Santa Rosa, Ca

ARBORIST'S SUMMARY
September 14, 2020

This property, formerly a mobile home park, burned in the Tubbs fire, and many of the homes, outbuildings, infrastructure, trees and landscaping were lost. The site has been cleaned up, but a few dead and dying trees are still standing, as well as unburned trees. I have visited this site and evaluated all the remaining trees on site, including some undamaged street trees along Mendocino Ave. Some of the Chinese pistache street trees on the north end will be preserved. There is a surprising number of palms and other ornamental trees still left on site though they vary widely in condition.

All trees have been tagged on the site with numbers which relate to the inventory and are shown on the Tentative Map by the civil engineers, BkF. They have been identified by species, diameter, rated for health and structural soundness, with comments regarding whether to be removed or retained, and whether they are Heritage Trees as per SR Ordinance Section 17-24.020

Please contact me if further information is needed.

Respectfully submitted,

Becky Duckles

Appendix B SANTA ROSA WATER DEPARTMENT WATER SUPPLY LETTER

June 4, 2020

Ms. Karen Massey, Applicant Representative
Burbank Housing
790 Sonoma Avenue
Santa Rosa, CA 95404

Via email to: kmassey@burbankhousing.org

Subj: 3575 Mendocino Avenue Water Supply Assessment

The City of Santa Rosa's Planning Division has accepted discretionary entitlement applications for the 3575 Mendocino project, which proposes redevelopment of the 13.18-acre former Journey's End mobile home park (Project Site) into a 532-unit multi-family development comprised of 162 affordable (Very Low- to Low-Income) Senior Housing units and up to 370 market rate units. Required discretionary Planning entitlements include:

- a General Plan Amendment to Transit Village Medium;
- a Rezoning to Transit Village-Residential + Senior Housing combining district;
- a 5-parcel Tentative Map-Major Subdivision; and
- Minor Design Review.

Environmental review under CEQA is required.

California Water Code § 10910(c)(1) requires that a city or county land use authority request that the public water system prepare a water supply assessment to determine whether water supplies are sufficient to meet the projected water demand associated with a proposed project as defined in Section 10912. Per § 10912(a)(1), a project includes "a proposed residential development of more than 500 dwelling units." Section 10912 does not additionally define dwelling units as detached single family, multi-family dwelling units, or by any other characteristics.

The City of Santa Rosa's public water system is owned by the City and operated by the City's Water Department (City Water). The Water Department has analyzed water supply and demand in a 2008 Water Supply Assessment (2008 WSA) for the City's General Plan 2035 and its 2015 Urban Water Management Plan (2015 Plan). When both reports were prepared, the former

Journey's End site was a 13.18-acre mobile home park consisting of 161 age-restricted mobile home units and a single detached manager dwelling unit. The General Plan Land Use designation was Mobile Home Park with a density of 4-18 units per acre. The actual density of the developed project site was 12 units per acre.

For the 2008 WSA and 2015 Plan analyses, mobile home dwelling units were categorized as detached single-family residential units. Therefore, the project site's water demand included would have been the equivalent of 162 single-family detached residences. The current project proposes 532 multi-family units, which represents a net increase of 370 units. Planning concludes that the net increase of 370 units does not qualify this as a project under § 10912. Therefore, preparation of a water supply assessment would not be required.

Sincerely,

Andrew Trippel, Senior Planner
City of Santa Rosa

Attachment: City of Santa Rosa Water Department memorandum dated June 4, 2020

City of Santa Rosa
WATER

MEMORANDUM

DATE: 6/4/2020

TO: Jennifer Burke, Director of Water

FROM: Peter Martin, Deputy Director Water Resources PM

SUBJECT: Water determinations related to proposed 3575 Mendocino project

The City of Santa Rosa's Planning Division (Planning) has accepted project applications for the 3575 Mendocino project, which proposes redevelopment of the 13.18-acre former Journey's End mobile home park (Project Site) into a 532-unit multi-family development comprised of 162 affordable (Very Low-Low Income) Senior Housing units and up to 370 market rate units. The area proposed for development is the location of the former Journey's End site, which was a 13.18-acre mobile home park consisting of 161 age-restricted mobile homes and a single detached manager dwelling unit (162 detached units total). Planning has determined that environmental review under CEQA is required for the new development.

California Water Code (CWC) § 10910 requires the city or county land use authority to request the public water system to prepare a water supply assessment for projects defined under CWC § 10912. The definition of a project includes "a proposed residential development of more than 500 dwelling units." However, Planning recognizes that the water demand of the Journey's End mobile home park with 162 detached units was included in the 2008 Water Supply Assessment (2008 WSA) for the City's General Plan 2035 and the City's 2015 Urban Water Management Plan (2015 Plan), both of which were prepared by the City of Santa Rosa's Water Department (Water). As a result, Planning has determined that the proposed Project Site includes a net increase of 370 units (532 proposed units – 162 previous units). Planning has concluded that the net increase of 370 units does not qualify this as a project under § 10912.

CWC § 10910 provides that, if a project has been the subject of a water supply assessment, no additional water supply assessment shall be required for subsequent projects that were part of a larger project for which a water supply assessment was completed and that has complied with requirements and for which the public water system has concluded that its water supplies are sufficient to meet the projected water demand.

Water Department staff has reviewed information provided by Planning for the proposed project and has determined based on that information in addition to the existing WSA and 2015 Urban Water Management Plan that (1) there are no changes that would result in a net increase in water demand for the proposed project over the demand of a 500 dwelling unit project, (2) there are no changes in the circumstances or conditions substantially affecting the ability of the City's water system to provide a sufficient supply of water for the project, and (3) no significant new information has become available that was not known and could not have been known at the time when the City's General Plan WSA and the 2015 Urban Water Management Plans were prepared that would impact the City's ability to meet the propose water demand for the project.

Appendix D AIR QUALITY AND GREENHOUSE GAS MODELING

Stantec

Memo

To:	Karen Massey BRJE Communities, LLC	From:	Elena Nuño and Blake Barroso Stantec Consulting Services Inc.
File:	185704993	Date:	August 31, 2020

Reference: Air Quality and Greenhouse Gas Methodology and Assumptions Memorandum

PROJECT UNDERSTANDING

The 3575 Mendocino Avenue Project (proposed project) includes redevelopment of a 13.3 acre in-fill site to construct a compact, sustainable, transit-oriented, master planned community (transit village) of up to 532 high-density multi-family housing units that includes the following: 1) constructing 162 affordable senior housing units comprised of three separate four-story buildings, approximately 79,685 square feet (sf), 29,800 sf, and 26,700 sf each; 2) constructing up to 370 market rate units comprised of approximately eight separate three- to four-story buildings; 3) constructing an approximately one acre central park, public street, landscaping, on- and off-site utility infrastructure, parking (including surface, covered, and garage), driveways, frontage improvements and other associated improvements; and 4) constructing a storm drain outfall into the adjacent, off-site Russell Creek. The project site is located in the Mendocino Avenue Corridor Priority Development Area in the City of Santa Rosa (City).

MODELING PARAMETERS AND ASSUMPTIONS

The following modeling parameters and assumptions will be used to generate criteria air pollutant and greenhouse gas emissions (GHG) for the 3575 Mendocino Avenue Project.

MODEL SELECTION

The California Emissions Estimator Model (CalEEMod) is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and greenhouse gas (GHG) emissions associated with both construction and operations from a variety of land use projects. CalEEMod quantifies direct emissions from construction and operation activities (including vehicle use), as well as indirect emissions, such as GHG emissions from energy use, solid waste disposal, vegetation planting and/or removal, and water use. Further, CalEEMod identifies mitigation measures to reduce criteria pollutant and GHG emissions along with calculating the benefits achieved from measures chosen by the user.

CalEEMod was developed for the California Air Pollution Control Officers Association (CAPCOA) in collaboration with the California Air Districts. Default data (e.g., emission factors, trip lengths, meteorology, source inventory, etc.) have been provided by the various California Air Districts to account for local requirements and conditions.

CalEEMod is a comprehensive tool for quantifying air quality impacts from land use projects located throughout California. The model can be used for a variety of situations where an air quality analysis is necessary or desirable such as preparing CEQA or National Environmental Policy Act documents, conducting pre-project planning, and, verifying compliance with local air quality rules and regulations, etc.

CalEEMod version 2016.3.2 will be used to estimate construction and operational impacts of the proposed project.

Reference: **Air Quality and Greenhouse Gas Methodology and Assumptions Memorandum**

AIR POLLUTANTS AND GHGS TO BE ASSESSED

Criteria Pollutants Assessed

The following criteria air pollutants are assessed in this analysis: ROG, NO_X, PM_{10}, and $PM_{2.5}$.

Note that the proposed project would emit ozone precursors ROG and NO_X. However, the proposed project would not directly emit ozone since it is formed in the atmosphere during the photochemical reaction of ozone precursors.

GHGs Assessed

This analysis is restricted to GHGs identified by AB 32, which include CO_2, CH_4, N_2O, HFCs, PFCs, SF_6, and NF_3. The proposed project would generate a variety of GHGs, including several defined by AB 32 such as CO_2, CH_4 and N_2O.

Certain GHGs defined by AB 32 would not be emitted by the project. HFCs, PFCs, SF_6, and NF_3 are typically used in industrial applications, none of which would be used by the proposed project. Therefore, it is not anticipated that the proposed project would emit those GHGs.

GHG emissions associated with the proposed project construction, and future operations were estimated using CO_2e emissions as a proxy for all GHG emissions. Construction GHG emissions would be amortized over the lifetime of the Project. In order to obtain the CO_2e, an individual GHG is multiplied by its GWP. The GWP designates on a pound for pound basis the potency of the GHG compared to CO_2.

ASSUMPTIONS

Construction Modeling Assumptions

Schedule

The proposed project would require various tasks including demolition, site preparation, grading, architectural coatings, and paving for the affordable housing and market rate housing. Table 1 shows the anticipated construction schedule based on the assumption that construction would begin in 2021, and it is estimated all construction tasks would be completed by early 2023 (22 months of construction are anticipated); however, construction may extend up to 24 additional months due to market conditions. 22 months is a conservative assumption because potential impacts would be more concentrated rather than spreading construction activities out over four years. It is anticipated that ancillary improvements would occur concurrently with the construction of the facilities, by phase. Project construction would occur six days per week, Monday through Saturday.

Table 1: Project Construction Schedule

Project Phase	Construction Task	Start Date	End Date	Workdays
Phase 1-Affordable Housing	Demolition	6/1/2021	6/30/2021	26
	Site Preparation	7/1/2021	7/31/2021	27

Reference: **Air Quality and Greenhouse Gas Methodology and Assumptions Memorandum**

Project Phase	Construction Task	Start Date	End Date	Workdays
	Grading	8/1/2021	8/15/2021	12
	Building Construction	8/16/2021	12/31/2022	432
	Architectural Coating	11/1/2022	12/17/2022	41
	Paving	1/3/2023	3/11/2023	59
Phase 2- Market Rate Housing	Demolition	6/1/2021	6/30/2021	26
	Site Preparation	7/1/2021	7/31/2021	27
	Grading	8/1/2021	8/15/2021	12
	Building Construction	8/16/2021	12/31/2022	432
	Architectural Coating	11/1/2022	12/17/2022	41
	Paving	1/3/2023	3/11/2023	59

Equipment

The offroad equipment fleet for Phase 1 and Phase 2 construction were generated using default values from CalEEMod. CalEEMod generates construction fleets for construction activities based on the size of the construction areas. Phase 1 would have a construction area of approximately three acres and Phase 2 would have a construction area of approximately 10 acres, therefore, the construction equipment fleet for Phase 1 is based on a three-acre site and Phase 2 is based on a 10-acre site. Construction equipment for each construction activity for Phase 1 and Phase 2 are shown in Table 2. No pile driving is proposed.

Table 2: Project Construction Equipment

	Rollers	2	8	80	0.38

Vehicles Trips

Off-site construction emissions are caused by motor vehicle exhaust from delivery vehicles, worker traffic, and road dust (PM_{10} and $PM_{2.5}$). Construction will only evaluate exhaust emissions since the BAAQMD thresholds for PM_{10} and $PM_{2.5}$ are based on engine exhaust. Table 3 provides a summary of the construction-related vehicle trips. The number of construction workers for each task would fluctuate between 22 and 160 workers per day, with an average of 91 workers per day. The analysis will conservatively assume each construction task to have 91 workers per day, resulting in 182 worker trips per day as shown in Table 3. CalEEMod default values were used to estimate the number of vendor vehicle trips. The number of vendor trips during the

Reference: **Air Quality and Greenhouse Gas Methodology and Assumptions Memorandum**

Building Construction phase is derived from a study conducted by the Sacramento Metropolitan Air Quality Management District (SMAQMD). The SMAQMD trip survey during construction counted cement and water trucks as vendor trips (instead of counting them as off-road vehicle trips) and these trip rates were incorporated into the calculations for the Building Construction phase. The default values for hauling trips are based on the assumption that a truck can haul 20 tons (or 16 cubic yards) of material per load. If one load of material is delivered, CalEEMod assumes that one haul truck importing material will also have a return trip with an empty truck (e.g., 2 one-way trips).

The fleet mix for worker trips is light-duty passenger vehicles to light-duty trucks. The vendor trips fleet mix is composed of a mixture of medium and heavy-duty diesel trucks. The hauling trips are assumed to be 100% heavy-duty diesel truck trips. CalEEMod default trip lengths were used for the worker (10.8 miles), vendor (7.3 miles), and hauling trips (20 miles).

Table 3: Construction Vehicle Trips

Construction Task	Worker Trips per Day	Vendor Trips per Day	Total Haul Truck Trips
Phase 1-Demolition	182	0	72

Operational Modeling Assumptions

Operational emissions are those emissions that occur during operation of the proposed project. The sources are summarized below.

Motor Vehicles

Motor vehicle emissions refer to exhaust and road dust emissions from the automobiles that would travel to and from the proposed project site. The trip generation rates for each phase of the project are shown in Table 4.

Reference: **Air Quality and Greenhouse Gas Methodology and Assumptions Memorandum**

Table 4: Trip Generation Rates

Housing Type	Land Use Type	Size (Dwelling Units)	Weekday Average Daily Trip Rate	Saturday Average Daily Trip Rate	Sunday Average Daily Trip Rate
Affordable Housing[1]	Apartments Mid Rise	162	3.70	3.23	3.14
Market Rate Housing[2]	Apartments Mid Rise	370	5.44	5.44	5.44

[2] W-Trans Traffic Impact Study for 3575 Mendocino Avenue Project. April 2020

Trip Lengths

The CalEEMod default round trip lengths for an urban setting (Sonoma County portion of the BAAQMD) were used in this analysis. Residential trip types are defined as home-work (H-W), home-shop (H-S), and home-other (H-O). The CalEEMod defaults of 31 percent for H-W, 15 percent for H-S, and 54 percent for H-O were used. The trip lengths are 10.8 miles for H-W trips, 4.8 miles for H-S trips, and 5.7 miles for H-O trips. Trip lengths are for primary trips. Trip purposes are primary, diverted, and pass-by trips. Diverted trips are assumed to take a slightly different path than a primary trip. The CalEEMod default rates of 86% for primary, 11% for diverted, and 3% for pass-by were used.

Vehicle Fleet Mix

The vehicle fleet mix is defined as the mix of motor vehicle classes active during the operation of the proposed project. Emission factors are assigned to the expected vehicle mix as a function of vehicle class, speed, and fuel use (gasoline- and diesel-powered vehicles). The CalEEMod default vehicle fleet mix was used for the proposed project.

Area Sources

Hearths

The Project would install a total of 378 natural gas fireplaces. CalEEMod would estimate criteria pollutant and GHG emissions based on default emission factors and operating parameters.

Consumer Products

Consumer products are various solvents used in non-industrial applications that emit ROGs during their product use. These typically include cleaning supplies, kitchen aerosols, cosmetics and toiletries. The default CalEEMod value was used for this project.

Architectural Coatings (Painting)

Paints release VOC emissions. The building would be repainted on occasion. CalEEMod defaults were used for this purpose.

Landscaping Emissions

CalEEMod estimated a total of 180 days for which landscaping equipment would be used to estimate potential emissions for the proposed project.

Energy Use

The emissions associated with the building electricity and natural gas usage (non-hearth) are estimated based on the land use type and size. The electricity energy use is in units of kilowatt hours per size metric for each land use type. Natural gas use is in units of a thousand British Thermal Units per size metric for each land use type.

Water and Wastewater Use

Supplying and treating water for residences generates GHG emissions. Depending on the specific water supply used or treatment method used these numbers can vary over a wide range. Supplying water is bringing the water from its primary source such as the ground, river, or snowpack to the treatment plant. Distributing the water is bringing the water from the treatment plant to the end users. The electricity intensity factors are multiplied by the utility GHG emissions intensity factors for the GHGs and are classified as indirect emissions. The default electricity intensity is from the CEC's 2006 Refining Estimates of Water-Related Energy Use in California using the average values for Northern and Southern California. The location will automatically select the appropriate values if using these defaults. Since the electricity can vary greatly based on locations, the user should override these values if they have more specific information regarding their specific water supply and treatment.

Wastewater may also have direct emissions of GHGs. These depend on the type of wastewater treatment system (e.g., septic, aerobic or lagoons) used and therefore the wastewater treatment type percentages are variables.

Solid Waste

GHG emissions are associated with the disposal of solid waste generated by the proposed project into landfills.

Emergency Generators

The Project would include up to seven propane-fueled generators to be used during grid power outages. Criteria pollutant and GHG emissions would result from testing and maintenance of the generators.

HEALTH RISK ASSESSMENT

The health risk assessment would be conducted in accordance with BAAQMD and the Office of Environmental Health Hazard Assessment (OEHHA) guidelines. The health risk assessment will use the American Meteorological Society/Environmental Protection Agency regulatory air dispersion model (AERMOD version 19191) to estimate concentrations of toxic air contaminants (TACs) and $PM_{2.5}$ at distinct receptor locations. AERMOD incorporates local meteorological data, terrain data, and surface characteristics which influence air pollutant transport and dispersion.

Reference: **Air Quality and Greenhouse Gas Methodology and Assumptions Memorandum**

Health risks would be evaluated for two scenarios:1) impacts to offsite receptors from TACs and $PM_{2.5}$ emissions and 2) impacts to onsite receptors from TACs and $PM_{2.5}$.

Scenario 1

Scenario 1 would include DPM emissions from construction activities and TAC emissions from emergency generator operations impacting existing offsite receptors. During construction, DPM emissions would be generated by offroad equipment operating onsite and heavy-duty trucks traveling on local roadways near the project. Construction DPM emissions were based on the construction schedule and equipment information in Table 1, Table 2, and Table 3. PM_{10} exhaust emissions were used as a surrogate to estimate DPM emissions.

Once construction is complete, the project would include seven propane-fueled emergency generators onsite. Each generator would have an engine rating of approximately 400 horsepower. The emergency generators would generate TAC emissions from combustion of propane. Criteria pollutant and TAC emissions factors were based on data from the Environmental Protection Agency's AP-42, Chapter 3.2. Consistent with BAAQMD guidelines, the emergency generators would not exceed 100 hours of operation for maintenance and testing activities, therefore, the impacts of the emergency generators were based on 100 hours of annual operations for each generator. This scenario also evaluated annual concentrations of $PM_{2.5}$ from these sources.

Scenario 2

Scenario 2 would include DPM and TAC emissions from mobile sources traveling along Highway 101 and TAC emissions from emergency generator operations impacting the project's onsite residents. The HRA evaluated the impacts of DPM from heavy-duty vehicles and total organic gases (TOG) emissions from gasoline vehicles traveling along Highway 101. Emissions factors for mobile sources were based on information from the California Air Resources Board's (CARB) EMission FACtor model, EMFAC2017. Gasoline exhaust and evaporative TOG emissions were speciated into TACs based on CARB speciation profiles as shown in Table 5. Traffic data for the highway segment nearest the project site was obtained from Caltrans' Performance Measurement System (PeMS). Freeway impacts were evaluated for traffic traveling within one-quarter of the project site. Freeway traffic included vehicles traveling along northbound and southbound mainline segments, as well as on- and off-ramps.

As discussed previously in Scenario 1, the project would include seven propane-fueled emergency generators during operations. The emergency generators would emit TACs from the combustion of propane based on 100 hours of annual operation for maintenance and testing activities. Annual $PM_{2.5}$ concentrations from these sources were also evaluated for this scenario.
