the difference between 500 gpm and needed fire flows (i.e., the difference between 500 gpm standard availability on the domestic system and a NFF of 1,500 gpm would be 1,000 gpm to be supplied by the reclaimed water supply). *This is an extremely important concept!*

One underlying focus of this manual is to explore possible methods of reducing required water supplies by building code and or needed fire flow developed by the ISO. Instead of considering the reduction of required or needed fire flows, it is equally important to consider alternatives for meeting the structural fire suppression water supply needs. Reclaimed water is one important way to augment existing water supplies to provide water for fire protection without enhancing a water system based on fire flows. In facts with fire flow reductions, a given water system may be more adequate to meet consumer consumption demands without needing improvements to the potable treatment plant or the distribution system to meet both consumer consumption and fire flow simultaneously.

This would require new diligence in fireground operations. Fire department pumpers operating on the domestic fire hydrant system *cannot* have supply lines also coming from a fire hydrant on a reclaimed or essentially a nonpotable water system. The reclaimed water supply **CANNOT** contaminate the treated water supply. Where the types of systems co-exist, there needs to be development and adherence to standard operating procedures. Important considerations on this matter are presented under Reclaimed Piping Systems below.

Features of Reclaimed Water Distribution Systems

The general features of Dual Water Systems as defined in this Manual which coincides with AWWA-M–24 basically considers water treated piping systems for the irrigation, lawn watering car washing, street cleaning, and some selective industrial uses with more recent attention to providing water in commercial

buildings for sanitary requirements. The distribution systems are hydraulically designed to the end user requirements which typically are low flow because irrigation is done on alternative days and the same applies to watering lawns, shrubs, greenways, etc. Constant users are car washes, and some industrial applications. Therefore, pipes along streets may be as small as 2 inches, and many systems have pipe no larger than 4 inches.

This presents a problem when reclaimed water is to be considered for fire protection. The only documented used of reclaimed water for fire protection is in Florida, California, and Arizona. It should be noted that all three States have essentially nonfreezing weather where this application is in evidence. This allows for the use of wet-barrel hydrants and the lack of requirements to bury pipelines below the frostline. The only real requirement is to provide sufficient cover for loading under roads and driveways. Since no overall standards or engineering documentation are in place concerning these issues, an actually reclaimed-water fire hydrant system used in southern Florida is presented as one possible approach to augmenting existing treated water supplies to provide water for the wildland/urban interface problems and to provide "make-up" water to meet needed fire flow in high value districts and even residential districts when there is a water shortage problem.

The waste water treatment facility is located just west of the Intercoastal Waterway. One pipeline parallels U.S. Route 1, one follows a major boulevard, and one tracks along the east side of I-95. Wet-barrel fire hydrants are located approximately every 1,000 feet along the primary line located 15 feet from the edge of the roadways. Hydrants along the I-95 corridor are located on the outboard side of the northbound lanes, 5 feet away from guard rails and 1 mile apart. The intent of the hydrant distribution along the Interstate highway is to provide water for natural cover fuel fires and other fire emergencies on the highway plus as source for refilling water tankers.

Hydrants along Route 1 and the boulevard are used to protect both commercial and residential developments along with protecting boating marinas along the coastal waterway. Smaller diameter pipes, ranging from 4 inch down to 2 inch, cross-connect along major streets that run east and west in order to provide water for lawn irrigation, car washes, street cleaning, and dry vegetation spraying. To avoid any possible confusions with fire hydrants on the treated potable water system, the fire hydrants are painted *purple* and have posted signs indicating that the water is "Treated Waste Water." The greatest fire protection use for this system has been in the control and extinguishment of brush fires in highly populated areas.

While such a system as described above is practical and rather economical to install in non-freezing climates such installation in northern climates would require frostproof fire hydrants, much deeper pipe trenches, and valving. However, the concept still has much merit as the demand for potable water increases. Care must be exercised in the design to make sure that the desired water for fire protection use is available when there is peak demands on the system for irrigation or the watering of lawns.

The Future Role of Dual Water Systems

Dual water systems, must of necessity, become larger role players in providing water supplies to populated areas to meet a significant portion of the demand for water. This Chapter has identified the many uses of reclaimed water through proper treatment. One of those area to be carefully evaluated in the future is the role dual water systems can play in meeting required and needed fire flow demands which could take away the necessity for expensive new potable water treatment plants and water main enlargements to meet both domestic water supply needs and fire flow needs.

In new communities or in the expansion of communities, consideration also can be given to shifting the water supply for fire protection to the reused water supply. This would require designing the pipe distribution system to provide needed fire flows for representative risk location at 20 psi residual pressure while maintaining the other demands such as irrigation that may be in operation at the same time. The big payoff is that this would leave the domestic water system with the challenge of just meeting consumer consumption requirements *without* meeting needed fire flows. Re-channeling the supply of water for fire protection may be a more reasonable and responsible approach to the water supply crisis than focusing on reducing the requirements and needed fire flows during extreme dry weather and to provide fire breaks.

CHAPTER 9: WATER SUPPLY AND EFFECTIVE FIRE PROTECTION

Overview

Most communities in the United States consider that *growth* is a good thing. Development brings prosperity to cities, communities, suburbs, and the rural environment. And many parts of America are experiencing *extraordinary* residential and commercial growth.

But, growth can also strain community resources that include but are not limited to fire alarm, and emergency communications, fire department response to structural fires and other emergencies, and, most importantly the community water system. New construction, increasing population, and expanding economic activity places demands on a wide variety of municipal services including the above three elements of public sector fire protection. In many places, the need to enlarge public services, especially those functions related to fire protection, comes at the time when other priorities are competing for the same budget dollars.

The results can be devastating. If the fire department, emergency communication facilities, and *water supply* cannot keep up with the demand for services, a growing community faces the risk of property loss and personal injuries. The purpose of this Chapter is to examine the importance of water supply in the equation of providing effective fire protection at the local government level. This includes looking at water for structural fire suppression provided by fire departments and installed fire protection provided by automatic sprinkler systems and the new water application technology–*water mist systems*. Performance considerations and economic considerations are taken into account in examining the following topic headings.

The Insurance Services Office, Inc.

Property/Casualty insurance companies have long supported the efforts of individual communities to maintain and improve there fire protection services. ISO's Public Protection Classification (PPC) program helps insurance companies measure and evaluate the effectiveness of fire-mitigation services throughout the country. (1) The PPC program also offers economic benefits in the form of lower insurance premiums for communities that invest in the firefighting services that are evaluated in determining PPCs on a scale of 1 to 10. The Community Classification is determined by evaluating the 1) public fire alarm and communication capability for receiving and handling fire and emergency calls, 2) public fire department capability to confine, control, and extinguish developing fires in structures, and 3) adequacy and reliability of the municipal water supply to deliver needed fire flows at representative *fire risks* throughout the community.

A given community is surveyed by ISO Field Representatives using the ISO *Fire Suppression Rating Schedule*. The weighted credit is assigned as follows: (1)

1) Receiving and Handling Fire Alarms..... 10 percent

2) Fire Department..... 50 percent

3) Water Supply40 percent..... 40 percent

Total 100 percent

ISO is an independent organization the serves over 1,300 property and casualty underwriters in the United States. In addition, ISO directly serves fire departments, insurance regulatory agencies, and others about fire and casualty risk levels. ISO's expert field staff visits communities around the country to collect information about the items evaluated under the *Grading Schedule* items as titled above. For each of more than 46,000 fire districts in the United States, ISO analyzes that information and assigns a PPC on a scale of 1 to 10. Class 1 represents exemplary fire protection, and Class 10 indicates that the area's fire suppression program does not meet ISO's minimum criteria; this is an "unprotected" classification for insurance rating purposes. Of special *note* is Class 9 properties. This class includes all structures that are within 5 travel miles of a fire station but are located more than 1,000 feet from a recognized fire hydrant that flows a minimum of 250 gpm. According to a recent survey by the ISO 34.8 percent of the 46,000 fire districts in the United States do not have a recognized water supply for fixed protection; that is in excess of 1/3 of the land surface of the United States. (1)

The Ability of Fire Departments to Provide Effective Fire Protection

Even in well-protected areas, growth often threatens the ability of fire department to keep up with the demand for service. (1)

Many fire chiefs believe that residential and commercial growth is threatening the ability of fire departments to protect the communities they serve. Without careful attention, long-term planning, and adequate funding, communities risk deterioration in their protection, especially in these fast-growing areas. The threat is real, even in communities where fire protection is adequate today.

Those are the most important findings from a survey of fire chiefs, water superintendents and other municipal officials conducted for ISO by the independent polling firm Opinion Research Corporation (ORC) of Princeton, New Jersey, and published in 2003. (1) ORC interviewed 500 top-level municipal officials from randomly sampled communities around the country. The survey examined current conditions as well as development likely to occur over the next 3 years. The margin of error for survey results is plus or minus 2 percentage points.

About 86 percent of the fire officials reported that their communities had experienced residential or commercial growth over the past 3 years. In those communities, almost three-quarters (73 percent) of the respondents said that the growth is straining their departments' ability to protect the communities. Asked where growth had occurred, 71 percent of the chiefs said that it occurred in areas where they needed or still need improvement to water mains, fire hydrant distribution, or hauled water services. And 50 percent said that growth had occurred in areas where they needed or still need additional fire stations.

[Sidebar: The term "hauled water" has the same reference as alternative water supplies as used in this Manual (Chapter 6).]

Fire Insurance Rates

Property and casualty underwriters use two basic factors to establish fire insurance rate premiums:

1) Fire losses or loss costs.
2) Fire protection jurisdiction PPC.

Only loss costs are used for cities of over 500,000 population; fire losses are evaluated by counties and States. (1) It should be obvious that the adequacy and reliability of water supplies has a very significant impact on both life loss and property loss reduction at the time of a fire and the PPC. If water supply does not meet demand, it could have an adverse effect on insurance premiums for both commercial property owners and homeowners–more for commercial properties and than homeowners. Conversely, the ability to meet needed fire flows in both hydrated nonhydrated areas most likely will result in premium reductions if all factors of the fire protection system keep pace with urban and suburban growth.

An Overview of Water Supply Under the ISO Fire Suppression Rating Schedule

It appears important to have a relative understanding of the items that are reviewed by the ISO Field Representatives in conducting municipal water supply evaluations. Copies of the most recent survey of a water system can be obtained from the Regional Office of ISO found in the Reference Section to this Chapter. The following information provides the highlights of each item considered, by title. (2)

- **Part of the City (Community) Unprotected:** If any part of the city is not within 1,000 feet of a recognized water system, the unprotected area may receive a Class 9 rating. A recognized water system must delivery 250 gpm for a duration of 2 hours.
- **Maximum Daily Consumption Rate (MDC):** The maximum daily consumption rate is the average rate of consumption on the maximum day. The maximum day is the 24-hour period during which the highest consumption total is recorded in the last 3-year period. High consumption that will not occur again due to changes in the water system, or water loss caused by unusual conditions (i.e., a water main break lasting less than 1 hour) will not be considered.
- **Minimum Pressure:** A water system is reviewed at a residual pressure of 20 psi.
- **Fire Flow and Duration:** The fire flow duration should be 2 hours for needed fire flows up to 2,500 gpm, and 3 hours for needed fire flows of 2,000 and 3,500 gpm as determined under Section I of the *Grading Schedule*. Requirements under Section II of the *Grading Schedule* call for a 4-hour duration for fire flows ranging from 4,000 gpm to 12,000 gpm.
- **Service Level:** A service level is a part of the city distribution system that is served by one or more sources of supply but that is separated from the remaining distribution system by closed valves, check valves, or pressured regulating equipment, or is not connected.
- **Review of Supply System:** The ability of the water supply system to deliver needed fire flow at representative locations throughout the city is reviewed under the following bullet items. For each *representative* location, the supply works, mains, and hydrant distribution are reviewed separately.

- **Supply Works:** The absolute minimum supply available from water sources under extreme dry conditions should not be taken as the measure of the normal ability of the source supply. The normal sustained flow of supplies should be used as the normal capacity of the water source. If the water supply is regularly reduced for a period exceeding 1 month, the available supply is to be prorated by the time it is available. This evaluation covers:
  - Minimum storage
  - Pumps
  - Filters
  - Emergency supplies
  - Alternative water supplies (i.e., See Chapter 6)
- **Water Main Capacity:** The normal ability of the distribution system to deliver needed fire flows at representative risk locations throughout the community, as determined by the ISO are to be evaluated. The results of flow tests at each representative test location will indicate the ability of the water mains to carry water to that location. The AWWA/ISO methods of flow testing are covered in Manual II on *Water Supply Evaluation Concepts.*
- **Fire Hydrant Distribution:** Only fire hydrants located within 1,000 feet of a representative risk location measured as fire hose can be laid by responding fire apparatus is credited to satisfy needed fire flow requirements. Maximum credit for each fire hydrant within 1,000 feet of and identified fire risk is as follows: 1) Credit up to 1,000 gpm for each hydrant within 300 feet of the location, 2) 670 gpm from hydrants within 301 to 600 feet of the location, and 3) 250 gpm from hydrants within 601 to 1,000 feet of the risk location. Furthermore, the maximum credit for each fire hydrant maybe limited by the lack of a pumper connection and the number of 2-1/2-inch house outlets and a minimum water delivery capability of 250 gpm.
- **Fire Hydrants–Size, Type and Installation:** Point awards for installed and connected fire hydrants to water delivery piping of 4 inch or larger are prorated according to the following chart:

Installation Condition	Points
with 6" or larger branch, a pumper outlet and 2 to 2-1/2" outlets	100
with 6" or larger branch, no pumper outlet and 2 to 2-1/2" or more outlets	75
with 1 to 2-1/2" outlet only	25
with less than a 6-inch branch	25
Flush type	25
Cistern or suction point	25

- **Inspection and Condition of Fire Hydrants:** The inspection and condition of fire hydrants should be in accordance with AWWA Manual M-17–*Installation, Maintenance, and Field Testing of Fire Hydrants*. (3) To receive full credit under this item, fire hydrants need to be inspected every 6 months. Reduced prorated credit is given for less frequent inspection and flow testing up to 5 years. After 5 years a hydrant is considered "unreliable" and no credit is given for the fire hydrant in protecting a specific fire risk. (3)

Insurance Company Assistance on Evaluating Water Supplies

The insurance industry can assist communities in the following ways to assess the current water supply demand requirements:

- ISO can provide an identified community with a list of the needed fire flows for representative fire risk, along with available fire flows at the time of the last community PPC Survey.

[Sidebar: See appropriate contact information through the Regional ISO Offices identified under the references.]

- ISO can provide an identified community with a copy of the last PPC Report that covers all elements of the water supply system.
- If significant changes have been made in either the water treatment facility and/or the water distribution system since the last PPC Survey, a request can be made for a new evaluation. ISO does not provide engineering advice on water supply improvements but they will provide guidelines on water supply demand for any new community development.
- The insurance carriers for property protected by automatic sprinkler systems should be able to provide both supply and demand water curves for each protected property or HPR (Highly Protected Risk) property.

The following discusses how automatic sprinkler systems can be used to reduce needed fire flow demand.

Automatic Fire Sprinkler Systems

Cote and Linville state, "Automatic Sprinklers have been the most important single system for the automatic control of hostile fire in buildings for more than a century. Among the benefits of automatic sprinkler systems is the fact that they operate directly over the fire. Smoke, toxic gases, and reduced visibility do not affect their operation. In addition, *much less water is used* because only those sprinklers fused by the heat of the fire operate, especially if the building is compartmented." (4)

The above statement points out the fact that, of all the tools available to facilitate and promote fire protection, none offers such a wide variety of benefits to the building owner, developer, fire service, water authorities including conservationists, and the general public as does the widespread use of automatic sprinkler systems. One of the most important topics of this Chapter is to review a number of factors relating to the use of automatic sprinkler systems with special attention to their *effect* on required fire flows in building codes and the *effect* on ISO needed fire flows. Finally, some initiatives need to be considered in a further attempt to encourage the use of automatic sprinklers in both commercial and residential properties.

Advantages of Automatic Sprinkler Systems

While the insurance industry can be given much credit for promulgating and advancing the use of sprinkler systems in commercial properties, the cost and benefits of sprinkler protection in the United States industrial world were realized in the early 1900s. Warehouses and large industrial manufacturing facilities typically were protected by automatic sprinklers systems. This distinction often meant the difference between a company staying in business versus not being able to recover from a devastating loss.

Long before building codes required sprinkler systems, insurance companies gave substantial reductions in premiums for properties protected by automatic sprinkler systems.

Although automatic sprinklers were not recognized immediately for their life safety features, a trend was evident that indicted reductions in fire-related injuries and deaths when sprinklers were present. Currently, large area, highrise buildings, and high-value buildings and high density public buildings of all occupancy types signify the need for automatic sprinkler systems in all of the model building codes. As of 1990 the NFPA reported in the NFPA *Journal* that there was no record of a fire in 20 years that killed more than two persons in a completely sprinklered public assembly, educational, institutional, or residential complex where the sprinkler system was maintained and operated according to the original design. (5)

[Sidebar: The two deaths reported were from smoke inhalation in an area remote from the fire area.]

The Factory Mutual Research Corporation (FM) has documented some very interesting data on automatic sprinkler operations in industrial properties from 1987 though 1997. **Table 9-1** depicts some very important performance data in terms of number of heads operating, total number of fires based on heads operating, the cumulative number of fires, the percent of the total number of fires investigated–2,860, the cumulative percent and the estimated water flow for 28 minutes of operation, which was the longest period the sprinkler system is reported to have operated on any of the investigated fires. In other words, this total water flow was a maximum flow duration and, most likely, much less where 10 or fewer heads operated. These were ordinary hazards Group 3 properties where the sprinkler design was 0.20 gpm/sq. ft. and the area of sprinkler coverage was 100 square feet; this equates to a discharge of 20 gpm per head. (5)

Table 9-1: FM Study Sprinkler Performance Operations Study (1)

Number of Heads	Fires	Cumulative Number	Percent of Total	Cumulative Percent	Projected Flow Rate in Gallons Per Minute
1	797	797	28	28	20
2	520	1,317	18	46	40
3	291	1,608	10	56	60
4	221	1,829	8	64	80
5	147	1,976	5	69	100
6	146	2,122	5	74	120
7	74	2,196	3	77	140
8	77	2,273	3	80	160
9	44	2,317	1	81	180
10	55	2,372	2	83	200
11—15	172	2,544	6	89	220—300
16—20	100	2,644	3	92	320—400
21—25	49	2,693	2	94	420—500
26+	167	2,860	6	100	520—Not Estimated

Observations:

1) Note the outstanding fact that in 83 percent of the fires studied the fires were confined, controlled, and extinguished with 10 or fewer sprinkler heads operating. Assuming a design density of .2 gpm/sq. ft. for ordinary hazard Group 3 property, the water flow would have been 200 gpm for a maximum of 30 minutes, or 600 gallons of water total. A fire of this size would have been confined to a fire area not *exceeding* 10,000 sq. ft. The water requirements from hose streams for a fire of this size in ordinary combustibles materials would have been in the range of 1,500 to 2,000 gallons of water.
2) From the above analysis it should be observed that automatic sprinklers also potentially reduce significant amounts of water damage. The cuts insurance losses two ways: 1) structural and content loss from the fire destruction, and 2) significant loss reduction from water damage.
3) From the FM study of the 2,860 fires in commercial and industrial complexes, it is important to note that even in the 6 fires where 25 or more sprinkler heads operated, the buildings of origin were saved from total destruction and could be rebuilt at a cost much less than rebuilding the entire structure. In all of the larger fires, the sprinkler heads confined the fire until the fire department could complete extinguishment with supplemental fire streams.

Water Supply Requirements for Sprinklered Properties

Under the ISO *Fire Suppression Rating Schedule*, needed fire flows represent a water flow demand based on calculations for structures and building *not protected* by automatic sprinkler systems. In recognition of the value and effectiveness of automatic sprinklers systems for the confinement, control, and extinguishment of developing hostile fires in structures and buildings, the needed fire flow requirement extends, in effect, 100-percent credit is given for all buildings within a *Graded Area* that are graded and credited as automatic sprinklered property.

The ISO-required water supply (i.e., not needed fire flow) consists of the flow required for operating sprinkler in the event of a fire and generally a hose stream allowance of 500 gpm for final extinguishment and overhaul of smoldering materials. The full range of the water supply for sprinkler heads will vary from 150 gpm to 1,600 gpm. These flows are dependent on the classification of hazard, whether the system is hydraulically designed or a pipe schedule systems in accordance with NFPA Standard No. 13 on *Sprinkler Systems*, the type of materials being stored, and the storage configuration. Under these limiting factors, the *maximum* amount of water needed for an insured building rated and codes for sprinkler protection is 1,600 gpm for the sprinkler heads + 500 gpm for the supplemental hose streams = 2,100 gpm; this is far different from needed fire flows that could range up to 12,000 gpm. (6)

Design Curves

NFPA 13 provides design criteria for automatic sprinkler system based on hazard level of the occupancy. These criteria are represented in design curves and in minimum water supply requirements. These design curves are used to determine the density required for various hazard classifications. (7) Density is defined as the flow required, in gpm per square foot, to be discharged over a selected area of operation. For example, if the density required is 0.10 gpm/foot squared and it is applied to an area of operation of 1,500 square feet, the minimum system demand, excluding hose streams, will be 150 gpm. These design curves indicate a range of basic system demands from 150 gpm for minimum light hazards to 1,600 gpm for extra hazard.

The required water supply for the sprinkler system developed for a specific fire risk from this curve may need to be increased to allow for two additional factors. To compensate for friction loss in the piping for pipe schedule systems, the normal design practice is to add 10 percent to the basic systems design. In hydraulically designed systems, discussed below, computer design models are used to select pipe sizes that will minimize friction loss for design flow and match the pipe design to available flow from water supply curves obtained for the building to be protected.

The second factor considers the hose stream allowance that needs to be included to permit the operation of inside and outside hose streams to complete extinguishment of fires in deep seated combustible materials. The hose stream allowance and fire flow duration are based on the hazard classification in accordance with the schedule in **Table 9-2**. (7)

It should be further noted that fire insurance carriers that write insurance for highly protected risks may have additional water demand requirements based on separate NFPA Standards or internal underwriting requirements. The high-rack storage of materials is a perfect example of this condition. When rack storage up to 20 feet in height is present, the design curves for ceiling sprinklers will increase to a maximum of 1,800 gpm for Class 5 unencapsulated commodities (NFPA 231C: *Covered Rack Storage of Materials*). If the rack storage is 25 feet high, the basic system will demand an increase to 3,250 gpm. (8)

Table 9-2: Hose Stream Allowance

Hazard Classification	Hose Stream Allowance Gallons Per Minute	Duration Minutes
Light	100	30
Ordinary—Group 1	250	60—90
Ordinary—Group 2	250	60—90
Ordinary—Group 3	500	60—120
Extra Hazard Group 1	500	90—120
Extra Hazard Group 2	1,000	120

Hazard Classification

It is apparent that, while sprinklered buildings are not included when determining the needed fire flow for insurance rating purposes, it is necessary to calculate the demand in order to ensure adequate water supplies to the sprinklered building. Average commercial occupancies, such as retail stores, offices, hotels, and institutional buildings, usually will fall into the category of ordinary hazard Group 1 occupancies. Warehouses and manufacturing occupancies will fall into ordinary hazard Groups 2 and 3. Occupancies in which there are highly flammable products or processes enlarge quantities will be classed as extra hazard.

The determination of special hazard classifications is defined in detail in specific NFPA Standards referenced at the end of this Chapter. These references need to be examined because automatic sprinkler system demands for potential sprinklered properties must be carefully calculated based on this data. Plans and calculations for such systems need to be submitted to the building department for the community, the fire marshal or fire protection engineer for approval and in many states the office of the state fire marshal for code compliance assurance, in addition to the insurance carriers engineering staff.

Residential Sprinklers Systems

There is an increasing requirement by local government, especially at the county level of government, to install residential type sprinklers in one and two family dwellings. One specific example is Prince Georges County located just north of the District of Columbia. There is now a sprinkler requirement for all new residential properties and rental space in existing homes. Since this ordinance was passed in 2001, there has not been a fatality in a home fire where residential sprinklers have been installed. Hostile fires in residential property with residential sprinkler protection have been confined to the room of origin or completely extinguished before the Prince George Fire Department arrived at the fire site where the system was functioning according to installation requirements. Two house fire receive moderate damage where the residential sprinkler system alarm device had been tampered with by the occupant or an electrician between 2002 and the end of 2005 when records were reported. In 2006, children were playing with matches in a bedroom and caught the bedding on fire. When the fire department arrived at the fire site, the fire was confined and extinguished by one operating residential sprinkler head. (9)

Records kept by the NFPA up to the beginning of 2006 has prompted the ISO recently to announce that it is reducing the needed fire flow for strictly single-family homes not over two stories in defined communities to a needed fire flow of 500 gpm regardless of exposure conditions. This is a *huge* reduction in required water supplies for closely built residential housing, and it will have a positive ripple effect on water supply requirements for both treated water and water supply pipe sizing.

Types of Sprinklers for Commercial Buildings

The required fire flow for automatic sprinkler systems is determined by applying the criteria in NFPA 13, *Standard for the Installation of Sprinkler Systems*. (6)

[It is extremely important to use the latest published edition of this Standard.]

Two types of sprinkler systems are in general use for commercial building:

1) Pipe schedule systems.
2) Hydraulically calculated or designed systems.

A pipe schedule systems is a sprinkler system that is designed using pipe size table with corresponding minimum water flow rates from NFPA 13. (6) A hydraulically designed system is a sprinkler system that is designed using existing or designated water supply pressure and calculating all water flow rates available for each size of piping in the system. Special sprinkler systems, such as deluge systems, occasionally are installed for special hazards. Today, it is almost essential that all *special types* of sprinkler systems be hydraulically calculated using computer modeling. (7)

Pipe Schedule Systems

The required fire flow for pipe schedule systems will vary from 250 to 1,500 gpm, based on the occupancy of the building. The required water supply at the needed residual pressure should be available at the base of the sprinkler rise to provide 15 psi at the highest elevation sprinkler head with sprinkler operating. In these types of systems the sprinkler pipe sizes are specified in the appropriate standard, and the piping is arranged like a "tree with branches" where all the branch lines and cross mains are dead

ended; not an efficient water supply system, although these systems have been around for over 100 years. (7)

Hydraulically Calculated Systems

The required water demand for hydraulically calculated sprinkler systems will vary from 150 gpm up to several thousand gpm for business, entertainment, educational, religious, industrial, and governmental buildings, based on the area of the *largest* open area room (up to 5,000 square feet) and the occupancy. The required "fire flow for any given sprinkler systems" needs to be available at the base of the riser (alarm valve) at a sufficient pressure to deliver the required fire flow through the sprinkler piping to the *design area*, with a minimum pressure at every sprinkler head of 7 psi. NFPA 13 specifies a minimum size pipe and allows for looping the piping to cut down on the head loss in the piping system. The design of these systems is based on the calculated residual pressure available at the base of the automatic sprinkler system riser when delivering the required fire flow at the point of design. The calculated residual pressure is determined from the available fire flow data in the vicinity of the building to be protection and plotted on hydraulic graph paper.

[See Manual II on Water Supply Testing and Evaluation.]

The higher the calculated residual pressure for the needed sprinkler system flow demand, the smaller the sprinkler system piping that can be used. Such flow tests should be conducted when there is peak consumer consumption demand.

For economic reasons, these sprinkler systems are designed using the highest residual pressure at which the required fire flow is available. Unfortunately this information usually is needed before the building is built, and perhaps even before water mains are extended to the construction site. Therefore, it is important that the hydraulic data used accurately reflect the hydraulic conditions that can be expected in the vicinity of the proposed building. For both types of systems, the duration for which the sprinkler system must be designed to operate varies from 30 to 120 minutes, depending on the hazard of the occupancy and the ability to remotely control water flow.

It should be noted that a lowering of the normal pressure throughout a community or a general overall intentional lowering of the distribution system pressure can result in many formerly adequate sprinkler systems becoming inadequate. Hydraulically calculated sprinkler systems do provide an advantage in this regard for responding fire departments. It is now required that the design pressure and flow for the design area be recorded on a metal plate attached to the main control valve to the sprinkler system. The valve room should be accessible to the responding fire department in case of a fire. Observation of the pressure gauge during a fire can clearly indicate if the pressure on the system is being maintained. If the riser pressure drops below the demand pressure, the fire department can boost both the pressure and flow using fire department pumpers to supply hose streams to the fire department connection. The pressure at the sprinkler riser should be coordinated with the pump operator to maintain, but not exceed, the riser demand pressure. Too-high pressures will loft the water over he sprinklers making the sprinkler discharge less effective for controlling the fire.

Standpipes

Most local building codes require standpipes to be installed in any building five stories or 50 feet in height including buildings protected by automatic sprinkler systems. Standpipes are classified as follows: (7)

- Class 1: One 2-1/2-inch fire department outlet on each floor;
- Class 2: One 1-1/2-inch tenant hose station on each floor; and
- Class 3: Combined 2-1/2-inch and 1-1/2-inch outlets on each floor.

NFPA 14, *Standard for Installation of Standpipes and Hose Systems* covers the requirements for standpipes. (7) The water requirements for standpipes are 65 psi residual pressure at the highest outlet, with 500 gpm for the first standpipe and 250 gpm for each additional standpipe, to a maximum of 2,500 gpm. These requirements apply for Class 1 and Class 3 systems. A Class 2 standpipe system requires a total supply of 100 gpm at 65 psi residual pressure at the outlets. In *fully* sprinklered buildings, the water supply must satisfy the more stringent of two demands (stand-pipe or sprinkler system). Inside hose stream allowances for hose stations supplied from sprinkler systems (not necessarily Class 2 standpipe systems) of 50 gpm each, to a maximum of 100 gpm are added to the sprinkler water supply, but no minimum residual pressure is mandated. This inside hose requirement is included in the total hose allowance that was previously discussed.

Economic Advantages of Installing Automatic Sprinkler Systems

The *economic* advantages both to communities and individual property owners realized by protecting structural properties is *no small thing* as identified in the following examples and understanding related to property insurance and water supply.

Approximately 30 years ago, in the City of Fresno, California, the City Fire Marshal, the municipal planning department, the water department, and other municipal agencies joined in developing an innovative Mater Plan for Fire Protection. The plan was based around features of the insurance industry *Grading Schedule* combined with an integrated system of codes and ordinances. Prior to development of the master plan, the fire department budget represented approximately 13 percent of a total municipal budget of over $14 million dollars. At that time, the fire department was rated Class 1, but the water department was only rated a Class 3.

The codes and ordinances adopted as part of the new plan included a "dangerous-building ordinance" which gave the fire marshal authority to condemn property unsafe, a fire hazard, or unsanitary or that presented a clear and present danger to the community. Owners of condemned property had a choice of selling their buildings to an urban renewal agency or renovating the building to code standards, which included *mandatory automatic sprinkler systems.* In addition, all new construction required complete automatic sprinkler systems under the Federal Urban Renewal Agency Agreement with the city. (7)

At the time of this action, Fresno covered 21 square miles with a population of 115,000. The fire department maintained 68 career firefighters on duty at all times after full implementation of the mater plan development work for assistance in the sprinkler enforcement program. At the end of the program, 95 percent of all buildings in the urban renewal area were completed with automatic sprinkler protection. This area alone covered 40 square blocks of nonresidential property. Fire losses were reduced at least 22 percent a year after implementation of the sprinkler program, and the fire department retained a Insurance Class 1 rating.

All of this work and code enforcement results in more efficient distribution of municipal funds under the total municipal budget, and the water department classification rating changed from a 3 to a 1. The end result was reduced insurance premiums for all commercial classes of property in the city and added 10 percent to 30 percent insurance reduction for properties actually protected by automatic sprinklers

At about the same time period, a serious hardware store fire occurred in a community of about 14,000 population outside of Buffalo, NY. The building was brick wood-joist construction with no opening to exposures on both sides; one an insurance agency and the other a drug store. The fire was fought by the village volunteer fire department and three area fire departments operating under mutual aid. The building was essentially "gutted" but the exterior walls stayed intact on there was only smoke and water damage to adjacent occupancies.

The owner-occupant decided to rebuild and, with the advice of his insurance agent, installed a wet pipe automatic sprinkler system. The insurance agent showed the owner how the sprinkler system would pay for itself in 9 years through reduced property, content, and liability, and business interruption insurance. The owner also had the peace of mind that the likelihood of a second damaging fire was almost nil. This also had a positive impact on the water system by reducing the representative needed fire flow at that location to 500 gpm. (10)

In relation to the *Fire Suppression Rating Schedule*, every level of local government from the county, to the cities, to the towns, to the villages, need to understand that any commercial building that is coded and rated as sprinklered property for insurance purposes does not of and by itself have a needed fire flow requirement. The fire flow requirement is for the sprinkler system and the supplemental hose streams as indicated above in this chapter.

Based on the growing performance record of residential sprinkler systems, it is expected that more insurance reduction credit will be given for installed residential sprinkler systems in one-and two-family dwellings. In new developments that have a requirement for residential sprinklers, the needed fire flow is reduced to 500 gpm through the community. This has an impact on the need for new water mains and water treatment requirements.

The installation of automatic sprinkler systems in both residential and commercial properties is a win-win situation for both individual property owners and for municipal water supply systems.

Water as an Effective Fire Suppression Agent

Water has been used for fighting structural fires in America since the first fire department was organized in New Amsterdam, which was renamed New York City in 1664. Water is the agent of choice for structural fire suppression for many reasons: (11)

- The general ability of water from fire hydrants in communities that have a municipal water system.
- The general availability of water in suburban and rural areas without fire hydrant service from farm ponds, wells, small lakes, creeks, streams, and, in many locations larger rivers and lakes.
- These water sources can be used to provide *separate water supplies* for structural fire suppression, as discussed in Chapter 10. These water resources also can be used with dry hydrants to refill mobile water tankers and transport water to fire sites or, where feasible, by use of mobile pumpers that can be used to pump water directly to fire sites.
- Water is the least expensive of all the types of fire extinguishing agents currently available.
- It is available in a liquid state over a wide range of temperatures extending from 32 °F (0 °C), to 212 °F (100 °C), or the boiling point of water.
- Both treated and untreated water are generally considered safe to use in human and animal environments when *properly* applied through sprinkler heads or fire department nozzles.

- It is most normally selected to control and extinguish structural fires because its nontoxic, noncorrosive, and is stable over a wide range of conditions. This means that when water H_2O is applied to a developing fire in ordinary combustible materials, the water does not break down into the basic elements of Hydrogen (H) and Oxygen (O), both of which would encourage fire growth.
- Water can be applied to building fires while occupants are still in the building under approved fire-suppression techniques. This is not the case with some gaseous extinguishing agents, which may cause asphyxiation or adverse health side effects.

The Physical Properties of Water

It is essential that community officials, including the chief executive officer and staff, along with the water superintendent and fire chief understand the physical properties of water the permits the use of water as an effective fire extinguishing agent. The fundamental considerations include the following, documented by the NFPA. (2)

[Sidebar: The term "structure" is used in this Chapter to denote both unoccupied and occupied buildings for the sake of simplicity. Model building codes generally reference structures as being unoccupied and buildings as being generally occupied. This distinction will be made where the water application could be injurious to occupants still in a building when the initial fire attack is made on a developing fire.]

1) At ordinary room temperatures in a structure, water exists as a stable liquid. Water viscosity in the range of 24 to 210 °F remains constant, which allows water to be transported in water mains and pumped by fire department pumpers through fire hose.
2) Water has a high density, which allows it to be discharged from fire hose lines with nozzles and projected into structures on fire. Water's surface tension allows it to exist from small droplets to a solid stream.
3) The latent heat of fusion is the amount of energy required to change the state of water from a solid (ice) at 32 °F to a liquid. Water absorbs 143.4 Btus per pound in this process.
4) The specific heat of water is 1.0 Btus per pound. Therefore, raising the temperature of 1 pound of water180 °F from 32 °F to 212 °F requires 180 Btus.
5) Water is an effective cooling agent because of its high *latent* heat of evaporation (i.e. changing water from a liquid to a vapor) which is 970.3 Btus per pound as will be described below.
6) Water expands in its conversion from a liquid state to a vapor state from 1,600 to 1,700 times the liquid volume. One gallon of water produces 223 cubic feet of steam. Therefore, it follows, that 1 gallon of water at room temperature applied to a fire and converted to steam (**complete conversion)** will have the following results.
   a) Heat required to raise the temperature of water to boiling: 212 °F - 68 °F (Average room temperature) = 114 °F. 114 °F × 1 Btu/lb × 8.33 (Weight of 1 gallon of water) = 1,200 Btu.
   b) Heat required to change water from a liquid to a vapor:
      970.3 Btu/lb × 8.33 = 8,083 Btu
   c) Total heat absorbed is 1,200 Btu + 8,083 = 9,283 Btu/gallon of water

The above concepts are extremely important to *effective* fire suppression as can be observed in the following example. A fire department hand-held hose stream discharging 100 gpm *could* have the potential capability to absorb 928,300 Btus per minute in a complete conversion from a solid state to complete steam

conversions; this represents 100 percent effectiveness of using water to extinguish fire through both absorbing heat and oxygen displacement. This is realized by recognizing that the same fire department hose stream has the capability to create 22,300 cubic feet of steam in the conversion process.

To achieve this capability, water has to be applied in the form of a fog stream with finely divided particles in contrast to solid fire streams supplies by a tapered nozzle. A solid fire stream has been determined from numerous structural fire tests by the Western Actuarial Bureau to have only 10 percent or less of the cooling capacity of fog steams. In fact, 90 percent of the water applied from solid streams results in run-off with little or no extinguishing capability and may just do water damage inside a structure fire. (11)

All of this explains why the effective progress of a fire attack on a developing structure fire can be estimated and evaluated by observing the volume of smoke and condensing steam coming from the involved building. This has to be emphasized in the training of fire suppression personnel and especially in the training of tactical fire officers. Fire suppression personnel should be acquainted thoroughly with the characteristics of condensing steam and be able to evaluate the information it conveys on the fireground. Condensing steam can be observed and recognized instantly when projected against the sky. It is visible to the human eye in daylight or darkness. Observe a picture of the old steam locomotives when exhausting steam; the live steam is invisible as it comes from the exhaust valve. However, as it expands and loses some of its heat, the process of condensation begins and the expanded cloud of steam becomes visible. Condensing steam contains insufficient heat to cause physical injury. This has been used as a concern for *not* using fog nozzles to generate steam. To avoid any possible injury from steam generation at structure fires, the following three prerequisites are essential:

1) Fire suppression personnel needs to be trained to stay close to the ground or floor level where the attack is initiated since the steam will rise to the highest point of the enclosure.
2) Immediately after the initial fire attack, ventilation is required on the floor above the fire level or at the roof level for single-story structures.
3) *Complete* personal protective clothing is required for all fire service personnel making the fire attack; this includes self-contained breathing apparatus (SCBA) and the helmet ear flaps need to be down after the face piece is in place.

Above all, training fires need to be extinguished before attempting a real-world fire attack on a structure that could produce volumes of steam.

When all of this is in place, structural fire suppression effectiveness will significantly improve and the actual use of water to extinguish fires will be reduced for the communities that employ effective fire suppression which reduces water consumption records. As a final reminder, the following listing demonstrates the effective uses of water as a percent function for the cooling potential of 1 pound of water:

100 percent of efficiency—1,150 Btu/lb

75 percent of efficiency—863 Btu/lb

50 percent of efficiency—575 Btu/lb

25 percent of efficiency—288 Btu/lb

10 percent of efficiency—115 Btu/lb

Recall from above that a straight fire steam, whether from a hand hoseline or a master stream appliance has only about 10 percent of water efficiency. The above numbers clearly indicate the inefficiency of applying water by straight stream method, although this method may be necessary for coping with deep-seated fires and for overhauling fires. Water that is not used effectively in fire extinguishment often results in more water damage to the property than the fire itself.

The Latest Methods for Improving Structural Fire Suppression Effectiveness

Two fast-growing developments in structural fire suppression may have a significant impact on water demand needs for specific occupies and for initial fire attack in the near future.

First, is the use of water mist technology for special-hazard fire problems and for protecting one- and two-family homes.

Second, is both the introduction of Class A Foams and the technology to apply these foams for the reported dramatic improvement of confining and extinguishing developing structure fires to the room or area of origin.

Each of these approaches to improved structural fire suppression is examined separately.

Water Mist Fire Protection Systems

Since the early 1980s, there has been a very strong interest in the fire protection field considering the use of fine water sprays, better known now as *water mist*. The basic concept of *water mist* is as follows:

> Water is ejected from special nozzles at pressures ranging from 800 psi to 1500 psi to form sprays of finely divided water particles applied to generally confined areas where combustibles are present to extinguish a developing fire by the dilution of the air or oxygen content and by creating a water vapor through the space; maybe better defined as steam. The steam is generated from the rapid evaporation of the water droplets in the heated area surrounding the fire.

Instrumented tests of *water mist* application to room fires indicates that not only does it rapidly reduce oxygen content in the room which is needed for fire development but the *water mist* provides a very rapid cooling of the entire atmosphere which is important to confining the fire to the point of origin.

The concept of high-pressure fog for extinguishing ordinary combustible fires is not a new phenomenon. High-pressure fog nozzles were used on the "booster lines" of fire apparatus back in the 1950s. However, the lack of proper firefighting training resulted in many injuries to firefighters and therefore this type of equipment lost favor with the fire service. Installed *water mist* systems of today are an outgrowth of earlier technologies in structural fire suppression.

Fixed water mist systems is a subject of very high interest to all aspects of the fire protection field at the present time. In 2006, the Marriott Corporation was doing extensive studies of water mist applications to control and extinguish developing fires in residential occupancies to the item of origin or confine damage to the room of origin, first as a life safety measure, and second to minimize fire, smoke, and water damage to the room of origin. These sponsored tests were conducted at the University of Maryland as a cooperate effort between the Department of Fire Protection Engineering and the Maryland Fire and Rescue Institute. (12)

The term "*water mist*" implies a very fine water spray that remains suspended in air for an extended period of time. The term reflects one of the qualities of a spray (i.e., the drop sizes are very small)

relative to raindrops, or to the spray from automatic sprinkler heads. For example, there are three basic characteristics that influence its effectiveness as an extinguishing agent:

1) The density of the spray, (mass of suspended water per unit volume of space).
2) The velocity with which it is delivered to the seat of the fire.
3) The quantity of water itself (which may contain dissolved additives to enhance suppression.

There are four characteristics of water mist for fires suppression purposes:

1) Drop size distribution.
2) Flux density.
3) Spray momentum.
4) Additives.

The current characteristics for Water Mist System are covered in NFPA 750, *Standard on Water Mist Fire Protection Systems*, 2003. (13)

Water Demand and Flow Duration

The water discharge rate for water mist systems is determined from full-scale fire tests for the type of hazard to be protected. Testing has been done on a wide range of fire scenarios, including shipboard cabin space for passenger ships through the Maritime Commission, machinery spaces, computer rooms, telecommunication centers and wire rooms, laboratory facilities of many kinds and both single- and multiple-family dwellings, along with hotels and motels. Research reports from these testing programs indicate flow ranges from 7 to 30 gpm for spaces occupied by humans. Machinery spaces may require flows up to 60 gpm. The recommended discharge period in NFPA 750 is 30 minutes. This implies that the needed water supply ranges from a minimum of 210 gallons to a maximum of 900 gallons for occupied spaces and a maximum of 1,800 gallons for machinery spaces. Compared to all other types of fire extinguishing methods with water, this is a tremendous reduction is water supply for fire control, confinement, and extinguishment. Remember, the fire tests conducted include water for final extinguishment.

Special Considerations for Residential Fire Protection

The following material addresses applications of *water mist* that applies specifically to the residential property classification. It should be understood that significant research on *water mist* for residential properties is ongoing. One important example is the cooperative effort of former fire chief and now Director of Corporate Fire Protection, Sonny Scariff, Marriott International, Inc.; Deputy Chief Michael Love, Montgomery County, Maryland, the Maryland State Fire Marshal's Office; Gary Briese, Executive Director for the IAFC; Dr. James Milke, Department of Fire Protection Engineering, University of Maryland; which formed a partnership to do *water mist* testing on room fires in hotels, motels, multiple occupancy residential properties, and single-family dwelling. (14) Other research is on-going at the NIST, Underwriters Laboratories, Inc. (UL) FM, and private organization including "Hi-Fog" Water Mist Fire Protection, Inc.

In the United States, the greatest loss of life from fire continues to be in the single-family home. Many fire protection leaders feel that this Nation has reached the limit to which we can **dramatically** further reduce the numbers of those injured and killed by fire each year in our country. (14)

Using current approaches to fire protection, it does not appear that this Nation will decrease the number of lives lost in residential fires much further than reported by NFPA in 2005. What may be even worse is that the numbers may actually increase, given that our fire services are being called upon to accomplish so much more in the post 9-11 environment. The American fire service is now an emergency services delivery system that is the first responder to any emergency eventuality**.** In order to make a major shift in the status quo, it is essential that new concepts and applications be applied to protect residential occupants from hostile fires.

Of further importance, in 2005, 82 percent of the fire deaths in America occurred in the home, to say nothing about the associated property loss from these deadly fires. Based on data from both the NFPA and the USFA: (14)

- On the average, single-family residential fires kill 9 people every day in America.
- On the average, 45 residential fires are reported every hour across the Nation.
- Single-family residential-type fires account for nearly 6 billion dollars in direct property damage each year since 2000 (with the dramatic increase in hosing costs this number will climb).
- Fires in homes are a constant threat from the largest cities to the smallest towns, in communities of all economic levels, in both newly constructed dwellings and in dwellings built many, many years ago.

In response to this carefully documented fire problem in residential properties, many communities are passing ordinances that require the installation of residential sprinkler systems in **new** residential construction. No documentation has been found on any requirement for retrofitting residential sprinklers in homes. Retrofit water mist fire protection systems just may be the answer for the proper protection of residential properties without affecting the municipal water system demand. The Marriott Corporation, along with the Hi Fog Corporation, are currently (2006) conducting live burn tests in a single-family dwelling at the Maryland Fire Rescue Institute facility, College Park, MD, to study different retrofit *water mist* technologies relating to nozzle type and placement nozzle pressures, and the amount of water to be stored in high-pressure cylinders, types of alarming devices in relation to a wide range of fire scenarios in the living room, kitchen, dinning area, and bedrooms while providing fire protection for all occupied space. This work should form the basis for writing a standard on the design, installation, and testing of *Water Mist Systems for Residential Occupancies.* (14)

Class A Foam Fire Protection

Ever since World War II, a number of different additives to water have come on the market in hopes of improving fire protection in general. Of significant importance has been the development of several foam concentrates to be used with water for the extinguishment of flammable liquid or Class B fires. More recently, Class A foam agents have been developed for ordinary combustible materials, with the objective of improving structural fire suppression effectiveness using both hand-held fire streams and used in conjunction with automatic sprinkler systems. The fire service literature claims that Class A foam makes fire streams up to 100 percent more effective than plain water. A larger view of the fire protection literature, including some full-scale fire tests and laboratory tests at the NIST in Gaithersburg, MD, point out that there are a number of variables associated with determining the effective use of Class A foam with fire streams. The percent of increased effectiveness in the use of Class A foam with automatic sprinkler systems is definitely positive but, again, is dependent on the type and arrangement of the combustible fuel loading.

At the beginning of 2006, there appears to be a significant amount of confusion about Class A foam concentrates and their application to structural fire suppression.

A first consideration is that Class A foams do not contain chemical fire-retardant compounds. Class A foam has it's origin with forest and wildland firefighting since the early 1980s. Today, this Class of fire-retardant chemicals is considered by many forest officials to be the agent of choice when making wildland and forest air drops in advance of an oncoming flame front(s).

Key Concept: The forestry service Class A fire retardants **are not** the same as the synthetic Class A foam agents for structural fire suppression. These two Class A foam agents should not be confused.

The NFPA definition of a chemical fire retardant is "any substance, with the exception of water, that by chemical action reduces the combustibility of fuels or slows down their rate of combustion." A Class A foam concentrate approved for structural fire suppression is classified as a fire suppressant." As a fire suppressant, UL and other approval agencies state that Class A foam concentrate is mixed with water and directly applied to *burning fuels* to provide both blanketing and wetting actions. Furthermore, Class A foams for structural fire suppression do not *chemically inhibit fuel ignition*. (15)

Listed below are some basic characteristics of Class A foam agents for structural fire suppression:

1) There is promotional material on Class A foam that appears to confuse firefighters concerning the finished foam as a chemical fire retardant. The issue revolves around the facts concerning the possible delay in ignition by the efficient wetting of fuels that absorb moisture, such as a dwelling with unsealed wood siding that is threatened by fire exposures. Indications are that one should not expect the Class A foam approved for structural fire suppression to act as a fire-retardant agent. Fire retardants generally are applied to fuel surfaces before the flames approach. This they continue to retard fuel ignition even after the water mixed with the chemicals evaporates from fuel surfaces. The retardant action continues to occur for a specific time period based on the specific agent after application. (15)
2) Once Class A foam for structural fire suppression has been applied and has evaporated, ignition can reoccur if final extinguishment has not been achieved and proper overhaul procedures are not carried out. There is little evidence to indicate that Class A foam solutions approved for structural fire suppression will chemically inhibit fire ignition.
3) Another issue concerns single applications of Class A foam solution to ordinary combustibles. Tests indicate that after a single Class A foam application, the water evaporates, **or** the heat content of the burning material boils off internal moisture, and erupts in flames after the materials reach ignition temperatures. This is why it is essential to either reapply the foam solution to the burning material or after "flame knockdown" complete the extinguishing process with water.

Despite these considerations, there are a lot of real-world success stories about using Class A foam for structural firefighting, and almost all new fire engines are being equipped with foam proportioning systems for Class A foams or compressed air foam systems. Journal articles and books are promoting the use of Class A foam for structural fire suppression. The following points appear to present the best current understanding on the use of Class A foam as predicted in the fire service literature:

- Class A foam delivered from 1-1/2- to 2-inch hoselines with fog nozzles have demonstrated very effective knockdown of developing fires and single and multiple family homes, barn fires, and small commercial building fires.
- Depending on the area of the fire involvement, the initial fire attack has extinguished the fire. However, re-applications are needed to prevent reignition, which indicates that below the foam surface

ignition temperatures still exist. Foam followed by a water application appears to be the most effective way of controlling the fire and extinguishing the fire.

- Less water is used when Class A foam is employed for the initial fire attack, except where the building is fully involved upon arrival of the first fire apparatus. Some of the best success stores come from volunteer fire departments that protect rural areas without a municipal water supply.
- A comprehensive training program involving fires at a training center or buildings that are to be town down is a **must** for firefighters who are going to use Class A foam.
- The ISO has recognized the use of Class A foam by giving credit for carrying the type of foam on fire department pumpers.

Chapter 10 Separate Water Systems and Emergency Water Supplies

Part I

During the middle 1800s and up to 1915 the United States experienced what often has been referred to as the "Age of Conflagrations." Major fires in large cites and some smaller cites during this period literally destroyed the commercial areas of the city and, in some cases, the whole community. The more significant fires occurred during the San Francisco earthquake, the conflagration-type fire that ripped through Chicago, the downtown business fire right after the turn of the century in Baltimore, MD, and the shipyard fire that spread throughout much of Charleston, SC. The list is rather extensive as depicted in **Table 10-1**.

Table 10-1: Famous Conflagrations in the United States Occurring Prior to 1915

Date	Location	Property Destroyed	Dollar Loss*
1835	New York, NY	Buildings covering 13 acres	$ 15,000,000
1845	Pittsburgh, PA	1,000 buildings	$ 3,500.000
1849	St. Louis, MO	425 buildings, 45 steamboats	$ 3,500,000
1851	San Francisco, CA	2,500 buildings	$ 3,500,000
1861	Charleston, SC	Ships, docks, and business district	$ 10,000,000
1866	Portland ME	1,500 buildings	$ 10,000,000
1871	Chicago, IL	17,430 buildings–250 people killed	$ 168,000,000
1871	Pestigo, WI	17 towns destroyed by forest fires–1,052 people killed	$ No loss data
1872	Boston, MA	776 building–13 people killed	$ 75,000,000
1874	Chicago, IL	Waterfront buildings	$ 5,000,000
1889	Seattle, WA	Commercial and residential properties	$ 5,000,000
1889	Spokane, WA	Commercial and residential properties	$ 6,000,000
1189	Boston, MA	52 commercial buildings–4 killed	$ 3,600,000
1889	Lynn, MA	Commercial and residential properties	$ 5,000,000
1892	Milwaukee, WI	Commercial district	$ 6,000,000
1900	Hoboken, NJ	Piers and steamships–326 killed	$ 4,600,000
1901	Jacksonville, FL	Commercial and residential properties	$ 11,000,000
1902	Paterson, NJ	525 commercial buildings	$ 5,500,000

1904	Baltimore, MD	80 city blocks in the central business area	$ 50,000,000
1906	San Francisco, CA	28,000 buildings–earthquake/conflagration	
		452 killed or missing	$ 350,000,000
1908	Chelsea, MA	3,500 buildings, 11 killed	$ 12,000,000
1911	Bangor, ME	267 buildings, 2 killed	$ 3,189,000

* Fire losses are estimated for the year of the conflagration type fire. These numbers do not reflect growing economic values. (1)

As with most large-scale fires in cities and communities, the water system in each incident was overtaxed. Water pressures dropped with the number of hosestreams placed into operation to the point where fire streams were not effective and it is reported that hosestreams were shut down to establish a perimeter around the fire to keep it from spreading. The fires in Baltimore and Chicago destroyed the entire commercial districts, while the earthquake that started fires in San Francisco all but destroyed the whole city because the earthquake disrupted the entire water system.

In response to the water-supply-crisis during these fires, the idea of establishing independent water supplies that would supply special fire hydrants to support higher pressures so that hose-line could be fed off from the hydrants without pumping equipment to provide required pressures on nozzles at the end of hoselines. These individual water systems, which are separate from the domestic treated water system, are still in existence in some major cities. A brief description of two current systems is provided below.

1. Baltimore, Maryland.

This city essentially rebuilt its individual fire water system some 30 years ago by placing the pumping station at the lowest level to the block-square central fire station located a half mile from the waterfront. The water supply comes from two 20-inch suction pipes leading from different locations in Chesapeake Bay, and travels underground to the pumping equipment in the fire station. Trash racks are used to filter out any debris from the bay water. Water leaving the pumping station is treated with injected chlorine as a disinfectant, but the water does not meet EPA standards for drinking water. A 20-inch loop main extends around the high-value district of downtown Baltimore with interconnecting secondary feeders along major streets. Special high-pressure hydrants are primarily located at the intersection of many streets and painted a distinguishing *orange* color in contrast to the red fire hydrants on the domestic water system. In the older part of the downtown section of the city, fire hydrants are located at least every 1,000 feet on the secondary feeders. The pumping station has the capability to deliver up to 10,000 gallons of water a minute at pressures up to 300 psi. (2)

The system pressure is kept at 60 psi to monitor any possible leaks or breaks in the water system. On routine first-alarm fires, water is supplied from fire hydrants on the domestic water system to supply mobile pumpers. The high-pressure system is activated on demand by the highest ranking fire officer at a fire site or emergency. The system was most recently use when a CSX freight train traveling through Baltimore derailed in a tunnel with a hazardous cargo and caught fire. (3)

2. New York, New York.

The old high-pressure individual water system in New York City was replaced in the 1960s with a different type of individual water supply approach to augment the domestic water system used for normal fire-suppression operations. The water supply for New York City is unique in that the water source comes from reservoirs and lakes in the Catskill Mountains, 80 to 120 miles from the city limits. Water is transported by gravity pressure through 10-foot aqueducts to treatment plants north of the city. Large water mains are installed in a grid system through the streets of New York. However, the piping system is very old, so the pressures are kept relatively low, and building pumping systems are used to develop the higher pressures required for the multistory buildings. Due to the very old building construction going back to the mid-1600s in what is referred to as "loft buildings," the FDNY has to fight some very challenging fires and, in doing so, the loss of life on this fire department is quite high.

A 40-inch main now runs parallel to Broadway in New York City, and is cross-connected every 10 blocks to the Hudson River and the East River. On the river fronts at these cross-connector are located a battery of fire hose connections. Either mobile fire pumpers or fire boats can pump water from the two rivers as required to pressurize the individual water supply which, in turn, supplies special "steamer" or 6-inch outlets on fire hydrants mounted on this special pipe network. (4) At the time of the 9-11 disaster at the twin towers in New York, the domestic system supplied an estimated 8,000 gpm for firefighting while the individual water system provided another 10,000 to 12,000 gpm for an approximate total of 20,000 gallons of water being pumped at the fire site every minute during and after the collapse of the towers. This gives another dimension to the terrific nature of this event. (5)

A Current Need for Individual Water Systems for Fire Protection

The water supply below the aquifer is diminishing at a rapid rate in population growth areas. On a community water system in southern Maryland, the required well depth was 57 feet in 1960. Forty-six years later the well depth is 759 feet, and the water system is running out of water. The cost of treating water to meet EPA water-quality standards is rising exponentially. It appears that a significant portion of these costs, along with meeting higher consumer demand plus building-code-required fire flows, and the ISO needed fire flows is becoming an extremely costly consideration for taxpayers. The key consideration here is that water for public fire protection over 500 gpm should be studied and costed out as a *separate* water supply for considerations as an intelligent alternative to the way water is being supplied to communities today. Water supplies in excess of 500 gpm to handle the initial attack on developing structural fires do not have to be treated water that meets EPA water quality standards. It only needs to be screened to prevent trash, leaves, and other debris from entering the intake to supply pumps; a literature search to review Federal and State water supply requirements for fire protection indicates that only chlorination is required to prevent microorganisms from forming the pipe lines. This reduces the needed fire flow on the municipal water system, it adds reliability to the water supply for fire protection, it conserves water for domestic use, and, economically, it should reduce taxes and property/casualty insurance rates. The design and installation of individual water systems could be a Federal works project reducing the financial burden of these systems on local governments.

Basic Design Concepts for Individual Water Supplies for Fire Protection

Three separate types of water systems have been identified on the East Coast. Two of these systems are operational, and the third is in the planning and design stage. The communities involved have requested that only generic information be presented at the request of the municipal Attorney's Office. A conceptual scheme for each system is provided.

1) **System 1:** The following system is located in a northeast State. The community population is about 7,500 people and is located on a substantial river that typically has a very good year-around flow rate in million gallons per day past the suction point for the individual water system. This suction point is upstream of the water treatment plant. The community has two old mill buildings, a fair-size business district and a Federal enclave of buildings, plus residential areas. The community also serve a farming region and has a rather large commuter population to a larger city.

   The community dates to the Civil War era and the buildings are either brick wood-joist or frame construction; the old mill buildings, even though modernized, still are heavy beam and timber construction with a wood roof and wood siding requiring a needed fire flow of 6,500 gpm. Fire flow tests in the area indicate an available fire flow of 3,550 gpm under an average daily consumption rate. Therefore, there is a significant deficiency in meeting the community need fire flow at several locations.

   In order to increase the available fire flow without improvement to the water treatment facility and the distribution system, the fire department sought the advise of a civil engineer for the County Department of Soil and Water Conservation. Plans were made to use the nearby river as a water supply to feed a loop main around the business district with separate fire hydrants to be painted blue in contrast to the regular red fire hydrants. Fire hydrants were located 500 feet apart around the loop. A pump house was located 200 feet from the volunteer fire station, and a concrete pad was installed so that two mobile fire department pumpers also could draft water from the river and pump water into the loop main as a reliability factor to the pump house, or to pump directly into the loop main using 6-inch connections with the necessary reducers for the supply hose being used. Check valves were installed to prevent backfeed to either the industrial pump or to the mobile fire department pumpers. Weatherproof bourdon gauges where installed so the residual pressures could be monitored at the supply connection. The objective was to provide the best possible volume at any fire hydrant on the loop at 20 psi residual pressure.

   The stationary pump selected was a diesel-driven industrial water pump that could deliver 2,000 gallons of water a minute at 50 psi header pressure. Separate flow tests after the pump house installation indicted a flow of 2,000 gpm at 20 psi by the old mill buildings, and 1,850 gpm at 20 psi by the middle school on the back side of the pipe loop. These flow were increased at the same pressures by almost 1,000 gpm when a 1,500 gpm mobile pump also was pumping into the system. Therefore, in a severe emergency, the community water system could potentially provide 3,500 gpm for fire suppression and the individual water supply could provide an additional 3,000 gpm for a total of 6,500 gpm within the business district of the community. Using large-diameter hose and relay operations, the two individual water systems should be able to meet all needed fire flows throughout the community including the Federal enclave. The community has not been regraded by ISO since the individual water supply was placed in service.

2) **System 2: An Individual Primary Feeder Pipe to Supply Fire Hydrants in Florida**

In central Florida there is an island that is located between the Atlantic Ocean and the Intracoastal Waterway. For a stretch of about 12 miles in a highly developed resort area of highrise buildings, there is an installed independent 10-inch water main that runs South from a pumping station that takes water from the Intracoastal Waterway. Nonfrostproof fire hydrants with only a pumper connection are located every 1,000 feet on this pipeline. The pumping station has two 1,500 gpm pumps that have discharge pressures of 100 psi. One pump is electric drive and one pump is diesel drive. The discharge piping is arranged and gated to provide for independent or parallel pumping into the water main. Water flow tests at the time of the installation indicate that a minimum of 3,000 gallons can be delivered at 20 psi residual pressure on any three consecutive fire hydrants located on the independent water source. This supply is in addition to the normal municipal water supply availability. (7)

3) **System 3: An Independent Water Supply with Two Supply Points to Protect Two Adjacent Communities**

On one of the eastern Great Lakes there are two communities that have a common political jurisdiction line. The larger of the two communities have a population of about 27,000 and is located adjacent to the lake; this will be identified as Community #1. There are several small industries in this community that are dependent on the lake water. The municipal water supply comes from the lake, and fire protection is provided by a combination career and volunteer fire department.

Community #2 is about 3 miles inland from the lake and is home to a moderately sized university and supports an agricultural surrounding area with retail stores, shops, banks, restaurants, and hotel/motels. This community supports a volunteer fire department, and the public works department has charge of the water supply system. Water supply comes from a manmade reservoir with a high-level dam located 2 miles from the village limits.

Both communities have underground water supply piping that is at least 100 years old on many residential streets and the needed fire flows in each community is less than 50 percent adequate in the high value districts and in the perimeter residential areas. The second community has a special water supply problem. During the harvest and canning season, water flows in the main business district have been recorded as low as 135 gpm at 20 psi residual pressure by a fire protection engineer.

The two communities have embarked on a joint water supply program that is both unique and based on a cooperative agreement between the two communities to prove significantly improved water supplies for fire protection and improve the reliability of treated water for each community in case of drought conditions for Community 2 or ice blockage on the intake lines to the treatment plant for Community 1. The basic planning has been completed by a professional engineering firm with a fire protection engineer on the staff. A cost development study is in progress, and funding is being sought through grants to implement the plan.

[Sidebar: The two communities combined experienced from a low of 75 structural fires per year to a high of 111 fires per year from 1995 to 2005.]

The cost development study will assess the potential impact on property insurance rates, needed improvement costs to the existing water supply treatment facilities, water distribution system piping costs, and cost revenues from supplying nontreated water for municipal and industrial uses, and possibly for supplying water to be treated for consumer consumption between the two communities during peak-demand periods and for emergency purification in case of a water system disruption.

The general plan calls for frostproof hydrants with pumper connections to be located every 500 feet in the business, commercial, and industrial areas of each community and 1,000 feet in the residential

areas where the existing fire flow from the treated water system is less than 500 gpm at 20 psi during periods of maximum daily consumption. The details for this smaller piping layout had not been completed at the beginning of 2006, and probably will not be available until the funding source(s) are in place for the primary piping system. For this manual, it is the basic concepts that are important as a means of meeting fire flow requirements while reducing the needed expansion of two water treatment plants and enhancing the water distribution piping system. The following points identify the significant features of this plan:

- In Community 1, a separate water pumping station would be supplied by lake water where the intake is 10 feet below the 50-year lake drought index as measured by a hydrologist. Two 2,000 gpm pumps would be located in the pumping station that can be controlled by the water treatment plant operator. One pump would have an electric driver and the second pump would be diesel driven with remote start capability. In order to monitor the pipe condition, 25 psi static pressure would be maintained on the piping system at all times. Note: This includes all of underground piping for both communities up to the two control valves.
- Community 2 would provide untreated water from the reservoir through two primary feeders to the identified control valves. The Public Works Department that provides staffing 24/7/365 would activate these valves as requested by the water treatment facility in Community 1 based on actual flow demand. Water from the reservoir would enter the pipe network at about 80 psi, and the pressure profiles would balance through the individual distribution system.

While this is a conceptual plan at this writing, the potential for transferring the demand for fire protection water supplies higher than 500 gpm and for reducing the need for treated water supplies for a variety of uses, plus the potential for emergency water supplies to be discussed later as a function of Homeland Security deserves a second look. Even if the cost-benefit analysis is not promising for the experimental program, it may be more feasible for larger population groups. This is an example of thinking "outside the box" from current standards and textbooks to solve both current and future water demand issues.

Part II: Emergency Water Supplies

The concept of emergency water supplies as referenced by the AWWA pertains to implementing procedures to provide potable water in the event that a municipal water supply system is in a failure mode for whatever reason.(8) A failure mode could apply to a section of a community because of a pipe failure, or to the entire community if there is a drought and the water supply source dries up. These are two example of water system unreliability where emergency water supplies need to be transported or otherwise provided for a community population, or the population has to be evacuated to a community that has an ample water supply.

After 9-11 the conceptual framework of emergency water supplies has taken on a different perspective. A water system could be knocked out by a terrorist attack that physically disrupts the water treatment facility, the water distribution system, or biologically contaminates a community's water supply source, which is the equivalent of having a "dried up" water supply. Likewise natural disasters such as floods, earthquake, and severe weather can create disruptions to water supplies.

In response to such events, it is essential that municipal government officials, water supply superintendents and their staffs, the fire administrator/fire chief and senior fire officials along with consulting engineers plan for and initiate an emergency water supply delivery program to transport potable water to specific areas of a community or to the entire community.

Three independent methods of transporting potable water for human consumption are identified below. There are other techniques that are being evaluated at the present time, especially where the community is located in the vicinity of a salt-water source. Water superintendents will learn more about this from future AWWA publications.

1) **Method 1:** Provide an underground secured vault interconnection between two different potable water systems. Examples include adjacent communities, or communities with a separate potable water system provided by a college or university, a State or Federal government facility including a military base, or a private water company that services the public school system in some counties; obviously there are other examples. The AHJ may require backflow prevention devices so that one system cannot backflow to the other system after the emergency condition has been corrected.
2) **Method 2:** A separately valved fire hydrant is placed at the remote point on Water System A near an adjacent water system. The adjacent Water System B also has a separately valve-controlled fire hydrant within 50 feet of Hydrant A. A 1,000- to 1,500-gallon mobile fire department pumper is arranged to pump from one system to the other; this can be from Hydrant A to Hydrant B or Hydrant B to Hydrant A. Discharge pressures should not exceed 40 psi unless approved by the water supply superintendent for the receiving water system, or a staff member. Overpressurization could cause another pipe failure.
3) **Method 3:** Some county fire and emergency services organizations have a converted a used "milk tanker" pulled by a semi-tractor as an emergency vehicle that can fill and transport 8,000 gallons of water to individual buildings (e.g., schools, nursing homes, hospitals, apartment buildings, etc.) in case they lose their municipal water supply or a well system goes dry. Because of the operating costs involved this type of water transport is best implemented where there is a county-level office of emergency services and a fire station or an emergency service training facility that can house the mobile tanker for what should be considered infrequent use. Maintaining the sanitation of tankers that are seldom used can be problematic. One alternate is to contract with firms who transport dairy products or other potable liquids to supply these emergency support services.

   There is still another approach to providing potable water to buildings or areas where either the municipal water supply is out of service, or wells run dry. The Navy especially, and now all branches of the military services including the National Guard have portable water-purifying equipment that uses reverse osmosis to purify nonpotable water from streams, lakes, rivers, and even salt water from the oceans. An environmental company on the West Coast has built a prototype fire department pump that has a combined reverse osmosis and water-treatment package so that the pumper can take draft from essentially any water source and pump either nonpotable water for fire suppression or potable water to be delivered through a special polyvinyl hose to fill water cans for domestic use.

RE: Notice of Preparation of Environmental Impact Report North Coast Land Holdings, LLC Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit, Project ID: P1490 APN(s): 043-261-25; 043-261-26; 043-262-03; 043-262-06; 043-401-05; 043-401-10; 043-401-16; 043-402-03; 043-402-06

Summary: CDA's version of the 1953 Conditional Use Permit (CUP) for the former Golden Gate Baptist Theological Seminary in Strawberry is demonstrably incorrect. Contrary to CDA's version, the 1953 CUP has only one condition, namely, that **"prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission."** The 1953 CUP does not contain a condition for a student body of 1,000 students, as CDA claims. As a consequence, the current applicant (North Coast Land Holdings) does not have a vested right for a student body of 1,000 students, which CDA has incorrectly maintained for years. CDA's incorrect version of the 1953 CUP has caused the Strawberry Community and other stakeholders irreparable harm. Among other things, the amended Notice of Preparation of Environmental Impact Report is both incorrect and misleading. CDA is required to provide the EIR consultant with a clear understanding of the base case according to the provisions of the 1953 CUP and Strawberry Community Plan.

Dear Acting Director Tom Lai and Senior Planner Michelle Levenson,

Thank you for your e-mail memorandum dated November 20, 2020, in which you provided me with your version of the 1953 Conditional Use Permit (CUP) for the former Golden Gate Baptist Seminary (Seminary) property in Strawberry.

Since my last letter to you about this subject dated November 18, 2020, I have conducted my own research about the 1953 CUP, and my findings contradict your version. The most striking differences between your version and my findings are related to two key documents that you failed to provide to me, even though they are part of the historical public record. After hours of trial and error searching, I was able to find them myself without your help.

BOS October 7, 1953 Letter to Planning Commission

The first missing document (see attachment A) is a letter dated October 7, 1953 from the Marin County Board of Supervisors to the Planning Commission that confirms the Board's approval of a CUP for the Seminary in concurrence with the recommendation of the Planning Commission. This letter was received and stamped by the Office of the County Clerk the following day. This one-page document is entitled "Excerpt from Minutes" of the Marin County Board of Supervisors meeting held on October 6, 1953, and it records the Supervisors' unanimous decision to grant a Use Permit to Edward D. Landel, the Seminary's representative, as follows:

> **RE: Application for Use Permit –Edward D. Landel**
>
> **The Planning Director addressed the Board in favor of granting a Use Permit to permit the construction of a Theological Seminary and dormitories on the approximately 130 acres of real property, lying adjacent to and south of Strawberry Manor Subdivision Four. Dr. Graves, President of the Seminary now located in Berkeley, addressed the Board, and on motion of Supervisor Schultz, seconded by Supervisor Kehoe, the Board concurred in the recommendation of the Planning Commission to grant a Use Permit to Edward D. Landel, subject to the condition that prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission.**
> **AYES: All**
> **Noes: None**
> **Absent: None Attest: Geo. S. Jones, Clerk**

According to this first missing document, the Supervisors approved the 1953 CUP with only one condition.

Actual Second Page of the 1953 CUP

Inexplicably, the second missing document (see Attachment C) is the actual second page of the 1953 CUP dated October 13, 1953 that was signed by Planning Director Mary A. Summers that same day and was signed by Golden Gate Baptist Theological Seminary representative Edward D. Landel on October 15, 1953. This missing actual second page states the sole condition of the 1953 Conditional Use Permit, agreed to and signed by both parties, as follows:

> **This permit was granted subject to the following condition:**
>
> **That prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission of a development plan as provided under Section 11.23, paragraph (f), Ordinance No. 264, as amended.**

There are no other conditions attached to the actual 1953 CUP.

Actual Complete 1953 CUP

Putting both pages of the actual 1953 CUP together (see Attachments B and C), we have a very clear and simple authorization, namely:

> **A Use Permit is hereby granted authorizing Edward D. Landel to permit construction of a Theological Seminary and dormitories and other buildings incidental to such use, subject to the following condition… That prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission of a development plan as provided under section 11.23, paragraph (f), Ordinance No. 264, as amended.**

Planning Director Mary R. Summers's October 6, 1953 Letter to BOS

In contrast to the clear and simple actual 1953 CUP, your version is a subjective construct of different documents that you have cobbled together. Based on the documents you have provided to me in your e-mail message dated November 20, 2020, your version of the 1953 Conditional Use Permit apparently rests, not on the missing actual second page of the Use Permit, but on Planning Director Mary A. Summers's October 6, 1953 letter to the Board of Supervisors, in which she reported her summary of the "general facts" discussed at the Planning Commission hearing in response to comments by various stakeholders (see Attachments D and E). One of those "general facts" is a student body of "around 1,000 students," which you incorrectly have claimed is a condition of the 1953 CUP.

In rebuttal to your version, I posit to you that "general facts" are not conditions of approval, which even Planning Director Summers herself reveals in her letter in her own words by separating and distinguishing between the two and by concluding her summary with the statement that the CUP was granted **"subject to the condition that prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission of a development plan as provided under Section 11.23, paragraph (f), Ordinance No. 284, as amended."** If Planning Director Summers had intended "general facts" to be conditions, then she would have included them in her letter as conditions, but she did not do so. More specifically, if Planning Director Summers had intended a student body of around 1,000 students to be a condition, then she would have reported that element as a condition in her letter, but she did not, because it was not a condition. She reported only one condition to the Board of Supervisors as stated above.

So here we have the third document that states that there is only one condition attached to the 1953 CUP (although this document lacks the gravitas of the two previously referenced missing documents that either were stamped by the County Clerk or signed by both applicant Edward D. Landel and Planning Director Summers).

Therefore, if vested rights are based on the 1953 CUP, then current applicant North Coast Land Holdings does not have a vested right for a student body of 1,000 students.

CDA's Incorrect, Confusing Version of the 1953 CUP

If, on the other hand, you continue to hold the position that vested rights are based on the "general facts" in Planning Director Summer's October 6, 1953 letter, then, to be consistent, all of the other "general facts" must be vested rights as well. Otherwise, your position is arbitrary and selective. In addition to a student body of "around 1,000 students," those other "general facts" include:

- Seminary will operate as a "self-contained unit"
- A buffer of recreational land will surround the entire property; adequate land on site for student recreation and parking
- Seminary will provide apartments on site for the expected 60% of student body that are married, and will provide dormitories on site for unmarried students
- A post-graduate college would be an asset to the neighborhood
- Seminary will be responsible for paying its fair share of local services
- Seminary will provide a well-coordinated development plan showing location of buildings and land uses for County review

So which is it? Given my findings, will CDA continue to recognize vested rights based on Planning Director Summer's letter, or will CDA concede that vested rights are based on the actual 1953 CUP? Confusion still persists because you never have acknowledged any of the other "general facts" as conditions of approval and vested rights. I repeatedly have tried to solicit a clear answer from you, but you have obfuscated each time.

CDA's Mischaracterization of 1953 CUP Benefits NCLH, but Harms Strawberry Community

Your mischaracterization of the actual 1953 CUP has conveyed to NCLH a vested right for a student body of 1,000 students that does not exist. This mischaracterization has benefited the applicant who wants to maximize income with the largest student body and the most units of housing possible without regard for any "pesky" limitations of the 1953 CUP and Strawberry Community Plan, but it has caused the Strawberry Community irreparable harm because we want a project that conforms to the 1953 CUP and Strawberry Community Plan.

In addition, the Strawberry Community also has been harmed in the following ways:

- At the November 10, 2020 Board of Supervisors (BOS) Meeting, Supervisor Connolly proposed an amendment to the Notice of Preparation of Environmental Impact Report (NOP) to include notification of a project with a student body up to 1,000 students. He intended his amendment to be a public clarification of what he believed at that time to be a condition of the 1953 CUP, but his belief was based on your incorrect version of the 1953 CUP. The BOS unanimously approved his amendment. So now we have an incorrect and misleading NOP in the hands of the public and the independent EIR consultant.
- Your position that the applicant has a vested right for a student body of 1,000 students has bestowed on NCLH a lever with which it has extracted concessions from the Strawberry Community that otherwise would not have been considered. After 18 months of what members

of the Strawberry Community thought were good faith meetings, NCLH abruptly walked out of the Seminary Tomorrow negotiations without any agreement because it would not commit to a substantial reduction from 1,000 students. NCLH used the Seminary Tomorrow meetings, which were sanctioned by Supervisor Sears, for its own gain—to discover our ideas for a better project and to learn our willingness to make concessions, but with no intention of ever reaching a compromise agreement.

- According to the sole condition of the 1953 CUP, the applicant is required to secure the approval of the Marin County Planning Commission. However, the November 10, 2020 BOS hearing that denied Riley Hurd's appeal and approved the NOP was designed in such a way as to bypass the Planning Commission. The Planning Commission has not vetted the current application, which is different from the application that the Planning Commission vetted three years ago. Although the Strawberry Design Review Board vetted the current application and unanimously voted to deny the application and to deny the NOP, the Strawberry Community did not have the opportunity to present its case to the Planning Commission. The BOS made its determination to deny the Riley Hurd appeal and to approve the NOP without the recommendation of its own land use experts on the Planning Commission. The Planning Commission's opinion also will be bypassed in the NOP scoping period that ends on January 31, 2021. The usual approval process that includes a Planning Commission hearing has been circumvented to the detriment of the Strawberry Community.
- The Community Development Agency (CDA) is supposed to give the independent EIR consultant guidance based on the land use limitations in the 1953 CUP and the Strawberry Community Plan, which is the governing document for Strawberry. You are required to provide the independent EIR consultant with a clear understanding of the base case, i.e., a project built out according to the provisions of the 1953 CUP and Strawberry Community Plan, but you have turned the process on its head by either mischaracterizing or simply ignoring the actual contents of these administrative laws. For example, as previously discussed, there is no condition for a student body of 1,000 students. In addition, all of the private market rate housing allocated in the SCP for the Seminary property already has been built, and only student and faculty housing remains to be built, but you have accepted an application with all private market rate housing and no student and faculty housing at all as a "conforming" project. Moreover, prior to the approval of the 1984 Master Plan, County Counsel opined that housing for Seminary students and faculty were "specialized units," that would <u>not</u> be included in the calculation of inclusionary housing. With the completion of the sale of land for private housing in the 1990s, the inclusionary housing requirement for the entire Seminary property was satisfied. Therefore, the exclusionary housing requirement for the Seminary should not be required again, but you are allowing NCLH to destroy student and faculty housing and then you are awarding the applicant with additional density bonuses. The SCP never envisioned or approved a commuter graduate school with no student or faculty housing on campus. A commuter graduate school will not improve the housing shortage because students and faculty will have to find housing off campus, and it will increase traffic congestion and emission of greenhouse gases from both commuters and private market renters. The EIR process is not supposed to be an open-ended one in which the independent EIR consultant has total discretion to determine the size and

scope of this project without clear guidance from CDA about legal and administrative precedents. Unfortunately, the prevailing attitude of CDA is that if NCLH wants a project with new land uses, then all NCLH has to do is simply amend the 1953 CUP and Strawberry Community Plan by crossing out inconvenient provisions with a red pen. It's easier for CDA to amend existing regulations than to risk the potential complications of enforcing them, so CDA rarely enforces anything, but if the 1953 CUP and Strawberry Community Plan have no legal standing, then what's the point of all of these public hearings? The Strawberry Community also has rights, but CDA is not defending our rights with the same zeal it provides to NCLH.

- The County/CDA and NCLH are aligned in the EIR process because they share the same goal, namely, to cram as many housing units on the Seminary property as possible. The County/CDA is concerned about meeting the requirements of new state housing laws. The more housing units on the Seminary property, the fewer housing units required on unincorporated properties in other Districts of Marin County. Texas big oil Fasken Trust, NCLH's parent, is motivated by corporate greed. The greater the number of housing units on the Seminary property, the greater the total of rental income and profits. Even though CDA also is supposed to defend our interests, not just the applicant's interests, the Strawberry Community is left to fend for itself against this powerful alliance.

Conclusion

Mr. Lai and Ms. Levenson, this is my fourth letter to you seeking clarification of the County's position about the 1953 CUP. You have not been forthcoming in your responses to me. In fact, you have made things more difficult for me. In your last reply, you told me to look for answers to my inquiries in a packet of material from 2014 that you claim to have sent me. Getting your clarification about the 1953 CUP should not be this difficult. It is a straight forward matter.

For all of these reasons, the Strawberry Community is concerned that we will not get a fair hearing during the EIR process. You have overridden the unanimous determination of our Strawberry Design Review Board, so there is no semblance of local control over development projects in our own community. NCLH turned the Seminary Tomorrow meetings into a complete waste of time for the Strawberry Community, so we are farther apart now than ever. You have mischaracterized or ignored our governing documents, so there are no limits to what you will allow NCLH to build. We cannot even get a straight answer about CDA's position on the 1953 CUP, so we have lost trust in CDA and County government. We are frustrated by the record of applicant-centric bias, and we are upset because we have been disrespected and marginalized at every turn.

Our fate is in the hands of unelected County administrators and planners, none of whom lives in Strawberry or knows our community as well as we do. Similarly, only one of five elected Supervisors is directly accountable to us. While I continue to hope for the best outcome, I fear that Dick Spotswood's recent November 10, 2020 Marin IJ op-ed, entitled "Developer Makes Mistake in Pushing Deceptive

Strawberry Seminary Plan," is correct—without NCLH's willingness to compromise, this application will be decided in a court of law.

Very truly yours,

Bruce Corcoran

OFFICE OF THE COUNTY CLERK

MARIN COUNTY BOARD OF SUPERVISORS
SAN RAFAEL, CALIFORNIA

TO: PLANNING COMMISSION DATE OCTOBER 7, 1953

EXCERPT FROM MINUTES, MEETING HELD OCTOBER 6TH , 1953

RE: APPLICATION FOR USE PERMIT - EDWARD D. LANDEL

The Planning Director addressed the Board in favor of granting a Use Permit to permit the construction of a Theological Seminary and dormitories on approximately 140 acres of real property, lying adjacent to and south of Strawberry Manor Subdivision Four. Dr. Graves, President of the Seminary now located in Berkeley, addressed the Board, and on motion of Supervisor Schultz, seconded by Supervisor Kehoe, the Board concurred in the recommendation of the Planning Commission to grant a Use Permit to Edward D. Landel, subject to the condition that prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission.

Board of Supervisors
Court House
San Rafael, California

Honorable Board of Supervisors:

It is understood that you have agreed to consider the application of Edward D. Landel for a Use Permit to permit the construction of a Theological Seminary and dormitories and other buildings incidental to such use on certain real property generally described as approximately 130 acres more or less, lying adjacent to and south of Strawberry Manor Subdivision Four, where Ricardson Drive intersects with Reed Boulevard, Marin County, California.

The Commission heldd this application at their meeting last evening. They received two (2) communications in writing thereon, one to the effect that they were not in favor of the granting of this application until some plan is submitted showing some access roads, the other opposing thereto.

At the meeting there was considerable discussion which brought out the following general facts:

1. The 130 acres will be developed in general, as shown on the plan for land use, in such a manner so as to make a self-contai unit, with major residential streets of the Str...berry Point neighborhood going by the development rather than through it.

2. A buffer of recreational open land of varying width will surround the entire holding, and adequate lands will be available for recreation of the studentbody and the parking of automobiles.

3. The studentbody will consists of around 1,000 students, about 60% of these students will be married and the seminary will provide apartments on their land for these students, and a pre-school nursery for the children of these families. Dormitories will be provided for the unmarried students.

4. It was brought out by those in favor that a college community, particularly of a post-graduate nature,

was an asset to a neighborhood and that its general effect was to increase surrounding property values.

5. It was also brought out that the seminary will of necessity have to contract with local districts in order to secure service and that in so doing, they would be paying their way for their fair share of the expense of the local service districts.

6. It was felt that the assure a well coordinated plan, the County should review a development plan which would show the location of buildings proposed for construction and uses of land.

Upon a motion by Commissioner Marsh, seconded by Commissioner Upton, the Commission unanimously resolved to recommend to your Board, the approval and confirmation of its decision to grant a Use Permit to Edward D. Landel as above setforth, subject to the condition that prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission of a development plan as provided under Section 11.23, paragraph (f), Ordinance No. 264, as amended.

Respectfully submitted,

MARY R. SUTHERS

RE: Notice of Preparation of Environmental Impact Report North Coast Land Holdings, LLC Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit, Project ID: P1490 APN(s): 043-261-25; 043-261-26; 043-262-03; 043-262-06; 043-401-05; 043-401-10; 043-401-16; 043-402-03; 043-402-06

Dear Acting CDA Director Tom Lai, Senior Planner Michelle Levenson, and Environmental Planning Manager Rachel Reid,

My wife Fran and I have been actively engaged in monitoring the development plans for the former Seminary property for the past 40 years. We have been involved with the 1982 Strawberry Community Plan, the 1984 Golden Gate Baptist Theological Seminary (GGBTS) Master Plan, the sale of land for development of the Seminary Cove Condominiums in 1997, the first ministerial extension of 1984 Master Plan in 2009, the 2011 HartMarin development plan fiasco, the second ministerial extension of the 1984 Master Plan in 2012, the 2015 North Coast Land Holdings development plan for The Branson School plan debacle, the 2017 expiration of the 1984 Master Plan, and now NCLH's current development proposal.

Of particular note, Fran was appointed by the Board of Supervisors in 1981 to serve on the Citizen Advisory Committee to update the Strawberry Community Plan. The Committee members worked tirelessly that year meeting weekly to prepare a community plan that was both inclusive and comprehensive. All stakeholders were invited to participate and all of their comments were given careful consideration. The result was the Strawberry Community Plan (SCP), which was adopted by the Board of Supervisors in February 1982. The SCP has proven to be durable. Three of the four major development areas studied—Watertank Hill (Strawberry Vista), De Silva Island, Strawberry Spit (Strawberry Shores) —have been completed according to the SCP years ago. Only the Seminary remains just partially built according to SCP.

Therefore, we can provide the EIR consultant with a first-hand historical perspective of the goals of the Strawberry Community, the failings of GGBTS and NCLH to meet those goals, and the attendant

determinations of County planners and administrators, Planning Commissioners, Supervisors, and County Counsel.

Based on our direct experience, we offer the following items for the EIR consultant's consideration:

1. The 1982 Strawberry Community Plan (SCP) is the governing document for re-development of the former GGBTS property because SCP is more specific that the Countywide Plan (CWP). A new NCLH Master Plan can only be approved if it is consistent with the goals, policies, objectives, and programs of the SCP and CWP, and it would not be detrimental to the public interest, health, safety, convenience, or welfare of the County. (MC 22.44.070) Please measure your recommendations against the SCP.
2. NCLH's intention to amend the SCP with red-line-strike-outs is an abomination and an insult to the Strawberry Community. To illustrate how unfair this procedure is, I am attaching SCP Map 4. Notice the red line running down the entire left side of Map 4. With the stroke of a pen, NCLH completely guts the SCP and the work of the Citizens Advisory Committee with this single red line. Unlike the inclusivity sought by the 1982 Citizens Advisory Committee, NCLH is proposing an audaciously large plan with multiple new uses without consideration of other stakeholders. NCLH must be reminded that its application is for the last major project in Strawberry, and that as each year passes, its ability to complete the remainder of development according to the SCP becomes increasingly difficult because other projects in Strawberry and in other areas along the Highway 101 corridor already have been completed and have used up available resources. The current application will face long delays unless NCLH is willing to collaborate and compromise with all stakeholders. Please keep this reality in mind during your review.
3. As long as SCP is the governing document for Strawberry, we recommend for clarity the use of SCP MAP 4 in the EIR analysis rather than adopting nomenclature of the applicant's invention. Map 4 summarizes the land use and "maximum desirable" development of the former Seminary property in each of the 8 distinct areas on the Map. Area 6, the location of campus buildings and student and faculty housing, is by far the largest area. Note that Area 6 also includes the area surrounding the Forested Knoll, which is connected to the main campus by a thin neck of land along Chapel Drive. The current application does not conform to the land use in SCP because NCLH is proposing to build all market rate rental housing in Area 6, which is an area designated in SCP for student and faculty housing only.
4. Upon the sale of land on the periphery of the Seminary property in the 1990's (ostensibly to raise money to continue developing the main campus, which never occurred) all of the private market rate housing that SCP, "determined to be the maximum desirable based on the projected traffic impact and the context of the property within the community," was built and completed. There is no remaining authorization in SCP for additional market rate housing. The only type of housing that remains to be built is student and faculty housing.
5. In 1984, County Counsel opined that student and faculty housing were "specialized units" that would not be included in the calculation of the inclusionary housing requirement.

6. During the 1997 approval process for the Seminary Cove Condominium project, an argument arose that inclusionary housing should be increased because the requirement for inclusionary housing had subsequently increased following approval of the 1984 Master Plan. County Counsel opined that the new inclusionary housing requirement was not retroactive.
7. Therefore, the inclusionary housing requirement for the entire Seminary was completely satisfied with the sale of property for private market rate housing in the 1990s. As proof, County always collects the inclusionary housing requirement prior to final project approval. In light of this history, please analyze why NCLH should receive a density bonus for destroying "specialized units" of student and faculty housing and replacing them with units of private market rate rental housing.
8. Returning to SCP Map 4, Area 8 is a large area of the property on which NCLH has no plans for any development. If additional market rate housing is recommended in conflict with SCP, then Area 8 offers many buildable sites for housing units. In addition, SCP initially determined that Area 8 would be an appropriate location for a maximum of 36 attached dwelling units or a maximum of 10 single family detached units. Area 8 has the advantage of access from Seminary Drive or from Chapel Drive. Attached dwelling units would be consistent with the other attached housing units that are located around this cove. Furthermore, Area 8 offers scenic views of the cove and Mt. Tam. Please analyze alternative scenarios that allocate housing units to Area 8.
9. NCLH proposes to build market rate housing in Area 6 on the south-facing slope adjacent to Chapel Drive and above Mission Drive. Locating market rate housing here does not conform to SCP because Area 6 is dedicated to expansion of the academic campus and to student and faculty housing. This site is directly below the Chapel Drive hilltop that is identified in SCP as a prominent visual landmark that should remain undeveloped—more specifically, "no housing should be placed on this site." Placing housing here would violate a SCP goal of providing "such amenities as visual backdrops" and "neighborhood separators." In addition, this site is very steep, and building housing here would require extensive grading. Furthermore, NCLH wants to put market rate housing on this site to maximize rental income by capturing views of San Francisco. Housing with views of San Francisco will have high rents that will not satisfy the County's goal of providing additional affordable housing. Therefore, if additional market rate housing is recommended in spite of restrictions in SCP, then please analyze the alternative of building market rate housing in Area 8 instead.
10. Similarly, NCLH proposes to build detached market rate rental housing in Area 6 below the Forested Knoll, which is a non-conforming land use in the SCP. Area 6 is dedicated to student and faculty housing. The Forested Knoll also has been identified as a prominent visual landmark, and no development of the Forested Knoll is permitted. The forest-covered south facing and western facing areas below the Forested Knoll also are visual amenities. The existing student apartment buildings on the northwestern portion of this site are barely visible now because of screening provided by the mature trees, but NCLH proposes to demolish these units. In contrast, new detached market rate homes will be very visible because the renters will want unobstructed views of the Bay. Please analyze the alternative of locating the single family detached homes in Area 8 instead.

11. The area of Strawberry that contains the Seminary is bounded by Highway 101 on the west and by State Route 131 (Tiburon Boulevard) on the north. Caltrans controls these state highways and the intersections at Highway 101/Seminary Drive, Highway 101/SR 131, and SR 131/East Strawberry Drive. In addition, the City of Mill Valley considers the Highway 101/SR 131 intersection to be within its sphere of influence. Consequently, the City's Traffic Management Authority has synchronized the traffic signals to accommodate the east-west flow of traffic to the detriment of Strawberry, which experiences long traffic delays at the northbound Redwood Frontage Road/SR 131 intersection. Please consult Caltrans and the City of Mill Valley as soon as possible about the capacity of these intersections to accommodate projected traffic generation from NCLH's proposals.
12. According to SCP, NCLH will be responsible for funding any additional roadway improvements required because of its development plan. Please analyze the necessary roadway improvements and the cost of those improvements.
13. According to the US Census, 60.8% of Strawberry's housing stock is renter occupied housing. Only Marin City is higher, at 69.3%. By comparison, Mill Valley is 34.7%; Tiburon is 32.2%; and Belvedere is 25.1%. Strawberry doesn't need any more rental housing. What we need is additional owner occupied housing on which more owners must pay parcel taxes to support public services. NCLH property consists of only 9 parcels, but NCLH is proposing as many as 546 housing units with density bonuses. Please determine the maximum entitlement with state density bonuses. Then please analyze the impact of NCLH's additional rental housing on Strawberry's tax base and Strawberry's ability to provide essential public services without increasing the tax burden of existing home owners.
14. NCLH is proposing two major new land uses—market rate rental housing for the general public and a Residential Care Facility (RCF)—that compete with the existing approved land use of a graduate academic institution (more exactly, a graduate level seminary). The SCP envisions a self-contained graduate level institution (seminary); it does not envision a commuter school. A commuter school will not increase Marin County's housing stock. It will require student and faculty to find housing off campus. As a consequence, traffic generation will increase because students and faculty must commute to school and renters on site will drive back and forth from work and for attending to other activities of their daily lives. Strawberry residents generally liked the concept of a RCF, but that was before they learned that that the proposed 150 units would count as only one unit under County code. The proposed CCRC gives NCLH another density bonus of 149 units in addition to the density bonus for market rate housing. Taken together, these three major land uses with density bonuses create a project that can only be described as piggish. At a minimum, NCLH's proposal has <u>at least one</u> major land use too many. Please analyze the impact of a graduate level academic institution plus market rate housing, and a graduate level academic institution plus a CCRC separately.
15. In addition to the three major proposed uses, NCLH also is proposing other new land uses, including corporate headquarters, a catering business serving the general public, a fitness center open to the residents of Strawberry, an art museum for the general public, a nursery school open to residents of Strawberry, a public park on Chapel Hill, and rental space as an event destination. The collective impact of all of these proposed new land uses is significant and,

when added to the impacts of the three major new uses, leads to a project that is way too large. Please analyze proposed new land uses that are unnecessary and can be eliminated.

16. For example, please analyze the need for a large fitness center for a commuter school. Converting an existing classroom to an exercise room may be a better viable alternative.
17. NCLH's trial of renting its property as an event destination for weddings and rock concerts was a disaster for the Strawberry Community. The echo effect of loud noises disturbed the serenity of our community and minimized the enjoyment of our properties. Please add restrictions to such land uses.
18. The proposal for a public park on Chapel Hill is not a popular idea because it will become a destination point and increase local traffic. The homeowners on Chapel Drive purchased their homes with the understanding that their immediate neighbor would be a Seminary, not a busy public park. Please eliminate this public park as a new land use.
19. The proposal to closed Chapel Drive at Chapel Hill is another unpopular idea. For safety, Strawberry needs as many roadways as possible to reach Highway 101 and SR 131. Please keep in mind that the southern tip of Strawberry is a narrow peninsula. In the event of a fire or other natural disaster, residents need more options for egress, not less. In addition, to distribute the flow of traffic from the estimated additional 2,000 Seminary residents, we should not be closing existing roadways. Please analyze the aspect of public safety.
20. The proposed RCF building is enormous, and it will be visible from many different vantage points. The building will be 267,354 square feet in size, which is equivalent to 178 single family homes with an average size of 1,500 square feet. Given that most COVID-19 cases were contracted in senior care facilities, our community may want to reconsider supporting a CCRC for health reasons. Please closely examine the RCF in light of these realities.
21. The proposal to raise the level of the athletic field by 20 feet is unnecessary and extreme. It would require a huge number of cubic yards of fill and an extensive new drainage system to the Bay. In addition, the view of the green field from Seminary Drive is aesthetically pleasing. The alternative of driving by a berm 20 feet high is not appealing. Pleas analyze the need for raising the height of the athletic field.
22. The number of bicycle riders on Seminary Drive and on East Strawberry Drive has increased dramatically over the past several years, especially because of the popularity of new bicycle rental businesses. Please analyze roadway capacity for the safety of both passenger vehicles and bicycle riders.
23. NCLH's "Local Residential Density Comparison" on page 7 of the project description is sophomoric because it does not take into account the approximately 408,000 square feet of proposed and existing institutional buildings, plus an additional 100,000 square feet for the playing field, plus an additional 100,000 square feet for parking. The combined total of approximately 608,000 square feet of space is equivalent to an additional 405 single family homes with an average size of 1,500 square feet. Furthermore, as the Comparison points out, the Seminary is surrounded by two existing dense developments—Harbor Point Apartments (17units/acre) and Strawberry Shores Apartments (15 units/acre). Please recognize that NCLH's statistics are self-serving.

24. There are several new state housing laws. Please examine the impact of all of these new state housing laws on NCLH's proposals.

Thank you for considering these topics.

Very truly yours,

Bruce Corcoran

Dick Spotswood: Developers make mistake in pushing deceptive Strawberry seminary plan

By DICK SPOTSWOOD | spotswood@comcast.net |

PUBLISHED: November 10, 2020 at 10:50 a.m. | UPDATED: November 10, 2020 at 11:31 a.m. MARIN INDEPENDENT JOURNAL

Marin is familiar with land use disputes that persist for years.

That was the history of Novato's Hamilton Field, which ultimately became a roaring success. It's been the fate of San Rafael's St. Vincent School at Silveira Ranch, whose long-term future remains in doubt. Unless county supervisors get the parties to negotiate, that's the likely prospect for the Strawberry site of Golden Gate Baptist Theological Seminary which relocated to Southern California in 2016.

Unfortunately for all involved — except the lawyers — the County of Marin and the developer, North Coast Land Holdings, are making a mistake which could easily lead to years of protracted litigation. It's needless since the interested parties were close to achieving a fair compromise.

The potential settlement fashioned under the voluntary "Seminary Tomorrow" working group exploded when North Coast prematurely halted negotiations. Until then all were dealing in good faith. Apparently the developer believes they'll get a better result from the Board of Supervisors than at the bargaining table.

North Coast was asked for comments on Seminary Tomorrow negotiations and the neighborhood's appeal. Spokesperson Charlie Goodyear indicated that officials won't reply "at this time."

The developer has now filed a request to proceed with a master plan and design review. The application omits the largest component proposed on the 126-acre Strawberry Peninsula site: a college campus. A piecemeal process without any details of the yet undefined institution of high learning makes environmental review useless.

The county's Planning Department is recommending the environmental process commence without specifics regarding the campus. Strawberry residents appealed that call to the Board of Supervisors as the former seminary lies in unincorporated Southern Marin. The hearing was scheduled to take place Tuesday afternoon.

North Coast and Marin County planners are putting the cart before the horse. The purpose of an environmental review is to provide decision makers documented information on all potential uses, resulting impacts and needed mitigation measures for any proposal. Omitting the campus component is bad planning. The traffic impact of the combined housing, senior complex, event venues, athletic competitions and the college is now unknowable thus causing the ultimate decision makers to be misinformed.

Neighborhood leaders report Seminary Tomorrow addressed "academic uses" before negotiations ceased. Community members proposed a 350-attendee school with half of the proposed housing devoted to students and staff. They indicate North Coast had suggested a school with 700 students. Now they're asking for 1,000.

The sides came to a provisional understanding regarding on-site housing. The neighbors and North Coast agreed on 233 units including 47 affordable and 186 market rate. With negotiations over, the developer is now asking for 288 market rate and 50 affordable plus a 100-unit density bonus for a total of 438.

ADDENDUM – COMMUNITY ALTERNATIVE PROPOSAL 28

"Such a beautiful tract of land should be a benefit to the entire community, not a problem child."

INTRODUCTION

The Seminary Neighborhood Association (SNA) is a local neighborhood group that represents over 1000 residents who live next to or near the Seminary property. SNA has been involved in the various planning processes with this property for over 8 years, and is incredibly familiar with the conditions at the site and in the surrounding community. Accordingly, SNA is uniquely qualified to provide comments on the environmental review for this project.

The comments herein specifically respond to the Revised Notice of Preparation of EIR issued for this project on November 20, 2020. Furthermore, these comments primarily address the *scope* of the EIR. More detailed input regarding the impacts and merits of the project will be presented in future communications.

Limitation on these comments

The centerpiece of the Seminary property is a significant academic campus. Despite the applicants stated intent to operate a very large college or university at the property, the current application provides not one scintilla of information about this significant use. Accordingly, with such a massive amount of information missing from the project description, the ability to meaningfully provide scoping comments is significantly hampered. The record should reflect this flaw in the process.

On September 21, 2020, the Strawberry Design Review Board unanimously rejected the NCLH proposal citing unanimously that "The proposed project is not stable, finite, accurate, nor sufficient as required to proceed, and the proposed project is lacking operational characteristics for the 1,000 person graduate institution, among other deficiencies." However, at its meeting on November 10, 2020, the Marin County Board of Supervisors ruled that the EIR for the project could proceed, but that it must include and consider the impacts of the proposed academic institution. So far, such information has not been provided.

Flaws in the initial project description

The project description outlined for the EIR contains misinformation. First, the developable portion of the site is only 101.1 acres, as 26 acres are underwater and have been formally disallowed for use in development calculations via a mapped easement. Second, significant portions of the property have already been developed (academic/administrative buildings, parking lots, student & faculty housing, playing field, etc). The area available for redevelopment needs to be reduced by the amount of area that has already been developed. Third, when considering existing development (buildings, housing units, parking areas and roadways), approximately 73% of the property is open space. The proposal reduces open space to approximately 50%. Due to hillside and dangerous soil conditions, the proposal will utilize well over 50% of the available space and a significant portion of the passive open space.

The following issues are submitted for EIR consideration.

1. AESTHETICS

Particular care will need to be given to aesthetic considerations because the Seminary property is a prominent piece of property widely visible from multiple public and private locations.

Obvious areas of analysis include:

2. The view corridor from highway 101 towards the property
3. The view corridor from Richardson's Bay to the property
4. The view corridor from the private development abutting the property

In addition to these major views, the project proposed to take areas specifically required to remain as open space in the Strawberry Community Plan and develop them. The reasons these areas were to be preserved was their aesthetic impact. The proposal would unwind this important visual and natural buffer, creating an uninterrupted line of visible development.

The December 12, 1982 *Visual Analysis of the GGBTS Master Plan* by John Roberto and Associates contains a thorough review of the as is site and should be reviewed as a starting point.

The area known as Chapel Hill is proposed to undergo a significant change that compromises the serenity, views and mobility of the existing, adjacent private land owners. Similarly, the open space known as Shuck Knoll is proposed for development with visual impacts to existing residences that need to be studied, defined, and mitigated. Seminary Point and Seminary Knoll are visually prominent ridge lines as defined by Title 22 Development Code standards., and must be analyzed as such.

Investigate and mitigate the visual impacts of the proposed development to all existing residences. The development proposed opposite the homes at the "top" of Chapel Dr deserves special attention.

Further, the architectural design is strikingly different from and incompatible with that existing on the site.

The Strawberry Community Plan singles out the location identified for a chapel, the open space band between Chapel Dr and Seminary Dr and the “point” (current location of GGBTS dormitories) as being of regional significance. The impact of the proposal on all of these locations should be carefully examined.

The proposed CCRC requires 332,500sf. This is an enormous structure for Strawberry and out of scale with anything in the seminary neighborhood. Its mass and scale require careful study.

In its entirety, the site is large, varied and sloped, making it hard to visualize. A large-scale 3D model must be created to allow all stakeholders (particularly those not trained in the reading of design documents) to understand how the proposal and each of the alternatives will appear from every vantage point - such as views from Hwy 101 and from the Bay, lantern effect at night time. The Forested Knoll is a prominent regional view and must not be destroyed.

2. AGRICULTURAL AND FORESTRY RESOURCES

An arborist and biologist must be hired to examine all vegetation and habitats on the site and determine species that must be preserved and how to mitigate significant tree and habitat impacts.

The Monterey Pines are reaching the end of their natural life. The site needs a comprehensive revegetation plan. This plan should include a detailed description of how vegetation will transition from as-is, to as proposed, and how biological resources will be impacted by revegetation. For example, does NCLH intend to denude the site with the wholesale removal of the Monterey Pines or will this be done in carefully orchestrated phases? Over the years, a meaningful maintenance program for the existing trees has been nonexistent, resulting in problems. Consider a bond or other enforceable instrument to ensure that any re-forestation plan is enforceable in the future.

3. AIR QUALITY

Project implementation will result in extensive construction-related traffic and resulting air quality impacts.

- How many car and truck trips/day will be required over what period of time?
- What steps will be taken to ensure that debris doesn't leave trucks and land in the streets and neighborhoods?
- How much particulate matter will be entailed by all of this traffic? How many cases of asthma and other respiratory illnesses will result? How will this airborne matter interact with the region's already numerous spare the air days?
- How much greenhouse gases will be expanded by construction-related traffic?

The project will result in a significant increase in vehicular traffic (both people commuting to the campus and residents going about their daily lives). Given Strawberry's roadway system, all of this traffic will funnel through a small number of intersections. Please study the traffic increases at all intersections and:

- Calculate how much additional greenhouse gases will be emitted by vehicles for the overall project and for waiting to transit these intersections.
- Calculate how many additional cases of asthma and other respiratory illnesses will result from the exhaust of vehicles waiting to transit these intersections.
- All of this traffic will result in increased airborne dust. How will all of this entailed particulate matter interact with the region's already numerous spare the air days?
- How will dust and noise monitoring be performed and reported to the neighbors during construction?
- Who will enforce the construction mitigation measures?

The project is not contemplating onsite housing for the people who work or study at the CCRC, fitness center, childcare center or college. How much greenhouse gas will be emitted by people driving from their place of residence to the Seminary site?

- How will the new building construction achieve energy efficiency goals? What can be done to offset greenhouse gas emissions resulting from the operation and maintenance of the existing building and infrastructure?

4. BIOLOGICAL RESOURCES

A licensed Biologist should be hired to determine the negative impacts that this development will have on wildlife, flora, and fauna. Also, consultations should be made with such groups as the Richardson Bay Audubon, Audubon Canyon Ranch, the Marin Conservation League, the California Conservation Corps, and other related environmental groups. Due to the age of any previous development on this site, there is missing data in County records on many issues, such as wetland and stream mapping, and other data layers critical for analysis.

The site is home to a Great Blue Heronry, Peregrine Falcons, Egrets, and a number of species of Eagles, including Bald Eagles that recently returned to Southern Marin for the first time in decades. Bald Eagles have regularly been observed in all parts of the property including Chapel Hill, Forested Knoll, and Shuck Knoll. An abundance of deer and coyotes also occupy the site. The impact of the proposed development on these and other wildlife should be closely studied.

The abundant wildlife on the site is largely cut off from nearby habitat by highway 101, Tiburon Blvd, etc. Because of this, existing wildlife corridors should be identified and protected. During the wet season, a vernal pool has been observed around an outcropping in the Shuck Knoll area where development is proposed, and the sensitive species in this area need to be investigated, documented, and protected.

Investigation of impact on wetlands, and the identification of blue line streams[1] must be investigated. For example, salt marsh harvest mice may inhabit the wetlands adjacent to the Seminary property, sensitive bird, fish, and other species inhabit the wetland and surrounding Bay environment and may be impacted by runoff from construction and/or improvements associated with the project such as storm drainage, water, and sewer systems that may require repair/upsizing adjacent to the site.

[1] Blue-line stream" means that a stream appears as a broken or solid blue line (or a purple line) on a USGS topographic map. Streams do not have to be "blue-line" to be considered waters of the State.

5. CULTURAL RESOURCES

Cultural resources on the site need to be investigated by qualified specialists. How was the site used by Native Americans and what cultural resources remain? Additionally, the Theological Seminary has a rich history in Strawberry. Its cultural history should be studied and certain aspects of building and/or the site preserved as cultural resources for future generations.

6. GEOLOGY AND SOILS

A licensed geotechnical engineering firm must be hired to investigate the stability of the area under development. It is known, for instance, that soils on the hillsides are not stable and development would probably cause unexpected movements damaging nearby properties.

GIS data indicates the property is "mostly landslides," has issues with liquefaction, and areas of mapped debris flow. The 1982 Master Plan for the site required landslide repairs at the property. There is no information as to whether this actually occurred.

Previous reports for the property indicate that several seeps exist on the site and the ground water is close to the surface of the land in several locations.

The following published literature and other available information must be considered.

- Davenport, C. W., 1984, An Analysis of Slope Failures in Eastern Marin County, California, Resulting From the January 3 & 4, 1982 Storm, California Department of Conservations, Division of Mines and Geology DMG Open-File Report 84-22.
- Donald Herzog & Associates, August 10, 1982, Preliminary Report: Anticipated Remedial Measures, Golden Gate Seminary, Seminary Point, California, Job Number 944.1.

- Herzog Geotechnical Consulting Engineers, March 21, 2011, Report on potential for landslides in the Seminary property hillsides, File Report 1833-03-11.
- Huntington Engineering & Environmental, Inc., November 4, 1944, Report, Geotechnical Investigation, Lot 25 Seminary Ridge Subdivision, Marin County, California, Project Number 6768.01-0-1.
- Rice, S.J., Smith, T.C., and Strand, R.G., 1976 Geology for Planning: Central and Southeastern Marin County, California, California Division of Mines and Geology, OFR 76-2.

- All other California Department of Conservation reports on the general area.

7. HAZARDS AND HAZARDOUS MATERIALS

Phase I and Phase II environmental site assessments are needed. It is expected that lead paint has contaminated the soils around the existing structures and needs to be remediated prior to demolition and new construction. It is requested that the site be investigated for asbestos that may be present in import soils in the road base, as a component of the asphalt paving, and as building materials. Appropriate investigation, planning, and precautions are needed to properly demolish the existing buildings/materials. Additionally, significant debris, drums, and oil containers have been observed over the years at the maintenance shed area, and it appears debris has been spread adjacent to the existing dirt road from the maintenance shed area to Shuck Knoll.

A previous Phase I for the property found that there is a hydraulic lift and empty underground fuel tank in the maintenance building but of which must be removed. No record of permits for these facilities is provided. The removal plan must be analyzed.

The property is located in the “very high” fire risk zone. A detailed mitigation and evacuation plan for a wildfire scenario must be analyzed. Strawberry is already built out per the master plan, this development will add to the already dangerous vehicular evacuation choke points.

8. HYDROLOGY AND WATER QUALITY

This section addresses storm drainage, sanitary sewer, and potable water.

Storm Drainage:

The existing site is centrally located on the Strawberry Peninsula, and the site was constructed before most of the adjacent residential housing. Therefore, there are a significant number of "private" drainage features and assets associated with the site that convey drainage from the site to the adjacent San Francisco Bay. It is presumed these facilities are owned and maintained by NCLH. However, NCLH disputes this. The ownership and responsibility of these drainage facilities need to be determined and identified. Many of these drainage facilities cross private and public property. Nearly all the drainage facilities are well beyond their useful life and are in a state of complete disrepair. The County has indicated they have no responsibility for these drainage features. These features must be studied and repaired as part of the development project, and the scope of the repairs needs to be defined as it is critical to the environmental review process as it includes disturbance in wetland and sensitive habitats.

The development will increase the impervious area and runoff from the site considerably, overwhelming existing drainage facilities. A drainage study is requested consisting of: a hydrology study of the site and adjacent areas that contribute to the overall drainage system, a condition assessment of existing drainage facilities from the site to their point of discharge, hydraulics study of the capacity of the existing drainage facilities, and consideration and mitigation of sea level rise.

It is anticipated that upsizing and repair of these existing facilities are required, including construction within the tidal marsh area and within very sensitive habitats that may contain endangered species. A few areas of note include:

- The existing drainage swale and corroded corrugated metal culvert conveying runoff from Shuck Knoll, through Strawberry Shores Apartments property, and discharging to the wetland approximately 175 feet south of the intersection of Ricardo Rd and Seminary Drive intersection.

- Water drains through the site, across the playing fields, and floods the Strawberry Cove condominium complex.
- Multiple swales and culverts conveying and discharging runoff to the wetland adjacent to the Seminary Playing Field.
- Multiple additional culverts along Seminary Drive.
- The remaining drainage system at the perimeter of the site.

Additionally, the increased runoff from proposed development on Shuck Knoll is expected to increase the risk of flooding of downstream properties that are currently located in the flood plain. The impacts of this additional runoff coincident with sea level rise and possible mitigation measures are requested to be studied/considered. A new stormwater pump station at Ricardo Rd and Seminary Drive is requested to be studied as a potential solution to mitigate flood risk and sea level rise impacts, especially to address stormwater runoff at high tide, and potentially to mitigate roadway flooding during storms and sea level rise.

The sewage pump station behind the 7-Eleven would seem to be vulnerable to sea level rise. With the proposed increase in development, the viability of this infrastructure should be studied and mitigated. - What is the impact of the expected 3-foot sea level rise on Seminary Drive as it is the primary entrance to the property?

Finally, portions of Seminary Drive and the Redwood Frontage Road (including the Seminary on and off ramps on both sides of the freeway) are within the flood zone and are known to regularly flood upon high tide. These tidal flooding impacts need to be studied and mitigated to avoid impacts to traffic during the flooding events and allow continual use of the roadways in the face of climate change and sea level rise. Mitigation measures requested to be studied include a pump station at Ricardo Rd and Seminary Drive, a sea wall along Seminary Drive and other strategies.

These complex issues need to be studied in detail by experts including specialists in hydrology, wetlands.

Sanitary Sewer:

New sanitary sewer service connections onsite are expected to support the proposed large increase of development. Additionally the volume and diurnal flow patterns are expected to change since many of the site uses are proposed to change (e.g. different academic use and operational characteristics, CCRC, gym, etc.). These changes are anticipated to change the volume, quality/type, and flow patterns to the public sanitary sewer system. Given these substantial changes, it is requested that a qualified licensed civil engineer be hired to study these changes and work with the local sanitary sewer service provider to determine the impact on the related public sanitary sewer collection system, pump stations, odor control, treatment, and treated water discharge to the San Francisco Bay.

It is anticipated that significant upgrades to the local sanitary sewer system (e.g. upsizing collection pipes, upsizing pumps, upsizing treatment, etc.) may be required. Many of these facilities are located in close proximity and impact wetland habitats. The required upgrades need to be studied, defined, and mitigated through a formal study that is completed in collaboration with the local sanitary sewer agency. These studies typically require significant effort and time.

Potable Water:

New potable water demand is expected to support the proposed large increase of development. Additionally the demand patterns are expected to change since many of the site uses are proposed to change (e.g. different academic use and operational characteristics, CCRC, gym, etc.). These changes need to be studied by a qualified licensed Civil Engineer in collaboration with Marin Municipal Water District to determine if upsizing treatment, storage (tanks), and conveyance (pipelines) systems are required.

9. LAND USE AND PLANNING AND NOISE

The Project irreparably conflicts with the Strawberry Community Plan

The Strawberry Community Plan (SCP) is the specific, controlling document for the project site, and the SCP has always contemplated that the site be used only as a Seminary, with associated student and faculty housing. (See numerous discussions in 1974 SCP regarding Seminary at pages 32, 47, and 58, for example.) While the SCP was amended in 1982 to permit a finite amount of market-rate housing in a very specific area, this amendment did not change the fact that only a seminary and its associated student and faculty housing would remain on the areas of the property not being sold off for housing. More importantly, this amendment contained some very clear language about the capacity for the site when it stated that the additional development approved via the amendment, "was determined to be the maximum desirable based on the projected traffic and the context of the property within the community."

A series of self-serving SCP edits are proposed to delete the requirement that the housing on site be for students and faculty only, and to totally change the for-sale requirement of the market-rate homes to now allow 100% rental. These major SCP components now sought to be stricken were the result of years of negotiations and hard work by the Strawberry Community, and should not be permitted to occur in such a haphazard and singularly focused manner.

As important as the deletions, however, is what isn't proposed to be changed in the SCP. The remainder of the document, including the amendment regarding the Seminary site, is untouched, thereby resulting in a wholly inconsistent document. For example, the following SCP language would remain, which is not only inconsistent, but also shows why the project cannot be approved:

"Of particular concern was the increasing number of attached multiple residential developments and the increasing impacts of traffic generated by these new developments."

"If new development is to occur, it can strengthen this character by providing the traditional setting of detached single family units within any new development proposed for the area."

The SCP should be respected, and a comprehensive community-driven update process undertaken before consideration of a nonconforming project. The entire context of the SCP should be respected, and only uses that take into account the current traffic situation and residential nature of the surrounding community should be considered.

The Project requires a CUP for the School

The 1953 Use Permit allowing a self-contained seminary to operate at the property was superseded by the approval of a 1984 Master Plan for the site. When the Master Plan expired, so did the right to operate an educational use. Accordingly, in order for the current application to be complete, it must also include a request for a Use Permit for a school, and clearly describe the operational characteristics of said school such that there can be meaningful environmental review, as well as an informed consideration of the required CUP findings.

The 1953 CUP for the Property was for one use, and one use only:

"…to permit the construction of a Theological Seminary and dormitories and other buildings incidental to such use…"

The record for the 1953 CUP indicates that two factors were central reasons a seminary was ever even considered as acceptable at this site:

1. That 100% of the students would be housed on the property, and

2. That the college was post-graduate, thereby making it an asset to the area.

A school without the characteristics cited above would in no way meet these criteria. A school that does not house its students on site generates significantly more vehicle

trips, noise, and other impacts, at a level far greater than the self-contained post-graduate institution contemplated in 1953. On top of this, the applicant also requests 100s of new rental housing units based on the theory that the student and faculty housing units are somehow equivalent to much larger homes that will be inhabited by people that primarily work off-site. This apples to oranges comparison is not supported by logic or the law, and flies in the face of the original concepts underlying the CUP approval.

Please refer to the January 25, 2021, letter from Riley Hurd setting forth the need for a new CUP for the school use. This letter was submitted, in part, as a response to the NOP for the EIR.

- **Details of the proposed college need to be defined**
  - Number of students
  - Number of faculty
  - Number of staff
  - Number of visitors each day
  - Amount of onsite housing dedicated to students, faculty and staff
    - Plan for ensuring that onsite dedicated housing remains dedicated to that use over time

  -How many students, faculty and staff will have to commute each day
  -Hours of operation
  - What will the academic nature of the college be?
  - For how many months or years will students attend the college?
  - Will students at the college interact with students or faculty at other academic institutions in the Bay Area? With the tech industry or other businesses? If so, how and where?
  -Activities provided outside of class (social events, sporting events, conferences, etc.)
  -Lighting plans
  -How much noise will be generated
  -and so on.

  As the college is studied, care must be used before using standard “book rates”

that estimate the impacts (e.g., traffic) for colleges since the proposed college isn't very "standard" (e.g., no student housing, extensive connections to other regional academic institutions and businesses, many special events, etc).

- Similar questions arise from the CCRC, fitness center and art museum
  - Number of visitors
  - Number of staff
  - Amount of onsite housing dedicated to staff
    - Plan for ensuring that onsite dedicated housing remains dedicated to that use over time
  - Hours of operation
  - Special events
  - Lighting plans
  - How much noise will be generated
  - and so on.

- How will the playing field be used?
  - Field/park hours of operation, noise, traffic, and light impact.

- The EIR should study how durable any plan approved by the County will be over time and identify measures that can be taken to ensure durability. For example, most of the homeowners (at least those who purchased in the last 60 years), did so with the expectation that the future of the seminary was settled. It was well defined in a Community Plan, Master Plan and Conditional Use Permit. Over the last decade we've learned that none of these documents provide any assurance of what the future will bring. How do we know that open space will stay open? That schools won't continue to expand? That limitations on use of the fitness center won't be removed?

- In its April 10, 2017 letter to NCLH, Marin Code Enforcement made these findings and conclusions:

> "FINDINGS: Based on the background and facts in evidence, we have concluded that the following non-residential activities are unauthorized: (1) North Coast's business offices, (2) the Golden Gate Academy, except to the extent that it enrolls children of Seminarians; and (3) All Seasons Catering except to the extent it serves Seminarians. In addition, we have determined that renting the residential units to the general public is unauthorized as long the 1984 Master Plan is in effect because the Master Plan permitted their development specifically for the purpose of providing housing for the students, staff, and faculty of the Seminary.
>
> CONCLUSIONS: If it is your intention to pursue legalizing the unauthorized activities, please revise your current planning applications to include these uses for consideration. *Please note that baseline determinations for environmental review do not include the effects of unauthorized uses on a property*."

We draw your attention to the final sentence of the County's conclusion.

Note that the current onsite tenant, Olivet University, which is a private Christian institution of biblical higher education, broadly complies with the now expired[2] 1953 conditional use permit.

[2] **See Riley F. Hurd letter of January 25, 2021.**

10. POPULATION AND HOUSING

Currently, the NCLH site includes 211 student and faculty living units. The proposal includes 488 living units. The attached breakdown shows the type of housing units for each.

Unit Size	Existing	Proposed
Four Bedrooms	2	8
Three Bedrooms	19	197
Two Bedrooms	54	109
One Bedroom	54	24
Studios	82	0
Sub-Totals	211	338
CCRC	0	150
Totals	211	488

The NCLH proposal specifies 50 affordable units and then goes on to claim a density bonus of 96 units. However, as noted above, they will destroy anywhere from 112 (82 studios plus 30 one bedroom units) to 211 restricted (for the use of seminary students and faculty) units. NCLH proposes to destroy more affordable housing units than they propose to create. Therefore, they are not entitled to any density bonus. Their entitlement is limited to the maximum allowable units of 242 (general area zoning) or 210 (Strawberry Community Plan)[3].

Recently the State and County have embraced accessory dwelling units. How will ADU's fit into the NCLH proposal? If allowed, then the impacts (traffic, open space, greenhouse gases, noise, light pollution, etc.) should all be studied. ADU's may also be built by other Strawberry homeowners. The impact of the overall increase in density of Strawberry associated with ADU's should also be considered as part of this EIR.

[3] This assumes 100 buildable acres. However as noted above, developable acreage needs to be carefully calculated based on total acreage less underwater acreage, already developed acreage (e.g., academic campus and student and faculty housing, parking lots, roads) and land undevelopable because of slope, springs, etc.

NCLH plans for 100% of the built housing to be rental. We think it's worth studying how the difference in ownership patterns (rental vs ownership) effects community life (volunteerism, voting, etc).

11. PUBLIC SERVICES

The population on the NCLH site will explode with the addition of more than 2,000 additional residents, all of whom will need public services. Many of these services are funded by parcel taxes. Currently, NCLH only pays taxes on 9 parcels and their plan contemplates no additional parcels. If each residential unit were its own parcel, NCLH would pay approximately an additional $1 million per year in parcel tax. As proposed by NCLH, this shortfall in revenue will fall onto the shoulders of other parcel owners. This inequity needs to be carefully studied.

Furthermore, the impact of this development on the availability of adequate water pressure (1,000 GPM vs. 500 GPM) must be assured. And any delay in the response time of the Southern Marin Fire Protection District Fire Station #9 (Reed Blvd) must be measured in light of the added development and any costs thereof, assuring that there will be no delays from current.

The waste water infrastructure (sewer pipes, pump stations, treatment plants, etc.) should all be studied for adequacy and resilience in the face of sea level rise. Mitigation plans for all identified impacts should be surfaced. Please see the section titled “HYDROLOGY AND WATER QUALITY” for an expanded description of the aquatic impacts of this project on public services.

12. TRANSPORTATION/TRAFFIC

The proposed development will increase street traffic substantially. An increase in daily traffic by a factor of at least 4 (which the proposed development can result in) will cause significant safety concerns. It is considered mandatory that a professional traffic engineering group be hired to closely examine the impacts of the added development to the area.

- Safety concerns

  -Essentially, the Strawberry area has two lane roadways with very busy bike lanes and limited walkways and walkway crossings. Also, current street parking along with the pedestrian and bike traffic make vehicle passage often dangerous.

  -Portions of East Strawberry Drive are particularly dangerous with 10 feet height difference between lanes with no guardrails.

  - Speeding is especially hazardous on the lower (i.e., water side) of the divided section of East Strawberry Drive. The older houses were built in the late 1940s and early 1950s when East Strawberry ended near 313 East Strawberry Drive. Driveways and garages for these older houses were designed to be approached from the north. Turning into these driveways and garages approaching from the south requires much lower speeds, complete stops, and sharper turns. Backing out of these home's driveways is already scary with the current levels of traffic levels. Residents checking their roadside mailboxes and even the mailman are also at risk from fast traffic on this street. The situation will become even less safe with the increased traffic that comes from the proposed development.

  - Strawberry Point School, and to a lesser extent the Strawberry Recreation Center and playing fields and the blind downhill corner approaching from the south, provide natural and necessary traffic hazards. There are crosswalks and flashing signs but observance requires attentive drivers. These hazards should not be exacerbated by the addition of substantial traffic on East Strawberry Drive.

  - Increased traffic enforcement, radar signs, speed bumps, etc have all been requested for East Strawberry in the past, but no action has been taken.

  -Turning lane from Seminary Drive onto Gilbert (the primary point of access to the Seminary property) is blind to opposing traffic.

-Within the property being studied, it is understood that the roadways do not meet County standards of width nor of the degree of steepness allowable. This must be identified in the study.

- Roadway capability – Seminary Drive/Strawberry Drive & Intersections
  -There are two main entrances/exits from the Strawberry area – Frontage Road at Hwy 101 (incl both Northbound and Southbound traffic) and at Tiburon Boulevard.
  -The service at these intersections is classified as marginal at best today. A 4-fold increase of daily traffic due to the proposed development plan is an intolerable situation.
  -The intersections at Ricardo and Seminary Drive pose potentially dangerous safety concerns as does the intersection of Belvedere and E. Strawberry where higher speed traffic turns off Tiburon Blvd into potentially oncoming traffic from Belvedere.
  -Reed Blvd poses potentially dangerous safety concerns with increased traffic due to steepness and limited roadway.
  -Furthermore, the present entrance and exits off Seminary Drive to the property in question will create a congestion nightmare with the increase being proposed. There is parking on both sides of the roadway and, as previously mentioned, there is considerable bike traffic daily so as to interfere with the driving lanes.
  -NCLH purposes to close Chapel Dr. to through traffic. This change enjoys no support from the residents of Chapel Dr. The implications on traffic circulation need careful study.
  -The locations of all driveways require careful analysis. Driveways should connect to roadways in the interior of the campus and not the periphery (e.g., Chapel Dr.).
  - McDonald's drive-through traffic consistently spills out onto the Redwood Frontage Road during peak commute time, snarling traffic. Please factor this into the traffic studies.
  - The location of the two 7-Eleven driveways is highly dysfunctional and interrupts the safe and efficient flow of traffic. This should be studied and mitigated.

Traffic calming on Seminary Drive and other neighborhood streets should be studied and implemented as a mitigation measure. For example, the nearby sports car vendors' customers often test drive their cars at high speeds along Seminary Drive creating a life safety hazard that will be magnified with additional vehicle and pedestrian traffic from the proposed project.

The community prides itself on walking and biking when possible. School-age children are encouraged to walk to school (especially to our local elementary school). How will the increase in traffic associated with the proposed development impact these values? Especially given the lack of sidewalks and bike lanes in Strawberry? Also Seminary Drive has recently become very popular with cyclists, including tourists on rental bicycles from San Francisco. The impacts of the proposed development on all of these uses need to be studied and mitigated.

We believe an independent study on safety and mobility for Strawberry should be conducted as part of this EIR.

Furthermore, this is hardly an ideal location in regards to Vehicle Miles Traveled. Where will all of these new residents work? Where will the CCRC and students and faculty live? The proposal sets up a perfect storm of peak cross-commutes by failing to provide on-site housing and by overbuilding the market-rate units in an area not near any meaningful employment centers.

ADDENDUM – COMMUNITY ALTERNATIVE PROPOSAL

The Strawberry Community Plan is the controlling document for Strawberry and the seminary site. It can't be amended without demonstrating overriding community benefit. Since the NCLH plan provides no such benefit, we suggest that the EIR study an alternative plan that requires no amendment to the SCP (i.e., a plan that completely conforms to the SCP):

> A theological graduate school with 211 units for students and faculty housing.[4] Historically, the traffic for such a development has been measured at approximately 1,600 trips per day and has not caused any significant safety problems. Site density is 18.5%.
>
> OR
>
> 210 housing units (RMP 2.1) – primarily single family units. With this type of plan, daily trips are estimated at 2,000. Density is estimated at 30%.

Both of these alternatives would preserve passive open space and ridgelines. Neither provides for a CCRC, business offices, a fitness center nor for a childcare facility.

In addition to studying the above alternative, we request that other *variations* on the NCLH proposal be examined. In particular:

- Examine a variation where 100% of the students and faculty are provided with onsite housing.

- During 2019/2020 NCLH repeatedly expressed their intention to build something akin to The Rockefeller Foundation Bellagio Center in Italy. NCLH should be taken at their word and something on the scale of the Bellagio Center be studied as a variation for the proposed college.

[4] Some people may scoff at the possibility of the site ever becoming a seminary again after the Golden Gate Baptist sold to NCLH. However the campus is currently occupied by Olivet theological seminary, and they have made plain their desire to stay there as long as possible.

Subject: Baptist Seminary Property Proposed Development

I live on Seminary Drive, which means that I routinely enter and exit the 101 at the Seminary exit. The short stretch of Redwood highway to the intersection with Seminary has become a major traffic problem. The gas stations (2), Car Wash, 7-Eleven, and McDonalds customers often spill out while waiting/exiting on to Redwood Hwy. blocking the north bound and even the middle lanes. Add to this are the bikers, who are in the northbound lane (no bike lane, no room for one) who use this route to go around Strawberry Point to Tiburon. This can lead to back-ups on the 101 exit, and great frustration as well as danger on Redwood Highway. Furthermore, Strawberry Dr. is a local street that has cars typically parked along both sides of the road with no bike lanes. It can get dicey between cars, bikes, runners and pedestrians all competing. Since this route is markedly superior to E. Strawberry Dr. it would likely bear the major load of traffic to and from the proposed new development, which by the way is also used by So. Marin Fire.

You already know all this. Anything but minor additions to the historic traffic flows to Seminary will result in the kind of bottlenecks that exist all over Marin (E. Blithedate, Tiburon Blvd., Sir Francis Drake, etc.,etc, etc. Marin's geography and terrain cannot safely accommodate heavier traffic loads under normal circumstances, not to mention emergencies!!!

Subject: Strawberry Redevelopment

Greetings
We live in Sunrise Point. We have noticed a tremendous increase in traffic at the E Blithedale exit/entrance over
the past 15 years. The traffic increase used to be at rush hours-- now it is at all times during the day. This has led to
increased smog and pollution since it can now take 20 minutes to exit Mill Valley from Camino Alto to the freeway
How do the developers plan to help deal with FURTHER and MORE traffic flow problems? I think that we are at
PEAK flow problems right now. When it was a seminary, most students stayed on the campus. I doubt this will happen
with the "redeveloped" campus. Then the new housing-- lots of increased traffic during construction and then on going
traffic increases by the homeowners and their "staffs"
Also, we should not expect the traffic problem to just be at the E Blithedale exit, in my opinion it will build up on THE FREEWAY
and affect freeway traffic especially East bound
NEXT is the water issue- we already have water crises. Where is the "new" water going to come from? At a bare minimum
the developers should pay to find new resources-- A saline plant?, recycled "gray" water and certainly NO GRASS or
swimming pools
We also believe that the developers should provide copies of the plans to all Mill Valley residents so that they/we can look
at the project and comment about it.
Thank you,
David Chittenden

Subject: EIR forms

Hi Rachel.....

I saw you at Stephanie's zoom meeting on May 11 when you talked about the Seminary property EIR process.
I was the person who talked obout our drain storm problems at Strawberry Cove Condominiums due to water coming down from the Seminary property.

Is there a form I need to fill out explaining our problem and why we need to be included in the EIR?
What's the exact procedure?

Thanks so much for a very informative presentation.

Subject: Seminary EIR

The 100 homes to be demolished by North Coast Holdings are “affordable” housing units by most logical standards They're affordable because of their smaller size, their age, and their actual rental rates. They should not be targets for demolition at a time when we need more affordable housing. With basic renovations, these homes will continue to sustain work–force housing.

But, since they’re not designated as “official" Marin County affordable housing units, they fall through the cracks. That’s the fine print. This doesn't diminish the fact that the developer is eliminating 100 units of affordable housing in Marin County.

As a contractor who has renovated well over 150 homes, I know that renovation and restoration is usually the better answer. Renovation produces less waste to land fill than demolition, and it requires far less time and material to complete. Renovation is common practice in most of the world, but here we tend to tear down anything old and rebuild it new. The problem is that new construction is expensive and developers require a profit margin which they only get by building market–rate housing. But if Marin County is serious about providing affordable housing, renovating older properties is the best way to go.

So, is Marin really serious about affordable housing?

To make matters worse, this developer expects a “density bonus” for demolishing over 100 units so they can build many more market–rate units - at least 80% of them will be expensive homes. While code requires a developer to replace demolished affordable units at a 1 to 1 rate, this developer is apparently immune because they’re only affordable for the renters and not “officially designated” by the County. That’s bad enough, but to grant a density bonus on top of that?

If the EIR is to proceed with any credibility, it should consider the sheer waste of material gone to landfill so this developer can build high–profit market rate housing, ignore the replacement mandate, and expect a density bonus. Planners should also ask why they’re proceeding with an EIR when the biggest entity (the school) is not even specified.

The absurdity of this EIR and the blatant disregard for what should be considered affordable housing boggles the mind.

As an adjacent neighbor to the Seminary property, please enter my comments for the record.

The Nature of Connection

Enso Village News

Construction Is Slated to Begin Summer 2021.
Only a Few Floor Plans Still Available.

Welcome to The Nature of Connection!

Live Now. Live Here.

The Nature of Connection is your place to learn about Enso Village—a Zen-inspired Life Plan Community currently being developed in Healdsburg, California. With a focus on mindful aging, the joys of nature, environmental stewardship, contemplative care, and healthy life choices, Enso Village offers a new paradigm in retirement living. Through a unique collaboration between San Francisco Zen Center and The Kendal Corporation, Enso Village will be an inclusive community welcoming to all.

With construction slated to begin in the summer of 2021 and the opening of Enso Village slated for 2023, we have only a few floor plans remaining. Reserve your future home now. Place a fully refundable deposit to lock in special, limited-time benefits:

- 80% Repayable Entrance Fee
- Second-Person Entrance Fee Waived
- 15% Discount on Assisted Living/Memory Care
- Residence Personalization during Development-Phase

You are invited to make an appointment to visit the Enso Village Preview Center, where you may view a large-scale model of the community and a kitchen vignette featuring contemporary design finishes.

To ensure your wellbeing and safety, the Preview Center is Guest Ready and secure. Our team is only scheduling one appointment at a time, and we are following all recommended health and safety guidelines.

Schedule your individual, in-person appointment:

See Our Development Progress

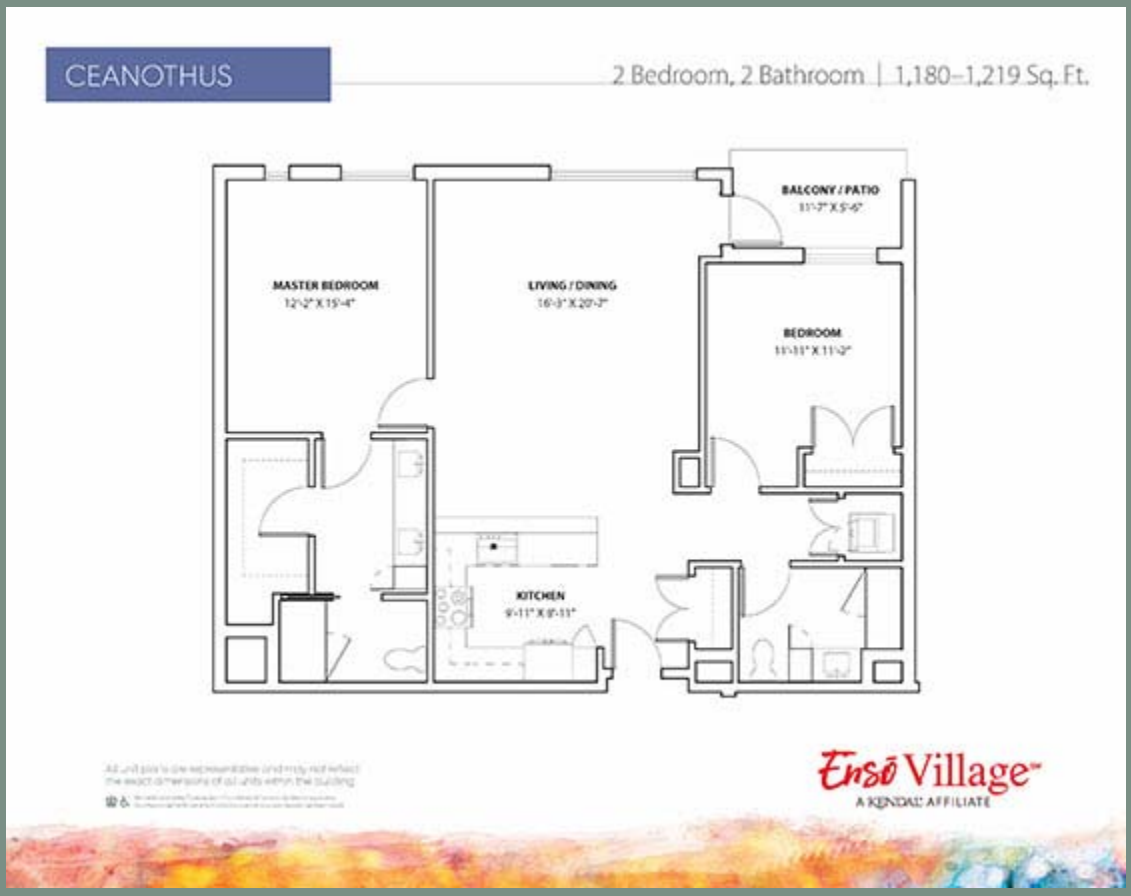
Construction Is Scheduled to Begin This Summer!

We're happy to share the latest headway in the Enso Village development process:

- The development team continues to work with the City of Healdsburg in their review of the Enso Village building permit. The review is progressing on schedule.
- The construction of the shared roadways, including all the utilities that will serve the future hotel and retail, as well as Enso Village, is underway.
- Financing documents are being finalized in preparation for the public offering of the tax-exempt bonds that will fund the construction. It is anticipated that the bonds will be certified by a third-party as "green bonds," a first for a startup senior living community. "Green bond" designation is based on a commitment to long-term sustainability. Some examples of what Enso Village will do are:
    - Divert 65-percent of construction waste.
    - Utilize composting to repurpose food waste.
    - Incorporate energy-efficient cooking, heating, and lighting.
    - Install onsite solar panels.
    - Use drought-tolerant native plantings to reduce water consumption.
    - Provide exterior lighting designed to reduce light pollution and to protect night skies and local, nocturnal fauna.
    - Include an urban farm as a source of local, organic produce.
- Construction at Enso Village is scheduled to begin this summer!

Featured Floor Plan

Introducing the Ceanothus:
Limited 2-Bedroom Inventory



All designed to offer light, space, comfort, privacy, and modern technology, an array of varying floor plans at Enso Village present options to fit different budgets and ways of life. This unique two-bedroom/two-bathroom plan features a central, open living/dining area flanked by spacious bedrooms.

With only a few residences remaining, this plan will not be available for long. Call today to find out how to make the Ceanothus your new home.

"This is an adventure. It means giving up my home and community to leap into the unknown. I look forward to less responsibilities, meeting strangers and becoming friends, and digging into what is really important to me."

The Perfection of Giving

Volunteerism as a Practice

Volunteers from San Francisco Zen Center and Kendal Communities Share Their Experiences

In Buddhist teachings, the paramitas, or "perfections," are a set of virtues we strive to cultivate as part of the path to enlightenment. The first is dana, the perfection of giving, by which we give without expecting anything in return.

Jeffrey Schneider, San Francisco Zen Center, Outreach & Volunteer Coordinator

"There are many ways to be of service," says Jeffrey Schneider, an ordained Zen priest who has served as the outreach and volunteer coordinator at San Francisco Zen Center's (SFZC) City Center for the last decade. "Some people are able to give time, while others are able to give money. We all practice generosity in a way that is appropriate to our particular circumstances. Volunteering, or being of service to others—giving our time, energy, physical presence, work—is one way we can practice the perfection of giving."

City Center, also known as Beginner's Mind Temple, provides volunteer and outreach opportunities—both within and beyond the Temple—for volunteers of varying backgrounds and levels of understanding of Buddhist teachings. During normal times when in-person events are not on hold due to COVID-19*, volunteer opportunities at the Center itself include everything from the ringing of bells and leading of chants during services in the Zendo, to staffing the Center's library, bookstore, and kitchen. Some of the outreach opportunities beyond the Temple include leading offsite meditation groups throughout the community (currently taking place online), providing meals for homeless and formerly homeless people, and helping host holiday festivities for children and families in transitional housing. A program that has been able to continue without interruption throughout the pandemic is the Prison Correspondence Program. City Center's volunteer penpals, who must have an established practice and understanding of Buddhist teachings to volunteer, collectively answer hundreds of letters a year from incarcerated individuals from all over the country.

For Jeffrey, volunteering has always been central to life, even before he came to San Francisco Zen Center. In addition to the many volunteer efforts he coordinates and participates in as volunteer coordinator at City Center, he makes time to serve others during his personal time. For example, he volunteers at the San Francisco Food Bank on Tuesdays. And over the years, he has performed many memorial services for formerly homeless people who have passed away while living in permanent shelters. "Knowing that I'm out in the community supporting other people, helping to the extent that I can—that's very important to me," he says. "That's why this is my dream job, as well as an important expression of my religious practice."

While true generosity gives without expecting anything in return, volunteering in service of others often enriches the lives of those serving in addition to the lives of those being served. "A lot of people who volunteer are in search of more than just spirituality. They are in search of community," says Jeffrey. "It's not only about the practice of giving, but the practice of forming deep, strong connections with people who share the same values. It's about the Sangha—the community of people who practice together, and the sense of fulfillment that comes with that community. For example, for years, a group of six of us have come to Zen Center every Thursday to make lunches. Now, even though we can't do that, we still meet on Zoom each week, and several times this year, we've been able to meet in person in a local park while wearing masks and maintaining social distancing. We've become very good friends and still support each

other." Volunteer opportunities and outreach efforts have been the beginning of many enduring, enriching friendships.

There is also the joy of being able to give and the deepening of one's own practice that comes through volunteering. "For example, when I correspond with someone as a penpal in the Prison Correspondence Program," Jeffrey explains, "I sometimes have to dig deeply to find the intentions of my own practice in ways I might not be able to without that give and take."

Visit City Center's Outreach & Volunteer page for more information.

**City Center staff members are hopeful that regularly scheduled volunteer and outreach programming will be able to be resumed by May, 2021. Stay tuned.*

Anne Elder, Kendal at Oberlin, Oberlin Volunteer Coordinating Committee Chair

"It's interesting to see how quickly new residents become involved in volunteering here at Kendal," says Anne Elder, a resident at Kendal"Service is part of why people come to Kendal. They hear that as part of the mission." Anne was encouraged to be a part of the Committee from her earliest days at Kendal at Oberlin. "I worked my way through until I was holding the reins," she says.

The primary responsibilities of the Oberlin Volunteer Coordinating Committee are tracking and reporting annually on resident volunteer hours and activities, and keeping residents apprised of all volunteer opportunities—both on and off campus. On campus, residents volunteer sitting at the front desk when staff is on leave, entertaining prospective residents as part of the Marketing Committee, and—during the pandemic—delivering mail, packages, and food to fellow residents. "Our volunteers accumulated almost 45,000 hours in 2020—nearly all on campus and Zoom due to the pandemic," Anne says.

Many of the off campus volunteer opportunities take place within Oberlin City Schools. "There are so many amazing opportunities," Anne says. Each week, a group of residents goes into elementary schools to read to kindergarteners, while for many years another group set up listening posts within elementary schools and junior high schools, where residents met with students who needed a sympathetic ear.

Resident volunteers also participate in a number of programs at the nearby Oberlin College. Some audition for and play in concerts by the Oberlin Arts and Sciences Orchestra, an ensemble open to college students and members of the community. Others sing in the College's Musical Union. Other volunteers participated in an Oberlin College course exploring death and dying, in which first-year students were paired with Kendal residents who spent time talking and studying with them, shared an older person's perspective, and, in some cases, provided some of the benefits of a grandparent for students who may not have known one. In another program, Kendal resident volunteers mentor second-year music conservatory students from Asia, meeting with them virtually throughout the year to help them improve their English.

As it is in the Buddhist tradition, service is core to the Quaker philosophy and puts into practice several of Kendal's values, such as "To take responsibility for our role in maintaining the larger community in which we live and work;" and "To foster a culture of generosity, encouraging and developing full use of our time, talent, and resources." In some cases, service takes the form of being a "change agent," a person with the skill and desire to transform an organization, a community, or a society. "When people are first visiting here as prospective residents," says Anne, "they hear from current residents who share how busy they keep with volunteer activities. That's how the culture gets passed along."

While not a Quaker herself, but a member of a United Church of Christ congregation, Anne resonates strongly with the mission to serve and help others. “Research shows, you’ll live a longer and happier life through service. One enriches one’s own life by giving time to people other than one’s self,” Anne says. “Volunteer work out in the community beyond Kendal often brings us up against others’ needs in the world. While I find Kendal residents to be pretty aware of what’s happening in the world, we are still often reminded through volunteering that we are privileged here, and we have something that we should share.”

Tova Green, San Francisco Zen Center, Liaison for Zen Centers in the Suzuki Roshi Lineage

“One of the vows we take in Zen practice is to live and be lived for the benefit of all beings. It is a teaching that permeates everything we do,” says Tova Green, who is the liaison for San Francisco Zen Center’s network of 75 affiliated Zen groups in the Suzuki Roshi lineage. As a licensed clinical social worker by profession, and a Zen priest and teacher, for Tova, being of service to others is a way of life—a way “to make a difference in the world.”

Tova’s volunteer activities included leading a monthly meditation group at the San Francisco Public Library (currently on hold due to the pandemic). Participants came from all walks of life—library staff, library patrons (many of whom were homeless), and people working in offices nearby. “You never knew who would turn up,” she says, “and I miss doing that.”

She also trained and served as a volunteer with Zen Hospice Project (ZHP). For a year, she volunteered weekly at a large public hospital and then joined the ZHP staff as a volunteer coordinator. In more recent years, Tova volunteered for a local hospice where she meditated or chanted with Buddhist patients and their families or taught meditation when it was requested. Tova comments, “Being with people as they are dying is a great honor because it is a profound life transition.”

At San Francisco Zen Center, Tova co-leads two affinity groups. She cofounded the SFZC Queer Dharma Group eleven years ago, which welcomes those who identify as LGBTQIA, and “Unpacking Whiteness: Reflection and Action,” which explores white privilege and racism.

During the weeks leading up to the 2020 U.S. presidential election, Tova attended an online election retreat organized by members of Berkeley Zen Center. For several weeks afterward, she and other City Center residents met to write letters to voters and potential voters in swing states. “This was something we could do during the pandemic to connect with larger political themes,” she says.

Some of Tova’s volunteer experiences have given her a chance to be of service to people she wouldn’t otherwise get to know, including people who are homeless. “You can hardly go for a walk in San Francisco without encountering a person who is homeless, but it’s different to develop relationships with them,” she says. “That kind of intimacy is possible especially when a volunteer activity is repeated. You get to know the people you are serving. Volunteering is a way of expanding my awareness of the wider community and opening my eyes more fully to the pain of people’s situations. I feel it widens my vision and opens my heart.”

Tova feels deeply grateful for all she has received from Zen study and living in a Zen community. “Zen practice is not just for my own peace of mind,” says Tova. “It is a way to express my gratitude and give something back to my community and the wider world.” Yet, as she points out, according to Buddhist teaching, “There is truly no giver, receiver, or gift, as all three are interconnected.”

Betty Warner, Kendal at Longwood, President-elect of Kendal at Longwood Residents Association

"I prefer the term 'engagement' to 'volunteerism,'" says Betty Warner, a resident for the past seven years at Kendal at Longwood in Kennett Square, Pennsylvania, where she is president-elect of the Kendal at Longwood Residents Association. "'Volunteering' implies you are providing a service for someone, while 'engaging' implies you are sharing your passion." Home to some 400 residents, Kendal at Longwood has nearly 100 committees—all springing from someone's passion. "I like to say that our committees pop up like mushrooms after a rain," says Betty. "They come and they go with the passions of the people who found them."

Among the many efforts through which Betty has shared her passions, she formed and chaired the Intergenerational Committee, a group aiming to promote intergenerational activity among Longwood residents and the broader community. During one of the Committee's most successful programs, The Storytelling Exchange, residents from Longwood were partnered with students from Lincoln University, a Historically Black College and University located nearby. For seven weeks, the intergenerational pairs of friends shared in conversation as the students listened to the residents' stories, then repeated the stories back to the residents. "The experience was lifechanging," says Betty. "The insights that came from that exchange were stunning. For example, when we visited Lincoln's walled campus in the midst of what had once been a cornfield, we asked the students, 'How can you bear to live here in such isolation?' They answered, 'We feel safe here. We feel taken care of. And in the spring, it is beautiful.' In turn, when the students visited Kendal at Longwood, they asked us, 'Coming from large, spacious homes, how do you bear to live so close together in these small cottages?' We answered, 'We feel safe here. We feel taken care of. And in the spring, it is beautiful.'"

Betty was also among the founding members of the website team and is a member of the Zoom team, which came into being in response to the pandemic. "We set about converting a campus of 400 residents, where the average resident-age is in the 80s, into Zoom users. It was a challenge," she says, "but it was the only way for committee members to stay connected and continue meeting." Some volunteers facilitate Zoom meetings five days a week, allowing two-thirds of Longwood's committees to continue to meet throughout the pandemic. "We joke here that, when you move in, the contract contains an invisibly inked clause saying, 'I will no longer be retired,'" she laughs.

As Kendal at Longwood prepares to celebrate its 50th anniversary in 2023, Betty reflects on the Quaker values upon which it is built. "Stewardship, caring, and compassion are components of every one of our committees and structures," she says. Many volunteers engage with the Health Center residents, from pouring water, to pushing wheelchairs, to singing to the residents. Respect is another core value at Longwood. "One Quaker belief is that we all have the light of divinity within us," she explains, "and that leads to people having a mutual respect for one another." This reciprocity is exemplified by the fact that many of the community's 100 committees operate with no chairperson, but by consensus. "We all share a passion and solve challenges together," she says.

Betty feels that the opportunities for engagement, shared passions, and learning give her a reason to get up in the mornings. "Recently, a fellow Longwood resident wrote to me concerning our on-campus woodshop which is in dire need of rehabilitation before it can reopen," she says. "He wrote, 'You know, I need to get to the business of sharing what I love, and that is making things.' To all the people who are planning a move to Enso Village when it opens, I would say this: Think about what your passion is and think about how you might share that passion. Begin to consider what is going to get you up in the mornings with pleasure. What is it you can share?"

Some of you have thanked me or said that they agree
If you are concerned about Mill Valley and about traffic and water issues, I would encourage you to let the planners know
The 15 minutes that you spend writing a letter maybe translated into 15 minutes less every time you exit/enter Mill Valley
not just at the Tiburon exit but also at shoreline as folks change their traffic routines
Thx
David

Subject: Strawberry Redevelopment

Greetings
We live in Sunrise Point. We have noticed a tremendous increase in traffic at the E Blithedale exit/entrance over
the past 15 years. The traffic increase used to be at rush hours-- now it is at all times during the day. This has led to
increased smog and pollution since it can now take 20 minutes to exit Mill Valley from Camino Alto to the freeway
How do the developers plan to help deal with FURTHER and MORE traffic flow problems? I think that we are at
PEAK flow problems right now. When it was a seminary, most students stayed on the campus. I doubt this will happen
with the "redeveloped" campus. Then the new housing-- lots of increased traffic during construction and then on going
traffic increases by the homeowners and their "staffs"
Also, we should not expect the traffic problem to just be at the E Blithedale exit, in my opinion it will build up on THE FREEWAY
and affect freeway traffic especially East bound

NEXT is the water issue- we already have water crises. Where is the "new" water going to come from? At a bare minimum
the developers should pay to find new resources-- A saline plant?, recycled "gray" water and certainly NO GRASS or
swimming pools
We also believe that the developers should provide copies of the plans to all Mill Valley residents so that they/we can look
at the project and comment about it.
Thank you,
David Chittenden

Subject: Conduct of May 18, 2021 NCLH Scoping Session

I wish to reiterate my complaint from last night in writing. In particular, I feel that the decision to hide the list of participants at last night's NCLH scoping session was inconsistent with the Brown Act and the Governor's executive order from March of 2020 which allowed public meetings to be conducted via teleconference. If you review the final paragraph of the executive order (below), you'll see the Governor urging you to adhere as close as reasonably possible to local law and to maximize transparency.

The Board of Supervisors and Planning Commission make the participant's pane available to all attendees. What's different about last night's scoping session? Why the secrecy? Did NCLH or any of its representatives have access to the list of participants? Why did the organizer's of the Zoom call take the overt step to disable the participant's pane?

Also was condition (ii) from the executive order met last night? Has the County been addressing condition (ii) since it begin conducting public meetings via Zoom?

Sadly, it feels like we're off to a bad start with the EIR process.

Sincerely,

Josh Sale

11. Notwithstanding any other provision of state or local law, including the Bagley-Keene Act or the Brown Act, a local legislative body or state body is authorized to hold public meetings via teleconferencing and to make public meetings accessible telephonically or otherwise electronically to all members of the public seeking to attend and to address the local legislative body or state body, during the period in which state or local public officials impose or recommend measures to promote social distancing, including but not limited to limitations on public events. All requirements in both the Bagley-Keene Act and the Brown Act expressly or impliedly requiring the physical presence of members, the clerk or other personnel of the body, or of the public as a condition of participation in or quorum for a public meeting are hereby waived.

In particular, any otherwise-applicable requirements that

(i) state and local bodies notice each teleconference location from which a member will be participating in a public meeting;
(ii) each teleconference location be accessible to the public;
(iii) members of the public may address the body at each teleconference conference location;
(iv) state and local bodies post agendas at all teleconference locations;
(v) at least one member of the state body be physically present at the location specified in the notice of the meeting; and
(vi) during teleconference meetings, a least a quorum of the members of the local body participate from locations within the boundaries of the territory over which the local body exercises jurisdiction

are hereby suspended, on the conditions that:

(i) each state or local body must give advance notice of each public meeting, according to the timeframe otherwise prescribed by the Bagley-Keene Act or the Brown Act, and using the means otherwise prescribed by the Bagley-Keene Act or the Brown Act, as applicable; and
(ii) consistent with the notice requirement in paragraph (i), each state or local body must notice at least one publicly accessible location from which members of the public shall have the right to observe and offer public comment at the public meeting, consistent with the public's rights of access and public comment otherwise provided for by the Bagley-Keene Act and the Brown Act, as applicable (including, but not limited to, the requirement that such rights of access and public comment be made available in a manner consistent with the Americans with Disabilities Act).

In addition to the mandatory conditions set forth above, all state and local bodies are urged to use sound discretion and to make reasonable efforts to adhere as closely as reasonably possible to the provisions of the Bagley-Keene Act and the Brown Act, and other applicable local laws regulating the conduct of public meetings, in order to maximize transparency and provide the public access to their meetings.

Subject: EIR Comment on North Coast Land's proposal for the Seminary

I listened to tonite's entire presentation, and was shocked that no one mentioned the Strawberry Recreation Board's position on the Seminary development plans. That Board is, for all practical purposes, the seat of government for the unincorporated Strawberry community, and has the responsibility to submit positions on local development projects to Marin County.

After several Board meetings where Strawberry residents had the opportunity to share their opinions about North Coast's development plans for the Seminary, which opinions were overwhelmingly negative, the Board voted unanimously to NOT approve North Coast's submitted plans, and urged County Planning to NOT begin the EIR, citing the facts that much was left out of the plans, and that the plans in no way complied with the Strawberry Community Plan.

I urge you to thoroughly review the Strawberry Recreation Board's submission to Marin County, which has been totally ignored.

This 50-year Strawberry resident/homeowner wonders why?

Subject: EIR for Seminary Project

To: Environmental Planning (re:Seminary Project EIR)

From: Patricia Albo
Homeowner: 24 Heron Dr, Mill Valley 94941

I would like the following 3 items addressed in the Seminary Project EIR:

1. Review of traffic and impacts on Seminary Drive. It should be noted that Seminary Drive cannot be widened to allow more traffic as the roadway (from the Stop sign to the first Condo bldg on the right) is flooded on occasion during the winter by water from the Richardson Bay estuary. These floods impact all drivers, regardless of the direction they are traveling. Drivers heading toward the Seminary main entrance during one of these floods must drive their car over the center line so they can avoid the pooled water.

2. Regardless of the findings on traffic impacts I request the EIR include a statement referencing the above mentioned flooding as well as the estuary being a habitat for numerous animals, specifically over 30+ Egrets at one time and stating that Seminary Drive cannot be widened either now or in the future..

3. In addition, it should be obvious that Strawberry Drive cannot be widened and the EiR should also include this information.

Thank you.

Subject: Seminary Scoping Comments

Statement of Richard Harris to Marin County CDA Scoping Session – May 18, 2020

My name is Richard Haris. My wife and I have lived at 313 Richardson Drive in Strawberry for 34 years. I am also a former board member and president of the Marin Municipal Water District.

I want to address the specific environmental impact of the proposed development of the Golden Gate Baptist Theological Seminary on MMWD's ability to provide water for human consumption, sanitation, and fire protection.

Adequacy of Water Supply During a Normal Year
CWP Section 4.9-1: Land uses and development consistent with the *Draft 2005 CWP Update* would increase the demand for water. As a result, "*water supplies would be insufficient to serve some of the unincorporated and incorporated areas in normal rainfall years"*. Development of additional water resources would be required. Impact: Significant and Unavoidable

CWP Limits on New Development
CWP Section 3.11: Marin's 2007 Countywide Plan recognizes that new development generates a need for new and expanded public facilities related to water supply and "*limits growth based on the availability of services that cannot be distributed without limitations and conservation requirements".*

Factors Exacerbating Supply Shortage
If the current environment weren't sufficiently dire, two other factors will exacerbate an already inadequate water supply – climate change and development.

As mentioned in the 2007 CWP (Section 2.7) "*climate change will amplify existing environmental problems, such as erosion, storm-surge floods, and landslide risk, and changes to the water cycle will further stress domestic water supply"*. Indeed, recently released NOAA data shows that since 2000 Marin County has experienced:

- 14 yrs. of moderate drought
- 10 yrs. of severe drought
- 7 yrs. of extreme drought
- parts of 6 yrs. of exceptional drought

And, in Sacramento, housing legislation currently under consideration could easily have the effect of doubling Marin's population.

Marin Municipal Water District
In addition to the County, MMWD has also recognized the water shortage by declaring a water emergency on April 20th. A water emergency can only be declared when "*the ordinary demands and requirements of water consumers cannot be satisfied without depleting the water supply to the extent that there would be insufficient water for human consumption, sanitation, and fire protection"*. The Building Industry Association of Northern California v. MMWD case found that MMWD may declare a moratorium on new water connections upon the declaration of a water emergency. Such a moratorium was implemented under a more enlightened board in 1976. It's unlikely the MMWD will declare a moratorium given the very tentative nature of their finances. However, they may be compelled to do so via a ballot initiative.

The development of the Seminary property will unquestionably adversely impact a water supply that is already recognized as inadequate by both the Countywide Plan and the MMWD Water Emergency.

Subject: North Coast Land Holdings (P1490) -- CUP issue and scoping comment
Attachments: Ltr - CUP - 5.18.21 w exhibits.pdf

Brian,

Attached please find a letter and exhibits regarding the issue of the seminary CUP. We would implore you to carefully review and consider the evidence presented in the letter. There is simply no way the 1984 Master Plan for the Seminary was superseding a roadway bonding agreement. It turns out the 1953 Cup was amended through 1959, and that's what the now expired master plan replaced. This was common practice in Marin in the 80's.

This is a significant project, and I know the housing is important to the County. However, if the school use is not adequately addressed in the EIR, and a new CUP not obtained that actually addresses the proposed academic use, the environmental review and entitlements will be deficient, which will likely result in costly and time-consuming litigation. The Seminary Neighborhood Association supports housing at this property, but the project as a whole needs to be sized appropriately, and sufficiently studied.

Thank you.

Re: North Coast Land Holdings (P1490) -- New CUP required for educational use

**** FOR INCLUSION IN THE ADMINISTRATIVE RECORD ****

**** EIR SCOPING COMMENT ****

Dear Mr. Case:

This letter in response to your letter of March 2, 2021, regarding the above referenced matter. This letter also constitutes an EIR scoping comment, and should be included in the administrative record for this project.

On January 25, 2021, I wrote to you and noted that if North Coast Land Holdings seeks an educational use at the former seminary property, a new CUP for that use is required. My letter, attached as **Exhibit A**, very clearly laid out the evidence that the 1953 Use Permit allowing a self-contained seminary was superseded by the approval of the 1984 Master Plan, which has since expired. Your response letter, attached as **Exhibit B**, disregarded the evidence I provided, and instead reasserted that a roadway bond agreement was somehow the "CUP" that was superseded by the 1984 Master plan. As discussed below, this cannot be true. Accordingly:

- **If the proposed educational use is not analyzed in the project EIR, it will be a deficient CEQA document**

- **If a new CUP is not sought for any educational use proposed at the property, such a use will be unpermitted**

In your letter of March 2, 2021, you assert that a document entitled "Improvement Agreement Under Conditional Use Permit" is the "1959 Campus Plan Use Permit" that was superseded by the 1984 Master Plan. This document is objectively not a use permit. Even its title states that it is an "Improvement Agreement" being submitted "**under**" (i.e. pursuant to) a use permit. Attached as **Exhibit C** is a June 29, 1959, letter from then County Counsel, Leland Jordan, to the Golden Gate Baptist Theological Seminary, by which he transmitted the subject Improvement Agreement. This letter opens with the following sentence:

> In accordance with your request, I am submitting herewith an agreement to be executed by the County and the Seminary under your Use Permit which is in the form I would recommend to the Board of Supervisors.

It is immediately clear from this language that the agreement is being submitted as required by the school's use permit.

Then, there is the language of the Improvement Agreement itself. All throughout the Improvement Agreement there are specific references to the actual use permit that required the Improvement Agreement. Nearly all of the WHEREAS sections of the Improvement Agreement reference the Use Permit granted to GGBTS, and that the Improvement Agreement is being entered into as a condition of said use permit.

For example, the Improvement Agreement contains the following statements:

> WHEREAS, Seminary has heretofore applied to County for a Use Permit to allow the construction of a theological seminary, and other buildings incidental to such use, on

As you can see, the Improvement Agreement starts by acknowledging a use permit for the Seminary.

> WHEREAS, County has heretofore granted said Use Permit subject to the condition that Seminary construct a public road from the southeasterly terminus of Ricardo Road to Gate III of the theological seminary as said Gate III is

The Improvement Agreement then notes that the use permit had a condition of approval that the seminary construct a public road around the seminary.

WHEREAS, the terms of said Use Permit require that Seminary, prior to occupancy of any buildings constructed upon said property, enter into an agreement secured by an adequate performance bond agreeing to the construction of said roads; and

The Improvement Agreement then recites that the Use Permit required a performance agreement and bond for the construction of the roadway prior to occupancy of the new Seminary buildings. Very clearly, the Improvement Agreement is **not** the 1959 Campus Plan Use Permit, or any use permit for that matter.

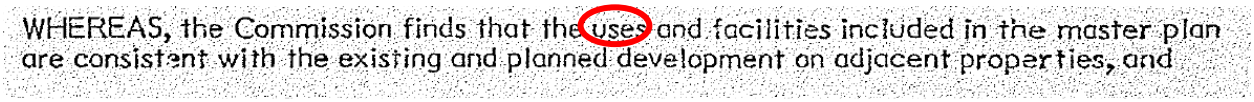
With this in mind, now consider the County's position and statements regarding the CUP for the subject property. The County asserts that the 1953 CUP for the property is the only governing entitlement, and that it remains in force. The County also states that the 1953 CUP has **just a single condition attached to it**. Specifically, that singular condition was: "that prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission." (See **Exhibit D.**)

Originally, it was true that this was the singular added condition to the CUP. (Many other conditions were contained in the project description themselves and became "conditions" when the project was approved; i.e. "self-contained unit," buffer of open space, all students to be housed on site, etc.). However, the County appears to be unaware that the 1953 CUP was amended many times over a period of 6 years until 1959. Attached as **Exhibit E** are the various minutes of the hearings at which the CUP was amended. The record is clear that many conditions beyond the sole original condition were added to the CUP as part of approving the "development plan." For example, on July 29, 1957, a hearing was held regarding "**reconsideration of original use permit conditions**." At this hearing, a condition regarding the construction of one of the residences on the Seminary property was amended (i.e. the condition **already existed**, so clearly more conditions were added beyond the first one). The CUP, and its conditions, evolved as the Campus Plan was developed, and new and different conditions were added. On October 28, 1957, another use permit condition was amended regarding the dedication of West Seminary Drive. Even on April 3, 1958, the Planning Commission was holding a hearing for the GGBTS project labeled "**reconsideration of use permit conditions**."

Obviously, these amendments were not to the 1959 Improvement Agreement, as it didn't even exist yet. In actuality, the 1953 Use Permit was amended through 1959 as part of the original condition to secure a development plan. The final CUP, after all the amendments, was the 1959 Campus Plan Use Permit, which was addressed by the 1984 Master Plan as follows:

> **"With the approval of this Master Plan, the previously approved 1959 Campus Plan Use Permit shall become null and void and of no further effect or benefit."**

It makes no sense that the Master Plan was superseding a roadway improvement agreement. Unfortunately, the staff report for the BOS meeting where the Master Plan was approved has gone missing from the County files. However, there are multiple examples countywide of Master Plans in the 80's replacing Conditional Use Permits from the 50's and 60's. During this era, Master Plans were utilized as site-specific zoning, approving both **uses** and physical development. That's exactly what happened here. For example, the approval resolution for the Master Plan states:



WHEREAS, the Commission finds that the uses and facilities included in the master plan are consistent with the existing and planned development on adjacent properties, and

The RMP zoning designation, pursuant to Table 2-3 in Code Section 22.10.030, **only allows educational uses with a conditional use permit**. Accordingly, if NCLH seeks to establish a new academic use at the property, a new Use Permit is required.

Conclusion

We understand that this information is a significant deviation from the County's stated position on the entitlement status for the Seminary property. However, this is a project that needs to be done right. It is too significant for an error of this proportion to continue to be advanced.

If the applicant wants to run a school at the property, it must include a request for a Use Permit for a school, and clearly describe the operational characteristics of said school such that there can be a meaningful environmental review, as well as an informed consideration of the required CUP findings. The current failure to provide **any information whatsoever** about the new school use, which is central to the property, and most significant in its impact, leaves a gaping hole in the project description, and will result in a deficient EIR and insufficient entitlements for the proposed use.

Any entitlement or EIR without a school CUP will be null and void, and subject to legal challenge. Accordingly, it seems best for all involved that the school be described and analyzed, and the required CUP be applied for.

Thank you.

Very Truly Yours,

Re: North Coast Land Holdings (P1490) -- New CUP required for educational use

Dear Mr. Lai:

Our office continues to represent the Seminary Neighborhood Association in connection with North Coast Land Holdings' proposal to redevelop the old Seminary site. This letter is regarding a critical missing component of the application currently on file with the County.

Specifically, if NCLH seeks an educational use at the property, a new CUP for that use is required. The 1953 Use Permit allowing a self-contained seminary to operate at the property was superseded by the approval of a 1984 Master Plan for the site. When the Master Plan expired, so did the right to operate an educational use. Accordingly, in order for the current application to be complete, it must also include a request for a Use Permit for a school, and clearly describe the operational characteristics of said school such that there can be meaningful environmental review, as well as an informed consideration of the required CUP findings.

Background

The Golden Gate Baptist Theological Seminary ("GGBTS") bought the Strawberry property in September of 1953. In October of 1953, the GGBTS obtained an initial CUP from the County that allowed for a very specific use: "**a Theological Seminary and dormitories and other building incidental to such use**."

USE PERMIT

Under the provisions of Section 20 of Ord. No. 264, the Zoning Ordinance of the County of Marin, State of California.

A USE PERMIT is hereby granted authorizing Edward D. Landels
(Name of person)
to permit the construction of a Theological Seminary and dormitories and xxx other buildings incidental to such use, subject to the attached con-
(Use of land, building or structure proposed to be conducted) dition.

The record for the CUP indicates that there were specific operational characteristics that were a part of the Seminary's application, and that a single initial condition of approval was also placed on the CUP.

On October 6, 1953, the Planning Director for the County wrote a staff report for the Board of Supervisors in advance of their consideration of the Seminary's Use Permit. This report set forth a set of six "general facts" regarding the application. In summary, the general facts about the application were as follows:

1. The property would be developed as a "self-contained unit."
2. A buffer of "recreational open land" would surround the entire property.
3. There would be approximately 1,000 students, and **all of the students would be housed on-site**. Married students would live in on-site apartments, and single students would live in on-site dorms.
4. The community supported the presence of a post-graduate institution.
5. The community liked that the school would pay its fair share to local service districts.
6. Further review of a development plan for the property would be needed to ensure an appropriate layout of buildings on the site.

The conclusion of the October 6, 1953, staff report noted that the Planning Commission voted to recommend that the Board of Supervisors approve the CUP **"as above set forth,"** on the condition that the Seminary come back to the Commission for approval of a development plan for the property.

The Board of Supervisors then approved the application, **inclusive of its details regarding housing, open space, and enrollment,** and did impose the condition that "prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission."

After approval of the initial 1953 CUP, GGBTS spent years developing a campus plan and returning to the Planning Commission for what the minutes repeatedly describe as **"Reconsideration of Use Permit."** The record is clear that many conditions beyond the sole original condition were added to the CUP over the years. For example, on July 29, 1957, a hearing was held regarding "**reconsideration of original use permit conditions**." At this hearing, a condition regarding the construction of one of the residences on the Seminary property was amended (i.e. the condition **already existed**, so clearly more conditions were added beyond the first one). The CUP, and its conditions, evolved as the Campus Plan was developed, and new and different conditions were added.

On October 28, 1957, another use permit condition was amended regarding the dedication of West Seminary Drive. Even on April 3, 1958, the Planning Commission was holding a hearing for the GGBTS project labeled "**reconsideration of use permit conditions**." Clearly, the original condition to the CUP that the applicants return to the Planning Commission for approval of their development plan led to a much more robust and evolved set of conditions and an ultimate CUP allowing for the construction of the project.

Why does all of this matter?

Because, in the early 1980's, GGBTS applied for a Master Plan for the entire property in order to allow for more development. The narrative in this Master Plan indicates that, at the time, GGBTS felt it had a vested right in its existing CUP, and therefore a Master Plan was not necessary for further development. However, the Master Plan itself states that **GGBTS ultimately decided not to try and rely on any allegedly remaining vested rights, and instead applied for, and fully participated in, the Master Plan process.** The Master Plan was eventually approved by the County Board of Supervisors in March of 1984.

Condition 19 of the Master Plan stated the following:

> **"With the approval of this Master Plan, the previously approved 1959 Campus Plan Use Permit shall become null and void and of no further effect or benefit."**

The Master Plan is unequivocal that it became the governing entitlement document for the property, and that the CUP, as amended by the many hearings through 1959, was now null and void.

However, when asked about this specific language, we were informed by County staff that the term "1959 Campus Plan Use Permit" was not referring to the use permit for the property, but instead to an approval for a roadway. Only recently have we actually been provided with the document that the County claimed was nullified by the Master Plan, and it simply is not, and cannot be, the referenced "1959 Campus Plan Use Permit."

Instead, what the County provided was a document entitled "**Improvement Agreement** Under Conditional Use Permit." Just as it sounds, this document is an improvement agreement by which the GGBTS agrees to dedicate and bond a roadway, which was a condition of its amended CUP. All throughout the Improvement Agreement there are specific references to the actual use permit that required the improvement agreement. Nearly all of the WHEREAS sections of the Improvement Agreement reference the Use Permit granted to GGBTS, and that the Improvement Agreement is being entered into as a condition of said use permit. Despite further requests, the County has failed/refused to provide the actual ultimate CUP referenced time and again in years of minutes.

It is unclear how or why the County would ever assert that an Improvement Agreement was somehow the document deemed null and void by the Master Plan, when the Master Plan so clearly states it is replacing a 1959 Campus **Use Permit**. Unfortunately/mysteriously, the staff report for the BOS meeting where the Master Plan was approved has gone missing from the County files. There are multiple examples countywide of Master Plans in the 80's replacing Conditional Use Permits from the 50's and 60's. During this era, Master Plans were utilized as site-specific zoning, approving both **uses** and physical development. That's exactly what happened here. If the County is unaware of these examples, we are happy to provide specific references.

GGBTS ended up obtaining quite a windfall from the Master Plan, including a significant amount of market rate housing, which was supposedly going to finance future school infrastructure. Of course, we now know that the market rate housing was built and sold, but the needed campus improvements were never made.

Ultimately, on December 12, 2017, after many extensions, the Master Plan for the Seminary expired. When the Plan expired, the property reverted back to its traditional RMP zoning designation, which, pursuant to Table 2-3 in Code Section 22.10.030, **only allows educational uses with a conditional use permit**. Accordingly, if NCLH seeks to establish a new academic use at the property, a new Master Use Permit is required.

What if the 1953 Use Permit Still Applies?

It doesn't matter, **unless** NCLH is interested in running a self-contained seminary. While CUPs run with the land (unless nullified) -- "Subsequent owners of the land have no greater rights than those of the owner at the time the conditional use permit was issued." A use permit, "is both a grant of authority to use and a limitation on the authorized uses of the property." (*Sports Arenas Properties, Inc. v. City of San Diego* (1985) 40 Cal. 3d. 808, 815.) "Absence of conditions in the use permit does not mean that the permittee may make use of the property permitted neither by the use permit nor by the zoning ordinance without permit." (*Id.*) "A use permit "must be read **in the light of the application for it**, and when that is done, it is apparent that the terms of the permit are clear." (*Id.* at 815-16.)

Here, GGBTS applied for and was granted a CUP for a theological seminary and, pursuant to the cases cited above, the terms of the application as described by the Planning Director's report to the Board are tantamount to "conditions." Setting case law aside, it is clear that the terms of the application describe and control the use being approved. The applicant has stated *as nauseum* that they have a right to an enrollment level of 1,000 students. This number only comes from the project description, not from a particular condition. Specifically, the project description stated:

> "There would be approximately 1,000 students, and **all of the students would be housed on-site**. Married students would live in on-site apartments, and single students would live in on-site dorms."

So, any assertion of a right to 1,000 students cannot ignore the words immediately following that number, which clearly required all students to be housed on site. One cannot cherry pick only the project specifications they desire, while ignoring other specifics that may be limiting.

The difference between the community impacts of a seminary, versus the impacts of other types of schools, cannot be understated. It was these very differences that played a central part in the granting of the CUP in the first place (the self-contained nature of the Seminary carried the day).

Other types of school uses generate significantly more vehicle trips, noise, and other impacts, at a level far greater than the self-contained post-graduate institution contemplated in 1953. So, even if the voided CUP were somehow still valid, it would only allow for a theological seminary with on-campus housing, not any and every "school" type of use.

Conclusion

In order for the current application to be complete, it must include a request for a Use Permit for a school, and clearly describe the operational characteristics of said school such that there can be a meaningful environmental review, as well as an informed consideration of the required CUP findings. The current failure to provide **any information whatsoever** about the new school use, which is central to the property, and most significant in its impact, leaves a gaping hole in the application. It is this total lack of data that caused the Seminary Neighborhood Association to appeal the decision to start an EIR. Despite requests from the Board of Supervisors, and assurances from planning staff, there has yet to be any description of the new school use the applicant seeks to entitle. The County needs to hit pause until this information is provided.

Any entitlement or EIR without a school CUP will be null and void, and subject to legal challenge. Accordingly, it seems best for all involved that the school be described and analyzed.

Thank you.

Mr. Hurd:

I am in receipt of the January 25, 2021 letter you wrote to the County's Community Development Agency on behalf of the Seminary Neighborhood Association ("Association"), entitled "Re: North Coast Land Holdings (P1490) – New CUP required for educational use." The Community Development Agency has referred the letter to our office for a response.

The County objects to the Association's suggestion that the 1953 use permit was amended in 1959 and that the County is "failing" or "refusing" to supply a copy of the purported 1959 amendment. As the County has already informed the Association, when the Master Plan referred to a "1959 Campus Plan Use Permit" it actually wasn't referring to any sort of 1959 amendment to the 1953 use permit for the *property*. Rather, in 1959, the County issued an approval for a *roadway* entitled "Improvement Agreement Under Conditional Use Permit." I have attached a copy of that 1959 Agreement to this letter. Staff believes that this is what the Master Plan called the "1959 Campus Plan Use Permit." If the County had any documents that suggested anything else, our staff would certainly provide them to you, as required by the Public Records Act.

Since we do not agree that there is newly discovered information that affects the County's previous analysis, we will not address other issues that newly discovered information might require the County to consider, such as how the County's previous representations to the property owner on the 1953 use permit's status might impact your argument, or how your client's position in the 2017 proceedings might affect their ability to raise the issues in your letter now or in subsequent proceedings.

Sincerely,

Brian Case
Deputy County Counsel

IMPROVEMENT AGREEMENT UNDER CONDITIONAL USE PERMIT

THIS AGREEMENT, made and entered into this 1st day of July, 1959, by and between the GOLDEN GATE BAPTIST THEOLOGICAL SEMINARY, a corporation, hereinafter referred to as "Seminary" and the COUNTY OF MARIN, a political subdivision of the State of California, hereinafter referred to as "County";

WITNESSETH:

WHEREAS, Seminary has heretofore applied to County for a Use Permit to allow the construction of a theological seminary, and other buildings incidental to such use, on property containing approximately 126 acres lying adjacent to and south of Strawberry Manor Subdivision 4 where Richardson Drive intersects with Reed Boulevard, Marin County, California; and

WHEREAS, County has heretofore granted said Use Permit subject to the condition that Seminary construct a public road from Gate III to Gate II as shown on the site plan approved pursuant to said Use Permit; and

WHEREAS, the terms of said Use Permit require that Seminary, prior to occupancy of any buildings constructed upon said property, enter into an agreement secured by an adequate performance bond agreeing to the construction of said road; and

WHEREAS, Seminary has constructed buildings on said property pursuant to said Use Permit and is now ready to occupy the same and therefore desires to execute this agreement for the construction of said road as required by the Use Permit; and

WHEREAS, Seminary has caused to be prepared plans and specifications forthe construction of said public road from Gate III to Gate II,

RECEIVED
JUL 6 1959
MARIN COUNTY
PLANNING COMMISSION

NOW, THEREFORE, IT IS HEREBY AGREED by and between the parties hereto as follows:

1. Seminary agrees that on or before July 1, 1961, it will construct a public road in accordance with the standards hereinafter set forth from Gate III to Gate II as said gates are shown on the site plan submitted and approved in accordance with said Use Permit.

The public road herein referred to between Gate III and Gate II as shown on said site plan shall be constructed in accordance with plans and specifications attached hereto, marked Exhibit "A" and incorporated in this agreement by reference.

2. On or before July 1, 1961, Seminary shall convey to County clear and marketable title to a strip of land fifty (50') feet in width between Gate III and Gate II, as shown on said site plan with a centerline as shown on the plans and specifications attached hereto and marked Exhibit "A".

3. Seminary, immediately upon the execution of this agreement, shall deliver to County a satisfactory performance security in the principal sum of $97,500.00 to secure the faithful performance of this contract.

IN WITNESS WHEREOF, the parties hereto have executed this agreement the day and year first hereinabove mentioned.

COPY

Gentlemen:

In accordance with your request, I am submitting herewith an agreement to be executed by the County and the Seminary under your Use Permit which is in the form I would recommend to the Board of Supervisors.

There are a number of points which you will note remain unsettled and should be agreed upon by the Seminary and the Board of Supervisors before the agreement can be executed:

1) The minutes of the Board of Supervisors' meeting of July 15, 1958 refer to a period of two years for construction of the road. The minutes are not clear whether the two-year period is to be measured from July 15, 1958, the date of the Board's action, or from the date occupancy commences. Your original proposed agreement provides that the construction will be completed from September 1, 1961, the original proposed date of occupancy. I assume, therefore, that it may have been the understanding of the parties that the two-year period was to measure from date of occupancy. If this is true, the appropriate completion date should be inserted in the various places therefor in the agreement.

2) You have represented that pursuant to agreement with Marin Land Company you will be able to enter upon the property between Ricardo Road and Gate III in the near future. The date established for such entry pursuant to that agreement should be inserted in the agreement in the appropriate places.

3) As far as I have been able to determine, no final understanding was reached between the Seminary and the County as to width of right-of-way and pavement for the road between Ricardo and Gate III. This should be determined and inserted in the agreement.

4) I do not know whether a centerline description has been prepared for the road from Ricardo to Gate III. If it has, it may be attached to the agreement as Exhibit B'. If not, the wording of the agreement would have to be slightly changed by referring to the alignment of this portion of the road as shown on the site plan.

5) It will be necessary to work out with the Director of Public Works and the Board of Supervisors minimum standards for the design and construction of the road from Ricardo to Gate III. These must then be inserted in the agreement. At this time these standards will, of course, (with the exception of whatever width of paving is agreed upon) be tentative and may have to be altered when the road is engineered in the field.

6) The exact amount of the bond to be posted must be determined. Among the items which the Board will probably want to consider in determining the principal sum of the bond will be an estimated cost of design of the road from Ricardo to Gate III, the estimated cost of construction of both roads (from Ricardo to Gate III and from Gate III to Gate II) and the estimated cost of acquisition of the land if conveyance is not made to the County.

Inasmuch as the agreement can at this time be tied down to definite plans and specifications only for the road from Gate III to Gate II, I have attempted to tie down as specifically as possible the remaining road. It will, of course, be your responsibility to convince the Board of Supervisors that the agreement in the form proposed should be executed inasmuch as you are not able at present to prepare plans and specifications for the road from Ricardo to Gate III.

Very truly yours,

CLAUD F. JORDAN
County Counsel

Board of Supervisors
Court House
San Rafael, California

Honorable Board of Supervisors:

It is understood that you have agreed to consider the application of Edward A. Landel for a Use Permit to permit the construction of a Theological Seminary and dormitories and other buildings incidental to such use on certain real property generally described as approximately 130 acres more or less, lying adjacent to and south of Strawberry Manor Subdivision Four, where Ricardson Drive intersects with Reed Boulevard, Marin County, California.

The Commission heard this application at their meeting last evening. They received two (2) communications in writing thereon, one to the effect that they were not in favor of the granting of this application until some plan is submitted showing some access roads, the other opposing thereto.

At the meeting there was considerable discussion which brought out the following general facts:

1. The 130 acres will be developed in general, as shown on the plan for land use, in such a manner so as to make a self-contained unit, with major residential streets of the Strawberry Point neighborhood going by the development rather than through it.

2. A buffer of recreational open land of varying width will surround the entire holding, and adequate lands will be available for recreation of the studentbody and the parking of automobiles.

3. The studentbody will consists of around 1,000 students, about 60% of these students will be married and the seminary will provide apartments on their land for these students, and a pre-school nursery for the children of these families. Dormitories will be provided for the unmarried students.

4. It was brought out by those in favor that a college community, particularly of a post-graduate nature,

was an asset to a neighborhood and that its general effect was to increase surrounding property values.

5. It was also brought out that the seminary will of necessity have to contract with local districts in order to secure service and that in so doing, they would be paying their way for their fair share of the expenses of the local service districts.

6. It was felt that to ensure a well coordinated plan, the County should review a development plan which would show the location of buildings proposed for construction and uses of land.

Upon a motion by Commissioner Marsh, seconded by Commissioner Upton, the Commission unanimously resolved to recommend to your Board, the approval and confirmation of its decision to grant a Use Permit to Edward D. Landel as above set forth, subject to the condition that prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission of a development plan as provided under Section 11.23, paragraph (f), Ordinance No. 264, as amended.

Respectfully submitted,

MARY R. SUMMERS
PLANNING DIRECTOR

Compilation of Minutes and Staff Report
Re: Golden Gate Baptist Seminary Use Permit - Strawberry

STAFF REPORT - October 5, 1953

APPLICATION FOR USE PERMIT - Edward D. Landels

For the construction of a Theological Seminary and dormitories and other buildings incidental to such use on property containing approximately 130 acres lying adjacent to and south of Strawberry Manor Subdivision Four, where Richardson Drive intersects with Reed Boulevard, Marin County.

The staff can see no objection to the granting of this Use Permit. This use of land should fit in very well with the residential area and be an asset both to Strawberry and to the County. Preliminary plans indicate that they will be a self contained unit and any grant of adjustment should contain a requirement that a complete development plan be submitted prior to the beginning of any construction on the same.

This proposed use of land is shown on the amended master plan of the Strawberry Neighborhood, and the applicant states that all improvements will be made pursuant to a development plan to be submitted to the County for approval as is permitted under the zoning ordinance if a master plan has been approved.

MINUTES - October 5, 1953

The Commission considered the application of Edward D. Landels for a Use Permit for the construction of a Theological Seminary and dormitories and other buildings incidental to such use on property containing approximately 130 acres lying adjacent to and south of Strawberry Manor Subdivision Four, where Richardson Drive intersects with Reed Boulevard.

Mrs. Summers read two communications objecting to the Use Permit.

Mr. Hammond, representing the property owners, addressed the Planning Commission and stated that Mr. Warnecke will be the architect. Mr. Hammond then introduced Mr. Livingston who is the Land Planner working in Mr. Warnecke's office.

Mr. Livingston stated that Dr. Harold Graves, President of the Golden Gate Baptist Theological Seminary, is present tonight. Mr. Livingston then submitted a revised land use and traffic plan for the contemplated Seminary. He stated that this was separate from the application by Mr. Neider. Mr. Livingston further stated that the impact of a development of this kind is known to the people of Marin with the present San Francisco Theological Seminary in San Anselmo. He further stated that approximately $10,000,000 will be spent to improve this property. He pointed out that 130 acres will be developed in general, as shown by the plan for land use, in such a manner so as to make a self-contained unit, with major residential streets of the Strawberry Point neighborhood going by the development rather than through it.

He stated that a buffer of recreational open land of varying width will surround the entire holding, and adequate lands will be available for recreation of the student body and the parking of automobiles.

Mr. Livingston also stated that the student body will consist of around 1,000 students, 60% of these students will be married and the Seminary will provide apartments on their land for these students, and a pre-school nursery for the children of these families. Dormitories will be provided for the unmarried students.

Mr. Hillman, a nearby property owner, questioned the method by which the Seminary would obtain public services since they are not taxable.

Mr. Hammond stated that they must enter into contracts with the local service district.

Dr. Graves stated that they had already contacted the sewer district and water district in this respect. Dr. Graves further stated that the largest building will be an 8 or 12 unit apartment and that no buildings including dormitories will be over two stories.

He pointed out that 90% of the students will be college graduates and that the building will be done on the knolls first with actual construction in two or three years, and students in four years.

Mr. Kaufman, a property owner, stated that he had talked with a number of people in the area and that none were against the use permit. He stated that nothing could be more beneficial. He said that it would be attractive, and everyone knows the benefits of a college town and this would actually be post graduate school.

Mr. Johnson expressed his desire to have the school established and stated that it would raise the surrounding property values.

Commissioner Marsh, therefore, moved, seconded by Commissioner Upton and carried by a unanimous roll call vote, that the Commission recommend to the Board of Supervisors the approval and confirmation of its decision to grant a Use Permit to Edward D. Landels as above set forth, subject to the condition that prior to any construction or improvement, the applicant shall secure the approval of the Marin County Planning Commission of a development plan as provided under Section 11.23, paragraph (f), Ordinance No. 264, as amended.

Mrs. Summers stated that the applicant would like this matter to go before the Board of Supervisors tomorrow. The Chairman announced that this matter would be before the Board of Supervisors on October 6, 1953, at 11:00 A.M., in the Supervisors' Chambers, Court House, San Rafael.

STAFF REPORT - May 24, 1954

RECONSIDERATION - Baptist Seminary Road System

The planning consultants for the Baptist Seminary, planned for Strawberry, have asked the staff to review their preliminary plans as they relate to circulation within and around the Seminary.

In reviewing the same, we determined that the planners had designed a major residential street which was to cross from the East to the West across the point of Strawberry and which was shown on the Streets and Highways Plan for the Strawberry Point Neighborhood in such a manner as to discourage its use as a major street.

We advised the planners that they should review this circulation system, since it was in conflict with the Streets and Highways Plan, with the Commission before their master plan was so fixed as to make it difficult to comply with the Streets and Highways Plan for Strawberry Point should the Commission, in the future, require the same when the plans are finally submitted for approval.

The staff recommends compliance with the adopted Streets and Highways Plan, both in the alignment of this major street and in requiring its improvement with a minimum surfacing of 40 feet.

MINUTES - May 24, 1954 - BAPTIST SEMINARY ROAD SYSTEM RECONSIDERATION APPROVED

Mrs. Summers stated that the planning consultants for the Baptist Seminary, planned for Strawberry, have asked the staff to review their preliminary plans as they relate to circulation within and around the Seminary.

She further stated that in reviewing the same, the staff determined

that the planners had designed a major residential street which was to cross from the East to the West across the point of Strawberry and which was shown on the Streets and Highways Plan for the Strawberry Point Neighborhood in such a manner as to discourage its use as a major street.

She went on to say that the planners were advised that they should review this circulation system, since it was in conflict with the Streets and Highways Plan, with the Commission before their master plan was so fixed as to make it difficult to comply with the Streets and Highways Plan of Strawberry Point should the Commission, in the future, require the same when the plans are finally submitted for approval.

Mr. Lawrence Livingston, planning consultant from the firm of John Carl Warnecke Architects, introduced himself to the Commission and posted two maps of the Strawberry Point area and presented a large model of the same area on which the proposed road system for the Baptist Seminary Campus and the remaining residential area of Strawberry Point was outlined.

He pointed out the three principal entrances to the campus and stated that the principal reason for their request for a change in road alignment was to allow through circulation through the campus from west to east, but to discourage the use of this route for fast, through-traffic in order to preserve the quiet, residential-like area, and to make the campus safer for the children of the students who would live there.

He pointed out further that the differences between the accepted master plan and this proposal are two:

1. That the alignment of the principal road around Strawberry Point should for reasons of economy as well as preservation of scenic route, and in order not to split up a small portion of the campus, go around a small peninsula which projects into the water instead of following the original route, which would take it over a camel-back highway of a steep grade.

2. That the road connecting the east and west entrances of the Seminary are still proposed to connect all the way through, but by a much more circuitous route, which would discourage traffic through the campus.

He stated that staff had measured the distance and driving time on both proposed routes from the east gate to the west gate of the campus, that the difference in distance was approximately one mile and that the difference in driving time would be approximately three minutes.

In answer to a question by Commissioner Upton as to other means of discouraging traffic, Mr. Livingston stated that the right of way could be made narrower in addition to being circuitous, stop signs could be placed on the street, and a gate or gates could be installed at the campus entrances.

Mrs. Summers stated that the staff's understanding had previously been that the road across the campus connecting the east and west sides thereof was desirable for the convenience of the residents of the east side of the Strawberry peninsula.

Mr. Hammond said that from a residential standpoint, he could see no objection to a round-about route, and that it would be bad planning to cut through such a campus. He added, that there are not enough residential lots on the east side of Strawberry to make a difference, and said that the requested change in the master plan was in order. In addition, he stated, there should be no need for parking on the main road around the peninsula.

Commissioner Rasmussen stated that he believed that it would be better to keep the 60-foot right of way (40-foot paving) in the master plan rather than start to cut down the standards at this time, before it is known what future conditions on Strawberry peninsula will require.

Mr. Livingston stated that he believed parking should be kept on the water side in order to make the most out of the scenic view and also to provide for emergencies.

It was Mr. Hammond's opinion that an unpaved shoulder might provide such facilities.

Commissioner Rasmussen asked how many homes would be located on the lower part of Strawberry Point to which Mr. Hammond's reply was about 50 homes.

Commissioner Rasmussen stated his opinion that if density is to be great, the road should be paved to give adequate service to these homes.

Mr. Hammond said that the main road would be used for access as well as for a scenic drive.

Mr. Livingston stated that no lots will front on the main road, and that all residences will have access by way of 40-foot roads to the 40 or 50 houses in the village, and that no width less than 60 feet was proposed for the principal road.

Commissioner Rasmussen asked the staff to restate its opinion.

Mrs. Summers remarked that she thought the people would take the shortest route from their homes to work, and that two or three minutes may be very important when one is late to work. People who will live in the area will find the shortest route and probably 50% of them will take the road across the Seminary campus. For this reason, the staff has been recommending good alignment across the campus against a circuitous one.

Mr. Livingston asked the Commission what they thought of the advisability of providing no road at all across the campus, or the feasibility of closed gates to keep out all but emergency traffic, since this is private property.

Commissioner Rasmussen admitted that the areas on the east side of the peninsula do not have much land to build on, and that the areas to the south would take the main road anyway.

Mrs. Summers stated that the Commission still has the right to insist on unobstructed circulation through the Seminary campus, as a part of the use permit grant.

Mr. Livingston said that the master plan requires only minor adjustments, and that the roads are adequate for the density which will exist; and with the main road going south and north, would have very good access to the surrounding acres.

Chairman Von Rotz stated that the road across the campus should be open to the traffic or shouldn't be there at all.

Commissioner Rasmussen said that he liked the idea of not having any through traffic across the campus, but that he still thought a County-standard road (60-foot right of way- 40-foot paving width) should be maintained to allow whatever incidental circulation is necessary.

Mrs. Summers stated that the only thing to be decided at this meeting is the road alignment, and not the right of way and paving widths.

Stating that he thought that the Commission was in agreement that this proposed change was acceptable, Commissioner Rasmussen moved, seconded by Commissioner Upton and unanimously carried by a roll call vote that the Commission approve the alignment as shown on the site plan with respect to alignment of East and West Strawberry Drives, and that the circulation between Gate 1 and Gate 3 be approved as shown on the map, copies of which are to be filed with the staff for inclusion in the Streets and Highways Plan and the Strawberry Master Plan.

STAFF REPORT - June 20, 1955

APPROVAL OF IMPROVEMENT PLANS FOR GOLDEN GATE BAPTIST THEOLOGICAL SEMINARY

Plans have been reviewed only superficially, enough to make certain that they were adequate for presentation to the Commission.

They will be further reviewed over the week-end for recommendations of the Staff.

MINUTES - June 20, 1955

APPROVAL OF IMPROVEMENT PLANS FOR GOLDEN GATE BAPTIST THEOLOGICAL SEMINARY

The Commission considered the improvement plans for the Golden Gate Baptist Theological Seminary.

Mr. Rossi, representing the firm of J.C. Warnecke architect, was present.

Mr. Darnell presented the site plan, which included complete grading plans for the Seminary. He pointed out that the major grading was taking about 20 feet off of the areas for the administration portion of the Seminary and placing this in the parking area, and a sculpturing of the area in order to provide a workable topographical relationship between the buildings and their pedestrian and parking areas.

Mrs. Summers pointed out that the reason the complete plans were before the Commission at this time, was that when the use permit was granted it was required that complete plans be submitted for review in order to make sure that the Seminary fitted in with the overall plan for Strawberry.

Mrs. Summers pointed out that the part in which the general public is most interested is not the Seminary itself and the circulation within it, but that the community circulation is provided for, and she asked when West Strawberry Drive was to be constructed.

Mr. Rossi stated that they would like to postpone it just as long as possible, that it was really up to theCommission and the Director of Public Works when it was to be put in. He further stated that the grading would be done this fall and spring, and that they would be moving into the building in 1958, and one year from now actual construction would begin.

There was considerable discussion as to the County's interest in securing for the Strawberry neighborhood a circulation around and through the Seminary. Specifically that West Strawberry Drive and its connection to East Strawberry Drive, as shown on the site plan, be improved by theSeminary prior to the opening of the university and the connection between Gate 1 and Gate 3 should all be maintained as a roadway up to County standards.

Commissioner Upton moved, seconded by Commissioner Rasmussen that the Commission approve the grading and site plans as submitted subject to the condition that no building permits be issued unless a bond has been posted to assure the construction of West Strawberry Drive and its connection to East Strawberry Drive.

The motion was passed by a unanimous roll call vote.

STAFF REPORT - February 4, 1957

USE PERMIT RECONSIDERATION - Golden Gate Baptist Seminary

In order to permit the construction of buildings without the necessity of constructing West Strawberry Drive around the western periphery of their campus.

It has been generally understood that it is not necessary that West Strawberry Drive from the entry road to the Golden Gate Baptist Seminary to the entry of Harbor Point Unit No. 2 be constructed immediately or even at the time construction starts on the Seminary Buildings, but that a bond be posted to insure its eventual construction. The eventual construction of this drive becomes increasingly important with the increased number of lots in Harbor Point Unit #2, the proposed multiple housing in Harbor Point Unit #1 and the reduced right of way for East Strawberry Drive through Harbor Point #1.

The review of plans of the Golden Gate Baptist Seminary has been on an equal basis to other land developments in that each should share in the construction of facilities of a neighborhood traffic nature as well as exclusively for the use of the parcel being developed. The use permit for the Seminary could not have been granted if it was not concluded that it fitted or would fit into the neighborhood development program.

On June 20, 1956, the Planning Commission approved the grading plans for the Golden Gate Baptist Seminary with the condition that a bond be posted for the construction of West Strawberry Drive before any building permits are issued. It is important that the plan for a continuous road be maintained and the staff recommends that the Commission reaffirm its decision of June 20th to require the posting of a bond for the eventual construction of West Strawberry Drive before any building permits are issued.

MINUTES - February 4, 1957

RECONSIDERATION OF USE PERMIT - Golden Gate Baptist Seminary

The Commission reconsidered the use permit for the Golden Gate Baptist Seminary in order to permit the construction of buildings without the necessity of constructing West Strawberry Drive around the western periphery of their campus.

A communication was read from John F. Glasner as being against any change in the plan for West Strawberry Drive.

Mrs. Summers posted the Strawberry Point Master Plan, explained it and gave the Staff Report as found on pages 4 & 5 of Staff Report of February 4, 1957.

Dr. Graves, president of the Seminary, stated that the reason for the request for this change being so late was that the previous action had taken place in June 1955, and going back further, Mr. Livingston had stated that traffic would be such that the street would be necessary on both sides of the property and that they had agreed that a road should be on that side of the property. He said that the grading plans had been presented in 1955 and approved and that grading has been carried out and completed. He further stated that he received a transmittal slip from the Planning Commission's office stating that they should be interested in the letter from the Department of Public Works. He then quoted from this letter which in brief stated that "no building permits would be issued for any building until improvement plans for West Strawberry Drive were submitted and approved and a sufficient bond had been filed to assure the construction of the street."

Dr. Graves stated the representative who handled the original matter failed to notify the architect's office or him regarding the contingency on this street. He pointed out on a building location plan the buildings and the road in question and stated that the road had little or no relationship to the buildings and he could see no reason for refusing the building permits for the buildings. He further explained that West Strawberry Drive would not be needed until far in the future, and he did not feel that they should have to put in this road before building permits would be issued.

It has been generally understood that it is not necessary that West Strawberry Drive from the entry road to the Golden Gate Baptist Seminary to the entry of Harbor Point Unit No. 2 be constructed immediately or even at the time construction starts on the Seminary Buildings, but that a bond be posted to insure its eventual construction. The eventual construction of this drive becomes increasingly important with the increased number of lots in Harbor Point Unit #2, the proposed multiple housing in Harbor Point Unit #1 and the reduced right of way for East Strawberry Drive through Harbor Point #1.

The review of plans of the Golden Gate Baptist Seminary has been on an equal basis to other land developments in that each should share in the construction of facilities of a neighborhood traffic nature as well as exclusively for the use of the parcel being developed. The use permit for the Seminary could not have been granted if it was not concluded that it fitted or would fit into the neighborhood development program.

On June 20, 1956, the Planning Commission approved the grading plans for the Golden Gate Baptist Seminary with the condition that a bond be posted for the construction of West Strawberry Drive before any building permits are issued. It is important that the plan for a continuous road be maintained and the staff recommends that the Commission reaffirm its decision of June 20th to require the posting of a bond for the eventual construction of West Strawberry Drive before any building permits are issued.

MINUTES - February 4, 1957

RECONSIDERATION OF USE PERMIT - Golden Gate Baptist Seminary

The Commission reconsidered the use permit for the Golden Gate Baptist Seminary in order to permit the construction of buildings without the necessity of constructing West Strawberry Drive around the western periphery of their campus.

A communication was read from John F. Glasner as being against any change in the plan for West Strawberry Drive.

Mrs. Summers posted the Strawberry Point Master Plan, explained it and gave the Staff Report as found on pages 4 & 5 of Staff Report of February 4, 1957.

Dr. Graves, president of the Seminary, stated that the reason for the request for this change being so late was that the previous action had taken place in June 1955, and going back further, Mr. Livingston had stated that traffic would be such that the street would be necessary on both sides of the property and that they had agreed that a road should be on that side of the property. He said that the grading plans had been presented in 1955 and approved and that grading has been carried out and completed. He further stated that he received a transmittal slip from the Planning Commission's office stating that they should be interested in the letter from the Department of Public Works. He then quoted from this letter which in brief stated that "no building permits would be issued for any building until improvement plans for West Strawberry Drive were submitted and approved and a sufficient bond had been filed to assure the construction of the street."

Dr. Graves stated the representative who handled the original matter failed to notify the architect's office or him regarding the contingency on this street. He pointed out on a building location plan the buildings and the road in question and stated that the road had little or no relationship to the buildings and he could see no reason for refusing the building permits for the buildings. He further explained that West Strawberry Drive would not be needed until far in the future, and he did not feel that they should have to put in this road before building permits would be issued.

He continued that they planned to have all of the building under contract by the end of the year, and to be ready for occupancy by 1959.

Commissioner Azevedo asked if the Harbor Point Development was dependent on this road for access.

Mrs. Summers pointed out that it was not.

Mr. Rossi stated that it would be at least two years until the end of the Point is developed. He stated that he brought back notes on the meetings on these matters and that there was never any mention of a bond.

Mrs. Summers stated that Mr. Rossi should remember the "hot" argument between herself, Mr. Rowland Darnell and Mr. Rossi as to whether or not the road should go in.

Chairman Rasmussen asked if it was customary to give a set of the stipulations or conditions on a use permit when it was granted to the applicant.

He was answered in the affirmative.

Chairman Rasmussen then stated that apparently Dr. Graves and Mr. Rossi were completely unaware of the conditions in this case, and it should be a practice in all cases where applications were granted conditionally.

Commissioner Upton stated that the Minutes were public and it might be well to send copies of same to the applicants.

Commissioner Schultz stated that he felt that all the conditions should be put on different copies and sent to the applicant.

Commissioner Azevedo stated that it might be wise to handle the stipulations on a copy to the applicant even though it is a matter of approval of plans and not a use permit. She then asked Dr. Graves if his objection was to the putting in of the road or to the road itself.

Dr. Graves stated both, and that it is a very serious matter in dollars and cents.

Chairman Rasmussen stated that he felt the road was definitely the responsibility of the Church organization, since they will eventually be using the road for their own development.

Commissioner Schultz brought out that in a subdivision the subdivider was not required to put in road improvements beyond the need of that particular subdivision.

Commissioner Azevedo asked if the road was not built for 10 or 15 years would Mr. Neider be able to have access to his development on the Point without detriment to the community.

Mrs. Summers pointed out the route on East Strawberry Drive, that would be taken in order to get out to the highway from the Point.

Commissioner Azevedo, after assurance by Dr. Graves that two weeks delay would cause no difficulty, stated that she did not feel that she was ready to vote on this matter as yet, and would like to have it continued for time for more specific study, and therefore, moved that this matter be continued until the meeting of February 18, 1957, at 10:00 A.M.

The motion was seconded by Commissioner Schultz and passed by a unanimous roll call vote.

STAFF REPORT - February 18, 1957

USE PERMIT RECONSIDERATION - Golden Gate Baptist Seminary
Continued

The Staff has presented a report at the previous meeting as contained in the Staff Report of February 4, 1957.

The Commission continued this matter at the request of Commissioner Azevedo who wished time for further thought and specific study on the problems involved.

MINUTES - February 18, 1957

USE PERMIT RECONSIDERATION - Golden Gate Baptist Seminary
Continued

The Commission again considered the use permit for the Golden Gate Baptist Seminary in order to permit the construction of buildings without the necessity of constructing West Strawberry Drive around the western periphery of their campus.

For report and recommendations as given by Mrs. Summers, see Staff Report of February 18, 1957, at page 4.

Mrs. Summers posted the location plan of the Seminary and explained same.

Commissioner Azevedo stated that when looking over these plans it had occurred to her that the Seminary has made a choice to run the public traffic around instead of through the Seminary, and in so doing has eliminated the immediate need and means of constructing the road. Even so, the Seminary still has an obligation to the public to provide for a circulation road.

She further wondered if, considering the cost, the Seminary has considered a shorter route.

Dr. Graves stated that a shorter route would be impossible because of the slope, which would be too steep.

Commissioner Schultz pointed out that the round-about road is useless to the Seminary and asked if that road could be relocated so that it could avoid the bluff.

Commissioner Upton asked about the ownership of the tidelands adjoining the bluff.

Commissioner Azevedo pointed out that if the Commission considered this road as not being entirely the responsibility of the Seminary, it would in effect establish a new policy, and she wanted to know just what implications this would have in the future, how often it would arise, etc.

Dr. Graves stated that the Seminary is willing to dedicate all the land necessary for this road to the County right now. He felt that the condition which required the Seminary to improve the road was at variance with policy, because the road is of no use to the Seminary.

Commissioner Schultz asked, if it would be a reasonable condition if the Commission requires dedication of the road and that the Seminary join in the construction of the road at such time as the adjoining lands (The Coleman Estate) are developed.

Dr. Graves stated that when it becomes necessary for this road to be improved the Seminary would be willing to pay its share.

Commissioner Schultz stated that he felt that the road from the entrance to the point would not be benefiting the Seminary, except two villages, but would be benefiting the Coleman Estate property and it would be unfair to require the Seminary to improve a road which would only be of benefit to the neighborhood.

Mrs. Summers suggested continuing the use permit, and let the engineers figure out an assessment district, such as, say 60% being Seminary, 40% others, etc.

Commissioner Schultz stated that it would be hard to estimate the value to the different parties concerned, and that the general public would also be an interested party.

Commissioner Azevedo asked what engineers would be determining the fair shares.

Mrs. Summers answered that it would be the Department of Public Works. She continued that since the Seminary did not feel that it was their whole responsibility, then it must be determined who would share the responsibility.

Commissioner Schultz said that if the Seminary is willing to dedicate the land for the route, and enter into an agreement to share the development of the road at some future date, then the use permit should be in order.

Mrs. Summers stated that the only way she knew that this could be assured would be by either construction or bond.

Commissioner Schultz asked if the interior roads would be open to the public.

Dr. Graves answered yes, although they are not built to county standards.

Commissioner Schultz then moved that the approval of the improvement or development plans on June 20, 1955, as required by the Use Permit as issued, be amended to add thereto the following: "except that the right of way for the road around the point from Gate 3 to Gate 2, as shown on the approved site plan, be dedicated as soon as it can be described, and that at such time as adjoining property owners are ready to proceed with the development of the road the Seminary shall share the cost of road construction according to the benefits to be derived therefrom."

The motion was seconded by Commissioner Scott.

Commissioner Azevedo stated that she felt the use permit should be amended to permit the sharing of the final cost of the road, but that she was not ready to drop the idea of the bond, since that is a sure way to guarantee construction.

Dr. Graves asked wouldn't the assets of a five million dollar development and the integrity of the institution be enough.

Commissioner Schultz stated that a condition of a Use Permit is either valid and enforceable or else the Commission is not in a position to require it.

Commissioner Upton felt that the Seminary had the responsibility of building that road, but he did agree with Commissioner Schultz that the responsibility is not entirely that of the Seminary, nor due at this partiuclar time, and he did not feel that the building program should be held up.

The motion was passed by the following roll call vote, to-wit:

AYES: Commissioners; Upton, Scott, Schultz, Ludy, Rasmussen
NOES: Commissioners; Azevedo
ABSENT: Commissioners; None

STAFF REPORT - July 29, 1957

NONE

MINUTES - July 29, 1957.

APPLICATION FOR ARCHITECTURAL SUPERVISION - Golden Gate Baptist Theological Seminary 10.453

Mr. Darnell explained that this matter was erroneously listed on the agenda as a matter for architectural supervision; when, it should have been listed as the reconsideration of the original use permit conditions.

Mr. Darnell gave a report to the Commission and reviewed the original permit conditions, pointing out that these conditions had been amended at a later date to permit West Strawberry Drive between Gates 2 & 3 to be dropped from the original condition requiring dedication and improvement as a major residential street. He said that in the past week a building permit application has come in for a residence at a location on which previously a garage had been approved; and staff refused to sign the building permit because the building construction was not in accordance with plans as submitted and approved.

Bryan McCarthy appeared on behalf of Sam Neider and Harbor Estates, asking the Commission for a reconsideration of their action to drop the requirement for bonding the road between Gates 2 & 3. He reviewed the Streets and Highways Plan, which required circulation around the Strawberry Peninsula and through the property now held by the Golden Gate Baptist Theological Seminary.

Mr. McCarthy pointed out the fact that there would be 100 homes plus some multiple, and the fact that East Strawberry is quite well built-up; therefore, he said the Marin Land Company, whose interest he felt was identical with the County of Marin, has an interest between Ricardo Road and Gate 3. It is important, also, because this road is going to lead in and be one of the main access roads to Harbor Point. He said it is likely that the Board should stick with the 86-foot street as shown on the Master Plan, in his opinion; but it would be silly to require this up to Gate 3 and no access beyond it, and that, in this opinion, is where the matter stands right now.

Mr. McCarthy reviewed the necessity for circulation around Strawberry Peninsula. However, he said, in 1955 when the first real plans of the Seminary were brought before the Planning Commission, the Seminary requested an exception from the Master Plan, and asked that rather than a road straight through their grounds, which would have an adverse effect on their administration, that the road go around the edge of the Seminary property, ultimately connecting with the circulation system originally proposed. At that time, he said, the Commission accepted that proposal, as it did in fact keep the circulation although it did increase its length.

Mr. McCarthy continued, that at one point in the consideration this road around the point became a road at water level; and that is probably all right. But the hitch is that some of the tide lots across which this road will cross are owned by other parties. He stated that an off-hand opinion is that the road can be placed where it was originally, where the Seminary had it in 1955, a distance up from the water level, which would mean that the road could be contained entirely within Seminary lands. He felt that the Seminary should face this road problem now, and not in the future. He felt that if the Commission lets go of some of the rights they have to enforce their requirements they will never have them. He then asked the Commission to reconsider the road at this time with possible referral to the Planning staff to make a report on the road and its possible future and the possibility that the road be constructed on Seminary lands, as being their problem.

Commissioner Schultz pointed out at the February meeting there was a substantial showing by the Seminary that this was a through road for the benefit of parties in addition to the Seminary.

Mr. McCarthy stated that although this matter started in 1954, it was not until the February meeting in 1957 that the Seminary indicated they were not interested in putting in this road.

Dr. Graves reiterated the reason they had waited until June 1956 meeting was that they did not have knowledge of the action. He further stated that there was no drawing made by the architect which shows such a road on the Seminary plan. He said that there is a plan which was brought out some several years ago which did show some greenery outside that road.

Dr. Graves pointed out that Lots 313 and 314 belong to the Coleman Estate, and bordered the Seminary lands around to the point where Lots 315 & 316 begin which are owned by the Seminary. He said that they are in agreement to make a study to see if the road can be brought inland. The existing road proposed for Seminary use will not meet the County standards, however.

Chairman Upton felt that there were two considerations which should be made; one involving an engineering study to determine a feasibility of the road in question and the other the problem of whether or not the point should be maintained as it is to preserve its natural beauty. He felt that perhaps, even though it would require extra work by the Department of Public Works they should be asked to make a feasibility study of the road being brought inland.

Mr. McCarthy mentioned a site plan dated 1955, that he remembered as having a road around the interior.

Dr. Graves stated in the February meeting that he thought that the Commission was aware of theSeminary's good faith in indicating that they felt that the road was desirable and would be willing to sit with any group to determine the location and the possible development of such a road.

Mr. McCarthy stated that they are not opposing the granting of the application for the residential property now being considered, but felt that the major construction should not be commenced until such time as the road is worked out.

Commissioner Azevedo related her impression of the Commission's action. Two questions she posed: Is there a deadline on the solving of this problem; and if there is, should the question of the deadline be reopened. She then asked if it would be in order to ask that the staff work with the Seminary and Marin Land Company to study the possibility of another route.

Mrs. Summers suggested that the Department of Public Works be included as being the engineering section of the County government.

Dr. Graves stated that the Seminary has never disagreed with the fact that a road should go through, although they have denied that it was their total responsibility.

Chairman Upton reiterated in answer to Mrs. Summers' question that the staff is being directed to instigate a study with the Marin Land Company, The Seminary, and the Department of Public Works to determine where the road should go.

Commissioner Azevedo then moved that the staff be directed to get the principals together and to recommend where the road should go-- the various alternatives --, and one of the considerations should be the ownerships involved.

Commissioner Schultz felt that the County should not do the engineering, but make a minimum study as indicated by the foregoing discussion. He then seconded the motion, which was passed by a unanimous roll call vote.

Mr. Dobbs stated he felt that the dedication of this road around the point, as set forth in the previous action, must also be accomplished prior to the granting of permits.

It was pointed out that if they had a contrary thought it should be specifically spelled out at this time.

Mrs. Brown stated that many of the roads are completed and have gravel over them.

Chairman Upton felt that if the feasibility study showed the road on the lands of the Seminary it would be the responsibility of the Seminary.

Commissioner Schultz took issue and he felt that regardless of where the road goes, it is a through road and the costs should be more in proportion to the use of the road.

Mr. Hayes related the situation to the case where verbal agreements were made with the Terra Linda Corporation, and the resulting sales and changes of property places the requirements on people who were not in the original action.

Commissioner Schultz moved that the original Use Permit condition be amended, that the residence shown on the plans and discussed at this meeting be permitted, and that construction of said residence be permitted prior to the bond being placed on the construction of West Strawberry Drive and the construction of the road around the point.

Commissioner Azevedo seconded the motion.

Commissioner Scott brought out the point that it was his impression that they were not going to hold up the construction of the Seminary for the ironing out of the proper location of the road around the point.

Commissioner Scott said that he didn't agree with Mr. Dobbs' interpretation.

Commissioner Schultz stated that they have neither agreed nor disagreed.

The motion was passed by a unanimous roll call vote.

STAFF REPORT - October 14, 1957

RECONSIDERATION - Golden Gate Baptist Seminary

Reconsideration of Use Permit Conditions.

At the request of one of the interested parties to this problem of Strawberry Drive with relation to theSeminary, Dr. Graves has consented to the continuation of this hearing until Monday, October 28, 1957, your next meeting.

Dr. Graves has prepared an engineering plan for West Strawberry Drive, which plan has been reviewed and verbally approved by the Director of Public Works. The staff will proceed to cooperate with all the interested parties in the next two weeks in order to present a recommendation to you which is satisfactory to all.

MINUTES - October 14, 1957

Matter continued until the meeting of October 28, 1957

STAFF REPORT - October 28, 1957

RECONSIDERATION OF USE PERMIT - Golden Gate Baptist Seminary
Continued

The question under reconsideration is the location for West Strawberry Drive at the water's edge and the fact that the Seminary does not own all of the right of way along the water's edge and therefore, cannot at this time dedicate same as is required by the Use Permit.

The Seminary has prepared an engineering plan for West Strawberry Drive which has been approved, insofar as alignment is concerned, by the Department of Public Works.

From conferences by Mrs. Summers with the Seminary, attorney for Sam Neider and the Strawberry Recreation District, it has been determined that the three parties are working toward, and have general agreement as to appropriate ways and means to secure, by eminent domain or otherwise, the required 'missing-link' to West Strawberry Drive.

It is recommended that the Use Permit condition requiring dedication of an approved right of way for West Strawberry Drive be amended, in order to provide that the Seminary must dedicate all of West Strawberry Drive, which they own, as shown on the approved plan, except for a reserve strip which would prohibit access to the 'missing-link' such reserve strip to be dedicated when the 'missing-link' is dedicated to the County, and should it be impossible to secrue the 'missing-link' for dedication to the County, then the Use Permit should be submitted for reconsideration in order to provide for alternate routing for West Strawberry Drive through the Seminary properties.

MINUTES - October 28, 1957

RECONSIDERATION OF DEVELOPMENT PLAN - Golden Gate Baptist Seminary
Continued CONTKNUED

The Commission again considered the development plan of the Baptist Seminary.

For report and recommendations as given by Mrs. Summers, see Staff Report of October 28, 1957, pages 14 & 15.

Mrs. Summers explained that the original use permit was granted subject to the condition that the applicant secure the approval of the Planning Commission of a development plan which would be similar to a development plan as provided for under the Planned Community District, prior to any construction or improvement.

Subsequently the Seminary had approved a grading and site plan "subject to the condition that no building permit be issued unless a bond has been posted to assure the construction of W. Strawberry Drive and its connection to E. Strawberry Drive;"

Subsequently this condition was amended to add the following thereto: "except that the right of way for the road around the point from Gate 3 to Gate 2, as shown on the approved site plan, be dedicated as soon as it can be described, and that at such time as adjoining property owners are ready to proceed with the development of the road the Seminary shall share the cost of road construction according to the benefits to be derived therefrom."

Mrs. Summers explained that the Seminary had submitted a new plan showing a new alignment for W. Strawberry Drive which lay along the shoreline. These plans had been reviewed by the Director of Public Works who submitted a letter of recommendation thereon. Said letter was then read.

Dr. Harold Graves, President of the Seminary, stated that they were prepared to state they would dedicate to the County all of W. Strawberry Drive, as now planned, which they now own, and that the Seminary was now attempting to acquire additional tide lands which would make it possible for them to dedicate all of W. Strawberry Drive.

Bryan McCarthy, Attorney representing Sam Neider, brought out his opinion that the Seminary was still held, by the Commission's previous action, to posting a bond for whatever was considered the Seminary's share of W. Strawberry Drive construction.

Dr. Graves felt that the amendment to the original condition of approval of the grading the site plans relieved the Seminary of this requirement as did Commissioners Schultz and Scott.

Mr. McCarthy also suggested that until the dedication of the entire Drive was provided for the Commission to keep some control over the building program, only permitting the Seminary to do a portion of their construction at this time.

Dr. Graves pointed out that they were right now ready to build.

Commissioner Azevedo asked if this matter was continued until November 18, 1957 would it hold up the bids.

Chairman Upton suggested that we find out from Leland Jordan whether the bond is still required.

Mr. McCarthy said that if they were to argue on the basis of whether the bond was dropped or not it would call for much more extensive arguments.

Dr. Graves said that he could not possibly be here on November 18th. He cited his own confusion as to who was responsible in terms of the bond. He pointed out that the academic portion of the overall plan was to be bid on the 27th.

Commissioner Schultz moved that this matter be continued until December 2, 1957, so that an interpretation can be secured from the County Counsel as to the best procedure to follow to assure dedication of W. Strawberry Drive and as to whether or not under existing actions of the Commission a bond was required of the Seminary for their share of the construction of W. Strawberry Drive, but that the Commission at this time approve of the issuance of building permits for buildings within the area bounded by Roads #6, #8, #4, #2 and #9 as shown on Sheet 1 of 4, "Site Plan for Addition to W. Strawberry Drive," Golden Gate Baptist Theological Seminary as prepared by John Carl Warnecke A.I.A. being Job No. 52-18 G 4.

The motion was seconded by Commissioner Scott and unanimously carried.

Chairman Upton instructed Mrs. Summers to comply with the request of Mr. McCarthy that complete sets of previous Planning Commission minutes be prepared for each Planning Commission member.

RECONSIDERATION OF DEVELOPMENT PLAN - Golden Gate Baptist Seminary
Continued CONTINUED

There were no new communications on this matter. DEC 2 1957

For report and recommendations as given by Mrs. Summers, see Staff Report of December 2, 1957 at pages 5 & 6.

Mrs. Summers read the letter with questions to Mr. Jordan, and stated he had telephoned this morning stating that a bond in his opinion would be required and, the road should be dedicated now and that he would confirm his telephone call by letter.

Mrs. Summers explained she had sent Mr. Jordan an excerpt of the Commission's actual motions. Mr. Jordan felt that he should advise that if the County wishes to assure the setting aside of this area for road use they should, at this time, accept the dedication; that this is the only sure way, otherwise they would have to record an instrument which would call for action in the future. That by accepting the dedication the County is not obligating itself to construct a road upon a dedicated route.

Dr. Graves asked how could they bond for something on a share basis when the exact shares are not known and stated that they are just as willing to dedicate it as they are to promise to dedicate it. He stated further there is no question on the part of the Seminary that they are willing to dedicate.

Chairman Upton felt that the Department of Public Works should determine the share for bonding and submit it to the Board of Supervisors.

Dr. Graves stated that would be very fine, however, bonding it would admit responsibility for the whole road and they are not willing to do that.

Commissioner Azevedo felt that they would not hold the Seminary responsible for the entire road. She then raised the question as to methods of determining the amount of the bond.

Commissioner Schultz said he gathered that the bond would be required when other parties involved were ready to develop.

Dr. Graves expressed the fear that we would be holding them up until a bond was secured from the other parties, who might be responsible for part of the road.

DEC 2 1957

Commissioner Schultz felt we could not hold the building permits up for the Seminary until guarantee was secured for Mr. Neider that his portion of the road would be built.

Chairman Upton felt that the Commission would have to make some decision to assure that the road would go in.

Commissioner Azevedo asked if we have a method of getting a bond from Mr. Neider.

Commissioner Schultz stated that we have no means whatsoever. The only means for assuring the building of a road in an equitable manner is an improvement or assessment district. He pointed out that the Coleman Estate would also be a party, and that the Strawberry Recreation District might be a successor in interest and would also have to contribute their share, since they would be a beneficiary.

Dr. Graves stated that they have expressed their willingness, their desire to cooperate all along to get everything ironed out, that they are now ready to start to build. He feels that time is of the essence, and they request that approval not be delayed.

Commissioner Azevedo asked if they have explored all other methods of enforcing agreements other than with bonds.

Commissioner Azevedo felt that since other parties are involved it is certainly not her intention to try to make the Seminary wholly responsible for any other parties' interest. She said that was one of the things that has created this problem, the original premise was that the Seminary was responsible for the whole thing, and the road was entirely on Seminary land.

Dr. Graves, in answer to a question by Commissioner Schultz, stated that they would need a building permit within six weeks.

Commissioner Azevedo felt she would like to explore further the question of establishing that this sort of thing can be conditioned to the use permit with a time limit fixed. She felt that she would like to see a time limit fixed, within which time the Seminary would be required to provide its share of the road, and also to explore any other possibilities.

Commissioner Schultz felt it would be wise to look into the possibilities of an assessment district, which might be established at such time as the other parties involved become interested in the development of their property.

Commissioner Azevedo moved that this matter be continued, for the purpose of exploring whether there might be any alternatives to the bond, that would still be a guarantee that the Seminary's portion of the main road would be constructed, until the meeting of December 16, 1957.

Dr. Graves stated that they hope to sign the contract for their housing on January 14th. He pointed out his statement at the last meeting, and still states that they are perfectly willing to any other alignment which might call for the road going over land which they own. He reported that the Strawberry Recreation District might be very close to filing condemnation on the Coleman Estate even by the next meeting, and if that insues then the District will be the landowner involved, but all interests agreed the District would not be responsible for improving the road.

Commissioner Schultz seconded the motion.

Commissioner Scott stated he felt, according to the understanding at this meeting, that if there is no other solution found, that there must be a bond, and he was not ready to concede to that point.

The motion was carried by a unanimous roll call vote. DEC 2 1957

DEC 2 1957

It was also pointed out that if there is a question as to what share the Seminary is being held responsible for, that any new motion or new action can clarify that.

Dr. Graves pointed out that by private contract Mr. Neider has the entire responsibility of building the road from ~~West Strawberry~~ Rancho Drive ~~Drive~~ to their gate, to be finished about the expected date of occupancy, which is October 1, 1959.

Commissioner Schultz posed a question, that if the construction of the road is a condition of the use permit, and if the road is not constructed can the use permit then be revoked.

The Chairman asked that an answer to that question be secured from the County Counsel.

CORRECTION AND APPROVAL OF MINUTES of December 2, 1957 and Special meeting of September 19, 1957.

Commissioner Azevedo pointed out that on the item "Reconsideration of Development Plan for the Golden Gate Baptist Theological Seminary" page 8 the minutes should show Dr. Graves' statement relating to "...Richardo Drive to their gate..." and not "... West Strawberry Drive to their gate..."

DEC 16 1957

Commissioner Schultz stated that no vote is recorded on "Application for architectural Supervision - Main Street Properties."

Mr. Dobbs then recommended that the minutes be changed to add, at the end of the Main Street Properties item, on page 30, the following: "Commissioner Cuzner, who seconded the motion, accepted the revision. The motion was then passed by a unanimous roll call vote."

Commissioner Schultz then moved, Commissioner Azevedo seconded and it was unanimously carried that the minutes of December 2, 1957 be approved as above corrected and that the minutes of the special meeting of September 19, 1957 be approved as submitted.

RECONSIDERATION OF DEVELOPMENT PLAN - Golden Gate Baptist Theological Seminary

Continued CONTINUED

DEC 16 1957

Mrs. Summers reported the County Counsels' opinion that if a consultation of a use permit were not complied with the use permit could be revoked. His impression of what a Court would do, on the basis of whether they would close down the Seminary for non-compliance, was that the Court would probably give the County an injunction against the Seminary, but would not close down the use.

Mrs. Summers also reported on the Commission's request that she confer with Messrs. Brigham and Jordan on ways of assuring road dedication and construction, and if a basis of sharing cost could be arrived at now.

She further stated: " Mr. Landels, attorney for Dr. Graves of the Seminary, proposed an improvement agreement, a copy of which was sent with your staff report. This was reviewed by Mr. Brigham, and Mr. Jordan. I would say this, that their review of this agreement was on the basis, that the Commission in previous actions had already determined (1) that you would not require the Seminary to put a road in at their full expense (2) that you would permit a fair share at a future date. Basically that you wished to have the road dedicated, but that you didn't mind whether or not it was built immediately, but should be in time to serve the area, when a fair share could be established.

" It was on that basis that everyone reviewed this agreement. They did not review it on the basis: Would this require the Seminary to put a road in, as had originally been our proposal to the Commission.

"We have a letter from Mr. Jordan, on this."

Mrs. Summers then read a letter from Leland Jordan, dated December 12, 1957.

Mrs. Summers stated: "Mr. Jordan asked that I clarify, to the Commission this last sentence which reads; ' I believe that the agreement represents the greatest degree of protection which the County can obtain in connection with the construction of this roadway under present circumstances.' It was stated on the basis of presuming that the Commission had already made these decisions for the alternate route, a fair share and construction at a later date. Not that he was recommending this action.

"Have you had sufficient opportunity to study this agreement, or would you prefer that it be read aloud to think it through at this time?"

Chairman Upton felt that it might be a good plan to read the agreement aloud. This was done.

Attorney Landels reported he had met with Mr. Jordan, Mr. Brigham and Mrs. Summers part of one morning, and that they put into the agreement everything requested by them.

Mr. McCarthy, appearing on behalf of Mr. Neider stated that this matter was vital to the people he represents, that two new subdivisions and approximately 100 lots would be tied in to this road, and that it also ties in with residences on East Strawberry Drive. He said that it was very important to the County of Marin.

He referred to the minutes of the recent meeting where the actions on this matter, beginning in 1953 were summarized. He stated that he was not aware of the meetings which led up to these meetings between Messrs. Brigham and Jordan and Mrs. Summers. He said he felt that this agreement was a legal trap, and thought that it was a piece of legal maneuvering. He said that he could boil down the summary of events into four sentences.

Mr. McCarthy then pointed out that originally the Seminary was required ..." to build a road around Strawberry Point, that is to connect to its property, not all the way around, but that it had to connect this

DEC 16 1957

property off Ricardo Road, which was so-called West Strawberry Drive, it had to connect to East Strawberry Drive on the other side, not off its property but just on its property. That was clear, absolutely as set forth in these minutes; so the first thing they have is an obligation of the developer to put in a road. No questions asked, his obligation.

"The second step, also in these minutes, just as clearly as I am trying topresent to you, never have I ever been backed up by anything as good as these minutes before, when discussing previous actions; secondly, at the request of the Seminary the road moved from, through the Seminary over to the side of the Seminary. Still on their property, its still a road and still their obligation to build the road.

"Now, I am going to get into a discussion in a minute as to whether or not it is proper to have them build the road or whether it isn't, and whether or not your actions are consistent, but this is a record of the proceedings before you.

"First they build a road right through their property; secondly they build a road, but it's over on the side, because that's better for them. I think it was better for everybody concerned that the road be moved over. It wasn't unreasonable for the Seminary to request that moving, but then came the big change, a change in January or February of this year, at which time, there was no one present in opposition of the request of the Seminary's proposal. At that time we were not, I won't say we didn't have notice, but I was not representing the people I am representing at this time, and let's say without opposition. The Planning Commission staff, still showing against it, these minutes verify that. The staff was still against it, but this Commission left the road over at the side, but made one major change, and that major change was, that now the road still had to be there, still on Seminary's property, but now, it's a 'share-the-cost road.'

"The Seminary only has to pay part of the cost, other people, who are going to benefit now have to pay some of the cost. Who are those people? Well, in the minutes they were mentioned as the Coleman Tide Lots, the 'missing-link' in the proposed road. They would be benefitted if there was a road there. The funny part of it is that the Seminary doesn't want the Coleman Tide Lots to have access, but in any event that was the basic change. So you moved from a road built by the Seminary, down to a road built by fair-share.

"You might say 'What's so unfair about sharing the cost.' I'm not going to argue with you on that, except for this: you require it of other developers. I'm not going to argue the ethics of it except as it pertains to this specific agreement. But I am going to show you where you have required it of at least four other developers within the last two years in Marin County.

"What is the culmination of this thing? The culmination to me is in this agreement. If you adopted such a thing as this it wouldn't quite make it 'no obligation, and no road at all' which would be the end of this line; which would make it the full 360°, from a road to no road at all. This document simply requires the Seminary at this time to dedicate a strip of land.

"Notice we keep referring to "Exhibit A" here. Exhibit A is a description as to where this road is to go. Now, what is the matter with Exhibit A and this road? Well, it's three quarters of a road (Mr. McCarthy then pointed to the Tiburon Peninsula Master Plan and showed the proposed road.)

"If this contract or agreement is adopted, you are going to end with a dedicated strip of land, from here to here and then it's going to stop. Then you are goi g to have a strip of land from here to here, and it's going to join in with West Strawberry Drive. You are going to get three quarters of a road, with no assurance that you are ever going

DEC 16 1957

to get a road. Somebody could say, 'well, that's all right, if the County ever wants it, they can condemn it.' That's true. But how do we know the County wants to condemn the road, and secondly, can the County condemn it and not pay for it? There's always legal problems that come in as to whether or not somebody else has to put up money and force the taking of it. Condemnation is not a simple thing, it is not an easy thing. It sometime takes years, not months. Yet you are asking to take this now in the place of what you had in the beginning; a road through the Seminary and paid for.

"What is the other part of this agreement that all of a sudden is interjected? In my opinion, for the first time, from these minutes which is all I can gauge this thing on, for the first time the Seminary wants to be refunded whatever it has put in into a road-bed.

"Why did it put in the road-bed? Because it was trying all the time to get you to move off its property and down on the water. The more it accomplished this road-bed, the more it would get you on the water line and everybody else. You would say, 'look there is a road about half in. Fine, that's good, we will take it there.' Secondly they had to get rid of fill, I assume. I can't be sure of that, but I know there is fill on the property, and it's not imported fill. So what are you asking them to do in this agreement? You are asking, in my opinion, two mistakes, one fatal one. The fact that they get subtracted the cost of the fill, I don't even think is worth our argument. I think they shouldn't be allowed to subtract it, because they are getting so many benefits by what they are ending up with now, it is inconceivable to me, having appeared before this Commission on many items, on behalf of many developers, to see that they would ever end up with what they are getting away with on this.

"But that's the minor part. You may never be able to overcome the fact that you have lost your right of way through the property, so my conclusion is: insist, at the very least, on the fact that, if this missing piece is not able to be acquired, the Seminary must provide and dedicate an alternate access route through their property.

"That's their obligation. When I say others have been required to do this, I have been advised, that in Marin County and I have seen, at least four or five places where you have required not only someone to dedicate a road, but that they put in the roads.

"I cite first, Marinwood; Miller Creek Road is a four-lane, divided road, it crosses from U. S. 101, opposite the St. Vincent's gate around into Lucas Valley Road. The developer is putting it in, paying for it, and it is obvious that it is not necessarily for the use of Marinwood alone.

"As a second one, I cite Wilson Avenue in Novato. The major circulation route through Novato. I believe that Novak was required to improve and dedicate a 30-foot roadway, and that it was not necessary for his property alone. I believe that the Wheary Housing area in Ignacio there was dedicated a 100-foot right of way, no improvement was required, but the dedication of 100-foot right of way, for a through road, and also a required parking lane on each side, and I believe they had to put that in.

"In Terra Linda there is a street called Del Ganado, which is required to be a four-lane, divided road to Lucas Valley. I believe that the developer was required to put that one in.

"Now to me I don't think that I should have to cite these cases, because in appearing before this Commission over the last many years, I have seen that you have always done it, always required the developers to provide for circulation. Fortunately for you, unfortunately dollar-wise for a developer, the law seems to sanction it. There is a famous Los Angeles case, which sets up this authority. You have the right to require that circulation be taken into consideration when someone comes in to develop a whole area.

"I realize that a Seminary is different from a subdivision. That's why some of the action you have taken has come about, but it's not so unusual that from the start of having to provide a road, they end up with providing three quarters of a road and nothing else. That to me is the last straw. Now this is the last, last straw. That in the proposed agreement they are going to get their fill back. Are they giving, or what have they had to give to the County? You might say absolutely nothing. They have given a strip of land they filled in, they are going to give you some old mud flats. Now we are not giving property away, but treat these prople like you treat everybody else that comes before you.

" If next week a developer comes in, you are going to require that circulation be taken into consideration. If you are willing to abandon from here on out all circulation routes, that's a different story. You haven't abandoned it up to here, and in fact, are still requiring it. Why then do these people get this consideration? And in a key circulation area. You have to get circulation out this way. It so happens that Marin County is interested in getting circulation routes. I feel that this agreement should never under any conditions be entered into.

"Secondly, that no matter what action you take you should require an alternate route.

"Third, I feel that you should never let them get away with deducting an unknown quantity of fill when it's only for their own benefit that they put it there. Never leave a 'missing-link'.

"Now it seems that we have already gotten away from another point, which was mentioned in the October meeting, and that is the requirement of a bond. I believe that it was Mr. Jordan's interpretation that a bond is still required technically. That has never been done away with. I understand that there are several members of this Commission that feel that a bond is unworkable, and shouldn't be required in this case. All I can say in this case is that when the Commission acted in the past it felt that a bond is necessary. That does not mean that you have to continue with it if you don't want to. There has been a proposed substitute in this agreement, and that is that the Seminary withhold sale of 100 acres of property. Maybe that's just as good. I'm not in a position to say.

" Certainly 100 acres of land would be a satisfactory bond without being a bond by a company, and it's possible that just the Seminary alone, and your control of future actions, would be enough of a wedge that they would have to live up to future actions. However, there is something good about a bond, there is something immediate about a bond. It means that people will do it, without litigation and it is worth something. You have an agreement only based on 100 acres of land and somebody's word that they will do it. It usually means that a long legal action will follow. I think that someway you should get some assurance. If you don't like a bond, you don't like it. I'm not going to tell you you should have it, but don't take a deed of property right now, and foreclose an alternate route, if that route cannot be accepted.

" I know that in the October meeting we talked about this 'missing-link' being near accomplishment. It does not appear to be near accomplishment right now. Dr. Graves has said that he was trying to buy it. As far as I know in the past two months he has been unable to buy the tide lots to dedicate the 'missing-link.' If he did, a lot of our argument would disappear. He has not got it, and the Recreation District, who wants it, and has had it under condemnation for some time, has no money to buy it. Therefore, whether they will ever acquire the 'missing-link' is a question.

" I feel that this agreement is absolutely unacceptable to the County in its present form. I think these points I've raised should be given serious consideration.

DEC 16 1957

Mr. Landels then spoke for Dr. Graves, who was unable to be here. " This presents a very peculiar problem, in that the road serves only the area lying beyond the Seminary, and the fact that it's on a Peninsula. It is a difficult problem because of the small link of the Coleman property which has not been acquired. I want to say this. This agreement was entered into in the utmost good faith. We have met every requirement of your Planning Director, every requirement of the Road Commissioner and every requirement of your County Counsel.

"The Seminary, despite the fact that nothing that's being done in the Seminary makes this road necessary and it won't serve the Seminary for 20 years. Nevertheless the Seminary is willing to agree to put itself in the hands of the County, pay whatever portion of the road they feel is necessary. Further, we agree to do it anytime the County says you need the road. Under the existing circumstances, I don't know what else we can do. In addition to that, we are willing to agree to hold 100 acres as a bond for security. Now that's just as good as a bond. All a bond is, is an agreement with a third party that if you don't do it he will. You get just as much litigation one way as another. The reason you require a bond of a subdivider is that he is in today and gone tomorrow. You want someone else to pay after he's gone or sold his option. Here we have 100 acres of select land which we will hold unencumbered, and there is no question that the County is amply secure.

"This road is not necessary to the Seminary, will not be used by the Seminary and is necessary for only three reasons as the minutes point out: (1) the development of Harbor Point No. One, (2) the ultimate buildings in Harbor Point No. Two and (3) the narrowness of East Strawberry Drive. Those are the three reasons given by these minutes. None of which relate to the Seminary.

"Despite that, in an effort to cooperate with the County in every way the Seminary can, this is no attempt to circumvent anything, this road has been agreed to in the beginning from a scenic standpoint and from an engineering standpoint. We have met your requirements of your County Counsel, your Road Commissioner and the Staff. We agree to pay our share; we agreed not to protest an assessment district, if that's the way to do it. The cost of this 'missing-link' can be included in this assessment district, as Mr. Jordan has advised you. The County can condemn it anytime it wants to. There's no problem there. It's a very small piece, and until it has access, not a very valuable piece.

"It could be feasible for the County to condemn it, include it in an assessment district, and assess the cost against the Seminary and any other property that matters. The Seminary being the one property owner which agreed in writing to pay their share. The one property owner which agrees, come what may, to not protest the road, and come what may, to hold 100 acres of land as security and for assessments to pay its portion and share. What more we can do gentlemen, I don't know. Unless delay the matter until the property can be acquired. We haven't the power of condemnation, the County does.

"Frankly, we resent any suggestion of Mr. McCarthy's that we are attempting to circumvent anything. This hasn't been the attitude of the Seminary in the beginning; and it isn't the attitude of the Seminary now.

"The chief and primary purpose of this road, as everyone sitting here knows, it to provide access to the Point. It is necessary, we know that it is needed, and we are willing to pay our fair share. And I don't feel that this whole development should be held up until the problem of the Coleman strip can be resolved. Anyone knows that the County can get that any time it wants to and needs to.

"Gentlemen, I don't know what more we can do. We have met every requirement the County has set up. To be sure we haven't met Mr. Neider's requirements. He would like us to pay for the whole cost of this road. However, as I see our duty, it is to the County and we feel that we have met the County requirements in full.

"As for legal arguments, it is doubtful under the reasons given for this road, to what extent we can be compelled to improve it. Whether we can or can't is beside the point. We are prepared to do our share. The County can acquire the Coleman property anytime it wants to condemn it."

Mr. McCarthy: "It has been said that this agreement has met the requirements of the County. This is supposed to mean your attorney. I talked this thing over with Mr. Jordan, after he wrote this letter, and he didn't mean by this letter, and Mrs. Summers explained to you to start with, to approve this thing at all as to policy. He was given a certain hypothetical set of facts, in fact, the discussion of an alternate route was not even given to Mr. Jordan to consider, when he gave this opinion.

"Mr. Jordan has made it perfectly clear that this is no recommendation of his, all he is saying, is he was handed a document, and assuming this is the policy of the Commission, the document is all right. That's assuming you find everything that's here. It really hasn't met any requirements of the Counsel as to what should be in it. He says, as for the words on a document, the words are all right. So don't feel that Mr. Jordan has approved this thing. He never even considered an alternate route if you couldn't connect the middle.

"Mr. Landels says very kindly to you; 'What else can we do?' Well, I can tell you one thing they can do. Why can't they reserve for you an alternate route, if this other is not able to be taken? Why? Because he wants to be rid of it, right now. So that never, ever again will there be any possibility of this road moving any place else than where it is. From his standpoint I'd probably do the same thing. He stated that they have never tried to circumvent anything. What they tried to do and what they did, I don't know, but the record shows what has happened. I'm not going to bring motives into it. Look at it yourselves, you have never seen anything so circumvented as this road.

"He also stated that they are the only ones who have agreed in writing to pay their share. As if that was something real good for you to grab. Originally they had to pay the whole road right through their property. Certainly they should be happy, 'We'll put in writing that we will only pay our fair share.' How could anyone not want to pay their fair share of something which is about 10 times less than they were originally obligated to do? Each time down the line, each time less. If you approve this agreement you would have taken the next to last step down the ladder. The next step is no road at all, and this agreement may mean no road at all."

Mrs. Summers: "I would like to state, for the staff in this. You will recall that Mr. Brigham was asked to review these plans as to this specific alternate route, which was offered to your Commission and accepted by you. He said that it was engineeringly feasible, and a good route. Mr. Brigham is not recommending this as your solution. He is notadvising you as to what your action is. My part in this was to attempt to get somewhat near what I thought an aggregate of six different people were thinking. Going from the most restrictive to the least restrictive, and to try to find a happy medium.

"Mr. Brigham can't give you an estimate for a bond at this time without plans, specifications etc. for a road, and therefore, some sort of an agreement seems to be the answer in lieu of a bond. That's what this attempts to do.

" I think I made it clear, that Mr. Jordan never advised the County on policy, only on legal matters to the extent that he will see that what you wish to accomplish is placed in writing.

" I do want to, for the fairness of this to reaffirm what Mr. McCarthy just said, that none of the three advisors have told you that you should have made any of the three motions you made which led to the writing of this agreement. In fact, you will recall that my recommendation was contrarywise.

" I do have one question here that I would like to discuss with Mr. Landels, which I have not discussed with him previously, and in reading this agreement this morning, brings it to me. On page three where it says how the share would be determined. The reasons given for finding this share are related almost entirely to whether or not students and faculty and tenants and people working in the Seminary would use this particular route to come and go from the Seminary.

"In making such a finding; except to the proportionate benefits to land in general they own on the Peninsula as related to all other lands, that any land benefits from good circulation. That one thought is in here. Except for that, it would occur to me that there is a possibility that a very small share of the road would be determined, on the basis of use by the Seminary particularly with this alternate route when it runs around the outside of the Seminary and does not cut through it.

" I cannot help in reading this to refer back to my original recommendation, that as any developer of land is required to do certain improvements for the benefit of the entire area, this should be considered and if this section does not do that then it is incorrect.

"Would you like to comment on that Mr. Landels?"

Mr. Landels: "It was made just about as wide open and broad as human language could make it. To make it on a proportionate use basis to a proportionate basis of respective lands. They could allocate any share they wished under these terms."

Commissioner Azevedo: "I feel that this point that Mrs. Summers has brought out is one I already noticed in reading over that part of the agreement. I would like to review the points Mr. McCarthy made on the minutes. The first objection was that the Commissioners had broken a precedent that we usually use in requiring a developer to provide circulation onto the next development. We did this here because we felt that the Seminary was a different type of developer. That he didn't have a product, as in the case of the developer of lots. That he could sell which would be served by every foot of this road, and so we treated him differently, and that is one of the chief reasons we have gotten where we are.

"It seems to me that part of the answer to this would be, where do we determine the fair share? I think that this developer still does have an obligation to provide circulation, and this makes the Seminary no different than anyone else who will share in the road. He still has a certain obligation. If a fair share is determined only on what use is made of that road by the students living there, it would be very small. Because one of the reasons it was put out there was that the Seminary didn't want a road going through the Seminary property. I think we have to find some other measurement. I don't know how to do it, maybe we have to set an arbitrary percentage."

Commissioner Schultz: "They have it in there, a proportionate benefit to the property owned by the Seminary likely to improve other property located on Strawberry Point....."

Commissioner Azevedo: "The point I'm trying to make is the same one made before, that when the Seminary got the route of this road moved out of the center of its property to the outside, it still didn't, in my opinion, lose its obligation to provide the road."

There was some discussion among the Commissioners as to the interpretation of this particular part of the agreement and as to the intention.

Mr. McCarthy: " I believe in spelling out what you are thinking, and if that's what you are thinking you should spell it out and put it in writing."

Commissioner Azevedo: "I don't know how to put it in quantative terms in determining what is a fair share. However, it is something we could work on. Another point which was brought out was that we allowed the Seminary to substitute an original road alignment that went through only their property, to an alignment which now has a 'missing-link'. I would be ineterested in exploring the possibility of writing a condition into the agreement that they provide an alternate connection through land owned entirely by them. In the event that we can't condemn this other piece.

" The third point here was the point about allowing the grading and filling already done by the Seminary to be included in their share of the cost. I wondered if Mr. Cuzner's suggestion, that it be determined on the basis of its value, rather than what the Seminary actually spent. For one thing, if the road were starting from scratch the grading and filling would be included in the overall estimate, and if we once accept the principle of sharing the cost of the road, then why would we not include everything that has been done?"

Chairman Upton: "Mr. Landels, do I understand that you would be agreeable to providing in this agreement, that if the route is for some reason or other unobtainable, the 'missing-link', that you would provide an alternate route?"

Mr. Landels: "Yes, we discussed that with Mrs. Summers. We are willing to agree that if it is impossible to condemn the 'missing-link' then we will provide an alternate route. However, there is no great problem for the County to condemn it and get it when they want it.

" The County could condemn a strip right across the middle of the Seminary if it wanted to."

Chairman Upton: "It could attempt to 'condemn'."

Mr. McCarthy: "We are not saying that the County can't condemn this road, but there could be many difficulties which would come up, this thing may not actually be able to fit out there in the mud when they really get going on the engineering... The part you are talking about is in tide lands, and it may actually sit out in the water, which may be at high tide 3,4,5 or 6 feet deep. I feel that there should be a reservation here.."

(Here Mr. McCarthy and Mr. Landels are in argument which cannot be heard sufficiently well for transcription)

Mr. McCarthy: "...I think the words should be something like this... If the County finds that it is not feasible, based on findings of the County, then an alternate route shall be provided."

" In other words don't pin yourselves down to condemnation...it was said the other day that someone said 'you can't build a building on that site', and it was answered that 'you can build a building on any site, it is a question of dollars and cents,' and I think there is a lot of truth in that.

Mr. Landels: "From the report of your Road Commissioner it has already been said that it was entirely feasible."

Commissioner Schultz: "Would it be of any assistance if we proposed, say "Exhibit A", it's plotted on a map, and a legal description won't do us any good?"

Mrs. Summers showed the plans of the Seminary and the road to the Commissioners. The Commission discussed things among themselves.

Commissioner Azevedo: " This is the obligation we require of other developers..... do you want to take this wording down?..'if the development of this road is not feasible in the time by which the road is needed, the Seminary shall provide an alternate route on property fully owned by it'."

Chairman Upton: "Who's to decide when the road is needed?

Commissioner Azevedo: "If the County determines the development of this road is not feasible in the time by which the road is needed, then the Seminary shall provide an alternate route on property fully owner by it."

Chairman Upton: "Any other points on this?"

There was some discussion as to criteria to use in determining fair share of costs.

Chairman Upton concluded he thought the agreement needed some going over, and should be continued, and notice be taken of the points which have been brought out, and a new agreement be written, that embodies those points.

Commissioner Azevedo pointed out "...that the Seminary has an additional obligation for a share representing more than its beneficial use. That's the second point. The third point is the question of how much of the actual grading and filling has been put in. That leaves these two points, the first one seems to be pretty well agreed on."

Chairman Upton: "I would think that this agreement could be reworded and the thoughts which have come forth today be so placed, and I would suggest that you deal with Mrs. Summers. If any legal points come up, then have the County Counsel approve the wording etc."

Mr. McCarthy: "I would like to be present when these points are discussed with County Counsel; so that I may advise him on just what I think the Commission's viewpoints are.

"I feel that it is perfectly clear what you have said today that you want, but it seems that Mr. Landels doesn't want me to have any part of it. My feelings aren't hurt, but I feel if there is another agreement written like this, leaving holes like this, we will be spending another meeting like this trying to analyse what has been written.

"If we could have a meeting between Mr. Landels, Mrs. Summers, Mr. Jordan and myself, I think we could come up with, particularly if we have a transcript of these minutes, an agreement which would be acceptable to all parties concerned."

Commissioner Azevedo: "I can't quite escape the feeling that Mr. Neider is somewhat involved in this, and he is the only other owner of lands beyond, and that is what the whole question of circulation applies to. Therefore, I really can't see why we couldn't have a committee meeting including the people and possibly a Commissioner to see if we can work out some wording, maybe we won't, but maybe we can get closer and come up with something with which the Commission is in agreement."

Chairman Upton: "Is that agreeable Mr. Landels?"

Mr. Landels: "We will do everything in our power, but sooner or later ..... (unable to be transcribed)

Chairman Upton: "I might state that I have been here and followed this thing through completely from the beginning, and I will say that it actually has been a lot of attrition on the Commission. It started out one way, went another and still another way, and in my way of thinking I feel that the Seminary has a large responsibility for circulation, maybe not the complete responsibility, but I think that they have a responsibility, because in the first plans and the second plans that were presented, it was their total responsibility. I would think that if a meeting could be arranged before our next regular meeting, between Mrs. Summers, Mr. Landles, Mr. McCarthy and anyone else who would be interested in this, any of the Commission that wished to be present, I think they should be there, and Mr. Neider, or Mr. Neider's representative."

Commissioner Schultz: "He might even be willing to come into the agreement as a share of it himself."

Mr. Landels: "We are the only ones required to do anything now, and I am not very happy to have five or six people get their words in. We are assuming a very real obligation.. "

Commissioner Azevedo then moved that this matter be continued until the meeting of January 6, 1958, and in the meanwhile these points that have been an issue here, be discussed by a committee to consist of representatives of the Seminary, Mr. Neider, the Planning Staff any Commissioners who wish to be present, County Counsel and a representative of the Road Department if deemed necessary.

Mrs. Summers: "I have one further suggestion. If this is going to be a committee, that a member of the Board of Supervisors, either the Chairman or the member of the district, might be present, since they are the ones who are going to be hearing this all over again, and they might like to know what's in it."

Chairman Upton stated that he felt that this meeting should be set up by phone as all parties are not present who would be interested.

It was suggested that perhaps this matter could be continued at a later date in January because of the Christmas holidays making it rather hard to get people together.

Chairman Upton felt that if the committee's findings were not complete by the meeting of January 6, 1958, then it could again be continued. He didn't feel that this postponement would hurt the Seminary in any way because their building permits had been approved already.

It was brought out that they have another group of buildings going to bid in December.

There was no second to Commissioner Azevedo's motion.

Commissioner Schultz: "I move that this matter be continued to January 6, 1958, and in the meantime a revised agreement be prepared embodying the change regarding the alternate route, and the determination of a fair share, and that the agreement in the meantime be submitted to Mr. McCarthy for his recommendations, and a final agreement be reported back by the next meeting."

The motion was seconded by Commissioner Ludy and unanimously passed.

APPLICATION FOR USE PERMIT - Bethel Baptist Church GRANTED 10,630

The Commission considered the application of the Bethel Baptist Church for a use permit for the construction of a church sanctuary and educational building on property described as a Portion of Lot 49, Novato Ranch Subdivision 8, located on the south side of Novato Blvd, approximately 130 feet east of Simmons Lane, Novato.

Communication was read from Mr. & Mrs. Dewitt Lee in protest.

For report and recommendations as given by Mr. Dobbs, see Staff Report of December 16, 1957 pages 7 & 8.

The pastor of the group spoke stating that the posted plan had been submitted by the architect as the site study plan but they now only plan a 300 seating capacity in the sanctuary and only one educational building directly behind the first building to be built so all the remaining rear area would be for parking.

Commissioner Cuzner didn't feel that there was any conflict of use here, but that it was a matter of traffic and parking. He referred to another parish hall in the area which has off-street parking, but when it is in use there is a traffic snarl.

DEC 16 1957

5. RECONSIDERATION OF DEVELOPMENT PLAN - Golden Gate Baptist Seminary
Continued

Dr. Graves and his attorney, Mr. Landels, met in this office with Mrs. Summers, Leland Jordan and Marvin Brigham and had with them a proposed legal document which would be their guarantee to go forward with the road construction when required by the County.

Messrs Jordan and Brigham appeared to feel that the proposal would be satisfactory and acceptable to the County and both were to work further with Mr. Landels on details. A report will be ready for presentation at the meeting.

STAFF REPORT

DEC 16 1957

SPECIAL MEETING - January 30, 1958.

Commissioner Azevedo moved that a special meeting be held on January 30, 1958 at 8:00 P.M. to discuss this matter.

The motion was seconded by Commissioner Schultz and unanimously carried. JAN 6 1958

Mrs. Summers suggested that the County Counsel and Mr. Brigham be invited to be present, and to so advise the Board of Supervisors.

RECONSIDERATION OF DEVELOPMENT PLAN - Golden Gate Baptist Seminary
Continued
PART APPROVED
PART CONTINUED

Mrs. Summers explained that on Tuesday, December 24, 1957, Dr. Upton and herself had met with Dr. Graves and Mr. Landels to discuss the revised agreement proposed by the Seminary for the improvement of W. Strawberry Drive. She stated that copies of this revised agreementd had been submitted to Lee Jordan, Bryan McCarthy, Mr. Brigham and Commissioners Schultz & Azevedo,, in order that they might make any comments, recommendations or suggestions, at this time.

Mrs. Summers reported that this matter had been placed on the Board's agenda for Tuesday 7th, and that Mr. McCarthy had requested that it not go to the Board so soon; that Dr. Graves had been informed of Mr. McCarthy's request. JAN 6 1958

She said that Mr. Brigham has not had time to look at the revised agreement, due to illness.

Mrs. Summers: "In essence the new agreement makes three changes: (1) It drops any mention as to how the 'fair share' of the road cost would be determined. (2) It provides for an alternate route through the Seminary, in case this road as planned is not feasible, and this change is worded as follows: 'If the Board of Supervisors shall at any time determine, after being advised by its legal advisor that it is not possible legally to acquire the additional lands necessary to complete the right of way for said road or after being advised by the County engineering department that it is not possible except at prohibitive cost to construct said road, that the completion of said road is not feasible, then Seminary agrees to provide an alternate route through its lands.' (3) It now provides that the Seminary will be credited with the value of the present improvement rather than their cost, which Mr. Cuzner pointed out in the original agreement is possibly not a fair determination."

Mrs. Summers stated she and Dr. Upton felt these changes reflected the main points which had been brought out at the last meeting of the Commission.

Commissioner Azevedo asked Mrs. Summers if when they sat down to discuss this matter, did they think of leaving out altogether the mention of "fair share."

Mrs. Summers pointed out that a fair share of any property under an assessment district was determined by the engineer, and various engineers use various methods of determining this. In this case, it would be up to those making the determination what basis they felt would be reasonable and against what lands they felt would benefit.

Mr. McCarthy then reviewed at length the actions of record on the Golden Gate Baptist Theological Seminary to show the changes and the change of thinking that have taken place since the first approval of the Use Permit.

Chairman Upton stated that the building program will be held up if there is not some determination of this condition of the development plan.

JAN 6 1958

Mr. McCarthy then requested this item continued since something this important shouldn't be rushed into at the last minute.

Mr. Landels gave a history of the development of the Peninsula, stating that Mr. Neider owned the entire area, and that the agreement of sale to the Seminary, which constitute seven separate agreements, involves obligations between Mr. Neider and the Seminary. He stated that he had a complete file of those agreements and anyone who wished to do so was welcome to look at them. He then reviewed the revised agreement.

Commissioner Azevedo asked Mr. Landel if he had said that the Seminary had built E. Strawberry Drive.

Mr. Landel stated that it has been financed by the Seminary and that they gave $255,000. And that $150,000 was deposited in a bank for the building of East Strawberry Drive.

Commissioner Azevedo asked if the construction of E. Strawberry Drive and the access into the point was all that was required to serve the subdivision and would the planning staff feel that that fulfills Mr. Neider's obligation, as far as his own subdivisions were concerned? Presumably then the approach of E. Strawberry Drive was what was or would have been required from Mr. Neider?

Mr. Hammond, speaking for the property owners, asked that this matter be continued. He said that he was amazed at the change which had taken place the past year. He wanted the matter continued in order to inform the people of the area regarding what has happened so that they could be heard.

Mr. Landel stated that the question of whether or not the road was going in was not the problem. But to delay giving the Seminary building permits on the housing, until all of the road is accomplished will be a very serious matter. He continued that if they were given building permits, they were willing to go on with this discussion with any group or at any time. He stated that this matter has been put off every two weeks now since back in October 1957 and they now want an answer. "We now have our plans out to bid and they will come in soon and we want to have some assurance that we can get building permits. We expect that we will be actually in construction on this property by the 1st of February. I think we have gone into the problem in detail, and this might as well be that last one big meeting. At least we need the approval of this group to get building permits for the housing which is so very essential to our opening. Time is of the essence, June a year from now is the absolute deadline for the opening.

"The problem involves between a million and a half to two million dollars worth of building, so it is very important that we take advantage of every bit of time we can."

Commissioner Cuzner said that this matter had been before the Commission for so long that it was no longer clear to him as to what was being considered under this reconsideration.

He felt that he was in agreement with Mr. Landels and Dr. Graves that they have it exhausted as to study of this thing and he would like to bring it to a head. He asked if they should have a motion now, just what would it be on?

Commissioner Schultz explained that it would be to recommend to the Board of Supervisors that the County enter into this agreement in lieu of any bond that would be required, prior to the issuance of any building permits.

Commissioner Azevedo asked if this was the question of the bond.

JAN 6 1958

She was answered in the affirmative, but that then the question of whether the bond should cover the whole road or a part of the road had come up and it had been at this point ever since.

Commissioner Schultz wanted one point clarified, and that was, that this was only the first stage of building which the Seminary was seeking building permits for at this time.

He was answered in the affirmative.

Mrs. Summers: "In the first place you granted a use permit with conditions, one of the conditions was that the development plans must be approved by the Planning Commission. Under that condition plans were approved subject to conditions, one of which was the construction of this road. That condition has now been changed from requiring the construction, to requiring the bond, removing this portion from Gate 3 to Gate 1 from the requirement of bond or making it a dedication.

"I have always advised not to issue your final building permits until this was done, because this was your final hope of getting a road constructed. We are all saying, 'fine go ahead and issue your final building permits and go ahead with construction,' but I would like to advise that we don't lose the major control if occupancy of the building are withheld."

Commissioner Schultz: "I think that we have exhausted this thing, and we have considered this agreement and the one presented last time. As near as I can recollect, the changes that were suggested and indicated at our last meeting have been incorporated in this revised agreement.

"The provision for an alternate road seems clear in the agreement to be within the control of the Board of Supervisors, not at their complete discretion, but at least within their control to a reasonable degree.

"The provision for a 'fair share' by arbitration seems to be the only practical way of approaching the problem at this present time."

Commissioner Schultz then moved: (1) That the Commission recommend to the Board of Supervisors that the County enter into this improvement agreement with the Seminary, and that they accept this agreement in lieu of the bond, subject to the County Counsel's assurance that the agreement covers the necessary legal points. (2) That upon the execution of this agreement the building permits for the first stage of building be issued.

Commissioner Scott seconded the motion.

Commissioner Azevedo: "I think that the reason we have gone into this so exhaustively and exhaustingly, is that when we made our original change in position, to use Bill Wright's old expression, 'we opened a can of worms'. And I have become more and more aware of that as we have gone on and on, and it seems to me that we have been getting deeper in the morass instead of out of it.

"When we started, the original position of the Commission at that time, was that the developer provide circulation to lands beyond and the Seminary was the developer. We had a shift in that, we said the Seminary is different from other developers because the Seminary doesn't profit from each lot along the road, and so the Seminary shouldn't pay it all. I think the question that we didn't consider carefully at the time, I'm sure I didn't, was then who should?

" I remember the thought being in my mind, that perhaps the public should pay part of it if it could be seen that the route around the shoreline had benefits to the general public, that the route across the Seminary didn't have. However, if we should make a decision like that, then that is a very serious thing, because it means we are setting a precedent that the County pay part of roads, and up until now the County never has.

JAN 6 1958

"Then the solution proposed was that we use this agreement instead of a bond, that says the Seminary pay its 'fair share' and that it

JAN 6 1958

should be determined on the basis of the benefits received. But there has been a 'slight-of-hand', I don't mean secretly but in a sense, because the road got moved, from where the Seminary people were using it for immediate access, to where it was on the fringe of the property and they were not using it much. This would mean that if we apply this criterion 'benefits received' the Seminary might only pay a very small portion because their traffic isn't using it, and that the property owner out at the point, Mr. Neider, would pay the big portion because his people would be using it for their access. I am not sure that this would be fair. If he has done his share, regardless of any private agreements, If he has done his share by building E. Strawberry Drive, should he be required to pay a big share of this road? I don't know.

"I'm not satisfied with this agreement, because it doesn't tell me, there is not enough to tell me, how this is going to turn out. Maybe it's going to turn out with the Seminary paying 10 to 20% and other property owners paying much more. I think that is not fair, because the Seminary made the original change to move the circulation from the middle of its grounds to the fringe.

"If the Recreation Department is going to take some land in there and they want it on the shoreline, then they might participate in building the road; if property owners other than Mr. Neider are going to develop then they are going to see a great use of it. Then I could understand better how this 'fair share' might be worked out, but without that, and only this agreement to go on, my inclination would be to go back to the original premise, that the Seminary is the developer and the developer should pay for the circulation road. I've come to a full circle on this. I was the one who proposed an agreement and that we go over it again, but with further thought I don't see it as a solution unless we should go on in much greater detail and find land owners other than Mr. Neider who would rightfully participate in this construction and possibly even the County."

Chairman Upton felt that this agreement was about as far as the Commission could go since the road position has been changed. He didn't think that the Seminary was in the same category as a private developer inasmuch as they have no product to sell, they have no lots to sell, and from a precedent setting standpoint they would not be vulnerable, because it is a different type of thing entirely. He felt that the best way to accomplish the building of a road like this is with an assessment district, but other than that this agreement would seem to be all right.

Mr. McCarthy referred to Chairman Upton's last statement and wondered why this was all they could do.

Chairman Upton reviewed the motion and asked for a roll call vote.

Mrs. Summers: "Dr. Graves asked that if this was approved today it go to the Board of Supervisors tomorrow, and I have asked the County Clerk to place it on their agenda. Under this motion then, I would only report to the Board that this is ready for the Board but has not had the review of the County Counsel."

Commissioner Schultz said that he thought Mr. Jordan had reviewed this agreement.

Mrs. Summers stated that he might have an answer on this for tomorrow.

Mr. McCarthy strongly objected to having this go before the Board so soon, because he felt that it was a "rush act." He said that it should have at least a week before it went to the Board.

The roll call vote was as follows:

JAN 6 1958

AYES:	Commissioners:	Schultz, Scott
NOES:	Commissioners:	Azevedo, Cuzner, Ludy, Upton
ABSENT:	Commissioners:	None

Commissioner Azevedo stated that she would agree to substituting such an agreement for a bond, if it were to show specifically in it that the Seminary was accepting the obligation for circulation as well as for benefit received.

Chairman Upton stated that he also was voting no for the same reason as Commissioner Azevedo. He felt that the Seminary has some responsibility for the circulation, if not all, and it has not really been shown.

Commissioner Cuzner then moved that the Commission deny reconsideration.

The motion was seconded by Commissioner Ludy.

The motion was clarified as now meaning; that a bond would be required before building permits were issued.

Commissioner Schultz: "Do you have a basis on which to suggest a method by which the bond amount can be determined?"

Chairman Upton: "I would think in order not to hold up the Seminary, we could approve the building permits and not the occupancy, and give this thing a little more study, perhaps some agreement can be arrived at whereby there is the responsibility shown for circulation."

Commissioner Azevedo: "I'm willing to give it one more try, to find a solution which doesn't put an unfair burden on other property owners."

Commissioner Azevedo recalled at one of the meetings she had asked Dr. Graves if he was objecting to the bond or objecting to putting in the whole road and it was her recollection that he has said "both."

Chairman Upton: "I'm sure this thing will be worked out some way or other. I would think the basic thing, as far as the Seminary is concerned, is the fact that they are interested in getting on with their building. As Mrs. Summers stated, there is one more step we can go whereby the County still has control, and that is, to approve building permits without occupancy and then see if we can work out some agreement which satisfies everybody. I think it can be done."

Mr. Landel: "We have never objected to discussing this matter in any way or at any time, but all this time has gone by and we need building permits to move ahead. If you want to do it without occupancy and have that control over it we are perfectly willing to do so."

Mr. Hammond: "I believe it has become apparent to the Commissioners that the Seminary has a moral obligation; if not a contractual one, to provide this road, and always has had. As I see it, the only sensible position you have is the original one; to project the road through the Seminary property, and that it be bonded to provide for it.

"I make these two comments; (1) the bond can be determined by the Public Works Department and they can proceed with their construction just like anyone else. That bond, like any other agreement is subject to change if it is shown later that it is not equitable. It seems to me that's the best suggestion.

" (2) You know as well as I do, that if theSeminary doesn't build that road it will never be built, because there are no public funds available, either recreation or otherwise. That road was on there when they bought the property, and I feel that your only recourse is to require this road to be put in, in a normal manner, and that it be bonded."

Commissioner Cuzner withdrew his motion and Commissioner Ludy withdrew his second to it.

Commissioner Schultz then moved that the conditions of approval of the Development Plan be amended to the extent that the balance of the building permits, for the first stage be approved without the necessity of a bond, but that certificate of occupancy be withheld pending final determination of the matter of the agreement or bond.

The motion was seconded by Commissioner Cuzner and it passed by a unanimous roll call vote.

5. RECONSIDERATION OF DEVELOPMENT PLAN - Golden Gate Baptist Seminary
Continued

On Tuesday, December 24, 1957, Dr. Upton and Mrs. Summers met with Dr. Graves and Attorney Landels to discuss the revised agreement proposed by the Golden Gate Seminary for the improvement of West Strawberry Drive.

Copies have been submitted to the County Counsel, Bryan McCarthy, Director of Public Works and Commissioners Schultz and Azevedo.

The Changes in the revised agreement are: 1. Drop any mention therein as to how the "fair share" will be determined. 2. Provide for an alternate route through the Seminary (see paragraph 6 last page) and 3. Provide that Seminary will be credited with the value of present improvements rather than their cost.

JAN 6 1958
STAFF REPORT

JAN 6 1958
-5- STAFF REPORT

Subject to receiving and reviewing comments from others, it is Mrs. Summers' impression that this revision meets the majority opinion of the Planning Commission as expressed at the last meeting.

MINUTES OF THE PLANNING COMMISSION
COUNTY OF MARIN, STATE OF CALIFORNIA

A special meeting of the Marin County Planning Commission was held on Thursday, April 3, 1958, in the Marin County Office Building, 1711 Grand Avenue, San Rafael, California.

COMMISSIONERS PRESENT: Wm. F. Upton, Chairman
Niels, Schultz Jr., Vice Chairman
George Ludy
James Cuzner
Margaret Azevedo, arrived at 8:25 P.M.

COMMISSIONERS ABSENT: George Scott, Secretary

OTHERS PRESENT: Mary R. Summers, Planning Director
R. J. Darnell, Planning Engineer
B. D. Dobbs, Zoning Administrator

The Chairman called the meeting to order at 8:00 P.M.

RECONSIDERATION OF USE PERMIT CONDITIONS
Golden Gate Baptist Theological Seminary
Continued Hearing

Mrs. Summers reviewed the previous actions of the Commission relative to the alignment and improving of West Strawberry Drive in conjunction with Use Permit grant to the Golden Gate Baptist Theological Seminary to locate on Strawberry Point.

Mr. Landels, Attorney for the Seminary, stated that the Seminary had no objection to the dedication of right of way for Strawberry Drive but felt that Dr. Graves would be disloyal to his trust if he constructed the road around the point, considering the source of the money. He felt that the need for the road was not caused by the Seminary and that the Seminary would have little use for it. He further questioned the Commission's legal right to make the requirement.

Dr. Graves supported Mr. Landel and stated that the Seminary did not consider the Commission could legally require the Seminary to construct a road for which he contended the Seminary had little or no use.

Bryan McCarthy, Attorney for Sam Neider, again reviewed the Commission's previous minutes on this matter bringing out the point that the Seminary had originally accepted the responsibility of complying with the master plan for Strawberry Point Neighborhood in the design of the Seminary and had gradually moved West Strawberry Drive to the perimeter of their property, after several sessions with the Commission, in order that it would not bisect their campus.

Chairman Upton had Dr. Graves verify that for sometime in the future there was planned a village development as a part of the Seminary which would have West Strawberry Drive as its access.

Chairman Upton had all of the prior motions of the Commission read and Commissioner Azevedo had Mrs. Summers review the original Strawberry Point Neighborhood Street and Highway plan in order to show that the Seminary had purchased land through which the major circulation of the Strawberry peninsula would run.

Mrs. Summers was asked to estimate the traffic volume which might occur through the Seminary, had the original master plan for West Strawberry Drive been followed. From estimates of traffic made by Rolland Hammond who drafted the Strawberry Master Plan and traffic estimates made by the Staff during hearings on the U. S. 101 Freeway agreement in this area, she estimated that about 5,400 movements would be the volume under the conditions suggested.

Commissioner Azevedo said she had been willing to try to work out some simple arrangement that would apply here and had been waiting for Dr. Graves and Messrs. Landels and McCarthy to produce and harmonious solution. She then stated her opinion that the Commission had no alternate but to require the Seminary to provide for a circulation as all other developers. She pointed out that the County had not excused other groups because they were churches or non-profit groups. She further pointed out that if the Seminary felt that the road around the point as planned by the Seminary was too long and too expensive and does not give them service then they could return to their original plan with the major route through the Seminary.

Commissioner Azevedo then moved that the Commission return to its original condition. This motion was discussed as to its wording and reworded as follows: That in accordance with the condition on the Use Permit the grading and site plans are approved by this Commission subject to the condition that the Golden Gate Baptist Seminary be required to build a circulation route in accordance with County standards through their property either along the shoreline as now shown on the plans, or on an alternate route which had been approved by the Planning Staff, and that a bond, in the amount of the cost of the road be posted before occupancy to assure construction within a two year period.

The motion was seconded by Commissioner Cuzner and passed by the following vote, to-wit:

AYES: Commissioners: Ludy, Cuzner, Azevedo and Upton
NOES: Commissioner Schultz
ABSENT: Commissioner Scott

Prior to voting on the motion the Commissioners discussed again that the Seminary had requested the rerouting of West Strawberry Drive from a location through their property which would have been of service both to the Seminary and the neighborhood to the a route around the shoreline which would not have as direct a benefit to the Seminary in traffic service but would remove traffic foreign to the Seminary from travelling through it.

Dr. Graves pointed out that a route through the Seminary was impractical under the present plan and grading which had been accomplished.

Mrs. Summers was asked by the Chairman to obtain an opinion from the County Counsel as to the possibility of an appeal on the Commission's decision to the Board of Supervisors.

PETITION TO AMEND ORDINANCE NO. 264 - J. E. Andreu
Returned to Planning Commission by Board of Supervisors

The Commission further considered this matter, first hearing a report from Rowland Darnell that he had again inspected the property in the field with Mr. Stokes, Deputy Public Works Director. Mr. Stokes had stated that any subdivision of this property would create a drainage problem but that two or three additional homes in the subdivision would not add substantially to the problem.

Chairman Upton summed up the staff's finding that the development of a few more houses in a specified area would make only a negligible difference in the drainage problem.

Mr. Stokes did say, however, that the overall affect of subdivision would of course be to aggravate the drainage problem.

Commissioner Azevedo commented that in the original review of this matter it had been the Commission's decision that to follow the slope policy and require large lots on hillsides also permitted in all fairness the more minimum lots on level terrain, if the smaller lots were in keeping with neighborhood development.

She also asked if a solution to the whole flood problem to Tamalpais Valley might be establishing a much larger minimum lot size, say one-half acre, for all properties in the valley, and commented that this was a basic policy question for discussion.

Harold Stockstad, resident of Tamalpais Valley, agreed that if this rezoning would only increase by one or two the number of houses expected out of the subdivision of about 50 houses, there would be a negligible effect upon drainage, but stated they had not protested entirely on drainage but on changing an established zoning.

Commissioner Azevedo stated that to try to solve the Tamalpais Valley Flood control problem by zoning was inappropriate. By denying this zoning the Commission would be saying, in effect, "If the zoning is 10,000 square feet you had better adhere to it. On the other hand if it is 7,500 square feet you had better bring the sizes up to the larger lots under the slope policy." She felt that if we were going to consider a subdivision under the slopepolicy the larger lots in turn could be balanced somewhat by permission to use a smaller lot in the area where the terrain would permit it.

Commissioner Schultz moved that the Commission report to the Board of Supervisors that the effect of the change in zone classification would appear to be to increase by three or four the number of lots in a subdivision of the land and this would have negligible effect on drainage and that the Commission feels that their previous recommendation to change the zoning is still valid. The motion was seconded by Commissioner Ludy and unanimously carried.

COMMUNICATION - Warren Callister

A letter from Warren Callister requesting a discussion regarding means of furthering a study on hillside development was read.

Subject: Comment for the EIR for the Seminary (North Coast Land Holdings Project)
Attachments: Public access bench concern for EIR.png

I believe this should be addressed to: Rachel Reid, Environmental Planning Manager, however if there are other ways for this comment to be added to the EIR record, please do so. Thank you.

Hello, I am Steve Bower, the owner of 1 Strawberry Landing, Mill Valley, CA. 94131 Parcel 043-293-65

My neighbors who live at 2 Strawberry Landing, are also the owners of Parcel 043-293-08, a plot of land down on the water through which they have their right of way to their dock. The parcel is about a four minute walk from the Herring Drive entrance to the Seminary off of E. Strawberry Drive.

On this parcel there is a bench which, I believe, is a public access bench. There is a little sign saying so on the access stairs down to the parcel. I don't know the history, but I've heard it's some sort of compromise holdover from how parcels were broken up many years ago when the property of the Sisters of Mercy was subdivided. But, truthfully, I don't know.

I've lived at this address for roughly seven years, and the number of people who have bothered to find this public bench, is very, very, very small, roughly one or two a year. The bench is close to our house, and if people are there talking, etc. we are acutely aware of them. It has never been a problem because it gets no traffic.

My concern is that if a High School is included as part of the Seminary property, and when little area is discovered by kids, then it will become a hangout of some type for groups, drugs, etc. and become a nuisance problem.

Therefore, I would like this issue to be included in the EIR report. I have attached a map of the parcel which may help explain it.

I believe a viable solution would be to simply remove the public access. I don't think it would impact almost anybody, and I think the owners would be ok with that as would I. I don't know what process, zoning changes, etc. would be needed to effect that change.

Please acknowledge the receipt of this message, Thanks, Steve Bower. 415 602-6163

Subject: Seminary property EIR--Hydrology section
Attachments: IMG_9522[1][6][4].jpg; request #2 re EIR.docx

To: Rachel Reid and Michelle Levinson
From: Strawberry Cove Condominiums
Re: Seminary property EIR----Hydrology

The NCLH Seminary property EIR should include an evaluation of the hydrological impact on our property, the Strawberry Cove Condominiums complex at 110, 120, 150, and 160 Seminary Drive.

During the summer of 2018, we observed Mixus Services Inc. (MSI) relining the two storm drain pipes under the street in front of our buildings at 150 and 160 Seminary Drive. This was done under contract between MSI and Marin County. These corrugated metal pipes which collect drainage from the The Seminary (the uphill property) channel the water under Seminary Drive at Gilbert Ave and at the sinkhole in the Seminary playing field. Both pipes were badly corroded, leaking, and therefore required relining.

These downstream pipes connect directly to the ones underneath our Condominium property. None of the water carried by these pipes originates on our property. The Strawberry Cove Homeowners Association (SCHOA) Board and our 72 owners became very concerned that the two drains containing the runoff from the Seminary which are under our property could be similarly compromised.

In November 2019 we hired Mixus to video the storm drains which run under our property and are very close to buildings 150 and 160 Seminary Drive. At your request, we can forward a copy of their report including the expensive estimate for repair, the photos, and a thumb drive containing the video which verifies that the pipes that run under our property are also corrugated metal, are similarly very badly corroded, and are definitely leaking water into the subsoil. Additional proof of the pipe leakage is evident in several areas of our lawn and the path behind both buildings where are constantly wet in dry weather.

Our property does not contribute any water at all to these storm drains, and they do not empty onto our property. All the water comes directly from the Seminary property, runs under our property, and then empties into the bay.
We are extremely concerned about the existing pipes under the ground near the 150 and 160 buildings as they are parallel to and in close proximity to the structural footings for our buildings. The leakage from these drainage systems could very well be compromising the structural integrity of these foundations where 36 of our homeowners reside.

Thank you for your attention to this issue of great concern to us.

Subject: North Coast Land Holdings, LLC. EIR Scoping Comments

Dear Planning Department,

I have two main areas of concern regarding the scoping of the EIR for North Coast Land Holdings' proposed development for Strawberry:

1) **Exclusion of 1,000 person school from project description.** The project description acts as if the school is not being developed now so I fear it may not be analyzed as part of the EIR. I believe it is critical to evaluate the impact from a school along with the rest of the project. Since no description is provided for the school, the worst-case scenario of a commuter school should be used in the EIR along with the other components of the project. Not including the worst-case school would make the EIR worthless for issues such as traffic. The key question is what should the project be compared against? My belief is the project with a 1,000 person commuter school should be compared to existing conditions or conditions when the Baptist Seminary school was operational.

2) **Traffic**. In my mind this is the biggest issue related to the project, yet it is not listed as one of the 21 topical areas to be evaluated. Presumably it is a sub-category not shown under transportation. A thorough evaluation of the impact on traffic in Strawberry must be considered. It should be based on reasonable estimates of those who would actually use public transportation. It should consider what traffic will be like when the 101 ramp meters are being used. And most importantly, it should include a 1,000 person commuter school along with the described project.

Sincerely,
Kevin Killingsworth
Strawberry resident

Re: NCLH EIR --impact on Seminary Drive

THE TREMENDOUS IMPACT ON SEMINARY DRIVE, A SIMPLE TWO-LANE RESIDENTIAL STREET, SHOULD BE INCLUDED IN THE NCLH SEMINARY PROPERTY EIR.

I'm submitting this request on behalf of the 72 owners (and 125+ residents) in the Strawberry Cove Condominium Complex at 110, 120, 150, and 160 Seminary Drive. This is also for the benefit of the 202 apartments (and 400+ residents) at the Strawberry Shores Apartments, also on this street.

Seminary Drive is a two-lane street, one lane in each direction, with no way of widening the street from our buildings to the entrance to the Seminary property. It is necessary to point out over and over again that the main entrance to the Seminary is directly across from 160 Seminary Drive.

Since Seminary Drive is the only street wide enough and straight enough, most of the vehicles coming and going to the Seminary will be using our street. The quality of life and safety of all of us on Seminary Drive will be impacted forever by the wide scope of the project.

To begin with, all the heavy construction vehicles and equipment will be using our street for several years. And then the main artery for the thousands of people living, working, and going to school on the newly developed property will be coming and going daily on our street forever.

I understand that traffic is not to be directly considered in the EIR, but how can it be ignored? Maybe the issue of our street can come under the topic of transportation or quality of life or safety or noise….

Furthermore, how much time will it take us to get on or off the freeway? How will we safely get in and out of our driveways? What will this do to our property values during the building process? I can imagine it would be difficult to sell any of our condos with such a mess going on. And then there's the impact on the residents of De Silva Island, and people in Mill Valley, Tiburon, and Belvedere.

Unless NCLH can construct a new thoroughfare to and from the Seminary Property, this project seems untenable for the hundreds of us living on Seminary Drive. The plans for

the property would be lovely if only it was located somewhere else.

In my opinion after living on Seminary Drive for 34 years, this project is entirely too large in scope for this area. I believe they need to eliminate many parts of it, especially the school with up to 1000 students.

Respectfully submitted,
Rona Weintraub

Subject: NCLH Scoping Letter (P1490)

Dear EIR Consultant for the North Coast Land Holdings (NCLH) Project in Strawberry (P1490),

When you analyze the environmental impacts of North Coast Land Holdings' proposal to transform the former Golden Gate Baptist Theological Seminary (GGBTS) from a residential seminary to a commuter graduate school for up to 1,000 students plus several additional new land uses, please consider the following historical facts:

1. **Does the Strawberry Community Plan (SCP), which is the governing document for our community, have any legal standing at all?** Most residents of our community advocated for letting the 1984 GGBTS Master Plan (MP) expire in 2017 because:) it was 33 years old and still had not been completed, and b.) County planners and Supervisors regularly would re-interpreted it at will anyway (sorry to be so cynical). But, we reasoned, surely County would respect our SCP. However, given events so far, we have strong doubts that even our SCP will be upheld.

2. **You are not the first EIR consulting firm to analyze the former GGBTS property.** Please review the studies and recommendations of previous environmental consulting firms. In particular, please review the December 12, 1983 "Visual Analysis of the Golden Gate Baptist Theological Seminary Master Plan" prepared by John Roberto Associates. This study conformed to SCP and pre-dated the approval of the 1984 MP.
3. **Before you consider various iterations of plans, please consult Caltrans first to provide the Marin County Community Development Agency (CDA) and all other stakeholders with the current maximum traffic capacity constraints at all of the local interchanges along Highway 101 and SR-131.** Those impacted interchanges include Highway 101 and Seminary Drive; Highway 101 and SR-131 (Tiburon Boulevard/East Blithedale Drive); SR-131 and Knoll Drive; and SR-131 and East Strawberry Drive. Of additional concern to Strawberry residents is the heavily congested northbound Redwood Frontage Road/SR-131 (Tiburon Boulevard) intersection during Peak Hours.

Also note that the traffic signals at the Highway 101/SR-131 interchange are synchronized with 9 other traffic signals that control traffic in Mill Valley. As a result, traffic in Mill Valley, Tiburon, and Belvedere also will be impacted by this project. In addition, traffic will be impacted all along the Highway 101 corridor, especially from Marin City to Sir Francis Drake Boulevard in Larkspur, a section of Highway 101 Northbound that already operates at LOS F during PM Peak.

If traffic improvements are required for the proposed project, the applicant (North Coast Land Holdings, which is a subsidiary of the $3 billion Fasken Oil Trust of Texas) should be required to pay for them. Such improvement payments would be consistent with the provisions of the Strawberry Community Plan.

4. **Be aware of Marin County inter-District rivalries.** NCLH principal Bruce Jones is a resident of District 2. He has no problem proposing oversized, heavy traffic-generating projects in our District 3, but he opposes such projects in his own District. This is the second time that he has proposed an oversized project for the former Seminary property that our community opposes. One would think after the Branson project fiasco that Mr. Jones would want to cooperate and compromise with his fellow neighbors in Strawberry, but the opposite is true. He went “big” the first time, but now he’s going even “bigger.” He has refused to reduce the size of the student body from 1,000 students. His refusal to compromise was the reason that the Seminary Tomorrow negotiations broke down. As a resident of Strawberry for 44 years, I can attest that the Seminary never had 1,000 student commuters per year.

Thank you for considering these facts.

Sincerely,

Bruce Corcoran

Subject: NCLH EIR Scoping Comments

Please include the following items in the EIR process for the former Seminary site:

1. At the scoping session, it was explained that the EIR would consider the cumulative impacts of all projects in the pipeline. In that spirit, I hope the EIR will consider: the 1,000 unit project nearing approval at Northgate; the 15,000 units that ABAG has assigned to Marin as its RHNA target; the potential growth in ADU's that result from the new mandates that came from Sacramento and which have been adopted by the County and other local entities; and other housing mandates coming from Sacramento (e.g., SB330).

2. The scoping session also described the review process. I find it puzzling that there is no role for the Strawberry Design Review Board. This Board is both more familiar with Strawberry and NCLH's proposal than any other entity in the County. It seems an obvious gap that the EIR review process doesn't include them.

3. The contract with the EIR consultants mentions measuring traffic baselines. How is this accomplished during a pandemic when traffic patterns are still atypical (e.g., people working from home)?

4. The contract with the EIR consultants mentions performing LOS analysis at a number of intersections, but the list is missing at least three important intersections:
   Redwood Highway Frontage Road and Tiburon Blvd.
   Redwood Highway Frontage Road onramp to 101 south.
   Redwood Highway Frontage road onramp to 101 north.

5. The primary entrance to the seminary (turning left from Seminary Dr onto Gilbert Dr) is unsafe because drivers can't see oncoming traffic on Seminary Dr until it's on upon them. This is particularly true when there are cars parked on the west side of Seminary Dr.

Thank you,

Josh Sale

Subject: Seminary Project EIR

I request the following item be included and addressed in the Seminary Project Environmental Review:

A traffic study which looks at a high school in Marin County and then overlays that traffic onto the 2 roads entering and exiting the seminary property.
The study should be conducted during months when school is in session. Exam periods, vacations and summer school should be excluded. Timing should be when students are driving to and from school and school activities.
Accurate traffic analysis can not be conducted while Covid-19 is impacting the county schools. The analysis should be conducted when all schools have returned to normal activities which may mean the traffic study cannot occur until 2022 or later.

Possible high schools:

- -Marin Catholic which reports an enrollment of approximately 800 students.
- -Terra Linda High School 1200 students.

Please do not refer to the prior traffic study. I do not think it is accurate or representative of the actual traffic that occurs around an active high school as it did not review HS traffic.

Thank You,
Patricia Albo, homeowner

County of Marin – Environmental Planning Office
Seminary Redevelopment/EIR

To whom it may concern:
I live on De Silva Island and I am writing because North Coast Land Holding's redevelopment plan for the Seminary conflicts in many significant ways with the Strawberry Community Plan. As a resident of Strawberry, I hope and expect that the county will require the developer to adhere to the spirit and letter of the SCP throughout the planning process, including full disclosure of any plans for a proposed school on the site. After all, what's the point of having a community plan - especially one that aligns with the countywide plan - if the county can then allow a developer to simply ignore it?

Thank you.

Michelle,

I was disappointed by this series of communications. I asked for the hydrology and geotechnical studies for the project, a reasonable request when considering the scope of environmental review. You sent me the project page link. I informed you I had already reviewed that and the documents were not there. In response, you sent me the same links again. I did not find this to be productive for either of us.

These studies are necessary for a meaningful comment on the scoping. If they haven't been done, I have no idea how a drainage plan could be developed or the buildings sited and designed. If they have been done, they are public records that should have been made available.

Because these have not been done or have not been provided, we will simply submit the attached May 25 letter without the benefit of update from the studies.

Project ID P1490

Dear Ms. Reid,

We have been retained by the Seminary Neighborhood Association to help provide civil engineering review of the above reference project. We have limited our review questions and comments to CEQA Appendix G (*Public Resources Code sections 21073, 21074, 21080.3.1, 21080.3.2, 21082.3/ 21084.2 and 21084.3*), and ask that these be addressed in the scoping session review.

VI. Geology

The environmental document should review all existing landslides, as the County of Marin has labeled nearly the entirety of this project as being an area of "mostly landslide."

Do the earthwork calculations include any remedial grading to mitigate existing landslides that may need repairs? If not, what are those quantities, and do they impact the import/export of soil?

Do the earthwork calculations include key-ways for all new fill slopes?
There is a planned fill slope that is 28-feet high on the grading plan (sheet C6.10). Given that the fields above the slope drain towards and over the slope, can this be accomplished without a bench?

The rough earthwork quantities show a balanced site. Can all of the excavated soils be used as fill, as shown on the site plans?

TARNOFF
engineering corp.

IX. Hydrology & Water Quality

Does the County of Marin have a provision in their code regarding stormwater treatment for new/replaced improvements that exceed 50% of total existing impervious surfaces onsite? If so, does this project trigger that threshold? If it does, what are the plans to treat the existing impervious surfaces?

XVI. Transportation/Traffic:

The proposed road widths (of existing and proposed roads within the subject property) conflict with the County's standards laid out in the municipal code. The proposed project would seem to require at least "Residential Roads" or "Minor Residential Roads," which have a minimum paved width of 36 feet and 28 feet respectively. The project generally proposes roads with the travel way only 20 feet wide. What are the impacts to the site plan if the roadways need to be widened?

Southern Marin Fire District's minimum roadway radii is 50 feet (for the inside curve). Judson Lane, Shuck Knoll, and Oliver Lane (at the access to Shuck Drive) all appear to have roadway curves sharper than 50 feet. How will fire access equipment navigate these very tight turns? For Oliver Lane, how will a fire truck turn around once it's entered the roadway?

Southern Marin Fire District's maximum roadway slope (without exceptions, which this project does not seem to meet) is 18%. However, this project is in a State Responsibility Area, and so the maximum roadway slope would be 16%. There are portions of the project that exceed that maximum allowable slope. What are the impacts to the site if roadway slopes must be no greater than 16%?

Sincerely,

Tarnoff Engineering Corporation

Michael L. Tarnoff

North Coast Land Holdings – Notice of Preparation (NOP) of an Environmental Impact report (EIR)

Dear Michelle Levenson:

Thank you for including the California Department of Transportation (Caltrans) in the environmental review process for the North Coast Land Holdings project. We are committed to ensuring that impacts to the State's multimodal transportation system and to our natural environment are identified and mitigated to support a safe, sustainable, integrated and efficient transportation system. The following comments are based on our review of the September 2020 NOP.

Project Understanding

The proposed project includes the following components: 1) construct a new 20,000 square feet (s.f.) facility to house a pre-school and fitness center; 2) replace a majority of the existing residences and dorm rooms with a mixture of single-family and multi-family residences and construct new single-family and multi-family residence (336 units in total); 3) construct a new 267,354 s.f. residential care facility; 4) renovate and expand the Administration Building; 5) demolish the existing maintenance building and construct a new 2,200 s.f. one in a different location; 6) install landscape and hardscape improvements associated with the school campus and residential development; and 7) provide open space and establish a network of trails throughout the project area. This 123-acre project site is located north of the Golden Gate Bridge and adjacent to US-101 and the Seminary Drive exit.

Travel Impact Analysis
With the enactment of Senate Bill (SB) 743, Caltrans is focused on maximizing efficient development patterns, innovative travel demand reduction strategies, and multimodal improvements. For more information on how Caltrans assesses Transportation Impact Studies, please review Caltrans' Transportation Impact Study Guide. The detailed Vehicle Miles Traveled (VMT) analysis should include the following:

- A VMT analysis pursuant to the County's guidelines or, if the County has no guidelines, the Office of Planning and Research's Guidelines. Projects that result in automobile VMT per capita above the threshold of significance for existing (i.e. baseline) city-wide or regional values for similar land use types may indicate a significant impact. If necessary, mitigation for increasing VMT should be identified. Mitigation should support the use of transit and active transportation modes. Potential mitigation measures that include the requirements of other agencies such as Caltrans are fully enforceable through permit conditions, agreements, or other legally-binding instruments under the control of the City.

- A schematic illustration of walking, biking and auto conditions at the project site and study area roadways. Potential safety issues for all road users should be identified and fully mitigated.

- The project's primary and secondary effects on pedestrians, bicycles, travelers with disabilities and transit performance should be evaluated, including countermeasures and trade-offs resulting from mitigating VMT increases. Access to pedestrians, bicycle, and transit facilities must be maintained.

- Clarification of the intensity of events/receptions to be held at the location and how the associated travel demand and VMT will be mitigated.

Additionally, potential impacts due to the project generated trips on the US-101 should be analyzed, given that the project is in proximity to US-101. Please submit the transportation impact study to Caltrans when it becomes available.

Sea Level Rise
The effects of sea level rise may have impact on the transportation facilities located in the project area. California Executive Order (EO) S-13-08 directs State agencies planning construction projects in areas vulnerable to sea level rise to begin planning for potential impacts by considering a range of sea level

rise scenarios for years 2050 and 2100. Higher water levels may increase erosion rates, change environmental characteristics that affect materials durability, lead to increased groundwater levels and change sediment movement along shores and at estuaries and river mouths, as well as affect sole pore pressure at dikes and levees on which the transportation facilities are constructed. All these factors must be addressed through the geotechnical and hydrological studies conducted in coordination with Caltrans.

Construction-Related Impacts

Because the project area is within close vicinity of US-101, potential impacts to the State Right-of-Way (ROW) from project-related temporary access points should be analyzed. Mitigation for significant impacts due to construction and noise should be identified in the DEIR. Project work that requires movement of oversized or excessive load vehicles on state roadways requires a transportation permit that is issued by Caltrans. To apply, visit: https://dot.ca.gov/programs/traffic-operations/transportation-permits.

Prior to construction, coordination may be required with Caltrans to develop a Transportation Management Plan (TMP) to reduce construction traffic impacts to US-101.

Lead Agency

As the Lead Agency, the County of Marin is responsible for all project mitigation, including any needed improvements to the State Transportation Network (STN). The project's fair share contribution, financing, scheduling, implementation responsibilities and lead agency monitoring should be fully discussed for all proposed mitigation measures.

Thank you again for including Caltrans in the environmental review process. Should you have any questions regarding this letter, please contact Yunsheng Luo at Yunsheng.Luo@dot.ca.gov. Additionally, for future notifications and requests for review of new projects, please contact LDIGR-D4@dot.ca.gov.

Sincerely,

Mark Leong

envplanning@marincounty.org

Subject: North Coast Land Holdings, LLC, Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal, Notice of Preparation of a Draft Environmental Impact Report, SCH No. 2020090488, Marin County

Dear Ms. Levenson:

The California Department of Fish and Wildlife (CDFW) reviewed the County of Marin's (County) Notice of Preparation (NOP) of a draft Environmental Impact Report (EIR) provided for the North Coast Land Holdings, LLC, Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal (Project) located at 201 Seminary Drive, Mill Valley, CA 94941, Marin County.

CDFW is a Trustee Agency with responsibility under the California Environmental Quality Act (CEQA) §15386 for commenting on projects that could impact fish, plant, and wildlife resources. CDFW is also considered a Responsible Agency if a project would require discretionary approval, such as the California Endangered Species Act (CESA) Permit, the Native Plant Protection Act, the Lake and Streambed Alteration Agreement (LSAA) and other provisions of the Fish and Game Code that afford protection to the State's fish and wildlife trust resources. Pursuant to our jurisdiction, CDFW has the following concerns, comments, and recommendations regarding the Project.

PROJECT DESCRIPTION AND LOCATION

Proponent: North Coast Land Holdings, LLC

Objective: The Project will develop a residential care facility for senior citizens, residential housing, pre-school, and fitness center on the 127-acre Golden Gate Baptist Seminary property. Pre-existing buildings, including seminary dorm rooms, residences, and a maintenance building will be demolished or renovated.

Location: The Project is located at 201 Seminary Drive, Mill Valley, CA 94941. While identified as within Mill Valley, the Project occurs in unincorporated Marin County in census-designated Strawberry. The Project is approximately bounded by Richardson

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Bay to the west, Seminary Drive to the south, Storer Drive to the east, and Ricardo Road to the north. It is east of U.S. Route 101.

The CEQA Guidelines (§§15124 and 15378) require that the draft EIR incorporate a full Project description, including reasonably foreseeable future phases of the Project, and that contains sufficient information to evaluate and review the Project's environmental impact. Please include a complete description of the following Project components in the Project description:

- Footprints of permanent Project features and temporarily impacted areas, such as staging areas and access routes.
- Encroachments into riparian habitats, wetlands, or other sensitive areas.
- Tree removal, including the number of trees by species, diameter at breast height, and health status.
- Area and plans for proposed buildings/structures, demolition of existing structures, renovation of existing structures, ground disturbing activities, fencing, paving, stationary machinery, landscaping, and stormwater systems.
- Operational features of the Project, including level of anticipated human presence (describe seasonal or daily peaks in activity, if relevant), artificial lighting/light reflection, noise and greenhouse gas generation, traffic generation, and other features.
- Construction schedule, activities, equipment, and crew sizes.

ENVIRONMENTAL SETTING

Sufficient information regarding the environmental setting is necessary to understand the Project's, and its alternative's (if applicable), significant impacts on the environment (CEQA Guidelines, §§15125 and 15360). CDFW recommends that the CEQA document prepared for the Project provide baseline habitat assessments for special-status plant, fish, and wildlife species located and potentially located within the Project area and surrounding lands, including all rare, threatened, or endangered species (CEQA Guidelines, §15380). Fully protected, threatened or endangered, candidate, and other special-status species that are known to occur, or have the potential to occur in or near the Project site, include, but are not limited to:

- Tiburon jewelflower (*Streptanthus glandulosus* ssp. *niger*), state and federally listed as endangered, California Rare Plant Rank (CRPR) 1B.1
- Salt marsh harvest mouse (*Reithrodontomys raviventris*), state and federally listed as endangered, California fully protected species
- California Ridgway's rail (*Rallus obsoletus obsoletus*), federally and state listed

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

as endangered, California fully protected species

- California black rail (*Laterallus jamaicensis coturniculus*), state listed as threatened, California fully protected species
- Longfin smelt (*Spirinchus thaleichthys*), state listed as threatened and federal candidate for listing
- Pallid bat (*Antrozous pallidus*), California Species of Special Concern (SSC)
- Townsend's big-eared bat (*Corynorhinus townsendii*), SSC
- Western red bat (*Lasiurus blossevillii*), SSC
- Hairless popcorn flower (*Plagiobothrys glaber*), CRPR 1A
- Franciscan thistle (*Cirsium andrewsii*), CRPR 1B.2
- White-tailed kite (*Elanus leucurus*), California fully protected species
- Oak woodland (*Quercus* spp.), Areas of Conservation Emphasis-Terrestrial Significant Habitat[1] and sensitive natural community[2]

Habitat descriptions and species profiles should include information from multiple sources: aerial imagery, historical and recent survey data, field reconnaissance, scientific literature and reports, and findings from "positive occurrence" databases such as California Natural Diversity Database (CNDDB). Based on the data and information from the habitat assessment, the CEQA document can then adequately assess which special-status species are likely to occur in the Project vicinity.

CDFW recommends that during Project planning and prior to Project implementation, surveys be conducted for special-status species with potential to occur, following recommended survey protocols if available. Survey and monitoring protocols and guidelines are available at: https://wildlife.ca.gov/Conservation/Survey-Protocols.

Botanical surveys for special-status plant species, including those with a California Rare Plant Rank (http://www.cnps.org/cnps/rareplants/inventory/), must be conducted during the blooming period for all sensitive plant species potentially occurring within the Project area and require the identification of reference populations. Please refer to CDFW protocols for surveying and evaluating impacts to rare plants available at: https://wildlife.ca.gov/Conservation/Plants.

[2] CDFW maintains a list of vegetation alliances considered sensitive natural communities based on state and global rarity ranks: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=153609&inline

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

IMPACT ANALYSIS AND MITIGATION MEASURES

The CEQA Guidelines (§15126.2) necessitate that the draft EIR discuss all direct and indirect impacts (temporary and permanent) that may occur with implementation of the Project. This includes evaluating and describing impacts such as:

- Potential for "take" of special-status species.
- Loss or modification of breeding, nesting, dispersal and foraging habitat, including vegetation removal, alteration of soils and hydrology, and removal of habitat structural features (e.g. snags, roosts, overhanging banks, and anthropogenic habitat such as buildings).
- Loss or modification of sensitive natural communities or vegetation associations.
- Permanent and temporary habitat disturbances associated with ground disturbance, noise, lighting, reflection, air pollution, traffic, or human presence.
- Obstruction of movement corridors, fish passage, or access to water sources and other core habitat features.

The CEQA document also should identify reasonably foreseeable future projects in the Project vicinity, disclose any cumulative impacts associated with these projects, determine the significance of each cumulative impact, and assess the significance of the project's contribution to the impact (CEQA Guidelines, §15355). Although a project's impacts may be insignificant individually, its contributions to a cumulative impact may be considerable; a contribution to a significant cumulative impact – e.g., reduction of available habitat for a listed species – should be considered cumulatively considerable without mitigation to minimize or avoid the impact.

Based on the comprehensive analysis of the direct, indirect, and cumulative impacts of the Project, the CEQA Guidelines (§§ 15021, 15063, 15071, 15126.2, 15126.4 and 15370) direct the lead agency to consider and describe all feasible mitigation measures to avoid potentially significant impacts in the draft EIR, and/or mitigate significant impacts of the Project on the environment. This includes a discussion of take avoidance and minimization measures for special-status species, which are recommended to be developed in early consultation with the U.S. Fish and Wildlife Service (USFWS), the National Marine Fisheries Service and CDFW. These measures can then be incorporated as enforceable Project conditions to reduce potential impacts to biological resources to less-than-significant levels. Fully protected species such as California black rail and white-tailed kite may not be taken or possessed at any time (Fish and Game Code § 3511). Therefore, the draft EIR is advised to include measures to ensure complete take avoidance of these fully protected species. CDFW recommends the following mitigation measures be incorporated into the draft EIR to reduce potentially significant impacts to special-status species:

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Mitigation Measure 1: Special-Status Plant Surveys and Avoidance

A Qualified Biologist shall conduct a survey during the appropriate blooming period for all special-status plants that have the potential to occur on the Project site the season prior to the start of construction. Surveys should be conducted following *Protocols for Surveying and Evaluating Impacts to Special-Status Native Plant Populations and Sensitive Natural Communities*, prepared by CDFW, dated March 20, 2018[3]. If special-status plants are found during surveys, the Project will be re-designed to avoid impacts to special-status plants to the greatest extent feasible. If impacts to special-status plants cannot be avoided completely during construction, the draft EIR should outline adequate compensatory mitigation, and, for species listed as threatened or endangered pursuant to CESA, the Project will apply for an Incidental Take Permit from CDFW.

Mitigation Measure 2: California Ridgway's Rail and California Black Rail Habitat Assessment, Surveys, and Avoidance

The CEQA document should outline the location of salt marsh habitat relative to the Project activities. Any Project activities within or adjacent to tidal marsh or suitable California Ridgway's rail (CRR) or California black rail (CBR) habitat shall be avoided during rail breeding season, (January 15 to August 31 for CRR, February 1 to August 31 for CBR), each year unless appropriately timed, yearly protocol level surveys are conducted and survey methodology and results are submitted to and accepted by CDFW, or, the Project implements noise and vegetation avoidance measures below. Surveys shall focus on suitable habitat that may be disturbed by Project activities during the breeding season to ensure that CRR or CBR are not nesting in these locations.

If breeding rails are determined to be present, no activities, visual disturbance (direct line of sight) and/or an increase in the ambient noise level shall occur within 700 feet of areas where CRR or CBR have been detected during the breeding season. If surveys have not been conducted, all work shall be conducted 700 feet from rail habitat during nesting season.

If work must be done during the breeding season within 700 feet of CRR or CBR habitat, noise levels cannot exceed 10 dBA over existing ambient noise levels and a noise attenuating fence or visual barrier must be installed to reduce visual and/or acoustic impacts.

Mitigation Measure 3: Salt Marsh Harvest Mouse Habitat Assessment and Avoidance

The CEQA document should outline the location of salt marsh habitat relative to the Project activities. Prior to impacting salt marsh habitat, a Qualified Biologist or Biological

[3] https://www.wildlife.ca.gov/Conservation/Survey-Protocols#377281280-plants

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Monitor, familiar with salt marsh harvest mouse (SMHM), shall walk through and inspect suitable habitat prior to vegetation removal and search for signs of harvest mice or other sensitive wildlife and plants. Following inspection, personnel, under the supervision of the qualified biologist, will disturb (e.g., flush) vegetation to force movement of SMHM into adjacent marsh areas. Flushing of vegetation will first occur in the center of the site then progress toward the two sides away from the open water areas or in this case, away from impacted habitat. Immediately following vegetation flushing, personnel, under the supervision of the qualified biologist or biological monitor, will remove vegetation with hand tools (e.g. weed-eater, hoe, rake, trowel, shovel, grazing) so that vegetation is no taller than two inches.

After vegetation removal, a mouse-proof barrier shall be placed along the edge of the area removed of vegetation to further reduce the likelihood of SMHM returning to the area prior to construction. The fence shall be made of a heavy plastic sheeting material that does not allow salt marsh harvest mice to pass through or climb, and the bottom shall be buried to a depth of 4 inches so that salt marsh harvest mouse cannot crawl under the fence. Fence height shall be at least 12 inches higher than the highest adjacent vegetation with a maximum height of 4 feet. All supports for the exclusion fencing shall be placed on the inside of the work area. An approximately 2-foot wide de-vegetated buffer shall be created along the habitat side of the exclusion fence. The SMHM exclusion fencing shall remain in operating condition throughout the duration of the Project. The Qualified Biologist or Biological Monitor shall daily inspect the integrity of the exclusion fencing to ensure there are no gaps, tears or damage. Maintenance of the fencing shall be conducted as needed. Any necessary repairs to the fencing shall be completed within 24 hours of the initial observance of the damage. Any mice found along or outside the fence shall be closely monitored until they move away from the Project area.

Mitigation Measure 4: Nesting Bird Surveys and Protections

If construction, grading, vegetation removal, or other Project-related activities are scheduled during the nesting season of protected raptors and migratory birds, February 1 to August 31, a focused survey for active nests of such birds shall be conducted by a Qualified Biologist within 7 days prior to the beginning of Project-related activities. If an active nest is found, Permittee shall consult with USFWS and CDFW regarding appropriate action to comply with the Migratory Bird Treaty Act of 1918 and Fish and Game Code. If a lapse in Project-related work of 7 days or longer occurs, another focused survey shall be required before Project work can be reinitiated.

Mitigation Measure 5: Roosting Bat Surveys and Protections-Buildings

Buildings shall be surveyed for bats by a Qualified Bat Biologist within 15 days prior to any building demolition or renovation. Demolition or renovation plans shall cease if bats are found roosting within the buildings until proper eviction and exclusion plans have

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

been implemented. Eviction and exclusion of bats shall consist of daytime installation of blockage material or one-way exits between March 1 and April 15 or September 1 and October 15 (outside of maternity season and hibernation season). Exclusion materials shall be re-evaluated for effectiveness by the Qualified Biologist up to two weeks prior to building demolition.

Mitigation Measure 6: Roosting Bat Surveys and Protections-Trees

Removal of trees containing suitable potential bat roosting habitat in the form of crevices, cavities, or exfoliating bark, as with exclusion/eviction from buildings, must be conducted only during seasonal periods of bat activity, and under supervision of a Qualified Bat Biologist. Trees within the Project area shall be assessed by a Qualified Bat Biologist within 15 days prior to any tree removal. If trees are identified as potential bat roost trees, tree removal shall occur outside of the maternity season and hibernation season and via a two-step method conducted over two consecutive days. On day one, create noise and vibration by cutting non-habitat branches and limbs from habitat trees using chainsaws only (no excavators or other heavy machinery). The noise and vibration disturbance, together with the visible alteration of the tree, is effective in causing bats that emerge nightly not to return to the roost that night. On day two, the remainder of the tree will be removed.

Mitigation Measure 7: Tree Removal Mitigation

Live trees removed from the Project area shall be replaced on-site at the following ratios:

Oak trees:

- 4:1 replacement for trees 5 to 10 inches diameter at breast height (DBH)
- 5:1 replacement for trees greater than 10 inches to 15 inches DBH
- 15:1 replacement for trees greater than 15-inch DBH, which are considered old-growth oaks

Replacement oaks will come from nursery stock grown from locally sourced acorns, or from acorns gathered locally, preferably from the same watershed in which they are planted.

Other tree species greater than or equal to 6-inch DBH will be mitigated at the following ratios:

- 1:1 replacement for non-native trees
- 3:1 replacement for native trees

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

Sea Level Rise

The Project should assess potential sea-level rise in the area and evaluate development location and habitat impacts with future conditions in mind. The State of California Sea-Level Rise Guidance/2018 Update[4] provides a science-based methodology for state and local governments to analyze and assess the risks associated with sea-level rise and incorporate sea-level rise into their planning, permitting, and investment decisions. The Marin Shoreline Sea Level Rise Vulnerability Assessment/Bay Waterfront Adaptation & Vulnerability Evaluation (BayWAVE)[5] provides context and estimates of the physical and fiscal impacts across the County's bayside shoreline over the coming decades. It includes sea level rise scenarios ranging from 10 inches in the near-term (15 years) to 20 inches in the medium-term (mid-century) and to 60 inches in the long-term (end of century). Since the purpose of the Project is to provide long-term residential and associated structures and it is located on a small peninsula in Richardson Bay, CDFW recommends incorporating the long-term (end of century) scenarios for sea level rise to fully evaluate Project impacts.

REGULATORY REQUIREMENTS

California Endangered Species Act

Please be advised that a CESA Incidental Take Permit (ITP) must be obtained if the Project has the potential to result in take[6] of plants or animals listed under CESA, either during construction or over the life of the Project. Issuance of a CESA Permit is subject to CEQA documentation; the CEQA document must specify impacts, mitigation measures, and a mitigation monitoring and reporting program. If the Project will impact CESA listed species, early consultation is encouraged, as significant modification to the Project and mitigation measures may be required in order to obtain a CESA ITP.

CEQA requires a Mandatory Finding of Significance if a project is likely to substantially restrict the range or reduce the population of a threatened or endangered species. (Pub. Resources Code, §§ 21001, subd. (c), 21083; CEQA Guidelines, §§ 15380, 15064, and 15065). Impacts must be avoided or mitigated to less-than-significant levels unless the CEQA Lead Agency makes and supports Findings of Overriding Consideration (FOC).

---

[4] California Natural Resources Agency. 2018. State of California Sea-level Rise Guidance. https://opc.ca.gov/webmaster/ftp/pdf/agenda_items/20180314/Item3_Exhibit-A_OPC_SLR_Guidance-rd3.pdf

[5] Marin County. 2017. Marin Shoreline Sea Level Rise Vulnerability Assessment/Bay Waterfront Adaptation & Vulnerability Evaluation. Prepared by BVB Consulting LLC for Marin County Department of Public Works, June 2017. https://www.marincounty.org/-/media/files/departments/cd/planning/slr/baywave/vulnerability-assessment-final/final_allpages_bvbconsulting_reduced.pdf?la=en

[6] Take is defined in Fish and Game Code section 86 as hunt, pursue, catch, capture, or kill, or attempt any of those activities.

DocuSign Envelope ID: CE9A7608-E7F8-4D4B-991E-9BF3552BC098

The CEQA Lead Agency's FOC does not eliminate the project proponent's obligation to comply with CESA.

Lake and Streambed Alteration Agreement

CDFW requires an LSA Notification, pursuant to Fish and Game Code section 1600 et. seq., for Project activities affecting lakes or streams and associated riparian habitat. Notification is required for any activity that may substantially divert or obstruct the natural flow; change or use material from the bed, channel, or bank including associated riparian or wetland resources; or deposit or dispose of material where it may pass into a river, lake or stream. Work within ephemeral streams, washes, watercourses with a subsurface flow, and floodplains are subject to notification requirements. CDFW will consider the CEQA document for the project and may issue an LSA Agreement. CDFW may not execute the final LSA Agreement until it has complied with CEQA as a Responsible Agency.

Migratory Birds and Raptors

CDFW also has authority over actions that may disturb or destroy active nest sites or take birds without authorization. Fish and Game Code sections protecting birds, their eggs, and nests include sections 3503, 3503.5, and 3513. Fully protected species may not be taken or possessed at any time (Fish and Game Code, § 3511). Migratory birds are also protected under the federal Migratory Bird Treaty Act.

ENVIRONMENTAL DATA

CEQA requires that information developed in environmental impact reports and negative declarations be incorporated into a database which may be used to make subsequent or supplemental environmental determinations. [Pub. Resources Code, § 21003, subd. (e)]. Accordingly, please report any special-status species and natural communities detected during Project surveys to the California Natural Diversity Database (CNDDB). The CNNDB online field survey form and other methods for submitting data can be found at https://wildlife.ca.gov/Data/CNDDB/Submitting-Data. The types of information reported to CNDDB can be found at https://wildlife.ca.gov/Data/CNDDB/Plants-and-Animals.

FILING FEES

CDFW anticipates that the Project will have an impact on fish and/or wildlife, and assessment of filing fees is necessary (Fish and Game Code, § 711.4; Pub. Resources Code, § 21089). Fees are payable upon filing of the Notice of Determination by the Lead Agency and serve to help defray the cost of environmental review by CDFW.

Tammy Taylor, Environmental Planner
Marin County Community Development Agency
3501 Civic Center Drive, #308
San Rafael, CA 94903

Re: 2020090488, North Coast Land Holdings, LLC Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit Project, Marin County

Dear Ms. Taylor:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements**. If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Nancy.Gonzalez-Lopez@nahc.ca.gov.

Sincerely,

Nancy Gonzalez-Lopez
Cultural Resources Analyst

Marin County North Coast Land Holdings Project
Scoping Meeting

May 18, 2021, 6:00 p.m. to 7:35 p.m

OVERVIEW

Marin County held a teleconference scoping meeting for the proposed North Coast Land Holdings Planning Application on the former Golden Gate Baptist Seminary Site (project). At the meeting, Ascent Environmental gave a presentation about the project and the California Environmental Quality Act (CEQA) process. After the presentation, the County accepted comments regarding the project and the scope of the Environmental Impact Report (EIR) to be prepared pursuant to CEQA. These meeting notes provide a summary of the verbal questions and comments provided by attendees during the scoping meeting.

COMMENTS

Richard Harris

- Commenter is disappointed that there is not an opportunity to see the number of participants, who they are, and their faces, which are elements envisioned under the Brown Act.
- Commenter and wife have lived on Richardson Drive for 34 years; commenter is also a former Board member and president of MMWD.
- The project affects MMWD's ability to provide water for consumption, fire, etc. The Countywide Plan recognizes that water supplies are insufficient to serve some areas of Marin in a normal rainfall year, and it goes on to say impact of that inadequacy is significant and unavoidable. The Countywide Plan also says that limits will be imposed on growth based on availability of services that cannot be distributed without limitation and conservation requirements.
- Two other factors impact the availability of water in Marin County. One is climate change. The Countywide Plan says climate change will amplify existing environmental problems. NOAA data also shows that, in the last 21 years, Marin County has experienced years of various kinds of drought. The second factor is development. Housing legislation currently under consideration has the potential to double population of Marin County. MMWD also declared water shortage, and there may be a moratorium of new water connections though it is unlikely due to their tentative financial status.
- The project will unquestionably impact an already inadequate water supply.
- If an impact can be demonstrated, does the County or Ascent have the authority to effectively overlook that impact? *(Ascent: The EIR is required to focus on significant impacts and also identify all feasible mitigation measures. The County then considers this and if it is determined that an impact is still*

significant, then it is significant and unavoidable. It does not mean the County cannot approve it. If they decide to approve the project, they will need to adopt overriding considerations, which are other factors that indicates that despite the impact, there are benefits and other factors that warrant its approval).

Paul Kayfetz

- Developer has been trying to finesse the project by claiming it is already permitted so it need not be evaluated. That will completely defeat consideration of traffic and other impacts, which will vary completely depending on nature of the institution. A count of 1,000 students and 200 staff communicating to the site in morning and out in the afternoon, according to traffic studies, will quadruple traffic load at the Blithedale Avenue/US 101 intersection.
- It is going to be completely inappropriate to accept developers' inclination and ignore the details of exactly what kind of school will be there and what the transportation implications are. It must be examined in detail; it cannot be finessed as being previously permitted and therefore not be considered.
- MMWD later this evening is considering a moratorium on new water connections and that would end this project for years. The EIR must seriously consider water and other implications as part of this process. Fines are already being imposed on users who are simply maintaining their landscaping. Why should this project be allowed when existing residents are being fined for maintaining their existing landscaping?

Patricia Albo

- The presentation slide said there is no change to the use permit of 1,000 students, even though North Coast went down to 700 students. The commenter asked for this to be addressed. *(Ascent noted there is no proposed change to the use permit maximum capacity, and EIR will be examining the appropriate baseline for evaluation.)*
- Is wildlife considered an issue in the EIR? *(Ascent confirmed it will be addressed in the EIR.)*
- Commenter submitted a prior comment via email, stating that the concern on traffic is with Seminary Drive and Strawberry Drive. It is pretty obvious Strawberry Drive cannot be widened. Commenter wanted to make sure that the EIR is not only looking at traffic impacts but also considering that from the stop sign to the first condominium building on the right during the winter at certain high tides it floods. Drivers in both directions are impacted, and the driver going toward Seminary must drive over the center line to avoid the pooled water. So, there is no immediate widening and no widening in the future.

Riley Hurd, Seminary Neighborhood Association

- Commenter submitted a detailed letter regarding the CUP.
- Regarding aesthetics, the site is highly visible, from US 101, Richardson Bay, Sausalito, GGNRA, Marin City, and there need to be view simulations of these. There are also Title 22 ridgelines (Seminary Point, Seminary Knoll).
- Regarding biological resources, the project site is a significant heron rookery.
- Regarding geology and soils, the Marin County GIS says the area is mostly landslides, with debris flow and a high liquefaction risk. The old Master Plan for the property required multiple landslides to be repaired and the commenter does not know if that has occurred.

- Regarding hazardous materials, there is a Phase I that identifies an underground storage tank that needs to be removed, as well as an abandoned hydraulic lift. The commenter is unsure if either have been removed.
- Regarding hydrology and water quality, the GIS system has never been updated to map streams on property. A previous biological study found several jurisdictional seepages on the site that need to be avoided.
- Regarding land use and planning, the project objectively violates the Strawberry Community Plan that calls for a self-contained seminary. It conflicts with the zoning code because RMP zoning requires a CUP for educational uses, and this use permit was superseded by the Master Plan. Even if it was not superseded, it had a specific description as a self-contained seminary. The commenter refers to a previous letter regarding vesting. The project also conflicts with Marin County single-family residence design guidelines.
- Regarding population and housing, there will be a significant impact with displacement of existing housing. There is a letter from County code enforcement noting the homes are rented out at below market prices, and the residents will be displaced; that has to be analyzed
- Regarding transportation, the EIR must evaluate hazards from inadequate roadway widths. Look at Reed Boulevard, it is an access point frequently utilized even though it was supposed to have a closed gate at the end.
- The appropriate baseline is nothing more than existing physical conditions. It is not the past, it is not the future, it is only right now and it is pretty low.

Bob Hendry

- Commenter is a resident of seminary drive. The commenter is happy to see the 1,000-student proposal is included in the study. There are a lot of assumptions, though, that someone is going to have to guess at, including staff, visitors, recreation, social activities because the developer has never outlined that out for anyone. Will the EIR state what those assumptions are? *(Ascent: the analysis in the EIR needs to be based on substantial evidence, and we pay close attention to legal requirements and so we will share whatever facts are underpinning the analysis, as well as any assumptions based on those facts).*

Doug Brown

- Commenter is a frequent bike rider on Seminary Drive and Strawberry Drive and wants to bring up the concern of safety for bike riders given the substantial increase in traffic if the project is approved, particularly from the freeway direction. What improvements will be made to seminary drive (e.g., widen it, install a bike lane) to make it safe for bike riders to share the road with these vehicles? Is there a possibility of some sort of shuttle service (e.g., electric buses) that will be less of a concern to all of us?
- Commenter understands main entrance is on the south side of the property, but there is also a road from the west from Seminary Drive. Commenter thinks if main entrance is further west that would minimize the impact on Strawberry Drive and is wondering if that entrance has been considered.
- During construction, the commenter is wondering what they will do to make traffic more manageable especially on Seminary Drive.

Jill Templeton

- Commenter has lived on East Strawberry Drive since 1958 and spent much of childhood playing with children who grew up at Baptist seminary.
- Commenter collected monarch butterflies because the site was an overwintering site, and wants the EIR to emphasize the historical perspective on biological resources.
- The site has unique geography and topography for Marin because it is surrounded on three sides tidal wetlands, includes habitat for overwintering insects and birds as they migrate in winter and spring.
- Commenter wants the baseline to consider prior conditions, not just current conditions.
- Commenter also wants to look for restoration in the new project scope.

Josh Andresen

- Commenter was a volunteer in Seminary Tomorrow process that met with developer.
- Regarding population and housing, the rents at the site are currently some of the lowest in the County and help meet local housing needs and reduce traffic. The developer would replace the housing with a smaller amount of affordable housing and more high-end units. The project will displace housing with faculty, students living offsite. Study net negative on affordable housing, regional housing, and traffic.
- This is a very large project, and community members have had issues understanding it. The commenter wants a 3D physical model of alternatives they can touch, feel, and understand.
- All universities expand, so whatever North Coast is proposing should also consider future development. It is reasonably foreseeable that North Coast will want to increase housing over time.
- Sea level rise is also reasonably foreseeable impacts as are drainage impacts on neighboring properties.
- Commenter provided assumptions that should be accounted for in traffic: 100 percent of student/faculty commute; large conferences and events (700 guests at peak afternoon commute); daily interaction with industry and increase traffic of 25 to 50%; courses open to general public; and general public access to library, cafeteria, art museum and other amenities.
- The developer proposed alternatives, so what is the approach and scope of the alternatives and how can public influence the alternatives? *(Ascent: The EIR must have a reasonable range of alternatives, which is not a specific number. The alternatives evaluation needs to include the No Project alternative. We look to define the alternatives in ways that meet the basic objectives of the proposed action and reduce one or more significant impacts as identified in the analysis. CEQA also requires identification of the environmentally superior alternative.)*

Josh Sale

- Ascent Contract describes collecting traffic baselines; how are those baselines developed in a pandemic when traffic patterns and life patterns are still atypical?
- Ascent Contract describes LOS analysis and 6 intersections but leaves out important intersections: Redwood Highway Frontage Road/Tiburon Boulevard, Redwood Highway Frontage onramp to US 101 South, Redwood Highway Frontage onramp to US 101 North.

- The primary entrance to the site is at Seminary Drive and Gilbert Drive, which is an unsafe intersection because of the forced left onto Gilbert. It is completely blind, so you can't see oncoming traffic and it seems inevitable that increased traffic will result in accidents due to poor sight lines.
- Commenter objects to how the meeting is being conducted. If there was not a pandemic, we could see who was there, and the list of participants should not be secret.

Chuck Ballinger

- Commenter is an adjacent neighbor on Ricardo Road.
- One hundred homes to be demolished are affordable housing by most logical standards because they are smaller, old, and have low rates. They should not be targets for demolition when more affordable housing is needed. But, since they are not official housing units, they fall through the cracks. Renovating instead of demolishing reduces materials that go into the landfill. Rebuilding is about making profits. What makes it worse is they get a density bonus for demolishing and building market rate units.
- If the EIR is perceived with any credibility, it should consider the waste of material gone to landfill so this developer can build housing.
- Planners should ask why they are proceeding with an EIR when the biggest entity (i.e., school) is not even specified.

Julie Brown

- Commenter has been a member of Design Review Board and Seminary Tomorrow.
- Commenter is saddened to share that the proposed project is not the project discussed in Seminary Tomorrow.
- Commenter seconds the request for physical models of this project and alternatives to scale. The CCRC alone is over 330,000 square feet, which is 2/3 the size of the Civic Center, which is only one component of this project, which totals over 1 million square feet. Looking at a physical model is the only way to understand physical impact.
- The project proposes separating ancillary housing from education facility. Commenter wants to make sure the County studies the drain on the local housing supply that 1,200 to 1,400 students will create when they cannot find housing on site.
- Explain how the developer will then be bound by EIR assumptions in initial phase and future phases as the project grows and continues to drain housing resources.

David Leimsider

- Commenter is a Strawberry resident and member of the Strawberry Community Association.
- Commenter requests that fiscal impacts: requests they be studied as part of this review, specifically impacts to parcel taxes. The applicant requests 486 housing units that currently sit on only 9 parcels of land. 486 units need services (e.g., fire department, schools, sewer), and those services are funded by parcel taxes that the proposal avoids paying because they would only pay taxes on the 9 parcels in existence today. If you do the math, it amounts to a $1.2 million per year recurring shortfall. It would lead to parcel tax increases on surrounding neighbors, which would essentially subsidize a wealthy land trust. The applicants should subdivide so each unit pays parcel taxes and their fair share.
- There is a long history of the seminary being on the property, and it was a closed environment with students living on campus. The commute impact was people walking from dorms. Any new school or

institution should have a similar setup, or the impact will be much greater than baseline. Students at the old seminary were often out of the country doing missions, and so the impact here for another type of school would be unlike prior impacts.

Rebecca Lind

- Commenter is a resident on Inez Place in Strawberry and also member of Design Review Board.
- The approach for the Community Plan Amendment, which is limited to strikeout, does not address the comprehensive nature of the kind of review that will need to be done to evaluate conformance with plans and policies. There are sections dealing with population and housing, transportation, community goals, etc., that need to be addressed. The Design Review Committee will need a comprehensive approach. The commenter will send in more-detailed written comment.

Justin Durack

- Commenter lives on Chapel Drive.
- The project would completely change the experience and what people love about being in Strawberry. There are birds chirping, deer wondering around, and it is hard to imagine how much it would be transformed. Egrets, heron, deer, hawks, quails, bald eagle; it feels like they are part of the community.
- Commenter is concerned about changes in noise level as well as traffic during construction and in general. Commenter is also concerned about traffic, especially bottlenecks. There would also be changes in light pollution due to exterior lighting. Changes to wildlife habitat and tree removal are a concern.
- With housing not dedicated to school, then the entirety of residents would be leaving community while the school community would be pouring in and maximizing traffic.
- Sensible mitigation includes drastically reducing number of new units or dedicating new housing for school only to reduce double load of traffic.
- It all adds up to well beyond a reasonable threshold for the current community.

Rusty Williams

- Commenter appreciates the community meetings, and the community is sincere about working with the County where everybody compromises. Commenter has lived on Chapel Drive for 24 years and have always expected some development in the area which is fine.
- In terms of considering effect on the environment, have you considered the effect of the distribution of housing? Not simply the number of units—which is an issue—but the distribution. Commenter is in one of two houses most directly affected by the plans and thinks there may be alternatives to distribution that may reduce traffic and environmental impacts.
- With respect to traffic flow, would it be better to have traffic go through the internal part of the campus rather than around the periphery when the peripheral roads are limited in how much they can be expanded?

Bruce Corcoran

- Commenter lives in Strawberry and has been reviewing plans at the seminary for 40 years. The 1953 use permit is for a seminary and uses associated with that. Commenter submitted detailed analysis of

1953 use permit that challenges vested right to 1,000-student institution. The plain reading of 1953 use permit shows that 1,000 students is not a condition.

- North Coast is once again launching a fight between districts in Marin County. Bruce Jones is in District 2 trying to force on District 3 an oversized project, just like "fiasco" with Branson. And, once again, we have a school with no dormitories, and this will cause traffic at Strawberry Drive/Tiburon Boulevard and up and down the US 101 corridor.
- The project is too large and has too many new uses.

Babette Bloch

- Commenter has been a resident on Ricardo Road since 1961.
- Commenter is particularly interested in location of senior facility. It seems to be way up on the hill, which looks utterly useless for the group they are trying to serve because the senior citizens would have to walk down the hill to do any walking in the neighborhood. To think people living in a senior facility do not drive is naïve.
- Commenter hopes planners will look at how many people will be staffing that facility; it takes a lot of staff particularly for assisted living.

Penna Omega

- Commenter is a resident since 1975 and went to Strawberry Point school and walked the streets that have no sidewalks. Commenter is now a homeowner and business owner in Strawberry Village and has been on the Design Review Board for the past 6 or 7 years. Commenter is surprised and shocked at how little the applicant has listened to the residents. They have tried to work with them and give them positive ideas they feel will benefit the community and it's being ignored, and that is problematic.
- The change to the Master Plan needs to be voted on by the residents in Strawberry so they have a say in what the Master Plan lan changes look like, how that impacts their visions for their own homes and their ADU ideas. It will also impact already the community and traffic. There is a lot of growth that is happening outside of seminary that impacts Strawberry, and the commenter wants the residents to have a voice.

Rona Weintraub

- Commenter is speaking because no one who lives on Seminary Drive has spoken; she lives in the condominium complex right across from the seminary. They have 72 homeowners who will be incredibly impacted by entire project; Seminary Drive is only two lanes, one way in each direction. It cannot be widened, and they will live through years of construction and then, after it is finished, a lot of traffic. They will be unable to get out of their own driveways.
- The project is too big for this area. Marin needs s senior center, but commenter is unsure this is the place because there is so little access. The preschool should probably stay. How can we possibly approve the school when we do not know what we are talking about when it comes to the school? The prior use never went near 1,000 students. It is going to be a nightmare.

MARIN COUNTY COMMUNITY DEVELOPMENT AGENCY

PUBLIC SCOPING SESSION
ENVIRONMENTAL IMPACT REPORT
NORTH COAST LAND HOLDINGS LLC PLANNING APPLICATION ON THE FORMER GOLDEN GATE BAPTIST SEMINARY SITE
May 18, 2021
6:00 pm to 8:00 pm

EIR PROCEDURAL INFORMATION

Purpose of the Scoping Session

The County is holding this public scoping session to facilitate maximum public participation in the development of an Environmental Impact Report (EIR) for the North Coast Land Holdings, LLC. Community Plan Amendment, Master Plan, Design Review, Vesting Tentative Map, Master Use Permit, and Tree Removal Permit project. This scoping session is being held pursuant to the California Environmental Quality Act (CEQA) to provide early consultation with the public on the EIR being prepared for the project. This early consultation is typically called scoping.

The purpose of this public scoping session is to provide individuals, organizations and agencies an opportunity to raise concerns about the environmental effects of the proposed project. Comments will be recorded and be made part of the formal EIR record. There are likely to be questions raised by speakers at the session, although in the interest of giving everyone a chance to speak, any questions asked will be responded to through the EIR process rather than at this meeting. Responses to comments and questions will not be provided at the scoping session since the purpose of the session is for the public to provide information to the County.

Comments must be limited to the scope of environmental effects to be studied, rather than commenting on the merits of the project at this time. CEQA defines environmental effects as direct, indirect, and cumulative impacts to the natural and man-made environment affected by the project. Effects analyzed under CEQA must be related to a physical change in the environment. (State CEQA Guidelines sections 15358 and 15360.)

Comment Procedure

In accordance with the current COVID-19 adaptive procedures, the scoping session will be held virtually via Zoom. The Zoom meeting details are included in the public notice of scoping session and on the environmental planning website, which is listed at the end of this procedures guide. During the virtual public scoping session, members of the public will have the opportunity to speak their comments, which will be recorded and posted on the environmental webpage for this project. Those wishing to speak will need to indicate so during the course of the meeting by either using

the "Raise Hand" button, or if you choose to call in to the Zoom meeting, press *9 to inform the moderator that you would like to comment.

In anticipation of a good turnout and limited time, and in order to allow everyone an equal opportunity to speak, each speaker will be limited to three minutes, more or less, depending upon the number of speakers in the queue. Members of organizations are encouraged to select a spokesperson from the organization to speak on the group's behalf to avoid repetition of the same concerns.

Following the scoping session, written comments about the scope of the environmental report will be accepted until **4:00 p.m.** on **Tuesday, May 25, 2021**. Please submit written comments that you have on the scope of the EIR to County staff by email prior to the May 25, 2021. Comment letters and/or emails should clearly identify the subject of the comments as the Scoping Session for the North Coast Land Holdings, LLC. EIR. Commenters are advised to mail written comments postmarked on or before May 25, 2021 to the attention of Rachel Reid, Environmental Planning Manager at 3501 Civic Center Drive, Suite 308, San Rafael, CA 94903. Comments are also encouraged to be submitted via email to envplanning@marincounty.org before the end of the comment period deadline.

Other Opportunities for Public Comment

The public will have additional opportunities to comment during the EIR process and hearings on the merits of the proposed project. Updates will be emailed to everyone who subscribes to the environmental webpage for the project. Please visit the environmental project page listed below and click on “subscribe to this page” in order to receive email updates:
https://www.marincounty.org/depts/cd/divisions/environmental-review/current-eir-projects/north-coast-land-holdings-llc

More information about the project application is available online at:
http://www.marincounty.org/depts/cd/divisions/planning/projects, where projects are listed for the Alto/Strawberry area.

1.0 INTRODUCTION

This report discusses the existing visual quality of the North Coast Land Holdings, LLC. Community Plan Amendment Master Plan, Design Review, Vesting Tentative Map, Master Use Permit (the Project) site and evaluates the potential impacts on aesthetics from implementation of the Project. The impacts associated with the proposed Project are compared with the thresholds of significance adopted by the California Environmental Quality Act (CEQA). This report also provides discussion of the applicable Marin County policies that regulate aesthetics and consistency of the Project with those policies and guidelines.

1.1 Project Description

This report is based on the based on the Draft Project description for the County of Marin and on the following design documents provided by North Coast Land Holdings, LLC.

- Architectural, planning, and site master plan drawings by Mark Cavagnero Associates dated January 31, 2020.
- Civil engineering and grading plans by CSW / Stuber-Streek Engineering Group, Inc dated January 31, 2020.
- Landscape plans by SWA, dated January 31, 2020.
- An amended architectural site plan with elevations, models, and floor plans for three six-story apartment buildings at northwest corner of Hodges Drive and Shuck Drive dated April 11, 2023.

Additionally arborist reports by Macnair & Associates dated August 20, 2015 and February 5, 2020 were referenced for the analysis.

1.2 Definitions

Aesthetics

Aesthetics refers to the nature and appreciation of beauty in both form and appearance as perceived through the visual sense only. Aesthetic resources include the visual character and quality of an area, consisting of both the landscape features and the social environment from which it is viewed. Aesthetic resources include, but are not limited to:

- Federal, state, and local designated scenic resources
- Places of cultural importance, such as traditional cultural properties
- Designated federal, state, and local historic properties
- Areas of high visual quality (e.g., scenic vistas, scenic hiking trails, and scenic highways)
- Recreation and open space areas that attract users with sensitivity to visual quality
- Landscape features, including ridgelines, mountains, and the vegetative mosaic
- Dark night skies

Visual Quality

Visual quality is defined as the overall visual impression or attractiveness of an area as determined by its particular landscape characteristics, including landforms, rock forms,

water features, and vegetation patterns. The viewer attributes of natural harmony, orderliness, and coherence contribute to the overall visual quality of a setting.

Viewer Sensitivity

Viewer sensitivity is a composite measurement of the overall susceptibility of a viewer to adverse visual or aesthetic impacts, given the combined factors of the visual quality of the characteristic landscape, affected population, viewer exposure, and viewer awareness of the visual impact. Viewer sensitivity considers whether the general public, when seeing the Project, is engaged in an active (e.g., soccer) or passive (e.g., bird-watching) activity. Viewer sensitivity often is reflected according to high, moderate and low visual sensitivity ranges.

Viewer Exposure

Viewer exposure addresses the variables that affect viewing conditions from potentially sensitive areas. Viewer exposure considers the following factors:

- **Landscape Visibility.** The ability to see the majority of the Project site as a whole or see only selected features of the Project site because they are screened by existing topography, vegetation, or structures.
- **Distance Zones.** The proximity of viewers to the Project site. Distance zones are measured from one static point, such as the location of a key view. There are four defined distance zones:
  - **Immediate Foreground:** properties and streets that are immediately adjacent to the Project site
  - **Foreground:** 0.25-0.5 mile from the viewer
  - **Middleground:** 0.5 to 2 miles from the viewer
  - **Background:** beyond 2 miles from the viewer

  Figure V-1 illustrates the distance zones relative to the Project site.
- **Viewing Angle.** Considers whether the Project site would be viewed from above (superior), below (inferior) or from a level (normal) line of sight. If along a street or path, consideration is given to whether the Project site is in the direct line of sight or at an acute angle relative to the direction of travel. Viewing angle also affects whether project components include a backdrop or are silhouetted against the sky.
- **Extent of Visibility.** Considers the relative location of the Project site to the viewer and whether visibility conditions are open, framed, or limited by intervening vegetation, structures, or terrain; additionally whether the view is part of a larger panorama.
- **Duration of View.** Pertains to the amount of time the Project site would typically be seen from a sensitive viewpoint. In general, duration of view, and hence impact, would be less in instances where the Project would be seen for a short period while traveling (0 to 10 seconds), moderate or intermittent period when traveling (up to a minute), or would be seen as a constant from a stationary position condition such as from public gathering area, vista point, park, or trail.

1.3 Impact Assessment Methodology

Field reconnaissance of the Project site was conducted on June 15, 2021, June 16, 2021, and September 9, 2021. The impact assessment employed a line-of-sight analysis to consider the net visual effects that would result from implementation of the Project as seen from publicly accessible locations within the Strawberry Peninsula and from the surrounding areas.

The assessment was conducted according to generally accepted industry practices. The primary existing visual condition factors considered in this section include:

- Visual quality of the existing landscape
- Affected population
- Viewer exposure
- Viewer sensitivity

The impact assessment was conducted according to industry standard methodologies for characterizing the aesthetic setting and impacts of the Project. Appropriate to this Project are the Federal Highway Administration's visual impact assessment guidelines (2015) that address compatibility of impacts, distance zones, the sensitivity of the viewers, and how changed conditions affect the natural harmony, cultural order, and coherence of the characteristic landscape. The assessment considers changes in visual character looking at the Project site from the surrounding road network, parks, and trails.

The assessment included identification of representative Key Observation Point (KOP) locations from which a viewer would see the Project. Selected KOPs were used to produce photo simulations representative of the visual change that would result with the development of the Project without mitigation.

Photographs were taken using a digital single-lens reflex (SLR) camera with standard 50-millimeter lens that represents an approximately 40-degree horizontal view angle. Photography viewpoint locations were documented in the field using photo log sheet notation, global positioning system (GPS) recording, and base map annotation. Digital aerial photographs and Project design information supplied by the Project proponent provided the basis for developing three–dimensional computer modeling of the Project components. For each simulation viewpoint, viewer location was input from GPS data using 5 feet as the assumed eye level. Computer "wireframe" perspective plots were overlaid on the simulation photographs to verify scale and viewpoint location. Digital visual simulation images were then produced based on computer renderings of the three-dimensional modeling combined with selected digital site photographs.

1.4 Scoping Comments

A number of comments were submitted through the Notice of Preparation process about visual resources related to the Project's impact on natural harmony, orderliness, and coherence. The significant areas of expressed visual concern are:

- Consistency with the policies of the Strawberry Community Plan.
- The preservation of key visual landmarks including local ridgelines, the forested Seminary Point, and Chapel Hill.
- Visual compatibility with surrounding neighborhood character.

- Extent of grading.
- Size/bulk of the proposed residential care facility.
- General visibility particularly from Richardson Bay, Highway 101, and public park, recreation, and open space lands.

2.0 EXISTING SETTING

2.1 Key Observation Points

Visual conditions, viewer experience, and viewer response to visual change are studied in the environmental review process through the identification and selection of the most critical and representative public viewpoints of a project, referred to as Key Observation Points (KOPs).

KOPs serve as the basis for the subsequent assessment of visual impacts after determining the visual quality of the Project site. Key views are representative of the range of views that would be affected by the Project. These representative views are selected to catalog an image of critical baseline conditions that were used to assess the visual impacts of the Project.

Twenty-five KOPs were used to evaluate the existing visual quality of the Project site and visual impacts of the Project. Figure V-2 illustrates the locations of each KOP.

Table V-1 keys to Figure V-2 and lists each KOP and describes its general characteristics in terms of the following viewer exposure considerations:

- Proximity / Distance Zone
- Landscape Visibility
- Viewing Angle
- Extent of Visibility
- Duration of View
- Viewer Sensitivity

KOPs used for the preparation of photo-realistic visual simulations are indicated with an asterisk (*).

2.2 Topography and Local Ridgelines

Attachement A presents the planning areas of the Project. As illustrated in Figure V-3, there are a series of local ridgelines that play an important role in defining the Project site, its planning areas, and how they are viewed. At an elevation of approximately 190 feet, the central point on the Project site is Chapel Hill. From Chapel Hill local ridgelines extend:

- South to Strawberry Point with a break through a saddle where Seminary Drive transitions into Strawberry Drive.
- West to the forested Seminary Point (approximate elevation 125').
- North through the Campus to a saddle composing Dormitory Hill (approximate elevation 115') then up to near Richardson Drive residences (approximate elevation 250') and then arching west down to Schuck Knoll (approximate elevation 110').

Visually, a series of minor local ridgelines further divides the Project site. Because of its location surrounded on three sides by Richardson Bay, Seminary Point is the most prominant visual natural feature of the Project site.

The topography and local ridgelines tend to control views into the Project site such that the entire Project site is generally not visible from any one surrounding location. This is particualrly true from the immediate foreground and foreground distances. Because of the topography the major portion of the Project site is only visible from the southwest and west.

2.3 Characteristic Landscape

The Project site generally encompasses the middle portions of the Strawberry Peninsula. The lands surrounding the Project site are fully developed visually by single family homes, duplex homes, apartments, and condominiums.

As shown on Figure V-4, the Project site can be visually characterized in five landscape units with similar qualities of harmony, cultural order, and coherence. A description of each and its corresponding planning unit follows.

1. Seminary Point / Forested Knoll: A significant natural feature of the Project site and of the Strawberry Peninsula. A singular forest dominates and provides a high degree of harmony and natural coherence extending down to the Richardson Bay shoreline. Existing housing development along the extended Chapel Drive within the Project site is visually camouflaged due to relatively dark architectural colors and screening by the forest. (Planning Area #7 - Seminary Point / Forested Knoll).

2. Chapel Hill Park: A southwest-facing slope, consisting of a band of sparse trees at the top of the area along Chapel Drive with denser forest and shrubland vegetation toward the bottom along Seminary Drive. An open grassland is located mid-slope. The park provides a harmonious foil of undeveloped lands that contrasts with the lack of order seen in the pattern, color, and textures of surrounding private residences. (No improvements proposed in this landscape unit).

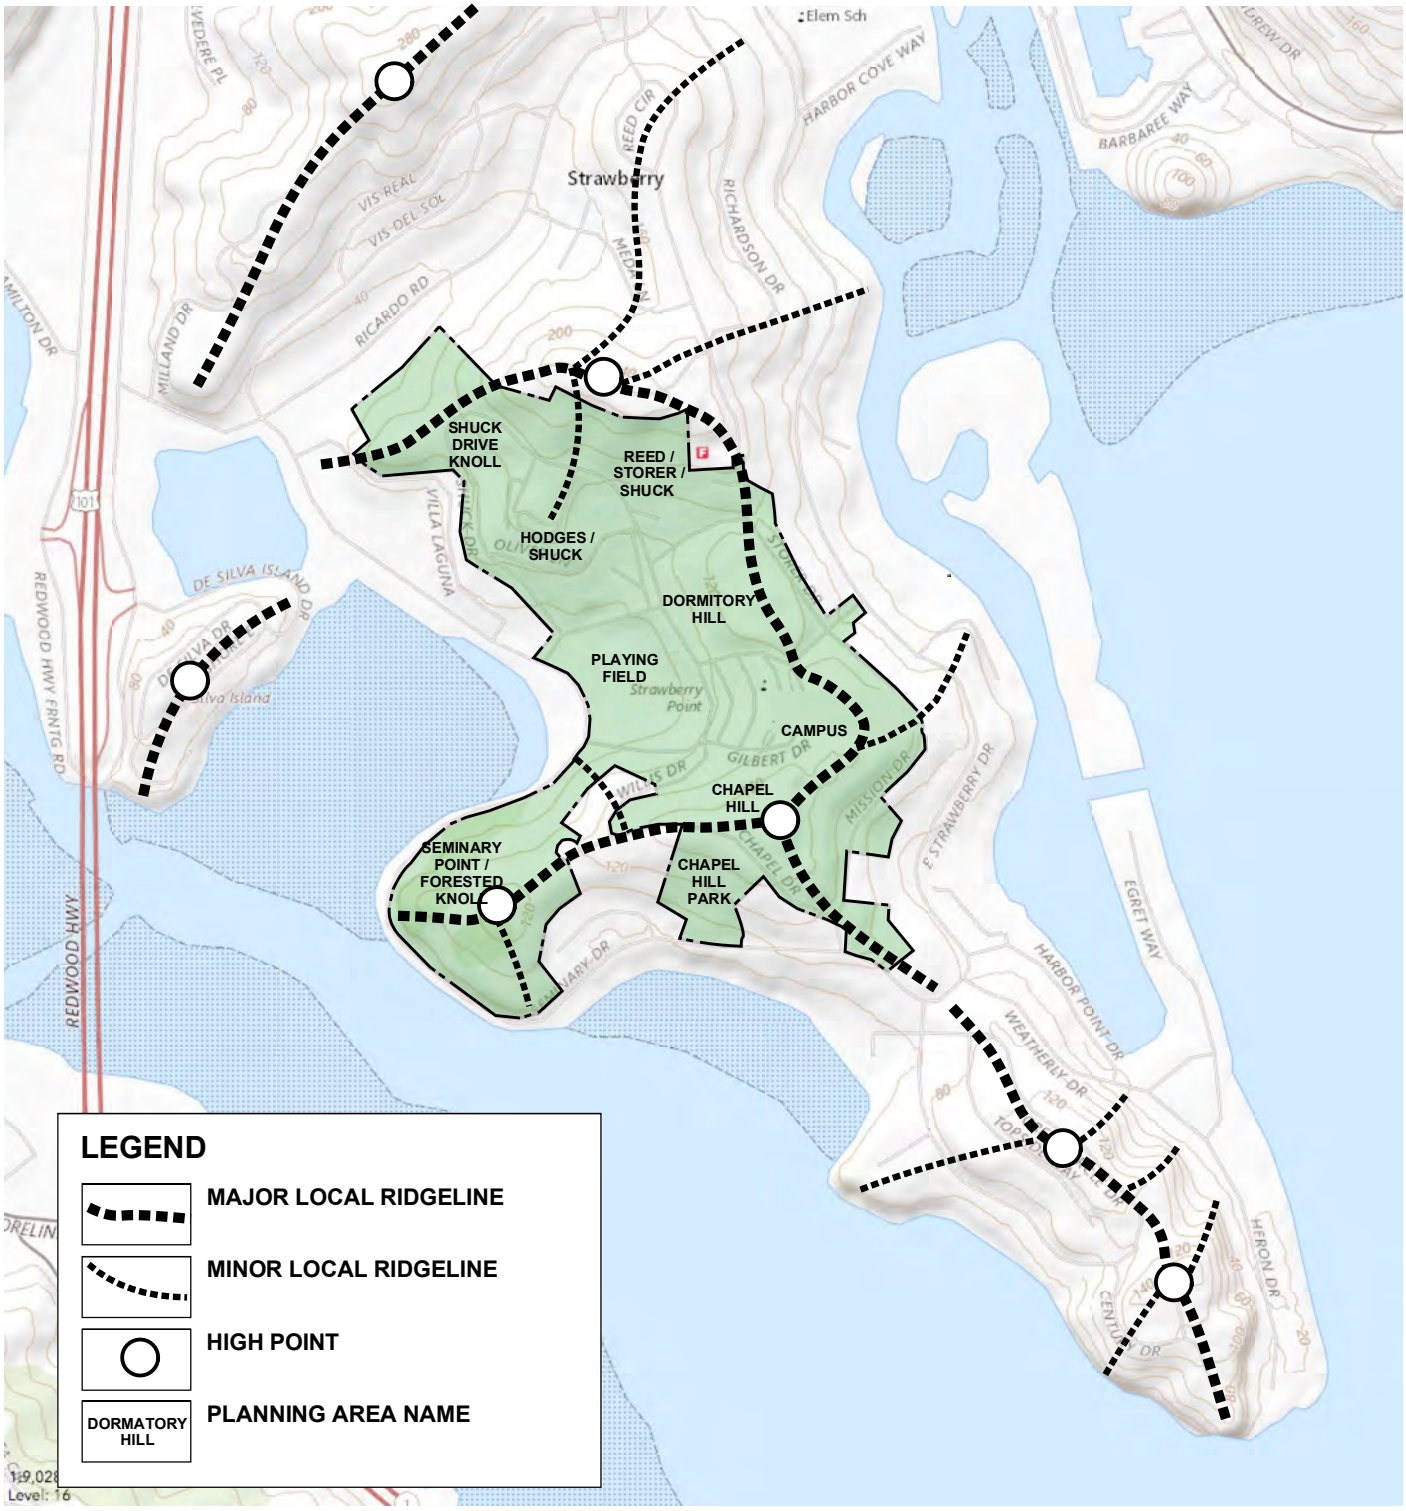

FIGURE V-3

LOCAL RIDGELINES AND PLANNING AREAS

SEE TEXT FOR EXPLANATION

Scale
0' 300' 1500'

North

DATE: 1-22-24

3. Playing Field: A bowl-like setting with irrigated turf surrounded by forest vegetation. Views to and within the area are partially contained by topography and perimeter vegetation. (Planning Area #3 - Seminary Playing Field.)

4. Academic Campus / Chapel Hill: A developed landscape with a moderate degree of cultural order and coherence created by disparate elements of streets, terraced parking, campus academic structures, and graded landforms of Chapel Hill. (Planning Area #1 - Academic Campus; and Planning Area #2 - Chapel Hill.)

5. Dormitory Hill to Schuck Knoll: A partially developed landscape visually consisting of the open grasslands and graded landforms visually punctuated by sparse low-profile structures, among clustered tree groupings and individual trees. The overall visual character of the area presents a moderate degree of cultural order, harmony, and coherence. Private residential structures at the top of the slopes to the north and the colors and bulk of the fire station contribute to the lack of overall harmony and coherence. (Planning Area#3 - Dormitory Hill; Planning Area #4 - Hodges/Shuck; Planning Area #5 - Mission Drive; and Planning Ara #6 - Reed/Storer/Shuck.)

Visually the area surrounding the Project site presents a predominantly developed residential landscape. Development occurs from the peninsula's local ridgelines to the edges of Richardson Bay. The overall visual character of these areas presents a moderate degree of cultural order, harmony, and coherence.

High density apartment complexes are located along Seminary Drive, including Strawberry Shores and Harbor Point Apartments. The large bulk appearance of these structures visually contrasts with the finer visual texture presented by surrounding individual residences. This contrast tends to reduce the harmony and coherence of the area as a whole. Relatively large duplex houses occur within Strawberry Cove at the base of Seminary Point and Chapel Hill with a similar, yet not as contrasting, effect. The remaining residential development consists of moderate to relatively large, single-family homes.

The predominantly concrete Station #9 of the Southern Marin Fire District and its communications tower located above Dormitory Hill is visible in the immediate surrounding foreground area of the structure and the middleground as seen from the east presenting a bulk and form not typical of the surrounding residences.

Architectural styles and colors of the development surrounding the Project site vary widely. Generally light-valued colors on structures stand out and dark-valued colors on structures visually recede. Such is the case with many of the exiting structures within the Hughes-Shuck Planning Area or those on Seminary Point that tend to not be readily noticable. Ridgeline development within and around the Project site generally parallels the natural ridgeline contours. The majority of rooflines, with a few exceptions, do not visually extend above the natural ridgeline. Most of those that do are surrounded by landscaping that projects above the structures and provides a more natural edge as seen against the open sky backdrop.

The majority of vegetation within and around the Project site is ornamental with a wide variety of species present. However, within the Project site a number of native oaks exist. Significant

forest stands exist: on Shuck Knoll and behind the residences along Ricardo Road; around the playing field; from the west side of the campus extending to Seminary Point; and on the lower portions of Chapel Hill Park.

Where available, virtually all development is oriented to take advantage of views to Richardson Bay, surrounding shoreline cities, San Francisco, Mount Tamalpais State Park, and the open space lands of the Marin Municipal Water District and the Golden Gate National Recreation Area.

2.4 Visibility

Visibility into the Project site and proposed facilities is generally greatest from the west and southwest from adjacent streets, Richardson Bay, and looking over Richardson Bay from Sausalito and Marin City. Views from Tiburon are limited to the immediate crest of the ridgeline between Chapel Hill and Dormitory Hill.

The following descriptions present the principal views to the Project site available to the general public from the surrounding street network, parks, trails, and Richardson Bay.

Immediate Foreground Views

Other than those within the site boundaries, the Project site is not seen by the general public from most of the surrounding neighborhood streets due to topography, existing development, and vegetation.

Along Chapel Drive (KOP#1) there is a direct view to the existing open contoured grasslands of Chapel Hill. West of the crest of Chapel Drive (KOP #2) is an expansive view north toward Shuck Knoll overlooking the playing field. Visually dominant structures are the residences in the backdrop along Richardson Drive projecting above the ridgeline and the Southern Marin Fire District station. The primary view orientation of most of the single family residences along Chapel Drive is south toward Richardson Bay away from the Project site.

Views from Seminary Drive immediately adjacent to the Project site (KOP #3, KOP #4) when traveling in either direction focus on the park-like setting of the playing field and redwood grove. Existing mature trees surrounding the open playing field on the east side screen the majority of structures on Dormitory Hill and the parking lots and structures of the main campus.

Foreground Views

Views to the Project site are available from the following streets: Seminary Drive, Chapel Drive, Willis Drive, Ricardo Drive, and a short segment of Great Circle Drive. Portions of the Project site area are seen from Strawberry Cove Park, Brickyard Park, and the Shoreline Access Path near Egret Way.

Approaching the Project site on Seminary Drive from Ricardo Road, the first open view to the Project site (KOP #9) is over Strawberry Cove Park to the forests of Seminary Point. While the skylined roofs of residences along Campus Drive and the horizontal roofline of the existing

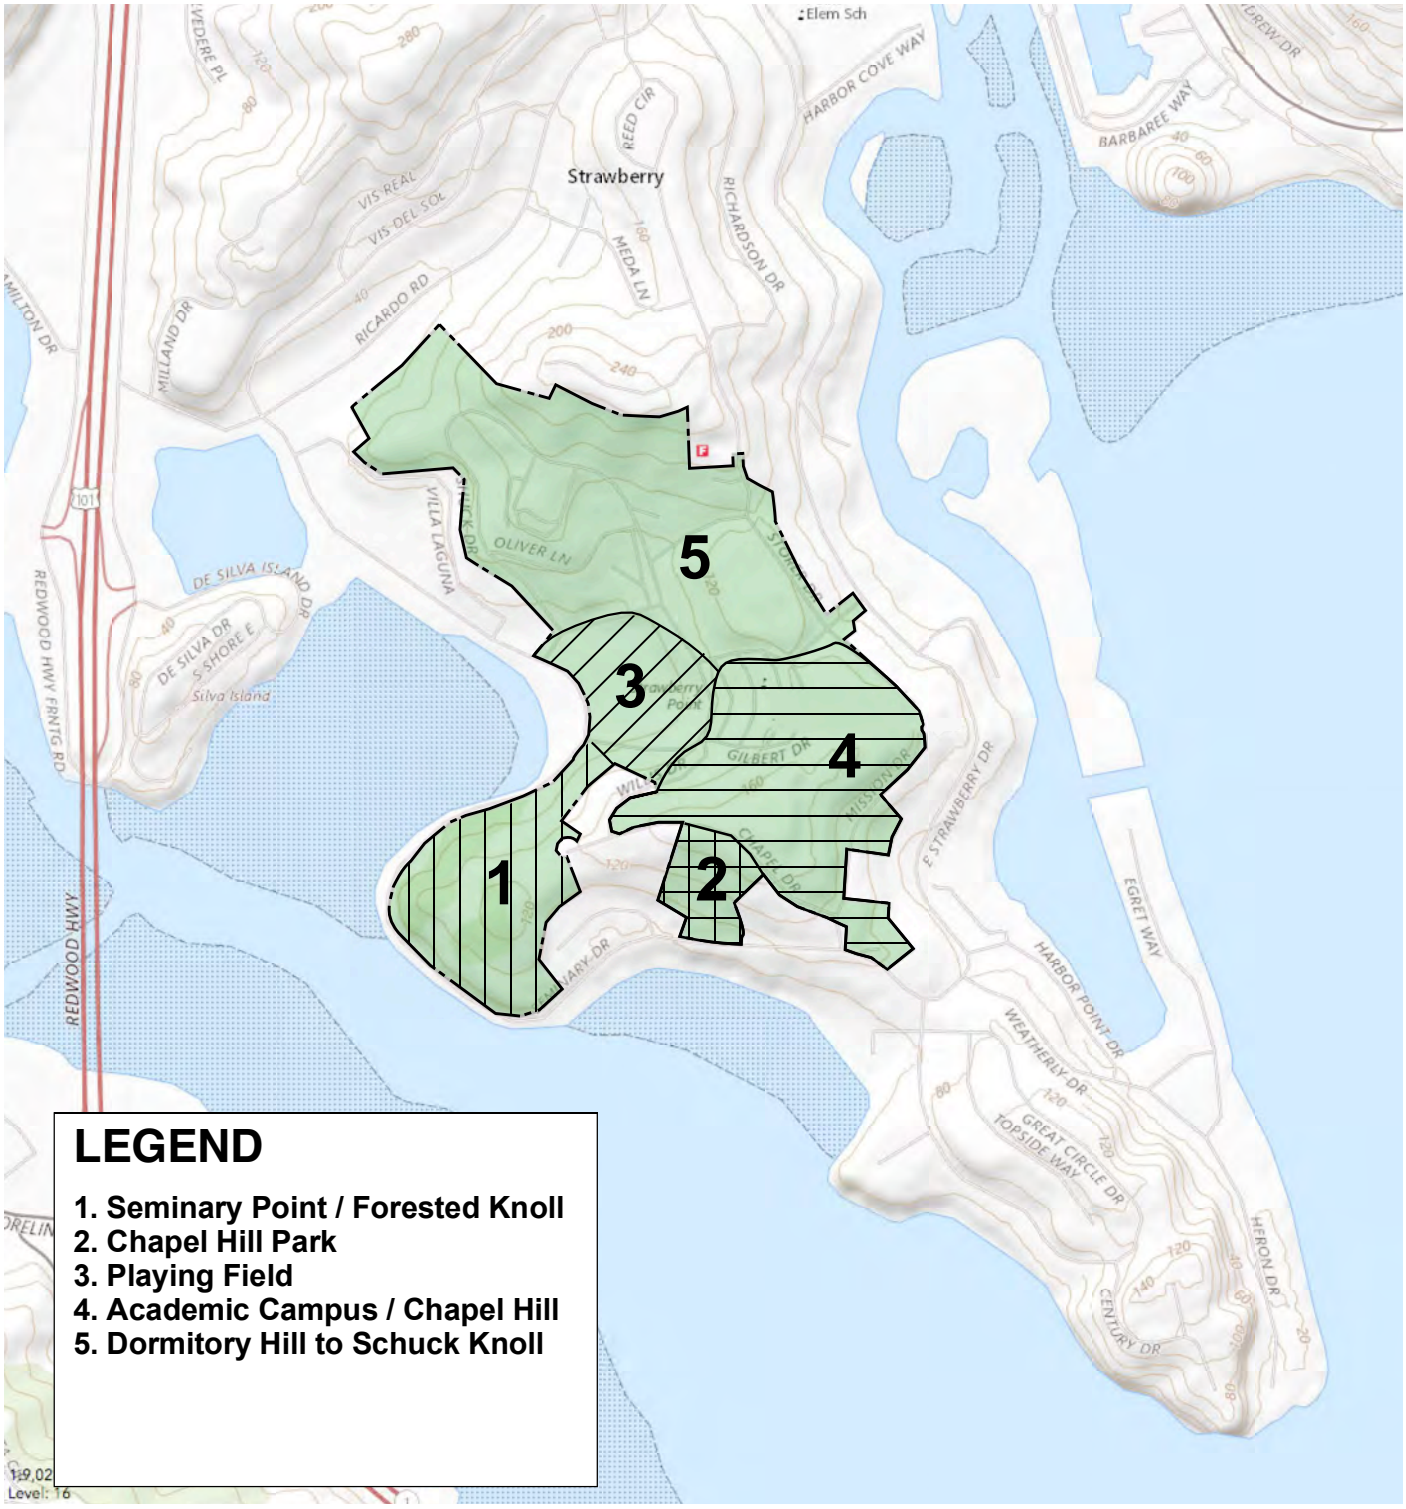

FIGURE V-4

CHARACTERISTIC LANDSCAPE UNITS

SEE TEXT FOR EXPLANATION

Scale
0' 300' 1500'

North

DATE: 1-22-24

multi-family housing on the point are visible, their presence is subservient to the forest and the visually dominant bay edge and marshlands at the base of the hill.

As Seminary Road bends toward the Project site (KOP #6), a funneled view to the Project site's forest above the playing field is created by three- story condinium buildings on either side of the road. A break in the corridor view is provided (KOP #5) by views to the south over bay marshlands to the forested knoll. The forest gnerally screens housing located on Chapel Drive and on the slopes of the knoll.

From Ricardo Street (KOP #7), the Project site sits above continuous single family houses backdropped by the woodland buffer area of the Project site. The houses dominate the view from the street with PG&E utillity lines visible parallel to the back property line of the houses. The forest and topography limit views into the Project site and existing dormitory devlopment in the Hodges/Shuck Planning Area.

From Seminary Dirve (KOP #8) traveling north there is a direct view focusing on the forested Seminary Point. A similar view exists from Brickyard Park (KOP #10). Dominant visual features are: the rounded forested knoll; duplex houses along Seminary Cove, and the shoreline edge.

Only a small portion of the Project site along the Dormitory Hill and Campus ridgeline is seen from the south and east. In the foreground from the shoreline park at the end of Egret Way (KOP #11) only the rooflines of the existing campus administration and classoom buildings are visible. Though seen, they are in the backdrop and essentially extend the roofline view of the houses along Egret Way. Also, the entire orientation of the hourses along Egret Way, the park, and the trail is to the east toward the Bay and the Tiburon peninsula, looking away from the Project site.

A brief view to Chapel Hill and the Administrative buildings exists when traveling north on Great Circle Drive (KOP #25). The horizontal character of the graded open space and building rooflines contrasts with the backdrop of the Mount Tamalpais East Peak ridgeline.

Principal visibility to the expanse of the Project site is afforded with a continuous view from the south and southeast from Richardson Bay itself or looking over Richardson Bay from Highway 101 traveling north (KOP #15), and from the Francisco Bay Trail /Mill Valley – Sausalito Path (KOP #21, KOP #22) and shoreline (KOP #23). Views for kayakers and other boaters in Richardson Bay would be similar to KOP#23. Looking toward the Project site, the most prominent natural features are Richardson Bay itself, the opposite Richardson Bay shoreline, the forested knoll, grasslands of Shuck Knoll, the woodland buffer and the grasslands of Watertank Hill or the Ring Mountain Preserve in the background. The bulk of condominiums and duplex housing along Seminary Drive visually contrast with the forest surrounding them.

Middleround Views from the East

Views to the Project site from Tiburon Boulevard (State Route 131), the San Francisco Bay Trail / Tiiburon Linear Park, and other public spaces (KOP #12, KOP #13) are limited to the Chapel Hill and Dormitory Hill ridgelines. The campus library, cafeteria, and dormitory residences are visible. The rooflines of the structures are generally horizontal and parallel the ridgeline.

However the scale of the structures is relatively large as compared to the texture of the surrounding residences.

Middleground Views from the West and South
Views to the Project site from Bridgeway and downtown Sausalito are predominantly blocked by development along Bridgeway or, as in the case of Dunphy Park, strongly screened by boats and masts. The forested Seminary Point can be seen as a component of the development in Strawberry and Tiburon from the public pier adjacent to The Spinnaker (KOP #20). However, the features that dominate the view are Richardson Bay and the East Peak of Mount Tamalpais State Park.

From the crest of Drake Avenue in Marin City (KOP #17) a view includes the forested knoll, Chapel Hill Park, the Chapel Hill Planning Area, and the Reed Storer/Shuck Planning Area of the Project with Ring Mountain Preserve in the backdrop. Numerous rooftops in the foreground on the streets below and residences along Seminary Avenue, Campus Drive, and Richardson Drive punctuate the view. A similar view, but one filtered by trailside vegetation, exists from Alta Trail in the Golden Gate National Recreation Area (KOP #16). The higher in elevation on the trail system the more of the Project site is visible.

Views to the Project site as seen from Richardson Bay and its margins to the west of Highway 101 (KOP #24) are limited to Seminary Point and are filtered and dominated by the highway bridge itself and north shoreline commercial development. Views to the remainder of the Project site are blocked by the topography of de Silva Island,

Views from the North
Views into the Project site from the ridge along Richardson Drive and Milland Drive are generally blocked by residences. Some of the forest buffer on the north side of Shuck Knoll is seen from Richardson Drive.

Background Views from Mount Tamalpais State Park
A 270° panorarmic view extending from the Pacific Ocean to San Pablo Bay is available from East Peak of Mount Tamalpais State Park. The Project site can be seen to the southeast from both the top of the mountain around the fire lookout (KOP #18) and the Verna Dunshee Trail Overlook (KOP #19).

3.0 REGULATORY SETTING

3.1 STATE

California Building Code

The California Building Code (California Code of Regulations, Title 24, Part 2) contains various building standards derived and adapted from the International Building Code, authorized by the California legislature, that address California building issues, including several that are applicable to the visual condition of a site (especially at night). They include standards for outdoor lighting intended to improve energy efficiency, minimize light pollution and nighttime glare, and provide design solutions to shield and control outdoor lighting fixtures.

Related to glare, the 2022 California Green Building Standards Code, Title 24 Section A4.106.7 Reduction of Heat Island Effect on Nonroof Areas includes voluntary measures for residential

buildings. It states "Use high albedo materials with an initial solar reflectance value of at least 0.30 as determined in accordance with American Society for Testing and Materials (ASTM) Standards E1918 or C 1549". This is a minimum threshold. For roofs the minimum value threshold varies by Building Climate Zone and building type tier levels (low-rise and high-rise). The project site is in Building Climate Zone 3. There are no minimum thresholds values indicated in the code for low-rise residential roofs in Zone 3.

California Department of Transportation: Scenic Highway Program

The State Scenic Highway Program—a provision of Sections 260 through 263 of the Streets and Highways Code—was established by the Legislature in 1963 to preserve and enhance the natural beauty of California. The State Scenic Highway System includes highways that are either eligible for designation as scenic highways or have been designated as such. The status of a State Scenic Highway changes from "eligible" to "officially designated" when the local jurisdiction adopts a scenic corridor protection program, applies to Caltrans for scenic highway approval, and receives the designation from Caltrans.

The following routes are eligible as a State Scenic Highway but have not been adopted as such by Marin County:

- Highway 101 north from the Golden Gate Bridge to Highway 1 north
- Highway 1 north
- Highway 37 east to the Sonoma County line

3.2 LOCAL

There are three principal Marin County regulatory documents that address visual reaources. These are:

- The Marin Countwide Plan
- The Marin County Development Code
- The Strawberry Community Plan and Amendments

Goals, policies, and design guidelines related to visual resources and visual quality as applicable to the Project are listed below.

Marin Countywide Plan

Built Environment Element

Goal DES-3: New Development in Built Areas. New construction should occur in a compact form in developed locations whenever feasible.
Policy DES-3.1: Promote Infill. Encourage the development of vacant and underutilized parcels consistent with neighborhood character.
Policy DES-3.2: Promote Green Spaces. Encourage the creation of high-quality community plazas, squares, greens, commons, community and neighborhood parks, and rooftop gardens.

Implementing Programs

Goal DES-4: Protection of Scenic Resources. Minimize visual impacts of development and preserve vistas of important natural features.

Policy DES-4.1: Preserve Visual Quality. Protect scenic quality and views of the natural environment — including ridgelines and upland greenbelts, hillsides, water, and trees — from adverse impacts related to development.

Implementing Programs

DES-4.a: Protect Key Public Views. Work with community groups to identify, map, and protect important view corridors. Establish design standards for development in these areas as part of the design review requirements and individual community plans (see DES-3.b).

DES-4.b : Minimize Visual Impacts of Public Facilities. Amend applicable codes and procedures to require appropriate placement, design, setbacks, and native landscaping of public facilities (including sound walls, medians, retaining walls, power lines, and water tanks) to reduce visual impacts, and encourage local agencies to adopt similar standards.

DES-4.c: Regulate Mass and Scale. Ensure that the mass and scale of new structures respect environmental site constraints and character of the surrounding neighborhood (see Program DES-3.b), are compatible with ridge protection policies (see Program DES-4e), and avoid tree-cutting (especially on wooded hillsides) and grading wherever possible. Community plans should consider regulations concerning home size.

DES-4.d: Protect Views of Ridgelines. Implement Development Code standards that require development proposed on or near visually prominent ridgelines (including in the Ridge and Upland Greenbelt Areas shown on Map 3-4) to be clustered below the ridgeline on the least visually prominent portion of the site. Expand the implementation of these standards by including in the Ridge and Upland Greenbelt Area those unmapped ridgelines identified as having countywide significance and rezoning Ridge and Upland Greenbelt lands to Planned District categories and adjacent buffer area to a transitional district. (See DES-4.e.)

DES-4.e: Protect Views of Ridge and Upland Greenbelt Areas. Employ a variety of strategies to protect views of Ridge and Upland Greenbelt areas, including the following:

- Identifying any unmapped ridgelines of countywide significance, both developed and undeveloped, and adjusting the Ridge and Upland Greenbelt Areas map as appropriate;
- Amending the Development Code and County zoning maps to designate a suburban edge on all parcels contiguous to the City-Centered Corridor that abut the Ridge and Upland Greenbelt, and requiring that those parcels develop at rural densities with visually sensitive site design;
- Rezoning Ridge and Upland Greenbelt lands to the Planned District category and adjacent buffer areas to a transitional district, thereby subjecting them to County Design Review Requirements that include hillside protection;
- Requiring buildings in Ridge and Upland Greenbelt areas to be screened from view by wooded areas, rock outcrops, or topographical features (see DES-3.b); and
- Calculating density for Ridge and Upland Greenbelt subdivisions at the lowest end of the Countywide Plan designation range.

Glossary

- **View Corridor**. The line of sight — identified as the height, width, and distance — of an observer looking toward an object of significance to the community; the route that directs the viewer's attention.
- **Viewshed.** The area within view from a defined observation point.

FIGURES

- Map 3-4: Ridge and Upland Greenbelt Areas

Marin County Development Code

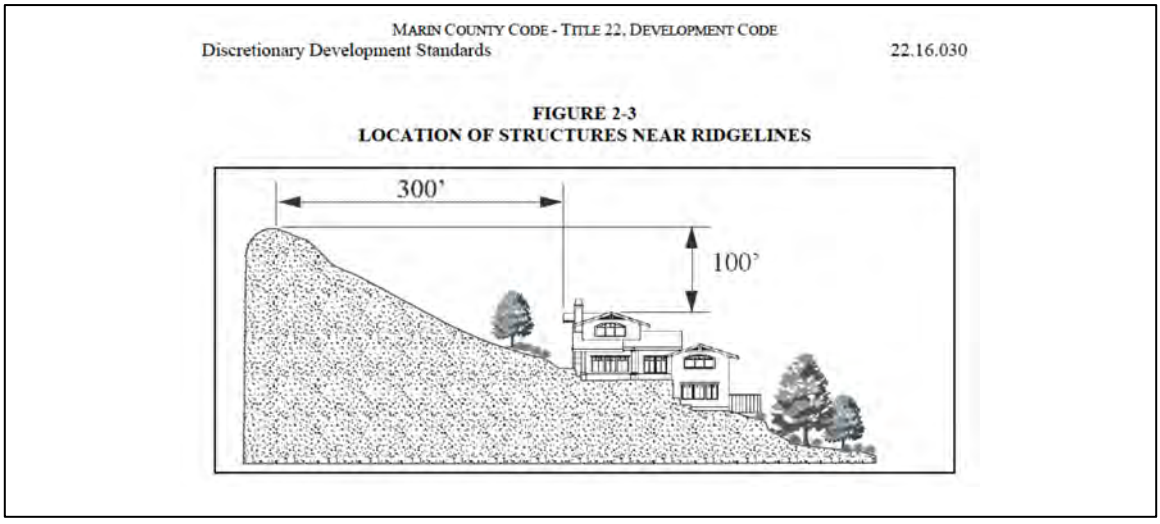
22.10.040 – Residential District Development Standards

B. Development standards for planned districts. Table 2-5, Residential District Development Standards, outlines the RMP district height limit for primary structures as 30 ft and accessory structure as 16 feet. There are no applicable minimum setback requirements outlined in the table for the RMP zoning district.

22.16.030 – General Standards

D. Building location

1. **Clustering requirement.** Structures shall be clustered in the most accessible, least visually prominent, and most geologically stable portions of the site, consistent with needs for privacy where multiple residential units are proposed. Clustering is especially important on open grassy hillsides; a greater scattering of buildings may be preferable on wooded hillsides to save trees.
2. **Development near ridgelines.** No construction shall occur on top of, or within 300 feet horizontally, or within 100 feet vertically of visually prominent ridgelines, whichever is more restrictive, unless no other suitable locations are available on the site or the lot is located substantially within the ridgeline area as defined herein. If structures must be placed within this restricted area because of site constraints or because siting the development outside of the ridgeline area will result in greater visual or environmental impacts, they shall be in locations that are the least visible from adjacent properties and view corridors.



F. Landscaping. Introduced landscaping should be designed to minimally disturb natural areas, and shall be compatible with the native plant setting. Landscaping plans should be prepared in compliance with Chapter 22.26 (Landscaping). Landscaping plans should consider fire protection, solar access, the use of native and drought tolerant plant species and minimal water use. Planting should not block scenic views from adjacent properties or disturb wildlife trails. See also Chapter 22.26 (Landscaping).

G. Lighting, exterior. Exterior lighting visible from off-site should be allowed for safety purposes only, shall consist of low-wattage fixtures, and should be directed downward and shielded to prevent adverse lighting impacts on nearby properties, subject to the approval of the Director.

I. Project design

1. Height limits for structures:
   a. 30 feet for primary structures, except that multi-family residential buildings may be increased in height to 40 feet when side yard setbacks of 15 feet or greater are provided.
   b. The floor level of the lowest floor shall not exceed 10 feet above natural grade at the lowest corner.
   c. Structures located within the ridgeline areas pursuant to Subsection F.2 above shall be limited to a maximum height of 18 feet.

2. Materials and colors. Building materials and colors shall be chosen to blend into the natural environment unobtrusively, to the greatest extent possible.

22.26.040 – Landscaping Objectives

A. Provide visual amenities. Landscaping should enhance the appearance of new development and surrounding areas by being designed, installed, and maintained to blend new structures into the context of an established community.

D. Screen incompatible land uses. Landscaping should be utilized to screen incompatible land uses by creating visual separation, where deemed necessary and appropriate, between land uses.

CHAPTER 22.42 – Design Review
22.42.010 – Purpose of Chapter

D. The design of the built environment respects and preserves the natural beauty of the County and the environmental resources found within.

G. Conflicts between land uses are eliminated, environmental values of the site are preserved, and adverse physical or visual effects which might otherwise result from unplanned or inappropriate development, design, or placement are minimized or eliminated.

24.04.410 - Parking lot lighting.

Lighting fixtures shall be shielded so as not to produce obtrusive glare on the public right of way or adjoining properties. All luminaries shall meet the most recently adopted criteria of the Illuminating Society of North American (IESNA) for "full cut off" luminaries.

22.130.030 – Definitions of Specialized Terms and Phrases
Visually Prominent Ridgeline. A line connecting the topographic highpoints within the Countywide Plan's Ridge and Upland Greenbelt along a ridge that separates watersheds and is visible from public viewpoints from open space areas, parks, trailheads, highways, arterial roads, the bay and other water bodies.

Strawberry Community Plan (1977)

General Design Guidelines

- Landscaping: Site plans shall be designed to incorporate landscaping to screen views of proposed structures. Landscaping shall be placed to provide privacy between proposed and existing structures.
- Ridgelines: Hilltops, forested areas and other prominent visual landmarks in the community should be recognized in development plan proposals and preserved in their natural state.
- View Corridors: Existing significant view corridors should be identified and designs for maintaining those corridors should be incorporated into development proposals. Structures in view of existing development should be designed to incorporate a variety of interesting structure planes and angles while adhering to a 30' 0" height limitation that maintains those existing views.

Specific Policy Framework

2.0 Preserve and Enhance the Scale and Character of the Area.

2.1 Preserve the natural appearance of hills, ridgelines, and other prominent or significant landforms.

2.12 Permit no development which would significantly interfere with views from ridges or hilltops to the Bay or lowlands.

2.13 Permit no development which would interrupt a continuous view of the visual crest of the surrounding hillsides from adjacent lowlands.

Strawberry Community Plan and Amendments (1982)

II. Goals
A. Community Amenities
It is the desire of the Community to assure that future development provide for such amenities as visual backdrops, neighborhood separators, retention of ridgelines, and protection of environmentally important areas, through careful planning and clustering of structures. In addition, all means of open space acquisition should be pursued, including purchase and dedication.

III. Development Guidelines
C. Golden Gate Baptist Theological Seminary - Land Use
(Area 5) Slope between Chapel and Seminary Drive - A band of open undeveloped land should extend from Chapel Drive to Seminary Drive.

(Area 6) Any expansion of the campus or student housing should be developed in this area. Hilltop adjacent to Chapel Drive is a prominent visual landmark within the Community and should remain undeveloped, if possible. However, if development of this site is to occur, it should be limited to structures for Seminary activities. No housing-should be placed on this site. structures should be designed and placed so that they are as unobtrusive as possible. This should be accomplished by placing structures in the northern quadrant of the site and by "benching" the slope to provide a lower building pad and profile. Landscaping should also be incorporated into the site plan to screen views of the structure from existing dwellings. The existing views from residences along Hillard Drive should not be blocked by development on this hilltop.

(Area 8) Location of Development - The Forested Knoll above Seminary Drive should remain undeveloped because it is a prominent visual landmark in the Community.

E. General Design Guidelines

- Landscaping: Site plans shall be designed to incorporate landscaping to screen views of proposed structures. Landscaping shall be placed to provide privacy between proposed and existing structures.
- Ridgelines: Hilltops, forested areas and other prominent visual landmarks in the community should be recognized in development plan proposals and preserved in their natural state.
- View Corridors: Existing significant view corridors should be identified and designs for maintaining those corridors should be incorporated into development proposals. Structures in view of existing development should be designed to incorporate a variety of interesting structure planes and angles while adhering to a 30' 0" height limitation that maintains those existing views.

4.0 VISUAL RESOURCE IMPACT ANALYSIS

Threshold of significance criteria for assessing the impacts to aesthetics are based on the CEQA Environmental Checklist. According to the CEQA Checklist, a project would result in a significant impact if it would:

- Have a substantial adverse effect on a scenic vista.
- Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.
- In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings. (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?
- Create a new source of substantial light or glare that would adversely affect day or nighttime views in the area.

4.1. Scenic Vistas

Impact Analysis: No Impact

A scenic vista is defined as (1) a public view from an existing park, plaza, major roadway or other public area, or (2) a gateway or panoramic view from areas generally available to the

general public. Views from private residences and non-public access are not considered scenic views because they are not available to the general public.

There are numerous panoramic and scenic views throughout the area's roadways, trails, public parks, and the Bay. The Fire Lookout and the Verna Dunshee Trail Overlook in Mount Tamalpais State Park could be considered formal designated vista points.

The Project will not block public views from any local or designated scenic vista points. Nor will the Project block views to any regional landmarks such as Richardson Bay, San Francisco Bay, Mount Tamalpais, or from other bayside communities including San Francisco as seen from areas surrounding the Project site. There is no substantial adverse effect on a scenic vista.

4.2 Scenic Resources within a State Scenic Highway

Impact Analysis: No Impact

There are no designated State Scenic Highways within Marin County. Therefore the Project would not be visible from any state scenic highway or damage scenic resources within a state scenic highway, including, but not limited to trees, rock outcroppings, and historic buildings.

4.3 Conflict with Applicable Zoning and Other Regulations Governing Scenic Quality

Impact Analysis: Less Than Significant with Mitigation

Construction Impacts

During construction, the following may be seen throughout the immediate Project area and from all KOPs in the foreground and to a lesser extent the middleground.

- Removal of existing vegetation.
- Demolition of existing structures and off-hauling of materials.
- Cut and fill grading necessary to develop Project area access roads and building sites.
- Fill placement at the existing playing field.
- Large pieces of equipment used for: moving earth; trenching ditches; transporting, lifting, placing materials; hauling cement; water trucks spraying water to control dust; and assorted construction vehicles.
- Construction activities for individual of Project facilities.

These activities will be dominant features in the landscape setting and will attract attention to the Project. It would usually not be feasible to fully screen or avoid the visibility of all project construction activities; however, visual impacts from construction are generally temporary (estimated by the applicant to require approximately 4 years) and would be less than significant.

Operation Impacts

The Project is in an urbanized area within the jurisdiction of Marin County. As such, the significance of visual impacts is defined by the consistency of the Project with the adopted goals, policies, and guidelines relating to visual character and quality. These are contained in the Marin Countywide Plan, Marin County Development Code, and Strawberry Community Plan and Amendments. The Project proposes a series of new amendments to the Strawberry Community Plan that relate to overall development within the Project site. This section includes: a description of the Project-related change to existing visual conditions; an

evaluation of potential visual effects on key public views; a series of recommended measures to mitigate those effects; and how those mitigated effects conform to the County's policies related to visual character and quality.

Long-term impacts to the visual character of the Strawberry area as seen by the general public will principally be related to changes in views created by the presence of new development. Key elements of the Project's development that affect its ability to conform to County policies are color, bulk, and relationship to the Project site's local ridgelines as seen from lower elevations. The main color palette for most of buildings consists of relatively light-valued materials including light beige cement plaster.

Table V-2 provides an overview of the Project impact on existing visual character as seen from all KOPs.

Eight KOPs were identified for preparing visual simulations to illustrate the Project-related visual change that would occur. These are:

- KOP #2 – Seminary Drive at Gilbert Drive (looking north)
- KOP #3 – Seminary Drive at Gilbert Drive (looking northeast)
- KOP #8 – Seminary Drive west of Chapel Drive (looking west)
- KOP #10 – Brickyard Park (looking northwest)
- KOP #14 – San Francisco Bay Trail / Mill Valley – Sausalito Path (looking north)
- KOP #17 – Drake Avenue, Marin City (looking north)
- KOP #19 – Verna Dunshee Trail Overlook, Mount Tamalpais State Park (looking southeast)
- KOP #23 – Richardson Bay adjacent to Shoreline Office Center (looking northeast)

These KOPs represent a variety of views from publicly accessible locations. The selection was also based on information presented in Table V-1 and, in part, on public comments made through the Notice of Preparation process.

The simulations are based on architectural, engineering, and landscape architectural drawings and materials selection provided by North Coast Land Holdings, LLC. They do not present a final design. There are potential details of the Project, such as the installation of solar electricity-generating panels on the building roofs that would be hidden behind parapets, as required by building codes. These and other details, such as lighting standards, are not shown in the simulations. The simulations are intended to illustrate the overall pattern, form, scale, color, and texture of the proposed development related to the characteristic landscape.

The simulations assumed the following about vegetative conditions:

- An approximate five-year growth period for planted vegetation after completion of construction.
- The Project proponent would implement a long-term landscape plan to replace dead or dying trees, maintain the forested nature of the Project site, and comply with Marin County fire codes. It is assumed that vegetative clearing and tree removal will be initially caused by grading, removal of existing structures, creating a defensible space around all new structures per code, or removing of existing dead or highly diseased trees that are currently standing. In addition, removal of selected downed wood on

the ground plane in forested areas and limbing up trees to avoid fuel ladder conditions would take place.

Many, but not all, of the KOPs identified above and in Figure V-2 provide relatively expansive views to the Project site. Attachment B includes, when applicable, panoramic images depicting existing visual conditions at the selected KOPs listed above used for simulations.

Visual simulations of the Project as seen from the selected KOPs are found in Attachment C. These consist of full-page images designated "a" and "b," with the existing views shown in the "a" figure and the five years after construction visual simulations in the "b" figure.

Table V-2: Impact on Visual Character from Key Observation Points

KOP ID #	Location	Impact Description
1	Chapel Drive: On the sidewalk in front of the residence at 125 Chapel Drive.	Impacts of the overall project are limited to the immediate foreground view to the open grassland hilltop of Chapel Hill Park. Viewing time for vehicles traveling along Chapel Hill Drive is approximately 20 seconds when traveling 35 mph. The view will be modified to a developed landscape with clustered apartments on the side slopes of the hill. The majority of structures are attached that will visually increase their perceived overall bulk. However, the resulting development will be coherent and unified. The hilltop will remain open space but converted to a formal, rectilinear viewing plaza with perimeter canopy / arbor structure. As Chapel Hill and its slopes will be redeveloped in their entirety, the resulting fit between new structures and open space will also be harmonious. Light-valued surfaces of architectural components will present a contrast and draw attention to the buildings. The visibility of the apartments from Chapel Drive will depend on the landscaping along Chapel Drive.
2*	Chapel Drive: On the sidewalk across from the residence at 141 Chapel Drive.	See simulation. The view north over the existing playing field includes the Shuck Drive Knoll, Hodges / Shuck, Reed/Storer/Shuck, and a portion of Dormitory Hill Planning Areas. The view will be significantly altered with the removal of random sparse structures and development of tightly spaced distinct housing located along the existing road system. Light-valued surfaces of architectural components will contrast with the grassland and forest backdrop and draw attention to the buildings. Landscape and undeveloped open space between the structures will remain visible in some areas and visually break up the various development clusters. Only the upper floors of the taller six-story structures at the corner of Hodge and Shuck Drives will be visible. The apartment buildings being located at the lower elevations of the Project site will be visually backdropped by hillside topography and smaller apartments of a similar architectural style.
3*	Seminary Drive: On the sidewalk opposite the Gilbert Drive intersection	See simulation. Views to the playing field will be eliminated from Seminary Drive with the creation of a 1:1 (horizontal to vertical) gradient fill slope. The slope will be landscaped with native trees that will filter existing views up the toward Dormitory Hill. Views beyond the elevated playing field will include the upper stories of the residential care facility and the six-story apartment buildings in the Hodges/Shuck Planning Area. As seen from Seminary Drive, views to the structures will be further filtered by street trees and landscape in and between the structures.
4	Seminary Drive: On the sidewalk at the driveway entrance to 150 Seminary Drive.	Similar to KOP #3, views to the playing field and hillside backdrop will be eliminated with a 1:1 gradient fill slope in the immediate foreground. The redwood grove will remain. The slope will be landscaped with trees.
5	Seminary Drive: On the sidewalk near the pedestrian path along	Views to the forested Seminary Point will be altered by with the inclusion of light-valued surfaces on two to three-story structures that will contrast with the darker forest vegetation and change what is now seen as essentially undeveloped hillside. Forest thinning of downed and

Table V-2: Impact on Visual Character from Key Observation Points

KOP ID #	Location	Impact Description
	the bay shore behind 150 Seminary Drive.	diseased trees can be expected. Because the structures are sited relatively low on the hillside, the ridgeline backdrop will remain intact.
6	Seminary Drive: On the street adjacent to 110 Seminary Drive and Strawberry Shores Apartments.	The view is funneled along the street by adjacent apartment and condominium buildings focusing on the exiting hillside vegetation above the existing playing field. The Monterey pine trees will initially remain with locally native tree species replacing them over time. Raising the playing field will not be seen because the existing condominium structure at 150 Seminary Drive blocks the view. The rest of the Project will not be visible.
7	Ricardo Drive: On the sidewalk opposite the residence located at 301 Ricardo Drive.	Because of topography, views to most of the Project development will not be seen. The existing forest buffer on the north and west sides of Shuck Knoll, noting that some of the forest is not within the Project boundaries, will generally screen development on the upper portions of Shuck Knoll.
8*	Seminary Drive: Approximately 150 feet west from intersection with Chapel Drive.	See simulation. Three units of the proposed apartments will be seen along the lower portions of Seminary Point. When seen individually their scale and bulk will be smaller than the duplex units in the foreground. The forest immediately around the structures will be thinned / cleared for fire protection making the structures more visible. Light-valued surfaces of architectural components will present a contrast with the forest setting and draw attention to the buildings. The ridgeline will not be altered.
9	Strawberry Cove Park: From edge of developed playground / picnic area.	The units that replace the existing apartments will be seen because of forest thinning and with attention drawn to them due to the light-valued surfaces of architectural components that will contrast with the forest setting. The ridgeline will not be altered.
10*	Brickyard Park: From edge of developed playground / picnic area.	See simulation. Similar to KOP #8, Portions of three or four apartment units will be seen along the lower portions of Seminary Point. The forest will be thinned of downed wood and diseased trees for fire protection. The ridgeline will not be altered.
11	Shoreline Access Path: At end of Egret Way.	The foreground view to the existing rooflines of the academic buildings in the Campus area will remain. The view will not change.
12	Interpretive Overlook, Richardson Bay Audubon Center & Sanctuary	The Campus library and cafe can be seen in the middleground as one component of the fully developed east-facing hillside of the Strawberry Peninsula. As no changes are proposed in this portion of the Project site, the view will not be altered.
13	San Francisco Bay Trail / Tiburon Old Rail Trail	The middleground view to the east side of Dormitory Hill ridgeline will change only slightly. The existing Campus library and cafe will continue to be seen. The horizontal roofline of the highest level of the residential care facility will replace the visible upper levels of the existing dormitories along the ridgeline. The residential care facility will be unified with the existing topography. Overall, the lines of the structure will parallel the ridgeline and generally blend with the texture

Table V-2: Impact on Visual Character from Key Observation Points

KOP ID #	Location	Impact Description
		of the fully developed east-facing hillside of the Strawberry Peninsula. Over time landscape trees will break up the horizontality of the structure.
14*	San Francisco Bay Trail / Mill Valley – Sausalito Path	See simulation. The forms of Chapel Hill and Seminary Point are openly visible. These topographic features screen the rest of the Project Area from view. The vegetation at the top of Chapel Hill Park will screen the development on the east side of Chapel Drive. Most of the apartments and residences proposed at Seminary Point will be visible. When seen individually or in mass their scale and bulk will be similar to the duplex units along Seminary Drive. The forest immediately around the structures will be thinned / cleared of downed wood and diseased trees for fire protection making the structures more visible. Light-valued surfaces of architectural components will present a contrast with the forest setting and draw attention to the buildings. The ridgeline will not be altered.
15	Highway 101: Traveling north.	Views to the Project site are available when traveling north on Highway 1 from the Sausalito-Marin City exit to the end of the Highway 101 bridge over Richardson Bay. In some sections, views from the highway are generally blocked by development along Bridgeway until approaching the bridge spanning Richardson Bay. On the bridge views are blocked by commercial buildings on the south and de Silva island on the north. For all vehicles traveling north views from the Sausalito-Marin City exit to the Project site could last approximately 75 seconds when traveling 65 mph with 17 seconds of that being open views while on the bridge. On the bridge, views begin at a 30-degree angle at the southern end of the bridge and increase to a 90-degree angle nearing de Silva island. The visibility of Project site will be similar to that of KOP #23 except with a more superior perspective.
16	Golden Gate National Recreation Area, Alta Trail	At the lower elevations of the Golden Gate National Recreation Area trail system, middleground views are often blocked by trailside vegetation. Where views are available, they will be similar to that of KOP #17 but with a more superior perspective.
17*	Drake Avenue	See simulation. Direct middleground views from Marin City to the forested knoll of Seminary Point, Chapel Hill Park, and Chapel Hill exist. The Ring Mountain Preserve on the Tiburon peninsula provides a backdrop to the entire Project site. As with KOP #14, topography and vegetation of Seminary Point will screen most the Project Area from view. The vegetation at the top of Chapel Hill Park will only partially screen the apartment development on Chapel Hill. The apartments on the south side of Chapel Hill will be visible. The bulk and scale of the apartment units will be similar to the houses along the west side of Chapel Drive. The light-valued color of the architectural surfaces will be noticeable. However the overall visibility of the development over time will depend on the landscaping along Chapel Drive.

Table V-2: Impact on Visual Character from Key Observation Points

KOP ID #	Location	Impact Description
		Most of the apartments proposed at Seminary Point will be visible. When seen individually or in mass their scale and bulk will be similar to the duplex units along Seminary Drive. The forest immediately around the structures will be thinned / cleared for fire protection making the structures more visible. Light-valued surfaces of architectural components will present a contrast with the forest setting and draw attention to the buildings. The ridgeline will not be altered.
18	Mount Tamalpais State Park: At the base of fire tower lookout on the east side.	Background panorarmic views are available from East Peak of Mount Tamalpais State Park. From this superior position, vitrtually the entire Strawberry Peninsula can be seen. Visually, only the structure groupings because of their light-valued architectural surfaces will be evident as three distinct development areas: Strawberry Point; Chapel Hill; and the Domritory Hill to Shuck Knoll area. The spaces that are distributed in between these clusters will be revegetated and at a background distance will not be noticably altered.
19*	Mount Tamalpais State Park: At the Verna Dunshee Trail Overlook.	See simulation. The view is essentially the same as KOP #18 but taken from a developed scenic overlook point.
20	Public access pier adjacent to The Spinnaker	The only portion of the Project site that is distinctly visible in the background is Strawberry Point. The roofline of the eastern-most academic building is also visible. While the apartments on Strawberry Point may be seen because of their light-valued architectural surfaces, their scale will be minimal and not affect the overall panorama of Richardson Bay seen from the pier.
21 / 22	Richardson Bay Shoreline at parking area at the end of Salinas Street behind Seaplane Adventures	This viewing point location is not officially identified as a public shoreline and therefore is little used by the general public. The east-facing panorama over Richardson Bay allows virtually the entire Project to be seen. The visual impacts would be similar to that of KOP #23 that is a publicly accessible shoreline park area.
23*	Richardson Bay Shoreline public access point adjacent to Shoreline Office Center	See simulation. Virtually the entire Project will be seen in the foreground from the east-facing panorama over Richardson Bay. This is a similar perspective to what would be seen by kayakers and other boaters on Richardson Bay. The perspective of the KOP to the Project site is inferior so that development will be seen behind but above the existing apartment and condominiums that line the Richardson Bay shoreline along Seminary Drive. The light-valued surfaces and uniform architectural components of the Project will contrast with surrounding landscape and development. The bulk and scale of the residential care facility is somewhat visually mitigated by the stepped nature of the architecture and, though attched, the segmentation of the building into distinct units. In some areas, trees would be planted between the units further breaking up the structure visually. The rooflines of the apartments in the top of the Reed/Storer/Shuck Planning Area and the upper-most residential care facility

Table V-2: Impact on Visual Character from Key Observation Points

KOP ID #	Location	Impact Description
		structure will initially be skylined. If on the water, this effect would be more noticible as one approaches to the western shoreline of Richardson Bay. Over time, however, trees planted on the northeast side of the residential care facililty will grow above the roofeline and visually create a more natural edge condition.
24	San Francisco Bay Trail / Mill Valley – Sausalito Path: At Bothen Marsh Preserve.	A middlegroud view to Seminary Point is partially blocked and visually dominated by the Highway 101 bridge over Richardson Bay and the moving traffic on it. While some portion of the apartments on Seminary Point might be seen, they would be in the background and a minor feature of the view. The remainder of the Project site is not visible.
25	Great Circle Drive	An open view to Chapel Hill is available north of the crest of Great Circle Drive. When driving at 25 mph the view lasts for approximately 5 seconds. The apartment cluster on the south side of Chapel Hill and the redeveloped Chapel Hill plaza would be openly visible. The degree of visibility to the apartments over time will be dependent on the downhill landscaping of the Project and street trees planted along the east side of Chapel Drive.

*** KOP selected for visual simulation**

General Considerations

Open Space: The principal open space feature of the Project site is Seminary Point with its forested knoll. The overall open space prominence of Seminary Point as seen from any direction will remain. However, the new apartments along Chapel Drive will be seen as a linear feature along the lower slopes of Seminary Point linking with the duplex housing of Seminary Cove.

The Project within the Dormitory Hill, Reed/Shuck/Storer, Hughs/Shuck, and Shuck Knoll Drive Planning Areas will convert a portion of the existing undeveloped, private open space into housing, the residential care facility, and other community facilities. The visual effect, particularly as seen from inferior viewer positions on Richardson Bay and its western shoreline area will be the development of these open spaces. This effect is significantly less so when seen at higher elevations where open space between development clusters is observed. The side slopes of Chapel Hill will be developed with the westernmost point of Chapel Hill being reconfigured but remaining as open space. Chapel Hill Park, also a visual open space as seen from the south and west, will remain untouched.

Scale: Most proposed apartments and dormitory structures are generally compatible in scale with the surrounding single family homes, condominiums, and large apartment buildings that ring the shoreline.

The mass and scale of the residential care facility, while larger than surrounding buildings, is mitigated by: its angled footprint forming two wings that mimic the existing topography; stepping the five floors down the slope; street trees that help screen the building; and tree plantings between the wings of the buildings that further visually separate them. In addition the horizontal nature of the building includes fenestration of the facade that further visually breaks the building into smaller components.

The mass and scale of the six-story apartment structures at the corner of Hodges Drive and Shuck Drive will be visually distinct when viewed in the immediate foreground from within the Project site. Seen from surrounding areas outside the Project site the lower floors will generally not be visible as the structures are located in the lower elevations of the Project site. While the upper floors of the structures may be seen, they will be similar in color and fenestration to the smaller apartment structures that backdrop them and are visually unified with them.

Color: The proposed buildings emphasize use of a light-valued off-white cement plaster. Streets and pedestrian pavements use high albedo surfaces that are also light-valued in color. While off-white and other light-valued colors do appear in the residential structures in the surrounding community, they are intermittent in the overall landscape. With a common architecture throughout the entire proposed development, the overall effect of the buildings taken in their entirety displays a color contrast with the surrounding natural landscape that draws the attention of the viewer. This is particularly true for views from the southwest in the afternoon looking at the Project over Richardson Bay. While the Project internally is harmonious and coherent it draws the viewer's attention when seen in context with the established harmony of the surrounding landscape and community.

Views

Views from the North

The Project site is blocked from view from the majority of the public street system to the north by continuous residential development, the ridgeline extending from the Reed/Storer/Shuck and Shuck Knoll Drive Planning Areas, and the existing woodland buffer located along Ricardo Road and Richardson Drive. A portion of that woodland buffer is within the Project site. To the extent that the on-site woodland buffer is thinned, the apartments on the west and north sides of Shuck Knoll would be seen, though filtered, from the western end of Ricardo Road (KOP #7) near Seminary Drive. The scale of the apartments would be in harmony with the scale of residences along Ricardo Road / Vista Del Sol neighborhood.

Views from the Northeast and East

Views from the Tiburon Peninsula (KOP #12 and KOP #13) into the Project site are generally blocked by the ridgeline connecting the Campus, Dormitory Hill, and Reed/Storer/Shuck Planning Areas and by existing mature vegetation along the residential area of East Strawberry Drive. Project facilities will not be seen with the exception of portions of the uppermost level of the residential care facility. The flat roofline will parallel the topography and will be backdropped by the ridgelines of the Golden Gate National Recreation Area.

Views from Egret Way (KOP #11) to the existing campus buildings will not change.

Views from the Southeast

Views of the Chapel Hill Planning Area apartments will be directly visible from Chapel Drive (KOP #1) in the immediate foreground and from Great Circle Drive (KOP #25). The degree of visibility will be dependent on street trees and landscaping associated with the final project design. When driving, views into the Project site will be relatively short to moderate.

Open views into the Project site in the immediate foreground to the majority of apartments and dormitory development in the Reed/Storer/Shuck, Hodges/Shuck, and Shuck Knoll Planning Areas would be afforded from Chapel Drive traveling west beyond the crest of Chapel Hill. The central portions of the Project site will change from one of scattered structures to more intense but clustered development (KOP #2 – see simulation).

For the remainder of views from the southeast the majority of the Project is blocked by the ridgeline from the Campus Planning Area to Seminary Point. Views focus on the forested knoll of Seminary Point. Apartment development on Seminary Point would be seen from Seminary Drive (KOP #8 – see simulation) and from Brickyard Park (KOP #10 – see simulation). Only a portion of the apartment development would be seen from the south and would be smaller in scale than that of the existing duplex housing. A cleared area will be created from grading associated with the Project cutting into the hillside, to meet fire code around structures, and from thinning of the forest to remove downed undergrowth and dead and/or diseased trees.

Views from the Southwest and West

The greatest visual impact of the Project is for views from the southwest and west where a significant portion of the Project site is viewed.

The Project would require approximately 220,000 cubic yards of cut and fill, which would be balanced onsite by raising the Seminary Playing Field approximately 27 to 28 feet as seen from Seminary Drive. The result is that an existing view to the playing field In the immediate foreground from Seminary Drive (KOP #3 – see simulation) that takes the eye into the Project site will become a view to a vegetated slope with a 1:1 gradient (horizontal to vertical). The view from Seminary Drive traveling east (KOP #4) will be altered similarly to that of KOP #3 but with the steep slope behind the existing redwood grove. Because of vegetation removal required by the Project to place the fill and construct the residential care facility, the upper levels of the residential care facility will be seen against a skyline backdrop. The degree of screening of the residential care facility will be dependent on the density and coverage of native shade tree planting indicated for the hillside.

The central portions of the Project site consisting of student housing and dormitories will change from one of scattered structures to more intense but clustered development as seen in the middleground from the Sausalito shoreline (KOP #13, KOP #21, KOP #23 - see simulation) Highway 101 (KOP #15), and to varying degrees, from the trail system of the Golden Gate National Recreation Area. The Project will visually reflect the single and multiple-family residential development that cover the Strawberry Peninsula and that, except for Watertank Hill, surrounds it. However, while there is visually dense clustered development, many areas within the Project site will remain as undeveloped land that visually continues to provide an open space foil for the remainder of the peninsula. Notably these are the forested knoll, Chapel Hill Park, and the upper slopes of Dormitory Hill.

The proposed apartments mid-slope along Seminary Point, the most visually prominent feature of the Project site, will be seen in the foreground from Seminary Drive (KOP #6), Strawberry Cove Park (KOP #9) and in the middleground from the Sausalito shoreline and the San Francisco Bay Trail (KOP #14 - see simulation), Highway 101 Richardson Bay (KOP #23 - see simulation), Marin City (KOP #17 - see simulation) and, again to varying degrees, from the trail system of the Golden Gate National Recreation Area (KOP #16).

Recommended Mitigation

The significant visual impacts to the existing visual character and related County policies, goals, and guidelines created by the Project are: views into the Project site from surrounding streets and trails; color of structures; and the bulk and skylining effect of the residential care facility. The following recommended mitigation measures should be addressed through the detailed planting design for the Project and through the Design Review process. Mitigation measures should consider the following:

Aesthetics Mitigation Measure V-1 (see Figure V-5): To visually buffer views into the Project from adjacent streets, specify evergreen shrubs and trees along the north side of Chapel Drive, including the south slopes of Chapel Hill extending from Mission Drive to Willis Drive that:

- Screen and/or block views of the Project housing on the sides of Chapel Hill when driving along Chapel Drive.
- Screen and/or block views into the central area of the Project on the south side of Chapel Drive west of Chapel Hill.
- Allow a view corridor to Richardson and San Francisco Bays from Chapel Hill.

Aesthetics Mitigation Measure V-2 (see Figure V-5): To screen views of the residential care facility as seen from Seminary Drive (KOP #3), specify native shade trees on the hillside created by fill placement immediately adjacent to Seminary Drive to extend over the top of the fill and onto the playing field level. Specify a naturalistic hedgerow of screening shrubs along the top edge of the slope to further block views uphill.

Aesthetics Mitigation Measure V-3 (see Figure V-5): To mitigate the skylining effects of the residential care facility as seen from the west and southwest, specify a variety of fast-growing trees planted on the north and east sides of the facility so that, with time, a natural-appearing backdrop is created.

Aesthetics Mitigation Measure V-4: To reduce the color contrast with the surrounding natural landscape and community setting created by the use of only light-valued cement plaster building material, use a variety of light and dark-valued earth-toned materials that are flat and non-reflective (either integral to the material or painted).

4.4 Regulatory Framework Consistency Analysis

Table V-3 provides a consistency analysis of the Project with recommended mitigation measures listed above based on the goals, policies and guidelines listed in Section 3.2. The County's policies generally direct that: the natural appearance of hills, local ridgelines, and other prominent or significant landforms be preserved; views to the Bay and lowlands be maintained; that the visual crest of the hillsides not be interrupted; and that materials and colors should unobtrusively blend with the natural environment.

As specifically noted in Table V-3, the Project along with recommended mitigation measures listed above serve to provide consistency with adopted Marin County goals, policies, and guidelines related to visual resources.

Table V-3: Policy Consistency Analysis

Policy	Consistency Analysis
Marin Countywide Plan: Built Environment Element	
Goal DES-3: New Development in Built Areas	Consistent: Proposed development is visually clustered with open space surrounding and between building clusters.
DES-3.1 Promote Infill	Consistent: The visual character of surrounding neighborhoods on the Strawberry Peninsula is continuous development with little to no visual open space between structures. The Project would visually expand that development but continue some open spaces between building clusters.
DES-3.2 Promote Green Spaces	Consistent: Visual open space and park areas are either preserved or redeveloped and are evident.
Goal DES-4: Protection of Scenic Resources	Consistent: No existing vistas to important natural features will be blocked. The form of Seminary Point, the major visible natural feature of the Project site, will not be changed and will continue to be a locally dominant natural promontory.
DES-4.1: Preserve Visual Quality	Consistent: Though more expansive, the Project will create a harmonious, ordered, and coherent development within the Project site as compared to existing improvements.
Marin Countywide Plan: Implementing Programs	
DES-4.a Protect Key Public Views	Consistent: Key view corridors identified in the Strawberry Community Plan (see below) and through public scoping comments are from Chapel Hill and to Seminary Point. These will not be blocked.
DES-4.b Minimize Visual Impacts of Public Facilities	Consistent: The majority of parking related to new structures will be interior or in underground garages. All utilities will be underground. Predominantly native tree and shrub species will be used to reduce visual impacts.
DES-4.c Regulate Mass and Scale	Consistent with Mitigation: The majority of Project structures conform with the bulk and scale of existing development on the Strawberry Peninsula. Visibility to

Table V-3: Policy Consistency Analysis

Policy	Consistency Analysis
	the residential care facility is limited to public views from the southwest. The structure is stepped to follow the existing topography and broken into distinct building components. Recommended Mitigation Measures V-2 and V-3 combined with site landscaping, over time, will reduce visibility and further disguise the bulk of the structure visually. Because of their location along the lower elevations of the Project site, the three six-story apartment buildings at the corner of Hodges Drive and Shuck Drive will have limited exposure to surrounding areas. The upper floors may be seen from selected locations but will be backdropped by topography and other development similar in color and texture to the apartment structures such that the bulk of the buildings will be visually blended with the overall development.
DES-4.d: Protect Views of Ridgelines.	Consistent with Mitigation: Map 3-4 of the Marin Countywide Plan does not show the Project site within a Ridge or Upland Greenbelt area to be protected. The majority of development visible to the general public will be clustered below local ridgelines. The uppermost component of the residential care facility (Building 52.a) is a horizontal structure whose roofline will parallel existing topography. Public visibility to the Project site is limited to a middleground view from Tiburon (KOP #13), views from the west including Seminary Drive (KOP #2 - see simulation), and middleground views from the edge of Richardson Bay (KOP 23 - see simulation). This effect would be eliminated with the implementation of recommended Mitigation Measures V- 2 and V-3.
DES-4.e: Protect Views of Ridge and Upland Greenbelt Areas	Consistent: Map 3-4 of the Marin Countywide Plan does not show the Project site within a Ridge or Upland Greenbelt area to be protected.
Marin County Development Code - 22.10.040 – Residential District Development Standards	
B. Development standards for planned districts.	Consistent with Mitigation: The uppermost component of the residential care facility (Building 52.a) is a horizontal structure whose roofline will parallel existing topography. Public visibility to the Project site is limited to a middleground view from Tiburon (KOP #13), views from the west including Seminary Drive (KOP #2 - see simulation), and middleground views from the edge of Richardson Bay (KOP 23 - see simulation). This effect would be eliminated with the implementation of recommended Mitigation Measures V- 2 and V-3.
Marin County Development Code - Section 22.16.030 – General Standards	
D.1 Building Location- Clustering requirement	Consistent: Structures are visually clustered, particularly in open grassland areas between Dormitory Hill and

Table V-3: Policy Consistency Analysis

Policy	Consistency Analysis
	Shuck Knoll. Existing and new plantings will assist in screening most facilities.
D.2 Building Location- Development near ridgelines	Consistent with Mitigation: Development does not occur on an identified regionally prominent ridgeline. Development does occur within 300' of visually prominent local ridgelines.
F. Landscaping	Consistent: Landscaping will be designed to be compatible with the native plant setting. Planting will not block scenic views to Richardson Bay or Mount Tamalpais from adjacent properties.
G. Lighting, exterior	Consistent: Low-wattage fixtures will be directed downward and shielded to prevent adverse lighting impacts on nearby properties.
I.1. Project Design: Height limits	Consistent with Mitigation: The local Dormitory Hill ridgeline includes a wide plateau in the saddle between the Campus and the Reed/Storer/Shuck Planning Areas. The uppermost component of the residential care facility (Building 52.a) extends approximately 39.75 feet above the plateau at its highest point and is seen above the ridgeline from various locations. This effect would be eliminated with the implementation of recommended Mitigation Measure V-3.
I.2 Project Design: Materials and colors	Consistent with Mitigation: The light-valued colors of the structures and albedo pavements will contrast with colors of the natural environment. Recommended Mitigation Measure V-4 would visually blend new structures with the natural environment and mimic the variety and pattern of colors in the surrounding residential areas.
Marin County Development Code - 22.26.040 Landscaping Objectives	
A. Provide visual amenities	Consistent: Proposed landscaping will enhance the appearance of new development and surrounding areas by being designed, installed, and maintained to blend new structures into the context of the established community.
D. Screen incompatible land uses	Consistent: Landscaping in recommended Mitigation Measures V-1 and V-2 will screen the Project to create visual separation from adjacent residential areas.
Marin County Development Code - 22.42 Design Review. 22.42.010 – Purpose of Chapter	
D. Natural Beauty	Consistent: Visually the Project results in a highly ordered and coherent development preserving Seminary Point, vistas from Chapel Hill, and respecting the local ridgelines between Chapel Hill and Shuck Knoll.
G. Conflicts	Consistent with Mitigation: With vegetative screening as recommended in Mitigation Measures V-1 and V-2, visual conflicts with surrounding areas are minimized.

Table V-3: Policy Consistency Analysis

Policy	Consistency Analysis
Strawberry Community Plan (1973)	
General Design Guidelines: Landscaping	Consistent with Mitigation: Landscaping as part of the development combined with recommended Mitigation Measure V-1 will be used to screen views and provide privacy.
General Design Guidelines: Ridgelines	Consistent: Hilltops, forested areas, and other prominent visual landmarks are recognized in the Project. The form of Seminary Point, the major visible natural feature of the Project site, will be preserved in its natural state. Chapel Hill consisting of a leveled hilltop, will be retained as a developed overlook to Richardson Bay with proposed apartments located on the slopes below it.
General Design Guidelines: View Corridors	Consistent: No existing public view corridors to Richardson Bay, San Francisco Bay, Mount Tamalpais or other regional landmarks including San Francisco will be blocked.
Specific Policy Framework 2.0 Preserve and Enhance the Scale and Character of the Area	Consistent: The Project will preserve the natural appearance and ridgeline of Strawberry Point. Chapel Hill, partially graded in the past, will be reconfigured and developed as a formal vista point. The Project will not interfere with views from ridges or hilltops to the Bay or lowlands. No structures would interrupt a continuous view of the visual crest of the surrounding hillsides from adjacent lowlands.
Strawberry Community Plan and Amendments (1982) Note: The Project is a proposed amendment to the Strawberry Community Plan.	
II. Goals A. Community Amenities	Consistent: Proposed development retains visual backdrops and provides visual neighborhood separators by retaining existing vegetation and through landscaping and revegetation. Local ridgelines are visually retained or in the case of the residential care facility, mimicked in the lines of the architecture. New structures are generally clustered.
III. Development Guidelines	
C. Golden Gate Baptist Theological Seminary - Land Use (Area 5)	Consistent: A band of open undeveloped land extending from Chapel Drive to Seminary Drive is retained in Chapel Hill Park.
C. Golden Gate Baptist Theological Seminary - Land Use (Area 6)	Consistent with Mitigation: Housing is proposed on the sides of Chapel Hill. However the housing is sited to be lower than the promontory of the hill and will not block views from the hill. Landscaping and Recommended Mitigation Measure V-1 incorporated into the site plan will screen views of the structure from existing dwellings.

Table V-3: Policy Consistency Analysis

Policy	Consistency Analysis
C. Golden Gate Baptist Theological Seminary - Land Use (Area 8)	Consistent: Existing mid to lower slope development on Seminary Point will be replaced and expanded. However, Seminary Point will remain a visually prominent visual landmark in the community.
E. General Design Guidelines: Landscaping	Consistent: Landscaping will be used to screen views and provide privacy.
E. General Design Guidelines: Ridgelines	Consistent: Hilltops, forested areas, and other prominent visual landmarks are recognized in the Project. The form of Seminary Point, the major visible natural feature of the Project site, will be preserved in its natural state. Chapel Hill, while being more formally developed, will be retained as an overlook to Richardson Bay with proposed apartments located on the slopes below it.
E. General Design Guidelines: View corridors	Consistent: No existing public view corridors to Richardson Bay, San Francisco Bay, Mount Tamalpais or other regional landmarks including San Francisco will be blocked.
Specific Policy Framework	
2.0 Preserve and Enhance the Scale and Character of the Area	Consistent: The Project will preserve the natural appearance and ridgeline of Strawberry Point. Chapel Hill, partially graded in the past, will be reconfigured and developed as a formal vista point. The Project will not interfere with views from ridges or hilltops to the Bay or lowlands. No structures would interrupt a continuous view of the visual crest of the surrounding hillsides from adjacent lowlands.

4.5 Light and Glare

Impact Analysis: Less Than Significant with Mitigation

The Project will meet Marin County's outdoor lighting standards such that night lighting will be consistent with Marin County's Design Review Standards and Development Code (see Table V-3 above). The Project will not create a new source of substantial light that would adversely affect day or nighttime views in the area.

In relation to glare, albedo, sometimes referred to as 'reflection coefficient', is a measure of how reflective a surface is. Albedo is commonly defined by a coefficient value between 0 and 1. The higher the value, the more energy is reflected back to the source. Complete reflection is 1 or 100%, and complete absorption is 0. There are no standards in the Marin County building code addressing albedo. The *2022 California Green Building Standards Code, Title 24 Section A4.106.7 Reduction of Heat Island Effect on Nonroof Areas* states "Use high albedo materials with an initial solar reflectance value of at least 0.30 as determined in accordance with American Society for Testing and Materials (ASTM) Standards E1918 or C 1549". This is a minimum threshold. For roofs the minimum value threshold varies by Building Climate Zone and building type tier levels (low-rise and high-rise). The project site is in Building

Climate Zone 3. There are no minimum thresholds values indicated in the code for low-rise residential roofs in Zone 3.

Depending on the reflective coefficient value to be employed, albedo surfacing materials used on the horizontal surfaces of the project (streets, pedestrian walks and plazas, and roofs) may create solar reflectivity and glare that could affect daytime and nighttime views. During the daytime, glare would be uncomfortable to the eye. At night, the main concern would be that of visibility of surface markings and traffic signs. In either case, there is common concern during wet conditions when surface markings may become difficult to notice. Within the project site use of high albedo coefficient materials may also potentially compromise outdoor thermal comfort, indoor thermal environments, and potentially affect nearby plant growth characteristics.

Viewers most affected would be the residents and visitors within the project area. Foreground views from neighboring areas located above the project site looking downward into the project site could also be affected such as along Campus Drive (KOP #2). The remaining foreground and middleground views into the project site from surrounding areas are generally from inferior viewing positions such that there would be no significant glare impacts caused by use of albedo materials.

Recommended Mitigation

Aesthetics Mitigation Measure V-5: The reflectance coefficients for albedo surfaces (streets, pedestrian walks and plazas, and roofs) used for the project shall not exceed a maximum coefficient of 0.6 as higher values would entail glare issues. Consistency with this maximum coefficient to be verified by the Architect of Record as part of the design review process.

KOP #23: Richardson Bay at shoreline public access point adjacent to Shoreline Office Center (Photo date: September 9, 2021)

ATTACHMENT C
Photo Simulations from Selected KOPs

KOP #2a – Existing View from Chapel Road (looking north)

KOP #2b – Simulation of Project 5 without mitigation years after construction s as seen from Chapel Road

KOP #3a – Existing view from Seminary Drive at Gilbert Drive (looking northeast)

KOP #3b – Simulation of Project without mitigation 5 years after construction as seen from Seminary Drive at Gilbert Drive

KOP #8a – Existing view from Seminary Drive west of Chapel Drive (looking west)

KOP #8b – Simulation of Project without mitigation 5 years after construction as seen Seminary Drive west of Chapel Drive

KOP #10a– Existing view from Brickyard Park (looking northwest)

KOP #10b – Simulation of Project without mitigation 5 years after construction as seen from Brickyard Park

KOP #14a - Existing view from San Francisco Bay Trail /Mill Valley – Sausalito Path (looking northeast)

KOP #14b - Simulation of Project without mitigation 5 years after construction as seen from San Francisco Bay Trail

KOP #17a - Existing view from Drake Avenue, Marin City (looking northeast)

KOP #17b - Simulation of Project without mitigation 5 years after construction as seen from Drake Avenue, Marin City (looking north)

KOP #19a - Existing view from Verna Dunshee Trail Overlook, Mount Tamalpais State Park (looking southeast)

KOP #19b - Simulation of Project without mitigation 5 years after construction as seen from Verna Dunshee Trail Overlook, Mount Tamalpais State Park

KOP #23a - Existing view from Richardson Bay adjacent to Shoreline Office Center (looking northeast)

KOP #23b - Simulation of Project without mitigation 5 years after construction as seen from Richardson Bay adjacent to Shoreline Office Center

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Marin NCLH - Renovations around Existing Administration & Academic Buildings

Marin County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	76.40	1000sqft	1.75	76,400.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	69
Climate Zone	5			**Operational Year**	2026
Utility Company	Pacific Gas and Electric Company				
CO2 Intensity (lb/MWhr)	203.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Renovation of Admin and Academic Buildings

Construction Phase - Based on data request response

Off-road Equipment - based on data request response

Off-road Equipment - Based on data request response

Off-road Equipment - Based on data request response

Off-road Equipment - based on data request response

Off-road Equipment - BAsed on data request response

Off-road Equipment - Based on data request response

Trips and VMT - Based on data request response. Hauling trips are estimated using the number of dump trucks in each phase.

Architectural Coating -

Date: 10/6/2022 1:03 AM

Marin NCLH - Renovations around Existing Administration & Academic Buildings - Marin County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Woodstoves -

Area Coating - Construction run only

Energy Use - Construction run only

Water And Wastewater - Construction run only

Solid Waste - Construction run only

Construction Off-road Equipment Mitigation - 90% tier 4 construction equipments and watering exposed area twice a day mitigation applied.

Area Mitigation -

Fleet Mix -

Vehicle Trips - Construction run only

Consumer Products - Construction run only

Landscape Equipment - Construction run only

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	1.00	1000sqft	0.02	1.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	69
Climate Zone	5			**Operational Year**	2027
Utility Company	Pacific Gas and Electric Company				
CO2 Intensity (lb/MWhr)	203.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - For landscaping and general site improvements. No new construction for this run.

Construction Phase - Based on data request response

Off-road Equipment - based on data request response

Off-road Equipment - Based on data request response

Off-road Equipment - Based on data request response

Off-road Equipment - s

Trips and VMT - Based on data request response. Hauling trips are estimated using the number of dump trucks in each phase.

Architectural Coating -

Woodstoves -

Area Coating - Construction run only

Date: 10/6/2022 12:41 PM

Marin NCLH - Landscaping and Site Improvements - Marin County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Energy Use - Construction run only

Water And Wastewater - Construction run only

Solid Waste - Construction run only

Construction Off-road Equipment Mitigation - 90% tier 4 construction equipments and watering exposed area twice a day mitigation applied.

Area Mitigation -

Fleet Mix -

Off-road Equipment - Based on data request response

Vehicle Trips - Construction run only

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Consumer Products - Construction run only

Landscape Equipment - Construction run only

8.0 Waste Detail

8.1 Mitigation Measures Waste

Category/Year

	Total CO2	CH4	N2O	CO2e
	MT/yr			
Mitigated	0.0000	0.0000	0.0000	0.0000
Unmitigated	0.0000	0.0000	0.0000	0.0000

8.2 Waste by Land Use

Unmitigated

	Waste Disposed	Total CO2	CH4	N2O	CO2e

Marin NCLH - New Administriation Building - Marin County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Land Use	tons	MT/yr			
General Office Building	0	0.0000	0.0000	0.0000	0.0000
Total		**0.0000**	**0.0000**	**0.0000**	**0.0000**

Mitigated

	Waste Disposed	Total CO2	CH4	N2O	CO2e
Land Use	tons	MT/yr			
General Office Building	0	0.0000	0.0000	0.0000	0.0000
Total		**0.0000**	**0.0000**	**0.0000**	**0.0000**

9.0 Operational Offroad

Equipment Type	Number	Hours/Day	Days/Year	Horse Power	Load Factor	Fuel Type

10.0 Stationary Equipment

Fire Pumps and Emergency Generators

Equipment Type	Number	Hours/Day	Hours/Year	Horse Power	Load Factor	Fuel Type

Boilers

Marin NCLH - New Administriation Building - Marin County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Equipment Type	Number	Heat Input/Day	Heat Input/Year	Boiler Rating	Fuel Type

User Defined Equipment

Equipment Type	Number

11.0 Vegetation

Marin NCLH - Residential Care Facility (Residential) - Marin County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Marin NCLH - Residential Care Facility (Residential)

Marin County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Apartments Mid Rise	170.00	Dwelling Unit	4.47	267,354.00	486

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	69
Climate Zone	5			**Operational Year**	2026
Utility Company	Pacific Gas and Electric Company				
CO2 Intensity (lb/MWhr)	203.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Based on PD

Construction Phase - Based on data request

Off-road Equipment - based on data request response

Off-road Equipment - Based on data request response

Off-road Equipment - Based on data request response

Off-road Equipment - Based on data request response

Off-road Equipment - Based on data request response

Trips and VMT - Based on data request response. Hauling trips are estimated using the number of dump trucks in each phase.

Architectural Coating -

Vehicle Trips - Construction run only

Marin NCLH - Residential Care Facility (Residential) - Marin County, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Woodstoves - Construction run only

Consumer Products - Construction run only

Area Coating - Construction run only

Landscape Equipment - Construction run only

Energy Use - Construction run only

Water And Wastewater - Construction run only

Solid Waste - Construction run only

Construction Off-road Equipment Mitigation - 90% tier 4 construction equipments and watering exposed area twice a day mitigation applied.

Area Mitigation -

Fleet Mix -

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
General Office Building	15.80	1000sqft	0.36	15,800.00	0
Day-Care Center	3.00	1000sqft	0.07	3,000.00	0
Health Club	17.00	1000sqft	0.39	17,000.00	0
Apartments Mid Rise	325.00	Dwelling Unit	8.55	325,000.00	930
Single Family Housing	11.00	Dwelling Unit	3.57	19,800.00	31

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	69
Climate Zone	5			**Operational Year**	2027
Utility Company	Pacific Gas and Electric Company				
CO2 Intensity (lb/MWhr)	203.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Based on the data request and project description. All the renovations and redevelopment land uses like library, cafe, admin & academic buildings were not considered as they would have same operational emissions as before.

Construction Phase - Only operational run

Off-road Equipment - based on data request response

Off-road Equipment - Only operational run

Off-road Equipment -

Off-road Equipment -

Marin NCLH Operations - Marin County, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Off-road Equipment -

Off-road Equipment -

Trips and VMT - Only operational run

On-road Fugitive Dust - Only operational run

Demolition - Only operational run

Grading - Only operational run

Architectural Coating - Only operational run

Vehicle Trips - Based on transportation analysis

Woodstoves -

Consumer Products -

Area Coating -

Landscape Equipment -

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation -

Area Mitigation - Only Natural Gas Hearth

Fleet Mix -

Vehicle Emission Factors -

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Ha	Result for P	Unit
Temperatur	10.3	annual days of extreme heat
Extreme Pre	13.1	annual days with precipitation above 20 mm
Sea Level Rise		meters of inundation depth
Wildfire	6.15	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive Ca	Vulnerability Score
Temperatur	N/A	N/A	N/A	N/A
Extreme Pre	4	0	0	N/A
Sea Level R	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality I	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Ha	Exposure S	Sensitivity S	Adaptive Ca	Vulnerability Score
Temperatur	N/A	N/A	N/A	N/A
Extreme Pre	4	1	1	4
Sea Level R	1	1	1	2

Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack I	N/A	N/A	N/A	N/A
Air Quality I	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Subject: Health Risk Assessment for the Marin NCLH Project

1 INTRODUCTION

This health risk assessment (HRA) evaluates the potential health risks associated with redevelopment the Golden Gate Baptist Theological Seminary property on the Strawberry Peninsula in unincorporated Marin County. The proposed development would include renovation of an existing academic campus, relocation of an existing daycare center, construction of a new fitness center, construction of a new residential care facility, upgrades to existing housing and construction of new housing, retention and access improvements to existing open space and recreation areas, and creation of new bicycle and pedestrian paths within the property (project).

The focus of this HRA is to evaluate the exposure of nearby residential receptors to construction related toxic air contaminants (TACs), primarily diesel particulate matter (diesel PM), from diesel-powered equipment and vehicles used during construction and the hauling of materials and emissions of fine particulate matter ($PM_{2.5}$). This study was conducted in accordance with BAAQMD's *Recommended Methods for Screening and Modeling Local Risks and Hazards* (*Recommended Methods*) (BAAQMD 2020). Additionally, in preparing this HRA, procedures detailed in OEHHA's *Air Toxic Hot Spot Program Guidance Manual for Preparation of Health and Risk Assessments* (OEHHA 2015) were followed to quantify the potential health risks experienced by nearby receptors due to project-generated construction emissions. This report discusses the analysis methodology, thresholds of significance used, and the results of the HRA.

2 INVENTORY OF TOXIC AIR CONTAMINANT EMISSIONS

Construction-related emissions of diesel PM were determined by conducting detailed construction emissions modeling for the project using the Bay Area Air Quality Management District (BAAQMD)-approved California Emissions Estimator Model (CalEEMod), project-specific details (e.g., construction phasing, equipment lists, excavation estimates), and model defaults where project-specific information was not available. Generally, emissions were quantified for all phases of project construction that is anticipated to occur across the eight planning areas of the project site for the entire duration of project buildout (i.e., four years). Mass emissions were averaged over the anticipated construction duration, in accordance with BAAQMD's guidance and consistent with their adopted average daily mass emissions thresholds. Outputs from the mass emissions calculations conducted with CalEEMod were used to conduct the HRA. Specific inputs and methods are explained in further detail below.

Construction activities for the project would include demolition, grading, building construction, paving and landscaping. Construction is assumed to begin no sooner than 2023 and would be completed in 4 years; thus, offroad exhaust emissions factors are considered conservative as they were based on the earliest

possible year construction could occur. $PM_{2.5}$ exhaust emissions would occur from diesel-powered heavy-duty construction equipment, diesel generators, and diesel trucks used during construction. To estimate risk, average daily and annual construction emissions of PM_{10}, used as a proxy for diesel PM, were computed.

The diesel PM emissions generated by off-site vehicle traffic (e.g., vendor and off-hauling trips) were modeled along one haul route terminating at the project site (see Section 3.3 for haul route details). According to the information provided by the applicant, there would be a total of approximately 340 worker trips during a typical day of construction. The applicant also provided a proposed construction equipment inventory that would be used during the construction at different areas within the project site. Heavy-duty equipment use would occur in areas where demolition, grading, and new construction would occur. Emissions estimates from construction equipment and on-road truck trips are shown in Attachment A. In summary, the sources modeled for this construction HRA were:

- Heavy-duty construction equipment exhaust diesel PM emissions as an array of adjacent volume sources;
- Construction worker on-road emissions of diesel PM during daily commute (included in on-site emissions) as adjacent line-volume sources.
- Heavy-duty off-haul truck diesel PM emissions as adjacent line-volume sources
- Fugitive dust emissions associated with onsite construction activity and travel on offsite haul routes.

3 AIR DISPERSION MODELING

3.1 APPROACH

To determine health risk and pollutant concentrations at specific locations (i.e., receptors), first, air dispersion modeling was conducted using site-specific parameters (e.g., terrain, meteorological data), and then risk calculations were conducted. Dispersion modeling was conducted using CARB's approved American Meteorological Society/Environmental Protection Agency Regulatory Model Improvement Committee modeling system (AERMOD) Version 19191, with a unit emission rate of 1 gram per second (g/s) for all modeled sources. This approach is used so that resulting ground-level concentrations can be multiplied by actual emission rates for various scenarios (e.g., unmitigated, mitigated) without running AERMOD multiple times.

Then, using the ground-level concentrations from the AERMOD run at each receptor location in combination with emission estimates for $PM_{2.5}$, the Hotspots Analysis and Reporting Program Version 2.0.3 Version 2.0.3 (ADMRT 19121), or HARP2 software was used to estimate cancer, non-cancer health risk levels, and $PM_{2.5}$ concentrations. The modeling included all standard regulatory default options, including the use of urban dispersion parameters and local terrain. Terrain in the project vicinity is generally flat.

Nearby land uses include many multi-story and variable-size buildings, which results in urban flow patterns that are likely influenced by recirculation and channeling in urban canyons. The urban dispersion modeling parameters account for such patterns. The urban heat island effect, which results from surface heating of paved and built-up environment, is likely prevalent in some areas surrounding the project site, which leads to longer periods of mixing and generally lower predicted air concentrations. AERMOD allows the user to model urban heat island impacts by selecting urban land use option. The project area fits the definition of

an urban area; thus, this land use option was used in the AERMOD dispersion runs to estimate air pollutant concentrations.

3.2 AERMOD MODEL CONFIGURATION

The following input parameters were used in the model run:

- Projected Coordinate System: Universal Transverse Mercator (UTM) zone 10;
- Geographic Datum: World Geodetic System (WGS) of 1984;
- Urban land use based on AERMOD's Land Use Procedure based on the level of development within a 3-kilometer (km) radius of the project site;
- Period (i.e., annual) averaging of concentrations for construction activity;
- Unit emission rate of 1 g/s for all sources; and
- CARB's Digital Elevation Model Files for terrain data.

3.3 INPUTS AND ASSUMPTIONS

3.3.1 Meteorological Data

Pre-processed meteorological data from 2015-2017 collected at the Chevron Tower were obtained from BAAQMD. The Chevron Tower is the nearest and; therefore, most representative, meteorological station for the project site. The wind primarily blows from the South to North. Dispersion modeling applied a time-averaged, simplified representation of turbulent, atmospheric transport to approximate how pollutants are carried, mixed, dispersed, and diluted by the local winds.

3.3.2 Receptor Grid

A receptor grid was placed out to 4,900 meters (m) by 4,500 m from the project site boundary to encompass nearby residential and commercial land uses. The grid was placed with 25 m spacing between receptors for the first 200 m, then 50 m spacing between 200 m to 500 m and 100 m spacing from 500 m to 2000 m. Discrete receptors were removed from the project site. All receptors were given a flagpole receptor height of 1.8 m to represent average breathing height per OEHHA guidance (OEHHA 2015:4-22). All receptor points are shown in Attachment A.

3.3.3 Source Type and Dimensions

For the project site where construction activities would occur, construction emission sources (i.e., the use of heavy-duty equipment on site and fugitive dust) were modeled as an array of adjacent volume sources. Each volume source was assumed to have 10 m sides, an internal lateral dimension of 2.33 m, and an internal vertical dimension of 1 m, the latter two attributes were calculated from the length of the volume source side. The volume sources were grouped based on the construction areas defined in the project description. Each of these groups had combined emission rate of 1 gram per second.

One haul route was modeled as a line source to represent a series of volume sources. The line sources represent the haul truck emissions traveling to and from the site. These line sources were assumed to have an adjacent configuration of volume sources spaced at 10-meter intervals, with a 2.55 m plume height, 13 m plume width, and a 1.27 m release height. These were calculated based on the assumption that trucks traveling on these routes would have an average height of 3 m (10 feet) and width of 2.4 m (8 feet). The length of haul route was approximately one mile long, was modeled from the northwest project site entrance on Seminary Drive joining the US-101 freeway. Source locations and haul routes are shown in Attachment A.

4 HEALTH RISK CALCULATIONS

4.1 CANCER AND NON-CANCER RISK

To analyze impacts to sensitive receptors, the resulting pollutant concentrations from the AERMOD dispersion analysis were multiplied by the emission rates to obtain risk estimates. CARB developed HARP2 as a tool to implement risk assessments and incorporates requirements from OEHHA's *Air Toxics Hot Spot Program Risk Assessment Guidelines: Guidance Manual for Preparation of Health Risk Assessments* (OEHHA 2015).

Total annual tons of exhaust PM_{10} emissions resulting from project construction were converted to pounds per year and pounds per day, which were then input into HARP2. The estimates of potential residential cancer risk were prepared in accordance with OEHHA Guidance. The cancer risk was estimated for the 4-year construction period occurring from 2023 to 2027. Risk parameters for cancer and non-cancer scenarios are presented in Table 1, below.

Table 1 Risk Parameters for Cancer and Non-Cancer Risk from Construction Emissions[1]

Risk Parameters	Residential Receptors
Analysis Type	Cancer Risk and Chronic Risk (Non-cancer)
Receptor Type	Residential
Exposure Duration	4 years
Starting Age	0 years
Intake Rate Percentile	OEHHA Derived Method
Risk Pathways Evaluated	Minimum Residential Pathways
Deposition Rate	0.05 m/s
FAH	Off
Climate	Mixed

[1] Analysis was prepared consistent with OEHHA Guidance (OEHHA 2015).

Notes: OEHHA = Office of Environmental Health Hazard Assessment; m/s = meters per second; FAH = fraction of time at home

Source: Prepared by Ascent Environmental, Inc., in 2022

4.2 ANNUAL AVERAGE $PM_{2.5}$ CONCENTRATIONS

In addition to cancer and non-cancer health risks resulting from exposure to diesel PM emissions, potential impacts from fugitive $PM_{2.5}$ construction emissions were evaluated. The same basic modeling approach

that was used for assessing health risks was used in the modeling of $PM_{2.5}$ concentrations. Both exhaust and fugitive $PM_{2.5}$ emissions were included. Dispersion modeling of $PM_{2.5}$ using the AERMOD model was conducted in the same manner as the TAC modeling. The model predicted the maximum annual average $PM_{2.5}$ concentration (i.e., combined exhaust and fugitive $PM_{2.5}$ emissions).

5 HEALTH RISK CEQA THRESHOLDS OF SIGNIFICANCE

According to BAAQMD, a project's impact on health risks would be considered significant under the California Environmental Quality Act (CEQA) if the project-related increase in risks would exceed the following thresholds shown in Table 2. Results of this HRA were compared to the BAAQMD-adopted thresholds of significance.

Table 2 Significant Health Risk Levels

	Significance Risk Threshold
Maximum Incremental Cancer Risk[1]	10.0 chances in a million
Total Chronic Non-Cancer Health Hazard Index[2]	1.0
Incremental Annual Average $PM_{2.5}$ Concentration[3]	Ambient $PM_{2.5}$ increase: >0.3 µg/m^3

1. Maximum Incremental Cancer Risk is the maximum lifetime excess cancer risk estimate (per million) at residential or worker receptor (whichever is greater). The maximum estimated risk generally is possible at only one location. All other locations show lower risks. Actual cancer risk would likely be less.
2. Total Chronic Health Hazard Index (HIC) is the sum of the ratios of the average annual exposure level of each compound to the compound's Reference Exposure Level (REL). Actual HIC would likely be less.
3. An incremental increase of greater than 0.3 micrograms per cubic meter (µg/m^3) annual average $PM_{2.5}$ would be a cumulatively considerable contribution

Source: BAAQMD 2017:23

6 RESULTS

6.1 CONSTRUCTION

Based on CalEEMod model defaults, air dispersion modeling, and risk calculations discussed above, project-generated diesel PM emissions would result in a point of maximum impact (PMI) of an increase in 134 chances in a million for cancer risk and a non-cancer chronic risk hazard index of 3.03 x 10^{-2}. The nearest residential receptor or the maximally exposed individual resident (MEIR) would be exposed to a cancer risk increase of 48 chances in one million. Table 3 summarizes the cancer PMI and MEIR results under an unmitigated and mitigated scenario. Figure 1 graphically depicts the cancer risk at nearby receptors as colored contours radiating outward from the project site. Considering BAAQMD threshold of significance of 10 chances in a million for cancer risk and a non-cancer health index threshold of less than 1.0, the project would result in the exposure of nearby residential receptors to TAC-related health risks that exceed thresholds of significance for cancer risk but not chronic risk. Additionally, based on dispersion modeling, the annual average increase in ambient $PM_{2.5}$ concentration in the project vicinity was found to be 2.67 micrograms per cubic meter (µg/m^3), which exceeds the BAAQMD's $PM_{2.5}$ annual average concentration threshold of 0.3 µg/m^3. The unmitigated $PM_{2.5}$ ambient concentration results are depicted graphically in Figure 2.

Table 3 Modeled Cancer Risks from Construction Emissions Sources

Receptor[1]	Unmitigated Scenario Cancer Risk (Chances in a million)	Mitigated Scenario[3] Cancer Risk (Chances in a million)	Easting (m)[2]	Northing (m)[2]
PMI	134	11.25	543416.5	4193376.73
MEIR (On-Site)	48	5.69	543607.77	4193515.85
BAAQMD Significance Threshold	10.0	10.0	N/A	N/A
Threshold Exceeded?	**Yes**	**No**	N/A	N/A

Notes: PMI = point of maximum impact; MEIR = maximally exposed individual resident; N/A = not applicable

1. Receptors selected based on occurrence under Proposed Scenario.

2. Based on Universal Transverse Mercator coordinates.

3. Mitigation applied in the mitigated scenario is described in detail in the Air Quality Chapter of the EIR; however, to briefly summarize here, measures included BAAQMD's dust suppression measures and inclusion of USA EPA Tier 4 engines.

Source: Data modeled by Ascent Environmental, Inc., in 2023

6.1.1 Conclusion

Without exhaust and fugitive dust control measures, construction-generated non-cancer health risks would not exceed BAAQMD thresholds of significance but cancer risk and $PM_{2.5}$ would be exceeded. With dust and exhaust control measures, construction-generated TACs would not expose nearby receptors to significant cancer risk (i.e., 10 chances in one million) or result in ambient $PM_{2.5}$ concentration in excess of the BAAQMD significance threshold of 0.3 µg/m^3.

Methods templace to paste in CEQA doc

Construction

Energy use during construction was estimated using a combination of methods and energy consumption factors from published best available documentation. Fuel consumption was estimated for each piece based on the proposed project construction schedule and duration, equipment activity hours from the California Emissions Estimator Model (CalEEMod) program, and equipment fuel consumption factors from the CARB OFFROAD model (CARB 2022a). Fuel consumption was estimated for haul trucks, delivery trucks, and worker commute using the fuel consumption factors from CARB's EMission FACtors (EMFAC) model for the Statewide vehicle fleet.

Operations

Energy use during operations was estimated using a combination of methods and energy consumption factors from published best available documentation. Fuel consumption for mobile sources was estimated using the fuel consumption factors from CARB's EMission FACtors (EMFAC) model for the Statewide vehicle fleet and VMT data for the project's operations. Utility consumption data, measured in megawatt-hours of electricity and thousand British Thermal Units (BTU) for natural gas, were taken directly from the modeling performed within the California Emissions Estimator Model (CalEEMod) program.

User Needs to paste 3 tables from Caleemod output
These tables are in Section 3.0 Construction Detail

1. Construction Phase
2. Trips and VMT ='USER INPUT'!'USER INPUT'!D:DD59
3. Offroad Equipment

In section **3.0 Construction Detail from CalEEMod output,** paste three tables: the *Construction Phase* , *Trips and VMT* and *Offroad Equipment* tables
Best practice. Save the CalEEMout output as PDF, then, open the PDF in the Adobe App, highlight the tables, right click "copy formatting", then paste below.
See example to the right.
Note that this "copy formatting" function only works in the Adobe app. It does not work if viewing the PDF directly in Chrome or Edge. Download the PDF to your computer, if necessary.

Energy Calculations Summary Page

Operations

Source	Gas (gal)	Diesel (gal)	Kwh	kBTU
Mobile Sources	#REF!	#REF!		
Electricity			1,678,638	
Natural Gas				3,937,703

Construction

Phase Name	Gas (gal)	Diesel (gal)
Offroad		428,818
Trucks		75,593
Worker Commute	886,626	
Total	**886,626**	**504,410**

Construction Offroad Calculations

Nothing for the user to do here.

This tab calculates fuel consumption from offroad equipment and schedule input in the USER INPUT tab

Fuel consumption calculated from OFFROAD based on fuel consumption divided by horsepower hours to generate an average for all epuipment output

Total =	**428,818**

OffRoad Equipment

Region Type: Statewide
Region: California
Calendar Year: 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

Region Type: Statewide
Region: California

Calendar Year: 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050
Season: Annual
Vehicle Classification: EMFAC2007 Categories
Units: miles/day for CVMT and EVMT, trips/day for Trips, kWh/day for Energy Consumption, tons/day for Emissions, 1000 gallons/day for Fuel Consumption

															MPG Weighting for Summary

EMFAC OUTPUT

Model Output: OFFROAD2021 (v1.0.3) Emissions Inventory
Region Type: Statewide
Region: California

Calendar Year: 2000, 2001, 2002, 2003, 2004, 2005, 2006, 2007, 2008, 2009, 2010, 2011, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019, 2020, 2021, 2022, 2023, 2024, 2025, 2026, 2027, 2028, 2029, 2030, 2031, 2032, 2033, 2034, 2035, 2036, 2037, 2038, 2039, 2040, 2041, 2042, 2043, 2044, 2045, 2046, 2047, 2048, 2049, 2050
Scenario: All Adopted Rules - Exhaust
Vehicle Classification: OFFROAD2021 Equipment Types
Units: tons/day for Emissions, gallons/year for Fuel, hours/year for Activity, Horsepower-hours/year for Horsepower-hours
